The Immanuel
Velikovsky Archive

Org

Im. Velikovsky

This archive is being maintained by a team of historians to ensure the integrity and preservation of Immanuel Velikovsky's unpublished writings; it is strictly non-profit and its sole purpose is the advancement of education and scholarship.

Days and Years, an autobiography giving an account of Velikovsky's life from the earliest years until 1958.

Before the Day Breaks, the story of Velikovsky's discussions with Einstein on the role of electromagnetism in the universe.

In the Beginning, the story of the catastrophes that preceded those described in *Worlds in Collision*.

The Dark Age of Greece, a critical examination of the mysterious gap of close to five centuries thought to follow the Mycenaean civilization.

The Assyrian Conquest, a volume in the *Ages in Chaos* series, covering the period from the end of the Amarna Period to the time of Ramses II.

Collected Essays, comprising articles and fragmentary manuscripts such as *Shamir*, *The Secret of Baalbek*, *Sinai and Olympus*, *Test of Time*, *The Orbit* and the 'Observer' editorials.

The Psychoanalytic Papers from the years between the two world wars when Velikovsky was a practicing psychoanalyst.

Correspondence selections from Velikovsky's scholarly correspondence spanning more than fifty years.

More Federn correspondence from 1957-58

Lectures including an [audio recording](#) of Velikovsky's talk at Eastern Baptist College in Wayne, Pennsylvania and [transcripts](#) from the 1974 AAAS Symposium.

“From Book to Book and Land to Land”

May 5, 1966

(click on the photo to play the audio)

This is an audio file, compressed using the standard MP3 format, of Velikovsky’s lecture “From Book To Book And Land To Land,” at Eastern Baptist College in Wayne, Pennsylvania. It lasts just over 51 minutes.

Transcripts of the Morning and Evening Sessions
of the A.A.A.S. Symposium on
“Velikovsky’s Challenge to Science”
held on February 25, 1974

Transcribed and Edited
by Lynn E. Rose

INTRODUCTION

Full, verbatim transcripts were prepared by me between 1977 and 1979, covering both the Mornig Session and the Evening Session of the A.A.A.S. Symposium in San Franscisco; these were based not only upon my own tapes but also upon other tapes kindly provided by Warner B. Sizemore and by Frederic B. Jueneman. A few spots that have remained inaudible are marked with “[?],” “[inaudible],” or the like.

*The prepared papers themselves are simply mentioned at the points where they were delivered; they are not included as part of the transcripts. All six of the speakers eventually published papers elsewhere anyway, either in *Pensée IVR VII* or in *Scientists Confront Velikovsky*, or in *Velikovsky and Establishment Science (Kronos III:2)*. Velikovsky’s paper was ready to be printed on the very day of the Symposium, and three of the other papers were also published more or less as delivered. In various noteworthy respects Huber’s paper was established altered prior to publication (See *Kronos IV:2*, especially pages 33-34 and 53-54). Sagan’s own paper, as many now realize, was radically revised and greatly expanded, virtually into a new paper. Much of that new paper, including all of the much-touted Appendices, was not seen by Velikovsky or by any of his supporters until nearly two years after the Symposium. Meanwhile, Velikovsky was being required to answer in 30 days a paper that Sagan had taken nearly two years to produce! But that is another story.*

The editing of the transcripts themselves has in nearly all cases been by way of deletion. If a speaker repeated the same word, or the same string of words, I have deleted the repetitious material. If a speaker made an error, and immediately corrected that error, I have deleted the incorrect version. If a speaker began a sentence, abandoned it, and started a new sentence, I have deleted the incomplete sentence. (All “uhs” and the like have also been deleted.)

If a speaker made an error, and did not correct it himself, I have not amended his actual remarks. In such situations, and in other situations as well, I have sometimes inserted editorial notes in square brackets. But I emphasize that everything not in

square brackets was actually spoken.

For the sake of readability, I have sometimes deleted a superfluous word, or even an inappropriate s. In other cases, an ungrammatical form has been deleted in its entirety, but then replaced by the correct form in square brackets.

Let me illustrate some of these editorial procedures. When Velikovsky referred to his New York Times article of the “twenty-first of July, nineteen thirty-sixty-nine,” I simply deleted the “thirty.” But when Velikovsky referred to Hatshepsut of the “Nineteenth Dynasty,” and did not catch himself, I let that stand, and added a correction in square brackets. At one point Storer’s actual remarks were: “No, I don’t, I don’t think that the, the panel has been set up. It’s not rigged. and as far—It’s, It’s an occason for the public to watch a scientific debate.” After deletion of the repetitions and the false start, this became: “No, I don’t think that the panel has been set up. It’s not rigged. It’s an occasion fro the public to watch a scientific debate.”

Two of the participants (Velikovsky and Huber) were not native speakers of English, but I think it should be pointed out that the remarks of all of those who spoke (myself as well, when I rasied a question from the audience) seemed to cry out for the kind of vetting by deletion that I have just illustrated in the case of Storer. All of the participants have benefitted about equally from this. In no case have any of the editing procedures affected matters of substance.

Lynn E. Rose

THE MORNING SESSION

KING:

Good morning. I would like to welcome you to this first session of the American Association for the Advancement of Science, and to apologize, first of all, for our delay in getting started. One of our speakers has not yet arrived.

One of the funcitons of the A.A.A.S. is to act as a bridge between scientists and the public, and, as science becomes more specialized, this responsibility becomes more important.

Today we are going to consider a set of ideas that have at their core a completely unconventional picture of planetary motion. Most scientists would say that this picture is totally impossible, because it violates many of the most firmly established principles of physics.

To this Dr. Velikovsky would reply that there is overwhelming evidence that these events really did occur, and that, if they cause difficulties for the scientists, it is up to the scientists to resolve their own problems.

No one who is involved with the organization of this symposium believes that Dr. Velikovsky's ideas are correct. Yet millions of people have read his books, and, after more than twenty years of condemnation by the scientific establishment, he still has a large and often devoted following.

It is for this reason that we believe that discussion of his ideas at a meeting of the A.S. A.S. is a public service. It's in this spirit that we present this morning's symposium.

The program includes six speakers. Since early on the first morning of the meeting some of you will have been unable to visit the registration desk to pick up your programs, I'll outline it briefly.

The first speaker is going to be Professor Norman Storer, of the City University of New York, who will give a sociological talk devoted to "The Sociological Context of the Velikovsky Controversy."

Then we'll have Professor Peter Huber, of the Eidgenössische Technische [sic] Hochschule of Zürich, who will talk about "Ancient Historical Records."

The third speaker will be Dr. Velikovsky, whose talk is entitled "The Challenge to Accepted Ideas."

Fourth will be Professor J. Derral Mulholland, of the University of Texas, who will talk on "Considerations of Dynamics."

We will then have Professor Carl Sagan, of Cornell University, speaking on "Venus and Dr. Velikovsky."

And the sixth speaker will be Professor Irving Michelson, of the Illinois Institute of Technology, who will give a talk entitled "Mechanics Bear Witness."

And, finally, as we have it scheduled, there will be an opportunity for Dr. Velikovsky to give an answer at the end of the program.

I would like to remind you also that our schedule goes on just this morning. We must vacate the room by one o'clock, and I do hope that if [only for the sake<] of the weariness of the audience, that we don't go on that long. [laughter]. But we will resume our meeting again at seven-thirty this evening, where we will have all the panelists at that time seated on the platform, and we will have an open discussion, without any formal program, with the opportunity for everyone who wishes to participate.

We will have an opportunity after each speaker talks this morning for questions from the audience. I would like to ask that the questions be framed in the form of questions, and that members of the audience not use the occasion to make speeches [laughter]; I am sure you will bear with us on that. The time is somewhat limited, and we'll do our best.

Each speaker will have twenty minutes, and after each speaker we'll have about ten minutes available for the discussion. There will be one exception to this rule. When the program was originally put together, Dr. Velikovsky insisted that he should have at least thirty minutes for the presentation of his ideas. I only learned last night that Dr. Velikovsky intends to overrun even this time limit. I can only deplore this, and hope that Dr. Velikovsky will return our courtesy in inviting him here by keeping the length of his talk within reasonable bounds. [laughter].

Well, you haven't come here to hear me talk, [laughter] so let's move on now to our program. [laughter] The first speaker is Professor Norman Storer, of Baruch College in the City University of New York, where he is Chairman of the Sociology Department. Professor Storer has made a speciality within sociology of studying the sociology of the scientific community, and he is going to give us a talk entitled "The Sociological Context of the Velikovsky Controversy."

And may I mention that I have, courtesy of my wife, a little timer, and I'll ring a bell at eighteen minutes and set it again for two minutes.

STORER [to King]:

Do you want me to field questions ... [inaudible]...?

KING [to Storer]:

I will come up again and help you take questions.

STORER [to King]:

Great.

STORER:

[Storer's paper, entitled "The Sociological Context of the Velikovsky Controversy" was presented at this point.]

That's the end! [applause]

KING:

We have some time now for questions from the other participants or the audience. Yes.

QUESTIONER:

Yes, Dr. Storer?

STORER:

Right.

QUESTIONER:

Yes, I would like to comment on the introduction that Dr. King gave, which, to me, put this symposium in the context of the recognized scientists' setting the layment straight on what's really going on, with no mention of the validation of some of Dr. Velikovsky's assertions, not that that makes his conclusions correct.

STORER:

All right. The question is, would I comment [delayed applause], would I comment on Professor King's introduction, which the questioner *construed* as saying, "Here is the real science, and we're gonna show you people what's wrong with Dr. Velikovsky." I don't think it needs to be read that way. [laughter] As a matter of fact, my stance, anyway, is, is determined, dogged neutrality on this. [laughter] Nobody would believe me if I said, sure, comets do this or that.

No, I don't think that the panel has been set up. It's not rigged. It's an occasion for the public to watch a scientific debate.

STORER and KING [briefly conferring]:

... [inaudible]...

STORER:

Next, the lady over there.

QUESTIONER:

As a sociologist, I would seriously like to challenge a great many of the things that Professor Storer has been telling us about the sociology of science. I can't begin to go into some of the reasons why I feel it's very much open to question. I would like to recommend that some of you look at Stuart Blume's *Toward a Political Sociology of Science*. And he also ... [inaudible]...the power of lobbying.

STORER:

Could you give the second reference again?

QUESTIONER:

The separate table of the power of lobbying... [?]

STORER:

Oh, I see. Yeah, I happen to be reading that book right now. It's a good book.

QUESTIONER:

Stuart Blume, *Toward a Political Sociology of Science*.

STORER:

Toward a Political Sociology of Science, by Stuart Blume, published by Free Press in this year.

KING:

Back there.

QUESTIONER:

I wonder if Dr. Storer, offhand, could give me just two examples in which a brilliant new idea now accepted as fact was welcomed by the scientific community. [laughter, applause]

STORER:

I am tempted to defer this to some of the historians of science here. [laughter] It's my understanding that Albert Einstein's ideas met very little resistance among the top physicists of that day. You disagree with that statement.

QUESTIONER:

...[inaudible]... the mathematicians.

STORER:

I'm sorry, What?

QUESTIONER:

He was attacked by the mathematicians. The second rank took him off.

STORER:

Oh. [laughter]

KING:

Dr. Mulholland.

MULHOLLAND:

I would like to reply to the last question. I think, [laughter] I think two examples that can be brought to answer that question are the discovery of mass concentrations on the Moon and the internal heat in the Moon, which have both thrown the discussion of the history, the evolution of the Moon, into a state of extreme excitement, and has totally rejuvenated the entire subject. [applause]

KING:

I should mention that, with the lights shining in our faces here, it's a little bit hard for me to see people's hands, so raise them high.

QUESTIONER:

May I ask—

KING:

Yes.

QUESTIONER:

I would have thought the normal way of dealing with a crackpot is to ignore him. Is it the usual practice in scientific publications to review books by proclaiming that you have not read them before you review them? [laughter]

STORER:

It's frequently charged by the injured authors of those books, [laughter] and denied just as often by the men who did review them.

KING:

One more question.

VOICE:

Mr. Velikovsky had his hand up.

KING:

Oh, I'm sorry. Did you wish to say something? [laughter]

VELIKOVSKY:

I wish to ask Professor Mulholland whether he knows who was the first to claim, in time, a steep thermal gradient under the surface of the Moon?

I wish to also ask whether there is an explanation for the mascons on the Moon, beside the explanation that the Moon was close to some heavy, gravitating body that pull out some mass towards the surface? [applause]

And besides, would you consider these two observations as fundamental theories?

VOICES:

No, no.

KING:

Can you answer that briefly?

MULHOLLAND:

Yes. [delayed applause] I regret to say I do not, in fact, know who might have first suggested the Moon was hot inside. I will acknowledge definitely that Dr. Velikovsky did so, many years ago. And I must blushinglly admit that he has put a finger on a weak point in my statement, because what I have as the response a few moments ago were observational determinations rather than theoretical structures. [applause]

VOICE:

I think we refuted it ...[remainder inaudible]...

KING:

I am sorry we have not been provided with a second microphone. What I will ask, since it's understood that people are asking questions rather than making speeches, I'll ask that, if a question is not easily audible, that the person who is up here at the microphone repeat the question, as Dr. Storer did with at least the first question that was asked of him.

We'll move on to our second speaker now. Professor Peter Huber, of the Eigenössische Technical [sic] Hochschule in Zürich, has made a study of the ancient archaeological records relating to astronomy. He also, incidentally, has a second specialty in statistics, and we're very pleased to have him speaking to us today on "Ancient Historical Records" Professor Huber. [Huber, of the Eidgenössische Technische Hochschule in Zürich, has statistics as his first and only professional specialty. He also, incidentally, has repeatedly described himself as a "hobby-assyriologist." Thus King has conferred upon Huber a profession status that Huber does not have. The A.A.A.S. Program misrepresented Huber in the same sort of way, describing him as a "Prof. of Ancient History" }page 23].]

HUBER:

[Huber's paper, entitled "Early Cuneiform Evidence for the Planet Venus," was presented at this point.]

That's the end! [appluase]

VOICE:

Question?

KING:

Dr. Velikovsky says he has several questions, and would like to use the microphone for them.

VELIKOVSKY:

Understand, I had not chance to have your paper before this morning, so I did not know the phenomena that you would record.

We had yesterday a short chat. You mentioned that the most important statement is an eclipse that was calculated for something like—what would it be?

HUBER:

Perhaps I get the document. [pause] What is most important eclipse is a total eclipse of -708 [astronomical; 709 B.C. would be historical], July—which, I've forgotten—July 17, which—

VELIKOVSKY:

It is from China?

HUBER:

It's from China, from these Spring-Autumn Annals.

VELIKOVSKY:

What is from Ras Shamra? You spoke of Ras Shamra.

HUBER:

No, I didn't mention Ras Shamra.

VELIKOVSKY:

But you mentioned to me yesterday—

HUBER:

No.

VELIKOVSKY:

—that most important—

HUBER:

No, not Ras Shamra.

VELIKOVSKY:

Fine.

HUBER:

I'm sorry.

VELIKOVSKY:

Well, Chinese date, was in this document mentioned also the place?

HUBER:

For this particular eclipse the place is not mentioned, but—[laughter]

VELIKOVSKY:

As long as—

HUBER:

But there is something else. For some other eclipses it is mentioned that the eclipse happened in the province. The inference is that this particular eclipse happened at the capital. And to make it precise, what I mean is, if you take the probably most reliable eclipse we have now from antiquity, it's the Babylonian eclipse of -135 [astronomical; 136 B.C. historical], and use this to determine the—

VELIKOVSKY:

Which eclipse?

HUBER:

Babylonian eclipse, -135. We only learned about it last December. [laughter] It's very definite, description of a total eclipse, with all the details. If you take this eclipse, which is absolutely certain, and—

VELIKOVSKY:

That's 135?

HUBER:

Ja. And if you use this eclipse to determine the values for the secular accelerations, and calculate back to -709 [historical], you obtain the eclipse as total right at the capital of where this dynasty was reigning.

VELIKOVSKY:

Let me ask you, Professor Huber, are you familiar with the same discussion that I had with Princeton astronomer Stewart, printed in June, 1951 issue of *Harper's*?

HUBER:

Ja.

VELIKOVSKY:

You are. He brought at that time, on the basis of a lecture of Fotheringham, three ancient eclipses: one from China, one from Assyria, one from Babylonia. I replied. Stewart claimed that three only existing established dates of full solar eclipses. I replied. I have the reply with me. Do you agree with Fotheringham and my opponent, or do you agree with me today?

HUBER:

I agree you were quite right in rejecting these three Fotheringham eclipses as right evidence.

VELIKOVSKY:

Yes.

HUBER:

[They are] not well-dated.

VELIKOVSKY:

So—

HUBER:

The date is established astronomically in these cases.

VELIKOVSKY:

So in that case we will say so, that the argument that was brought by astronomers in 1951 in the debate on the pages of *Harper's*, three eclipses as if established, were,

well, answered by me, and I showed that none of them was really an eclipse, neither the date could be a date of eclipse, because an eclipse doesn't happen on the twenty-sixth of a lunar month, neither the places were indicated, and neither they fit into chronology. Place is very important. If the total eclipse is in Brazil, you cannot look into records of North America.

Now, next question. Do you believe that, as you have written to me, there is some very strong argument, for one specific eclipse that is beyond any doubt, established by Stephenson, I believe?

HUBER:

Stephenson and Muller, yes.

VELIKOVSKY:

Did they publish their work?

HUBER:

It's not yet published. I learned about this last January.

VELIKOVSKY:

Yes.

HUBER:

It's going to be published in the proceedings of a conference on changes in the rate of rotation of the Earth—

VELIKOVSKY:

Do you know the year of the eclipse?

HUBER:

Which eclipse do you mean?

VELIKOVSKY:

Of Stephenson, the one he claimed [as] the one, and you believe it is the most strong evidence?

HUBER:

The most strong evidence against these catastrophes, in minus sixteen [presumably meaning the eighth century]—?

VELIKOVSKY:

Yes.

HUBER:

That is the one of minus seven hundred and eight, July 17.

VELIKOVSKY:

No, I asked you about the work of Stephenson.

HUBER:

Yes, that's the work of Stephenson.

VELIKOVSKY:

Did not Stephenson wrote about the eclipse discovered in the library of Ugarit?

HUBER:

I am not aware of—

VELIKOVSKY:

Are you aware of his publication in *Nature*?

HUBER:

Which publication in *Nature*? We had a discussion—

VELIKOVSKY:

About the eclipse yesterday.

HUBER:

We had a discussion—

VELIKOVSKY:

Yes.

HUBER:

—yesterday—

VELIKOVSKY:

About the eclipse.

HUBER:

—and we couldn't agree on which publication it was.

VELIKOVSKY:

He published only one papaer in *Nature* on one eclipse, that he believes this is the only one [that early] that he established with complete, absolute, so to say, firmness, and he referred to the library of El-Amarna [meaning Ras Shamra].

HUBER:

I am not aware of that.

VELIKOVSKY:

You were not aware. It was published in *Nature*. It was published by Stephenson in *Nature*. This issue is of November 14, 1970. He speaks about the eclipse of 1375. He believes that this is the only one [that early] that is established beyond doubt, and let me say, if you have read my *Ages in Chaos*, you know, of course, that Ugarit is no more, in reconstruction, related to the fourteenth century, the library of Ugarit, but to the ninth century. So in that case of course, all the calculation would not fit.

Interestingly, also, it is said that Rashap, which is Mars—correct?—was in attendance. Interestingly, this eclipse is described in Greek sources; [it] is described, however, as something very different from regular eclipse. The Sun was disturbed in its motion, and Stephenson printed: “The Sun went down (in the daytime) with Rashap [or Mars] in attendance.” And we have exactly the same statement in Greek sources, referring to the date when Romulus supposedly was born, that Mars caused disturbance in movement of the Sun, and at the same time it occurred that Sun and Moon were in eclipse.

Well, let us come to the question of Sumerian materials that you claim that Venus was referred [to] in early ages. You refer to 3000 B.C., and to 1900 B.C., and to the time of Ammizaduga tablets.

Now, let me ask you, this Sumerian hymn, in your opinion, refers—and is the best proof that Venus was already observed earlier that it became a morning and evening star. That Venus was observed before it came into conflict with Earth is clear from what I wrote. It did not come from Jupiter just on the eve of that collision. [laughter] It came thousands of years before. It could be seen. However, you are right. In that hymn, Venus is referred [to] as connected with morning and evening. But what is else in that hymn? And I am very thankful to you for giving me the text of that hymn.

First, it is in Sumerian. Sumerian as a living language really extinguished rather early. But Sumerian was the Latin of the cuneiform-writing people, and it survived as long as Latin survived, past the Roman Empire, so the fact that it is written in Latin doesn't say much about the age.

Here is spoken about Inanna. Let us assume that Inanna referred to Venus. So we know that Ishtar—and I stressed this in my book—at some time in the past was the name for Jupiter, became later the name for Venus.

Now, “Inanna shines as bright as the Sun,” Is Venus shining as bright as the Sun today?

Now, in the same hymn, says, Inanna is a star foreign to use, *fremdartige Stern*, not from this family.

Now, it's again said, on daytime, on midday, it shines as bright as the Sun. Does it today?

HUBER:

I... [inaudible]...

VELIKOVSKY:

Also it says during the night as the Moon.

HUBER:

You are twisting the translation from German into English.

VELIKOVSKY:

“Zur Natchzeit sendet sie Licht aus wie der Mond, am Mittag sendet sie Licht aus wie die Sonne.”

HUBER:

Which means that—

VELIKOVSKY:

“shined as bright as the Moon in the night, shined as bright as the Sun—”

HUBER:

The “bright” is not there.

VELIKOVSKY:

Where is?

HUBER:

She sends out light like the Sun.

VELIKOVSKY:

Like the Sun?

HUBER:

And this passage—

SAGAN:

Dr. Huber, talk into the microphone, I can't hear.

HUBER:

Yeah. This passage, actually it was used by Schaumberger in the third *Ergänzungshefte* [to Kugler's *Sternkunde und Sterndienst in Babel*] as an argument that Venus was visible during the day, and you quote, in *Worlds in Collision*, that passage from Schaumberger, if I remember correctly. [See *Worlds in Collision*, page 164.]

VELIKOVSKY:

Yes, and I quoted many other passages from Babylonian sources that say that Venus is like a torch, like a torch in the sky, that Venus covers all the sky. And this is not only from Babylonian sources.

Now, also there is spoken about honey and cakes being given to Inanna. If it is Venus it would be exactly what was given later to Athena, and which is also observed in so many religious cults up to today. [laughter]

Now, let me ask you, [laughter] as to this Sumerian hymn, it would be good if you could discuss it on the basis of the original, because this is the German translation, again translated into English. do you read Sumerian? [laughter]

HUBER:

I read cuneiform, but I do not really speak the Sumerian language. [laughter]

VELIKOVSKY:

No, I didn't ask whether you speak Sumerian language. I asked you whether you read Sumerian language.

HUBER:

I'm not so familiar with Sumerian as a Sumerologist would be.

VELIKOVSKY:

Fine. So you are not familiar with Sumerian language. [laughter] Let us say, let us ask you, [as laughter finally dies away] let us ask you whether cuneiform in Akkadian language is, well, your main occupation. Do you teach cuneiform or ancient history in Zürich?

HUBER:

No, I don't.

VELIKOVSKY:

You don't. So you don't teach [them]. You teach, I understand, and you are very foremost in the field of statistic, and it is correct that Akkadian language, self-taught, is your hobby?

HUBER:

Yes.

VELIKOVSKY:

Correct?

HUBER:

Not quite self-taught.

VELIKOVSKY:

Well. Well. [laughter] Now let us say this. The Babylonian sources, by Weidner and by many others, show the fact that for long periods of time, as also in India, [there] was in Babylonia four-planet system. Later Venus was figured, as you have seen, together with the Sun and the Moon, in a triad, separately from the planets, and it was called the new planet that joined the other planets.

And then it of course was referred to as moving not in a perfect orbit. Here were the tablets of Ammizaduga. As to tablets of Ammizaduga—in the hard-cover edition of *Worlds in Collision*, pages 199-200 [the entire discussion being cited extends from page 198 to page 200], if my memory is right, are dedicated.

It is not as it was shown here [in Huber's slides], *if* Venus—this is a translation,

because otherwise it could not be understood. In the Akkadian text there is no such things as, *if* Venus appears on this day or on that day, Just it is said, it appears on this day or on that day. And there is a way to check on it. It is mentioned. It appears on that day. It disappears on that day. And in between are so many days. You have the way to check, because if from fifteen of Sivan to the seventeen of Tammuz, or whatever the dates are, you can calculate by the calendar, but, interestingly, by the calendar of thirty days in a month, and thirty days in the month without intercalary months is the prerequisite to understand what is going on there.

Those who try to understand those tablets and to translate them needed to correct the translators and ascribe to scribes great errors. West is changed into east. Evening is changed into morning. Nine months and five days are changed just into five days [the interval of nine months and five days is based on B.M. 36395; several otehr tablets suggest that the interval was nine months and four days], to make sense, because as today, Venus, when in inferior conjunction, which means between the Earth and the Sun, disappears from sight for approximately one single day, but when it is in superior conjunction, which means when the Sun is intervening between Venus and the Earth, today it is about—not always exactly so—two months and six days.

Now, in the tablets it is nine months and several days, and very different other figures which are not given to understanding. It is nothing of the “if.” It is just as it is.

Now, interesting again, as I say, it is a calendar of thirty days, without intercalary months, even if there are two references to Elul the second. Will you say that there is no refernec ein Langdon and Fortheringham to thirty-day calendar, without intercalary—

PANELIST:

Give him the microphone.

PANELIST:

Give him the mike!

KING:

Could you let Dr. Huber have the microphone?

VELIKOVSKY:

Yes.

KING:

He has a number of things to answer now.

VELIKOVSKY:

Yes.

HUBER:

One point is the question of the “if.” Now, that’s really a question pertaining to essentially all omina. Many of these omina begin with just a vertical bar at the

beginning. Now this vertical bar is either the stenographic notation for summa, “if” or it’s something like our horizontal bar, if you make a list. Usually it’s taken as the “if” nowadays, and I just joined the majority. It doesn’t really matter if you replace it by a horizontal bar. The factual meaning is the same.

But the question of the intercalary months is: we have intercalary months from documents which were written in the old Babylonian times, and I thought I made quite a fuss about the fact that seven intercalary months were recorded in contracts written in the time of Ammizaduga, and that these same intercalary months could be established from the Venus tablets. [Actually, there are eight or even nine attested intercalary months from the time of Ammizaduga, and only four of these clearly fit the months that would be required for a uniformitarian reading of the Ninsianna tablets; in addition, there are three months required for a uniformitarian reading of the Ninsianna tablets that are *not* attested from the time of Ammizaduga: Huber’s claimed seven-for-seven fit is a fabrication.] That was my main argument for establishing the date of the Ammizaduga tablets. And these intercalary months are discussed by Fortheringham in Langdon-Fortheringham-Schoch. That’s one comment.

The second comment, you said something about Venus joining the ranks of the great stars, if I am quoting correctly. Now, I followed that quote through. This is one of the quotes which I mentioned in the beginning, as they are based on a questionable translation. I took care to take along the cuneiform text of that. And I can tell you exactly what happened there. The cuneiform text has something—Now, “the great star which is beyond the great stars which in the certain part of the sky.” Now, “the great star which is beyond the great stars.” That is a literal translatoin. Somehow, this got into “the great star which joins the great stars.” But there’s a grammatical technicality involved. Akkadian doesn’t have the superlative. You have to express the superlative by syntactical means, and what this means is nothing more [than] “the great star which is the greatest of the great stars” which is, oh, that’s a grammatical question. And I didn’t want to go into these details, but since you started it, I have to do it.

VELIKOVSKY:

I wish to refer again to Ammizaduga tablets. Ammizaduga tablets were tablets describing twenty-one years of appearance and disappearance of Venus. These tablets were ascribed by [that is, “to”] Ammizaduga by Jesuit Father Kugler. Before this they were thought by astronomer and orientalist Schiaparelli, as referring to events of the seventh century B.C., not of the time of Ammizaduga., which would be fifteen, fourteen, or whatever century, or even earlier.

Now, again, what is the time of Ammizaduga? Ammizaduga was the last king of the First Babylonian Dynasty that started with Hammurabi. When I started my work, the research on it, Hammurabi was put in twenty-second century. Since then, the work of Albright and Sidney Smith reduced it more and more, until today it is 1680, approximately, the time till when Hammurabi ruled, and Ammizaduga would be at least a hundred years later. So Amizaduga would be in that case just before the time of the Exodus, or the end of the Middle Kingdom in Egypt.

But if Hommel and Schiaparelli are right—and there is reason to think that they are right—the reason is exactly the fact that the calendar used in these calculations of

the scribes is thirty-day months, and there is no mistake on this. This needed to be stressed. When in the tablets it is mentioned from this day to that day, immediately is given also the way of checking, by number of days inserted—not inserted later, inserted immediately in the text—they show that the months were thirty days long, and there were only twelve months, and there were no intercalary months, even if some occasion was Elul second.

Now, on this basis, I come now to the conclusion to which I had not yet come when I wrote *Worlds in Collision*, namely, that those tables were a little earlier than Schiaparelli thought, but not much earlier. Certainly they are not of the time from the First Babylonian Dynasty. It would make no difference for the thesis that the catastrophic events took place, that Venus did not move as it moves, but it is just for the purpose of establishing something of historical value.

Thirty-day months, twelve months, year of 360 days> as I put quite a long list, actually, from all ancient calendars, from Incan and from Mayas, from Peru—which [Mayas] means in Mexico—from all ancient European, like ancient Roman and Greek, and also Asian, near Eastern, and Far Eastern civilization. From each of them I put quotes from authority: twelve months of thirty days, strange as it is, without intercalary. Intercalary months were brought later in. And so later there were two Moon's calendars, Moon calendar of thirty days, and the new Moon calendar.

Well, in these circumstances, I come to the conclusion that Amizaduga tablets were created between the time of the catastrophic events of the middle second millennium and the catastrophic events that took place from the 776 on, from which the Greeks counted their Olympian Age, and more probably in the later part of it [that is, probably in the tenth, ninth, or eighth century], and then it will be very plainly what it is.

However, this disappearance to nine months and more, interestingly, is not a disappearance due to going of Venus beyond the Sun, as it would be in superior conjunction, because even then Venus was seen like a torch, and going behind the Sun would not hide it enough.

However, we have a series of data from many civilizations, also from China, like Soochow table, that Venus at that time was traveling to the south, was not traveling in ecliptic, which means in the plane of Earth's revolution. It was traveling to the south and reaching the star Sirius. Now, this is in various sources. Now, in that case, the disappearance of Venus would follow, not from going behind the Sun, but from disappearing as any southern star would disappear from the northern latitude where Babylonia or Egypt are located.

Thank you. [applause]

KING:

This is a discussion that clearly could go on for a long time. [laughter] I have put my head together with Dr. Huber, and have induced him not to reply to this until the evening session, in the interests of getting on with our morning program. During the evening we will have a free discussion, and I think I can freely predict that this particular vein will continue. [laughter]

Our next speaker on the program is Dr. Velikovsky. [laughter, applause] He has informed me that he has prepared a manuscript which he has gotten together in the

interests of speaking clearly, so that everyone will understand what he has to say. I have already said that I regret the length of it, but we'll allow him time to go through this manuscript. [applause]

VELIKOVSKY:

[Velikovsky's paper, entitled "[My Challenge to Conventional Views in Science](#)," was presented at this point.]

And thank you. [applause, lasting 35 seconds]

KING:

Thank you very much for your talk, Dr. Velikovsky, and also for your excellent and clear delivery.

I am getting very concerned about the hour of the day. We have three speakers remaining. We had planned a half hour per speaker, including the discussion, and we must be out of this room by one o'clock. Things are going to be very tight.

I will ask if there are any questions now that can be answered briefly, and I would like the answers to be brief, because we must get on to the other speakers. Yes.

QUESTIONER:

I was wondering if any of Dr. Velikovsky's predictions have turned out to be untrue so far, and if he would talk about those, if there are any, I don't know.

VOICE:

Repeat—

KING:

The question is, have any of Dr. Velikovsky's predictions turned out so far to be untrue, and would he discuss those?

VELIKOVSKY:

I do not know of any prediction proven to be disproven.

Professor Hess, the late Chairman of Geology at Princeton, who claimed that he knows at least one of my book by heart, *Earth in Upheaval*—it is a required reading in geology and paleontology at Princeton for over fifteen years—he was also Chairman of the Space Science Board of National Academy of Sciences that has supervision over NASA activities—he made a public statement in writing that my predictions were made long in advance of discoveries, that when they were made they were far away from what was commonly thought, and actually in contradiction, and that he does not know a single prediction that went wrong. If anybody knows, let me hear.

KING:

Dr. Sagan.

SAGAN:

Right. These microphones wired?

KING:

I think this is the only one that is connected yet.

SAGAN:

I think I know a large number of predictions which are incorrect, and I also think that I can show that the ones which are correct are not original with Dr. Velikovsky, but I will get to that when it's my talk.

What I would like to ask, just to ask a specific question. In Dr. Velikovsky's presentation to us now, he has said that the hydrocarbon clouds of Venus are consistent with all ultraviolet, visible, near infrared and far infrared observations, with the refractive index, and the volatility.

That is not my impression, so I'd like to ask, which organic compound has a refractive index of 1.44, as we know the Venus clouds do, from the polarization data, has a 3.1 micron and 11.2 micron absorption feature in the infrared, and is able to explain the discontinuity in the water abundance above and below the clouds?

I ask this because about a seventy-five percent solution of sulphuric acid explains all of these very well, and I know of no organic compound which does. And I've read the papers by Burghstahler and Velikovsky in the latest issue of *Pensée*.

VELIKOVSKY:

What Professor Sagan here said is in advance of what he will say, so I cannot judge what he would claim as wrong predictions. I had only the chance to read *Newsweek* magazine statement this week, in which Sagan was quoted, after his visiting *Newsweek* editorial staff, that Velikovsky predictions are either very vague, or they are in contradiction to physical laws, or that they are not original.

I believe that he will have a hard time to prove this. Maybe we will not be able to discuss it all in the morning session. We will have the evening session; then we'll discuss it at greater length.

But let us go to the question of the Venus clouds. I claimed about Venus number of things, and all of them went into fulfillment.

I claimed about Venus that it would be found incandescently hot when it was thought that it is not much above the terrestrial annual mean temperature.

I claimed that Venus was disturbed in its rotation.

I claimed that Venus has a very massive atmosphere at the time when my opponent and critic, the Royal Astronomer of England, Spencer Jones, claimed that Venus has less atmosphere than Earth, and as you know now, there are about ninety, maybe ninety-five atmospheric pressure close to the ground.

Now, as to the composition of the clouds, let us say the first thing this. The question of recentness of Venus is solved by the question of the origin of Venus' heat.

Professor Sagan clings to an unsupportable statement that this heat could have been a result of greenhouse effect. We will discuss this. already many authorities—

VOICE:

That's not the question.

VELIKOVSKY:

Already many authorities put it clear: it could not.

Now, in the last issue of *Pensée*—which, by the way, will be found at the door of this hall, where representative of that Student [Academic] Freedom Forum organization has a table—I was given the opportunity to answer Professor Burgstahler, chemist of University of Kansas—[aside to Lorraine Spiess] I wish number VI—as to the constituency of clouds..

I never put it that clouds must be composed of hydrocarbons. [Notice that this statement already makes the “specific” part of Sagan’s question irrelevant.] I have, however, claimed that Venus had hydrocarbons three and a half thousand years ago, and some of the deposits of petroleum on Earth came from Venus’ clouds, or trailing part of it.

But I also introduced this statement by words, “I assume.” I also said under what circumstances they can be found and where: in the deep infrared, and probably not at the top of the clouds, because, as heavy molecules, by physical law they will not be *there*.

But then again, Burgstahler came up, in this article of his, review of the literature, with the idea that more probable sulphuric acid diluted in twenty-five percent of water reflect the conditions in various parts of the spectra.

I answered, and the answer in here in *Pensée* instead of quoting my answer, which can be read, on page 31, is a table that answers Sagan.

SAGAN:

It does not.

VELIKOVSKY:

The table is not my words. The words are of Burgstahler. As to the refractive index, as to the volatility, as to the ultraviolet spectrum, as to the near infrared, as to infrared, and as to deep infrared. In no occasion is any word of mine.

And there is also a statement of Burgstahler, added to my article: he “appreciate ... Velikovsky lucid discussion... I appreciate...of my article,” of his article, “and especially the provocative tabular presentation of the spectral comments drawn from it.” [Burgstahler’s complete statement was: “I appreciate Dr. Velikovsky’s lucid discussion of my article, and especially the provocative tabular presentation of spectral comments drawn from it.” He then acknowledges Velikovsky’s priority in explaining the yellowish coloring of Venus, and mentions the possible “compatibility of sulfuric acid clouds with the sustained presence of appreciable amounts of hydrocarbons, especially in the lower regions of the atmosphere.”]

Now, the question was put to me, which of the organic molecules has the refractive index of 1.44. Let me say this, the entire problem started with an article by Professor Plummer, of University of Massachusetts, who published on the fourteenth of March, of 1969, in *Science* magazine, an article questioning the presence of hydrocarbons in the clouds of Venus. I answered this article; however, [I have] not reworked it to the desire of the reviewers for *Science*, and it was printed now here in

Pensée.

The question was of the refractive index, who claimed what. Plummer claimed water. Sagan claimed water. I claimed there is no water, because the refractive index is not of water.

Sagan was proven wrong, because 1.44 is not refractive index of water, which is 1.33, approximately, ice and water. And today exactly this statement of mine is repeated by a number of scientists: Plummer was wrong, Sagan was wrong, because of refractive index.

Now comes Sagan and asks me, where is the refractive index of organic molecules? Here is statement of organic chemist, who is Professor Burgstahler, and I have with me two or three statements more, of Professor Harris, organic chemist, whose speciality [it] is, of Furman University in South Carolina, and another statement, of Professor Bush, of the North Carolina University in Charlotte, both working on the spectrum of infrared of organic molecules, stating that *many organic molecules have infrared index of 1.44*. And I have another statement, from a resident of this area, Dr. Ballinger, who works as research chemist on organic material for the Exxon Company of California, and the statement is again the same.

And besides, what is the question? Plummer, for example, investigated—

MULHOLLAND:

We've forgotten by now.

VELIKOVSKY:

What is the question? Plummer investigated seventeen organic molecules, not on their refraction index. There are hundreds of thousand of organic molecules, either hydrocarbons or carbohydrates. They were not investigated. And there are many and many that have the refracting index of 1.44.

KING:

May I ask you to terminate your answer now?

VELIKOVSKY:

Well, this is the answer. I believe I answered completely.

KING:

It was a very complete answer. [laughter, applause]. We have on record your reference to page 31 of *Pensée*, and Dr. Sagan's remark that that does not satisfy his question. Let's leave it at that. We have two hours to discuss things in the evening. [Notice that King is still unaware that Sagan is leaving.]

Now, we have three more speakers on our program. The next two speakers are going to talk on different subject matter but in a similar vein, and the way I am going to organize the program is that I will ask Dr. Mulholland to give his talk, and hope very much that he will stick to the twenty-minute limit, and after that we will have Dr. Sagan immediately, and following that we'll have a chance for some more discussion, which I hope will be brief. Remember, we have two full hours for discussion this evening, and we have one more speaker after both Mulholland and Sagan.

So let me introduce the next speaker, Professor J. Derral Mulholland, of the University of Texas, in Austin, who is a celestial mechanic whose name is almost synonymous with high precision. [laughter]

MULHOLLAND:

[Mulholland's preliminary remarks, not included in this paper, were as follows:]

Before I am asked the question, I would like to point out that I first read Dr. Velikovsky's work in 1950 in *Collier's* magazine when I was sixteen years old, and I have read the same work [sic] three times since, the most recent yet this year. [What *Collier's* printed was the equivalent of six magazine-size pages that were "Excerpted and Adapted by John Lear from *Worlds in Collision* by Dr. Immanuel Velikovsky"; Velikovsky objected to the way *Collier's* treated his book, since he had agreed only to serialization, not to condensation, and the planned third installment of Lear's condensation was never printed. *Worlds in Collision* itself contains xii + 401 pages.]

I found it very entertaining when I was sixteen, incidentally, and I still do.

[Mulholland's paper entitled "Movements of Celestial Bodies—Velikovsky's Fatal Flaw," was presented at this point.]

Thank you. [applause]

KING:

As I announced previously, we'll move on immediately to the next speaker, and I wish to amend something that I said earlier.

Unfortunately, Dr. Sagan will not be allow-, will not be available, will not be with us this evening, on account of a previous commitment out of town.

I'll call on Professor Carl Sagan, of Cornell University, to talk on "Venus and Velikovsky."

SAGAN:

[Sagan's preliminary remarks, not included in his paper, were as follows:]

Thank you, Professor King.

I first started working on this paper, that I have here, on the invitation of Stephen Talbott, the editor of *Pensée*, who invited me to give a critique of Velikovsky's views about Venus, which I started to do, but then discovered that it's very difficult to keep one's focus only on Venus, because Velikovsky's perspective is extremely broad. And so what has come out is a manuscript called not "Venus and Dr. Velikovsky" but something called "An Analysis of 'Worlds in Collision,'" which is much too long to read here, and especially in the interests of time I'm going to just go through a fraction of it, something like a third of it. I don't know what Mr. Talbott will do when I talk about him about the manuscript.

Well—

[Sagan's paper, now retitled "An Analysis of 'Worlds in Collision,'" was presented at this point. The decision to put *Worlds in Collision* in quotation marks rather than italics was Sagan's.]

Thank you. [applause]

KING:

Thank you very much, Dr. Sagan.

Although I found your ten points immensely interesting, as chairman, trying to keep this meeting running, I feel as if I've been visited with the ten plagues. [laughter]

We are going to have to make a change in the schedule. It is obvious that discussion at this point is necessary. The time is already seventeen minutes to one. We are required to be out of the room at one o'clock or shortly afterwards.

And I must apologize to Professor Michelson, to be last speaker, that we must postpone his talk until the evening meeting. He has graciously agreed to do this, in order that we can have some discussion, which I imagine will be largely between Dr. Velikovsky and Dr. Sagan. [laughter]

I am sorry, Dr. Michelson, in my incompetence in manipulating people in the presence of ideas. [laughter, applause]

May I ask for one or two questions from the audience, in the hope that the questions will be brief, and the answers equally brief. Question.

BASS:

I have four brief questions that I wish to ask. [laughter]

KING:

You have been recognized to ask one question. Choose one of them, please.

BASS:

Where is Mulholland? Is Mulholland going to answer?

MULHOLLAND:

Yes.

BASS:

Yes. Yes, Mulholland. All right. Are you familiar with the published work of J.G. Hill's Yeale Ph.D. thesis, 1970, Michael We. Ovenden, *Nature*, 1972, and *Vistas in Astronomy*, in press, *Celestial Mechanics*, in press, and several other journals, in press, A. H. Wilson of the University of Chicago—by the way, Michael Ovenden is a fellow of the Royal Astronomical Society—A. H. Wilson—

MULHOLLAND(?):

And a friend of mine, I might add...

BASS:

—a dynamical astronomer, of—Also, are you familiar with the works—

MULHOLLAND(?):

We should say yes and just sit down.

BASS:

—of the three leading celestial mechanics in the world from the point of view

of rigorous mathematical proof, which exceeds that even of physical experiments—

MULHOLLAND:

Would you like to give you opinion as to who those three are before I say yes?

BASS:

[Bass has continued to speak, but was drowned out by Mulholland's question.] ... and I refer, of course, to V. I. Arnol'd of Moscow, [J. K. Moser of New York University, and Carl Ludwig Siegel of Göttingen, because these four gentlemen—I can give you the page referneces of their journal articles—have published explicit statments which show that almost everyting you said was superficial, and they diametrically refute many of your leading points. [applause]

VOICE:

Well.

KING:

... [inaudible] ... brief answer.

VOICE:

...[inaudible] ... controversy....

VOICE:

That's not the question.

KING:

This was a speech, not a question.

MULHOLLAND:

As I passed up here, somebody said that's a controversy, not a question. I will answer very briefly. Yes, am familiar with most of those works, and no, I do not agree with you that they confute anything that I said. [applause]

KING:

Thank you for your [brevity?].

SAGAN:

Alos, the represent an argument from authority. There was not a single substantive point in your question. It was all, "Have your read X, Y, X, or Q?"

KING:

One more question from the audience.

QUESTIONER:

I have a very brief question for Dr. Sagan. Following the recent Pioneer X

encounter with Jupiter, there was a wire services story in which there was a quotation attributed to you that there were hydrocarbons in the atmosphere of Jupiter that were precipitating "like manna in the wilderness." I wonder if— [laughter]

SAGAN:

This is another idea due to Rupert Wildt in 1940, about ten years before 1950. [laughter] Rupert Wildt, in fact, turns out to be the eminence grise of this subject matter, having thought of, but for the correct reasons, all of Velikovsky's principal arguments which are used to justify his thesis *post hoc*, almost all.

And it was Wildt who has correctly identified methane in the atmosphere of Jupiter, and Saturn, in the 1930's, and he proposed that other simple hydrocarbons were to be found there, which indeed turns out to be correct. In fact, just in the last few months, acetylene and ethane have been found in the atmosphere of Jupiter, in small quantities.

We have done laboratory experiments in which we duplicate the methane, ammonia, hydrogen, and probably water, which exist in the atmosphere of Jupiter, supply energy sources to it, and find that a large range of organic compounds are produced, including the precursors of amino acids. For this reason we think that Jupiter is of substantial interest for pre-biological organic chemistry, and I do think that organic matter is dropping from the skies of Jupiter like manna from heaven. It's on Earth where I have difficulty understanding manna from heaven. Jupiter makes perfect sense.

KING:

The two previous talks were directed largely to Dr. Velikovsky, and I think he should be the next one to comment on them.

VELIKOVSKY:

I think that Professor King made the right decision, and I thank Professor Michelson for agreeing to speak in the evening.

Actually, Professor Michelson was selected by the organizers of this Symposium to discuss the subject of celestial mechanics, requiring advanced knowledge in mathematics and physics. He is international authority in his field and I am pleased to say that I will yield to him to answer many things that I would have answered to Professor Mulholland.

However, one thing I wish to say. All what Professor Mulholland mentioned here was based again on the assumption that nothing had happened and could not have happened in the past, and therefore it must have begun as it goes. But this is not a law; this is a principle—

MULHOLLAND [overlapping]:

I'm sorry, that's not true, That was no assumption. These were observations.

VELIKOVSKY:

Yes.

MULHOLLAND:

Data, not assumptions.

VELIKOVSKY:

One of my data was that electromagnetic phenomena do participate, to whatever extent, in the celestial mechanics, and other catastrophic circumstances to much greater effect than, of course, a normal condition.

The discovery, for example of Professor Danjon, Director of Paris Observatory, that made sensation when he announced it, in the summer of 1960, at Helsinki, about the change in the rotation of the Earth, if only in milliseconds, following a flare, a regular flare on the Sun, was unbelievably by those who attended the International Geophysical Union session. But then it was confirmed, in Helsinki again.

So these electromagnetic phenomena were entirely not included [that is, calculated in, included in the calculations], but when now the celestial mechanics is presented in textbooks, the authors, like Clemence and others who are great authority in the field, have excused themselves, saying they knowingly omit phenomena that certainly do exist, but they do not include [that is, calculate them in]. They still go by pre-Faraday astronomy. Of course, Newton was not to blame. Even now I will read a sentence from Newton, because he was farsighted. He saw the phenomena which I—well—had long battle for with astronomical society. I was considered outcast exactly for, more than for anything else, for claiming that, besides inertia and gravitation, also electromagnetic forces and fields do participate, and on one of my letters, the late Einstein wrote, “Yes,” this was the main cause of the great agitation against you.

Now, as to Professor Sagan—[laughter, applause]

VOICE:

That's good. Right there.

VELIKOVSKY:

—let me quote one single sentence from his new book. In his new book he says, “Jokes are a way of dealing with anxiety.” [laughter, applause] And this is exactly what I said in my lecture. I wrote it before I read his book. I bought it only here, in San Francisco.

Well, you hear jokes. It is easy to put in a book something that is not there, and then make it a joke. I believe this is an action of a person who defends a position that is undefendable. [applause]

I would not have spoken on this subject now, but I heard that Professor Sagan will not attend the evening session, when we would have more time to discuss the matter, and since he is not prepared, or made advance—well—agreement on being somewhere else, though this Symposium already being prepared for more than half a year, so how advance could it have been? I would like to confront him in the evening, and I have with what to confront.

Nevertheless, to put into my book the story about Moses opening the sea, or Joshua asking the Sun to stop still, and then at the nick of a moment here coming the comet and do what Joshua or Moses asked, where I clearly said that these things are

entirely fabrication of folklore, that the story as it is need to be searched from one place to another place.

And though Professor Sagan claimed that he is not versed in mythology or folklore, but he went into that area, and had some ideas. But I already discussed these ideas, I think to satisfaction of those who deals with question of mythology, because mythology has a reason in fact, a basis in fact. It was not just carried from one population, from one island to another. The story were told differently, but the theme is always the same.

Now, again, to put into my book story that frogs were falling from the sky—not in his lecture here, but according to a tape recording of a lecture before tuition-fee paying students at Cornell—that frogs were falling from the sky, and this [was] what Velikovsky said, and I said exactly the opposite, that frogs were the brood of the Earth, because the quotes in the Bible is exactly to this.

He said also that mice were falling from the sky. Now, well, mice? Well—You need to know the Ten Plagues. There was no Mice Plague among the Ten Plagues. And certainly warm-blooded animals did not fall from there.

I even did not claim that flies came with Venus. I put in that way: It could be anybody's guess. So the idea of contamination of the Earth goes back to the beginning of the century, and you can find it in work of a Swedish geo-physicist of that age.

Now, again, as to the life on Venus, and the Venus clouds—

By the way, the story of the fogs falling from the sky was also a matter of discussion on the third of December when Jupiter probe, Pioneer X, passed by, and [there] was a press conference, and there was a confrontation between [Sagan and] Professor James Wavick, whom I never met, who demanded a fair treatment to me, claiming for me the advance claim of Jupiter noises. Now, well, this is one of the cases where Velikovsky made generalized statements. Jupiter noises, so clear as this, and who else said it?

So again Professor Sagan said, what is Jupiter noises? Frogs were falling from Jupiter clouds. But in the book, just I wrote it now, 1974, he claims that—well, some few things. One of the things is that on Mars there may be animals today, of the size of polar bears, they sleep thousand-year hibernation sleep, and they get their food by, well, eating or taking stores into their mouth and extracting water from the stones. Well, somebody who comes with those ideas should be very careful to criticize. [laughter] Well— Well-documented, from many civilization, idea of contamination of the Earth by some larvae coming with cometary tails, which I did not subscribe [to], but presented for discussion.

Now, again, let me ask about the correctness of prediction. In that new book I read that Professor Sagan claimed for himself such clear predictions in 1963 that Venus is very hot, and that Venus has many atmospheric pressures, and he claimed that he said it already in 1962.

Well, possibly he said it in 1962, but I have with me an article in Science from 1961, where he claimed that if the atmosphere is 600, and it was already stated by Professor Meyer in 1956. As soon as Jupiter noises were found, all planets were subjected to tests. Venus was found producing certain radiation, and this was not of the same length as from Jupiter, so it was not of the same kind. It was thermal signals. Now, these thermal signals would be like 600 degrees. It was not believed that 600

degree could be right. Sagan believed that it could be right, 600 degrees, but he said if the surface temperature is 600 degree, Venus would then be approximately four atmospheric pressures, and this is Science and this is twenty-fourth March, '61.

Now he claims in his new book, that in '62 he was such a great prophet that he claimed already fifty pressures. Well, from one year to another—

VOICE:

He's not perfect.

VELIKOVSKY:

No.

VOICE:

He's not perfect.

VELIKOVSKY:

He's not perfect. [applause]

Now he is opposing hydrocarbons on Venus. But I will quote some authorities concerning hydrocarbons on Venus. For example, here is an authority who says that about possible existence of some hydrocarbons in the lower atmosphere. Will you agree with this statement, Professor Sagan?

SAGAN:

Well, what was the statement? There is a possibility—

VELIKOVSKY:

Possible existence of hydrocarbons—

SAGAN:

How much?

VELIKOVSKY:

—in the lower atmosphere.

SAGAN:

How much?

VELIKOVSKY:

Not a question of how much.

SAGAN:

Yes, it is a question of how much. In fact, that's the *theme* which cause the most difficulty in this area. Remember [?]

VELIKOVSKY:

There are at the end of *Worlds in Collision* two sections dealing with physical conditions on Venus. In one I dealt with the constituency of the clouds and atmosphere, and I explained where, if there are hydrocarbons, to look for them; I said also how hydrocarbons could have been created from methane and ammonia. And this was confirmed ten years later by experiments, exactly this how it was done.

I claimed also later, in 1951, how hydrocarbons could be changed into carbohydrates, and this was in debate with Stewart that I mentioned before, in June '51, of Harper's.

Now, again, second section dealt with the thermal balance of Venus. And there I said if oxygen is still there, there must be hydrocarbon or petroleum fires. Now, you understand all right that if there is heat, as it is, and if there is oxygen, and if there are fires, hydrocarbon would not last. Actually if it is still there, it would only be a time clock to find out how long the process is going on. The other way of transforming would be into carbohydrates. But nevertheless, little or much, are hydrocarbons there? It is not the question of quantity; it is a question of quality.

Do you agree with this statement, that I claim, that hydrocarbons could be there?

SAGAN:

Do I answer?

VELIKOVSKY:

Yes.

KING:

Would you please answer into the micro—

VELIKOVSKY:

I would ask first this question, because immediately I will continue.

SAGAN:

You made a number of statements. Let me try to answer some of them.

VELIKOVSKY:

No, maybe I would continue, then you answer the others, but this I would ask.

SAGAN:

We are running out of time, and I am running out of remembering what your comments were. So how about letting me make some responses, and—

VELIKOVSKY:

Well, I wish to continue on this one question. [laughter]

SAGAN:

Well, why don't you let me answer, and then you can continue.

KING:

Please let him answer.

VELIKOVSKY:

No, because I am in the middle of an argument about hydrocarbons. [laughter]

SAGAN:

You're not in the middle of an argument if you don't let me answer.

VOICE [to Sagan]:

Say yes or no and sit down.

VELIKOVSKY [to Sagan]:

Well, if you wish.,

SAGAN:

I'll be glad to respond. No, you see, it is not just a yes or not question. Let me say why.

VOICE:

Why not?

SAGAN:

I'll explain.

VOICE:

Then qualify it first, sir.

SAGAN:

Many of the difficulties with the Velikovskian approach is the absence of quantitative thinking. So it's no enough to say, for example, that I said there were going to be large magnetic effects, and [it] turns out that Jupiter has a magnetic field of six gauss or whatever. There is bound to be some residual magnetism everywhere. There is bound to be, just as in the Earth's oxidizing atmosphere there are today hydrocarbons. Methane is one part per million of the Earth's atmosphere. That has nothing to do with manna. It has nothing to do with any of this. If you look closely enough you are going to find a large number of things.

Let me try to respond to a few of the remarks Dr. Velikovsky has made, and then I'll be glad to hear the resto fo this discussion and, if I can, try to respond to that.

In his response thus far, there has been very little substantive commentary on my remarks, but, on the other hand, he hasn't heard many of them befor enow, so I don't object to that. [Actually, Velikovsky had heard almost all of them before.]

The idea of oxygen burning fires on Venus is very bizarre, because Venus would come from Jupiter. Jupiter has an excess of hydrogne. There can be no oxygen on Jupiter. It would all have been reacted with hydrogen to form water. Therefore, there

should be no oxygen on Venus, and, indeed, there is none, as has been clearly shown by ground-based spectroscopic observations.

Dr. Velikovsky has criticized me for having changed my mind. I do not consider that to be a serious flaw. I think that it is precisely the ability to change one's mind which is the method by which science advances, and the unwillingness to change one's mind, the idea [an idea that Velikovsky has never presented!] that texts are canonical and need no revision in the light of twenty-five years of subsequent study, *that* I find more strange.

I do not consider this to be a debate between my theories and Dr. Velikovsky's theories. As I understood the function of this Symposium, it is merely to discuss Dr. Velikovsky's views in "Worlds in Collision."

To respond specifically to the remark he made, between 1961 and 1962 a significant change in our knowledge of Venus has occurred. It was the question of whether the atmosphere was mostly nitrogen or mostly carbon dioxide. Nitrogen had been deduced there by default. We then realized that the spectroscopic deductions were in error. The atmosphere was therefore mostly carbon dioxide. Therefore, the specific heat at constant pressure was different. Therefore, the adiabatic temperature gradient was different, and, therefore, to get down to 650 or 750 Kelvin you had to go much further down the adiabatic gradient, and therefore you got to much higher pressures. And it is precisely because we learned something new that we changed our views, and by 1962 the views that several of us had proposed turn out to be correct.

Now, on the question of frogs, mice, toads [no one mentioned toads before, not even Sagan], flies and other vermin from the skies, it is quite true that Velikovsky does not say that mice fell, nor in this lecture, have I. [The words "in this lecture" were spoken with such rapidity as to be unnoticed by most of those in the audience.] It is almost true that Velikovsky says that frogs have not fallen. I say "almost true," because he quotes an Iranian text, in apparent approval, which Iranian text seems to show frogs from the sky. [The Iranian text and other such texts are discussed in *Worlds in Collision*, pages 183-187, which Sagan is totally garbling.] But he does not say that. He says "probably" or words to that effect. [Actually, Velikovsky's words were "must be," which are hardly to the same effect as Sagan's "probably."] It was the heat produced by this cometary interaction which caused indigenous terrestrial frogs to proliferate.

That's fine, but notice that Velikovsky is now asking to have it both ways. Some of the plagues come from space, and others do not. Now, what is the decision as to which ones to accept and which ones not to accept based upon? A consistent view would be to say either "I have believed the accounts in Exodus" or "I don't" But to say "I will choose to accept some and not others" is very strange. [These questions are ones that are answered in Velikovsky's writings. Even if Sagan has never consulted the written answers, he should be able to recall how Velikovsky answered these questions no more than fifteen minutes earlier in the discussion. Velikovsky repeated once again that "mythology has a reason in fact, a basis in fact." Velikovsky accepts those elements of the mythological stories that have a plausible physical explanation and that are independently reported by different peoples. The stories "are told very differently, but the theme is always the same." Local embellishments that have no plausible physical explanation "are entirely fabrication of folklore," and each "story as it need[s] to be searched from one place to another place," if the common

theme is to be found. See also Velikovsky's "Afterword," where he explains that he rejects any local embellishments that do not have a plausible physical basis, is not testified to by other people, and is therefore to be regarded as an inaccurate elaboration by one person upon what actually transpired." Sagan's continuing need to describe his own garbled version of Velikovsky as "very strange" is itself "very strange.]

Let me give one specific example.

KING:

With all due respect,—

SAGAN [overlapping]:

OK. One second.

KING:

—I think you are introducing new material rather than responding.

SAGAN:

No, I am trying to respond to the question about frogs and mice. [applause]

Exodus states that manna fell every day for forty years, with the exception of the sabbath. It did not fall on Saturdays. Instead a double portion fell every Friday. [laughter] It didn't actually say fell. It said appeared. But, using the Velikovskian verb, let's say fell. [The verb is not Velikovskian, but biblical: Numbers 11:9 says, "the manna fell."]

Now it seems to me to pose serious problems with Velikovsky's hypothesis. How 10^{10} kilometers net path away from Earth, did the comet know to hold back on Saturdays but to give a double ration on Fridays? [Here, again, Sagan displays no understanding of what Velikovsky's views are. The 10^{10} kilometers is the approximate distance that Venus might have traveled during forty years. This, of course, has nothing to do with Velikovsky's theory, which is that various materials from Venus were transferred to Earth's atmosphere at the time of the Exodus. These materials were modified in Earth's atmosphere and over a period of time precipitated out of *Earth's atmosphere*. Sagan's idea of a dialy shipment from Venus to Earth, transported over the distance that Venus has covered since the Exodus (which was many times greater than the distance between Earth and Venus at any given moment), is entirely his own invention, and proves nothing, except that he is quite ignorant about the theory that he is attacking.]

So this is something that, of course, we see is absurd, so we do not invoke it. But why not? Why this preferential use of the fraction of *Exodus* which seems to match some preconceptions, and the avoidance of other things in *Exodus*?

If I had to choose—and we certainly don't have to choose, fortunately—but if we had to choose, is not the evidence almost as good as for the God of Moses as for the comet of Velikovsky? [This rhetorical question is essentially the last sentence of Sagan's paper, which he had omitted when he read the paper.]

KING:

The time is almost ten after one. I will hope that Dr. Velikovsky can give his present answers in five minutes and then postpone everything else until the evening.
... [inaudible] ...

VELIKOVSKY:

On the one hand I am accused of having gone into too many fields. On the other hand I am accused of having not gone far enough, and not calculated everything to last detail. I left something for Sagan to do. [laughter]

As to the question of the energy required for explosion from Jupiter, I discussed this subject in a special issue of *Yale Scientific Magazine*, dedicated completely to the question of my thesis of Venus being a young planet. It was April 1967, and there, with Professor Motz as my opponent, Lloyd Motz of Columbia University, I discussed and explained this subject.

It was not a kind of volcanic explosion. It was a fission of the planet being disturbed in a way how also British cosmologist, Lyttleton, describes in *Man's View of the Universe*—it's a popular work—1961, page 36, but also a year before in the *Monthly Notices of the Royal Astronomical Society*, in England, namely, how Jupiter had to come out of embarrassing situation by splitting in two unequal parts.

This of course Lyttleton put much farther in time, but the argument is even better if you know my arguments in the two volumes that precede *Earth in Upheaval* [meaning *Worlds in Collision*], describing the events concerning flood, universal flood, and other catastrophic events of the time. [Velikovsky is here referring to *Saturn and the Flood* and to *Jupiter of the Thunderbolt*, the two volumes that describe the earlier catastrophes, those that preceded “the last two acts of the cosmic drama” that are described in *Worlds in Collision*.]

As to the figures of mathematician and physicist, how they throw them! One less I had to give. Professor Straka, of Boston University, presented his piece, with calculation, with figures, to *Pensée*. It was printed in the second issue of *Pensée* dealing with Velikovsky. There are altogether ten, six already out, seventh to go to print soon, [it] will have all of these debates in it probably.

Now, in that occasion I took to give lesson to a mathematician. Read it. Read the figures, how they are put together, how [they] are brought before the lay public, and then read my answer.

I received a letter from Arthur Clarke in Ceylon. He says he would like to be present in the class of Straka, when students would bring that article into the class.

I don't claim to be a mathematician, and I leave this work to others, and I am happy that Professor Michelson, who started entirely uncommitted, not selected by me—not even asked I was whether I agree to selection of Professor Michelson. He will present to you in this evening—and I strongly advise you to be present—with complete answer to Professor Mulholland. Though he is not a philologist, not an historian. He will not go into this field. But he will come with two great calculations that will be something in science to remember, of his own.

Now, as to question of manna and Saturday, you see another joke. Of course I didn't say in my book, as if in my book is spoken about manna falling six days in the week and not on Saturday. Of course I did not say this. Of course I did not say that

the Israelites were much more fortunate than the Egyptians. At the Sea of Passage many of them perished. In the Plague of Darkness, despite the biblical statement, other rabbinical statements say that forty-nine of fifty Israelites perished during the Plague of Darkness.

So I stressed these points, this disagreement with the Bible. I am not a fundamentalist at all, and I oppose fundamentalism. So this brining story of manna as if it is my story is, of course, not serving the purpose of scientific debate.

Now, as to the oxygen on Venus, I think Professor Sagan is just wrong. The Russian probes found small quantities of oxygen below the clouds. Not did not find. They found it. And they found that it is a hot, oxidizing atmosphere, and so it is referred to numerous time in the recent literature in America, too. So how not to know this, if Sagan serves also as editor of a magazine on planetary sciences?

Now, as to prediction in general, on this I stand: Nobody yet brought a wrong prediction of mine. Some thing is not yet completely confirmed.

The question of clouds on Venus, what it consists, is a question still of debate. But I asked something [of] Professor Sagan. He interrupted me, and he did not go into that question. And the question was whether he agrees with the idea that hydrocarbons are in lower atmosphere of Venus. He did not answer, but this was quotation from his article. *[laughter]*.

Now, he also did not answer other questions, but let us say taht he prentends that he did not claim me writring in my book about frogs falling from the sky, and mice, too. Now he says he didn't say about mice, but this is on the tape. The tape exists. [Sagan made this and other outrageous statements on March 28, 1973, in a widely publicized lecture on "Venus and Velikovsky."]

And about frogs, we have here, in Pens0e number VI, also from a tape, discussion between Professor Warwick and Sagan on third of December, and Sagan say here, clearly: "Let me. Velikovsky explicitly predicts the presence of frogs and flies int he clouds of Jupiter," and here you heard that he says, no, he didn't say some things like this. But he said it only on third of December. So—

KING:

May I ask you, since it's a quarter after one, to stop?

VELIKOVSKY:

Yes, I am finishing with this. On this point I stop. I think that Professor Sagan, claiming water on the clouds, and there are none; claiming lower temperature, pressure, and it happened to be very high (of course subsequently he changed his view); and claiing now organic materials, and even life, in the clouds of Venus, and we heard here something contradictory to this, and this is another article of his. So if somebody has six days in the week for six opinions, he maybe sometimes be right, too. But with me, it happened so, that my claims were made long in advance of the findings.

And thank you. *[applause]*

KING:

May I thank Professor Michelson again for graciously allowing his talk to be

postponed till the evening.

[aside] Yes.

I would like to make one ... [inaudible]

... [inaudible] ...

QUESTIONER:

I would like to request that Professor Sagan be asked to continue his point of view.

VOICES:

... [inaudible]...

QUESTIONER:

I present it to the podium. If one man made the sacrifice of allowing him to continue, I think he should make the sacrifice to attempt to stay here.

KING:

When I was describing the genesis of this Symposium, I mentioned that A.A.A.S. put this Symposium together out of a feeling that the work of Dr. Velikovsky was worth presenting at a public forum. What I did not mention at that time was that Professor Sagan is not only a vigorous defender of science, he is also a vigorous defender of scientific freedom, and the suggestion that we hold this Symposium came directly from Professor Sagan. [This is false; the suggestion that A.A.A.S. should hold such a Symposium was first put forward by Walter Orr Roberts. Roberts' idea was later "supported" by Sagan and others.]

The meeting is now adjourned.

* * *

THE EVENING SESSION

GOLDSMITH:

How about now? Is this better?

My name's Donald Goldsmith. I'll be the chairman of tonight's session. We will have until ten o'clock, at which time, by the rules of the A.A.A.S. and the hotel, all the other things that have been worked out, to get the room ready for tomorrow, we'll have used up the time allotted to us, all too short—[filled -up] the morning. We'll have a full discussion of all the points people would like to discuss. So that I'd like to urge you to be short in your answers, short in your questions.. It would be nice if there were not enough people who had a lot to say, so that we could have a full, complete discussion. But I'm afraid that that will not be the case, and it'll be of extreme importance to use the time.

We'll start tonight with a talk by Professor Michelson, which he so kindly postponed until this evening: in order to allow for the extra time that was used up during the morning session. And after he speaks, we'll go into a panel format, with the members at the morning discussion here, who will answer questions, I hope never speaking more than one at a time, or perhaps two or three at a time. at a maximum. We have a microphone in the audience for those who wish to ask questions, make it easier, so that people won't have to get up and down here. And with luck we can have a reasonable exchange of views. With bad luck, we'll simply run out of time and all go home a little bit disgruntled. So we'll first have a talk by Professor Irving Michelson of the Illinois institute of Technology, who will speak to us on the topic of "Mechanics Bears Witness." Professor Michelson.

MICHELSON:

[Michelson's paper, entitled "Mechanics Bearn Witness," was presented at this point.]

That's all I have. [applause]

GOLDSMITH:

Thank you, Professor Michelson.

Before we go to the panel discussions, we will have a brief discussion period concerning the talk which Professor Mtchelson has just given. I will take questions from the audience for a brief while. Let me first call on—Professor Mulholland?

MULHOLLAND:

I would like to point out, with respect to this last calculation here, which produced such remarkable results, in a correspondence between the energy required to flip Lhe Earth over and the energy expended in a solar flare of great magnitude [Michelson had spoken of a geomagnetic storm, not a solar flare!], falls a little short when one realizes, that the Earth, as seen from the Sun, represents rather less than ten to the minus eighth power of the total space into which the energy of that flare is expelled.

Therefore, the 10^{23} ergs results in less than 10^{15} ergs at the Earth. Thank you.

Foreword

Days and Years is Immanuel Velikovsky's autobiography down to 1939, when he was forty-four years old. That was the year he and his family came to the United States. He was then just on the threshold of the far-reaching discoveries that were to change the course of his life.

Certainly there will be no shortage of biographical materials from the last forty years of Velikovsky's life, a period that was so rich in research, writing, correspondence, lecturing, and controversy. But Velikovsky did not continue his own life story past the year 1939. We have his working title—*Off the Mooring*—for the post-1939 portion of his autobiography, but this was never written. Velikovsky was always greatly interested in finding just the right titles for his books, and *Off the Mooring* would have been a particularly apt title for the story of his bold and unfettered voyages of discovery. Perhaps some future biographer of Velikovsky may still use that title.

Though *Days and Years* stops at 1939, the years that followed are covered in part by some of Velikovsky's other books and writings. Thus *Stargazers and Gravediggers* covers the period from 1939 to 1955. The emphasis is upon the story of Velikovsky's research and writing and of the criticisms and other reactions that his work provoked. Nevertheless, there is much personal detail in that story, as there is also in *Before the Day Breaks*, Velikovsky's account of his relationship with Albert Einstein. Both *Stargazers and Gravediggers* and *Before the Day Breaks* may be considered semi-autobiographical, though neither book was intended by Velikovsky as autobiography.

— Lynn E. Rose

Preface

In writing these autobiographical pages I am guided by two aims. Should my work and activity ever merit preoccupation with my person, I want to protect myself from guesses, inaccuracies and inventions, which all too frequently are the fate of biographies; and I wish to give to my children and to my fellow men an account of a life spent. I call it *kheshbon ha nefesh*, a Hebrew expression which has no exact translation, and at closest would be “searching of the soul” of a man who went ways all of his own.

Vitebsk

The ancient city of Vitebsk strides the Western Dvina. This large stream rises in the Valdai Hills, in that watershed from which also the Volga flows east, and the Dneper south. Not far from Vitebsk the Dvina makes a bend and majestically continues to the northwest. It empties its water into the Baltic Sea in the Gulf of Riga. In Tzarist times it used to carry barges and steamboats with the produce of the region to Riga and from there to the overseas markets.

Vitebsk was the capital of the Vitebsk Gubernia, one of the districts into which Tzarist Russia was divided. The town had about sixty or seventy thousand people, a substantial part of them being Jews: Vitebsk was in the “pale”—or inside the “line of permitted settlement.” It was not famous for its learning like a few smaller localities in Western Russia, renowned for their *yeshivot* or for the great authorities in Jewish studies residing in them and thus attracting the needle of the intellectual compass. But neither was Vitebsk among the cities in the “pale” which acquired an unsavory reputation. Not far away was the town of Liubavitchi, the seat of the famous dynasty of Hassidic *zadiks* (righteous men). Yet I believe the Jewry of Vitebsk was not Hassidic in the main. Its people were plain and kind, of a pleasant disposition, a little given to dreams and melodies. This quality is shown in the compositions of Marc Chagall, born in Vitebsk, who even in his old age, long away from his birthplace, continued to depict in many of his paintings Vitebsk and its Jews. Chagall and I never met, unless I chanced to come across him, a lad seven years older than myself, in the time we both resided in that city; but I left it much earlier than he, at the age of six and a half, never to visit it again; yet I could fill many pages with my memories of Vitebsk.

The city buildings were severe, rows of windows usually being the only ornament on their naked facades; the hamlet shacks of the neighboring villages carried heavy straw roofs over their log sidings. The hills, the little gardens, the green shutters, all had a pastel, dreamy quality; and clouds had golden rims, and cows in the countryside had bells, and birds were inquisitive and trusting, or so they appeared to me.

One thoroughfare, Smolenskaya, crossed a small confluent of the Dvina, the Viluika, and led to the main square with a *sobor* (cathedral) and court house; from the square the fashionable Zamkovaya Street turned past the city garden and crossed the bridge over the Western Dvina with a broad view in both directions. Should one pursue the route beyond the bridge, one would pass streets of single-story houses and arrive at the railroad station; and continuing farther one would come to a large field that once or twice a year served as a parade ground. Above were forested hills with narrow paths amid pine trees—the place is called Sosoniki and it is just outside the town

limits. From these hills one could count in the distance, between the town and the slopes, the number of freight cars in the train that occasionally and slowly crept along the plain.

There in Sosoniki on a late spring day, in a rented cottage, my mother gave birth to her third son. It was May 29, 1895 according to the Julian calendar; in Western Europe and the Americas it was June 10. The late spring of 1895 was unseasonably cool, and my parents-to-be contemplated a temporary return to town quarters, when the labor pains made my mother lie down. In those days birth-giving was a home affair, not a cause to go to a hospital. But there was progress in that not a midwife but a doctor would attend. I believe it was about two o'clock in the afternoon when I came into the world.

I was never shown that cottage, and on rare visits to the hills I do not remember having noticed any buildings there; neither was I, at these occasions, interested in such information. Sosoniki was for me the happy wide field, a few times filled with people and resounding with brass music; the forested hills had paths crossed by knotted roots of pine trees, to which the place owed its name (*sosna* = pine).

On the day I was born, or possibly on one of the following days, my father went on a walk in the forested hills and thought of a name for me. His first son was called Daniel, and Samuel in memory of one of his forefathers. The second son was called Alexander and Lev, the latter in memory of a great-grandfather. Daniel was two years older than Alexander and he, in his turn, was sixteen months older than myself; I, however, was not followed by a brother or sister, and remained the youngest.

My first name—I have no middle name—was chosen by my father, as he told me, on that solitary walk in the forested hills. He selected it from a verse of the seventh chapter of Isaiah; there was no Immanuel among our ancestors known to him. But he was visited by a thought, almost a wish cast before destiny, that I would be predestined to a great task in connection with the tragic history of our nation. One has to visualize the time, and also the personality of my father, a dedicated Jew with a vision of the national renaissance. It was a tragic time, of utter despair and of utter hope. When I was a child of six or seven my father would show me the chapter in the prophet Isaiah where the name Immanuel is found; more than once he spoke to me of the faith he put in me.

The events around the time of my birth were as if symbolic of the trends my life would take. In those days Theodor Herzl started his diary in a hotel room in Paris, having been assigned as a foreign correspondent to the trial of Dreyfuss. Until that spring Herzl, like so many of the Hungarian and Austrian Jews, felt alienated from the Jewish people. Then, while covering the Dreyfuss trial, Herzl experienced in the courtroom something akin to a transfiguration. He began to feel his bonds with his ancient nation, with its judges and prophets, and with the eighty generations of exiles, unbroken by persecution. It was then that he conceived his “mighty dream” and on June 10th, the day of my birth, he wrote in his diary: “I am taking up again the torn

thread of the tradition of our people. I am leading it to the Promised Land. Do not think this is a fantasy. I am not an architect of castles in the air. I am building a real house.” In Paris he also wrote the first pages of his political manifesto, *The Jewish State*.

In 1895 Freud, having two years earlier published with Breuer the first paper on psychoanalysis, began to write his *Interpretation of Dreams*.

In 1895 a new era in science was started by Roentgen with the discovery of X-rays, followed by the detection of radioactivity by Becquerel and of radium by the Curies. The old mechanistic philosophy of the world saw the daybreak of a new understanding of the universe.

Configurations of planets at the time of birth are claimed by astrologers as being decisive for the destiny of the newborn child. In astrology I never believed (I think I can explain its origin); I would rather assume that events on earth at the time of a person’s birth may in some way direct his life. One is under the influence of the spirit of the time. The dream of Herzl, the intuitions of Freud, and the rays of Roentgen in 1895 were the earthly constellations which marked the direction in which I was to wander—ideas, like men, need time to grow and to find their place in the world.

Long before the advent of Herzl, my father dedicated himself to the idea of a national renaissance for the Jewish people. Simon-Yehiel was the elder son of Jacob Meir and Sarah Velikovsky,¹

until their end residents of Mstislav, a small ancient town south of Vitebsk, renowned among the Jews. This town must have been founded in very early, possibly pagan, times. In the first half of the 19th century there occurred in Mstislav the so-called “rebellion of the Jews.” An interested reader will find details of it in the writings of Simon Dubnow, the renowned Jewish historian, himself a native of Mstislav.

My father was born in February on *shushan-Purim* of 1859. He had a sister older than himself, a brother Feivel younger by about five years, a younger sister, the mother of Moshe Halevi, and another brother, Israel. Their mother Sara, a little woman whom I remember on her visit one summer, probably in 1898, was a daughter of Jacob Hotimsker. Jacob Hotimsker was thought by the population of the region to be a holy man. He was the Dayan (religious judge) in Mstislav. He was all prayer and all humility. In the time when my father was a child the children of Mstislav believed that this holy man could make himself invisible, and other similar stories were told about him. I possess his portrait: a kind face, inquisitive eyes, light brown curly locks. On his deathbed this Rabbi Jacob blessed all his progeny that none of them would ever need to serve in the Tzarist army—and his blessing held good for almost forty years, until the Nazi invasion of Russia when a cousin of mine—a daughter of my elder brother—fell on the battlefield, and probably many more of the descendants of Rabbi Jacob served and fell. My great-grandfather, who died in about 1903 or 1904,

must have been born about 1820, and the terror of military service in the army of Nicholas I incited Rabbi Jacob to select this theme for his benediction. Jewish boys were abducted into the service by “catchers” at the age of 13 or 14 to stay in the service for 25 years and then on military settlements for the rest of their lives, without being able to study rabbinical law or give their children such an education, a main purpose in the life of traditional Jewry. I was about eight years old when Rabbi Jacob died; by then we were already living in Moscow. For days my father did not open the letter informing him of his grandfather’s death, and he wept when he read the news; never had I heard my father weep so bitterly. The whole town closed the stores and joined in the funeral procession.

I also possess pictures of my paternal grandparents. My grandfather Jacob Velikovsky looks handsome with an open face and regular features and a black beard into which the first silver strands had started to spin themselves. I never visited Mstislav, and do not know whether I ever saw him, unless he was one of the elderly men—all of whom could claim to be called “grandfather”—who visited us in Vitebsk, and who played with my hair, lovingly pulling it.

Of my grandfather, Jacob Velikovsky, my father told me that he never tore off a flower or a blade of grass, and never killed a fly. My cousin Moshe Halevi, who grew up in Mstislav, knew him well.²

He told me that our grandfather would go alone with his horse-driven cart to the forest, and there would sound the shofar, the ram’s horn, in different intonations and rhythms. I would not know whether he was practicing there the art of blowing the horn for the High Holidays, or whether he was spending his solitude in the forest in communion with God, as my cousin would insist. From my father I know that on the Sabbath Jacob Velikovsky would speak only in Hebrew; and since in those days Hebrew was not yet a spoken language, he experienced difficulties, but would not give up.

Jacob was a small merchant like his ancestors, many generations back. From the time of the Crusades, from the time of the Roman Empire many of the Jews were artisans, merchants, and rabbis; and often the rabbinical profession was exercised simultaneously with the manual or mercantile.

Jacob Velikovsky was also eager to do something for the poor of the town. In winter the needy used to suffer from the cold, being unable to buy firewood by the cart. He would buy several carts of wood and let the needy have the small quantities they could afford. My grandmother Sara would go outside in the dark of the pre-dawn winter mornings, on the knock of the “customers” at the door, to dispense the bundles of wood. She was small in stature, very tidy, and a kind person like her father, Jacob Hotimsker. But unselfish acts call for retribution—and to the great heartache of my grandparents, rumors reached them of allegations that they were profiting from this endeavor.

I never saw my maternal grandparents. They lived in Lodz. My mother was the eldest of ten children—four daughters and six sons. Nahum Grodenski came to Lodz from Grodno where my mother was born. A merchant with a Western European outlook, he traveled abroad and was highly respected. It was the pride of my mother that she was a daughter of Nahum Grodenski. I heard also from others that his word in business transactions was valued more than any written document. He liked my father as his own son and helped him in the beginning of his career.

As a boy my father studied in the *kheder* (preparatory school) together with Simon Dubnow, the future renowned historian of the Jewish people. Like the children of the generation before him and after him, my father found candies fallen “from heaven” on the table in front of him the first day at the *kheder* and he, like other children, believed that an angel had tossed them down.

When my father reached the age of fourteen or fifteen, he heard the unseen horizon’s call, and felt an urge to seek greater goals. The small business of his parents, probably a little shop, deteriorated; and it happened once that a creditor slapped the face of my father’s elder sister. This episode made a fierce impression on the young man, and he decided to strike out on his own and achieve a position in life through study. Study meant Hebrew study of the Law. In Mstislav there were great talmudists, but no *yeshiva* or academy of learning. My father conceived a plan to go away secretly to the famous center of Jewish learning—the *yeshiva* of Volojin. Very possibly his father would not have opposed his going to a *yeshiva* had he asked; but the reading of a book, I believe by Mendel Moher Seforim, made him emulate the way of leaving the paternal home, and even the letter of parting he wrote partly copying it from that book.

With a friend whom he persuaded to join him Simon departed secretly from Mstislav, leaving a note for his parents in the hands of his younger brother Feivel. Cooking their food in the woods, the two friends caused a forest fire. After one or two days’ march afoot they slept in the house of a woman who knew and revered Jacob Hotimsker. Awakening the next morning, Simon heard the voice of his father: travelers who had seen two boys running out of a burning forest probably directed him. But before starting the pursuit Jacob had asked the advice of the rabbi of the town, who advised him to let Simon study and even wrote a letter of introduction to the leader of the Yeshiva of Mir.

In Mir my father was the *matmid* (the most studious) of the Yeshiva: he spent sixteen hours daily in learning, sometimes pouring water into his shoes to keep himself from falling asleep. He would not see the sun rise or set, for he would be indoors studying; and alone, late at his folios, he would implore the Creator to redeem His people. At the words of the prayer “keeper of Israel, keep the remnant of Israel” tears would well up in his eyes.

The time came and he was called to Mstislav to present himself to the conscription board, and he remained there, occasionally studying the Gemarrah at the feet of a

local merchant-talmudist. He improved his knowledge of the Russian language word by word with the help of a Hebrew-Russian dictionary. The spirit of Haskala, the Jewish movement of literary renaissance and interest in secular subjects, was awakened in him. Simon Dubnow guided him in this, and he, in turn, kindled in Dubnow the national idea, as Dubnow himself wrote, more than fifty years later, in the Hebrew daily, *Haaretz*. The issue carried several other articles dedicated to my father, and Dubnow narrated among other reminiscences, how some Friday afternoon he was reading *The Love of Zion* by the poet Mapu on the steps of my grandfather's home.

My father felt that his world of ideas was too liberal for traditional rabbinical teachings, and he looked for a chance to find a way in life. His first tries were unsuccessful, and he began to accompany his father on his trips to Smolensk from where Jacob Velikovsky brought goods for the merchants of Mstislav on wagons or sleighs. Once my father remained in Smolensk and took a job in a store doing manual work. Then he arranged with his employer to work selling in the town. During his hours of rest he would try to study at the railway station, but was often asked to leave; when late at night he studied by the light of a candle, the employer in whose house he had a small room would call to him to extinguish the light, which cost money. But on Saturdays my father used to sit on the square in front of the synagogue and read, and he greatly enjoyed the freedom of the Sabbath; he promised himself that he would uphold the holiness of the day of rest—the great social institution established thousands of years ago by the Hebrew lawgiver—in the days when he would no longer be dependent on an employer.

Then he started his own business with the blessing and advice of one Peter Rifkin. This man happened to come to the store and, entering into conversation with my father, was surprised to find a learned youth at manual work. As soon as his business allowed, my father called his brother Feivel to Smolensk and made him a partner; and soon many relatives ate at his table.

One day my father conceived the idea to obtain the agency for Smolensk from the huge concern of Vogan, which traded in tea and many other kinds of merchandise. He wrote to Moscow. Rifkin advised him not to be so ambitious, but soon an invitation came from Moscow to present himself. He waited together with several men of obviously greater wealth. When his turn came and he made a good impression the Director asked him to come the next day and sign the papers. He answered that he was a Jew and would not sign on a Saturday. Here the story could easily have ended, because Vogan's firm did not as a rule employ Jews. But my father's straightforwardness gained him even more sympathy: the Director told him to return on Monday. He spent three nights in a hotel near the Kremlin, listening to the quarter hour melancholy beat of the clock on Spassky Gate. Would somebody come to Vogan from Smolensk and ask for the same business in the meantime? He was uncertain until the hour on Monday when he was given the papers to sign. Later he found out that the mother of the Director was Jewish and was buried in a Jewish cemetery. He became the favorite of this man. The Director would call an assistant

and tell him to go with my father and open credit for him in one bank or another, and the man would throw his overcoat over his shoulders and go. Many years later, when this assistant became the Director and also the President of the Moscow stock exchange he would stop his *cabriolet* (carriage) driven by a coachman in top hat, when seeing my father on his early walk, and exchange reminiscences.

I have here gone into some sentimental details of my father's life and career. My father once wrote his autobiography in Hebrew, during our wandering in the Ukraine, in the years of the civil war in Russia. This version having been left in Russia, he wrote it for a second time in Tel Aviv, this time describing also his work for the revival of the Jewish people in its ancient land and other efforts for the sake of this homeless nation.

My father met my mother in the town of Starodub in the northern Ukraine. My father apparently came there for business. My mother was sent there by her father to open a branch of his trading house and with her was her eldest brother Ephim. As I mentioned earlier, my mother was the first of ten children; her mother, Basha, took her out of the gymnasium at an early age in order to help at home with the ever increasing number of brothers and sisters. My mother regretted not having had a good schooling, and made it a goal in her life to give us, her children, the best schooling possible. Yet she could speak several languages fluently and at the age of sixty, on arriving in the land of Israel, took herself a teacher and soon spoke Hebrew and also wrote letters to me in perfect Hebrew.

After two years of engagement my parents were married. For seven or eight years they lived in Smolensk. Their first child was a girl, stillborn, and my mother was rather sick. In the seventh year my elder brother Daniel was born in Smolensk. After that they moved to Vitebsk, where Alexander was born.

My father was a dreamer, chained to his business; but he also had a grasp of economic problems on an international scale. My mother had a practical mind with a very strongly developed feeling of justice; my father told me how my mother once went back to the market to find the vendor who had given her one single kopek (half-cent) too much in change.

I have read that Leo Tolstoy believed that he remembered himself from the age of half a year. I certainly remember myself long before I was three years old, and some of my memories may refer to my being one year old. My earliest memory is dreamlike: in a small orchard or garden I am carried on the arm, I believe, of my father; there was a group of grown-ups, my mother among them, and the group was slowly walking in the orchard, it seems toward the house. How old I could have been I would not know; but many memories before I reached the age of three are very vivid, not dreamlike, and could be described in many details, as if they had taken place only recently.

The house in which we lived was situated at the riverside: the street, one of the main

thoroughfares, is here cut by the confluent of the West Dvina, Viluika, spanned by a bridge. A tiny garden was next to our house towards the stream, and a backyard. The house was three stories high, but the first had a low ceiling and was not occupied, but was used for storage and the like; we occupied the second story. The parents' bedroom had its windows to the Viluika, and in the spring rafts of beams and unattached tree trunks would move from morning till evening toward the Western Dvina and down toward Dvinsk and Riga on the Baltic Sea. The stream was small in the summer but in the spring it overflowed and once our yard was under water and a boat floated in it. Our beds were at the other corner of the house; a picture with horsemen on a mountain path was above my bed. In the winter snow was outside and the sun was bright in the windows; at night I listened to a monotonous sound, and I do not know whether it was a clock or a drip in the sink or the pulse in my arteries. A small and narrow valley lay between the windows and the next house. It led to a road with a mill, and farther to a field; the river made there a bend. In winter on walks there with our uncle Israel, the youngest brother of my father, we would throw stones that would skip along the ice, and in spring along the water's surface.

The only picture of us three brothers I know is a photograph showing me sitting in a girl's dress, with black curls, my brother Alexander-Lev, called Lelia, with blond curls, standing in a pose of little Lord Fauntleroy, and Daniel with a short haircut. I remember vividly the hour when my mother took me into the bedroom and changed my girl's dress to a boy's outfit; my brothers met me with great joy when I emerged from the parents' bedroom. I remember also when the hairdresser came to us, placed his bag of instruments on the couch, and clipped my hair, promising that it would be stronger if cut; thus my curls were gone. I was a strong and healthy boy, the only one of us three who was fed on mother's milk; my brothers were, as the custom then was, fed by wetnurses. I remember playing under the table when parents and guests dined, at the age when such things are done.

Growing up somewhat, I would stand in the drawing room, which had a balcony, and watch the passing clouds, and pray, probably to the glory of God, in my own words. Early I started to learn Hebrew: a *melamed* (teacher) used to come to us; he would put the book before me—sometimes it was upside down—and I would read the syllables. On High Holidays we used to visit the synagogue; my father had his seat at the East Wall, next to the holy enclosure with the rolls of the Torah. The synagogue was situated in a large garden on the quay of the South Dvina.

Standing on the mountain pathway, I liked to watch the steamboats with turning waterwheels moving towards the sea on the broad stream; and in the winter I remember walking on the ice of this great river, accompanied by an employee of my father.

During the summers we used to live in a cottage on a hill some distance from Vitebsk. Beyond was a field with rye, farther a forest, in which there were heaps built by ants; we would watch the ants become agitated when a broken treebranch was stuck into a heap. In the forest we collected berries. We tried to persuade a squirrel to

come down to eat nuts placed on a kerchief. We played in the grass when it was harvested, behind a nearby mill on a lawn surrounded by bushes and trees. Next to the mill there was a road and on the other side of it a pond dammed by the mill; reeds grew there, and we brought home shells with their occupants still inside. A narrow rivulet ran down from the dam, and once my brother Lelia, who was my permanent playmate, and I were caught by the sudden swelling of this rivulet. The road led to a larger road and there I loved to follow the carriages uphill and down. Farther there was a hill with a church on top and many ravens flying around and making noise.

Once my brother Alexander and I, probably age 5 and 4, went to a large Christmas tree party, arranged by some institution. I would not know how I made the causative conclusion, being yet more than twenty years ahead of my medical degree, but I thought that the very sweet and tasty almond milk which both of us enjoyed and of which second helpings were offered from unwashed glasses, brought measles to my brother—he became ill soon after that evening. The apartment was divided by a locked door, my brother being transferred to the half where also my parents' bedroom was, my mother taking care of him, and I was placed under the surveillance of a governess in the other part of the house. But recovering from measles—then a quite undesirable sickness to contract in view of the many complications that the doctors of that time were unable to cope with—my brother contracted scarlet fever. Again, entirely on my own, I arrived at the conclusion that the doctor visiting him daily brought to him the germs of the new disease. My mother, afraid of letting me live in the same apartment divided by a locked door, had me move to an apartment a floor higher. But at last Alexander recovered.

In 1900 or the beginning of 1901 my father left Vitebsk for Moscow. My mother soon followed with Daniel; we were left with a “bonne” (Freulein) and partly with uncle Israel. He was a bachelor, liked horses, and kept them when my parents were in Vitebsk. The very move to Vitebsk was preparatory to establishing a home in Moscow: only after paying for a number of years the dues of the first guild merchant, could my father as a Jew make his domicile in Moscow, generally out of bounds for Jews.

That summer (1901) part of Vitebsk burned and we watched the reddened sky from our summer home. From Daniel came letters telling us of the capital and the many gates in its walls. Meanwhile we, Lelia and I, began to learn to read Russian and German; our teacher was the “Freulein,” Meta Redlich, the daughter of a miller in Nevel, not far from Vitebsk. We had had governesses previously, but her we called our “beloved Freulein.” Meta Redlich was seventeen years old when she came to us and we became very attached to her.

In the fall of 1901, on a walk in the hills of Sosoniki, we saw from afar a horseless carriage, the first automobile any one of us had ever seen.

References

1. Since in many cases the place of origin of a person was used to form his surname, Velikovsky—so one of my reader-correspondents, also from Russia, suggested—could mean the origin of an ancestor from one of the geographical places that contain *veliky*, as Veliky Volochek or Veliky Luki, not far from Mstislav.
2. Moshe Halevi was a member of the Hebrew Theater Habima in Moscow and later founded the Ohel Theater in Israel.

Moscow

One day in October or November, 1901, Alexander and I were dressed in our warm clothes, and winter boots were put on our feet for our travel to Moscow. We were driven, accompanied by the “beloved Freulein,” in a horse-drawn carriage over the bridge on the Western Dvina to the railway station. We took our places in the second class compartment in the train that left in the early afternoon that October or November day. There was an exchange of harsh words between our Freulein and two gentlemen who insisted on occupying the same compartment; but then the gentlemen became more agreeable, and entered into an animated conversation with our Freulein. In the evening we reached Smolensk, but all I could see was a pool of water from rain outside our windows. Only many years later, passing through the station in daytime, I saw that, like a fortress, the town nests on an elevation.

In the grey morning I awoke and looked out of the window of the train. In a snowy landscape of fields and forests trees moved and ran swiftly, the swifter of them, those closer to the tracks, overrunning the trees away from the tracks. In my solitary watch it appeared to me that the train was circling for hours as if going up a hill on which Moscow stood.

In Moscow we were met at the station by our mother and our brother Daniel, who was excited to show us the capital. We traveled through to Tverskaya Street, and came to a residential hotel in the business section of the town, the Kitai Gorod, where our parents and Daniel lived. There the Freulein and we occupied a room. In the hotel I spent time looking at the incandescent electrical bulbs with spiral filaments—this was new to me. In our room Freulein read to us *The Prince and the Pauper* and the story of *Little Lord Fauntleroy*. I could already read them myself; I also liked to copy geographical maps, especially of Europe, and color them.

We lived in that hotel for a few months. The summer we spent on a *dacha* in Sokolniki. I became seven, and I remember well that day. My father, sitting in a hammock in the garden, asked me how many days, in my estimate, I had lived. Having in my memory an inexhaustible store of events, I made a guess—“a million days”; but then, when my father bode me to calculate, I found to my great surprise that all my memories came to me from the experiences of some two thousand days only. For that birthday my father gave me half a ruble, the price of admission to the children’s festival, a big affair that happened to be on that day. This entitled me to participate in track running—and I remember how I ran, the first of the group, probably admired; I was, however, overtaken by one or two other boys, but still felt happy. In the evening there was a lantern festival.

One day boys from the other side of the fence threw stones at us and we three brothers fought valiantly against a “superior” force, and returned stones. One stone hit me in the temple. My mother saw me through the window, my head covered with blood; but I did not cry, and stood my ground. She ran down the steps and brought me in to wash my head.

That summer, thinking of the little pool not far away from our *dacha*, I made the following invention, which I explained to my brothers—though, it seems to me, I expressed it as though it were an event that had actually happened. By going very swiftly over the pool, so that before my foot could sink I would move it into a new position on the surface of the water, I would be able to walk on water. This sounded good in principle, but my performance was just wishful thinking, and a bit of a fantasy.

It was the time of the Boer War. My father’s interest in world affairs and even more his preoccupation with the problem of the Jewish people—which must have been already then manifest to me—made me, when once asked, “Whom do you love more, father or mother?” answer “father.” His idealism, in my consideration, gave him the right to preference.

My father in his unusually pleasant voice sang Hebrew songs at the evening meal with the children on his lap; these were songs of longing for Israel, songs describing Rachel, who cries for her children, or telling of a rose, symbolizing the Jewish people, torn and trodden by the passers by. He had beautiful melodies for his songs.

One day my father called me into his bedroom. There was a steel safe; he opened it and showed me a book by Dr. Joseph Sapir, *Zionism*, in Russian, and on the introduction page it was written that the book owed its appearance to the munificence of Simon Velikovsky.

My father had been one of the leading members of the Jewish community of Vitebsk. He went to the Second Zionist Congress in Basel as a delegate, and there met Herzl who, impressed by my father’s appearance, approached him to press his hand. My father returned enthusiastic about the new National Bank. He spent many efforts to persuade his friends to participate in purchasing the foundation’s shares, but found ignorance and apathy among the people he approached. Then he made an offer to the Vilno Zionist Committee, which was the central organ in Russia, to contribute 300 rubles for a literary prize, which was then a large sum. More than twenty manuscripts were sent in; the manuscript of Sapir won the prize. But the committee needed money to print it, and my father supplied an additional five hundred rubles, a matter nowhere mentioned. It was not known that my father gave his last money to make this possible; in his autobiography written many years later he commented, “I thought that if everything is fallen, at least this should remain from all my efforts.” On this book a generation of Jewry was educated to the national idea. Its preface was written by Moses L. Lilienblum, a noted Jewish figure. The book was also translated into other languages.

In Moscow we rented an apartment on Milutenski Pereulok, off Miasnitzkaya Street. It was one of the most modern houses, six stories high, with an elevator. It had a front staircase with the fashionable embellishments characteristic of French architecture of the turn of the century. There was also a back staircase for the servants—a family would in those days usually have two female servants, a cook and a chambermaid. The older of them were born still in slavery, abolished in Russia one year before it was abolished in the United States. One day crowds filled the streets and the windows, and waited long. First a dog ran by, frightened by the crowds; then Tzar Nicholas II drove by in an open carriage on one of his rare visits to Moscow. I saw that his face was white with fear, since from any place a bomb could be thrown at him, as it had been at his father.

The business of my father was on Nikolskaya in Kitai-Gorod, housed in large flats with numerous workers; one flat was used as a storage-place for fabrics, visited by sales people who traveled to sell the merchandise; another flat was a tea dispensary—imported tea was divided by a dozen or more workers into packages wrapped with lead paper and stamped with the name of my father's firm. My mother assisted my father, who was always above the details, and easily cheated; but even the careful and exact nature of my mother did not spare the business from a collapse in a few years. No doubt the sales people took advantage of the freedom they had in giving credits; and with the outbreak of the Russo-Japanese War many merchants did not pay their debts, and probably also the import of tea from China was hampered. Thus my parents saw their business deteriorating and apparently heading toward an abyss.

Soon after we moved to Moscow, Meta Redlich, who used to tell us stories before we fell asleep, left for her home and sent us her picture; in her stead came Mr. Messerer, a Hebrew teacher from Vilno. He was middle-aged, with a black beard and bald head; he left his family at home, and possessing a diploma, but no knowledge, in dentistry, could live in Moscow, otherwise restricted to the Jews. Since the time the Jews were expelled from Moscow and then selectively readmitted, he was the first and only teacher of Hebrew in the city; he was to act as our educator. He lived with us a few years. When in the summer of 1904 Herzl died, Messerer cried bitterly. On one occasion I remember him explaining to me the creation of the soul by God: a lighted candle kindles more candles without losing its own light.

My lessons in German were displaced by lessons in French. By moving the family to Moscow my mother intended to provide for her children the best possible education; the best gymnasium was considered to be the new Medvednikov, or 9th Government Gymnasium, founded from the bequest capital left by a rich and liberal merchant. There were three "preparatoires" followed by eight grades. Already in the first preparatoire the knowledge of French was required. I went to exams at the age of seven for entrance to the first preparatoire; I was asked questions, both oral and in writing. I made a favorable impression, and my mother had to decide whether to let me or my elder brother, Daniel, who also presented himself for examinations to the

third preparatoire, be accepted: there was only one “Jewish vacancy,” the governmental rule being that Jews could compose but three percent of the students. She preferred, and justly so, that the elder brother be accepted.

Daniel traveled to the school, rather far away, and I was sent several times a week to a French lady, Madame Chaulet, who lived in the Dolgi Pereulok in the Devitchie Pole on the outskirts of town. She had taught in the Medvednikov Gymnasium in former years, and apparently was recommended to us to be my tutor. She was an elderly noble lady, of the Russian Orthodox faith, as I judged by the many icons in her bedroom. She was very kind to me. Each time I came she would greet me, inviting me to have a cup of sweet tea or chocolate with cookies. She was a good soul.

The way to Mme. Chaulet’s house was long. In Moscow there were no electric tramways as there were already in Vitebsk—only horse-drawn trolleys. I would walk to the Liubianskaya Square, where stood the building occupied by an insurance company, which fifteen years later became the headquarters of the secret police, a horrible place. On the square along the outside wall of the Kitai Gorod were little wooden stores with all kinds of merchandise; I would stop at stationery displays, at bookstores, and loaf. Sometimes I would buy a ball of chocolate with a “surprise” ring inside; the ring had a “stone,” and all was for three kopeks.

Daniel impressed on us early that the business of our parents was declining, and that they were having difficult times. Therefore, he told us, we had to save some of the travel money. My way to Devitchie Pole would cost five kopeks—half of the way in a two-story horse-drawn trolley and the second half in a one-story small trolley—to which I had to transfer at the quay of the Moscow River. But traveling only the first half on the open upper deck of the trolley, one paid three kopeks, but had to go afoot the second half. Thus to save two kopeks I would walk for an hour, but often I would save the whole amount by walking the entire distance both ways, which at my slow, loafing pace, took a full two hours. Sometimes I would go by the long park along the high wall of the Kremlin, sometimes through the Kremlin, by the long rows of cannons displayed there since the Napoleonic war. There was one particular cannon, not very big, that I could lift by one end, and I would not miss doing it each time I passed there. The Tzar bell, broken, the size of a house, and the Tzar cannon, with four immense cannon balls, were my permanent interest. But most of all I loafed, going by Volchovka and Mochovaya, with their many bookstores. I would look attentively at the postcards, and sometimes buy a few, with romantic content, such as a nymph at a well; but soon I was more and more interested in the books, and became familiar with many titles and authors. Daniel collected books, and all of us participated in this hobby; the books were mainly works of Russian authors or of foreign authors in translation, as given to subscribers of certain periodicals, usually in covers with gilded imprints.

When one year passed and I again had to present myself for examinations, I was not accepted—my French was but “satisfactory,” and not “very satisfactory.” I went

another year to Mme. Chaulet; at the same time I had at home a tutor for Russian and mathematics. He was a medical student named Bialo, and sometimes he used the lessons to practice on me the art of making bandages, a study that I recognized twelve years later when myself a student of medicine.

After another year, at the third try, I had again only “satisfactory” for French—this was a stragem to keep me out of the quota, promised to somebody else. Madame Chaulet, very indignant, since she knew my knowledge in French was not the reason for my non-acceptance, went to the Gymnasium, where she earlier had taught, to talk to the director. I did not have any feeling of degradation in that as a Jew I repeatedly met rejection, while the Gentile boys found acceptance with no difficulty. But my mother suffered. Once she went to see the director, Vasili Pavlovich Nedatchin, who posed as a liberal yet was of a dictatorial nature with aristocratic aspirations, though a commoner by birth. Suddenly my mother burst into tears. A proud woman, she could never pardon herself this display of human weakness; but she so much wanted me to enter this school, thought to be the best.

Two years we lived in our apartment in Milutinski Pereulok, and then we moved into a more modest place in Obidinski Pereulok. Yet the two years in our first apartment—from my age of seven to nine—left many imprints. Our apartment was on the top floor. An attic was over the adjacent part of the building, and there the chambermaids or cooks would hang the washed linen to dry—there was no such thing as sending linen to a laundry. One day Alexander, or Lolya as we would call him, and I went to investigate the place. It smelled of pigeon habitats; heavy beams supported the roof, with one or two dormers opening onto the steep metal roof. The domestics who happened to be there, an uneducated folk unable to read or write, thought it a good joke to bolt the door and frighten us by denying us a means of returning. Only with children could the female servants, actually still living in semi-slavery (half-day off every second Sunday) permit themselves such a practical joke; and they laughed behind the door. Without much hesitation, Alexander climbed out of the attic through one of the dormer windows. The opening was close to the edge of the roof and Alexander, holding on with his fingers to the tin of the roof, was moving with his feet towards another dormer—six or seven stories above the street. The women seeing him there shouted in fear and opened the locked door and called to me. I, however, was already one leg out of the dormer about to follow my brother and possibly was already crawling along the roof’s edge. I climbed back and made my way out through the door.

In 1905 I went for the fourth time for the examinations of entrance. This time Mme. Chaulet went with me to the examinations; I was accepted, at the age of ten, to the first class.

Now that I was enrolled as a student in the Gymnasium, my mother took me to a store of uniforms, and soon I was, like all the others, dressed in the school uniform. It was made of black cloth, and included a black belt with an emblem on the metal buckle, and a military cap, with another large emblem in front identifying our gymnasium.

There was also an overcoat in blue-grey, very similar to the one worn by officers in the army in peacetime. For festive occasions we had a short tailless jacket, in a dark color.

Ours was an unusually large class—fifty nine pupils; in the following years the number diminished to a little over forty. I still remember most of the names: Adelgeim, Aleksejev, Arkadjev, Armand, Bleklov, Vaganov, Vargaftig, Vasilief, Velikovsky... (In the Russian alphabet the letter V follows the letter B.)

The first, third and fourth, in a year or two, were no longer in the class. Yet very many of those with whom I started at the age of ten in the first class went with me through eight grades and finished, like myself, in 1913, at the age of 18—or some at the age of 19; I was one of the youngest in the class, by several months to a year younger than the others. The system required that a student be satisfactory in all subjects—and there was no free choice of subjects, with the exception of Greek, which was not obligatory and was offered in upper classes and taken only by a few students. If a student's marks were unsatisfactory in one subject, he had to pass an examination in the fall before the start of the new class; if he did not pass the examination, he would be required to repeat the entire grade in all subjects, joining the younger class. This was a great humiliation, not so much for the loss of a year as for being compelled to part with one's classmates and join the younger boys, for whom there was always some feeling of contempt just because they were younger. With more than two unsatisfactory subjects a boy would automatically "remain" in the class, without a chance to rehabilitate himself in the fall. Often such a boy would prefer to quit the gymnasium entirely; but some "remained" and even more than once, so that a few students who studied with Daniel became my comrades.

The year that I entered the class, two more students were *novitchki* or "green ones": Golunsky and Gorbov, both very talented boys; all the others had already spent three years in this group, having started at the first preparatoire. In my class there was one other Jew—Eugene Luntz, the son of a doctor. We were free to abstain from the class of "God's law," or religion, given by a priest.

On my way home from the gymnasium I was often joined by Golunski, whom his mother brought and came to pick up, whereas other students came and went by themselves. His father was a military staff doctor, whom I never saw. His mother was a large woman. The boy was pampered, always warmly dressed, with warm heavy boots long before the winter set in. He was very studious, never participated in any pranks, always knew his lessons excellently, was respectful toward authorities, and showed little imagination. Forty-five years later he was a prominent Bolshevik, a professor of international law, designated by the Soviet Union as Justice at the Hague tribunal. At his visit to the United States I could still recognize him by his picture in the press; but there was no one among the fifty nine students who fitted less the role of a revolutionary or member of the Bolshevik elite.

Gorbov was the son of a Jewish mother, with whom he lived; she was divorced or

separated from her husband, a justice in a minor court in Moscow. Gorbov later became a poet, then a Bolshevik; at the height of his career he was denounced and purged.

Vargaftig, who grew into a very strong boy, was a baptized Jew; not a few Jews baptized their children to open them a road in life. Being baptized, they were never again discriminated against. Being strong and big and jolly, he soon dominated the class, and around him several other boys of some distinction grouped themselves. But he did not grow up to what could be expected of him: he later became a tennis player, a boxer, a trainer in sport, but nothing outstanding.

Another group in the upper classes centered around Zavadski, a very tall and lean boy; he was talented in drawing and liked to participate in school plays. In adolescence he was not interested in girls, and in later years became a noted stage director of one of the famous studios of the Moscow Art Theater.

It seems that I hurry to tell of these boys as they grouped themselves in later grades and as they grew up; the fall of 1905 neither showed yet their talents as clearly, nor presaged their future.

I was placed at one desk with a boy of Polish extraction: Sedlezki. He tried by various means to frighten me, but was unsuccessful. Pupils sat two to a desk of good oak. They were placed at the desks according to their height: smaller boys at lower desks in front.

For eight years I would walk in the morning some four or five blocks of Moscow's side streets to the Medvednikov Gymnasium and in the afternoon retrace my steps homeward. My way passed a *kazienka* or a government monopoly store that sold exclusively vodka in bottles of various sizes. Occasionally I would see a man of the labor class come out of the store (it was not permitted to drink inside), slap the bottle on the bottom, thus uncorking it, and drink it on the spot, and stagger on his way, or return to the monopoly for another bottle. Sometimes I would see a drunk lying in the gutter, his broken bottle next to him.

The name *kazienka* was derived from *kazna* or State Treasury. Under Tzar Nicholas II every village in Russia had a *kazienka*, but by no means did every village have a primary or any other school. Russia was held in ignorance and illiteracy but was kept thoroughly drunk, and the government of the Tzar obtained its revenue from a monopoly that kept the peasant and labor classes in dissolution and mental decay. When drafted into the army, some of the men called to the colors had, during the training, straw tied to one boot and hay to the other, marching under the corporal's barking, "straw, hay, straw, hay!" since many of the inducted could not distinguish right from left.

The Russian-Japanese war was started for the protection of the possessions and concessions of the members of the House of Romanov on the River Yalu and in

Manchuria. It is true that upon mounting the throne in 1894, Nikolai had an idealistic plan for an international court (the Hague Tribunal), but this idealism did not last. In 1903 a pogrom in Kishinev, in southern Russia, was staged at the directives of the Tzar to frighten the Jewish population of the country and as punishment for their liberal tendencies and spirit of westernization. When the Japanese war was lost in the naval battle off Tsushima, the hero of the prolonged defence of Port Arthur, General Stessel, was sentenced to the Shliesselburg prison, a measure calculated to find a scapegoat outside of the inefficient and corrupt palace.

Workers who went to the palace to ask the Tzar's ("Little Father's") protection were shot by artillery, and Cossacks with their sabers were let loose into the crowd. In Moscow gendarmes occupied a place across the street from the university and shot at students, but the population of Moscow, undeterred by the "black hundreds," the butchers, and similar "patriots" of Moscow's lower places, staged huge marching demonstrations and won concessions from the Tzar: this was the 1905 revolution.

The Tzar was compelled to promise land to the landless peasantry and to grant a "constitution" and a representative Duma (Parliament), which he disbanded as soon as he felt safe. The members of the Duma, headed by the president, Professor Mourmizhev, gathered in Vyborg, Finland, and wrote the Vyborg declaration, inviting the population to refuse paying taxes; Mourmizhev and other signers of the document were sentenced to prison terms.

From one Duma to the next (there were four), the franchise was ever more limited: a rich person voted in a different curia than a poor person and his vote weighed a score of times the vote of the latter. Stolypin, the Prime Minister, gave his name to the "Stolypin tie" which meant a noose at the gallows. Many revolutionaries spent their lives in Siberia; some great men and women, like Nikolai Morozov and Vera Figner, spent years and decades in solitary confinement.

Nor would the Tzar tolerate the illustrious efforts of some of the nobility, most notably of Leo Tolstoy, to bring about reforms. Tolstoy did not advocate the overthrow of the regime, but he was persecuted by the government for his call to return to the ideals of early Christianity. While he lay dying in the station master's house at Ostapovo, a refugee from his own house and estate, the Holy Synod, dominated by the Tzar, forbade prayers for the octogenarian in any of the Orthodox churches of Russia, and when he died, he was refused a Christian burial. So also was the evil Tzar, who was to meet an evil end.

Student Years and Wanderings

In the early summer of 1912, when I was a tall seventeen-year-old youth, my wish of several years' standing came to fulfillment: I traveled to the land of Israel. My father still had not seen the land of Israel, but he made it possible for me to visit the land, then a Turkish province. I departed as soon as the term in the Gymnasium was concluded. By now I had finished the seventh "class" and one year was still left before graduation. I went first to Kursk to meet my companion, the arrangement having been made by my father. Mr. Supraski was not of my age—he was 36 years old, the father of a family, and a delegate to several Zionist Congresses. I stayed one or two days at his home. The arrival of a gymnasiast from the capital was an event in the dull life of a few young girls in Kursk and they came to meet me in the garden of Supraski. A little dog bit me as I approached the waiting group, but true to the code of behavior, I did not even turn around—yet the signs of the dog's teeth could be seen decades later.

From Kursk we travelled by train—stopping I believe at Kiev—to Vienna. There we stayed for a week. I went to museums, spent time at the Prater, and attended a meeting of the Parliament, which I remember only hazily. With Supraski I went to the cemetery where Theodor Herzl's tomb—in black granite if I remember right—was next to his father's grave. Another part of the same cemetery was Christian. I was in a mood that found expression in an elegy.

From Vienna we went to Trieste—a bustling city, then a part of the Austrian empire and its chief port. After two days we boarded the "Vienna," the boat on which, I believe, Herzl had made his voyage to the land of Israel about a decade earlier. This was my first sea voyage. The blue water of the Adriatic and of the Mediterranean, the seagulls following the ship, crimson stony Crete, and the colorful sunsets, all impressed me. In Port Said we spent one night, and the silvery calm water of the port, with numerous boats and shouting Egyptians, was again a new and exotic scene to my eyes and ears. We traveled now in the first class of some Ottoman ship, and the food, served with innumerable dishes, including big cakes with candles burning inside casting a reddish illumination, had a flavor out of the *Thousand and One Nights* in the capital of el-Rashid. Because of the Turkish-Italian war our ship went all the way to Beirut. There I lent my passport to a Jewish youth who had left Russia to escape service in the Tzarist army. After he entered the country (Ottoman Turkey), the passport was brought back to me on board, and I went to visit Beirut and the American University.

We came to Jaffa, and shouting Arabs in boats tossed about by waves took us off the ship far from the shore and brought us to the stony steps; Supraski read me a letter

from my father, and reminded me to kiss the earth for him—he had not yet been in Israel, the land of his dreams. But I reserved the carrying out of my father's wish until a visit to a hill in Rehoboth.

Tel-Aviv was three years old. I still see it with the Gymnasium on Herzl Street, the only store near the railway track, and a little stretch of a boulevard and a few streets. On Nahlat Benjamin Street I shared my room in a little house that pretended to be a hotel with Kaplansky, a young engineer, who later became known as a political figure. Bezalel Jaffe, a distant relative, was one of the founders of Tel-Aviv, and I was received warmly at his home. We attended some classes at the Gymnasium.

Supraski made the itinerary. We visited Rishon le-Zion, where we were shown the vinepresses. I bathed in a reservoir in an orange grove in Nes-Ziona. In Rechoboth, at a private party in the house of an American cantor, I saw a girl whose face and figure caught my imagination; she had large dark eyes, a Roman nose, was dreamy, and was an embodiment of my taste then, an Oriental beauty; she was, as I found out, only fourteen years old, but ripe for that age. I was in love with her at first sight. I hardly spoke to her, if at all. The next morning a lady guest at the little hotel in which we were staying volunteered to show me where the girl lived and we went to a little one-story house with green shutters; the girl—Esther Bashist was her name—came out, and I saw her again. For many years she was in my thoughts my future bride. To her and her little house I wrote some poetry, and for the next ten years, in faithfulness to her, I preserved my “innocence” or celibacy, until I found my real companion in life.

We went as far south as Katra (Hedera), and on donkeys' backs traveled to Ekron and Hulda. Then we went to Jerusalem and to the Wailing Wall. I was deeply impressed by the old city with its narrow streets, and by everything I saw there. Leaving Jerusalem for Tel-Aviv, I wrote in the train a piece of poetry “At the Wailing Wall.” It was, I believe, the first of my writings ever printed.

The journey from Tel-Aviv to Haifa took three days, the wagon being drawn by tired horses through deep sand dunes; there were no paved roads. We stopped at Petak Tikva, Hedera and Zichron-Jacob, and I remember many details of these overnight stops. From Haifa we went by train to Merhavia. This was the only settlement in the Emek (the plain), presently teeming with settlements; and it had no building but the old *sarai* of the sheik who had sold the “village” and the land. I slept in the field among the tall sheaves of harvested rye and watched the full moon. We went on to Degania, which was new then, crossed the Jordan, slept in Kinnereth on the shore, went up to Poria in the mountains, and spent time in Migdal. My father was the initiator and organizer of the group that had purchased Migdal, but he himself did not participate in the ownership since he wished the movement he started to be democratic and popular and not exclusive, as Visotzki and other people whom he influenced to purchase the land wanted it to be. We did not go farther north, nor did we visit south of Hedera. At about that time Ruhama, in the south—my father's second “pioneer colony”—was in the throes of being born.

We spent five weeks in Palestine. I parted with Supraski, who felt a little ill in Tel-Aviv, and I went to Egypt on the deck of an Arab boat. I slept in the life boat that was suspended above the deck, alone amidst the barefoot Arabs, probably pilgrims. On the train from Suez to Cairo it was so hot that I could not help but drink water from the tap in the dirty toilet compartment, and I wonder than I did not catch some disease. In Cairo I spent several days, went up the Cheops pyramid, pulled and pushed by three paid guides, and sitting to rest halfway up felt the immensity of the structure over the great valley.

On the streets of Cairo, as before in Vienna, prostitutes approached the seventeen-year-old youth, without evoking in him even the slightest desire to follow them.

In Alexandria I boarded a Russian ship bound for Odessa. I visited Piraeus, went to Athens, and climbed the Acropolis—and was almost late getting back to the ship. In Smyrna, on Turkey's Aegean coast, I went with two students from Petersburg to see the town and the surroundings; from afar our guide pointed out the place where, he said, Troy once stood—which, I understand, could not be the true site. Two oarsmen in their boat carried us to the ship in Smyrna harbor. The two cocky students in white helmets had some disagreement with the oarsmen, and when one of the students pulled a revolver out of his pocket to intimidate the men, one of these, a true bandit, beat him over his helmeted head with the oar, and only the helmet saved him; there was blood to all sides. I bent down to help the wounded, and the people who witnessed the scene from the ship told me later that by this movement I saved myself, since the other oarsman, behind me, was about to stab me with his knife. The shouts from the ship made the oarsmen let us out, to another boat, or to the ship itself.

In Istanbul I wandered alone, saw Hagia Sophia, visited Perun and Galata. I saw the dirt and the colors of the oriental city, and the little wooden cubicles on the streets where brothel women called to the marines. Then, back on the boat, I remember its quiet glide through Bosphorus, a storm in the Black Sea, and the landing in Odessa and a walk on its promenade above the port. From there I proceeded to Kiev. On Kiev's main street I chanced to meet Supraski who was on his way back from the land of Israel.

It was the middle of the summer when I returned to Moscow. Riding in a horse-driven carriage through the street where Mme. Chaulet lived, I was filled with reminiscences of the years I used to visit her almost daily between the ages of seven and ten. Returning from the south, the summer in Moscow felt chilly. On August 16 (old style), as usual, the classes started. I had before me my last year, the eighth class.

Already the year before I had edited the class journal, actually printed it on a typewriter several times; the main illustrator was Golz, a pupil who first studied with Daniel, but being twice left to repeat a year, was now with me in the same class. To be an editor gave me some pleasure.

Once there occurred a small—or in the world of a Gymnasium class a

big—disturbance. The class had to announce to the German teacher that our homework was not done: there had been an evening of dancing in some girls' school the night before. As the teacher's favorite, I was asked by the class to announce the failure. The teacher did not accept the collective "strike," and called the Inspector. Finding the class in revolution the Inspector summoned the guards. The end of the story was that Gorbov and I got a miserable mark in conduct and were barred for a season from the balls and concerts—the big events in the Gymnasium—and forbidden to visit any place of amusement in town for many months. I heard that at the teachers' meeting even our exclusion from the school was considered. I certainly was not a favorite of the director, Vasily Pavlovitch Nedatchin. He had a reputation as a liberal, but I am not sure that he was free from antisemitism—he was something of a libertine; certainly he had an affair with the mother of a close school friend of mine, who by now was in a lower grade. Yet Nedatchin compelled our French teacher to marry a girl whom this teacher, a bachelor, had made pregnant.

As two years before, I worked hard. I excelled in mathematics. Before graduation the final exams had to be passed, and I remember especially the written mathematics examination: it was held, as other exams, in the very big and high-ceilinged Aktovi Sall (Festivities Hall), each student at a separate desk, distanced from all other desks. I finished a full forty minutes before the next one (Golunski) and handed in the examination papers and left the hall, and certainly there were capable students among my classmates.

I knew history books by heart, and won high praise for my Russian composition. My permanent protector was Boris Ivanovitch Dunaev. His lectures were inspired. He loved the old Russian literature and traveled in northern regions and collected *bylins*, or songs and ballads, often of epic character. Once the teacher of English, Eduard Isaievitch Radunski, stopped before me in the class, and could not help telling me that at one of the teachers' meetings Dunaev had expressed his belief that I would be the future great Russian poet.

I, too, liked the old Russian *bylins*, and the charms of the language. And whether it was the story of Protopope Abbakume, sent away into exile for heretical views, or the song about the young merchant Kalashnikov, by Lermontov, or the tribulations of Turgenev's Rudin, whom I defended in a circle on literature under Dunaev that came together some evenings, I lived in Russian literature, and everyone thought that after graduation I would study philology. Once during the physics lecture, I believe it was the last year, I was observed by the teacher Baranov reading a book by Merejnovski on Tolstoi and Dostoievsky, and he, with some measure of respect to this interest of mine, took the book away and gave it to the Inspector (second only to the Director) Vladimir Pavlovitch Goncharov, who was also the librarian; but I was not scolded. I studied Latin second to none in the class; however in modern languages I did not excel, neither did I show great interest in natural sciences, if there were any courses in the last grade; but Russian, mathematics, Latin and history were considered the basic subjects.

It would take many pages to write of the colleagues who studied with me. Certainly there were talented men among them; I have already mentioned Zavadski, who became one of the leading stage directors in Russia. Some never proved their abilities because the war (World War I) and especially the revolution either killed them or reduced them to littleness. Of poets in our class there were three: Kharlamov, Gorbov, and myself. The first of these was an introvert; with Gorbov, however, I was on close terms.

About the time we finished the last grade and graduated, Kharlamov printed a booklet of his verse, and Gorbov and I printed a booklet together, each of us contributing, I believe, twelve pieces of poetry. I paid for this edition since Gorbov had no money to spend, as he said. We chose a miserable little press, which after the proofreading reset the pages—apparently they needed to use the types for some other printing job while waiting for our corrections, and so there were new typesetting errors introduced after proofreading. The booklet, entitled *Stikhi* (Poetry) was a success among our friends. At about the same time, or a little earlier, my poem “At the Wailing Wall” was printed in *Rassviet*, the leading Zionist weekly (or bi-weekly) published by Daniel Pasmanik, in Petersburg; it was the poem I had written on the train on leaving Jerusalem the summer before. A few months later, visiting the editorial room of *Rassviet*, I was told by the editor that I should continue to write.

I finished the Gymnasium in 1913, which was the three-hundred-year jubilee of the House of Romanov on the throne of all Russia. I received a gold medal at graduation, an equivalent of “summa cum laude.” It had on it the pictures of the first and last of the house of Romanov. Golunsky, Murahovsky and I were clearly the best in the class. Murahovsky was a silent, friendly, and industrious pupil. But in our class seven gold medals were given, and it was said that it was on account of Nedatchin’s, the Director’s, leaving that year, that the school made this rather unusual “splash”—unless our class had a true collection of very capable students.

The summer after my graduation—and what a feeling of freedom and relief—we three brothers spent several weeks in Finland. There, after a visit in Viborg and Helsinki (Helsingfors), we came to an isle in the Scheres. The travel by steamboat between the innumerable islands, with the sea narrowing to the size of a river and then again broadening to wide expanses, was an unforgettable experience, and throughout my life I have wished to visit those islands once more. On the small island on which we landed we left our luggage on the pier with nobody to take care of it, and found it still there when we returned after finding a room in the house of some fisherman. Possibly we spent there a week. With Alexander I went to Abo (Turku of today). Again together with Daniel, we went northward from Helsinki on one of the lakes, so numerous in Finland, and descended southward, slowly, on a boat that went through many sluices or gates, the level of water being adjusted after each descent from gate to gate.

Though I had graduated from the Gymnasium with a gold medal, I was not accepted to the Moscow Imperial University because that year a new measure was introduced.

Until that year of 1913, Jews were accepted only if they excelled—thus the recipients of medals filled the *numerus clausus*. But this arrangement compelled the Jewish gymnasiasts to study hard and thus many of them became the best students in their classes. Therefore in 1913 the antisemitic minister of education Kasso changed the procedure to a “lottery” ; henceforth not the Jewish students with the best marks, but those few to whom chance was gracious, would be accepted. At the offices of Moscow University I met an aspirant by the name of Burstein, from Balti in Bessarabia, who told me in advance that he would win the lottery, since his father was the managing agent on the estate of an important Petersburg bureaucrat. And in fact he won the lottery.

I did not regret at all not having been admitted to the University in Moscow, and made plans to study abroad. I thought of Italy, and bought a book to study Italian. Together with the choice of land of study I had before me the choice of the faculty—and this, to the surprise of those who knew me, was to be medicine. Actually my mother was insistent on that. I cannot claim that I myself had a strong inclination to this field, or that I had a burning desire to help humanity as a medical doctor. Yet I did have rather strong desires to be of some help, especially to my own race, and so ancient history, and in particular the history of the Jewish people was not unfamiliar to me. I was most interested in literature, but not in studying philology, which appeared too dry to me; I also felt an inclination toward architecture and interested myself in chances to study it—but not seriously enough. Actually, I was not attracted by any profession, and led a detached or dreamy way of life. In medicine I was interested in ophthalmology, and several times visited the Rumiantzevo library, the largest in Moscow, reading there on eyes, and even devising a plan for reducing myopia by cutting off a slice from the lens, thus decreasing its refractory power. For medical studies I had a certain disinclination, not believing in my abilities in chemistry, and thus in pharmacology. Before his exams, I gave some help in composition to my brother Alexander, who finished his Kommarcheskoe Uchinie (High School) the same year as I did; but I was aware of his far greater abilities in chemistry, a subject that did not attract me.¹

My father advised me to talk over the choice of university with a lawyer, Urison, a friend of his; he advised me to choose Montpellier in the south of France. I still remember many episodes of my journey to Montpellier. One late evening and night I spent on the train, my neighbors being people of show business or the circus. I stopped in Frankfurt on Main and observed a Zeppelin over the town, then a new sight. I did my sightseeing dutifully, visiting the Rothschild library; then I continued my journey. I arrived in Belfort early. Having to change trains, I went to see the lion carved into the rock of the outside wall to commemorate the defense of the stronghold in 1870. Passing through Dijon and Avignon, I came at night to Montpellier and slept in a hotel near the railway station. The next day I found a room in a pension close to the Roman viaduct.

About five hundred Jewish students from Russia gathered at Montpellier; it was the time of the trial of Beiliss. Every day at some fixed hour when the mail and

newspapers arrived, we would crowd the two rooms of our fraternity library where the detailed records of the trial were read to the assembled crowd. Many would stand under the windows in the quiet narrow street to listen to the newspaper readings from the Kiev courthouse, where the trial of Beiliss went on for weeks.

It is a matter of historical record that Tzar Nicholas II was the instigator of that trial, in which Beiliss (and by implication the entire Jewry) was accused of using gentile blood for *matza* (unleavened bread). The police and the government knew the real murderer of the boy, but let the female criminal appear as a witness for the prosecution. The civilized world shrugged it off as it had the Dreyfuss trial nineteen years earlier, but this time not Beiliss only, but clearly the entire Jewish people was under indictment.

The campaign against the Jews of Russia was formulated early in the twentieth century by Pobednoszev, the head of the Holy Synod: “A third will emigrate, a third will be killed, a third will assimilate.” Too true was this prognostication.

Among the students in Montpellier the socialist party of Bundists reigned supreme; the main speaker was a student named Fleischer. The Zionists were as if not present at all; nobody confessed openly to such leanings. Once when after the reading of the newspaper report the Bundist spoke provocatively, I answered with a speech. This proclamation of Zionism spread among the students like wildfire, and before long we had the majority in the student meetings. I was chosen to be the group’s chairman, and a student who had also just started his studies, Michael Marek, was elected as one of my assistants. He, too, had come from Moscow, but there we had not known each other. There was also a student from Israel, Garber: he was from Petah-Tikva, and was studying medicine at the insistence of his parents, although he loved agriculture. Another student from Israel was Baharav; the large majority of students, however, were from Russia and from Poland, then a part of the Russian empire.

Once, after a meeting, five of us climbed over the iron rail and walked on top of the aqueduct, a tall and narrow structure from Roman times, possibly just a meter wide, with no rails, as tall as a six story building and possibly a kilometer or more in length. It was evening, and seeing the numerous lights below and in the distance it appeared as if one could see the entire Provence. On the way we sat down, but it was frightening to stand up again; and when the one going in front announced to the one who followed, and this to the one behind him, that there was a bend—a new direction in the aqueduct—Baharav, who was supposed to be behind me did not answer; and we did not know whether he had fallen down until we reached the end. We went to the end, then returned to the starting point, and found him standing there.

One evening after a heated debate at a meeting, where I was among the disputants, Marek and I in our colorful student berets started toward the fishing village on the Mediterranean seashore to cool ourselves off by a long night walk. We ate and slept in a little chamber in the village and in the morning we continued southward, climbed towards a castle built a thousand years earlier by Charles Martel, saw the expanse of

the Mediterranean—at the other end, we knew, was the land of Israel—and wandered farther amid the dunes and the lagoons.

Back in Montpellier, soon after the classes started, we were unpleasantly impressed by the rigorous discipline and the disrespect shown by the teachers to the pupils in one of the classes—this was far different from the freedom we had known as students in the universities of Russia. Standing on the platform near my home, from where the aqueduct started, with a bright view stretching in front of us, I suggested to Marek that we not continue the classes but go together to Israel—to which he gladly agreed. Our friends in the group were impressed by this decision; to us it seemed to be merely the natural and immediate consequence of our Zionist attitude.

We traveled to Marseilles; from there we wrote home of our decision. Visiting the geographical society of Marseilles, we asked to be shown maps of the Sinai peninsula, since we had a fleeting idea to cross the peninsula by foot, thus repeating the desert wanderings of the children of Israel. We were dissuaded from the plan, being made aware of the lack of roads and of our own lack of preparation. This course would have been rather perilous, if realizable at all. We bought two revolvers in Marseilles.

Climbing the hill on which stands the church with a gigantic Madonna on its roof, we looked out at the island made famous by the novel *The Count of Monte Cristo*, which I had read many years earlier when I was about twelve. Then we boarded a ship; it brought us to Egypt, again on the blue waters of the sea familiar to me from my travels less than a year and a half earlier. In Egypt we found letters from our parents. My mother regretted my decision to drop the study of medicine, but my father wrote me an enthusiastic letter and blessed me on my road. Marek's parents thought his step unwise. Marek's father was a publisher of art books in Moscow; he eked out his existence, and it was an effort to send a son to study abroad. Michael's monthly check was not big, less than half of mine. Neither did Marek's parents feel bound to the land of Israel in any way.

In Cairo we climbed the pyramids, but once again I omitted visiting their interior—faced with the choice, it appeared more interesting to spend money for the ascent. By boat we came to Jaffa. In Tel-Aviv we received from Bezalel Jaffe, one of the leading citizens and a remote relative of my mother, a letter to Eisenberg, the director of Agudath-Netaim, in Rechoboth. We were seen only by his assistant, and were included in the cadres of plantation workers on a day-to-day basis. We took two rooms in the “colony,” as Rehoboth and other settlements were called, and ate in a primitive laborers' kitchen. But of work in the field not much was done: it was the rainy season and during the rain we had to stay home and were not paid. One day we worked at slicing the earth and pulling out the roots of *ingil*, a strong weed, and my tallness was not an advantage since the work was done in a bending position. Another day we worked in planting. And again ceaseless days of rain. Some days we subsisted on chocolate powder and condensed milk, preparing this drink again and again. In our room, I read Dostoievsky's *The Brothers Karamazov* and was impressed.

I met Esther Bashist at the square where mail was received, and again on a late afternoon on the hills near Rehoboth, when other girls were with her. I languished, hardly exchanging a word with her. This was untypical since among my friends in the Gymnasium I was the most daring and able to start an acquaintance with a girl, surprising these “wolves-to-be.” Here I was without initiative and without speech.

Marek and I would go to visit the huts of the *shomrim* (the sentries): this was the romantic period of the movement and the *shomrim*, who guarded the plantations and who rode horses, were the heroes whom the youth of the colony would come to visit, and sing or dance.

For our mail Marek and I used to go to Jaffa, a walking distance of five hours in each direction, but it did not appear to us impractical to make this trip each time on foot. On the way, in Nes-Ziona, we would take oranges in some grove—to take for one’s meal was regarded as permitted—and bury a few in sand and find them on our way back from Jaffa.

On our way we slept one night in Rishon le Zion. Since during those days the founding meeting of the Histadruth was taking place, presided over by Ben Gurion, there was no place to sleep under a roof, and we slept on the benches in front of the large synagogue building. In the middle of the night some pious man awakened us and brought us to sleep in a Hassidic prayer house; it was a cold winter night.

At the end of December—and we had long since given up the idea of working for Agudath Netaim (all we earned was a few silver coins)—we made our way afoot to Ruhama. It was the southernmost Jewish settlement. The first day we walked as far as Castini, which until the founding of Ruhama had been the southernmost of the Jewish settlements. There we slept. Early the next morning we were again on our way, being told that to find the way to Ruhama we had to follow the track of wheels, since Arabs at that time did not use vehicles on wheels but traveled on foot or rode camels. The entire day we hardly met any human beings. To the left were mountains at a distance, and once at the foot of a distant slope we saw what appeared to be the ruins of a large ancient town. The sun and the moon were of the same size, and like two equal arms of a balance stood symmetrically in the sky, the moon very shiny and the sun somewhat dimmed. When the winter’s early darkness fell rather suddenly on the semi-desert, we thought to lay ourselves down on the sand of the moon-lit desert for sleep. But when we had already selected the place to lie down we heard from afar the barking of dogs and we understood that the Ruhama farm was close by. We now traveled in the dark through valleys along some winding *wadi* and came to a farm yard. When we stood in front of some one-story building we heard from inside dancing and singing—it was Friday night—*Am Israel hai ad bli dai*: “The people of Israel is alive and so forever.”

This settlement, Ruhama, owed its existence to my father. It was founded by the group Sheerith Israel, which my father had organized. The idea of redemption of the

soil in the land of Israel first took shape when the Israel Colonization Association, a Baron Edmund Rothschild Foundation, began its work in the 1880's. The entire Herzl movement added but very little to the program of land redemption. In 1895 Warsaw Jews founded Rehoboth, and somewhat later The National Fund started a few points like Degania and Merhavia. Poria, a small settlement, was built above the lake of Kinnereth (Galilee), by the private endeavor of Americans.

In about 1909 Migdal on the shores of Kinnereth Lake was begun at my father's initiative. In the years 1905 and following he had influenced by personal efforts one by one a group of prominent Jews in Moscow to participate in the redemption of land in Palestine, not by donation of a few rubles to the National Fund (Keren-Kajemeth), but by an investment of substantial sums. Vissotzki and Gotz, rich Jews, were among the members, and Dr. Tchlenov, too. The latter was a leader of the Zionist movement in Russia. When a group was organized and land purchased, the farm that was founded was called Migdal. I remember with what unusual devotion and effort my father made this possible. It had not yet been tried, and nobody could think in terms of a national business action, buying land in an Ottoman province, governed by *pashas* and Ottoman law. My father needed to persuade people, but by nature he was not what one calls a "talker." So he "spoke his heart." His idea was not to have one settlement in Palestine, but to have a central cooperative, composed of Jews of Moscow, whom Jews of other Russian towns would trust, and in whose steps they would follow. This cooperative he intended to call *Sheerith Israel*. This name, familiar to him from his prayers when a youth in the *yeshiva*, was holy to him: "the remnant of Israel." Yet the group he organized decided to be exclusive and was disinterested to gather around itself more groups and to found more settlements. Then my father, again neglecting his own business, devoted his time and energies to creating a new group. Endlessly he tried, visiting those of his acquaintances whom he thought could be persuaded to become members of Sheerith Israel. The sum pledged by each member was about five thousand rubles, a substantially smaller amount than for Migdal, yet large enough in those days in Russia; it was to be paid in installments.

My father started this one-man crusade, as was said, when the revolution of 1905 had not yet been suppressed, and a pamphlet by Prof. O. Warburg was disseminated by a messenger when it was not very wise to do so. Buying land in Turkey was seen as a political activity abroad and must have aroused the Tzarist administration's suspicion. My father asked to have these activities legalized. He was called before a committee of the Governor-General in Moscow. He was ill on the day he had to appear but went nevertheless, together with Prof. Schor, a concert pianist and prominent figure. The matter, discussed and questioned before this bureaucratic assembly, was referred to the administration in Petersburg. But my father, who went there with a fever, fell sick with pneumonia. The sickness dragged on—he was sent to Menton in the south of France to recuperate, but he had Dr. Buchmil, an orator who had participated in Zionist congresses from the first one on, come out to him, and engaged him to travel to certain districts in Russia to try to find people interested in sacrificing part of their property to invest in the land of Israel. Yet Dr. Buchmil failed in the task. Upon his return from abroad, my father resumed his Sheerith Israel work, as soon as he was

able to do so. Whenever he would obtain another signature on the list he carried with him, he could not refrain from showing us that the list of names was growing. And how many times did he fail, too, to influence the men he went to see! He was oblivious of his own business. The expenses incurred by the organization work he carried gladly; in his entire life he always gave, never took from anyone. Finally, when he had about forty signatures, a group from Bialostock joined.

There was land for sale in southern Palestine. Dr. Ruppin, then new in Palestine, looked for a way to realize the purchase. Dr. Tchlenov influenced the group to invest the funds in Gemama, in the district of Gaza. My father wished to start from the extreme Negeb, from el-Arish, which was under the British, who governed Egypt; this was in line with the idea of Dr. Herzl, who thought of beginning in the small area outside of the Turkish province. Yet Gemama's land was bought. My father was asked by the group to choose a Hebrew name for the new settlement, and he chose Ruhama; in the prophet Hoshea, the rejected daughter, symbolizing the Jewish people, is renamed Ruhama, the one to whom grace and compassion are shown. In most settlements, especially in those founded by Baron Rothschild, the settlers employed the cheaper Arab laborers, thus making it impossible for Jewish workers to get a foothold; but my father insisted that in Ruhama Jewish workers should be hired. Then he stipulated that ten percent of the land should be owned by the workers; finally, that only Hebrew should be the language of Ruhama. When the "colony" was founded, the members of the group gave my father a palm tree, which stood in our apartment.

Marek and I arrived in Ruhama in the last week of April of 1913. Until then, I believe, nobody of the Moscow group had been there to see the place built. Hirschfeld, a farmer from Rishon le Zion, was chosen as manager, and he was eminently fitted for the job, where Jewish work and the Hebrew language had to be honored. He offered to let me see the books, but I was not interested to check on what he spent. Marek and I worked a little in the field, with other workers, their number being about thirty, or we rode horses.

The pride of Ruhama was its artesian well. At a depth of about fifty meters water was found and thus the problem of settlement in the south seemed solved from the standpoint of water. Gemama, the former name, means actually Waste or Deserted Land. The new name was prophetically chosen.

We stayed in Israel during the winter months. Memorable and dear is the religious experience I had when I went alone to the "cave of Samson" in the afternoon, alone in the deserted height, and returned in the dark.

In spring Marek and I returned to Moscow, traveling by fourth class. A few days after coming back I contracted diphtheria. But I was tall and generally in good health, and I pulled through.

In the spring of 1914 I entered the University of Edinburgh, Scotland, and took pre-

medical courses in the natural sciences. I had the opportunity to hear lecture of Henri Bergson, then a visiting professor at Edinburgh. But I was handicapped by lack of familiarity with the extensive nomenclature, especially in botany and zoology. For the first time I had a spell of indecision—I had to compel myself to persevere in my resolve to study medicine. There was in Edinburgh a very small Russian colony. I stayed for only one term.

On my return to Moscow for summer vacations the Sarajevo crisis was ripening. Soon there was war, and I was stranded in Russia. My parents were at that time in Germany, and with difficulty they made their way back via Switzerland and Bulgaria.

I enrolled in an institution which was not under the Ministry of Education, but under the Ministry of Commerce. The University of Moscow since its formation had enjoyed autonomy, which meant that there were not trustees, the university being managed by a rector who, instead of being appointed by the government, was elected by the professors. Now the reactionary government of Tsar Nicholas II wished to take away this autonomy from Moscow University, and this caused the rector and most of the professors and anybody with a good name to leave the university and to found a new school under the Ministry of Commerce. For this reason it was called the Commercial Institute, but actually it was a full-fledged university. The best minds in jurisprudence and philosophy were teaching there. I studied at the Institute for the next two years, taking courses in philosophy, law, ancient history, and other subjects. Of these my favorite subject was ancient history. But since the Institute had no medical faculty, I sought admission to the Medical School of Moscow University. After one year at the Commercial Institute I was admitted, following an interview with the new minister of education, Graf Ignatiev. For this I had to travel to Petrograd (the present Leningrad). I explained to the minister that I had a letter from the Dean of the University of Edinburgh that any points I would earn at Moscow University would be credited to me in Edinburgh. Graf Ignatiev, unlike his predecessor and unlike his own father, was a liberal man, and I was admitted, along with several other promising students, into the second year of study. For the next year I studied simultaneously at both universities.

In the year 1915-1916 I took a very strenuous program in medicine, besides a program in the humanities. I undertook to cover the entire course on anatomy in the two terms of a year. There was also a platonic but very emotional experience in the spring. All this together caused my athletic body to lose its resistance; and to work in an unhygienic and poorly ventilated anatomic theater certainly exposed the students to all kinds of infections. In the spring I lay down with signs of pneumonia and, according to the doctor, of the Fraenkel and Friedlander type simultaneously. At first my father called a doctor whom he knew as a Hebrew writer. Whether he was a good writer I do not know, but as a doctor he treated me for abdominal typhus. My brother Alexander, alarmed by my worsening condition, insisted on calling a doctor who had cured a friend of his. Dr. Loewenthal, a small and slenderly built elderly man, was kind to the patient, but harsh on the family, demanding strict rules. There was a consilium between the two doctors, and they raised their voices one against the other.

Dr. Loewenthal became my healer.

In the late spring of 1916 I went to the Crimea, and after a summer there, returned to resume my studies. The next term I again worked furiously. But before the new year 1917 I still felt run down and went to Kislovodsk in the Caucasus. There, in the mountainous resort, I took a room in a pension, but a few days later I found out that before me a patient dying of tuberculosis had used the same bed and mattress. I moved out and took another room. Once, walking on the snow-covered hills of the Kislovodsk Park, I spat blood. Seeing blood on the white snow, I became depressed and thought that I had become sick with tuberculosis. I applied to a doctor. He had a five-ruble note on his table, as if left by a previous patient, but, since I found it there again on the next visit, I realized that it was a sign to the patient not to leave less (in Russia there was no practice of billing a patient; money was usually stuck into the doctor's hand). The doctor assured me that there was nothing seriously wrong with me. So I could again turn my thoughts to problems not concerned specifically with myself and, walking in the streets of the Caucasian village, I wrote page after page of *The Third Exodus*, a pamphlet of religious fervor and Zionist zeal. In this work I urged that the nations of the world that would convene after the war should right a wrong and create a Jewish state in Palestine. I believe many sentences from the pamphlet became prophetic after World War I, and even more so after World War II.

At the end of February 1917 Kislovodsk, together with the rest of Russia, became excited by the news from Petrograd (as St. Petersburg was then called because of war with Germany). Every new day brought exciting news. The Tzar, last of the Romanovs, abdicated. I remember that day. Full of emotion I went across the hills of Kislovodsk; I met an old man. He seemed unaware of the news, or it did not mean much to him. "O little birds, little birds—such a snow, no food for you? How will you survive?" said he.

I left for Moscow. The land was in exaltation. Those years of war had witnessed Rasputin's baleful rise to power over the Tzarina, and hence the Tzar, and hence the country. An illiterate "monk," a debauching fraud, Rasputin hypnotized and mystified her as his mental prisoner; any prospective prime minister had to crawl to him and kiss his hand to be appointed—this was the case with prime ministers Gromykin, Stuermer and Plotopov. These were the days of World War I, and the Tzarina, originally a German princess, was suspected of disloyalty to Russia and its army.

Prince Yssupov and a few monarchists lured Rasputin to a dinner party and killed him in order to save the monarchy from complete perdition. This was the beginning of the revolution; ten weeks later, the war lost, the land in anarchy, the Tzar was forced to resign and Prince Lvov formed the Provisional Government, with Kerensky as minister of justice.

After two weeks in Moscow I left again for the Crimea, where I remained for eight months, mending my health, living in a village in the Crimea's mountainous crest. I returned to Moscow at the news that a new revolution, of the end of October, had

changed the order in Russia. The October Revolution of 1917 was followed by the Civil War. The White armies were brandishing anti-semitic slogans. The train did not go straight to Moscow. All was in a state of great strain. In the fall, with the country already under the Bolsheviks, I printed my pamphlet, *The Third Exodus*, under the pen name Immanuel Ram.

I spent the winter and the following spring as an intern in the clinics, and also attended the course of Prof. Ross.

On an evening in late November or early December 1917 I was in Moscow, only a few weeks since the street fighting against the regime of Kerensky was over. Some of the buildings showed the wounds of the battle: many stuccoes were pocked by numerous bullet-holes, and here and there a larger hole in a brick wall showed where artillery shots had fallen. There was no jubilation, as there had been in February, some nine months earlier, when the regime of the Tzar fell; the atmosphere was gloomy, either because such is the late autumn in Moscow, or because the fratricidal fight, at a time when Russia was still engaged in war with Germany, was a cheerless affair.

But the white Columned Hall of the old Nobility House was illuminated. The place had not yet been designated for the meetings of the All-Russian Soviets; and so soon after the October (actually November) Revolution, many of the activities which soon thereafter were to be banned were still possible in Moscow. The Jews of Moscow came there to participate in a festival: on November 3, during the very days when the city was in the grips of the street fighting, the so-called Balfour Declaration had been proclaimed by the government of Lloyd-George in England. It was not yet the foundation of the state, but the promise of a national home was made—a very unusual message, awaited for some two thousand years. Only a couple of years earlier, such a “messianic” event would have been laughed down by the same Jewry in Moscow. But the last two months were by themselves an apocalyptic time. The Jews of Moscow filled the white columned hall, the place of many glorious ball festivities in the past. I, too, went there. I was at that time a student in Moscow University, in my early twenties. All the places in the brightly illuminated hall were taken, and I stood to the side of the platform, built for the presiding officers, speakers, and notables of the community, or of the Zionist movement. I stood leaning on one of the big white marble pillars, hidden from most of the public by this pillar. Among the notables on the platform the absence of one person was conspicuous: Dr. Jacobson was the president of the organization that called the meeting; and if I was not wrong, I had seen him at the beginning of the evening—but then he disappeared.

As I stood there, and the speakers replaced one another on the platform, my face must have glowed with some inner light—not because of what the speaker said; not even because of this very festive convocation; I had believed that this event would come, and therefore was less aroused by it than those for whom it was above all expectations. But still my face must have glowed with some not everyday expression, because I was suddenly approached by a stranger, who made his request in the very

first sentence: "I am a sculptor; I would like to make a sculpture of your head. Would you like to sit for me?"

The man was not exactly small, but somewhat undersized. He had long hair, sticking in strains, which should denote an artist; on the other hand, he had something proletarian, even plebeian, in his face and figure. His face, and especially his forehead and his nose were bony, and the skin was brownish-sallow, tautly stretched and thin on the forehead, but lying in deep faults on his cheeks. He looked up to me; nevertheless, there was in his bearing something of a prince newly-recognized from the crowd of beggars, as if he was the man of the day. His age may have been thirty-five, but these must have been thirty-five years of deprivations. His Russian was very bad: not as of a foreigner, but as of a Jewish man who had spent his life entirely in a Yiddish-speaking community. Actually, I had never heard a Russian Jew so poorly in possession of the language of the country.

I asked him his name, and he spoke it—Itkin; it was familiar to me, and actually, I had already anticipated that he was Itkin. For the last two weeks I had read a few times in the newspapers about him. He really was the sensation of those days, when today one would think nothing could have been sensational in Russia next to the political revolution, or the events on the German-Austrian front. But it was not so. Itkin was the unusual news. The newspapers—there were still the bourgeois dailies—wrote about an exhibition of his works shown to a select crowd. But the story around him or, better, his discovery, was interesting. He had been a cobbler in some small town in south-western Russia until this very year. I believe he did not even have his own shop, but worked for somebody else; and in the time that he could spare from work or sleep he produced some unusual carvings. Then three sisters, baronesses—the titles were not yet abolished in Russia—all three unmarried, living in Moscow, became aware of his existence and work, interested themselves in him, and brought him to Moscow; they put at his disposal a mansion that belonged to them. All this was told in the papers, which also reproduced prints some of his sculptures.

Hearing his name, I told him that I had heard about him, and could read the satisfaction on his face. Before he gave me his address—to which he invited me to come in a few days—he interrupted himself and said: "Have you heard? Jacobson died of a heart attack."

We stood in the back of one of the marble pillars, between the platform and a room in the back, in which some activity was going on. I was surprised, since I knew the man. We inquired in the room: it was true. Dr. Jacobson had felt badly, apparently had a heart-attack, was ushered home, and died there. But we were told not to spread the news. The festivities of the Balfour declaration went on, and the organizers thought it better not to sadden the gathering by the news. There were speeches and singing, the large crowd not suspecting that the organizer of the affair had died the same evening.

Outside the weather was windy and cold. All the leaves in the parks and boulevards of Moscow had already fallen, patches of snow lay in the streets, and the wind

zoomed in the wires stretched between the poles.

A few days later, at the appointed hour, I was ringing at the door of the mansion, in one of the side-streets. The mansion was not large, but it was not a private home; it had all the attributes of a mansion: the elaborate facade in front, the expensive iron work, the very large and tall windows, the luxurious marble staircase. The sculptor came down himself to open the door. Possibly the house had been put at his disposal because otherwise it would have been requisitioned by some revolutionary group, not necessarily communists. At that time groups of people calling themselves anarchists rang bells, requisitioned private autos, or occupied villas, and there was no person or agency with which one could lodge a complaint.

Itkin led me upstairs to his studio—a room with a big window—probably a drawing room until recently. There he showed me several of his works. One was the head of a murdered man, his skull deformed by a blow—a Jew killed in a pogrom. It was impressive and even now, thirty years later, I remember the face. A large reclining figure of clay—he was still working on it—called “Russia” was a deformed woman with archaic, even animal features.

Then he asked me to sit down, and started preparing his clay on the rack, looking at me from time to time. When he had a large enough ball of clay on the wires of the rack, he started to work. After about half an hour of modelling, Itkin stopped, and turning to me, said:

“Do you remember the evening I spoke to you in the Hall of the Nobility, when the chairman, Jacobson, was ushered home, and died? Do you remember?”

Of course, I remembered it.

“You see, Dr. Jacobson wished me to make his portrait. We talked it over and we agreed that as soon as the festival affair was over, he would no longer be so overburdened, and he would come here. So he said he would come on Monday, after that festival week, at five o’clock in the afternoon. At the celebration I heard, and I told you, that Jacobson died. Well, it was a pity. But I knew him only slightly; he was not my friend, and I struck this appointment out of my mental calendar.

“But when it was Monday, shortly before five in the afternoon, strangely, I could not do any work. Sadness gripped me...” Itkin looked at me, his face was pale and strained, and he searched for words. The words did not come easily to him, and he brought them out as if improperly fashioned or chiseled.

“Yes, I sat there, sad, and thought, What is man? Here a man was to come to me in a few minutes to make his portrait, but he will never come. I will never make his portrait. What is man? Clay? Not even fired clay. Just dust. And what is his spirit that endures? Vanity of vanities? There was his desire to have his features retained in clay, and the model is dead, dead forever; what is man, and what are his days on

earth?

“As I sat here on this Monday, two days ago, at this hour, thinking these sad thoughts and deliberating over man who is just grass that dies overnight, as the clock started to sound—one—yes, he was to come—two—but he will not come—three—because he is dead—four—dead forever and ever—five—and the doorbell rang. I expected nobody and was startled. I shook a little as I went down the steps. I opened the door. There was a messenger. He said:

‘I am sent by Mrs. Jacobson.’ And he gave me an envelope. There was a note. It said, ‘Please come to take a mask from the face of Dr. Jacobson, my husband.’

“He had kept his word.”

I listened all this time without interrupting the sculptor; when he ended his story, we both sat in silence—he absentmindedly kneading clay with his hands, looking to the reddish hue of the pale grey sky, until it turned dark.

1. Alexander later became an outstanding chemist, and, as I was told, winner of the Lenin prize.

Ukraine

*And laughingly calls me the wide road far-running,
The winds of the plain bathe and roll in my breast.
How far to the master? It's far to the Master.
Don't rest.*

These lines from a poet—his name I did not keep in memory—I read in the summer of 1918. We spent that summer in a *dacha* in Malachovka, about an hour by train from Moscow. Feodor Chaliapin, the singer, occupied the neighboring, larger, summer house. That summer a Jewess, a member of the Social Revolutionary Party, made an attempt to kill Lenin, wounding him, and this act was followed by a policy of terror on the part of the Bolsheviks.

It was already the end of the summer; I sat alone on a bench opposite a field and thought poetry, when a note on a small piece of paper was handed to me. It was sent from a place of detention of the Cheka, the highly feared secret police,¹ and was from a young man named Birk, a student employed to visit new members of Sheerith-Israel to collect sums due for their shares. He had only slight success in his task, before he was arrested and a full list of names of members of this group was discovered on him. Yet he found a way of sending a note to me. In it he let me know in all brevity that under interrogation he had named my father as the head of the group; he urged my father to flee Moscow.

It was the second day of Rosh-Hashana, the day which, as I think now, was memorable in my father's life. The Haftara, or reading from the prophets before the congregation, is on that day from Isaiah and contains the words about Sheerith Israel, the remnants of the people of Israel, upon whom the Lord will have mercy. When my father first came to Vitebsk, and when he first came to Moscow, and when he, in the beginning of World War I, came to Odessa on his way to Moscow from Switzerland, he was honored by being asked to read these verses—a sign of respect and esteem. In Odessa this invitation was extended to him by the congregations of Ussishkin, Klausner and others. He used to read it incomparably, his voice being very melodic yet forceful, and invariably he moved his listeners deeply. It was from this Haftara (Isaiah) that he drew the name Sheerith Israel for the group which he hoped would comprise many of the nation. Delivery of the wastes of the land of Israel from the eighteen centuries of neglect was but part of the activities of the planned groups, with humanitarian activities of general character as the other part. But the work was cut short in the beginning.

It was certainly audacious and imprudent to gather every week another group of people in our home to give them a lecture on the land of Israel (which was my task), to let them join the groups of Sheerith Israel, and to collect money for redeeming the land—in the very year of the Bolshevik revolution, dictatorship and terror. The payments were made in uncut sheets of Kerenki, the inflationary money printed without numbers and even without dividing the sheets into individual bills of forty rubles each. Yet it was not actually against the law to participate in such activities. Under the Communist regime the policy was not yet formulated—so, for instance, the Hebrew theater Habima was patronized by Lunacharski, minister of education in Lenin's cabinet. The elected cashier was the civil engineer Cooper; but I brought the money to Izhak Goldberg and exchanged it for drafts on a London bank, an operation saving them from utter devaluation and thus directing the funds for their future purpose in Palestine—an operation certainly not officially permitted under the Bolsheviks. Thus we were taking a risk, and now the whole matter was in the hands of the Cheka, with the list of members taken from Birk. We had no way of knowing the steps that would ensue in the atmosphere of terror that followed the unsuccessful attempt on Lenin's life.

From that moment there was to be no more peace of mind for me until I would be able to take my parents to the Ukraine. I had to find my father; then we had to go into hiding. He did not sleep with us that night in our *dacha*; nor any of the following nights. He slept with the in-laws of my elder brother, not far from our summer place. My father never again entered our apartment in the city, nor did my mother. Our apartment was in an old aristocratic house, with N. Berdiaeff, the religious philosopher, and Prof. Focht, the famed cardiologist, as some of the tenants. Nothing, neither furniture, nor personal belongings, were saved from there; it was closed. My books were left behind; my diaries, about thirteen tomes, that I had written daily for seven years, from the age of sixteen, I left at the apartment of my brother Daniel, innocent of the thought that they could serve as indiscreet reading for his wife, Genia, or for anyone else who cared to read them. I was too open in them about my thoughts, my religious yearnings, and in my accounting of everything that accompanies the development of a boy into a youth. I should have destroyed these diaries. On the contrary, I continued to make my daily entries during our travels.

For about three weeks my parents slept in different places, and during this time all efforts were made toward leaving Moscow and going to the Ukraine, then separated from Soviet Russia by the treaty of Brest-Litovsk, signed by Trotski with the Germans, victors in the war. A few times I went to our home to take a few things. It certainly appeared to me that somebody was on the lookout for my father: once I saw a woman watching, half hidden under the staircase; another time I noticed a man on watch on the opposite sidewalk.

It was necessary to obtain a Ukrainian permit for entry. The courtyard of the Ukrainian legation was crowded by a throng waiting to be admitted. It was not easy to gain entrance into the building. My elder brother Daniel tried to reach the door but

was not let in; then I tried and succeeded. Actually, a classmate of mine, Michail Ionoff, though not a Ukrainian, was employed in the legation, and he helped me to get inside the building. My father, seeing me enter where my brother, always very capable in getting things done, failed, acquired the confidence, as he told me later, to put his and my mother's lives in my hands. And so it was I who was to accompany them on their way to the Ukraine. Daniel had a family of his own. Why Alexander did not go with us I found out only some years later: he was deeply in love—possibly unanswered—with the younger sister of Genia, Daniel's wife. Also, he was studying chemistry at the Economic Institute, and there was no need for more than one of us to go with the parents.

I was about to begin my last year in the medical school of Moscow University. The class before ours left after only four years of study in view of the dire need for doctors. Our class might have had possibly only one term of the last year of medical training; but whether it would have taken till December 1918 or May 1919 in order to obtain my medical degree, not the slightest thought ever entered my mind to continue my studies instead of taking my parents out of Moscow; and it could have easily happened that by leaving the University and the country then I might never have obtained the degree.

Before leaving, an accounting and a protocol of the now-discontinued activities of Sheerith Israel had to be prepared, and this was done together with civil engineers Cooper and Elkind, who served as honorary treasurer and secretary, and for this I had to make various ways through the terror-stricken Moscow. One night I slept at the apartment of a young lawyer, Hershmann, whom I knew from our common interest in the Jewish Legion (of Jabotinsky), and who was a son-in-law of a member of the first group of Sheerith Israel, which had purchased Ruhama before the World War, in 1911. Hershman gave me his nightshirt to use on that occasion, and this remained in my memory because of the Iskariot role this Hershmann was later to play in this same affair.

Never before had I known a sleepless night—but during those weeks I would turn over on my bed at night, tormented by the thought: Would I be able to save my father from doom? Our exile started on September 23, 1918, when, after several contacts were made to obtain passage on a train—some officials of the railway even came to the apartment of Daniel—we (my father, my mother and I) boarded a train at the Brianski Station and headed toward the Ukraine. I do not remember whether it was the same or the next day that we arrived at the Russian-Ukrainian frontier. Leaving the car at a whistle stop, I ran to an official on the track at some distance who was giving the permits to leave—two words written in pencil. I showed him my passport to travel to Palestine, given me nine months earlier by the Bolshevik government; but probably even without this I would have obtained the permit. From there a distance of several kilometers had to be covered; my parents traveled in a wagon drawn by horses and I followed afoot. At that moment it appeared to my father that the guards were taking me into a forest, but it was not so.

We arrived at the Khutor Michailovsky, in the Chernigov Gubernia, not too far from Starodub in the same Gubernia where my parents met for the first time back in the 1880s. We found a place to sleep in the utterly crowded village, in the house of a peasant. Outside, the migrants made here and there a bonfire to keep themselves warm. Shots were heard intermittently. In the early morning, walking through this village, I heard the loud wailing of a woman who, in the middle of the broad village street, was bemoaning the death of someone dear to her, killed that night.

During that day I came to the place where the Germans were giving permits of admittance to the railway station—following the treaty of Brest-Litovsk the German occupation forces ruled the Ukraine under Hetman Skoropadski. People stood outside and a young German soldier was counting them from the steps by touching their heads not too gently with his baton. When I finally succeeded in reaching the station—the track ran there on an embankment—there were shots; somebody on the track was killed. My father, who was waiting below, was told by the people around him that a student had been shot to death. He was terrified by the thought that it was I. Human life was worth but very little.

The train finally took us away to Konotop and another train to Bakhmach. There we waited long evening hours and I was sadly impressed by the sight, in a silent and tired evening crowd of travelers waiting for their transportation, of a German soldier in his metal helmet courting a handsome Jewish girl who was not displeased by this situation.

When the unilluminated train on which we were to travel forth was put on a track and people stormed toward it, I felt in the dark that my documents were being pickpocketed as I was caught in the squeeze, but I noticed it in time to shout that thieves were at work, and they dropped my passport, my pocket Bible, and my wallet on the floor, where I collected them as they ran away. After a night of travel the train stopped at a station, and we had to wait for transportation to Poltava. This town was a kossack *khutor*, on a flat plain, with low houses scattered in empty orchards in autumn garb. The place was noted for the pogroms made by the kossacks not long before and, I believe, also remembered for the same since the days of Hetman Khmielnitzki in the seventeenth century, under whom hundreds of thousands of Jews were slaughtered. We spent a day and a night there waiting for a train.

There my mother showed the first sign of a sickness that was to take hold of her soon after our arrival in Poltava.

It was my intent to go from Khutor Mikhailovski toward Odessa in order to find there a ship for Palestine. But my father decided that we should go to Poltava, where his brother Feivel, known to us as Uncle Pavel, lived. There my parents wished to rest and to wait until my brother Daniel would succeed in sending us some means, because we had left with very little money in our pockets. So I submitted.

Uncle Pavel met us with his horse-driven carriage at the station and took us into his

house. He was one of the richest men in town, belonging to the little group of four or five wealthy men whose names were known to all. He started his career in life when my father called him from Mstislav to Smolensk to assist him and to be his partner: thus the hardships of the start from nothing had been carried by my father alone, who was five years older than his brother. Always there remained cordial relations between them, but my father regretted Pavel's marriage to a daughter of a Poltava merchant, a family of hard dealing people. Yet relations were never clouded by any disagreement or neurosis, so common between brothers. Pavel had the greatest esteem for my father. Also in learning, knowing Hebrew only by his prayerbook, Pavel was by far inferior to my father. He had two sons and a daughter; one son, Peter, recently married, lived in Poltava. He was of a meek character. His younger brother, as also his mother and sister, maintained a household in Kharkov, a large city not far from the more agricultural Poltava. There they had a large apartment building, or several buildings, and a mansion for their own use. Thus Feivel lived most of the time alone in his Poltava house taking care of his soap factory.

A day after our arrival my mother fell ill with dysentery. With no specific drugs against this disease, it was a perilous illness. Feivel's wife, Pasha, on receiving the message that "illustrious guests" had arrived from Moscow, wrote that she would come in a few days, and so she came. But finding the house in Poltava occupied by refugees, and turned partly into a hospital for my sick mother, she quickly changed her attitude and became impatient and hostile.

From my childhood I knew that my elder brother, at the age of three, had fallen sick with dysentery and that the doctors had given up on him; but then someone who knew folk remedies advised my parents to give the child an infusion of flowers of white clover mixed with a certain herb. Daniel survived, though he never again was the sturdy boy he was before. Now remembering this family tradition, I went outside of the town to some wet fields covered with October or November mist in search of clover, and went to mills and asked them to grind the herb. The tannin in those plants might have been the helpful ingredient. Dr. Gurevitch, a local practitioner, who later worked as a podiatrist in Palestine, a man of few words, told me that the chances for my mother's survival were slim. There were also consilia, when more doctors conferred, helpless beyond prescribing bismuth. But finally my mother slowly recovered.

At the time that my mother was very ill, Pasha, instead of leaving for Kharkov where she had a house all for herself and her unmarried children, produced an hysterical grand fit by throwing herself on the floor, together with her daughter, true to her mother, demanding that my parents leave the house. There was no place to find for rent. The scene occurred when my mother was in bed, my father in his room, on the door of which the women banged, then dropped to the floor in cries; I was at the time not at home, actually looking for a place to rent.

Also outside the world was not at peace. Soon after we arrived at Poltava we heard that a movement started by Petliura had gathered momentum and an army of his was

driving the Germans and the puppet Hetman Skoropadski out of the land. Petliura was approaching Poltava from Kharkov. Feivel occupied the upper floor of his house, the lower floor being rented to the town police. Cannon shots resounded for several hours; we sat in a corridor which was but slightly more protected than other rooms, and listened to the cannonade. When Petliura's troops entered (shortly they would leave, only to come again) a police officer was seized by his antagonists, possibly his fellow police troopers, and beaten on the floor below us. This went on for hours, he ever weaker, crying for mercy, the blows by belts and clubs sounding in response to his cries, until he died.

But the rule of Petliura did not endure. More than once we heard cannonades shelling the town. And then, close to Christmas, the Reds took over the Ukraine, battling the armies of Petliura. In the foreshadows of a new change of power in town, Feivel and his wife married their daughter to a young "Don Juan," the son of a rich owner of mills. He used to seclude himself with the girl, who had big black eyes and who, on her arrival from Kharkov, showed certain interest in me. Uncle Feivel had long since harbored the idea of one of us brothers taking his daughter, our cousin, to wife. Now the family wedding went on like a hidden affair in the dining room, my parents and I not being invited though we stayed in the same apartment; I slept in a small office room in the apartment, and saw the lights and heard the voices from the wedding room.

My uncle was a kind and goodhearted man, but he was entirely helpless against his wife, a boisterous woman; there was something very hard in her, and the younger brother of my father, Israel, used to call her *grobovaya doska* ("coffin lid"), though not to her face. Israel, too, soon arrived in Poltava from Nizhniy-Novgorod (Gorky), deserting his business and property. He, too, was a man of means—a reason for fear under the new regime. Feivel's other fault, besides his being submissive to the will of his wife, was his tight-fistedness. In my father there was an unusual broadhandedness; in Israel there was a mixture of this and of great care for order and of thriftiness. Feivel had only the latter, yet was willing and eager to make any effort if only he could help a person. He was tall and stooped, and had a melancholy look in his large eyes. He obviously suffered from the behavior of his wife toward his brother, to whom he owed much and whom he almost worshiped.

About the beginning of January 1919 the guns thundered, the bullets whistled, and the Reds took Poltava. Somewhere nearby people were killed and buried in the field. The rich were arrested and required to pay large sums, and Feivel was repeatedly under arrest, being one of the leading rich men of the city.

Only with the approach of the Reds did I succeed in finding a place to live for my parents and myself: two front rooms in the house of Vorozheikin and his wife. A gentile married to a Jewess, Vorozheikin had a very rich estate. The entire block of large hotels belonged to him. He was one of those Gogol type of estate owners who did absolutely nothing, spending his day on his couch. His wife was good-looking and younger than himself. They rented out the two front rooms so that they would not

be requisitioned by the incoming troops, being by their economic status and political views very adverse to the communists. But a little time passed and a handsome, dashing Red army officer contacted our landlady and easily talked her into giving him our rooms; then he abruptly informed my parents that they would have to leave in a matter of hours. I was not at home and did not see the officer. When told of this I went to the department of "Living Space" and brought an official to see our place, then went to the headquarters of the commanding general, the conqueror of Poltava. I spoke to the general, a tall man, in a large room and made him put in his own handwriting his command to the officer to submit to the decision of the Department. He signed the document, "General Bondarenko." I hurried home and there I sent for the officer, a debauching type of hero soldier. I told him in our hall to stand at attention since I would read him the order of the general, and when I read it the man was done and left, to the disappointment of Mrs. Vorozheikin. Some time later, possibly two or three months thereafter, I heard that he had been shot by order of his commanding officers, after a court martial for debauchery.

We lived three months at Uncle Pavel's and about ten months at Vorozheikin's . During these months the city of Poltava changed hands many times; every incursion was followed by terror, White or Red. From the very beginning my father, expecting a prolonged stay and in order to have income for living expenses, organized in partnership with two of Feivel's young clerks a candlemaking workshop, he not taking part in the manual work, but asking me to participate. Thus I observed and learned candlemaking.

When money arrived in a Kharkov bank, sent by my brother Daniel, my father (we were still living at Feivel's) went to Kharkov by train and, having received there the poorly printed Ukrainian money, changed it in the same bank to English pounds—twenty banknotes of a hundred pounds each. Upon his return to Poltava, I expressed my fear that England would soon come on hard times—India, for instance, would fall away from the British Empire—and I went by train to Kharkov to try to return the British banknotes. The director of the bank refused to cancel the deal, and my father was prudent enough not to let me keep these banknotes with me; but we retracted an option for another thousand pounds. Soon the Ukrainian money was worth nothing.

Machno, a dwarfish robber who called himself an anarchist, also raised an army, established a front, and took Kremenchug, but did not reach Poltava. His warfare, like that of Petliura, was accompanied by pogroms. Then Denikin's "White Army" swept up from the south and occupied Poltava. Again, one army left, killing hostages and other unfortunates, and drew out of town, and another entered, sparkling with sabres and bayonets. Poltava was spared from a large pogrom, but many other towns and cities of the Ukraine were not so fortunate. Reading of the massacre in Kremenchug and the rape of Jewish girls by soldiers, I wrote a poem to those unfortunates, "Pure in the House of Israel." I sent this poem to Beka (Rebecca) whom I knew from the last year in Crimea and whose home was in Kremenchug, that she might console someone whom she knew, and she answered by letter that she had to console with my

lines her own sister, age 17. I sent to Beka all the money I earned from candlemaking.

When seven months of our stay in Poltava had passed, Daniel arrived for a visit. It was about the time of Passover, 1919. These seven months had seemed endless. Daniel could come while Ukraine was united with Russia under the Reds. But then the Whites came, and as usual the hotels in Vorozheikin's block were occupied by the officers of the victors. One evening while going home I was stopped by two or three soldiers of Denikin who attacked me as a Jew; but an officer passed by and ordered them to abstain. When I followed the officer in order to thank him, he said: "From a Jew I wish no thanks." I had only a wound on the palm of my hand, but a greater wound in my pride.

For the Jews it was a time of suffering that naturally called forth Messianic hopes. Only a few days after our arrival in Poltava a man came to see us, we having newly arrived from Moscow. He had a ruddy complexion, broad face and forehead, and a large beard, not unsimilar to the image of Zeus as usually painted or sculpted. He was finely clothed in an expensive coat with a velvet collar. He had messianic ideas, and if what he said sounded exalted, that which he had in writing was not very coherent. He said he had to see Trotsky and actually, later, went to see him in Moscow. I was told that he was a farmer or a merchant of a village who had been very tight with his money, his charity, and his love of neighbor. Then something happened to him and he changed completely; I believe he gave away his property. He had in his mind a vision collected from the teachings of Tolstoy, from messianic hopes, and from communistic ideology. But only later, when his behavior became even stranger and his appearance less immaculate, and he was also occasionally arrested, I heard that he suffered from progressive paranoia which took the form of religious delusion, entirely appropriate to that time of great sufferings.

I loved to spend time with the rabbi of Slobodka, as he was called, because he was a rabbi refugee from that famous place of learning in Lithuania. He resided that year in Poltava, and a few times I spoke with him, meeting him in the empty loft of a synagogue, he trying to introduce me to the works of Maimonides, but without much success.

In Poltava there were three synagogues, one next to another. One was Sephardic, for the oriental way of worship, though I wondered that there should be such worshipers in Poltava. Was the oriental worship a heritage from the movement of Shabbatai Zvi, the seventeenth-century messianic claimant who ended as an apostate and convert to Islam? One of the other synagogues in the group was Hassidic. Once a young cantor came to town and into one of these synagogues. He did not sing as cantors usually do, but spoke the prayer. Never before or since have I heard such conversation with God in public, never such a way of saying words, and I have known the celebrated actors of the Moscow Arts Theater, and have heard a number of times Chaliapin saying his monologue in Boris Godunov, and have seen Sarah Bernhardt on stage. The crowd was as still as if there were not a living soul in the synagogue save the cantor speaking to God for his people. The young cantor left town and was never heard of

again.

Several times I tried to arrange our departure toward some place from where we could proceed to the land of Israel. But by now it was becoming more and more dangerous to travel. Once when I made plans to leave with my parents the city of Poltava, where we were rooted now for so long, five or six Jews who had been killed in trains were brought to Poltava, displayed at the station, and then were carried in a cortege followed by a few hundred, or even thousand, Jews to the cemetery, the gentiles gazing from their windows. I participated in the cortege. The rabbi of Slobodka came to our home to dissuade us from traveling. All four routes from Poltava were equally dangerous.

At this rabbi's I was witness to a gentile man in his forties who came with his son to become Jews. He came from some place outside Poltava, and had the very fine face of a sufferer dedicated to his inner call. He was a man of some manual profession—a carpenter I believe. As is usual in such cases, the rabbi first used his eloquence to dissuade the man from his plan: the Jews are not only disinclined toward missionary zeal, but are adverse to having proselytes in their midst. But I was very strongly impressed by this man and his young son, age ten or eleven, who was following his father wherever he went or whatever he did. I met them again on the street, the man still going through the throes of his irrevocable decision; it was an hour of dim light, before evening, and the messianic expectations in the man, his boy at his hand, were close to madness amidst the wide stretches of the Ukraine, darkened in a craze of torture and blood.

In Poltava my father met Israel, his younger brother who, as I already said, arrived in town after us, coming from Nizhniy Novgorod, later named Gorki. After years of separation my father again became close to him. Being infirm on his legs, Israel usually carried a folding chair with him; a gentile woman of Caucasian origin, Sosieva, took care of him and was also his companion. We left Poltava later than he did, but he reached the land of Israel before my parents, by way of the Black Sea.

Before we left Poltava we talked of my father's plan for organizing cooperatives of land and farms in Israel for the Jews who congregated there as refugees, many of them from Vilno in Lithuania; but we took no direct part in the material or financial part of the cooperative. Its participants decided to start a business with the cooperative's funds to save them from devaluation, but this was the end of the plan because before the ware arrived (they were wool spinners, for the most part) they were already heading each in a different direction.

We, too, made a mistake. My father, seeing the money (not exchanged, as mentioned before) losing its value, bought some real estate, a group of tenement houses. The negotiation was made during Sukkoth (Tabernacle). I spent a sleepless night. Now, when I was hoping to get out of this place, it was as though, with the purchase of this property, we had chained ourselves to the town. But a few weeks passed and, leaving that property behind, never to have anything from it, we left Poltava for Kharkov.

It was a labor of love, preparing for this trip of a few hours, the first leg of a journey away from a 13-month-long frustration, some way or somehow toward the land of Israel. Under the “Whites” a Jew could not travel in a train unprotected without risking his life, almost forfeiting it. Therefore White officers were sought to accompany the travelers. There was in town a Jew, a military tailor on one of the main streets, who was supposed to know the officers and be able to procure their services. He acquainted me with a young officer for this purpose, but we did not travel with him. Some of the Vilna Jews hired several officers and a box car, used for cattle or for cargo—the manner of travel then ubiquitous in Russia—and one day, with others of the group and all protected by the hired officers of the White Guard, we traveled to Kharkov, usually a distance of only a few hours.

We arrived in Kharkov about midnight. Rain was pouring from the dark sky. We found an open, flat platform on wheels, unprotected from the rain, hired the vehicle and its man and horse, put the two trunks on the platform to use as seats, and then started looking for a hotel or guest house. On the Moskovskaia Ulitza, an old two-story house with a sign “hotel” made me cross the street, stepping into deep water, but the dimly lit place had no rooms free. Likewise a large hotel on the Ulitza had no vacancy. We passed in the rain a lone building on a square, and strangely loud music was blaring from the illuminated but otherwise as though uninhabited place. The streets were all empty, the windows were dark, the city was asleep; we were drenched. Then, after traveling along the streets for what seemed hours, my father ordered the driver to direct the vehicle toward the house of his brother Feivel. There in front of us stood a tall apartment building belonging to Feivel, and in the back his mansion. We rang at the door of the mansion and Uncle Feivel, poor of sleep, came down and opened the door; he let us in, arranged for us mattresses and covers on the floor of a big living room, and took care of us. In the morning I left early to look for a place to move. My parents were still asleep, and my uncle asked me to have tea; I, however, answered while going down the staircase: “I will not eat or drink until I find some place for my parents”—and asked him to protect them until I returned. I went first to a far-removed relative but was not admitted since his daughter was ill with scarlet fever. Then I found a room in the same large hotel I had visited during the night.

I immediately took my parents to our new quarters, a corner suite in the hotel. From there I went to the muddy autumn open market to buy victuals. This I continued to do in the days following, as I had done the whole year in Poltava, in order to relieve my mother, still weak after her sickness. From the peasants I could buy milk in clay jugs, bread, and other food. But not two weeks passed before Kharkov was in an uproar.

The Red Army once more rolled southward. It took Belgorod, north of Kharkov, on the chalk hills, and advanced on Kharkov, the capital of eastern Ukraine and the largest industrial city south of Moscow. The two-room corner suite which we occupied in the hotel—with windows on two streets—was, as we were told, occupied by the Red Army chief-of-staff the previous time the Reds held the city. It was

unwise to remain there. And actually we considered Kharkov a transit point of short duration on our way to the land of Israel. The way from there led to Rostov, and from Rostov to the Caucasus.

Soon after our arrival at Kharkov we were visited by a man, white-haired and sad and very likeable; his name was Janovsky. I believe he was from Grodno in Lithuania. He had a portion in Ruhama. His wife, if I remember correctly, had killed herself in a fit of melancholia during his wanderings in the Ukraine. He had a daughter and a young son in Russia, and two daughters attending school in Israel. He strove to reach them. He told us of a group of *halutzim*—or pioneers—that had convened in Vladikavkaz (later renamed Ordzhenikidze) in the Caucasus, on their way to the land of Israel. I believe he told us that his daughter was in that group.

Thus the direction was clear to me—via Rostov on the Don to Vladikavkaz. Now the task was to obtain passage to Rostov, not an easy thing because there was a stampede to get out of Kharkov. One of the Vilno wool merchants, who came from Poltava with us, went to the railway station to make arrangements but was snared by an agent of the Osobiy Otdel, the terrorizing secret police of the Whites; he was taken to the Otdel, questioned, and freed only after being relieved of his money. Still agitated and frightened, he came to our hotel to tell of his effort and to warn us not to try to obtain passage via the railways. Though running away from the Reds could not be looked upon by the Whites as anything but legitimate, yet it was—in the absence of law—thought a crime to try to obtain passage when only the military and the privileged were first to be evacuated.

I went with Janovsky to some distant office to ask for evacuation. Neither he nor I had reason to flee before the Reds, but our desire to reach the land of Israel dominated us entirely, and with the frontier moving over our heads, we feared that our goal would be cut off from us. I went also to the railway station, though warned not to do so. On my way there, in an overcrowded tramway car, I was pressed suddenly from all sides, and then my Bible was gone from my breast pocket; yet I found it on the floor, dropped by a disappointed pickpocket. In the station building I looked for an opportunity and found it: I saw there the young officer who was introduced to me by the military tailor in Poltava as one who was “honest” and ready to sell his services. I spoke to him and he told me to come to his address and bring money for the passage and for his services. Then I saw, not far from the hotel where we stayed, on the sidewalk, with his face to the thoroughfare, a white-haired general in a red-breasted coat, the usual garb of generals in Russia. I boldly approached him and asked him to help me and my parents get passage to Rostov. Certainly he was to leave in a private railway car. He was kind to me and told me to come to him the next morning. This was a perfect opportunity. But I was so eager to reach the Caucasus, the group there, and Palestine with them, that I made the mistake of going to the young officer at his hotel. It happened to be the same dark building that I had visited by chance two weeks earlier on that first night in Kharkov while looking for a room, stepping knee-deep into water. I was met by a soldier, and soon there were two, who told me to wait while one went to call the officer; soon I was with him and three

soldiers, all of the regiment of General Shkuro of Denikin's army. This regiment was famous for its cruelty. They closed the door with a key, and I understood that I was trapped.

My four captors were armed with rifles, pistols, sabres, and daggers; and if that was not enough, they were four against one. They tried to frighten me with their sixteen pieces of weaponry. I said: "Comrades, stop it!" (*Tovarishtchi, prosite*), and this was a slip of the tongue; though *tovarishtch* was a word much used among friends in our school days, presently it was a designation applied by communists or socialists to others of their kind. The officer, the scoundrel with a snubnose and shifting eyes who put me in the trap, started to repeat in a singing way: *tovarishtchi, tovarishtchi*, and his three men did the same. There was a mental struggle—for they kept me, I believe, for an hour or more; I do not remember what was said in detail, but I know that I did not humiliate myself; just the opposite—if I was not beaten or killed then and there, it was because of my bearing. They searched me for money and took that which I had brought for the passage. Then the officer ordered two men to take me to the Osobiy Otdel to be questioned further and then killed, and the two took me to the street. It was evening. We crossed Moskovskaia Street and I looked up at the hotel where my parents were waiting for me. The six-story building was dark, but the corner windows of my parents' rooms had light. The hotel, which only two weeks earlier had been filled to the last room, was deserted now because its occupants had run away. After crossing the street, we passed along the very walls of the hotel building, and in my thoughts I parted with my parents; their future without my return could not be anything but desperate. We went only a short distance—a block or a block and a half—when I spoke to the two soldiers; one was of Caucasian or southern origin. Would they let me go? And I may have mentioned my parents. "Let him go," said one to the other. I often thought, later, that in the mental struggle of that evening was born in me the future psychotherapist. They certainly saw me superior to them; my striving to go south and not be left in Kharkov indicated my not being a communist. But hundreds of thousands of people were killed in the Civil War without any reason or proof. I did not think of all this then. I went, liberated, not straight back to the hotel, but made a circuit around the block in order to calm myself before seeing my parents. I wanted to look at my watch—I had on me a little steel watch of my mother's—but it was gone; when I was being searched, one of my captors had stolen it without it coming to the notice of the others or of myself.

When I came to my parents, I did not tell them what had happened; but soon my mother asked what the time was, and I had no watch on me. She had already wondered why I was away for so long; now, with her unerring instinct, she guessed that I had been in a trap. She announced that she would not travel; we must remain in Kharkov—it was too late. I disagreed, determined to obtain passage through the general, in the morning. But in the morning when I looked upon my mother's pale and tired face—she hardly slept that night—I surrendered. The thirteen-month-long longing to go southward in the direction of Israel was left unrelieved, and we were faced with the prospect of staying in the Ukraine for an undetermined time longer.

I left the hotel in the morning to look for a more permanent place to stay: we were told that the hotel would probably be closed—the Reds were almost on the outskirts of Kharkov. I went on the same sidestreet on which I was led the evening before, then I turned left and saw a large platform truck. It was loaded with dead human bodies; the loaders put one row of corpses one way, the other row on top of the first, the other way, across. I lifted my eyes to the building from which they were being carried out—a large sign read “Osobiy Otdel.” For only a few seconds I observed the scene, then turned and went away. It was the place to which the soldiers had been leading me twelve hours earlier; I did not know then how close we were to the goal when they let me go.

I went toward the residential parts of the city and wandered about two miles; at several places I saw furniture or valises on the street, belonging to people making a last hour evacuation. Finally, seeing pieces of luggage being carried out from an apartment building, I asked the people whether they would rent their apartment; in the rush of evacuation, practically of escape, the people let me into the place and gave me the keys. Their name was Soloviev, and he was professor of gynecology and obstetrics at Kharkov University. Probably I made a reliable impression, but in their hurry they could not deliberate much, and an empty apartment would immediately be seized by the incoming Bolsheviks. They also left their maid servant in the place.

I brought my parents from the hotel. My father occupied a small room with a glass door, my mother the Solovievs' bedroom, and I made my place in the dining room; but after a while my mother, feeling the small dark bedroom depressing, exchanged with me. The Bolsheviks were in town. The first posters were signed with Stalin's name, Stalin being in the vanguard of the army, but at that time having a much lesser name than Trotsky, the organizer and commander of the entire Red Army.

In his room my father wrote his autobiography; in longing for the land of Israel, which he had not yet seen but for which he worked devotedly all his life, he sang a song which he composed—words and melody—to Ruhama, the farm which had been founded by his efforts—as if she were his daughter. It was a melancholy song. In the kitchen the maid sang a loud song, and sang it again and again. I put my feelings into the words of a poem about the sufferings of the Jewish people, and I adapted the Ukrainian melody of the maid to my song, and it suited it exceedingly well. The two front rooms, with gynecological instruments, we gave to a civil engineer with his wife, a gynecologist, who turned up by chance—and this we did since these rooms would certainly have been requisitioned, in an apartment occupied only by the three of us. After a while the maid made an attempt to steal some valises stuffed with valuables hidden in a storage space by sending an accomplice with forged instructions, as if from the Solovievs, to hand over the things. When this did not succeed, the maid disappeared.

The majority of the university professors, like Soloviev, ran away, and the only way open was to Rostov. But the University started to function with the remaining faculty. I registered in the medical school: since I could not travel farther, I intended to use

this time to finish my medical studies, cut short by our departure from Moscow. I especially remember three teachers. The pharmacologist, Prof. Postoeff, was the dean. Before I started medical studies years earlier, I deliberated whether I wanted to study chemistry and pharmacology, feeling an aversion to this last subject. Now I studied it in the book of Kravkov, and admit that never had I seen so interestingly written a textbook. I went repeatedly to Postoeff at his home for examination, part by part, of the subject. The lectures and laboratory work in criminal medicine were given by a professor with a Latin name, an elderly man with a big bald head, who was on intimate terms with one of his laboratory assistants. The course in psychiatry I took with a young lady examiner, and the course in surgical anatomy with a stern professor who, unmindful of the revolution and the new liberties, sat while examining the students, whom he made to stand in groups of four.

Some time passed, and my brother Lelia (Alexander) arrived. I was going up the staircase to our apartment and there he stood ringing the bell. He was lean, and his shoes were worn. He came to us after being released from prison. We had not been informed by Daniel of what had happened. My two brothers had continued their business and sold shipments of oil to some old customers. In one place there were, as it seems, parties in strife, and intrigues, and arrests; Alexander, who was more of a factotum, was accused of selling ware unregistered in the *kommisariat*, which issued permits for all manufacturing and trade activities. I do not know whether I correctly narrate here the cause of his arrest, but he was in a Bolshevik prison for several months. There *typhus exanthemus* was rampant: the cots of the prisoners were in rows, one near the other, and lice crawled all over them; yet Alexander did not get the disease, though in places next to him others had lain sick with it, with high fevers. The prisoners were reduced in number—new ones always arriving—by summary executions: repeatedly the prisoners were put in rows in the courtyard and every seventh, or fifth, or tenth, as the case would be, would be taken out of line and shot. Alexander was chosen by his fellow inmates to be their head, or chief; this would free him from certain duties, like carrying out the heavy pails of urine, but he would not take advantage of this privilege of the unwritten law of the prison. Daniel worked furiously to get Alexander free. Finally there was a court hearing. The justice was not above reason and human interest in the case. Alexander was freed. All this was told by him in the most unpretentious way.

Time went on. I do not remember going to any show, or movie, or concert in Kharkov. A Jewish philosopher, Ish-Horovitz, who in his time created a controversy by attacking another Jewish philosopher (Ahad-Haam), visited my father occasionally; and there was a circle in which Jewish problems were discussed. It convened in the house of one Hillmann, his son being the leader of the group.

The winter, spring, and summer of 1920 passed. In Kharkov I stopped writing my diary which I had been keeping since the age of sixteen, the beginning of the seventh “class” in gymnasium, for about eight or nine years. At some moment (possibly already in the first weeks of our stay in Kharkov) when there was danger of a change of power, with the usual searches, I gave the booknotes I wrote during our stay in the

Ukraine to an acquaintance—a person whom I do not remember and knew only slightly—to keep for me, never to see them again.

In August 1920 we received a message from Moscow that Daniel had been arrested. I left for Moscow. By the time I arrived there, Daniel was already free. He had some diamonds he wished to sell and fell into a trap, but his wife Genia had “connections” and succeeded in freeing him. When in Moscow—for perhaps ten days or less—I obtained a certificate from the University and, with the courses absolved in Kharkov, I was presently admitted to start the final examination for my medical degree.

Then I met a young acquaintance, Kimmelfeld. I had a message for him from his father, who was languishing in a cell of the Cheka in Kharkov. Once my father passed by on a sidewalk when this man, who had once been a rich man in Moscow, noticed and recognized him, and let him know from his iron-barred cellar window of his plight. But I found the son entirely indifferent to his father’s fate. His brother was in exile in the isles on the White Sea, and he himself might have been punished by the Bolsheviks. Were I a novelist, the little I observed of this family since the age of seven or eight would have inspired me to write a sketch.

In Moscow I also provided myself with a *kommandirovka*, or a statement that I was delegated to travel to Vladikavkaz—without a *kommandirovka* one could not travel; I obtained mine from a department where I had a friend. The department was that of mining, and the *kommandirovka* was for studying the mineralogical deposits of the Caucasus. It was my intention to take my parents and Alexander there: the Caucasus up to the ridge of the mountains was now in the hands of the Moscow regime. Daniel accompanied me to Kharkov to take leave of our parents, since we (my parents, Alexander, and I) intended to obtain Palestine via the Caucasus. After a few days in Kharkov, we parted with Daniel at the station, he being desirous to join us on our way. He then returned to his wife and child.

1. Cheka is a shortened form in Russian for an organization with the full title of All-Russian Extraordinary Commission for the Suppression of Counterrevolution and Sabotage.

Caucasus and Lithuania

Once more I left behind, without a single thought, the medical degree; to reach it would have required only weeks, no longer months or years. The train brought us to Rostov on the Don, the route on which I had been denied travel ten months earlier. And possibly it was for the better. At that time, in October or November 1919, an epidemic of *typhus exanthemus* (Flecktyphus) reaped a grim harvest in the terribly overcrowded trains, and many of the escapees did not reach Rostov.

We reached the station of Mineralnyi Vody, from which a short sidetrack leads to Kislovodsk, the place where the revolution of February 1917 found my father, myself, and Alexander. Now it was all very different. For two nights we slept on the floor of the station or its platform, during which people would be awakened and required to show their identification. Finally there was a train that carried Armenian refugees toward the south. We traveled in the crowded boxcars, changing trains somewhere. My mother, used to comfort, never complained. Some years later my father recalled that I had made a step of my back for my mother to get out of the boxcar. This was all self-understood and did not require any effort on my part. A train on a short track took us to Vladikavkaz. Upon arrival we obtained two rooms in a hotel, but after a few days we were told to move to a more permanent place. All we had eventually was a single room for the four of us (for Alexander was with us) with a kitchen and a yard, in a rather primitive building with a ladder instead of a staircase.

It was from Vladikavkaz that Janovsky, who reached it several months before, had written to tell us a few details about the group of *halutzim*, or pioneers, that assembled there and waited for a chance to reach the other side of the Caucasian ridge and from there to proceed to Palestine. Now Janovsky came to us, and sat next to the window in a dark corner, his face framed by white hair and a white beard; his boy, also silent, stood next to him. One of the first men we got to know was Lichtenstein, a local cobbler who was an active Zionist and interested himself in the *halutzim*. Then we got to know the group, too. Many of them were from Rostov, some from the mining region of Donetz, and a scattering from other places. Altogether, counting those who arrived after us, there were thirty or forty souls.

The oldest travelers were a bearded man, Ratner, and his wife, the sister of his first, deceased, wife. He had an estate in the land of Israel, in Rishon le Zion. Winter in Vladikavkaz was moving in rapidly, and it was cold in the unheated dwellings; it happened that I took Mr. Ratner, a sturdy octogenarian, to a place where I knew pieces of lumber could be purchased—cuts left by a maker of wooden soles for shoes. I would fill a large sack with the wooden pieces, lift it on my back, and carry it to his room to use to fuel their little stove. These stoves were usually placed in the middle

of a room so as to have heat also from the smokestack. Ratner promised to offer me wine from his vineyard in Rishon when we should reach that goal of ours. It was highly improbable that such old people as they would make it, but the day did come when I was offered a glass of wine by the Ratners in Rishon le Zion. Fate was not as merciful to many others.

The town of Vladikavkaz, later renamed Ordzhonikidze, lies at the foot of the Caucasian ridge, and the river Terek, emerging from the deep gorge of Daryal, rushes through the town. The main street runs on flat land, but in front of it rises the wall-like ridge, here dominated by the snow-covered Kazbek. The Voyenno-Gruzinskaya Doroga (the Military-Georgian Road) crosses the ridge, starting from Vladikavkaz and running to Tiflis, the capital of Georgia, on the other side of the Ridge. This road is famed all over the world for its wild beauty: a gorge runs alongside, and mountains rise above the road and the gorge. Snow covering the road and avalanches of snow falling on it from great heights cause the road to be closed in wintertime; yet that winter the Red Government tried to keep the passage free—but not for the usual mortals. The would-be emigres had congregated here to wait and wait for a miracle, or plan to travel afoot over the snow-covered slopes of the Kazbek when even the road was perilous for travel.

The bulk of the group rented, or more properly, occupied, a space on the main street and worked on farms somewhere close to the town. The leader of the group was a dedicated man in his middle or late twenties; he and Mina Janovsky, a girl of about twenty, with a kind and dreamy face and curly black hair, intended to marry. There was Nahum Karpovsky, a well-organized youth, but a little dry for a *halutz*—a bookkeeper; Raia, an exalted girl, tall, with sparks in her greenish-gray eyes and a crown of hair; Kulkin, a youth of small but athletic stature and a daring spirit; Vinnik, a simple soul, not handsome, with a deep furrow above his nose, a good worker; and many others. They called themselves *Hapoel baderekh*, or “laborers on the way.” In large dormitories they lived, they cooked and ate, and spoke of the land of Israel, and sang Hebrew songs.

One day there arrived a young man who called himself Gibori. Small in stature, with nervous ticks, he told a story of persecutions, wanderings and escapes. He knew perfect Hebrew, having come from the land of Israel. I had already met him briefly in Poltava where he gave a few Hebrew lessons to my uncle Israel. He thought himself followed by the Cheka, and more than once jumped from a train. He wrote poetry and sang a Hebrew song about the wind. After escaping from Vladikavkaz he was heard of here and there, and finally several years later made news by living in a cave in the outskirts of Jerusalem and having a Yemenite bride and followers.

Should I tell in advance the story of each of the members of the group, I would commit an error against the biographical character of the story: I could not know their individual destinies, as they would come to pass in succeeding years and decades. The members of the group *Hapoel Baderekh* and those who did not belong directly to the group were awaiting a chance to cross into Georgia, then outside of the Soviet

Union and communist domination; month after month passed. Alexander took a job, since without it he would hardly be in the graces of the local soviet administration, and so did many of the others stranded in Vladikavkaz. He and I would chop firewood to heat our place, and a neighbor, the wife of a communist, would express to our mother her liking for us, young fellows, working so handsomely. We slept all four in one room.

In Vladikavkaz I wrote “Thirty Days and Nights of Diego Pirez on the Bridge of Sant Angelo”—a poem in prose in Russian. Pirez, a *marrano* (a Jew from a family forcibly converted to Christianity), born about 1500, was high in the court of Portugal. He returned to his Jewish faith, impressed by the arrival of David Reubeni, who claimed to be a royal prince of a Jewish kingdom in Arabia, and an ambassador to Christian princes, the pope included, with the mission of finding allies for a war of deliverance against the Arabs and Turks who had penetrated to the outskirts of Vienna. Among the many unusual experiences of Diego—who upon circumcizing himself took the name Solomon Molcho—was a thirty-days-long vigil on a bridge across the Tiber, close to the Vatican; a death sentence from the Inquisition from which Pope Clement VII saved Molcho by having another prisoner burned in his stead; and finally a death by fire, after being condemned by Charles V, the emperor, to whom Molcho had traveled together with Reubeni, trying to convert him to their plans. I wrote—with no notes or books before me—three or four pages for each of the thirty days and nights of the vigil. The first four days I had already written in Kharkov, but all the rest I wrote in Vladikavkaz.

Once I read my poem in prose to Ierahmiel Krupenin, a youth from the northern Caucasus who arrived in town after us. He knew and loved my cousin, Njuta Rosenblatt. Knowing that I was her cousin, he was friendly to me. Once I went with him and Selig Rivkind, an unusual youth from the group, to the snowy slopes of the mountains rising over the city, and sat there and read from the Bible that I carried with me in my breast pocket all these years—the Hebrew Old Testament.

Once, trying to find the way out of Vladikavkaz, I went to the palace on the hill in which was the office of the chief of the military-political police, a kind of political governor of the area. He was a young Jew from Siberia. He knew very little of Jewish problems and was interested in what I would say. And I, like some Solomon Molcho going into the den of the powerful to plead for his people, pleaded the case of young and old who strove to reach their ancestral home in the land of Israel. I even invited this feared chief to come to the place where the majority of the group lived, and see for himself; they intended to go to the land of Israel and live there in a commune. It was a risky thing that I did, but I was full of faith and kindled something in him, too; he was not a scheming man, and he was impressed by me. Two or three times I visited him, and on one of these errands I took with me Nahum Karpovsky, one of the members of the group.

At the same time we looked for another means to proceed on our way. My father told me that some family whom he by chance met was about to depart on the road to

Tiflis, having bribed their way, and that they were ready to tell me with whom to do it; so I visited them—there were two couples, rich people trying to leave Russia. They introduced me to the police officer who had arranged the trip for them, and told me that their diamonds would be secreted in the tires of the hired automobile. A few days later, going up the staircase of the palace of the military police to see the police chief, I found the two men sitting on a bench. I approached them, but they told me to go and not to talk to them because they had been arrested, and the same would happen to me should I be seen talking to them. In their plight they thought of my safety; they had been trapped by a provocateur.

In this atmosphere of impatient waiting we lived through the end of 1920; in front of us stood the towering wall of the Kazbek, with the river Terek tearing and foaming through the town. The unusually good pears bought at the market and the food cooked by our mother kept us alive and healthy. One of the girls in the commune, Raia, had an exalted dream and told it to all: she saw me as a High Priest in some magnificent hall, someone to whom was entrusted the deliverance of the Jewish people. Rivkind, years later, told me of the strong impression my father and I made upon him at our visit to the group, when he first saw us.

By January 1921 I had decided to go back to Moscow and to seek there a chance to get out of Russia. This decision was taken in view of the fact that the Soviet regime was about to occupy Georgia.

I made my long travel to Moscow, leaving behind my parents and Alexander. It took several days. In the meantime Daniel's little daughter, born just before we left Moscow in September 1918, had grown into a charming child; I wrote for her long nursery rhymes about a cat and a goose, and she learned them by heart; by heart she could also narrate long poems read to her by her nurse. I slept with the child in her room, which had been our boys' room when we went to school. Only two rooms in the apartment were left for my brother and his family, and soon I moved in with Moshe Halevy, my cousin, who was a member of the cast of Habima, the Hebrew theater, then a kind of miracle, performing in Moscow.

Years earlier I had been one of the first two onlookers of Habima's first production. Now Habima was working on *ha-Dibbuk*; Moshe was competing with the director, for the role of a prophet in a messianic piece: both ended up playing the role.

Daniel told me of a great tragedy: Avsey, a brother of Moshe and our favorite cousin, had been killed by the Cheka during the years we were away. When in 1918 uncle Israel left Niznij Novgorod, he entrusted the business (factory) to his manager Zirlin, who had once worked for my father and loved us children, and to Avsey. This Avsey was very handsome. At the age of seventeen he had come from Mstislav to Moscow to work for my father. He was crazy about opera and introduced Daniel to this operamania. He would work during the day, managing the little factory as a trusted relative, and go to the opera almost nightly. Then he went to study in the conservatory of Petersburg, and there was a long affair with a Russian girl. When on

a visit to Moscow he would receive four or five letters from her every day; then, when we were in the Ukraine, he decided to leave her and to marry the daughter of a competitor, a rich family in Nizhnij. Zirlin was arrested. Instead of fleeing, Avsey stayed and tried to release the man, but was arrested too. Daniel in Moscow was alarmed and arranged that a demand be sent to Nizhnij to bring Avsey to the capital, but on the day arranged for his marriage he and Zirlin were shot. Avsey was then about 30 or 31.

I slept on the upholstered chairs put together at Moshe's room. He told me of Khana Rovina's love for him; she was then in the sanatorium, and I urged him, out of compassion, to go to see her there.

At Daniel's house I was once witness to this little scene. A couple of guests were visiting, among them Vladimir Mayakovsky, the famous poet. Genia, Daniel's wife, always had people of name or distinction among her acquaintances. Daniel was playing with them in some card game. During the game Mayakovsky announced that the "bank" was his, and threw the winning card on the table—face down. Daniel lifted it, put it with the rest of the cards, and shuffled them; after a little while Mayakovsky, who knew that Daniel had seen the card, called to resume the game, and pushed back the pile of cash he had grabbed before, saying it was a joke. Later, when the guests left, I asked Daniel the meaning of the thing: why did he not announce the fraud when he saw it? He answered, "He was my guest at my home." This Mayakovsky was deified, especially in later years, as *the* Bolshevik poet; in the end he killed himself.

I did not stay long in Moscow. It was a successful visit. During thirty days I passed thirteen medical examinations, and thus obtained my degree. The exams were spaced two or three days apart, but in a few cases there were two on the same day. There was very little to eat; it was the year of hunger, the winter of 1920-21. I studied in Moshe's room, went afoot to the clinics at the Devitchie Pole, a distance, and there drank a sort of "tea" made of carrots or other vegetables, with a little jam for sugar—there was nothing else. But at the abandoned Okhotnyi Riad in the center of Moscow, where once the most unusual delicacies filled the stores on both sides of the sidewalk, a solitary figure would sell me a quarter pound of butter from under his overcoat, and I would eat it in slices, without bread. But I passed all the exams.

Had I succeeded to leave by way of the Caucasus, I would not have become a doctor. During the same month I managed to achieve something else, which had actually been the purpose of my travel: to obtain a permit for my parents to leave Russia for the land of Israel. This was among the first such permits given. I found some protection. There was a distant relative, of the same name, working in the political police; I saw him at his house. The incident that made us leave Moscow in September 1918, when the Cheka looked for my father because of his Zionist activities, had apparently been lost in the files. Several weeks later Chaim Bialik, who too came to Moscow to seek a permit obtained it as well. One more thing I achieved: I went to the University (Kommercheski Institut) in the technical department where Alexander had

studied before his arrest, and reinstated him, obtaining permission for him to renew his studies and matriculate again. With these achievements I traveled again to the Caucasus, a journey of some days; I hardly remember this passage.

My father was daily awaiting me, often at the window or the glass-paned door of the humble place where we lived on the second floor, a ladder serving as the outside stairs. Finally I came. I did not boast of my achieved degree, so that months later my parents were surprised to hear from me that it was in my possession. Actually I did not take out the degree until close to my own departure from Russia—otherwise I could have been drafted as a military doctor. But my father I found with a bandaged head. The day before my arrival an automobile had knocked him down on the street; he was wounded in his temple. I went with him to the clinic of the town hospital, and when the dressing was taken off to be changed I felt a faint spell and had to sit down.

During my absence from the Caucasus the family of Janovsky, father, daughter and son, and Yania (Jacob) Zipelson, the daughter's husband-to-be, went to the mountains with guides who promised to take them over the Caucasus to Tiflis in Georgia. Even on the Military-Georgian road travel in winter was hazardous, but to go over the snowy slopes of the Kazbek was foolhardy. Yet the greatest danger was in the treacherous Osetin guides. It was agreed between Zipelson and Janovsky and their friends that should they succeed in crossing into Georgia they would send a note back with their guides. After several days a note did come, written by the hand of Yania, but it was hardly reassuring: it was obviously written under coercion: its contents were not as agreed beforehand; thus they sought to warn their friends, and a certainty of the disaster that befell them at the hand of their guides gripped the hearts of those who waited behind. Had I then been in the Caucasus, I probably would have opposed their going, an old man and a young boy being in the group.

Yet soon after I returned the other youths desired to follow Janovsky's example: one was Eliezer Finkel, the other by the name of Melodist, a tall and friendly youth. I remember the evening in the hall, the group gathered around the stove, these two, and a bearded Menshevik by the name of Mintz, leaving the Soviet Union for political reasons. Mr. Lichtenstein found them guides who would take them that night into the mountains. Possibly I tried to dissuade them, but it was too late to change their hearts. After parting with us they left, and went into the night. A year later when the bulk of *Hapoel Baderekh* reached Palestine in a round about way, through Europe, they found a heartbreaking letter from a sister of Finkel—please, oh please write us a single word that you are alive. But this letter awaited Finkel, and he was no longer alive; Melodist, I believe, was the only son of his mother, and how much must she have loved this fine youth.

Despite my father's wound we decided to start on our trek back from the Caucasus. His bandage, we trusted, we would be able to change at some stations where there were ambulance rooms. We found such an occasion on a train to which a salon car was attached—actually the car that once belonged to the Tzar's Prime Minister Stolypin (assassinated in Kiev in 1911). Under the conditions of the time this was

very fortunate. But our itinerary was not clear to me: the permit for my parents to go abroad had only a thirty-day force, and though after my return from Moscow I remained only a few counted days in the Caucasus, it became obvious that should my parents travel to Germany via Moscow, the permit would expire before they would be able to cross the border. Thus when the train remained standing for an hour or so at a station from which a side track was running toward the Black Sea port of Novorossijsk, I went through a spell of indecision. Having wandered with my parents for two and a half years, I was afraid to send them off on their own to Constantinople: they would have to find their way alone to the land of Israel, without knowledge of Turkish, French or English. And so I decided to take the risk of going via Moscow and applying for an extension of the permit, in the hope that this time, too, nothing would be uncovered that would trap my parents in Russia. But the indecision repeated itself at another station from where, again, a railway line ran to the same Novorossijsk. Many years later I traced to these events the indecision I would often experience before going on travels.

Thus we reached Rostov; we lived in the railway car for several days. The car was out somewhere on the very numerous tracks of the Rostov terminal. For over three days we waited for a train for Moscow. I went to town where by chance I met Yuza, my cousin, the son of my uncle Feivel. In 1919 they had succeeded to run away from Kharkov to Rostov, the route I tried then so unsuccessfully to go with my parents. On the way they experienced typhus—it was then a dreadful journey. Soon Feivel found my parents in the railway salon car—I was again away—and came to see them, after some seventeen months. He sat there in the car, sad, and asked the forgiveness of my parents for the way they had been treated in Kharkov, that night when, after seeking shelter from the rain, we slept on the floor of their mansion.

After three days of waiting I learned that a train set up at the platform was to leave for Moscow in a few hours, and I again arranged a salon car for my parents and berths for Alexander and myself. I transferred my father and a part of our belongings, and went back to transfer my mother, but I could not find the car on the sidings. There are several hundred sidings in Rostov, and all were blocked by the rolling stock, almost all of it boxcars, in the near-paralyzed traffic of Russia. I was frightened: the car with my mother in it had been moved away. I looked around and searched, and could not find it. I asked somebody and was told that it must have rolled away to Bataysk, across the river Don. After years of travel, during which I carried my parents through all perils, I had lost my mother. In the condition of Russia then, this would mean a parting forever. She would be helpless, and how could we proceed to Moscow without her? My father and Alexander were already in the train awaiting departure. I ran toward Bataysk. There are several stations, I read later, seven kilometers distant from Rostov. But could it be seven kilometers that I ran? I came to a railroad bridge over the river Don—I believe it was the longest bridge in Russia. An armed guard stood at the entrance and would not let me in, but there was another bridge close by. I climbed over barbed wire, in view of the guard, and ran over this bridge, waving to the soldiers that guarded it some papers I had in my hand, as if a permit, and I reached the other side at Bataysk. There stood a lonely train, very long, packed with

refugees, mostly orientals, who sat and also loitered in front of the cars of the train. I ran and cried: "Mama, mama!" I ran to the end of the very numerous boxcars of which the train was composed and there was not the car I looked for, nor my mother. Time was running out; in the meantime my father's train would leave without my mother and myself. I ran back to Rostov in the hope that I would find her there. This time I headed for the railway bridge; on this side, too, the sentinel would not permit me to enter it, but I waved my papers, and shouted at him: "Shoot!" and ran onto the bridge. With every step I had to touch the crossbeam under the rails: in between was the blue of the river beneath. A single false step and I would be flying to the depth. The kilometer-long bridge and a thousand steps in running, and not once did I slip: perhaps the fact that I was under great stress kept me from a false step, as if I were on "automatic pilot." On the other side of the bridge the guard that had not let me in let me out without shooting me, and soon I was again on the Rostov terminal sidings. I cried again "Mama!"—and suddenly saw her at the door of the car that had apparently been only slightly transferred to another track. With the rest of the strength in me I took my mother and the belongings still with her, which I loaded on my back, and ran to the train at the station. The train was still there. I lay myself on the upper berth, my shirt as wet as if taken from a pail of water. There I remained, unable to stand up.

The train moved. On the lower berth was a famous socialist, a military hero; years later, if I remember right, he was put to death in one of the purges. The travel was not short. It was around the time of Passover. Finally we reached Moscow.

In Moscow my parents came to know their first grandchild—Lenochka. The few weeks in Moscow until the permit was renewed (and this happened without a hitch), my parents lived in a rented room in the building complex where Daniel lived, and where we had lived for many years.

Came the day, and all three of us were at a station seeing our parents off in a very comfortable Pullman car, almost empty; direction: Riga, the capital of the newly-independent republic of Latvia. After the train left we three sat on a bench. It had taken me from September 1918 to late spring or early summer 1921 to achieve this.

In August of the same year it was planned for me to meet my parents, who would take the train in Riga and travel over Latvia to Germany: I would join them in Kovno (Kaunas), Lithuania, and accompany them to the German frontier in Virbalis or Eydtkuhnen. This also came to be and I spent a few hours with my parents whom I had not seen since the spring, when my brothers and I brought them to the railway station in Moscow and saw them off to Riga. My mother looked healthier and happier than I had seen her in many years. The stamp of deprivation from the years of wanderings in the Ukraine and the Caucasus during 1918-1921, amidst civil war, as refugees and with no household, were now all but erased in the healthy atmosphere of the seaside resort where they had spent the summer. My father, however, had had some fearful moments or worried days when the Latvian authorities questioned their right to enjoy a temporary residence in that republic; possibly he was even concerned

that they might be returned to Russia, probably an exaggerated fear. But their friends in Riga—an engineer whom we met in Kharkov, in the Ukraine—helped them to solve the bureaucratic difficulty. Now on the train, leaving Latvia, both of my parents seemed relieved and eager for a new leaf in life having Russia behind and life in the land of Israel before them. The stations of Virbalis, the old Russian frontier town, and of Eydtkuhnen, the German town on the other side of the state frontier, were familiar to me from several crossings, when at the age of 12 and then at the age of 14 our parents took us to the Baltic sea resort of Krantz near Koenigsberg. On one of these neighboring stations I parted with my parents who continued to Berlin. Waiting for a train to take me back to Kovno I looked over the small paperbound books on the rack and bought myself a copy of a book—I do not remember whether in German or in Russian—on the Theory of Relativity. I spent two months in Kovno and obtained documents to enable my two brothers and their families to leave Russia, should they wish to do so.

Now I had to think how to make my way to the land of Israel. I made several efforts. Returning to Moscow, I registered as of Lithuanian origin on the ground that my mother was born in Grodno. Eschelons with repatriates were then leaving Moscow and going through various steps, and I was registered with one eschelon. At the Lithuanian embassy in Moscow I had to receive a permit. I was asked whom I knew in Grodno, and I named the familiar Jewish names, and so was declared acceptable by the Lithuanians. Daniel was with me at that legation and asked advice whether he too should leave Russia; I did not influence him to do so, and for that in later years I blamed myself. But his wife was too much of a Muscovite, and strong-willed, too.

Alexander renewed his studies and did not consider leaving. He was in love with the sister of Genia, and for that reason he also had not left with us that September, three years earlier; but she was admired by a few others, one of whom she married, and died young several years later from measles, complicated by pneumonia.

Thus I was to part with my brothers at the age of 26, they being 27 and 29. They never saw our parents again. With Alexander especially we had been very close. He did not envy me in anything, and was proud of me; and since our early childhood there was an unusually fine relation between us two. Daniel was older, more precocious, and only when all of us were students in the universities did the relation become comrade-like; but his marriage again made a difference.

One day somebody appointed to my eschelon told me that that very day the eschelon would be leaving. I hurried home, to Daniel, and left for the Briensk railway station. I do not remember whether Alexander came to the station to see me off—I left in a hurry, when he was not home. It seems to me that he found out still in time and came. The eschelon was put in many boxcars and the train slowly left. The Russian frontier was in the town Sebez. Crossing into Latvia the “refugees” were interrogated by a Lithuanian commission visiting the train. I saw a group of Jews who were denied entrance, and they stood immobile; they had come from Siberia or some other distant place. I went to them and led them back to the members of the commission that they

should reconsider the decision. At this point I was also regarded as one to whom entrance had been denied, and I was turned back, too. Then I hid myself among the sacks and valises in a boxcar. Immediately upon my arrival in Latvia, all emigrants to Lithuania were called out to attend an evening meeting where communism was denounced and Jews were attacked (verbally); when the inmates of the car where I was hid returned, I heard the repeated word “zhid” (Jew). In the morning, possibly it was still Sebezh, I left the boxcar guarded by the military as if for some needs, and from the bushes headed over a large field into the town.

I succeeded to make my way to Riga, capital of Latvia, and from there to Tallin, capital of Estonia. Then a ferry took me to Stockholm. After about six days in Stockholm, I started on the last leg of my journey—toward Berlin.

My Years in Berlin

A train carried me from Stockholm over Göttesborg and by ferry to Germany, and in the early evening I was at the hotel on Kurfürstendam Street where my parents were staying.

It was a balmy evening; Kurfürstendam was brightly lit and my spirits were high. Now I was reunited with my parents after being separated from them since late spring. I was told that two messages were awaiting me—one a telegram from Daniel that he had arrived in Kovno to meet me: he had obtained a *kommandirovka* from the Kommissariat for External Trade in which he worked to go to Riga for a few days; and from there he made a quick trip to Kovno, only to find that I had already left. The other message was from the Jewish community in Vladikavkaz, in the form of a mandate to attend the Zionist Congress in Karlsbad, the first after the World War. I wished to be simultaneously in two places, and since the Congress had already convened, I telegraphed to my brother to wait for me, and having picked up the “mandate” at the Palästina Bureau, I headed by train towards Carlsbad. In the train I was approached by a friendly gentleman, the chief of the Palaestina Bureau in Berlin. He had the sign of the Congress in his lapel, and so we came to converse. Before parting I inquired where in Berlin I could have kosher meals and he gave me two addresses. There was some fatefulness in this meeting. An old Russian saying has it that “The one who is fated as your consort you cannot elude, not even on horseback.”

In Carlsbad I spent only one or two days. I hardly participated in the proceedings. I had to choose my place according to my political sympathies, and was not clear to me where I should take my seat. I was one with the left, since I was a socialist in my sympathies; I was one with the Mitzrahi, since I had a strong religious inclination; I was one with the Revisionists, the group of Vladimir Jabotinsky, since I was for the Legion and had wished to participate in it in the years that preceded, and felt not much differently now; finally I felt sympathy with the General Zionists, because I was against fractionalism and saw in this group a striving for union. Yet the question was merely academic; I hardly voted on any issue. But I made the acquaintance of Professor Heinrich Loewe, who spoke Hebrew with a mixture of German and Sephardic accents, and had a friendly smile. I needed Loewe’s help because I already had a plan. We agreed to meet in Berlin again.

I went from Carlsbad to Kovno, where I met Daniel. He was already eager to travel back to Moscow. I told him of the papers I had received in Lithuania which were to enable him with his family and also Alexander to leave Russia. When my train was taking me back to Berlin, I saw Daniel, one cheek wrapped in a kerchief because of a toothache. I have not seen him since then, nor my other brother Alexander.¹

Again I did not try to influence Daniel to leave Russia, since I knew the stand of his wife Genia, who was enamored of all things Russian, and would not leave Moscow; and Alexander had just resumed his studies.

It is a great pity that Daniel did not come out of Russia. Possibly also lack of funds abroad kept Daniel from undertaking a change of domicile: he had several great transfers to Western Europe—London, also Switzerland—but these needed first to be cashed. Life in the years to come would have been very different for my parents, for myself, and especially for Daniel, if he had decided to emigrate.

In Berlin my parents stayed at the same place as Itzhak Goldberg and from him they received the sums that in 1917 they had transferred abroad, some five or six thousand pounds sterling; besides they had the sums, not fully 2,000 pounds, that my father had bought in a bank in Kharkov. These were not large amounts; the greater part of my father's property was lost, either nationalized by the communist state (his houses, factory, business), or abandoned (his apartment with all in it), or not immediately obtainable (several large transfers abroad), and, as the following years would show, also lost and not redeemed.

Feeling gratitude for having come out of darkness into light, and nurtured by his never ceasing desire to do something for the good of the world or of his nation, he talked to me of his intention to start something of importance. The nations of the world were licking their wounds after the World War; my father thought that a new foundation for peace propaganda would be the proper way for him to invest part of what he had saved for himself—and the means should be spent on calculating and making known how many schools, hospitals, homes for the aged and infirm, scientific laboratories and other institutions for the benefit of all races could be built by the sums spent on war, the human sacrifice being irredeemable. I disagreed with this plan, believing that the roots of wars and animosity among the nations are hardly extricable by these means—that the knowledge of what could be bought by the resources spent on armaments and on war could hardly suffice to keep mankind from another war.

I offered my father another idea, and he immediately agreed with me. My idea was for a collective publication which would bring scientists and scholars of the Jewish faith together to prepare the intellectual foundation for the future Hebrew University in Jerusalem, to develop the Hebrew language in various scientific fields, and at the same time to advance science.

The planned publication would demonstrate the role played in the scientific world by Jews, who were then known only as citizens of their adopted countries—thus Einstein, or Paul Ehrlich, or von Wassermann, were considered Germans, Hadamard French, and Levi Civita Italian. The volumes were to be published in the name of the National Library and the University of Jerusalem. At the time, the National Library existed, but of the University there was only a piece of land on Mount Scopus, with a

foundation stone on it from before World War I and nothing else. The National Library, housed in a two-story unpretentious stone building in Jerusalem, had been founded decades earlier by a fanatical lover of books, Dr. Joseph Chasanowich who, residing and practicing medicine somewhere in the pale of Tzarist Russia, for many years collected books for a modest beginning of a National Library in the far-away Turkish province of Palestine. He died destitute in 1919 during the revolutionary war in the Ukraine. A year later the library which he founded in distant Jerusalem and which carried his name was recognized and renamed the “National Library,” and Dr. Hugo Bergmann became its director; he was known as a writer in philosophy who in the second decade of this century came from Prague, from the circle of Max Brod. He is no longer alive.

The idea of a University goes back to Hermann Schapira, professor of mathematics at Heidelberg, a position he achieved starting as a poor Jewish youth, self-educated and, like the others here named, dedicated to the idea of the Jewish renaissance. He offered his idea at the First Zionist Congress in 1897. I do not think that he ever visited the land of Israel—travels in those days were not what they are today. The idea of the University lay dormant for the next quarter of a century. It was the purpose of the *Scripta* to become the real founding stone of the University; today the Hebrew University in Jerusalem is one of the most prominent places of higher learning in the world.

I approached Prof. Heinrich Loewe, whom I had met, as told, at Carlsbad; he realized the scope of the idea and guided me (he prided himself on having guided, years earlier, Chaim Weizmann, then a student in Berlin, in Zionist education); my father, after giving me the funds, left with my mother for the land of Israel, now in British hands after having been seized from the Turks to become a mandate territory, the mandate of the league of Nations being to create there a “Jewish National Home.” Loewe and I came into written contact with hundreds of scientists and scholars. Weizmann, then president of the Zionist organization, who came from Manchester for a visit to Berlin, agreed with our plan and gave us his blessing. With all the energy stored during the years of wandering I immersed myself in the materialization of the plan. I had no previous experience with the publication of a scientific journal. One of the first tasks was to find a printing plant that could set type in Hebrew as well as in European languages, but also had types for mathematical articles, and oriental scripts like cuneiform, Arabic, or Ethiopic. After surveying a long list of printers, we selected Kreysing in Leipzig.

Each contribution was to be published both in the original language of the author and in a Hebrew translation. Soon the response showed that two fields were best represented, “Orientalia and Judaica” and “Mathematica and Physica.” Einstein, then in his forty-third year, one year after being accorded the Nobel prize, agreed to act as editor for the latter series. Soon we had contributions from a galaxy of illustrious names in mathematics, physics and engineering, like Harald Bohr, L. S. Ornstein, J. Hadamard, and others.

The answers from the scholars were by far not all in the affirmative: some French Jews refused to participate with German Jews in one venture—the wounds of the World War were not yet healed. Some German Jews wished to be known only as Germans *des mosaischen Glaubens* ("of Mosaic faith"), an attitude that did not save them years later from the onslaught of the Nazis. Freud, when requested to participate, answered in longhand, but refrained from contributing a paper: his readers would not be able to find his articles if printed outside his own journals. The collection of letters that thus came my way had historical-cultural value. But as I found on a recent visit to Israel, not much of this collection is still preserved.

The work of translating the contributions into Hebrew required the combined effort of quite a few Hebraists versed in the subjects, especially mathematics, physics and engineering, while translations in Judaica and Oriental Studies did not require pioneering work. I took the task very seriously. For instance, the article by Edmund Landau, the eminent Göttingen mathematician, was given for translation to three different scholars: Landau's own pupil Amira, a graduate of the Tel Aviv gymnasium, working for his doctorate (in years to come he himself was a professor of mathematics at the Hebrew University), Dr. Jacob Grommer, assistant to Professor Einstein, and Dr. H. A. Wolfson, earlier a professor at Kharkov University and at the time on a temporary sojourn in Kovno (Kaunas), Lithuania. I engaged Simon Rawidowicz, a young Hebrew writer, to work as the editor of the Hebrew translations, and also to see to it that there should be a certain uniformity in the use of scientific terms by various translators.

To translate the monographs by Levi Civita and Gino Loria from Italian into Hebrew it was necessary to find an Italian Hebraist knowledgeable in physics and engineering, and I was fortunate to find such a person in Dr. Nathan Sholem. Today, with many institutions of higher learning and many scientific publications, Israel has no problems of this nature—but it was a time when the field was virgin.

The secretarial work was all done by Rose Bombach, a dedicated worker, whom a cruel illness later snatched from normal life. Elisheva Kramer, a violin student under Adolf Busch, volunteered to help me in organizing the work. I had other help too, but Elisheva helped me not as an employee—it was a work of love. Elisheva had been a pupil of Hess, who wished to promote her, when she left to study with Adolf Busch, who gave her private lessons for only nominal pay because of her talent.

Every manuscript went through the mail more than a score of times, once after every one of the steps: each paper was typed (most were sent in handwritten), then corrected by the author, seen by the editor, sent to the translator, to the printer, to the editor of translation, and this was repeated for the series of galleys, on the same round.

I visited Einstein several times, and once or twice sent Elisheva Kramer to him. He admitted to me that he did not understand many of the articles, which were in various fields of physics or mathematics, but then he relied on the reputation of the authors.

He lived on the upper floor of an apartment building in a quiet residential section of Berlin. Still unconvinced that the Jewish nation needed to be preserved and not assimilated, he once asked me: “Are not all races equally ancient?” I called him to the window, next to which he had a small telescope, a gift from somebody, and asked him to look down on the street, and told him: “Do you see those cobblestones of which the road is made? They are ancient, but they are not collected and preserved in a museum.”

In February 1922 I traveled by boat and train from Europe to the land of Israel, to which I felt a strong attachment throughout all the years following my departure in the spring of 1914, after I had spent the winter there upon leaving Montpellier University. Now, in February 1922 I returned and spent the next five months there, directing the progress of “Scripta” from afar, but it gradually came to a standstill. Loewe admonished me in letters to come and continue the work we had started together. He also came to Israel, and we traveled with David Yellin, leader of the Jewish community in Jerusalem, to Mount Scopus; I photographed them at the foundation stone of the future university.

In Jerusalem I found the girl I had loved, Esther Bashist. She assured me that she loved me, but it was hardly sincere, and I asked God what was the purpose of these nine years of love at a distance to be ended at the first meeting. So I returned in July 1922 to Berlin and became closer to Elisheva. I plunged myself again into the task. The editorial office, which before I had in my furnished room, small as it was, on Schaperstrasse, I now transferred to 13 Xantenerstrasse, where I rented two larger rooms with balconies.²

When on the sixth of January Dr. Weizmann came to Berlin we met again and I acquainted him with the progress of the work; he was impressed. For years the idea of a Hebrew University had occupied his mind, but nothing was taking place. Now he spoke to me in Hebrew: *Thi av l'universita*—“Be the father of the university.” I was not yet twenty-eight. He wished that I should take upon myself to bring the university into existence, and thus to materialize the plan not progressed since 1897 when H. Schapira came with the idea to the First Zionist Congress. I did not promise, and Weizmann thought, as it appeared later, that I wished to think it over.

Already since my return from the visit to the land of Israel, in July 1922, I went rarely to the Moabit section of Berlin where Loewe lived, and soon took the entire work of editing and publishing upon myself. Possibly he was a little hurt, but generally he was a good-hearted man, with smiling eyes on his broad face, framed between a large bald top covered with a few tufts of hair overlaid from one side, and a glorious greying beard, which he liked to stroke; he and his wife were in love after many years of marriage, but children they had not.

I met personally only a few on the large list of those who agreed to collaborate. One of them was Professor A. von Wassermann, the discoverer of a diagnostic test for syphilis, in his office at the Kaiser Wilhelm Institute in Dahlem near Berlin; on the

same visit I also saw Professor Neuberg, who dominated the field of biological chemistry. Prof. A. Fodor at the University of Halle felt and complained that Neuberg had closed to him the doors for scientific advance and publications; he was soon in contact with Weizmann, later to become the first professor in the University of Jerusalem. I also visited Professor Ernst Cassirer, the philosopher, in his mansion in Hamburg.

In the early spring of 1923 Elisheva and I took out our marriage license (civil marriage, preceding religious rites) in Hamburg, where her father, George Tuvia Kramer, had a Hebrew bookstore and also published books on rabbinical subjects, among them the codifice Shulhan Aruh of the early sixteenth century by Joseph Caro of Safed. Elisheva had lost her mother at the age of 19; it was then that she left Hamburg to study in Berlin.

On April 15 we were married in Berlin by the well-known Rabbi Munk in the courtyard of his synagogue; the dinner thereafter we had, at the insistence of my landlady, only recently widowed, in her apartment. Professor Loewe represented my parents by reading a telegram sent to his address: "We bless you with Psalm 128."

The next afternoon we spent some time in the Berlin University Library, studying the ways scientific institutions published their proceedings. A visit to the library became an observance on many of our anniversaries. I regard my meeting Elisheva as the greatest luck I had in my life. The nobleness of her character, her femininity, her honesty, her self-denials—all is before me through now thirty-six years as an unending blessing. She would go afoot across a large part of Berlin to visit a girl from Poland suffering from a brain tumor whom she happened to meet; she would walk, and not ride, because it would be Shabbat. On some visits she would play the violin for the girl.

I would travel to Leipzig often, possibly once a week for some period of time—and sometimes Elisheva would go with me. I had only good experience with the printers. If Elisheva would not accompany me, leaving for the train I would whistle one of our melodies, and even from the other end of Oranienburg Platz, a block or two away, we would exchange the duet in the morning hours of this quiet residential quarter.

With collaborators of *Scripta*, I had only once an unpleasant experience. Professor Radcliff Solomon of London, when invited to participate, sent in a paper on "What Became of the Philistines?" The paper was forwarded by me to the printer, and the galleys arrived together with the plate prints of the lithographs for the illustrations; I read the galleys one morning still in bed and was aghast. Radcliff Solomon reproduced scenes from the bas-reliefs of Ramses III in Medinet-Habu that depict the Pereset, recognized in the historical literature as the Biblical Philistines. Now Semites are supposed to be dolichocephales, or of long skulls; Pereset on the bas-reliefs were brachicephales, or round-headed. Three thousand years later among the Jewish legionnaires fighting under the British general Allenby, many were round-headed, as seen on photographs which, I believe, Radcliff Solomon made himself. He came to

the conclusion that the Philistines became absorbed into the Jewish People. The argument seemed very flimsy, and, to add to it, the way I felt then and saw the purpose of the *Scripta*, it would have been almost sacrilegious to spread such an idea which would obtain, by publication in *Scripta*, a sanction of scholarship. I wrote to Solomon an apologetic letter and offered, also ordered, the lithographs to be sent to the author for his use wherever he might succeed. (Actually, two years later, at the opening of the Hebrew University, I received a reprint of the article with a few triumphant words of the author who came to participate in the opening—by then we lived in Jerusalem.)

When all this took place, I could not have anticipated that decades later I would write a volume on *Peoples of the Sea*, as a part of my reconstruction of ancient history, in which the Pereset would largely figure; and that I would be able to show that Pereset were Persians and not Philistines, and that the time was not before the conquest of Canaan by the Israelites, but long after the destruction of the Judean monarchy. The better that I was so resolute then.

A work in the volume on “Orientalia,” by E. Mahler of Vienna, dealt with the chronology of the el-Amarna Period; of it, too, I could not have anticipated that I would use it five decades later for certain source arguments in dealing with the cuneiform letters found in el-Amarna, in the frame of the same work on *Ages in Chaos*.

Scientific contributions that I received from scientists in the field of biological sciences—and there were a few great names—had not a true scientific value; a paper such as was sent by von Wassermann I did not find to be of an adequate level: it was a popularization instead of a scientific contribution. Thus the only monograph I selected for print was by Professor D. Katz from Rostock who claimed to discern special nerve endings that could register vibration.

I also published in Hebrew, separately from the *Scripta*, a popularizing work by Dr. Jacob Greenberg, who worked as one of our translators, on “Atom and Ether”; and I made a new edition of the two Hebrew volumes, *Sfotenu*, published by my father in Russia, with scores of philological essays by Dr. Joseph Klausner, later one of the leading Hebraists of the Hebrew University.

At that time Berlin was becoming a cultural center for Hebrew and Judaica, and several publishing enterprises were initiated; thus Nahum Goldman began a multivolume *Jewish Encyclopaedia*. Chaim Nahman Bialik, the great Hebrew poet in his earlier years, now more absorbed by the commercial publication of Hebrew books, having seen the plan of *Scripta* and its fulfillment, said to me in his affected way: “This is the greatest collective work [for Judaism] since the conclusion of the Talmud.”

Except for two short vacations to the Harz and to the Sächsische Schweiz (near Dresden) all my time was taken by work. At the beginning of my stay in Berlin I also

participated in several post-medical courses given to physicians, a number of them from various foreign countries, at Charite Clinic of the University of Berlin, and took courses in serology at the Kaiser Wilhelm Academy. I also bought myself a Zeiss microscope. There was nothing memorable in these courses; the time was before antibiotics, just before insulin; few hormones and hardly any vitamins were used in medicine. My mother wrote me letters advising me to specialize in some branch of medicine that was needed in Israel, but I was more and more absorbed by *Scripta*.

When in 1924 the volume with twelve papers on mathematics and physics by prominent scientists was published, together with the other volume on Orientalia and Judaica, the leading British journal *Nature* (June 28, 1924) observed that if from a scattered population of thirteen million Jewish people sprang talents like Edmund Landau, Jacques Hadamard, Albert Einstein, Levy Civita, Gino Loria, Theodor von Karman, Harald Bohr, and others, then clearly the Jewish nation is unusually rich in creative spirit and ability. The published volumes served the National Library in Jerusalem (Later University Library of Jerusalem) for exchange with many scientific institutions for their publications.

The Hebrew University was begun in 1924 and inaugurated in 1925: at the time of the inauguration the two volumes of the *Scripta* were placed in front of Lord Balfour, who came to the inauguration ceremony, and the wind coming from over the valley in which lies the Dead Sea played in the pages of these books, on which my father had spent a large part of his fortune, and to which I had dedicated several years of passionate work.

Home Ancestral

As soon as the two volumes of the *Scripta* arrived from the printer in the summer of 1923, Elisheva and I went on our way to Israel with two copies (still without title pages) in our hands. We traveled first to Kissingen, where we met Elisheva's uncle Solomo, then continued to Wurzburg, where we came late in the evening, and, waiting for the train to Carlsbad, wandered through this charming medieval town, even more charming because of the night, our steps in the empty street being the only sound except for the clocks on towers that sounded the time.

We arrived in Carlsbad, where the Zionist Congress was convened. On the sidewalk near the Congress hall, Professor Chaim Weizmann stopped me and said that he still waited for an answer to his proposal to me to head the work of establishing the University in Jerusalem. We gave the members of the Congress reprints of the works published in the *Scripta*, and not remaining too long there, traveled toward Trieste.

I believe that the first of our many visits to Venice took place then. This city later again and again attracted us. On the boat to Egypt was Elieser Kaplan, whom I knew well from my student years in Moscow, and I asked his advice about the form in which I should mention Prof. Loewe's role in publishing the *Scripta*. Loewe gave me much support and guidance in the beginning, but for more than a year since my return from Israel he was practically out of the picture. This indecision I called the "Loewe problem." In the end I mentioned him following my name. If I think back, I wonder why the name of my father, who gave the funds, is not mentioned at all on the front page of the books, which is printed in Latin, but appears only on the Hebrew side of the volumes; the volume on Mathematics and Physics also has his Preface. But in the libraries of the world these volumes are not mentioned on the catalogue cards in any relation to my father. Apparently the "Loewe problem" had something to do with my father, whose name I omitted on the Latin front page as if from modesty, as I understood then.

The work on the *Scripta* was not continued. Had I been a practical and honor-seeking man, I would have accepted Weizmann's offer, put myself to work to organize the University, traveled to America to find funds, and continued the *Scripta*. My father's funds were exhausted, and actually he had so little to begin with that nobody in his place would have thought to underwrite such a costly enterprise.

From Egypt we traveled by train, and on the sand near the primitive railway station in Tel Aviv we were met by my parents: there they saw Elisheva for the first time. With one arm I held her; in the other arm I had the fruit of our great effort—the two volumes of the *Scripta*.

My parents immediately liked Elisheva, and my mother, speaking fluent German, could converse well with her. But already on the very first day of our arrival, October 30th, 1923, I had to take over a mission: my father had come into agreement with the Anglo-Palestine Bank (later the Jewish National Bank) on the division of Ruhama. During the World War Ruhama played an important strategical role. In the British parliament and press the role of Ruhama was mentioned often, when for long months the army of General Allenby held the front there and had water from the only artesian well in the region. When the Turks under Djemal Pasha retreated before general Allenby's army, they planted a bomb in Ruhama's well, the only artesian well in the south of Israel. As soon as they departed after igniting the fuse, two Hebrew pioneers climbed all the way down into the well and at the last moment severed the fuse from the mine.

For many months the army of Allenby remained stationed in the Negeb, the well of Ruhama being its main water supply. Then the British Army and the Jewish-American Legion conquered Palestine. But the farm fell on difficult times: the manager, Mr. Hirschfeld, died of typhus, and the place became deserted. In some way the bank supported the place a little, and though not a single tree or plant was added the Bank presented a bill for 29,000 pounds sterling to my father for the loan. The entire farm with its plantations and buildings was worth much less. My father could refuse to acknowledge the debt because the Bank had not been asked by the owners to make this loan, and the amount of the loan was but the result of an arbitrary conversion of Turkish pounds into British pounds sterling. My father informed the Bank that he had the interests of the Bank—which he had helped to create as a member of the Second Zionist Congress in Basel—as much on his mind as the interests of the cooperative, and offered to divide the land with them. By this he hoped also to preserve this, the only settlement in the Negeb, because the members of the cooperative had no means, or were not reachable, since the October Revolution in Russia. The Bank agreed, and we had to accept the division as mapped by the Bank—certainly prepared to its advantage. And the day after my arrival I had on me this task.

Soon I found out that my father was having a very hard time also with the new group of Sheerith Israel. My father had lost as much as 95 percent of his property; his own transfers of money to Europe were not honored by the recipients, but the money of the second group of Sheerith Israel we saved to the last ruble, even though the rubles were worthless “Kerenski” money. Yet these sacrifices were not appreciated, and those who thought that they had some rights demanded money, as if we were in the money transfer business. Actually, none of the original members of the new group arrived in Israel. What we did was to purchase land in Palestine, or, as it was usual then to say, to “redeem” the land. Actually my father had already bought land for that purpose, but considering the changed conditions, and partly being influenced by brokers, he bought land adjacent to the developed portion of Tel Aviv, that was soon to become its central part.

My father appointed a lawyer, Hershman, mentioned earlier, a son-in-law of a

member of Ruhama, to help him, and to advertise in papers in Poland that anybody who participated should write to him. Soon, on being warned that this lawyer had a bad reputation, my father severed connection with him. Hershman used the answers he received to inform the writers that he could obtain money for them, whereas the plan was for a new settlement.

To make the long story short, for the next seven years my father was exploited by lawyers who wished to be near the pot, but who could not solve the problem—especially the legal problem of whether the old group and the new were the same or two different companies. I never hesitated to take on this burden and, instead of starting my medical practice, became involved in the protracted consultations.

I remember how once in the morning I stood on Herzl Street and waited to meet Hershman—I did not wish to see him, yet I needed to talk to him, the man in whose night shirt I had slept five years earlier when the secret police found out about my father's and mine Zionist activities. As for the money that was due to us from various sources, I made hardly any effort to recover it.

Elisheva took in her stride this our waste of time; she organized a quartet, and in the spring of 1924 they traveled through the Emek Israel and Galilee, and played, and I accompanied them. Still I hear in my ears the aria of Bach and the melody from Schubert's "Der Tod und das Madchen." It was the first time that the people in the *kwuzoth* heard chamber music in their places. In Kinnereth the mother of Marek, who had wandered to the land of Israel, wept, listening to the music.

About ten months after our arrival in Tel-Aviv, I traveled one day to Jerusalem, and found a place where I could practice medicine with a group of better-known doctors. Each practiced his own specialty, and the post of internal specialist happened to be open. So Elisheva and I moved to Jerusalem, and lived there for almost two years. We liked to go to the Old City, to the Wailing Wall, and walk on the walls around the Old City. Our daughter Shulamit was born in Jerusalem in 1925. My mother came from Tel-Aviv to help—from Shulamit she had her great and last joy. Our second daughter, Ruth, was also born in Jerusalem—on April 26, 1926, while I was away in Tel-Aviv. That day Elisheva accompanied me to the taxi—and I saw on her face the first signs of labor; but in her self-denial she told me to go, and then in Tel-Aviv I received the message that she was in the hospital.

One evening in 1926 we parted with Jerusalem, for the last time walking on the city wall. In the spring of 1927, after having spent about nine months in Tel-Aviv in the house of my parents in an ever-frustrating effort to find some legal solution to the conflict over the group Sheerith Israel, I went one day to Haifa. My nerves were strained; I was not earning anything, giving my time and efforts to helping my father in that thankless task. My mother was now on the decline in her health, and the means of my parents were also diminishing, all making mandatory a change in my unproductive way of life that now dragged, week after week, through the fall and

winter of 1926-1927.

In Haifa, in the space of two days, I had a little luck: passing by a pharmacy on a stony road uphill, I was called in by the proprietor—it was Simoni, who recognized me from the days back in Crimea where he had spent time ten years earlier because of an incipient tuberculosis. He told me of a musician's family in the building in the court who wished to have a violin teacher for their son—for very little pay, but it would be a beginning. Then from that family I heard of a violin teacher who was about to leave town and had a rather large class to give over. I visited him. He had about thirteen pupils, and cared that they should not fall into the hands of his competitor at the local music school, who was truly an unsympathetic character. Neither of them could measure up to Elisheva, even by a long stretch.

Traveling on the little bus to Mount Carmel, I entered into conversation with a man, Marcus his name, and he told me that in the Ahuza of Herbert Samuel, farther back on the Carmel, they would like very much to have a visiting physician, and would I not agree to look at the place and the room they had for that purpose in their new settlement? This Mr. Marcus was a brother of the organizer of the new settlement of Rumanian Jews, and himself an official of this enterprise. I continued to travel with him, and found the new houses high above the Mediterranean and the Jezreel to the northeast. There was no salary in it, but a kind of "monopoly." Then I found myself a place to live on Carmel: it was in a stone house with an entrance room, and two bedrooms, each with a stony and roofed porch—one to the sea and one to the woods. I also spoke with a lady physician who was leaving Carmel, and another physician who had a very small practice. There were no others on Carmel and I decided to settle there, and rented the place. I also agreed to take over the care of the thirty or so members of Kuputh-Holim, a labor union on Carmel. A few times a week I was to visit their clinic in a dingy little room, all for four Palestinian pounds a month: the only paying job I have held in my life.

I returned to Tel-Aviv after one night in Haifa at the house of Simoni, with a certain feeling of success: a good start! I would tell all these little achievements to Elisheva. We had not much to pack. So we moved. We looked at the wide horizon of the Mediterranean from our porch, and we said to ourselves, quoting the words of our poet friend Kamskoi:

The heaven all around closed us here in a ring,
And here we shall stay and not move.

It is much better in Yiddish. We longed for a place of our own for peaceful work, for the horizon of the sea, for a little sunny place in the homeland, that land we had dreamed of for so long. I would soon be thirty-two, and we wished to drop our anchor, prepared to find satisfaction in very little, to have peace. I was the only doctor on Carmel. Elisheva earned more than I did, giving violin lessons in Haifa. She had a large class, and two of her pupils later made prominent careers—Ivri Gitlis and Zvi Zeitlin.

My mother spent some time with us after we moved to Carmel, but her condition deteriorated; my father cared for her during the fall and winter of 1927-1928, and she died. Elisheva, I, and our two daughters, Shulamit and Ruth, lived on Carmel from the early spring of 1927 to December of 1930. I had an office in town, but would also go to Ahuza on foot, and say Kadish for my mother.

My father was left alone in Tel-Aviv. He came to Carmel to visit us and, upon returning, felt lonely. A year later he married a widow, a much less educated woman, who at first concealed that she had grown-up children in Tel-Aviv.

The death of my mother coincided with my beginning to work in psychiatry. I was reading books on psychology and occupied myself with the problems of memory, subconscious mnemes, automatic actions, and telepathy. The books that I read about spiritualism—though written by the detective mind of Sir Conan Doyle, the creator of Sherlock Holmes, and quoting as confirmed spiritualists such authorities as Crookes and Oliver Lodge the physicists, Flammarion the astronomer, Richet the physiologist, or Weber or Fechner the psychologists—did not convince me in the least: the messages of the deceased were just not worth dispatching, and the only feeling left was that from immemorial times—from the days of the witch of Endor—the same practices were repeated and the same claims made, in different ages and various cultures.

But still my thoughts were not exactly conservative. In the tower that was atop the house we rented on Mount Carmel, or in the train I jotted down my thoughts on the mental processes in man. In the summer of 1930 I went to Paris, visiting the Pasteur Institute, and then to Switzerland. There a very nice person, Rivka Schaerf, who later emigrated to Israel and lived in a kibbutz, gave me freely of her time to help me express the concepts in my paper in a more precise form; until then it was only a draft. The work done—I called the paper “*Ueber die physikallische Existenz der Gedankenwelt*” (“On the Physical Existence of the World of Thought”)—I showed it to Professor Eugen Bleuler. He was the most prominent psychiatrist of his generation; it was his interest in the work of Sigmund Freud, a private scholar, that brought the work of psychoanalysis out of the private domain into the academic circles. In Burghoelzi Krankenhaus the theories of Freud were tried out, and one of Bleuler’s assistants, Carl Jung, soon became the main armorbearer for Freud, only to become a renegade later. As Bleuler did to Freud over twenty years earlier, he did now to me. He showed enthusiasm for my essay and the thoughts it contained, discussed the themata with me at his home in Kuessnacht, close to Zurich, on Zurichsee, and invited me also to follow him to Lucerne, where a psychological convention was to take place. There we met again and he wrote a preface to my paper. In it he said that my work serves science by opening for discussion a region that had previously been taboo.

The main idea of my essay was the unity of mind and matter; thus an idea has a physical existence, and I imagined that the idea of light and the perception of physical

light have the same physical existence in the human brain. Memory (mnemes) are in a sense physical “negatives” of ideas and experiences; and thus I envisaged an artificial memory.

As an addendum to the paper I wrote a preliminary note about the prospects of applying electroencephalography in epileptics and expressed my opinion that strong discharges should characterize the brain waves of epileptics. This I was subsequently able to demonstrate in a series of experiments I performed at Hadassa Hospital in Tel-Aviv. A boy about ten years of age was brought to me from Tiberias. He was having daily epileptic seizures, and was under the care of a pediatrician there. I took this opportunity for recording an early curve of *petit mal* using a cardiograph adapted for the purpose.

In Zurich I also visited Carl Jung, in an effort to see whether his teaching would be in harmony with my own feelings and approaches. He was a tall man, inseparable from his dog, a Great Dane. All went very well until I mentioned that he was a pupil of Freud. He bristled at my words—he did not like the reference to himself as a pupil of Freud. Nevertheless I suggested that we should spend some time together. He referred me to a lady-analyst who was close to him, but after two meetings with her I decided not to continue. I worked for a while at the Monakow Brain Institute in Zurich, and developed a friendship with Prof. M. Minkowsky. In Geneva I investigated the methods of treatment applied by Baudouin and attended lectures of Prof. Claparede at the J. J. Rousseau Institute. But I could not stay indefinitely—my family was in Israel. Elisheva joined me for a week in Switzerland, then went to see her father in Hamburg.

Although my paper “On the Energetics of the Psyche” had a preface by Bleuler, the first scientific periodical to which I sent it upon my return to Carmel declined to publish it. Then I mailed it to *Zeitschrift fuer gesammte Neurologie und Psychiatrie*, the leading journal in its field, and its editors published it in the January 1931 issue. I sent a copy of the paper to Freud. He wrote me that he himself had very similar ideas—almost identical he said—ideas he had not yet published.¹

Shortly before my paper was printed, we moved from Carmel to Tel-Aviv. With an increased part of my practice devoted to psychotherapy, and with patients traveling from afar, I need to choose a central location in the country; this was one of the reasons for the move. Another was to enable Elisheva to participate in music. I rented a villa and paid my first rent, as agreed, later in the month—I arrived in Tel-Aviv with 33 piasters in my pocket. Beginning in December 1930 and for the next few years I was very busy with work on patients, being also chairman of the Psychological Society in Tel-Aviv, and often the lecturer at its meetings. This left me with very little time for reading or for following the scientific literature. The Sheerith Israel affair was practically finished. After securing from the Mandate Government the consent that the portions of absent members would be given to the Jewish National Fund, and not appropriated by the Government, a voluntary liquidation was arranged. The appointed liquidators—the prominent lawyer Mordechai Eliash was

one of them—wrote a statement officially praising my father's role, conduct, and sacrifices. Ruhama became the property of the Jewish National Fund. Today it is a large agricultural settlement.

The *Scripta* were not continued. In Jerusalem Dr. Magnes, later Chancellor of the Hebrew University, asked me to continue by printing textbooks and the like, but I declined. We had no means. All these years Elisheva and I worked hard for necessities, and my father's income was insufficient. My father greatly regretted that he could not do something like the *Scripta* anymore. In his seventies he wrote several dramas, two of which I published. I also saw to it that an issue of *Haaretz* and other newspapers carried several articles of prominent authors, among them Simon Dubnow, dedicated to the jubilee of my father, which gave him satisfaction in the atmosphere of oblivion in which he lived.

From December 8, 1930 until the summer of 1939 we lived in Tel-Aviv. These nine years in Tel-Aviv were taken up by work with patients. I used to start early and work till the late evening, and yet I could not earn more than expenses. Even so, we invited one after the other three sisters of Elisheva to move to Israel, and at first stay with us. While I practiced medicine, Elisheva brought music to the land. She was the first to organize a quartet to go to Emek and Galilee and play there; and there were among the listeners those who cried. She gave concerts in Jerusalem and also in Tel-Aviv, Haifa, and other places. She led the Palestine String Quartet, first with Bentwich and Yellin, traveling often from Tel-Aviv to Jerusalem for this, and I encouraged her to play. Then she organized another string quartet in Tel-Aviv. She is a very fine musician, and her playing was sometimes divine.

In the spring of 1933 Elisheva and I went to Vienna. On the way we visited Italy, going by train from Brindisi to Naples, to Rome, to Florence. I had already selected in advance to see Dr. Wilhelm Stekel. In a book that I had, describing various forms of psychotherapy and psychoanalysis, I liked Stekel's approach best of all. I thought that the shortest preparation and the shortest analysis would be the way that would suit me best, partly because of my temperament. Stekel was of the first generation of Freudian pupils. Freud started his work in 1895, the year I was born, and the next nine years he spent in "splendid isolation," a time when he had no followers and no pupils, and felt best. In 1904 he had two pupils, and these were Wilhelm Stekel and Paul Federn. Stekel was a very prolific writer and intuitive thinker, and was considered a better dream interpreter, quicker in thought, than Freud. But I did not come to Stekel empty-handed. I brought a paper in which I revised his analysis and interpretation of dreams in a case of his, described in detail in the first volume of his multivolume work on *Neuroses and Psychoses*. The patient was an opera singer, who had lost the ability to sing. Stekel described this analysis on many pages, including her associations and dreams. Though I was not very knowledgeable in German literature, I observed immediately that what she was telling Stekel was actually from Goethe's *Faust*. The entire analysis—her dreams, her associations—were from this poem, and she confabulated herself into the role of Margarete. Stekel did not notice this and gave a far-fetched interpretation of the dreams and the case itself. I wrote a

re-interpretation of this analysis, and with this came to Stekel, three years after my visit to Zurich. He read the paper and was so generous as to invite his group of followers, some twenty people or more, and let me read my paper—a devastating criticism of his way of analyzing this singer. He acknowledged that I was right, and only then revealed that the patient's real name was Margarete. On the part of a dream interpreter superior to Freud himself, it was magnanimous. But this was in some respect also my undoing, because after a rather short time Stekel told me: "You are a master, I don't need to give you analysis; you can do it yourself." He himself had taken only eight lessons from Freud.

In Vienna analytical practice and theory occupied a very important place in that year of 1933. Daily there were public lectures, especially open meetings held by people of the school of Alfred Adler. In order to have insight into the ideas of the contending schools of thought in psychoanalysis, I attended a seminar given by Adler at his house. I also visited periodically the psychiatric clinic of the University and attended consultations given to delinquent children by Aichhorn.

In those days of my sojourn in Vienna in 1933 I also became acquainted with Dr. Paul Federn. As president of the International Psychoanalytic Society, Federn chaired that year the monthly meetings of the Vienna Psychoanalytic Society, of which Sigmund Freud was the founding member. At one meeting that spring at which I was present, the discussion became rather emotional—a chapter in the new book by Freud was the theme, and it dealt with telepathy. Freud was absent due to his poor health (he repeatedly underwent surgery on a cancerous jaw) but his daughter Anna was present. The subject of telepathy, foreign to the tenets of psychoanalysis, caused visible and audible consternation among the assembled members of the Society, mostly psychoanalysts. Only Federn and I sided with Freud and spoke up. After that meeting Federn and I spent the rest of the evening in a Viennese cafe, and though I soon left for home, our friendship can be dated from that date.

With Freud himself I had a tête-à-tête on his 77th birthday in a suburb of Vienna where he went for this occasion. He left his guests on the terrace and came to see me, and we spent thirty or forty minutes together. We had already corresponded long before, and he had published several pieces of mine in *Imago*—so I was not a stranger to him. He impressed me as being a fragile man. I did not write down what we discussed, and regrettably I do not remember too well.

That spring Freud published a paper of mine, "On the Dream Interpretation in the Traktate Brachot of the Talmud."² In it I showed that the ancient Hebrews knew of various things considered innovations of psychoanalysis. I also published a paper in Stekel's *Psychanalytische Praxis* under the title "Psychische Anaphylaxie."³

In this paper on a case of my experience I established the existence of the anaphylactic phenomenon in mental processes. Thus I introduced a new understanding of the complex nature of neurosis. A patient who as a child almost

drowned reacted to the next peril to his life with asthma, although he suffered from no lack of air. This paper was accompanied by a short excursus on the physical signs of fear as self-defense. Finally, before leaving Vienna, I submitted to a medical journal a paper in which I discussed the phenomenon of melancholy, or depression, and the role which tears play in relieving a person in distress or mourning.⁴

We stayed a few months in Vienna—Hitler’s shadow was already reaching there. On our way back to Israel we visited Venice and fell in love with Lago d’Iseo, the village of Del Castro and the surroundings. After crossing the Mediterranean, we visited Cairo and saw the Cairo Museum and the pyramids. Then we continued by train to Tel-Aviv. Upon my return to Israel I resumed my practice, adopting a method of participating personally in the analysis, rather than the accepted way of sitting passively, making notes. I wrote several additional papers on psychoanalysis, among them one dealing with the psychological problem of the specificity of the brain centers and the discrepancy in the different levels of intelligence in the same person. In another paper I explored the question whether a newly-acquired language may become the language of the unconscious. I showed how in dreams are to be found plays on words—and not only in dreams, but the entire structure of a neurosis is sometimes built on a play on words. This I was able to show on numerous cases, presenting a few lines from each—and each case could have been made into a complete story by itself, had time permitted. Yet I see now how my years of sessions with patients prepared me for my future work by allowing me to see similarities in things that do not at first glance appear related. I also investigated the role played by subconscious homosexuality in neuroses, and planned a book on this theme entitled *The Masks of Homosexuality*, of which I wrote several sections.

In 1935 Elisheva’s father, George Kramer, and his second wife Mally came to Israel from Hamburg, leaving behind Nazi Germany. But he died several months later in Jerusalem and was buried on the Mount of Olives. Elisheva saw that morning a dream that was as if telepathic—we did not expect her father to die; he was not seriously ill.

In 1935 I published in Paris my Russian prose poem “Thirty Days and Nights of Diego Pirez on the Bridge of Sant’ Angelo,” written fifteen years earlier in the Ukraine and Caucasus. It was accepted by Petropolis Publishers after Ivan Bunin, the Nobel Laureate (1933) read it and wrote in praise about the talent of its author. It is the story of Solomon Molcho who spent thirty days before the palace of the pope, waiting for God’s sign to act as a messiah. I admit that many of the feelings ascribed to Molcho were ones I myself experienced during those years.

Once, in 1935, Elisheva and I went to the Cedars of Lebanon, and stayed there above the clouds. My hair greyed early, and Elisheva also had a few grey hairs. That same year I started to build a large building on the site in Tel-Aviv where my father had a small structure. I drew the plan myself, including the exterior—all that an architect would do. Capital we had not, even the small building was mortgaged, but I was able to raise the necessary money through a large mortgage based on future rents. But I

chose a difficult man to execute the building, and soon became depressed. The depression passed when I took a boat to Cyprus with my family; there the children enjoyed riding on horses on paths above precipices. Returning from Cyprus (1936), I sent the contractor away and finished the building myself, with great energy. It was one of the best buildings in town, and the professor of Architecture at the Haifa Technion came to see me, looked at my sketches, and said he would bring his class to see the building.

After I finished the building, Elisheva and I went on a grand tour of Europe. Four months we traveled, spending some time in northern Italy, again in Venice and Florence, then in Paris, on the left bank. In Paris I attended the XIth International Congress of Psychologists. A great number of psychologists attended, also from America. The Chairman of this convention, Prof. Claparede from Switzerland, read the main address, "Hatred among the Nations." My paper, "The Psychological Origins of the Hatred among the Nations" was the only other discussion of the same theme. Following the convention, Mally, the widow of Elisheva's father, brought our children, Shulamit and Ruth, to Venice, and we traveled with them to Como, Pontresina; there the children saw their first snow. When we returned to Tel-Aviv, my father was weak. He had waited for me so long, and said to me as Jacob said to Joseph, that it was good that he lived to see me. I visited him daily for the next few months until his death. He died on December 16, 1937, in the house he had built for himself. My father died as if he were going to a wedding with death—such was the expression on his face. I have a photograph made by myself. His last blessing to me was barely audible.

In Tel-Aviv we lived about two years in the rented villa, and seven years on Shadal Street. By now the war was approaching. In our new apartment on Rhov Balfour, we lived three months. To the memory of my father I started a new series, *Scripta Academica*. I saw Weizmann, explained to him the idea of an Academy, and later he gave me for publication a paper he had written in collaboration with E. Bergmann.⁵ After this I published a work of Prof. A. Fodor, also a chemist, the first professor of the University, the results of twelve years of his research.⁶ I regret that I did not start this series in the lifetime of my father—it would have been a source of great satisfaction to him.

Looking back on the almost sixteen years spent in Israel, I could note but little achievement. I treated many psychoanalytic patients, and usually succeeded. I published a few philological works of my father (*Sfotenu*), and two issues of *Scripta Academica* after his death. I wrote several psychological papers, as well as a treatise on philosophy and biology called *Introgenesis*, which was accepted for publication by Presses Universitaires of France but was left incomplete because of the war. I experimented with electroencephalography; Elisheva bore me two children; I built a large building in Tel-Aviv. But altogether it did not amount to much for the best years—my 28th to 44th—and I stated to myself that my achievements were few; at this tempo there was nothing but the chance to write some more essays on psychology, to see some few hundred patients, to make a few trips to Europe, and to

be the landlord of an office building. All this was far from what I expected from my life. But at the age of 43 I had already lost the faith of achieving something great as a scholar. I thought of continuing the *Scripta Academica* as a basis for a Hebrew Academy based in Jerusalem. But once Elisheva on a walk asked: “And what of your own vineyard (*kerem*)? Don’t you think to do something yourself?”

Once I stood before a window of a bookstore; there was the book of Hitler, *Mein Kampf*, and the book of Freud, *Moses and Monotheism*. I deliberated which to buy, and bought the latter. Actually, I had read Freud’s earlier presentation of his ideas about Moses already when I was in Paris in 1937. At the Bibliotheque Nationale, a place that I liked to visit, I read the paper by Freud in *Imago*. Now the reading of *Moses and Monotheism* led me to surmise that the Pharaoh Akhnaton, whom Freud thought to be the originator of monotheism and a teacher of Moses, was in fact the prototype of Oedipus of the Greek legend. Today I wonder what were the sufficient grounds for that conclusion, which I would later elaborate and substantiate with material which I did not then have. But in a few weeks I had a rather convincing list of supporting evidence. I also concluded that Freud had some unsolved problem of his own concerning his being a Jew, and I turned to his own dreams as found in his *Interpretation of Dreams*, about sixteen in number. I found that, truly, he had a subconscious desire to convert to Christianity, in order to open up for himself the road to advancement.

Thus I had the idea to write a book on Freud and his heroes. In Tel-Aviv I could hardly concentrate on writing, and the meager Tel-Aviv library did not suffice for doing research. Also, I looked with concern upon the approaching war, which I correctly predicted in an article offered to Klinoff, ed of Haaretz.. I decided to go to America. As long as my father and mother were alive, then my father alone, I could not leave them: the land was harsh and they had too many aggravations. Now they were resting in peace; and only three months later we were packing to go to the United States, with the plan to stay there for a while.

I remember coming to Ruth’s school to take her out: the children ran and jumped, not surmising with their parents that the war was approaching. I felt a little of a coward to leave at that time, but I had wished for so many years to start working on some book. *Freud and his Heroes* appeared to me an important enough work.

The last two nights, and especially the last before leaving Israel, were nights of agony. I could not overcome the feeling of indecision. It was like jumping into the unknown. The future was not revealed to me: many times I opened the Bible and looked for a verse to guide me. Finally, leaving my business affairs unsettled, we took a cab to Tel-Aviv harbor, intending to board a ship going to Trieste. There was no place there, and I could have room only on the ship from Haifa. We went to Haifa and took the ship bound for America. I wavered until the last moment; when the boat reached Larnaka in Cyprus, we disembarked, but immediately regretted it bitterly; Elisheva advised to cable Paris, and a new passage was secured. Within a few days the “Mauritania” came and we continued to New York, where we arrived on July 26,

1939. It was still a gay trip; a few weeks later the boats were arriving without lights. The war started with the invasion of Poland on September 1, five weeks after our arrival.

America

In America we took rooms, later an apartment, and I was visiting the library daily. For eight months I worked on “Freud and his Heroes,” publishing the interpretation of Freud’s dreams as a paper in the *Psychoanalytic Review* (1941). After eight months we were prepared to go home. On the day we had to sail, I was informed that my manuscript, “Freud and his Heroes” was accepted for print. We remained. In April 1940 I came upon the idea that the Exodus took place during a physical catastrophe; I started on the reconstruction of ancient history—from the end of the Middle Kingdom to Alexander of Macedonia, finding the correct correlation. In about October 20 the same year I came to the understanding of the real cause of that catastrophe that was embodied in *Worlds in Collision*. I also realized the implications for the celestial mechanics—and published a summary in “[Cosmos without Gravitation](#)” (1946), as an issue of *Scripta Academica*, to which previously Ch. Weizmann and Prof. Fodor contributed.

I worked hard for all those years. It is difficult to describe in short the enthusiasm and devotion provoked by and given to my research. We lived almost in poverty. I used pencils, two for a nickel, and could not buy a fountain pen, when I lost mine. We had for a year an apartment with a beautiful view of the Hudson, but none of us used 10-cent bus that passed in front of the house, because we could travel for 5 cents. Actually the second year in the U.S., we lived for \$2,000, out of which \$1,000 for apartment. Morning, day and evening I went to Columbia Library, and daily I had new finds. A little of the story is found in early sections of “Stargazers.” Elisheva studied sculpture at Columbia University under Moldarelli, and showed an unusual talent; her ability to give expression to a face, of unusual beauty, is probably unsurpassed, even in the sculptures of the Renaissance.

My books were rejected by many publishing houses. Finally Macmillan showed interest. When the mns. was given to the printer—I sailed with Elisheva to Palestine. Our daughter Shulamith left in 1946 after having finished college (Hunter), Jewish Theological Seminary and having started in Columbia (Physics, graduate). Ruth remained in the U.S. and married a boy, Sidney Sicherman (later Sharon); we first opposed, then conditioned our consent on his going to college—which we also made possible. During the 1948 war in Palestine Shulamith actively participated. She was in the most dangerous spot, the Old City of Jerusalem when it was besieged, she actually went there with the intent to fight. she was the last to leave when the city fell. She saw her girl friend die next to her, wounded. She was attacked by Arab soldiers, cried to God, and was saved by an Arab officer, before harm was done.

I published over 40 inspired articles “[Observer](#)” in *N.Y. Post* on the editorial page,

dealing with the Middle East. They were widely read, in U.N., in Washington, by Jews, and the identity of the author was a discussed topic—nobody knew, for several months not even the editor of the Post, Thackrey, who found it out only by a trick on the day the Israeli state was founded. Not many single items served so well the cause in America as these articles. Then in 1948, Oct. 27 we—Elisheva and I went to Israel, by Mauritania to France. In Paris when the Security Council deliberated sanctions on Israel, I wrote an article that caused indignation of the British representative. In Israel we met Shulamith. There I became depressed: My depression started in January 1949 and deepened. I was overworked (by the work on my books, by articles, by psychiatric patients that I started to see since 1945). On February 1 we left Israel, the new state, reaching New York on Feb. 9 after a hard time in Paris. Finally Elisheva broke down. We both spent time in sanatoriums; I was four weeks under care, but did not receive in these weeks any medicine except once or twice one tablet of aspirin. Finally by the end of April I was my old self and on May 8 I was reunited with Elisheva, who suffered for me.

I resumed my psychoanalytic practice, and worked on “*Ages*” and “*Worlds*.” The latter work was described by *Harper’s* (Eric Larrabee) in the January issue of 1950 in advance of publication. An enormous amount of criticism, for and against, followed the publication of the book. The story of the opposition is described in *Stargazers*. The book immediately rose to the first place on the non-fiction best-seller list and remained there for about 20 weeks. The opposition used unfair methods; Macmillan was coerced already in May-June 1950 to transfer the book to Doubleday.

In the fall of 1950 Shulamith came from Palestine and soon thereafter came Abraham Kogan and they were wed. Abraham studied aeronautics in Princeton. In 1952 first volume of *Ages in Chaos* was published; in the fall of that year we moved to Princeton, buying there a house. Shulamith bore a son, Meir; then they left for Israel. In the meantime, Ruth and Sidney moved to Princeton from California.

From November 1953 until the death of Einstein in April 1955 I had with him a series of long and exceedingly interesting debates. We also exchanged many letters. My debate with him centered only on one point, namely whether the sun and the planets and other celestial bodies are charged or not. From his marginal notes on my letters it is seen that he firmly opposed the idea of a charged earth and celestial bodies; he thought that I did not realize the largeness of the problem, until a month before his death, in two long sessions—till close to midnight, he read with me “On the Four Systems of the World,” agreeing that the fourth of these was well thought through. He read several of my manuscripts. *Worlds in Collision* was left on his desk when he went to hospital where he died. In the beginning he rudely rejected my work, though he, too, believed that some extraterrestrial (later he changed to terrestrially-caused) catastrophe took place. Nine days before his death, at our last meeting, he said to me—“I read much in your book [*Worlds in Collision*] and I find it very important” (previously he would say he thought it wrong that scientists do not read it and give their own explanation)—“but I would not oppose Newton—all in your book could be explained in the frame of his system.” In my books I left this chance standing

(Epilogue to *Worlds in Collision*) but I claimed that in case the Earth and other celestial bodies are electrically (and sufficiently strongly) magnetically charged, the theory as conceived about 1666 must be re-examined. But when Einstein died, his name was used to degrade me. His death and the new attacks caused me much aggravation. In the fall of 1955 Doubleday published “Earth in Upheaval”; it was unfairly attacked by the same group, the soul of which was Shapley of Harvard.

In the fall of 1955 Shulamith came to Princeton with her two children—Rivka was born in Israel. Abraham came and made his Ph.D. with distinction. They spent 17 months with us. They left in the spring of 1957.

In the summer of 1957 Elisheva and I left for Europe, spending almost three weeks in England, Holland, France and Switzerland. There we spent time with Schaeffer, he came to the same conclusions as myself about the catastrophes, their number and times, and we contemplated to write in two volumes a common work. I have postponed for very long this trip but was happy to have made it. Elisheva’s sight became weak due to a cataract, and I wished to show her Europe. I analyzed myself—why was it so difficult for me to go on a trip. Finally we went and enjoyed it. From Switzerland to Italy, to Greece, again Schaeffer, and to Israel. This we added to the original plan. Twelve days after we came I knew that I was sick. I was operated and under similar conditions as in 1949 became depressed and went through once more the “Valley of Tears.”

* * *

Elisheva was before me in the night air before our house and I entered our home. Over five weeks we have not seen one another, only spoke occasionally on the wire. Warm and loving she met me and I had to be grateful to God that he spared her and she was before me not broken in spirit or body. How awful were the days and nights alone for her, pacing the floor. We started the life anew: we loved one another even more than all the years that passed, in soul and in body.

But I was not free of my depression. The great humiliation that I experienced by “quarantening” myself I felt keenly, and twice I broke down in loudly reproaching the Providence for what passed over me, whereas I gave my life to work and research; my position in the defense of my scientific stand was now immeasurably more difficult. How, for instance, could I publish *Stargazers* with Shapley’s reference to “keepers”? I felt that I did not deserve the punishment, having led a life of devotion—years of wondering in Ukraine and the Caucasus, years of publishing *Scripta*, years of dissolving Sheerith Israel and protecting my parents to the best of my ability, years of writing *Worlds in Collision* and *Ages in Chaos*.

Psychoanalytically my outburst could have been interpreted as a protest to my late father for being punished for not having done the filial duty in time to his memory at the cemetery, though so much I have done to him and for him in his lifetime.

Time is a healer; Elisheva wept with me when I spoke of my experiences. Neither she

nor I could read without crying the letter I have mailed to her from the sanatorium, with words of love.

A month after my return, I offered Dr. W. Federn to assist me and though he was prepared for a while to work without pay, I named the sum that I could pay monthly, and this was a little more than he had from another work for a relative-doctor in translating from late Latin. For the first time in his life he could make up his budget by earning it.

He read my draft of *Oedipus*, and he wrote: (22.IX.58): “Ich habe ... den Eindruck dass Sie mit genialen Intuition wirklich das richtige getroffen haben, als Sie den Ursprung der Oedipus-Sage in historishcen Vorgängen der ausgehenden 18. Dynastie suchen.” Yet he tried to change my scheme, and to make not Akhnaton, but Amenhotep III, to Oedipus. It was a strange offer, since all personalities of the tragedy were without similarity with the changed prototypes, Ay had no role at all in Federn’s scheme. But for some reason, my work on Oedipus and Akhnaton provoked in Federn an eruption of new ideas. Three days later (Sept. 25.58) he wrote again: “The fertility of your idea is almost frightening.” and on Sept. 30, he wrote: “Ich habe Ihnen folgende geradezu welterschütternde, jedenfalls mich selbst erschütternden Mitteilungen zu machen.... und das Allerwichtigste: Ich bin jetzt der festen Überzeugung, dass “Ages in Chaos” richtig ist, und habe eine fast unüberschbare Fülle von Beweismaterial.” He twice underlined “richtig”; and he wrote that the second volume of Ages must be reworked.

This came to me seventeen years and eight months after first telling to Dr. Federn of my reconstruction on a snowy night near the Public Library, in January 1941, when for two hours we walked forth and back on the sidewalk of 42nd Street, Library side. Since then innumerable times he assured me that I cannot be right, yet he gave me all the constructive criticism and supplied me with bibliographical data. (*Worlds in Collision* he did not read before publication, but *Ages in Chaos* he read and supplied with many useful remarks). On May 31, exactly four months earlier, on his only visit to Princeton, he was completely declining my “Ages,” and telling me that I could not be right in my reconstruction, not even the smallest chance was for that, and the, I repeatedly interrupted him, saying—how does he say this to me, so harsh, when he sees me in depression. Then I needed only one “success,” only one achievement, and possibly I would have been able to straighten myself, if he would have told me on May 31 what he wrote me on Sept. 30.

Yet soon I saw that he intended to change drastically the scheme of 8-4 centuries, and to me it appeared entirely unsupported; then also he wished to change radically in vol. I of Ages, claiming, on the other hand, complete agreement. He started to call my scheme “New Chronology,” and many letters followed.

When I was away came a long letter from Claude Schaeffer, and it was so completely negating my reconstruction, that Elisheva spent many sleepless nights, not being able to face the situation: How will she ever be able to let me see Schaeffer’s letter. In that

letter he was intemperate; and instead of giving arguments, invoked his own and his colleagues' authority, even more his own position in learned institutions, than authority. Cannot be, is not, impossible, with these words he strafed all my identifications. Schaeffer asked Elisheva to show me his letter only after I shall recover, because he was by then acquainted with my break-down. But his letter almost broke completely Elisheva and she cried in the night and kept the letter hidden under her mattress. To me she would not show the letter, saying she misplaced or destroyed it—but finally, upon my insistence, about a week after my return home, showed it to me. I took it, to her surprise, very calmly, and then I wrote a long answer to Schaeffer. He was probably also personally hurt because his work in Alasia was not accounted by me (he forgot that I had my mns of Ages 2 set in 1951). “I beseech you” not to publish my work for the sake of my reputation and his friendship for me. But I was not disheartened.

Should I be given a chance to live and work, I have to publish “Ages” vol. 2 and other books. But I would also like to write an autobiography, “Days and Years” or “At Evetide.” Should I not be given the chance, I thank my Creator for the life I had, for Elisheva I met, for children and grandchildren, all very fine and cordial, for the three years in Caucasus and Ukraine, for two years with Scripta, for defending my parents in Palestine, for the discoveries it was my luck to make. Actually God let me know of the past of the world and possibly of its architectonics, more that it was disclosed to any other person, if I am right in what I found.

Postscript

When in 1940, in the early evening after a day in the Public Library at Forty-second Street in New York Emanuel and I walked to Central Park and sat down on a bench, I said to him life was not always easy with him, but it was certainly an adventure. This sums up in some way my life with Emanuel. In this autobiography of his this feeling of adventure comes through. Almost every day, especially since we came to the United States, unusual things happened.

He was always on a hunt for more knowledge, following roads into different directions to look for and find more clues to his intuitive thoughts and expectations. He was like a hunter on a trail—though he would never have hunted an animal or gone fishing, he respected life too much for such sports—but as a man of a vision, who looked into many directions, he was driven by a never ending urge to know more.

He was humble and proud at the same time, and before all he was a great fighter who never took no for an answer; who went to the authorities of the past as well as to the great living to ask for explanations. He was never discouraged. When one of his expectations was not fulfilled, he went into the next direction to find the answers he looked for. He abandoned one way and went to the next without losing confidence in his search for what he hoped to be the solution and the truth. All in all, Emanuel was a man of a very unusual character. As I said, proud and humble, courageous, never to give up even when the odds against him and the personal attacks on him would have overwhelmed many a man. Of course, the strain showed through his life. There were times when he felt depressed as in reaction to the difficulties found in his way. And no wonder, I lived with him through very trying times and I understood when the load became too heavy.

He was a very gentle human being, he cared for his parents, family, friends, and for the plain and simple. He lent a hand to people, he found time to comfort and advise and help, never being too busy to listen to the unfortunate, adults and children alike. He was a great optimist who believed in the goodness of man and in the purpose of life, and he also had a fine sense of humor. He was a great raconteur and would tell anecdotes and stories. I would ask him to cheer me up when I felt let down, and he would say, let us count our blessings. And we would count. And that helped every time to make us feel positive and happy again. He gave this advice also to his friends, who still remember him for that. It was always “the cup is half full and not half empty.” He called me Shevik, and when he was in a sentimental mood I was Shevinka; but when he called me Elisheva, I knew that something was wrong, that he did not approve of me at that moment. I, however, never had a nickname for him—he

always was Emanuel for me, also Aba. Some of his family called him Monia, but to me it sounded too much like “money,” and this association did not fit him at all. He could have gotten rich many times, but it was not written in his stars, and certainly not in mine. And when he was sometimes sorry that he did not take advantage of an opportunity to buy land and enrich himself and his family, I would say, never mind, you bought the sky. And he would smile.

He wrote about his first 6½ years in several but similar versions and in several languages: Russian, German, Hebrew and English. He made lists how to divide his life into different epochs, but wrote only sporadically, and some parts are missing. There were also letters, correspondence with his father, with friends and scholars, which are biographical. There were no letters between us, because we were almost never separated. All the trips to Europe and Palestine we made together, and I went with him across the United States to campuses to be with him when he lectured.

A few sentences of friends after his death:

S. Vaughan wrote me a poetic line: “So Velikovsky has left this fragile ship, but he is sailing the seas of space.”

Walter Kaufmann quoted Fulton Oursler, “Do not mourn that he has died, be glad that he has lived.”

And a recent note to me from a reader I don’t know: “May I . . . tell you how admiring I am of your matchless memorial to this great man—the publication of his unique works.” And that is what I have been doing these past two years, and that is what sustains me.

There is a saying which dates back to older times—Herodotus records it of Solon speaking of Croesus, the richest man, whether he was lucky. Only after his death do you know whether a person was lucky.

In this sense Emanuel was a lucky man. On a Sabbath morning, lying quietly on his bed after a rather restless night, speaking softly to me—I was sitting next to him, on the edge of his bed, and touching his shoulder asked him to repeat his last words I did not hear clearly; he turned his head a bit to the side, he did not answer—he had died—without a gasp, without a murmur. He was a lucky man in many ways because of his strong character, his honesty with himself, his total devotion and integrity, a man of vision, of commitment with belief in his work.

FOREWORD

This unpublished manuscript is a chronicle of Immanuel Velikovsky's contacts and debates with Albert Einstein. The two men first met in the early 1920's, when Einstein edited the *Mathematica et Physica* section of *Scripta Universitatis atque Bibliothecae Hierosolymitanarum* (*Writings of the University and the Library of Jerusalem*), of which Velikovsky was the general editor. There were a number of other contacts over the years, and in the late 1940's Einstein read parts of *Worlds in Collision* prior to publication.

Velikovsky begins his story in 1952, with a brief meeting at the lake in Princeton between the Velikovskys and Einstein. Velikovsky saw this meeting as a low point in the relationship between himself and Einstein. He then reviews, in a lengthy flashback, the contacts of the previous thirty years. Next he turns to the main subject of this book, the series of letters and conversations from 1952 to 1955 that were the setting of the ongoing debate between Einstein and Velikovsky on the subject of Velikovsky's theories, especially the role of electromagnetic factors in the celestial arena. By the end of Einstein's life, areas of disagreement between the two men remained, but those areas had been greatly reduced during the course of their increasingly cordial and productive discussions.

— Lynn E. Rose

INTRODUCTION

In the dark hours before morning, at the crossing of the Yabbok, flowing into the Jordan, Jacob struggled with a man whom he did not know; and the stranger, upon seeing the sky beginning to redden in the east, asked Jacob:

“Let me go, for the day breaketh.” Jacob, however, replied:
“I will not let thee go, except thou bless me.”

The title of this book is taken from this story in Genesis (32:24-27). The reader will find out at which juncture of our relations I exchanged this ancient dialogue with Albert Einstein.

For long months we carried on a struggle by written and spoken word; the subject of the struggle dealt with invisible but real forces, whether they do or do not take part in the movements of the silent mechanism that carries worlds on their paths. My claim of the participation of electromagnetic fields and their interrelations in the structure of the universe was opposed by him almost to the last, and this was *the* issue of the dispute. The Morning Star was also a subject of our contention.

The main story starts in August 1952, though there were some exchanges also earlier. We defined our positions, he in brief, I at length. Then, after an interruption of over a year, we came to closer grips. In letters (testimonials to the stands we took) in his marginal notes to manuscripts of mine, and in discussions that went sometimes nearly till midnight, we were not sparing of each other.

Before the debate started there certainly was in my opponent a preconceived stand which he shared with so many men of science who could not see in my published work any *vrai-semblance* of scientific truth. Yet as soon as the contact became personal it grew in warmth, and a reciprocal affection developed between us, unyielding as we were.

I believe it was not until our two long discussions accompanying the reading of my paper “On the Four Plans of the Universe” less than seven weeks before his death that my opponent fully comprehended my stand. By that time he had also read *Worlds in Collision* for another time, with a decidedly different reaction. At the end I felt as if he wished me to be proven right.

Our debate ended on Friday, April 8, 1955, only nine days before Einstein’s death. I think I was the last person with whom he discussed a scientific problem. On that day I brought him the published news that Jupiter sends out radio noises; ten months

earlier, in a letter to him, I had offered to stake our dispute on this my claim of an as yet undiscovered phenomenon — and at that time he let me have his reply in a marginal note to my letter. It happened repeatedly that he wrote his arguments in the form of notes, sometimes copious, on the margins of my letters, returning my originals to me; with notes he also supplied some of my manuscripts that he read: *Earth in Upheaval*, published half a year after his death, and *Stargazers and Gravediggers*, memoirs on the origin and reception of my work.

Over twenty years have passed since the figure that dominates this narrative left the abode of men. With the passing years many phenomena have come to light, and today it is sometimes difficult for a scientist to reconstruct his own and his colleagues' attitude of 1950 or 1955. And it is even more difficult for the young generation to envisage the stand of science in those years, almost a generation ago. Since then, many discoveries of the Space Age have completely changed our understanding of the structure of the solar system, and radioastronomy has brought home a new and exciting picture of cosmic spaces and of the forces that act in them. It is easy to be misled into thinking that this knowledge was already common in the early fifties; thus whom better to quote than Einstein as a spokesman for the prevalent scientific view of that time?

This short book is intended also as a personal tribute to a man who was simple to the extreme, strong in convictions, humble in fame, curious for human destiny, and very solitary.

If the years that have passed have not substantiated Einstein's stand in the arguments we exchanged, his very attitude in this exchange that much occupied his mind to the end of his life, and his effort to uphold the human dignity of a heretic ostracized by the entire scientific community, remains for me an unforgettable experience. I have tried to communicate to my readers this glow that lives in me undiminished since the dawn broke for me.

Many of the following pages were written when Einstein was still alive, and now, in a number of instances, I have had to change the present tense to the past tense. Other pages were written soon after his death, and some I add while preparing the story for print. Being now several years older than Einstein when he died, I think that I should not delay, but put together and leave a record of our relations and of the issue that divided us and bound us. I did not know intimately the man with whom I struggled before the dawn, but I sensed something angelic. *Before the Day Breaks* is a record and a tribute.

Princeton, 1976

At the Lake

It was August 1952, eight or ten weeks after we moved to Princeton. Elisheva and I sat on a bench at the boathouse on the shore of Carnegie Lake, which sprawls in the valley only a few minutes' walk from our home, and talked with the boatman. We saw a tiny boat with a sail approaching the anchorage. An elderly man with his head covered by a wide-brimmed hat against the rays of the setting sun came from the boat and, going toward the boathouse, looked at us with his friendly smile. Only now I recognized Einstein. I approached him and named myself.

"Ah, you are the man who brought the planets into disorder," said he in German, and the smile disappeared from his face. He was carrying the oars into the boathouse. I made a move to help him, but he kept the oars. I heard a challenge in this greeting and said:

"I would like an occasion to meet you and discuss. . . ."

"But what do you know of astronomy?" he said dryly.

"I know to put questions," I said, or only thought so.

"Not one of these days, sometime later," he said.

"May I write you?"

"Do it," he said, and was already a bit impatient to be away—his home is at the other end of town. His car moved on the unpaved road that runs along Carnegie Lake, and Elisheva and I went home, uphill, only several hundred feet from the mooring platform.

This short encounter made me realize that Einstein, too, was full of resentment against me. I had not yet had any chance to show him that I had thought through the physical consequences of the conclusions at which I arrived in my study of the natural phenomena of the past. Six years earlier, in 1946, as I will soon narrate, I had the ambitious plan to discuss with him the physical consequences of *Worlds in Collision*, then in manuscript, and on July 5th of that year visited him in his Princeton house. Einstein agreed then to look through a part of the manuscript. At that time he advised me to rework my book so as to make it acceptable to physicists and to save what was valuable in it; if I would not do this, I would not find physicists who would accept my views, nor a publisher willing to print them.

Since then six years had passed. Einstein was right: most astronomers declined even to deliberate my evidences; the publisher that had brought out my book had parted with me.

Now, after our accidental meeting, I wrote on August 26th a letter to Einstein:

Dear Professor Einstein:

When, by chance, we met last week at the lake, I became aware that you are angry with me personally for my “Worlds in Collision.” From you I have not expected this reaction.

I have written a culture-historical book. A physicist cannot prescribe to an historian what he is allowed to find in the past, even if he finds contradiction between the alleged historical facts and our understanding of natural laws. There are facts a physicist observes daily which are in conflict with the laws he formulated; one such case is the keeping together of positive elements in the nucleus of an atom; he accepts the fact though it contradicts the law, and he looks for some explanation.

Two facts appeared to the scientists as fallacious in my book: 1. No forces in the celestial sphere but a head long collision could retard the earth in its rotation or incline its axis into a different astronomical position, and in such a collision our earth would have perished; 2. No planet could have come to its orbit as recently as a few thousand years ago, and therefore Venus could not have traveled on a cometary orbit in historical times.

These two assertions are true only if gravitation and inertia are responsible for planetary motions, a notion subscribed by every “vernünftigen Physiker.” Here, though no physicist or astronomer, I am provoked to disagree.

The sun has a general magnetic field, the solar spots are magnets, the solar prominences return on an oblique line to the place on the solar surface from where they erupted, the cometary tails are repelled by the sun in a manner and with velocities which the pressure of light cannot explain; the earth is a magnet; the ionosphere, the polar light, the ground currents, the terrestrial magnetism react to solar disturbances; cosmic rays are charges that travel in magnetic lines of force; meteorites come down in a magnetic state; the position of the moon influences the radio reception (Stetson); the position of the planets influences the radio reception (Nelson of RCA); the fixed stars are strong magnets (Babcock). In the face of all this is it true or wrong to insist that only gravitation and inertia act in the celestial sphere? And if the electromagnetic fields are not invented by me for the solar system ad hoc in order to explain the phenomena and their interpretation as found in “Worlds in Collision,” then may I ask: Who is in conflict with observed facts, the astronomers that have all their calculations concerning the planetary motions perfect on the assumption that there are no electromagnetic fields in the solar system, or the author of “Worlds in Collision” ?

Venus could come to a circular orbit and the Earth could be retarded in its rotation or have its axis inclined, under the influence of electromagnetic fields. Such fields exist; at close distances they would act strongly. I believe, therefore, that not only the historical phenomena that I describe in my first book could have happened, but also that celestial mechanics that has all its motions explained without taking into account the electromagnetic fields in the solar system, is in conflict with facts.

I have read a book of a prominent astronomer of this city who says that nothing could take place in the celestial sphere which conflicts with the words of Jesus of Nazareth as preserved in the Gospels. Thus he has two world conceptions that live side by side in his mind—one of mathematics, the other of faith. But the rest of astronomers are like him: they acknowledge the magnetic and electrical properties of the sun and its spots, or of the fixed stars, of meteorites, of cosmic rays, occasionally also of cometary tails, and they do not deny that the Earth is a magnet, and that the sun, the moon, and the planets influence in some way the ionosphere; but as soon as it comes to the celestial motions, they still keep to pre-Faraday Laplace and Lagrange, and actually postulate sterile electricity and impotent magnetism, which do not act at distances, and which do no more than produce a Zeeman effect.

In my debate with Prof. J. Q. Stewart of Princeton Observatory in Harper's Magazine, he presented the common view by asserting that electromagnetic forces have no part in the planetary relations. I, on the other hand, have written that the general solar magnetic field discovered by Hale (1912) was often denied to exist (Menzel). "Has not a basic mistake in observation or interpretation been committed?" Now this April, the same Menzel announces that the sun must have a very strong magnetic field, and that there was a difficulty of finding it because of the angle of observation.

For over two years I have been a target of abuse and calumny. When did it happen that a spurious book caused such a fury in the minds of the contemporary scientists?

I have taken too much of your time. I wish you everything best.

Cordially,

Immanuel Velikovsky

To this my letter of August 26 Einstein answered the very next day. It reads in

A. Einstein
112 Mercer Street
Princeton
New Jersey, U.S.A.

27th August, 1952

Dear Dr. Velikovsky:

The reason for the energetic rejection of the opinions presented by you lies not in the *assumption* that in the motion of the heavenly bodies only gravitation and inertia are the determining factors. The reason for the rejection lies rather in the *fact* that on the basis of this assumption it was possible to calculate the temporal changes of star locations in the planetary system with an unimaginably great precision.

Against such precise knowledge, speculations of the kind as were advanced by you do not come into consideration by an expert. Therefore your book must appear to an expert as an attempt to mislead the public. I must admit that I myself had at first this impression, too. Only afterwards it became clear to me that intentional misleading was entirely foreign to you.

With friendly greetings,

Yours,

Albert Einstein

This answer, of words measured and precise, of a mathematical brevity, an art in which Einstein was a supreme master, made it clear that no argument in my letter produced any effect or even had attentive hearing, because I was up against a formidable structure erected by the greatest minds, proven correct by the supposedly most minute observations of the motions of celestial bodies; therefore it was not even a structure, but a natural massif, an Everest, that I was trying to shake. And who was I, and what was my knowledge, and against what opponents did I carry my arguments? Einstein was and still is considered the greatest mind, almost divine in his knowledge, whose word in the matters I was raising was thought infallible; and the great apparatus of mathematics was his, and the calculations of Newton, Lagrange, Laplace, Leverrier, and Newcomb were the basis for what he said, and the observations of the heavens for three centuries with ever greater telescopes unfailingly confirming the theory were on his side.

Yet, knowing me even as little as he did, how could Einstein think that my intention had been to mislead? In the two preceding years he must have been involved many times in discussions of *Worlds in Collision*, and the opinions of others must have colored his own. This would also explain his cold and even harsh greeting when we met at the lake. He was prepared to admit that I was deceiving myself; and deceiving myself I was, because I was pitting myself against the closed front of mathematics and astronomy.

In a hundred years, in over 400 revolutions, Mercury precesses (advances) ca. 5600 seconds of arc, of which 46 seconds are unexplained by classical celestial mechanics; the visible face of the moon is by comparison ca. 30 minutes, or 1800 seconds of arc. This anomaly of Mercury, so small, was so disturbing that for seventy years from 1845 when it was calculated by Leverrier, until 1915 when Einstein announced his General Theory of Relativity, it caused great unease among theoretical astronomers. Was possibly the mass of the sun unequally distributed?, it had been asked. Was possibly an undetected planet revolving between Mercury and the sun, obscured from observation by the sun's dazzling light? This was a problem which, so long as it remained unresolved, did not let astronomers live in peace; and only with Einstein's explanation for the phenomenon was the looked for solution found and peace restored: now, observations and calculations coincided almost precisely.

If such a tiny disagreement between observations and calculations made such an impression and claimed so many efforts for its solution, how could I brazenly claim admittance for two powerful natural forces, electricity and magnetism, into celestial mechanics? But I, on my part, thought it strange that nobody before or after Einstein had tried to figure out whether the Mercurial anomaly is or is not an effect of electrical or magnetic interrelations.

In the classical celestial mechanics there is no need nor place for electricity or magnetism; but was it proper never to consider electricity or magnetism as the explanation of an anomaly in the celestial motions? Were these two fundamental forces completely taboo in celestial mechanics? In 1908 Hale at Mount Wilson Observatory found that solar spots are magnets several thousand gauss strong. And in 1913 Hale announced that he had detected a general magnetic field of the sun, which he computed to be fifty gauss strong at the solar poles. Was it methodologically correct in 1915, when Einstein wrote and published his General Theory of Relativity, to disregard Hale's publications, the magnetic nature of the spots, and the general magnetic field of the sun? Methodologically, it was an oversight, whether Einstein was correct in his solutions or not.

Einstein knew nothing, and could not know, of the scruples I had concerning what I considered a methodological oversight. If there are electromagnetic interrelations in the solar system, then of course they must be considered in their effects on the precession of Mercury, on the red shift, and on the bending of light—all three regarded as proofs of the General Theory of Relativity.

September 10, 1952

Dear Professor Einstein:

By your answer to my letter you have truly obliged me to think the problem all over again. I have tarried to answer because I did not wish to appear just obstinate; but the problem is permanently on my mind. I have to ask patience, which a "Fachman" is generally reluctant to accord to an outsider. Without this patience we shall build barriers between sciences, in this case—astro- nomy and history. I would certainly listen carefully to what you may say on history or psycho- analysis.

You say that the *fact* of the exact correspondence of the planetary motions with the theory proves this theory as correct: in the celestial motions only two agents participate—gravitation and inertia. Let us first assume that your statement of exact correspondence between theory and phenomena is rigidly correct. Still the mere fact of a force acting at an inverse square rate would not exclude electricity and magnetism, also acting at the inverse square rate, from participation in celestial motions. But the statement is not rigidly correct, either. Let me illustrate.

Here is the year 1845. Leverrier in France and Adams in England, out of perturbations of Uranus calculated, to the exactness of one degree of arc, the presence of a yet unseen planet. Both of them assumed that a planet of a size not larger than that of Uranus travels on an orbit at a distance dictated by Bode's law. Neptune is actually of the size of Uranus, but the mean distance between their orbits is not ca. 1,750,000,000 miles, as Bode's law required, but only ca. 1,000,000,000 miles; thus the error is equal to ascribing to Neptune a triple mass. The discovery of Pluto did not solve the conflict between the theory and the fact and caused also conflicting estimates of Pluto's mass. Thus the finding of the planetary stations in relation to a chart of fixed stars is not enough; if the theory is true the distances must also be correct. And still the discovery of Neptune is regarded as the strongest proof of the Newtonian theory of celestial motions.

Now in the same 1845, the year of this triumph, Leverrier calculated also the anomaly of Mercury, and by this caused to think that the Newtonian law of gravitation may be not precisely true. Leverrier first thought of some planet moving inside the Mercurial orbit or of a possible unequal distribution of the mass in the sun. You have used the fact of the anomaly to prove that the space is curving in the presence of

a mass. About the same time—in 1913—G. E. Hale published his paper on “The general magnetic field of the sun” (Contr. M. Wilson Obs., #71), in which he estimated the general magnetic field of the sun as of 50 Gauss intensity. At this intensity “under certain conditions electromagnetic forces are much stronger than gravitation.” (Alfven) The last named author in his “cosmical Electro-dynamics” (Oxford, 1950, p. 2) shows that a hydrogen atom at the distance of the earth from the sun and moving with the earth’s orbital velocity, if ionized, is acted upon by the solar magnetic field ten thousand times stronger than by the solar gravitational field.

Now the visible streamers of the sun that conveyed to Hale the idea that the sun is a magnet reach a long way toward Mercury, almost half the way. Was the electromagnetic state of the sun ever considered as the cause of the anomaly? The effect of the e.-m. action must have been reckoned, and possibly excluded, but not disregarded. . . .

The *fact* that the theory accurately coincided with the observed planetary positions was the main argument for the Ptolemaic system and against the heliocentric system. For more than two generations, until 1600, it was not the Roman Church who opposed the Copernican theory; the scientists opposed it and used as their main argument their ability to predict planetary positions, conjunctions and eclipses. They have actually predicted eclipses that we still have to experience in the future. How could they achieve this degree of accuracy with the sun revolving on one of the orbs around the earth? By a continuous adjustment of their observations to their theories and their theories to observations. Similarly it is today. And when the facts prove to be different from what they were supposed to be—that the sun is charged, or that the cometary tails are electrically glowing, or that planetary positions of Saturn or Jupiter markedly influence our ionosphere,—then these facts are left outside of the theory and it covers less and less of the phenomena. No wonder that it agrees with the residual facts in such an arrangement.

Sometimes it seems to me that the hidden psychological cause of the emotional attitude of the scientists to “Worlds in Collision” is in its reminding a few repressed physical facts. In that book I have not invented new physical laws or new cosmical forces, as cranks usually do; I have also not contradicted any physical law; I came into conflict with a mechanistic theory that completely coincides with a *selected* group of observations; my book is as strange as the fact that the Earth is a magnet, the cause of which is indeterminate and the consequences of which are not estimated in the Earth-Moon relations.

When over a year ago, Professor Stewart, your neighbor, was invited

together with myself by the Presbyterian Society of this town to participate in a debate about my book, and the time became short, I asked my opponent: “But you have excluded the existing electromagnetic conditions in the solar system from the celestial mechanics,” his answer was: “We do not need them: our calculations are perfect without them.” Later, when our debate was renewed on the pages of Harper’s Magazine, I observed: “If the balance sheet of a bank is correct to the last cent, but two large deposits (electricity and magnetism) are omitted, the entire balance may be questioned.” . . .

I did not really expect an answer from Einstein, nor a conversion on his part. I did not speak basing my arguments on my work on global catastrophes; nor did I draw my evidence from folklore; I was enumerating physical facts left outside the domain of celestial mechanics, though they, by right, belonged there. A minute discrepancy in the motion of Mercury was noticed; to its explanation the majestic structure of the General Theory of Relativity was erected. Larger discrepancies, however, were left out of the discussion, or, in other cases, quite unsatisfactory explanations were offered, like light pressure as the cause of the behavior of cometary tails: no quantitative analysis was made for this assumption, yet it was taken into the textbooks.

To my letter of September 10 there was no answer, and the finality of Einstein’s previous short letter did not engender a hope for give and take. In that letter between my two, Einstein spoke of my evidence as if it consisted mostly of folklore—but it was physical. I wrote in my notebook:

As to the first paragraph of his letter, I was genuinely satisfied to have it in this wording. Not only the general public, but even people who know something of the natural sciences imagine that Einstein introduced electromagnetism into celestial mechanics. What he is actually trying to do is to find a unified theory in which gravitation should be integrated in a common structure with electricity and magnetism, as light was brought into the electromagnetic field theory by Maxwell, and before this, electricity and magnetism were found to be interrelated by Oersted in 1820. In his letter Einstein made it clear that he, like all others, regarded gravitation and inertia as the only forces that act among the celestial bodies and keep them on their orbits.

I thought: This is the second best reply I could have had—at least the opposition was spelled out; an agreement with my argument I could hardly expect.

As to his second paragraph—I saw that the muddy wave of suspicion had reached even Einstein and infected him for a while, despite the fact that he knew me a little from former years.

I have repeatedly, and also very recently, been asked: “What made you so strong that

you could persevere in the face of a concerted opposition of the entire scientific establishment, and to do it for so many years?” Whether this is the true ground or not, I usually answered, “It is the obstinacy of my race, the race of Marx, of Freud, and of Einstein.”

A Flashback

Thirty-one years earlier, on a late summer afternoon in 1921, I was the only stranded passenger in a small station on the frontier of Lithuania and Germany. I followed with my eyes the train that carried my parents; it left the platform and soon disappeared from sight. It was the end of our three years of wandering in Russia, in the Ukraine and the Caucasus, lands torn by civil war; perils of death were more than once only an arm's length away as we sought to reach the land of Israel, the elusive goal of our striving. Now, finally, my parents were traveling toward the West, intending to continue from there to the land of Israel.

Waiting for a train that would take me back to Kovno (Kaunas), I found a rack with books at the newsstand. I purchased a small book on Einstein's theory. This was very possibly the first time I encountered the name. I had only recently emerged from what later became known as the Iron Curtain—from the vast plain of a great country racked by war, disorganized and famished. Latvia and Lithuania, where I now found myself, were independent republics. Hardly any news about scientific progress in the outside world reached the reading public in the Soviet Union in those years. However, it is possible that during the several weeks that I spent in Lithuania the name of Einstein could have already met my eyes from a page of a Kaunas newspaper. I had not yet heard of Minkowski; the name Lobachevsky was familiar to me. There in the station building, and then on the train on the way back to Kaunas, I read the purchased paperback, and I was electrified. The theories presented in it stirred in me an intense interest, and even emotion. Energy is a form of matter; time is a fourth coordinate—in that first description of Einstein's theory that I read, ideas that had already visited me seemed to abound. I was rarely so struck by what I read as I was then.

Several weeks after parting with my parents at the train station in Lithuania, I came to Berlin by way of Stockholm to meet them again. I believe it was that very evening that my father told me that out of what was left him from all his possessions he would donate a large portion for a humanitarian purpose. Such were his ways all his life; he wished with the little means that he still had available to him to initiate something of great design—he thought of propaganda for peace. But I had a different idea, and my father agreed with me. My idea of organizing a series of scientific publications to serve as a platform for Jewish scholars around the world in preparation for the establishment of a Hebrew University in Jerusalem immediately appealed to him, and he offered me generously from his shrunken means to fund the *Scripta*.¹

I met Prof. Heinrich Loewe, a librarian of Berlin University, and found in him an enthusiastic collaborator. We approached a number of eminent scholars of Jewish

origin. The Jew was known the world over as a tradesman, but the renown of the nation's scholars belonged to other peoples. Rothschild was a Jew—everyone knew this. But many of the great names of science—Hertz, Michelson, Ehrlich, Wasserman, Minkovski, Bohr and others—belonged to the halls of fame of other nations.

Professor Loewe approached Einstein, and he agreed to be the editor of the part *Mathematica et Physica*. During the process of editing the papers in the section on *Mathematics and Physics*, I repeatedly met Einstein in his apartment in Berlin. He was then at the zenith of his fame, having been awarded the Nobel prize for physics in the previous year at the age of forty-one. His face was young, and framed by dark hair. I did not pretend to know much about the subjects discussed in the articles, and Einstein himself admitted to not being acquainted with several of the fields discussed by other authors. We had some interesting conversations. Still unconvinced that the Jewish nation needed to be preserved and not assimilated, he once remarked: “Are not all races equally ancient?” I called him to the window, next to which he had a small telescope, and asked him to look down on the street, and told him: “Do you see those cobblestones of which the road is made? They are ancient, but they are not collected and preserved in a museum.”

He was always friendly, as was also his wife, who was his cousin; it was she who regularly opened the door, and both of them would be at the door, friendly, when I would leave.

The work on *Scripta* progressed, and the eminence of the Jewish people in science and the humanities started to shine through. Some barriers had to be overcome, since the original works were to be printed not only in the language of their authors, but also in Hebrew translation. It fell to my task to create something like a collegium of translators, for at that time schools of higher learning did not exist in Hebrew, except Yeshivot. In many cases new terminology needed to be created. This work was partly helped by *Sfotenu*, two volumes of Hebrew terminology, published in Russia in former years with the funds of my father under the editorship of Dr. Joseph Klausner.

For two years I worked passionately on this undertaking. By the fall of 1923 over thirty bilingual monographs were printed. Most of them were subsequently united in two volumes, *Mathematica et Physica*, and *Orientalia et Judaica*.

In 1924 the British journal *Nature*, reviewing the volume on “Mathematics and Physics,” observed that if from a population of thirteen million Jewish people sprang talents like Edmund Landau, Karman, Hadamard, Einstein, Levi-Civita, Loria, Born, Landau and others, then clearly the Jewish nation was unusually rich in creative spirit and ability. The published volumes served the National Library in Jerusalem (later University Library of Jerusalem) for exchange with many scientific institutions for their publications.

I lived a number of years in what was then the British mandated territory of Palestine,

working as a medical doctor. In 1928, after the death of my mother, I turned my interest to psychoanalysis. In the spring of 1930 I wrote on “The Physical Existence of the World of Thought,” to which Eugen Bleuler, the dean of world psychiatry, whom I came to know, wrote a preface, stressing the pioneering nature of my work and revealing that he had harbored very similar ideas.

In 1939 I came with my family for a sabbatical to the United States to complete research on a manuscript on Freud and his heroes. A few weeks later the World War started, and humankind was enveloped by catastrophe for the second time in the space of twenty five years.

In 1940 I approached Einstein and discussed with him a plan for the foundation of an Academy of Sciences in Jerusalem—before this I had started a series of scientific papers called *Scripta Academica* with a paper by Chaim Weizmann and E. Bergmann. Einstein added his signature to the list of those who agreed to participate—it was headed by Franz Boas and Enrico Fermi.

Soon afterwards my research led me to an understanding that at the time of the Exodus an enormous natural catastrophe took place—an understanding that brought me to a realization that the ancient history of the Near East needs synchronization, and natural history needs a reconstruction. I spent the next several years in libraries reading and writing. Two manuscripts, *Worlds in Collision* and *Ages in Chaos*, resulted from these years of labor.

After a period of six years, during which Einstein and I had not met, I went to Princeton to see him on July 5, 1946. His telephone was not listed, and the telephone office did not supply the information without checking with the scientist about whether he wished a particular party to be given his telephone number. He asked me to come on that day, and I took my daughter Shulamit with me. She had spent many mornings with me in discussing some aspects of the gravitational theory. At that time she was taking graduate courses at Columbia University, having received her honors degree in physics from Hunter College in New York. She was my silent companion.

I never thought I would ever discuss physical problems with Einstein. But, as explained above, my work on natural upheavals of the past led me to consequences which I could not disregard. Going now to see Einstein, I knew I would not be able to explain all that I had thought through about the role of electrical and magnetic forces in the solar system, although I had it in writing. He received us on the terrace at the back of his house, overlooking the yard with tall trees; he was wearing sandals, and greeted us with his unique kindness and smile. Two hours passed in a discussion, my daughter listening. I did not feel like saying—“I have found some of the premises of the astronomers to be wrong” ; my intent was to prepare him through the reading of my manuscript to wonder about the conflict that presents itself between the theory of changeless orbits and the conclusions that ask to be drawn from the material I had assembled. I left with him the first half of my manuscript of *Worlds in Collision*, the part dealing with Venus. Three days later he already wrote his answer:²

July 8, 1946

Dr. Immanuel Velikovsky

526 West 113 Str.
New York City

Dear Mr. Velikovsky:

I have read the whole book about the planet Venus. There is much of interest in the book which proves that in fact catastrophes have taken place which must be attributed to extraterrestrial causes. However it is evident to every sensible physicist that these catastrophes can have nothing to do with the planet Venus and that also the direction of the inclination of the terrestrial axis towards the ecliptic could not have undergone a considerable change without the total destruction of the entire earth's crust. Your arguments in this regard are so weak as opposed to the mechanical-astronomical ones, that no expert will be able to take them seriously. It were best in my opinion if you would in this way revise your books, which contain truly valuable material. If you cannot decide on this, then what is valuable in your deliberations will become ineffective, and it may be difficult finding a sensible publisher who would take the risk of such a heavy fiasco upon himself.

I tell you this in writing and return to you your manuscript, since I will not be free on the considered days.

With friendly greetings, also to your daughter,

Your

Albert Einstein

The letter contained one positive statement and two negative ones, expressed with vigor and finality not given to appeal or reconsideration. To have Einstein subscribe to the thesis of global catastrophes in historical times and, furthermore, to make him agree with the extraterrestrial origin of such events can be counted as an achievement: this acceptance immediately carried Einstein into the camp of the catastrophists—not even a camp, because hardly anyone in the mid-twentieth century believed in the notion of global catastrophes. Astronomers had not produced a single man from among their ranks who would have conceded as much as Einstein did in that letter.

But I found no satisfaction in the concession obtained at the beginning of the letter because I hoped for more. I hoped that I would be able to continue the discussion

started on July 5th and to lead it to the subject that was the purpose of that discussion, namely, the consequences for celestial mechanics that followed from the historical events presented in my work. My stand was later formulated in the Preface to *Worlds in Collision*: "If, occasionally, historical evidence does not square with formulated laws, it should be remembered that a law is but a deduction from experience and experiment, and therefore laws must conform with historical facts, not facts with laws." I had planned to spread before Einstein the many facts that all point to the unjustified omittance of two all-pervading and interdependent natural forces, electricity and magnetism, from all and every consideration of being active agents in the plan of the universe, and in the mechanics of the solar system.

Now the discussion was cut short before we reached the theme; Einstein called off our next meeting and there was no point in asking him to read the second part of the manuscript. It appeared also that he was under the impression that he had seen the entire manuscript, whereas it was but the first folder that I had left with him.

Had I been insecure in my work and its conclusions, this would have been the moment to reappraise the entire endeavor. But I was so completely convinced of my theses that my reaction was not of re-orientation in order to salvage what to Einstein appeared as valuable in my manuscript and thus to secure a good chance of publishing it. It was a short-lived regret that my effort with Einstein was luckless. I wrote to him on July 16, 1946:

Dear Professor Einstein:

I thought carefully of what you wrote in your letter of July 8, for which I thank you very much. I thank you also wholeheartedly for the time you gave me on July 5, and for reading a part of my Ms "Worlds in Collision."

I was perfectly aware that my historical cosmology is in conflict with the accepted physical laws, and because of that I asked you to read it. You stress two instances. The reversal of rotation (not revolution) is attested not only in traditions but also in geo-physics: the magnetization of rocks "indicate that the polarity of the Earth has been completely reversed within recent geological times." . . .

In the last part of my cosmology I try to solve the problem of the conflicting geological and historical data versus the accepted laws.

Best regards to Miss H. Dukas who received us with friendliness at your home.

Very truly yours,

My efforts, accordingly, were directed to the following tasks:

First, to have one of the conclusions of my work, identifying Venus as the agent which caused the great global catastrophe, checked by a physical method, namely by spectroscopy on the presence of hydrocarbons, and already before approaching Einstein I had approached the Harvard College Observatory with the request of having this specific test made. The description of that step and the correspondence that ensued during April and May find their place in a separate publication.³

Second, to have my work's implications for celestial mechanics presented to a limited circle of specialists in a concise form, with physical facts being the only material of discussion. In this way I would be able to hear criticism of these implications in and of themselves, apart from the historical-mythological material which inspired them.

Thirdly, I decided not to postpone any longer and to inquire into the possibility of presenting my manuscript in book form to the scholarly world.

Before the Forum

Having surveyed the years when we created the *Scripta* and, again, the years of occasional contacts in the United States, first on behalf of the plan to initiate the Academy, then on behalf of my own work, starting with the visit of early July, 1946 in Princeton, I return to that period when, upon having met Einstein at the lake and exchanged letters with him, the contact seemed to be torn again. Yet, apparently, my bearing intrigued him. One evening, later in the fall (1952) I received a visit from a chemist, Dr. Plungian, accompanied by his wife, Gina, a sculptor. Gina was a friend of Einstein's daughter, Margot, who was also a sculptor. The Plungians had heard from Einstein that I was living in Princeton. Gina, interested in what she had read about my work or was told by Einstein, and generally interested in writers and artists, was pleasantly surprised to find that my wife also was a sculptor. Dr. Plungian came to invite me to deliver a lecture before the Society for the Advancement of Science of Summit, New Jersey. This is the site of Bell Laboratories, one of the largest scientific laboratories in the world; the members of the Science Society there were for the most part scientists working for Bell. I accepted the invitation.

I addressed a large audience at Summit. The lecture took place in February 1953. The chairman of the Society, Dr. Joseph Baker, met me in the hall and before I entered the large auditorium worriedly inquired whether I would be able to restrain myself if some in the audience should become abusive. I assured him that he had nothing to worry about.

In my lecture I spoke mainly on the geological problems that are related to the theory of *Worlds in Collision*. The question period went off without a disturbance. At tea in the gallery the discussion went on for another hour and I realized the great appeal that geological problems— of sea depths, of mountain building, and of ice ages— have to the minds of many. As I took leave of him, the chairman announced: “Dr. Velikovsky has acquired a new follower in me.”

On another occasion I was asked to meet a group of scholars and scientists at the home of the Plungians; Dr. Shockley, the co-discoverer of the transistor, and a future Nobel Prize winner, led the discussion. We had a little mathematical skirmish in which I happened to be right, and he generously and immediately admitted it.

About that time Margot Einstein, who had known Elisheva since the 1940's, began to come to our home. Margot and Elisheva met in 1941 at Columbia University, where they both studied sculpture under Oronzo Maldarelli. Once Margot arranged for Elisheva to come to Princeton to play quartets with Einstein. Elisheva is a professional violinist, and used to give many concerts before we came to the United

States. And so in April 1944 Elisheva came to Princeton, arranging for a violist and a cellist to join her, and played with Einstein three string quartets of Mozart.

At one of her visits Margot told us in great detail of her experience in Holland during the Hitler regime, and mostly her stories were about animals— lambs and birds— with whom she related better than with human beings in this evil world; it seemed she wished to be well thought of by us. Occasionally she came with Miss Helen Dukas, Einstein's secretary. Miss Dukas had then been with Einstein for almost twenty-five years— she entered her service with him several years after I knew him in Berlin. After the death of his second wife, she took care of his correspondence and of his household. Elisheva and her musical colleagues would have chamber music at our home, and a small company of intellectuals would gather at these occasions; there were animated discussions. Miss Dukas and Margot were present a few times and enjoyed these evenings.

The Graduate College, or Proctor Hall, lies separate from the Princeton University Campus; its tower is seen from a distance, rising above the fields and golf courses, by any car traveling on U.S. Route 1, and is the first visible landmark identifying the university town, hidden in verdure. The Common Room, with its ornately panelled walls, and leather easy-chairs, is reached through a gateway and a quadrangle.

In the fall of 1953 I was invited by the graduate students of Princeton University to address their Forum; the student who invited me, as I recently found out, was George Field, ten years later a scientist of achievement and subsequently Director of Harvard College Observatory, a post once occupied by Harlow Shapley. I was glad to have this occasion. As the theme of the lecture I selected: "*Worlds in Collision* in the light of recent findings in Astronomy, Geology and Archaeology."

The lecture took place on the evening of October 14. The Common Room was filled and many stood around the walls and in the doorways. In the front row sat Graduate College Dean Sir H. Taylor and other dignitaries. Among those who remained standing for about two hours— for the address and discussion— were, as I hardly noticed, Margot Einstein, Helen Dukas, and Gina Plungian.

Before the lecture started my wife overheard one of those in the audience, a graduate student or an instructor, as he assured his neighbor that it would be fun to listen to a crackpot. But as soon as I began, the audience followed my delivery with great attention. I offered non-conformist views, but there was nothing in them to confirm the expectation of a circus performance. I spoke for over an hour. A question and answer period followed. A few days later a young friend, a twenty-four year old assistant professor of aerodynamics, Ronald Probst, told me how a scholar in the audience with a pipe in his mouth looked on with sarcastic triumph when the question period started, and changed his expression with every answer I gave.

Question and answer periods, then and since then, have been my forte; the audience apparently discounts the knowledge that a lecturer offers in his delivery, since it

could be carefully prepared, but is surprised to observe that a lecturer has the information needed to answer and rebut questions from the floor. I answered without difficulty the queries of all who came up from whatever department. There was one inimical graduate student in geology who loudly inquired: "Whom did you read on Rancho La Brea?" And he suggested that this deposit contradicts my assertions. I answered: "In my lecture I have not discussed Rancho La Brea; but I read Merriam's monograph." "I worked with Merriam's son," said the student. Merriam was the original investigator of that deposit at a time when it was on the outskirts of Los Angeles— now it faces the "Miracle Mile," the elegant shopping avenue. Actually the asphalt beds of La Brea offer great difficulties for the uniformitarian theory of evolution: human bones were found under a skeleton of an extinct vulture; a multitude of bones, smashed and broken, were found there, not in good order or shape— despite what the student had asserted in his question. Yet, the student announced: "Catastrophes are your brainchildren," and thus had the last word. I did not answer. The audience applauded me warmly, and the student approached me to offer his apologies for his rudeness.

In the course of the lecture I made two statements as to the future findings I expected; after having reported on the manifold confirmations that had accumulated in the three and a half years since the publication of *Worlds in Collision* I thought it proper to conclude with one or two new predictions. For some time I had in my notes suggestions for tests to be made. I put it this way:

In Jupiter and its moons we have a system not unlike the solar family. The planet is cold, yet its gases are in motion. It appears probable to me that it sends out radio noises as do the sun and the stars. I suggest that this be investigated.

It is generally thought that the magnetic field of the earth does not reach sensitively to the moon. But there is a way to find out whether it does or does not. The moon makes daily rocking movements— librations of latitude, some of which are explained by no theory. I suggest investigating whether these unaccounted librations are synchronized with the daily revolutions of the magnetic poles of the earth around its geographical poles.

Actually, both tests suggested were derived from one and the same concept: that the celestial sphere is not electrically and magnetically sterile.

After the lecture one of the graduate students who surrounded me told me about certain folkloristic material of the Indians that would support my views; I observed that he did not come forward to say this during the question period.

As I walked to my car, I chanced to meet in the dark the three ladies who had come from Einstein's house to my lecture: his daughter, Margot, his secretary, Helen Dukas, and their friend, Gina Plungian. Later Gina told me that when she had called

to take Margot to the lecture and Miss Dukas joined them, Einstein said that he was eager to go, too, but was conscious of the interest that would be centered on himself to the detriment of the proceedings. He added, however, that he expected to receive three reports from the three ladies. And he did. Gina Plungian later said that the dinner hour at Einstein's the day after the Forum was spent discussing my lecture, and Einstein expressed sympathy for my position, that of a lone thinker defending his ideas.

The Princetonian, the undergraduate students' paper at Princeton, printed two articles about the lecture. In the first it described how "with sheaves of documented evidence, Velikovsky quoted a myriad of scientists in these fields whose recent work, he said, made his theory more conclusive." In the second article it said: "After his lecture last night, he impressed all attending by his well-reasoned and well-documented answers to questions posed by experts in physics, geology and other sciences."

In the next few weeks I put the lecture into writing, following the notes I had before me when addressing the Forum. After it was typed I gave a copy to Lloyd Motz, astronomer at Columbia University. Since the beginning of 1950 I had met with him on a number of occasions in his room on the upper floor of the Michael Pupin Physics Building. The subject we discussed was always the same: my insistence that the solar system, and by implication, the universe, is not electrically and magnetically sterile.

Since those memorable days at the end of 1949 and beginning of 1950, I would, at intervals of five or six months, again and again return to Motz, trying to prove to him by enumerating a series of physical facts, some of them discovered since our previous meeting, that the accepted celestial mechanics could not be right in excluding electricity and magnetism from participation in the movement of the celestial "clock." The arguments must have been much the same as those that I used in my letters to Einstein in August and September of 1952. Motz would patiently listen and remain adamant. I would describe the motion of the cometary tails and insist that the accepted explanation of this phenomenon as being due to the pressure of light was inadequate. I was trying to evince from Professor Motz the concession that this was a decidedly insufficient explanation that could not account for the observation of a large comet sweeping with its tail hundreds of millions of miles of space in a matter of a few hours, when going around the sun at perihelion. Yet, he would still try to explain it by the pressure of light. The sentence concerning the radio noises of Jupiter startled him, and we discussed it.

I asked for a meeting with Professor V. Bargmann, a physicist who was possibly closest to Einstein of all the scientists in Princeton. I remember the evening I visited him in his room in Fine Hall on the campus. I discussed the question of electromagnetism in the solar system. Instead of slowly preparing the issue in his mind, I showered him with facts and details that indicated the inadequacy of purely mechanical explanations. I assume that he must have been left with the impression that I was a man stubbornly questioning fundamentals which were beyond questioning. However, had he been present at my lecture in the Graduate College, he

would not think me without some knowledge, or with a deficiency in logic. At that my first meeting with him, Bargmann was a patient listener, possibly believing me to be irreparably lost to a fallacious view of things celestial, or perhaps recognizing some sound argument in what I said.

I left with him the typed text of my address before the Forum with its claims of radio noises coming from Jupiter and a magnetosphere surrounding the Earth and reaching the Moon. Though he intended to return it to me after he had read it, it so happened that he misplaced it and only found it over three years later— all of which was fortunate, and thinking of such incidents I could not help feeling that Providence was taking part in these matters: for in the meantime, in the spring of 1955, radio noises from Jupiter were discovered, as I had predicted in my lecture of 1953.

At McCarter Theater

A couple of weeks after my lecture before the Forum, it happened that at a concert at McCarter Theater in Princeton we met Einstein. It may be that he made up his mind to show a little of his change of heart in order to erase the impression of rejection he had left with me over a year earlier. During the intermission he stood up, greeted us from his seat a short distance away, and asked me to sit and chat with him. I took a temporarily vacant seat in the row in front of him, turning my head to hear him speak. There was something very unusual in this man. I am not a hero-worshipper, more nearly an iconoclast: great names do not startle me, nor do they make me feel humble. But in Einstein I felt this time something I had not felt on meeting him in Berlin, when he was a jolly man in his early forties who had achieved singular and spectacular success which was still new to him, and I was still in my twenties; nor when I spent time with him again in New York in the spring of 1940, nor when I visited him in the summer of 1946.

In 1921 he was a young-looking man with well-filled cheeks, warm and sparkling eyes, a forehead framed by dark and wavy hair, and a moustache over soft lips, with a ready laugh—almost the likeness of a bon-vivant. Epstein, who portrayed him several years later as flimsy, furrowed, and wiry, did not succeed at all. Now, thirty years later, at the age of seventy-four, the change in his appearance was very great. He had grown old, yet stood erect, with his grey-white hair, now long, falling on his collar. He had a kind face, and a clear and sonorous voice. Sufferings and private losses and human destiny had cleansed him and spiritualized him. He looked at me with kindness, and warmly pressed my hand with his own fleshy hand. The mattness of his face lighted up.

I reminded him of the *Scripta* on which we had worked together in Berlin. This made him wonder aloud on the mystery of time. Is time a stream flowing always in one direction from the present to the past? Do the present, future and the past all exist simultaneously? He wondered and asked me. Yet he brought counterargument to his own thought: but we cannot remember things that are in the future. This did not appear to me a valid argument, but I did not say so. Instead, I referred to Plato's discourse on simultaneous existence of the past and the future. The field of parapsychology deals with such problems. Yes, once I wrote and published something on the subject, and Freud commented in a letter. Einstein asked me whether I still had Freud's letters, and whether he could read one. I promised to select a letter for him to read. And we continued so, already old friends, when the bell called the audience into the hall. I returned to my seat.

I sent Einstein the letter of Freud that he wished to see. In that particular letter Freud

wrote me, as usual by longhand, that he had similar, almost identical ideas, and that he would subscribe to the preface to my work written by Eugen Bleuler.

A single week passed. There was again a concert at McCarter Theater: Einstein hardly showed himself twice a year in public, but this time he came again. Again, during the intermission—he sat across the aisle—he asked me to take the vacant seat next to him. Some of the Princeton graduate students sat in the row in front of my wife, and she could hear them wondering at this fellowship: Einstein when in public was of course the center of attention, though the public tried to make this not too obvious. Einstein spoke of religion, and mentioned Spinoza, a spirit toward whom he probably felt affinity. Like himself, Spinoza was a lonely man; like himself he was not concerned with material goods; like himself he was in conflict with men, though he was kind and humane; and like himself he was deeply religious, though not in the church or synagogue, and it is no wonder, if one considers the great sufferings to which his mentor Uriel Acosta was subjected—one of the saddest chapters in the long story of the Jewish people. But Spinoza was an Aristotelian, without wishing to be so; the cold reason which insists on explaining away anything unusual or singular separated Aristotle from his teacher Plato, who tended to the esoteric, the wonderful, and the singular.

Not long thereafter my wife and I received an invitation to have tea with Einstein. The day before our visit I found in the mail a letter in which the writer, a resident of Seaford in England, wrote:

The “authorities” will object to your subversion of their life-work, but it is from their minor followers that the bitterest opposition will come. Those who exercise authority are not so shocked by rebellion as their underlings. They are doubly offended, for you threaten their security and insult their judgement. . . . The one Roman Catholic I would expect to sympathize with my doubts on infallibility would be His Holiness. It is the hedge-priest and Sunday School teacher who would cry “Blasphemy!”

112 Mercer Street

Einstein's house at 112 Mercer Street is located only a short distance from Nassau Street, the main street of this university town. Nassau Street at its western end divides into several avenues, like the trunk of a maple tree that throws many unequal branches simultaneously at one and the same joint. Two of the streets run toward Trenton; if one should walk along one of them, Mercer Street, past the buildings of the Princeton Theological Seminary, he would find Einstein's house on the left side where the street begins to go downhill. The wooden two-story building stands between not dissimilar neighboring structures. It is unpretentious with a narrow front and stretches into the backyard with its gray-painted sidings. Located in an area of low elevation, it is probably in one of the less comfortable parts of town, hot and humid in the summer. Einstein used to leave the town in the summer months and go to Saranac Lake in the Adirondacks, but in later years he discontinued his summer departures and stayed home.

Continuing a block or two along the street, one comes to Springfield Street on the left, and this well-shadowed valley would bring Einstein on foot to the Institute for Advanced Study—he had only to choose one of the streets with mansions or well-kept villas, like Battle Road, to turn right and then he could already see the Institute, built in the nineteenth-century style, in red brick, with a cupola and spire, standing out across a field from the approaching visitor. In later years Einstein discontinued his daily walk to the Institute and back and used the Institute vehicle, a kind of small omnibus, which would pick him up as it did other members.

In the Institute he was rather lonely. I once read that Gödel, who used to travel on the same bus, was closest to him of all the members of the Institute. Dr. Kurt Gödel, a mathematician and a great introvert, who lived at the other end of the town, was a silent man, with greying hair, who even in summer bundled himself against drafts, and was certainly of limited inspiration for Einstein who, though solitary, was greatly interested in human contact, warm in handshake, roaring with laughter. Gödel, like other famous mathematicians in the history of this abstract and exact science, produced the feat that made him famous at an early age, in his twenties, only to find the spring dry in the following decades. They could converse on some philosophical subject—I repeatedly saw Gödel on the third floor of the University Library studying books on philosophy or psychology.

A man of very different disposition and much closer to Einstein was V. Bargmann, a theoretical physicist, who was not a member of the Institute, but a professor at Princeton University. He was—and is—an unswerving follower of Einstein, prepared to offer a fierce front to anybody who would challenge Einstein's theories. I believe

that among the physicists in Princeton Bargmann was closest to Einstein while the younger generation of physicists showed a certain skepticism concerning the General Theory of Relativity in view of its apparent conflict with Quantum Theory, and because of Einstein's rejection of Heisenberg's Principle of Indeterminacy ("God does not play dice").

Before the Chair of Jupiter

On November 8, Elisheva and I went to Einstein and were seated in the living room. When one enters his house, proceeding through the narrow hall, the living room is to the left; directly ahead is a steep staircase leading to the second floor: on the second floor there is a room with a large window toward the backyard, with a low table, books, chairs, and next to it to the right another room, also lined with books. In a little while Einstein came from the upper floor to us, his long hair well-groomed, his face lighted up with his friendly smile. He started to move a chair with a straight high upholstered back, which had already drawn my attention in the modestly furnished room, and as I helped him, a help he graciously accepted, he said, “this is my Jupiter chair.” During our conversation I took this lead and remarked that if one evening I should stop every passing student and professor on the campus and should ask which of the stars was Jupiter, it is possible that not even one would be able to point to the planet. How is it, then, that Jupiter was the highest deity in Rome, and likewise Zeus in Greece, Marduk in Babylonia, Amon in Egypt, and Mazda in Persia? All of them represented the planet Jupiter. I asked Einstein if he knew why this planet was worshipped by the peoples of antiquity and its name was in the mouth of everyone? Its movement is not spectacular; once in twelve years it circles the sky. It is a brilliant planet, but it does not dominate the heavens. Apollo, the sun—the dispenser of light and warmth—was only a secondary deity. After inquiring and hearing from me again that Marduk was the Babylonian name of the planet Jupiter and Mazda its Persian name, he expressed his wonder. Then I told him that in the *Iliad* it is said that Zeus can pull all the other planetary gods together, the Earth included, with his chain, being stronger than all of them together; and that an old commentary (by Eustatius, a Byzantine scholar) states that this means that the planet Jupiter is stronger in its pull than all the other planets combined, the Earth included. Einstein admitted that it was really very strange that the ancients should have known this.

When, after three quarters of an hour, during which we were served tea, we rose to go, Einstein kept us, saying, “We have only started.” In order not to appear a bore, or a fanatic of one idea, I repeatedly changed the theme of conversation, as was so easy with Einstein, whose associations were rich and whose interests were many; the conversation was vivid. We spoke again of the problem of time, which apparently occupied his mind then, and of coincidence and accident. He observed that it was an accident of unusual rarity that his chair should occupy its very position in space, but that it was no accident that we two were sitting together, because *meshugoim* are attracted to one another—and he laughed heartily and loudly. *Meshuga* is a Hebrew word, and it means “the possessed” ; in the Jewish-German parlance it is often heard, and it means “crazy,” in both senses (like the English word), more often in its milder meaning. Thus he likened me to himself. On this occasion, and several times more at other occasions, he liked to stress that each one of us is entirely alone in his scientific

standing. This was also said to heighten my spirit—was he not lonely, too? Of course, there was an enormous difference in our positions in the scientific community and in the attitude of the scientific world toward us—beyond comparison. I took up the problem of coincidences to illustrate it by several examples.

The authors of the Declaration of Independence were Adams and Jefferson, who subsequently became the second and the third presidents of the United States. They both died on the same day, and it was the fiftieth anniversary of the Declaration of Independence. What is the statistical chance of this coincidence of three dates? Or if a schoolboy or a man in the street should be asked to select the greatest statesman of the nineteenth century, and the greatest scientist of that century, he would most probably select Abraham Lincoln and Charles Darwin: both were born on the same day, February 12, 1809. Or similarly the two greatest writers of their age, Miguel Cervantes and William Shakespeare, died on the same day, April 23, 1616.

I mentioned these instances to illustrate the idea that coincidence sometimes bears the mark of the miraculous, and sometimes the explaining away of telepathy is stranger than telepathy itself, for which I offered a naturalistic explanation in my paper on “The Physical Existence of the World of Thought.”

Before we left, Einstein told us of his dream of the night before. This dream impressed him strongly and he recounted it with a voice of unusual warmth and passion, expecting that I would interpret it. He also related a dream he had had many years ago about an old colleague whom he had not liked, and he told the story in detail. The old dream’s explanation he already knew. I felt regret in having to disappoint him, but in accordance with standard psychoanalytic procedure I offered no clues to the understanding of the dream of the night before, especially since my wife, Miss Dukas, and Margot were present, though I could closely guess its meaning.

A Round Sun

Since Einstein at the time of my lecture before the Forum wished to be present, and later had to satisfy himself with the reports of the three females of his household (Gina Plungian could be counted as belonging to the household), I supplied him with a copy of it.

January 6, 1954

Dear Professor Einstein:

I have carefully put into writing my lecture before the Forum of the Graduate Students here (October 14, 1953). Doing so I was guided by the desire to place it before you for reading.

In the written form I have considerably shortened the archaeological and geological parts of my address; but I have elaborated on the astronomical part of it to a greater length than I did orally. Before submitting this paper to you I have asked Professor Lloyd Motz of the Astronomy Department of Columbia University to check its factual statements.

I am aware of the great demand on your time made by various authors; therefore have my sincerest thanks for agreeing to read this paper.

Cordially yours,

Immanuel Velikovsky

After a few days Einstein invited us to come and discuss my lecture. Thus the wall was breached. Until then, in our previous conversations that winter, neither he, nor I, mentioned anything of my *Worlds in Collision*. But during this visit of February 11, 1954 I turned to Einstein and said:

"Now imagine that the Lord sent a messenger to you with these words: 'I gave you, Albert Einstein, a very unusual mind and, what is still rarer, the recognition and admiration of your contemporaries. Now build a working plan for another universe; only don't apply gravitation that propagates at the inverse square, but electricity and magnetism you may use as much as you need.' Could you do this?"

"I would answer the Lord: 'Do such a thing yourself!'" Einstein burst into a loud laugh. But then he thought a few seconds and said: "Yes, on condition that it be a dark universe."

"Why?" I asked.

"The charge on the planets would be expended in the photoelectric process."

The problem he selected for discussion that evening, from a series of problems mentioned in my lecture, was the round shape of the sun. Because of rotation it should be somewhat flattened; and in addition the sun rotates at a greater velocity at its equator than at higher latitudes. We spent the evening talking about this and a few other points in my lecture; when my wife and I left, it was already late and Einstein's eyes were tired.

After a few hours of sleep, I awoke and jotted down my comments to various arguments Einstein had brought up, especially discharge by photoelectric effect. It appeared to me that this effect must *charge* a neutral body. In the morning I thought of calling Helen Dukas and saying a few words of apology for our too long conversation, when the phone rang and Miss Dukas said: "The professor would like to talk to you." His voice sounded resonant and clear, and I thought, if one does not see Einstein but only hears him, he may imagine that he is speaking with a young man. He said (as I recall):

"After our conversation last night I could not fall asleep. For the greater part of the night I turned over in my mind the problem of the spherical form of the sun. Then before morning I made light and calculated the form the sun must have under the influence of rotation, and I would like to report to you.

"Imagine the sun as a body one meter in diameter; because of the slowness of rotation—I took one rotation equal to 25 days—the deformity should be only"—I believe he said—"a quarter of a millimeter." While he was saying this I quickly calculated in my mind (in general, I am not quick at figures), that this would amount to about one half a second of the arc, the visible face of the sun being about half a degree, or 1800 seconds, and, in his opinion, this small difference could escape observation. I told Einstein his figure, translated into seconds of arc.

We agreed to inquire of Professor Lyman Spitzer Jr., Director of the Princeton Observatory, whether a difference was established in the length of the solar equatorial and polar diameters.

February 19, 1954

Dear Professor Spitzer:

May I ask for an information? Is a difference established in the length of the equatorial and polar diameters of the sun?

This question came up in a conversation with Prof. Einstein and he thought it would be right to put this question to you.

Very truly

Immanuel Velikovsky

PRINCETON UNIVERSITY OBSERVATORY

14 Prospect Avenue
Princeton, New Jersey

February 26, 1954

Dr. Immanuel Velikovsky
4 Hartley Avenue
Princeton, New Jersey

Dear Dr. Velikovsky:

In reply to your letter of February 23 I am writing to say that there is no established difference in the length of the equatorial and polar diameters of the sun. Some observers have reported a small difference but I believe that no such difference has been firmly established.

Very sincerely yours,

Lyman Spitzer, Jr.

I know that Dr. Donald Menzel even found an excess in the polar diameter which he was "loath" to consider.

In March the world paid Einstein a renewed tribute at the occasion of his reaching seventy-five years of age. His mail was coming in big sacks. I wrote him a quotation from Emerson:

Beware when great God lets loose a thinker on this planet. Then all things are at risk. It is as when a conflagration has broken out in a great city, and no man knows when it will end. There is not a piece of science but its flank may be turned tomorrow; there is not any literary reputation, not the so-called eternal names of fame, that may not be revised and condemned. The very hopes of man, the thoughts of his

heart, the religion of nations, the manners and morals of mankind are all at the mercy of a new generalization.

Einstein called by phone to express his thanks.

In Einstein's Study

On May 20, 1954 I went to see Einstein. This time I asked to see him. I wished to ask him to read a part of my *Earth in Upheaval* in manuscript. There was also another subject that I thought I ought to discuss with him. A few days before a correspondent in California drew my attention to an article in *Astounding Science Fiction* in which I was accused of inventing my sources. I realized the damage done by the Harvard group had spread into pulp magazines read by common people. I had not complained to Einstein before about the campaign of suppression and vilification carried on by some groups of scientists against my theory and myself.

He received us this time in his study on the second floor, which has a large window overlooking the garden in the backyard. It was about the time before sunset. He asked:

“Would you like our conversation between four eyes or between eight?”

“Between eight,” I replied, my wife and Miss Dukas being admitted.

“The women will listen but not participate,” he said, expecting something important to discuss with me.

“Like in a synagogue,” I remarked. But then I corrected myself. “No, I feel myself here as Solomon Molcho must have felt in the palace of Pope Clement VII.” I explained that this *marrano*, i.e., a Jew from a family that had been forcibly converted to Christianity, was sentenced to die for reverting to Judaism and was burned as a heretic in Rome by the Inquisition; but the next day he was alive in the inner chambers of the Vatican discussing philosophical problems with the Pope. The Pope had let another heretic be burned and hid Solomon Molcho. If only the Holy Inquisition knew *where* he was! This was my way of referring to what my opponents and detractors among the scientists might think and feel were they to know where I was spending that evening.

“Is he a gentleman who permanently turns his pockets out to show that he did not steal?” I quoted Vladimir Jabotinsky. I could not spend all my time proving that I have not misquoted or otherwise misused my sources. But silence on the part of the accused is understood as admission of guilt. Einstein agreed with me. And thinking of injustice to a man, he mentioned Oppenheimer, whose removal from the advisory committee to the Atomic Energy Commission caused at that time great agitation.

“But you do not do better,” I said. Einstein's face expressed surprise. “I do not think

of you personally, but of your colleagues, the scientists.” He wished to know more. I went down and brought from the car a file with some of the letters exchanged between Harlow Shapley and the Macmillan Publishers. He read them with great interest. But we did not proceed far enough; we had not come to read the letter of Whipple to Blackiston Publishers in Philadelphia, or the statement of Shapley in the *Harvard Crimson*.¹

Einstein was obviously impressed and did not spare harsh words in characterizing some of the actors in the campaign of suppression.

Einstein advised me to make the material public. I should, he said, find somebody with a talent for dramatic writing and entrust him with the task of presenting the case. He was obviously impressed and indignant. “This is worse than Oppenheimer’s case.”

I mentioned that in Germany the church also opposed me, and in fact suppressed *Worlds in Collision* at the hands of its publisher (Kohlhammer of Stuttgart). As in America the book had a great success, and went through five printings in less than a year when the lid fell down.

“But what should the church people have against the book?” asked Einstein, and turned his face to me (as often during our conversations, he was sitting to my left). The opposition of the churches to a work that provoked furor among the scientists must have appeared to him incongruous. All this must have been thought, not said, for my answer followed immediately:

“The church opposed my interpretation of miracles as natural phenomena.” Einstein laughed with his loud, hearty laugh. He wished to read more in the file. But now I was interested in taking up the problem that really occupied my mind—my theories.

Already at one of our earlier meetings, Einstein said to me: “I know how to explain the great global catastrophes that occurred in the past.” He spoke then of vestiges of an ice cover that were observed in the tropics and referred to an unpublished theory of Charles Hapgood, who thought that growing ice caps can cause a slippage of the terrestrial crust relative to the interior, thus displacing the poles. This evening Einstein returned to the same idea and said that terrestrial causes could have been responsible for the catastrophes. I told him that the problem of the displacement of the terrestrial pole was already much discussed in the last century by astronomers and geologists. “By whom and where?” he asked. “Here,” I said, about to leave, and showed him the second (of three) files of the manuscript of *Earth in Upheaval*, “Here you may find the arguments of that old discussion.” First he was reluctant to take another manuscript for reading. The daily mail alone takes so much of his time, he said, and standing at the top of the staircase, while I was a few steps down, showed with his hands how thick was the bundle of his daily mail. But, hearing that the physical problem of the terrestrial crust moving over the core is discussed in that file,

he took my manuscript.

The next day I wrote two letters:

May 21, 1954

Dear Professor Einstein:

It may be that I said more than I was aright to say when yesterday evening I expressed myself that Einstein is humanly obliged not to be indifferent to the wrong that was and is still done by an organized group of scientists. But because of your position of a recognized leader among scientists and fighter for human rights, I feel obligated to you not to keep you uninformed.

These are two problems, entirely independent: Am I right in my theory? I am striving to prove it. Have I the right to express in writing the conclusions to which I came in an honest endeavor? Though the answer is elementary, this right was so mistreated that, following an attack this month, after some hesitation, I decided to ask more than just a few minutes of your most precious time.

With sincere regard,

Immanuel Velikovsky

May 21, 1954

Dear Miss Dukas:

Yesterday evening Professor Einstein wondered to hear that in my book the role of Venus in the catastrophe is deduced from direct references in the folklore of many peoples. I am sending to you, Miss Dukas, a copy of the German edition of *Worlds in Collision*; between the pages 170 (where Venus is for the first time mentioned in my book) and 220 I have marked with pencil such references. Please, show them to Professor, if he likes to see them.

Professor wished also to see the passage concerning the solar eclipses before -687, especially one seen in China, with reference to Venus in the source. I have marked the passage in my reply to Stewart in Harper's. . . .

I enclose a few lines for Professor. I hope I have not tired him yesterday too much.

Cordially yours,

Immanuel Velikovsky

Two days after our meeting Einstein wrote me a long handwritten letter—which was rather unusual, since most of his letters were dictated and typed. He also returned my file and supplied some of the sections with numerous marginal notes.

22.V.54.

Dear Mr. Velikovsky!

Remarks on the part of your manuscript “poles displaced.”

The first impression is that the generations of scholars have a “bad memory.” Scientists generally have little historical sense, so that each single generation knows little of the struggles and inner difficulties of the former generation. Thus it happens that many ideas at different times are repeatedly conceived anew, without the initiator knowing that these subjects had been considered already before. In this sense I find your patience in examining the literature quite enlightening and valuable; it deserves the attentive consideration of researchers who according to their natural mentality live so much in the present that they are inclined to think of every idea that occurs to them, or their group, as new. *The* idea of a possible displacement of the poles as an explanation of the change of climate in any one point of the earth’s crust is a beautiful example. Even the idea of the possibility of a sliding of the rigid crust in relation to the plastic, or fluid deeper strata of the earth, was already considered by Lord Kelvin (and was in fact rejected).

The interpretation of the vote mentioned on pp. 159-160² as an attempt at a dogmatic fixation of the “truth” is not obvious to me. It is simply interesting for the participants of a congress to see how opinions concerning an interesting question are divided among those present. I don’t think that the underlying idea was that the outcome of the voting would somehow insure the objective correctness of the outcome of the vote.

From p. 182 on starts a wild robbers’ story (up to p. 189) which seems to rely more on a strong temperament than on organized considerations. Referring to p. 191: Blacket’s idea is untenable from a theoretical point of view. The remark about the strength of magnetization seems to be unjustified (p. 192); it could for example depend essentially upon the

speed of cooling as well as on particle shape and size. The direction of the magnetic field during solidification must however quite certainly determine the direction of magnetization. Bottom 192 etc.: wild fantasy! from here on marginal remarks with pencil in the manuscript.

The proof of “sudden” changes (p. 223 to the end) is quite convincing and meritorious. If you had done nothing else but to gather and present in a clear way this mass of evidence, you would have already a considerable merit. Unfortunately, this valuable accomplishment is impaired by the addition of a physical-astronomical theory to which every expert will react with a smile or with anger—according to his temperament; he notices that you know these things only from hearsay—and do not understand them in the real sense, also things that are elementary to him. He can easily come to the opinion that you yourself don’t believe it, and that you want only to mislead the public. I myself had originally thought that it could be so. This can *explain* Shapley’s behavior, but in no case *excuse* it. This is the intolerance and arrogance together with brutality which one often finds in successful people, but especially in successful Americans. The offence against truthfulness, to which you rightly called my attention, is generally human, and in my eyes, less important. One must however give him credit that in the political arena he conducted himself courageously and independently, and just about carried his hide to the marketplace.

Therefore it is more or less justified if we spread the mantle of Jewish neighborly love over him, difficult as it may be.

To the point, I can say in short: catastrophes *yes*, Venus *no*. Now I ask you: what do you mean when you request of me to do my duty in this case? It is not clear to me. Be quite frank and open towards me, this can only be good in every respect.

With cordial greetings to both of you,

Your

A. Einstein.

It took me seven weeks before I replied to him. With my first drafts I was dissatisfied. So many problems were raised that I could not possibly compress them into a letter of reasonable length. I decided on the strategy of challenging Einstein’s contention that terrestrial, not extraterrestrial (astronomical) agents caused the global catastrophes.

I decided not to answer in a direct way his questioning my competence to handle physical problems and, instead, by presenting my arguments, intended to confront him with the measure with which I *can* handle these problems. I omitted to meet his

challenge “Venus *no*”—in our debate this was premature; he agreed that there were global catastrophes, some in the memory of mankind; so next I had to show that only extraterrestrial agents could have been the cause, without identifying the agent.

June 16, 1954

Dear Professor Einstein:

During the three weeks since I received your kind letter, I have composed in my mind many answers to you, and made a few drafts. I realized soon that I would be unable to compress all the problems into one letter and I decided to try to achieve with this writing only one step - to bring you closer to the insight that the global catastrophes of the past were caused not by a terrestrial but by an extra-terrestrial cause. Before discussing this, I would like to say that I am very conscious of the fact that you give me of the most precious in your possession - your time; and I would not have asked to pay attention to these matters if I did not believe that my material may, perchance, serve you too, whatever your conclusions should be. My delay in replying you is certainly not an act of lack of attention; just the opposite - not a quick reply, but a well thought through is a real courtesy.

You agree that (1) there were global catastrophes, and (2) that at least one of them occurred in the not too remote past. These conclusions will make you, too, to a heretic in the eyes of geologists and evolutionists.

Eight years ago, in 1946, under the impression of those chapters of *Worlds in Collision* that you have read then in manuscript, you have acceded in a letter that “in der Tat Katastrophen stattgefunden haben, die auf extra-terrestrale Ursachen zuruckgefuehrt werden müssen.”³

Now, without re-examining the material that made you think so, you would like to retreat from this position. On the other hand, in 1946 you have brought two arguments against my theory, namely:

(1) “Dass diese Katastrophen nichts zu tun haben mit dem Planeten Venus.”⁴

(2) “Dass auch die Rotationstichtung der Erde gegenüber der Ecliptic keine erhebliche Aenderung hat erfahren können, ohne dass die ganze Erdkruste vollig vernichtet worden ware.”⁵

It appears to me that today you keep no longer the second objection in that definite form; you presently assume that the terrestrial crust, rather

catastrophically, moved over the interior of the earth; the experiences that the human kind must have had in such a plunge, would satisfactorily explain the phenomenon of the retreating sun (the cause of a great wrath in the days of Joshua and of Velikovsky as well), the change of cardinal points, of latitudes, of seasons and climate, and the inability of the ancient water- and sun-clocks to show correctly the time of today. It would, however, not explain the change in the number of days in the year, of which all ancient calendars (Maya, Inca, Hindu, China, Persia, Egypt, Babylonia, Assyria, Palestine, Greece, Rome) concur ("Worlds in Collision," pp. 312-359: these pages would certainly impress you).

*Against a terrestrial cause of
global catastrophes:*

The surmise that an asymmetrical growth of polar ice caused in the past a sudden shifting of the terrestrial crust

(1) disregards all references in the folklore to the celestial phenomena accompanying the catastrophe: meteorites and "bursting of the sky," also darkness.

(2) disregards the geological find of unusual concentration of meteoric iron and nickel in the ocean bed (I attach a section of my new manuscript, "The floor of the seas," with a description of the work of M. Pettersson of Goeteborg Oceanic Institute).

(3) disregards the magnitude of the force necessary to move the terrestrial crust over the equatorial bulge. Ice covers of the polar regions are placed in the least favorable position to disrupt the balance. The seasonal migration of ice and snow from one hemisphere to the other never induced the slightest displacement of the poles. And finally, the most important counter-argument concerns the mass and the form of the terrestrial crust:

(4) "The data secured from observations . . . of the transmission of seismic waves indicate that the earth is either solid throughout with the rigidity of steel, or that it is solid to a distance approximately 2000 miles below sea-level, with the solid portions having a rigidity greater than that of steel . . . This seems to indicate a contradiction between isostasy and geophysical data." (W. Bowie, "Isostasy," in *Physics of the Earth*, II, 104).

The theory of isostasy was conceived in 1851 when J. H. Pratt found that the Himalayas do not deflect the plumb line as expected considering the mass of the mountains. It was assumed that the crust is

thin and lighter than the magma and that every mountain has a mirror image protuberance immersed into the magma, thus the excess of the mass of the mountains is counterbalanced by a defect in the mass (difference between the lighter granite of the crust and the heavier magma). This, however, would signify that in order to move the crust over the very dense magma (twice the weight of granite) the isostatic protuberances (besides the equatorial bulge) will present obstacles that cannot be overcome by an asymmetric position of polar ice. If, moreover, the crust is 2000 miles thick, its mass represents a very substantial part of the globe.

What are the arguments against an extraterrestrial cause of the global catastrophes?

Arguments against extra-terrestrial agents are:

1. Ancient solar eclipses would not have taken place in appropriate times. Answer: As shown in my answer to Stewart, there is not a single case known where they actually did. By the way: the same argument, if true, would be good against the motion of the terrestrial crust in historical times.
2. Earth's axis of rotation would wobble: It does.
3. Things would have flown away if unattached: This depends on the time element.
4. Waves of translation and hurricanes would be generated: they were. A section from the first file of my geological work is attached, and explains, partly, the "wilde Raubergeschichte,"⁶ in the (second) file you just read.

Argument against a massive comet: The observed comets are of small mass. In answer:

1. Even Jupiter, as all other planets, was once in the category of comets, according to the planetismal and tidal theories.
2. The origin of the terrestrial planets (Mercury, Venus, Earth, Mars) from the large planets (to explain the difference in the specific weights) is an old legitimate story.

Arguments against the mechanism of disturbance: A gravitational pull by a passing body could not disturb the rotational velocity of the earth or the inclination of its axis. Answer: In *Worlds in Collision* I brought

historical material leaving astronomers to choose:

1. Either the earth was disturbed in rotation,
2. *or* the axis of rotation changed its inclination to the plane of the ecliptic.

Once more, I left for astronomers to choose: The earth was disturbed by entering

1. into a thick cloud of dust,
2. or into a magnet field.

In *Worlds in Collision* I left open the problem which of these mechanisms was in action (p. 386). You are indignant at the idea that magnetic fields had anything to do with the disturbances. You oppose such explanation

1. because magnetic actions are excluded from the celestial mechanics.
Answer: At usual distances. But at close approaches the magnetic fields could be felt.

2. because in a cloud of iron particles there is no reason for all of them to have the same magnetic orientation. Answer: The same question is asked concerning the polarized light of fixed stars that supposedly passes through clouds of gases or dust particles. Also: would the earth, which is a magnet, and possibly has an iron core, moving through a large charged cloud of dust preserve the direction of its axis or not?

The real cause of indignation against my theory of global catastrophes is the implication that celestial bodies may be charged. It was argued that only an astronomer can imagine the degree of coincidence between the calculations based on the gravitational theory and the observed planetary motions. But this very degree of coincidence is disturbing in the face of many facts known about the sun (behavior of protuberances), the planets (influence of radio-transmission), the comets (self-illuminating; behavior of tails), the fixed stars (strong magnets), the meteorites (magnets). Even for the cases of observed anomalies magnetic or electric charges were not considered, as if they were a tabu in celestial mechanics. Of the many unexplained phenomena presented in my address before the Forum of the Graduate College, you have explained only the apparent spherical form of the sun (and was it correct to disregard the very low atmospheric pressure on the sun in calculating its expected shape?), but not why the sun

rotates quicker on the equator, nor many other similar violations of mechanical laws.

Of course, I am a heretic, for I question the neutral state of celestial bodies. There are various tests that could be made. For instance, does Jupiter send radio-noises or not? This can easily be found, if you should wish.

If planets are charged, gravitation is a short range force, a terrible statement to make. Cavendish experiment with varying distances between the attracting bodies would easily disprove such notion. But if I am not wrong, the Cavendish experiment is not performed in a Faraday cage. It should be easy to find out the constant in a cage. But not easy for me. Especially since Shapley in a relentless effort made me “out of bounds” for scientists.

You, too, would not have had any suspicion about my motives in my book on folklore and ancient literature, were it not for the campaign initiated by Shapley. The few pages on astronomy in my book were edited by Lloyd Motz, professor of astronomy at Columbia University. Too early you have thrown the mantle of Jewish compassion over Shapley: you have seen only the beginning of the file of the documents concerning the “Stargazers and Gravediggers” and their leader. His being a liberal is not an excuse but an aggravating circumstance. My appeal to you to investigate this material was prompted by a new attack, a few days before I last saw you. Then I immersed myself in my work and calmed down.

Cordially,

Immanuel Velikovsky

My answer was written three weeks after I received his letter, but for an additional four weeks I postponed sending it to him. Then when my wife brought it (she went to see the new sculpture work of Margot), Einstein came in, and apparently was relieved of a thought that he had perchance hurt my feelings by some of his remarks. He read my letter immediately, and returned it and asked to see my *Worlds in Collision*, to which some references were made in my letter. Next we had a call and invitation to come and discuss the problems raised by my letter.

References

1. See *Stargazers and Gravediggers*, pp. 158-161.
2. pp. 117-118 of the book
3. “that in fact catastrophes have taken place which must attributed to

extraterrestrial causes.”

4. “That these catastrophes can have nothing to do with the planet Venus.”
5. “That also the direction of the inclination of the terrestrial crust towards the ecliptic could not have undergone a considerable change without the total destruction of the entire earth’s crust.”
6. “wild robbers’ story”

July 21, 1954

On July 21st, 1954 our meeting again took place in Einstein's study, and lasted for three hours, from 8:30 pm to 11:30 pm. When in our conversation I reminded him that in 1946 he had agreed that the causes of the global catastrophes were extraterrestrial, he answered:

"I was too rash to agree."

I replied, "Do you rely on your memory more than on your judgment?"—implying that he agreed when my material was fresh before him, and disagreed when he hardly could remember much of it.

Einstein still found attractive Hapgood's theory that ice covers growing asymmetrically caused the Earth's crust to slide. He wished to explain the catastrophes as the result of forces in the Earth itself. I asked how asymmetries of a few degrees could bring the ice covers to latitudes of 45 degrees where the crust would be the most liable to disbalancing. I also pointed out that his rejection of the theory of isostasy, which claims that mountain ranges rest on deep subterranean structures, undermines Hapgood's position about the sliding of the Earth's crust.

The conversation turned to my claim of the participation of electromagnetic forces in celestial mechanics. I said, "All the sciences—neurology, physiology, physics, and chemistry—recognize the overwhelming role of electromagnetic forces; only astronomy lives in an age before kerosene, in the age of candles." Einstein agreed with the thought I had expressed in my letter to him that it is my introduction of electromagnetic forces into celestial mechanics that caused the vehement opposition of the scientists. I explained to him that these matters are not discussed in *Worlds in Collision*, and read him a sentence from the Epilogue of that book:

The accepted celestial mechanics, notwithstanding the many calculations that have been carried out to many decimal places, or verified by celestial motions, stands only *if* the sun, the source of light, warmth, and other radiation produced by fusion and fission of atoms, *is as a whole an electrically neutral body*, and also if the planets, in their usual orbits, are neutral bodies.

Penelope

During the fall of 1954 we did not meet due to Einstein's poor health. He was told by his physician, Dr. Dean, not to see people and to reduce much of his activity. Einstein also ceased going to the Institute. As I heard later, at that time, in the late summer and the fall, his blood condition deteriorated and could not but cause concern. The medical findings were not known to the public, not even to acquaintances; in general there was always a desire to keep personal matters out of the public view. Thus, for instance, once during the period I describe in this book fire broke out in Einstein's house, an old frame structure with a porch, staircase and partitions, all well dried and a little rickety, which could easily be enveloped by fire. It was a case of faulty wiring. When the flames broke out, Einstein, the only man in the house, beat the fire out singlehandedly, first closing the windows to cut off the fire from inflow of oxygen. By the time the fire brigade arrived, the fire was already out. Such an event, if known to newsmen, would certainly have made the front page; but it was kept secret, and the fire department cooperated. The house was rewired.

The gravity of Einstein's sickness was an equally well-kept secret. His mind was inquisitive, but he was deprived of exchange of thoughts. Later I was told that he repeatedly asked to see me; Miss Dukas, however, followed the doctor's orders and kept Einstein in isolation from all but his closest circle. To this circle belonged Gina Plungian, mentioned on an earlier page, the ebullient, warm, outgoing admirer of Einstein, who became like a member of his little household, almost like a fixture in the house. For seven years she sculpted Einstein's head, sitting as quietly as possible in his study while he worked, not saying a word in order not to disturb his thoughts, though this must have been a great privation to her, a great talker and an interested listener to the personal matters of her acquaintances. Einstein and others of his household used to call her, though not to her face, Penelope, because she used to spoil the likeness she had already attained in clay, like the mythological figure who used to unravel during the night the knitting she had done during the day in order to prolong the process—or did it only seem that way? Whatever were Gina's abilities as a sculptor, she tried not to disturb, and all she asked was to sit quietly in some corner when Einstein worked. Some time earlier she and her family had moved away to Chattanooga, Tennessee, where her husband, a chemical engineer, obtained a position; yet Gina managed to come back, by plane or by bus, once in a while, whether the "while" was a month or a week. She would spend the night at our place, and the day at Einstein's. During the fall of 1954 I asked her to carry a letter to Mercer Street and bring back a reply. Giving her the letter to bring to Einstein, I added a little note for her to read to him.

Knowing that he was still weak and not yet recovered from his severe anemia, I felt

that I had to add a human touch to my unbending stand in the problem we discussed.
The note read:

And he said, “Let me go, for the day breaketh.”

And he said, “I will not let thee go, except thou bless me.”

It is from the book of Genesis, from the story of Jacob wrestling with the angel; Jacob rose that night, on his return to the land of his birth, passed over the ford of the Yabbok, and was alone in the dark of the Canaanite night; “and there wrestled a man with him until the breaking of the day.” The angel did not prevail and asked that the struggle cease (“Let me go”), which Jacob refused to do unless his adversary would bless him.

That evening upon her return from Einstein and again at the breakfast table the next morning Gina told us that when she gave my letter to Einstein she, as instructed, read him from my slip of paper the passage that was intended to mollify the impression my intransigence could create. Einstein liked the passage very much. Of course he understood whom I likened to Jacob and whom to the angel. In good humor he observed: “But why should an angel be fearful of the daybreak? What kind of an angel is it?” During the day he returned to that verse from Genesis more than once, and at the dinner table he recounted it to Margot and Miss Dukas. But when in the evening Gina was about to leave—in the meantime he wrote his answer to my letter all along the margins—he called her aside and told her, in German as usual: “Please, don’t say to Velikovsky that I remarked about the angel. Possibly Velikovsky is a religious man, and this remark may hurt his feelings.” Gina told me and I was not hurt; just the contrary—I thought that this was an example of how Einstein was sensitive to the feelings of others. But it was still night, and the struggle had to go on. I was not giving in; I was actually the attacking partner of the debate; the case of the comet grazing the sun was the square on the chessboard which I selected for the encounter decisive for the campaign to follow.

A Comet Grazing the Sun

The problem between Einstein and myself was always the same, and we were equally obstinate: he because the mathematical model coincided with such unimaginable precision with the natural events, nowhere better observable than in the celestial sphere with the planets and their satellites on the prescribed paths; I, because it appeared to me that these exact coincidences between theory and nature had been achieved at the cost of a grievous omission—of electrical charges and fields. Natural catastrophes which I discovered to have taken place were my starting point, but these catastrophes were denied, and my description of the phenomena that accompanied them evoked the accusation that I had committed an outrage against the entire house of science. Yet even independently of what I read in ancient sources, historical or legendary, the picture of the solar system in which electricity and magnetism were absent and denied a role was strange to me. Once I read that the Jewish people produced the geniuses of Marx, Freud, and Einstein—the three men who so greatly influenced the world of today—because by the nineteenth century the Jewish people was mature in intellect, yet foreign to European scientific thought, and entered this domain when no longer novices in the house of learning, therefore more given to criticism, skepticism, and an original grasp of the content. If I saw things differently, it was possibly because I came in conflict with the accepted notions, being myself no longer a fledgling; I did not go through the normal process of studying geology or astronomy as a student in college, accepting everything on faith, subdued by the assertion that science in our days and since some time ago is finally on the right track, after periods of ignorance of the ancients and erroneous ideas of the pre-Newtonian days. I could not help seeing things differently.

I decided to select a case in which electromagnetic interrelations between two bodies in the solar system would be more apparent than elsewhere. Such a case would be in the passage of a comet very close to the sun, actually grazing the solar corona. In my understanding there would be a very pronounced case of electromagnetic interaction. Physical science, or, better, celestial mechanics, forbade such an interpretation—and why? Because as soon as electromagnetism is given right of entry, the entire solar system with planets and satellites would be engulfed in a forbidding sweep of forces and interrelations. If a comet that goes through the corona of the sun experiences some electromagnetic effect, then what about the same comet a little distance from the sun, before it reaches perihelion, or the point of nearest approach, or after it passes it? And if there, too, there should be some electromagnetic effect, then what about still greater distances and the behavior of cometary tails in general? Cometary tails, as already mentioned on earlier pages, keep away from the sun: on approaching the sun the tail moves behind the head of the comet; at the time the comet circles the sun in perihelion, the tail sweeps the sky, almost like a stiff rod; and when the head retreats from perihelion and rushes on its orbit back into space, the tail precedes the

head, again kept away from the sun. The behavior of the cometary tails is not in accord with what should have been expected on the basis of gravitational forces; the tails should be attracted to, not repelled by the sun. The problem was also in the minds of astronomers of the nineteenth century. John Herschel wrote:

There is beyond any question some profound secret and mystery of nature concerned in the phenomenon of their tails; the enormous sweep which it [the tail] makes round the sun in perihelion in the manner of a straight and rigid rod, is in defiance of the law of gravitation, nay, even of the recorded laws of motion.¹

But when at the beginning of the present century the Russian physicist, P. Lebedew, succeeded in demonstrating that light exerts pressure on the surface it falls upon, in agreement with the postulate of Clerk Maxwell, he wrote: "this result is of importance to astrophysics as furnishing a much simpler explanation of the repulsive force of the sun than the hypothetical ones of electrical charges."²

This pressure, or repulsion, is generally much smaller—in the case of the sun 20,000 times less—than the opposite action of the gravitational attraction; but calculation shows that on particles of dust of a certain small diameter the pressure of light will exert a greater force than will gravitation, and this because gravitation acts according to the mass, and pressure according to the surface, and a small particle has more surface in relation to its mass than does a larger particle. Although celestial mechanics never really tried to investigate the problem quantitatively, the explanation was taken over into all textbooks. A quantitative analysis would show that the force needed to drive particles away from the sun at the speed observed must be between 200 and 2,000 times more powerful than the gravitational attraction exerted by the sun, instead of being 20,000 times weaker; (both act as the inverse square of distance—light and its pressure act four times weaker on an illuminated surface when the distance from the source of the light is doubled). A comet may have a tail as long as 100 million miles and thus reach all the distance from the sun to the terrestrial orbit, or even 200 million miles and thus reach past the orbit of Mars.

Finally, the cometary tails obviously have on one hand particles larger than dust grains and on the other hand they contain gases, but it is also obvious that light cannot drive these larger particles as it drives molecules of gases, and on this alone the argument capsizes—and leaves the behavior of tails unexplained.

The light of cometary tails is not just the reflected light of the sun; they glow by their own light, a fact established by spectroscopic analysis. It appeared to me that the comets are charged bodies, and possibly their tails and heads carry significantly different charges.

On the other hand the rotating sun, if it is a charged body, must create a magnetic field. Does not the corona when seen at full eclipse, or with the help of an occultation

disc (coronograph), have the appearance of magnetic lines of force as they can be traced by the position of iron filings spread over a Compton paper, in the presence of a magnetic field? Then would not a comet going through the corona of the sun be subject to electromagnetic interactions? Further, is not a comet held away from the sun by its magnetic field? But if comets are subject to electromagnetic forces when close to the sun, they may be subject to the same forces when at some distance from the sun, too; and if comets respond to forces besides gravitation, are not the planets also responsive to some—large or small or minute—but *some* influence emanating from the sun, besides gravitation, namely of electromagnetic nature? The consequences are innumerable: is space empty, or filled with fields and influences? This is a question not unlike the question in theology: Is there or is there not a God? But now I was like a chess player sitting opposite the world champion, I being just an amateur, a beginner, plotting my attack. I moved a pawn—but I placed it in such a position that the champion immediately grasped the implications of my strategy. Let this move stand, and one by one, the bishop, the castle, the queen, and the king himself would all be under attack. The pawn could not be left in its threatening position.

You can take a pawn from the board if you have a piece in position to do this, and if the consequences will not be harmful; Einstein made his move. It was contained in the remarks he made to a letter I wrote him on September 17, though I did not send it until eight weeks later, with Gina Plungian. I included a note for Miss Dukas. Einstein's handwritten marginal annotations on my letter are here given as footnotes.

November 12, 1954

Dear Miss Dukas:

Enclosed is a copy of my September letter, retyped double-spaced for easier reading. At the end of it stands a question which has far-reaching implications. This is a logical move on my part in our extended discussion, and when Professor feels inclined to answer and his health permits, ask him, please, to dictate whatever he has to say to the problem.

With cordial regards

Immanuel Velikovsky

September 17, 1954

Dear Professor Einstein:

May I renew our discussion? At our last long conversation on July 21, you have acceded that the cause of the global catastrophes of the past

could have been extra-terrestrial.¹

You have found the behavior of Lexell's comet almost unbelievable.²

The next step in my strategy is to show that the comets do not revolve as neutral bodies around a neutral sun. I quote from H. Spencer Jones:

"The presence of bright lines in the spectra [of comets] can only be due to a self-luminous body. . . . the electrical phenomena obtained by discharge through a Gessler's vacuum tube enable the assertion to be made with a high degree of probability that the comet's self-luminosity is due not to an actual combustion, but to an electrical phenomenon."³

More facts point to a charged state of the comets. The envelope (coma) of a comet contracts with the approach to the sun and expands with recession, though in the heat of the sun the reverse could be expected.⁴

"There is good evidence that all particles in the comet influence the motion of each other. The configuration of the streamers in the tails . . . strongly indicates a mutual repulsion." (N. Bobrovnikoff, "Comets" in *Astrophysics*, ed. Hynek, 1951, p. 328).⁵

As to the sun: "Certainly the formation of coronals over centers of attraction and sunspots can be caused by the extended electrical fields of these areas of the sun; just so, coronals can be formed by the electrical fields about the end of a moving prominence." (E. Pettit, "The Sun and Solar Radiation," *ibid.*, p. 296).⁶

When prominences on the sun were observed to run one into another, "both prominences participating in the action recoiled violently . . . Strong electrical fields of the same sign might explain the phenomenon." (*Ibid.*, p. 297).⁷

As to the spherical shape of the sun, the measurements were carried to one hundredth part of a second of an arc, and no departure from spherical shape was observed (*ibid.*, p. 260); the admitted error of observation could not exceed a tenth of a second.⁸

Should we now assume that a comet moves in perihelion without experiencing an electromagnetic effect between itself and the sun?⁹

Cordially yours,

Immanuel Velikovsky

¹ [E.: I saw at that time no other possibility for a quick change of climate at any point of the Earth's crust. But since the mobility of the crust as against the main body is probable, so is an explanation for such phenomena based upon itself much more plausible than the assumption of an extra-terrestrial cause.]

² [E.: As far as the comet is concerned, you have unjustly claimed that it orbited Jupiter for a certain time; this possibility I disputed. In fact, through disturbance by Jupiter the comet repeatedly experienced a strong change in its course, without being "caught" by Jupiter.]

³ [E: This is very vague and has nothing to do with the actual problem of motion.]

⁴ [E: This is a quite superficial way of inference. One would have first to show that the phenomenon cannot be explained through an independent movement of the tail, without assumption of specific forces.]

⁵ [E: A mere assertion.]

⁶ [E.: Vague assertion.]

⁷ [E: This is quite possible with formations which consist of (one-sided) charged ions.]

⁸ [E.: Weak explanation! On this one cannot build. It would be interesting to know what other specialists think of it.]

⁹ [E.: Yes. Otherwise Kepler's third law would not be valid.]

The best I could wish was that Einstein would cede me the point; and the next best that he would answer as he did; thus he documented the position of science on the issue in 1954. Four years will pass and it will be admitted that the pressure of light cannot, by a factor of 200 to 2,000, be the cause of the repulsion of the cometary tails³;

the time will come when scientists will think it elementary that a comet crossing the solar corona could not escape electromagnetic effects; but by then it will appear self-understood that this is as it should be; and then I will need to prove that not so long ago different notions prevailed; and how much easier it will be if a man whose authority is unmatched should have written the verdict of science on the very document in which I claimed a divergent view.

Johannes Kepler, mentioned in my letter and in Einstein's notes, the discoverer of the three laws of planetary motions known by his name, was a man to whom Einstein felt a special sympathy, even affinity.

I was obstinate. I was determined to face the issue squarely on this most obvious case—of a comet going through the corona of the sun. And I had to answer the reference on Einstein's part to Keplerian laws.

January 11, 1955

[sent January 18]

Dear Professor Einstein:

Am I right or wrong in the following: A comet grazing the sun can experience an el.-magn. effect without violating Kepler's 3rd law,¹ because:

1. A static potential difference between the sun and a body on an orbit would also produce an inverse square relation which can be hidden in the gravitational effect.²
2. The magnetic component of the effect would produce acceleration. And actually an unaccounted for acceleration is observed in comets passing close to the sun; this effect was studied on Comet Encke. (J. Zenneck, 'Gravitation' in *Encyclop. d. Mathem. Wiss.* vol. V, part I, p. 44).
3. Even assuming a comet as a neutral body partly consisting of ionized gases, and a solar protuberance as a collection of ions of one sign on a neutral sun, we would have in a grazing comet a conductor passing through an electrical field.

By the way, Kepler himself regarded the motion of the planets and comets on ellipses as originating wholly in the sun, and for a time thought of magnetic action (electricity was not yet known; but Gilbert's book on magnetism already appeared in 1600). Kepler wrote:

" [Sol] trahendo et repellendo retinet, retinendo circumducit" (*Opera omnia*, VI, 345).

Actually Kepler's idea of a magnetic field reaching from a primary to a satellite can be checked as follows:

If the lunar daily librations in latitude follow the rotation of the polar

magnetic field of the earth around the geographical pole, then the magnetic field of the earth reaches sensitively to the moon. Among lunar daily librations are some unaccounted for. According to H.T. Stetson of M.I.T., a magnetic needle slightly follows the sun.

As to Lexell's comet: It was removed by Jupiter from a parabolic orbit to an ellipse of $5\frac{1}{2}$ (five and a half) year period, and at the next passage it was sent away on a hyperbolic orbit. This I mentioned; you have thought it impossible, even after reading this in Newcomb's astronomy.³

You have asked me: what do the specialists say about the shape of the sun. I quote Donald Menzel of Harvard Solar Observatory (*Our Sun*, 1950, p. 39): "but the measures are as likely as not to indicate a *polar* diameter greater than the equatorial, which we are indeed loath to believe."

With all good wishes,

cordially,

Im. Velikovsky

¹ [E: No, that would be a miracle. If the forces of the solar system were of an electrical nature then for instance the following would occur: if the sun were charged positively, then the earth would have to be charged negatively, and the moon again positively. The sun would then repel the moon, so that the moon's motion would deviate considerably from the factual. Kepler's third law which connects periods of revolution and the radii of orbits of planets revolving around the sun would not be valid because the charge of each of these bodies would be independent of the charge of one another.]

² [E: It is not enough for the understanding of Kepler's *third* law.]

³ [E: No, you have stated that the comet was for a time captured by Jupiter. Only this I declared impossible.]

Einstein also appended the following postscript to my letter:

Nobody denies electromagnetic effects between the heavenly bodies. But these are too small to assert themselves upon the observable motions. With qualitative considerations only, one can achieve nothing against keen quantitative perceptions.

When an astronomer hears such arguments as yours, and he has not enough sense of humor, then he necessarily will be angry or rude.

That the sun cannot have any appreciable electrical charge can be seen from the following elementary consideration. The radiation of the sun generates positive and negative ions in its atmosphere. If the sun was originally (for example) positively charged, it would have repelled the positive ions and hurled them into space. Thereby its positive charge would be reduced. This process will last until the sun will have lost its positive charge. This consideration is likewise valid for negative charge.

The solar radiation produces also enough ions on the surface of the planets and moons for a charge to disappear in a short time.

Finally, if gravity were of an electrical nature, then a body would have to lose its weight as soon as it touches the earth, or is brought into conducting contact with it.

The Four Plans of the Universe

During the winter Miss Dukas informed me regularly of Einstein's progress. When he recovered a little he wrote notes to my letter of January 11, and as usual covered the margin of my letter and its back with his handwritten notes. From his answer I felt that I had not yet made myself sufficiently clear, all my discussions with him being up to now more in the nature of prolegomena. At the end of February 1955 I wrote a thirteen-page letter where I stated most of the problems concerning the nature of gravitation and inertia, and discussed the difficulties and the advantages of four plans of the universe. I reminded him of my challenge to him made over a year earlier, to construct a plan for a new universe in which gravitation and inertia would have no part. This time I wrote in German, in order that it should be more comprehensible to him, though it proved to be by far more difficult for me to express myself in writing in this language after years of disuse.

February 2, 1955

Dear Prof. Einstein:

All I wanted in my last letter to you was to gain the concession that a comet, going through the corona of the sun or through an outburst of ionized gases, sustains an electromagnetic effect. The consequences of opening the gate to such an effect into the heavenly mechanics force the astronomer to disregard physical experiences, in order not to violate in the least the system of 1666. But in fact the comets do not follow precisely Kepler's third law: those that pass near the sun (like Encke's comet) show acceleration unexplained by gravitational mechanics.

My knowledge is not great, yet gravitation with static electricity I do not identify, as you understood me and then refuted me with the fall of a body which must discharge itself upon touching the ground. In the following I present my thoughts about the nature of gravitation and discuss also in short—more in the form of questions—the four systems of the world, of which the first is the Newtonian, and the second actually does not violate the Newtonian.

Do you remember how I asked you: If the good Lord would give you the task to conceive a plan for a new universe, where gravitation of the inverse-square variety takes no part, would you be able to comply? To Newton He could not have made such a proposition, since Newton had only a very vague idea of electricity. However, the sentence with which

he concludes the “Principia” is very interesting. I let this sentence follow as a supplement.

Enclosure 1

The end paragraph of the PRINCIPIA by Newton

But hitherto I have not been able to discover the cause of those properties of gravity from phenomena, and I frame no hypotheses . . .

And now we might add something concerning a certain subtle spirit which pervades and lies hid in all gross bodies; by the force and action of which spirit the particles of bodies attract one another at near distances, and cohere, if contiguous; and electric bodies operate to greater distances, as well repelling as attracting the neighboring corpuscles; and light is emitted, reflected, refracted, inflected, and heats bodies; and all sensation is excited, and the members of animal bodies move at the command of the will, namely, by the vibrations of this spirit, mutually propagated along the solid filaments of the nerves, from the outward organs of sense to the brain, and from the brain into the muscles. But these are things that cannot be explained in few words, nor are we furnished with that sufficiency of experiments which is required to an accurate determination and demonstration of the laws by which this electric and elastic spirit operates.

[end of the *Mathematical Principles*; transl. by F. Cajori]

Plan 1

Newton’s plan in which the heavenly bodies in their movements are influenced only by gravitation (and in a very small measure by light pressure). For this plan speak:

- a) The simplicity of the law of gravitation. (The simplicity would be more complete if the same system would also be in action as the dominating force in the atom, and if gravitation, like all other energies in nature, were given to transformations).
- b) The exactness with which the positions of the planets are predicted. (The exactness of Ptolemaic astronomy in predicting eclipses and conjunctions was superior to that of Copernicus; and still the geocentric system is false).
- c) The discovery of Neptune and Pluto (Neptune’s position, but not its distance from the Sun was calculated in advance; Pluto’s mass is by far

not sufficient to explain the disturbances it causes).

Some of the circumstances which cannot be explained, or only with great effort, are:

1. The Sun, Jupiter and Saturn rotate quicker on their equators; the rings of Saturn rotate quicker than the planet. The inner satellite of Mars revolves quicker than Mars rotates; the sun possesses only 2% of the “angular momentum” of the solar system.
2. The Sun’s protuberances *gain* in speed with the distance from the Sun. They fall back as if attracted to the place from which they erupted, falling back (as if on a rubber band) to the sun without acceleration.
3. The Sun’s equatorial diameter is equal to, and in the consensus of other observers is 0.038 seconds of the arc smaller than the polar diameter (and to this says Menzel: “We are loathe . . .”).
4. The tides caused by the Sun in the Earth’s atmosphere are 16 to 20 times greater than those caused by the Moon.
5. The Moon and [some] other satellites always show their planets the same face.
6. The comets’ tails are turned away from the sun and move in perihelion with a speed approaching the speed of light; no attempt at quantitative calculation has been made in this direction.

Plan 2

The heavenly bodies are held in their orbits mainly by gravitation; however they are not neutral.

Since static electricity also acts according to the inverse square law, its presence is masked by gravitation. From this follows: The masses of the heavenly bodies are not exactly calculated.

This plan can explain satisfactorily most of the difficulties of Plan 1. For this Plan 2 speak also, among others, the following facts:

1. The Sun too has a general magnetic field the strength of which is estimated very differently—the difficulty lies in the angle of observation. The corona has a form which resembles the lines of force of a magnetic field and extends far out.

2. In several stars a strong magnetic field (7000 gauss) has been detected. These stars must also be electrically charged because electrical currents would hardly occur on hot stars. The movement of two members of a double star system which rotate around each other in a few hours must probably be affected by more than just gravitation alone.

3. The earth is a magnet. The earth is enveloped in electrical layers of the ionosphere. Chapman postulates a strong electrical layer high (12,000 to 16,000 miles) over and around the earth.

4. The planets Mercury, Venus, Mars, Jupiter, Saturn, clearly influence our ionosphere and radio-reception; Jupiter and Saturn also have a connection to the origin of the sunspots.

5. The polar lights consist of electrical charges which come from the sun and which, after eruptions on the sun, or after the passage of a big sunspot, influence radio transmission and ground currents, and cause magnetic storms.

6. Meteorites are magnetized without exception. Also, upon entering the atmosphere they are regularly diverted toward the east and sometimes even seem to be hurled out after they have already penetrated into the atmosphere.

7. The fact that comets glow in cold space (lines of emission), and also the contraction of their heads when closer to the sun, speaks for an electrical effect.

8. A rise and fall in the strength of mutual disturbances between Jupiter and Saturn in the years 1898-99 as opposed to that of the years 1916-17 (18 % difference: J. Zenneck, "Gravitation" in *Encycl. der Math. Wiss.*, vol. V, first part, p. 44), speaks also for this and the following plans.

As to the argument that the photoelectric effect of the sun would neutralize the charges on the planets, I would like to ask: Would not the photoelectric effect cause charges on neutral planets? And why is not our ionosphere neutralized by the photoelectric effect?

The other argument against this plan is in the assumption that the sun cannot be charged because it would repel the surplus ions. I would answer: According to spectral analysis, the atoms on the sun have been left without many, often without any orbiting electrons. Could not the electrons which have left the protons in their closest proximity where the attraction is tremendous, also have left the sun entirely? Actually the sun hurls out charged particles (polar lights, also cosmic rays) as if

it were charged and would like to reach a neutral state. (However the sun, charged as it is, changes its charge imperceptibly: were it not so, then the system would constantly change its paths.)

Another reply: In the atom the same problem exists: how can charges of the same sign hold together in the nucleus?

Now a third reply: The stars, which are strong magnets, must also be electrically charged, because no electrical currents can exist at such temperatures. Why do the surplus protons or electrons stay there? And if there, then probably also on the sun.

And finally: Should we not, instead of considering the sun as neutral, rather consider the whole solar system neutral, with a surplus of charge of one sign on the sun and of another sign on the planets?

Plan 3

Gravitation would be a force which quickly diminishes with distance. Static electricity would be the dominating force between the heavenly bodies.

This would mean that the force which we know from our experience on earth as gravitation does not effectively reach the moon.

Against such an explanation speaks the fact that the Cavendish experiment under different conditions and distances between mutually attracting masses always showed the same results. However, as far as I can judge, this experiment was not performed in a Faraday cage; at the same time we know that the atmosphere has an electric potential and that the potential difference strongly increases with distance from the ground, but probably could be almost identical in different laboratories.

This plan of static electricity as the dominating force between the heavenly bodies would explain most of the phenomena which are unexplainable in plans 1 and 2, but against it speak the following facts:

1. In the case the planets are all of the same charge (positive or negative), they would repel each other. But would they not behave like two parallel conductors which attract each other when their currents flow in the same direction?
2. If, for instance, the sun is positive and the earth negative, then the moon would again be positive, and the sun would repel the moon.

Plan 4

In this plan, too, gravitation would be a force which diminishes rapidly with distance. Planets, satellites, and comets are charged bodies which move in the magnetic field of the sun, and which themselves create magnetic fields.

This plan would explain:

- a. The retrograde movement of various satellites and comets;
- b. the distribution of angular momentum;
- c. the behavior of cometary tails; also the fact that comets are attracted to the sun from great distances, but were never seen falling into the sun, even though they are unstable in their orbits;
- d. the position of the moon and other satellites which continuously turn the same face to their planets;
- e. the energy of cosmic rays;

also the fact that the sun is hotter in the corona than in the photosphere; and several other facts.

Since magnetic force decreases quickly with distance, the heavenly bodies must be differently charged in order to obey Kepler's laws. The planets which are further away from the sun must have a correspondingly stronger charge. This would be analogous to the arrangement of electrons in the atom. It would also explain the disturbances caused by Pluto, the mass of which is by far not sufficient to explain such perturbations.

Against this (4) plan speak the enormity of electric and magnetic forces necessary to make this plan effective.

The sun moves in relation to the stars; it rotates; the charged planets revolve around the sun, and create a Rowland magnetic field. How does the magnetic field between the sun and the planets behave, and how quickly does it decrease? (The calculations which I received from several young physicists differ greatly and go all the way from $1/r$ to r^4).

But above all, are the physical experiences of laboratories always applicable to the sky? There, a very great and hot mass of gases moves

in the coldness of space; how would the magnetic field behave under such conditions?

It is apparent that plans 2 and 4 sin less against facts and observations than do plans 1 and 3. In order to decide between plan 2 and 4 the Cavendish measurements between impeccably neutral bodies must be repeated. But how impeccably? The electrical repulsion between two protons is 10^{40} times stronger than their gravitational attraction.

With cordial greetings,

Yours

Immanuel Velikovsky

*[It should be noted that during the last two decades or so of Velikovsky's life, the ideas that had been expressed in **Cosmos Without Gravitation** and in the fourth of the "Four Plans of the Universe" no longer reflected Velikovsky's approach to the extent that they once did. In particular, he backed off considerably from the idea of circumduction as a non-gravitational, non-inertial account sufficient in itself to explain orbital motions, and he also backed off from any general suggestions that gravity and inertia might somehow be banned from the celestial arena. What he often said in his later years was, not that gravity and inertia played **no** role, but rather that they did not play the **only** role, that is, that gravity and inertia were not **alone** responsible for what occurred in the celestial arena: electromagnetic interactions also played a considerable role in cosmic events—especially when celestial bodies were in close approach to each other, but also even when they were far apart.]*

*The Space Age brought the myriads of artificial satellites that orbit Earth on different planes and in different directions. Clearly Earth with its magnetic field does not "circumduct" these artificial satellites around itself in a common plane, nor is it able to control their direction of movement. In such cases, some of the lesser variations and perturbations might still be attributed to electromagnetic factors, but gravity and inertia would remain the principal determining factors. It was no doubt such considerations as these that led Velikovsky to change his stance here. In any case, each of "The Four Plans of the Universe," even the fourth, should be taken as a "construction," a working hypothesis for the purposes of discussion, not as a final position. The same is true of **Cosmos Without Gravitation**: not all of the ideas that were formulated in that early monograph were ones that Velikovsky continued to adhere to in his later work.*

Nevertheless, it must be emphasized that Velikovsky did not ever abandon the idea that gravity itself might eventually be interpreted as an electromagnetic phenomenon,

nor did he ever abandon the idea that the solar magnetic field might to some extent be responsible for the fact that the planetary orbits are roughly co-planar and for the fact that all nine of the major planets, and apparently all of the minor planets as well, orbit the Sun in a counterclockwise direction.—Lynn E. Rose]

March 4, 1955

In the beginning of March Einstein started again to visit the Institute; a call came from him through Miss Dukas: would we not come that evening?; he would like to discuss my letter.

Einstein was in his study, his feet wrapped in blankets, and an electric heater burning close by; he stood up in an attempt to bring us blankets too, though it was not cold in the room. A glass of water was on the table in front of him. I had not seen him since he became sick over a half year earlier. His face was rounder, his composure was mellower. He would not argue as vigorously as he usually did, and less often laughed his uproarious laugh.

He read my letter aloud, line after line, and discussed it; he read with great relish the page of Newton's that I included—the very last page from the *Principia*, where Newton made a prophetic statement concerning the role of electricity in nature; and we discussed Newton's discoveries, and the discoveries of Kepler of the ellipticity of planetary orbits. Einstein read my explanation of gravitation as a dipole, but could not see how I explained inertia; of his own work he thought this was the greatest achievement, his stressing the equality of gravitational and inertial masses (I quoted de Sitter that Newton himself regarded this equality as a remarkable coincidence).

We succeeded to read only up to page 9 in my letter—it became late, and although Einstein was prepared to go on reading and discussing, I asked to postpone this in order to spare him. Thus we interrupted the session after plan 2, at about 10:30, after two hours. At the end Einstein told me that I am not given to change of mind.

In general Einstein was on the defensive—insofar as he had to deny many facts and explanations that are accepted in astronomy: he saw the consequence for celestial mechanics where the people who formulated the theories did not see them. In our discussion I mentioned for instance that the unusually high energy of cosmic rays is explained by the existence of magnetic fields in which, as in a cyclotron, charged particles are accelerated in the solar corona, whirled to very high energies. But if there is such a field, the earth, a magnet, must also experience an effect as it travels through it—an argument that came to my mind on the way to Einstein's house that evening. Seeing this consequence, Einstein denied the existence of such a field; the other explanation, that cosmic rays achieve their energy because they are accelerated by a charged earth, certainly did not help him out of the difficulty: therefore he stated that we do not know what causes high energy cosmic rays. The circumstance that the sun rotates more quickly at the equator than at higher latitudes Einstein thought to explain possibly by some thermal effect. But the same phenomenon is observable on

Jupiter, and he wondered that Jupiter is cold; could it not possibly be hot? Are not its satellites illuminated by it?

As to comets' tails, Einstein expressed his disbelief in the high velocities achieved by the tails, and when I referred to John Herschel and W. Pickering, he wished to see the statements. After a few days I mailed these statements to him:

March 7, 1955

Dear Professor Einstein:

I thank you again for the discussion of the first 8 pages of my letter. Here are the quotations from John Herschel and W. Pickering I have mentioned in our last conversation:

“There is beyond any question some profound secret and mystery of nature concerned in the phenomenon of their tails”; “enormous sweep which it [the tail] makes round the sun in perihelion, in the manner of a straight and rigid rod, is in defiance of the law of gravitation, nay, even of the recorded laws of motion.”

J. Herschel, *Outlines of Astronomy*, p. 406

“What has puzzled astronomers since the time of Newton, is the fact that while all other bodies in the sidereal universe, as far as we are aware, obey the law of gravitation, comets' tails are clearly subject to some strong repulsive force, which drives the matter composing them away from the sun with enormously high velocities.”

— W.H. Pickering, article “Comets” in *Encyclopedia Americana*.

Cordially yours,

Immanuel Velikovsky

I cannot say differently: I became strongly attached to Einstein, as a son to a father, and I felt warmth coming in his feeling toward me. He said also that he too had almost everyone opposing him, but it is harder to tangle with them than with me—they would go into mathematics.

March 11, 1955

This evening, as one week earlier, and even more so, Einstein was of unusual concentration. We read the second half of my paper “On the Four Systems of the World.” We sat at the round low table in his study, he at my left, not in an easy chair as he was wont, light shining on the paper that we read passage after passage, stopping and discussing. We started at 8:30 and continued till after 11:15, for two and three quarter hours. This time, in order to keep Miss Dukas awake—her fatigue was usually the cause of our breaking up—I brought with me the first of the three triple-ring binders with “Stargazers and Gravediggers,” the story of the suppression of *Worlds in Collision*; I did not intend it for Einstein but for her, to have my discussion with Einstein unburdened by the usual sight of Dukas, vivid at the beginning of a session, but tired after a day of the many chores of both the household and the secretarial work, when it was close to eleven o’clock. She and my wife were regularly present at our meetings, she (Dukas) rarely leaving the room. She was usually interested in what was talked about, but not in physical problems—and on one of the previous evenings, when Einstein and I were concentrating on reading my paper, she said to my wife: “*Dies sind für mich Bömische Wälder*”—or “These to me are Bohemian forests”—impenetrable woods with no path through them, an expression of utter unfamiliarity with a subject. For an intelligent person associated with Einstein for twenty-five years this actually was a bit of insecurity that should have been overcome; it is a fact that she could carry on intelligently Einstein’s correspondence.

Now she was immersed in reading the account of my experiences. In the quiet atmosphere of the evening, with no exchange of sentences between Dukas and Elisheva, no telephone calls, no doorbell rings, Einstein and I took up passage by passage. That evening we read the third and fourth systems. The third system—the one which has the sun, planets, and satellites carrying static electrical charges, providing the mechanism of attraction, was included for the sake of completeness; the argument that if the sun attracts the earth because of the opposite signs of their charges, it would repel the moon which, in such a plan must have a charge of a sign opposite to that of the earth, but of the same sign as the sun, disposes of this system; it is an obvious argument, and it was also used by Einstein in one of his letters when he did not suspect that my own interpretation of the electromagnetic effects in the solar system was similar at least in some respects to a rather different model, which model was presented as the fourth system. According to it, the central body—the sun—carries an appreciable charge, and by rotating creates an extended electromagnetic field; charged planets move through the field—or are carried by it; those that rotate create magnetic fields and their satellites move through them; their motion is counterclockwise, or clockwise, depending at least in some cases upon the sign of the charge.

Einstein was obviously greatly interested and intrigued by the fourth model. When reading the text we encountered the issue of the decrease of the intensity of a field issuing from a dipole, as the inverse cube of the distance, which would require a greater charge for planets more remote from the sun in order that the overall effect should still follow the inverse square law, and by way of analogy I mentioned that this is the arrangement in the atom, where the electrons on external orbits carry more energy than those on internal orbits; Einstein's face immediately lighted—he was obviously struck by the analogy. This lighting of the face I observed twice that evening: it was as if a hunter suddenly perceived his game.

"And why do you need gravitation at all?" asked he, obviously fascinated by the model. But immediately he corrected himself: "Oh yes, in order to account for the phenomena on earth."

It is immaterial whether Einstein thought, as it appeared to me, that there could be truth in this system of the world; as a theoretician he was obviously fascinated by the model. It certainly appealed to him as a construction. Actually, I was presenting him with what I challenged him to produce at a meeting over a year earlier: "I gave you, Albert Einstein, a very unusual mind and, what is still rarer, the recognition and admiration of your contemporaries: Now build a working plan for another universe; only don't apply gravitation that propagates at the inverse square, but electricity and magnetism you may use as much as you need." "And why do you need gravitation?" he soon asked again, and again trapped himself—"yes, because of the terrestrial phenomena."

For the second time his face uprighted and lighted up when I mentioned that in this system the satellites, depending in part on the sign of their charge, revolve directly (counterclockwise) or retrogradely (clockwise).

His concentration that evening, the omission of counter-argument on his part, usual in our debates, and the great delight that he experienced in reading for three hours the few pages—the second half—of my paper, made us feel closer to each other than at any other meeting. And it was this that made him say at the end of that evening: "I think that it is a great error that the scientists do not read your book—there is much that is important in it"; and even more, that made him confess to me that among the scientists he had met during his lifetime he valued completely, as a human being, only one man—Lorentz of Holland, all others having shown human deficiencies. He expressed himself strongly, and it was a surprise to me that he, regarded by all as so humane and so forgiving, in his unique position which brought him recognition and admiration from everybody, should be so severe a judge of the human nature of all the scientists he knew, famous and obscure. He was standing, animated, telling me what, possibly, he had never said to any outsider; yet Miss Dukas, who was kept awake during the quiet evening by reading my "Stargazers," now by her response to Einstein's words displayed her knowledge of his attitude. Experience had taught him to regard his fellow men with suspicion and to see their moral inadequacies—it sounded almost as if he were a misanthrope, and this surprised me greatly; but I also

felt that he was taking me into his confidence as he had possibly never taken anybody of the outside world. He was certainly very good to me that evening; I felt some tie of great tenderness, and goodwill, and confidence.

"A theory," he said, "has a much greater chance for acceptance if it can predict a phenomenon" ; with these words he parted with me and then he went down the stairs to the door to press my hand again; he said also something about how he enjoyed the evening with me. In his words about a theory attaining success if it can predict a phenomenon was clearly a wish that I should be able to produce such a prediction, and there sounded a sincere desire that my theory should prove true.

I felt as if Einstein blessed me that night. "And he said, Let me go, for the day breaketh. And he said, I will not let thee go, except thou bless me." I probably did not think of these words that I had sent him several months earlier; but I felt an achievement: after all these months of debate about the participation of electromagnetic forces in the working of the universe, now for the first time I had made him understand how I envisaged the plan. The classical plan was compromised by evidence; the static electricity plan did not stand up against argument; but the other two plans—in both of which electromagnetic effects take part in varying degrees—vie for the position of the true system of the world. Now he knew that I was not contemplating a model in which electromagnetism played a static role of attraction and repulsion, but one in which it played predominantly a dynamic role. I presented my discourse in the dispassionate terms of a brief review of four contestants, and left it to reason, calculation, and experiment to make the selection.

The magnetic field of the earth, the origin of which is a mystery, would be a direct effect of a charged body in rotation; the great, almost unimaginable energies measured in billion billion electron volts with which some cosmic rays approach the earth could be explained by the magnetic field in space but especially by the charge of the earth—and in consequence, the linear acceleration experienced by these ray-particles.

I certainly left Einstein with food for thought that night.

The Last Letter

On March 14, 1955, Einstein completed his 76th year. He was adored and admired by all literate humanity as possibly no scientist before him, also admired for his human qualities, regarded as almost divine; but he was a lonesome man. Letters arrived daily at 112 Mercer Street in scores, from great men of the age and from humble ones; from politicians, scientists, and cranks. He liked to receive these letters. Einstein had experience with people who misused his replies and therefore he would keep copies of his answers, usually dictated to Miss Dukas, in the files. Only to very close people would he write by hand, and of these letters, too, Miss Dukas would occasionally then prepare typewritten copies for the records.

For his birthday letters came from all parts of the world, from royalty, academies, statesmen, scientists, the clergy, the military, artists, housewives, students and schoolchildren.

With a short note I sent him my *Ages in Chaos*, which he had not seen (it was published three years earlier) and Elisheva added that year a kiln-burnt ashtray which Margot chose for him out of several, just the littlest present, a thing hardly worth thanking for.

Many letters had Miss Dukas to write to royalty, to statesmen, and to the rest in reply to their good wishes, and she typed them. Einstein hardly wrote even a few of the acknowledgements by his own hand: it would have been an insurmountable task.

Three days after his birthday he wrote by hand one of his last letters, the last to me, or to us, since it was addressed to my wife and myself. He referred to his birthday as “unpropitious,” and how right he was. It was his last. “Soon the Devil will take me,” he once said to me; but deep down he was a religious man and in these words there was as if a confession of man’s sinful nature, in his calling Death by the name of the Devil. Although he was referring to the birthday as unpropitious, he had many plans and much work to do—the low round table in his study often had papers with calculations by his hand, and his great and protracted effort to solve the problem of the unified field theory was still evading final solution.

The following translation into English is as close as the idioms of the two languages permit. He used “corns” for toes.

17.III.55

Dear Mr. and dear Mrs Velikovsky!

At the occasion of this unpropitious birthday you have presented me once more with the fruits of an almost eruptive productivity. I look forward with pleasure to reading the historical book that does not bring into danger the toes of my guild. How it stands with the toes of the other faculty, I do not know as yet. I think of the touching prayer: “Holy St. Florian, spare my house, put fire to others!”

I have already carefully read the first volume of the memoirs to “Worlds in Collision,” and have supplied it with a few marginal notes in pencil that can be easily erased. I admire your dramatic talent and also the art and straightforwardness of Thackrey who has compelled the roaring astronomical lion to pull in a little his royal tail without showing enough respect for the truth. I would be happy if you, too, could enjoy the whole episode from its funny side.

Unimaginable letter debts and unread manuscripts that were sent in force me to be brief. Thanks to both of you and friendly wishes,

Your,

A. Einstein

This letter, for the brevity of which he asked consideration, was written four weeks before his death. By then he had read for the third time my *Worlds in Collision*, and was looking forward with anticipation to reading my historical work, *Ages in Chaos*. His saying that he would enjoy the embarrassment to which my work would probably subject the historians while his own field would be left untrampled, speaks for the difficulties he had lately experienced and for the thoughts during his waking hours in the dark of the night—his sleep was not good—provoked by our discussions in which I acted as if I were the advocate retained by two natural forces, electricity and magnetism, persistent in my calls and letters, unyielding, never retreating.

“I Would Have Written to You”

From Einstein's letter I learned that he had read my *Stargazers and Gravediggers*. Actually I had not intended to show it to him: as already said, on one of those two evenings in March when we read line by line my “On the Four Systems of the World,” and Miss Dukas was present, I gave her the first file of those memoirs to read in order to keep her awake. But Einstein read it as well; in the first file the story is brought up to the time just before my parting with Macmillan.

A year earlier, upon reading the exchange of letters between Shapley and the Macmillan Company, Einstein said that the material must be made public but that somebody with dramatic talent should be entrusted with the presentation of the story; now, upon reading the manuscript, he obviously found that I had succeeded in the task.

The first folder of the “Memoirs” was returned to me—several of its sections were supplied with marginal notes by a pencil, not a sharp pencil to boot. On the back of one of the pages with the story of Larrabee's article in *Harper's*, Einstein wrote:

Ich hätte Ihnen geschrieben: Die historische Argumente für gewaltsame Vorgänge an der Erdkruste sind recht überzeugend. Der Erklärungsversuch aber ist abenteuerlich und sollte nur als *tentativ* behandelt werden. Sonst verliert der wohlorientierte Leser auch das Vertrauen in das solid Begründete.

Translation:

I would have written to you: The historical arguments for violent events in the crust of the earth are quite convincing. The attempt to explain them is, however, adventurous and should have been offered only as *tentative*. Otherwise the well-oriented reader loses confidence also in what is solidly established by you.

If one should compare this evaluation with his own of 1946 (“*Blamage*”) or of 1950 or of 1952 or even of 1954, one must recognize how much Einstein's attitude had changed. He did not protest any more or argue against the events described, neither against the earth being disturbed in its rotation, nor against the role ascribed to Venus; even more remarkable was the fact that he no longer rejected outright the role of electromagnetism in the events and thus, in the celestial sphere in general: he would only have wished that I should not express myself with such finality. By this he made it clear that the explanation which I gave to the events was not

undiscussable—but only that I should have offered it merely as a hypothesis.

Strangely, one of Einstein's marginal notes to my chapter on Lafleur agreed with the latter's argument that the Earth is neutral because of the behavior of the leaves of an electroscope touching the ground—they do not diverge. To me it was clear that the behavior of the leaves does not give an answer to the question whether or not the Earth is charged. The Earth being charged in relation to the upper atmosphere, the lines of force would pass in near-parallel vertically and, consequently, there would be no divergence of the leaves of the electroscope. Nikola Tesla was a great inventor, perhaps the greatest electrical engineer who ever lived; he would not have asserted that the Earth is a highly charged body if such a simple test with an electroscope could solve the problem. Actually, there is a permanent stream of electrons flowing from the ground upwards: it is calculated that between the feet and the head of a standing man of medium height there is a 150 volt potential. The source of this stream of electrons, or of the source of replenishment of the permanent discharge of the Earth, is not known.

The question of whether the bodies of the solar system are charged or not was from the beginning *the* question between Einstein and myself; as he acknowledged in a marginal note to my letter of June 16, 1954, this contention of mine was the main reason for the display of indignation against myself and my work. On that page of the letter, as the reader will remember, I offered a test to find whether or not the planetary bodies are neutral. At that time, in the summer of 1954, Einstein did not undertake anything in answer to my challenge and request; my offer to stake our debate on whether Jupiter is a source of radio waves, he dismissed in his marginal note, and I could not ask for the test again—it was the time when Einstein became sick, the sickness having kept him weak through the entire fall. But when we parted close to midnight on March 11, after having spent two long sessions at a week interval reading my essay, he said those words about the ability of a theory to predict and see its prediction fulfilled.

Jove's Thunderbolts

In the spring of 1955 Providence wished that the drama should heighten itself. The old chief of all the pagans, the planet Jupiter, was destined to enter the scene and speak.

It was a spring day in early April in Princeton. This is the time of year when magnolia flower, and the Princeton campus has not a few of these trees, especially near the Firestone Library, profusely blooming. During the first week of April of that year the semi-annual meeting of the American Astronomical Society convened for three days in Princeton, in the University's Chemical Building (Frick Laboratories). I entered the auditorium during the reading of one of the papers, when the audience was already seated, and chose a place on one of the back benches, close to the entrance. I did not wish to disturb the convention by my presence because, being recognized, I would have caused some discomfort. After listening to Dr. W. Baade and possibly to one more speaker, I left as quietly as I entered—I did not return for other papers. The program of the three-day convention had one hundred and two papers presented by astronomers from all over the country, but only one—not scheduled, yet read because of the great impact it carried in the field of planetary astronomy—made news. The next day, April 6th, opening the *New York Times*, I found a page-length column on a sensational discovery reported at the meeting. The column read in parts:

Radio waves from the giant planet Jupiter have been detected by astronomers at the Carnegie Institution in Washington.

The waves appear to be short bursts of static, much like those produced by thunderstorms on conventional radio receivers . . . no radio sounds from planets in our solar system have been reported previously . . . the existence of the mysterious Jovian waves was disclosed by Dr. Bernard F. Burke and Dr. Kenneth L. Franklin in a report today at a meeting of the American Astronomical Society here . . .

The two scientists said that they did not have an explanation for the observed emission.

— Princeton, N.J., April 6

The discovery was made entirely by chance when the Carnegie Institution astronomers scanned the sky for radio noises from far-away galaxies. In the news release it was told that Burke and Franklin, who detected the radio noises of Jupiter, were entirely unprepared to observe any radio signal from the planet; later their

perplexity was more fully described: at one point they even assumed that some revellers returning from a party were the cause, trying to start the engine of their car, or that the radio noises were caused by some experiments on a neighboring radio station. But the noises were finally traced to Jupiter: in the weeks that followed, Burke and Franklin observed that the signals were arriving four minutes earlier each day and at length they realized that they must be of extraterrestrial origin. Every third night, for six minutes, when the receiving antenna was directed toward the spot crossed at these minutes by Jupiter, the signals repeated themselves. Then the astronomers of Washington came to the correct conclusion, unexpected and surprising as it was.

For me, this news had a special significance. My own earlier expectation of the noises of Jupiter was based on my view of the giant planet as the center of a powerful electromagnetic system. In ancient sources the planet Jupiter was associated with thunderbolts.

Before World War II, a discovery was made by Jansky of the Bell Laboratories that radio signals arrive from the Milky Way. During the War it was discovered by the U. S. Army Signal Corps in Belmar, New Jersey, that the sun sends out radio noises, too: it was a chance discovery made in the process of testing radar echoes from the moon. Then radio noises were found arriving from far-away galaxies and were explained as crashes between galaxies riding through one another. A new science—radioastronomy—was born.

My understanding of the nature of the sun and planets made me assume that these bodies are charged, or that at least their atmospheres are strongly ionized. Of Jupiter and Saturn it is known that they influence in some mysterious manner the solar spot activity: but nobody thought that these bodies or their atmospheres are charged.

Now, seeing my claims confirmed, I called Helen Dukas and told her that I would like to acquaint Professor Einstein with the discovery of the noises coming from Jupiter, and wished to see him, for a few minutes only—we agreed that I should come Friday, April 8th, in the afternoon. Then I called my editor at Doubleday, Walter Bradbury, and told him that I would come the next day, in the morning. Already on the phone I drew his attention to the column in the *Times*. My book, *Earth in Upheaval* was being prepared for print, together with my lecture before the Forum of October 14, 1953 as a supplement,¹ and this lecture contained my challenge that Jupiter would radiate radio signals. For several years I wished that a check should be made on Jupiter, and took this opportunity to suggest it to scientists. In my letter to Einstein of June 16, 1954 I again suggested that an investigation be performed—it was a challenge on my part to Einstein to stake the debate on this my claim and at the same time a plea to help me that the test should be performed. Einstein did not respond in that instance. In a note made on the margin of my letter he wrote that this would be no criterion. This was not well thought through. Either there must be on Jupiter a dissociation of negative and positive charges that would produce thunderstorms of unearthly magnitudes, or, more likely, the entire body of Jupiter is

charged, surrounded by an electromagnetic field, and attracts opposite charges from space, yet by continuous subatomic processes of fission in the great discharges, or by some other process, keeps its general charge undiminished.

The Forum lecture, a discussion of my theses of 1950 in the light of new discoveries in the fields of archaeology, geology, and astronomy, brought in its wake, even sooner than I dared to hope, a confirmation of a bold yet well-founded advance claim. the discovery of the Jupiter noises thrilled me as had no other confirmation before, and it was the first of a long and spectacular series.

References

1. The text was already copy-edited the summer before by Mrs. Kathryn Tebbel, a copy-editor at Doubleday, and the passage carries her pencil marks with two minor stylistic corrections. Thus Doubleday could witness that my lecture about Jupiter was in their hands long before the discovery was made.

“A Near Miss”

On April 8th I saw Walter Bradbury, the managing director of Doubleday, and my editor. He offered to write to the astronomers in Washington—though I told him not to expect anything favorable for me in their response. The same day he wrote this letter:

April 7, 1955

[read April 8, 1955]

Dr. Bernard F. Burke
Dr. Kenneth L. Franklin
Dept. of Terrestrial Magnetism
Carnegie Institution
Washington, D.C.

Dear Drs. Burke and Franklin:

We note the New York Times article of Wednesday, April 6 describing your detection of radio waves from the planet Jupiter.

In this connection I would like to bring to your attention the following passage:

“In Jupiter and its moons we have a system not unlike the solar family. The planet is cold, yet its gases are in motion. It appears probable to me that it sends out radio noises like the sun and the stars. I suggest that this be investigated.”

This passage appears in the manuscript of a book entitled *Earth in Upheaval* by Dr. Immanuel Velikovsky. This passage occurs in a supplement to Dr. Velikovsky’s manuscript which comprises an address given on the Princeton University campus, Forum of the Graduate Students in October 1953. The manuscript including this passage has been in our possession since last Spring and this particular paragraph was edited in our offices in the summer of 1954 by Mrs. Kathryn Tebbel, our copyeditor.

I understand that it was surprising for an astronomer to find these strong discharges on a planet. I would like to suggest that you might be

interested in discussing with Dr. Velikovsky the theory behind his statement in the quoted passage. In any case I would appreciate your reaction to the fact of Dr. Velikovsky's prediction of what you have subsequently discovered.

Yours sincerely,

Walter I. Bradbury
Managing Editor

The answer, signed by Bernard F. Burke and Kenneth L. Franklin, was written on April 12, 1955, and in order not to return to this issue for a while, I give already here the answer:

Mr. Walter I. Bradbury
Doubleday and Co., Inc.
575 Madison Avenue
New York 22, New York

Dear Mr. Bradbury:

Your letter of April 7, 1955, referring to our recent radio work has been received.

In his previous work Dr. Velikovsky has shown a willingness to make frequent speculations on the vaguest (and frequently incorrect) physical grounds. It is not surprising that an occasional near miss should be found in the large number of wild speculations that Dr. Velikovsky has produced, but such a coincidence could never be regarded as a true prediction.

We do not feel anything would be gained from a meeting with Dr. Velikovsky.

Sincerely,

Bernard F. Burke
Kenneth L. Franklin

The Last Meeting

After seeing Bradbury I took the train back to Princeton, and had very little time before my appointment to see Einstein. This time it had been Elisheva who asked me to do something about the fulfillment of my prognosis, and to see Einstein: this was very unusual on her part. It turned out to be my last meeting with him. Elisheva thought to remain in the car because I was dropping in for a few minutes only, but I asked her to enter with me, as at all previous occasions. She would have regretted it later if she had not been present at this meeting, the last, after having attended all our long conversations since November 1953. It was four in the afternoon when we arrived at Einstein's house.

As in all our conversations since the the previous summer, Einstein received us in his study on the second floor. As usual we found him standing in front of his chair to greet his visitors on entering the room. We sat in chairs, the low round table before us. On the table were pages with figures and calculations that Einstein was working on. He sat on my left, close by.

I could not keep to my intention of spending only a few minutes with him because he started on a different subject:

“I have carefully read your memoirs to *Worlds in Collision*, the first two files in their entirety, and most of the third file. It is very well written. But you should shorten it and omit some parts that do not sound proper. The book must be a collection of documents.”

“Give me an example of things to omit.”

“The section about scientists as priests—it is impossible to read it.”

This section, called “Nearer the Gods no Mortal May Approach,” was a biting satire on the astronomers, who have taken over the role of ancient priests in society; they were assured by Halley:

But now, behold,
Admitted to the banquets of the gods,
We contemplate the polities of heaven;
And spelling out the secrets of the earth,
Discern the changeless order of the world
And all the aeons of its history.

Of Newton, Halley said: “Nearer the gods no mortal may approach.” In this early version of the essay I finished this satire with a sentence from Charles Fort: “The astronomers explained. I don’t know what the mind of an astronomer looks like, but I think of a fizzle with excuses revolving around it.”

I accepted Einstein’s criticism without discussing it, and only asked whether he had read the section about himself, “Before the Chair of Jupiter.” He said that he had read it, and smiled approvingly; obviously he liked it.

We did not yet discuss Jupiter; I was precluded from touching the subject by his announcement:

“I have again read in *Worlds in Collision*. It is a book of immeasurable importance, and scientists should read it.” These words, to hear them—had I not come a long way? “But why do you need to change the theory of evolution and the accepted celestial mechanics?” Einstein continued—and the crest inside me started to fall. I was under the impression after our two night sessions in March that I had finally planted a seed of doubt in the accepted scheme, and I expected that this seed would grow in size, not shrink. But saying this, Einstein was again as if retreating to a system of material bodies with no electrical or magnetic interplay between them.

“I could explain everything you describe in your book on the basis of the accepted celestial mechanics of gravitation and inertia.”

“Even the circular orbit of Venus?” I asked.

“Even the circular orbit of Venus,” he answered, “though this would require a very unusual degree of coincidences.”

I admit—I was not equal to the task. Most probably the rush in the morning to New York and then back to Princeton drained me of my usual control—because at all our meetings I was very conscious of every word I said and turn I made. Here, instead of asking him to explain how would he, in theory, be able to make the orbit of Venus almost circular, I permitted myself to slip into a side track: instead of pressing him to tell me his treatment of the facts described in my book concerning celestial mechanics, I sidestepped to answer that part of his challenge that referred to Darwin. It can be understood, because there I knew more than Einstein, and I could elaborate on my opposition to the dogma of uniformity—the discourse of the concluding chapters of *Earth in Upheaval*. And, of course, I could not know that this was our last meeting.

Sometime during this visit I took out my letter to him with his marginal note concerning Jupiter, reminded him very shortly what had been discussed between us ten months earlier, and then read a few sentences from the *New York Times* of the day before about Jupiter. By now he was sitting to my right, facing me. He became obviously very much taken by what he learned, and the next question he asked was

this: “But how did you come to this conclusion?”

Should I have gone once more through all the gamut, played already more than once, and claimed the charged state of Jupiter—because if the solar system is charged, Jupiter would be the focus of much of that charge? Did not also the ancients, from one end of the world to the other, speak of Jupiter’s thunderbolts by which the “three-fold mountain masses fell”? Why did the ancients pray to this planet and sacrifice to it? Or why are Jupiter and Saturn in some way connected with the sun spot periods? By gravitation alone they could not produce such an influence.¹

Or why does the perturbation activity between Jupiter and Saturn suffer changes (between the minimum of the year 1898-1899 and the maximum of 1916-1917 there was found an 18 percent difference).²

And did I not apply the name “a dark star” to Jupiter in the Epilogue to *Worlds in Collision*? Charged and swiftly rotating, it must create an extended and rotating magnetic field in which its charged satellites move. . . Yet I hardly mentioned these things.

But he was embarrassed. Had he not told me when parting after our last meeting in March about the great importance for the acceptance of a theory that it be able to generate accurate predictions? This was on March 11th. Now, four weeks later, I brought him the message that the very probe that I offered as a crucial test between our stands came out in my favor. Now he inquired what my reasons had been. It was not easy to answer his question, because Einstein became very emphatic. He stood up. His face was glowing. He spoke loudly, in a way I had never heard him speak before. “Which experiment would you like to have performed now?” he asked, in obvious desire to mitigate his guilt, because the previous summer he had not given enough attention to my request, and he let my suggestion go without action on his part.

More than once Einstein had asked me to disregard the attitude of my opponents, to enjoy the solitary way, to take an example from him. Now he felt that he had failed me—the test was not made, whether to prove me right or wrong. He answered his own question: “I know which experiment you would like now—the Cavendish experiment in a Faraday Cage.” This was mentioned in my paper we read in March, and he remembered it—I also proposed it in my June, 1954 letter, right after proposing the Jupiter test.

“No,” I said. “I prefer you help me now to have a radiocarbon test for my historical work performed.” And I explained in a few sentences what this test is about. He was more than willing to help. “This will be done,” he spoke loudly and gesticulated, and repeated again, “This will certainly be done.” He was still standing in his excitement. He asked details of what he should do. I told him that I would like him to write to Dr. W. C. Hayes of the Metropolitan Museum of Art. He again asked me to let him know

what exactly he should request and I promised to prepare a short draft in a few days.

But soon he sat again close to me, almost touching my left arm, and listened to me, and peace descended on him; his long hair hung framing his face, his eyes were looking across the room through the picture window toward the upper branches of the big trees in the back yard, and the expanse of the sky.

“Oh, look. Please look,” he cried out and grasped my hand, “the birds are flying in big flocks.”

Hundreds of birds in a fluttering swarm flew at a distance, all in one direction, and the swarm moved in a wave-like motion down and up as they hurried by. I looked for a few moments at the flying birds, and then continued my words. But soon again Einstein, enchanted, looked at another swarm of birds returning from their winter quarters in the south, and again could not resist calling my attention to them. He followed their flight with longing, and his face shone with sweet sadness. It was already the hour of twilight, the trees stood silent outside, still leafless, the branches hardly moving in the stillness of the clear and balmy hour.

We spent over two hours together, a little less than at our other meetings, but certainly longer than the “few minutes” intended.

The Last Week

When I returned home I did what I had never before felt the need to do. Thinking of that part of our conversation where Einstein announced that he could explain all the phenomena described in my book without recourse to electromagnetic interplays, and realizing that I should have stuck to this subject during our conversation, I wrote down how the dialogue went and how it should have gone.

It took me a full week to prepare the few details for Einstein so that he could write to Dr. W. C. Hayes of the Metropolitan Museum concerning the desired radiocarbon tests—but the real cause of my procrastination was my desire to answer Einstein on two points of our debate. Is it possible to measure the charge of the Earth with an electroscope? Is it feasible that the sun may be charged? One of my critics, Laurence Lafleur, of whom Einstein read in File II of *Stargazers and Gravediggers*, asserted in *Scientific Monthly* in an article directed against me that if the Earth were charged, an electroscope would show this. Surprisingly, Einstein thought, too, that an electroscope would reveal whether the terrestrial globe were charged: since the foils are not repelled from one other when an electroscope touches the ground, the globe must be neutral. In the beginning of the week, actually on Tuesday, the 12th of April, I traveled to New York and conferred with Lloyd Motz at Columbia University, on the upper floor of the Michael Puppin Building, as I had done so many times before. He agreed with me that an electroscope would not disclose a charge of the ground. I, of course, counted on the probability that the charge of the Earth as a planet is concentrated on the periphery—the charge of a conducting object is usually spread on the surface—and that either the ionosphere is charged, or that above the ionosphere there are layers of greater intensity of charge.

I invited Dr. Cunningham, a young physicist, then on the staff of the Forrestal Center near Princeton, to spend an evening with me. We discussed the same question: whether one can prove with the help of an electroscope—two golden foils at the end of a rod, inside a jar—that the Earth is neutral. Parallel streams of particles moving not only through the foils but also around and alongside them would keep the foils together; thus an electroscope would not reveal whether the ground—and hence the globe in its entirety—is neutral. Dr. Cunningham agreed with me and explained in greater detail why this is so.

Next we discussed the charge on the sun, and Dr. Cunningham maintained that the sun not only can be charged positively, but that it must be charged so, and this due to the circumstance that electrons have a much greater mobility than the protons, and thus many more electrons must have left the sun before the relatively slow-moving protons could do the same, and the protons thus left behind would be responsible for

the positive charge of the sun. Thereafter positive and negative particles would leave the sun in equal numbers, but the original surplus of positive particles would permanently keep the sun positively charged. Thus in theory the sun not only can be charged, but must be so.

I, however, considered the whole solar system as a unit and a surplus of one sign charge on the sun would be neutralized by a surplus of the other sign charge on the planets, especially the larger planets, primarily Jupiter.

During that week I went also a few times to New York to work with Mrs. Kathryn Tebbel on the manuscript of *Earth in Upheaval*, which she was in the process of copyediting. This absorbed the week. By Friday, April 15th, I had prepared the necessary explanation of what should be asked from Dr. Hayes of the Metropolitan Museum of Art, and had also put into writing my answer to the two problems Einstein and I had discussed: the measurement of the Earth's charge by an electroscope, and whether the sun carries a positive charge.

In addition I answered in some detail Einstein's question about the basis for my prediction of the radionoisies from Jupiter. Finally, I enclosed a clipping from a *New York Times* article of April 12, 1955 about magnetic stars. It read as follows:

STARS CALLED FLATTENED BY ASTRAL MAGNETISM

Chicago, April 11 (UP)—Magnetism is so strong on some stars that they are flattened and look like "flying saucers," a scientist said today.

In fact, he said, there is evidence that cosmic rays, accelerated to terrific speeds by the magnetic fields of the Milky Way, may drain off completely these energy fields in "a hundred million years or so."

The role of magnetism in the universe was described by Subrahmayan Chandrasekhar, Professor of Astrophysics at the University of Chicago. He reported on studies made by himself and the late atomic physicist, Enrico Fermi.

A few notes about our last conversation on April 8th, 1955

1. The difference in voltage—100 volts for 1 meter altitude near the ground—indicates that the Earth is charged by 450,000 coulombs, which is very little for the globe of this size. (It is calculated that the Earth must lose its charge in 8 minutes, but some unidentified mechanism replenishes the charge).

But is it correct that if there is an electric layer far above the ground, the above measurement and calculation do *not* reveal the overall charge

of the Earth, which may be large?

2. A physicist at the Forrestal Center (Dr. Cunningham) expressed to me his opinion that the Sun not only can be charged but must be charged—positively—because the electrons easier surmounted the required velocity of escape from the sun than the protons; the equilibrium (balance) in escape of positive and negative ions was established after the sun was charged positively. Is it so?

3. Enclosed is a clipping from NYTimes, April 12th, concerning an opinion expressed by Chandrasekhar of the University of Chicago on magnetic stars.

4. My Jupiter prediction. In my letter to you of June 16, 1954, on which I worked for several weeks, I included my request to help me with the performance of two tests: “Does Jupiter send radio-noises or not? This can easily be found, if you should wish.” And “It should be easy to find out the [gravitational] constant in a cage. But not easy for me. Especially since Shapley in a relentless effort made me ‘out of bounds’ for scientists.” You found the tests unnecessary because no revealing results would be discovered.

Before writing to you, I wrote in my lecture at the Forum of the Graduate College: “In Jupiter with its moons we have a system not unlike the solar family. The planet is cold, yet its gases are in motion. It appears probable to me that it sends out radio noises like the sun and the stars. I suggest that this be investigated.” A copy of my address was read by you, and another copy with that prediction is still, now over a year, in the hands of Professor Bargmann.

A few weeks ago very violent noises were discovered coming from Jupiter, to the general surprise of the discoverers and astronomers in general. Now you say that I have not given an adequate substantiation of my prediction and therefore the revealed results do not support me. Only shortly before you said that a predicted discovery carries great weight.

Knowing from the ancient literature of the behavior of Jupiter and realizing its part in the great perturbations of the early historical past, I made my prediction. From the ancient traditions of many peoples of the world, I learned about violent discharges between Jupiter and bodies that passed close by. I concluded also that the connection between Jupiter and the solar spots cannot be purely gravitational; I assumed the charged state of Jupiter; in such case Jupiter would attract to itself charges of opposite sign and cause radio noises; or, if Jupiter is neutral, charges separated in Jupiter’s atmosphere would cause strong

discharges; such discharges, if directed to passing bodies, would have been the thunderbolts of Jupiter. Phaethon that caused the conflagration of the world by turning the solar chariot from its charted path, was struck by the thunderbolt of Jupiter and was changed into the Morning Star (Hyginus). Seneca distinguished lightnings that “seek houses” or “lesser bolts” and the bolts of Jupiter “by which the threefold mass of mountains fell” (*Worlds in Coll.*, p. 272, German edition p. 288). Much more on this subject will be in my story of earlier catastrophes, Deluge, Sodom and Gomorrah. Sulphur falling from the sky was, in my opinion, the result of nuclear fusion of two atoms of oxygen, at interplanetary discharges (On brimstone and fire from heaven—Genesis 19:24 and many other sources), or at least discharges between an overcharged ionosphere and the ground. In my letter to you I have not given the extensive literature to support my claim.

Whether my ground was firm or weak, now that my prediction is fulfilled, should we follow the evangelical rule (Matthew 13:12):

“For whosoever hath, to him shall be given, and he shall have abundance: but whosoever hath not, from him shall be taken away even that which he hath.”

On Friday, April 15th, armed with these materials, I telephoned Einstein’s home. I wished to see him. Miss Dukas as usual answered the telephone. “How is Professor? I prepared . . .”

But Miss Dukas answered in a sad voice: “Oh, dear Doctor, we are awaiting the ambulance to take Professor to the hospital. In less than an hour the ambulance must arrive. Since Wednesday he has felt very strong pains. Dr. Dean says it is of gall bladder that is very hot and painful.” My heart sank.

Einstein could suffer pain without complaining. He would not have agreed to go to a hospital were there not a great need for that. Miss Dukas sounded very worried. I asked her to call me the next day, and to tell of Einstein’s state of health. The next day, Saturday, I had a worried call from Dukas. She was alarmed. Einstein awaited his son from California. But the world, the town, and even close acquaintances were kept ignorant of Einstein’s sickness and the fact that he had been hospitalized. I kept the secret too.

The day thereafter, on Sunday, Dukas called and said: “It is better, definitely better. His son arrived from California. He wished to have him here.” Einstein’s physician wished to perform surgery—as I understood for gall bladder—but the Professor refused—with humor, but firmly; he said that he did not wish to be cut. A little reassured, but not in full measure, I spoke a sentence or two of our meeting nine days earlier and repeated Einstein’s words about my book. It was an achievement of eighteen months of struggle; probably I should not have at that hour thought about

my work and about what Einstein said at our last meeting. but it was as if I wished to be near him and talk to him again; I felt gratitude to him, the great scientist who through months of sickness occupied himself with my ideas and read my manuscripts and books at a time when the scientific world with its press was cruel to me.

Sunday passed—I do not remember whether we had another call from Dukas or not. It would not have been proper to call the hospital.

The following night I slept peacefully and, if I remember right, Elisheva and I both dreamt of Einstein. At eight in the morning I went to our garden, where the forsythia were already in bloom. I met Mrs. Baker, the neighbor, who said: “Have you heard on the radio? Dr. Einstein died this night.”

In silence I moved away and said the Hebrew prayer for the dead that is supposed to be said by a son after his father’s or mother’s death, in a congregation of not less than ten men, but that after the death of my mother I would often say walking along a road on the ridge of Mt. Carmel. The last sentence of it reads: “He who established peace in the sky will bring peace to you and the entire Israel!” The words “peace in the sky” or “peace on high” have a meaning in the light of events illuminated in my *Worlds in Collision*, and I think the rabbis who composed the prayer in ancient times had those events in mind. Einstein became a paternal figure to me, and though our meetings took place only once in a while, during these eighteen months we were often in each other’s thoughts.

The morning newspapers had no word about Einstein; his sickness, his being in the hospital, were known only to a few people, besides the personnel of the hospital, and did not leak to the press; therefore when he died in the night from Sunday to Monday, the *New York Times* and other always well-informed papers appeared with nothing even remotely foreboding the death of the most famous man on earth.

I went to the hospital. On the way I met Dr. Irving Levey, the Jewish chaplain of the University, on a bicycle—already on his way back from the hospital. We hardly exchanged a few words—there was nothing to say.

The begrudging press, which learned the sad news from the radio after an announcement by the hospital, hurriedly sent their correspondents, who tried to pry something out of anybody entering. Margot Einstein was sick in bed in the same hospital and in her room the “inner circle” gathered—only five or six persons. At first I was not admitted—to the inner circle I did not belong. Dr. V. Bargmann, physicist and close collaborator of Einstein arrived simultaneously with me and went up. Leaving the building I was met in the courtyard by Mrs. Ladenburg, the widow of a physicist and a close friend of the family, and she insisted on my going with her to Margot’s room. I was too passive to resist.

In her room I saw for the first time Hans Einstein, the son, professor of agricultural engineering in California; he looked handsome and unexpectedly young. The few

who were in the room stood at the wall next to the window, but in shade. Margot, always very kind to me, stretched her hands to me from her bed. I said nothing. Dukas came close to me from the row of the standing figures with dimly lit faces along the wall and spoke to me softly and quickly, narrating how everything happened; I listened but do not know what I heard. I brushed a tear from my eye and without having said a single word left the room. In the hall again a newspaperman started to question me. I advised him to clear his story with Helen Dukas at a later time.

At the time I was in the hospital, only a few hours after Einstein's death, the autopsy was being performed; it was found that Einstein had died of a bleeding aorta, a painful process that, as I learned later, was already chronic with him. And his brain, still warm, was being taken from the opened skull by Dr. Thomas Harvey, the hospital's pathologist, a pleasant and thinking man, shy too; but how could he drill into Einstein's head and pry open his skull? I had the feeling that all was done in a hurry. It seemed to me almost as if the brain still had its molecules moving in a thinking or feeling process. Dazed, I hurried from the hospital and went home.

Einstein ordered in his will that his body should be cremated, and only his brain should be used for scientific purposes. His body was cremated not far from the city borough that very day, so that when the next day's papers printed their story, they had to tell in one single issue of his disease, death, and cremation.

I did not feel like going to the library or working at my desk. I took the family (our daughter Ruth had moved recently from California with her husband) into the car, and drove for over an hour in a great circle on country roads around Princeton, past blossoming orchards, with the sky wide open over the spring ground. At that very hour Einstein's ashes, atomized to elements, were being spread over the fields in the afternoon spring breeze. He was consumed by fire and his physical remains returned and mingled with the cosmos and became a part of it, inseparable and anonymous.

Nine days earlier we had brought close to conclusion a protracted debate. "I will not let thee go unless thou bless me." I thought of the words I once wrote to him. I thought also of the longing look with which he followed the birds flying in formation back from their winter quarters, before the dusk when we sat that last time in his study, facing the window. "Do you see the birds flying?" he asked me. But now in my memory it sounded as if he had said: "Let me go."

Gina Plungian who arrived the same day went with Helen Dukas to the study to find how everything had been left there the Friday before. On Einstein's table close to the window was *Worlds in Collision* in German, with many strips of paper between the pages, and open on some page. It was the last book that he read, actually re-read for the third time, each time differently impressed. I was also the last man with whom he discussed a scientific subject (besides a doctor friend from Switzerland, with whom, as I was told by Miss Dukas, about the time of my last visit he also discussed some scientific matter).

The subject we discussed was brought to the finale. Especially grateful I was for the two long evening sessions in March when we read line by line my short essay. Only then did he really understand my thoughts.

I never discussed with him the Theory of Relativity. But by implication it was involved in our debate and even very heavily.

Days passed. The town of Princeton was orphaned but went its normal way. I had the sensation as though I had lost my father for the second time. I could not know him as closely as some others knew him, like Miss Dukas, who was his secretary for twenty-six years. But there was some special bond forged, a kindness and an empathy—and now the link was torn and the town became empty for me. His associates took it much easier, or so it appeared to me. Several days later Margot lost her pet bird which she had taught to share with her hours of vigil and sleep and who ate from her lips, and she was grieving over the bird. Miss Dukas was lifted by the great responsibility that now fell on her, with the archive and manuscripts, and she was up to this, and soon she was even more resolute than ever.

In the daily press one could read that there was already strife over who, the Montefiore Hospital in New York, or the Princeton Hospital, should have the brain of the deceased for study. Later there was some compromise achieved. When years afterward I asked Dr. Harvey, who sliced the brain, whether he found any unusual traits, he, in his shy and modest way, admitted that no unusual traits in form, volutions, or size were observed. If anywhere or anytime there was need to show how little we know of the human soul and its housing in matter, here was the case.

The Einstein-Velikovsky Correspondence

This correspondence is discussed in Velikovsky's book [Before the Day Breaks](#)

A Technical Note

I have been asked by the compilers of the Velikovsky archive to briefly describe the present condition of Velikovsky's unpublished manuscript entitled *In the Beginning*. As Velikovsky explains, parts of this volume were already complete in the 1940s and originally formed part of *Worlds in Collision*. The present manuscript also incorporates material written for a volume entitled *The Test of Time*, which dealt with the new information on the planets coming from the space probes, and contained frequent allusions to the earlier catastrophes; this work will probably never see publication. Other material included in this manuscript comes from Velikovsky's lectures and other scattered writings. During the time that I worked for Velikovsky (1976-1978) one of my tasks was to complete the cataloguing of his library notes, mostly from the 1940s. The headings of the catalogue generally corresponded to the section headings in *Worlds in Collision* and *In the Beginning*. The completion of *In the Beginning* was a cooperative effort between Velikovsky and myself. After Velikovsky's passing, when I returned to Princeton to work on his archive, I systematically moved the parts contributed by me into the notes apparatus and this is how this material appears in the unpublished manuscript.

Jan Sammer

In this edition Jan Sammer's annotations are distinguished from Velikovsky's text by being placed in square brackets and displayed in red letters. For the reader's interest we reproduce here the title page of Velikovsky's manuscript.

In the Beginning

by

Immortal Velvety
author of World in Collision and
Age in Chaos

This volume is carries the name In the Beginning - the words with which the book of Genesis starts. This name is appropriate because it for this volume - because it describes the events of cosmic events which are narrated in the first book of the Hebrew bible; but also because in it I speak of events that precedes those which were described by me in World in Collision - and the name of the book convey to the reader that to ~~read~~ ^{read} here an earlier history of the world compared with the story which started in the middle of the second millennium before the present era of World in Collision; and though it is a second volume of that series, in some sense it is the first volume, being the earlier story.

The Editors

INTRODUCTION

This volume carries the name *In the Beginning*—the words with which the book of Genesis starts. The name seems appropriate because it describes the cosmic events which are narrated in the first book of the Hebrew Bible; but also because in it I speak of events that preceded those described by me in *Worlds in Collision*—thus the name of the book conveys to the reader the notion that here is an earlier history of the world compared with the story of *Worlds in Collision*; although it is the second volume in that series, in some sense it is the first volume, being the earlier story.

When the manuscript of *Worlds in Collision* was first offered to the publisher (Macmillan Company, New York) it contained a brief story of the Deluge and of the cataclysm that terminated the Old Kingdom in Egypt. But after one of the publisher's readers suggested that the book should concentrate on one event, we compromised in presenting in the published volume two series of cataclysms—those that took place in the fifteenth century before the present era and were caused by the near-approaches of Venus, and those that occurred in the eighth century before this era and were caused by the near-approaches of Mars. The unused material was left for elaboration in a separate work on "Saturn and the Flood" and "Jupiter of the Thunderbolt." The reception of *Worlds in Collision*, however, made me understand that I had already offered more than was palatable. And so I did not hurry with what I consider to be the heritage of our common ancestors, an inheritance of which my contemporaries in the scientific circles preferred not to partake.

Researching and writing this book, I would sit at the feet of the sages of many ancient civilizations—one day of the Egyptian learned scribes, another of the Hebrew ancient rabbis, the next of the Hindus, Chinese, or the Pythagoreans. But then, rising to my feet, I would confer with present-day scientific knowledge. At times I came to understand what perplexed the ancients, and at other times I found answers to what perplexes the moderns. This shuttle back and forth was a daily occupation for a decade or more, and it became a way to understand the phenomena: to listen to those who lived close to the events of the past, even to witnesses, and to try to understand them in the light of the theoretical and experimental knowledge of the last few centuries, in this manner confronting witnesses and experts.

I realized very soon that the ancient sages lived in a frightened state of mind, justified by the events they or their close ancestors had witnessed. The ancients' message was an anguished effort to communicate their awe engendered at seeing nature with its elements unchained. The moderns, however, denied their ancestors' wisdom, even

their integrity, because of an all-embracing fear of facing the past, even the historically documented experiences of our progenitors, as recent as four score generations ago.

I have deliberately described the catastrophes of the second and first millennia before this era before I describe the catastrophes of the previous ages. The reason is obvious: the history of catastrophes is extremely unsettling to the historians, evolutionists, geologists, astronomers, and physicists. Therefore it is preferable to start from the better known and then proceed to the less known. For the last catastrophe caused by the contact of Mars and the Earth I could establish the year, the month, and even the day; not so for the catastrophes in which Venus and the Earth participated, when only the approximate time in the space of a definite century could be established. Still, I found it advisable to narrate the story of the second millennium first: it was possible to write the story of the contacts with Venus with a fair amount of detail. But each cataclysm is not only more remote in time from us, it is also obscured by the catastrophes that followed. As we seek to penetrate ever deeper into the past, we can see the foregoing periods through the veil of the catastrophes; dimmer and dimmer is the light behind every veil, till our eye can distinguish no more behind the veil that hangs over the period when the Earth was Moonless, though already inhabited by human life. We do not know the beginning; we can only enter the theater at what may have been the third or fourth act.

The Hebrew Cosmogony

This world came into existence out of a chaos of fluid driven by a divine blast: this is the epic beginning of the Book of Genesis: “The earth was chaotic and void; and darkness was upon the face of the deep; and God’s wind moved upon the face of the fluid.” From this primeval matter, in a process of subsequent creations, was born the home of the living.

Already before the birth of our Earth, worlds were shaped and brought into existence, only to be destroyed in the course of time: “Nor is this world inhabited by man the first of things earthly created by God. He made several worlds before ours, but he destroyed them all.”⁽¹⁾ The Earth underwent re-shaping: six consecutive remouldings. Heaven and Earth were changed in every catastrophe. Six times the Earth was rebuilt—without entire extirpation of life on it, but with major catastrophes. Six ages have passed into the great beyond; this is the seventh creation, the time in which we live.

According to another tradition, several heavens were created, seven in fact. Also seven earths were created: the most removed being the seventh Erez, followed by the sixth Adamah, the fifth Arka, the fourth Harabbah, the third Yabbashah, the second Tebel and our own land called Heled, and like the others, it is separated from the foregoing by abyss, chaos, and waters.⁽²⁾

The description permits an interpretation that all the seven earths exist simultaneously; but a deeper insight will allow us to recognize that the original idea did not admit seven concurrent but separate firmaments and worlds in space, but only consecutive in time, and built one out of another: “The seven heavens form a unity, the seven kinds of earth form a unity, and the heavens and the earth together also form a unity.”⁽³⁾ The Hebrew cosmogony in its true sense is a conception of worlds built and reshaped with the purpose of bringing creation closer to perfection. The separation of one world from another by abyss and chaos evidently refers to the cataclyms that separated the ages.⁽⁴⁾

[The notion of a succession of worlds created and destroyed is common to many nations of antiquity. Vicentius Sangermano (*Cosmographia Burmana*, quoted by F. Buchanan, “On the Religion and Literature of the Burmas,” *Asiatick Researches* VI [1799], p. 174, 180) wrote: “The Universe is called by the Burmas *Logha*, which signifies successive destruction and reproduction.... The Burma writings do not conceive of one world, but of an infinite number, one constantly succeeding another; so that when one is destroyed, another of the same form and structure arises....”].

Planet Ages

The ages of the past, between the successive catastrophes, are called in many diverse sources “sun ages.” I have tried to show why this designation is meaningful.⁽¹⁾ But the ancients also maintained that the successive ages were initiated by planets: Moon, Saturn, Mercury, Jupiter, Venus, Mars. Therefore the sun-ages could also have been called planet ages.

Hesiod ascribed the Golden age to the time when the planet Saturn was ruling, and the Silver and Iron ages to the time of the planet Jupiter.⁽²⁾ The same concept is found in Vergil, who says that “before Jove’s day [i.e., in the Golden age when Saturn reigned] no tillers subdued the land—even to mark the field or divide it with bounds was unlawful.”⁽³⁾

The idea that the Earth was under the sway of different planets at different ages is also the teaching of the Pythagoreans, the Magi, Gnostic sects and other secret societies.

In numerous astrological texts the same concept is repeated, that seven millennia were dominated by seven planets, one after the other.⁽⁴⁾

The worshipers of the devil, the Syrian sect of the Yezidis, believed that seven thousand years had passed since the Deluge; at the end of every millennium one of the seven planet-gods descends on the earth, establishes a new order and new laws, and then retreats to his place.⁽⁵⁾

An identical tradition is found in the writings of Julius Africanus: the ages of the ancestors passed under the government of the planets, each in its turn.⁽⁶⁾ Also according to the Ethiopian text of the *First Book of Enoch*, the seven world-ages were each dominated by one planet.⁽⁷⁾

The gnostic sect of the Mandaean taught in its holy book *Sidra Rabba* that the history of mankind is composed of seven epochs, that these epochs were terminated by catastrophes, and that one of the planets ruled in each epoch.⁽⁸⁾

The length of the ages in the *Sidra Rabba* is made very long, but the concept is, nevertheless, common to many ancient creeds.

Sabbath

The idea of naming the days of the week in honor of the seven planets was, according to Eusebius, introduced by the Persians at the time of the war of Xerxes against Greece.⁽¹⁾ Dio Cassius, the Roman author of the fourth century, wrote that the division of the week into seven days in honor of the seven planets originated with the Egyptians, and then spread to other peoples.⁽²⁾

Even today the names of the days of the week in European languages can be traced to the names of the planets. Thus the Roman *dies Solis* (Sun), or Sunday, is *Sonntag* in German; *dies Lunae* (Moon), or Monday, is *lundi* in French and *Montag* in German; *dies Martis* (Mars), or Tuesday, is *mardi* in French and *martes* in Spanish; *dies Jovis* (Jupiter), or Thursday, is *jeudi* in French and *Donnerstag* in German;⁽³⁾ Friday is *dies Veneris* (Venus), or *vendredi* in French, while Saturday is *dies Saturnis*, the day of Saturn.⁽⁴⁾

The naming of the seven days of the week in honor of the seven planets is not only an act of reverence apportioned to these gods, but also a memorial to the seven ages that were governed by each of the seven planets in succession. This idea can be traced in the establishment of the Jewish week with its Sabbath. Although the social significance of the Sabbath as the universal day of rest for man, his servant, and the domestic animal working for him is so apparent from many passages in the Scriptures and especially from the beneficent application of a weekly day of rest by all civilized nations that took this precept from the Hebrew Bible, the cosmological meaning of the Sabbath must not remain overlooked.

In six ages the world and mankind went through the pangs of genesis or creation with its metamorphoses. It is not by mistake that the ages which were brought to their end in the catastrophes of the Deluge, of the Confusion of Languages or of the Overturning of the Plain, are described in the book of Genesis: the time of Genesis or creation was not over until the Sabbath of the Universe arrived. With the end of the world age simultaneous with the end of the Middle Kingdom and the Exodus, the Sabbath of the Universe should have begun.

The destruction of the world in the days of the Exodus closed, in the conception of the Hebrews, the age of creation. It was to signify the end of the time when the Earth and men were to be shaped and reshaped. The traditional and very old Hebrew prayer at the beginning of the Sabbath opens with these words: "The sixth day. And the heavens and the earth were established. And the Lord finished in the seventh day the entire work that He did and rested from all the work that He did."

The meaning of this passage is that in six world ages the heavens and the earth were finally established, and that now, in the seventh age, no further changes in the cosmic order should be expected. The Lord is actually implored to refrain from further reshaping the Earth.

The idea that God's day is a millennium is often met in Talmudic literature; the apostle Peter also says: "One day is with the Lord as a thousand years." ⁽⁵⁾ Thus the seven days of the week represent seven world ages; and the day of the Sabbath represents the seventh world age, which is our age. According to the rabbis of the Tractate Shabbat of the *Babylonian Talmud*, "Sabbath" is to be interpreted as *sabbatu* - cessation of the divine wrath. ⁽⁶⁾ This fits exactly our idea of the Sabbath as the age of rest when the heavens and the earth are established and are not to be disturbed again.

Many exegetes have wondered as to why the prayer of benediction to the Sabbath starts with the words: "The sixth day," expecting to find there the words "The seventh day." The words "the sixth day" are not necessarily wrong here: the meaning may be that with the expiration of the sixth age the heaven and the earth become unchangeable. But it may be that the prayer originated in pre-Exodus days when only six ages were counted. The prayer next refers to the Sabbath as "the day of rest, the memorial to the act of genesis, because this day is the beginning of the reckoning of days, memory of the Exodus from Egypt." The assembling of three different causes for the establishment of the Sabbath would appear confusing were it not for the fact that the three occurrences were simultaneous: the last act of creation, the new flow of time, the Exodus from Egypt.

Although after the beginning of the seventh age new world catastrophes disrupted the established order—in the eighth and seventh centuries before the present era—the idea of the Sabbath of the Universe was already so deeply rooted that the new world catastrophes were not counted, so as not to discredit the establishment of the Sabbath. But the return of the sun's shadow ten degrees in the days of Hezekiah and Isaiah was registered as "the seventh world wonder," ⁽⁷⁾ and thus actually the eighth world age started. The difference in the magnitude of the catastrophes caused also some nations of antiquity to count six, seven (as most nations), or eight, or nine, or even ten ages; ⁽⁸⁾ one and the same people, like the Mayas, had traditions of five and seven ages in diverse books of theirs. Also, catastrophes recurring at short intervals, as those which took place in the eighth and beginning of the seventh century before the present era, could be regarded as the closing of one age, or a few short additional ages could be conceived. Catastrophes, variable as they were in their magnitude and consequences, could have had a subjective appraisal. Even the encounter of the earth with a lesser comet, which appeared very bright, in the days when Octavian Augustus observed the mortuary activities in honor of Julius Caesar, and which dispersed its gases in the atmosphere of the Earth, was regarded by one contemporary author as the end of a world age and the beginning of a new one, although no perceptible changes in the

motion of the earth and no greater calamity than a year-long gloom were observed. ⁽⁹⁾

The Sabbath being a day of rest in the social order, its cosmic meaning in the great fear of the end of the world can be suspected also in view of the rigor with which it was observed; at the beginning of the Christian era, members of some sects among the Jews would not even move, and would remain in the place and position in which the beginning of the Sabbath found them. ⁽¹⁰⁾ Social institutions are generally not observed with such an awe and with such rigor. It was actually not the Deity, having worked during six ages and reposed in the seventh who gives example to man; it is man, by abstaining from work on the seventh day, the symbol of the seventh world age, who invites the Supreme Being to keep the established order of the heaven and earth, and not to submit them to new revolutions.

The same idea is found in the prayer of the Chinese Emperor Shun, who lived shortly after the Emperor Yahu. This prayer, declaimed by him, reads: “The sun and moon are constant; the stars and other heavenly bodies have their motions; the four seasons observe their rule.” ⁽¹¹⁾ A number of centuries thereafter, in the days of the Emperor Kwei, the order of the celestial sphere was again disrupted: “the planets went out of their courses.” ⁽¹²⁾

Also Hebrew psalmists and prophets tried to suggest to nature to abstain from revolt; but at the same time they expressed their fear of changes in the future comparable to those in the past. After more than two thousand five hundred years, one of the two original ideas of the Sabbath, its cosmic meaning, was lost to mankind, leaving the social idea conscious and triumphant the world over.

Deification of the Planets

The Sun and the Moon are two great luminaries, and it is easily understandable that the imagination of the peoples should be preoccupied with them and should ascribe to them mythological deeds. Yet the ancient mythologies of the Chaldeans, the Greeks, the Romans, the Hindus, the Mayans, preoccupy themselves not with the Sun or the Moon, but *prima facie* with the planets. Marduk, the great god of the Babylonians, was the planet Jupiter; so was Amon of the Egyptians, Zeus of the Greeks and Jupiter of the Romans.⁽¹⁾ It was much superior to Shamash-Helios, the Sun. Why was it revered by all peoples? Why was the planet Mars chosen to be the personification of the god of war? Why did Kronos of the Greeks, Saturn of the Romans, play a part in hundreds of myths and legends? Thoth of the Egyptians, Nebo and Nergal of the Babylonians, Mithra and Mazda of the Persians, Vishnu and Shiva of the Hindus, Huitzilopochtli and Quetzalcoatl of the Mexicans, were personifications of planets; innumerable hymns were dedicated to them and adventures and exploits ascribed to them.

“The life of our planet has its real source in the Sun,” wrote E. Renan. “All force is a transformation of the Sun. Before religion had gone so far as to proclaim that God must be placed in the absolute and the ideal, that is to say, outside of the world, one cult only was reasonable and scientific, and that was the cult of the Sun.”⁽²⁾ But the Sun was subordinate to the planets, even though they are not conspicuous, poor sources of light, and no sources of warmth.

The night sky illuminated by stars is majestic. The geometrical figures of the constellations, such as the Pleiades, Orion, or the Great Bear, rolling from the east in the evening to the west before morning, are favorite motifs in poetry, no less than the Sun and the Moon. But the discrepancy in the choice of motifs by the ancients becomes still more obvious. The constellations of the sky took only a minor and incidental part in the mythology of the ancient peoples. The *planets* were the major gods, and they rule the universe.⁽³⁾

“It is not easy to understand the idea which was the basis for the identification of the Babylonian gods with the planets,” writes an author;⁽⁴⁾ but the same process of identification of major gods with the planets can be found in the religions of the peoples in all parts of the world. The planets were not affiliated to the gods, or symbols of the gods—they *were* the gods. In prayers and liturgies they were invoked as gods. “The greater gods, even when addressed by name in prayer, were regarded as astral powers.”⁽⁵⁾ This or that planet is selected, according to the text of the prayer, from “the multitude of the stars of heaven” to receive a gift.

“The planetary gods are much the most powerful of all. Their positions in the sky, their reciprocal relations . . . have a decisive influence on all physical and moral phenomena of the world.” ⁽⁶⁾

The great majority of us moderns pay no attention to these points in the night sky, and probably not one in ten or even in a hundred is able to point to Jupiter or Mars in the firmament. The planets change their places, but not conspicuously. Were they indebted for their deification to this slow movement, by which they differ from the fixed stars? Did Zeus-Jupiter-Marduk-Amon become the supreme deity, the thunderer and dreadful lord of the universe, only because of his slow movement—he passes in twelve years the circle of the zodiac, traversed by the Sun in twenty-four hours, and by the Moon even quicker? When seen with the naked eye the planet Jupiter distinguishes itself from the fixed stars of first magnitude only by this slow change of position.

Augustine, confused by the problem of the deification of the planets, wrote in the fourth century:

But possibly these stars which have been called by their names are these gods. They call a certain star Mercury, and likewise a certain other star Mars. But among those stars which are called by the name of gods, is that one which they call Jupiter, and yet with them Jupiter is the world. There also is that one they call Saturn, and yet they give him no small property beside, namely all seeds. ⁽⁷⁾

Mercury, the closest to the Sun, is barely visible, being hidden in the Sun's rays. But the ancients made the planet Mercury into a great god—Hermes or Nebo. Why was it feared and worshiped? What is there generally in the planets to inspire awe, so as to influence people to build temples for them, to sing liturgies, to bring sacrifices, to narrate legends, and to dedicate to them the domain of science, of war, of agriculture?

The ancients were sufficiently enlightened to know that the planets are large rocks like the Earth that circle on orbits. ⁽⁸⁾ And this makes the modern scholars wonder: knowing that the planets are rocks, why did the ancients believe that they are gods? ⁽⁹⁾

The key to this problem, which is the major problem of all classical mythology, is already in our hands. The planet Venus was deified because of its dramatic appearance and because of the havoc it brought to the world, as described in *Worlds in Collision*. I illuminated also the events which made Mars a feared god. Divine qualities were ascribed to the other planets because of the catastrophes they wrought in earlier ages.

In the Persian holy books it is said that “on the planets depends the existence or non-

existence of the world—wherefore are they especially to be venerated.” ⁽¹⁰⁾ “The seven planets rule the universe,” says a Nabatean inscription. ⁽¹¹⁾ The Greeks and Romans believed that “everything is, in fact, subject to the changes brought about by the revolutions of the stars.” ⁽¹²⁾

“The celestial orbs by their combined movements are the authors of all that was, and is, and is to come.” According to ancient Hebrew traditions, “there are seven archangels, each of whom is associated with a planet.” ⁽¹³⁾ “The seven archangels were believed to play an important part in the universal order through their associations with the planets. . . .” ⁽¹⁴⁾

The reason for the deification of the planets lay in the fact that the planets only a short time ago were not faultlessly circling celestial bodies, nor were they harmless. This is also expressed in a Mandaeen text: “How cruel are the planets that stay there and conspire evil in their rage . . . the planets conspire in rage against us.” ⁽¹⁵⁾

Uranus

The seven planets of the ancients comprised the Sun, the Moon, Mercury, Venus, Mars, Jupiter, and Saturn. However, the ancients' religions and mythology speak for their knowledge of Uranus; the dynasty of gods had Uranus followed by Saturn, and the latter by Jupiter. In the clear sky of Babylonia the planet Uranus could have been observed by an unaided eye; but since it was known as a deposed deity, it would seem that at some later time the planet lost much of its brightness. ⁽¹⁾

It is quite possible that the planet Uranus is the very planet known by this name to the ancients. The age of Uranus preceded the age of Saturn; it came to an end with the “removal” of Uranus by Saturn. Saturn is said to have emasculated his father Uranus. ⁽²⁾

Behind this story there might have been a scene in the sky. In one theory of the origin of the solar system a sideswiping star tears out from the sun a long filament of gaseous material. Similarly Saturn may at one time have “emasculated” Uranus—Saturn was represented by the Romans with a sickle in his hands.

Circumcision may have originated as an emulation of the acts displayed in the sky—when it appeared that Saturn with a sickle emasculated Uranus, the Egyptians, and so also the Hebrews, introduced circumcision, the removal of the foreskin being *pars per toto*, or instead of castration. ⁽³⁾

It is not unthinkable that sometime before the age the record of ancient civilizations reaches, Uranus, together with Neptune, Saturn and Jupiter, formed a quadruple system that was captured by the sun and from which the planets of the solar system had their origin—but here nothing but imagination takes over where tradition based on witnessing does not reach.

[According to Hesiod, the catastrophe described as the removal of Uranus by Saturn gave birth to Aphrodite. In *Worlds in Collision* Aphrodite was identified with the Moon.] ⁽⁴⁾

References

1. Uranus was discovered in 1781 by William Herschel. Its planetary character was not immediately apparent to him—Herschel actually announced the discovery of a comet.

2. Hesiod, *Theogony* 133-187; cf. lines 616-623. [Cf. also the Hittite myth of “Kingship in Heaven” in J. Pritchard ed., *Ancient Near Eastern Texts Relating to the Old Testament* (Princeton, 1950), pp. 120-121.] The similar story of Jupiter emasculating his father Saturn [Apollonius Rhodius, *Argonautica* IV. 984 with scholium; scholium to Lycophron’s *Cassandra* 76; Proclus, *In Timaeo*, transl. by A. J. Festugière, (Paris, 1967), Vol. III, p. 255] may be “transfer” or borrowing, but may be a reflection in mythology of similar events.
3. Circumcision has a hygienic value; it could have been found out and sanctified by the astral events. Having been “commanded” in the days of the patriarch Abraham (Genesis 17:10ff.) it may reflect the latter event, i.e., Jupiter’s emasculation of Saturn. Cf. Sanchuniathon’s *Phoenician History* in Eusebius, *Praeparatio Evangelica* I. ix: “Cronos was circumcis’d in his privities and forced his followers to do the same” (transl. by R. Cumberland [London, 1720], p. 38).
4. [Velikovsky’s identification of Aphrodite with the Moon has been disputed by several writers; but in the fourth century A.D. Macrobius was able to refer to ancient authorities who affirmed that Aphrodite was the Moon. *Saturnalia* VIII. 1-3.].

The Earth Without the Moon

The period when the Earth was Moonless is probably the most remote recollection of mankind. Democritus and Anaxagoras taught that there was a time when the Earth was without the Moon.⁽¹⁾ Aristotle wrote that Arcadia in Greece, before being inhabited by the Hellenes, had a population of Pelasgians, and that these aborigines occupied the land already before there was a moon in the sky above the Earth; for this reason they were called Proselenes.⁽²⁾

Apollonius of Rhodes mentioned the time “when not all the orbs were yet in the heavens, before the Danai and Deukalion races came into existence, and only the Arcadians lived, of whom it is said that they dwelt on mountains and fed on acorns, before there was a moon.”⁽³⁾

Plutarch wrote in *The Roman Questions*: “There were Arcadians of Evander’s following, the so-called pre-Lunar people.”⁽⁴⁾ Similarly wrote Ovid: “The Arcadians are said to have possessed their land before the birth of Jove, and the folk is older than the Moon.”⁽⁵⁾ Hippolytus refers to a legend that “Arcadia brought forth Pelasgus, of greater antiquity than the moon.”⁽⁶⁾ Lucian in his *Astrology* says that “the Arcadians affirm in their folly that they are older than the moon.”⁽⁷⁾

Censorinus also alludes to the time in the past when there was no moon in the sky.⁽⁸⁾

Some allusions to the time before there was a Moon may be found also in the Scriptures. In Job 25:5 the grandeur of the Lord who “Makes peace in the heights” is praised and the time is mentioned “before [there was] a moon and it did not shine.” Also in Psalm 72:5 it is said: “Thou wast feared since [the time of] the sun and before [the time of] the moon, a generation of generations.” A “generation of generations” means a very long time. Of course, it is of no use to counter this psalm with the myth of the first chapter of Genesis, a tale brought down from exotic and later sources.

The memory of a world without a moon lives in oral tradition among the Indians. The Indians of the Bogota highlands in the eastern Cordilleras of Colombia relate some of their tribal reminiscences to the time before there was a moon. “In the earliest times, when the moon was not yet in the heavens,” say the tribesmen of Chibchas.⁽⁹⁾

There are currently three theories of the origin of the moon:

1) The Moon originated at the same time as the Earth, being formed substantially from the same material, aggregating and solidifying.

2) The Moon was formed not in the vicinity of the Earth, but in a different part of the solar system, and was later captured by the Earth.

3) The Moon was originally a portion of the terrestrial crust and was torn out, leaving behind the bed of the Pacific.

All three theories claim the presence of the Moon on an orbit around the Earth for billions of years. Mythology may supply each of these views with some support (Genesis I for the first view; the birth of Aphrodite from the sea for the third view; Aphrodite's origin in the disruption of Uranus, and also the violence of Sin—the Babylonian Moon—seems to support the second view).

Since mankind on both sides of the Atlantic preserved the memory of a time when the Earth was without the Moon, the first hypothesis, namely, of the Moon originating simultaneously with the Earth and in its vicinity, is to be excluded, leaving the other two hypotheses to compete between themselves.

We have seen that the traditions of diverse peoples offer corroborative testimony to the effect that in a very early age, but still in the memory of mankind, no moon accompanied the Earth.⁽¹⁰⁾ Since human beings already peopled the Earth, it is improbable that the Moon sprang from it: there must have existed a solid lithosphere, not a liquid earth. Thus while I do not claim to know the origin of the Moon, I find it more probable that the Moon was captured by the Earth. Such an event would have occurred as a catastrophe.⁽¹¹⁾ If the Moon's formation took place away from the Earth,⁽¹²⁾ its composition may be quite different.

There is no evidence to suggest whether the Moon was a planet, a satellite of another planet, or a comet at the time of its capture by the Earth. Whatever atmosphere it may have had⁽¹³⁾ was pulled away by the Earth, by other contacting bodies, or dissipated in some other way.

Since the time the Moon began to accompany the Earth, it underwent the influence of contacts with comets and planets that passed near the Earth in subsequent ages. The mass of the Moon being less than that of the Earth, the Moon must have suffered greater disturbances in cosmic contacts. During these contacts the Moon was not carried away: this is due to the fact that no body more powerful than the Earth came sufficiently close to the Moon to take it away from the Earth for good; but in the contacts that took place the Moon was removed repeatedly from one orbit to another.

The variations in the position of the Moon can be read in the variations in the length of the month. The length of the month repeatedly changed in subsequent catastrophic

events—and for this there exists a large amount of supporting evidence. In these later occurrences the Moon played a passive role, and Zeus in the *Iliad* advised it (Aphrodite) to stay out of the battle in which Athene and Ares (Venus and Mars) were the main contestants.

A Brighter Moon

Many traditions persist that at some time in the past the Moon was much brighter than it is now, and larger in appearance than the Sun. In many rabbinical sources it is stated that the Sun and the Moon were equally bright at first.⁽¹⁾ The same statement was made to de Sahagun by the aborigines of the New World: “the Sun and the moon had equal light in the past.”⁽²⁾ At the other end of the world the Japanese asserted the same: the Nihongi Chronicle says that in the past “the radiance of the moon was next to that of the sun in splendor.”⁽³⁾

Traditions of many peoples maintain that the Moon lost a large part of its light and became much dimmer than it had been in earlier ages.⁽⁴⁾

In order that the Sun and the Moon should give off comparable light, the Moon must have had an atmosphere with a high albedo (refracting power)⁽⁵⁾ or it must have been much closer to the earth. In the latter case the Moon would have appeared larger than the Sun. In fact, the Babylonian astronomers computed the visible diameter of the Sun as only two-thirds of the visible diameter of the Moon, which makes a relation of four to nine for the illuminating surfaces. This measure surprised modern scholars, who are aware of the exactness of the measurements made by the Babylonian astronomers and who reason that during the eclipses one can easily observe the approximate equality of the visible disks.⁽⁶⁾

The Worship of the Moon

Because of its size and also because of the events which accompanied the first appearance of the Moon, many ancient peoples regarded the Moon as the chief of the two luminaries. “The sun was of smaller importance than the moon in the eyes of the Babylonian astrologers.” ⁽¹⁾

The Assyrians and the Chaldeans referred to the time of the Moon-god as the oldest period in the memory of the people: before other planetary gods came to dominate the world ages, the Moon was the supreme deity. Such references are found in the inscriptions of Sargon II (ca. -720) ⁽²⁾ and Nabonidus (ca. -550). ⁽³⁾ The Babylonian Sin—the Moon—was a very ancient deity: Mount Sinai owes its name to Sin.

The Moon, appearing as a body larger than the Sun, was endowed by the imagination of the peoples with a masculine role, while the Sun was assigned a feminine role. Many languages reserved a masculine name for the Moon. ⁽⁴⁾ It was probably when the Moon was removed to a greater distance from the earth and became smaller to observers on the earth, that another name, usually feminine, came to designate the Moon in most languages. ⁽⁵⁾

(Transl. by P. Davies)].

The Pre-Adamite Age

An ancient tradition ascribed the establishment of Moon worship to Adam, the first man. The medieval Arab scholar Abubacer wrote:

They [the Sabaeans] say that Adam was born from male and female, just like the rest of mankind, but they honored him greatly, and said that he had come from the Moon, that he was the prophet and apostle of the Moon, and that he had exhorted the nations that they should serve the Moon. . . . They also related about Adam that when he had left the Moon and proceeded from the area of India towards Babylonia, that he brought many wonders with him.⁽¹⁾

The Adamites, the ante-diluvial men, were most probably not the first human beings on the planet. Even admitting that by “expulsion from the Garden of Eden” is allegorized a catastrophe which quite destroyed mankind prior to the Deluge, it is impossible to declare that it was the first catastrophe. It depends on the memory of the peoples which catastrophe they consider as the act of creation. Human beings, rising from some catastrophe, bereft of memory of what had happened, regarded themselves as created from the dust of the earth. All knowledge about the ancestors, who they were and in what interstellar space they lived, was wiped away from the memory of the few survivors. The talmudic-rabbinical tradition believes that before Adam was created, the world was more than once inhabited and more than once destroyed.

It was at the end of the first age, symbolized by the expulsion of man from the blessed Garden of Eden, that the moon lost its brightness.⁽²⁾ It was not just a single human pair—the tradition ascribes to Adam the invention of seventy languages.

Hebrew mythology assigns to the period preceding Adam’s expulsion different geophysical and biological conditions. The sun shone permanently on the Earth, and the Garden of Eden, placed in the East, was, it must be conceived, under perpetual rays of the Dawn. The earth was not watered by rain, but mist ascending from the ground condensed as dew upon the leaves. “The plants looked only to the earth for nourishment.” Man was of exceedingly great stature: “The dimensions of man’s body were gigantic.” His appearance was unlike that of later men: “His body was overlaid with a horny skin.” But a day came and the celestial illumination ceased: “The sun . . . had grown dark the instant Adam became guilty of disobedience.”⁽³⁾ The flames of the ever-turning sword terrified Adam (Genesis 3:24). In another legend it is told that the celestial light shone a little in the darkness. And then “the celestial

light ceased, to the consternation of Adam.” The illumination of the first period never returned. The sky that man was used to see never appeared before him again: “The firmament is not the same as the heavens of the first day.” The “day” of Genesis, as I have already noted, is said to be equal to a thousand years.

It was after the fall of man, according to Hebrew tradition, that the sun set for the first time: “The first time Adam witnessed the sinking of the sun, he was seized with anxious fears. All the night he spent in tears. When day began to dawn, he understood that what he had deplored was but the course of nature.” It was also then that the seasons began. This is told in the following story: “Adam noticed that the days were growing shorter and feared lest the world be darkened . . . but after the winter solstice he saw that the days grew longer again.”

The earth also underwent changes: “Independent before, she was hereafter to wait to be watered by the rain from above.” ⁽⁴⁾ The variety of species diminished. Man, according to Hebrew legends, decreased in size; there was a “vast difference between his later and his former state—between his supernatural size then, and his shrunken size now.” ⁽⁵⁾ He also lost his horny skin. The whole of nature altered its ways.

Giants

The traditions of peoples all over the world are quite unanimous in asserting that an earlier time a race of giants lived on the earth, that most of the race were destroyed in great catastrophes; that they were of cruel nature and were furiously fighting among themselves; that the last of them were exterminated when after a cataclysm a migration of peoples brought the forebears of the peoples of today to their new homelands.

The Japanese narrate that when their forefathers after a great catastrophe about two and a half or three thousand years ago, came from the continent and invaded the isles, they found there long-legged, furry giants. These giants were called Ainu. The forefathers of the Japanese were defeated in the first encounter, but in the second encounter they were victorious.

Ixtlilxochitl described the wandering of peoples of the western hemisphere in the four ages of the world. The first age came to its end in the Flood. In the second age, called “the sun of the earthquake,” there lived the generation of the giants, which was destroyed in the cataclysm that terminated this age. The third period was “the sun of the wind,” called so because at the end of this period terrible hurricanes annihilated everything. The new inhabitants of the new world were Ulme and Xicalauca who came from the east to find a foothold at Potouchan: here they met a number of giants, the last survivors of the second catastrophe. The fourth age was called “the fire sun,” because of the great fire that put an end to this epoch. At that time the Toltecs arrived in the land of Anahuac, put to flight by the catastrophe: they wandered for 104 years before they settled in their new home.

Also F. L. Gomara in his *Conquista de Mexico*, in the chapter about “cinco soles que son edades,” wrote:

The second sun perished when the sky fell upon the earth; the collapse killed all the people and every living thing; and they say that giants lived in those days, and that to them belong the bones that our Spaniards have found while digging mines and tombs. From their measure and proportion it seems that those men were twenty hands tall—a very great stature, but quite certain. ⁽¹⁾

The Hebrew scriptures as preserved in the Old Testament and in the Talmud and Midrashim, narrate that among the races of the world in a previous age were races of

giants, “men of great size and tremendous strength and ferocity,” who were destroying other races, but also were turning upon each other and destroying themselves.

The Book of Genesis (6: 4) narrates that in the antediluvian time “there were giants in the earth in those days.” The Greek Book of Baruch narrates that over four hundred thousand of the race of giants were destroyed by the Flood. After the Flood there were only a few districts where some of them remained alive.

When after a number of centuries another catastrophe ruined the world and the Israelites left Egypt and sent a few men to explore Palestine, those reported that the people of the land were generally of tall stature, and that besides “there we saw the giants, the sons of Anak, which came of the giants, and we were in our own sight as grasshoppers, and so were we in their sight.”

This description clearly differentiates between the people of a tall stature and the giants, and the supposition that the Israelites found in Palestine a normal race only taller than themselves, and thought them to be giants, is not supported by the text.

A similar distinction is made in Deuteronomy (1: 28): “The people is greater and taller than we . . . and moreover we have seen the sons of the Anakim [giants] there.” they—a few families—lived in Hebron (Numbers 13: 22).

At the time when the Israelites approached the fields of Bashan in the Transjordan, “only Og king of Bashan” remained of the remnant of the giants (Joshua 13:12 and Deut. 3:11). The other individuals of monstrous size had been annihilated in the meantime. “Behold, his bedstead was a bedstead of iron; is it not in Rabbath of the children of Ammon? nine cubits is the length thereof, and four cubits the breadth of it, after the cubit of a man.” The text implies that at the time the book of Deuteronomy was written the bedstead of Og was still in existence and was a wonder for the onlookers.

The giants were the remnant of a race close to extinction. Og was “of the remnant of the giants that dwelt in Ashtaroth and Edrel” (Joshua 12: 4). They were also called Emim, or the furious ones. “The Emim dwelt therein [in Moab of the Transjordan] in times past, a people great and many, and tall as the Anakim, which also were accounted giants, as the Anakim; but Moab calls them Emim” (). This branch of the giants was already extinct; but two cosmic ages earlier, in the days of Amraphel, king of Shinar, and Abraham the Patriarch, Eimim flourished in the Transjordan (Genesis 14: 5).

Nefilim

The present state of the Moon and of Mars and other celestial bodies does not imply that in the past they were equally desolate. Concerning Mars and Moon we have the testimony of our ancestors, supported by modern observations, that these bodies were engaged in near-collisions only a few thousand years ago. It is not excluded that under conditions prevailing on their surfaces prior to these events, life could have developed there or elsewhere in the solar system to an advanced stage.

Working in the early 1940's on *Worlds in Collision*, which in its original form covered also the cataclysmic events preceding the Exodus, I wondered at a certain description that sounded like a visit from space.⁽¹⁾

The sixth chapter of the book of Genesis starts this way:

And it came to pass, when men began to multiply on the face of the earth, and daughters were born unto them, that the sons of God [*bnei Elim*] saw the daughters of men that they were fair; and they took them wives of all which they chose.⁽²⁾

The story told in Genesis VI about the sons of God (*bnei Elim*) coming to the daughters of men is usually explained as referring to an advanced priesthood that mingled with backward tribesmen.⁽³⁾ When Columbus discovered America, the natives, according to the diary of his first voyage, regarded him and his crew as having arrived from the sky.⁽⁴⁾ A similar occurrence could have taken place in prediluvial times, when some invaders from a remote part of the world came and were regarded as "sons of God."

But if we are today on the eve of interplanetary travel, we must not declare as absolutely impossible the thought that this Earth was visited, ages ago, by some people from another planet. Or was this earth alone populated by intelligent beings? In my understanding this passage from the book of Genesis is a literary relic dealing with a visit of intelligent beings from another planet.

It appears that the extraterrestrial visitors made their landing as if in advance knowledge of the impending catastrophe of the Deluge.⁽⁵⁾ It could be that Jupiter and Saturn were approaching each other ever closer on their orbits and that a disruption of one of them was expected.⁽⁶⁾

Possibly many centuries, or even millennia, passed between the landing and the Deluge. The mission could have been undertaken to ascertain the conditions on Earth. If it was an escape it could also have been from another catastrophe in the solar system, one of those that preceded the Deluge, like the one described as the dethronement and emasculation of Uranus by Kronos. If the ancient legends of a battle between the gods and titans, so persistent in the Greek world, but also in the mythologies of other civilizations, have any historical value, we may try to find what may have been the substratum of this fantasy. It seems that following great convulsions of nature observable in the celestial sphere, giant bodies were hurled on the earth. They arrived burned and were crushed by impact.⁽⁷⁾ But at least one group of escapees succeeded in safely reaching the earth.⁽⁸⁾ They descended on Mount Hermon or Anti-Lebanon.⁽⁹⁾ Of the extra-biblical traditions dealing with the subject some reach hoary antiquity, antecedent to the composition of the Biblical texts. The Book of Enoch narrates that the group was composed of males only, two hundred in number, under the leadership of one by the name of Shemhazai.⁽¹⁰⁾ The Aggadic literature says that the “sons of God” tried to return to heaven from where they had come, but could not.⁽¹¹⁾

The new arrivals were probably of gigantic stature—their progeny with women of the earth were giants:

The Nephilim were on earth in those days, and also afterward, when the sons of God came in to the daughters of men, and they bore children to them. These were the mighty men that were of old, the men of renown.⁽¹²⁾

Having fathered giants, they themselves must have been not of human size.⁽¹³⁾

The planet from which they came I would not know to determine. It would refer to Saturn.⁽¹⁴⁾ The great size of the visitors would suggest a smaller body where the gravitational influence would be less.⁽¹⁵⁾

Ten thousand years is only an instant in the life of the cosmos; ten thousand years ago man was only in a rude stone age; today he contemplates to visit other planets. If such progress is made in a time as short as this, who knows what secrets are concealed in the past or in the future?

1. Because the story seemed so fantastic, I made up my mind at that time not to publish anything on the subject when discussing the Deluge and still earlier events. I came to this idea in 1940-41. In the 1950's many people reported sighting UFO's , which were claimed to be vehicles of visitors from other

planets (a view which does not find any credence with me). In 1957 the space age began, and by the late 1960's, when the proposal that there were ancient visitors to Earth from other star systems found its way into print, the idea provoked little ridicule.

Astronomical Knowledge Before the Deluge

In the Deluge a civilization was destroyed the real value of which is incalculable. Hebrew tradition estimates that the population of the ante-diluvian world “amounted to millions.” Adam is said to have invented seventy languages; Cain, his son, built cities and monuments and ruled over kings. They were representatives of generations. According to Hebrew legends the Deluge and its time had already been predicted by Enoch, and even more ancient generations were said to have erected tablets with calendric and astronomical calculations predicting the catastrophe.⁽¹⁾ This might have been the knowledge of months, of years, and of the periods of comets that the remote generations had acquired.

It was in the celestial harmony and disharmony that the secrets of the upheavals were conceived to lie. The science about the times in which calamity could return and fall on our Earth was cultivated among populations that had a vivid remembrance of days of misfortune or of lucky escape.

It is told about the children of Seth, the son of Adam, that

they were the inventors of that peculiar sort of wisdom which is concerned with the heavenly bodies and their order.

And that their inventions might not be lost before they were sufficiently known, they made two pillars upon Adam’s prediction that the world was to be destroyed at one time by the force of fire and at another time by the violence and quantity of water.

The one was of brick, the other of stone, and they inscribed their discoveries on both, that in case the pillar of brick should be destroyed by the flood, the pillar of stone might remain, and exhibit these discoveries to mankind and also inform them that there was another pillar, of brick, erected by them.⁽²⁾

This means that stelae with calendric and astronomical calculations were made public knowledge in that early age. According to the Aggada it was the pious Enoch (the seventh generation) who achieved the deepest knowledge of the celestial secret. He was the man who “walked with God: and he was not; for God took him.”⁽³⁾ In this ascension to heaven was taken away the man who more than any other knew the plan

of the world and of its creation. Enoch was a great man of his generation.

Kings and princes, not less than one hundred and thirty in number, assembled about him, and submitted themselves to his dominion, to be taught and guided by him. Peace reigned thus over the whole world for all the two hundred and forty three years during which the influence of Enoch prevailed.

In the story of Enoch's ascension it is said that he predicted the disaster.

Enoch was carried into the heavens in a fiery chariot drawn by fiery chargers. The day thereafter the kings who had turned back in good time sent messengers to inquire into the fate of the men who had refused to separate themselves from Enoch, for they had noted the number of them. They found snow and great hailstones upon the spot whence Enoch had risen, and, when they searched beneath, they discovered the bodies of all who had remained behind with Enoch; he alone was not among them: he was high in heaven.

What the Aggada means to tell is that a human being—and one gifted with the greatest “wisdom concerning the heavenly bodies and their order,” was brought away in a fiery storm which killed many, brought snow and meteorites, and which had been predicted by the one who disappeared.

Some exact knowledge of the revolution of the bodies in the sky is ascribed here to the antediluvian generations.

Deluge

The scriptural deluge is regarded by historians and critical exegetes as a legendary product. “The legend of a universal deluge is in itself a myth and cannot be anything else.” ⁽¹⁾ It is “most nakedly and unreservedly mythological.”

The tradition of a universal deluge is told by all ancient civilizations, and also by races that never reached the ability to express themselves in the written symbols of a language. It is found all over the world, on all continents, on the islands of the Pacific and Atlantic, everywhere. Usually it is explained as a local experience carried from race to race by word of mouth. The work of collating such material has repeatedly been done, and it would only fatigue the reader were I to repeat these stories as told in all parts of the world, even in places never visited by missionaries. ⁽²⁾

The rest of the collected traditions are also not identical in detail, and are sometimes very different in their setting from the Noah story, but all agree that the earth was covered to the mountain tops by the water of the deluge coming from above, and that only a few human beings escaped death in the flood. The stories are often accompanied by details about a simultaneous cleavage of the earth. ⁽³⁾

In pre-Columbian America the story of a universal flood was very persistent; the first world-age was called Atonatiuh, or the age that was brought to its end by a universal deluge. This is written and illustrated in the ancient codices of the Mexicans and was narrated to the Spaniards who came to the New Continent. ⁽⁴⁾ The natives of Australia, Polynesia, and Tasmania, discovered in the seventeenth century, related almost identical traditions. ⁽⁵⁾

Clay tablets with inscriptions concerning the early ages and the deluge were found in Mesopotamia. Their similarity to the biblical account, and to the story of the Chaldean priest Berosus ⁽⁶⁾ who lived in the Hellenistic age, caused a great sensation at the end of the last century and the beginning of the current one. On this sensational discovery was based the sensational pamphlet *Babel und Bibel* by Friedrich Delitsch (1902) who tried to show in it that the Hebrews had simply borrowed this story, along with many others, from the Babylonian store of legends.

But if here and there the story of the flood could be said to have been borrowed by the scriptural writer from the Babylonians, and by some natives from the missionaries, in other cases no such explanation could be offered. The indigenous character of the stories in many regions of the world makes the borrowing theory

seem very fragile.

Geologists see vestiges of diluvial rains all over the world; folklorists hear the story of a universal flood wherever folklore is collected; historians read of a universal flood in American manuscripts, in Babylonian clay tablets and in the annals of practically all cultured peoples. But the climatologists make it very clear that even should the entire water content of the atmosphere pour down as rain, the resulting flood could not have covered even the lowland slopes, far less the peaks of the mountains, as all accounts insist that this deluge did.

William Whiston and the Deluge

The years 1680 and 1682 were years of unusually bright comets. Many pamphlets were printed, especially in Germany, on the imminent end of the world; at the very least, great catastrophes were expected. There was nothing new in such prognostications. In earlier centuries and also earlier in the seventeenth century, comets were regarded with awe and every possible evil effect was ascribed to them. Thus a scholarly author, David Herlicius, published in 1619 a discourse on a comet that had appeared shortly before, in 1618, and enumerated the calamities that this comet, and comets in general, bring with them or presage:

Desiccation of the crops and barrenness, pestilence, great stormy winds, great inundations, shipwrecks, defeat of armies or destruction of kingdoms . . . decease of great potentates and scholars, schisms and rifts in religion, etc. The portents of comets are threefold—in part natural, in part political, and in part theological.⁽¹⁾

David Herlicius also quoted Cicero: “From the remotest remembrance of antiquity it is known that comets have always presaged disasters.”⁽²⁾

The fear and even horror caused by the comet of 1680 was just beginning to calm down when in 1682 another great comet appeared.

Edmund Halley was twenty-six years old when this comet of 1682 appeared. He had experience in astronomical observations and calculations, having spent time on the island of St. Helena, cataloguing there 341 southern stars; he had observed the transit of Mercury, and made pendulum observations. Now he calculated the orbit of the comet of 1682, and predicted its return in 1759. Actually, the periodicity of comets was not first discovered by Halley. The ancient authors knew that comets have their time of revolution. Seneca wrote in his treatise *De Cometis*—in some respects still the most advanced discussion of this subject—that the Chaldeans counted the comets among the planets.⁽³⁾ A comet with a periodicity of about 70 years was known to the rabbis.⁽⁴⁾

Nevertheless, only little aware of the works of the ancients, the modern world acclaimed Halley to be the discoverer of the periodicity of comets; however, this acclaim came only after his prognostication realized itself. The comet of 1682, or Halley’s comet, returned in 1759. It came somewhat retarded on account of its passage near the planets Jupiter and Saturn. This delay had been calculated, though not quite accurately, by Halley. On the grave of Halley these words are engraved:

“Under this marble peacefully rests . . . Edmundus Halleius, LL.D., unquestionably the greatest astronomer of his age.”

But when Halley offered his theory of the periodicity of comets, and of the return of the observed comet after seventy-five years, this theory was not received immediately with enthusiasm. Yet in the mind of a contemporary mathematician the idea of a periodic return of comets was the beginning of a broadly-developed theory of the origin of the world and of the nature of the deluge.

William Whiston, born in 1667, published in 1696 his *New Theory of the Earth*. In this book he claimed that the comet of 1682 was of a 575&half year periodicity; that the same comet had appeared in February of 1106, in +531 in the consulate of Lampadius and Orestes, and in September of -44, the year of Caesar’s assassination.

⁽⁵⁾ Whiston further asserted that this comet had met the earth in -2346, and caused the Deluge.⁽⁶⁾

Whiston found in classical literature references to the change in inclination of the terrestrial axis and, ascribing it to a displacement of the poles by the comet of the Deluge, concluded that before this catastrophe the planes of daily rotation and yearly revolution coincided and that, therefore, there had been no seasons. He also found references to a year consisting of 360 days only, and although the Greek authors referred the change to the time of Atreus and Thyestes, and the Romans to the time of Numa, ca. -700, Whiston ascribed these changes to the effect of the Earth’s encounter with the comet of the Deluge. Whiston thought that the Earth itself was once a comet.

Whiston was chosen by Isaac Newton to take over his chair of mathematics at Trinity College in Cambridge when Newton, after many years, retired in order to dedicate himself to the duties of the president of the Royal Society. Whiston, like Newton, was a Unitarian. He was also close to being a fundamentalist. He was certain that only one global catastrophe was described in the Scripture—that of the Deluge. Of the phenomenon described in the book of Joshua, he wrote: “The Scripture did not intend to teach men philosophy, or accomodate itself to the true and Pythagoric system of the world.”

It is difficult to say what caused Newton, who selected Whiston as his successor, to oppose Whiston’s election to the membership of the Royal Society. We have another similar instance a century later, when Sir Humphry Davy, the mentor of Michael Faraday, conducted a strenuous campaign to keep Faraday from being admitted to the Royal Society, of which Davy was president.

But the very idea of a periodicity of comets, gleaned by Whiston from Halley, was not yet accepted. In 1744 a German author wrote: “It is well known that Whiston and others like him who wish to predict the comings and goings of comets, deceive themselves, and have become an object of ridicule by the entire world.” ⁽⁷⁾

Still later Whiston was ridiculed by Georges Cuvier, himself a proponent of a catastrophist theory:

Whiston fancied that the earth was created from the atmosphere of one comet, and that it was deluged by the tail of another. The heat which remained from its first origin, in his opinion, excited the whole antediluvian population, men and animals, to sin, for which they were all drowned in the deluge, excepting the fish, whose passions were apparently less violent.”

Deluge and Comet

The idea that a comet heralded the Deluge was not new with William Whiston: it is found in several earlier authors, the so-called cometographers and chronologists of the seventeenth century. But they only described the appearance of the comet at the time of the Deluge as a matter of fact, and did not deduce any theory from it. No causal relation was seen: it was more in the nature of a coincidence. New in Whiston was the identification of the comet of 1680 as the comet of the Deluge, and the perturbatory effects on the position and motion of our planet, ascribed by him to the activities of the comet; finally, his general theory that the Earth itself was once a comet.

The author whom Whiston names as his source was J. Hevelius, whose *Cometographia* was published in 1668. Apparently Whiston did not go further back to the sources of Hevelius: to Abraham Rockenbach (15 -16), Seth Calvisius (1556-1615), Henricus Ecstormius, Christopher Helvicus (1581-1617) and David Herlicius (1557-1636).⁽¹⁾ Abraham Rockenbach was a scholar of the late Renaissance, a man of broad interests, already evident from that fact that he occupied both, the chair of Greek and of Mathematics at the University of Frankfurt, and later taught law and became Dean of the Philosophical College at that University. In 1602 he published a short treatise in Latin, *De cometis tractatus novus methodicus*, and in it he had the following entry concerning the Deluge:

In the year of the creation of the world 1656, after Noah had attained the age of 600 years, three days before the death of Methusalem, a comet appeared in the constellation Pisces, was seen by the entire world as it traversed the twelve signs of the zodiac in the space of a month; on the sixteenth of April it again disappeared. After this the Deluge immediately followed, in which all creatures which live on earth and creep on the ground were drowned, with the exception of Noah and the rest of the creatures that had gone with him into the ark.

About these things is written in Genesis, chapter 7.⁽²⁾

Rockenbach lived and wrote nearly a hundred years before Whiston. What were Rockenbach's sources? He did not let us know. He referred to them at the beginning of his treatise, claiming that it was based on information *ex probatissimis & antiquissimis veterum scriptoribus*—"from the most trustworthy and the most ancient of the early writers." We have already had occasion to quote from Rockenbach in connection with the comet that shone during the Exodus.⁽³⁾ There he refers only to Pliny, although he probably used other sources besides: Lydus, Servius, Hephaestion,

and Junctinus wrote about comets, and Servius mentions also the writings of Campester and Petosiris.

Although we may never be certain of the sources on which Abraham Rockenbach and other cometographers drew in mentioning a comet in connection with the Deluge, the great medieval rabbinical authority Rashi was probably among them.⁽⁴⁾ Rashi wrote concerning *Khima*, a celestial body mentioned in Job 9:9 and 38:31, and in Amos 5:8, that it is “a star with a tail,” or a comet. In the Talmud, *Khima* is associated with the Deluge, and this seems to have been the source of the cometographers’ assertion that a comet appeared in conjunction with that event.

The question now is, what was *Khima*, and what was its role in the Deluge? Was it really a comet as Rashi thought?

4. “Rashi” is an abbreviation for Rabbi Isaac ben Solomon; he lived in the south of France in the eleventh century. His commentary to the Bible and to some parts of the Talmud is still regarded as the most authoritative in the field of rabbinical knowledge, which has great authorities in every one of the twenty centuries since the beginning of rabbinical learning. Till today Rashi’s commentary is supplied to many Hebrew editions of the Scriptures and Talmud, with supracommentary on Rashi by later authorities added as well.

Khima

In the Tractate Brakhot of the *Babylonian Talmud* it is said that the Deluge was caused by two stars that fell from Khima toward the earth. The statement reads:

When the Holy One . . . wanted to bring a flood upon the world, He took two stars from *Khima* and brought a flood upon the world.⁽¹⁾

I have already mentioned that Rashi, the medieval exegete whose authority is unsurpassed among the rabbis, says that in the quoted sentence Khima means a star with a tail, or a comet. This explanation found its way into the works of several gentile theologians.⁽²⁾ Should it be understood so that two large meteorites fell from a comet and falling on Earth caused tidal waves? Instances when meteorites fell while a comet was glowing in the sky are known, and the classic case is found in Aristotle.⁽³⁾ Should a meteorite equal in mass to the one which by its impact formed the Arizona crater fall into the ocean, tidal waves of a wide spread would result, possibly circling the globe. Then are we to understand the Deluge as a huge tidal wave rushing across the continents? This picture differs widely from the story in Genesis, according to which water was falling for a long period from the sky and the waters of the depths rose, covering the surface of the earth.

The Tractate Brakhot so explicitly points to the cause of the Deluge that before classifying the narrative in Genesis in its entirety as folkloristic imagery (which in part it most certainly is), and also before following Rashi's idea any further, we ought to inquire: Which celestial body is Khima? Is it correctly explained as a comet?

In the Old Testament Khima is mentioned in several instances. In Job, Chapter 9, the Lord is He who "removes the mountains . . . and overturns them . . . and shakes the earth out of her place . . . which commands the sun and it rises not . . . which alone spreads the heaven . . . which makes Aish and Kesil, and Khima, and the chambers of the south . . ." In the King James Version these names are translated as Arcturus, Orion, and Pleiades. Chambers of the South are usually explained as constellations of the south.

Khima and Kesil are also named in Job, chapter 38, here again in a text that deals with the violent acts to which the Earth was once subjected: ". . . Who shut up the sea with doors [barriers], when it brake forth, as if it had issued out of the womb? . . . [Who] might take hold of the ends of the earth, that the wicked might be shaken out of it? . . ." The Lord asks Job: "Canst thou bind the chains [feters] of Khima and loosen the reins of Kesil? Canst thou lead forth the Mazzaroth in its season? . . ." Davidson and Lanchester wonder at the meaning of this passage: like the King James Version they translate Pleiades for Khima and Orion for Kesil.⁽⁴⁾ Mazzaroth is left untranslated.

In Amos, chapter 5, once more, Khima and Kesil are mentioned in a verse that reveals the great acts of

the Lord who “makes Khima and Kesil, and turns the shadow of death into morning, and makes the day dark with night: that calls for the waters of the sea, and pours them upon the face of the earth. . . .”

Hieronymus, also known as St. Jerome, the fourth century author of the *Vulgate*, the Latin version of the Old Testament, translates Khima as Arcturus in one instance (Amos 5), as Pleiades in another (Job 38), and as Hyades in the third (Job 9):

| | KHIMA | KESIL | AISH |
|-----------|----------|----------|----------|
| Job 9:9 | Hyades | Orion | Arcturus |
| Job 38:31 | Pleiades | Arcturus | |
| Amos 5:8 | Arcturus | Orion | |

Similarly Kesil was translated by the *Septuagint*, the Greek version of the Old Testament that dates back to third century before the present era, as Hesperus, or the Evening Star, and in another instance as Orion. Aish, translated as Arcturus in the *Vulgate*, is rendered as Pleiades by the *Septuagint*:

| | KHIMA | KESIL | AISH |
|-----------|-----------|-----------|----------|
| Job 9:9 | Arcturus | Hesperus | Pleiades |
| Job 38:31 | Pleiades | Orion | |
| Amos 5:8 | not given | not given | |

Obviously the true meaning of these names was lost, because one and the same authority in various instances used different star constellations or planets for each of them: Kesil, Khima, Mazzaroth, Aish. Later interpreters groped in the dark; so Calmet, the eminent French commentator and exegete of the early eighteenth century translated Khima as Great Bear.⁽⁵⁾ Others rendered it as Sirius (Canis Major).

The interpreters were especially intrigued by the description in Job 38. The Lord asks Job whether he can bind the chains of Khima or loosen the reins of Kesil. “The word in the second clause is from a root always meaning to draw . . .”⁽⁶⁾ Which star is in chains? And which star is drawn by reins, as if by horses?

The identities of Khima and Kesil, Aish and Mazzaroth, were of lesser importance when it amounted to finding their meaning for their own sake in the poetical sentences of Amos and Job. But such identification, especially of Khima, grows in importance if the quoted sentence from the Tractate Brakhot may contribute to an understanding of the etiology of the Deluge, as the ancients knew or thought to know it.

In *Worlds in Collision* I have already explained that Mazzaroth signifies the Morning (Evening) star;

the Vulgate has Lucifer for Mazzaroth and the Septuagint reads: “Canst thou bring forth Mazzaroth in his season and guide the Evening Star by his long hair?” I have already shown why the Morning-Evening star was described as having hair or coma, and why Venus did not appear in its seasons.

Apparently the other members of the group were planets, too. And actually we could have started by the disclosure that in the rabbinical literature Khima is referred to as Mazal Khima.⁽⁷⁾ In Hebrew *mazal* means “planet.” Then which planet is Khima? If we can find out which of the planets is Khima, then we may know also to which planet the Talmud assigned the physical cause of the world inundation. As we have seen, the Biblical texts by themselves do not contain the means to determine which of the planets Khima and Kesil are.

“Were it not for the heat of Kesil the world could not endure the cold of Khima; and were it not for the cold of Khima, the world could not endure the heat of Kesil.” This sentence is found, too, in the *Babylonian Talmud*, in the Tractate Brakhot.⁽⁸⁾

Kesil means in Hebrew “fool.” From the biblical texts it is not apparent why one of the planets received this adverse name, or, why, more probably, the word “fool” was derived from the name of the planet.⁽⁹⁾

In the *Iliad* Ares-Mars is called “fool.” Pallas Athena said to him: “Fool, not even yet hast thou learned how much mightier than thou I avow me to be, that thou matchest thy strength with mine.”⁽¹⁰⁾ These words explain also why Mars was called fool: it clashed repeatedly with the planet-comet Venus, much more massive and stronger than itself. To the peoples of the world this prolonged combat must have appeared either as a very valiant action on the part of Mars, not resting but coming up again and again to attack the stupendous Venus, or it must have appeared as a foolish action of going again and again against the stronger planet. Homer described the celestial battles as actions of foolishness on the part of Mars. Thus Kesil, or “fool,” among the planets named in the Old Testament, is most probably Mars.

In Pliny we find a sentence which reads: “The star Mars has a fiery glow . . . owing to its excessive heat and Saturn’s frost, Jupiter being situated between them combines the influence of each and renders it healthy.”⁽¹¹⁾ The heating effect ascribed in the Talmud to Kesil is ascribed by Pliny to Mars, and the cooling effect of Khima to Saturn. By this sentence of Pliny we are strengthened in our identification of Kesil as the planet Mars; it corroborates the conclusion we just made with the help of the *Iliad*. But what is even more important, Pliny helps to identify the “planet Khima” : it is Saturn.

Cicero also wrote that “Saturn has a cooling influence,” whereas Mars “imparts heat.”⁽¹²⁾ Porphyry, an author of the third century, wrote similarly with Pliny and Cicero: “The power of Kronos [Saturn] they perceive to be sluggish and slow and cold. The power of Ares [Mars] they perceive to be fiery.”⁽¹³⁾

Porphyry’s contemporary Plotinus wrote: “When the cold planet [Saturn] is in opposition to the warm planet [Mars], both become harmful.”⁽¹⁴⁾ Other statements to the same effect are found in Vitruvius,⁽¹⁵⁾ and Proclus.⁽¹⁶⁾ In these sentences, as in those of Pliny and of the Talmud, Mars is regarded as being a fiery planet,⁽¹⁷⁾ Saturn as being a cold planet.⁽¹⁸⁾

The passage in the Book of Job (38:31) can now be read: “Canst thou bind the bonds of Saturn and loosen the reins of Mars?” The bonds of Saturn can be seen even today with a small telescope. The reins of Kesil I discussed in *Worlds in Collision*, section “The Steeds of Mars.” The two small moons of Mars, Phobos and Deimos, were known to Homer⁽¹⁹⁾ and are mentioned by Vergil.⁽²⁰⁾ They were regarded by the peoples of antiquity as steeds yoked to Mars’ chariot.

The passage in the Talmud that makes the planet Khima responsible for the Deluge means: “Two stars erupted from the planet Saturn and caused the Deluge.”

Saturnian Comets

Before searching ancient traditions for any possible association of Saturn with the Deluge, let us notice that the idea that Saturn may have anything to do with the origin of some of the comets of the solar system is not without a theoretical foundation. A group of short-period comets carries the name of “Saturnian family of comets” ; they revolve on ellipses that approach closely the orbit of Saturn. A larger family of short-period comets carries the name “Jovian” and Jupiter is regarded as having something to do with their origin: their orbits come close to the orbit of Jupiter.

The usual explanation for the Saturnian and Jovian families of comets is that they had originally traveled on extremely elongated or even parabolic orbits and, passing close to one of the large planets, were changed into short-period comets, traveling on ellipses—it is usual to say that they were “captured.” However, the Russian astronomer K. Vshekhsviatsky of the Kiev Observatory, one of the leading authorities on comets, has brought strong arguments to show that the comets of the solar system are very youthful bodies—only a few thousand years old—and that they originated in explosions from the planets, especially from the major planets Saturn and Jupiter or their moons. By comparing the observed luminosity of the periodic comets on their subsequent returns, he found it failing and their masses rapidly diminishing by loss of matter to the space through which they travel; the head of the comet emits tails on each passage close to the sun and then dissipates the matter of the tails without recovery. Thus Vshekhsviatsky concluded that comets of short duration originated in the solar system, were not captured from outside of that system—a point to which the majority of astronomers still adhere—and that they came into existence by explosion from Jupiter and Saturn, and to a smaller extent by explosion from the smaller planets, like Venus and Mars.⁽¹⁾

In order to originate in this manner from a planet the exploded mass must overcome the gravitational pull of the parent body; the larger the mass of the planet, the greater must be the initial velocity of the exploding matter, the velocity of escape. For this reason the idea of explosion of comets from the planets is preferred to the idea of their explosion from the sun. Due to the great mass of the sun the velocity of escape from there must be in the approximation of xxx kilometers in the first second, and from Saturn only 35 km. But even these velocities are rather high, so that Professor Vshekhsviatsky acknowledged that there must have been unusual circumstances which he did not try to determine, but the existence of which he claimed on the basis of the effects produced, namely the short-lived comets reaching to the orbits of Jupiter and Saturn every time these comets recede from the sun to their farthest points (*aphelia*).⁽²⁾

The sentence in the Tractate Brakhot that ascribes the cause of the Deluge to the cometary bodies that erupted from the planet Saturn no longer appears as fantastic as when we first understood the meaning of Khima in that sentence.

The explosion of cometary bodies from Saturn and Jupiter is claimed on the basis of purely astronomical observations and calculations; the circumstances of such explosions must have been admittedly extraordinary; the time when this happened must be measured in thousands of years, not tens of thousands or millions. Will we also be able to establish with the help of collective human memory what were the extraordinary conditions?

But should we not first, as intended, place ourselves on firmer ground by showing that the statement in the Tractate Brakhot is not a lone testimony unsupported in the traditions and beliefs of the ancient races of the world?

2. [Su-ma Chien, the Chinese historian (ca. -145 to ca -80) wrote that the planet Jupiter, "if it is not in the place where it should be" may produce different types of cometary bodies. (*Les gouverneurs du ciel*, transl. by E. Chavannes). The origin of comets from conjunctions of planets was postulated by several Greek philosophers, among them Democritus and Anaxagoras. (Aristotle, *Meteorologica* I, 6; Diogenes Laertius; Seneca, *Quaestiones Naturales*.)]

Saturn and the Deluge

Following the rabbinical sources which declare that the Deluge was caused by two comets ejected by the planet Khima, and our interpretation of the planet Khima as Saturn, we begin to understand the astrological texts, such as certain passages in the *Tetrabiblos* of Ptolemy, which attribute to the planet Saturn floods and all catastrophes caused by high water.⁽¹⁾

The planet's presence in Aquarius especially brought expectations of heavy rains and flooding⁽²⁾ as is attested, among others, by the first-century Roman author Lucan.⁽³⁾ Many of the ancient astrologers were in agreement on this point.⁽⁴⁾ In a work entitled *Speculum astrologiae*, Junctinus ascribes inundations to the action of Saturn's comets.⁽⁵⁾ Cuneiform texts contain prophecies of a deluge taking place when a comet assumes a direction with its head towards the Earth.⁽⁶⁾

Philosophers of antiquity who were not astrologers also expressed their belief that Saturn is in some way related to moisture—among them the pre-Socratics Philolaus and Philodemus,⁽⁷⁾ and, somewhat later, Plato.⁽⁸⁾ The elder Pliny wrote in his *Natural History* that it is well known that heavy rains follow transitions of Saturn.⁽⁹⁾ Servius asserted that “Saturn is a god of rains When in the sign of Capricorn, he causes very heavy rains, especially in Italy”⁽¹⁰⁾ and again: “Saturn is the god of all that is humid and cold.”⁽¹¹⁾ Proclus recorded the beliefs of the Pythagoreans: “Again, in the heavens, Ares is fire, Jupiter air, Kronos water.”⁽¹²⁾ Nonnos referred to “ancient Kronos, heavy-kneed, pouring rain.”⁽¹³⁾ Hippolytus wrote of the beliefs of a member of the Peratae sect: “But water, he says, is destruction; nor did the world, he says, perish by any other thing quicker than by water. Water, however . . . they assert (it to be) Cronus.”⁽¹⁴⁾ We recognize that the astrological connection between Saturn and catastrophes created by high water has a very ancient origin.

In the Chaldean story of the Deluge, as told by Berossos, Kronos (Saturn) disclosed to the king Xisuthros that a universal flood would begin on the 15th of the month Dasios. Abydenos says: “Kronos announced to Sisithros that a flood would pour from above.”⁽¹⁵⁾

Cf. also the account of Alexander Polyhistor in Cyril, *Contra Julianum*, *loc. cit.* [The traditions of the Hindus assign the Deluge to the end of the Satya yuga and to the reign of Satyavrata, who is acknowledged to be Saturn (E. Moor, *The Hindu Pantheon* [1864], p. 108). Cf. Sir W. Jones, "On the Gods of Greece, Italy and India," *Asiatick Researches* Vol. I (1799), p. 234: "The Satya, or (if we may call it) the Saturnian, age was, in truth, the age of the general flood. . . ." Brahma (i.e., the planet Saturn—see below, section "The Worship of Saturn," n. 5), is said to have warned Manu of the Deluge soon to engulf the world (*The Mahabharata*, XXXX); and when the waters of the deluge covered the earth, Brahma is described as floating over the expanse of the ocean (*Agneya Purana*, chapter IV; cf. S. Shastri, *The Flood Legend in Sanscrit Literature* [Delhi, 1950], p. 51). An ancient woodcut published by Athanasius Kircher (*China Illustrata* [Amsterdam, 1667], p. 158)

portrays Brahma (identifiable by his four faces, or *chatra mukha*) as seated on a rayed disk, apparently Saturn, that hovers over the waters of the Deluge. Cf. F. Maurice, *Indian Antiquities* (London, 1800), Vol. II, opp. p. 352. The woodcut illustrates the third avatar of Vishnu and, more specifically, may be inspired by the words of the *Padma Purana*: “then the lord . . . floated over the vast ocean, void of the sun and the moon. . . .” (Shastri, *The Flood Legend*, p. 41; compare also Psalm 29: “the Lord sitteth upon the flood”).].

The Light of the Seven Days

Isaiah in describing the days to come, when great changes in nature will take place, says that the earth will give its increase in abundance, and “the light of the moon shall be as the light of the sun, and the light of the sun shall be sevenfold, as the light of the seven days. . . .” ⁽¹⁾

One could think that “the light of the seven days” refers to the seven days of creation—however, the actual explanation appears to me to be different: the expression “the light of the seven days” refers, in my view, to the seven days preceding the Flood that are referred to in the verse: “For yet seven days, and I will cause it to rain upon the earth. . . . And it came to pass after seven days, that the waters of the Flood were upon the earth.” (Genesis 7: 4, 10) It is not explained in the text—after seven days of what? But the rabbinical tradition relates that for seven days before the Deluge “the people heard a great commotion in the heaven,” that signified “the end of the age.”

The Talmudic tradition that often reaches much farther into the past than better known sources, like the books of the Scriptures, reveals in this instance a memory not suspected at the reading of the seventh chapter of Genesis. But in view of what we have brought out until now, and what we intend to illuminate on the following pages, the blinding light preceding the Deluge by seven days is an interesting and important detail. The world was in a dazzling light, sevenfold stronger than the light of the sun; the light was so strong and so brilliant day and night alike, that the sun was entirely overpowered by it; and in the days of Isaiah, thousands of years later, the memory of the light of the seven days was vivid in tradition, so that the prophet could refer to it in desiring to describe the solar light of the messianic age. ⁽²⁾

Numerous Sanscrit texts assert that seven or even twelve suns shone just before the Deluge. “Being ignited, all of a sudden, the entire terrestrial sphere blazed forth.” Twelve suns shone with “dazzling radiance” and consumed the world. (*The Skanda Purana in Shastri, The Flood Legend in Sanscrit Literature*, p. 86). Cf. similar accounts in the *Matsya Purana*, ch. ii, the *Padma Purana*, ch. xxxvi, the *Vishnu Purana*, ch. iii, the *Kalika Purana*, ch. xxv, and in the *Mahabharata*, chapter “Matsyopakhyaana.”]].

The light of the seven days was not of solar origin. Of what origin was it? Was it caused by brightly illuminated clouds of ionized hydrogen, or protons, hurled throughout the solar system and poured on earth? In the latter case they could have arrived from the present distance of Saturn in about a week, considering that the proton particles—ionized hydrogen—arrive from the sun in the space of twenty-five

hours.⁽³⁾ This is the time which elapses from a flare-up on the sun (protuberance) to the display of the polar lights—the aurora borealis.

The light of the seven days served the population of the world as a warning of some extraordinary events.⁽⁴⁾

2. [A memory of the light of the seven days may be preserved in the Babylonian account of “flaming torches, lighting up the land with their brightness” just prior to the arrival of the waters of the Deluge. (*The Epic of Gilgamesh*, transl. by A. Heidel, tablet XI).]
3. The distance of Saturn from the Sun is about 9.5 astronomical units. See below, section “Saturn’s Golden Age.”
4. [A warning of seven days’ duration is also a feature of several of the Sanscrit accounts. See S. Shastri, *The Flood Legend in Sanscrit Literature* (Delhi, 1950), p. 30.]

Hydrogen and Oxygen

The conflict between the larger planets resulted in long-stretched filaments ejected by a disturbed Saturn to cross the Earth's orbit. The hydrogen of the planet combined with the oxygen of the terrestrial atmosphere in electrical discharges and turned into water.

There are definite indications of a drastic drop in the atmospheric oxygen at the time of the Deluge—for instance, the survivors of the catastrophe are said in many sources to have been unable to light fires.⁽¹⁾

The consumption of the oxygen in the air by its conversion into water could not fail to have a marked effect upon all that breathes. The animal life that survived needed to accommodate itself to the changed conditions.

According to rabbinical sources, before the Deluge man was vegetarian; but the post-diluvian population did not continue the vegetarian habits of the “sinful” population of the earth. The Talmud and the Midrashim narrate that after the Deluge a carnivorous instinct was awakened in animal and man, and everyone had the impulse to bite.⁽²⁾

The fear of you and the dread of you shall be upon every beast of the earth and upon every bird of the air. . . . Every moving thing that lives shall be food for you; and as I gave you the green plants, I will give you everything.⁽³⁾

The prohibition against quenching the thirst for blood⁽⁴⁾ is an ordinance said to have been introduced immediately after the Deluge.

In a teleological program this result of the Deluge does not seem appropriate for a catastrophe brought about to chastize the human race and the animals, to cleanse them of their vices and make them better. Because of its non-program appearance the carnivorous urge must have been not a mythological motif, but a result of physiological changes. Most probably an anemia connected with the diminution of oxygen in the air was responsible for the new inclination.⁽⁵⁾

1. [Such were the accounts of the Sioux, Menomini, and other Indian tribes as

told by J. G. Frazer in his “Remarks” to Volume II of Apollodorus’ *The Library* in the Loeb series, p. 342. Cf. Skanda Purana, describing the deluged world in which “nothing could be seen . . . fire there was not, nor moon, nor sun.” (Shastri, *The Flood Legend in Sanscrit Literature*, p. 88). Even in the relatively slightly rarefied atmosphere of La Paz, Bolivia, “because of the reduced oxygen content . . . fires start with such reluctance that there is little work for the city’s fire department.” (*Area Handbook for Bolivia* [Washington, 1974], p. 55.).

2. *The Book of Enoch* 89:11: “After the deluge they began to bite one another.” According to Midrash Aggada to Genesis 10:8, Nimrod was the first to eat meat.
3. Genesis 9:2-3
4. Genesis 9:4ff.
5. [One might speculate that the diet of meat would be conducive to the production of the additional red blood cells needed by the body to absorb more efficiently the diminished amount of oxygen entering the lungs. In Tibet the high altitude and rarefied atmosphere is said to make it impossible to follow the vegetarian diet advocated by Buddhist teaching. Cf. *Science* Vol. 203, no. 4383 (March 23, 1979), p. 1230: “At high altitudes all animals hyperventilate—an involuntary mechanism of fast breathing in which carbon dioxide causes the *ph* of the blood to become alkaline and constricts blood vessels. This, in turn, reduces the blood flow to the brain and brain cells become starved of oxygen, eventually dying. An alkaline *ph* in the blood can also produce other fatal effects.”].

The Origin of the Oceans

It must have been at the very beginning of my occupation with the problems later developed in my books and in not yet published manuscripts, that I came upon the question of the origin of salts in seas and oceans. The common salt is a substantial ingredient of the oceanic content, or, said differently, the water of the oceans and seas contains a substantial solution of NaCl, or sodium chloride. Even though our blood and tissues abound in sodium chloride, man and animals are not adapted to drink salty water, and life on land could develop only thanks to the evaporation of the water from the surface of seas and oceans, or to distillation—the evaporating water is free from salts. Falling as rain or snow or dew, it feeds underground sources and also glaciers, and through them the brooks and rivers and lakes, and is delivered to our use usually through concrete tubes and metal pipes.

Of the salts of the seas sodium chloride is by far the most abundant. The provenance of it is, however, a riddle. It was, and still is, assumed that the salts in the oceans originated mainly through importation from land, having been dissolved from rocks by flowing rivulets and rivers, themselves fed by underground sources, and the same process working on the rocks of the seabed. Terrestrial formations are rich in sodium, and in eons of time, it is assumed, the sodium washed out of the rocks supplied its content to the oceans; the seas evaporate and the concentration of these salts grows. But the rocks are by far not so rich in chlorine, and hence the problem—from where did chlorine come to contribute its abundance to oceanic water? There is chlorine in source water, but usually not in significant amounts. The proportion of salts in the rivers is very different from their proportion in the seas. River water has many carbonates (80 percent of the salts), fewer sulphates (13 percent) and still fewer chlorides (7 percent). Sea water has many chlorides (89 percent), fewer sulphates (10 percent) and only a few carbonates (0.2 percent). The comparison of these figures makes it clear that rivers cannot be made responsible for most of the salts of the seas. Therefore it is also obvious that there is no proper way of calculating the age of the Earth by comparing the amount of salts in the seas with the annual discharge by the rivers; the most that can be done in this respect is to calculate the rich amount of carbonates in the rivers in their relation to the relatively poor concentration to these salts in the seas; but then there will be no explanation for the rich concentration of chlorides in the seas in comparison with their poor concentration in the rivers.

A part of the salts could be traced to the washing of lands and the floor of the seas; chlorine is known also to be discharged by volcanoes, but to account for the chlorine locked in the seas, volcanic eruptions, whether on land or under the surface of the seas, needed to have taken place on an unimaginable scale—actually, it was figured out, on an impossible scale. Thus it was acknowledged that the provenance of

chlorine in the salts of the seas is a problem unsolved.

Paleontological research makes it rather apparent that marine animals in some early age were more closely related to fresh-water fauna; in other words, the salinity of the oceans increased markedly at some age in the past.

The most obvious and permanent effect of a deluge of extraterrestrial origin on the Earth would be the increase in its water volume and of the place occupied by the seas. Presently four-fifths of the Earth are covered with water. A stupendous addition of water to the Earth should have decreased, not increased its salinity, if the water came down in a pure state. But if the Earth was showered by torrents of hydrogen and water some other ingredients of the Saturnian atmosphere could also have swept across the Earth's orbit.

In the Buddhist book on "The World Cycles," the *Visuddhi-Magga*, where the catastrophes that terminated the world ages are described, it is said:

But when a world cycle perishes by water . . . there arises a cycle-destroying great cloud of salt water. At first it rains with a very fine rain which gradually increases to great torrents which fill one hundred thousand times ten million worlds, and then the mountain peaks of the earth become flooded with saltish water, and hidden from view. And the water is buoyed up on all sides by the wind, and rises upward from the earth until it engulfs the heavens.⁽¹⁾

Volcanoes which were active during the cataclysm of the Deluge and during other cosmic upheavals vomited sulphur, chlorine, and carbonates, and contributed to the composition of the salts of the oceans. Carbonates fell on Earth in large quantities in some of the upheavals, certainly in the one which took place in the middle of the second millennium before the present era, at the very end of the Middle Kingdom in Egypt, an upheaval described in detail in *Worlds in Collision*. But a major portion of the chlorine in which the oceans are so rich must have come from an extraterrestrial source.⁽²⁾

My explanation of the origin of a large portion of the salts of the seas suggests that Saturn is rich not only in water but also in chlorine, either in the form of sodium chloride or in some other combination, or even atomic free. The last solution, of atomic free chlorine, appeared chemically and biologically somewhat difficult to contemplate, because chlorine is a very active element, seeking ties with other elements; biologically because it would be damaging to any plant life, yet there are other indications which point to the possibility of plant life on Saturn.

(Cambridge, Mass., 1896), Chap. xiii, p. 327.

2. [The knowledge that the water of the oceans came from the most part from Saturn and that the waters were salty was combined by the Greeks into a metaphor which has the sea being the “tear of Kronos.” This tradition originated with the Pythagorean school and may derive ultimately from Egypt. (Plutarch, *De Iside et Osiride*, ch. 32: “According to what the Pythagoreans say, the sea is the tear of Kronos.” Clement of Alexandria, *Stromata*, V. 8, 20f.: “This the Pythagoreans believed . . . comparing the sea to a tear of Kronos.” The same is found in a fragment of Aristotle in the edition of V. Rose (Teubner, 1886), no. 196. Cf. Porphyry’s *Life of Pythagoras* (Nauck ed., p. 39). Cf. also E. Lefebure, *Etudes Egyptologiques*, Vol. III: *Le Mythe osirien* (Paris, 1874), p. 125: . . . *et il faut sans doute regarder comme égyptienne cette croyance des Pythagoriciens rapportée par Plutarch, que la mer était une larme de Kronos. . . .*]

Saturn the God of Seeds

Saturn was called “the god of seeds” or “of sowing,” ⁽¹⁾ also “the lord of the fieldfruits.” ⁽²⁾

A Deluge destroying much faunal life must have caused a dissemination of plants: in many places new forms of vegetation must have sprouted from the rich soil fertilized by lava and mud; seeds were carried from all parts of the globe and in many instances, because of the change in climate, they were able to grow in new surroundings. The axis of the earth was displaced, the orbit changed, the speed of rotation altered, the conditions of irrigation became different, the composition of the atmosphere was not the same—entirely new conditions of growth prevailed.

Ovid thus describes the exuberant growth of vegetation following the Flood. “After the old moisture remaining from the Flood had grown warm from the rays of the sun, the slime of the wet marshes swelled with heat, and the fertile seeds of life, nourished in that life-giving soil, as in a mother’s womb, grew, and in time took on some special form.” “When, therefore, the earth, covered with mud from the recent Flood, became heated up by the hot and genial rays of the sun, she brought forth innumerable forms of life, in part of ancient shapes, and in part creatures new and strange.” ⁽³⁾

The innumerable new forms of life in the animal and plant kingdoms following the Deluge could have been solely a result of multiple mutations. ⁽⁴⁾ Although this seems a sufficient explanation of why and how Saturn came to be credited with the work of dissemination and mutation, the mention of another possibility should not be omitted.

If it is true that the Earth passed through the gases exploded from Saturn, it should not be entirely excluded that germs were carried together with meteorites and gases and thus reached the Earth.

The scholarly world in recent years has occupied itself with the idea that microorganisms—living cells or spores—can reach the Earth from interstellar spaces, carried along by the pressure of light rays. ⁽⁵⁾ The explosion of a planet is a more likely method of carrying seeds and spores through interplanetary spaces.

The new forms of life could be the result of mutations, a subject I have discussed in *Earth in Upheaval*. But the possibility that seeds were carried away from an exploding planet cannot be dismissed either.

3. Ovid, *Metamorphoses*, lines 418ff., transl. by F. J. Miller. Cf. Empedocles, fg. 60, 61, edited by J. Brun (Paris, 1966); cf. also Plato, *The Statesman*, 65.
4. [The effects of nearby supernovae on the biosphere have been the object of intensive study by geologists in recent years, in the attempt to account for abrupt changes in the history of life on this planet. Cf. D. Russel and W. Tucker, “Supernovae and the Extinction of the Dinosaurs,” *Nature* 229 (Feb. 19, 1971), pp. 553-554. Sudden extinctions were followed by the appearance of new species, quite different from those preceding them in the stratigraphic record. In a relatively brief interval whole genera were annihilated, giving way to new creatures of radically different aspect, having little in common with the forms they replaced. See N. D. Newell, “Revolutions in the History of Life,” *Geological Society of America Special Papers* 89, pp. 68-91; Cf. S. J. Gould and N. Eldredge, “Punctuated equilibria: the tempo and mode of evolution reconsidered,” *Paleobiology* 1977, Vol. III, pp. 115-151. Thus over the past two or three decades many geologists and paleontologists have found themselves increasingly drawn to the view that the observed abrupt changes in the biosphere, such as that which marked the end of the Mesozoic and is thought to have brought with it the extinction of the dinosaurs, among other animal groups, could best be explained by the exposure of the then living organisms to massive doses of radiation coming from a nearby supernova. The radiation would annihilate many species, especially those whose representatives, whether because of their large size or for other reasons, were unable to shield themselves from the powerful rays; at the same time new organisms would be created through mutations or “macro-evolution.” See Velikovsky’s comments in “The Pitfalls of Radiocarbon Dating,” *Pensée* IV (1973), p. 13: “. . . in the catastrophe of the Deluge, which I ascribe to Saturn exploding as a nova, the cosmic rays must have been very abundant to cause massive mutations among all species of life. . . .” Animals would suffer much more severely than plants—on plants the principle effect would be mutagenic. See K. D. Terry and W. H. Tucker, “Biologic Effects of Supernovae,” *Science* 159 (1968), pp. 421-423.]

The Worship of Saturn

Saturn, so active in the cosmic changes, was regarded by all mankind as the supreme god. Seneca says that Epigenes, who studied astronomy among the Chaldeans, “estimates that the planet Saturn exerts the greatest influence upon all the movements of celestial bodies.” ⁽¹⁾

On becoming a nova, it ejected filaments in all directions and the solar system became illuminated as if by a hundred suns. It subsided rather quickly and retreated into far-away regions.

Peoples that remembered early tragedies enacted in the sky by the heavenly bodies asserted that Jupiter drove Saturn away from its place in the sky. Before Jupiter (Zeus) became the chief god, Saturn (Kronos) occupied the celestial throne. In all ancient religions the dominion passes from Saturn to Jupiter. ⁽²⁾ In Greek mythology, Kronos is presented as the father and Zeus as his son who dethrones him. Kronos devours some of his children. After this act Zeus overpowers his father, puts him in chains, and drives him from his royal station in the sky. In Egyptian folklore or religion the participants of the drama are said to be Osiris-Saturn, brother and husband of Isis-Jupiter.

The cult of Osiris and the mysteries associated with it dominated the Egyptian religion as nothing else. Every dead man or woman was entombed with observances honoring Osiris; the city of Abydos in the desert west of the Nile and north-west of Thebes was sacred to him; Sais in the Delta used to commemorate the floating of Osiris' body carried by the Nile into the Mediterranean. What made Osiris so deeply ingrained in the religious memory of the nation that his cult pervaded mythology and religion?

Osiris' dominion, before his murder by Seth, was remembered as a time of bliss. According to the legend Seth, Osiris' brother, killed and dismembered him, whereupon Isis, Osiris' wife, went on peregrinations to collect his dispersed members. Having gathered them and wrapped them together with swathings, she brought Osiris back to life. The memory of this event was a matter of yearly jubilation among the Egyptians. ⁽³⁾ Osiris became lord of the netherworld, the land of the dead. A legend, a prominent part of the Osiris cycle, tells that Isis gave birth to Horus, whom she conceived from the already dead Osiris, ⁽⁴⁾

and that Horus grew up to avenge his father by engaging Seth in mortal combat.

In Egyptology the meaning of these occurrences stands as an unresolved mystery. The myth of Osiris “is too remarkable and occurs in too many divergent forms not to contain a considerable element of historic truth,” wrote Sir Alan Gardiner, the leading scholar in these fields;⁽⁵⁾ but what historical truth is it? Could it be of “an ancient king upon whose tragic death the entire legend hinged” ? wondered Gardiner.⁽⁶⁾ But of such a king “not a trace has been found before the time of the Pyramid texts,” and in these texts Osiris is spoken of without end. There he appears as a dead god or king or judge of the dead. But who was Osiris in his life? asked Gardiner. At times “he is represented to us as the vegetation which perishes in the flood-water mysteriously issuing from himself. . . .”⁽⁷⁾ He is associated with brilliant light.⁽⁸⁾

After a life of studying Egyptian history and religion Gardiner confessed that he remained unaware of whom Osiris represented or memorialized: “The origin of Osiris remains from me an insoluble mystery.”⁽⁹⁾ Nor could others in his field help him find an answer.

The Egyptologist John Wilson wrote that it is an admission of failure that the chief cultural content of Egyptian civilization, its religion, its mythological features again and again narrated and alluded to in texts and represented in statues and temple reliefs, is not understood.⁽¹⁰⁾ The astral meaning of Egyptian deities was not realized and the cosmic events their activities represent were not thought of.

* * *

The prophet Ezekiel in the Babylonian exile had a vision—the likeness of a man, but made of fire and amber who lifted him by the lock of his hair and brought him to some darkened chamber where the ancients of the house of Israel with censers in their hands were worshipping idols portrayed upon the wall round about. Then the angel of the vision told him: “Thou shalt see greater abominations that they do”—and he brought the prophet to the door of the gate of the Lord’s house—“and, behold, there sat women weeping for Tammuz.” Next he showed him also Jews in the inner court of the Lord’s house “with their back toward the temple of the Lord and their faces toward the east; and they worshipped the sun toward the east.”⁽¹¹⁾

The worship of the sun and the planets was decried by Jeremiah, a contemporary of Ezekiel. But what was this weeping for Tammuz?

Tammuz was a Babylonian god; one of the months of the year, approximately coinciding with July, in the summer, was named in his honor; and by this very name it is known in the present-day Hebrew calendar. Tammuz was a god that died and was then hidden in the underworld; his death was the reason for a fast, accompanied by lamentations of the women of the land. His finding or his return to life in resurrection were the motifs of the passion.⁽¹²⁾

Tammuz was a god of vegetation, of the flood, and of seeds: “The god Tammuz came from Armenia every year in his ark in the overflowing river, blessing the alluvium with new growth.” (13) In the month of Tammuz he was “bound, and the liturgies speak of his having been drowned among flowers which were thrown upon him as he sank beneath the waves of the Euphrates.” (14) The drowning of Tammuz was an occasion for wailing by women: “The flood has taken Tammuz, the raging storm has brought him low.” (15)

Of Tammuz it also is narrated that he was associated with brilliant light, (16) with descent into the nether world, visited there by Ishtar, his spouse. Tammuz’ death, his subsequent resurrection, or his discovery in the far reaches, but no longer brilliant, were the themes of the cult that was not just one of the mysteries, but the chief and paramount cult.

The Osirian mysteries, the wailing for Tammuz, all refer to the transformation of Saturn during and following the Deluge. Osiris was not a king but the planet Saturn, Kronos of the Greeks, Tammuz of the Babylonians. The Babylonians called Saturn “the Star of Tammuz.” (17) After the Deluge Saturn was invisible (the sky was covered for a long time by clouds of volcanic dust) and the Egyptians cried for Osiris, and the Babylonians cried for Tammuz. Isis (Jupiter at that time) went in search of her husband, and Ishtar (also Jupiter at that early time) went to the netherworld to find her husband Tammuz. For a time Saturn disappeared, driven away by Jupiter, and when it reappeared it was no longer the same planet: it moved very slowly. The disappearance of the planet Saturn in the “nether world” became the theme of many religious observances, comprising liturgies, mystery plays, lamentations, and fasts. When Osiris was seen again in the sky, though greatly diminished, the people were frenzied by the return of Osiris from death; nevertheless he became king of the netherworld. In the Egyptian way of seeing the celestial drama, Isis (Jupiter), the spouse of Osiris (Saturn) wrapped him in swathings. Osiris was known as “the swathed”—the way the dead came to be dressed for their journey to the world of the dead, over which Osiris reigns. Similar rites were celebrated in honor of Adonis, who died and was resurrected after a stay in the netherland (18), in the mysteries of Orpheus. (19)

Sir James G. Frazer, the collector of folklore, came to regard Osiris as a vegetation god (20); likewise he saw in the Babylonian Tammuz, an equivalent of the Egyptian Osiris, a vegetation god and, carried away by this concept, wrote his *The Golden Bough*, (21) built around the idea of the vegetation god that dies and is resurrected the following year.

A few peoples through consecutive planetary ages kept fidelity to the ancient Saturn, or Kronos, or Brahma, (22) whose age was previous to that of Jupiter. Thus the Scythians were called Umman-Manda by the Chaldeans (23) —“People of

Manda"—and Manda is the name of Saturn.⁽²⁴⁾ The Phoenicians regarded El-Saturn as their chief deity; Eusebius informs us that El, a name used also in the Bible as a name for God, was the name of Saturn.⁽²⁵⁾ In Persia Saturn was known as Kevan or Kaivan.⁽²⁶⁾

The different names for God in the Bible reflect the process of going through the many ages in which one planet superseded another and was again superseded by the next one in the celestial war. El was the name of Saturn; Adonis of the Syrians, the bewailed deity, was also, like Osiris, the planet Saturn; but in the period of the contest between the two major planets, Jupiter and Saturn, the appellation of the dual gods became Adonai, which means “my lords” ; then, with the victory of Jupiter, it came to be applied to him alone.⁽²⁷⁾

 20. This was also recognized by Hugo Gressman ("Tod und Auferstehung des Osiris," *Das Alte Orient* [1923], p. 12.
 21. See especially the volume entitled *Adonis, Attis, Osiris*.
 22. [That Brahma is Saturn was understood by Velikovsky as long ago as the early 1940's though he did not publish the idea until 1974 in the text of his lecture before the American Association for the Advancement of Science Symposium. See *Pensée* VII (1974), p. 10 and *KRONOS* III.2 (1977), p. 6. The identification of Brahma with Saturn is evidenced by the fact that the god is assigned a celestial sphere (cf. *The Ramayana*, transl. by R. Griffith, Vol. I [London, 1870], Canto XLV, p. 208; cf. also *The Kalika Purana*, ch. xxv). A celestial sphere should probably be interpreted as an orbit. In the *Mahabharata* it is further said that "the high-souled Brahma [is] seated in the highest (abode)" (quoted in Shastri, *The Flood Legend*, p. 10). *The Brhad-aranyaka Upanishad* places Brahman in the highest "world." In the cosmology of the *Yogabhasya* of Vyasa, the highest celestial sphere is that of Brahma. In the

Vishnu Purana the Brahmaloaka, which is the heaven of Brahma, is the seventh and highest heaven. In some sources the Brahmaloaka is referred to as Satyaloka. Cf. Tacitus, *The Histories* V. 4: "In the highest orbit and exerting the greatest influence moves the star Saturn." Many years ago F. Wilford reported the opinion of certain learned Brahmins who told him that while Shiva shines in the planet Jupiter, "Saturn is directed by Brahma." ("On Egypt etc. from the Ancient Books of the Hindus," *Asiatick Researches* III (1799), p. 382). Cf. E. Moor, *The Hindu Pantheon* 1864), p. 218. I believe Wilford is the unacknowledged source of Moor's assertion that Brahma is Saturn.

In China the planet Saturn was associated with the palace and with the Emperor. It was called "the planet of the Son of Heaven." (Se-ma Ts'ien, *Les memoires historiques*, ed. by E. Chavannes, vol. III, pt. 2, p. 367.].

Seventeen

In the story of the Universal Deluge it is said: “In the six hundredth year of Noah’s life, in the second month, on the seventeenth day of the month, the same day were all the fountains of the great deep broken up, and the windows of heaven were opened.”

⁽¹⁾ Five months later, according to the Book of Genesis, on the seventeenth day of the seventh month, the ark rested upon Ararat.

In Egyptian religious belief Osiris was drowned “on the seventeenth day of the month Athyr.” ⁽²⁾ The fast for Tammuz, commemorating his descent into the netherworld, began on the seventeenth of the month named for him. ⁽³⁾ Although the similarity of the Babylonian and Biblical versions of the story of the Deluge was repeatedly stressed, the significance of the number seventeen in the story of Tammuz in relation to the same number in the book of Genesis was not emphasized, or even noticed.

The feast of Saturnalia began “always on the 17th of December” and with time, in imperial Rome, when it was celebrated for three consecutive days, it began on the fifteenth and continued for two more days, until the seventeenth. ⁽⁴⁾

The connection between the number seventeen and the Deluge is thus not confined to the Biblical, Babylonian, and Egyptian sources—we meet it also in Roman beliefs and practices. The significance of the number seventeen in the mystery plays related to Osiris’ drowning and in the festivities of Saturnalia is an indication that these memorials were related to the Deluge.

1. Genesis 7:11.
2. Plutarch, *De Iside et Osiride*, ch. 13; cf. also ch. 42. [The coincidence of the Biblical date of the beginning of the Deluge with the date of Osiris’ disappearance, or drowning, was noted by the eighteenth-century scholar Jacob Bryant, who claimed, in addition, that in both accounts the month was the second after the autumn equinox (*A New System or An Analysis of Ancient Mythology*, second edition [London, 1775], p. 334. Bryant also believed that “in this history of Osiris we have a memorial of the Patriarch and the Deluge” (*ibid.*, p. 334, n. 76). The identity of the two dates has been noted by several other authors, among them George St. Clair. See his *Creation Records Discovered in Egypt* (London, 1898), p. 437. On the significance of the date seventeen in Egypt, cf. Griffiths, *Plutarch’s De Iside et Osiride*, p. 312. Cf. H. E. Winlock, “Origin of the Ancient Egyptian Calendar,” *Proceedings of the*

American Philosophical Society 83 (1940), p. 456 n.: “Throughout Coptic and Arab times at least, the night of June seventeenth was celebrated as ‘the night of the Drop’ when it was believed that a miraculous drop fell into the Nile, causing it to rise.”].

3. [According to Langdon, “In Babylonia the god Tammuz was said to have descended to the lower world on the 18th of Tammuz and to have risen on the 28th of Kislev (December).” (*Babylonian Menologies and the Semitic Calendars* [London, 1935], p. 121). Originally the date had been the seventeenth; but when “the reckoning of time was altered to the extent of making the day begin with sunrise instead of with the approach of night” (M. Jastrow, *The Religion of Babylonia and Assyria* [Boston, 1898], p. 78), the 18th day of the month began about twelve hours earlier and encroached upon the daylight hours of the seventeenth day, which were now counted as part of the eighteenth. According to rabbinical sources, the end of the 40 days of rain mentioned in the Genesis account came on the 27th of Kislev—the very same day as the 28th of Kislev in the Babylonian reckoning, when Tammuz is said to have risen.].

Festivals of Light

The Deluge and the seven days of brilliant light immediately preceding it were a universal experience, and they left indelible memories. Many of the religious rites and observances of all creeds go back to these events of the past in which the celestial gods Saturn and Jupiter were the main participants. Among the most ancient of all such observances were festivals of light of seven days' duration, held in honor of Saturn. The "seven days of light" just before the Deluge overwhelmed the Earth are recreated in these feasts. ⁽¹⁾

Herodotos describes a nocturnal light festival held each year at Sais in commemoration of Osiris' death and resurrection. It was called the Feast of Lamps:

There is one night on which the inhabitants all burn a multitude of lights in the open air round their houses. . . . These burn the whole night. . . . The Egyptians who are absent from the festival observe the night of the sacrifice, no less than the rest, by a general lighting of lamps; so that the illumination is not confined to the city of Sais, but extends over the whole of Egypt. ⁽²⁾

In Rome the feast of light was named Saturnalia. According to tradition the Saturnalia had been established in honor of Saturn when, all of a sudden, after a lengthy and prosperous reign, "Saturn suddenly disappeared." ⁽³⁾ Macrobius wrote that in celebrating the Saturnalia the Romans used to honor the altars of Saturn with lighted candles . . . sending round wax tapers during the Saturnalia." ⁽⁴⁾ In his time the festival was celebrated for three consecutive days but, Macrobius wrote,

And yet in fact among the men of old there were some who supposed that the Saturnalia lasted for seven days . . . for Novius . . . says: 'Long-awaited they come, the seven days of Saturnalia' ; and Mummius too . . . says: 'Of the many excellent institutions of our ancestors, this is the best—that they made the seven days of the Saturnalia begin when the weather is coldest.' ⁽⁵⁾

Hannukah and Christmas are both feasts of light and, like the Saturnalia, both can be traced to the days of the Universal Deluge. The Hebrew tradition that Hanukkah was established to commemorate the "miracle with the oil" that was found undepleted and sufficed for seven days, is a poor rationalization. A better ground for a re-establishment of a holiday, so similar to the Saturnalia, in Judea, was in the fact that in the middle of the second century before the present era Rome conquered Greece,

and about the same time in the rebellion of the Hashmanaim (better known by the name of one of the sons, Judah Maccabi) against Hellenistic rule, the people of Palestine were drawing near the Roman world with its usages. It appears that the Romans fomented the revolt in the Hellenized provinces at the time of their conquest of Greece. Thus the feast of Hanukkah seems to be an adaptation of the Roman Saturnalia.⁽⁶⁾

The observation of this festival was later taken over by the festival of Christmas, which was originally observed for seven days, from the 25th of December until the first of the New Year.

References

1. [The earliest of the festivals of this type that we know of was the yearly seven-day-long celebration commemorating the inauguration of the temple of Ningirsu in Babylonia in the time of Gudea (before ca. 2000 B.C.). For this and other similar festivals, see P. Bourboulis, *Ancient Festivals of "Saturnalia" Type* (Salonica, 1964). Ningirsu was "he who changed darkness into light," the same as Ninib, or Saturn (M. Jastrow, *Die Religion Babyloniens und Assyriens*, ch. IV, pp. 56ff). In Athens the feast in honor of Saturn was called the *Kronia*. See H. W. Parke, *Festivals of the Athenians* (London, 1977), pp. 29-30. It would appear that the main idea behind the Saturnalia-type festivals, so widespread in antiquity, was a re-enactment of the conditions that existed during the Golden Age when Saturn reigned. The celebration of the Roman Saturnalia, which, according to Macrobius, pre-dates the founding of Rome by many centuries (VII. ??), was marked by a reversal of social relations, the release of the statue of Saturn that stood in the Forum from its bonds (Macrobius, *Saturnalia* VII. ??), the crowning of a mock-king (apparently representing Saturn) whose every command had to be strictly obeyed (Tacitus, *Annales* 13, 15; Epictetus, *D*, I. 25. 8; Lucian, *Saturn.* 2. 4. 9), and who was later sacrificed on the altar of Saturn. Some details of such a sacrifice are given in *Acta Sancti Dasii*, ed. by F. Cumont in *Analecta Bollandiana* XVI (1897). See also Cumont, "Le roi des saturnales," *Revue de Philologie* XXI (1897), pp. 143-153. Porphyry reports the existence of a similar festival on Rhodes during which a man was sacrificed to Kronos (*De Abstinencia* II. 54). A similar Persian festival was the Sacaia (Dio Chrysostom, *Orationes* IV. 66). A possible parallel in Mexico may be the festival Atemoztli, "Coming Down of the Waters," described in a manuscript reproduced in Kingsborough, *The Antiquities of Mexico*: "On the XXI of December they celebrate the festival of that god who, they say, was the one that uncovered the earth when it was annihilated by the waters of the Deluge."].

3. Macrobius, *Saturnalia* I. 7. 24: subito non comparuisset. [It was then, according to Macrobius, that Italy came to be called Saturnia in honor of the

planet. Cf. Dionysius of Halicarnassus, *Antiquitates Romanorum* I. 6; Ovid, *Fasti*, VI. 1. 31.]

4. (*Saturnalia* I. 7. 31-32, transl. by P. Davies, 1969). Macrobius noted also the opinion of those who “think that the practice is derived simply from the fact that it was in the reign of Saturn that we made our way, as thou to the light, from a rude and gloomy existence to a knowledge of the liberal arts.” [Cf. above, “Tammuz and Osiris,” n. 9 on the Egyptian light festival in honor of Osiris.]
5. *Saturnalia* X.
6. Similarly, the way of praying with covered head appears to be a taking over of the Roman usage—the Greek custom was to pray with an uncovered head.

Saturn and Jupiter

The history of this pair, the ancient Kronos and Zeus, or Saturn and Jupiter, as reflected in many traditions all around the world, tells a story that has nothing in it resembling the sedate and uneventful circling of these bodies on their orbits that modern astronomy asserts as a fact.

Saturn and Jupiter are very much like the sun; were they not planets, they would be considered stars, like our sun.⁽¹⁾ Jupiter is nearly 330 times more massive than the Earth, and Saturn 80 times. Both planets are covered with gases which are in constant motion, like the gaseous atmosphere of the sun. The sun has nine satellites and numerous asteroids and comets; Jupiter has at least fourteen satellites and several asteroids and comets. Saturn has ten known satellites; and four or five comets constitute the Saturnian family (though these comets do not circle around Saturn itself, they are commonly regarded as related to the orbit of Saturn).

Were Jupiter and Saturn free from the bonds of the sun, they could be considered as stars or suns. Were two such stars set in space close to one another, they would constitute a double-star system, both stars circling around a common focus.

As told, the picture that emerges from comparative folklore and mythology presents Saturn and Jupiter in vigorous interactions. Suppose that these two bodies approached each other rather closely at one time, causing violent perturbations and huge tidal effects in each other's atmospheres. Their mutual disturbance led to a stellar explosion, or nova. As we have seen, a nova is thought to result from an instability in a star, generated by a sudden influx of matter, usually derived from its companion in a binary system. If what we call today Jupiter and Saturn are the products of such a sequence of events, their appearance and respective masses must formerly have been quite different.⁽²⁾

A scenario such as this would explain the prominence of Saturn prior to its cataclysmic disruption and dismemberment—it must have been a larger body than it is now, possibly of the volume of Jupiter. Interestingly, for certain reasons G. Kuiper assumed that Saturn originally was of a mass equal to that of Jupiter.⁽³⁾ At some point during a close approach to Jupiter, Saturn became unstable; and, as a result of the influx of extraneous material, it exploded, flaring as a nova which, after subsiding, left a remnant that the ancients still recognized as Saturn, even though it was but a fraction of the celestial body of earlier days. In Saturn's explosion much of the matter absorbed earlier was thrown off into space. Saturn was greatly reduced in size and removed to a distant orbit—the binary system was broken up and Jupiter took over

the dominant position in the sky. The ancient Greeks saw this as Zeus, victorious over his father, forcing him to release the children he earlier had swallowed and banishing him to the outer reaches of the sky. In Egyptian eyes it was Horus-Jupiter assuming royal power, leaving Osiris to reign over the kingdom of the dead.

If the descriptions of Saturn as a “sun” mean anything, Saturn must have been visible, in the time before its explosion, as a large disk. If this was the case the increased distance between the Earth and Saturn could have been the result of the removal of the Earth from its place or of Saturn from its place, or both. Saturn could be removed only by the planet Jupiter, the sole member of the planetary family more powerful than Saturn. And indeed, the myth says that Saturn was removed by Jupiter.

References

1. [In *Worlds in Collision* Velikovsky wrote of events that may theoretically take place in the future: “Some *dark star*, like Jupiter or Saturn, may be in the path of the sun, and may be attracted to the solar system and cause havoc in it.” (Emphasis added). While in 1950 both planets were assumed by astronomers to be covered by thick layers of ice, they are now known to be star-like in their composition and thermal properties. In the case of Saturn, H. Spencer Jones (*Life on Other Worlds* [Macmillan Company: New York, 1940], ch. 6) argued that Saturn must be coated with water ice or frozen ammonia. Spencer-Jones’ book was published in the same year in which Velikovsky drew very different conclusions about Saturn’s thermal history and structure. The astronomers’ conjecture was based on a simple calculation of the amount of heat reaching the planet: Saturn, being almost ten times farther away from the Sun than the Earth had to have a mean temperature in the neighborhood of -155 degrees Celsius. The reasons why Velikovsky concluded that Saturn’s temperature must be considerably higher than the accepted estimate were, first, in “the residual heat of the catastrophe in which Saturn was derailed from its orbit” and, second, “the radioactivity that resulted from the catastrophe must still be pronounced on Saturn.” (From the unpublished manuscript, *The Test of Time*). On top of all this, “based on its past history, Saturn can be regarded as a star and may have some of the mechanism that makes our sun burn with intense light.”

In 1966 Kellerman described his observations and measurements at a wavelength of 21.3 cm, which showed a temperature of 90 degrees Fahrenheit for the inner atmospheric layers. (*Icarus*) Revised textbooks, taking account of the findings, began to speak of “room temperature” on Saturn, recorded in the 21-centimeter band. (E.g., Fred Whipple, *Earth, Moon and Planets* third revised edition [Cambridge, Mass., 1968], p. 187). By 1972 measurements at radio wavelengths of 50 and 100 centimeters found “unusually high” temperatures—about 240 degrees F. and 520 degrees F. respectively. “Thus it appears that Saturn, like Jupiter, is not the entirely frozen wasteland it was once thought to be.” (D. McNally, “Are the Jovian Planets ‘Failed’ Stars?”

Soon it was realized that Saturn must have an internal energy source, and is in fact more like a star than like a planet, though it is not considered sufficiently massive to function as a true star. (*Science News* 101 [1972], p. 312. The article compares the view expressed only a few years previously by C. Sagan that Saturn could not be an abode of life because of atmospheric temperatures several hundred degrees below zero Fahrenheit. Cf. *Intelligent Life in the Universe*).

Measurements in the far-infrared and submillimeter ranges, published in 1977, indicate that the internal energy source on Saturn lies “within the range of 2.3 to 3.2 times the absorbed solar flux.” (R. F. Loewenstein *et al.*, “Far Infrared and Submillimeter Observations of the Planets,” *Icarus* 31 [1977], p. 315. Cf. *The Astrophysical Journal* 157, pp. 169ff.). In other words, Saturn gives off up to about three times the amount of energy it receives from the Sun.

At the beginning of 1980 analysis of measurements taken by Pioneer 11 during its flight past Saturn showed that the interior of the planet has a temperature exceeding 10,000 degrees Kelvin, which is considerably hotter than the surface of the Sun (less than 6,000 degrees Kelvin).]

2. A hypothesis that the protoplanet masses of Jupiter and Saturn were nearly the same was advanced by G. Kuiper. See *Sky and Telescope*, (March, 1959), p. 259.
3. *Sky and Telescope* (March, 1959), p. 259.

Nova

From time to time, once in a decade or once in a century, a dimly shining or invisible star flares with brilliant light; it may become brighter than any of the fixed stars, or any of the planets in the sky; it may be seen not only in the nocturnal sky, but in some cases in full daylight; it burns for weeks or months, then loses its brilliance, and finally becomes once more a hardly visible star. Such a blazing star is called a nova.

⁽¹⁾ The *stella nova* seen in 1572 in the days of Tycho de Brahe belonged actually to the supernova category. De Brahe observed that the nova did not belong to the solar system but was one of the fixed stars. It was brighter than Jupiter and Venus and was seen at midday—for months it remained visible to the naked eye. Another supernova was observed by Johannes Kepler in 1604. An earlier such event, recorded in the Chinese annals for the year 1054, gave rise to the Crab Nebula. Other observations indicate that a supernova also occurred in 1006.

Isaac Newton suggested a collision between two stars as the cause of the formation of a nova. The prevalent view is that a nova results from the interaction of two stars in a binary system when the two members disrupt one another on close approach. In such a case filaments of the disrupted star are torn out of its body and hurled in great spurts, to be absorbed by the companion star. The sudden transfer of matter is thought to set off the star's cataclysmic explosion.⁽²⁾

With the development of spectroscopy in the nineteenth century it was found by the displacement of the spectral lines that the gases of a nova move rapidly toward the observer, as also in all other directions; the star's atmosphere expands with a velocity reaching at times over three thousand kilometers per second.⁽³⁾

While the star's outer gases are hurled into space, much of the inner core remains.

1. [It is thought that as many as twenty novae occur in our galaxy each year, but only rarely does one become so prominent as to approach even a third magnitude brightness. A supernova in the part of our galaxy observable from the Earth may occur once in several hundred years: Kepler's nova (1604) was the last such event.]
2. [In the case of small novae the increase in brightness is about hundredfold. See J. S. Gallagher *et al.*, *Astrophysical Letters* Aug. 15, 1976.]
3. [More commonly the velocities range from 1,300 to 2,500 km/sec.]

“Star of the Sun”

Saturn is not a conspicuous planet in the sky. Were it not for its sluggish movement, an unaided eye would hardly distinguish it from the surrounding stars. In many ancient sources Saturn is called “sun.” The usual name for Saturn in Chaldean astronomy was Alap-Shamas, meaning “Star of the Sun.” ⁽¹⁾ Diodorus of Sicily reported that the Chaldeans called Cronos (Saturn) by the name Helios, or the sun, and he explained that this was because Saturn was the most conspicuous of the planets; ⁽²⁾ Hyginus also wrote that Saturn was called “Sol.” ⁽³⁾ In the Babylonian astrological texts the word Shamash (Sun) was used to designate Saturn: “We learn from the notes written by the astrologers that by the word ‘sun’ we must understand the ‘star of the sun,’ i.e., Saturn.” ⁽⁴⁾ Ninib was the Babylonian name for Saturn: “Ninib in various places is said to shine like the sun.” He was known as UT-GAL-LU, the “great sun of storms.” ⁽⁵⁾ The Greeks used to call Saturn *Phaenon*, “the shining one.” ⁽⁶⁾

If Saturn was always as inconspicuous as it is at present, what could have caused the races of antiquity, as if by common consent, to give to Saturn the appellative “sun” or “the shining one” ? “The astrologers certainly must have found it increasingly contrary to reason to associate the star that gives us light and life with one of the palest, and the slowest of the planets.” ⁽⁷⁾

The folk etymology of the Hebrews explained the name Khima as meaning “about a hundred (*ke'me-ah*) stars.” ⁽⁸⁾

The *Bhagavat Gita* contains the following description of a deity: “If the radiance of a thousand suns were to burst at once into the sky, that would be like the splendor of the mighty one . . . the shatterer of worlds.” ⁽⁹⁾

All that we have considered up to now indicates that Saturn once exploded in a nova-like burst of light. The date of this event I would be hard-put to specify, even approximately, but possibly it took place about ten thousand years ago. The solar system and reaches beyond it were illuminated by the exploded star, and in a matter of a week the Earth was enveloped in waters of Saturnian origin.

6. Cicero, *De Natura Deorum* II. 52. [Cf. Manetho, *Apotelesmaticorum libri sex* IV. 14. Cf. also J. Geffcken, “Eine gnostische Vision,” *op. cit.*, p. 699. “The Shining Star” was a designation for Saturn in Babylonia. See for instance, an inscription of Nabonidus in James B. Pritchard ed., *Ancient Near Eastern Texts Relating to the Old Testament* (Princeton, 1950), p. 310.

In India the appellation of the sun, *arki*, was also applied to Saturn. R. Temple writes (*The Sirius Mystery* [New York, 1976], p. 180):

In Sanscrit again *arka* means “belonging or relating to the sun.” *Arkam* means “as far as the sun, even to the sun inclusively.” *Arki* has become a name for Saturn, thought at that time to be the most distant planet. *Arc* means “to shine, be brilliant,” and can mean “to cause to shine.” *Arkin* means “radiant with light.”

Arkaja, the name often applied to Saturn, designates it as an offspring of the Sun (*Markandeya Purana*).]

7. Bidez, *Revue de Philologie*, *op. cit.*, p. 320: “*Les astrologues trouverent sans doute de plus en plus deraisonnable de donner en appanage a l’astre d’ou nous vient la lumiere et la vie, une des plus pales et la plus lente des planetes.*”

Arrival of the Waters

Following the “seven days” when the world appeared to be ablaze in “the radiance of a thousand suns” the Deluge started.

First, according to the Hindu account, vast clouds gathered which “overshadowed the entire world.” ⁽¹⁾

“These ominous clouds . . . rumbling and shooting lightning, overspread the sky.” ⁽²⁾ They were “as vast as mountains.” “Some were dusky, some crimson, some white, some brilliant (in hue).” ⁽³⁾ Other sources describe them as yellow, or azure, or red. “Loud in roar and mighty in size they fill the entire sky.” ⁽⁴⁾ They were “fringed with lightning, meteors and thunderbolts.” ⁽⁵⁾ Then, “rumbling aloud with lightning [they] poured torrential streams thick like chariot wheels.” ⁽⁶⁾ They “rained with a sullen roar, inundating the three worlds with ceaseless downpour of torrents. . . .” ⁽⁷⁾ “And then there were seen on all sides the four oceans engulfing with tempestuous waves the whole surface of the earth.” ⁽⁸⁾ All creation was “smitten by the luminous dense floods.” ⁽⁹⁾

In the beginning of the deluge the nova in the sky shone through the splendor of the illuminated skies and through the sheets of rain, ever increasing in intensity. ⁽¹⁰⁾ The Biblical expression “the Lord sitteth upon the flood” ⁽¹¹⁾ was an apt description of the blazing nova above the waters of the Deluge. It has a Babylonian counterpart in the title of Tammuz as *bel girsu*: “lord of the flood.” ⁽¹²⁾ The nova blazed terrifically, but soon the light became diffused, the shadows grew ever dimmer, the world that was all splendor and light turned gloomier and gloomier; the outpouring waters grew ever thicker; the clouds of dust darkened ever more the sky, and finally the drama of what was taking place on earth went on in darkness.

The Deluge was not a peaceful though abundant rain filling the earth with water, rising ever higher. Ancient sources give a description of the Deluge that differs greatly from the pageant of showers pouring from above on a peaceful land and peaceful sea.

The Deluge in Rabbinical Sources

During the “seven days” when the world was flooded by sheets of light, and terrifying signs and commotion filled the heavens, “the Holy One . . . reversed the order of nature, the sun rising in the west and setting in the east.” ⁽¹⁾

But during the Deluge “the sun and the moon shed no light” ⁽²⁾ and for an entire year the planets did not follow their regular courses. ⁽³⁾ It may be that because of dust discharged by volcanoes the sky remained veiled for a long period, and this veil made any celestial orientation impossible for the few survivors; but quite possibly the statement refers to a change in the celestial orbits. The rabbinical sources add that the earth was quaking, and the sun was darkened, and the foundations of the cosmos were dislodged. The entire world was in volcanic activity; “amidst lightnings and thunders a very loud sound was heard in the entire world, never heard before.” ⁽⁴⁾

The Flood was caused by waters pouring from above, but also by waters drawn up from the ground. “All the fountains of the great deep were broken up, and all the windows of heaven were opened.” ⁽⁵⁾ The waters that came from the sky were heated. Many passages in the rabbinical literature refer to the heated water. ⁽⁶⁾

The rabbinical literature also refers to great tides and surges of water that covered the face of the earth. “The flood began to toss the ark from side to side. All inside of it were shaken up like lentils in a pot.” ⁽⁷⁾ It is also said that not one, but many arks or vessels were used as a means of escape, but they were ruined or capsized one after the other in the surging water. ⁽⁸⁾ Judged by this, one would think that there were ample signs of the impending catastrophe, and attempts to organize rescue by preparing boats or ships, all probably destined to fail. The Biblical account, in order to explain the survival of the human species and some land animals, made the ark of Noah the central theme of the story. There must have been many Noahs, and the Midrashim also say so—but probably none of them escaped with his boat the outrages of nature. Possibly, in some caves high in the mountains, in far separated regions of the earth, human beings survived the Deluge; but hardly any vessel or ark. The attempt to find the remains of an ark on Mount Ararat are probably as futile as looking for the ribs of Adam. Yet such attempts are made even in our time. ⁽⁹⁾

The duration of the flood is described differently—forty days, and also much longer. ⁽¹⁰⁾ Like the former catastrophe of the fall of man, this catastrophe of the Deluge, according to the Hebrew cosmogony, changed the nature of herb, animal and man.

The prosperity of the time before the great was gone, never to return; the world lay in ruins. The earth was changed; even the sky was not the same.

The continents changed their places in the former catastrophes, and once again in the catastrophe of the Deluge. The areas which are now the shores of the Mediterranean were the shores of an open ocean—or so one may conclude from the following statement: “Before the birth of Noah, the sea was in the habit of transgressing its bounds twice daily, morning and evening. Afterwards it kept within its confines.”

As volcanoes erupted, the sky was darkened, and the ocean swelled and rolled on a helpless planet that fluttered when caught in hydrogen clouds of cosmic origin.

4. Ha-Yewani Zerahiah, *Sefer Hayashar, The Book of the Righteous*, ed. and transl. by S. J. Cohen (New York, 1973), p.
5. Genesis 7:11.
6. The opinion of Rabbi Hisda to this effect is recorded in Rosh Hashanah 12A and Sanhedrin 108B. Cf. J. B. Wiedeburg, *Astronomische Bedenken* (Jena, 1744), p. 80, and sources in Ginzberg, *Legends* Vol. V, p. 178.
7. Ginzberg, *Legends*, vol. I, p. 162.
8. *Ibid.*, Vol. VI, p. 35.
9. E.g., the expedition recounted by D. Balsinger and C. Sellier, jr. in *In Search of Noah’s Ark* (Los Angeles, 1976). If there are some ancient fossilized structures that resemble an ark, as some explorers assert, then more probably it was the presence of these remains which caused the Biblical penman to relate the rescue ship to the mountainous crag of Ararat in the southern Caucasus.
10. It appears that the tradition of “a year” of the deluge led to confusion in calculations, and the traces of this confusion seem to be found in the double redaction of the story of the Deluge. The age of Noah and his contemporaries would indicate that the year was shorter; it could still have consisted of a number of months, but not of months of thirty days; and the days themselves

could have been shorter.

The Rings of Saturn

One instance of the Saturn myth can be verified with the help of a small telescope: Saturn is in chains. Instead of solving anything, this fact presents a new problem that demands a solution. How did the ancient Greeks and Romans know that Saturn is encircled by rings?⁽¹⁾ It is strange that this question was not asked before.⁽²⁾ The existence of these rings around Saturn became known in modern times only in the seventeenth century, after the telescope was invented. They were first seen, but misunderstood, by Galileo⁽³⁾ and understood by Huygens.⁽⁴⁾

If the myth did not by mere chance invent these rings, the Greeks must have seen them. The last case could be true if the Greeks or some other oriental people possessed lenses adapted for the observation of celestial bodies, or if the rings around Saturn were visible to the naked eye at some time in the past—today they are not visible without magnifying instruments. There are cases of exact observations by the Chaldeans which suggest the use of some accurate technical means.⁽⁵⁾ These means could consist of a sort of astrolabe like that of Tyche de Brahe who made most accurate observations of celestial bodies without the help of a telescope; also Copernicus, prior to Tyche de Brahe, made all his calculations of the movements of the planets before the telescope was invented. But neither Tycho de Brahe nor Copernicus saw the rings.

The statue of Saturn on the Roman capitol had bands around its feet,⁽⁶⁾ and Macrobius in the fifth century of our era, already ignorant of the meaning of these bands, asked: “But why is the god Saturn in chains?”

In the Egyptian legend Isis (Jupiter) swathes Osiris (Saturn). The Egyptian appellation for Osiris was “the swathed.”⁽⁷⁾

In the *Zend-Avesta* it is said that the star Tistrya (Jupiter, later Venus) keeps Pairiko in twofold bonds.⁽⁸⁾ Saturn is encircled by two groups of rings—one larger and one smaller, with a space in between. To see this a better telescope than that used by Galilei or that used by Huygens is needed; the twofold structure of the girdle was first observed in 1675.⁽⁹⁾

The rings of Saturn were known also to the aborigines of America before Columbus discovered the land; this means also before the telescope was invented at the beginning of the seventeenth century. An ancient engraved wooden panel from Mexico shows the family of the planets: one of them is Saturn, easily recognizable by

its rings. ⁽¹⁰⁾

Nor were the Maoris of New Zealand ignorant of them: “One of the great mysteries connected with Saturn is the still unanswered question of how the ancient Maoris of New Zealand knew about her rings—for there is evidence that they did have a Saturnian ring legend long before the days of Galileo.” ⁽¹¹⁾

In the myth it is said that Jupiter drove Saturn away and that on this occasion Saturn was put in chains. If these words mean what they say and are not a meaningless portion of the myth—in a dream, at least, there are no meaningless parts—then the knowledge of the ancients about the rings of Saturn could have been acquired because of better visibility: in other words, at some time in the past Saturn and Earth appear to have been closer to one another.

Originally I assumed that the rings of Saturn may consist of water in the form of ice, but since the ancient lore all around the world tells that it was Jupiter that put these rings around Saturn, ⁽¹²⁾ I considered that they might have some other components, too. Since the 1960’s spectroscopic study of the Saturnian rings has confirmed that they consist most probably of water in the form of ice. ⁽¹³⁾

References

1. [The rings of Saturn are referred to by Aeschylus, *Eumenides* 641: “He [Zeus] himself cast into bonds his aged father Cronus” ; cf. Lucian, *Astrology*, 21: “Moreover, it is not true, neither, that Saturn is in chains.” Neoplatonists like Proclus *In Timaeo*, tr. by Festugiere, vol. III, p. 255 and n. 4; *In Cratylō* 209.3f) and Porphyry (*De Antro Nympharum* 67.21ff.) sought a philosophical or mystical meaning in the tradition. Cf. also Clemens Alexandrinus, *Homilia*, VI. xiii in *Patrologiae Cursus Completus*, Series Graeca, J.-P. Migne ed., vol. II.207f; Dio Chrysostom, *Fourteenth Discourse* 21ff: “And yet the King of the Gods, the first and eldest one, is in bonds, they say, if we are to believe Hesiod and Homer and the other wise men who tell this tale about Cronus.” Cf. Hesiod, *Works and Days*, 169ff. Augustine, refuting those who asserted that the Jewish Sabbath was held in honor of Saturn, wrote: “*ita patres nostri longe fuerunt a Saturniacis catenis, quamvis pro tempore propheetiae sabbati vacationem observaverint.*” (*Contra Faustum Manichaeum* XX. 13. in Migne ed., *Patrologiae Cursus Completus*, Series Latina, Vol. XLII, p. 379).  11. Guy Murchie, *Music of the Spheres* (Boston, 1961), p. 94. [A useful discussion of Maori astronomical ideas is provided in a monograph by E. Best, *The Astronomical Knowledge of the Maori, Genuine and Empirical*, New Zealand Dominion Museum Monograph no. 3 (Wellington, 1922), p. 35:

PAREARAU represents one of the planets. Stowell says that it

is Saturn; that Parearau is a descriptive name for that planet, and describes its appearance, surrounded by a ring. The word *pare* denotes a fillet or headband; *arau* means “entangled”—or perhaps “surrounded” in this case, if the natives really can see the *pare* of Saturn with the naked eye. If so, then the name seems a suitable one. . . . Of the origin of this name one says, ‘Her band quite surrounds her, hence she is called Parearau.’”].

12. [Regarding the process of formation of Saturn’s rings, Velikovsky thought that it might have been analogous to the formation of a disc-like ring of gaseous material around some stars in binary systems, as described by H. Friedman in *Science* 181, (Aug. 3, 1973), p. 396: “The gas enters into Keplerian orbits and accumulates in a disc somewhat resembling Saturn’s rings. . . .”].
13. In August 1965 Tobias Owen, writing in *Science*, (p. 975) reported that “the reflection spectrum from the ice block gave best match to the absorption observed in Saturn’s ring”—but that “the most likely alternatives” would be “ices of methane and ammonia”—both known ingredients of the Jovian atmosphere, methane being also in the composition of the Saturnian cloud envelope. See also Appendix 26. [As early as 1947 Kuiper (*The Atmospheres of the Earth and Planets* [1949]), concluded on the basis of spectral measurements in the infrared that “the rings are covered by frost, if not composed of ice.” Cf. A. Cook *et al.*, “Saturn’s Rings—A Survey,” *Icarus* 18 (1973), p. 317: “Although frozen H₂O is a major constituent, the spectral reflectivity indicates the presence of other materials.”].

Saturn's Golden Age

The age that man later called the Age of Kronos (Saturn) was remembered with nostalgia as an age of bliss. References to the Age of Kronos in the ancient lore are very numerous. [\(1\)](#)

Hesiod tells of

A golden race of mortal men who lived in the time of Kronos when he was reigning in heaven. And they lived like gods without sorrow of heart, remote and free from toil: miserable age rested not on them . . . The fruitful earth unforced bare them fruit abundantly and without stint. They dwelt in ease and peace upon their lands with many good things. . . . [\(2\)](#)

Similarly writes Ovid in the sixth book of his *Metamorphoses*:

In the beginning was the Golden Age, when men of their own accord, without threat of punishment, without laws, maintained good faith and did what was right. . . . The earth itself, without compulsion, untouched by the hoe, unfurrowed by any share, produced all things spontaneously. . . . It was a season of everlasting spring. [\(3\)](#)

Rabbinical sources recount that men lived under very favorable conditions before the Deluge, and that these contributed to their sinfulness: "They knew neither toil nor care and as a consequence of their extraordinary prosperity they grew insolent." [\(4\)](#)

The dominance of Saturn at some remote period in the history of the life of the peoples on Earth was of such pronounced and all-pervading character that the question arises whether the adventures of the planet going through many exploits could by itself be the full cause of the worship of the planet and the naming of the Golden Age "the Age of Kronos" (Saturn). Saturn exploded and caused the Earth to go through the greatest of its historical catastrophes, and this was completely sufficient to make of Saturn the supreme deity; but it appears that the Age of Saturn is a name for the epoch *before* the Deluge; after the Deluge Saturn, dismembered, almost ceased to exist as a planetary body and when at length it was reconstituted it was fettered by rings, and was far from being the dominant celestial body that would behoove it as the supreme deity of the epoch. The "Age of Kronos" is so glorious an age that it is hardly thinkable to connect it with the period after the Deluge. The wailing for Adonis, Tammuz of the Babylonians, or Osiris of the Egyptians, deplored

the end of its dominance, not the beginning of it.

Then why was Saturn the supreme deity by whose name the great and glorious age *before* the Deluge was named? Because it removed Uranus from its role of chief deity, and to the onlookers on Earth, emasculated him? If the distances between the Earth and Saturn and Uranus were then what they are now, then such occurrences could scarcely be observable: Uranus is only faintly visible in the night sky over Mesopotamia in a most translucent night. Saturn is clearly visible but is not, for an unaided eye, a spectacle in the sky; it was more voluminous and more luminous before the Deluge, but if it moved on an orbit not too different from the present one, and the Earth were moving approximately in the same quarters where it moves today, then the surprise still persists as to how a body on a 30-years-long orbit could make the inhabitants of the Earth on its one-year-long orbit, regard it the supreme of all celestial bodies in the sky.

The appellative “sun” employed for Saturn could be explained by its unusual brightness when it exploded as a nova for a short time, actually for seven days, before the beginning of the Deluge on Earth. Assuming the length of the day in those times to have been not too dissimilar from its present value, the velocity of the moving masses being on the order of 100 kilometers a second or 8,600,000 kilometers in a 24-hour period, and the Earth and Saturn being on the closest points on their reciprocal orbits, or in conjunction (which is another surmise), in seven days a distance of ca. 60 million kilometers would be covered. On present orbits the distance between Saturn and Earth varies from 1,279 million kilometers at superior conjunction to 1,578 million kilometers at opposition; the lesser of these distances is ca. 21 times greater than that above calculated. This means also that unless the velocity of the ejected water was an order of magnitude greater than 100 km per second, the distance between Saturn and Earth must have been substantially smaller than it is at present.

I have rather arbitrarily selected the figure of 100 kilometers a second for the motion of the exploded material; today the escape velocity, or the speed required for a projectile on the surface of Saturn to leave the gravitational attraction of the planet is but 35 kilometers a second. For Jupiter the escape velocity is 59 kilometers a second. Assuming that Saturn was of a mass equal to that of Jupiter, the same figure would apply to it too. With 100 kilometers a second we have almost double the velocity of escape. The arbitrariness of the assumption of such velocity for our calculations is obvious. But if the set of figures is not too far from what they actually were, the conclusion would be that the distance of the Earth from Saturn was but a twentieth part of what it is now; this would permit us to speculate whether the Earth could at some early period have been a satellite of Saturn. The distance 60 million km is commensurate with the distance of Mercury from the Sun, or 58 million km; Jupiter’s satellites revolve at distances up to 24 million km from the primary. Theoretically Saturn could have satellites as large as the Earth: the Moon is only one-fortieth of the Earth in volume, whereas Saturn is 760 times larger than our planet. ⁽⁵⁾

If such was ever the case, the “Age of Saturn” and the very unusual conditions under

which mankind lived in it, and Saturn's worship prior to the Deluge, would gain in meaning. The appellative "sun" used for Saturn would be understood as resulting not only from the great light it emitted for a short period when a nova, but also from its long-standing role of a primary for the revolving Earth.

If there is truth in the surmise, and nothing more it is than a surmise, that the Earth was once a satellite of Saturn, the latter must have revolved closer to the sun in order that the Earth should receive heat from it—Saturn exudes little heat⁽⁶⁾—and if the age of Kronos was a golden age, then it is also proper to assume that the conditions on the satellite Earth were not unfavorable for life. The geological record documents extreme climates for the past of the Earth—times when corals grew in the Arctic, and times when the Earth, partly even on the equator, was fettered by ice. Such climates require definitely abnormal conditions that could be created only by varying positions of our planet as an astronomical body. Therefore surmises as made in this section are not in conflict with geological and paleo-climatological records—yet it is not what could have taken place, but what took place, or the historical record, that is the proper goal for inquest. In the absence of direct indications we may only deal with the problem of the Earth as a satellite of Saturn as with a hypothetical construction, requiring further elucidation.

It is assumed by modern astronomy that the ninth planet, Pluto, was once a satellite of Neptune, which, having collided with Triton, another satellite of the planet, was thrown out of the ring and became an independent planet; the satellite Triton, however, as a consequence of the collision, reversed the direction of its revolution and became a retrograde satellite.⁽⁷⁾ Another instance of a postulated conversion of a planetary satellite into an independent planet is discussed by Van Flandern and Harrington in their paper "A Dynamical Investigation of the Conjecture that Mercury is an Escaped Satellite of Venus," *Icarus* 28 (1976), pp. 435-440.]. Thus the principle of a conversion of a satellite into a planet in its own right is not a phenomenon that is discussed here for the first time.

The Golden Age of Saturn or Kronos came to its end with the supreme god of that period, the planet Saturn, was broken up. The Age of Kronos was not the earliest age of which man retained some, however dim, memories—but farther into the past the dimness amounts almost to darkness.⁽⁸⁾

Rainbow

After the Deluge the hope grew into faith that no such or similar destruction would again come to decimate mankind. The story is told that the Lord made a covenant with Noah, and the following were the terms of the covenant:

Then God said to Noah. . . . “I establish my covenant with you, that never again shall all flesh be cut off by the waters of a flood, and never again shall there be a flood to destroy the earth.” [\(1\)](#)

As a visible sign of the obligation not to repeat the catastrophe, a colorful rainbow appeared for the first time after the Deluge—it was a new and till then unknown atmospheric phenomenon. In this colored refraction of sunlight in small and suspended drops of water the rescued believed to see the divine promise not to repeat the flood:

And God said, “This is the sign of the covenant which I make between me and you and every living creature that is with you, for all future generations: I set my bow in the cloud, and it shall be a sign of the covenant between me and the earth. When I bring the clouds over the earth and the bow is seen in the clouds, I will remember my covenant.” [\(2\)](#)

The covenant, according to the moral conception of the Hebrews, was a reciprocal deed. It was kept only in its promise not to bring a paramount flood upon the Earth: the Earth and man continued to be shaped and reshaped in further catastrophes before the close of the age of creation that is the theme of the Book of Genesis.

References

1. Genesis IX. 8-11.
2. Genesis IX. 12-15. [According to Genesis II. 5-6 no rain fell on the newly created earth, which was watered only by a mist ascending from the ground and falling as dew. If this phenomenon persisted until the Deluge this would explain the novelty of the rainbow after the catastrophe.]

Pedro Sarmiento de Gamboa, the Spanish conquistador who traveled in the Andes in the sixteenth century, recorded in his *Historia de los Incas* a tale about Manco Capac, the first Inca, which has a curious resemblance to the Biblical story. Emerging from a cave after the re-appearance of the sun,

Manco Capac and his brothers “arrived at the mountain which is two leagues, approximately, from the town of Cuzco, and climbing to the top, they saw in it the rainbow, which the natives call *guanacuari*. And, interpreting it as a favorable omen, Manco Capac said: ‘Consider this a sign that the world will not again be destroyed by water’” (“*Tened aquello por senal que no sera el mundo mas destruido por agua!*” Chapter 12). The rainbow was depicted on the altar of the Coricancha in the temple of Viracocha in Cuzco. See R. T. Zuidema, “La Imagen del Sol y la Huaca de Susurpuquio en el Sistema Astronomico de los Incas en el Cuzco,” *Journal de la Societe de Americanistes* LXIII (1974-76), p. 218. If, as Dwardu Cardona has suggested, the reference to the rainbow in this passage is to the rings of Saturn—a suggestion with which I tend to concur—the “bondage” of Saturn in its rings may have been regarded as a guarantee of its future behavior.].

The Confusion of Languages

The sequence of events as presented in the Book of Genesis places the catastrophe of Babel next after the Deluge.

And the whole land was of one language and of one speech. . . . And they said, Go to, let us build us a city and a tower whose top may reach unto heaven. . . . And the Lord said, behold, the people is one, and they have all one language. . . . Go to, let us go down, and there confound their language that they may not understand one another's speech. So the Lord scattered them abroad from thence upon the face of all the earth.⁽¹⁾

The rabbinical sources explain that the purpose of the Tower was to secure a shelter for the city of Babel in case the Deluge should occur another time:

The men who were before us God has destroyed with a deluge; if he shall again think fit to be wroth with us, and seek to destroy us even with a deluge, we shall all perish to a man. But come, let us prepare bricks and burn them with fire, that they may withstand the waters and building them together with asphalt, let us make a high tower the top of which shall reach to heaven, in order that being delivered from the deluge we may find safety in the tower.⁽²⁾

This purpose of the builders is found also in an account of this catastrophe which the aborigines of Central America transmitted from generation to generation. Ixtlilxochitl, after narrating the story of the Deluge which brought to a close the first world age, Atonatiuh, and destroyed most of mankind, described the catastrophe which ended the second age or Ehecatonatiuh—"the sun of wind."

And as men were thereafter multiplying they constructed a very high and strong *Zacualli*, which means "a very high tower" in order to protect themselves when again the second world should be destroyed. At the crucial moment their languages were changed, and as they did not understand one another, they went into different parts of the world.⁽³⁾

The same author also gives another version of the same catastrophe:

When 1715 years had passed since the Deluge [men] were destroyed by

a violent hurricane (Uracan) which carried off trees, mountains, houses and people, and great buildings, although many men and women escaped, especially those that were able to take refuge in caves and places where this great hurricane could not reach. ⁽⁴⁾

Similarly wrote Gomara (ca. 1510-1560): “The wind which occurred at that time was so great and of such force that it overthrew all buildings and trees, and even broke mountains apart.” ⁽⁵⁾

Many of the sources which recount the destruction of the Tower of Babel maintain, in close accord with the Mexican account, that the catastrophe was caused by a violent wind. Thus the Sibyl is said to have prophesied:

When are fulfilled the threats of the great God
With which he threatened men, when formerly
In the Assyrian land they built a tower,
And all were of one speech, and wished to rise
Even till they climbed unto the starry heaven,
Then the Immortal raised a mighty wind
And laid upon them strong necessity;
For when the wind threw down the mighty tower,
Then rose among mankind fierce strife and hate.
One speech was changed into many dialects,
And earth was filled with divers tribes and kings. ⁽⁶⁾

In the *Book of Jubilees* it is said that “the Lord sent a mighty wind against the tower and overthrew it upon the earth.” ⁽⁷⁾

The Babylonian account, as transmitted by Abydenus, tells that once men “built a high tower where now is Babylon, and when it was already close to heaven, the gods sent winds and ruined the entire scheme. . . . and men, having till then been all of the same speech, received [now] from the gods many languages.” ⁽⁸⁾

Other accounts give the impression that a strong electrical discharge—possibly from an overcharged ionosphere—found a contact body in the high structure. According to a tradition known to the twelfth century traveler Benjamin of Tudela, “fire from heaven fell in the midst of the tower and broke it asunder.” ⁽⁹⁾ In the Tractate Sanhedrin of the Babylonian *Talmud* it is said: “A third of the tower was burnt, a third sank [into the earth] and a third is still standing.” ⁽¹⁰⁾

The Tower of Babel story was found in the most remote parts of the world prior to the arrival of missionaries in those places, thus before the Biblical account became known to the aborigines.

For instance, on the island of Hao, part of the Puamotu (or Tuamotu) islands in Polynesia, the people used to tell that after a great flood the sons of Rata, who

survived, made an attempt to erect a building by which they could reach the sky and see the creator god Vatea (or Atea). “But the god in anger chased the builders away, broke down the building, and changed their language, so that they spoke divers tongues.” [\(11\)](#)

The question of Biblical influence was discussed by the folklorist: “They [the natives of Hao] declared that this tradition existed already with their ancestors, before the arrival of the Europeans. I leave to them the responsibility for this declaration. All I can certify is that this tradition contains many ancient words which today are no longer understood by the natives.” [\(12\)](#)

Popol Vuh, the sacred book of the Quiche Mayas, narrates that the language of all the families that were gathered at Tulan was confused and none could understand the speech of the others. [\(13\)](#)

The Kaska (Indian) story makes the result into the cause. The Indians narrate that “a great darkness came on, and high winds which drove the vessels hither and thither. The people became separated. Some were driven away. . . . Long afterwards, when in their wanderings they met people from another place, they spoke different languages, and could not understand one another.” [\(14\)](#)

With this exception—the Kaska story may refer to any great upheaval and is actually an effect of large-scale migrations—the traditions of the peoples make the catastrophe the immediate cause of the confusion of languages and the dispersion as well.

While the account in Genesis, and that given by Abydenos and various other sources connect the story with a certain place in Mesopotamia, other traditions localize it in many different countries. [\(15\)](#) In each case the entire population of the world is said to have been affected. If the nature of the catastrophe was cosmic, the same occurrence could have taken place in different countries. In this case the existence of similar traditions in many corners of the globe is of no avail for tracing the migration of ancient tribes. The Arabic tradition makes South Arabia the scene of the upheaval, followed by confusion of languages and migrations. [\(16\)](#) Similar experiences could have been brought about by one and the same cause in many places.

It appears that after the Flood the plain of Mesopotamia became one of the few cultural centers of the world. Another flood would have caused the utter destruction of the human race, and this was feared because the memory of the Flood a few centuries earlier was very vivid. Observations of the movements of the heavenly bodies may have provided a warning of a new catastrophe and large structures were built for refuge. But when the event came, the structures were overwhelmed and destroyed by hurricanes and powerful electrical discharges.

In the rabbinical concept of the seven earths, molded one out of another in successive

catastrophes, the generation which built the Tower of Babel inhabited the fourth earth; but it goes on to the fifth earth where the men become oblivious of their origin and home:⁽¹⁷⁾ those who built the Tower of Babel are told to forget their language. This generation is called “the people who lost their memory.” The earth which they inhabited was “the fifth earth, that of oblivion (Neshiah)⁽¹⁸⁾

In the ancient Mexican traditions it is told that those who survived the catastrophe of the “sun of wind” lost “their reason and speech.”⁽¹⁹⁾

The characteristic of this catastrophe was its influence upon the mental, or mnemonic, capacity of the peoples. The description of it, as told by many tribes and peoples, if it contains authentic features, arouses the surmise that the earth underwent an electromagnetic disturbance, and that the human race experienced something that in modern terms seems like a consequence of a deep electrical shock.

The application of electrical current to the head of a human being often results in a partial loss of memory; also a loss of speech may be induced by the application of electrodes to specific areas of the brain.⁽²⁰⁾

 15. Many different traditions were collected by James G. Frazer in *Folk-lore in the Old Testament*, (London, 1918), Vol. I, ch. V. Cf. H. H. Bankroft, *The Native Races of the Pacific States*, Vol. V.
 16. D. Reiske, *De Arabum Epocha Vetustissima, Sail Ol Arem, etc.* (Leipzig, 1748). [The question of whether the Greeks transmitted an account of the same events was debated by several writers in antiquity, including Philo of Alexandria (*De Confusione Linguarum*), Cyril of Alexandria (*Contra*

Julianum, Bk. IV) and Origen (*Contra Celsum* IV. 21). These writers saw a link between the story of the revolt of the giants—the sons of Aloeus who piled Ossa upon Olympus and Pelion atop Ossa in a vain effort to reach the lofty dwelling of Zeus and make war on the gods—and the account of the construction of the tower of Babel in Genesis XI. 3-8. The earliest allusion to these events is in Homer's *Odyssey* (XI. 315-316); Homer ascribes the destruction of the giants to Apollo. Pliny *N. H.* II. 8. 30) and Macrobius (*Saturn.* I. 19. 7) identified Apollo with the planet Mercury. Apuleius wrote (*De Mundo*, 336) that Mercury and Apollo were alternate names for “Stilbon,” the planet Mercury.

Hesiod described the battle with the giants as an immense catastrophe involving the earth and heaven alike.

The boundless sea rang terribly around, and the earth crashed loudly: wide heaven was shaken and groaned, and high Olympus reeled from its foundations under the charge of the undying gods, and a heavy quaking reached Tartarus. . . . the cry of both armies as they shouted reached to starry heaven.

Then Zeus no longer held back his might; but straight his heart was filled with fury and he showed forth all his strength. From heaven and from Olympus he came forthwith, hurling his lightning: the bolts flew thick and fast from his strong hand, together with thunder and lightning, whirling and awesome flame. The life-giving earth crashed around in burning, and the vast wood cracked loud with fire all about. All the land seethed, and Ocean's streams and the unfruitful sea. The hot vapour lapped round the earthborn Titans: flame unspeakable rose to the bright upper air: the flashing glare of the thunder shone and lightning blinded their eyes, for all that they were strong.

It seemed as if Earth and wide Heaven above came together; for such a mighty crash would have arisen if the Earth were being hurled to ruin and Heaven from on high were hurling her down.

. . . Also the winds brought rumbling earthquake and duststorm, thunder and lightning, and the lurid thunderbolt, which are the shafts of great Zeus.

Seneca also referred to the same events in mentioning Jupiter's thunderbolts “by which the threefold mass of mountains fell” and a tradition held that this was the first occasion on which Jupiter used his bolts (Ovid, *Fasti* III. 438). The pagans disputed with the Jews and Christians whether Moses took the story from Homer or Homer from Moses, but the common origin of the two accounts was generally conceded. One early writer, Eupolemus, drew on both

sources in asserting that “the city of Babylon had been founded by those who saved themselves from the deluge: they were giants, and they built the famous tower.” (Eusebius, *Praep. Evang.*) From the viewpoint of sequential chronology, the link is plausible. The giants’ revolt is said to have occurred not long after Zeus had taken over from Kronos the dominion of the sky, and it marks the real beginning of Jupiter’s dominion. Cf. Bochart, *Geographia Sacra*, I. 13.]

17. This is told in allegorical form in the tale of the wanderings of Adam. The myth of Man (Adam) traveling through all the seven earths is a transparent allegory of the physical and human history of the earth. See *Sefer Raziel*; cf. Ginzberg, *Legends* I. 90ff., V. 117f.
18. *Midrash Rabba* to Genesis, Exodus; Ginzberg, *Legends* I. 114; *Zohar Hadesch Bereshit* 8a-8b, *Zohar Ruth* 97b, and other sources in Ginzberg, *Legends*, V. 143. [In *Tractate Sanhedrin* 109a it is said that the place where the Tower once stood retains the peculiar quality of inducing a total loss of memory in anyone who passes it.]
19. H. H. Bankroft, *The Native Races* (San Francisco, 1882), vol. III, p. 64.
20. The electro-convulsive therapy used in psychiatry for the treatment of certain mental cases is administered by passing current through electrodes on the forehead. Conducted through the brain, the electric discharge causes a period of confusion and a subsequent complete, though temporary, loss of memory of the events immediately preceding the discharge. A number of patients complain also of consequent disturbances of longer duration, and some of them suffer a patchy, retrograde amnesia. See the article by Siskind in *Archive of Neurological Psychiatry* (Chicago, 1941), p. 215, 223.

Mercury

It can be assumed with a fair amount of probability that the planet that caused the disturbances described above was the planet Mercury, the Greek Hermes, the Babylonian Nebo.

To each of the planets is ascribed a world age, and the ages of the other planets—Moon, Saturn, Jupiter, Venus, and Mars—are well discernible; the dominion of Mercury must be looked for in one of the world ages, and one of the world cataclysms was apparently ascribed to this lesser planet.⁽¹⁾ Mercury was a feared god long before Mars (Nergal) became one. As the name of Mount Sinai refers to Sin, the Moon, so the name of Mount Nebo in Moab where Moses died⁽²⁾ was called already in that early time by the name of the planet Mercury. Later in the seventh and sixth centuries before the present era, this god was much venerated, especially by the Chaldeans and other peoples of Mesopotamia, as the names of Nabopolassar and his son Nebuchadnezzar prove.⁽³⁾ In earlier times Mercury was known to the Sumerians as Enki.⁽⁴⁾

Equally pronounced was the position of Thoth, the planet Mercury of the Egyptian pantheon, the theophoric part of the name Thutmose.⁽⁵⁾ For the northern peoples, Mercury was Odin.⁽⁶⁾

It is characteristic that in many astronomical texts Mercury, the Greek Hermes, the Babylonian Nebo, the Egyptian Thoth, is portrayed as the planet-god which had in his dominion the physiological capacity of memory in man,⁽⁷⁾ as well as that of speech. According to Augustine, “speech is Mercury.”⁽⁸⁾

Direct information that confirms our assumption is provided by Hyginus. Hyginus wrote that for many centuries men “lived without town or laws, speaking one tongue under the rule of Jove. But after Mercury explained the languages of men (whence he is called *hermeneutes*, ‘interpreter,’ for Mercury in Greek is called Hermes; he, too, divided the nations) then discord arose among mortals. . . .”⁽⁹⁾

The Romans as well as the Greeks pictured Mercury with wings, either on his headgear or at his ankles,⁽¹⁰⁾ and with an emblem, the caduceus, a staff with two snakes winding. The double serpent (caduceus), the emblem of Mercury, is found in ornaments of all peoples of antiquity; a special treatise could be written about this subject; I found the caduceus all around the world.⁽¹¹⁾ Mercury, or Hermes of the

Greeks, was a messenger of the gods that speeded on his errand, sent by Jupiter. ⁽¹²⁾

Among the satellites that presently orbit each of the giant planets are bodies comparable in size to Mercury, or even larger. ⁽¹³⁾ Abraham Rockenbach, whose *De Cometis Tractatus Novus Methodicus* we had occasion to quote when investigating the causes of the Deluge, included in his treatise also the following entry:

In the year of the world one thousand nine hundred and forty-four, two hundred and eighty-eight years after the Deluge, a comet was seen in Egypt of the nature of Saturn, in the vicinity of Cairo, in the constellation of Capricorn, and within the space of sixty-five days it traversed three signs in the sky. Confusions of languages and dispersals of peoples followed. On this the text of the eleventh chapter of Genesis speaks in more detail. ⁽¹⁴⁾

From the annals of modern astronomy we know of cases when a comet traveling on an elongated orbit was “caught” by the planet Jupiter, by which is meant the change of the cometary orbit to one of a short period, with the sun in the focus of its orbit.

It is possible to reconstruct the planetary disturbances of that age with some approximation. In my understanding Mercury was once a satellite of Jupiter, or possibly of Saturn. In the course of the events which followed Saturn’s interaction with Jupiter and its subsequent disruption, Mercury was pushed from its orbit and was directed to the sun by Jupiter. It could, however, have been a comet and the entwined snakes of the caduceus may memorialize the appearance it had when seen by the inhabitants of the Earth. At some point a contact occurred between the magnetospheres of Mercury and the Earth, described in the traditions of various nations. ⁽¹⁵⁾

That the Earth was once a satellite of a giant planet is nothing more than a surmise; we dealt with it only as with a hypothetical construction, requiring further elucidation. But with a greater show of support derived from the mythological and folkloristic sources we have tried to demonstrate on the case of Mercury that once it had been a satellite of one of the giant planets and was “directed” by Jupiter closer to the sun. ⁽¹⁶⁾

The claim therefore is that Mercury has traveled on its present orbit for only some five or six thousand years. This view conflicts with both the nebular and the tidal theories of the origin of the planetary family, and with the assumption that the planets have occupied the same orbits for billions of years.

References

1. [Among the reasons which suggest that Mercury was the planet which caused

the catastrophe of the confusion of languages is the fact that the age of Mercury follows that of Saturn. In the Hindu conception of the world ages, Satya yuga, the Saturnian age, was brought to a close by a general flood. Cf. Sir William Jones, "On the Gods of Greece, Italy and India," *Asiatick Researches* I (1799), p. 234: ". . . The Satya, or (if we may venture to call it) the Saturnian age was, in truth, the age of the *general* flood" (emphasis in text). Mercury appeared soon after the beginning of the next age, the Treta yuga; and for at least a part of this age men lived under the aegis of Mercury. In Hindu astronomy the usual name for the planet Mercury was Budha. In the *Bhagavatamrita* it is said that "Budha [Mercury] became visible the 1002nd year of the Cali yug." According to John Bentley, "the 1002nd year of the Cali yug [astronomical era] corresponds . . . with "the 179th year of the Treta yug of the poets." "Remarks on the Principal Aeras and Dates of the Ancient Hindus," *Asiatick Researches* V (1799), pp. 320f. The *Bhagavatamrita* describes in mythical language the first appearance of Mercury. See W. Jones, "On the Chronology of the Hindus," *Asiatick Researches* II (1799), p. 122. Jones also placed "the ancient Budha, or Mercury . . . about the beginning of the Treta yug." In Hindu lore Budha, or Mercury, is said to have married Ila, the daughter of Satyavrata, the Manu of the Satya yuga, in whose days the Deluge occurred. This is but a way of saying that the time of Mercury's prominence was shortly after the Deluge, the age of Saturn, the Satya yuga. *The Matsya Puranam* ed. and transl. by Jamna das Akhtar (Delhi, 1972), ch. xi.

Among the descriptive epithets applied to Mercury in India, were *budha*—"mind, spirit, intelligence," *sarvagna*—"all-knowing," *shadhabhigna*—"possessor of the six sciences," *advayavadi*—"eloquent, unequalled in speech." See Fr. Paulinus, *Systema Brahmanicum* (Rome, 1791), pp. 156f. The presence of the god could induce forgetfulness. (*The Matsyapuranam* XI. 61).].

2. Deuteronomy 34: 1-5; cf. Jastrow, *Die Religion Babylonien und Assyriens*, p. 124, n. 3.
3. [Nebo was regarded as the son of Marduk, or Jupiter. His chief cult center in Babylonia was Borsippa, whose ziggurat, or stepped pyramid, was consecrated to Nebo. In the Talmud (Sanhedrin XI. 109a) the ruins of this structure were considered to be the remains of the Tower of Babel. (Cf. Obermeyer, pp. 314, 327, 346). It was of these ruins that R. Yochanan is reported to have said "a third of the tower was burnt, a third sunk [into the earth], and a third is still standing." The Talmud next quotes Rab as having said "The atmosphere of the tower causes forgetfulness."

Nebo was also thought of as the herald of the gods, and as presiding over all matters pertaining to the intellect. Cf. Jastrow, *Die Religion Babylonien und Assyriens*, Vol. I, pp. 121, 123, 238; Cf. the prayer of Assurbanipal: "For Nebo the perfect son, regulator of all things in heaven and earth, him that holds the tablet of wisdom, carrier of the stylus of fate. . . ." S. Langdon, *Sumerian and*

Babylonian Psalms (Paris, 1909), p. 129.].

4. ["The Sumerians believed that there was a time when all mankind spoke one and the same language, and that it was Enki, the Sumerian god of wisdom, who confounded their speech"—so concluded S. N. Kramer after publishing his translation of a Sumerian epic fragment. See S. N. Kramer, "The 'Bible of Tongues' : A Sumerian Version," *The Journal of the American Oriental Society* 88, pp. 108-111. The text of the tablet is translated by Kramer as follows:

The whole universe, the people in unison To Enlil in one tongue _ _ _ Enki _ _ _ the leader of the gods, Endowed with wisdom _ _ _ Changed the speech in their mouths (brought) contention into it, Into the speech of man that (until then) had been one.

Cf. K. Seybold, "Der Turmbau zu Babel," *Vetus Testamentum* 26 (197x), pp. 453-479; J. van Dijk, "La 'Confusion des langues' . Note sur le lexique et sur la morphologie d'Enmerkar, 147-155," *Orientalia* 39 (1970), pp. 302-310; B. Alster, "An Aspect of 'Enmerkar and the Lord of Aratta' ," *Revue d'Assyriologie* 67 (1973), pp. 101-109.

The Sumerian Enki was the same as the Babylonian Ea; See for instance M. Jastrow, *Die Religion Babyloniens und Assyriens* (Giessen, 1905), Vol. I, p. 62. The name Ea was written with the ideogram EN.KI. Students of Babylonian astronomy are well aware that "by 'Star of the god Ea' Mercury is meant." *Ibid.*, Vol. II, p. 667, note 2.].

5. Cf. P. Boylan, *Thoth the Hermes of Egypt* (Oxford, 1922). [Diodorus wrote (I. 17. 3) that when Isis took over the kingdom from Osiris, Hermes (i.e., Thoth) became her chief counsellor. This means that the planet Mercury was prominent in the period after Jupiter replaced Saturn as the dominant planet. Diodorus also wrote that it was by the Egyptian Hermes "that the common language of mankind was first further articulated" (I. 16. 1).

An Egyptian hymn calls Thoth the deity that "made different the tongue of one country from another." (J. Cerny, "Thoth as Creator of Languages," *The Journal of Egyptian Archaeology* 34 (1[48], pp. 121-122.) Another text tells that this god "distinguished (or separated) the tongue of country from country." (*Ibid.*, p. 121). Yet another recounts that he "distinguished the tongue of every foreign land." (*Ibid.*, *loc. cit.*) Cerny comments that the words "made different" or "distinguished" or "separated" are "past participles alluding probably to some lost myth or legend according to which Thoth differentiated the languages of the various countries. These epithets might even be cited as evidence of an Egyptian parallel to the Hebrew fable of Yahwe and the Tower of Babel." Cf. J. G. Griffith, *Plutarch's De Iside et Osiride*, pp. 263f. In Egyptian texts Thoth was called "lord of divine words" and "mighty in speech" ; according to E. A. W. Budge, "from one aspect he is

speech itself . . . Thoth could teach a man not only words of power, but also the manner in which to utter them. . . . The words, however . . . must be learned from Thoth.” Thoth was also known as “scribe of the gods” and “lord of books.” (*The Gods of the Egyptians* [London, 1904], vol. I, p. 401; cf. P. Boylan, *Thoth the Hermes of Egypt* [Oxford, 1922] and B. von Turayeff, “Zwei Hymnen an Thoth,” *Zeitschrift fuer Aegyptische Sprache* 33 [1895], pp. 120-125).

In the dialogue *Phaedrus* (sect. 274-275), Plato presents a story about the invention of letters by Thoth, and explores some of the implications of this new skill. It “will create forgetfulness in the learners’ souls, because they will not use their memories; they will trust to the external written characters and not remember of themselves.” (transl. by B. Jowett)].

6. [See Tacitus, *Germania* IX, transl. by H. Mattingly (1948): “Above all they worship Mercury, and count it no sin to win his favor on certain days by human sacrifices.” Odin was the head of the Nordic pantheon. Matthew of Westminster (Flores ed., 1601, p. 82) transmits a speech by Saxon envoys to Britain ca. 450 A.D.: “*Deos patrios, scilicet Saturnum, Jovem atque ceteros, qui mundum gubernant, colimus, maxime autem Mercurium, quem lingua nostra Voden apellamus.*”—“We worship the gods of our fathers, that is, Jupiter, Saturn, and the rest of those that rule the world, but most of all [we worship] Mercury, whom in our language we call Voden.”

Of Odin it was said: “He spoke so well and so smoothly that all who heard him believed all he said was true.”—*Heimskringla: History of the Kings of Norway*, transl. by Lee M. Hollander (Austin, 1964), pp. 10-11. He was associated with Hugin or “thought” and Munin or “memory.”

One of the myths about Odin connects him with the multiplicity of languages. In the *Gylfaginning*, ch. XIX, it is said that the reason why Odin is known by many different names is “the fact that there are in the world so many different languages.”]

7. [*Hermes*. “The planet Mercury [is] the deity which presides over the rational energy,” wrote the neo-Platonist philosopher Porphyry (*On the Wanderings of Ulysses*, transl. by Th. Taylor [London. 1823], p. 259) and Proclus, the last great representative of that school, elaborated in his description of Mercury’s powers: “(Mercury) unfolds into light intellectual gifts, fills all things with divine reasons, elevates souls to intellect, wakens them as from a profound sleep. . . .” (*In Euclidi Elementa* lib. I, par. 14; cf. *idem, In Platonis Rem Publicam*, ed. Nauck, I. 255, II. 221). Proclus also described Hermes as “responsible for distinguishing and interpreting things, recalling to memory the sources of the intellect” (*In Platonis Rem Publicam* II. 224).

Nebo. See above, n. 3

Thoth. An Egyptian hymn assigns to Thoth control over man’s mnemonic

- powers, invoking him as the deity “that recalls all what had been forgotten.” (R. Hari, *Horemheb et le Reine Moutnedjemet* [Geneva, 1965]).]
8. *The City of God* VII. 14. 1. [Servius called Mercury “et orationis deus et interpres deorum” (*In Vergili Aeneidem* IV. 239). Arnobius (*Adversus Gentes* III. 32) argued that Mercury is simply speech and words exchanged in conversation. Cf. Hippolytus, *Refutatio* V. 2; Clement of Alexandria, *Homilia* VI. xv; Macrobius wrote in his *Saturnalia*: “*scimus autem Mercurium vocis et sermonis potentem.*” Proclus, (*Commentaire sur le Timee*, transl. by Festugiere, Vol. V, p. 237) asserted that “la faculte de langage [correspond a] Hermes. . . .” Cf. F. Buffiere, *Les Mythes d’Homere et la Pensée grecque* (Paris, 1956), pp. 289ff. A scholium to Aristophanes’ *Plutus*, Act. IV, scene I, and a scholium to Apollonius Rhodius’ *Argonautica* 1. 517 provide further details about Mercury’s association with language.]
 9. Hyginus, *Fabulae*, no. 143: “Phoroneus,” transl. by M. Grant in *The Myths of Hyginus* (University of Kansas Publications: Lawrence, 1960). Here Mercury is made directly responsible for the confusion of languages. “The meaning is clearly that Hermes invented one language for one people, another for another. The whole account reminds one of the Biblical Tower of Babel.” *ibid.*, p. 118.
 10. According to Servius (*In Vergili Aeneidem Commentarii* IV. 239) “*Mercurius ideo dicitur habere pennas, quia citius ab omnibus planetis in ortum suum recurrit unde et velox et errans inducitur, ut (Georgica I. 337) ‘quos ignis caeli Cyllenius erret in orbis.’*”
 11. The caduceus was an emblem of the Babylonian deity Ningishzida, and an astronomical tablet from Boghazkoi identifies Ningishzida with Nebo-Mercury (Weidner, *Handbuch der babylonischen Astronomie*, p. 61). Cf. H. Th. Bossert, *Altsyrien* (Tuebingen, 1951), p. 139, figs. 442 & 445. H. Schliemann found the caduceus at Mycenae. Ancient Mexican codices portray the worship of entwined snakes. See Lord Kingsborough, *The Antiquities of Mexico* (London, 1830), Vol. II, p. 4. Cf. H. B. Alexander, *Latin American Mythology (Mythology of All Races*, Vol. XI (1920), p. 72; cf. also Franz Boas, *Kwakiutl Culture as Reflected in Mythology*, (New York, 1935), p. 137.
 12. Homer, *The Odyssey* VI; Vergil, *The Aeneid* IV. 239.
 13. Jupiter’s satellite Ganymede is larger than Mercury, and Saturn’s biggest moon, Titan, is almost as large.
 14. *De Cometis Tractatus Novus Methodicus* (Wittenbergae, 1602), pp. 113f.: “*Anno mundi millesimo, nongentesimo, quadragesimo quarto. Anno post diluvium, ducentesimo octuagesimo octavo, Cometa in Aegypto naturam Saturni referens, circa Alcairum, in dodecatemorio Capricorni visus est, hicque spatio sexaginta quinque dierum, tria signa in coelo percurrit. The Overthrow of the Cities of the Plain

The Book of Genesis portrays the age of the patriarchs as a time of great upheavals in nature in which the geology of the Jordan Valley underwent some drastic changes. The focus of these events was in the place now occupied by the Dead Sea. The Dead Sea, according to the Genesis account, was not yet in existence in the days of Abraham. In its place there was a fertile plain, known as the plain of Sittim, with five populous cities: Sodom, Gomorrah, Admah, Zeboiim, and Zoar. When Lot arrived in the region he “lifted up his eyes, and beheld all the plain of Jordan, that it was well-watered everywhere . . . even as the garden of the Lord, like the land of Egypt.” ⁽¹⁾

The nineteenth chapter of the Book of Genesis tells of a catastrophe in which these cities were overwhelmed, overturned, and swallowed by the earth:

The sun was risen upon the earth when . . . the Lord rained upon Sodom and upon Gomorrah brimstone and fire from the Lord out of heaven; And he overthrew those cities, and all the plain, and all the inhabitants of the cities, and that which grew upon the ground. . . .

And Abraham got up early in the morning to the place where he stood before the Lord; And he looked toward Sodom and Gomorrah, and toward all the land of the plain, and beheld, and, lo, the smoke of the country went up as the smoke of a furnace. ⁽²⁾

The description of this upheaval has always aroused wonder: “There is clearly something unnatural or extraordinary that is recorded,” one commentator wrote. ⁽³⁾

The great rift of the Jordan and the Dead Sea bear witness to a tremendous upheaval. “With the end of the Tertiary period, in an event of extreme violence . . . the entire Syrian land, from its south end to its north end, was torn apart and the ground in between sank into the depths.” So wrote Professor M. Blanckenhorn, the explorer of the region of the Dead Sea. ⁽⁴⁾ In his later work he advanced the age of the rift to the pluvial, or the beginning of the first glacial age. The origin of the Dead Sea occurred “in a great mountain movement, with collapse and dislocation, that took place at the beginning of the pluvial, in the first glacial period. . . . In these titanic events conditions were created for the existence of an inner sea.” ⁽⁵⁾

A period of dryness followed the first glacial, or pluvial period. In a new pluvial period, the second glacial epoch, the lake reached its greatest dimensions: the Dead

Sea spread to the northern side of the present Sea of Galilee, engulfing it together with the Jordan Valley between. At the time, as fossil snails show, the water was not yet saline.

The rift in which the Lake of Galilee, the Jordan, and the Dead Sea lie is the deepest depression on any continent. The surface of the Dead Sea is close to 400 meters below the level of the Mediterranean, and its deepest bottom is some 320 meters lower still. The shore falls steeply from the Judean mountains on the west; on the eastern side of the rift rise the Moabite mountains. The walls of the chasm show sharp broken strata that remained horizontal, which proves that the breaking down was instantaneous.⁽⁶⁾ The force which caused this slide movement must have been stupendous. The ground of the rift around the Dead Sea is covered with coagulated lava masses, taking the form of an immense herd of giant elephants with rough skin. These lava eruptions from fissures are ascribed to the second interglacial period.⁽⁷⁾ To the south end of the Dead Sea towers a big cliff of salt called Jebel Usdum (Mount of Sodom). “It is absolutely impossible that the salt sediment of a sea should precipitate in such a form.”⁽⁸⁾ “Only the rupture of the ground could create this site, singular in the entire world.”⁽⁹⁾

The destruction of Sodom and Gomorrah took place in historical times, according to my scheme in a catastrophe which caused also the end of the Old Kingdom in Egypt. The geologists refer the upheaval which tore Syria in two to the end of the Tertiary period—long before human history began.

Now the question is legitimate: how old is the Dead Sea?

The Age of the Dead Sea

There is a way of calculating the age of the Dead Sea. This interior lake contains concentrated solutions of salts. These salts flow into the sea with the waters of its tributaries. Thermal springs bring salt to the Sea of Galilee, and the Jordan carries them to the Dead Sea, which has no outlet. From the surface of the Dead Sea, in the deep hot rift, the water evaporates, leaving the salts behind. By calculating the amount of salts in the sea and the amount that reaches it annually by way of the Jordan and other streams, as well as from thermal springs on its shores, the approximate age of the Dead Sea can be determined. Such an attempt was partially made. The magnesium salts in the Jordan served as a basis for the calculation. It was reckoned that the present annual rate of influx of magnesium in the water of the Jordan alone, when related to the concentration of magnesium in the Dead Sea, should give a figure of approximately 50,000 years as the age of the sea.⁽¹⁾ The author of this estimate admitted that even this figure is probably too high; the salinity of the Jordan must have decreased with time, for the thermal sources carry more salt when they are young and their temperature is high.

In the above calculation, it was estimated that the Jordan carries six million tons of water daily to the Dead Sea and that it deposits 181 million tons of magnesium annually. However, on an average day more than double that amount evaporates from the Dead Sea,⁽²⁾ and its surface does not fall, other sources must be making up the difference.

The rivers Zerka (Callirhoe) and Arnon, which flow into the sea from the east, carry salt solutions from many springs. The shores of the Dead Sea abound in highly concentrated thermal springs which contain rich amounts of magnesium. These sources flow directly into the sea, bringing a richer influx of magnesium than the Jordan.⁽³⁾ In addition there are, on the shores of the Dead Sea, abundant vestiges of thermal springs with rich sediments of salts that are inactive at present.⁽⁴⁾ It is highly probable, too, that there are submarine sources in the Dead Sea which may provide magnesium, but they are indeterminable.⁽⁵⁾

When these factors are taken into consideration the age of the Dead Sea, computed on the basis of its magnesium content, must be drastically reduced.

A computation that takes, as its basis, the amount of sodium in the Jordan points to a recent date for the origin of the Dead Sea. The proportion of sodium to magnesium in the water of the Jordan is about 4:1; in the Dead Sea it is 1:2.⁽⁶⁾ If the Jordan were the

only source of the sodium for the Dead Sea the age of the Dead Sea would be only about 6,000 years. But the thermal sources on the western, eastern, and southern shores contain sodium too; so may the submarine sources, which cannot be evaluated. It is likely, therefore, that the sea has existed for only about four thousand years. When again the fact is taken into account that the thermal sources are usually more concentrated when they first break out and when they are at a higher temperature, it may well be asked why the age of this sea should not be reduced still more. It is probable that deeper levels of water have a greater salt concentration.⁽⁷⁾

Fifty thousand years as the age of the Dead Sea was an unexpectedly low estimate: the rift in which the Dead Sea is situated is considered to be the result of a catastrophe at the beginning of the first glacial period.⁽⁸⁾ Now a simple reckoning shows that the saline sea with the Jordan has not existed longer than five thousand years.

7. The figures for magnesium according to Terreil, quoted by Irwin (p. 431), are: At the surface of the sea, at the north shore, magnesium constitutes 13.20 percent of solid salt; 120 meters below the surface, five miles east of Kasel Fesaka, magnesium amounts to 16.80 percent of the solid residue; and 300 meters deep at the same point, 15.99 percent. From the account of Tacitus (*Histories* V. 6) it would appear that the Dead Sea was already saturated with salts nineteen centuries ago.

The Great Rift and the Jordan

The story of the violent changes that occurred in the Jordan Valley, the memory of which is connected with the time of the patriarchs and in which Sodom and Gomorrah were overturned, does not mention that the Valley of Sittim, where the cities were located, became an inner sea. Sulphur and brimstone fell from heaven, one of the best cultivated areas was overturned, fire from beneath and fire from above accomplished the desolation—all this is described; but not the appearance of a sea. However, when the Israelites under Moses and Joshua reached the area in their flight from Egypt, they found the lake there.⁽¹⁾ It seems to have appeared after a catastrophe later than the one that destroyed Sodom and Gomorrah.

But if there was no Dead Sea before the time of the Exodus, whither did the Jordan flow, assuming it was already in existence? The Jordan might not have existed at all, or it could have flowed into the open sea, the Mediterranean. It probably did not flow along the Rift over the Arabah into the Aqaba Gulf of the Red Sea, as no traces of marine life are found at the height of the watershed of Arabah. The barrier between the Dead Sea and the Aqaba Gulf is about 500 meters high. The watershed between the Jordan River and the Kishon River which flows into the Mediterranean, at Mount Gilboa, is 500 meters above the ocean level. The topographical shape of the region of the Beth Shan Valley, stretching from the Jordan towards the Esdraelon Valley, makes the flow of the Jordan into the Mediterranean a far more acceptable conjecture than a presumed flow of the Jordan over the slopes of the mountain of Hor into the Red Sea. Of course, it can be regarded as certain that the geography of the environs of the Red Sea and of the continents in general was quite different before and after the catastrophe that resulted in the formation of the Dead Sea.

The Great Rift, which begins in Syria between the Lebanon and Anti-Lebanon, runs along the Jordan Valley, the Dead Sea, the Arabah, the Aqaba gulf, the Red Sea, and continues through the continent of Africa as far as Zimbabwe, is generally regarded as the product of a grandiose revolution in the shell of the Earth: for many thousands of kilometers the Great Rift runs from Asia to Africa.

Prehistoric man witnessed the latest phases of widespread tectonic movements which convulsed East Africa and provoked great subsidences (of as much as 1500 feet or more) in the early Quarternary strata, whereby was occasioned the discharge of lava and erupted scoriae, modifying notably the courses of the rivers and the circumstances in which the lakes rose or fell in level, and even changing the outlines of these bodies of water.⁽²⁾

Changes in the watercourses and lakes took place along the entire length of the Rift. The deepest place in the Rift on land is the valley of the Jordan and the Dead Sea. It appears that the catastrophe which originated the Dead Sea, caused also the origin of the Great Rift.

Beyond the Red Sea, which stretches for several hundred kilometers and has not a single affluent river, the aquatic life of the African lakes and rivers belongs to the so-called Ethiopian zoogeographical region. According to Annandale “the explanation of the Ethiopian affinity of the fish fauna of the Jordan is that the Jordan formed at one time merely part of a river system that ran down the Great Rift Valley. The Jordan was one branch of this huge river system, the chain of lakes in East Africa represents the other; and together they opened into the Indian Ocean.” ⁽³⁾

Whatever the structural changes of the earth in the catastrophes before that which I describe here, there must have been some time when the Jordan streamed into the valley of Sittim (the name of the plain before the Dead Sea originated) and continued into the Mediterranean, most probably through the Jezreel Valley.

Legendary reminiscences from the patriarchal age indicate that the Jordan existed before the Dead Sea came into being. ⁽⁴⁾ It appears that the coming out of Paddan-aram to Canaan required the passage of a river. Today the way from Palestine to the north does not require the crossing of water. But if the Jordan did flow through the Esdraelon Valley into the Mediterranean, it had to flow in a direction opposite to the one in which it flows today.

Does there exist any reminiscence about the Jordan changing the direction of its flow?

It is not the story in the book of Joshua about the Jordan halting its flow—there it is told that the water was stopped at Adama, north of Jericho. ⁽⁵⁾ This indicates that the flow of the Jordan was already from north to south, as today. The existence of the Dead Sea is also mentioned at the time the Israelites approached Canaan, but it is described as recent: it is called “the sea of the plain.” ⁽⁶⁾

The blocking of the Jordan River by falling slices of the banks happened a number of times. ⁽⁷⁾ The stoppage referred to in the book of Joshua is described as a temporary blocking of the Jordan River in a time of frequent earthquakes, and not as a reversal of the flow.

But there are, in Scripture, references to the reversal of the flow of the Jordan:

When Israel went out of Egypt. . . The sea saw and fled: Jordan was driven back. The mountains skipped like rams, the little hills like lambs. What ailed thee, o thou sea, that thou fleddest? thou Jordan that

thou was driven back? Tremble, thou earth, at the presence of the Lord . . . Which turned the rock into a standing water, the flint into a fountain of waters. ⁽⁸⁾

Here the reversal of the flow of the Jordan is associated in time not only with the Exodus and the catastrophe of the Sea of Passage, but also with the appearance of a new inner sea ("standing water").

A river that changed the direction of its flow must have been regarded as a very remarkable phenomenon.

An inscription of Thutmose I reads: "Frontier northern, as far as that inverted water which goeth down in going up." ⁽⁹⁾ In order to explain this passage it was supposed that the Egyptians could not imagine that a river flows otherwise than from south to north, as does the Nile, and they wondered at a river flowing in another direction. The Euphrates flows from the north-west to the south-east; the Orontes north to south for part of its course, afterwards turning west and emptying into the Mediterranean. The explanation is obviously inadequate. There are many rivers in the world and they flow in all directions. The river that reversed its direction is the Jordan.

Prior to the Exodus, the Jordan Valley was on a higher level than the Mediterranean Sea. With the rupture of the tectonic structure along the river and the dropping of the Dead Sea chasm, many brooks in southern Palestine which had been flowing to the south must have changed their direction and started to flow towards Palestine, emptying into the southern shore of the Dead Sea. This occurrence served as a symbolic picture for the dispersed Children of Israel, who also will return to their homeland: "Turn again our captivity as the streams in the south." ⁽¹⁰⁾

The plain of Siddim became a sea. When Israel "wandered into the wilderness in a solitary way [the Lord turned] rivers into the wilderness, and the watersprings into dry ground; and fruitful land into barrenness; [but elsewhere he turned] the wilderness into standing water, and the dry ground into watersprings." ⁽¹¹⁾

The opening of the Great Rift, or its further expansion, accompanied by the overturning of the plain and the origin of the Dead Sea, was a catastrophe that ended an era. In my understanding the end of the Early Bronze Age or the Old Kingdom in Egypt coincided with these events.

The End of the Early Bronze Age

The Old Kingdom in Egypt, the period when the pyramids were built, a great and splendid age, came to its end in a natural disaster. “At the conclusion of the Sixth Dynasty . . . Egypt is suddenly blotted out from our sight as if some great catastrophe had overwhelmed it.” ⁽¹⁾ The second city of Troy came to an end at the same time the Old Kingdom of Egypt fell; it was destroyed in a violent paroxysm of nature. The Early Bronze Age was simultaneously terminated in all the countries of the ancient East—a vast catastrophe spread ruin from Troy to the Valley of the Nile. This fact has been extensively documented by Claude F. A. Schaeffer, professor at College de France, excavator of Ras Shamra (Ugarit).

Schaeffer observed at Ras Shamra on the Syrian coast clear signs of great destruction that pointed to violent earthquakes and tidal waves, and other signs of a natural disaster. Among the greatest of these took place at the end of the Old Kingdom in Egypt. At the occasion of his visit to Troy, then under excavation by Carl Blegen, he became aware that Troy, too, had been repeatedly destroyed by natural catastrophes at the same times when Ras Shamra was destroyed. The distance from the Dardanelles near which the mound of Troy lies to Ras Shamra in Syria is about 600 miles on a straight line. In modern annals of seismology no earthquake is known to have occurred covering an area of such an extent. He then compared the findings of these two places with signs of earthquakes in numerous other localities of the ancient East. After painstaking work he came to the conclusion that more than once in historical times the entire region had been shaken by prodigious earthquakes. As to the destruction that ended the Early Bronze Age, Schaeffer wrote:

There is not for us the slightest doubt that the conflagration of Troy II corresponds to the catastrophe that made an end to the habitations of the Early Bronze Age of Alaca Huyuk, of Alisar, of Tarsus, of Tepe Hissar [in Asia Minor], and to the catastrophe that burned ancient Ugarit (II) in Syria, the city of Byblos that flourished under the Old Kingdom of Egypt, the contemporaneous cities of Palestine, and that was among the causes that terminated the Old Kingdom of Egypt. ⁽²⁾

In the same catastrophe were destroyed the civilizations of Mesopotamia and Cyprus. What caused “the disappearance of so many cities and the upheaval of an entire civilization” ? ⁽³⁾ “It was an all-encompassing catastrophe. Ethnic migrations were, no doubt, the consequence of the manifestation of nature. The initial and real causes must be looked for in some cataclysm over which man had no control.” ⁽⁴⁾ Everywhere it was simultaneous and sudden.

The shortcoming in Schaeffer's work was in not making the logical deduction that if catastrophes of such dimensions took place in historical times, there must be references to them in ancient literary sources. If a cataclysm terminated the Early Bronze Age, decimated the population, but left also survivors, then some memory of the events must have also found its way to be preserved in writing—if not by survivors, turned to vagrancy and having to take care for the first necessities of life, then by the descendants of the survivors.

In my scheme the end of the Early Bronze Age or Old Kingdom in Egypt is the time of the momentous events connected with the story of the patriarch Abraham, and described in the Book of Genesis as the overturning of the plain.⁽⁵⁾ The cause of the catastrophe could not have been entirely unknown to the ancients. We must therefore become attentive also to other traditions connected with these events.

3. R. de Vaux, "Palestine in the Early Bronze Age," *The Cambridge Ancient History*, Third ed., vol. I, pt. 2 (1971), ch. xv, p. 236. [According to J. Mellaart ("The Catastrophe at the End of the Early Bronze Age 2 Period," *The Cambridge Ancient History* third ed. [1971], Vol. I, pt. 2, p. 406) in the period after the catastrophe the number of settlements "is reduced to a quarter of the number in the previous period." Jacques Courtois, reporting the results of a survey in the valley of the Orontes, writes of the "extreme density of habitation of the plain in the Bronze Age, and particularly in the Early Bronze Age." (*Syria*, 50 [1973], p. 99). In eastern Arabia "a sharp downturn in settlements and activity becomes apparent" after ca. 2000 B.C. (Michael Rice, "The States of Archaeology in Eastern Arabia and the Persian Gulf," *Asian Affairs*, 64 [1977], p. 143). According to Kathleen Kenyon, "The final end of the Early Bronze Age civilization came with catastrophic completeness . . . Jericho . . . was probably completely destroyed. . . . Every town in Palestine that has so far been investigated shows the same break. . . . All traces of the Early Bronze Age civilization disappeared." (*Archaeology in the Holy Land* [London, 1960], p. 134). According to Ernest Wright, "one of the most striking facts about the Early Bronze civilization is its destruction, one so violent that scarcely a vestige of it survived. We do not know when the event took place; we only know that there is not an Early Bronze Age city excavated or explored in all Palestine which does not have a gap in its occupation between Early Bronze Age III and the Middle Bronze Age. To date this gap, we know that it must be approximately contemporary with a similar period in Egypt called the 'First Intermediate Period' between dynasties VI and XI (ca. 22nd and 21st centuries B.C.)." ("The Archaeology of Palestine" in *The Bible and the Ancient Near East, Essays in Honor of William Foxwell Albright*

The destruction can be traced also in Greece. “The destruction of the Early Helladic II town at Lerna in the eastern Peloponnese” is an example of “the widespread and violent destruction that occurred ca. 2300 B.C. in the Aegean and East Mediterranean” (Marija Gimbutas, “The Destruction of the Aegean and East Mediterranean Urban Civilization around 2300 B.C.,” *Bronze Age Migrations in the Aegean*, ed. by R. A. Crossland and Ann Birchall [London, 1973], pp. 129f.) For Lerna, see also J. Caskey, “The Early Helladic Period in the Argolid,” *Hesperia* 29 (1960), pp. 289-290. “The burning of the House of Tiles . . . was the end of an era at Lerna.” The settlement “came to a violent end.” Not only Lerna, but also “the tiled buildings at Tiryns and Asine were destroyed by fire.”

It is quite probable that the end of the Third Dynasty of Ur occurred at the same time. Thorkild Jacobsen wonders about “the reasons for the dire catastrophes that befell the city of Ur in the reign of Ibbi-Suen, the sudden collapse of its great empire, and the later utter destruction of the city itself at the hands of barbarian invaders. . . . How an empire like that of the Third Dynasty of Ur . . . could so quickly collapse is really quite puzzling.” (“The Reign of Ibbi-Suen,” *The Journal of Cuneiform Studies* 7 (1953), p. 36. Although Jacobsen refers to the text known as “Lamentation over the Destruction of Ur,” he does not treat it seriously. Yet this poem provides specific information about the causes of the disaster. It speaks of a “storm’s cyclone-like destruction” (99), of a “storm that annihilates the land” (178), “in front of the storm fires burned; the people groan” (188). It tells of the sun being obscured: “In the land the bright sun rose not, like the evening star it shone” (191). It describes earthquakes that shook the land: “the destructive storm makes the land tremble and quake” (199). “In all the streets, where they were wont to promenade, dead bodies were lying about” (217). “Mothers and fathers who did not leave their houses were overcome by fire; the young lying on their mothers’ laps like fish were carried off by the waters” (228-229). The city, prostrated by the storm “which overwhelmed the living creatures of heaven and earth,” fell prey to hostile tribes and was looted. See S. N. Kramer, “Lamentation over the Destruction of Ur,” *Ancient Near Eastern Texts Relating to the Old Testament* (Princeton, 1950). Another lament, *Oh, Angry Sea*, transl. by R. Kutscher (Yale University Press, 1975), tells of the destruction of Ur, Larsa, Nippur, Sippar, Babylon and Isin by inundations sent by Enlil. I consider Enlil to be Jupiter.]

4. Schaeffer, *Stratigraphie comparee*, p. 537. In Alaca Huyuk there are unequivocal signs that an earthquake was responsible for the destruction (pp. 296f.). Cf. B. Bell, “The Dark Ages in Ancient History,” *American Journal of Archaeology* 75 (1971).
5. [The archaeological evidence uncovered in recent years strongly supports the conclusion that the cities of the plain flourished during the Early Bronze Age and that their destruction took place at the end of this period, more specifically

at the end of EB III. See H. Shanks, "Have Sodom and Gomorrah Been Found?" *Biblical Archaeology Review* VI:5 (Sept./Oct. 1980), p. 28. Cf. D. Cardona, "Jupiter—God of Abraham (Part III)," *KRONOS* Vol. VIII.1 (1982), pp. 69ff.]

Zedek

The time of the patriarch Abraham witnessed unusual behavior by the planet Jupiter. The fact that Jupiter displayed a burst of activity exactly in the time of Abraham must not appear a coincidence: it was in the times of great global catastrophes, when the world was threatened with destruction, that religious reformers gained prominence and contemporaries looked to a divine man for guidance.⁽¹⁾

Zedek was the name of Jupiter, and we read that in the days of Abraham the planet underwent some visible changes. Rabbinical sources relate that when Abraham was on an expedition against Cherdlaomer, king of Elam, and his allied kings—who had captured and despoiled Sodom, and taken Abraham’s nephew Lot into captivity—the star Zedek illuminated the night, thereby ensuring the expedition’s success.⁽²⁾

“When he returned from his victory over Cherdlaomer and the kings who were allied with him,” the book of Genesis relates, “the king of Sodom came out to greet him. And Melchizedek, king of Salem, brought out bread and wine; he was priest of the Most High.”⁽³⁾ Abraham ceded to Melchizedek the spoils of the war he had obtained in Syria from Cherdlaomer.

Ancient Salem was a holy place, and Palestine was a holy land from grey antiquity. Thus, in the documents of the Old Kingdom in Egypt, Palestine is named God’s Land (*Toneter*), or Divine (Holy) Land.⁽⁴⁾ Abraham lived at the end of the Old Kingdom in Egypt; and documents from that time already refer to Palestine as God’s Land. But in early times, it was an astral god.

The meaning of the name Melchizedek is “Zedek is [My] King.” Zedek, as said, is the name of the planet Jupiter, remaining so in the astronomy of the Jews in later ages. In the Talmud Zedek refers to Jupiter.⁽⁵⁾ Zedek also has the meaning of “righteousness” or “justice.” It is beyond the scope of this work to find which of the meanings—the name of the planet or a word in common usage—preceded and which followed. It is conceivable that this planet was worshipped in that remote time and that, in the days of the patriarch Abraham, the cult of Jupiter was prominent in the Salem of the high priest Melchizedek. Melchizedek, “priest of the most high,” was, it follows, a worshipper of Jupiter⁽⁶⁾.

References

1. For example, the time of the great catastrophes of the Exodus saw Moses

leading the Israelites from Egypt, to revelations and a covenant with God. And the time of the great upheavals of the eighth and seventh century before this era heard the voice of Isaiah. In later centuries, religious reformers found an especially large and responsive following when they announced the approach of the end of the world, or the beginning of the Kingdom of God on Earth. Numerous instances may be cited, but the best known became the foundation of the religion of a large part of the Old and New World.

6. Melchizedek, the priest-king of ancient Salem, plays an important part in Christian catechism. [*The Epistle to the Hebrews* 5:6, 10; 6:20; 7:1ff. Cf. also F. Horton, *The Melchizedek Tradition* (Cambridge University Press, 1976).]

The Change in Jupiter's Motion

In the Tractate Shabbat of the Babylonian Talmud it is said that in order to teach Abraham the futility and meaninglessness of astrology, the Lord let the planet Zedek, or Jupiter, change its rising point from west to east:

“Go forth (i.e. cease) thy planet-(gazing), for Israel is free from planetary influence. What is thy calculation? Because *Zedek* (Jupiter) stands in the West? I will turn it back and place it in the East.” And thus it is written, *Who hath raised up Zedek from the East? He hath summoned it for his sake* (sc. for the sake of Abraham).⁽¹⁾

This statement of the rabbis contains some contradictory ideas. Nevertheless, it may preserve certain elements of ancient lore.

The Babylonians described Marduk, or Jupiter, as having an eastward motion, different from the other planets: “The earliest system from Babylon has, however, East and West reversed, and assigns to its chief god Marduk, as god of the planet Jupiter, a definite easterly direction; to Mercury, on the other hand, a westerly one.”⁽²⁾

“The Ra-mythology [of Egypt] is that which describes [Ra's] course from west to east.”⁽³⁾ Ra, rising in the west, was called “Harakhte, only god, king of the gods; he riseth in the west.”⁽⁴⁾ However, some hymns were addressed to “Ra when he riseth in the Eastern part of heaven.”⁽⁵⁾

Egyptian lore also knew of a “Horus of the West” and a “Horus of the East.”⁽⁶⁾ Horus was the planet Jupiter.

The expression found in Latin literature, Jupiter Dianus,⁽⁷⁾ or two-faced, could be interpreted as denoting two motions of Jupiter, and eastward and a westward. This conforms to the same expression applied to the Sun where, as I endeavored to show, it denotes easterly and westerly movements of the luminary.⁽⁸⁾

The celestial mechanics of the implied reversal of Jupiter's apparent motion remains unsolved. Jupiter apparently changed the place of its rising points without a similar and simultaneous change by the Sun and all the planets and stars. It might seem that in order for Jupiter alone to be subject to a change, a reversal of orbital motion is

required, an unlikely proposition from the point of view of celestial mechanics.

Earlier we asked in relation to Saturn's great prominence, was not the Earth at some early period a satellite of that planet?; and we may ask again, with the ascendance of Jupiter, was the Earth not in the domain of this successor to the celestial throne? Theoretically, if the Earth were revolving around Jupiter, a reversal of our planet's north and south geographical poles would cause Jupiter to appear to change the point of its rising.

The Worship of Jupiter

“From Zeus let us begin; him do we mortals never leave unnamed; full of Zeus are all the streets and all the marketplaces of men; full is the sea and the heavens thereof . . . He it was who first set up the signs in heaven . . . Wherefore him do we men ever worship first and last.” ⁽¹⁾

In these words Aratus (fl. -310) pictured the place the planet-god Jupiter occupied in the thoughts of men. Nobody today in the streets and marketplaces mentions the planet Jupiter.

St. Augustine, seven centuries after Aratus, asked:

But since they call Jupiter king of all, who will not laugh to see his star so far surpassed in brilliancy by the star of Venus? . . . They answer that it only appears so because it is higher up and much farther away from the earth. If, therefore, its greater dignity has deserved a higher place, why is Saturn higher in the heavens than Jupiter? ⁽²⁾

Marduk, the great god of the Babylonians, was the planet Jupiter; ⁽³⁾ so was Amon of the Egyptians; ⁽⁴⁾ Zeus of the Greeks was the same planet; Jupiter of the Romans, as the name shows, was again the same planet. Why was this planet chosen as the most exalted deity? In Greece it was called “all-highest, mighty Zeus,” ⁽⁵⁾ in Rome “Jupiter Optimus, Maximus” ; ⁽⁶⁾ in Babylon it was known as “the greatest of the stars” ⁽⁷⁾; as Ahuramazda it was called by Darius “the greatest of the gods” ⁽⁸⁾; In India Shiva was described as “the great ruler” and considered the mightiest of all the gods ⁽⁹⁾; he was said to be “as brilliant as the sun.” ⁽¹⁰⁾ Everywhere Jupiter was regarded as the greatest deity, greater than the sun, moon, and other planets. ⁽¹¹⁾

Homer makes Zeus say that all the other gods together could not pull him down, but he could pull them along with the Earth. ⁽¹²⁾ “That is how far I overwhelm you all, both gods and men.” Commenting on this passage, Eustathius wrote that according to some ancient authorities Homer meant the orbits of the planets from which Jupiter could drive the rest of them, but they could not drive it. ⁽¹³⁾ This sentence of Homer is close to the truth. Jupiter is greater and more powerful than Saturn, its rival, together with Mars, Earth, Venus, and Mercury. Jupiter is more than a thousand times greater than the Earth or Venus in volume, and six thousand times greater than Mercury. ⁽¹⁴⁾

But it appears that one could not guess this from observation with the naked eye. Even through a very powerful telescope Jupiter looks like an inch-large flat disc, surrounded by its four larger satellites. ⁽¹⁵⁾

The ancients knew something unknown to the moderns when they asserted that Jupiter can overpower all other planets, the Earth included. ⁽¹⁶⁾

Kugler, *Sternkunde und Sterndienst in Babel*, Vol. I (1907), p. 7.]

Jupiter of the Thunderbolt

Nobody who observes a thunderstorm would arrive at the conclusion that the planet Jupiter sends the lightning. Therefore it is singular that peoples of antiquity pictured the planet-god Jupiter as wielding a thunderbolt—this is equally true of the Roman Jupiter, the Greek Zeus, and the Babylonian Marduk.

Pliny wrote:

It is not generally known what has been discovered by men who are the most eminent for their learning, in consequence of their assiduous observations of the heavens, that the fires which fall upon the earth, and receive the name of thunderbolts (*fulminum nomen habeant*) proceed from the three superior stars (*siderum*), but principally from the one which is situated in the middle . . . and hence it is commonly said, the thunderbolts are darted by Jupiter.⁽¹⁾

Pliny knew the origin of lightning in the friction of clouds—he wrote that “by the dashing of two clouds, the lightning may flash out.”⁽²⁾ He did not confuse lightning with the thunderbolt that is discharged by the planets. He makes a distinction between “earthly bolts, not from stars,” and “the bolts from the stars.”⁽³⁾ Pliny knew that the Earth is one of the planets: “Human beings are distributed all around the earth and stand with their feet pointing towards each other . . . Another marvel, that the earth herself hangs suspended and does not fall and carry us with it.”

The planet-god Jupiter was frequently shown with a thunderbolt in his hand. The electrical discharge coming from Jupiter is described in many ancient texts. In the Orphic Hymn to Jupiter the Thunderer, he is described as he “who shak’st with fiery light the World.” “From thee proceeds th’etherial lightning’s blaze, flashing around intolerable rays.” “Horrid, untamed, thou rollest thy flames along. Rapid, etherial bolt, descending fire, the earth . . . trembles.”⁽⁴⁾ The earth does not quake when struck by regular lightnings. The bolt of Jupiter falls from the azure sky, not veiled by clouds.

The electrical discharge from a planet is described very clearly by Pliny: “heavenly fire is spit forth by the planet as a crackling charcoal flies from a burning log.”⁽⁵⁾ “It is accompanied by a very great disturbance of the air,” produced “by the birth-pangs, so to speak, of the planet in travail.”

Also Seneca discerns between “the lesser bolts” which seek “houses and undeserving homes” and the bolts of the planet Jupiter “by which the threefold mass of mountains fell.” [\(6\)](#)

In the Babylonian epic, the *Enuma Elish*, it is told how Marduk, or the planet Jupiter, “raised the thunderbolt, his mighty weapon. He mounted the chariot, the storm unequalled for terror. . . . With overpowering brightness his head was crowned.” He is also described as the planet-god “at whose battle heaven quaked, at whose wrath the Deep is troubled . . . in the bright firmament his course is supreme . . . with the evil wind his weapons blaze forth, with his flame steep mountains are destroyed. . . .”

[\(7\)](#) A hymn to Marduk tells that “by his warfare the heaven resounds; before his anger the deep is shaken; before his sharp weapon the gods draw back.” [\(8\)](#)

The Egyptian pharaoh Seti described Amon as “a circling star which scatters its seed in fire . . . like a flame of fire . . . irresistible in heaven and in earth.” [\(9\)](#)

Brihaspati, or the planet Jupiter in Hindu astronomy, is invoked in the Rig Veda as one who “in destroying enemies cleaves apart their cities Brihaspati strikes the enemy with his thunderbolts.” [\(10\)](#) Shiva is called “wielder of the thunderbolt.” [\(11\)](#)

In *Worlds in Collision* the overpowering of one planet by another in conjunctions was quoted from the Hindu astronomical books; the electrical power which manifests itself in conjunctions is called *bala*. Jupiter as the strongest planet is a *balin*. [\(12\)](#)

Where a Planetary Bolt Struck the Ground

We recognize in the change in Jupiter's motion the cause of great catastrophes in the solar system which affected also the Earth in the age of the patriarchs, or at the close of the Old Kingdom. In that period Jupiter became the supreme deity, having removed Saturn from its orbit. Classical historians, speaking of the destruction of the Cities of the Plain, told of "fire from the sky." Tacitus narrated that the catastrophe of Sodom and Gomorrah was caused by a thunderbolt—the plain was "consumed by lightning"—and he added: "Personally I am quite prepared to grant that once-famous cities may have been burnt by fire from heaven." ⁽¹⁾ Also Josephus asserted that the cities had been "consumed by thunderbolts." ⁽²⁾ Philo wrote that "lightnings poured out of heaven," ⁽³⁾ destroying the cities.

Since the time of Abraham was the period of Jupiter's domination that followed Saturn's and preceded that of Venus, we are led to the surmise that the thunderbolts which destroyed the plain with its cities originated from Jupiter, or from a magnetosphere or ionosphere overcharged by the nearby presence of the giant planet. Even today discharges leap between Jupiter and Io, one of its satellites. The charging of the Earth's atmosphere in the presence of Jupiter's huge magnetosphere prepared the way for a discharge: a planetary bolt struck the ground in the Valley of Sittim.

For a long time I thought that the destruction of Sodom and Gomorrah and other cities of the Plain resulted from an interplanetary discharge caused by Jupiter: classical historians speaking of this event told of "fire from the sky." The period was that of Jupiter's era of domination that followed that of Saturn and preceded that of Venus; and reference to the king and high priest Malki-zedek ("My King is Zedek," Zedek being the usual name of the planet Jupiter), in the days of the patriarch Abraham and of the destruction of Sodom and Gomorrah, seem to support my interpretation of the agent of the catastrophe. This very catastrophe caused the origin of the Dead Sea and also of the entire African Rift that extends from north of the River Jordan all the way through two thirds of the length of Africa. But, reading in 1960 of a reference to Professor Agrest, a Russian astronomer who thought that an atomic explosion had taken place, I saw some alluring points in it. If, as Prof. Agrest seems to assume, the three angels were extraterrestrial beings that followed Abraham from Mamre to Sodom and placed a time device in Sodom, the warning to Lot and his family to leave the place and not to turn their faces to the city they soon would flee, finds some parallels in the atomic age.

The observers of the first atomic explosion at Alamogordo, New Mexico were told,

as was Lot and his family, not to look at the fission, but the wife of Lot looked; she may have been blinded—in the legend she turned into a pillar of salt.

At Alamogordo the observers were impressed, actually overwhelmed, by the tremendous light effect, even with their eyes closed. Next rose a pillar of smoke as if from a furnace (Genesis XIX: 28): Abraham “looked toward Sodom and Gomorrah, and towards all the land of the plain, and beheld, and, lo, the smoke of the country went up as the smoke of the furnace.”

If the time of the event is asked to be determined, I would strongly question the implication that extraterrestrial visitors came to Earth as late as the end of the Old Kingdom of Egypt, for this is the time to which the age of the Patriarch Abraham belongs—and on this I would expand somewhere else.

Yet we are left with my original idea that goes back to the early forties—that the agent of the destruction was a bolt from Jupiter, or from the magnetosphere or ionosphere, overcharged by the nearby presence of the giant planet.

The Origin of Nitrate Deposits

The Dead Sea, for many centuries proclaimed to be dead and capable of yielding nothing, is today one of the greatest reservoirs of natural nitrate under exploitation in the world, competing with the deposits of Chile.

The deposits of nitrate in Chile are found in a narrow strip over 1400 miles in length, in the great desert in the northern part of the country. The origin of the nitrates is a problem that has not been solved.

This is a moot question on which no two geologists agree . . . One [theory] is that in prehistoric times the entire nitrate zone was a part of the Pacific Ocean, and that through volcanic disturbances that portion of the sea was cut off and the water evaporated by a very slow process. Fish skeletons found in the caliche furnish good proof of this assertion, as does the fact that the Pacific coast is rising gradually. This theory is, however, contradicted by the fact that no bromine exists there—a substance naturally looked for in deposits thus formed.”

Another theory attributes the origin of the *caliche* to an electrical process. A passage of an electric spark through the moist air produces a combination of nitrogen and oxygen resulting in nitric acid. Electrical storms—a frequent occurrence in the Andes—may have acted in this way and formed great quantities of nitric acid. . . . ⁽¹⁾

But thunderstorms occur in many other places all over the world, near and far from the sea, and yet there are no deposits of nitrates in these places.

“A later theory maintains that the deposits are an accumulation of land drainage brought down through ages from the highlands along the coast.” But how was it formed in the highlands of Chile? “Others explain the formation as the work of microbes, or as the result of the action of volcanoes discharging through their craters ammonia-charged steam there condensed.” But deposits of nitrates are not formed in other volcanic regions.

No explanation satisfied the chemists and geologists, and therefore new ideas were constantly launched. In the laboratory a very efficient method of building oxides of nitrates is applied: “passing air through a powerful electric arc, in which the nitrogen and oxygen of the air combine chemically to form oxides of nitrogen.” ⁽²⁾

Nature is a great laboratory too. The Dead Sea region was the scene of an interplanetary electrical discharge when a powerful electrical spark leaped down from above or sprang up from the earth.

A similar event created the Chilean deposits of nitrates, and the recollections of the Incas of Peru preserved the memory of this grandiose discharge. “Fire came down from heaven and destroyed a great part of the people, while those who were taking to flight were turned into stones.” [\(3\)](#)

The Transmutation of Oxygen into Sulphur

In the building of saltpeter, or potassium nitrate, the nitrogen of the air took a major part. How was the oxygen of the atmosphere affected by the interplanetary discharges?

It has been observed since ancient times that lightnings are attended by an odor of sulphur. In the twelfth book of the *Odyssey*, Homer says:

“Zeus thundered and hurled his bolt upon the ship, and she quivered from stem to stern, smitten by the bolt of Zeus, and was filled with sulphurous smoke.” ⁽¹⁾

Again, in the *Iliad*: “When beneath the blast of father Zeus an oak falleth uprooted, and a dread reek of brimstone ariseth therefrom,—then verily courage no longer possesseth him that looketh thereon. . .” ⁽²⁾

And: “[Zeus] thundered horribly and let loose the shimmering lightning and dashed it to the ground in front of the horses of Diomedes, and a ghastly blaze of flaming sulphur shot up, and the horses, terrified, both cringed away against the chariot.” ⁽³⁾

The same observation is put into a scientific prose by Pliny: “Lightning and thunder are attended with a strong smell of sulphur, and the light produced by them is of a sulphurous complexion.” ⁽⁴⁾ The second part of Pliny’s sentence is also correct: pioneer work on electrical discharges in modern times was produced using globes of sulphur in rotation. Sulphur is one of the best insulators and static electricity, when accumulated on it, discharges in electrical sparks toward objects brought close to it.

Electrical discharges produced without the help of sulphur are also accompanied by the smell of it. This odor was referred to by Benjamin Franklin who, comparing lightning and electricity, wrote to the Royal Society in London that both phenomena are attended by a sulphurous smell. This he mentioned among twelve other properties which suggested that lightning is an electrical discharge. No importance was attributed by him or by anyone else since to this sulphurous smell. The smell of ozone is different from the smell of vaporized sulphur or sulphurous compounds, ⁽⁵⁾ and the supposition that the ancients were unable to distinguish between the two disregards the fact that besides the smell of ozone a sulphurous smell follows an electric discharge. ⁽⁶⁾

This suggests to me that sulphur is actually produced from the air by the passage of an electrical discharge. The quantity of sulphur must be detectable in a careful laboratory experiment.

Quite possibly the detection of sulphur produced by a strong electrical discharge, by means other than smell, has already been fulfilled. A very strong discharge of electricity passing through the air formed solid sulphur. The bolt of electricity that fell upon the plain of the Pentapolis was of a magnitude sufficient to cause a transmutation of elements on a great scale. It rained “brimstone and fire from the Lord out of heaven.” The overturned plain became full of sulphurous deposits—“the whole land thereof is brimstone, and salt [probably potash], and burning” ⁽⁷⁾—and when later in another great upheaval the plain became covered by the Dead Sea, sulphurous springs continued to flow into the valley of the Jordan and into the Dead Sea from submerged strata and from the springs on the shores.

At the end of the eighth century and the beginning of the seventh century before the present era, when every fifteen years Mars was approaching dangerously close to the Earth, Isaiah prophesied “the day of the Lord’s vengeance,” in which day “the streams [of Idumea] shall be turned into pitch, and the dust thereof into brimstone, and the land thereof shall become burning pitch.” ⁽⁸⁾ A curse upon man and his land was that “brimstone shall be scattered upon his habitation.” ⁽⁹⁾ “Upon the wicked he shall rain pitch, fire and brimstone, and a horrible tempest.” ⁽¹⁰⁾ This eschatological vision was alive with Ezekiel in the days of the Babylonian Exile. He spoke about “an overflowing rain, and great hailstones [meteorites], fire and brimstone.” ⁽¹¹⁾

These stories of sulphur raining from the sky and the fearful expectations built upon them could be taken as fictions of an imaginative mind, were not the smell of sulphur an indication of its presence in the air following the passage of a discharge, and were not also the presence of sulphur deposits around the Dead Sea, thrust in deep below the ocean level, a substantiation of the story of the cataclysm.

Is the atomic source of sulphur generated by a discharge in oxygen, or does the nitrogen of the air participate also in the building of sulphur? It seems more probable that two atoms of oxygen are smashed into one atom of sulphur. If the atomic weight of sulphur obtained by electrical discharge will be found to be more than 32 (that of sulphur is 32.06) it might be due to the presence of some atoms of oxygen of the atomic weight 17. This heavy oxygen is the product of a nitrogen atom transmuted by the bombardment of alpha particles. ⁽¹²⁾ We must reckon with the possibility that a proton from broken atoms of oxygen or ozone or nitrogen enters the new combination, or that electrons which cause the perturbation are able by themselves to change the atomic weight of the elements. ⁽¹³⁾

13. In the late 1940s I asked Dr. A. V. Grosse whether it would be possible to create, by a strong discharge, an atom of sulphur from two atoms of oxygen. His answer was that, as soon as there would be developed cyclotrons capable of releasing two billion electron-volts of energy, sulphur could be made from oxygen. [Cf. also the comments of Frederic B. Jueneman in *KRONOS VI.4* (1981), pp. 53-56.]

Jupiter, Gold, and the Birth of Athene

Pindar, speaking of the island of Rhodes, says that Zeus “rained down on the city with golden flakes of snow” at the time Athene was born from Zeus’ head, “shouting with a far-ringing cry, and all Heaven and Mother Earth shuddered before her.” ⁽¹⁾ Homer also says that “upon them [the people of Rhodes] wondrous wealth was shed by the son of Cronus.” Strabo, after quoting Homer, adds that other writers “say that gold rained on the island the time when Athena was born from the head of Zeus, as Pindar states.” ⁽²⁾

Gold-bearing gravel—with ingots in it—originated from outside of the Earth and, if we should look upon the Greek legend of Zeus and the golden rain in Rhodes as containing revealing elements, then the ingots came from Jupiter. ⁽³⁾ It could be meteoric gold, and as to the origin the ancients could err; but the event happened in human memory, actually during the Early Bronze Age, or at its end. ⁽⁴⁾

In 1866 a human skull was unearthed in the interior of Bald Mountain near Altaville, in Calaveras County, California. The skull of Bald Mountain was reported to have been found in the shaft of a gold mine, in a layer of auriferous (gold-bearing) gravel, beneath four layers of lava, each separated from the other by four layers of gravel. The skull did not differ in structure or dimensions from the skull of modern man; however, it was fossilized. ⁽⁵⁾ In the gold-bearing gravel of Calaveras were also unearthed fossilized bones of the mammoth, the great mastodon, the tapir, horse, hippopotamus, rhinoceros and camel, all extinct animals in pre-Columbian America. But geologically the layer in which it was found belongs to the Tertiary, and therefore a great embarrassment was in store for the geologists and evolutionists. They divide the strata according to the fossils found in them and hold that in the Tertiary there could have been no human beings, for it is an age before the advent of man. But we have seen in the case of the Dead Sea that the great upheavals ascribed to the end of the Tertiary took place at a much later time, actually in the time of the Patriarchs, which is the end of the Early Bronze Age period. The auriferous gravels of California and of the Ural Mountains had their origin at this same time.

The rain of gold on Rhodes is assigned by Pindar to the time when Athene was born from the head of Zeus. The expulsion of the protoplanet Venus from the body of Jupiter followed, by decades or by centuries, the contact of Saturn and Jupiter, and the fantasy of the peoples regarded Venus as a child of Jupiter, conceived to him by Saturn.

The ancient Persians called Venus Tishtrya, “a magnificent and glorious star which

Ahura Mazda [i.e., Jupiter] has established as master and overseer of all the stars.” (6)
Plutarch described the events in the following terms: “Then Horomazes [Ahura Mazda], having magnified himself to three times his size, removed himself as far from the sun as the sun is distant from the earth . . . and one star, *seirios* [i.e., Tishtrya, or Venus] he established above all others as a guardian and watcher.” (7)

4. [It is a remarkable fact that gold appears only in very recent geological formations. Sir Roderick Impey Murchison dedicated chapter XVII of his geological opus *Siluria* to this phenomenon: “On the Original Formation of Gold and Its Subsequent Distribution in Debris over Parts of the Earth’s Surface.” He argued, on the basis of his field observations in northern Russia, that gold is of *recent* origin:

Whatever may have been the date when the rock was first rendered auriferous [gold-bearing], the date of this great superficial distribution of gold is clearly indicated. For it contains in many places the same remains of extinct fossil quadrupeds that are found in the coarse drift-gravel of Western Europe. The elephas primogenius, or Mammoth, bos aurochs, rhinoceros tochorrhinus, with gigantic stags, and many other species, including large carnivores, were unquestionably before that period of destruction the denizens of Europe and Siberia.

The period of the distribution of gold in the late Pleistocene strata was that of the mass extinctions of the great quadrupeds at the end of the last ice age. next Murchison tried to determine the time when the rocks were first “impregnated

with gold.” He wrote:

Now, it would seem as if these rocks, in the Ural, have been chiefly impregnated with gold, in a comparatively recent period. In the first place, the western flank of the Ural chain offers strong evidence that this golden transfusion had not been effected in this region when the Permian deposits were completed.

No sign of gold was found in these older strata.

Nowhere does it [the Permian debris] contain visible traces of gold or platinum. Had these metals then existed in the Ural mountains, in the quantities which now prevail, many remnants of them must have been washed down together with the other rocks and minerals and have formed part of the old Permian conglomerates. On the other hand, when the much more modern debacles, that destroyed the great animals, and heaped up the piles of gravel above described, proceeded from this chain, then the debris became largely auriferous. It is manifest therefore that the principal impregnation of the rocks with gold—i.e., when the lumps and strings of it were formed—took place in the intervening time.

Sometime between the Permian and the last ice age some event resulted in the infusion of the rocks with gold. Murchison tried to fix the time more precisely:

We cannot believe that it occurred shortly after the Permian era, nore even when any of the secondary rocks were forming; since no golden debris is found in any of the older Tertiary grits and sands which occur in the Siberian flank of the chain. *If, then, the mammoth drift be the oldest mass of detritus in which gold occurs abundantly*, not only in the Ural, but in many parts of the world, we are led to believe that this noble metal, though for the most part formed in ancient crystalline rocks, or in the igneous rocks which penetrated them, was only abundantly imparted to them in a comparatively recent period—i.e., a short time (in geological language) before the epoch when the very powerful and general denudations took place which destroyed the large extinct mammalia.

In another work of his, *The Geology of Russia and the Ural Mountains*, Vol. I (London, 1845), p. 473, Murchison presented his conclusions about the geological events which accompanied the deposition of gold:

. . . We conclude that the [Ural] chain became (chiefly)

auriferous during the most recent disturbances by which it was affected, and that this took place when the highest peaks were thrown up, when the present watershed was established, and when the syenitic granite and other comparatively recent igneous rocks were erupted along its eastern edges.

Murchison, one of the founders of modern geology, insisted that it was during a major geological upheaval that gold became part of the rocks—it was the time of mountains being “thrown up” and molten rock flowing, before solidifying into granite. Murchison next wondered about the “agency” which deposited the gold in the mountains of the Ural and elsewhere. As a geologist he observed that “the material has been chiefly accumulated towards the surface of the rocks, and then by the abrasion and dispersion of their superficial parts, the richest golden materials have been spread out. . . .” (*Siluria*, p. 455).

This last observation is of fundamental importance, in that since the gold was deposited close to the surface, it could not have come from inside the earth.].

A Technical Note

I have been asked by the compilers of the Velikovsky archive to briefly explain the present condition of Velikovsky's unpublished manuscript entitled *The Dark Age of Greece*. Velikovsky worked on the manuscript of *The Dark Age of Greece* fairly intensively during the last years of his life, drawing in part on the library research of Edwin Schorr, a graduate student at the University of Cincinnati, whom he employed for this purpose in Princeton for several summers in a row in the mid-seventies. Readers of *Pensée* know Schorr under his *nom de plume* Israel M. Isaacson, which he used to protect himself from the wrath of his professors at Cincinnati. At the time that I began to work for Velikovsky in 1976, the manuscript was still "work in progress." While Velikovsky was writing and rewriting the main text, my task was to annotate the material, drawing in part on the voluminous notes and photocopies of articles prepared by Schorr and partly on my own research. In addition, Velikovsky and I co-authored certain sections; others, written solely by me, were to have been included in a supplement to the book. Subsequent to 1980, pursuant to Elisheva Velikovsky's wishes, I moved some of these contributions from the main text into footnotes and removed the rest from the manuscript altogether. Several of them were published in *Kronos* VIII.2 in 1983. Another planned supplement to *The Dark Age of Greece* was to have been Edwin Schorr's work on Mycenae, [*Applying the Revised Chronology*](#). This detailed study on the archeology of Mycenae was commissioned by Velikovsky and written specifically for this purpose. Although incomplete, it is an impressive work of scholarship that deserves publication.

Jan Sammer

In this edition Jan Sammer's annotations are distinguished from Velikovsky's text by being placed in square brackets and displayed in red letters. All such annotations should be understood as being by Jan Sammer, unless marked with the initials EMS, in which case they are by Edwin Schorr. In conformity with reliable information we have received with respect to Velikovsky's plan for the book, we have included Schorr's and Sammer's work as a supplement to *The Dark Age of Greece*.

The Editors

PREFACE

The task of my few words is to ask prominent scholars to reconsider their opinions about the dark age of Greece in the light of Velikovsky's present book. My personal difficulty is mainly caused by the fact that a short preface cannot be a scholarly treatise and therefore it is impossible to ask here all the questions which arise when Velikovsky's theory is applied to our special problem. And as I am not an archaeologist, but a Greek scholar, I am not able to control how far Velikovsky is right in questions of stratigraphy. Here I depend on his quotations of archaeological reports and it is not possible for me to decide how far his selection of passages from these reports is subjective. My difficulty is that now I have to accept the view that the period of Geometric style overlaps, at least partially, the Mycenaean and Minoan period. This is new for me, but I admit that it is not impossible that two different artistic approaches can exist at the same time.

But the most important problem in connection with the present book is how far this theory is dictated by the whole of Velikovsky's chronological system and how far his results in the present study are valid independently from it. Velikovsky puts the "true time of the events recounted in the Iliad in the second half of the eighth century and the beginning of the seventh. . . . The time in which the drama of the Iliad was set was -687; yet the poet condensed the events of more than one year into the tenth year of the Trojan siege, the time of the Iliad's action." Velikovsky came to this date because he identified the description of the battle between the gods in the Iliad with a cosmic catastrophe. His date for the conquest of Troy is unusually late. As Homer had to live after the events he describes, the space of the time between Homer and the classical Greek literature seems to me personally to be too short. But the main question is about the interrelation between Velikovsky's chronological system and the single historical facts. Or in other words: does this system solve the concrete difficulties in our approach to ancient history? The present book tries to solve such a serious problem, namely, does the so-called dark age of Greece really exist? Is the supposed span between Mycenae and classical Greece too long? Are we not in this case victim of a false Egyptian chronology, which was invented by Egyptian patriots in order to show that the Greeks were in comparison with the Egyptians mere children? Was the history of Egypt in reality much shorter than it is supposed today? If this could be shown, then the problem of the dark age of Greece would disappear. Only open-minded specialists can reject or accept Velikovsky's solutions. One thing is clear: the new book treats a real problem. It was not its author who created it. The whole complex of questions was re-opened by the decipherment of the Linear B script, when it was definitely shown that the Mycenaeans were Greeks, speaking a language which was an older stage of the linguistic substrate of the Iliad and Odyssey. It is a merit of the new book that it offers an original solution for a real problem. Will there be a sufficient number of good specialists who are prepared to

wrestle with the proposed solution?

Prof. David Flusser Hebrew University

The Reconstruction of Ancient History

The history of the ancient East is an interwoven nexus, embracing Egypt, Israel, Syria and Mesopotamia, known also as the Biblical lands. The interconnections extend to Asia Minor, to Mycenaean Greece, and to the Mediterranean islands—Cyprus, Crete, and the Aegean archipelago. The histories of many of these nations are, for most of their existence, devoid of absolute dates and depend on interrelations with other nations.

The chronologies of the Mycenaean civilization in Greece and of the Minoan civilization on Crete are built upon contacts with Egypt, for Egypt's chronology is considered reliable. In turn, the widespread Mycenaean and Minoan contacts and influences found in the archaeological sites of many countries are distributed on the scale of time by detailed study of Mycenaean and Minoan pottery and its development. This pottery is found in countries as far apart as Italy and the Danubian region.

Egyptian History

Although Egypt's chronology is used to determine the dates of other cultures, Egypt had no written account of its history, and the earliest surviving effort to put its past into a narrative is from the pen of Herodotus of the mid-fifth century before the present era, regarded by modern historians as largely unreliable.¹

Though various king-lists from earlier times have been preserved, it is the list of Manetho, an Egyptian priest of Hellenistic times, (third pre-Christian century) that served the historiographers as the basis for making a narrative out of the Egyptian past. The names read on monuments were equated, often by trial and error, with Manethonian dynasties and kings. The mathematics of history, it was agreed, could not be entrusted to Manetho, and is largely borrowed from the sixteenth-century European chronographers, notably Joseph Scaliger, and his sixteenth- and seventeenth-century emulators Seth Calvisius and others,² who dated in the same tables also various mythological motifs, such as the scandals among the Olympian gods or Heracles' heroic exploits.

With the reading of the Egyptian hieroglyphs achieved in the nineteenth century, some selected dates of Scaliger were used by Lepsius (1810-84) to date the monuments and thus the reigns of the kings of Egypt whose names were on the monuments. Lepsius was, for instance, of the view that Ramses II was the pharaoh of

the Exodus—and thus Biblical history, too, was drawn into a comprehensive scheme on which other histories could find their first foothold. Such was also the case with “Hittite” history because of a peace treaty of Ramses II with one of the Hittite kings (Hattusilis). Manethonian mathematics, or the number of years allotted to dynasties and kings, was soon disregarded.

*Astronomical Dating*³

Even before Young and Champollion first read the hieroglyphic texts in the 1820s, Biot and others decided that astronomical calendric calculations could be used to ascertain the dates of the Egyptian dynasties. It was known that the Egyptian civil year consisted of 365 days, approximately a quarter of a day short of the true sidereal year. Thus the calendric dates of the Egyptians would gradually have fallen out of their proper place in relation to the seasons, and made a complete circle in $365 \times 4 = 1460$ years.

With the decipherment of the multitudinous Egyptian texts, a few references to a star *spdt* were found, and were interpreted as recording the heliacal⁴ rising of the southern fixed star Sirius—and if from monuments it could also be learned in which months and on what day the star rose heliacally, events could be dated within the 1460-year-long “Sothic cycle.” This made it possible to build a chronology of Egypt around the few dates so fixed—and much work was spent in such an effort. With this as a basis, refinement could be achieved in various ways, most notably by trying to ascertain the length of the years of a king, usually relying on the highest year of his reign found recorded on monuments. Each king counted the years from his coronation—Egypt had no continuous timetable. However, in Egyptian texts no reference to calculating by Sothic observations was ever found.

Archaeological work in Egypt showed that besides the so-called pre-dynastic times, from which the data are incomplete, the historical past was twice interrupted for centuries when the land fell into neglect. The First Intermediate Period intervened between the epochs that received the names of the Old and Middle Kingdoms; the Second Intermediate Period between the Middle and New Kingdoms; the New Kingdom consists of the Manethonian dynasties Eighteen, Nineteen and Twenty—what follows is called the Late Kingdom.

Hebrew History

Hebrew history has a narrative that consists of the book of Genesis—the history of the world in which catastrophic events (the Deluge, the overturning of the Tower of Babel, the destruction of Sodom and Gomorrah) come to the fore, the latest of these coinciding with the beginning of the age of the Patriarchs which ends with the migration of the fourth generation to Egypt because of drought in Canaan. This part of the history is considered largely legendary. Following a sojourn in Egypt, the Exodus—the subject of the other four books of the Pentateuch—inaugurates the

historical period. The historical events until the Exile to Babylon are further narrated in the books of Joshua, Judges, Kings, Chronicles, and Prophets and the post-Babylonian period in the books Nehemiah, Ezra, and of the later prophets. Many non-Scriptural books with varying degrees of historical veracity add and take over where the Old Testament ceases its narrative.

It was agreed since the days of Josephus Flavius, the Jewish historian of the days of Emperor Vespasian, that the Exodus of the Israelites from Egypt took place after the Second Intermediate period, during the Egyptian New Kingdom, whether at its very beginning or several generations later. However, they disagree among themselves, some placing the Exodus under Thutmose III of the Eighteenth Dynasty, others under Amenhotep III or his heir Akhnaton of the same dynasty (the time of the el-Amarna correspondence), some placing it under Ramses II or Merneptah of the Nineteenth Dynasty (“Israel Stele”), and some as late as the Twentieth Dynasty (after Ramses III repelled the invasion of the Peoples of the Sea, supposedly in the first quarter of the twelfth century). So many various dates for the Exodus—a point that connects the Hebrew and the Egyptian histories—could be contemplated because these two histories as they are usually taught are remarkably out of contact for the entire length of the New Kingdom, and equally so for the rest of their histories, down to the time of Alexander of Macedon.

The Revised Chronology

My approach to the problem of the synchronization of ancient histories took the following form. Upon realizing that the Exodus was preceded and accompanied by natural disturbances described as plagues of darkness, of earthquake, of vermin, accompanied by hurricanes and followed by a disruption of the sea, by volcanic phenomena in the desert and then by the prolonged “Shadow of Death” of the years of wandering, I looked for similar descriptions in Egyptian literary relics and found them in a papyrus ascribed to a certain Ipuwer, an eyewitness and survivor of the events. Additional data I found in an inscription carved on a stone shrine found at el-Arish on the Egyptian-Palestinian frontier. Taking the latest possible date for the events described in the papyrus Ipuwer, namely, the collapse of the Middle Kingdom in Egypt on the eve of its being overrun by the Hyksos, the date was still centuries earlier than the earliest considered dates for the Exodus on the Egyptian time-scale.

If the parallels in texts elucidated by me are not a matter of coincidence, then the test would be in whether it would be possible, in leveling the two histories by synchronizing the end of the Middle Kingdom and the Exodus, to trace contemporaneity also in subsequent generations, not yet deciding whether the Egyptian history would need extirpation of “ghost centuries” or the Israelite history extension by the insertion of “lost centuries.”

The next clue in my work of reconstruction was in equating the Asiatic Hyksos (called Amu by the Egyptians) that overran Egypt, prostrated as it was by the natural disaster described in the Ipuwer Papyrus, with the Amalekites that the Israelites met

on their flight from Egypt. The autochthonous Arab sources, as preserved by medieval Moslem historians, refer to a several-centuries-prolonged occupation of Egypt by the Amalekites, evicted from the Hedjaz by plagues of earthquakes and vermin, while tidal waves swept other tribes from their lands.

I could establish that the period of the Judges, when the population was oppressed by the Amalekites and Midianites, was the time of the Second Intermediate Period in Egypt and that Saul, who captured the capital of the Amalekites (el-Arish being the ancient Hyksos capital Avaris) put an end to the Amalekite-Hyksos domination from Mesopotamia to Egypt. In Egypt the Eighteenth Dynasty came into existence, thus inaugurating the New Kingdom. Was it ca. -1030, the time the Biblical scholars would assign to Saul's capture of the Amalekite fortress, or ca. -1580, the time the Egyptologists would place the fall of Avaris?

King David fought the remnants of the Amalekites; his marshal Joab invaded Arabia, while Amenhotep I ruled in Egypt; Solomon accordingly had to be a contemporary of Thutmose I and of Hatshepsut; I could establish that this queen came to Jerusalem and had reliefs depicting her journey to the Divine Land carved on the walls of her temple at Deir el-Bahari. In Hebrew history and legend she lives as the Queen of Sheba who visited Solomon.

The next generation saw Thutmose III invade Judea, sack the palace and temple of Jerusalem, and impose a tribute on the now-divided country. The furnishings of the Temple, carried away by Thutmose, were depicted by him on a temple wall in Karnak. These depictions match the Biblical record of some of the Temple furnishings.

Amenhotep II was identified with the king whom an ancient epic poem portrayed as leading an enormous army against the city of Ugarit, only to be pursued to the Sinai Desert. He was further shown to be the alter ego of the Scriptural Zerah, whose enterprise started similarly and ended identically.

The last three chapters of the first volume of *Ages in Chaos* deal with the el-Amarna correspondence; if the reconstruction is correct then the time in Judah must be that of King Jehoshaphat and in Israel of King Ahab. It so happened that the books of Kings and Chronicles are especially rich in many details of the events that took place under these kings, and the numerous letters on the clay tablets of the el-Amarna archive present a perfect ground for comparison as to persons, places, names, and events. Scores of identifications and parallels are brought forth. Did Jehoshaphat and his generals and Ahab and his adversaries in Damascus exchange letters with Amenhotep III and his heir Akhnaton across the centuries?

At first we left the problem open, which of the two histories would require re-adjustment—is the Israelite history in need of finding lost centuries, or does the Egyptian history require excision of ghost centuries? Soon it became a matter of certainty that of the two timetables, the Egyptian and the Israelite, the former is out of

step with historical reality by over five centuries.

A chronology with centuries that never occurred made necessary the introduction of “Dark Ages” between the Mycenaean and the Hellenic periods in Greece. Thus the shortening of Egyptian history by the elimination of phantom centuries must have as a consequence the shortening of Mycenaean-Greek history by the same length of time.

The Greek Past

The theme pursued in this volume is the basic design of Greek history—the passage of the Mycenaean civilization and the intervening Dark Age of five centuries duration before the Hellenic or historical age starts ca. 700 years before the present era. This structure of the Greek past is subjected to a reexamination as to the historicity of the Dark Age.

Greek antiquity is conventionally divided into three periods—Helladic, Hellenic, and Hellenistic. The Helladic period in its later subdivision comprises the Mycenaean civilization. It ends not long after the conquest of Troy, regularly put about -1200. Its last generation is dubbed “the Heroic Age.” At this point five centuries of dark ages are inserted into Greek history. The Hellenic period embraces the Ionian and classical ages, and stretches from ca. -700 to the conquest of the East by Alexander of Macedon. With his march toward the Nile, the Euphrates, and the Indus (-331 to -327), the culture of Greece was spread through the Orient and was itself modified by oriental elements; this was the beginning of the Hellenistic Age. Mycenae can be regarded as the cultural center of the Late Helladic period; Athens of the Hellenic; and Alexandria of the Hellenistic. In this scheme, as just said, the five centuries of the Dark Age are inserted between the Helladic and the Hellenic or, in other nomenclature, following the Mycenaean and preceding the Ionian ages.

The Mycenaean Age in Greece and the contemporary and partly preceding Minoan Age on Crete have no chronologies of their own and depend on correlations with Egypt. Objects inscribed with the names of Amenhotep II, Amenhotep III and Queen Tiy of the Eighteenth Dynasty, found at Mycenae, were like a calendar leaf. Then excavations at el-Amarna in Egypt established the presence of Mycenaean ware in Akhnaton’s short-lived city. Such quantities of Mycenaean ware came to light in the course of the excavations that a street in el-Amarna was dubbed “Greek Street.” Since Akhnaton’s capital existed for only about a decade and a half, a very precise dating for the Mycenaean ware could be evinced, thus providing a link between Mycenaean history and the established Egyptian chronology. It was therefore concluded that the Mycenaean civilization was at its apogee in the days of Amenhotep III and Akhnaton of the Eighteenth Egyptian Dynasty.

The first and most important consequence was a radical recasting of Greek history. Since Akhnaton’s conventional date was the fourteenth and thirteenth centuries before the present era, Mycenaean ware was also ascribed to the same period. By the

end of the twelfth century before the present era, the Mycenaean civilization would have run its course. The Greek or Hellenic time does not start until about -700. The years in between are without history on Greek soil. There existed tenacious memories of the time of the tyrants who ruled in the late eighth and seventh centuries, but beyond that, there was complete darkness.

Thus by the 1890s the Hellenists were coerced by the evidence presented by the Egyptologists to introduce five centuries of darkness between the end of the Mycenaean Age and the beginning of the Hellenic. As we shall read on a later page, there was some consternation on the part of classical scholars when first the fact dawned on them that between the Mycenaean age and the historical Greek time there was a span, more in the nature of a lacuna, of several centuries' duration. In the end they accepted the Egyptian plan as being valid for Greece—still without having investigated the evidence on which the claim of the Egyptologists was founded.⁵

In *Ages in Chaos* we have seen that, with the fall of the Middle Kingdom and the Exodus synchronized, events in the histories of the peoples of the ancient world coincide all along the centuries.

For a space of over one thousand years records of Egyptian history have been compared with the records of the Hebrews, Assyrians, Chaldeans, and finally with those of the Greeks, with a resulting correspondence which denotes synchronism.

In Volume I of *Ages in Chaos* it was shown in great detail why Akhnaton of the Eighteenth Dynasty must be placed in the latter part of the ninth century. If Akhnaton flourished in -840 and not in -1380, the ceramics from Mycenae found in the palace of Akhnaton are younger by five or six hundred years than they are presumed to be, and the Late Mycenaean period would accordingly move forward by about half a thousand years on the scale of time.

Yet independently of the results attained in *Ages in Chaos*, the problem of blank centuries, usually termed “dark ages,” increasingly claims the attention of archaeologists and historians. Although the enigma of “dark centuries” reappears in many countries of the ancient East, in no place did it create such discomfort as in Hellenic history. There it is an inveterate problem that dominates the so-called Homeric question: The historical period in Greece, the Hellenic Age, is ushered in by the sudden and bright light of a literary creation—the Homeric epics, of perfect form, of exquisite rhythm, of a grandeur unsurpassed in world literature, a sudden sunrise with no predawn light in a previously profoundly dark world, with the sun starting its day at zenith—from almost five hundred years that divide the end of the Mycenaean Age from the Hellenic Age, not a single inscription or written word survived.

Against this set-up the Homeric Question grew to ever greater proportions. In the light of—or better to say—in the darkness of the Homeric problem, we will try to orient ourselves by scanning some early chapters of Greek archaeology, and having

done this, we should return to the problem of the deciphered Linear B script. Two timetables are applied simultaneously to the past of Greece, one built on the evidence of Greece itself, the other on relations with Egypt; thus instead of any new discovery reducing the question to smaller confines, every subsequent discovery enlarged the confines and decreased the chances of finding a solution.

The Setting of the Stage

A traveller afoot, steadily on the road, marching from Athens westward, crosses the Corinthian Isthmus and, by continuing to the south, may arrive at Mycenae before the sunset of the second day. He follows the rocky road uphill and reaches the fortification wall of the ancient citadel. Rampant stone lions in relief crown the gate of Mycenae. Inside the gate, immediately to the right, he is shown the shaft graves of the ancient kings. The place is deserted; no village occupies the site. Resting at the gate, the traveller has before him the Argive plain, the scene of some of the most celebrated events of the human past.

Before the historical age of Greece started, called also the Ionian or Hellenic Age, Greece had another civilization. It centered at Mycenae; it spread over Greece and over the Helladic islands; vestiges of it were found in many places of the ancient world. It was closely contemporaneous with the last phase of another civilization, the so-called Minoan, centered on the island of Crete to the south. These two great cultures left cities and palaces, ruined and deserted, and rich relics—pottery of exquisite forms, and gold and jewels—but no history known to modern man. Yet of Mycenae and of her heroes such a treasure of legend is preserved in Greek lore that some of the heroes of that kingdom in the Argive plain and their contemporaries are more familiar to us than leaders of other races and other times much more recent. Agamemnon, Menelaus, Nestor, Achilles, and Odysseus are better remembered and more widely known than most of the military leaders of the great wars of our own century. Heroes of other times and nations are too often not known at all.

Their names were . . . Ask oblivion!

“They had no poet, and they died.”¹

This is said not just of heroes but of whole civilizations.

Agamemnon and Menelaus were sons of Atreus, king of Mycenae; and legends were told about Atreus and Thyestes, brothers who quarreled over the throne, and about the sign in favor of Atreus that was seen in the sun retracing its course. These legends lived in Greek lore. Another cycle of legends centered on Thebes in Boeotia, and on the Argonaut expedition to Colchis on the Caucasian coast of the Black Sea, which preceded the Trojan War by several decades.

The world of these legends, cruel and heroic and treacherous, occupied the fantasy of the Greeks; and Greek tragic poets of the fifth century, Aeschylus, Sophocles, and Euripides, had an inexhaustible store of themes to draw upon.

There is hardly any problem in the entire history of literature that occupies the minds of scholars as much as the origin of the Homeric epics—the Iliad and the Odyssey—especially the question as to the time of their origin.

The Iliad tells of the events of the final stage of the siege of Troy by the host of the Achaeans under Agamemnon, king of Mycenae. The Odyssey tells of the long wanderings of Odysseus, one of the heroes of that siege, on his circuitous way home.

Tradition has it that Homer was a blind bard who lived and wandered on the Aegean coast of Asia Minor. Among the cities and islands that claimed to have been his birthplace were Smyrna, Chios, Colophon, Salamis, Rhodes, Argos, and Athens. Beyond this the tradition is very meager as to the personality of the poet and the events of his life. Several apocryphal writings pretending to tell something of him were composed in Greece, but had nothing to commend them. When did he live and create? In his great epics he described the Mycenaean world which supposedly ended almost five centuries before him; he shows a very great knowledge of that time—yet he knew the world of the seventh century, too.

There are those who argue that the author of the Iliad and Odyssey was not one man but a group of bards, or a succession of wandering poets, each of whom added of his inspiration to the epics; and sometimes it is also argued that there was no historical siege of Troy and that the story of the war is but the poet's creation. The Odyssey appears to be just a story of fancy. However, a war expedition in which many leaders, kings of cities in Greece, took part, and the capture of a fortress named Ilion or Troy, ruled by King Priam, could not be easily relegated, all and sundry, to the domain of fancy. Many Greek and Latin authors referred to it, though their source was invariably Homer. Among the early authors Aeschylus, Sophocles and Euripides wrote cycles of tragedies dealing with the personalities of the Homeric epics and with their families, and many other poets followed in the path of the ancient bard. Virgil's Aeneid, telling the story of the peregrinations of Aeneas, one of the defenders of Troy, is famed as emulation of Homer's Odyssey.

Through the classical period of Greece, through the Hellenistic age that followed, through the age of the Roman Empire, then through the Middle Ages, the Trojan War was the main event of the past, competing in this with the exploits of Alexander of Macedon, for whom Achilles of the Iliad served as the model. But in the nineteenth century, in the "age of reasonableness" that followed the "age of reason," the view prevailed that the Trojan War was part of the imagery of a poet and Troy itself had never existed.

However in the 1870s the skeptics were confounded by Heinrich Schliemann, an adventurer with rich imagination, who as a cabin boy went on a merchant ship bound for America that suffered shipwreck;²

he was a clerk in Holland, an importer in St. Petersburg, a man not to miss the

California goldrush. Having grown rich through the years of adventures, Schliemann went to Hissarlik, a low hill near the Dardanelles, on the Aegean shore of Turkey, after proclaiming that he would find Troy there. Schliemann's advance public announcement as to his intent to discover Troy was met partly with disbelief and sarcasm, but mostly with indifference. He dug, destroyed much valuable material and disturbed some of the archaeological sequence; but he discovered beneath the mound of Hissarlik the remains of seven cities, one beneath the other.³

He identified the second city from the bottom as the Troy of which Homer sang: it was a fortress, strong and rich in treasures, seemingly destroyed in a violent earthquake.⁴

Later scholars identified King Priam's city as the sixth from the bottom, still later as Troy VIIa.

In 1876 Schliemann, now crowned with success, went to the Argive plain in Greece, to Mycenae, to locate the tomb of Agamemnon, "king of men," the leader of the Achaeans at the siege of Troy. Soon he cabled to King George of the Hellenes that he had opened the grave of his predecessor among the five large shaft tombs which he discovered hewn in rock, with the skeletons of their occupants, with gold crowns and gold masks and much jewelry, gold vessels with oriental designs, and pottery. All kinds of voices were now heard. One scholar announced that the find and its treasures date from the Byzantine age (first millennium A.D); but in time the royal graves came to be accepted for what they were—of an era preceding the historical period in Greece—however not of Agamemnon and his house who supposedly lived in the thirteenth or early twelfth century, but of an age several centuries earlier. How was this figured out? In the buildings and tombs of Mycenae cartouches of Amenhotep II, Amenhotep III, and Queen Tiy, wife of Amenhotep III and mother of Akhnaton were found,⁵ and in Akhnaton's short-lived city Akhetaton, deposits of typical Mycenaean pottery were unearthed. The age of these pharaohs in the conventional timetable belongs to the first half of the fourteenth century. Schliemann was wrong again in his identification, but right in the main: here were for all to see rich relics of the Mycenaean civilization.

Schliemann made further diggings at Tiryns, in the Argive plain, and next intended to dig on Crete, but he did not come to terms with the owners of the land, for which he made a bargain offer.

At the beginning of this century Arthur Evans, having obtained a concession, dug at Knossos on Crete and brought to light the Minoan civilization—palaces and frescoes and paved courts, a silent world of bygone days. The Minoan civilization could be traced to various stages separated by definite interruptions—Early Minoan, Middle Minoan, and Late Minoan—and it was the Late Minoan age that ran parallel with the Mycenaean age. If anything, the Minoan civilization appeared as the dominant of the two. It was Evans' excavations on Crete that established the contemporaneity of

Mycenaean ware with that of the Late Minoan period. On Crete Evans also found tablets with incised signs of two scripts, called by him Linear A and Linear B. Later tablets with the Linear B script were found in large numbers at Pylos and at other ruined cities on the Greek mainland, and still later they were deciphered. But we are ahead of our story.

Why no Literary Relics from Five Centuries?

The Dark Ages left no literary remains, not even a single word on a sherd or a few characters on a clay tablet.

M. Bowra in his book *Homer and His Forerunners* puts the problem in straight terms:

There is no evidence whatsoever that the Mycenaean script continued anywhere in Greece after c. 1200. There is no trace of writing of any kind in the sub-Mycenaean and Protogeometric periods, or indeed before the middle of the eighth century, when the new and totally different Greek alphabet makes its first appearance. Now, this is surely not an accident. A single scratched letter from this period would be enough to show that writing survived; but not one has been found. This is undeniably a most remarkable phenomenon, for which it is hard to find either a parallel or an explanation. A society seems suddenly to have become illiterate, and to have remained so for centuries. How and why this happened we do not know. . . ¹

Bowra expresses his wonder at “this astounding state of affairs.” It “undermines any hope that the transmission of heroic poetry was maintained by a succession of written texts from the time of the Trojan War.”

On the one hand, “the Homeric poems contain material which is older than 1200.” On the other hand, Bowra states his conviction that we can be “reasonably confident that Homer worked in the latter part of the eighth century, since this suits both the latest datable elements in his details and his general outlook.” Is this not an impasse—the poet separated from his subject by almost five centuries, with an intimate knowledge of a vanished civilization and no art of writing in between?

Alan J. B. Wace challenged this view, and in his preface to Ventris’ and Chadwick’s *Documents in Mycenaean Greek* (1956) wrote that future discoveries and study would “undoubtedly make clear” whether the Dark Age was really dark:

The orthodox view of classical archaeologists is that there was a ‘Dark Age’ when all culture in Greece declined to barbarism, at the close of the Bronze Age and in the early period of the ensuing Iron Age. Even now, when it is admitted that the Greeks of the Late Bronze Age could

read and write the Linear B Script, it is still believed by some that in the transition time, the Age of Bronze to that of Iron, the Greeks forgot how to read and write until about the eighth century when they adapted the Phoenician alphabet. It is incredible that a people as intelligent as the Greeks should have forgotten how to read and write once they had learned how to do so.²

Then where are the documents, what is the testimony?

“. . . Letters or literary texts may well have been on wooden tablets or some form of parchment or even papyrus; some fortunate discovery will possibly one day reveal them to us.” A quarter century since this was written nothing has been found that would substantiate this hope, as nothing was found in the preceding eighty years of excavation in Greece. In the quoted passage the words “it is still believed by some that . . . the Greeks forgot how to read and write” refers to almost every classicist who agrees that the Dark Age left no written record because none was written.³

“There is no scrap of evidence,” writes Denys L. Page in *History and the Homeric Iliad*, “and no reason whatever to assume that the art of writing was practiced in Greece between the end of the Mycenaean era and the eighth century B.C. . . .”⁴

And one hundred pages later: “. . . The Iliad preserves facts about the Trojans which could not have been known to anybody after the fall of Troy VIIa.”⁵

Then back to the question one hundred pages earlier: “How did the truth survive through the Dark Ages into the Iliad?”⁶

3. The contention that during the Dark Ages the Greeks wrote only on perishables does not carry weight. In Mycenaean times, and again from the eighth century on, the Greeks left writing on imperishable materials, such as baked clay or stone, as well as on perishable ones, such as papyrus or wood. The view that *all* writing during the Dark Ages was on perishable materials, none of which was found, is thus rather difficult to uphold. In *The Local Scripts of Archaic Greece* (Oxford, 1961) p. 17, L. H. Jeffrey convincingly disputes the “perishables” theory.

Rhys Carpenter is among those who argue that an oral tradition stretching over centuries was not capable of preserving a detailed picture of Mycenaean Greece (*Folk Tale, Fiction and Saga in the Homeric Epics*); yet Denys Page and many other scholars state unequivocally that an accurate picture *was* somehow preserved.

Troy in the Dark Ages

The Dark Age enveloped Greece; it enveloped Troy too,

for the site is barren of deposits which might be referred to the period c. 1100-700 B.C. Not one sherd of proto-geometric pottery is known to have been found at Troy—not by Schliemann, or by Doerpfeld, or by Blegen himself. We are now in effect asking what happened at Troy during the Dark Ages of Greece, from the [beginning of] the 11th to the [end of the] 8th century B.C.: and this is the answer which we must accept—that there is nothing at Troy to fill the huge lacuna. For 2000 years men had left traces of their living there; some chapters in the story were brief and obscure, but there was never yet a chapter left wholly blank. Now at last there is silence, profound and prolonged for 400 years.¹

This observation of Denys Page, Professor of Greek at the University of Cambridge, is in the nature of amazement: out of a mound covering a ruined place, an archaeologist expects to extract stray objects that accumulated there in the space of centuries. In Troy there is “silence profound and prolonged” as if time itself had stopped.

But the same author stresses that “the Iliad preserves facts about the Trojans which could not have been known to anybody after the fall of Troy VIIa.”²

Thus not only did Homer know of the kingdom and people of Mycenae that were buried for centuries of the Dark Ages, but he knew also of the kingdom and people of Troy who, too, were dead, buried, and forgotten in the darkness of the Dark Ages.

The site of Troy was reoccupied late in the seventh century; but from the fall of Troy, now put by archaeologists ca. -1260, until Homer’s time, there was nothing on the surface of the mound that could disclose to the poet the many intricate details which he webbed into his epics.

It is realized that Homer knew the scene of the Aegean coast of Asia Minor of the eighth and seventh centuries; therefore, it was argued, he could not have lived in the days of the Trojan War (or shortly thereafter) in the 12th century. A poet having composed the poems in the twelfth century would not be able to introduce into them innumerable references to the Iron Age in Greece and the post-Phrygian Age in Asia Minor of the seventh century.

Was the site of Troy alone in Asia Minor an archaeological void for five hundred years, following that city's destruction at the end of the Mycenaean Age?

The Dark Age in Asia Minor

Like Greece and the Aegean, Asia Minor has no history for a period of close to five centuries. Certain scholars disagree with this verdict, but it comes from the pen of one of the foremost authorities on archaeology and art of Asia Minor, Professor Ekrem Akurgal of the University of Ankara.¹

“ . . . Today [1961], despite all industrious archaeological exploration of the last decades, the period from 1200 to 750 for most parts of the Anatolian region lies still in complete darkness. The old nations of Asia Minor, like the Lycians and the Carians, the names of which are mentioned in the documents of the second half of the second millennium, are archaeologically, i.e., with their material heritage, first noticeable about 700 or later . . . Hence the cultural remains of the time between 1200 and 750 in central Anatolia, especially on the plateau, seem to be quite irretrievably lost for us.”

The huge land of Asia Minor for almost five centuries is historically and archaeologically void. The cause of the interruption in the flow of history about -1200 is assumed to lie in some military conquest; but the Phrygians, who are supposed to have been these conquerors, did not themselves leave any sign of their occupation of the country from before -750.

Thus the explanation that the end of the Anatolian civilization about 1200 was due to the incursion of the Phrygians is not supported by archaeological finds. According to Akurgal, the repeatedly undertaken efforts to close the hiatus by relics of Phrygian art “cannot be harmonized with the results of archaeological study. None of the Phrygian finds and none of the oriental ones found with them can be dated earlier than the eighth century.” “Such results compel us to exclude from the study of Asia Minor between 1200 and 750 any Phrygian presence and heritage.”

If there is no sign of Phrygian occupation for the period, are there possibly some vestiges of occupation by other peoples?

“It is startling,” writes Akurgal, “that until now in Central Anatolia not only no Phrygian, but altogether no cultural remains of any people, came to light that could be dated in time between 1200 and 750.” Nothing was left by any possible survivors of previous occupants, namely by Hittites, and nothing by any people or tribe that could have supplanted them. Also on the rim of Asia Minor the darkness of the Dark Age is complete: “In the south of the peninsula, in Mersin, Tarsus and Karatepe, in recent years important archaeological work was done . . . here, too, the early Iron Age, i.e.,

the period between 1200 and 750, is enwrapped in darkness.”²

Even after only a few decades of settlement a town should leave discernible relics for archaeologists; usually under such circumstances potsherds or a few beads, or a clay figurine, are found. Ash and kitchen refuse are ubiquitous finds wherever there was human habitation. But that on an area over 250,000 square miles in extent there should, as Akurgal claims, be found nothing, not even tombs, from a period counted not just by decades but by centuries, actually a period of almost five hundred years, is hardly less than miraculous.

The Homeric Question

The idea of a wide gap separating the Mycenaean Age from the historical age of Greece has gained almost universal acceptance since it was first advanced more than a century ago. Because no literary documents and almost no signs of culture could be found for that long period, it came to be known as the Dark Age.

Hellenists and historians in general use the term Dark Age for the twelfth, eleventh, tenth, ninth, and most of the eighth centuries, or the period that lies between the Mycenaean and Archaic ages, the latter being the opening of the Ionian period that in due course developed into the Classical period. The time from about -1200 to -750 is the Dark Age in continental Greece, on the Aegean islands and shores, and in the interior of Asia Minor. The reader may think that the term is bequeathed to us from ancient times, from Greek historians or philosophers of the classical period. The fact, however, is that no Greek historian, philosopher, or poet used the term Dark Age or dark centuries or any substitute for such a concept; nor did Roman writers, much occupied with the Greek past, have a concept of a Dark Age for the period following the Trojan War and preceding the historical age in Greece. The term, and the concept as well, are a creation of modern scholarship in Hellenic studies for the period from which we have neither history, nor literary remains.

If, as most scholars now believe, Homer lived and created at the end of the eighth or the beginning of the seventh century, and if the Trojan War took place just before the beginning of the Dark Age, he could hardly have omitted to refer in some direct or only indirect way to the more than four centuries of the Dark Age that separated him from the epic events he described. Why did no poet—and Greece had many—ever mention a lengthy Dark Age, if only in passing? Neither Herodotus, nor Thucydides,¹ nor Xenophon—the Greek historians—had anything to say about a four or five centuries' span that separated the Greek history from the Mycenaean. Greece had also many outstanding philosophers; then how are we to explain that a period—not covering just a few decades, but more than four centuries—is passed over in silence by Greek poets, philosophers and historians alike? Should not Aristotle or, much later, Diodorus of Sicily or Pausanias in their voluminous writings have devoted as much as a single passage to the Dark Age—if there was one? Neither the Roman writers, nor the chronographers of the Renaissance, applied themselves to the illumination of the Dark centuries, and it is only since the last decades of the nineteenth century that the term Dark Age in Greek history has been used.

Despite being separated by five centuries from the Mycenaean civilization of which he sings, Homer displays a surprising knowledge of details no longer existent in the

Greek world of his day:

We know from the archaeological evidence that Homer attempts to archaeologize, even to take us into the Mycenaean Age . . . yet in Homer's day there was no science of archaeology, no written history to assist the historical novelist. Where then did he get these details from the past?

So writes one author in the preface to his translation of the Iliad.²

As an example of such knowledge, the author cites Homer's description of Nestor's cup with doves on its handles, a description that fits a vessel actually disinterred in the Mycenaean strata which according to the conventionally written history were deposited some five centuries before Homer began to compose his epics.

The technique of metal inlay of the shield of Achilles—described by Homer in the Iliad—was practiced in Greece in the Bronze Age and “disappeared before its close, and apparently never returned there.” The boar's tusk helmet described by Homer was reconstituted by Reichel from slivers of tusk found in many Bronze Age graves. “It is difficult to imagine Homer transmitting a description of an object which we could not visualize . . . For four centuries at least no one could possibly have seen a boar's tusk helmet . . .”

On the other hand in Homer are found descriptions of objects “which cannot have found a place there before the 7th century.” One such object is the clasp which fastened the cloak of Odysseus when on his way to Troy. “It points to the second decade of the 7th century as the time of the composition of the Odyssey (unless it is an interpolation, the dates of which could not be much earlier or later than the first half of the 7th century).”

If the Mycenaean Age closed with the twelfth century and Homer composed at the end of the eighth, four and a half centuries constitute a hiatus, and separate the poet from the objects he describes.

The blending of elements testifying to the Mycenaean Age together with elements the age of which could not precede the seventh and certainly not the eighth century is a characteristic feature of the Iliad. Some scholars have expended enormous efforts in trying to separate passages of the epics and ascribe their authorship to different generations of poets, from contemporaries of the events to the final editor of the poems in the seventh century. But all these efforts were spent unprofitably, and their authors at the end of their labors usually declared their perplexity. The following evaluation is from the pen of M. P. Nilsson:

“To sum up. There is considerable evidence in Homer which without any doubt refers to the Mycenaean Age. . . The Homeric poems contain elements from widely

differing ages. The most bewildering fact is, however, that the Mycenaean elements are not distributed according to the age of the strata in the poems.” Nilsson continued: “The Mycenaean and the orientalizing elements differ in age by more than half a millennium. They are inextricably blended. How is it credible that the former elements were preserved through the centuries and incorporated in poems whose composition may be about half a millennium later?”³

The Allies of Priam

I must admit that not so long ago I tended to consider the Trojan War as a legend, with more mythology in it than history: neither in its cause nor in its conduct did this conflict seem to reflect historical events. The cause of the war, according to tradition, was a seduction or abduction of the spouse of one of the Helladic chiefs; and this, we are told, raised the leaders of all Hellas to undertake a mobilization and campaign to the coast of Asia and to endure hardships for ten years, leaving their own spouses to be ravished or besieged by suitors in the meantime. And if Hissarlik is the site of Troy, there is the additional incongruity of a great war effort the goal of which was to capture a fortress occupying not much more than two acres of land (Troy VIIa)—so Carl Blegen, the last excavator of the site. And what of the participation of Ares, Athene, Zeus, and other divinities? The emphasis is on the courage and proficiency of a few single heroes who trace their descent, and in some cases even their parenthood, to various deities and other mythological figures (Thetis in the case of Achilles).

With the end of the siege of ten years' duration and the fall of Troy, the navy of the Achaeans—of which the second book of the Iliad gives a record enumerating the number of ships that carried the warriors from each of the cities¹—is as if no more existent. Victory and triumph are followed by only a few wretched returns home. Nothing is heard of the return to Greece of the Achaeans, victorious in war, as an organized force. We hear of single warriors, like Agamemnon, the leader of the expedition, returning only to find violent death waiting for him in his own town and house or, like Odysseus, spending another ten years striving to reach home by a round-about way. Those of the heroes who succeed in returning find their wives, some faithful, some unfaithful, some in cohort with their scheming lovers and having to be avenged by their children—but little is said of the continuing royal houses, whether of Agamemnon in Mycenae, or of Menelaus in Sparta, or of Odysseus in Ithaca, or of Nestor in Pylos.

Then in a matter of hardly half a generation a curtain descends on Achaean Greece, which presumably for close to five hundred years presents only a picture of void enveloped in primeval darkness. Nothing is known of the subsequent history of these city states, the personal tragedies having ended in family blood-baths. It is as if in the theater the curtain descended for the last time, the lights are extinguished, the hall hurriedly locked, and then five hundred years of impenetrable darkness. Yet a success of the protracted expedition, if undertaken, as some scholars have theorized, to protect the marine route through the Hellespont, across the Black Sea, and to the Caucasian coast, should have made the Hellenes, having forged their national unity in war, exploit the success by expansion of overseas trade and traffic.

The curtain of darkness descends also on Troy—and the void endures there almost as long as in Greece, though it is presumed that some wretched inhabitants settled in hovels, but not before centuries passed. Of the defenders of Troy, from among those who survived the siege, we read also very little—as if they evaporated into thin air—with the exception of Aeneas and his household; and he, like Odysseus, spends a decade or so in wanderings, before reaching Italy.

Strangely, in that substantial portion of the enormous literature on the Trojan War and Troy that I consulted, I scarcely ever found a discussion of the nationality of the people of Troy.²

In the Iliad they are regularly referred to as “the people of Priam,” their king, but this is not an ethnic designation.

Thus while it is known that the besiegers of Troy were Achaeans, also called Danaans, and it is generally accepted that they were Mycenaean Greeks—actually the last generation of them, sometimes designated as the Heroic Generation—the question of which race were the people of Priam was left unanswered by Homer. But at least let us look at Priam’s allies. Here some clear indications come to the fore; and if we are still not helped in our pursuit—which nation did the Achaeans fight at Troy?—at least we see a ray of hope that, by knowing the allies we may be guided to the proper time. By knowing the correct century of the events we may obtain an insight into the interplay of nations and races and perhaps come to realize the true reason for the conflict that summoned the Achaean host to the Troad, the region surrounding Troy.

Phrygians are named as allies of Priam;³ also Ethiopians are counted among his allies. The identification of both these nations carries indications as to the century to which the most famous war of ancient times needs to be ascribed.

Of the Phrygians it is told that their origin stems from Thrace, north of Macedonia, west of the Hellespont. The time of their migration to Asia Minor is not known. No Phrygian antiquities from before the first half of the eighth century have been found,⁴ and the opinion is expressed that Homer’s reference to the Phrygians is an anachronism. It seems that in one of the earliest waves of the eighth century migrations the Phrygians moved from Thrace over the Hellespont to Asia Minor.

Tradition has it that the first king in their new domicile was Gordias, and the story of his selecting the site for his capital Gordion is a well known legend.⁵

The son of Gordias, Midas, is even more than his father an object of legendary motifs—whatever he touched turned to gold, he had the ears of an ass—yet he was a historical figure as well who, according to the chronicle of Hieronymus, reigned from -742 to -696.⁶

Soon the Phrygians came into conflict with the Assyrians who opposed the penetration of newcomers into central Asia Minor; and Sargon II (-726 to -705), the conqueror of Samaria and of the Israelite tribes, moved westward to stop the penetration of the Phrygians.⁷ Altogether the Phrygian kingdom in Asia Minor had a short duration.⁸ Already the Körte brothers, the early excavators of Gordion, noted that of the royal mounds (kurgans) only three could be dated before the Cimmerian invasion of the early seventh century which put an end to the Phrygian kingdom, and probably the number of royal successions did not exceed this number.⁹ Little is known of its history besides the fact that ca. -687 Gordion was overrun by the Cimmerians.

The Cimmerians came from the north, traversing the coastal routes of the Caucasus; their original homeland is often thought to have been the Crimea in southern Russia. They occupied Gordion, displacing the Phrygians westward, toward the Lydian kingdom and the Aegean coast. While the displaced Phrygians may have continued to live for a time in the western confines of Asia Minor, the year -687 saw the end of their kingdom.

It appears that the Cimmerians did not tarry for any length of time in Phrygia; like the Scythians, a nomadic race from the steppes of Russia, who soon followed them on the coastal roads of the Caucasus, they were but transient conquerors. The time they came from their native land, -687 or soon thereafter,¹⁰ makes it quite certain that they were put on their migration by the natural events of that year—described at some length in *Worlds in Collision*:¹¹ by the world-wide upheavals, earthquakes, frightening apparitions in the sky, as well as by the changes in climate that made many accustomed pursuits and agricultural practices obsolete. -687 (or possibly -701) was also the year that Sennacherib met his famous debacle as described in the books of Isaiah, II Kings, and II Chronicles, while threatening Jerusalem with capture and its population with eviction and exile.

Phrygians as allies of Priam, in the hinterland of the Troad, in conflict with the Cimmerians, themselves pursued by the Scythians, would limit the period of the Trojan War to the years between -720 and -687.

After the passing of the Cimmerians, Phrygia was exposed to the occupation and influence of neighboring states, in particular to that of the Lydian Kingdom to the west, with its capital at Sardis. Lydia was ruled by Gyges, a great king who played a conspicuous role in the politics of the Near East. He was on friendly terms with Assurbanipal, grandson of Sennacherib, king of Assyria; then, feeling the threat of the growing Assyrian empire, he supported Egypt's rise to independence: he sent Ionian and Carian detachments to Psammetichus, king of Egypt, which enabled that country to free itself from the supremacy of Assyria.

The Homeric epics were created on the Asia shore of Asia Minor; it is most probable

that Homer was a contemporary of Gyges, king of Lydia.¹²

This view was also offered and supported with arguments by Emile Mireaux; moreover, Mireaux ascribed also the very events of the poems to the time of Gyges.¹³

The allies of Priam also included Ethiopians under Memnon;¹⁴ the Ethiopian allies of Priam must date in all probability to the period when the Ethiopians were one of the most honored nations, highly regarded for their military prowess. What is called here Ethiopians were actually Sudanese: in Egyptian history the Ethiopian Dynasty and their most glorious period is dated from ca. -712 to -663, when Ashurbanipal pursued Tirhaka to Thebes, occupied it, and expelled the Ethiopian from Egypt proper. The tradition concerning Memnon, the Ethiopian warrior who came to the help of Troy, would reasonably limit the time of the conflict also to the end of the eighth and the beginning of the seventh century.¹⁵ The possibility of an Ethiopian landing at Troy in the days of the Ethiopian pharaoh Tirhaka need not be dismissed because of the remoteness of the place: as just said, close to the middle of the seventh century, and possibly at an earlier date, Gyges, the king of Sardis, sent in the reverse direction Carian and Ionian mercenaries to assist the Egyptian king Psammetichus in throwing off the Assyrian hegemony.

Thus it seems that if the participants in the Trojan War all belong to the eighth-seventh century, Homer, who is thought to have lived at the end of the eighth century or the beginning of the seventh, must have been either a contemporary of the siege of Troy, or separated from it by one generation only.

A correct historical placement of the Trojan War may contain a clue to its real cause: we can surmise that the Helladic city-states, alarmed by rumors of hordes of Cimmerians, preceded by dispossessed Phrygians, pushing towards the Hellespont, united under the leadership of Agamemnon and moved across the Aegean sea to preclude the invasion of their land, should the migrating Cimmerians or displaced Phrygians attempt to cross the straits into mainland Greece. Troy was located in the vicinity of the Hellespont, crossed by armies in ancient times, by Alexander, by Darius I, and by other conquerors before them.

While the Greek expedition may have had some limited success, its forces were wrecked and dispersed in the natural upheavals that accompanied the fall of Troy.

Aeneas

Following the fall of Troy Aeneas, son of Priam, a Trojan hero second only to Hector, fled the fortress; he lost his wife in the escape, himself carrying his aged father on his back and leading his young son by the hand. This is the way Virgil, in the first century before our era, imagined the beginning of Aeneas' travels; but already before Virgil, the fate of Aeneas was the subject of poetic tradition. Virgil's creation is regarded as the greatest of Roman epics; Virgil, however, studied the subject drawing on Greek authors.

Upon visiting Thrace and the islands of the Aegean Sea, and following a sojourn on Crete, Aeneas and his little band of companions landed at Carthage; there Queen Dido fell in love with him; his refusal to make Carthage his home and Dido his wife caused her, upon his departure, to take her own life.

Aeneas' further wanderings brought him finally to Latium in Italy, the land of the Latini. According to the Roman legendary tradition, he became the progenitor of the Romans through his son Ascanios, the first king to reign in the new capital of Latium, Alba Longa, of which Rome was a dependent city; or, in another version, through Numitos in direct descent from Ascanios. But a more popular tradition had Aeneas himself as the founder of Rome; the Greek historian Timaios (ca. -346 to ca. -250) followed this tradition. A still better known legend has Romulus for the founder of Rome; sometimes Romulus is made a descendant of Aeneas and Ascanios.

Rome was founded, according to Varro, in -753.¹

As to Carthage, the generally accepted view is that it was founded in the second half of the ninth century; Timaios placed its foundation in the year -814. Timaios was the first to fix the chronology of the Olympiads.²

Philistos, a Greek author, born in -435, placed Carthage's foundation "a man's life length" before the Trojan War; but Philistos' dating of the Trojan War is unknown. Philistos' date for the foundation of Carthage, sixty or seventy years before the fall of Troy, is thought to be in conflict with Timaios' date because the Trojan War would need to be placed in the middle of the eighth century, shortly before the foundation of Rome. But is there a conflict between the founding dates of Carthage in Timaios and in Philistos?

A refugee from Troy in the first half of the twelfth century could not find Carthage, a city built almost three centuries later by colonists from Phoenicia; and he could not be

associated with the founding of Rome either directly or by one of his descendants of several generations, the gap between -1183, the conventional year of Troy's fall, and -753, the traditional date of Rome's foundation, being more than four centuries wide.

References

1. Fabius Pictor gave -747 as the date of Rome's founding.
2. He was a native of Sicily, the history of which he wrote from the earliest times to -264; of that history, regarded as authoritative in antiquity, only single passages survived in authors who quoted him; Carthage is across the straits from Sicily.

Olympic Games in the Iliad

The recording of events in ancient Greece was by the years of the Olympiads, four years apart, the first year of the first Olympiad having been -776. An important contest at the Olympiads was among charioteers, each driving a four-horse team. Olympia was located in the district of Elis in the western part of the Peloponnesian peninsula.

Tradition has it that the Olympic games were initiated by Pelops, an immigrant from Phrygia in Asia Minor. Another account ascribes the founding of the festival to Heracles, as a celebration of his conquest of Elis.¹ In *Worlds in Collision* the identity of Heracles with the planet Mars was brought out from the statements of several ancient authors:² While the founding of the games was attributed to Heracles, or Mars, the festival also honored Athene, or the planet Venus. This is shown by the fact that the early games were held at eight-year intervals,³ typical for Venus festivals, since eight terrestrial years equal five synodical years of Venus. Later they were celebrated every four years, or two and a half synodical periods of Venus. The eighth century was a time when the planet Mars was prominent among the heavenly bodies and caused much destruction on earth. Nestor, the future king of Pylos, was but a young man at the time of the rampage of Heracles-Mars through the western Peloponnese—he himself saw all his elder brothers killed by the god and his native Pylos burned to the ground⁴—but by the tenth year of the siege of Troy, Homer tells, “two generations of mortal men had [already] perished: those who had grown up with him and they who had been born to these in sacred Pylos, and he was king in the third age.”⁵ This information permits the rough guess that some fifty to sixty years passed between the founding of the Olympic Games in Nestor’s youth and the Trojan War.

In the *Iliad* the aging Nestor recalls that soon after the rebuilding of Pylos his father Neleus sent from Pylos a team of four horses with a chariot to race for a tripod for a competition to be held at Elis. But the fine steeds were detained by the Elean king and their driver was sent home to Pylos empty-handed.⁶

. . . For in Elis a great debt was his [Neleus’] due: a four-horse team of racing horses and their chariot that would have contended in the games and raced to win the tripod.

That this passage from the *Iliad* is a reference to the Olympic Games was understood already in antiquity, as we gather from a discussion of it by the geographer Strabo.⁷ This means that Homer knew of the Olympic games and had Nestor refer to them as

an event that began to be celebrated several decades before the drama that is the subject of the *Iliad*. However, it is beyond dispute that the beginning of time reckoning by Olympiads was in the eighth century, more precisely in -776. The fact that these games are mentioned as taking place when Neleus, the father of Nestor, was a young man gives some indication of the time in which the Trojan War was fought.

Troy and Gordion

When Schliemann dug through the strata of Hissarlik's hill, he discovered, on the second level from the virgin ground beneath, great walls of a fortress, and in the same level some treasures, all of which he attributed to Priam's Troy. His view was invalidated, and properly so, because a correlation with Egypt made it appear too early for Troy. The second level, Troy II, was shown to have been in existence during the Old Kingdom of Egypt, and thus long before the traditional date for Troy's fall. The end of Troy VI, identified by Wilhelm Doerpfeld as the Ilion of the siege, was found to have been contemporaneous with the mid-Eighteenth Dynasty of the Egyptian New Kingdom, and was therefore also too early for the Trojan War.

Carl Blegen identified forty-six layers of occupation of the mound of Hissarlik, the Troy of the excavators, but divided them between the nine strata of occupation classified by Doerpfeld. Troy VI was a well-built fortress; Blegen specified eight separate levels of occupation in this stratum alone. It ended in a violent earthquake. Blegen, however, looked for a fortress that fell not due to an earthquake, but in a siege and assault; thus he identified the Troy sung by Homer as Troy VIIa.

The sixth city of Troy is conventionally placed in the fourteenth-thirteenth centuries before the present era, a dating which ultimately depends on Egyptian chronology. Here an observation by Rodney Young, the excavator of the Phrygian capital Gordion,¹ needs to be cited:

“In their batter as well as their masonry construction the walls of the Phrygian Gate at Gordion find their closest parallel in the wall of the sixth city at Troy.” But a gulf of time separates these two constructions in the conventional timetable.

Though separated in time by five hundred years or thereabouts, the two fortifications may well represent a common tradition of construction in north-western Anatolia; if so, intermediate examples have yet to be found.²

Still today no intermediate examples have been found. As to the date of the Phrygian Gate and wall of Gordion, Young wrote:

The Phrygian Kingdom was . . . at the apex of its power toward the end of the eighth century, when it apparently extended as far to the southeast as the Taurus and was in contact with Assyria. This period of power was apparently the time of the adornment and fortification of its capital city.

This points to the eighth century for the erection of the city wall and gate.³ Eighth-century Gordion is similar to thirteenth-century Troy, yet intermediate examples of the peculiar way of building the gate and the wall beg to be found.⁴

1. Gordion, the capital of Phrygia, was excavated by the Koerte brothers at the beginning of this century. In 1950 Rodney Young led there a team and then returned for many seasons sponsored by the University of Pennsylvania Museum. The date of the Phrygian remains found at Gordion was ascribed to the late eighth and early seventh centuries before the present era.
2. R. Young, "Gordion 1953," *American Journal of Archaeology*, (1954). [The post-Hittite and pre-Phrygian levels at Gordion have not provided the much looked-for intermediate examples.]
3. [The Phrygian Gate of Gordion was uncovered in 1953 by a team from the University of Pennsylvania led by Rodney Young. It was in the form of a large double gateway with a central courtyard. Since it belonged to the Phrygian period, its date, like that of most of the Phrygian constructions at Gordion, was put sometime in the eighth century.]
4. [Whereas the Trojans had a long tradition of building in stone, the Phrygian gateway appears suddenly, without any other close antecedents; nevertheless, it displays technical skills that speak of a long period of development. This apparent contradiction is also noted by Young ("The Nomadic Impact: Gordion," p. 52): ". . . The planning of the [Phrygian] gateway and the execution of its masonry imply a familiarity with contemporary military architecture and long practice in handling stone for masonry. The masonry, in fact, with its sloping batter and its more or less regular coursing recalls neither the cyclopean Hittite masonry of the Anatolian plateau in earlier times, nor the commonly prevalent contemporary construction of crude brick. The closest parallel is the masonry of the walls of Troy VI, admittedly very much earlier. If any links exist to fill this time-gap, they must lie in west Anatolia rather than on the plateau." According to the revised chronology, the Trojan fortifications were standing and in use as late as the ninth century; the Phrygian fortifications at Gordion, dating from the late eighth, could well have been part of the same tradition of building in stone.]

The Lion Gate of Mycenae

The Lion Gate of Mycenae was the entrance to the city. Atop the gate, two lions rampant are carved in stone relief. Similar bas-reliefs of two lions rampant facing each other are found in a number of places in Phrygia in Asia Minor.¹

The Lion Gate of Mycenae

Arslantas, Rock-cut Phrygian tomb

“The resemblance in idea is complete,” wrote W. M. Ramsay in 1888.² He considered the scheme “so peculiarly characteristic of Phrygia, that we can hardly admit it to have been borrowed from any other country.” He found himself “driven to the conclusion that the Mycenaean artists either are Phrygians or learned the idea from the Phrygians.”³ “It is not allowable to separate them [the Phrygian and Mycenaean monuments] in time by several centuries.”⁴

“The Phrygian monuments,” in Ramsay’s view, belong to the ninth and eighth centuries.⁵

... The end of the Phrygian kingdom is a fixed date, about 675 B.C.”⁶ when the invasion of Asia Minor by the Cimmerians put an end to the Phrygian culture and art. Ramsay went on:

I do not think it is allowable to place the Mycenaean gateway earlier than the ninth, and it is more likely to belong to the eighth century.

The view to which I find myself forced is as follows. There was in the eighth century lively intercourse between Argos and Asia Minor: in this intercourse the Argives learned . . . to fortify their city in the Phrygian style with lions over the gate. Historically there is certainly good reason to assign at least part of the fortifications of Mycenae to the time when the Argive kings [the tyrants of the eighth century] were the greatest power in Greece [here follow the names of several authorities among the historians who hold the same view].⁸

On the other hand, the almost universal opinion of archaeologists rejects this hypothesis. . . .

Oriental influences found in the remains of Mycenae are “precisely what we should expect in a kingdom like the Argos of the eighth century,” when this kingdom had intercourse with Asia Minor, Phoenicia and Egypt. “I wish however to express no opinion here about the date of the Mycenaean tombs and about Mycenaean pottery, but only to argue that the fortifications of the Lion Gate belong to the period 800-700 B. C.”⁹

I quote this opinion of Ramsay with the special intention of showing how this viewpoint was invalidated.

The Egyptologist Flinders Petrie made the following reply:

“[A] matter which demands notice is Professor Ramsay’s conclusion that the lion gateway is of as late a date as the eighth century B.C. This results from assuming it to be derived from Phrygian lion groups, on the ground of not knowing of any other prototype. As however we now have a wooden lion, in exactly the same attitude, dated to 1450 in Egypt . . . it seems that the Phrygian designs are not the only source of this motive for Mykenae.”¹⁰

In Egypt of the latter part of the Eighteenth Dynasty a single instance of a rampant lion (not two rampant lions facing each other as at Mycenae and in Phrygia) made Petrie claim Egypt as a possible place of origin of this image rather than Phrygia. He had discovered heaps of Mycenaean ware in Egypt of the time of Akhnaton. He could not but conclude that these heaps coming from Mycenae must be dated to the fourteenth century.¹¹

Equally impressive was the discovery at Mycenae of a number of objects of Eighteenth-Dynasty date, such as objects bearing the cartouches of Amenhotep II, Amenhotep III, and Queen Tiy.¹²

Therefore Petrie decidedly opposed Ramsay in his estimate of eighth century for the Lion Gate and the fortification wall of Mycenae.¹³

Here is a case where evidence from Anatolia pointed to the eighth century;¹⁴ but the Egyptologist demanded of the classical scholar that he disregard this evidence in favor of the time scale of Egypt.

The debate between Ramsay and Petrie took place before Evans' archaeological work on Crete; there rampant lions were found engraved on Late Minoan gems,¹⁵ conveying the idea that Mycenae must have borrowed the image from there, from a period well preceding the Phrygian models.¹⁶ Yet one should not lose sight of the fact that Crete's chronology was also built upon relations with Egypt. In the section "[The Scandal of Enkomi](#)" we shall read how Evans objected to the chronological implications of Cypriote archaeology by stressing relations between the Egyptian and the Minoan (Cretan) chronologies on the one hand, and Minoan and Cypriote on the other. In *Ages in Chaos* it was shown in great detail why the end of the Eighteenth Dynasty of Egypt must be placed in the latter part of the ninth century. Thus even if Crete was the original source of the motif, Mycenae and Phrygia both deriving it thence, the dependence of Cretan chronology on that of Egypt constitutes the crux of the problem.¹⁷

Let us keep in mind that in the 1880s and 1890s classical scholars of the stature of W. M. Ramsay (1851-1939) questioned the inclusion of the Dark Ages of several hundred years' duration between the Mycenaean past and the Ionic age in Greece. And let us not overlook what was the supposedly crushing argument for wedging more than half a millennium into the history of ancient Greece.

15. [Some of these gems were known even before Evans' digs—see for instance the intaglio in G. Perrot and C. Chipiez, *History of Art in Primitive Greece* II (London, 1894), pp. 214 and 246, depicting two rampant lions facing each other in a way similar to that on the Lion Gate. Cf. also the gems shown in *Corpus der minoischen und mykenischen Siegel*, ed. F. Matz and H. Bisantz (Berlin, 1964) nos. 46, 144, 145, 172.]
16. [N. Platon, ("Cretan-Mycenaean Art," *Encyclopaedia of World Art* IV [New York, 1958], p. 109) thought that "the technique of the execution [of the Lion Gate] is clearly inspired by Cretan sculpture." But the Cretan sculptures, unlike those in Phrygia, are miniatures, and Platon needs to assume "the effective translation of a miniature theme into a major sculptural creation" (R. Higgins, *Minoan-Mycenaean Art* [New York, 1967], p. 92). Sandars in *The Sea Peoples* points out the similarity of the monumental carving style of the Lion Gate of Boghazkoi in central Anatolia to the Lion Gate of Mycenae.]

17. [The discovery of Late Helladic IIIB pottery in strata excavated underneath the gate is used to establish the date of its construction.] But this pottery, too, is dated on the basis of relations with Egypt.

Olympia

The scholarly world without any further deliberation decided not to bring the Mycenaean Age down to the first millennium, but this decision did not eliminate the disturbing facts. At the same time another one-man battle was being carried on at the other end of the front. Greek antiquities, commonly regarded as belonging to the eighth and seventh centuries, were declared by a dissenting authority to date from the second millennium, to have been contemporaneous with the Mycenaean Age, and even to have partly preceded it.

According to the accepted view the Mycenaean ware came to an end in the second millennium, and the Dorian invasion subsequently brought a “primitive” art, a pottery with incised designs; later a pattern of painted geometric designs developed, reaching its full expression by the late eighth century. Thereafter new motifs were brought into Greek art—griffins, sphinxes and other oriental figures; this is the period of the orientalization of the art of Greece in the seventh century.

This scheme was accepted; and today, with only slight variations, it is the credo of archaeological art.

According to Dörpfeld in the second millennium two or three different cultures met in Greece.¹

Dörpfeld insisted that the geometric ware ascribed to the first millennium was actually contemporaneous with, and even antecedent to, the Mycenaean art of the second millennium, and that the “primitive” pottery was also of the second millennium.

The archaeological evidence for the contemporaneity of the geometric and Mycenaean ware and of all other products of these two cultures, and even of the partial precedence of the geometric ware, was the basic issue for Dörpfeld, who spent a lifetime digging in Greece. Observing that the Mycenaean Age is contemporaneous with the period of the Eighteenth dynasty, and that the geometric ware is contemporaneous with the Mycenaean ware, he referred the geometric ware also to the second millennium.²

This aroused much wrath.

A. Furtwängler, who during the excavations of Olympia in the western Peloponnesus, under the direction of Curtius, was the first to attach importance to bits of pottery, and who spent over a quarter of a century classifying small finds, bronzes, ceramics

and other products of art, and devised the system of their development, disagreed on all points.

Dörpfeld chose to prove his thesis on the excavations of Olympia, on which he and Furtwaengler had both worked since the eighties of the last century. In those early days Curtius, one of the excavators of Olympia, was strongly impressed by proofs of the great antiquity of the bronzes and pottery discovered under the Heraion (temple of Hera) at Olympia; he was inclined to date the temple in the twelfth or thirteenth century and the bronzes and pottery found beneath it to a still earlier period, and this view is reflected in the monumental volumes containing the report of the excavation.³

At that time Furtwängler was also inclined to disregard the chronological value of occasional younger objects found there.⁴

New excavations under the Heraion were undertaken by Dörpfeld for the special purpose of establishing that the finds, as well as the original Heraion, date from the second millennium.⁵ But the excavated bronzes and pottery strengthened each side still more in its convictions. Each of the two scholars brought a mass of material to prove his own point—Dörpfeld, that the geometric ware, which he had himself found together with the Mycenaean at such sites as Troy and Tiryns⁶ was contemporaneous with the Mycenaean ware and therefore belongs to the second millennium; Furtwängler, that the geometric ware is a product of the first millennium, and especially of the ninth to eighth centuries, and is therefore separated from the Mycenaean by *einer ungeheueren Kluft* (a tremendous chasm).⁷

Who but an ignoramus, argued Furtwängler, would place in the second millennium the geometric vases found in the necropolis near the Dipylon Gate at Athens?⁸ Were there not found, he asked, in this same necropolis, porcelain lions of Egyptian manufacture dating from the Twenty-sixth, the Saitic, Dynasty of Psammetichus and Necho?⁹

Were not also a great number of iron tools found beneath the Heraion in Olympia? The Mycenaean Age is the Late Bronze Age; the Geometric Age that of iron. It is true, claimed Furtwängler, that a few iron objects have been found in the Mycenaean tombs—but they only show that iron was very precious at the time these tombs were built.

Both sides linked the question of the date of the origin of the Homeric epic to the question at hand. Most scholars claimed that the epics originated in the eighth century. But, according to the dissident Dörpfeld, they originated five or six centuries earlier, in the Mycenaean Age, which is also the Geometric Age.

The dispute was waged with *ungehörigen persönlichen Beleidigungen* (outrageous

personal slander);¹⁰ and a quarter century after one of the disputants (Furtwängler) was resting in his grave the other, (Dörpfeld), then an octogenarian, filled two volumes with arguments. They vilified each other on their deathbeds, and their pupils participated in the quarrel. In the end the followers of Dörpfeld, the dissident scholar, deserted him and went over to the camp of his detractors.

But by that time he had already been completely discredited, and his obstinacy made him a target for further attacks by the younger generation of scholars properly trained in the science of archaeology, who are able at a glance to tell the exact age and provenance of a sherd. They have no doubt whatsoever that the Mycenaean Age came to a close ca. -1100 and that the real Geometric Age belongs to the ninth and eighth centuries, and for a long time now the issue has not been open to dispute.

But this does not mean that the facts ceased to perplex. According to E. A. Gardner, “fragments of geometrical vases . . . have been found on various sites in Greece together with late examples of Mycenaean pottery.”¹¹

When then did the Mycenaean Age end, ca. -1100 or ca. -700?

In this dispute between the two scholars, both were guided by the chronology of the Egyptologists, according to which the Eighteenth Dynasty ended in the fourteenth century, the Nineteenth came to a close before ca. -1200, and the Twenty-sixth Dynasty belongs to the seventh and early part of the sixth centuries. In their application of these undisputed facts to the past of Greece, both disputant scholars agreed that the Mycenaean Age belongs to the second millennium.

The Geometric Age did not follow the Mycenaean Age, but was of the same time or even earlier, argued one scholar (Dörpfeld), and was he wrong? The Geometric Age belongs to the first millennium, argued the other scholar (Furtwaengler), and was he wrong? Wrong was their common borrowing of dates for the Mycenaean Age from the Egyptologists.

In view of the fact that later generations of archaeologists followed Furtwaengler and not Dörpfeld, it is worthwhile to reproduce the assessment of the latter as an archaeologist by one who knew him and his work, herself a great figure in classical studies built on Mycenaean and Classical archaeology, H. L. Lorimer, author of *Homer and the Monuments* (1950). In her Preface to that book Lorimer writes:

I wish to record the debt which in common with all Homeric archaeologists I owe to a great figure, forgotten to-day in some quarters and in others the object of an ill-informed contempt. To Wilhelm Dörpfeld, the co-adjutor of Schliemann in his later years and long associated with the German Archeological Institute in Athens, scholars owe not only the basic elucidation of the sites of Tiryns and Troy which ensured their further fruitful exploration, but the

establishment of rigidly scientific standards in the business of excavation, an innovation which has preserved for us untold treasures all over the Aegean area. That in later years he became the exponent of many wild theories is true but irrelevant and does not diminish our debt. In his own realm his work, as those testify who have had access to the daily records of his digs, was as nearly impeccable as anything human can be. . .

This is an evaluation of Dörpfeld as an archaeologist from the hand of a scholar who did not follow the lonely scholar on his “wild theories.” The archaeological work that brought him to his theories regarding the sequence of pottery styles was impeccable; and his theories were wild mainly because he did not make the final step and free Greek archaeology and chronology from the erroneous Egyptian timetable. The contemporaneity of the Mycenaean and early Geometric wares, if true, contains the clue to the removal of the last argument for the preservation of the Dark Ages between the Mycenaean and Greek periods of history.

5. [Dörpfeld distinguished three consecutive temples—the existing Heraion, built at the beginning of the ninth century, the original temple which, on the evidence of Pausanias (V.16.1) he dated to -1096, and an intermediate structure, which in his view was never completed. Today scholars find no basis for positing this intermediate temple and, furthermore, on the basis of the geometric pottery found beneath the first temple, discount the “erroneous tradition” (H. E. Searls and W. B. Dinsmoor, “The Date of the Olympia Heraeum,” *American Journal of Archaeology* 49 [1945] p. 73) of Pausanias which originally led Dörpfeld to his early dating of it. The Elean tradition recorded by Pausanias has the Olympia Heraion built “about eight years after Oxylus came to the throne of Elis.” (V.16.1) Elsewhere (V.3.6) he puts Oxylus two generations after the Trojan War. The tradition is “erroneous” only if the Trojan War is placed in the thirteenth or early twelfth centuries. If it was in fact fought in the late eighth, the tradition then would accord well with the

- findings of the archaeologists who place the first temple ca. -650 (A. Mallwitz, *Olympia und seine Bauten* [Munich, 1972] pp. 85-88; H.-V. Herrman, *Olympia, Heiligtum und Wettkampfstätte* [Munich, 1972] pp. 93-94; E. Kunze, “Zur Geschichte und zu den Denkmälern Olympias” in *100 Jahre deutsche Ausgrabung in Olympia* [Munich, 1972] p. 11).]
6. See below, section “A Palace and a Temple at Tiryns.” Only small quantities of Mycenaean ware were found at Olympia, and none beneath the Heraion.
 7. [Quite early on, Furtwängler had become convinced that none of the bronzes found at Olympia could be dated before the eighth century (“Bronzefunde aus Olympia,” *Abhandlungen Berl. Akad.*, 1879, IV; *Kleine Schriften*, Munich, 1912, I, pp. 339-421). In 1880 more bronzes were discovered in the black stratum beneath the floor of the Heraion (*Olympia*, vol. IV), and they seemingly confirmed a late eighth century date; this meant that the temple had to be somewhat more recent. Furtwängler later admitted that the evidence of several small finds, indicating a much more recent date of construction of the temple, had been rejected by him at the time because it diverged too radically from accepted views. In 1906 he published his influential study of the objects newly dug up from beneath the floor of the Heraion (“*Das Alter des Heraion und das Alter des Heiligtums von Olympia*,” *Sitzungsberichte der philosophisch-philologischen Klasse der königlich bayerischen Akademie der Wissenschaften*) in which he concluded that the Heraion and the pottery associated with it belong in the latter part of the seventh century.]
 8. [The Dipylon period, so named after the funeral vessels first discovered near the Dipylon Gate at Athens by the Greek Archaeological Society in 1873-74, was dated originally to the tenth or ninth centuries B.C. According to Schliemann, Dipylon ware was at one time “commonly held to be the most ancient pottery in Greece . . . When it was recognized that the Mycenaean pottery was of a higher antiquity, it was also found that the Dipylon graves must belong to a later time. . .” *Tiryns* (London, 1886) p. 87. Of course, Mycenaean pottery was “recognized” as being “of a higher antiquity” largely because of synchronisms with Egypt.]
 9. [The two porcelain lions were found in tombs excavated in 1891 near the Dipylon Gate, together with “vases of characteristic Dipylon ware,” according to E. A. Gardner, *Ancient Athens* (London, 1902) p. 157. However, cf. *Ramses II and his Time* (1978) in which monuments now attributed to the Twenty-sixth Dynasty are redated for the most part to the subsequent period of Persian domination.]

“The Scandal of Enkomi”

The lengthening of Egyptian history by phantom centuries must have as a consequence the lengthening of Mycenaen-Greek history by the same length of time. On Cyprus, Aegean culture came into contact with the cultures of the Orient, particularly with that of Egypt, and unavoidably embarrassing situations were in store for archaeology.

In 1896 the British Museum conducted excavations at the village of Enkomi, the site of an ancient capital of Cyprus, not far from Famagusta, with A. S. Murray in charge.¹

A necropolis was cleared, and many sepulchral chambers investigated. “In general there was not apparent in the tombs we opened any wide differences of epoch. For all we could say, the whole burying-ground may have been the work of a century.”

“From first to last there was no question that this whole burying-ground belonged to what is called the Mycenaean Age, the characteristics of which are already abundantly known from the tombs of Mycenae . . . and many other places in the Greek islands and in Egypt.”

However the pottery, porcelain, gems, glass, ivory, bronze, and gold found in the tombs all presented one and the same difficulty. From the Egyptological point of view many objects belong to the time of Amenhotep III and Akhnaton, supposedly of the fifteenth to the fourteenth centuries. From the Assyrian, Phoenician, and Greek viewpoint the same objects belong to the period of the ninth to the eighth or seventh centuries. Since the objects are representative of Mycenaean culture, the excavator questioned the true time of the Mycenaean Age. But as the Mycenaean Age is linked to the Egyptian chronology he found himself at an impasse.

We shall follow him in his efforts to come out of the labyrinth. He submitted a vase, typical of the tombs of Enkomi, to a thorough examination. The dark outlines of the figures on the vase are accompanied by white dotted lines, making the contours of men and animals appear to be perforated. This feature is very characteristic. “The same peculiarity of white dotted lines is found also on a vase from Caere [in Etruria], signed by the potter Aristonothos which, it is argued, cannot be older than the seventh century B.C. The same method of dotted lines is to be seen again on a pinax [plate] from Cameiros [on Rhodes] in the [British] Museum, representing the combat of Menelaos and Hector over the body of Euphorbos, with their names inscribed. That vase also is assigned to the seventh century B.C. Is it possible that the Mycenae and Enkomi vases are seven or eight centuries older?”

Analyzing the workmanship and design of sphinxes or griffins with human forelegs on the vase, the archaeologist stressed “its relationship, on the one hand, to the fragmentary vase of Tell el-Amarna (see Petrie, *Tell el-Amarna*, Plate 27) and a fragment of fresco from Tiryns (*Perrot and Chipiez*, VI, 545), and on the other hand to the pattern which occurs on a terracotta sarcophagus from Clazomenae, [in Ionia] now in Berlin, a work of the early sixth century B.C.”

The connection between the Mycenaean and Aristonothos vases caused “a remarkable divergence of opinion, even among those who defend systematically the high antiquity of Mycenaean art.”

The problem of pottery which belongs to two different ages is repeated in ivory. The ivories of the Enkomi tombs are very similar to those found by Layard in the palace of Nimroud, the ancient capital of Assyria. There is, for example, a carving of a man slaying a griffin,

“the man being remarkable for the helmet with chin strap which he wears. It is a subject which appears frequently on the metal bowls of the Phoenicians, and is found in two instances among the ivories discovered by Layard in the palace at Nimroud. The date of the palace is given as 850-700 B.C.”

An oblong box for the game of draughts, found in Enkomi, “must date from a period when the art of Assyria was approaching its decline,” five or six centuries after the reputed end of the Mycenaean age.

“Among the Nimroud ivories (850-700 B.C.) is a fragmentary relief of a chariot in pursuit of a lion to the left, with a dog running alongside the horses as at Enkomi, the harness of the horses being also similar.” The style of the sculpture (of Nimroud) “is more archaic than on the Enkomi casket.” But how could this be if the objects found in Enkomi date no later than the 12th Century? Comparing the two objects, I. J. Winter wrote:

A hunting scene depicted on a rectangular panel from an ivory gaming board of ‘Cypro-Mycenaean’ style found at Enkomi, with its blanketed horses and chariot with six-spoked wheel, so closely resembles a similar hunting scene on one of the pyxides from Nimroud that only details such as the hairdo of one of the chariot followers or the flying gallop of the animals mark the Enkomi piece as a work of the second millennium B.C., separated by some four centuries from the Nimroud pyxis.²

A bronze of Enkomi repeats a theme of the Nimroud ivories, representing a woman at a window. “The conception is so singular, and the similarity of our bronze to the ivory so striking, that there can hardly be much difference of date between the

two—somewhere about 850-700 B.C.”

“Another surprise among our bronzes is a pair of greaves. . . It is contended by Reichel³ that metal greaves are unknown in Homer. He is satisfied that they were the invention of a later age (about 700 B.C.).”

Bronze fibulae, too, were found in the Enkomi tombs, as well as a large tripod “with spiral patterns resembling one in Athens, which is assigned to the Dipylon period,” and a pair of scales of a balance like the one figured on the Arkesilaos vase. But such finds are separated by a wide span of time from the twelfth century.

The silver vases of the Enkomi tombs “are obviously Mycenaean in shape.” “On the other hand,” there were found two similar silver rings, one with hieroglyphics and the other engraved on the bezel “with a design of a distinctly Assyrian character—a man dressed in a lion’s skin standing before a seated king, to whom he offers an oblation. Two figures in this costume may be seen on an Assyrian sculpture from Nimroud of the time of Assurnazirpal (884-860), and there is no doubt that this fantastic idea spread rapidly westward.”

Next are the objects of gold. Gold pins were found in a tomb of Enkomi. “One of them, ornamented with six discs, is identical in shape with the pin which fastens the chiton [tunic] on the shoulders of the Fates on the Francois vase in Florence (sixth century B.C.).” A pendant “covered with diagonal patterns consisting of minute globules of gold soldered down on the surface of the pendant” was made by “precisely the same process of soldering down minute globules of gold and arranging them in the same patterns” that “abounds in a series of gold ornaments in the British Museum which were found at Cameiros in Rhodes” and which were dated to the seventh or eighth century.

Among the pottery of “the ordinary Mycenaean and pre-Mycenaean type” gems were found. A scarab “bears the cartouche of Thi [Tiy], the queen of Amenophis [Amenhotep] III, and must therefore be placed in the same rank as those other cartouches of her husband, found at Ialysos [on Rhodes] and Mycenae, which hitherto have played so conspicuous a part in determining the Mycenaean antiquities as being in some instances of that date (fifteenth century).”⁴

As for the porcelain, it “may fairly be ranked” with the series of Phoenician silver and bronze bowls from Nimroud of about the eighth century. A porcelain head of a woman from Enkomi “seems to be Greek, not only in her features, but also in the way in which her hair is gathered up at the back in a net, just as on the sixth century vases of this shape.” Greek vases of this shape “differ, of course, in being of a more advanced artistic style, and in having a handle. But it may fairly be questioned whether these differences can represent any very long period of time.”

Murray surveyed the glass:

In several tombs, but particularly in one, we found vases of variegated glass, differing but slightly in shape and fabric from the fine series of glass vases obtained from the tombs of Cameiros, and dating from the seventh and sixth centuries, or even later in some cases. It happens, however, that these slight differences of shape and fabric bring our Enkomi glass vases into direct comparison with certain specimens found by Professor Flinders Petrie at Gurob in Egypt, and now in the British Museum. If Professor Petrie is right in assigning his vases to about 1400 B.C.,⁵ our Enkomi specimens must follow suit. It appears that he had found certain fragmentary specimens of this particular glass ware beside a porcelain necklace, to which belonged an amulet stamped with the name of Tutankhamen, that is to say, about 1400 B.C.

Murray comes to the conclusion that “Phoenicians manufactured the glass ware of Gurob and Enkomi at one and the same time.” Consequently

the question is, what was that time? For the present we must either accept Professor Petrie’s date (about 1400 B.C.) based on scanty observations collected from the poor remains of a foreign settlement in Egypt, or fall back on the ordinary method of comparing the glass vessels of Gurob with those from Greek tombs of the seventh century B. C. or later, and then allowing a reasonable interval of time for the slight changes of shape or fabric which may have intervened. In matters of chronology it is no new thing for the Egyptians to instruct the Greeks, as we know from the pages of Herodotus.

With this last remark the excavator at Enkomi came close to the real problem, but he shrank from it. He did not dare to revise Egyptian chronology; all he asked was that the age of the Mycenaean period be reduced. How to do this he did not know. He quoted an author (Helbig) who thought that all Mycenaean culture was really Phoenician culture, the development of which remained at a standstill for seven centuries.

In 1896 there was found in a tomb at Thebes in Egypt a bronze patera [a shallow vessel] which in shape and decoration has so much in common with the bronze Phoenician bowls from Nimroud that we feel some surprise on being told that the coffins with which it was found belong unmistakably to the time of Amenophis [Amenhotep] III or the first years of Amenophis IV [Akhnaton]. It is admitted that this new patera had been a foreign import into Egypt. Equally the relationship between it and the bronze Phoenician bowls is undeniable, so that again we are confronted with Helbig’s theory of a lapse of seven centuries during which little artistic progress or decline had been effected.⁶

It was necessary to assume a state of hibernation of almost seven hundred years.

The endeavor of the excavator of Enkomi was directed toward bringing the Mycenaean Age closer in time by five or six hundred years, so that there would be no chasm between the Mycenaean Age and the Greek Age. As curator of Greek and Roman antiquities of the British Museum, he constantly had before him the numerous connections and relations between Mycenaean and Greek art, which could not be explained if an interval of many centuries lay between them. He tried to disconnect the link between Mycenaean and Egyptian archaeologies and chronologies, but he felt that this was an unsolvable problem.

The proposal to reduce the time of the Mycenaean Age was rejected by the scholarly world.

Arthur J. Evans, at the time having just embarked on a long series of excavations at Knossos on Crete, came out against Murray's work, "so full of suggested chronological deductions and—if its authors [i.e., A. S. Murray and his collaborators] will pardon the expression—archaeological insinuations, all pointing in the same direction," namely, "a chronology which brings the pure Mycenaean style down to the Age of the Tyrants" of the eighth century, and makes it "the immediate predecessor of the Ionian Greek art of the seventh century B.C."⁷

Evans had to admit that "nothing is clearer than that Ionian art in many respects represents the continuity of Mycenaean tradition," but he built his argument on the manifold connections of Mycenaean art with Egypt of the Eighteenth Dynasty. Are not the flasks of the Enkomi tomb almost as numerous in Egyptian tombs of the Eighteenth Dynasty? A fine gold collar or pectoral inlaid with glass paste, found in Enkomi, has gold pendants in nine different patterns, eight of which are well known designs of the time of Akhnaton (Amenhotep IV), "but are not found a century later." The metal ring of Enkomi, with cartouches of the heretic Akhnaton, is especially important because "he was not a pharaoh whose cartouches were imitated at later periods," and so on.

One of the silver vases of Enkomi, Evans wrote, "is of great interest as representing the type of the famous gold cup of the Vapheio tomb."⁸ These cups, as their marvellous *repousse* designs sufficiently declare, belong to the most perfect period of Mycenaean art." This should establish that the theory of the latency of Mycenaean art for six or seven centuries after its flowering in the second millennium cannot help to solve the problem of Enkomi; the Enkomi finds date from the apogee of the Mycenaean Age.

Evans insisted that the material supplied by the Cypriote graves "takes us back at every point to a period contemporary with that of the mature art of the class as seen in the Aegean area," and this despite his own admission that a number of objects from Enkomi point to a later age, like the porcelain figures "which present the most remarkable resemblance, as Dr. Murray justly pointed out, to some Greek painted

vases of the sixth century B.C.” Nevertheless, he concluded with regret that “views so subversive” should come from so high an authority in classical studies.

Two scholars clashed because one of them saw the close connection between Mycenaean art and the Greek art of the seventh century, and the other saw the very same Mycenaean objects disinterred in the Egypt of Akhnaton, dated to the fourteenth century.

The Mycenaean Age has no timetable of its own independent of that of Egypt. I have referred to this question in the chapter dealing with Ras Shamra in *Ages in Chaos*.

If Evans had had some evidence, independent of Egypt, on which to calculate the ages of the Minoan and Mycenaean cultures, we would have needed to take into account all Minoan and Mycenaean chronological material, as we did with the Egyptian. But there is none.⁹

“The chronological scheme depends ultimately upon Egyptian datings of Aegean pottery,” wrote H. R. Hall,¹⁰ who served as curator of Egyptian and Assyrian antiquities at the British Museum.

“Using this Egyptian evidence as his guide, and checking the results of excavation with its aid, Sir Arthur Evans finds that the Bronze Age pottery and with it the general culture of Crete divides itself into three main chronological periods: Early, Middle, and Late, each of which again is divided into three sub-periods.”¹¹

The Mycenaean Age started at the same time as the Late Minoan Age.

Dr. Murray’s case was lost. He had built its defense on two points, one strong, the other weak. His strong point was this: he analyzed and made clear the close interrelation between Mycenaean culture and the early Greek culture of the seventh century. His weak point was his anxiety to disregard the connection between Mycenaean culture and the Egyptian world of the end of the Eighteenth Dynasty. But in el-Amarna of Akhnaton scattered heaps of Mycenaean ware were found.

It was asked, Which fact should be given greater weight by an unbiased judge: the close relation between Mycenaean and Greek cultures or the fact that Mycenaean ware was found in the city of el-Amarna (Akhet-Aton), which was built and destroyed in the fourteenth century?

The verdict in the matter of the age of Mycenae was unanimous: its period of greatest influence is dated between the fifteenth and the twelfth centuries.

This [Mycenaean] ware did not appear in large quantities in Egypt until about 1375 B.C., and little of it was received in the coastal countries

after the middle of the thirteenth century. Therefore, whenever a piece of it is found in place in an ancient city, it dates the context between about 1375 [the first year of Akhnaton according to the presently accepted chronology¹² and 1225 B.C.¹³

The verdict with regard to Enkomi was, in the words of Hall, as follows:

Excavations of the British Museum at Enkomi and Hala Sultan Tekke (near Larnaka on Cyprus) have brought to light tombs filled with objects of Minoan or Mycenaean art, now mostly in the British Museum, most of which cannot be later in date than the fourteenth and thirteenth centuries B.C. The Egyptian objects found in them are demonstrably of this date, and not later, being all of the late Eighteenth and Nineteenth Dynasties. Rings of Akhenaten [Akhnaton] and a scarab of Teie [Tiy, mother of Akhnaton] have been found here as at Mycenae, and fine Egyptian necklaces of gold also, which, from their style, one would adjudge to the Eighteenth or Nineteenth Dynasty. Probably, too, the greater part of the treasure of gold-work found in the tombs and now in the British Museum is of this early date. The golden tiaras and bands certainly seem to connect with those of the Mycenaean shaft-graves. But at the same time there are many objects of later date, such as a bronze tripod . . . which are demonstrably of the Dipylon period, and cannot be earlier than the tenth or ninth century.¹⁴

Thus, in effect the excavator of Enkomi is accused of having been unable to distinguish burials of different ages in a grave.¹⁵

He denied that the graves of Enkomi had been re-used.

Somewhere I came upon the expression, “the scandal of Enkomi.” I ask: Was the excavator to be blamed for something that was not his fault? The allegation that possibly objects dating from two different epochs were mixed up in Murray’s archaeological heaps does not meet his main arguments. His elaborated statements dealt with *simultaneous* relationships of *single* objects with Egypt of the fourteenth century and Assyria and Greece of the ninth and eighth centuries.

We learn from this case the fact which both sides admitted: the Greek culture of the seventh century has many interrelations with Mycenaean culture. The resulting chronological gap, as we have seen in Chapter I, had to be taken as a Dark Age.

“Cyprus no less than Greece itself passed through a long and tedious Dark Age.”
“Cyprus withdrew into herself, and life during this transitional age was dull and poverty-stricken, unenterprising and dim,” and after the Mycenaean Age came to its close elsewhere, “in Cyprus it was perpetuated.”¹⁶

A generation after the excavations at Enkomi. in 1896, other excavators opened more graves there and passed the following judgment:

The burials in the graves belong to the second or Bronze Age, its Late or third period, the second part (out of three) of this third period, more precisely to the subdivisions A (9 graves), B (10 graves) and C (8 graves) also a few belong to Late Bronze IA and IB. Thus the graves on the acropolis are “all intermingled with each other in a seemingly arbitrary way.”¹⁷

What does this mean? It means that simple and great questions are eclipsed by nomenclatures.

In recent years French and French-British campaigns at Enkomi¹⁸ have failed to solve the problems left by the British Museum excavations of 1896. The finds are still evaluated by Egyptian chronology.

Tiryns

The same problem that caused the difference of opinions at Enkomi and at the Heraion of Olympia arose at other excavated sites. To demonstrate this on another case of Greek archaeology, I chose Tiryns, south-east of Mycenae. Tiryns was excavated by Schliemann and Doerpfeld in 1884-85. Along with Mycenae, it was an important center of Mycenaean culture. On the acropolis, foundations of a palace were discovered. Together with Mycenaean ware, and mixed with it,¹ geometric ware of the eighth century and archaic ware of the sixth century were found, among them many little flasks in which libations had been brought to the sacred place.²

According to Schliemann, Tiryns was destroyed simultaneously with Mycenae and the palace was burned down. But his collaborator Doerpfeld, who agreed with him as to the time the palace had been built, disagreed as to when it was destroyed, and their opinions differed by six hundred years.³

From Greek literature it is known that in early Greek times, in the eighth or seventh century and until the first part of the fifth century, there was a temple of Hera in Tiryns which was deserted when the Argives vanquished the city in -460. In later times Tiryns was occasionally visited by travelers coming to pay homage to the sacred place of bygone days.⁴

When the excavation of Tiryns was resumed in 1905 by a team headed by A. Frickenhaus and continued in the following years, special attention was paid to the question of the time in which the Mycenaean palace there was destroyed.

On the site of the palace and, in part, on its original foundations a smaller edifice was built, identified as the temple of Hera of Greek times. The excavators felt that many facts point to the conclusion that the Greek temple was built over the Mycenaean palace very shortly after the palace was destroyed by fire.⁵ The altar of the temple was an adaptation of the Mycenaean palace altar;⁶ the plan of the Mycenaean palace was familiar to the builders of the temple; the floor of the palace served as the floor of the temple.⁷

However, the Greek temple was built in the seventh century.⁸

After deliberating on the evidence, the excavators refused to accept the end of the Mycenaean Age in the second millennium as the time of the destruction of the palace, and decided that the palace had survived until the seventh century. In their opinion

the Mycenaean pottery was the refuse of an early stage of the palace; the terracotta figures and flasks of archaic (seventh-century) type were offerings of the pilgrims to the Greek temple of Hera. A continuity of culture from Mycenaean to Greek times was claimed; even the worship of Hera, they felt, must have been inherited.⁹

Frickenhaus and his team realized that their explanation required some unusual assumptions: for instance, that the inhabitants of the palace did not undertake any alteration for the entire period of more than half a millennium,¹⁰ and that in one part of the palace the refuse of centuries was preserved, while in another part life went on.¹¹

But the excavators knew no other explanation, because it was clear to them that “the fire of the palace was followed immediately by the erection of the temple.”¹²

A decade later, when the temple of Hera was found to be very similar in plan to a Mycenaean building excavated at Korakou, near Corinth, “grave doubts” were expressed about the correctness of the above interpretations of the excavators of Tiryns, who had been “involved in a number of difficulties, both architectural and chronological.”¹³

The critic (C. W. Blegen) agreed that the temple had been built immediately after the palace was destroyed, but he could not agree that the temple was a building of the seventh century.

How is it possible, if a Greek temple was established at the Mycenaean level in the megaron [the throne room] and if the open court before the megaron was used at its Mycenaean level from the seventh century B. C. onward,—how is it then possible that this same area was later covered over with almost purely Mycenaean debris?¹⁴

He therefore concluded that “the later building within the megaron at Tiryns is not a Greek temple” but “a reconstruction carried out toward the end of the Mycenaean Period after the destruction of the palace by fire.” He also denied the significance of the capital of a Doric column found during the excavation of the temple.

Although Blegen’s arguments seemed to carry weight when he denied that the Mycenaean palace had survived the Mycenaean Age by almost five centuries, they appeared without force when he asserted that the building erected on the foundations of the palace was not a Greek temple.¹⁵ Blegen’s view was also questioned by an eminent classicist, M. P. Nilsson.¹⁶

Because it is as inconceivable that the Greek temple was built in the thirteenth century as it is that the Mycenaean palace stood until the seventh century without

alterations, its floor not even showing signs of wear,¹⁷ Nilsson confessed his inability to draw a conclusion: “The time of the reconstruction being uncertain, the question whether or not the building is the temple of Hera remains unanswerable.”¹⁸

In a book on the architecture of the palace of Tiryns, another excavator of that city, K. Muller, arrived at the conclusion that the difference of opinions is irreconcilable, but he shared the view of the scholars who ascribe the palace fire to about -750 and consider the edifice a Greek temple.¹⁹

Most of the archaeologists agreed on the continuity of the culture and cult of both buildings,²⁰ but each of the attempts to bridge the chasm of almost five hundred years met with insurmountable difficulties. The answer would not be difficult if the Mycenaean Age were not displaced by this interval of time, pushed back into history, before its proper place.

14. *Ibid.*, p. 132. [At the same time, Blegen noted, “the debris and potsherds which we should expect from the seventh century and subsequently during the period when the temple was in use, have almost completely vanished.” Cf. Mylonas, *Mycenae and the Mycenaean Age*, p. 49.].
15. [Mylonas, (*Mycenae and the Mycenaean Age*, p. 52) and Jantzen, (*Fuehrer durch Tiryns*, p. 33) reaffirm Frickenhaus’ conclusion that the later building is a Greek temple. Per Alin (*Das Ende der mykenischen Fundstaetten*, p. 32) supports Blegen’s view].
16. *The Minoan-Mycenaean Religion and Its Survival in Greek Religion*
17. Rodenwaldt, quoted by K. Muller in *Tiryns III*. [However, see above, footnote 213 about the floor level. Rodenwaldt himself agreed with Blegen in placing the destruction of what he considered a rebuilt megaron in Mycenaean time: *Tiryns II*, p. 235, n.2. Cf. idem, “Zur der monumentalen Architektur in Griechenland,” *Athenische Mitteilungen* 44 (1919), pp. 179-180; “Mykenische Studien I” in *Jahrbuch des deutschen archaeologischen Instituts* 34 (1919) p. 95 and n.2. But cf. above, n. 6 about the floor level].
18. [Nevertheless, Nilsson inclined more to the view of Frickenhaus that the later building was indeed a Greek temple, and not a smaller megaron of Mycenaean time; he stressed the evidence for the cult of Hera: “the thousands of votive terracottas of a standing and seated goddess and others cannot be so lightly pushed aside as is done by Mr. Blegen” ; and he argued that “we know from votive deposits that there was a temple on the acropolis of Tiryns, if the building itself is not accepted as satisfactory evidence. . . Under these circumstances the doubt concerning the identity seems unreasonable.” Additional sacred objects were found by Muller in 1926 (*Tiryns III*, pp. 214ff.) in a refuse pit; they were assigned dates from the mid-eighth to the mid-seventh centuries. An attempt to explain them in the light of Blegen’s theory was made by Alin (*Das Ende der mykenischen Fundstaetten* p. 32)].
19. Muller, *Tiryns III*, pp. 207ff. [Time did not help to reconcile the divergent views. H. Lorimer, writing in 1950 (*Homer and the Monuments*, p. 435) admitted that at “Tiryns the circumstances are obscure” yet opted for Frickenhaus’ and Muller’s conclusion. “It appears certain,” she wrote, “that . . . the megaron remained intact and uninhabited until it perished in a conflagration probably ca. 750. It is difficult to conceive what purpose it could have served through the long post-Mycenaean period if not that of continuing to house the ancient cult.” But it was against exactly such a possibility that Blegen had brought arguments a quarter of a century earlier. In the same year W. B. Dinsmoor published *The Architecture of Ancient Greece* (New York, 1950), in which he advocated Blegen’s solution (p. 21 and n.1). More recently Per Alin (see above, n. 14) brought additional arguments in support of Blegen].
20. [However, G. Mylonas had argued that the later Greek temple was built long after the destruction of the Mycenaean megaron by new settlers who followed the plan of the by then five-hundred-years-old ruins. This view is also

followed by U. Jantzen in his *Führer durch Tiryns* (Athens, 1975), who nevertheless sees a continuation of the religious cult from Mycenaean into archaic times (p. 33).— EMS]

Mute Witnesses

The divergence of almost five hundred years in the archaeological age evaluations repeats itself with respect to many sites of the Greek past. Because two timetables are applied simultaneously to the past of Greece—one built on the evidences of Greece itself, the other on the evidences of relations with Egypt—a clash of opinions in matters of age appraisal is almost inevitable.

The theory that “a period covering the seventh century and extending, perhaps, into the eighth century, was the time in which pottery and other antiquities of the Mycenae class were produced for the home market of Greece and possibly in Greece itself” (Murray)¹ was pronounced an “archaeological insinuation” (Evans)²

The other attempt at synchronizing the geometric with the Mycenaean ware by ascribing them to the second millennium (Doerpfeld) was called “the naivete of complete ignorance” (Furtwängler).³

The separation of the Mycenaean Age from the Greek Age by five hundred years of Dark Age was paid for with an ever-growing mass of conflicting facts. Already in the shaft tombs of Mycenae some of the finds bore conflicting and unreconcilable evidence:

Nor . . . is the evidence of Greek excavation always as simple and convincing as it looks. It has been usual to regard all the contents of the acropolis-graves at Mycenae as dating more or less to the same period. But some of the objects from these graves can be shown, if we are not to throw aside all that we have learned of the development of early Greek art, to be of far later date than others.”⁴

The same author admitted that the graves in Greece were as a rule not re-used. This makes the presence of objects of two different epochs in the Mycenaean graves in Greece very enigmatic.⁵

The epochs, as usual, are separated by close to five hundred years.⁶

A Votive Cretan Cave

On Crete a long interval is thought to separate the last period of the Minoan civilization from the late Geometric period in art and history, which belong in the eighth century; six hundred years of Dark Age if Evans is right that the Minoan civilization came to its end in -1400, and four hundred years if Leonard Palmer is right in claiming that it endured to almost -1200. But if, as we maintain, the Minoan civilization continued until the eighth century or even until the later part of it, then, of course, the Minoan ware in its latest style must be found contemporary with the geometric ware and the same perplexing relations would be discovered on Crete as were discovered in continental Greece.

The Dictaeon Cave on Crete supplied the Cretan Collection in Oxford's Ashmolean Museum with many objects; the cave was a votive place in the Late Minoan III age and an abundance of bronze figures was stored there. J. Boardman published a study of the Cretan Collection and tried to classify the finds by their style and affiliation.¹

Of bronze figurines of men from the votive cave he wrote: "These Cretan figures have been dated, apparently by style, to Late Minoan III. they must be related in some way to the well-known Geometric type of mainland Greece which exhibits the same characteristics."²

Of the bronze figures of women from the same cave, the author says: "Although no such figures of women have been recovered from Late Minoan III deposits [elsewhere], it is likely that the cruder specimens from the cave are of this date, although Pendlebury³ thought some might be Geometric."⁴

The bronze male and female figurines divided the experts, with the Minoan and the Geometric ages contesting for them. Would the animal figures from the same assemblage make the decision easier?

"Again there is as yet no reason to believe that bronze animal votives were being made uninterruptedly from Minoan to Geometric times. It should then be possible to distinguish the early from the late, but it is not easy."⁵

Next came knives with human heads at the end of the handles. "The style of the head is exceptionally fine. . . . Its superficial resemblance to a group of Cretan Geometric bronzes is noteworthy, and although the shape of the blade and solid handle point to the latest Bronze Age, there is much in the style to be explained." The layers in which it was found "suggest a Middle Minoan III-Late Minoan I context" and this

“considerably complicates the problem to which no solution is offered here.”⁶

A “cut-out plaque from the cave . . . is of a woman with a full skirt. The dress and pose, with elbows high, seem Minoan, but the decoration of the small bosses is more Geometric in spirit.”⁷

Thus bronze figurines, rings and plaques perplex the art expert when he tries to determine the period from which they date, and the difference frequently amounts to more than half a millennium. Will not then the pottery—vases and dishes, the hallmark of their age—throw some light on the problem?

For the storage jars with reliefs, (*pithoi*) from the Dictaeon Cave, two authorities⁸ “imply a Geometric date.” But two other authorities⁹ “have them Minoan.”¹⁰

Then what is the verdict of the fifth expert, familiar with the opinions of the other four?

“It is tempting to see in these pieces the immediate predecessors of the finely moulded and impressed *pithoi* of seventh-century Crete, but for these the independent inspiration of mainland Greece or the islands can be adduced, and the cave fragments are best regarded as purely Minoan in date.”¹¹

The very same features tend to confuse the experts. Some Cretan vases have a very characteristic decoration on them and it could be expected that this would help solve the problem of the age, but it does not.

There are several Cretan examples of heads or masks being used to decorate the necks of vases. . . . The example from Knossos was published by Evans as Minoan, and the signs on the cheeks thought to be signs in a linear script. The technique and the decoration tell against this. The patterns are purely Geometric. . . . The outline of the features is common in Cretan Geometric.¹²

In other cases the confusion is still greater when a decision is to be made between the Minoan (or Mycenaean) of the second millennium, the Geometric of the eighth century and the Archaic (of the seventh-sixth centuries).

The case of the votive Dictaeon Cave and its contents was selected here to illustrate how the problem stands on Crete. The verdict drawn by the art expert quoted on these pages did not clarify the issue by its recourse to our ignorance of what transpired during the Dark Age:

After the collapse or overthrow of the major Bronze Age civilizations

of the Aegean world in the twelfth century B.C. Crete, with the rest of Greece, entered upon a Dark Age which the still inadequate archaeological record can illuminate but little and the literary record not at all.¹³

Etruria

The Etruscans are thought to have arrived in northern Italy sometime before the end of the eighth century before the present era. In Etruria, between the rivers Arno and Tiber, are found vaulted structures erected by the Etruscans: they are of the type known as “false vaulting.” O. W. von Vacano in his *Etruscans in the Ancient World* (1960) comments with wondering:

. . .The Mycenaean corridor design and *tholos* [circular domed tomb] structures are related to the vaulted buildings which make their appearance in the orientalizing period in Etruria—and here it is even more difficult to solve, even though the connection itself is undisputed.¹

The Etruscan vaulted chambers impress one by their similarity to Mycenaean architecture. Other Etruscan structures of the seventh-sixth centuries also show such similarity.

The remains of the city walls of Populonia, Vetulonia and Rusellae, consisting of huge stone blocks which have a ‘Mycenaean’ look, do not date further back than the end of the sixth century B.C.: their gateways may well have had arches rounded like the entrance doors to the *Grotta Campana*, on the outskirts of Veii, which dates from the second half of the seventh century B.C., and is one of the earliest painted chamber-tombs of Etruria.²

A dilemma no less serious is posed by a vase fashioned by a Greek master who signed it with his name, Aristonothos (fig.); between -675 and -650 he studied in Athens, then migrated to Syracuse (Sicily) and later to Etruria (Tuscany). The vase was found at Cerveteri, in southern Etruria. “There is an obvious link between the design of the Aristonothos crater and another earthenware vessel, scarcely less often discussed and more than five hundred years older, the vase known from the principal figure decorating it as ‘the Warrior Vase of Mycenae.’”³

It becomes ever clearer that the end of the Mycenaean Age, put at ca. -1200, is placed so not by a true verdict.

References

1. Von Vacano, *The Etruscans in the Ancient World*, p. 81. [After the

monuments of Mycenae and Tiryns received, on the basis of Egyptian chronology, dates in the second millennium, some scholars attempted to age the Etruscan tombs by five hundred years to make them contemporary with their Mycenaean counterparts: so “striking” was the similarity, so “evident” the relation of the two architectural styles, that if the Mycenaean tombs belong in the second millennium, one expert argued, the ones found in Etruria “are probably not of inferior antiquity.” (G. Dennis, *The Cities and Cemeteries of Etruria* [London, 1878], vol. I, p. 265, n.2; cf. p. 368, n. 6.) But what of the contents of the tombs, which invariably consisted of Etruscan products of the eighth century and later? The surmise that this situation reflected “a reappropriation of a very ancient sepulchre” (Dennis, *op. cit.*, p. 154) was unanimously rejected by experts (e.g., A. Mosso, *The Dawn of Mediterranean Civilization* [New York, 1911], p. 393). There was no reason to suppose that the tombs had been built by anyone but the people who used them; and these people first arrived on the scene in the middle of the eighth century. The relation of these eighth-century tombs to the five-hundred-years-earlier structures of Mycenaean Greece has remained a puzzle. *The Dawn of Mediterranean Civilization* (New York, 1911) pp. 392-93; A. N. Modona, *A Guide to Etruscan Antiquities* (Florence, 1954), p. 92; S. von Cles-Reden, *The Buried People: A Study of the Etruscan World*, transl. by C. M. Woodhouse (New York, 1955), p. 180; A. Boethius and J. B. Ward-Perkins, *Etruscan and Roman Architecture* (Baltimore, 1970) p. 78 and pl. 47. The oldest is the Grotta Regolini Galassi, dated to ca. B.C.]

2. *Ibid.*, p. 82; cf. Cles-Reden, *The Buried People*, p. 122. [Numerous other Etruscan cultural traits reflect Mycenaean models, something that would be not unexpected if, as the revised timetable postulates, the two cultures were contemporary, yet most difficult to account for if, as the conventional scheme requires, five hundred years of darkness intervened. (a) *Columns*. The types of columns used in Etruscan buildings derive from columns of Knossos and Mycenae, and have nothing in common with the Doric columns of seventh and sixth-century Greece. (S. von Cles-Redden, *The Buried People: A Study of the Etruscan World*, transl. by C. M. Woodhouse [New York, 1955], p. 35.) But it is presumed that no Mycenaean or Minoan structures were left standing in Etruscan times. Where, then, did the Etruscans find the models for their wooden columns? (b) *Frescoes*. The famous Etruscan frescoes, such as those that decorate the tombs near Veii, display an “obvious reminiscence of Crete”—however not of Crete of the Dark Ages, but rather of Minoan Crete (von Cles-Redden, *op. cit.*, p. 143). But had not the Cretan palaces with their frescoes been destroyed many centuries earlier? (c) *Burials*. The sepulchral slabs used in some Etruscan tombs, especially those bearing reliefs of men and animals, resemble those found by Schliemann at Mycenae (Dennis, *op. cit.*, p. lxxix, n. 9). Also Etruscan burial customs appear to be derived from Mycenaean models (S. von Cles-Redden, *op. cit.*, p. 150.)]

Sicily

In Mycenaean times Sicily had a prosperous civilization that carried on a busy commerce with the Helladic city-state of mainland Greece and the Minoan empire of Crete. This civilization disappears from view about the same time that the chief Mycenaean centers were destroyed, and five centuries of darkness are said to descend on the island.¹ Not till the beginning of the seventh century is the gloom dispelled by the arrival of the first Greek colonists.

The earliest of the Greek settlements was at Gela on the southern coast, founded by migrants from Crete and Rhodes at a date fixed by the ancient chronographers as - 689. Tradition also claimed that Gela's founder was Antiphemos, one of the Greek heroes returning from Troy: and Virgil has Aeneas, the Trojan hero, sail along the southern coast of the island and admire flourishing Gela and two other Greek settlements which by all accounts did not come into existence till the beginning of the seventh century.² Besides furnishing further proof our dating of the Trojan War, these traditions are especially important in linking the Greek colonization of Sicily with the closed of the Mycenaean age, and help explain the many survivals of Mycenaean culture in the Greek colonies of seventh century Sicily.

A little to the north of Agrigento, somewhat west of Gela on Sicily's southern coast, are found tholos tombs of the Mycenaean type.³ Inside of one of the tombs were found gold bowls and seal rings manufactured in a style that derives from Mycenaean gold work.⁴ Yet neither the tombs nor the objects found inside them can be dated before the end of the eighth century. It is a puzzle how "splendid gold rings" with incised animal figures, so reminiscent of Mycenaean objects and having nothing in common with contemporary Greek prototypes could have been manufactured by Greek colonists in the seventh century if "a real Dark Age"⁵ of five hundred years' duration did in fact separate them from the latest phase of the Mycenaean civilization. In Sicily the time between the end of the Mycenaean age and the beginning of Greek colonization is an absolute void, with a total lack of archaeological remains: even the Protogeometric and Geometric pottery which elsewhere is claimed to span the Dark Age, is absent; only late Geometric ware appears with the arrival of the Greeks.⁶ The decorative motifs used by the Greek colonists are once more under strong Mycenaean influence; a detailed comparison of the motifs in use in the seventh century with those on Mycenaean ware caused much amazement among art historians, but not even a suggestion of how the motifs could have been transmitted through the Dark Ages.⁷ Moreover, Minoan influences were identified in the shape and decoration of pottery discovered at Gela, presenting the same problems.

All the evidence we have examined argues against a long gap between the Mycenaean age in Sicily and the arrival of the Greek colonists in the seventh century. Then why is it necessary for historians to postulate a five hundred year long Dark Age between the two epochs? Of the sherds found on the island some were fragments of “exactly the same pottery as that found in Egypt in the ruins of Tell el Amarna, the capital of Pharaoh Amenophis IV [Akhnaton] (1372-1355 B.C.)” .⁸ It was the erroneous timetable of Egypt which caused the historians to remove the Mycenaean civilization of Sicily into the second millennium, severing its links to its Hellenic successor.

Mycenae and Scythia

“According to the account which the Scythians themselves give,” reported the fifth-century Greek historian Herodotus, “they are the youngest of all nations.”¹ It was the great disturbances and movements of people of the eighth and seventh centuries before the present era that brought these nomadic tribes from the depths of Asia to the doorstep of the civilized nations of the ancient East—Assyria, Egypt and Greece. Formerly the Scythians dwelt east of the Araxus²—their first settlements in southern Russia date to the end of the eighth century, about the time also that the Assyrians clashed with them in the vicinity of Lake Urmia.³ In the course of the decades that followed the Scythians attained the peak of their power, menacing Egypt and helping to bring about the downfall of Assyria. Later the powerful Chaldean and Persian empires succeeded to confine them to the steppes north of the Caucasus.

The appearance of the Scythians on the scene of the ancient East coincides in revised scheme with the final years of the Mycenaean civilization; the accepted timetable, however, needs to place their arrival fully five centuries after the last of the Mycenae citadels had been abandoned.

The tombs of the Scythian kings in the Crimea were built in a way “surprisingly reminiscent of Mycenaean constructions,”⁴ the burial chamber consisting of “enormous blocks of dressed stone set to overlap each other so as to meet in the center in an impressive vault.”⁵ To explain the use by the Scythians of the corbelled vault of the type common in the Mycenaean period, it was suggested that there must have been a continuing tradition going back to Mycenaean times, despite the lack of even a single exemplar between the twelfth and seventh centuries. “I have no doubt,” wrote the historian Rostovzeff, “although we possess no examples, that the corbelled vault was continuously employed in Thrace, and in Greece and in Asia Minor as well, from the Mycenaean period onwards. . . .”⁶ We, on the contrary, must begin to have doubts about a scheme which needs to postulate a five hundred year tradition of work in stone for which not a thread of evidence exists. Stone constructions of the type, had they existed, would have survived.

Gregory Borovka in his *Scythian Art* writes of “the striking circumstance that the Scytho-Siberian animal style exhibits an inexplicable but far-reaching affinity with the Minoan-Mycenaean. Nearly all its motives recur in Minoan-Mycenaean art.”⁷

Solomon Reinach, long ago, called attention to certain striking resemblances between Scythian and Minoan-Mycenaean art.⁸ For instance, the design of animal bodies in ”

‘flying gallop’ in which the animal is represented as stretched out with its forelegs extended in a line with the body and its hind legs thrown back accordingly, is at once characteristic of Minoan-Mycenaean art and foreign to that of all other ancient and modern peoples; it recurs only in Scythia, Siberia and the Far East.”

Another example of great similarity in style is in “the Siberian gold and bronze plaques depicting scenes of fighting animals.” Borovka supplies his description with illustrations. “How often are the animals depicted with the body so twisted that the forequarters are turned downwards, while the hind quarters are turned upwards? Can the agonized writhings of a wounded beast or fury of his assailant be more simply rendered?”⁹

”Other motives of the [Scythian] animal style, too, reappear in Minoan and Mycenaean art. We may cite the animals with hanging legs and those which are curled almost into a circle. Conversely, the standard motif of the Minoan-Mycenaean lion, often represented in the Aegean with reverted head, reappears again in Scythian and Siberian art.”

The similarity first observed by Reinach and elaborated upon by Borovka is very unusual. But what appeared to them most surprising was the fact that two such similar art styles should be separated not only by a vast geographical distance, but also by an enormous gulf in time.

”How are we to explain this far-reaching kinship in aim between the two artistic schools? It remains, on the face of it, a riddle. Immediate relations between Minoan-Mycenaean and Scytho-Siberian civilizations are unthinkable; the two are too widely separated in space and time. An interval of some 500 years separates them. . . Still, the kinship between the two provinces of art remains striking and typical of both of them.”¹⁰

Pylos

Pylos in Messenia, on the western coast of the Peloponnese, was the capital of Nestor, the elderly statesman in the league headed by Agamemnon, king of Mycenae, against Priam, king of Troy, and his allies.¹ In 1939 Carl Blegen came to Messenia to search the countryside for signs of the ancient city of Pylos with Nestor's famous palace, celebrated by Homer. Blegen selected for his first dig a prominent hilltop, a short distance from the sea, which seemed to him eminently suitable to be the site of a royal palace; and in fact, as soon as he began to lift the earth from his first trench, extensive structures began to appear, and much pottery of Mycenaean time. He soon arrived at the conclusion that the palace was Nestor's: the building he excavated had been occupied, in his estimate, in the second part of the thirteenth century before the present era—the preferred time for the Trojan War.²

Already early during the work of excavation Blegen unearthed scores of tablets written in the Linear B script, and soon there were hundreds of them. Linear B had been first discovered on Crete by Sir Arthur Evans, who found tablets with incised signs of two scripts, which he termed Linear A and Linear B. The profusion of tablets found in Pylos made the archaeologists question whether the script was Minoan or had its origin on the mainland of Greece; and when subsequently more tablets inscribed with these characters were found in other sites of the Greek mainland—at Mycenae and at Thebes—the name Mycenaean became rather regularly applied to the script.

For over a decade after their discovery the tablets were neither published nor read;³ but when read—and the story will be told on subsequent pages—they were found to contain no literary text: they were regularly archive notes, dealing with taxation or conscription, or human and animal census or storage inventory. Nevertheless, interesting parallels could be drawn with the Homeric epics: Pylos is mentioned at the head of nine other towns that profess allegiance to it—both in Homer and on the tablets;⁴ again, a seven-town coastal strip mentioned in the Iliad finds a parallel in a strip of seven coastal settlements referred to on one of the tablets. And to Blegen's great satisfaction Pylos was found repeatedly mentioned on the tablets retrieved from the palace he identified as Nestor's.⁵

Nestor's name, however, was not found.

The tablets, originally not fired but only dried, would have disintegrated long ago, were it not for the fire that destroyed the palace and baked the tablets. A great conflagration raged over the structure; it came rather suddenly, since most furniture,

pottery, the contents of the storage rooms and archives were not removed: but humans all fled.⁶

Blegen placed the destruction not long after the Trojan War, at the close of the Mycenaean Age.⁷

However, no signs of warfare, siege, re-occupation by people of another culture or occupation in general were found.⁸

The palace presented Blegen and his collaborators with problems not unlike those that were to occupy him later at Troy. In the report of the excavations Blegen wrote: “In some places . . . in the upper black layer . . . were found, along with the usual Mycenaean pottery, a few glazed sherds of Late Geometric Style, as in so many other parts of the site, where similar deposits were encountered.”⁹

Linear B Deciphered

For a long time the Linear B script did not disclose its secret to those who worked on its solution. Nor was the decipherment facilitated by the manner in which Sir Arthur Evans published the texts of the Linear B tablets—not all at once, but seriatim. When Blegen discovered the Linear B tablets on the Greek mainland in the ruins of the ancient palace in Pylos, they were ascribed to the Heroic Age of Troy, the final stage of the Mycenaean Age that ended abruptly.

Yet even after the Linear B tablets were found on the mainland of Greece their language was not thought to be Greek. The reason for that was, first of all, in the accepted chronological scale: the Ionian age, according to conventional chronology, was separated from the Mycenaean Age by five hundred years. Greek writing appears for the first time in the eighth century. Efforts to read the tablets made by classical philologists were unsuccessful, and whatever clue was tried out, the result was negative.

One of the most important and far-reaching theses of the reconstruction of ancient history is in the conclusion that the so-called Dark Ages of the Greek and Anatolian histories are but artifacts of the historians, and never took place. The Mycenaean Age ended in the eighth century and was followed by the Ionic times, with no centuries intervening, the break in culture being but the consequence of natural upheavals of the eighth century and of the subsequent migrations of peoples. Consequently the Ionic culture must show great affinity with the Mycenaean heritage; and therefore I have claimed that the Linear B script would prove to be Greek; but this was not a view that had many supporters.

In 1950 the eminent authority on Homeric Greece, Helen L. Lorimer, in her treatise *Homer and the Monuments* wrote of this script and of the efforts to read it: “The result is wholly unfavorable to any hope entertained that the language of the inscriptions might be Greek.”

Nevertheless, on the occasion of addressing the Forum of the Graduate College of Princeton University on October 4, 1953, I formulated my expectations:

I expect new evidence from the Minoan Scripts and the so-called Hittite pictographs. Texts in the Minoan (Linear B) script were found years ago on Crete and in Mycenae and in several other places on the Greek mainland. I believe that when the Minoan writings unearthed in Mycenae are deciphered they will be found to be Greek. I also claim that these texts are of a later date than generally believed. “No ‘Dark

Age' of six centuries' duration intervened in Greece between the Mycenaean Age and the Ionian Age of the seventh century."

The address was printed as a supplement to *Earth in Upheaval*, but the last passage in the address was quoted from my *Theses for the Reconstruction of Ancient History*, published eight years earlier, in 1945.¹

When speaking to the Princeton Forum in October 1953 I did not know that a young English architect was by then on the verge of publishing the solution to the riddle of the Linear B script. Only six months passed since my addressing the Graduate Forum, and the April 9, 1954 front page news of *The New York Times* made known the exciting performance of decoding Linear B by Michael Ventris. The ancient script "that for the last half century and longer has baffled archaeologists and linguists has been decoded finally—by an amateur." Ventris, an architect and "leisure-time scholar of pre-classic scripts," served as a cryptographer during World War II. The script that had been tried without avail in a variety of languages—Hittite, Sumerian and Basque among others—was found by Ventris to be Greek.²

Ventris as a boy attended a lecture by Sir Arthur Evans on the Minoan tablets with unread scripts and, like Schliemann who since boyhood was determined to find Troy and the tomb of Agamemnon, was intrigued to decipher the script of which he heard Evans speak. Thus the greatest discoveries in the world of classical studies were made by non-specialists, a merchant and an architect.

But Ventris was not immediately on the right path. In 1949 he had sent out a questionnaire on Linear B to leading authorities on Aegean questions; he privately distributed the replies in 1950 as *The Languages of the Minoan and Mycenaean Civilizations* (known as the "Mid-Century Report"). None of his queried correspondents came upon the right trail.

In 1962 Leonard R. Palmer testified as to the stand the Hellenic scholars and Ventris himself had taken prior to the achievement; in his book *Mycenaeans and Minoans*, Palmer wrote: "Evans ventured no guess at the possible affinities of the Minoan language. That it was Greek never entered his head." Also Blegen, who was the first to find the tablets on Greek soil, "was 'almost certain' that the language of his tablets was 'Minoan' . . . Nor did the possibility that the Linear B tablets concealed the Greek language occur to Michael Ventris." He "guessed that the language was related to Etruscan . . . This wrong diagnosis was maintained by Ventris right up to the final stages of his decipherment." "It figures in the so-called 'Mid-Century Report,' which records what could be deduced by the most eminent living authorities from the archaeological and other evidence available at the time preceding the decipherment of the script. The remarkable fact stands out that not one of the scholars concerned suggested that the language could be Greek."

But a few years more and Ventris found the true solution. Even then loud voices of

skepticism and opposition made themselves heard.³

But the method being perfected disclosed more and more Greek words and names which could not result from a mistaken decipherment. The entire field of early Greek civilization experienced the greatest shock since the discovery of Troy. To the even greater surprise of the scholarly world the names of the deities of the Greek pantheon, supposedly “created” by Homer and Hesiod, were found on the deciphered Linear B tablets.

The reading of these tablets in the Greek language raised the question: How could a literate people in the fourteenth century become illiterate for almost five centuries, to regain literacy in the eighth century? Thus the problem already answered in *Ages in Chaos* was brought into relief, and a heretical idea crept into the minds of a few scholars: is there some mistake in the accepted timetable? In the last century a Dark Age of five centuries’ duration between the Mycenaean and the Ionian ages was forced upon the scholars of the Greek past by students of Egyptology, and in three quarters of a century this notion, first bitterly opposed, became as bitterly defended by the new generation of classical scholars, only to be confronted with the riddle of the Mycenaean tablets written in Greek more than five hundred years before the oldest known Greek inscription in alphabetic characters adapted from the Hebrew-Phoenician script.

Ventris died young, in an auto accident, soon after his triumph. One of the most tantalizing riddles of classical archaeology was solved, but not without creating some puzzling situations. The Homeric Question, instead of being solved, grew now to astonishing, one would like to say, Homeric, proportions.

The Greek Pantheon

When the texts in Linear B were read the so-called Homeric problem did not approach a solution but, contrariwise, grew more urgent, more enigmatic, more perplexing.

Since antiquity it had been believed that “Homer and Hesiod were the first to compose Theogonies, and give the gods their epithets...”¹ Therefore reading the names of Greek gods and goddesses on the Linear B tables from Knossos on Crete and Pylos on the mainland was something of a shock to classical scholars.² Hera, Artemis and Hermes were worshipped in Pylos. Zeus and Poseidon were worshipped in Pylos and Knossos. Athene was deified in Knossos; Dionysus’ name was found on a Pylos tablet.³

With Greek gods and goddesses spelled by their names on the tablets, it was conducive to recognize Apollo in a figure on a vase, singing among the Muses, or Poseidon in a figure depicted driving a chariot over the sea, or Zeus with Europa in the depiction of a bull carrying a woman. The Minotaur and centaurs were recognized as likely Mycenaean images.⁴

Not less unexpected were the names of Achaean heroes known from the Homeric epics when found on the Pylos and Knossos tablets, and a “wealth of Trojan names,” too. Ajax (called by his patronymic “Telamonian”) and his brother, Telamonian Teucer, have namesakes in Homer; “and between them they killed two Trojans with tablet names Pyrasos and Ophelostas, and a third Simoeisios, whose father’s name, Anthemos, occurs at Knossos.” Hector’s name and Priam’s name, and that of Tros, are found in Pylos. Achilles’ name is found both a Knossos and at Pylos, and Kastor’s at Knossos.⁵

In Homer Laodokos’s father is Antenor and on a Pylos tablet Laodokos holds land in a village or suburb where Antenor is mayor. In Homer Laodokos is from Pylos, where the tablet with his name was found.

Aigyptos of the *Odyssey* has a namesake on a Knossos tablet; admittedly, there was no contact with Egypt during the Dark Ages and until the seventh century, and how could a bard of one of those centuries, if the epos was not yet completed in the Mycenaean Age, come upon calling a hero after the river Nile, asked T. B. Webster. The name Neritos in met in both, the *Iliad* and the *Odyssey*, and it was thought to be a misnomer for some Greek term, corrupted in the later versions of the epics to look as a private name, but the name was found on a table as that of a sheep owner.

“Unfortunately the establishment of Neritos as a good Mycenaean name does not help the difficult geographical problem of Ithaca’s location.”

The campaign of the Seven against Thebes and the sack of the city by the Epigoni are alluded to by Homer. “Mycenaean names in the story are Amphiaros (Knossos), Adrastos, Eteocles, Polyphontes (Pylos).” One of the sons of Eteocles in Pylos was called Alektryon, a name known from the *Iliad* (XVII.602). In Pylos a man was called Theseus and men at Knossos bore the names Selenos and Iakchos known from the *Odyssey*. The name Aeneas is read on a tablet from Mycenae. Phegeus’ name, found in the *Iliad* (V.10f) is found also on a tablet from Mycenae. The Trojan Pedasos (*Iliad* VI.21) had a namesake at Knossos.

Not less amazing are the attributes and adjectives accompanying the names as used by Homer and found on the tablets. “The evidence of the tablets” is “that such formulae as Telamonian Ajax were Mycenaean titles.”⁶ Nestor of Homer “has Mycenaean titles”;⁷ Agamemnon’s title *wanax* is “certainly Mycenaean”;⁸ “king of men” is a title most probably “remembered from Mycenaean poetry” half a millennium before Homer.⁹

“The epithet *hippocharmes* (chariot-fighter), which is applied to Troilos in the *Iliad* and to Amythaon (a name found on the Pylos tablets) in the *Odyssey*, has been recognized as derived from the Mycenaean word for chariot.”¹⁰

If five hundred years separate Homer from the tablets, is it not a cause for wonder that the poet should know these names and titles and use them for his epics?

Mycenaean City Names in the Iliad

Most notable among the passages in the Iliad traceable to Mycenaean times is the so-called Catalogue of Cities and Ships.¹

It is an enumeration, in the second book of the Iliad, of the contributions in ships made by various cities and towns of the Achaeans or Greeks of the Heroic Age to the expedition against Troy. There are scores of localities in the list and many of them, actually about half, did not survive into the modern Ionian Age; then how could the Greek poet, separated from the Mycenaean Age by dark centuries, have had such an extensive and detailed knowledge of these localities?

Archaeological research has already identified the ruins of quite a few sites which had not been rebuilt and were not known in the classical period of Greece; and it is safe to assume that future digging will reveal more of the cities of this list. By assuming that the oral delivery from one generation to another can account for the survival of the epics, it is also necessary to assume that a long list of localities, many of them small, many of them no more extant, was capable of surviving by means of such oral tradition. But would generations of bards carry over centuries of the Dark Ages the multitudinous names of towns and villages of which nothing was extant for century upon century? It is conceivable that a few names of ancient palace cities would defy time and survive in the memory of bards. But to assume that almost a hundred names of localities that were but abandoned mounds in the time when the Iliad was put to writing survived in that manner implies nothing short of a miracle. In the view of Denys Page, "There is no escape from this conclusion: the names in the Catalogue afford proof positive and unrefuted that the Catalogue offers a truthful, though selective, description of Mycenaean Greece."² At the same time, "there is no scrap of evidence, and no reason whatsoever to assume, that the art of writing was practiced in Greece between the end of the Mycenaean era and the eighth century B.C."³

Yet "it is inconceivable that such a list should have been first compiled during or after the Dark Ages."⁴ But is it a solution that bards transmitted all those names?⁵

And where did the bards sing? Was not the land without palaces and with hardly any houses of occupation?

Denys Page continues on the subject with growing wonderment: "Descriptive epithets are attached to some fifty of the place names. . . . Many of the epithets are distinctive, not generally applicable. One place is a meadowland, another is rocky; one place is rich in vineyards, another is famous for its sheep; one place is rugged, another has

many flowers; one place is on a riverbank, another on the seashore.” “Let us ask,” Page continues, “how could an Ionian poet living in the 10th or 9th or 8th century B. C. know how to describe so many places—some of them very obscure places—all over Greece? How could he know that there were many doves at Messe (if anyone could still find the place); and vineyards at Hine (if it had not yet been swallowed up by the lake); that Aegylips was rugged, Olosson white, Enispe windy, Ptellos a meadowland, Helos on the coast?”⁶

And is it thinkable that the bards came to Greece from the Aegean coast of Asia Minor towards the end of the Dark Ages? But Asia Minor together with its Ionian coast was also immersed in a Dark Age; nor was there recovered a palace in which a bard upon return from Greece could sing of those Mycenaean cities, towns and hamlets—so impoverished was the Greek region of Asia Minor during the Dark Ages, with the highland of Anatolia being quite empty of any human habitation.⁷

The problem of the Mycenaean heritage in the Homeric poetry is staggering and remains unresolved through hundreds of volumes dealing with it; it is the despair of anyone endeavoring to solve it within the framework of the accepted chronological timetable.

The Mycenaean Dialect

When Mycenaean Linear B was deciphered by Michael Ventris, it was thought to be an archaic form of Greek, preceding Homer by almost five centuries. A name was proposed for it—"Old Achaean." However, a closer examination of Mycenaean resulted in a startling conclusion expressed by A. Tovar:

"But contrary to what we expect from Greek documents of the fourteenth and thirteenth centuries B.C., the Mycenaean dialect is not seen to be closer to proto-Greek than are Homer or Thucydides. If sometimes Mycenaean shows very primitive features, it also sometimes appears more advanced than the dialects of the first millennium."¹

John Chadwick, who collaborated with Ventris in the decipherment of Linear B, writes: "Since 1952 important new work has modified the general view and this has entailed a shift of emphasis, and the abandonment of the name proposed for this dialect, 'Old Achaean.'"²

The Mycenaean Linear B dialect was found to be best preserved in the southern (Arcado-Cyprian) group, and to be distinct from the Ionian-Attic dialect; the theory that Mycenaean was the mother tongue of all Greek dialects conflicts with the fact expressed in these words: "But Mycenaean presents many dialectal phenomena of quite recent aspect and is in some traits as far from 'common [early] Greek' as the dialects known a millennium later."³

Against the view of E. Risch that Mycenaean was the proto-language of all Greek dialects, Tovar writes: "The weak point in Risch's argument is that it ignores the fact that against the innovations which appear in Mycenaean (and Arcado-Cyprian), Ionic shows many old forms." E. Benveniste, too, expressed his criticism of the view of Mycenaean as proto-Greek, or "Old Achaean":

It must be admitted that according to the hypothesis maintained by Risch during this period [the 450 years between the last Mycenaean texts and the first literary testimony in eighth-century Greek] a remarkable conservation of Mycenaean was upheld in its Arcado-Cypriote dialect and a profound evolution of Mycenaean in its Ionian dialect took place. Is it not more plausible to assume that in the epoch of our tablets the Ionian (not represented in the tablets) already substantially differed?⁴

Four hundred and fifty years passed between the last Mycenaean texts and the first literary testimony. Is not the confusion discussed here a result of this erroneous premise? If the true figure is something like sixty years and not five hundred, all perplexities disappear.

Cadmus

The classical Greek alphabet, its order of letters, and their form, were borrowed from the Hebrew-Phoenician alphabet; alpha, beta, gamma, delta, are but Grecized aleph, beth, gimel, daleth of the Hebrew language.¹

In early times Greek was also written from right to left, as Hebrew is still written today.

Cadmus, the legendary hero who came to Greece from Phoenicia and founded Thebes in Boeotia, is credited with the introduction of the Hebrew or “Phoenician” alphabet to the Greek language; in its Hellenized early form the alphabet is called Cadmeian. As Herodotus tells the story,

The Phoenicians who came with Cadmus . . . introduced into Greece, after their settlement in the country, a number of accomplishments, of which the most important was writing, an art till then, I think, unknown to the Greeks. At first they used the same characters as all the other Phoenicians, but as time went on, and they changed their language, they also changed the shape of their letters. At that period most of the Greeks in the neighborhood were Ionians; they were taught these letters by the Phoenicians and adopted them, with a few alterations, for their own use, continuing to refer to them as the Phoenician characters—as was only right, as the Phoenicians had introduced them.²

However, Cadmus, the founder of Thebes, preceded by several generations the Trojan War; on this the Greek tradition is unanimous. Tradition also has it that the Cadmeian alphabet originally consisted of sixteen letters and that four additional characters were introduced later, about the time of the Trojan War.³

The Theban cycle of legends deals with the time preceding the Trojan War. Thebes in Boeotia was outside of the Mycenaean dominion. No contingent from Thebes participated with the other Greek cities in the Trojan War for, according to tradition, Thebes as a city had been reduced shortly before the new war started. With the conventional date of the Trojan War in the beginning of the twelfth century, Cadmus needed to be placed in the fourteenth: his dynasty comprised several generations of rulers before the Epigoni conquered and ruined the Boeotian Thebes; some of the Epigoni later participated in the siege of Troy.

This order of events in the semi-historical, semi-legendary Greek past conflicts with

the fact that the Cadmeian alphabet has not been found in Greece before about the middle of the eighth century. Furthermore, because of certain characteristics in their form, the earliest Cadmeian letters bear the best resemblance to the Hebrew-Phoenician letters of the ninth century—as exemplified by the Mesha stele.⁴

But in Greece no inscription in Cadmeian letters was found that could be attributed to even so early a time as the ninth century. Therefore among the classical epigraphists a protracted debate was waged between those who claimed a date in the ninth century as the time the Cadmeian alphabet was introduced into Greece and those who claimed the seventh century.⁵ Yet independently of the question whether the Cadmeian letters originated in the ninth or in the seventh century,

it is generally agreed that the fourteenth century is out of the question;⁶ but even should we follow the proponents of the earlier date—that of the mid-ninth century, we still would be at pains to harmonize dates so far apart as the ninth and fourteenth centuries, the date assigned to Cadmus. If the tradition about Cadmus, the originator of the Greek alphabet, has any historical value,⁷ and if Cadmus lived in the ninth century, his descendants, participants in the Trojan War, could not have flourished about -1200.

4. King Mesha of Moab was a contemporary of King Ahab of Samaria. See *Ages in Chaos*, vol. I, Sections, “Mesha’s Rebellion,” and “The ‘Great Indignation.’”
5. At that time the Cadmeian alphabet had not been found in Greece before the seventh century. However, since this debate between Carpenter and Ullman, an inscription of the middle of the eighth century has come to light, the earliest known inscription in Greek employing the Cadmeian letters.
6. Cf. the debate between Rhys Carpenter (“The Antiquity of the Greek Alphabet,” *American Journal of Archaeology* 37 [1933] pp. 8-29) and B. Ullman (“How Old is the Greek Alphabet?” in *American Journal of Archaeology* 38 [1934] pp. 359-381). Cf. P. Kyle McCarter Jr., *The Antiquity of the Greek Alphabet and Early Phoenician Scripts* (Ann Arbor, 1975). [Cf. also Carpenter’s reply: “The Greek Alphabet Again” in the same journal, vol. 42 (1938) pp. 58-69. While Carpenter defended a date ca. -700 for the adoption of the alphabet by the Greeks, Ullman argued for “the eleventh or twelfth century or even earlier as the time for the introduction of the alphabet

into Greece.” A. Mentz (“Die Urgeschichte des Alphabets,” *Rheinisches Museum für Philologie* 85 [1936] pp. 347-366) judged Ullman’s proposed dates to be too *low* and suggested ca. -1400 as the date for the adoption of the alphabet, based on the Cadmus tradition. W. Dörpfeld, (*Alt-Olympia II* (Berlin, 1935) pp. 401-409), V. Berard *Les Phéniciens et l’Odyssée* (Paris, 1927-28) held similar views. Cf. also Livio C. Stecchini, “The Origin of the Alphabet,” *The American Behavioral Scientist* IV. 6 (February, 1961), pp. 2-7].

7. [M. C. Astour has suggested (*Hellenosemitica* [Leiden, 1967] p.) that Linear B, the administrative script of the Myceneans and Minoans, was what the later Greeks remembered as *phoinikeia grammata*, or “Phoenician letters,” introduced by Cadmus. There appears to be little justification for such a view since the Linear B script had, as far as is known, no connection to Phoenicia, whereas the Greek alphabet was directly adapted from the ninth-eighth century Hebrew-Phoenician script. Herodotus’ statement on the subject could not be less ambiguous. In the same book, Astour vigorously defends Cadmus’ Phoenician origin (pp. 147ff.) Cf. J. Rason, “La Cadmée, Knossos et le lineaire B,” *Revue archeologique* (1977) p. 79].

Seismology and Chronology

Independently of my effort to construe a synchronical history starting with the common event that overwhelmed and vexed all nations of the globe—the great catastrophe that ended the Middle Kingdom—a similar effort was made by Claude F. A. Schaeffer, Professor at College de France. The reader of *Ages in Chaos* is familiar with his work of excavating Ras-Shamra (Ugarit) from the chapter carrying this title. He observed in Ras-Shamra on the Syrian coast obvious signs of great destruction that pointed to violent earthquakes, tidal waves, and other signs of a natural disaster. At the occasion of his visit to Troy, excavated by C. Blegen, Schaeffer became aware that Troy was destroyed by the elements—and repeatedly so—at the same times when Ras-Shamra was destroyed.

The distance from the Dardanelles, near which the mound of Troy lies, to Ras-Shamra is about six hundred miles on a straight line. In modern annals of seismology no earthquake is known to have affected so wide an area. Schaeffer investigated the excavated places in Asia Minor, and the archaeologists' reports, and in every place found the same picture. He turned his attention to Persia, farther to the East—and the very same signs of catastrophes were evident in each and every excavated place. Then he turned his attention to the Caucasus—and there, too, the similarity of the causes and effects was undeniable. In his own excavations on Cyprus he could once more establish the very same series of interventions by the frenzied elements of nature. He was so impressed by what he found that during the next few years he put into writing a voluminous work, *Stratigraphie comparée et chronologie de l'Asie occidentale (IIIe et IIe millénaires)*, published by Oxford University Press in 1948. In over six hundred pages supplemented by many tables, he presented his thesis.

Several times during the third and second millennia before the present era the ancient East was disturbed by stupendous catastrophes; he also found evidence that in the fourth, as well as in the first millennium, the ancient East went through great natural paroxysms, but their description Schaeffer reserved for future publications. In the published work covering the third and second millennia, Schaeffer discerned five or six great upheavals. The greatest of these took place at the very end of the Early Bronze, or the Old Kingdom in Egypt. At each of these occurrences, life was suddenly disturbed and the flow of history interrupted. Schaeffer also indicated that his acquaintance with European archaeology made him feel certain that Europe, too, was involved in those catastrophes; if so, they must have been more than continental—actually global in dimension.

Thus Schaeffer, like myself, came to the conviction that the ancient world was disturbed by repeated upheavals. We even arrived at the same number of

disturbances, a common realization of their grandiose nature, and the same relative dating of these events. However, we came to the same conclusions travelling by entirely different routes. In this there was a considerable assurance of our having closely approached the historical truth.

A reader unequipped to follow Schaeffer through his large and technical volume may well let the the last chapter (*Resume et Conclusion*) impress him by its questions and answers. In concluding his book Schaeffer epitomized: “Our inquiry has demonstrated that these repeated crises which opened and closed the principal periods . . . were caused not by the action of man. Far from it—because, compared with the vastness of these all-embracing crises and their profound effects, the exploits of conquerors and all combinations of state politics would appear only very insignificant. The philosophy of the history of antiquity of the East appears to us singularly deformed”—namely, by describing the past of nations and civilizations as the history of dynasties, rather than as a history of great ages, and by ignoring the role physical causes played in their sequence.

As to the chronology—in his printed work Schaeffer follows with certain reservations, the accepted timetable. In correspondence, however, he envisaged the possibility of shortening the Egyptian history, but not to the extent claimed in *Ages in Chaos*. Then how can we be in agreement as to the times of the catastrophes?

The answer lies in the fact that both of us relate these catastrophes to the termination of the (identical) great periods in history. In other words, we are in agreement as to the relative chronology, not the absolute one.

At the end of his long discourse, Schaeffer also made clear his stand even before he became aware of my work. He wrote: “The value of absolute dates adopted by us depends, understandably, to an extent on the degree of precision obtained in the field of study of the historic documents that can be used for chronology and that derive from those collected in Egypt, Palestine, Asia Minor, Mesopotamia, and Persia.”

Thus the absolute dates used in his work are dependent on chronology that in its turn depends on historical documents. But he adds: “On the other hand, thanks to the improvement of archaeological methods, today we no longer depend so completely on epigraphic documentation for an absolute chronology.”

I regard myself very fortunate that the task of presenting the archaeological evidence from the lands of the Middle and Near East was performed by a scholar of great stature, Claude F. A. Schaeffer. The almost superhuman enterprise of unravelling the manifold ramifications of the recent tribulations of this planet was not committed all to one scholar.

Celestial Events in the Iliad

The eighth century, starting with -776, was together with the beginning of the seventh a period of great natural upheavals. Populations migrated, partly to Asia Minor, and other populations descended from the north. The siege of Troy might therefore have been an effort of the Greeks to plant a foothold on the coast of Asia Minor. The true time of the events recounted in the Iliad was the second half of the eighth and the beginning of the seventh centuries before the present era.

In *Worlds in Collision* an effort was made to recognize in the description of *theomachy* and of the natural phenomena that accompanied the battle of the gods, the events that took place in the sky and on earth between -747 and -687.¹

The Trojan War was waged to the accompaniment of blows exchanged by the planetary gods—Earth (Hera), Moon (Aphrodite), Venus (Athene), Mars (Ares) and Jupiter (Zeus).

These celestial phenomena could not have taken place in the sky over Troy alone: the entire world had to witness the events, if they were not mere creations of the bard. That they were not can be deduced from the fact that these very events, witnessed in all parts of the world, are also described in sacred epics from Finland (*Kalevala*), Lapland and Iceland (*Edda*), from Mexico, Peru, India, the South Sea Islands, China and Japan, and, of course, by the poets and dramatists, annalists and astronomers, of the Near and Far East. It would require repeating close to two hundred pages of *Worlds in Collision*, actually the entire part II (Mars) of that book, should we desire here to evidence and illuminate this in some detail.

Perturbations in the celestial sphere, or Theomachy, in which Mars endangered the Earth at nearly regular intervals during this century, preoccupied the minds of men and repeatedly intervened in human history. Pestilence also broke out, and many references in the cuneiform literature ascribe its cause to Nergal (Mars). Earthquakes, overflowing, change of climate, evidenced by Klimasturz, did not spare a single land. These changes moved entire nations to migrations. Calendars were repeatedly thrown out of order and reformed—and the reader will find abundant material in the second part of *Worlds in Collision* and also in *Earth in Upheaval*, where no human testimony, but only the testimony of nature was presented; and this material could be multiplied by any dedicated researcher.

It appears, however, that in the Iliad Homer telescoped into a few weeks events that took place in the space of several decades. At least some of the events may be placed in a chronological order with the help of ancient Israelite sources: namely, on the day

when King Ahaz was interred the motion of the Earth was disturbed so that the Sun set before its appointed time;²

at the time of the destruction of Sennacherib's army in the days of Hezekiah, son of Ahaz, another disturbance occurred with the contrary effect: the Sun appeared to return several degrees to the east before proceeding on its regular westward path. It is asserted in the rabbinical literature that the second disturbance rectified the effects of the first—and this is also the meaning of the sentence in Isaiah 38:8: “So the sun returned ten degrees by which degrees it was gone down.”³

In Greek legendary tradition the first event took place in the days of the two brothers, Atreus and Thyestes, contesting the throne of Mycenae—when, according to Seneca, the Sun set earlier than usual.⁴

Yet a certain compression or amalgamating of two events, separated in time, must have taken place, for another version of the story tells of a reversal of the sun's motion. This version is recorded by Apollodorus and several other authors.⁵

The event described as the reversal of motion of the sun took place, as illuminated *Worlds in Collision*, on March 23rd, -687.⁶

The fixing of the event to the early spring of -687 is made on the strength of the information from Hebrew sources that the event took place on the night of Passover, during the second campaign of Sennacherib against Judah, the ninth campaign of his reign. The exact date for the last of this series of catastrophes⁷ is provided by the records of the astronomical observations of the Chinese, where we learn that in the year -687, on the 23rd of March, “during the night the fixed stars did not appear, though the sky was clear. In the middle of the night stars fell like rain.”⁸

This date is also confirmed by Roman sources—Romulus found his end during a celestial-terrestrial catastrophe connected with the planet Mars:

Both the poles shook, and Atlas lifted the burden of the sky . . . The sun vanished and rising clouds obscured the heaven . . . the sky was riven by shooting flames. The people fled and the king [Romulus] upon his father's [Mars'] steeds soared to the stars.⁹

Romulus was a contemporary of Hezekiah;¹⁰ and the 23rd of March was the most important day in the Roman cult of Mars.¹¹

We must not forget that the Romans and the Greeks worshipped their gods *in* the planets, not as gods *of* the planets. Invocations to the gods, such as the Homeric

Hymn to Ares (Mars) are addressed directly to the planet as an astral power.¹²

The siege of Troy under Agamemnon followed by less than one generation the natural disturbances of the days of his father Atreus, when this king of Mycenae competed with his brother Thyestes for the crown of the realm and the Sun was disrupted in its motion.

Atreus and Thyestes, being contemporaries of Ahaz and Hezekiah, and Agamemnon, son of Atreus, a contemporary of the latter king of Jerusalem, it seems that the time in which the drama of the Iliad was set was the second half of the eighth century, and not later than -687;¹³ yet the poet condensed the events separated by decades into the tenth year of the Trojan siege, the time of the Iliad's action.¹⁴

Thus we come to realize that it was a rather late time; clearly Homer could not have lived before the events he described; and therefore Homer's time cannot be any earlier than the end of the eighth century. But more probably he wrote several decades after the Trojan War, when the events of the war had become enveloped in a veil due to a certain remoteness in time, and obtained a halo of heroic, god-like exploits. The Odyssey, describing the wanderings of Odysseus after the Trojan War, requires, too, a distancing between the poet and the Trojan War, on the assumption that both Homeric poems were the product of one author. If not of one, then we must assume that two poets of unique genius lived close in time to one another.

Placed in its true time, the Trojan War may obtain some historical plausibility; and, as we have seen, its mythological parts also serve, instead of obfuscation, to the elucidation of some complex chronological problems. With *theomachy* displayed on the celestial screen, the story in the Iliad gains, rather than loses, its historical validity.

Changes in Land and Sea

The celestial phenomena that pervade the narrative of the Iliad and even dominate it in books five, twenty and twenty-one, were accompanied also by terrestrial changes—Earth, called Hera, participated in the strife among the gods. In the Iliad these terrestrial disturbances are narrated too: earthquakes shook the Trojan plain amid the battle of the celestial gods.

Then terribly thundered the father of the gods and men from on high; and beneath did Poseidon cause the vast earth to quake and the steep crests of the mountains. All the roots of many-fountained Ida were shaken and all her peaks, and the city of the Trojans, and the ships of the Achaeans. And seized with fear in the world below was Aidoneus, lord of the shades . . . Lest above him the earth be cloven by Poseidon, the Shaker of the Earth, and his abode be made plain to view for mortals and immortals . . . So great was the din that arose when the gods clashed in strife.¹

Strabo of the first century before the present era and Pliny of the first century of this era were well aware of the physical changes that the area of western Asia Minor and of the Aegean islands did undergo. Some of these changes are ascribed to the time of the Trojan War or the time closely preceding or following it; but others may refer to earlier upheavals.²

Strabo cited Democles “who recalls certain great earthquakes some of which long ago took place about Lydia and Ionia as far north as the Troad, and by their action not only were villages swallowed up, but Mount Sipylus was shattered—in the reign of Tantalus. And lakes arose from swamps, and a tidal wave submerged the Troad.”³

Pliny described the changes in land and sea distribution. “Land is sometimes formed . . . rising suddenly out of the sea. Delos and Rhodes, islands which have now been long famous, are recorded to have risen up in this way. More lately there have been some smaller islands formed,” and he names them: Anapha, Nea, Halone, Thera, Therasia,⁴ Hieria, and Thia, the last of which appeared in his own time.⁵

Pindar said that “the isle of Rhodes was not yet to be seen in the open main, but was hidden in the briny depths of the sea” ; then it was born in the darkness—the sun was absent. When the sun finally lighted the earth again, a plot of land was seen “rising from the bottom of the foaming main.”⁶

Under the heading *Lands Which Have Been Separated by the Sea* Pliny mentions:

“The sea has torn Sicily from Italy,⁷ Cyprus from Syria, Euboea from Boeotia,” and other similar instances.

Under the heading *Islands Which Have Been United to the Main Land* Pliny mentions Antissa which was added to Lesbos, Zephyrium to Halicarnassus, and the like in other places.

Lands Which Have Been Totally Changed Into Seas: the sea has totally carried off certain lands, and first of all, if we are to believe Plato, for an immense space where the Atlantic Ocean is now extended. More lately we see what has been produced by our inland sea; Acarnania has been overwhelmed by the Ambracian Gulf, Achaia by the Corinthian, Europe and Asia by the Propontis and Pontus. And besides these, the sea has rent asunder Leucas, Antirrhium, the Hellespont and the two Bospori.”⁸

Pliny tells about *Cities Which Have Been Absorbed by the Sea:* Pyrrha and Antissa, Elice and Bura [on the Gulf of Corinth]⁹ from the island of Cea the sea suddenly tore off 30,000 paces “with many persons on them.” In like manner it carried off Eleusina in Boeotia, and half of the city of Tyndaris in Sicily.

And not to speak of bays and gulfs, the earth feeds on itself: it has devoured the very high mountain of Cybotus with the town of the Curites; also Sipylus in Magnesia, and formerly in the same place, a very celebrated city, which was called Tantalus.¹⁰

These descriptions by Pliny have corroborating references in other classical authors.¹¹

Minor changes they were not: the Bosphorus tearing Asia apart from Europe, like the breaking of the Mediterranean into the Ocean at Gibraltar were major changes. Smaller changes where single cities were engulfed or isles born could have been the after-effects of the cataclysms, which for hundreds of years still agitated the distorted strata of the earth; even today they have not completely subsided. Some of these changes occurred earlier and some later, but for the most part they occurred in historical times; the memory of them survived, and the same testimony comes from all quarters of the globe.

In the effort to regard the fantastic events in the sky as pure invention or flights of poetic imagination, the terrestrial changes described by Homer were also kept out of the discussion. Actually, Carl Blegen rejected Wilhelm Doerpfeld’s identification of Troy VI with the Troy of the siege because he found that the walls and structures of Troy VI had been destroyed by an earthquake apparently oblivious of the fact that the

Iliad contains a description of an earthquake at the final stage of the siege.¹²

Thus Blegen became besieged by contradictions, derived from misinterpreting the Iliad and from following an erroneous chronology as well. To the confusion of the Furtwängler-Dörpfeld debate,¹³ a misreading of the Iliad brought more confusion, and made the tragedy complete.

A Gap Closed

A chronology with centuries that never occurred made necessary the introduction of “Dark Ages” between the years -1100 and -750 in many areas of the ancient world; these upper and lower figures are already pulled together on the chronological timetable, and still some 400 years are unaccounted for—thus it is spoken of the “mysterious spell of Dark Ages.”¹

But when the hinges of history are fastened at correct levels the ghost centuries vanish and the chasm is shown to be imaginary.

Yet it cannot be denied that there was some interruption between the Late Bronze and Early Iron Ages in Greece and elsewhere; no smooth and evolutionary transition took place from the Mycenaean to the Ionian Age. There were great migrations in the eighth century and in the first part of the seventh. What kind of interruption, then, occurred in the entire ancient East?

In his book *Discontinuity in Greek Civilization*, (1966) Rhys Carpenter stands before observations made by a number of investigators in the archaeology of Greece and the Helladic islands and, after reviewing the evidence on the mainland in its various regions and on the islands, one by one, he comes to the conclusion:

“Despite the fact that there is no indication that the late Myceneans were driven out by any human intervention, they abandoned the south Aegean islands even as they deserted the central Peloponnese. For some reason and for some cause over which they had no control they found life in Greece and in the southern Aegean so unendurable that they could not remain.”²

And Carpenter asks: “What caused them to evacuate their towns and villages?” From here on he gropes in the dark and asks, was it a pestilence or a famine, was it a change of climate? and he continues: “In the seventh book of his *History* Herodotus recounts that Crete was so beset by famine and pestilence after the Trojan War that it became virtually uninhabited until its resettlement by later inhabitants. Could Herodotus by any chance have had access to a true tradition?”³

There is a rather vague reference to the Dorian wandering: the Dorians migrated from Thrace and, moving presumably along the Adriatic coast, crossed into the Peloponnese and occupied Sparta, becoming the progenitors of this severe and puritan tribe. In the absence of any other known cause for the cessation of the Mycenaean world, the Dorian invasion was considered as the most probable. But the

Minoan civilization on Crete, which in the later stage showed much affinity with the Mycenaean, was also terminated; and the Dorian invasion was made to continue over the sea to Crete.

It was not the Dorians who dispossessed the original population of eastern and central Greece: “The Dorian Greeks,” writes Carpenter, “seem to have moved into a depopulated land.” (p. 16) “...The Dorians had nothing whatever to do with the collapse of Mycenaean civilization, since they did not enter the Peloponnese until long after the collapse had already taken place.”⁴ It was some natural event: “A ‘time of trouble’ was occasioned by climatic causes that brought persistent drought with its attendant famine to most mainland Greece; and it was this unbelievable condition of their native abode that forced the Mycenaeans to emigrate, ending their century-long prosperity.” But was there any specific cause for the climatic change?

Carpenter surveys the available evidence: G. Welter, in a monograph on the island of Aegina, maintains that it became uninhabited after the Mycenaean Age. V. R. d’A. Desborough holds that the island of Melos had been abandoned by its Mycenaean inhabitants. Discussing the island of Kos, Desborough “was puzzled at finding ‘no clue as to the cause of its final desertion’ in Late Mycenaean times.” There must have been some serious disaster, ‘he decides. . .’ It can hardly be supposed that there was a complete depopulation, and yet there is no clear evidence of continuity into the Protogeometric period.”⁵

Carpenter stresses here, too, “a definite instance of interruption of cultural continuity.”⁶

In his search for climatic changes and physical upheavals Carpenter comes to cite three cases, during the Libyan and Ethiopian dynasties in Egypt, when unseasonal and excessive flooding took place in Egypt: in the eighth century, under the Libyan king Osorkon II, the Nile rose, breaking all the dykes;⁷ in the days of Shabaka, the Delta was repeatedly flooded and earth was heaped against the towns to protect them;⁸ and in the sixth year of Taharka, “the land was like the sea.”⁹

But how could these instances in Egypt of the eighth and early seventh centuries help to understand what happened in Greece at the end of the Mycenaean Age if this end occurred shortly after -1200?

Carpenter goes on:

Even more spectacular, but somewhat insecure chronologically, is the inference from circumstantial evidence that the Hungarian plain, an immense tract of comparatively low-lying land in which a number of large rivers converge, must have become almost totally submerged early in the first millennium B.C. How else shall we explain the fact

that the rich and active phase of the Hungarian Bronze Age known to archaeologists as Bronze IV and dated by Alberg as lasting from about 1000 to about 850 B.C. (the drought period in Greece!) met, in Alberg's words, 'an unexpected and sudden end... after which the country is without any discoverable sign of occupation and seems deserted'?¹⁰

The words in Carpenter's preface to his 1966 book reveal that were he to follow Plato, quoted by him, he would have been led to the realizations familiar to readers of *Worlds in Collision* and *Earth in Upheaval*. I quote from Plato's *Timaeus* in Carpenter's translation. The speaker is an Egyptian priest and the listener is Solon, one of the Seven Wise Men of antiquity.

. . . All this, though told in mythic guise, is true, inasmuch as a deviation of the celestial bodies moving past the earth does, at long intervals, cause destruction of earthly things through burning heat. . .

So this is the reason why among us here oldest traditions still prevail and whenever anything great or glorious or otherwise noteworthy occurs, it is written down and preserved in our temples; whereas among you and other nations that chance to be but recently endowed with the art of writing and civilized needs, at stated turn of years there has recurred like a plague brought down upon you a celestial current, leaving only an unlettered and uncivilized remnant; wherefore you have to begin all over again, like children, without knowledge of what has taken place in older times either in our land or in yours. . . .¹¹

As set forth at great length in *Worlds in Collision*, part II, the world in the eighth and seventh centuries before the present era was going through a series of natural catastrophes, with frightening apparitions in the sky, disturbances in the position and direction of the terrestrial axis, drastic changes in climate, and subsequent mass movements of populations. The Cimmerians descended from Russia into Asia Minor and engulfed the Phrygian kingdom. Dorians presumably reached Crete, Latins were pushed from their homeland into Italy by newly arrived tribes—these were only a few of the migrating hordes that then moved in many directions all around the globe. The Minoan civilization of Crete did not succumb to the Dorians; it succumbed to the ravages of nature, and if the Dorians reached the devastated island, it was only because in desperation they looked for any room to move into, and there was nobody able or willing to defend the island from invaders.

Digging on Crete Arthur Evans arrived at the conclusion that each of the various stages of civilization on the island had come to its end in enormous natural paroxysms until the last of the stages found its end in the overturned palaces and

cities, not to be rebuilt again.¹²

The interruptions in the flow of Minoan civilization had baffled Evans until the day when he experienced an earthquake on Crete. Now he understood the nature of the agent of the destruction that he observed in the ruins of the palaces: the agent was not an enemy reaching the island; and from that moment Evans filled his volumes on Knossos (*The Palace of Minos*) with the evidence of seismic catastrophes that terminated the great ages of Minoan civilization.¹³

Spyridon Marinatos detected a devastation ascribed by him to an overwhelming wave coming from the north and sweeping over the mountainous island and carrying also ashes of volcanic eruptions.¹⁴ “A normal earthquake, however, is wholly insufficient to explain so great a disaster.”¹⁵

That climate changed, and repeatedly so, between the eighth and seventh centuries is well documented, and since the works of the Scandinavian scientists A. Blytt, R. Sernander¹⁶ and others, and also of H. Gams and R. Nordhagen¹⁷ of Germany, no effort needs to be spent to prove the point anew. The change was global, as the work of Helmut de Terra in Mexico¹⁸ and the inquiry of C. E. P. Brooks and F. E. Zeuner¹⁹ amply document. Of the changes in nature many eloquent descriptions were left by their contemporaries, by Assyrian annalists and Hebrew prophets, and also in many other documents of the literate peoples of the world.

Migrations were the consequences of destruction of domiciles, subsequent plagues, and of changes in climate that made agricultural experience dependent on former climates inapplicable. The climate in Europe that changed in the eighth century to dry and warm changed soon again to wet and cold.²⁰ This double change is documented equally well in the New World (Helmut de Terra).²¹

The upheavals of nature continued through the major part of the eighth century and climaxed in the last great cosmic disturbance which I was able to date on March 23rd, -687.²²

The Mycenaean age came to its end in the catastrophic events of the eighth and seventh centuries—thus there were no Dark Ages between the Mycenaean Age and the Greek or Ionian Age. Whether the catastrophic changes that accompanied and followed these upheavals were by themselves enough to cause the end of the Mycenaean Age, or whether the migrations and invasions contributed, the great Mycenaean age came to its close not before the eighth century was over. There were no dark ages in between.

Certain changes did take place between the end of the Mycenaean and the beginning of the Ionian ages—but they are better understood not by assuming four or five

hundred intervening dark years, but by the very fact of dislocations created by catastrophes. Cities with their palaces crumbled; surviving populations migrated and were partly replaced by new settlers—in the case of Greece by the Dorian invaders, the returning Heraclid Greeks who at an earlier date had migrated northward.

These upheavals of nature were responsible for the break in continuity that is found in Greece, in Asia Minor and in many other places. There was a disruption in occupation of lands and a discontinuity in civilizations. But there were no Dark Ages and the four centuries inserted between the Mycenaean and Greek periods are unreal. Thus we have the explanation of the fact that so much in common is found in the late Mycenaean and early Greek ages, and also an explanation of the fact that no literary relics and scarcely any archaeological ones are found from the four or five centuries of the presumed Dark Ages, and yet that, on the other hand, there *was* some break in continuity.

Competing for a Greater Antiquity

The date of Trojan War is traditionally placed in the beginning of the twelfth century before the present era: this tradition goes back to Eratosthenes, a Greek scholar in the employ of Ptolemy III Euergetes in the third pre-Christian century. He calculated that the last year of the ten-year-long siege of Troy fell in the year that in the modern calendar corresponds to -1183.¹

This date is still upheld today by many scholars—a very unusual case of adherence to a chronological computation made over twenty-two centuries ago, and dealing with an event presumably nine hundred years earlier.² In antiquity some other, differing calculations were made, too,³ but that of Eratosthenes survived until our time as the conventional date of Troy's fall. Only in recent years has a trend showed itself among the Homeric scholars to remove the date in question by a few decades into the past⁴—into the thirteenth century: with the chronological scheme arranged according to the timetable of Egyptian history, certain advantages were seen in moving the Trojan War to greater antiquity than the inroad of the Peoples of the Sea into Egypt, computed to have taken place in -1174.⁵ Eratosthenes, however, did not connect in any way the events that took place in the days of Ramses III with the Trojan expedition.

Was there any special intent in Eratosthenes' effort to place the Trojan War more than nine centuries before his own time? If his motive was to prove that the Greeks were an ancient nation, then his reasoning should be viewed as tendentious. This is, in fact, the case.

When the Greeks under the leadership of Alexander of Macedon subjugated Mesopotamia and Egypt, and soon thereafter established there Greek dynasties of Seleucus and Ptolemy, and introduced the Greek language and Hellenistic civilization, the erudites in what was once Babylonia and equally so in Egypt felt an urge to prove to their conquerors that they, the conquered, belonged to cultures more exalted, because more ancient. Berosus, a Chaldean priest who flourished in Babylon in the first part of the third century, wrote his famed *Babyloniaca*, or, us History of Babylonia and Chaldea, and in it he stretched the history of his land and nation to a gargantuan length. In order to do so he ascribed unnatural lengths of reign to earlier kings and also invented kings (his list largely disagrees with the cuneiform king-lists).⁶

Manetho—a Greek-writing Egyptian, and a contemporary of Berosus—composed

under Ptolemy II Philadelphus the story of his nation, and a few passages from it are preserved by Josephus; his genealogies of kings and dynasties are preserved in the writings of the Fathers of the Church, Pamphilius, Eusebius, and Julius Africanus.⁷

The regnal years ascribed to single Manethonian dynasties (30 in number until shortly before the arrival of Alexander in Egypt) are excessively long: kings are often invented—no monumental confirmation of the existence of many of them was ever found; complete dynasties were invented by him, too. Like Berosus, Manetho tried to impress the Greek masters with the fact that his nation was already ancient when the Greeks only began to emerge from their barbarous state.

Such an attitude toward the Greeks was already expressed almost three centuries earlier in the narrative of the priest of Sais to Solon as told in the *Timaeus* by Plato. Because of written records stored in their temples, the Egyptians were aware of the past of their land, “so this is why among us here oldest traditions still prevail, and whenever anything great or otherwise noteworthy occurs, it is written down and preserved in our temples, . . . [but] you and other nations that chance to be but recently endowed with the art of writing and civilized needs at stated turn of years there has recurred like a plague brought down upon you, a celestial current, leaving only an unlettered and uncivilized remnant, wherefore you have to begin all over again like children, without knowledge of what has taken place in older times in our land or in yours. . . .”⁸

The same pride in the antiquity of the nation is found also in the narrative of another priest of Sais, a hundred years later, who gave the following account to Herodotus: From their first king until Sethos, the king-priest who was about to meet Sennacherib in battle when the latter’s host was destroyed by a natural cause, 341 generations passed. Calculating three generations to a century, Herodotus found that it would comprise 11,340 years⁹—quite a long time if we should consider that from the foundation of Rome to the present day not even a quarter of such time has passed.

When the Egyptians came under foreign domination they experienced an even greater need to impress their masters with the excellence of their culture and its duration, in order not to be counted as barbarians; they wished to provoke and sustain a feeling of admiration on the part of the subjugators. Such claims could produce in the Greeks a feeling of their own inadequacy and inferiority—they had, since their first contacts with the Egyptians, developed for them a feeling of respect bordering on awe, whereas to the Persians, despite the magnificence of their court and bearing, the Greeks applied the name “barbarians.” With excessive claims as to national antiquity the orientals were combatting their own feelings of shortcomings as politically subordinate nations.¹⁰

Eratosthenes was a contemporary of Manetho and Berosus. Born in Cyrenaica, he was of Greek origin. In his calculations of the time of the Trojan War he was evidently guided by the same motive as Berosus and Manetho, namely, to show the

antiquity of his nation; the date of -1183 for the end of the Trojan War served that purpose.¹¹

The “Dark Age” inserted between the Mycenaean and Ionic ages originated in the old calculations performed by Eratosthenes as to the time of the Trojan War, and on the reliance of modern historians of Greece on Egyptian chronology and order of dynasties as offered by Manetho; both them lived in Egypt in the Ptolemaic age in the third century before the present era. It is not excluded that Eratosthenes based himself on Manetho.¹²

However, neither Eratosthenes, nor before him Homer, nor any other Greek historian or philosopher ever referred to such a Dark Age;¹³ it is a creation of modern historians. But they found support for its historical existence in the Egyptian chronology built on Manetho’s list of dynasties—the Mycenaean Age was dated by the archaeologically documented contacts of Mycenaean sites with Egypt. Thus Eratosthenes found support in Manetho and Manetho in Eratosthenes.¹⁴

14. [As early as the fifth century, writers like Hekataeus and Herodotus (II.145) put the Trojan War into the 14th-12th centuries—they, too, were misled by the Egyptians. See for example the above-mentioned story told to Herodotus by a priest of Sais.]

Summing Up

Having started on a journey that first took us to Mycenae, but then also to Tiryns, Olympia, Pylos and a number of other ancient sites on the mainland of Greece and the Peloponnesos, also on Crete, Cyprus, the Troad and the interior of Asia Minor, we found at all sites one and the same embarrassing problem: close to five hundred years between conflicting evidences or discordant views. The list of archaeological sites discussed could be enlarged to encompass almost every excavated place in the area, with hardly any of them standing a chance of escaping the very same perplexing state of affairs.¹

What I call here “the perplexing state of affairs” often took the form of a dispute—to which of the two ages, separated by nearly half a millennium, does a stratum, a building, or a tomb belong? The holders of conflicting views are usually at equal disadvantage in meeting archaeological facts that, with the conventional chronological scheme not questioned, point simultaneously to two widely separated ages. Was Tiryns’ palace rebuilt in the Mycenaean or in the Ionic Age—in other words, in the Bronze Age or in the Iron Age? And if the first alternative is selected, how could it be that for almost five hundred years the building lay abandoned, unoccupied by any of the twenty intermediate generations, since they left nothing of their own, no relic whatsoever? The alternative situation is equally beset with perplexing evidence.

Are the Mycenaean lions, carved in the peculiar position of standing erect on their hind legs facing a pillar that divides them, contemporary with similar Phrygian monumental sculptures, and if not, how does one explain the many centuries’ gap? How is it that the wall of the Phrygian Gate at Gordion is built like that of Troy VI, if some five hundred years separate them? In what way does one explain the affinity of Mycenaean art of the pre-twelfth century with the art of Scythia, the Danubian region, and Etruria of the eighth and seventh centuries? Was the great strife between Furtwaengler and Doerpfeld ever resolved? Because two timetables are applied simultaneously to the past of Greece, a clash of opinions is almost inevitable.

How is it that Greece and the entire Aegean area of the Mycenaean Age suddenly became depopulated, with scarcely any traces of human activity surviving? And if such was the case, how is it that so many details of Mycenaean life, habits and armaments were well known to Homer who knew equally well the life, habits, and armaments of the eighth and seventh century, though a Dark Age of several centuries’ duration intervened?

When the decipherment of the Mycenaean Linear B script, to the surprise of many

Hellenist scholars proved the language to be Greek, the so-called Homeric problem did not approach a solution but, contrariwise, grew more urgent, more enigmatic, more perplexing. The historians were startled because the Minoan-Mycenaean inscriptions are ascribed by them at the latest to the twelfth century, and the earliest Greek texts were of the eighth century. How could a people that was already literate forfeit its literacy so completely for over four hundred years?

The very fact that none of the Greek philosophers, historians, geographers, statesmen or poets ever referred to a Dark Age preceding the Ionic Age and separating it from the Mycenaean Age, should have been enough to cast doubt on the soundness of the overall construction.

Wherever we turn—poetry, arms, architecture, arts—the same Nemesis disturbs the excavator, the explorer and the critic, and from all sides the very same problem in various forms mockingly stares in the face of all of them, whatever their persuasion.

Where lies the root of all this confusion, a root hidden from sight and discussion? The Mycenaean Age in Greece and in the Aegean, as well as the Minoan Age on Crete, do not have an absolute chronology of their own, and this is not disputed. As I have already stressed on several occasions on preceding pages, the dating depends on contacts with other countries that have an absolute chronology of their own, and Egypt was selected for that purpose.²

When a cartouche of Queen Tiy was found at Mycenae, that stratum was dated accordingly to ca. -1400. When in the short-lived city of Akhet-Aton, built by Akhnaton and abandoned in the same generation, Mycenaean ware was found in profusion, the ware was regarded as contemporary with Akhnaton, and was dated to the fourteenth century. We have already dwelt on the subject, but it needs repetition in the light of what was brought to discussion all through the foregoing chapters and sections. In an extended examination of the Egyptian chronology its structure was put on a scale and found wanting. Now it is clear that if there is a miscalculation in Egyptian datings, the error must have spread through more than one land and vitiated more than one nations' chronology.

The problem is once more thrown to Egypt. In *Ages in Chaos* we have seen that, with the fall of the Middle Kingdom and the Exodus synchronized, events in the histories of the peoples of the ancient world coincide all along the centuries.

For a space of over one thousand years records of Egyptian history have been compared with the records of the Hebrews, Assyrians, Chaldeans, and finally with those of the Greeks, with a resulting correspondence which denotes synchronism.

In Volume I of *Ages in Chaos* it was shown in great detail why Akhnaton of the Eighteenth Dynasty must be placed in the latter part of the ninth century. If Akhnaton flourished in -840 and not in -1380, the ceramics from Mycenae found in the palace

of Akhnaton are younger by five or six hundred years than they are presumed to be, and the Late Mycenaean period would accordingly move forward by about half a thousand years on the scale of time. If the ages of Amenhotep III, of Tiy and of Akhnaton, need to be reduced by about five hundred years, classical studies could take a deep breath.

Actually, when in the eighties of the nineteenth century, the Hellenists were coerced, upon the evidence presented by Egyptologists, to introduce those five dark centuries, they did it only after a period of protest and resistance. But now that three generations of historians have lived with those dark centuries as a historical reality, it is even more difficult to part with them. Nevertheless, sooner or later, they will have to part with the phantom centuries, and have the history of Greece and the development of its writing as a normal process without a four-hundred-year gap.

The conclusion at which we have arrived is this: between the Mycenaean and the Ionian Ages there was no Dark Age, but one followed the other, with only a few decades intervening. The natural catastrophes of the eighth century and of the beginning of the seventh brought an end to the civilization that centered at Mycenae in Greece, to cities and citadels and kingdoms; even the profile of the Greek mainland changed and many islands submerged and others emerged. These changes moved entire nations to migrations in the hope that beyond the horizon fertile lands, not damaged by unchained forces of nature, awaited the conquerors. This explains the break in continuity—the change is not due to some intervening dark ages that left no vestige of themselves, but to the paroxysms of nature and the migrations.

Classical studies have been troubled by many unresolved situations, archaeological and cultural. The field has been plagued by the presence of the Dark Age—a presence only schematic, never in effect. It engendered and continues to engender an ever-growing scholarly literature. If it can be shown that the Egyptian timetable is off its hinges, the bondage of these studies and their dependence on Egypt may terminate.

The removal of the Dark Age from the historical sequence unshackles what was for centuries shackled and releases the scholarly endeavor from travelling on the same circular paths with no exit from the modern version of the Cretan Labyrinth. Moreover, it rehabilitates scholars accused of ignorance or negligence, their having been guilty only of not perceiving that the problems they dealt with were not problems at all, as soon as unreal centuries are stricken out.

INTRODUCTION

In the work of reconstruction of ancient history and replacement of the conventional scheme by a synchronized version, *The Assyrian Conquest* belongs, in chronological order, after *Ages in Chaos: From the Exodus to King Akhnaton*, and before *Ramses II and His Time* and *Peoples of the Sea*. By offering it to the readers I fill the gap left by publishing the Reconstruction not in the chronological order, and rely on the indulgence of the readers, many of whom urged me to come out with what reaches maturity or a stage satisfactory for presentation.

The period of the Theban Dynasty (labeled “Eighteenth”)—the subject of the first volume of *Ages in Chaos*—was followed by two and a half centuries during which the ancient East lived in the shadow of Assyrian domination. During this period the world experienced repeated outrages of nature, the theme of Part II (“Mars”) of *Worlds in Collision* and to a great extent also of *Earth in Upheaval*, dedicated to the evidence from the domain of the natural sciences.

The Assyrian military state thrust its sword into all four directions—to the north across the Caucasus into Scythia; to the east into Elam; to the west into Asia Minor, dislodging the Chaldeans and closing in on Phrygia and Lydia, but with the greatest tenacity to the south, into Syria, Phoenicia, Israel, Judah, Egypt, even the Sudan, in ancient times called Ethiopia, or Kush.

Although a military state, Assyria developed sculptural art of great power. The hunting scenes with portrayals of lions, wounded or dying, yet still attacking, are unequalled in power of expression in ancient or modern art. The Assyrians, troubled like the rest of the nations by the fear of a repetition of the close cosmic encounters in the disarranged planetary family, excelled in observing the events taking place in the sky. Repeated displacements of orbital planes and even small variations in planetary positions and motions, and abrupt changes in the position and direction of the earth’s axis, and the changes in the times of the equinoxes and solstices—all were registered on clay tablets, numbering in the tens of thousands. Despite this cultural progress at home, the Assyrians carried on wars of unusual brutality, and often wantonness.

In the double shadow of the brutality and wantonness spread by excesses of nature and the Assyrian weapons, the peoples on the land bridge between present Iraq—the home of Assyria and Babylonia—and Egypt, namely the Syrians, Phoenicians, Israelites and Judeans, acted each in line with their cultural instincts. The Syrians emulated the Assyrians, the Phoenicians heroically defended their maritime cities, but then retreated to build new colonies overseas; yet in parts of the Lebanon of today the

proclivity for trade still survives, attesting to the persistence of a national character. To the south, in Israel and Judah, the said double shadow gave birth to a unique brand of prophets, actually a blend of religious reformers and social revolutionaries, who vigorously opposed the priests, the sacrifices, and even the Temple worship as long as the poor were exploited by the rich, and widows, orphans, and the downtrodden were not protected. Further, they were statesmen, trying to select the proper political orientation for the state, going with their message or warning to the people in the market places and in hamlets, but also mounting the steps to the kings' palaces, and even abusing the kings, unafraid of the throne as they were unafraid of the altar. Finally they were poets, since equal poetic prose can be searched for in the old ages and the new, but will not be found. Miracles they did not perform, neither miraculous healings; their prophecies were limited to forebodings of political developments, and to their threatening with the arrival of more natural disasters to be brought about by renewed dislodgements in the spheres, but consistently ascribed to the Creator of man and watcher over his deeds and even over the thoughts of his soul, as if righteousness would keep nature in bonds.

The narrative of this volume comes to its close when the Assyrian conquest ended in a conquest of Assyria and extirpation of that state. There followed not quite a hundred years of Chaldean domination—the theme of *Ramses II and His Time*. After that Persia ruled the ancient world for over two hundred years (-546 to -332)—the theme of *Peoples of the Sea*.

The main and singular purpose of this composition, through all its volumes, was and is to replace what are ages in chaos by a revised, or synchronized, chronology and history. In this respect the present volume is pivotal.

The generations from the Exodus to King Jehoshaphat or, in Egyptian history, from the fall of the Middle Kingdom to King Akhnaton, were shown in the first volume of this reconstruction to be synchronical by mere juxtaposition of events and personalities: it is brought to light by moving in relation to one another the Egyptian and Israelite histories, a generation after generation, along the entire period, and always at the same interval of ca. 540 years, thus setting the two chronological columns at a synchronical level. At first we left the problem open, which of the two histories would require re-adjustment—is the Israelite history in need of finding lost centuries, or does the Egyptian history require excision of unreal ones? Jehoshat and his generals and Ahab and his adversaries in Damascus could not have exchanged letters with Amenhotep III and his heir on the throne, Akhnaton, across the centuries. Soon we realized that of the two time tables, the Egyptian and the Israelite, the former is out of step with historical reality by over five centuries.

The Assyrian Conquest is pivotal because the procedure no longer is a mere relative shifting of two chronologies. As I will show, the order of the dynasties, past the conclusion of the Eighteenth (Theban) Dynasty, needs to be altered.

The present volume dealing with the period characterized by Assyrian contest for the

domination of the lands of the ancient East completes the narrative part of the reconstruction of ancient history from the end of the Middle Kingdom to the spread of Hellenistic culture after the fall of the Persian Empire.

When the House of Akhnaton Died Out

Stormy and unsettled was the period of the eighth and seventh centuries before the present era. The world was uneasy and in a tumultuous state. Terrifying portents were seen in the sky and were accompanied by great perturbations of nature—among them earthquakes and changes of climate. The nations of the ancient East were in turmoil. Peoples of the steppes of the north crossed mountain barriers and transgressed the boundaries of states. Civilian unrest flared up in many places and armies marched along military roads, engaging one another in strife and wars.

A few decades before this uproar, in the second part of the ninth century, the glorious Theban (Eighteenth) Dynasty of Egypt came to an end and the house of Akhnaton degenerated and was extirpated.

For only a short time did Akhnaton's residence city, Akhet-Aton, enjoy the sounds of agitated life, with messengers and ambassadors coming and going. Soon the place was abandoned by men and desert sands swept over it and buried it, to make place at last for the few poor settlements of el-Amarna. With Akhet-Aton left to decay, Thebes, the old southern residence, once more was made the capital of the land. Two heirs of Akhnaton in quick succession occupied the throne, each reigning for a short while, before dying young. The younger was Tutankhamen, whose tomb was discovered in 1922. Never before had such riches in gold, jewels and furniture been found in the vault of a dead person. He was buried by the last king of the Eighteenth Dynasty, the old Ay, the granduncle of the last two reigning youths.

This much is known: the religious reform of Akhnaton was abolished, his line died out, and his palace and his city were abandoned; but history professes not to know the personal fate of Akhnaton and of the epigoni that followed on the throne of Egypt, nor what happened during the anarchy which followed or which may also have preceded the end of this glorious dynasty.

In *Oedipus and Akhnaton* I undertook the task of reviving the pageant of this era and of illuminating the personal fate of its heroes. I showed also how the tragic fate of the house of Akhnaton gave rise to a legendary cycle that reached to the shores of Greece, took hold of the imagination of generations of poets, and survived in its legendary form till our own days.⁽¹⁾

Paintings on a wooden chest found in the tomb of Tutankhamen show the young king in war against the Ethiopians and Syrians. It appears that in the fraternal war his elder

brother Smenkhkare, deprived of his throne, called to his assistance foreign troops; in this war both young princes died. Smenkhkare was buried clandestinely by his sister-spouse, who also placed a song of love, cut into gold foil, at the feet of the dead. His burial was violated by the emissaries of Ay, brother of Queen Tiy, mother of Akhnaton. Ay, assuming the royal power, officiated at the splendid funeral of his protege Tutankhamen. Having reached the throne in his old age, Ay did not occupy it for long. The exact order of events that ended with Ay's elaborate and beautiful sarcophagus being smashed to smithereens, we do not know; but the Eighteenth Dynasty was terminated by invasion. Ay was not followed on the throne by any kin of his—the House of Akhnaton was followed by foreign rule.

The Sequence of Dynasties

With the close of the Amarna period we have reached, according to our revised scheme, the latter part of the ninth century. The eighth century and the beginning of the seventh were the periods of Libyan and Ethiopian dynasties in Egypt. The conventional scheme assigns the Amarna period to the earlier part of the fourteenth century and has the Nineteenth Dynasty, that of Seti and Ramses II, and the Twentieth Dynasty, that of Ramses III, the last great emperor of Egypt, succeed before the Libyans and Ethiopians ruled Egypt.

The transition of power from the Eighteenth to the Nineteenth Dynasty is regarded as an obscure period of Egyptian history. The circumstances under which the Nineteenth Dynasty was established are said to be unknown. This Dynasty is one of the most famous successions of pharaohs—Ramses I, Seti I, Ramses II, and Merneptah. Still another name is preserved, that of Haremhab. He belonged neither to the Eighteenth nor to the Nineteenth Dynasty; he was not a descendant of Akhnaton, nor was he an ancestor of the Ramessides. He is supposed to have ruled Egypt during an interregnum. It is not apparent why he was “chosen to be king” and to administer Egypt. Nothing is known of his end. The idea so often expressed that Haremhab was a successor of Ay is baseless. We shall encounter Haremhab later in this volume—but he lived one hundred and fifty years after Ay.

On the pages to follow I shall endeavor to show that the Libyan and Ethiopian dynasties followed closely the Eighteenth Dynasty and preceded the Nineteenth and the Twentieth. This result of the present reconstruction is probably the most unexpected of all. Yet in *Peoples of the Sea* (1977) the time of Ramses III and with him the entire Twentieth Dynasty have already been shown to belong into the fourth century; and the volume *Ramses II and His Time* (1978) has carried the task of identifying the Nineteenth Dynasty as synonymous with the Twenty-sixth, that of Necho I, Psammetichus, Necho II, and Apries.

The so-called Nineteenth Dynasty will be found to have been displaced not only by the five hundred and forty years of error in the dating of the Eighteenth Dynasty, but also by an additional one hundred and seventy years—the duration of the Libyan and Ethiopian dominations over Egypt: and the total error will be found reaching the huge figure of seven hundred years.

Since the pharaohs of these dynasties waged wars and maintained peaceful relations with the kingdoms and peoples of the north, the transfer of these Egyptian dynasties to a time much more recent carries an enormous tide into the histories of the entire ancient East, including Asia Minor and Greece.

The evidence of the present volume will lead us to the conclusion that the Libyan Dynasty that superseded the Eighteenth started not about -945, but more than a century later: the Libyan Dynasty has been allotted a longer span of time than it actually occupied. In the chapter dealing with the sack of the Temple of Jerusalem, it was demonstrated that the biblical Shishak, its plunderer, was Thutmose III of the Eighteenth Dynasty, and the objects of his loot, depicted on the bas relief at Karnak, were identified as the vessels, utensils, and furniture of the Temple. His heir Amenhotep II was identified as the Biblical Zerah who invaded Palestine in the days of King Asa at the beginning of the ninth century. Thus they could not have been the Libyan kings Shoshenk and Osorkon. These Libyans reigned later, and the entire duration of that dynasty was shorter than is conventionally assumed.

But we shall also show that Osorkon could not have reigned in the beginning of the ninth century and that Shoshenk could not have been the biblical Shishak because he was the Biblical Pharaoh So referred to in the Scriptures during the closing days of Samaria, in the time of King Hezekiah.

The Libyan Dynasty endured for about one hundred and twenty years and the Ethiopian rule for close to fifty years, the latter being repeatedly interrupted by Assyrian conquests of Egypt. Thus in our view the only Dynasty correctly placed in the conventional scheme is the Ethiopian.

With one period, namely the Ethiopian, torn out of a dislocated order of events and kept in its proper place in time, it happened that causes became consequences and consequences changed to causes, and descendants became ancestors, turning progenitors into offspring.

Before we shall deal with the major problem of identifying the historical time of the origin of the Nineteenth Dynasty, we shall be concerned in a few of the following sections with a comparatively minor re-adjustment—returning Shoshenk and Osorkon of the Libyan Dynasty from the tenth and ninth centuries to their proper places in the eighth century.

The Libyans in Egypt

The period of Libyan domination in Egypt, the Twenty-second Dynasty, is said by Manetho to have lasted for a hundred and twenty years:⁽¹⁾ “But the accepted chronology,” wrote Sir Alan Gardiner, “finds itself compelled to legislate for fully two centuries. . .”⁽²⁾

What is the basis for beginning the time of the Libyan Dynasty of Egypt, that of Shoshenks and Osorkons, as early as -945 or even earlier and for stretching the period for over two hundred years? The end of the period is well established, because ca. -712 the Libyan rule was supplanted by the Ethiopian domination,⁽³⁾ and the latter stands firmly fixed in time in relation to Biblical and Assyrian sources.

The beginning of the Libyan Dynasty was dated to -945 because a synchronical link was claimed to exist between the Biblical references to Pharaoh Shishak who conquered Palestine in the fifth year after Solomon, and Shoshenk Hedjkheperre of the Libyan dynasty. The placing of Shoshenk Hedjkheperre in the second half of the tenth century did not follow from the Egyptian material, But from the supposed synchronism of Rehoboam, who followed Solomon on the throne in Jerusalem, and Shoshenk Hedjkheperre. In *Ages in Chaos* I have pointed out that this alleged synchronism is not supported by the available evidence, and I was able to show that the conqueror of Jerusalem and sacker of its temple was not a Libyan king but Thutmose III of the Eighteenth Dynasty. In the Chapter entitled “The Temple in Jerusalem” I compare Thutmose’s depiction of the booty taken by him with the Biblical description of the vessels and furnishings of Solomon’s Temple to arrive at a positive identification of the sacker of Jerusalem’s temple.⁽⁴⁾

Now to bring Shoshenk Hedjkheperre to the head of the Libyan Dynasty is unnecessary; actually he will be shown to belong to the end of the period of Libyan domination in Egypt, and to be the Pharaoh So of the Scriptures.⁽⁵⁾

During the greater part of the eighth century, when the Libyan Dynasty of Osorkons and Shoshenks ruled over Egypt, the kings of this country vied with the kings of Assyria for influence in Palestine and Phoenicia. Elibaal, king of the Phoenician port-city of Byblos, had an Egyptian artist carve a statue of Osorkon I and cut an inscription on its chest: “Statue of Elibaal, king of Gebal (Byblos) made . . .”⁽⁶⁾ Since the conventional chronology made Osorkon a contemporary of Asa, who ruled over Israel in the early ninth century before the present era, Elibaal needed also to be placed in the ninth century—nearly a hundred years too early, according to the

conclusions reached in this work. Abibaal, another king of Byblos, ordered a statue of Shoshenk Hedjkheperre to be carved and inscribed in his name;⁽⁷⁾ for this reason Abibaal was placed in the tenth century as a contemporary of that king. Placing Elibaal and Abibaal in the tenth and early ninth centuries respectively created problems for epigraphists concerned with the history of the Hebrew script. The inscriptions on the sculptures are in Hebrew characters, and were the subject of much discussion in connection with the development of the Hebrew alphabet. The epigraphists, who must take directives from the archaeologists, tried to reconcile the dates derived from these inscriptions with the characters on the stele of Mesha, the king of Moab, who in the middle of the ninth century revolted against Ahab, king of Israel, and with the ivories from Samaria belonging to the same period—and were rather puzzled. The inscriptions of Elibaal and Abibaal are written in a script that appears to bear the closest resemblance to the eighth-century ostraka from Samaria; yet the conventional historians have them *precede* the stele of Mesha. Evidently, the order of the Libyan kings on the throne of Egypt is not properly put together, and Elibaal and Abibaal belong to the eighth century, just as do Osorkon I and Shoshenk Hedjkheperre, their contemporaries in Egypt.

[For criticism of the monumental evidence traditionally used to assign long reigns to some Libyan kings, see Helen K. Jaquet-Gordon, “The Illusory Year 36 of Osorkon I,” *The Journal of Egyptian Archaeology* 53 (1967), pp. 63-68, and R. Caminos, “An Ancient Egyptian Donation Stela,” *Centaurus* 14 (1969), pp. 42-46. The first author showed that because of a faulty reading by Flinders Petrie of the year formula on a stela of Osorkon I, this king had been wrongly credited with a thirty-six year reign; in fact it is unlikely that he reigned beyond the fifteen years recorded by Manetho—the highest date mentioned on his documents is twelve years. In a note Jaquet-Gordon contended that the reign of Osorkon I’s successor on the throne, Takelot I, needs to be similarly reduced, for a stela “on the basis of which a 23-year reign has been meted out to him does not in fact belong to him at all.” She suggested that Takelot only reigned the seven years which are attested on his genuine monuments. The attribution of the stela was definitively clarified by Caminos in an article published two years later, removing an error which “has particularly affected king-lists and discussions of the Libyan period in Egypt.” As a result of the two adjustments the Libyan period becomes shorter by a total of thirty-five years. This did not, however,

produce a lowering of the absolute date for the beginning of the Dynasty, which is still held to be firmly tied to the supposed synchronism between Shoshenk Hedjkheperre and Rehoboam. But the shortening of the individual reigns within the Dynasty is putting the entire scheme under increased strain.]

Libyan and Ethiopian Art & Culture

EVIDENCE FROM LANGUAGE, ART, AND RELIGION

In conjunction with the attempt to bring the period of Libyan and Ethiopian domination in Egypt into correct alignment — within the framework of the history of that land and in proper synchronism with the histories of foreign countries — I shall select several examples from the fields of language, art, and religion to demonstrate that the revised chronology does not contradict the natural evolutionary process we would expect to find in these various fields. To the contrary, the evidence in all these fields will argue *for* the new version of history. Paradoxical finds will no longer be paradoxical and enigmatic solutions will be easily understood. We shall elucidate, on such examples, the close following of the Libyan and Ethiopian dynasties upon the Eighteenth and their precedence in relation to the Nineteenth Dynasty.

On the other hand, the comparison of language, art, and religion of the Eighteenth Dynasty with examples from the same three fields under the Nineteenth Dynasty exhibits a veritable gulf, or break in tradition. With the beginning of the Nineteenth Dynasty, “Egypt was a changed world” . The author of this evaluation, Sir Alan Gardiner, explained: “it is impossible not to notice the marked deterioration of the art, the literature, and indeed the general culture of the people. The language which they wrote approximates more closely to the vernacular and incorporates many foreign words; the copies of ancient texts are incredibly careless, as if the scribes utterly failed to understand their meaning.” [\(1\)](#)

Considering that, in the conventional chronology, between the end of the Eighteenth Dynasty (King Ay) and the beginning of the Nineteenth (counted from Ramses I) only some fifteen to twenty years are available (and Haremhab is supposed to fill them) — and even taking into account the revolutionary tendencies of Akhnaton — a break in all aspects of cultural development marking the transition between the two dynasties, the Eighteenth and the Nineteenth, is more than enigmatic.

THE LITERARY STYLE OF THE LIBYAN PERIOD

The oracular stele of Thutmose IV, father of Amenhotep III and grandfather of Akhnaton, is a famous relic. Thutmose, when still a prince in his teens, visited the oracle of the Great Sphinx at Gizeh. There he fell asleep and heard in his dream that he, not the eldest among his brothers and not in the line of succession, was destined to follow his father Amenhotep II on the throne. The oracle required Thutmose, upon

his ascent to the throne, to clear the Sphinx of the desert sand that had swept in around it; when pharaoh, Thutmose fulfilled his vow and also erected a stele with a description of both the oracular dream and his freeing of the Sphinx from the sand. This stele was found between the paws of the Sphinx when in modern times the sand, that had again buried the huge figure above its paws, was removed under the supervision of archaeologists.

A. Erman, an eminent Egyptologist, tried to prove that the stele is a product of a late dynasty, possibly the Libyan. He presented the evidence of literary style, epigraphy, and spelling, concluding that the stele must have originated between the tenth and sixth centuries, and not in the fifteenth which was the accepted time of Thutmose IV.

⁽²⁾ “Our Sphinx stele is thus to be regarded as a restored inscription, but obviously a careless and free restoration. The time at which it was completed cannot be estimated exactly; it is not in any case later than the Saitic period, but can be placed equally well in the 21st or 22nd [Libyan] dynasty.” ⁽³⁾

Erman’s position was disputed by another equally eminent Egyptologist, W. Spiegelberg, who presented the argument that the “late style and spelling” are actually not late and that, furthermore, the texts of the Saitic period are conspicuous for their classical style; additionally, no marked difference is evident between the texts of these two periods. “The good archaizing texts of the Saitic period are conspicuous in their use of correct ‘classic’ orthography.” ⁽⁴⁾

Spiegelberg concluded that, because of this similarity in the art of writing in these two periods, separated by half a millennium and more, Erman’s argument was unfounded and the stele must have been carved in the days of the pharaoh whose name it bears, Thutmose IV.

Is it not strange that the style and epigraphy of two periods, thought to be separated by such a large span of time, are so similar as to engage two specialists in such a dispute?

The Eighteenth Dynasty and the Libyan period in Egypt produced very similar literary works. In no language, ancient or new, would four to seven hundred years have passed without very considerable changes: one need think only of the metamorphosis of English between the time of Geoffrey Chaucer and that of Oscar Wilde. It was no different with the Egyptian language; and most likely, the two epochs under consideration show so little change simply because there was so little time difference. Thus the conflicting opinions are much less conflicting if only scores of years, not five centuries, separate the time of Thutmose IV from the beginning of Libyan rule.

THE ART OF THE EIGHTEENTH AND LIBYAN DYNASTIES

The Libyan Dynasty, following directly upon the Eighteenth, perpetuated not only its

literary style, but many of its artistic traditions as well. In some instances, the resemblance was so close that experts mistakenly attributed a work of art to the wrong Dynasty; and while the difference in time actually amounted to not more than a few decades, on the conventional time scale many centuries were involved — centuries which could not have passed without profound changes in the mode of execution of statues, bas-reliefs, and paintings.

Metal sculpture: One such instance is the Carnarvon statuette of Amun, a rare *chef-d'oeuvre* discovered by Howard Carter at Karnak in 1916. When first exhibited in 1922 it was described by Carter as a “Statuette of the God in the Likeness of Thotmosis III” . “This attribution has never been challenged by any of the scholars who have published illustrations of the specimen,” wrote Cyril Aldred in 1956, ⁽⁵⁾ “and the present writer must include himself among those who accepted without cavil a dating to the Tuthmosid period.” But a more detailed examination of the statuette convinced Aldred that “a date in the Eighteenth Dynasty is untenable” . The statue was not of the Eighteenth Dynasty. It was not even Ramesside. “There is, in fact, nothing in this statuette which does not belong to the style of the Third Intermediate Period [the Libyan and Ethiopian dynasties] and everything is in favour of such a date. . . . If a more precise dating within the Third Intermediate Period be insisted upon, then the writer is inclined to place this statuette of Amun early in the Twenty-second Dynasty, since it shows the stylistic features of such metal sculpture in fully developed form. . . .”⁽⁶⁾

Conventional chronology puts almost six hundred years between the the time of Thutmose III and the early Libyan (Twenty-second) Dynasty kings. Were the changes in the execution of the sculptures so minute in this span of time that they could not be detected by an art expert? Or was the elapsed time much shorter, a century perhaps, as the revised chronology implies?

In trying to explain how a blunder of this magnitude was possible, Aldred goes on to discuss the history of metal sculpture in Egypt. Metal sculpture, introduced under the Eighteenth Dynasty, experienced a setback under the Nineteenth Dynasty, but becomes plentiful again in the Libyan period. With the time of Libyan domination immediately following on the Eighteenth Dynasty, there was no interruption between the introduction of the technique under the Eighteenth Dynasty and its greatest florescence in Libyan times.

We can cite another instance of misattribution of a sculpture in metal. A bronze figurine of Anubis, dated to the Libyan period in 1963, was only three years later re-dated by half a millennium to the Eighteenth or early Nineteenth Dynasties.⁽⁷⁾

Sculpture in stone: Problems not unlike those involved in the dating of metal sculpture arose in the attribution of monumental sculpture in stone. In a private communication, the late Egyptologist Walter Federn brought to my attention the case of the sphinxes erected at Karnak in the temple of Mut. According to Federn:

"In the temple of Mut at Karnak stand more than a hundred statues of the lion-goddess Sekhmet. The majority date from [the time of] Amenhotep II, and can be so identified by their inscriptions. Many were dedicated also by Shoshenk I, and are without the inscriptions characteristic of the others; they are notable for their somewhat careless execution. . . . It is remarkable also that one statue, which is the largest of all, and which was formerly taken to be the oldest of them, originates rather from Shoshenk I." (8)

Was the completion of the Sekhmet sphinxes interrupted for more than six centuries? Why did Seti the Great or Ramses II not complete the work, if, as is generally thought, they followed the Eighteenth Dynasty? It was the Libyan kings who completed the decoration of the temple begun by Amenhotep II, only a few decades after his death; and they did so in a style hardly distinguishable from the original work.

Chalices: Chalices, or drinking vessels with relief decorations, are unique objects; they seem to have been made "by the same group of men over no long period of time" . (9) Some of them definitely belong to the Libyan period (Twenty-second Dynasty) because the names of Libyan kings, such as "Shoshenk" , are inscribed on them. These come from Memphis, at the apex of the Delta; but another group of somewhat finer workmanship originates in the town of Tuna in the vicinity of Hermopolis, almost directly across the river from Tell el-Amama. The style of the uninscribed chalices from Tuna recalled so strongly the el-Amarna style of art that several experts ascribed to them a late Eighteenth Dynasty date. The case was argued most forcefully by Ricketts in an article he published in 1918. (10)

In the decoration of one chalice Ricketts found "an almost Asiatic richness of design, a certain lack of severity" which tended to confirm his impression that it belonged "to an age of experiment, even of cross-influences, such as the later years of the Eighteenth Dynasty" . (11) Another cup which he examined made him even more secure in his attribution: it was "yet richer in aspect and, with its sparse figures, more certainly in the temper of the Eighteenth Dynasty" . (12) A "spirited fowling scene" on a third chalice, so familiar from Eighteenth Dynasty painted tombs, strengthened his case still more. (13)

The arguments presented in 1918 for a late Eighteenth Dynasty date for some of the chalices were at first accepted by most scholars; and when Sotheby, the renowned art dealer, listed them in his 1921 catalog, he also labeled them as such.

Soon, however, several art experts expressed their unhappiness at such an early attribution, chiefly because of the similar, though somewhat inferior, chalices from Memphis, which could be dated securely to Libyan times on the basis of inscriptional evidence. It was unthinkable that there could have been a gap of over four centuries

between the two groups. It was difficult to imagine that the art of manufacturing the objects died out under the Nineteenth, Twentieth, and Twenty-first Dynasties, only to be revived under the Twenty-second or Libyan Dynasty. Scholarly opinion swung toward a Libyan date for all the chalices. Ricketts' paper of 1918, so carefully argued on the basis of artistic analogies, was termed "misleading"⁽¹⁴⁾ - yet no real reasons were adduced to invalidate the Eighteenth Dynasty attribution of the objects discussed by him.

The solution to the dilemma becomes obvious when the Egyptian dynasties are placed in their correct sequence. The chalices were made as Ricketts deduced, during the Amarna period — the late Eighteenth Dynasty. They continued to be manufactured under the Libyan Dynasty that followed, even while exhibiting the same decline in artistic standards which characterized all Egyptian art in the wake of the civil war and foreign invasion that precipitated the end of the house of Akhnaton. And if they were made, as Tait argued, "by the same group of men over no long period of time", they appear to have been manufactured in the space of two or three consecutive generations.

SURVIVALS OF THE CULT OF ATON IN LIBYAN AND ETHIOPIAN TIMES

The Eighteenth Dynasty saw, toward its end, the worship of Aton. Akhnaton in his religious reform — or heresy as it is usually called — instituted Aton as the supreme god. His heirs, Smenkhkare and Tutankhamen, having worshipped Aton in their earlier years, reverted again to the worship of Amon, and the circumstances of these religious vacillations are described in my *Oedipus and Akhnaton*. These kings, however, reigned for a few years only and died in their youth; they served as prototypes for Polynices and Eteocles of the Theban cycle of tragedies.

Under the Libyan Dynasty not only the worship of Amon, but even the worship of Aton survived. Amon was a deity through long periods of Egyptian history, but the worship of Aton was very characteristic for the end of the Eighteenth Dynasty only.

A stele,⁽¹⁵⁾ now in the Cairo Museum, shows a priest in office under king Osorkon II, one of the later Libyan pharaohs. The priest is described in the text as "Prophet of Amonrasonter in Karnak who contemplates Aton of Thebes", a somewhat peculiar description which H. Kees remarked upon. He noted that it is "as if the priest had lived in Amarna times!"⁽¹⁶⁾

At the beginning of this century James H. Breasted drew attention to the fact that the Ethiopian temple-city Gem-Aten, known from the annals of the Nubian kings, carries the same name as Akhnaton's temple at Thebes, and that the two must be in some relation, despite the great difference in age. A relief in a Theban tomb shows Akhnaton with his family worshipping in the temple of Gem-Aten. "The name of the

Theban temple of Aton therefore furnished the name of the Nubian city, and there can be no doubt that Ikhenaton [Akhnaton] was its founder, and that he named it after the Theban temple of his god. . . . We have here the remarkable fact that this Nubian city of Ikhenaton survived and still bore the name he gave it nearly a thousand years after his death and the destruction of the new city of his god in Egypt (Amarna).” (17)

Recently, Alexander Badawy discussed the worship observed by Akhnaton at the Gem-Aten ("Meeting of the Aten") which stood at Amarna. It is thought that the king used to come to meet the Aton “daily in the eastern open courts of the Gem-Aten” . (18) “Music and singing, rattling of sistra, presentation of incense and flowers gave a festive note of jubilation to the daily liturgy of Aten. “(19)

The Gem-Aten (or Gempaton) of the annals of the Nubian kings was found by F. Addison at Kawa in 1929.

The further excavations of Griffith and Macadam at the site uncovered “two documents of Amenophis III which attested the foundation by this king of the historical Gempaton” . (20) Breasted’s conclusion that the later Ethiopian temple went back to the Amama period was now confirmed by archaeology. (21)

This only underlines the “remarkable fact” that the city carried, through the many centuries that supposedly elapsed between the Amama period and Ethiopian times, a name recalling a heretical cult and, moreover, remained unnoticed throughout this period in contemporary documents. After Akhnaton’s time the name Gem-Aten is first referred to in an inscription of Tirhaka in one of the side-chambers of the Gebel-Barkal temple (22) — yet “its earlier history is totally unknown” . (23) Between the Amama period and the time of Tirhaka, the accepted chronology inserts almost 700 years — but we know that in fact only little more than a century elapsed, the period of Libyan domination; and we have seen that the cult of Aton persisted through the Libyan period.

Possibly the cult of Aton was perpetuated for a time by priests who fled south when, about - 830, the tide turned back in favor of the religion of Amon and the Libyan kings from the Delta were pushing toward Thebes. In any case, the religion of Atenism did not survive into Ethiopian times. When Piay (Piankhy) invaded Egypt about - 725 he did so under the guidance of Amon — but even then, ironically, Amon’s chief sanctuary in Ethiopia retained the name it had received from Akhnaton a century earlier.

THE TOMB OF MENTUEMHAT

The Ethiopian period, following the Libyan, came between the Eighteenth and the Nineteenth Dynasties, and its art shows affinities with both. This can be seen for instance in the decoration of the tomb of Mentuemhat, governor of Thebes in the time

of Tirhaka and Assurbanipal.

In 1947 the Brooklyn Museum purchased “a fragment of limestone relief of exceptional quality” ⁽²⁴⁾ It was evaluated by John D. Cooney of the Egyptian Department as a product of the late Eighteenth Dynasty. The bas-relief contains scenes already known from paintings in the Eighteenth Dynasty tomb of Menna in the Theban necropolis (tomb no. 69) — a peasant girl sitting on a chair and taking a thorn out of the foot of another girl sitting opposite her; and a second scene of a woman with a child in a sling at her breast arranging fruits in a basket (Plate XIV). Both scenes, of exquisite bas-relief technique, have so many identical details with the paintings of the tomb of Menna that Professor Cooney was not acting inconsiderately when he assumed he purchased objects of art of the late Eighteenth Dynasty.

However, “only a few months later,” Professor Cooney narrates, “two other fragmentary reliefs were offered to the Museum” and were assessed by him as dating from the seventh century. ⁽²⁵⁾ They were also purchased at a price appropriate for art of the Saite period, or the seventh and early sixth centuries, which is by far below the value of comparable art pieces of the Eighteenth Dynasty. The two fragments contained a scene depicting musicians and scribes with certain details that “made a Saite date completely certain” ⁽²⁶⁾ (Plates XIII and XVI).

Of the first acquisition Cooney wrote: “I was so convinced of the early date of the relief with peasant scenes that I failed even to consider a relationship between it and the Saite pieces.” ⁽²⁷⁾ Yet when, at the suggestion of a colleague (W. Stevenson Smith), he compared all three reliefs he found that the limestone and the heights and divisions of the registers were the same in all of them; the conclusion became unavoidable that all three had been made in the seventh century, and actually were recognized as being derived from the same tomb (Theban tomb no. 34) — that of Mentuemhat, the governor of Thebes under Tirhaka the Ethiopian. ⁽²⁸⁾

Because of the artistic similarities between the scenes in the tombs of Menna and Mentuemhat, Professor Cooney had to assume that the Eighteenth Dynasty example was still accessible and artistically influential after more than seven hundred years had elapsed. “The lucky preservation of the Eighteenth Dynasty original,” wrote Cooney, “which served as model to the Saite sculptor provides an ideal chance to grasp the basic differences between the art of these periods separated by a span of almost eight centuries.” ⁽²⁹⁾ Actually, however, between the time of Menna and the time of Mentuemhat not 800, but ca. 200 years passed, only a fourth of the span noted by Cooney.

Upon having surveyed some of the problems in language (style and trends) and art (including religious art), in comparing the Eighteenth Dynasty with the Libyan and Ethiopian dynasties, the conclusion is irresistible that the logical development of Egyptian culture requires re-ordering the sequence of the dynasties as they are

presently known from Manethonian heritage to modern scholarship.

At the same time, the obvious rift between the language, art, and religion of the latter part of the Eighteenth Dynasty and the language, art, and religion evident at the inception of the Nineteenth Dynasty is extremely difficult to explain given the proximity of the two dynasties in the conventional scheme of Egyptian chronology.

Jeroboam II and Osorkon II

The conventional timetable has Ahab, the king of the Northern Kingdom of Israel, as a contemporary of one of the kings of the Libyan Dynasty, usually Osorkon II. And almost regularly reference is made to archaeological evidence called to substantiate this synchronism; it is worded thus: "Osorkon II. He was a contemporary of Ahab, for in his palace at Samaria an alabaster vase bearing the name of Osorkon II was found."

[\(1\)](#)

In the chapters VI to VIII of *Ages in Chaos*, dealing with the el-Amarna period, it is demonstrated that Ahab was a contemporary of the later kings of the Eighteenth Dynasty, Amenhotep III and IV (Akhnaton), and that over sixty-five letters on clay tablets addressed by him to these kings are still in existence, in originals, as written by the royal scribes, found in the ground of el-Amarna. Having been a contemporary of these pharaohs, the synchronization of Ahab with Osorkon II of the Libyan Dynasty cannot but be grounded in error. To expose the error of the quoted sentence, we have to check the records of the excavators.

During the years 1908-1910 the Harvard University archaeological expedition at Sebastieh, ancient Samaria, uncovered the foundation of a palace. It was tentatively identified as the palace built by Omri and enlarged by Ahab.

Like the unearthed portions of the city wall of Samaria, the palace was built on virgin rock. The biblical passage about Omri building his capital on an unoccupied hill was regarded as confirmed. The floor of the palace was covered with layers containing the remains of later structures; but no vestige of earlier structures was found under the floor, nor were any signs of settlement prior to the time of Omri, except for a neolithic encampment, unearthed on the site of Samaria.

On the floor of the palace numerous small Egyptian objects were found, among them scarabs (signets). The carvings on the scarabs are mostly decorative designs, but on one of them a cartouche, or royal name, was found engraved. The cartouche was that of Thutmose III. Since there was no plausible explanation for the presence of the cartouche of Thutmose III in the palace at Samaria, presumably built about six centuries after this pharaoh had died, the excavators suggested: "This may be a local imitation of an Egyptian scarab." [\(2\)](#) As we have seen in the first volume of *Ages in Chaos*, Thutmose III reigned only a few decades before Omri; the cartouche apparently is genuine.

A jar with the cartouches of Osorkon II was found near the palace of Samaria and it

was brought forth as an evidence for the contemporaneity of Osorkon II and Ahab. Scores of ostraca were also found in Samaria. Ostraca, or potsherds inscribed with ink, were less expensive than burnt clay tablets or papyri; they were used when it was not expected that the writing would be preserved in an archive. Wine and oil when delivered were accompanied by these shards.

The ostraca of Samaria are inscribed with the names of persons or towns that delivered oil or wine to the king's palace; they are dated "in the ninth year," "in the tenth year," "in the seventeenth year," of the king, but the name of the king is not mentioned.

In various books and articles it is asserted that the jar of Osorkon, contemporary of Ahab, was found in the *same* debris as the ostraca,⁽³⁾ and it has been concluded that the ostraca of Samaria refer to the ruling years of Ahab. But is it true that these inscribed shards were found in the same debris as the Osorkon jar? And then, is it true that the ostraca of Samaria date from the reign of Ahab?

The report of the excavation gives the location precisely:

The southern wall of the Osorkon House [so-called because of Osorkon's jar] was built in part over the foundations of the north wall of rooms 406, 407, and 408. The foundations of the assumed northern part of the Ostraca House must have been destroyed previous to the construction of the Osorkon House.⁽⁴⁾

It follows that Osorkon's jar came to its location later than the ostraca came to theirs. This nullifies the argument that the jar must be of the same age as the ostraca. Thus even had the ostraca been inscribed during Ahab's reign, Osorkon's jar found its place at a definitely later date. But of what age are the ostraca?

The archaeologists at first reasoned thus: Since Osorkon II is known to have been a contemporary of Omri and Ahab, and since Omri reigned but twelve years, and the ostraca mention the seventeenth year of the king, they must have been written in the days of Ahab. It follows that the ostraca of Samaria are about the same age as the Mesha stele of the middle of the ninth century.⁽⁵⁾

A comparison of the Hebrew signs of the Samaritan ostraca with the Hebrew characters of the Mesha stele shows a definite change in the writing of single letters. The same characteristics found in the Samaritan letters reappear in the Shiloah inscription of King Hezekiah, dating from close to -700. "How to explain that the characters of the ostraca, a quarter of a century older than the stele of Mesha, are more directly related to the later characters of the Shiloah inscription?"⁽⁶⁾ This compelled the researchers to advance the hypothesis that the Hebrew letters passed through a retrograde stage of development before resuming their progress, or that in

Moab the development was slower than in Samaria.

In subsequent excavations at Samaria ivories with Hebrew letters were unearthed. These letters were found to be of the same type as those on the stele of Mesha and to have therefore originated in the ninth century. They are of a more archaic type than the characters of the ostraca of Samaria.⁽⁷⁾

The conclusion has now for some time been generally accepted that the Samaritan ostraca were written not in Ahab's time, but in the time of one of the last kings of Samaria. Of the kings of Israel after Ahab, only Jeroboam II and Pekah reigned for more than seventeen years. The scholarly opinion arrived at an almost unanimous conclusion that the ostraca were written in the days of Jeroboam II (ca. -785 to -744).

⁽⁸⁾ This conclusion appears to be correct.

The house that sheltered the jar of Osorkon II in Samaria was built on the ruins of the house that sheltered the inscribed potsherds. Since the ostraca were written in the days of Jeroboam II, one of the last kings of Israel to reign in Samaria, every ground for making Pharaoh Osorkon II a contemporary of Ahab because of the findings in Samaria vanishes. Judged by these findings, Osorkon II was not only later than Ahab, but also later than Jeroboam II.

Revolutions in Egypt and Israel

The revolt of Jehu, whose horses tread the dead body of Jezebel, thrown out of a window of the palace in Jezreel (Gubla), was a signal for a change not just in religious allegiance, but equally so in political orientation. The palace revolution in Egypt and the lowering of Egypt's standing in international politics prompted Jehu's pro-Assyrian revolt, which met no true opposition in Israel nor in Judea: at Jezreel he killed the kings of both kingdoms, related by marriage.

At home Jehu started as a cruel tyrant by eliminating all the progeny of Ahab in Jezreel and in Samaria—baskets full of heads of the royal sons were carried to him from Samaria; next he ordered the priests of Baal and his worshippers killed. But against Hazael, king of Damascus, Jehu proved himself a poor opponent.

While the house of Judah and the house of Israel went through a series of revolutions and fraternal wars, the Assyrians, who already in the days of Shalmaneser III towered over other nations of Western Asia, did not cease their penetration into the region of Syria and Palestine, the bridge to Egypt and Ethiopia. The Assyrian expansion which had started under Ashurnasirpal (ca -883 to -859), the father of Shalmaneser III, took a more aggressive form under Shalmaneser, whose inroads into Syria, Phoenicia, Israel, and Judah can be read in the el-Amarna tablets as those of Burraburiash, King of Hatti. At Qarqar he fought a coalition in which also Ahab of Samaria participated, backed by a brigade of Egyptian (Musri) troops.

But besides this direct contact with Egyptian troops, Shalmaneser did not dispatch any military forces past the line Tyre-Qarqar-Damascus, instead employing local princelings in an effort to disrupt the Egyptian colonial domain. The rebellion of Mesha, a vassal king of Moab, against Ahab, the king of Samaria, and the intrusion of desert tribes from across the Jordan toward Jerusalem in the days of Jehoshaphat resulted from this disruptive policy, with the king of Damascus changing more than once his political orientation.

Shalmaneser fought also on several other fronts—he claims to have defeated, among others, Sopalulme of Hattina. We may identify this Sopalulme with Suppiluliumas, King of Hatti, author of one, possibly two, el-Amarna letters—a collection of hundreds of diplomatic missives exchanged between the pharaohs Amenhotep III, and Akhnaton after him, and the independent kings of Asia Minor and Mesopotamia, and also the vassal kings of Syria, Phoenicia, Israel, and Judah. As was shown in the chapters dealing with the letters of el-Amarna, Shalmaneser of the Assyrian texts is Burraburiash of that correspondence. Burraburiash wrote insulting letters to Akhnaton and demanded gifts in objects of gold, ivory, and other objects of art in

quantities amounting to a tribute.⁽¹⁾

On an obelisk Shalmaneser let himself be portrayed in low relief with his entourage, while a kneeling person kisses the ground near his feet. The text names the person Jehu, king of Judah. It is often assumed that the figure represents a messenger of Jehu.

In those days the Lord began to cut Israel short:
and Hazael smote them in all the coasts of Israel.
From the Jordan eastward, all the land of Gilead,
from Aroer, which is by the river Arnon,
even Gilead and Bashan.

At the same time we read in Shalmaneser's detailed annals that he carried on war against Damascus, and though the Assyrian king claimed victory, from the very fact that Shalmaneser's ally Jehu was such a loser, one would conclude that Hazael was much on the offensive.

Under Jehu and his son Jehoaz, Israel was so oppressed by Hazael that Jehoaz' army was reduced to ten chariots, fifty horsemen, and ten thousand footmen. Hope of relief came only in the days of Joash, son of Jehu. The Second Book of Kings gives this vivid picture:

Now Elisha was fallen sick of the sickness whereof he died. And Joash the king of Israel came down unto him and wept over his face. . . . And Elisha said unto him, "Take bow and arrows." And he said to the king of Israel, "Put thine hand upon the bow." And he put his hand upon it: and Elisha put his hands upon the king's hands. And he said, "Open the window eastward." And he opened it. Then Elisha said, "Shoot." And he shot. And he said, "The arrow of the Lord's deliverance, and the arrow of deliverance from Syria."

"And Jehoash slept with his fathers, and was buried in Samaria with the kings of Israel; and Jeroboam his son reigned in his stead." The sepulcher of the kings of Israel has not been found, even though Samaria was excavated.

Joash's son, Jeroboam II, one of the later kings of Israel and the last of the house of Jehu, reigned forty-one years in Samaria in the palace built by Omri and Ahab. "He restored the coast of Israel from the entering of Hamath unto the sea of the plain." After many years of "affliction" that beset Israel (II Kings 14: 26), the enlargement of the state toward the north (Hamath is a hundred miles north of Damascus) and toward the south ("sea of the plain" is known today as the Dead Sea), constituted the high point in the history of Israel, only a few decades before the extinction of the state and the final eviction of its people from its land.

“ . . . And all that he [Jeroboam] did and his might how he warred, and how he recovered Damascus and Hamath . . . are they not written in the book of Chronicles of the kings of Israel?” (II Kings 14: 28).

The Book of Chronicles incorporated in the Old Testament is not the book referred to in this and several other passages of the Book of Kings. It obviously dealt with the records of the Kings of Israel, whereas the existing Book of Chronicles is a short survey, predominantly of the events in the Kingdom of Judah. Were it extant, such a record, especially of the reign of Jeroboam II, who ruled longer and more successfully than other kings of Israel in the last century of the kingdom, would now be of inestimable value also for the exact synchronization of the political history of Israel with that of neighboring countries, Egypt and others.

References

1. This tribute was also found near Kalah, the capital of Shalmaneser. Only a few miles from Kalah, in the early 1950's , a mound was opened, containing Fort Shalmaneser. It was excavated by Mallowan. In large storage rooms were found ivories with Egyptian motifs in great profusion; one of the rooms, ninety feet long, was found filled to the ceiling with objects of art, mainly ivory—the very objects described in an inventory sent by Akhnaton to Buraburiash.

The Last Kings of Israel

Amos, one of the earliest tribunes, called prophets in Judah and Israel, whose words are preserved in writing, lived and spoke, or “saw his words” (Amos 1:1) in the days of King Jeroboam II of Samaria and of King Uzziah of Jerusalem. A herdsman of Tekoah (south of Bethlehem) and gatherer of sycamore fruits, Amos felt the call two years before the *raash* in the days of Uzziah. His are only nine chapters, together not even as many pages. But the Decalogue is even shorter: verbosity is not a sign of inspiration. The Midrashim tell that Amos was a stammerer.⁽¹⁾ Amos’ career was also very short—he was put to death by King Uzziah. He was a firebrand from the hour he heard the call to carry his fivefold message to near and to far: a haranguer in the service of the downtrodden, a religious zealot of monotheism in a world of passionate pagan worship; a statesman or geopolitician with hardly more than a cluster of listeners; a prognosticator of a natural upheaval to come; a visionary of a compassionate reconciliation of Man with his Creator, and above all, of Israel with his Maker, after the dire things he foretold would come to pass.

The upheaval of nature, or “commotion” which shook the nations of the ancient East in the middle of the eighth century before the present era brought, amid the devastation and dislocations caused by nature, political revolutions that swept away long-established dynasties.

Following the earthquake of -747, king Uzziah ceded effective control of Judah to his son Jotham.

It was in the same year, even the very day of the catastrophe according to rabbinical sources,⁽²⁾ that marked the beginning of the prophetic career of Isaiah. In a flash of an intense experience Isaiah understood that the upheaval that the nation witnessed on that day was to be one of many, and that they would not cease “until the cities be wasted without inhabitant, and the houses without man, and the land be utterly desolate.” (6:11) He spoke to Judah, depicting the catastrophe that had taken place: “Your country is desolate, your cities are burned with fire” (1:7)—for the Lord “hath stretched forth his hand” against his people “and hath smitten them: and the hills did tremble, and their carcasses were torn in the midst of the streets.” And he warned of new disasters to come: “For all this his anger is not turned away but his hand is stretched out still.” (5:25)

In the northern kingdom the “commotion” brought an end to the house of Jeroboam II; it perished by the sword, as Amos had prophesied. (7:9) Jeroboam’s son Zachariah reigned only six months when “Shallum the son of Jabesh conspired against him before the people, and slew him, and reigned in his stead.” (II Kings 15:10) But

within a month the throne was wrested away from the usurper by Menahem, son of Gadi.

In Assyria a revolution also brought a usurper to power—Tiglath-Pileser III, a military man of unusual abilities, climbed the throne and brought about a resurgence of Assyrian power, following several decades of weakness.

Already in his second year the new king marched his armies to the west, and also came up against Israel, demanding of Menachem a heavy indemnity in return for not destroying the land. A thousand talents of silver was the price, and Menachem collected the metal from all the “men of wealth” in Israel. (II Kings 19: 20)⁽³⁾

For ten years Menahem reigned in Samaria. “And Menahem slept with his fathers; and Pekahiah his son reigned in his stead.” Pekahiah’s reign was short: two years later “Pekah, son of Remaliah, a captain of his, conspired against him and smote him in Samaria in the palace of the king’s house.” (II Kings 15:25) Pekah’s seizure of power meant a victory for those who wished to put an end to the heavy exactions of the Assyrian king and the position of vassalage that had become Israel’s lot under Menachem and his son.

While Tiglath-Pileser was absent on campaigns in the north and east,⁽⁴⁾ Pekah concluded an alliance with Rezin king of Damascus (Isaiah 7: 4) and set out against Judah. Ahaz, son of Jotham, was new on the throne in Jerusalem when the armies of Pekah and Rezin marched against his kingdom and laid siege to the city. At this crisis Isaiah, the prophet, called on the young king—Ahaz was but twenty years old when he began to reign—and met him on a road next to a field, away from the palace; and he comforted him, saying: “Take heed and be quiet; fear not, neither be fainthearted”—for the Lord would bring the Assyrians to destroy the power of Damascus and of Israel. (Isaiah 7:4)

Though Jerusalem was not taken, the Book of Chronicles reports that “a hundred and twenty thousand” of the men of Judah perished in the war; Ahaz’s son, Maaseiah, was among those killed. Pekah also “carried away captive of their own brethren two hundred thousand, women, sons and daughters” and brought them, together with much spoil, to Samaria. But a prophet named Oded protested that the children of Judah should stay as bondmen and bondwomen in Samaria and threatened the victors with the Lord’s fierce wrath. And certain princes of Israel “stood up against them that came from the war” and forced them to release the captives. They were clothed, fed, and returned, “the feeble of them upon asses . . . to Jericho, the city of palm trees.” (II Chronicles 18: 5-15)

Meanwhile Ahaz “sent messengers to Tiglath-Pileser king of Assyria, saying: “I am thy servant and thy son; come up and save me out of the hand of the king of Syria and out of the hand of the king of Israel, which rise up against me.”” He also sent to the king of Assyria gold and silver for presents. And Tiglath-Pileser “hearkened unto

him: for the king of Assyria went up against Damascus, and took it.” (II Kings 16: 7-9) In his own annals Tiglath-Pileser III records his war against Damascus, and how he killed Rezin and devastated the country. “The sixteen districts of Aram [Syria] I destroyed [and turned into] mounds [as if] left by a flood.” ⁽⁵⁾ Following Pekah’s defeat, “Hoshea, son of Elah, made a conspiracy against Pekah, the son of Remaliah, and smote him, and slew him, and reigned in his stead.” ⁽⁶⁾

3. Cf. the recently published stele of Tiglath-Pileser III in which “Menachem of Samaria” is listed among those who sent tribute to Assyria. See L. D. Levine, *Two Neo-Assyrian Stelae from Iran* (Royal Ontario Museum Art and Archaeology Occasional Paper, 23 [Toronto, 1972], pp. 11-24). The text of I Chronicles 15: 19 calls the invading king “Pul” ; this may have been Tiglath-Pileser’s name in Babylonia.
4. [After about -737].
5. Luckenbill, *Records of Assyria*, I. 815-819.
6. The Assyrian version is almost identical: according to an inscription of Tiglath-Pileser III, the people of Israel “overthrew their king Pekah and placed Hoshea as king over them.”

Pharaoh So

Hoshea began to reign in Samaria in the twelfth year of Ahaz, king of Judah. When Tiglath-Pileser died, Hoshea made some moves towards greater independence. “Against him came up Shalmaneser [V] king of Assyria” (II Kings 17:3); Hoshea submitted and became a tribute-paying vassal. But in his sixth year, weary of the heavy oppression, Hoshea sought protection of the king of Egypt.

And the king of Assyria found conspiracy in Hoshea: for he had sent messengers to So king of Egypt, and brought no present to the king of Assyria, as he had done year by year: therefore the king of Assyria shut him up, and bound him in prison.⁽¹⁾

Who was pharaoh So, to whom the king of Israel gave allegiance? He was not identified by the historians: many efforts were made and no acceptable assumption made.

Since most of the eighth century before the present era Egypt was dominated by the kings of the Libyan Dynasty, and the time when Hoshea dispatched messengers to So, king of Egypt, was about -726, the simple solution is to identify one of the Shoshenks as the biblical So, king of Egypt. And further, since on the walls of the Amon temple at Karnak a bas-relief with Israeli cities depicted as tributaries to Shoshenk Hedjkheperre of the Libyan Dynasty is a well-known and much discussed archaeological relic, the identification of the pharaoh So should be simple. Then why was not this identification made?

It was not made because Shoshenk of the Karnak relief was already identified in the conventionally written history with Shishak, the plunderer of Solomon’s temple and conqueror of Judah over two hundred years before the time of king Hoshea of Samaria.

The Karnak temple has on its walls also a relief of Thutmose III of the Eighteenth Dynasty with the captured cities of Palestine shown as men with shields covering the body, inscribed with the names of the cities. Shoshenk’s relief with its scores of similar men symbolizing cities imitates the relief of Thutmose. But whereas the names of cities claimed by Thutmose are all identifiable names, mainly in Judea, the cities listed by Shoshenk are only partly identified, and those are sites in Samaria and Galilee, not in Judea.⁽²⁾ With the reliefs of Thutmose (Shishak of the Book of Kings) we occupied ourselves in detail in the fourth chapter of *Ages in Chaos*.

Thutmose left also a description of his campaign accompanying the reliefs; besides, he pictured the booty he brought back from the campaign and presented to the temple of Amon. We have identified this booty, object upon object, with the description of the furnishings and the utensils of the temple of Solomon, and found the designs, the metals, whether gold or silver or brass, from which they were made, and the number of individual objects in the booty (such as the number of golden targets), all in agreement between the biblical and hieroglyphic accounts. Nevertheless it was thought that Thutmose III's booty was from a pre-Israelite Canaan.

On the other hand, Shoshenk left no record of any campaign in Palestine; next to his relief in Karnak there is only a brief mention of tribute from Syria (*Kharu*) received by Shoshenk. Therefore it was also repeatedly said that the relief does not convey anything beyond the fact that cities in the northern part of Palestine were claimed as paying tribute to Shoshenk and that on the basis of his relief we could not learn anything about a military conquest of Palestine.⁽³⁾ While the text seems to show that there was an "oral or written request" from Palestine for the pharaoh to intervene,⁽⁴⁾ there is nothing to suggest that Shoshenk ever acted on it—nevertheless, all historians agreed that Shoshenk's relief serves as a counterpart to the biblical record of the events in the fifth year after Solomon's death when the pharaoh Shishak invaded Judea, took Jerusalem and other fortified cities, and carried away the treasures of the Temple built by Solomon. An omission to refer to such facts on the part of Shoshenk did not provoke the question of the truth in the identification of Shoshenk and Shishak.

Since, in accordance with the conventional scheme, Shoshenk of the Karnak relief was made to Shishak (this in violation of the way Hebrew letters are transcribed in hieroglyphics) there was no way to identify pharaoh So as another Shoshenk of which there were more than one in the Libyan Dynasty: the name Shoshenk could not be transcribed as both, Shishak and So. Thus the identity of So became an unsolved, and in the frame of that scheme, an unsolvable problem. How annoying it became can be judged by the fact that when, some years ago, a scholar offered to dispose of So and to read the biblical text: "for he [Hoshea] sent messengers to Sais, to the king of Egypt," Sais being identified as the village Sa el-Hagar, and called his paper "The end of 'So, king of Egypt,'" ⁽⁵⁾ it was acclaimed with relief as one of the "most important clarifications of biblical history in recent years—precisely because 'So, king of Egypt' was so difficult to identify with any known historical figure."⁽⁶⁾ Yet were So a geographical name, the Hebrew phrase would be *le So, le melech Mitzraim*—"to So, to the king of Egypt." As the sentence stands, the second "*le*" being absent, So is clearly the name of an Egyptian king, and in the revised scheme there is no necessity to dispose of So, king of Egypt.

The seemingly complicated problem is very uncomplicated. In the Scriptures there is a record of tribute paid by Rehoboam, son of Solomon, to pharaoh Shishak as a result of his conquest of Judah; and there is a record of tribute paid two hundred years later by Hoshea of Israel to pharaoh So. In Egypt there are two reliefs depicting tribute

received from Palestine: by Thutmose III of the Eighteenth Dynasty from the cities of Judah, and by Shoshenk of the Libyan Dynasty from the cities of Israel. We have identified the first of the two pharaohs who received tribute (from Rehoboam) as Thutmose III⁽⁷⁾ and the second, who received tribute from Hoshea, as Shoshenk. Thus two biblical records and two Egyptian documents are in complete agreement. Conventional history, however, by making the Libyan Shoshenk the sacker of Solomon's Temple, has no counterpart to the records of Thutmose III concerning his campaign in Palestine or tribute paid to him; and it has no Egyptian counterpart to the biblical record of a tribute paid by Israel to pharaoh So.

The End of Samaria

When Samaria chose to give her allegiance to Egypt, Isaiah regarded it as a political mistake.

Woe to the rebellious children . . . that walk to go down into Egypt . . . to strengthen themselves in the strength of Pharaoh, and to trust in the shadow of Egypt. . . . For his princes were at Zoan [Tanis] and his ambassadors came to Hanes. (30: 1, 2, 4)

Because of the tribute Shoshenk received from Hoshea, king of Samaria, the Ten Tribes of Israel were doomed to lose their homeland. Shalmaneser V besieged Samaria, but Shoshenk did not send any military expedition to relieve the siege of Samaria by the Assyrians: there is no mention of it in the books of Kings or Chronicles, nor in the extant Egyptian documents.

Isaiah warned:

Therefore shall the strength of Pharaoh be your shame, and the trust in the shadow of Egypt your confusion.

For the Egyptians shall help in vain, and to no purpose . . . their strength is to sit still. (30: 3, 7)

It was more than confusion: it was an end of national existence for the northern kingdom, or of Israel, the Ten Tribes.

“Then the king of Assyria came up throughout all the land, and went up to Samaria, and besieged it three years.” (II Kings 17: 5)

For three long years Samaria withstood the siege; nothing is known of what took place among the besieged, besides that they defended their capital, the last unconquered city; no word of any prophet among the besieged survived, as did the words of Jeremiah from the besieged Jerusalem less than one hundred and forty years later. This is how Sargon II described the conquest of Samaria:

At the beginning of my royal rule, I _ _ _ the town of the Samaritans I besieged, conquered. _ _ _ for the god _ _ _ who let me achieve this my triumph _ _ _ I led away as prisoners 27,290 inhabitants of it and equipped from among them soldiers to man 50 chariots of my royal

In earlier Assyrian conquests by Tiglath-Pileser III and Shalmaneser V, the people of the land had already been carried into exile; those removed by Sargon were the last of Israel—if we do not count those few who, still in time, went over to Judah.⁽²⁾ Hoshea was among those deported.⁽³⁾

The account of the Second Book of Kings is: “In the ninth year of Hoshea the king of Assyria took Samaria and carried Israel away into Assyria, and placed them in Halah and in Habor by the river Gozan, and in the cities of the Medes.”⁽⁴⁾

Sargon, referring to another of his campaigns (against Babylon) wrote: “I bespatted his people with the venom of death.” Of his campaign against Elam he wrote: “Into all their cities I cast gloom and turned all their provinces into deserted mounds.” He did likewise to Israel and to Israel’s land.

The king of Assyria brought throngs of settlers from Babylon, Cuthah, Hamath, Ava, and Sepharvaim and placed them in the city of Samaria. “The town I rebuilt better than it was before and settled therein peoples from countries which I myself had conquered.”⁽⁵⁾

The reign of Sargon II (-723 to -702), the conqueror of Samaria and the Israelite tribes, fell in the midst of a period of great natural upheavals. These upheavals, which marked the century between -776 and -687, I showed in *Worlds in Collision*, part II (“Mars”) to have been caused by perturbations in the celestial sphere—a battleground dominated in the sight of man on Earth by the planet Mars. The Earth was endangered at nearly regular intervals during this century by repeated near-approaches of this planet. Pestilence also broke out in many places and references in the cuneiform literature ascribe the cause of it to Nergal (Mars); earthquakes, overflowing, changes of climate—attested by Klimasturz and the abandonment of lake-dwellings in Central Europe—did not spare a single land. Calendars were repeatedly thrown out of order and re-founded—and the reader will find abundant material in the second part of *Worlds in Collision* and in *Earth in Upheaval*, where no human testimony, but only the testimony of nature, was presented; and my material could be multiplied by any dedicated researcher. these changes moved entire nations to migrations in the hope that beyond the horizon fertile lands, not damaged by unchained forces of nature, awaited the conquerors.

It seems that in one of the earliest waves of the eighth-century migrations the Phrygians moved from Thrace over the Hellespont into Asia Minor. The tradition is that the first king in their new domicile was Gordias, and the story of his selecting the site for his capital Gordion is a well-known legend. Soon he came into conflict with the Assyrians who opposed the penetration of newcomers into central Asia Minor, and Sargon II moved westward to stop the penetration of the Phrygians, by now ruled

by Gordias' son Midas.

In the decades that followed the Scythians descended from the steppes of Russia and moved along the Caspican coast. The Scythians at that time worshipped Mars, and a sword as his sign, for a while leaving their ancient worship of Saturn in abeyance—they were called Umman-Manda, or People of Saturn, in the Akkadian and so-called “Hittite” literary texts. The Scythians in their migration displaced the nomadic Cimmerians, pushing them towards the south and west. The Assyrian defenses withstood the Cimmerian onslaught, but at a heavy cost, which included the death of Sargon in battle in -702.

The Conquest of Ashdod

With Samaria's fall, the last stronghold of opposition to Assyria was extirpated; not only did Egypt lose all of its remaining influence in Asia—its last Libyan rulers were themselves compelled to submit to Assyrian overlordship. By Sargon's seventh year "Pir'u the king of Musru" (Pharaoh, king of Egypt) is listed among those sending tribute to Assyria. Later in the same year a certain Yamani⁽¹⁾ seized power in Ashdod, an independent principality next to Judah on the coast; trying to organize an anti-Assyrian league and to enroll the help of Egypt, he, as Sargon recounts in his annals, "sent bribes to Pir'u king of Musru, a potentate incapable to save him—and asked him to be an ally." The rebellious prince tried also to involve Judah (Ia-u-di) in the conspiracy: but Hezekiah, probably at Isaiah's urging, refused to risk the nation's fate on so doubtful a venture. Informed of Yamani's revolt, Sargon gathered chosen troops and sent them against the rebel: "In a sudden rage I marched quickly . . . against Ashdod, his royal residence."⁽²⁾ Without Egyptian help, the outcome was not long in doubt—the Assyrian king looted the rebellious city, along with other towns on the Philistine coast. Yamani "fled into the territory of Musru [Egypt] which belongs (now) to Ethiopia."⁽³⁾

The rebel king of Ashdod, however, did not find a safe haven with the Ethiopian king: "The king of Ethiopia, who lives in a distant country, in an inapproachable region . . . whose fathers never—from remote days until now—had sent messengers to inquire after the health of my royal forefathers, he did hear, even that far away, of the might of Ashur, Nebo, and Marduk. The awe-inspiring glamor of my kingship blinded him and terror overcame him." The Ethiopian king, anxious to conciliate the powerful king of the north, extradited the rebel Yamani: "He threw him in fetters, shackles and iron bands, and they brought him to Assyria, a long journey." No mention is made of "Pir'u king of Musru" whose aid Yamani had sought only a few months earlier, and it must be assumed that he had been deposed by the king of Ethiopia.⁽⁴⁾

This episode marks the first appearance of the Ethiopians in the Assyrian annals.

The same events are described by Isaiah, a contemporary. The short twentieth chapter of Isaiah opens with the verse: "In the year that Tartan came to Ashdod, when Sargon the king of Assyria sent him, and fought against Ashdod, and took it." Isaiah continued and warned: "So shall the king of Assyria lead away the Egyptian prisoners and the Ethiopians captives, young and old, naked and barefoot, even with their buttocks uncovered, to the shame of Egypt. And they shall be afraid and ashamed of Ethiopia their expectation, and of Egypt their glory."

It is not spelled out whom the prophet had in mind by saying “they”: Israel had already been exiled in Sargon’s first year; Isaiah apparently had in mind a party in Judah which saw rays of hope in the recent replacement of the Libyan masters of Egypt by an Ethiopian overlordship.

Displaying a sense of statesmanship, Isaiah, in the manner of a dervish, walked unclothed and barefoot to emphasize the significance and possible consequences of an erroneous orientation.

The quoted first verse of the twentieth chapter of Isaiah contains the only mention of Sargon in the Scriptures. Tartan, sent by Sargon to fight against Ashdod, is not a private name; it is a high military and administrative title.⁽⁵⁾

We have already read of the circumstances of the fall of Ashdod in the cuneiform inscriptions of Sargon II.

Sennacherib: the Year - 701

The empire Sennacherib, son of Sargon, inherited was enormous: “The god Assur has intrusted in me an unrivalled kingship . . . from the upper sea of the setting sun to the lower sea of the rising sun, all mankind he has brought in submission at my feet—and mighty kings feared my warfare, leaving their abodes and fleeing. . . .” On climbing the throne, Sennacherib embarked on a series of campaigns aimed at expanding it further still. He wrote of his marching troops: “With the dust of their feet they covered the wide heavens like a mighty storm with masses of dense clouds,” and he boasted: “The tents of the steppe . . . I turned into a mass of flames . . . I swept like a hurricane. I besieged, I captured, I destroyed, I devastated, I burned with fire.”

After two campaigns against his enemies in the north, and still early in his reign, Sennacherib led his forces toward Syria and Palestine. The Assyrian army swept along the coast. It attacked Sidon and Luli, its king, fled into the sea and perished. Sennacherib appointed a new king and received tribute from him. Arvad and Ashdod, Ammon and Edom, brought him gifts and “kissed [his] feet.”

Sennacherib encircled Beth-Dagon, Jaffa, and Bne-Brak and conquered them. “The people of Ekron became afraid and called upon the Egyptian king, the bowmen, chariots and horses of the king of Melukha [Ethiopia], a boundless host, and these came to their aid.” The Assyrian army met them at Eltekeh, a small town on Palestine’s Mediterranean coast. “In the plain of Eltkekeh (*Al-ta-qu-u*), their battle lines were drawn up against me, and they sharpened their weapons.” Sennacherib “fought with them and brought about their defeat. The Egyptian charioteers and princes, together with the charioteers of the Ethiopian king my hands took alive in the midst of battle.” the Egyptian-Ethiopian army was defeated at the walls of Eltekeh; neighboring Ekron was stormed and its inhabitants killed, their corpses hung on poles around the town.

“As to Hezekiah, the Judean (*Ha-za-qi-(i)a-u Ia-u-da-ai*), he did not submit to my yoke.” Sennacherib besieged the “strong cities” of Judah and the “walled forts” and “countless small villages in their vicinity,” and took them by assault, sending the surviving population into exile: “200,150 people, young and old, male and female.” Then he turned against the capital: “I made (Hezekiah) a prisoner in Jerusalem, his royal residence, like a bird in a cage.” Nevertheless, Jerusalem held out and Sennacherib withdrew, though not before exacting a heavy ransom. “Hezekiah himself, whom the terror-inspiring filendor of my lordship had overwhelmed . . . did send me, later, to Nineveh, my lordly city, together with 30 talents of gold, 800 talents of silver, precious stones . . . couches (inlaid) with ivory . . . elephants hides . . . and all kinds of valuable treasures, his own daughters, concubines, male and

female musicians. In order to deliver the tribute and to do obeisance as a slave he sent his (personal) messenger.” Having agreed to the ransom, Jerusalem was not entered by the Assyrian army. The corresponding Biblical record in the Second Book of Kings (18:14) differs only in the quantity of silver in the ransom. It, too, mentions thirty talents of gold, but only three hundred talents of silver.

Besides this record on a clay prism, Assyrian bas-reliefs show the siege of Lachish in southern Palestine, on the way from Jerusalem to Egypt. From the Biblical narrative (II Kings 18:14) we know that Sennacherib was at Lachish, pressing the siege, when he received Hezekiah’s submission. Lachish must have fallen not long afterwards; the reliefs depict the fall of the city and a procession of its inhabitants being taken away to Assyria, some on donkeys, some on foot, carrying their meagre possessions.

Did Sennacherib press further south toward Egypt? In the extant inscriptions Sennacherib did not mention a specific campaign in Egypt and Ethiopia. Since early times the question has occupied the historians: Did Sennacherib subdue Egypt, or did he not?

Herodotos wrote that Sennacherib came against the land of Egypt “with a great host” and encamped at Pelusium near its northeastern frontier.⁽¹⁾ Berosus, who wrote a history of Chaldea, said that Sennacherib conducted an expedition against “all Asia and Egypt.”⁽²⁾ Jewish tradition tells of the conquest of Egypt by Sennacherib and of his march towards Ethiopia: “Sennacherib was forced to stop his campaign against Hezekiah for a short time, as he had to move hurriedly against Ethiopia. Having conquered this ‘pearl of all countries’ he returned to Judea.”⁽³⁾

It appears that after the battle of Eltekeh in southern Palestine, where he was victorious over the Ethiopian-Egyptian army, and having broken the resistance of Hezekiah and reduced the fortified city of Lachish on the approaches to Egypt, Sennacherib crossed the border of Egypt proper and at Pelusium received a declaration of submission.

Sethos

Herodotus in his history of Egypt placed Sennacherib's invasion in the reign of "the priest of Hephaestos, whose name was Sethos." At that time, he wrote, "king Sanacharib (came) against Egypt with a great host of Arabians and Assyrians."⁽¹⁾ It is generally assumed that Herodotus or his informants made a mistake: "In the popular tradition preserved by Herodotus the name of the Egyptian king is given as 'Sethos' . . . the true appellation of the monarch has disappeared in favor of the great Seti. . . . It is impossible to reject the whole story to the actual period of Seti in face of the direct mention of Sennacherib (Sanacharaibos)."⁽²⁾

In the conventional scheme of history Seti the Great lived in the latter part of the fourteenth century; the events with which we are now concerned took place in the final years of the eighth century. Sethos of Herodotus was now, however, Seti the Great, as was surmised by the historian quoted above: he was his grandfather. To keep the narrative free from misunderstandings, I shall call the first of that name the way Herodotus called him, "Sethos," retaining for the more famous grandson the name Seti.⁽³⁾ If we can prove our thesis then the confusion of history, for which Herodotus is not to be blamed, put the grandson six hundred years before his grandfather.

Sennacherib invaded Egypt twice. His first campaign resulted in a victory for the Assyrians and Egypt's submission; his second, fifteen years later, as it will be told, ended in disaster. Sennacherib's records speak only of his first campaign and are silent about the second; the Scriptures do not distinguish between the two campaigns; and in the Egyptian record, transmitted by Herodotus, only the second campaign was remembered.⁽⁴⁾ Each of our sources has preserved only a part of the story, and to obtain the complete picture we must draw on each of them in turn.

1. Herodotus, *The Histories*, transl. by A. D. Godley (London, 1938), II. 141.
2. H. R. Hall, *The Ancient History of the Near East*, p. 492. See also idem in *The Cambridge Ancient History* (1925), Vol. III, p. 279: "It is simpler to suppose that it is merely a traditional confusion of the old name Seti in a wrong setting."
3. The more complete name of the grandfather, Sethos, was Userkheprure-setpenre Seti-merenptah, and of his famous grandson *Seti-merenptah - menmaat* re, or Seti Ptah-maat. Merenptah means "beloved of Ptah." The

Greeks identified Ptah with Hephaestos. In describing Sethos as a priest of Hephaestos, Herodotos was evidently referring to Seti's second name. Cf. F. Ll. Griffith, *Stories of the High Priests of Memphis* (Oxford, 1900), p. 8, note 1.

4. Herodotus is likewise silent about the conquest of Egypt by Esarhaddon and Ashurbanipal; nor does Manetho record Egypt's humiliation by Assyria.

The Three Brothers

Egyptian traditions recorded by Manetho and preserved by Josephus contain some intriguing facts about Sethos and his contemporaries. The heroes of the story are Sethosis and his two brothers Ramesses and Harmais. Sethosis was the king of Egypt. His name is like that of king Sethos who, according to Herodotus, went to war against Sennacherib. The text, familiar to all who read Josephus, is as follows:

The last-named king [Sethosis], who possessed an army of cavalry and a strong fleet, made his brother Harmais viceroy of Egypt and conferred upon him all the royal prerogatives, except that he enjoined upon him not to wear the diadem [and] not to wrong the queen . . . He then departed on a campaign against Cyprus and Phoenicia, and later against the Assyrians and the Medes . . . meanwhile, sometime after his departure, Harmais, whom he had left in Egypt, unscrupulously defied all his brother's injunctions. He violated the queen . . . put on a diadem, and rose in revolt against his brother. . . . Sethosis instantly returned to Pelusium and recovered his kingdom.⁽¹⁾

This is the opening of the story as Josephus gleaned it from Manetho. Manetho, in his Sethosis, amalgamated the Sethos mentioned by Herodotus who went to war against the Assyrians under Sennacherib, and Seti the Great, who two generations later fought against the Scythians, Babylonians, and Medes as ally of Assyria, the subject of a later chapter of this volume. Harmais is Haremhab of the monuments; his being a brother of the king probably reflects the true situation. Like Sethos, he was educated to be a priest.

The work of Josephus Flavius which contains the above-quoted passage, *Contra Apionem* ("Against Apion"), a polemical work of the first-century Jewish historian, was copied repeatedly by hand; the earliest version that reached us dates from the eleventh century and is called the "Laurentinian" manuscript, so named for the monastery of St. Laurence where it was preserved; other extant versions are but copies of the Laurentinian manuscript. In that earliest extant manuscript of the work, where the story of the two brothers Sethos and Harmais starts, there is an interpolation in the form of a marginal note, worded as follows: "In another copy was found this reading: 'After him⁽²⁾ Sethosis and Ramesses, two brothers. The former [Sethosis] . . . slew Ramesses and appointed Harmais, another of his brothers, viceroy of Egypt.'"

In Egypt, since ancient times, the royal succession was supposed to follow the female line—an heir to the throne usually legitimized his claim by marrying a sister of his.

The exhortation by Sethosis when he left for the front, made to his brother Harmais, not to wrong the queen and not to wear the diadem, we understand now is but one exhortation. Taking over the supreme power in the country was conditional on “violating” the queen, or marrying her while she was still the wife of another.

Queen Tworse

There now comes upon the scene a remarkable woman by the name of Twosre.”⁽¹⁾ Jewelry found in a nameless *cache* in the Valley of the Kings shows her to have been Sethos’ principal wife; “a silver bracelet depicts her standing before her husband and pouring wine into his outstretched goblet.”

“Remarkable” Twosre is claimed to have been not because of what is known about her life and reign—and very little is known—but for circumstances that are baffling. Why did she have a separate tomb in the same valley as her husband? The honor of having her own tomb in the Valley was a distinction previously accorded “to only one other royalty of female sex, namely Hatshepsowe [Hatshepsut]”⁽²⁾ however, Hatshepsut was not a queen by virtue of having married a king, but in her own right, as a suzerain.

Besides the very fact of having her own tomb in the Valley, separate from that of her husband Sethos, the contents of the tomb are “even more intriguing.” Gardiner describes the perplexing circumstances: she bears the title of “King’s Great Wife” by virtue of her marriage to Sethos, but one scene⁽³⁾ shows her standing behind another king who is making an offering; the name of this king, Merneptah-Siptah, has been plastered over and that of Sethos cut into the same space. “Since there are excellent reasons for thinking that Sethos was the earlier of the two kings, this replacement [the substitution of Sethos’ name for Merneptah-Siptah’s] must have been due to Twosre’s later preference to be depicted with the king who had been her actual husband.”⁽⁴⁾ With this motive Gardiner sought to explain why the name of Sethos, Twosre’s presumably deceased husband, had been carved over the name of the other king, Merneptah-Siptah, who is depicted standing next to her.

Twosre and her consorts intrigued the historians since the early days of modern Egyptology. In her tomb in the Valley of the Kings, on various places on the walls, she is called *King’s Great Wife*—but immediately we will be confronted with the problem of who were here husband-kings and in what order. Further, she is called *Lady of the Two Lands* and *Mistress of Upper and Lower Egypt*, which is the same as being a pharaoh herself; and another title is attested: *Hereditary Princess*.

For the present effort to resolve the vagaries surrounding Twosre and her time the last of the mentioned titles is of import. Twosre had claims to a pedigree from a royal house—and in the frame of this reconstruction it must have been the house of the Thutmoses and Amenhoteps of the Theban (Eighteenth) Dynasty that came to its end over a hundred years earlier, with the advent of Libyan rule.

A genealogical evidence of Twosre's pedigree must have survived and must have been rather unique. In Egypt, traditionally, the throne was inherited through a royal princess and marriage of a royal son to such an heiress legalized the succession. Her consort, whoever he was, would be elevated to kingship.

The evidence from the tomb of Twosre and from the other scattered archaeological finds, instead of offering a clear answer, presents a confused and much debated state of affairs. What follows is an attempt at a reconstruction of the sequence of events.

As we see it, a clue to the strange facts of Twosre having a tomb separate from that of her husband, and of her being pictured there with another king whose name was subsequently replaced with that of her husband Sethos, can be sought in the legend about the three brothers. Ramses Siptah appears to correspond to Ramses of the legend, and to have died at the hands of Sethos.

When Sethos killed his brother Ramses Siptah, he did not replace him yet on the throne of Egypt; his action was in the nature of a guerrilla assassination, he being an insurgent leader opposing the Assyrian domination of his country.

At some period of her career Twosre claimed the title of Pharaoh, not just royal wife or queen. All points to the time immediately following the assassination of her husband, Ramses Siptah. At the death of her husband she was pregnant and Bey, the Assyrian plenipotentiary, set to pronounce her issue as the occupant of the throne upon birth, would not leave the pharaoh's seat vacant in the interim. This Bey, who was not of Egyptian origin, but possibly "a Syrian by birth" let a tomb be excavated for himself in the Valley of the Kings; even though this tomb is not spectacular, still it was most inappropriate for anybody not of the royal house to be entombed in the Valley of the Kings. "It is a strange and unprecedented thing that three contemporaries should have possessed tombs in the Valley of the Tombs of the Kings," the other two being Sethos and his wife Twosre.

This order of events explains the otherwise enigmatic state of things with Twosre called "Hereditary Princess," then "Royal Wife," with a different husband holding the scepter and donning the crown of upper and lower Egypt. Her claiming the Pharaoh's role and title is attested by the fact that she took a throne name⁽⁵⁾

and called herself "Lady of the Two Lands" and "Mistress of Upper and Lower Egypt" ;⁽⁶⁾ later even "King of Upper and Lower Egypt."⁽⁷⁾ She is associated with Bey, who refers to himself as "Great Chancellor of the Entire Land."⁽⁸⁾ As soon as Twosre bore a son, he was made the pharaoh; he received the name Merneptah Siptah. Bey, according to his own words, "establishes the king on the seat of his father."⁽⁹⁾ Whereas Ramses Siptah provened from a not princely family and gained his kingdom thanks to marrying Twosre, in the case of his infant son Merneptah Siptah, Bey could base his action on the fact that the deceased father had been a

pharaoh.

In 1962 a scholar discerned a certain figure of Merneptah-Siptah, showing him as a small boy sitting on the lap of his mother Twosre, who is referred to as a protectress of the boy-Pharaoh.⁽¹⁰⁾ Thus the throne was ceded to the infant, and he occupied it for several years, possibly six. Twosre's new title was "protectress of the pharaoh."

Ramses Siptah was buried in a tomb of his own in the Valley of the Kings, and in his funerary temple at Thebes Bey's name was found in the foundation deposits.⁽¹¹⁾ His tomb was discovered by Theodore Davis in 1~~~. He suffered in life from the effects of polio—one leg was found shorter than the other. At his death he was in his early twenties.⁽¹²⁾

In the same volume Davis published also find he made in an unnamed tomb—it was a *chache* with treasures of Queen Twosre. Among other bracelets and jewelry, a silver bracelet, mentioned earlier, is most significant—she is shown pouring wine into a goblet held by her husband Sethos. The engraved scene bears similarity to a scene adorning the throne of Tutankhamen—with him sitting, holding a goblet, and Ankhesenpaaten, his young wife, standing before him and pouring wine. This, and several other scenes and statements, make clear that Twosre at some time became the royal wife of Sethos. This way he, too, established in the eyes of the clerics and the people his right to mount the throne. Like his brother Tamses Siptah, he was of rather undistinguished origin.

By the size of the boy, Merneptah Siptah, compared with the lap of his mother and the part of the hand still surviving on the sculpture, it can be judged that Merneptah Siptah remained "in power" or in the position of a puppet of Sargon and Bey for a number of years. An inscription found in Nubia refers to his sixth year.⁽¹³⁾

Sargon's ruling years are given as -722 to -705 when he was killed battling against the Cimmerians on his northern frontier, and his son Sennacherib grasped the scepter. During these seventeen years Ramses Siptah counted a year or so on the throne, Twosre less than a year, Merneptah Siptah six years. From then on the count of Sethos' years starts. He survived Sargon. Since his occupation of Thebes, the Assyrian influence in Egypt was quickly abating. Of Bey nothing is heard again, nor of any other Assyrian functionary. With the advent of Sethos, no longer an insurgent, but an occupant of the throne, Twosre being now his wife, of the boy pharaoh nothing is heard. Was he banned, did he die a natural death, was he killed, or was he only deposed and exiled, or even imprisoned?—we do not know. But there are indications that the marriageable Twosre had some more romantic or tragic experiences in her matrimony. We shall retake the detection effort before long.

Haremhab Appointed to Administer Egypt

It is regularly admitted that it is not known how and when Haremhab became king of Egypt. Some think that he was the last king of the Eighteenth Dynasty; some place him at the beginning of the Nineteenth Dynasty.⁽¹⁾ He was not the son of a king, nor was he the father of Ramses I, who followed him.⁽²⁾ “Nothing is known of his antecedents.”⁽³⁾ He was appointed by a king to rule the country, and some time after a campaign of conquest or re-conquest against Ethiopia he was designated by the king to be crowned. Nowhere is found the name of the king who appointed him to this extraordinary office. Who could the appointing monarch have been? It was often surmised that he was Akhnaton. But Akhnaton had sons-in-law who followed him on the throne, Smenkhkare and Tutankhamen. Often this role is ascribed to Tutankhamen—but the youthful king was followed by an old general, Ay, the maternal grandfather of the two young princes. Was it Ay who appointed Haremhab to administer the land for him, and then, in his own lifetime, crowned him? But “of Haremhab’s relation to Ay we know absolutely nothing.”⁽⁴⁾ And if there is no historical link between Haremhab and Ay, the last known king of the Eighteenth Dynasty, does any compelling reason exist, or even any ground whatsoever, to place Haremhab immediately after Tutankhamen or after Ay, where we usually find him in books on history? A likely ground is not only non-existent, but everything confounds such placement of the “appointed pharaoh.”

Had Haremhab been a prominent official in the days of el-Amarna, he, like other generals and courtiers, would have had a sepulchral chamber built for him in the necropolis of Akhet-Aton (el-Amarna).⁽⁵⁾ But no tomb, nor any other monument of his, was found there. However, while yet a general, he built for himself a tomb near Memphis, a place rather neglected during the Eighteenth Dynasty; later he prepared another tomb for himself at Thebes.⁽⁶⁾

The finely sculptured Memphite tomb of the “Great Commander of the Army” Haremhab was discovered early in the nineteenth century. At that time it was dismantled and its blocks with inscriptions and bas-reliefs were scattered among many private and public collections. Through subsequent decades scholars spent efforts in trying to trace the parts and collate the pictures and texts. Some blocks described in older publications have since been lost—a block seen many years ago in a private collection in Alexandria is such a case. The museums of Leyden, Vienna, Bologna, and Berlin preserve disunited portions of the tomb. More sculptured blocks

have been retrieved in the newly-resumed excavations by the Egypt Exploration Society, beginning in 1975.⁽⁷⁾

Haremhab's own statement of his title at the time his sepulcher near Memphis was being prepared is:

Chosen of the king, Presider over the Two Lands [Egypt], in order to carry on the administration of the Two Lands, general of generals of the Lord of the Two Lands.⁽⁸⁾

Such titles no officer under the king had ever borne. Under what ruler he thus served is not certain, but whoever he was, such power in the hands of a subject must necessarily have endangered his throne.”⁽⁹⁾ On another fragment from his tomb he is called “The commander-in-chief of the army, Haremhab,” and on still another, “Deputy of the King, presiding over the Two Lands.”⁽¹⁰⁾ But in the pictures next to these inscriptions he wears the diadem with the uraeus, a cobra, the emblem of royal power in Egypt.

The scholars are thus compelled to the conclusion: “Incongruity in the tomb: Throughout its reliefs the figure of the general Haremhab wears the uraeus.”⁽¹¹⁾ It is unique in Egyptian representational art that a uraeus should crown the head of a person who does not occupy the throne. An explanation was offered that the uraeus must have been added to the diadem at some later time, after Haremhab was crowned.⁽¹²⁾

The bas-reliefs in the tomb in various scenes show Haremhab in a pose of submission before a king, but the figure of the king is regularly erased on the surviving fragments; the figure of the king was deliberately destroyed in ancient times. On one bas-relief Haremhab is shown with his right arm lifted in adoration of the king whose figure, probably much larger than that of Haremhab, is not preserved; in his left hand Haremhab holds a fan, and throughout the texts he carries the honorific title “the fan-bearer to the right of the king.”

On another block (Berlin fragment), Haremhab is shown in front of another group of Egyptian dignitaries; he and the rest of them display obeisance by bending their bodies before the king whose likeness is not preserved; Haremhab, though in front of those who pay homage, is not depicted larger than the others in the group: nor does he wear a diadem on this bas-relief.

Dignitaries of foreign lands, Syrians being prominent among them, are shown as paying homage and affirming their role of vassals to the king, whose likeness is destroyed.

The text, reconstructed by Gardiner, makes it appear that the foreign chiefs availed

themselves of Haremhab's good standing with the king to assure him of their loyalty.

Words spoken to His Majesty _ _ _ when _ _ _ came the great ones of all foreign lands to beg life from him, by the hereditary prince, sole friend and royal scribe Haremhab, justified. He said, making answer (to the king _ _ _ foreigners) who knew not Egypt, they are beneath thy feet forever and ever; Amun has handed them over to thee. . . . Thy battle cry is in their hearts.” [\(13\)](#)

Despite the lacunae it is clear that “the king is addressed with flattering words and is assured that his might extends over all lands.” [\(14\)](#)

In front of a huddled group of foreigners, none shackled, a personage proclaimed by a group to be an interpreter, speaks to them; Haremhab, also present and shown larger than the interpreter, attentively listens to him. A raised surface above the head of that man had been prepared for the words spoken by him, but was never filled. The foreigners, by their arms lifted in adoration, document the royal presence; the figure of the king, however, as in the rest of the bas-reliefs, is not preserved. Like Haremhab, “the great ones of all lands who came to beg life” listen to what the interpreter has to say. “The words *of all lands* are of importance,” observes Gardiner, and makes a point also of the fact that Haremhab is seen “in converse with the interpreter,” but he draws no further conclusion from these texts.

On many bas-reliefs of the Eighteenth Dynasty, like those of Hatshepsut, Thutmose III, Amenhotep III, or Akhnaton, foreigners are shown in the presence of the pharaoh either as prisoners or as vassals, but never is a person designated as interpreter depicted; nor do the bas-reliefs of the Nineteenth Dynasty, with foreigners depicted, show interpreters. Was the king whose likeness we miss not versed in Egyptian?

Another fragment from the Memphite tomb of General Haremhab (no. 1889 from Bologna) has a scene chiseled in low relief showing a horse rider between groups of what appear to be soldiers and laborers, possibly in an armed camp. A horserider is practically unknown from Egyptian art—the Egyptians used horses to draw chariots or wagons, but not to ride horseback. The rider in the scene sits on the horse with no saddle under him. “A person is shown mounted on a horse without a saddle—a representation most unique *rarissime*) in Egyptian art, and the person has not the appearance of an Egyptian, though he holds in his hand an emblem of a dignitary. . . .” [\(15\)](#) But this was the Assyrian way of riding horses—never with a saddle, for the most placing a rug or cloth on the horse's back to sit upon.

The way the horses are depicted on Assyrian bas-reliefs differs greatly from the ways they are presented in Egyptian, Mycenaean, or Scythian reliefs, and each of these differs also from all others. The design of the horse with its rider on the stone plate in the Bologna collection from the Memphite tomb of Haremhab is not Egyptian, but clearly Assyrian. the prancing horse under a rider with one of the front

legs raised from the ground, and also its mane arrangement, and the way the artist generally treats the horse, are eminently Assyrian. The Egyptian steed, never for horseback riding and regularly drawing a chariot whether in war or in hunt, has traditionally two forelegs raised, thus charging in gallop, differs in every detail from the horse under the rider on the Bologna fragment from Haremhab's bas-relief. The Assyrians are credited with the development of cavalry; in the words of a Hebrew prophet, "Assyrians . . . horsemen riding upon horses." [\(16\)](#)

The fact that throughout the texts the name of the king is not given is strange, and does not follow established practice, or, one may say, an otherwise unalterable rule: in Egyptian texts the native Pharaoh is always named by his royal names and cognomens, not just as "His Majesty." Together with the presence of a translator to interpret the words of the king to his vassals, the Egyptian commander-of-the-army among them, and likewise the employ of cavalry, must impress ever stronger that the king whose likeness is absent and whose name is not given was a foreign monarch, and more concretely, an Assyrian king.

In the same tomb the enigmatic king is called "The Great of Strength [who] will send his mighty arm in front of [his army _ _ _ and will] destroy them and plunder their towns and cast fire into _ _ _ and _ _ _ foreign countries will set others in their places." [\(17\)](#)

In Egyptian texts of conquest, the expression "plunder their towns" is not infrequently met with; but "cast fire into [their lands]" is not usual. In the records of Sennacherib and of his son Esarhaddon, as also in those of earlier and later Assyrian kings, the graphic descriptions of their "scorched earth" tactics make clear that casting fire was a never absent feature of their warfare. "I besieged, I captured, I destroyed, I devastated, I burned with fire," wrote Sennacherib in the record of his second campaign, and similarly of his fifth, sixth, and seventh campaigns. [\(18\)](#) He called himself "the flame that consumes the insubmissive." [\(19\)](#) This epithet of the great king—"the flame"—is also used by Haremhab: not in describing himself, but in addressing the king who appointed him: "Thy name is flame." [\(20\)](#) It was a fitting cognomen of Sennacherib, and Haremhab used it too in offering an epithet in lieu of a name to designate the Assyrian king.

The removal of entire populations from their lands was a practice peculiar to the Assyrians and their warfare (later also adopted by the Chaldeans); the Egyptians never transferred conquered peoples from one country to another. Yet the last line of the above quoted text from the tomb of Haremhab (" _ _ _ foreign countries will set others in their places") refers to such measures. Breasted's reading of the passage was: " _ _ _ Asiatics; others have been placed in their abodes." [\(21\)](#) Sargon, father of Sennacherib, removed the last of the Ten Tribes from Samaria and her cities and settled others in their place (II Kings 17:24), and according to his prism inscriptions Sennacherib removed large numbers of people of Judah, over two hundred thousand,

from their land to exile. ⁽²²⁾

On a stone from Haremhab's tomb, discovered serving as a doorpost in a building in Cairo, Haremhab is described as "a henchman at the feet of his lord on the battle field on this day of slaughtering the Asiatics." ⁽²³⁾ On another fragment (at Alexandria) he is said to have been "sent as the King's envoy to the sun-disc's rising, returning in triumph, his attack having succeeded." ⁽²⁴⁾ Many times in his tomb he is entitled "Great Commander of the Army," also one who was "chosen by the king to carry on the administration of the Two Lands [Egypt]."

All leads to the conclusion that Haremhab served under an Assyrian king as an appointed military administrator of Egypt.

Haremhab Crowned

After a period of time during which Haremhab officiated as the head of the army and administrator of the land, he was crowned. The coronation inscription is preserved on the back of a double statue—of himself sitting with his queen.⁽¹⁾ This statue, now in the Turin Museum, is of fine workmanship; the head of the king, however, is broken off. The queen's name survived: Mutnodjme; and her position next to Haremhab at his coronation and the titles she bore indicate that she played an important part in the ceremony. When we study the text of the inscription it will become evident that Haremhab was in fact crowned at the wedding ceremony at which he married Mutnodjme; he was thus obliged to her for his elevation to the throne.

It would be not usual, but not unthinkable, that a commoner or a military man, having climbed in his career, should become a pharaoh when the throne turned vacant; or that a usurper should put the crown on his head after murdering the rightful pharaoh. But the case of Haremhab mounting the throne followed neither of these models. He was crowned by the king who did not abdicate at the occasion, nor remained as a co-ruler. Further, as just said, he was crowned at a wedding ceremony.

The inscription on the statue gives the story of Haremhab's grown in the king's favor and an account of the coronation ceremonial. "Now he acted as vice-regent of the Two Lands [Upper and Lower Egypt] over a period of many years." With his councillors Haremhab was "doing obeisance at the gates of the King's House." It also happened that "He being summoned before the Sovereign when the Palace fell into rage, and he opened his mouth and answered the King and appeased him with the utterance of his mouth." Haremhab had to assuage the King in his rage. Was the raging king the teenager Tutakhamen?⁽²⁾

In order to shorten the process of unravelling before the reader the meaning of the coronation text, let us substitute the proper person for the anonymous king. Sennacherib was the sovereign. He had Haremhab, a scribe, priest, and military man—a not unusual combination of offices in ancient Egypt—as the commanding officer in charge of an expedition against Ethiopia (Nubia) and as his regent over Egypt. In this capacity Haremhab succeeded to weather the rages of the wrathful overlord; by this, he claims, he won also the appreciation of his own people ("the people were happy").

Then the king, according to the inscription on the double statue,

knew the day of his good pleasure to give him his kingship. Lo, this god distinguished his son in the sight of the entire people. . . . The heart of the King being content with his dealings, and rejoicing at the choice of him.

In this and other passages “king” and “this god” are designations of the sovereign who crowned Haremhab.

The scene of the coronation starts when “his father Horus placed him [Haremhab] behind himself.” The translator of the text, Gardiner, comments in wondering: “but the place of a protective deity was behind the protected person” and he refers to various known instances when the falcon Horus or goddesses with protecting wings place themselves behind the royal figure they protect. Assuming a textual error and thinking of Horus as a deity, Gardiner corrects the sentence and makes of it: “His father Horus placed himself behind him [Haremhab].” The text however makes it clear that it was the much-feared monarch who stood in front of Haremhab and led him through the ceremony. “The form of a god was his aspect in sight of him who beheld his dread image,” is in the text, and once again Gardiner stumbles on the adjective “dread,” not usually applied to divine statues. ⁽³⁾

“Lo, this noble god Horus of Hnes, his heart desired to establish his son upon his eternal throne and he commanded _ _ _ [lines broken].” It was usual in Egypt to call the king “god” and also “noble god Horus” apparently in appreciation of the syllable *hr* in the name Sennacherib; more specifically, the Assyrian king is referred to as “this noble god Horus of Hnes.” Haremhab calls himself “god Horus of Hnes’ son.”

Then did Horus proceed amid rejoicing to Thebes, the city of the lord of Eternity, his son in his embrace, to Ipet-Isut (Karnak), in order to induct him into the presence of Amun for the handing over to him of his office of king.

The god-king inducted him “to his office and his throne.” From now on Haremhab is “Hereditary Prince, Chieftain [King] over the Two Lands” and his future issue is supposed to inherit the title and the throne. he proceeded to the palace, to “his [the king’s] noble daughter the Great of Magic, her arms in welcoming attitude, and she embraced his beauty and established herself in front of him.” ⁽⁴⁾

Mutnodjme is here identified as daughter of Sennacherib. She brought the crown to Haremhab: the coronation and the marriage ceremonies took place one following the other, on the same day. Haremhab became son-in-law of Sennacherib and for this reason he was called “son” of “this god”—the Assyrian king. The royal crown was placed “upon his head” and the populace acclaimed Haremhab as their savior. From now on, as the text makes it known, his titulary would be “Horus of Gold, Satisfied with Truth, fostering the Two Lands, King of Upper and Lower Egypt Djeserkheprure-setpenre, son of Re, Haremhab-Miamun, given life.”

Haremhab's wife is called "Great Wife of the King, Lady of the Two Lands, Mutnodjme, beloved of Isis." Queen Mutnodjme is also spoken of as a "great hereditary princess" and as "regent of Egypt"—and even "of all the countries." ⁽⁵⁾ Thus the queen occupied the throne not just because she was the king's spouse, but in her own right. Her exalted position is also reflected in her scarabs or signets. They were made of gold. The queens of the preceding ages, those that had scarabs of her own, had them made of various materials, mostly minerals, but not of gold; not even Hatshepsut who occupied the throne as "king" or from Tiy, the exalted queen of Amenhotep III, do we possess scarabs of gold. "Scarabs of gold are extremely rare—of the scores of thousands found in the soil of Egypt, not more than four examples are known." ⁽⁶⁾

The cause of this unusual status of the queen Mutnodjme as a regent of Egypt and also the reason for her having her scarabs molded in gold are no longer obscure—she was given as a wife to the administrator of Egypt by his suzerain, the king of Assyria, and at the same time her husband was promoted from the position of "King's Deputy" in Egypt to the status of a pharaoh, yet still dependent on his suzerain and even subordinate to his own queen.

6. *Ibid.*, p. 199.

Haremhab's Great Edict

Having assumed royal powers, Haremhab composed and published a decree, his Great Edict. The fragmentary text is inscribed on the largest stele ever found in Egypt. G. Maspero discovered it in Karnak in 1882.

“Hear ye these commands which my majesty has made for the first time, governing the whole land, when my majesty remembered these cases of oppression. . . .” And he gave his edict to deliver “the Egyptians from the oppressions which were among them.” [\(1\)](#)

The king who bestowed the crown on Haremhab was exalted by him, and called “god” and Haremhab called himself his “son” ; at the same time the rule of the land preceding that of Haremhab was branded by him as a wicked rule. Here again is an incongruity, unless the king who gave him the crown was not the king who ruled Egypt as a native ruler. The rule of Haremhab was that of a king named to administer Egypt by the decree of the foreign king.

Haremhab's Great Edict is a manifesto of his policy for keeping the state in order. The language of the Edict differs from the usual mode of expression of Egyptian edicts. It is a dry juridical document, clear and, apart from the introduction, free from the usual verbosity and figurative exaltations of Egyptian inscriptions. In such language were the legal documents of the Assyrians written.

Throughout the Edict of Haremhab emphasis is placed on the principle of justice. The Edict “might be entitled ‘The Justice of the King.’” [\(2\)](#)

Sennacherib wrote of himself as one “who likes justice, who established order.” [\(3\)](#) Haremhab used the same sort of language.

The Edict of Haremhab contains provisions for martial law. Punishment for offenders was severe: anyone interfering with boat traffic on the Nile, “his nose shall be cut off and he shall be sent to Tharu.” [\(4\)](#) This penalty was not known in Egypt before Haremhab; [\(5\)](#) but in the time of Sennacherib it was a customary punishment inflicted by the Assyrians on vanquished peoples. Sennacherib wrote in the annals of his eighth campaign, against Elam: “With sharp swords I cut off their noses.” [\(6\)](#)

For this reason Tharu, the place of exile of the mutilated offenders, was called Rhinocorura or Rhinocolura by Greek authors, meaning “cut-off noses.” [\(7\)](#)

Rhinocolura is el-Arish on the Palestinian border of Egypt.⁽⁸⁾

Another punishment prescribed in Haremhab's Edict is for a soldier accused of stealing hides: "one shall apply the law to him by beating him with 100 blows and 5 open wounds."⁽⁹⁾

Egyptian justice was traditionally marked by its humane treatment of criminals. From the first legal text that became available under the Old Kingdom, through the Middle Kingdom and much of the New Kingdom—in fact, until the time of Haremhab and the Great Edict—the punishment for most crimes involved the confiscation of a person's property and removal from office, in some cases forced labor. Only high treason, directed against the person of the king, was punishable by death. Although kings had themselves portrayed as killing prisoners of war, the maiming of Egyptian prisoners by disfiguring their faces is so uncharacteristic of the Egyptian idea of justice that some scholars have looked for a foreign influence to explain the introduction of these practices in the time of Haremhab.⁽¹⁰⁾ Punishments reminiscent of those mentioned in Haremhab's Decree—beatings, cutting-off of ears, nose, lips, and pulling out of the hair—are prescribed in Assyrian law codes of the second millennium. There are no Assyrian law codes extant from the time of Sennacherib—but clearly, there was a tradition and practice of harsh punishments in Assyria. Its introduction into Egypt, however, was only possible at the time that Egypt fell under direct Assyrian domination, and this occurred for the first time in the days of Sennacherib.

The Edict confirms what we have already deduced from the study of the Memphite tomb of Haremhab and of his coronation text: the pharaoh was an appointee of his Assyrian overlord. He refers to himself in terms not dissimilar from those with which Sennacherib, on the Taylor Prism, refers to his august person, stressing love of justice and support of the needy, but vengeance upon the offenders and the insubmissive. Sennacherib introduces himself in the opening passage as "The wise ruler (literally, "shepherd"), favorite of the great gods, guardian of the right, lover of justice, who comes to the aid of the needy, who turns (his thoughts) to pious deeds, perfect hero, mighty man; first among the princes, the flame that consumes the insubmissive . . ."⁽¹¹⁾ We have already noted Haremhab's comparison of his overlord to a "flame."⁽¹²⁾

Haremhab's Contemporaries

Haremhab and the Crown Prince Sheshonk. According to this reconstruction, Haremhab began his career under the last kings of the Libyan Dynasty. We get a first glimpse of him in the tomb of the prince Sheshonk, son of Osorkon II and his wife Karoma. The prince, named as successor to his father, died young, still during his father's reign, and never assumed the royal diadem. The king built for him a funerary chamber in Memphis, where the prince had served in his lifetime as the high priest of Ptah. The excavations of Samaria, discussed [above](#), revealed that the Libyan king Osorkon II was not a contemporary of Ahab, as is usually asserted, but reigned after the time of Jeroboam II—i.e., after ca. -744, which marks the death of Jeroboam II, but before the destruction of Samaria by the Assyrians in -722.

The tomb was discovered in 1942, and its clearance and publication were entrusted to Ahmad Badawi.⁽¹⁾ At the entrance to the tomb, on the lintel of the doorway, Badawi found an incised relief showing Haremhab kneeling in front of a talbe bedecked with offerings; behind Harmhab can be seen the deceased prince, also in a kneeling position. Haremhab's cartouche is somewhat damaged; a deliberate attempt had been made to erase it. But from what remains Badawi could identify the figure in front of the crown prince as that of Haremhab.

In the accepted scheme of history Haremhab is supposed to have reigned some six hundred years before the funeral chamber for Prince Shoshenk, son of Osorkon II, was built. But what incentive would the builder of the tomb have to decorate the monument with the figure of Haremhab and his cartouche? This king did not enjoy such reputation that six centuries after his death a Libyan prince should prominently show himself and Haremhab in an offering scene. There was nothing in the memory of Haremhab that an occupant of a tomb of about -725 would consider as bringing salvation or possessing magic against unclean spirits. Therefore Haremhab's figure and cartouche in a Libyan tomb made historians wonder and grope for a solution.

One detail needs an explanation: Haremhab is depicted as a king, his name enclosed inside a cartouche, sign of royal power—this at least twenty-five years before his appointment as king by Sennacherib. One could assume from this that he was a viceroy of Memphis under the last Libyan kings, continuing in that position under the Ethiopians, until his defection to the Assyrian side in -702. As such he could well have enjoyed the privilege of using the insignia of royalty.

Haremhab and Tirhaka. In this reconstruction Haremhab and Tirhaka, the Ethiopian, are contemporaries; in the conventional version of history they are separated by more than six centuries, Haremhab being dated to the late fourteenth and Tirhaka to the

early seventh. A certain scene, carved on one of the walls of a small Ethiopian temple at Karnak, shows them together. The scene proves not only the contemporaneity of Haremhab and Tirhaka, but also permits to establish a short period in their relations from which it dates. De Rouge in his 1873 study of the monuments of Tirhaka, describes the relief:

Tirhaka is standing and takes part in a paneguric. An important personage, named Hor-em-heb, a priest and hereditary governor, addresses to the people the following discourse in the name of the two forms of Amon: "Hear Amon-ra, Lord of the Thrones of the World and Amon-ra, the husband of his mother, residing in Thebes! This is what they say to their son, the king of Upper and Lower Egypt [Neferatmukhure] son of the sun, Tirhaka, given life, forever: 'You are our son whom we love, in whom we repose, to whom we have given Upper and Lower Egypt; we do not like the kings of Asia _ _ _'"⁽²⁾

The monument must be dated to the time early in Haremhab's career when he was acting as priest and governor under his brother Sethos. Egypt was then allied with Ethiopia, actually under Ethiopian domination, and was bracing itself to meet the armies of Assyria; for Sennacherib had shut up Hezekiah in Jerusalem "like a bird in a cage" and was advancing to the border of Egypt. The Egyptian-Ethiopian army which had gone to block him had suffered a crushing defeat at Eltekeh in Palestine. The declaration "We do not like the kings of Asia" was appropriate for the moment. The ways of Tirhaka and Haremhab would soon part: Tirhaka would flee to Ethiopia and become the bitterest enemy of Haremhab, who would go over to the side of Sennacherib and campaign against the Ethiopian king and his own brother Sethos.

The Tomb of Petamenophis. Of the hundreds of rock-cut tombs crowding the Theban necropolis, the Valley of the Kings, one bearing the name of Petamenophis, a high official of the Ethiopian time, early attracted the attention of Egyptologists by its large size and ambitious layout. It was first described in detail by Lepsius in his pioneering work *Denkmaeler aus Aegypten und Aethiopien*.⁽³⁾ To have occupied a spacious tomb in this prestigious location, Petamenophis must have been a person of distinction. In his inscriptions he describes himself as "Sealbearer and Sole Beloved Friend, Lector and Scribe of the Records in the Sight of the King, Petamenophis."⁽⁴⁾ The king is not named, but his identity is revealed by an inscription, also reproduced by Lepsius, on a wall in the northern part of the great outer courtyard. Though much damaged in the course of time it contains two names, still clearly legible: Petamenophis, and next to it a cartouche of King Haremhab.⁽⁵⁾

The tomb was later visited and described separately by Wilkinson, by Duemichen, and others, before Maspero, seeing its deteriorating condition and realizing the necessity of protecting it from despoliation, had it sealed at the end of the last century. It remained closed until 1936 when W. F. von Bissing obtained permission to re-open it with the purpose of performing a definitive survey and publication.

Braving the “billions of bats” infesting the place and the thick air (the ventilation shafts “left much to be desired”) he persevered, and within two years (1938) published a detailed description of the finds.

Rudolf Anthes and ~. Grapow were entrusted with making a cast of the inscription with Haremhab’s cartouche and found that “the name [Haremhab] stands out quite clearly” “*steht der name völlig deutlich da*”).

Next arose the question of the tomb’s date and the time of Petamenophis’ career. The archaeologists were unable to agree, except that on stylistic grounds it could not be earlier than Ethiopian time. “Unfortunately,” von Bissing wrote, “in the entire vast tomb, not a single indication was found that would directly yield a date.” ⁽⁶⁾ But was not the cartouche of Haremhab just the sought-for indication? In the context of the accepted chronology Haremhab’s named carved next to that of the tomb’s owner was rejected as an anachronism, and since no other royal name was found, the date of the tomb was held to be in doubt. Anthes nevertheless arrived at what appears to be the correct estimate when he placed it in the time of Tirhaka. ⁽⁷⁾

Year 59 Under Haremhab. A legal document in hieroglyphics composed under Ramses II refers to a contract concluded under Haremhab, and gives, without any further amplification, the “fifty-ninth year.” ⁽⁸⁾

Haremhab did not rule Egypt anywhere that long. No era is known in Egyptian history to which the figure could apply. Much was written on the subject, but without a satisfying solution.

It was proposed that Haremhab counted as his own the years of the heretical pharaohs of the Eighteenth Dynasty: Akhnaton, Smenkhkare, Tutankhamon and Ay. ⁽⁹⁾ But it is now admitted that such a solution would require the sole reign of Haremhab to have lasted not less than twenty-seven years, while his dated monuments cease after year eight, ⁽¹⁰⁾ indicating that he reigned but eight years after being crowned.

In the light of the understanding here presented of the true time and role of Haremhab, the thought must come that the “fifty-ninth year” refers to an Assyrian era. On February 26, -747 started the era of Nabonassar; this era was still in use in the second Christian century when Claudius Ptolemy, the Alexandrian scholar, wrote his astronomical treatises. ⁽¹¹⁾

The year 59 in the era of Nabonassar is the year 689 or 688 before the present era. About this time Tirhaka came from Ethiopia and occupied Egypt. This leads us to the conclusion that the document in question was written at the very end of Haremhab’s reign, just before he was expelled by the Ethiopian king and fled by sea. A few months later Sennacherib embarked on his second campaign against Judah and Egypt.

The Later Campaigns of Sennacherib

In the last century scholars became aware that there were two invasions of Palestine by Sennacherib and that it is possible to discern in the scriptural record an early and a late campaign against Hezekiah.⁽¹⁾ The first campaign to Palestine took place about -701. The second campaign is dated by modern historians to -687 or -686.⁽²⁾

The annals of Sennacherib record only eight campaigns. The second march into Palestine, which ended disastrously and which probably was his last military undertaking, was not recorded by the Assyrian king, who had no intention of preserving for posterity the story of his reverses.

The last two campaigns memorialized by Sennacherib on the eight-faced Taylor Prism were against Elam. Elam, occupying roughly the territory of modern Iran, was already the goal of earlier Assyrian kings, Sargon II, father of Sennacherib among them. During the seventh campaign Sennacherib succeeded to invade only a marginal part of the country; he recorded reducing to ashes thirty-four strong cities together with their “countless” surrounding towns. “I besieged, I conquered, I despoiled, I destroyed, I devastated, I burned with fire; with the smoke of their conflagration I covered the wide heavens like a hurricane.”

But “extreme cold” and heavy storms with “rain upon rain and snow” set in. “I was afraid of the swollen mountain streams; the front of my yoke I turned and took the road to Nineveh.”⁽³⁾

But before long Sennacherib returned to Elam to continue the orgy of destruction. To the king and people of Elam went an alarm from the people of Babylon, who still warred for independence, asking for aid. Without delay Sennacherib set out on his eighth campaign: “My great battle chariot . . . I hurriedly mounted.” Defeating the Elamites in battle,

I cut their throats like lambs . . . My prancing steeds, harnessed for my riding, plunged into the streams of their blood. . . . The wheels of my war chariot . . . were bespattered with blood and filth. . . . Their testicles I cut off and tore out their privates . . . their hands I cut off . . .

Next Sennacherib turned towards Elam’s allies, the Babylonians, and brought them to a panicky flight: “They held back their urine, but let their dung go into their chariots”

and in hot pursuit “150,000 of their warriors I cut down with the sword.”

After this feast of carnage Sennacherib again, as before the campaign against Elam, seized “the mighty bow which Assur had given me . . . in my hands; the javelin I grasped” and faced to road to Jerusalem.

1. The first to realize that there were two Palestinian campaigns by Sennacherib was Henry Rawlinson. While some scholars continued to maintain a one-campaign hypothesis, recent studies by Albright (*Bulletin of the American Schools of Oriental Research* no. 141, Feb. 1956, pp. 23-26) and John Bright, (*A History of Israel* [Philadelphia, 1962], *Excursus I*, “The Problem of Sennacherib’s Campaigns to Palestine,” pp. 296-308) support the view that there were indeed two campaigns. Bright’s conclusion is that “a two-campaign theory seems at present to satisfy the evidence best.” He suggests a date ca. - 688 for the second (unrecorded) campaign of Sennacherib.

The Siloam Aqueduct

In the years that Sennacherib was carrying on wars against Babylon and Elam, Hezekiah fortified his cities, repaired the citadel of Millo at Jerusalem, prepared arrows and shields, ordered that the fountains and brooks in the land be stopped at the first sign of invasion, and with the help of the prophet Isaiah, heartened the people. Once more he concluded an alliance with the Egyptians and the Ethiopians, and waited for Sennacherib to come again.

Hezekiah realized the importance of an adequate water supply in case of siege. Harboring in his heart the thought to resist Sennacherib should he try to continue to reduce Jerusalem and the surrounding towns to vassalage and exploit the people's resources and the royal treasury, once the appetite of the conquerors was awakened, Hezekiah was prepared to sacrifice the cities outside Jerusalem and was set upon to part with life, but not to open once more the gates of the capital before the ravenous pillager from the banks of the Tigris. He planned to secure water for the inhabitants of Jerusalem and executed the plan.

. . . Hezekiah also stopped the upper watercourse of Gihon and brought it straight down to the west side of the city of David. (II Chronicles 32: 30)

And the rest of the acts of Hezekiah, and all his might, and how he made a pool, and a conduit, and brought water into the city, are they not written in the book of the Chronicles of the kings of Judah? (II Kings 20: 20)

The book of the Chronicles of the Kings of Judah must have been a much more extensive work than the just quoted book of Chronicles.

In the Old City of Jerusalem, inside the walls, in the Christian sector, till today the large stone pool serving as a reservoir is shown; it carries the name Breikhat Hezekiah, or the Reservoir (pool) of Hezekiah. In 1880, south of the Temple area in Jerusalem, in the rock wall of the lower entrance to the tunnel of Hezekiah, an inscription was discovered. It actually occupied the lower part of a prepared stone surface and is therefore judged to be but the last half of the planned (or even executed) inscription. Six lines remain. For the upper part the mason could have planned the date of the execution and the purpose, possibly referring to its value in war time.

The source of water lies lower than the reservoir and it needed to be raised to

adequate height by mechanical means—an engineering feat solvable by means whether primitive or more sophisticated. But a real engineering achievement was in digging the conduit simultaneously from two ends, especially considering the substantial distance from the spring to the reservoir and the depth from the surface of the rock to the conduit beneath.

The inscription—in biblical Hebrew—slightly damaged, in its six lines tells:

[.. when] (the tunnel) was driven through. And this was the way in which it was cut through: >_ While [..] (were) still [..] axe(s), each man toward his fellow, and while there were still three cubits to be cut through, [there was heard] the voice of a man calling to his fellow, for there was *an overlap* in the rock on the right [and on the left]. And when the tunnel was driven through, the quarrymen hewed (the rock), each man toward his fellow, axe against axe; and the water flowed from the spring toward the reservoir for 1,200 cubits, and the height of the rock above the head(s) of the quarrymen was 100 cubits. ⁽¹⁾

The two teams of excavators of the channel for the conduit, one working in the rock formation beginning from the end designated for the reservoir, the other standing at a distance of 1,200 cubits at the underground spring, heard each other when they were separated by the last intervening three cubits of rock. Even in modern times, with all the developed surveillance methods, road tunnels running under mountain passes, when dug from two ends with the two teams not bypassing each other, are a cause of celebration—a deviation of even a fraction of a degree would result in a failure.

For supplying Jerusalem with water and for security reasons, Hezekiah, as already quoted, “stopped the upper watercourse of Gihon and brought it straight down to the west side of the city of David.”

When the feared moment arrived and “Hezekiah saw that Sennacherib was come, and that he was purposed to fight against Jerusalem,” the governors were summoned to the city.

He took counsel with his princes and his mighty men to stop the water of the fountains which were without the city: and they did help him.

So there were gathered much people together, who stopped all the fountains, and the brook that ran through the midst of the land, saying, Why should the kings of Assyria come, and find much water? (II Chronicles 32: 3-4)

But Sennacherib—Isaiah speaking for him—said: “I have digged and drunk water; and with the sole of my feet I have dried up all the rivers of the besieged places.” ⁽²⁾

The Reign of King Hezekiah

The thirty-eighth chapter of Isaiah, or the next-to-last of what is regarded as Isaiah I, starts with the words: “In those days was Hezekiah sick unto death.” There follows the story of Isaiah coming to Hezekiah with the words: “Set thine house in order—for thou shouldst die and not live.” Hezekiah, upon hearing the message, turned his face toward the wall, and prayed to the Lord. “The grave cannot praise thee, death cannot celebrate thee, they that go down into the pit cannot hope for thy truth.” In a little while Isaiah returned, brought a lump of figs to place on the boil erupted on the body of the sick king, and said in the name of the Lord: “I have heard thy prayer, I have seen thy tears: behold, I will deliver thee and this city out of the hand of the king of Assyria: and I will defend this city.”

Hezekiah asked the seer: “What is the sign that I shall go up to the house of the Lord?” Isaiah’s answer was:

And this shall be a sign unto thee from the Lord, that the Lord will do this thing that he hath spoken. Behold, I will bring again the shadow of the degrees, which is gone down in the sun-dial of Ahaz, ten degrees backward. So the sun returned ten degrees, by which degrees it was gone down.

I have discussed the nature of the event in *Worlds in Collision* (“The Year -687”) and do it again in the present volume. Here, however, the concern is with a chronological problem, albeit minor, dealing with the reign of Hezekiah and the order of the events of that time.

It is stated that Hezekiah reigned twenty-nine years (II Chron. 29:1; II Kings 18:2); that Hoshea, the last king of Israel, started to reign in Samaria in the twelfth year of Ahaz, father of Hezekiah (II Kings 17: 1); that Ahaz reigned sixteen years in Jerusalem (II Chron. 28: 1); that in the third year of Hoshea, Hezekiah began to reign (II Kings 18: 1); that Hoshea reigned in Samaria nine years (II Kings 17: 1); but that already in the fourth year of Hezekiah “which was the seventh year of Hoshea” Shalmaneser came against Samaria and besieged it (II Kings 18: 9); that the siege of Samaria endured three years (II Kings 17: 5); that at the end of these three years, in the ninth year of Hoshea, which was the sixth of Hezekiah, Samaria fell (II Kings 18: 10); that in the ninth year of his reign Hoshea was captured, fettered, and put in prison (II Kings 17: 9), probably in Assyria.

The accepted date for the fall of Samaria is -722. The calculations, mostly based on cuneiform data, by which this was figured out, were not retraced in the course of this

reconstruction. Sargon reigned seventeen years, beginning with the fall of Samaria in his first year. Consequently if Samaria fell in -722, Sennacherib mounted the throne in -705. This is also the accepted date for the beginning of his reign.

In the fourteenth year of Hezekiah Sennacherib came “against all the fenced cities of Judah and took them” (II Kings 18: 13). It was during Sennacherib’s third campaign, or his first against Judah. Sennacherib ceased to write his annals (Taylor Prism) after his eighth year.

The Scriptural data cited here are generally in good agreement one with others, and if there is any possible disagreement it amounts to no more than one or two years, and this could be adjusted by one of the devices usually applied by commentators for minor discords in texts.

But a problem amounting to a decade or even decades comes to light if Hezekiah was already on the throne in Jerusalem three full years before the fall of Samaria, or in -725. Reigning for twenty-nine years, he must have ended his reign and life in -696.

These figures, or small variants of them, are also accepted by a few scholars.⁽¹⁾ But if Sennacherib invaded Judah in -701, and this should be Hezekiah’s fourteenth year, then this king of Jerusalem must have started to reign in -715, or seven years after the accepted date for the fall of Samaria⁽²⁾, and there is a disagreement of ten to eleven years. Could it be that Hezekiah after the fall of Samaria was not yet a sole ruler but a co-ruler with Ahaz, his father, and those years should not count in the twenty-nine, assigned to him as king? Or should the date of the fall of Samaria be lowered? The problem connected with Hezekiah’s reign is not limited to this issue alone.

When Hezekiah fell sick he was promised a grace of fifteen years. The figure fifteen is not arbitrarily chosen. In *Worlds in Collision* it was brought out that the turbulent events of that time were caused by repeated close approaches of the planet Mars that repeat themselves till today at the same fifteen-year period, called “favorable opposition” (favorable for observation); only twenty-seven centuries ago this phenomenon was much more pronounced—the opposing celestial bodies were at such encounters closer to each other.⁽³⁾

As elsewhere in this volume the nature of the paroxysms and the subsequent calendric changes are discussed (and in *Worlds in Collision* records of these phenomena were collected from many ancient civilizations, in East and West), I will keep here to the subject only insofar as it concerns the chronological problems under scrutiny. The *midrashim* explain that on the memorable day of Hezekiah the sun retarded to set by the same amount, namely ten degrees (*maaloth* in Hebrew is preferably “degrees” and more so when applied to the sundial) by which it speeded up to descend on the sundial built by Ahaz—and, further, that this phenomenon of acceleration of the sun reaching the horizon took place on the day Ahaz was brought to the grave. Since Sennacherib came toward all the fenced cities in Hezekiah’s domain in his (Hezekiah’s) fourteenth year, and Sennacherib, according to his own

descriptions and reliefs, was tarrying in Palestine, besieging Lachish and reducing many places one by one to his yoke, it is well thinkable that Jerusalem under the “proud Judean, Hezekiah” besieged like “a bird in a cage” submitted to pay tribute when nearly fifteen years of Hezekiah on the throne had passed (Sennacherib records that before the campaign he consulted astrologers and was told to be sure of the protection of the gods; rabbinical sources also tell that he consulted astrologers before going toward Jerusalem, and he was cautioned to hurry, and not to tarry, but he tarried. The promise to the sick Hezekiah of a fifteen year period of grace intends to convey to the reader of the Scriptures that such grace came really into fulfillment. But that would mean that Hezekiah was permitted to live another fifteen years, and to stay altogether twenty-nine on the throne, or reach his fifty-fourth year—he mounted the throne at twenty-five.

Everything just told seems in good agreement but for several things. First, three separate texts in the Scriptures, and so also Herodotus in his history of Egypt, tell of an unusual debacle suffered by the Assyrian army under Sennacherib. He won the battle of Eltekeh, close to Jaffa on the Mediterranean coast, against Sethos and Ethiopian generals, and properly recorded it; he continued warfare and carried it east into Elam, southeast into Babylon, west into Anatolia, north into the Caucasus, and beyond.

The realization that Sennacherib came again to Palestine on his ninth campaign was initially made by Rawlinson in 18~~, and with years gained an almost universal acceptance. It means that the Scriptural records in its versions of II Kings, II Chronicles, and Isaiah, needs to be regarded as an amalgam of reports of two campaigns by the same king to the same country, but nearly fifteen years apart. I have dwelt on this in *Worlds in Collision* and again elsewhere in the present volume. The debacle that overtook the Assyrian host occurred at the second invasion of Palestine, it being also the second confrontation with the Egyptian allies of Hezekiah together with Tirhaka, king of Ethiopia.

Herodotus, too, told of only one campaign of Sennacherib, met by Sethos on the Palestinian frontier, when nature intervened. In *Worlds in Collision* I brought out the fact, neglected by the commentators of the Scriptures and of Herodotus alike, that the story of the sun having changed the rising and setting points four times since Egypt became a kingdom is included in Herodotus immediately following the story of the debacle Sennacherib’s army suffered. The phenomenon of the sun returning on the sundial is described in all three biblical sources in the same context of Sennacherib’s debacle. The Assyrian king for his part refrained from all military activity in the last seven or eight years of his life, and spent his time prostrated before the image of the god Nergal, the planet Mars, and was assassinated in that position by two of his sons.

It appears that the descriptive chapters in the book of Isaiah, and, accordingly, the passages in Kings and Chronicles, require an emendation in the sense of transposition of chapters or passages.

The sickness of Hezekiah from which he was healed by Isaiah belongs to the time of the first invasion by Sennacherib. Should this episode be retained for the second invasion, Hezekiah's life and reign would extend to fifteen years past -687, and even starting the reign at the lower date of -715, he would need to remain on the throne much longer than the twenty-nine years, given both by Kings and Chronicles. This means that Hezekiah died during the second invasion by Sennacherib, or shortly thereafter. The words "In those days was Hezekiah sick unto death" which start chapter 38 of Isaiah would make more sense if the chapter were placed earlier and generally if the Scriptures discerned between the two campaigns of Sennacherib to Palestine.

The visit of the ambassadors of Merodach-Baladan of Babylon, who sent presents to Hezekiah on the occasion of his having recovered from his illness, seems to have occurred not after Sennacherib's debacle, but much earlier. As the political situation suggests, the visit of the ambassadors and Hezekiah's showing them his treasures in gold and otherwise seems misplaced: Hezekiah paid tribute in gold (30 talents) and silver (300 or 800 talents) to Sennacherib on his first campaign to Palestine, and he stripped his palace and the temple—besides, he must have remained in awe of Sennacherib to entertain ambassadors of the king of Babylon, Sennacherib's enemy. It would look better if the arrival of Merodach Baladan's envoys took place after the solar disturbance that coincided with Hezekiah's mounting the throne—the funeral day of Ahaz, his father. At that time Hezekiah had not yet impoverished his treasury by the tribute to the Assyrian king.

The scholarly opinion held that the second campaign of Sennacherib against Palestine-Egypt could not have occurred before -689, the year Tirhaka mounted the throne.⁽⁴⁾

1. See for instance, Nadav Na'aman in *Bulletin of the American Schools of Oriental Research* (April, 1974), p. 32, note 28: "I have adopted here the dates of 727 - 696 B.C. [or -726 to -695] for the reign of Hezekiah."
2. This is the solution proposed by Thiele, who regards the source used by the compiler of the Second Book of Kings to have erred in relating the fall of Samaria with the beginning of Hezekiah's reign.
3. At 14½ year intervals, now more than 15 year.
4. If to harmonize the involved chronological problems the debacle of Sennacherib's army needs to be placed fifteen years earlier (not in -687 but in -701), and the first invasion in -715, and the beginning of Hezekiah's reign in -729, then I would need to change the date for the last global catastrophe from -687 to -701 or -702.

Sennacherib's Last Campaign

The last campaign of Sennacherib was directed not only against Jerusalem, but also against Egypt and Ethiopia (Sudan)—an enterprising warrior, Tirhaka, who invaded Egypt from the Sudan, reinstated Sethos, and put the occupant of the throne of Egypt, underling of Sennacherib, to flight.

When Sennacherib came to Palestine for the second time, Hezekiah refused to submit or to pay tribute. The Ethiopian king Tirhakah (Taharka) stood together with his Egyptian confederate, Sethos, at the border of Egypt, prepared to meet the threat. Sennacherib sent his messengers to Hezekiah from Lachish and once more from Libnah to demand submission; he also wrote him an ultimatum, and blasphemed the Hebrew God.

Then in a single night the Assyrian host, about 185,000 warriors, perished, destroyed by some natural cause. ⁽¹⁾

Herodotus (II. 141) relates this event and gives a version he heard from the Egyptians when he visited their land two and a half centuries after it happened. When Sennacherib invaded Pelusium, the priest-king Sethos went with a weak army to defend the frontier. In a single night hordes of field mice overran the Assyrian camp, devoured quivers, bowstrings and shield handles, and put the Assyrian army to flight. Another version was given by Berosus, the Chaldean priest of the third century before the present era.

This event and the writings relating to it have been investigated in *Worlds in Collision*, Part II, which deals with the natural history of the period. A sequence of natural phenomena that bewildered the world for almost a hundred years during the eighth century and the beginning of the seventh is investigated and described in that volume. With knowledge of the precise character and time of these physical phenomena, an exact synchronism can be established; for the purposes of the present book I borrow from *Worlds in Collision* the exact date: Sennacherib's army was annihilated on the night of March 23, -687. The calculations of modern historians who place the second invasion of Judah by Sennacherib in -687 are correct. However if to harmonize the involved chronological problems the debacle of Sennacherib's army needs to be placed fifteen years earlier (not in -687 but in -701) and the first invasion in -715 and the beginning of Hezekiah's reign in -729, then I would need to change the date for the last global catastrophe from -687 to -701 or -702.

1. II Kings 19: 35; Isaiah 37: 36; cf. Josephus quoting Berosus in *Jewish Antiquities* X. i. 4-5.

Political Turmoil Around - 687

The natural events of March -687, a final recurrence of earlier such disasters that had taken place during the eighth century, were once more followed by renewed migrations of peoples, political revolutions and economic dislocations. Climatic change was again very significant and oscillations of climate marked the ninety years from -776 to -687.⁽¹⁾ In many places cultivated lands grew barren, strata were dislocated, water sources became in numerous sites sealed off, many river courses changed, glaciers melted, some overflowed streams caused inundations, and altogether contributed to “wolf-time, sword-time” in the words of the Edda, the Icelandic epic, or internecine wars.

In -687 the Cimmerians, a nomadic people from southern Russia—the basin of the Don and the Crimea—moved along the coastal route round the eastern shores of the Black Sea and descended on Anatolia in their westward sweep. The same year saw the horde reaching Gordion. Their incursion marked the end of the short-lived Phrygian kingdom, founded by Gordias, who supposedly had migrated from Thrace, and who was followed by his son Midas. The Cimmerians had earlier (-707/-706) clashed with the armies of Urartu and of Assyria, as is shown from the Assyrian state correspondence. The young Sennacherib, still a crown prince under his father Sargon, sent dispatches to Dur-Sharrukin, Assyria’s capital, about the movements of the Cimmerians. This time they were repulsed, but some twenty years later, in -687, they succeeded to penetrate into Anatolia. Soon after their passage the Cimmerians become lost to history, possibly having crossed the Bosphorus into Thrace. The remnants left behind in Asia were destroyed by Esarhaddon in alliance with the Scythians in -679.

About the time of the sack of Gordion, Sardis, capital of Lydia, close to the Aegean shore, experienced a palace revolution: in -687 or about that year Gyges overthrew the Heraclid Dynasty, probably so called for its ruling under the aegis of Mars (Heracles) and its worship of this planet.

The end of the Heroic Age, or the final stage of the Mycenaean Age, was due not to the onslaught of the Sea Peoples—nor were the Mycenaeans themselves the Sea Peoples: this myth, created by the historians and related to ca. -1200 is refuted in the volume *Peoples of the Sea*. Violent earthshocks and other perturbations of nature destroyed the Mycenaean citadels and left their defenders exposed to the assaults of migrant tribes, dislodged in the same upheavals, and calling themselves the Children of Heracles, or Mars.

The seventh century opened with the migration of the Cimmerians followed by the

Scythians who came also by way of the Caucasus and by the route of the Caspian sea coast. These nomadic peoples from the Asiatic steppes, displaced by upheavals of nature, injected themselves into the policies of the warring nations in the ancient East, and changed the course of history.

Esarhaddon's Reconquest of Egypt

Several years after Sennacherib returned from his ill-fated campaign against Judah and Egypt, he was slain by two of his sons while worshipping in the temple of Nergal (Mars).⁽¹⁾ Esarhaddon, his heir, pursued his brothers, but they escaped over the mountains to the north.⁽²⁾ Then he tried to re-establish the shattered authority of Assyria in Syria and on the Phoenician shore.

“I besieged, I captured, I plundered, I destroyed, I devastated, I burned with fire,” wrote Esarhaddon.⁽³⁾ I hung the heads of the kings upon the shoulders of their nobles and with singing and music I paraded.”⁽⁴⁾ He threatened Tyre whose king “had put his trust in his friend Tirhakah (Tarku), king of Ethiopia.” He “threw up earthworks against the city,” captured it, and made a vassal of its king Ba’lu.⁽⁵⁾ He also marched into the desert “where serpents and scorpions cover the plain like ants.”⁽⁶⁾ And having thus ensured the safety of his rear and flank along the roads to Egypt, he moved his army against that country.

In the sixth year the troops of Assyria went to Egypt; they fled before a storm.” This laconic item in the short “Esarhaddon Chronicle”⁽⁷⁾ was written more than one hundred years after his death; if it does not refer to the debacle of Sennacherib, one may conjecture that at certain ominous signs in the sky the persistent recollection of the disaster which only a few years earlier had overtaken Sennacherib’s army, threw the army of his son into a panic.

Thereafter, “in the tenth year, the troops of Assyria went to Egypt.”⁽⁸⁾ Esarhaddon marched along the military road running across Syria and along the coast of Palestine. He conquered Sidon and “tore up and cast into the sea its walls and its foundations.” This ancient Phoenician city was situated on a promontory jutting into the sea. Its king Abdimilkute tried to escape on a boat, but was “pulled out of the sea, like a fish.”⁽⁹⁾ The Assyrian king cut off the head of this Sidonian king and sent off to Assyria a rich booty, to wit: “gold, silver, precious stones, elephant hides, ivory, maple and boxwood, garments of brightly colored wool and linen.”⁽¹⁰⁾ He took away the king’s wife, his children, and his courtiers: His people from far and near, which were countless . . . I deported to Assyria.”⁽¹¹⁾

Following the fall of Sidon, he “called up the kings of the country of Hatti”—namely Ba’lu, king of Tyre, Manasseh (Me-na-si-i), king of Judah (Ia-u-di), also kings of Edom, Moab, Gaza, Ashkelon, Ekron, Byblos, Arvad, Beth-Ammon and Ashdod, all

named by their names and spoken of also as “twelve kings of the seacoast.” ⁽¹²⁾ Esarhaddon summoned also ten kings from Cyprus (Iadnana)—their names are given, too—altogether “twenty-two kings of Hatti, the seashore, and the islands.” he made them “transport under terrible difficulties, to Nineveh as building material for my palace” logs and beams of cedar of Lebanon “which had grown for a long time into tall and strong timber” ; the vassal kings had also to deliver to Nineveh slabs of stones from the quarries of the entire region. ⁽¹³⁾

The king of Tyre “bowed down and implored me as his lord.” He “kissed my feet” and was ordered to pay heavy tribute, and to send “his daughters with dowries.” ⁽¹⁴⁾ “As for Hazail, king of Arabia, the splendor of my majesty overwhelmed him and with gold, silver, precious stones he came into my presence” and also “kissed my feet.” ⁽¹⁵⁾ Into Arabia Esarhaddon sent “bowmen mounted on horseback” and brought the villages of the desert under his yoke.

The road to Egypt and the flanks having been made secure, Esarhaddon wrote: “I trod upon Arzani [to] the Brook of Egypt.” ⁽¹⁶⁾ We had already occasion to explain the geographical term Arzani as the Hebrew Arzenu, “our land” by which the Scriptures (Joshua 9:11, Judges 16:24, Psalms 85:10, Micah 5:4) repeatedly refer to Israel and Judah; by the same term (*'rezenu*) this land was known to the rulers of the Eighteenth Dynasty, Thutmose and others. ⁽¹⁷⁾ “Brook of Egypt,” or in the Assyrian text Nahal Musur, is Nahal Mizraim of Hebrew texts; it is Wadi el-Arish, the historical frontier of Egypt and Palestine. The “town of the Brook of Egypt” in Esarhaddon’s inscription is el-Arish, the ancient Avaris. ⁽¹⁸⁾

It was in his tenth year, or -671, that Esarhaddon entered Egypt: he marched unopposed only as far as a place he calls Ishupri: there he met his adversary, Tirhaka, king of Ethiopia (Nubia) and Egypt. The progress from here on was slow; it took fifteen days to advance from Ishupri to Memphis, close to the apex of the Delta a few miles south from present-day Cairo.

“From the town of Ishupri as far as Memphis, his royal residence, a distance of fifteen days’ march, I fought daily, without interruption, very bloody battles against Tirhakah, king of Egypt and Ethiopia, the one accursed by all the great gods. Five times I hit him with the point of my arrows, inflicting wounds from which he should not recover, and then I laid siege to Memphis, his royal residence, and conquered it in half a day by means of mines, breaches, and assault ladders; I destroyed it, tore down its walls, and burned it down.” ⁽¹⁹⁾

Before we go on to recount the events that followed, we should examine more closely the question which was the “town of Ishupri” that Esarhaddon mentions as the starting point in his confrontation with Tirhaka. Its name was not known from the list of cities compiled from hieroglyphic texts of the imperial age of Egypt, and it intrigued the Orientalists. When their efforts to find its derivation were crowned with

success, the solution raised a rather grave question.

Ishupri was understood as an Assyrian transcription of the throne name of pharaoh Sethos (Wesher-khepru-re) and meaning “Sethosville” or the like. The leading German Orientalist Albrecht Alt came to this conclusion,⁽²⁰⁾ and the solution was accepted by other Orientalists. The question raised by this solution was in the enormous time span between Sethos and Esarhaddon on the conventional time-table. Sethos (in the conventional history Seti II) is placed in the second part of the thirteenth century, and Esarhaddon ruled Assyria from -681 to -668, invading Egypt in -671; in between there lie some five hundred and seventy years. The survival of the name Sethosville (Ishupri) was estimated by Alt as “remarkable,” and even more remarkable (*um so bemerkenswerter*) is the fact that for these almost six hundred years this locality remained unmentioned in the hieroglyphic texts and appeared for the first time in the annals of Esarhaddon. In his inscriptions he refers to Ishupri not less than three times. How did an Assyrian king of the seventh century come to call a fortress or a locality east of the Delta, possibly at Kantara of today,⁽²¹⁾ by the name of an obscure pharaoh of an age long past? Or why did this city name, familiar to Esarhaddon, escape mention in all texts, Egyptian or others, prior to -671? Should it not have been preserved on some document belonging to the king who built it or the following generations, if the city was called after him?

In the present reconstruction Sethos is recognized as the grandfather of Seti the Great; we found him in the history of Herodotus as the adversary of Sennacherib, father of Esarhaddon. He was considered a savior of Egypt and it was therefore only natural to find that a city or fortress guarding the Asiatic frontier was named after him: Esarhaddon on his campaign to recover Egypt, only a few years after the events of -687, called it by the name it then carried “House of Sethos,” or “Sethosville.” Sethos, the adversary of Esarhaddon’s father, could even have been still alive.

Upon seizing Memphis Esarhaddon captured Tirhaka’s queen, his children, the women of his palace, “as well as horses and cattle beyond counting,” and all this he sent as booty to Assyria.

“All Ethiopians I deported from Egypt, leaving not even one to do homage to me. Everywhere in Egypt I appointed new kings, governors, officers.” The word “new” means that the kings and governors had already once been appointed by his father Sennacherib—but Haremhab was not among those who were now re-appointed. The Assyrian king obliged Egypt with sacrificial dues “for Ashur and other great gods my lords, for all times.” He also imposed tribute to the Assyrian crown to be paid “annually without ceasing.” Besides the prisoners of war, Esarhaddon sent to Nineveh also civilians, namely physicians, divination experts, goldsmiths, cabinetmakers, cartwrights, and shipwrights.

Esarhaddon continued along the Nile towards the Sudan (Ethiopia). “From Egypt I departed, to Melukha (Ethiopia) I marched straightway.”⁽²²⁾ He described briefly the

march of thirty days from Egypt to Melukha—on none of the existing steles, however, have the details of this part of his campaign remained preserved. Tirhaka retreated before the Assyrian king who already covered an immense distance from Nineveh to the cataracts on the Nile.

Summing up the campaign of his tenth year, Esarhaddon wrote: “I conquered Egypt, Upper Egypt, and Ethiopia (Musur, Patursi, and Kusi). Tirhakah, its king, five times I fought with him with my javelin, and I brought all of his land under my sway, I ruled it.” ⁽²³⁾ Esarhaddon called himself “king of Sumur and Akkad, king of the kings of Egypt, Upper Egypt, and Ethiopia, the son of Sennacherib, King of Assyria.”

Egypt reconquered, Esarhaddon returned home. He erected at Sendjirli, in eastern Anatolia, a memorial stele to glorify his lord Ashur by recounting his own mighty deeds when he marched against the enemy “upon the trustworthy oracles” of his lord Ashur.

Not many years passed and Tirhaka again emerged from Nubia and once more took possession of Egypt. Esarhaddon put his army on a hurried march.

From Nineveh to Ni

“I am powerful, I am all-powerful, I am a hero, I am gigantic, I am colossal . . . I am without an equal among all kings,” wrote Esarhaddon.⁽¹⁾ He died after a reign of not full twelve years. “In the twelfth year the king of Assyria went to Egypt, fell sick on the road, and died on the tenth day of the month Marcheswan.” “Esarhaddon exercised sovereign power in Assyria twelve years,” narrates a chronicle of his reign, written more than one hundred years later.⁽²⁾

In his lifetime Esarhaddon appointed his son Assurbanipal Crown Prince of Assyria, and another of his sons, Shamash-shum-ukin Crown prince of Babylonia. At a great assembly in Nineveh in -672 Esarhaddon made a proclamation to the governors of the provinces and vassal rulers:

When Esarhaddon, king of Assyria, dies, you will seat Assurbanipal, the Crown Prince, upon the royal throne~.~.~ you will help to seat Shamash-shum-ukin, his co-equal brother, the Crown Prince of Babylon, on the throne of Babylon.

At Esarhaddon’s death the plan of succession went into effect and Assurbanipal, in accordance with his father’s will, assumed the crown of Assyria.

Despite the impression of full manhood conveyed by muscular bodies, heavy-set, and full beards, the Assyrian kings, at least Sennacherib, Esarhaddon, and Assurbanipal, must have mounted successively the throne in their primes. The time of the Sargonids, from the beginning of Sargon II’s reign in the year of the fall of Samaria till the time of the fall of Nineveh in the days of Sin-shar-ishkun, successor of Assurbanipal, amounted to only 110 years (722 to -612). They were married early and became fathers in their teens. Being young did not keep them from exhibiting cruelty of character. When Assurbanipal replaced his father Esarhaddon, who reigned but twelve years, he sought out anybody who possibly could have been implicated in the temple assassination of his grandfather Sennacherib and, according to his own words,

I tore out the tongues of those whose slanderous mouths had uttered blasphemies against my lord Assur and had plotted against me, his god-fearing prince; I defeated them (completely). The others, I smashed alive with the very same statues of protective deities with which they had smashed my own grandfather Sennacherib—now (finally) as a (belated) burial sacrifice for his soul. I fed their corpses, cut into small

pieces, to dogs, pigs, *zibu* birds, vultures, the birds of the sky and (also) the fish of the ocean. After I had performed this and (thus) made quiet (again) the hearts of the great gods, my lords, I removed the corpses of those whom the pestilence had felled, whose leftovers (after) the dogs and pigs had fed on them were obstructing the streets, filling the places (of Babylon), (and) of those who had lost their lives through the terrible famine.⁽³⁾

Immediately upon asserting his kingship, Assurbanipal made preparations for a campaign to recover Egypt. The sudden death of Esarhaddon had given a respite to Tirhaka, and for a number of years the Ethiopians ruled the land unopposed. Assurbanipal in his account of the events that led to his Egyptian campaign narrates how “Tirhakah (*Tarqu*) without permission of the gods, marched forth to seize Egypt~.~.~. the evil treatment which my father had given him had not penetrated his heart~.~.~. He came and entered Memphis. That city he took for himself.”⁽⁴⁾

There is no word of any resistance on the part of the Assyrian-appointed kings and governors: When Tirhaka “sent his army to kill, to plunder, to despoil” Egypt, they appealed to Assyria for aid. “I was walking round in the midst of Nineveh,” recounts Assurbanipal, “when a swift courier came and reported to me.” And “my heart was bitter and much afflicted.” There and then Assurbanipal vowed “to make the greatest haste to aid the kings and governors, my vassals.”

For the reconquest of Egypt Assurbanipal relied heavily on foreign troops from his dependencies on the Phoenician coast and the vassal kings of Cyprus.⁽⁵⁾

In the year -667 a great army was assembled and set out on the road to Egypt. “With furious haste they marched.” Assurbanipal did not personally participate in the campaign, but entrusted this task to his generals. “Tirhaka, king of Kush, heard of the coming of my armies in Memphis.” The Ethiopian king sent his men to meet the enemy, but they were no match for the Assyrian army, made up of the assembled troops of a score of nations. Assurbanipal wrote simply: “On the wide battlefield I accomplished the overthrow of his [Tirhaka’s] army” ; “his fighting men [my troops] destroyed with the sword.” When the news of the defeat reached Tirhaka in his residence in Memphis, “terrible fear struck him.” He made up his mind to flee: “To save his life in a ship he sailed; his camp he abandoned and fled alone.” Tirhaka retreated up the Nile to Thebes (Ni), while the Assyrians took Memphis together with the ships of the Ethiopian fleet. “A messenger of good tidings hastily returned and told me.” For the Assyrians this was an important strategic gain, for it enabled them to quickly press their attack southward; they were joined by the local kings who had been suppressed under the Ethiopian domination.

It took but ten days for the Assyrian-led army to reach Thebes—yet on their arrival the soldiers found that Tirhaka was no longer there. He had forsaken the city and, crossing the Nile, established for himself on the opposite bank a fortified place. The

Assyrian generals were content for the time being to leave Tirhaka in peace.

5. The twenty-two kings on who Assurbanipal called for support for his Egyptian campaign (Cyl. A, col. I, 1. 71) are apparently the same twelve kings from the seacoast and ten kings from Iadnana (Cyprus), named in the annals of Esarhaddon.

Dakhamun

In the course of the brief reign of Ramses I (Necho I), Tirhaka, who had fought against Sennacherib, Esarhaddon and Assurbanipal, died at his capital of Napata. In Assurbanipal's words, "The night of death overtook him." ⁽¹⁾ He left behind, widowed, his chief wife Duk-hat-amun, but no sons—a son and another wife had been captured years earlier by Esarhaddon in Memphis and deported to Assyria. The succession to the Ethiopian throne would pass through Duk-hat-amun if she could find a husband of royal blood; if not, Tirhaka's nephew, Tandamane, was next in the line of succession.

In the biography of Suppiluliumas, compiled by his son Mursilis, there is quoted a letter from a queen of Egypt named Dakhamun: "My husband died," she wrote, "and I have no son. People say that you have many sons. If you were to send me one of your sons, he might become my husband." ⁽²⁾ She added she did not wish to marry a commoner from among her subjects. Since the reign of Suppiluliumas has been placed about 600 years before the reign of Tirhaka, the identity of Dakhamun has remained a mystery. She is usually identified as one of Akhnaton's daughters. But of all the queens of ancient Egypt, only one had a name that corresponds to Dakhamun of the annals of Mursilis—namely, Duk-hat-amun, the widow of Tirhaka.

A request of this kind was unheard of, and Suppiluliumas sought the advice of his consellers, exclaiming: "Since of old such a thing has never happened before me!" They advised caution: He should first assure himself that no deception was being planned. It was decided that the royal chamberlain should be sent to Egypt to find out "whether perhaps they have a prince" and "do not really want one of my sons to take over the kingship."

Dakhamun answered in a letter: "Why do you say: 'They may try to deceive me' ? If I had a son, would I write to a foreign country in a manner which is humiliating to myself and to my country? You do not trust me and tell me even such a thing. He who was my husband died and I have no sons. Shall I perhaps take one of my servants and make him my husband? I have not written to any other country, I have written only to you. People say you have many sons. Give me one of your sons and he is my husband and king in the land of Egypt."

At this, Suppiluliumas "complied with the lady's wishes," and sent her a prince.

But a few weeks later the news arrived that the prince had been assassinated. Whether this was done by the Assyrians, who held control over Syria-Palestine, as well as

northern Egypt, or whether a court intrigue by the opponents of Duk-hat-amun caused the prince's death is not known.

The Sack of Thebes

The assassination of Suppiluliuma's son frustrated Dakhamun's hopes of retaining royal power, and the reigns of government passed on to Tirhaka's nephew, Tandamane.⁽¹⁾ On Tandamane's accession the Ethiopians renewed their drive to dominate Egypt. Tandamane fortified Thebes and Heliopolis, and besieged the Assyrian garrison of Memphis.

We know from Herodotus that Necho I, called by him Necos, was killed by the Ethiopians after a very short reign.⁽²⁾ His son, a youth, escaped to Palestine and lived there in exile. But "when the Ethiopian departed by reason of what he saw in a dream, the Egyptians of the province of Sais brought him [the son of Necho] back from Syria."

The Ethiopian left Egypt not so much because of a dream, but because of Assurbanipal, who was marching against Egypt and Ethiopia in all haste. "Against Egypt and Ethiopia I waged bitter warfare and established my might." This was the second campaign of Assurbanipal against Egypt. "Tandamane heard of the approach of my expedition (only when) I had (already) set foot in Egyptian territory." The Assyrian troops "defeated him in a great open battle and scattered his (armed) might." Tandamane abandoned Memphis, "fled alone and entered Thebes, his royal residence." But Assurbanipal's army followed in close pursuit. "They marched after him, covering a distance of one month in ten days on difficult roads as far as Thebes." The Ethiopian did not risk another confrontation with Assurbanipal: "He saw my mighty battle array approaching, left Thebes, and fled to Kipkipi." Never again did the Ethiopians transgress the frontier of the Sudan.

Thebes now lay prostrate before Assurbanipal's troops and was "smashed (as if by) a floodstorm." Its chief citizens were led into captivity. Isaiah's prophecy about Egypt was fulfilled: "So shall the king of Assyria lead away the Egyptian prisoners, and the Ethiopian captives, young and old, naked and barefoot, even with their buttocks uncovered" (20:4). Assurbanipal boasted of having carried away "inhabitants, male and female." Besides, he wrote, "I carried off from Thebes heavy booty, beyond counting," and he listed silver, gold, precious stones, fine horses; even two obelisks covered with "shining copper" were pulled down and carted off to Assyria. "I made Egypt (*Musur*) and Nubia (*Kush*) feel my weapons bitterly and celebrated my triumph. With full hands and safely I returned to Nineveh." Many years later the prophet Nahum recalled "populous No (Thebes) that was situated among the rivers~.~.~ Ethiopia and Egypt were her strength and it was infinite~.~.~ Yet was she carried away, she went into captivity: her young children were dashed into pieces at the top of all her streets: and they cast lots for her honorable men, and her great men were

bound in chains.”

Seti-Psammetich, the young exile, returned to Egypt following the chariot of Assurbanipal.

2. Herodotus II. 152. Herodotus’ statement calls for a correction. Not Sabacos (Shabaku) but Tandamane, son of Sabacos, killed Necos. See E. Meyer, *Geschichte des Alten Aegyptens* (Berlin, 1887), p. 325; also A. Spalinger, “Assurbanipal and Egypt: A Source Study,” in *Journal of the American Oriental Society* 94 (1974), p. 323.

Necho I

The new administration set up in Egypt at Assurbanipal's behest consisted again of the twenty governors and vice-kings appointed earlier by Esarhaddon. At the head of the list was Necho, who received Memphis and Sais as his share—two of the most important cities of the period.

But the governors were not content with their subordinate position under an Asiatic overlord. As told by Assurbanipal, "their hearts plotted evil." They sent mounted messengers to Tirhaka, saying: "Let brotherhood be established among us, and let us help one another. We shall divide the land in two, and among us there shall not be another lord." But soon the Assyrians caught wind of the plot: "An officer of mine heard of these matters and met their cunning with cunning. He captured their mounted messengers together with their messages, which they had dispatched to Tirhaka, king of Ethiopia." ⁽¹⁾ The Assyrian reaction was characteristically swift and decisive: The governors were arrested, bound in chains, and sent to Nineveh to face the wrath of Assurbanipal.

There followed a wave of savage reprisals in the cities of Egypt against the civilian population. The soldiers "out to the sword the inhabitants, young and old~.~. they did not spare anybody among them. They hung their corpses from stakes, flayed their skins, and covered with them the wall of the towns." ⁽²⁾ It happened as Isaiah had prophesied when he warned that the Egyptians would be given "into the hand of a cruel lord; and a fierce king shall rule over them." (19:4).

When the twenty governors reached Nineveh, all save one were put to death: only Necho, vice-king of Memphis and Sais, was allowed to live. Assurbanipal, in need of a reliable ally to govern Egypt and keep it safe from the Ethiopians, chose Necho to be sent back to the country as its sole king. "And I, Assurbanipal, inclined towards friendliness, had mercy upon Necho, my own servant, whom Esarhaddon, my own father, had made king in Kar-bel-matate [Sais]." The king of Assyria secured Necho's allegiance by "an oath more severe than the former. I inspired his heart with confidence, clothed him in splendid (brightly-colored) garments, laid upon him a golden chain as the emblem of his royalty~.~. Chariots, horses, mules, I presented to him for his royal riding. My officials I sent with him at his request." ⁽³⁾

This Necho lives in history as Ramses I of the Nineteenth, and Necho I of the Twenty-sixth Dynasties. He was installed by Assurbanipal in ca. -655, a score of years after Haremhab's final expulsion. We shall continue, in this reconstruction of history, to refer to him as Ramses I, although an earlier king of that name, Ramses Siptah, held

the throne briefly decades earlier, in the time of Sargon II, and might therefore have a better claim to that title.

It is sometimes surmised that it was Haremhab who appointed Ramses I to the throne; but the course of this reconstruction makes it evident that some twenty-two years passed from the time of Haremhab's expulsion by Tirhaka (ca. -688) and the accession of Ramses I (ca. -665). Historians have wondered that none of the extant inscriptions of Ramses I contains any reference to Haremhab, and that no traceable relation of Ramses I to the family of Haremhab has been found.⁽⁴⁾ Instead, Ramses I calls himself "Conductor of the Chariot of His Majesty," "Deputy of His Majesty in North and South," "Fanbearer of the King on His Right Hand."⁽⁵⁾ The similarity of these titles to those borne earlier by Haremhab has been noted⁽⁶⁾—as we saw, both Haremhab and Ramses I were appointees of Assyrian kings: Haremhab of Sennacherib and Ramses I of Assurbanipal.

Assurbanipal also elevated Necho's son to the position of co-rulership with his father, and let him reign in Athribis. The Assyrian called him Nabushezibanni, but the Greek authors knew him as Psammetichos. In his own inscriptions he names himself Seti Meri-en-Men-maat-Re, or Seti Ptah-Maat. It is known from Egyptian sources that Seti was co-regent with his father Ramses I.⁽⁷⁾

In both his existences, Ramses I--Necho I lived only one year and a few months after being crowned.⁽⁸⁾

8. [Ramses I reigned, according to Manetho, for one year and four months; This is confirmed by a stele dated to his second year (Gardiner, *Egypt of the Pharaohs*, p. 248. The length of Necho's reign can be determined from the Assyrian documents: It began ca. -655 when he was installed by Assurbanipal, and ended in -664/663 with his assassination by Tandamane. The Egyptologists, looking for Necho's monuments apart from those of Ramses I, have failed to find any inscriptional evidence whatsoever for the reign of

The First Greeks in Egypt

When upon the death of Necho Assurbanipal reconquered Egypt he re-established the system of numerous vice-kings, who “came to meet me and kissed my feet.”

We are informed by Assurbanipal that this governmental organization was discontinued a few years later, when one of the vice-kings took all the power to himself, accomplishing this with the help of the soldiers who arrived in Egypt from Sardis on the Aegean shore of Asia Minor. Gyges was at that time king of Sardis in Lydia.

At first Gyges sent messengers to Assurbanipal: “Guggu (Gyges), king of Lydia, a district of the other side of the sea, a distant place, whose name the kings, my fathers, had not heard, he dispatched his messengers to bring greetings to me.”⁽¹⁾

But after a few years, Gyges ceased to ally himself with Assurbanipal. “His messengers, whom he kept sending to me to bring greetings, he discontinued.”

According to Assurbanipal, Gyges sent his forces to the aid of the king of Egypt,⁽²⁾ “who had thrown off the yoke of my sovereignty.”

Herodotus wrote that Psammetichos, one of the twelve vice-kings, deposed his eleven co-rulers, and he did it with the help of Ionian and Carian mercenaries. According to Herodotus, the Greek and Carian mercenaries arrived in Egypt in the days of Psammetichos, brought by a gale.

. . . Certain Ionians and Carians, voyaging for plunder, were forced to put in on the coast of Egypt, where they disembarked in their mail of bronze.

. . . Psammetichos made friends with the Ionians and Carians and promised them great rewards if they would join him.⁽³⁾

The Egyptian sovereign placed them in two camps on opposite shores of the Pelusian branch of the Nile and “paid them all that he had promised.”

Moreover he put Egyptian boys in their hands to be taught the Greek tongue; these, learning Greek, were the ancestors of the Egyptian interpreters.

The Ionians and Carians dwelt a long time in these places, which are

near the sea, on the arm of the Nile called the Pelusian, a little way below the town of Bubastis.

Herodotus states they “were the first men of alien speech to settle in that country” (II, 154).

A glance at a historical map of the western shore of Asia Minor reveals that the tiny maritime states of Ionia and Caria jutted well into the border of Lydia, whose capital was Sardis. Gyges was able to provide Egypt with Ionian mercenaries because he had recently occupied Colophon in Ionia.⁽⁴⁾ Thus it appears that Ionians and Carians arrived at the shores of Egypt in mail of bronze, not because of a gale, but because of an agreement with King Gyges of Sardis, as stated by Assurbanipal.

Diodorus of Sicily, too, wrote about the first meeting of the Egyptians with the Greeks on the soil of Egypt, when Ionians and Carians arrived and were hired as mercenaries.

He [Psammetichos] was the first Egyptian king to open to other nations the trading places throughout the rest of Egypt. . . . For his predecessors in power had consistently closed Egypt to strangers.⁽⁵⁾

Diodorus also said that Psammetichos was a great admirer of the Hellenes and gave his son Necho (the future Ramses II), a Greek education.

Greek arms, utensils and vases, and the very bones of the Greek mercenaries in their peculiar sarcophagi, have been found in and near the Delta, often together with objects of the Nineteenth Dynasty.⁽⁶⁾

Formations of mercenaries from Sardis, called Shardana or Sar-an, were in the service of Seti the Great.

The time of Seti is, in the conventional scheme, the end of the fourteenth century; of Psammetichos, the seventh century. Herodotus, who lived in the fifth century, wrote that in the days of Psammetichos, only two hundred years before, Greeks for the first time came to live in Egypt. He must have been well informed, for not merely the history of Egypt was involved but that of his own people likewise: his birthplace was Halicarnassus in Ionia-Caria. Also, in Beth-Shan in Palestine, where the excavators were able to determine the successive layers of the tell (mound), tombs of mercenaries from the Aegean-Anatolian region have been unearthed. “Doubtless among all these troops [of Seti] were many Mediterranean (Aegean-Anatolian) mercenaries, including the redoubtable Sherdenen [Shardana]; these must have formed the major part of the garrison left at Beth-shan by Seti.”⁽⁷⁾ Thus wrote the archaeologist of that place.

Does this mean that Lydians and Ionians were present in Egypt when the Israelites were there in bondage? If, as many scholars believe, Ramses II was the Pharaoh of Oppression, the presence of soldiers from the Aegean-Anatolian region in the Delta in his days in the days of his father Seti would signify a meeting of Greek and Israelite peoples in pre-Exodus Egypt. The problem thus stated will not appeal to those same historians.

The explanation of the presence of Greek mercenaries in the army of Seti, seven hundred years before Psammetichos, is simple: Seti was the Psammetichos of Herodotus and other Greek writers, and he lived seven hundred years after the time assigned to him by modern historians.

Seti Becomes an Ally of Assurbanipal

Two campaigns against Egypt and Ethiopia and one against Tyre, and Assurbanipal found himself surrounded by enemies. The instigator was his brother Shamash-shum-ukin, to whom Esarhaddon had bequeathed Babylonia, leaving Assyria to Assurbanipal. Shamash-shum-ukin corresponded with Tirhakah the Ethiopian until the death of the latter, and with the kings of Elam, Aram (Damascus), and other countries that were alarmed by Assyria's aggressive policy.

After a campaign toward Elam, whose king "plotted" against him, Assurbanipal became aware that his own brother was his chief enemy. "In these days Shamash-shum-ukin, the faithless brother of mine, king of Babylon, stirred to revolt against me the people of Akkad, Chaldea, the Arameans . . . along with the kings of Gute, Arnurru and Melukha [Ethiopia] ." [\(1\)](#)

Assurbanipal was no longer able to interfere in the affairs of Egypt, and Seti succeeded in overcoming the eleven vice-kings of the nomes and regained the throne of his father. The revolt stirred up all around Assyria absorbed Assurbanipal's entire attention. In the fraternal war he captured Babylon, and his brother Shamash-shum-ukin killed himself. But a number of years later a new opponent, an untiring avenger, arose in the person of Nabopolassar.

Nabopolassar, together with the king of the Medes, waged a protracted war against Assurbanipal, who desperately needed an ally. Assurbanipal found him in Seti, whose father had been pardoned and crowned by him. In this way Seti rose from the status of a vassal to that of a partner of the Assyrian king in a long war.

Seti may have numbered the years of his reign from the day he became the sole king of Egypt, or from the day he achieved independence for Egypt and was recognized as Assurbanipal's ally. This explains the fact that already in his first year Seti, in recording his accomplishments, could refer to his campaigns in Palestine, Arabia, and Libya. [\(2\)](#)

The princes of Babylon, Nabopolassar and his brother, revolting against Assyria, sent emissaries to Aleppo, Hamath, and Damascus, and to the chieftains of the unsettled tribes of the desert, inciting them to create disturbances in the Assyrian domain. At that time, in the reign of Assurbanipal, the provinces were ruled more by anarchy than by the will of the despot. Usurper replaced usurper, to be assassinated in his turn, and there was neither order nor authority in northern Palestine and Syria. "They have

taken to cursing and quarrelling, each of them slaying his neighbor, “⁽³⁾ wrote Seti.

He moved into Galilee. The land of the Ten Tribes was desolate after the exile, and the new settlers were unable to protect their habitations against bands from the desert or even against wild beasts (II Kings 17:25f.).

In the days of Esarhaddon and Assurbanipal, Menashe (Manasseh), son of Hezekiah, reigned in Judea. For fifty-five years he occupied the throne of Jerusalem. The Scriptures do not mention any war of Menashe, only his being carried away into a short captivity in Babylon. In those turbulent times fifty-five years could hardly have passed without involving Judea more than once in greater or lesser conflicts. Menashe certainly must have been successful in his politics if he could keep Judea out of war that long.

Seti repeatedly led military expeditions toward the Euphrates; he also took measures to secure the safety of the cities of Galilee and defended them against bands from the desert. His activities in Galilee and his numerous marches across the plains of the Philistines, close to Judea, might easily have infringed on Menashe’s territorial rights. But apparently Menashe leaned toward Assyria and Egypt; he called his son Amon, a sacred name among the Egyptians. He tried to avoid a major conflict.

The latter part of Menashe’s long reign coincided with the earlier part of the long reign of Seti, and it would be strange indeed if, in Seti’s account of his march to Galilee and Syria, he did not mention Menashe. With this thought in mind, it is worthwhile to reread the annals of Seti. There we find Seti’s boast that he had “set terror in Retenu [Palestine],” had taken from there “every costly stone of God’s land,” and had “beat down the men of Menate (M-n-ty).” The men of Menate, twice named in this passage of Seti’s annals,⁽⁴⁾ are the men of Menashe. We have here the name we had every reason to expect to find, inasmuch as Seti and Menashe were contemporaries.

The question, ‘Why do the Scriptures not mention the presence of a pharaoh in Palestine in the days of Menashe?’ is not the point. Although the Scriptures contain no reference to this fact, the historians admit that a pharaoh went with his army on a prolonged expedition to Palestine in the time of Menashe, but they call him Psammetichos, as Herodotus narrated.

The reason for the omission on the part of the Scriptures is at hand. Since the time of Hezekiah, the father of Menashe, the land of the Ten Tribes had been settled by non-Israelites, and the Books of Kings and of Chronicles no longer occupy themselves with the history of the place, in respect to this or any other event.

"Not far into Asia, Seti apparently meets a fortified town, to which the relief gives the name Pekan [Pekanon]. . . . Exactly what this name means here is not certain.”⁽⁵⁾
A scene on a bas-relief illustrates the occupation of the fortress Pekanon in Palestine.

The accompanying inscription reads:

Town of Pekanan (P' -k' -n' -n'), Year I, King of Upper and Lower Egypt, Menmare (Seti). The destruction which the mighty sword of Pharaoh made among the vanquished of the Shasu (invading Bedouins) from the fortress of Tharu (in Egypt) to Pekanan, when his majesty marched against them like a fierce-eyed lion, making them carcasses in their valleys, overturned in their blood. . . .” ⁽⁶⁾

A few other places in the plain of Jezreel are also mentioned as having been occupied with the intention of repelling the invasion of the foreigners, but prominence is given to Pekanon.

No reference to the city of Pekanon is found in previous lists of Palestinian cities compiled by the pharaohs, nor had the Israelites found a city by that name when they occupied Canaan. Some scholars presume that it may mean Pi-Canaan or “The Canaan,” but others disagree. ⁽⁷⁾ The name has the sign of a country, but it is pictured on the bas-relief as a city. This suggests that the city was the capital of a country.

The city of Pekanon must have existed for but a short moment. It is conceded that Egyptian documents before Seti (whose reign, according to the conventional chronology, started in -1310) do not know such a city. Hebrew annals containing a list of the Palestinian cities of the thirteenth century (the supposed time of the conquest by Joshua) do not know it either. In the Egyptian sources Pekanon is met once more on the stele of Merneptah (the grandson of Seti), who mentions the Israelites in Palestine. Thus the name Pekanon became a hopeless issue in historical geography.

Pekanon was a city fortified by Pekah, the next to the last king of Israel. ⁽⁸⁾ Cities built, rebuilt, or fortified by kings were often named in their honor. Pekah, son of Remaliah, reigned in Samaria

for twenty years (II Kings 15:27). He was a ruler eager for enterprises, from the day he slew Pekahiah, his master, until the day he slaughtered 120,000 people of Judah and “carried away captive of their brethren two hundred thousand” (II Chronicles 28:8), only to release them shortly thereafter.

According to the reconstruction of history offered here, Pekah preceded Seti the Great by two generations. This order of things explains why, in the list of Thutmose III containing the names of hundreds of Palestinian and Syrian localities, the name of Pekanon does not appear, and why, in the biblical register of cities of Canaan, there is no mention of this name in the days of Joshua’s conquest or later. Judging by the significance attached to Pekanon in the records of Seti, it was an important city in or near the Esdraelon Valley, renamed by King Pekah, who rebuilt or fortified it.

8. The form "Pekanon" is derived from Pekah, like Shomron from Shemer (I Kings 16:24). Pekanon could also be Shomron (Samaria) renamed by Pekah.

The End of Nineveh

Seti, who, as an ally of Assyria, took it upon himself to attend to rebellious Syria, moved with his army along the Esdraelon Valley and came to the city of Beth-Shan not far from the Jordan. A stele of Seti was found in Beth-Shan, the inscription of which reads:

The wretched enemy who was in the city of Hamath, he had collected to himself many people, was taking away the town of Beth-Shan...⁽¹⁾

The stele further states that the Egyptian army of Ra, called also “Many Braves,” captured the city of Beth Shan at the command of the pharaoh. The erection of the stele in that place indicates that Seti succeeded in conquering this city-fortress.

Beth-Shan guards the road from Gilead in Trans-Jordan and also from Galilee along the valley of the Jordan; consequently it is an important strategic point at a crossroads, protecting the eastern gate of the Esdraelon Valley against encroachment from the north and east.

In the days of Assurbanipal’s father, Esarhaddon, the Scythians came down from the steppes of Russia and, crossing the Caucasus, arrived at the lake of Urmia. Their king went to the help of Assur-banipal when the Medes and the Babylonians marched against Assyria.⁽²⁾

Herodotus⁽³⁾ narrates that the Scythians descended from the slopes of the Caucasus, battled the Medes who were pressing on Nineveh, and, moving southward, reached Palestine. There they were met by Psammetichos, the pharaoh, who for a long time tarried in Palestine.

Chapters 4-6 of the young Jeremiah are generally regarded as expressing the fear of the people of Palestine at the approach of the Scythian hordes. The prophet spoke of the evil that would come down from the north and a great destruction (4:6), of whole cities that would “flee for the noise of the horsemen and bowmen” (4:29), of “a mighty nation . . . whose language thou knowest not” (5:15). “Behold, a people cometh from the north country, and a great nation shall be raised from the sides of the earth” (6:22).

The Egyptian king, however, succeeded by persuasion in halting their advance toward Egypt. He, like the Scythians, was an ally of Assurbanipal. According to Herodotus, Psammetichos was besieging a city in Palestine when the Scythians

reached that country.

I have identified Seti the Great with Psammetichos of Herodotus. Now we are bound to ask: What city was Psammetichos besieging when the Scythians descended from the north?

The translation of the Seventy (Septuagint) calls Beth-Shan by the name of Scythopolis;⁽⁴⁾ so do Josephus⁽⁵⁾ and Eusebius.⁽⁶⁾ Georgius Syncellus,⁽⁷⁾ the Byzantine chronologist, explained that the use of the name Scythopolis for Beth-Shan was due to the presence of Scythians, who had remained there from among the invading hordes in the days of Psammetichos.

As has been said above, Beth-Shan was besieged and occupied by Seti, and his steles and the graves of the Greek mercenaries who served with him were discovered there. Ramses II, his successor, also occupied Beth-Shan for some time, but no vestiges have been found there of Egyptian kings of later times. The conventional chronology compelled the archaeologists of Beth-Shan to conclude that after Seti and Ramses II the city was practically uninhabited until the time of the Neo-Babylonian Empire in the seventh century, although from the Scriptures we know that Beth-Shan was an important city in the days of Judges and Kings.

Seti-meri-en-Ptah Men-maat-Re, who left his steles in Beth-Shan, was Psammetichos of Herodotus. It was the seventh century.

There is a mural that shows Seti capturing a city called Kadesh.⁽⁸⁾ Modern scholars recognized that this Kadesh or Temple City was not the Kadesh mentioned in the annals of Thutmose.⁽⁹⁾ Whereas the Kadesh of Thutmose was in southern Palestine, the Kadesh of Seti was in Coele-Syria. The position of the northern city suggested that it was Dunip, the site of an Amon temple built in the days of Thutmose III. Dunip, in its turn, was identified as Baalbek.⁽¹⁰⁾

Following the Orontes, which has its source not far from Baalbek, Seti occupied the site of Tell Nebi-Mend near the village of Riblah and built a fortress. A fragment of a stele of his was unearthed there.⁽¹¹⁾ Then he proceeded farther to the north and fought in the valley of the Euphrates. In his war record on the wall of the Karnak temple he wrote that he fought in Mesopotamia (Naharin), but with the destruction of the upper row of his bas-reliefs the illustrations of this part of the campaign were lost.⁽¹²⁾

The war in the valley of the Euphrates is described by Seti, king of Egypt, by Assurbanipal, king of Assyria, by Nabopolassar, king of Babylonia,⁽¹³⁾ and by Greek authors.⁽¹⁴⁾ But there is still another description of this war. We have documentary sources in the so-called Hittite annals. The Annals of Mursilis describe the very same conflict as the Chronicle of Nabopolassar, Nabopolassar and Mursilis being the same

person. However, I leave the narration of this last phase of Seti's long campaign for the volume *Ramses II and His Time*.

Nabopolassar, the Chaldean, was allied with Cyaxares, the king of the Medes and the prince of Damascus; Assurbanipal and after him Sin-shar-ishkun of Assyria were aided by Pharaoh Seti and for some time by the king of the Scythians. Egyptian troops are mentioned for the first time in Nabopolassar's year 10 (-616). For many years the fortunes of war changed camps. Then Nabopolassar and Cyaxares, the Mede, brought the Scythians over to their side. Their armies advanced from three sides against Nineveh. In August of the year -612 The dam on the Tigris was breached, and Nineveh was stormed. In a single night the city that was the splendor of its epoch went up in flames, and the centuries-old empire that ceaselessly carried sword and fire to the four quarters of the ancient world—as far as Elam and Lydia, Sarmatia and Ethiopia—ceased to exist forever.

“The shield of [the] mighty men is made red, the valiant men are in scarlet; the chariots are fire of steel. . . . The chariots rush madly in the streets, they jostle one against another in the broad places; the appearance of them is like torches, they run to and fro like the lightnings. . . . Hark! the whip, and hark! the rattling of wheels; and prancing horses, and bounding chariots; the horsemen charging, and the flashing sword, and the glittering spear; and a multitude of slain, and a heap of carcasses . . . and they stumble upon their corpses. . . . Nineveh is laid waste; who will bemoan her?”

Thus did Nahum, a contemporary seer, describe the end of Nineveh and Assyria.⁽¹⁵⁾

The Assyrian king Sin-shar-ishkun perished in the flames of his own palace. His brother Ashurballit succeeded in escaping and with Egyptian assistance resisted Nabopolassar for a few more years.

Nabopolassar founded the Neo-Babylonian Empire and defended and strengthened it in endless wars. When he was struck by illness and after a time died, the empire was threatened with disintegration. But his young sons successfully defended it against all enemies. The most formidable among the latter was the new king of Egypt, the successor to Seti.

How I Arrived at My Concepts

I have often been asked to explain how I arrived at the concepts expressed in my books. I shall try to tell the story as briefly as possible.

I think that it was at my fortieth birthday (1935) that my father gave me as a present the Hebrew book by Bar-Droma, *Negeb* ("The South"). Busy as I was with medical practice, I did not read the book, and only opened it at a few places and chanced to read that according to somebody's view, Mt. Sinai was a volcano.

In the summer of 1937 I was in Paris to read a paper at the International Psychological Congress. In the Bibliotheque Nationale I read the articles of Freud in *Imago* about Moses. When in the Spring of 1939 the articles appeared as a book, *Moses and Monotheism*, I bought a copy in a Tel-Aviv bookstore. The reading of this book brought me to the surmise that pharaoh Akhnaton, who Freud thought to be the originator of monotheism and a teacher of Moses, was in fact the prototype of Oedipus of the Greek legend. In a few weeks I had a rather convincing list of supporting evidence, but the meager Tel-Aviv library did not suffice for the kind of research I needed to do. I planned a sabbatical year in the United States to write a book on "Freud and his Heroes." I arrived there with my family on the eve of World War II. The next eight months I spent in the Public Library on Forty-second Street in New York, reading on the subject, mostly the Egyptological material on the el-Amarna period. At the very beginning of these efforts, the Egyptologist Otto Ranke (whom I met at the Metropolitan Museum of Art in New York) gave me some guidance, yet tried strongly to dissuade me from pursuing my subject. However, I persisted.

At the beginning of April, 1940, we intended to return to Palestine, but at the last moment decided to remain a little longer. About that time, discussing with Dr. Gruenbaum, a rabbinical scholar who came to see me at our home on the fifth floor of 5 Riverside Drive, I came upon the idea that the Dead Sea might be of recent origin, because in the story of Sodom and Gomorrah the place is referred to as a plain. The idea had already visited me while still in Palestine, and at that time a check in the *Encyclopaedia Britannica* led me to an article by W. Irwin in the *Geological Journal*, printed in England. The calculation of the age of the sea based on the accumulation of salts in it showed that the sea, actually a lake, was not a million years old (the Tertiary period), but only fifty thousand years. Revising these figures (taking as a base for calculation different salts and considering other sources of accretion besides the Jordan), I came to an even more recent age for the Sea. During the discussion that took place with the visiting scholar, I remembered that in some passage dealing with the Exodus the Dead Sea was referred to as recently created. I also remembered the

sentence I had read in Bar Droma's book on the Sinai and surmised that the Exodus took place in catastrophic circumstances. The story of the plagues and of the passage of the sea appeared to me as a description of some calamities in nature.

We decided to extend our stay in the United States. I looked for an Egyptian reference to natural catastrophes. In the textbooks on Egyptian history nothing was mentioned. I read the pamphlet of Charles Beke⁽¹⁾ (the author of the idea referred to by Bar Droma), who maintained that Mount Sinai was a volcano. At the occasion of a small social gathering at the home of Dr. Paul Federn, the renowned psychologist, I put the question before a visitor, an Egyptologist from Vienna, and before Dr. Walter Federn, also an Egyptologist, the son of Paul Federn. The former asked the latter—where is the reference about the Nile turning to blood? (I did not wish to disclose my thesis and was all ears). Walter Federn referred me to a book by Junker (under whom he studied) and Delaporte. The next day in the library on Forty-second Street I read the passage: it referred to words of one Ipuwer. Next I needed to find who Ipuwer was and locate the complete text.

At the Metropolitan Museum of Art I asked the help of Dr. W. C. Hayes. For over an hour he searched in the staff library room and, finally, I myself found on the shelves the text and translation of a papyrus stored in Leyden, Holland, since the early nineteenth century, published by Alan H. Gardiner in 1909 under the title "Admonitions of an Egyptian Sage." Studying the text, I became convinced that I had before me not just a story of a social revolution, but the Egyptian version of the plagues described by an eyewitness, and it was surprising to me that Gardiner had not observed these similarities between the Ipuwer text and the Biblical account of the plagues accompanying the Exodus. Even the wording is similar in both texts—later, in *Ages in Chaos*, I published a detailed comparison of the two sources. This was about April 20, 1940. But the true advance came a few weeks later when I realized that the Amu, who were described as having invaded Egypt while the country lay prostrate, were the Amalekites, met by the Israelites moving out of Egypt, as narrated in the Scriptures. A book on the Amalekites by Noeldeke⁽²⁾ was not in the Forty-second Street Library (one of the greatest in the world) and I went for the first time to the Columbia University Library. From Noeldeke I learned that the Arab authors of the Golden Age of Arab literature claimed that the Amalekites, coming from Mecca, had invaded Egypt and ruled over the country for several centuries at some ancient time. Noeldeke disbelieved this persistent tradition, but for me it was a strong support to what I considered a breakthrough.

This was in June 1940, and in a few days the entire plan of *Ages in Chaos* was born in my mind. I am myself surprised when looking through my one-line notes made in the excitement of the discovery, that in a couple of days I had already concluded not only that the Eighteenth Dynasty in Egypt must be contemporary with the kings of David's Dynasty, but arrived even to such a detail as that Haremhab, assumed to be the last of the Eighteenth Dynasty, was actually an appointee of King Sennacherib, the Assyrian king—a difference of over six hundred years between the accepted chronology and my new time table.

I knew of course of the el-Amarna tablets, found in King Akhnaton's short-lived capital, that contain the royal correspondence of the late Eighteenth Dynasty,⁽³⁾ but I had never read the text of the tablets. I remember going to the library of the Metropolitan Museum of Art with the expectation of finding in those tablets letters of king Jehoshaphat of Jerusalem, of king Ahab of Samaria, and of the kings Ben-Hadad and Hazael of Damascus—and I found them there. Similarly I went to the library on Forty-second Street, and Elisheva, my wife, who participated with me in my searches, brought from the shelves the description of the “Punt” expedition of Queen Hatshepshe (Hatshepsut) who, according to my calculations, must have been the Biblical Queen [of] Sheba. The historian Josephus Flavius described her as the queen “of Egypt and Ethiopia.” I expected to see in the reliefs reproduced in that book how the Israelites of the time of Solomon looked, and almost with trepidation I opened the volume. Next I expected to see the treasures of Solomon's temple as the booty of Thutmose III, who followed Hatshepsut on the throne, and in the historical atlas of Egyptian archaeology by Wreszinski I saw pictures of the sacred furniture and utensils of Solomon's temple, even in the same numbers as described in the Scriptures. All these finds were made by me in a matter of days in June 1940. At that time I thought to call the book “From Exodus to Exile” since the reconstruction at that time reached the fall of Jerusalem and the Babylonian Exile. But I had already realized that the “Forgotten Empire” of the Hittites was but the story of the Chaldean kingdom. I thought that I would finish the book in a matter of a few months.

Early in the fall of 1940 we moved to 525 Riverside Drive to a small apartment on the twelfth floor, overlooking the Hudson.

There on about October 20, in the afternoon, sitting at the window of the kitchenette, I read in the book of Joshua. I was struck by the fact that the verse in which the sun and moon are described as disrupted in their motion was preceded by a verse telling of great stones falling from the sky. In the library of Columbia University, which I visited several times each day for the next ten or twelve years, I made a list of books on Chinese and Mexican lore—east and west—to find out whether a disruption in the motion of the sun is mentioned there. From the long list made, one of the first books chosen was by Etienne Brasseur de Bourbourg, a missionary of the last century, and the first decipherer of a few Mayan hieroglyphics.⁽⁴⁾ A passage in the book attracted my special attention—it told that St. Augustine wrote that Varro (a learned Roman of Caesar's time whose books are not extant) referred to two authorities who claimed that in the time of Ogyges Venus changed its form and orbit. It was not more than two weeks, probably less, from the time that I realized that the catastrophes of the times of Moses and Joshua must have been not local but global, that I also realized that Venus must have played a decisive role in the events: I already understood that Ogyges was the Biblical Agog, the king of the Amalekites, mentioned in the blessing of Israel by Balaam in the days of the conquest by Joshua. For the next ten years I worked simultaneously on *Ages in Chaos* (a reconstruction of ancient political and cultural history) and *Worlds in Collision* (a reconstruction of natural events).

Early in my work I became convinced that not only is the cosmology of the solar system very different from what is thought, but also the celestial mechanics that claims that only inertia and gravitation participate in the spheres above will need re-examination and so also the Darwinian evolution based on the principle of uniformitarianism or gradualism.

Soon I became aware that I had precursors—one was William Whiston, successor to Newton at Cambridge, who at the end of the 17th century claimed that the Deluge had been caused by a comet that was seen in 1680. The “miracle of Joshua” however, Whiston dismissed as a worthless piece of folk fantasy. He considered that prior to the Deluge the Earth’s axis of rotation had been perpendicular to the ecliptic, and therefore there were no seasons and that the year had exactly 360 days. Ignatius Donnelly, a member of the House of Representatives, in the later part of the 19th century wrote a book, *Ragnarok*, in which he claimed that in prehistoric times a comet had passed near the Earth and showered till over that part of the globe that happened to be turned toward it. A. Olrik, a Scandinavian author, wrote another book under the same title. Neither one of these two gave any indication of being aware of the work of Whiston. Georges Cuvier, the famous paleontologist, claimed catastrophic interruptions in the history of the globe but made sarcastic remarks about Whiston. Dr. Walter Federn drew my attention to the work of the Viennese engineer Hoerbiger who claimed that thin ice pervades the universe, causes shifts in orbits, the repeated captures of successive moons, and their disintegration millions of years later. [\(5\)](#)

With Whiston I agreed as to the Deluge having been caused by a comet; but I had much more to say: Saturn was disrupted by the close approach of Jupiter, and exploded; the explosion of Saturn engulfed the Earth and other planets. This is the story of Tammuz of the Babylonians and of Osiris of the Egyptians, and of Kronos of the Greeks. Centuries later Venus was born by the fission of Jupiter, which collected much of the material dispersed by Saturn. I concluded that Saturn must be made up largely of hydrogen, a fact I soon found confirmed. From Donnelly and from Bellamy, a follower of Hoerbiger, I used a few literary references to the age of darkness and gave credit in each case.

Ages in Chaos occupied most of my time: soon I revised the chronology of ancient history up to the time of Alexander of Macedon’s arrival in Egypt. For a year and a half I did not tell Walter Federn of my thesis. I showed it to Dr. Schwartz of the Oriental Department of the Public Library, Forty-second Street, and he thought me wrong; besides, he advised me to write in some language I knew well, rather than in my ferocious English. I discussed my work with Ralph Marcus, translator of Josephus Flavius, in his office at Columbia University, and he, though very friendly, advised me, too, to return to my profession and leave history alone. I corresponded with Prof. Harry Wolfson of Harvard and sent to him an early version of *Ages in Chaos* and he gave it to Prof. Robert Pfeiffer. Next I came to see both, and Pfeiffer discussed with me my history and found me knowledgeable, yet reserved judgment.

One winter night, I think it was in January 1942, I told Walter Federn of my reconstruction, and from that time on he was of great assistance to me with his knowledge of the immense literature on Egyptology. He opposed me consistently but never refused information. I had no similar help from any scholar in cuneiform, though Prof. I. J. Gelb of the Chicago Oriental Institute wrote answers to occasional inquiries.

One morning in 1942 I typed (in erroneous English) a number of pages, and went to Washington D.C. There I had a discussion with Prof. F. R. Moulton, co-author with T. C. Chamberlin of the tidal theory of origin of the solar system, and at the National Academy I tried in vain to persuade the Secretary of the Academy to accept my essay for safekeeping. Returning home I had my essay notarized, and in the court downtown had the court clerk authenticate the notary's signature. ⁽⁶⁾

I also devised an experiment to find whether the velocity of light would be influenced by the motion of the illuminating or of the illuminated body. I sent it to Prof. Paul Epstein of the California Institute of Technology, but he assured me, though he did not persuade me, that the issue is settled without an experiment.

Occasionally I would find that some other author had already come to one of the aspects of my theory. Once, I remember, in the library on Forty-second Street, I read the book of an author who advanced the idea that the Pyramids were built to serve as shelters against natural catastrophes, an idea I had already put into writing several years earlier.

In 1945 I put together *Theses for the Reconstruction of Ancient History* and gave it that summer to a printer in Canaan, Connecticut. I published it as a monograph in *Scripta Academica*, a series I started with the funds of my father while still in Palestine and to which Chaim Weizmann and E. Bergmann contributed the first monograph and Prof. A. Fodor, of the Hebrew University, the second. Of the 284 statements in the "Theses," I would today correct only a very few.

Nine publishers rejected *Ages in Chaos* though Prof. Pfeiffer tried to help. Eight publishers rejected *Worlds in Collision*, mostly because of the many footnotes, believing that the book should be brought out by some subsidized academic (University) press. It was contracted by Macmillan in 1947 and published in 1950. The history of its reception is not dealt with here and is partly known. ⁽⁷⁾

Chronicles of Discovery

Marked June 25, 1940

June 20. First time told Elisheva (on Riverside Drive walk) of my idea that coming toward the Israelites leaving Egypt, the conquering Hyksos. The same evening, in the library, I ascertained that this is true. The history must be moved by 700-800 years.

June 21. Read Josephus Flavius Against Apion.

June 22. In Metropol. Mus. of Art Library. Found in Gauthier the name of Tahpanheth. Looked for the first time in T. El Amarna letters by Knudtzon. The name of Abdi-Ashirta, called also Rib-Addi.

June 23. Till afternoon made lists from O.T. Afternoon in the library. Became satisfied from Knudtzon T A that the time is of Jehoshaphat, as also expected.

June 24. With Elisheva in the Hebrew Division of the Library (42nd Str.) The Amalekites were summoning the Israelites to slavery (upon becoming masters of Egypt)

June 25. Afternoon from 3 to 9:45 in the library. I found what I also thought the evening before. Haremhab was placed at the head of Egypt by Sennacherib. I also found confirmed what I thought that either Sethos or Ramses is Necho. By comparing the material about Nebkadnezzar and about Ramses, that Ramses is Necho. The name is mentioned also in Assyrian documents and also in Egypt. "From Exodus to Exile" (the name of the book to write).

June 26. In the library till 3 pm (forgotten to go to dentist) I met Federn. Did not tell him the subject of my work. I completed the search. Now to classify the material. Cuneiform in the letter of El Amarna understandable because this was the time of Assyrian advance toward Egypt.

June 27. Queen of Seba (=Hatshepsut). At once lookup in Encycl—acc. to Josephus, she was queen of Egypt. And what kind of theories. See Koran —I was depressed today and I was weary. Now I read a chapter in Psalms. — It was given me to solve also this riddle (Q. Sheba) and to know that I am building on a firm ground.

June 28. We have sent the children to a camp. In the evening I came afoot to the library and Elisheva also came. On the way I thought that the letter of the widow of

Smenkhkare fits with the story of the Seven Against Thebes and so I learned to know who fought against Thebes. In the Library, Elisheva found the text of the travel of Hatshepsut to Solomon.

This evening we shall not forget. Like drunken wine we sat the evening in the Central Park on our way from the library.

“To remain here till the morning, and in the morning to go again to the library,” said Elisheva. The life was not easy with you but I can say as Wilkie’s wife (he was nominated that day and nothing to envy her) that the life with you was an adventure. We spoke about my father and mother. We felt as if the world opened itself before us. It was fated that we remained on the sixth of April here. Who would believe that in one week all this research was made.

Not to tarry even for a day. To return respect (glory) to the nation. Sheilok situation. We have suffered for [being identified as] Amalek.

Nov. 7, 940

Less than two weeks ago I was reading the book of Joshua, as I undertook to read (a part of the chapters possible for the first time, or for the first time since childhood) up to Sam. II incl. for the chapter Hyksos-Amalekites.

As I came to the chapter 10 of Joshua, the reading instantly caused the association: the sun and moon staying at the sky and the stones which fell—a celestial body passed near by.

I read once that in Koran there is a legend that hot stones fall on sinners (with inscribed names)—I brought this in connection.

I read about Harras in Arabia, scorched by fire, I brought this in connection.

I decided: a change of the movement is possible at an impact like this. And I thought about the ice age. I knew quite nothing about it. I read about ice age. My supposition was right. When it was, why it had the shape (Am. & Eur. but not Asia), why it ceased—no satis. explanation. I measured the center. I found it to be near the Baffine. Then I thought—and where are the magnetic poles? Are they not in vicinity. I went again to the atlas and I found them in vicinity. I explained to myself that the sun is magnetizing the earth, so the poles are the result of the previous age. And now? Must be some other point—between the pole (or the point near the pole where the sun just reaches) and the magnetic pole. Thus exists at 78 degrees n. larg. (Maybe this was the ground of complicated influence?) The pole was previously in America.

At the same time I looked for comets in the old time. The list (Roscher or Wissowa) comets in ancient time started with a later time. I looked in the legends of all nations, the Sacred Books of Orient, Golden Bough—no mention of meteorites. Something in China but later. But I knew I must find it—because at the time the sun stopped, the

night side of the earth had to experience the hardest blow and be in vicinity of our earth. In the legends of the redskin Indians I found about the hot stones falling from the sky. It looked like a description of a comet.

I had to look in the old description from the time before Columbus. I knew nothing about the Indians, but always was interested to have in future a chance to know what was their culture at the time Columbus came. I looked at the catalogue. Thousands books. I chose a list of them. I got nothing interesting. Next day I ordered another book of my list. It was Brasseur de Bourbourg. I found what I knew I must find. The traditions of the Mexicans from before Columbus are full of memories about great catastrophes.

The idea that meanwhile came to me that some—possibly 65— years before the earthquake and eruptions at Exodus were due to the same cause: now the comet returned to continue the destruction. (That an earthquake was at the Red Sea I found since April; together with the idea of new appearance of the Dead Sea it was the beginning of my paper; then I looked for traces in Egypt, up to - after denials on the part of the Egyptologist that any earthquake was—I found Ipuwer witness).

In Mexican sources I found that there were three catastrophes. Their identification as I possess from Brasseur de Bourbourg has satisfied my desire to find these witnesses. I have to read the sources. Meanwhile I write the chapter.

The sky had to change the constellation-view. I found it in Mexican legends. I looked at Job and found it too.

The time-measure underwent a change together with the new order in the axis, orbit, swiftness. This could be the cause why the age of the patriarchs and their contemporaries was longer and just with Joshua this age over 100 ceases. A year was shorter. Maybe under new influences the life is really shorter?

This issue may be the cause of the mistake of some 600 years in the chronology, which I discovered previously, and which let me identify: Hyksos-Amalekites. Saul freeing Egypt from slavery, Queen Seba-Hatshepsut, Shisha-Thutmosis III, El Amarna letters-letter of Jehoshaphat and Ahab or Joram, Sanherib and the time of Horemhab his soldier, Ramses and Necho, etc., etc.

Now the Atlantide disappeared at one of these two catastrophes. Arabia and Africa ceased to be lands of cultivation. Now I knew that hot ... in Arabia-Gulf was the center of the catastrophe.

And neft? May be it was sprayed by the comet?

That Europe and N. America have culture—they owe to the comet.

That we have still a moon and the happy circumstance that at the first catastrophe was full moon, (and in Mexico was day, at the second, it was beginning of the month (moon afternoon)).

The reading of the book of Brasseur de Bourbourg brought me to the idea that Solomon and Hiram were sending their ships to America (Tarshish). I read about Ophir and Tarshish. Would it be at Arabia or in India, they had sent caravans; things and animals that were brought from there exercised the same astonishing effect as the things and animals brought by the conquerors of America. And silver, peacocks (maybe brought just by Phoen. from America are now in Africa) apes (on the picture of Hat-shep-sut I hoped to differentiate what ape this was from O.W or from the N. W.)

Dec. 8. 940.

More than a week ago, when two parts of the chapter about paleont. were already written, I took the liberty to say and repeat: not all of the huge animals in the hall of reptilia (extinct) are reptilia, there must be (the Brontosaurus) mammalia. As the destruction was in historical times they must not be animals of millions years ago. I saw these animals only twice more than a year ago. The story of mutation in Indian tales was in my eyes a reflect of the history. So I told to Elisheva and children I am sure to find in Brontosaurus signs of mammalia.

I me with Elisheva and Ruth in the museum, Saturday a week ago. The pelvis, the jaw and the legs—without that I read any book about zoology at all or knew the signs of mammalia—from the common sense only—were for me the signs I found. Now I wrote the chapter about Brontos. (another animal too) as mammalia.

During the week I read a chapter in one of the encyclopedias that there are extinct mammalia—mammoth and mastodont. Mammoths that were found frozen and in condition of preservation in N.E. Siberia—I could instantly explain: they were killed by the comet and their bodies were few hours later brought into the new polar circle. I read that Mastodont is a name given by Cuvier. I went to the geol. library and read Cuvier, one chapter. thus he begins: Mammoths were found in North, their corpses did not decay; they were killed just before their bodies were frozen. But they could not live in a cold desert. A common ground was for the killing and the change of temperature—a catastrophe.

He is right! Now there is also found by me the cause of all this; the cause that killed (possibly asphyxiated) the animals and turned the land to be cold. —I suppose in N.E. of Siberia rich remnants of culture may be found.-

Since the second part of October (about 20) when I read the book of Jehoshua and at once returned to read two lines before the “sun stopped” about the stones that fell, I realized that...

Dec. 8. 940.

Since Friday a week ago it became clear that 7 days of a week are 7 ages; the meaning of a rest from creation—that the creation went through all the time up to Exodus. The changes in the world were the days (Mex.= the suns) of creation (for this reason all history before exodus—in Breshith). But it came a new catastrophe (in the days of Jehoshua)—this was neglected, just because it was promised, no new catastrophe will come (in Aggada—the stones of Red Sea were suspended and fall in the days of Jeshua). The prayer of Saturday evening expresses the idea: Sabbath is the remembrance of the Exodus, of the new calendar, of the Creation. What it means? All the three started together.

Also in Saturday evening prayer (Hardala) the same idea is expressed.

Now I realize that it could really be a double tide—due to the influence of the comet-gravitation. If so—the Jews have all the right to think themselves a chosen people: they were rescued from slavery and from peril at one time. Would the sea at Dunkirk open itself before the British and drown the Nazis—would not the British had the right to believe they are chosen.

In some 10 days a comet will appear in the sky. Who knows whether she will not strike with stones all over Germany? This would be a Divine participation in this struggle.

I know what can happen to our earth from a comet. I would like to have the possibility to write my book to the end.

One or two days during this week I read the legends of creation of Jews. Now the stories of huge animals, fishes and birds seen by travellers have a true part.

The whole idea of very slow development is not exact, because this theory (Darwin) never reckon the catastrophes. The piece of coal must not be of millions of years; because it could burn 3400 years ago. New conditions had to produce new forms. And then the idea of a reserve in the plasma (and in seed) came to me.

Amusant is the story in Agada that the Brontosaurus (Behemoth) in pregnancy the “last year” could not go on feet. This what I expected when I wrote few days before that due to the increase in weight these huge animals had to perish.

Also the story of a mortal battle between Brontosaurus (Behemoth) and the bid Ziz remembered me the scene I saw in Museum last Saturday as one extinct devoured another one.

These animals were remnants of a previous epoch, just as the giants the spies found in Palestine; the immigrants of Mexico found there; and recalled by other peoples too.

Geology is “writing and arithmetic.” The millions of years—as Cuvier says—“a century is of no value.”

(Darwin I have not read. I shall read him now.)

Dec. 8. 940.

Since two or three days I told Elisheva that it seems to me as if the planet Venus is the head of the comet that struck our earth many times and after one collision turned to go through the sun and became a planet. What was the suggestion? In different sagas I found the same idea. (Beside the snaring of the sun)—a stone is thrown in the sun, and a crown, or a piece or an eye (Egypt) falls. It was mere supposition. For the new star in the horizon of Mexico and Egypt could be Sirius, after the horizon moved southward. but already the confusion in Mexico and in Egypt between Sirius and Venus was a problem. Venus fumed—I found it twice. At first I thought the comet passed through Venus too, and later I came to the above idea.

Yesterday morning I remembered that there exists a legend that a goddess came out of the head of Zeus. I thought it was Aphrodite, in any way I concluded: this is the same story, the goddess is the new planet. Now I was sure. Then I asked Shulamith, she shall be reading the Bible (she was read the moment) look to find about a new star. She told me at once about the passage of Isaiah: Hillel Ben Shahaar wished to be over the world and fell: the explanation she learned: it was the morning star (Ben-Shahaar). So I had the new proof; I was without doubt. I said to Elisheva: I suppose the light of Venus must be not at all reflected, in any way Venus must be hot, after only 3400 years passed since she went through the sun. I went to the library and in Encyclop. Brit. I could read (Venus, Planets) that she emits heat, and the explanation I found (possibly she turns quick?, or she turns once a year?) was not plausible. Now our earth—similar to Venus—has done the same development.

One moment is a problem for me. When occurred this going through the sun, and “break up” of the sun? After Exodus, or after Jehoshua? In first case in days of Jehoshua the comet was already without its head.

I hope to find the answer in the story of forlorn eye of Osiris (I have not yet read it) or in other sagas.

Since or or two days I intend to think that what happened before the Exodus and in the high and day at Red Sea were two impacts with the same comet—once descending to the sun and one on her return.

The spots on the Sun—are they not smokes from nafta burning, but not escaping, some process there return the composition to nafta once more?

The semi-darkness during 25? years (Mexico)—Desert (no sun in some variant)—due possibly to the same effect.

It is good that the planet Venus is smaller (a little smaller) than our earth. It disturbed the way of our moon, but could not capture it.

Dec. 8. 940.

To day I think about the second rule of Kepler I read yesterday. How may it be that the mass and the speed of planets (of this system?) are in an invariable ratio, without regard to the magnetic forces and the place of the axis and the magn. poles? I suppose the rule may be good only for a planet in her first age.

Since weeks I was eager to find in Hebrew sources an allusion to sun going from West to East. I was directed by the book of Thomson to Gaster; I went to 42str—but the two allusions were of no value. I wrote from Concord. west & east;

Today I asked Shulamith, (I was encouraged by her yesterday's answer) whether by reading Bible she will look to an allusion to sun rising from west. Few hours later I found in the legends of Jews—when I already was disappointed to find an allusion to what I looked for, that—the last week before the Deluge the Sun rose in the West. And it good that it is written—the deluge was combined with disruption of the run of the earth. I am under my finding done few minutes ago—and already announced to Elisheva, Shulamith & Ruth.

Dec. 8. 940.

Two days ago reading about Typhon that he ruled in the days of great perturbances; and that he was smitten by Zeus and is drowned in the sea; I came to the idea (an idea came to me) that typhon is possibly the name of the pharaoh who was smitten and drowned in the sea. The struggle between the God and the pharaoh; and the struggle between the sun and the comet were identified in the mythus. So Typhon became the name of the devil of storm, comet, volcano; but it was originally the name of the pharaoh. Now I have to find in the lists of the pharaohs of the time of Exodus this name. "Tymoethus" begins the story of Manetho-Josephus. He was possibly the next pharaoh, as the invasion of Hyksos followed the drowning of pharaoh? Or this is the other version of the name? The other thing I understood was: the last change in the direction of movement was during the comet of Exodus. Zeus in his struggle with

Typhon has the time to rob Europe from Phoenicia. Europe-Erev-Evening. It was not alight hear on the side of Zeus: the west turned to east. Kadmus—the brother of Europe—came to Hellas; this is the time of general migration. the new dwellers of Hellas were from Phoenicia.

526 WEST 113TH STREET,
NEW YORK, N. Y.

DR IMMANUEL VELIKOVSKY

PHONE: MONUMENT 2-2225

Affidavit

This exposé on nine pages I brought last week, on Tuesday 24th of this November 1942, to the National Academy of Sciences, 2101 Constitution Avenue, Washington, D.C., at approximately 3,45 p.m. I applied there to Mr.P.Brockett, the curator, asking to accept from me for secure keeping the nine pages which I proposed to put in an envelope, after he would, (if he likes) to inspect them. To introduce myself I showed my publications 'Scripta Academica'. I waived in advance any responsibility on the part of the Academy, in case my exposé would be destroyed by fire, by an enemy action or be lost otherwise. I explained that the results of my research are of a far reaching importance for many fields of science. The curator refused to my asking, telling me that this is not the duty of the Academy, and such procedure is unknown. I insisted, explaining that this courtesy would be a logical duty of an academy; I do not ask printing in Proceedings, nor bringing my paper before a meeting; I am interested in securing my priority for the results of my research. I asked whether he would like hear an opinion of the President or Secretary of the Academy.He answered me that he himself is the Executive Secretary of the Academy. He suggested to me that I shall apply to the National Archiv. I replied that I understand that the suggested Institution is serving only as the Governmental Archiv, and would not accept a paper of a scholarly character brought by a private person. I was asked why I should not read about my research in a scientific society. I explained that the research with all its material is very large (The Mns now is well over five hundred pages, and it will take probably one or two years before it will be printed; another another book will precede in publication), and to bring the results without the

material which served as proofs, would be unadvisable, especially because of the extraordinary character of my results. There can't be nothing in the Statutes of the Academy, why my envelope should not be accepted. How would he act, if not my humble personality, but a Copernicus or Newton would apply with a similar asking? - But in spite of all arguments - I could not be more eloquent, and to keep better the exact measure in all respects, - I did not succeed in this long and friendly conversation. Then I asked him to write me his refusal, and he noticed my address in N.Y. But up till to day I did not receive any notice.

signed before Notary

Rose Richardson Mandel, Dec. 5, 1942
certified by Supreme Court Clerk DC. 11, 1942

I present here some results of my research based upon inquiry in different material, historical, geological, physical, geophysical, pertaining to folklore and to history of religions. A full description of results of my research will appear in book form, and there the material will be presented in full.

The results to which I arrived, appear to be of fundamental importance to science in all its branches.

To begin with, our Earth collided (contacted) in the fifteenth century before this era with a comet. The head of the comet exchanged violent electrical discharges with our planet, and also with its own tail. The Earth changed the poles, south becoming north, changed axis, changed the orbit of revolution changed speed. As a result, the year that consisted previously of 260 became 360 days (our orbit was approximately that of Venus today). The moon changed its orbit, and the month of 20 days became of 36. Iron previously neared to the core of the Earth, appeared in upper layers. Neft poured from sky and built the present deposit. Meteorites fell in abundance. Harras in desert of Arabia are meteorites fields. Lava streamed on the surface of the Earth not only from volcanoes, but also from clefts. Continents and seas changed places. Rivers disappeared, others

appeared, still others inversed their direction (f.e. Jordan, that flow previously to the Meditteraneum, Dead sea being not in existence). A major part of human kind perished. A double tide of immense high swept seas and continents. In general conflagration woods burned down, rivers boiled; magnetic storms reached degree hurtful to bioplasma; immense hurricane accompanied the change of rotation of the Earth. In places struck by electrical contact with the comet nitogren was converted into (deposits) of saltpeter. Air became filled with clouds of carbons or hydrocarbons, and Earth was enveloped in them during a number of years. These compounds of carbon precipitated slowly in the process of cooling.

South pole which was approximately between Greenland and Northern America, or in North America, changed its place by approximately 159 degrees. Its former place might be found by locating the center of the later ice-age-cover; ice age did came to close at that moment. The magnetic pole previous to that contact, or still earlier was probably coinciding with the geographic pole,

The comet changed its path too after the electrical contact with the Earth, its orbit became a stretched ellipse, and was semi-planet semi-comet. After 50 or 52 years it contacted for the second time with the Earth, and the Earth was brought out of rotation. This encounter in the fourteenth century before the present era, had similar effects as the previous contact. But there was no permanent change of direction of rotation, nor change of north and south. Since 34 centuries the sun rises in the East. After the second encounter the Earth was endangered every 50-52 years by this new planet of the solar system: this is the planet Venus. The above recorded calendar changes are effects of first a n d the second encounter.

In the ninth century Venus moving on a stretched ellipse contacted with Mars, brought Mars out of its path, and repeated this contact for a number of times, and since then has Venus occupied approximately its present position in the solar system, and ceased to endanger the Earth. But Mars brought out of its orbit became the dangerous neighbour of the Earth. In -747 the Earth contacted with Mars. The peril of contact repeated itself every fifteen years. At midnight March 23, -687,

Earth contacted again with Mars. The catastrophe was of lesser dimensions than that of 14th or 15th century. Still Earth was brought out of its rotation, changed its orbit from one of 360 days to 365 and a quarter somewhat different days; the moon changed its orbit from 36 days to 29 days. Poles were displaced, Europe moving to the South, but the north and south poles did not exchange direction. Mars took its present position in the solar system. In contacts with Venus and Earth, Mars lost most of its organic life; it acquired some of the atmosphere of Venus (carbohydrate) and lost some of its atmosphere to our planet (probably argon and neon). Mars should be examined as to the presence of these rare gases. As a result of these contacts Earth, but also Venus and Mars are warmer than the solar radiation can account for. Anomaly in movement of Mercury, as well as the precession of the earth can have their origin in these displacements of planets.

Before contacts with Venus and Mars, our Earth suffered a number of cataclysmic contacts. One of the earliest was when the Earth attracted the Moon, still in memory of human kind. Thereafter passing in Saturn atmosphere the Earth was drowned in hydrogen, which drifting through oxygen of the Earth, became water. Thereafter Earth suffered heavily when Saturn and Jupiter collided, and the Earth passed dangerous close to Jupiter. Electrical contacts, change of calendar (year, month, day) happened already at that times, in the fourth (?) and third millennia before the present era. Gigantic forms of life which existed at that time, only in few exemplars survived these catastrophes, but were still in existence 34 centuries ago, at the contact-cataclysm caused by Venus. The teaching of Darwin which supposes but slow changes in life-forms is wrong. Gigantic reptilia ceased to exist not tens of millions of years ago, but they lived still a few thousand years ago; they perished in catastrophes, and those that survived could not exist in new conditions, especially because of changed weight of all objects, and of their large bodies, not capable to move, esp. during gravity. Brontosaurus was not a reptile, as it is thought, but a mammal. Humankind survived in races of small kind. Gigants were exterminated. The buildings of cyclopic size-stones were possible chiefly because of different weight of all objects before the contacts. The theories

of slowly development of mountains and valleys under causes like rain and wind, are wrong. The earthquakes are the post-effects of the contacts and are readjustments of displaced masses and twisted strata.

This my research is based not upon speculations but primarily on historical data; its results, better to say the results of the cataclysms can be proven by many different ways, astronomical, geological, physical, historical. As to the last it should be taken in consideration that the world (political) history of the thousand years, starting with the catastrophe of Venus is entirely confused. This catastrophe caused the end of the Middle Kingdom in Egypt. The Reconstruction of the Millenium which closed with arrival of Alexander into Egypt is prepared for print under the name 'A chimerical millenium'. The manuscript dealing with the here recounted cosmic revolutions is written and bears the name 'Worlds in collision' . The other research was conceived in its all main features April 1940; the present research in October 1940; Some results, (concerning Mars) and also the concrete formulating of the fallibility of Newton's teaching of gravitation were brought to clarity in March 1942.

As to this here mentioned fruit of my research I like to point out: the planetary bodies at contacts were not crushed (this possibility is not excluded), but exchanged electrical discharges. The bipolarity is well balanced in the planets; bipolarity of comets is divided in tail and head. This is the cause of approach and retreat of comets to and from the sun.

The behaviour of our earth, Mars, Venus, Moon, and other planets at contacts, shows clearly that there is no such phenomenon as gravitation. The mathematical proofs of Newton are completely erroneous. He admitted a primary push or pull that brought the moon into motion on a straight line; he admitted gravitation force of the Earth that tries to remove the Moon from the straight line motion. An object falls near the surface of the Earth with the initial mean speed of 16,1 feet in the first second. The moon is remote from the Earth's centre sixty times the distance of an object on the Earth surface from Earth's center (Earth's radius). The initial velocity of fall at the distance of the moon

should be 60 times slower, 16,1 feet in a minute. 15,43 feet in a minute is the 'fall' of the moon from the tangent of its orbit. The approximity of these two figures 16,1 and 15,4 is but accidental. There is no logical reason to count the velocity of fall by seconds, which are but human, not in nature preexisting time measure. Reckoning by two seconds the velocity of fall would be 48,3 feet here, and the same amount in the two minutes at the distance of the moon; and the fall from the tangent line is but 30,8 feet.

The fallacy of Newton's scheme is obvious also in terms of mechanics. The primary force was not infinite in its strength as pull or push. It does not act anymore. The Earth on the other side pulls permanently. In many different elementary ways it is possible to show that under such conditions the permanently acting force of gravitation would let the Moon approach the Earth in a quick spiral.

As the computation concerning the Moon caused Newton to postulate a general law concerning the whole solar system and the whole Universe, it, the law of gravitation is wrong in all its applications. Velocities and masses computed with its help are probably wrong in many instances.

There exist attraction and repulsion. Electrical phenomena are responsible for attraction and for repulsion. To explain the fact that objects close to the surface of the Earth are more attracted than repulsed, we owe to admit that a high layer in the atmosphere repulses what the solid portion of the Earth attracts. The phenomenon of the tail of the comets repulsed from the sun, of polar light, of zodiacal light will find here their explanation. The phenomenon (why not questioned at all?) that Nitrogen lighter than Oxygen does not move to the higher level in the atmosphere, though the air is a mixture and not a compound, is another fact of disobedience to the 'law' of gravitation. Also water, in small drops, is lifted then dropped by electrical charges and discharges. The radio-layer in the atmosphere is probably the attracting and repulsing medium acting contrary to the ground. The moving of negative electricity into the ground does is due to the charge of the Earth. At near distances

special law acts in magnetism (also electrical phenomenon) and electricity. Levitation is conceivable. Perpetuum mobile theroretically possible. Discharge from upper layer might be exploited, also with destructive purposes. A flight to interplanetary space in defiance of gravitation is thinkable.

Electrical charges in the Earth and its atmosphere are chiefly induced and sent by the Sun. Sun sends two kinds of charges, positive and negative. Heat and light are transformations; (transformation into heat is achieved by passing media [through?] coolness of summits, but the heating of Moon surface must be accounted for, before accepting the last hypothesis.) Cosmical rays which reach the Earth have probably their origin in the Sun (and also in other cosmical bodies). They arrive during the night or during sun-eclipse, because they are moving not in straight lines. (Their efficiency on malign tumors should be explored by sending sick persons to a mountanous sanatorium near the southern 0or northern) magnetic pole).

Whether elements mutated under influence of electrical contacts of cosmic dimensions-(in cataclysms) is difficult ascertain or to deny and laboratory work will gave reply.

The building of the solar system as revealed by grandious esperiments exhibited by the nature in sight of the historical man, is composed of a two fold process : distributing of (solar) energy and arrival of new members from interstellar space, collisions, violent discharges.If an atom is built as a microcosmical model of a solar system, elements arriving from interatomic space, also travelling from one atom to another must be in existence. Contacts between elements, increase in numbers of electrones, polarities, change of orbits, all must take place. Change of orbits and emitting of energy at these moments were supposed by Bohr.

This statement I like to have guarded by an Academy of Sciences. I wrote it the night before leaving at an early hour for Washington where I shall try to leave it at the office of the Academy (there) As the largest part of this statement I wrote directly by the typewriter, I concede that a better shape might be given to the

results of my research and to the physical conclusions deducted from those results. The few lines about heat had not to be written at all, at present. In the Mns the research is put in many hundreds of pages, and the physical deductions, meanwhile, are put on some tens of pages. There are problems esp. concerning 'weight' , 'attraction and repulsion' , magnetism, cosmic rays, heat, and I would like to experiment as to come to farther answers.

THESES FOR THE RECONSTRUCTION OF ANCIENT HISTORY

FROM THE END OF THE MIDDLE KINGDOM IN EGYPT
TO THE ADVENT OF ALEXANDER THE GREAT

BY

IMMANUEL VELIKOVSKY

1945

INTRODUCTION

The written history of the ancient world is composed without correct synchronization of the histories of different peoples of antiquity: a discrepancy of about six hundred years exists between the Hebrew and Egyptian histories as they are conventionally written; since the histories of other peoples are synchronized both with the Hebrew and the Egyptian past, they are completely distorted.

The ground plan for a redesigning of ancient history was ready in its main features in the spring 1940. During the years 1940-1944, I wrote and completed a Reconstruction of ancient history from the end of the Middle Kingdom in Egypt to the advent of Alexander the Great. Due to war conditions and their interference with the printing of extensive scientific works, the publication of "Ages in Chaos" had to be postponed. This short paper is intended to bring together in concise form most of the innovations of my work; I present them in the form of theses; the manifold proofs which underlie the Reconstruction and the numerous collations of historical material are reserved for the work itself.

New York, June 10, 1945.

manner. It is entirely confused, and is a disarray of centuries, kingdoms and persons.

2. The cause of this confusion lies in an incorrect representation of the Egyptian past; and since the history of Egypt is chosen to serve for orientation in compiling the histories of other peoples of antiquity, the histories of these other peoples are brought into disorder as well. The error in Egyptian history consists of six to seven and, in some places, eight centuries of retardation.

3. Histories of Palestine, Syria, Babylonia, Assyria, Mycenae, Classical Greece, Chaldea, Phoenicia, and Caria, are written in duplicate form, with the same events repeated after a period of six or seven centuries. The confusion of centuries makes the life of many personages double; descendants are transformed into ancestors, and entire peoples and empires are invented.

4. The Egyptian and Jewish histories, as they are written, are devoid of a single synchronism in a period of many hundreds of years. Exodus, an event which concerns both peoples, is presumably not mentioned in the Egyptian documents of the past. The establishing of the time of the Exodus must help to synchronize the histories of these two peoples.

5. The literal meaning of many passages in the Scriptures which relate to the time of the Exodus, imply that there was a great natural cataclysm of enormous dimensions.

6. The synchronous moment between the Egyptian and Jewish histories can be established if the same catastrophe can also be traced in Egyptian literature.

7. The Papyrus Ipuwer describes a natural catastrophe and not merely a social revolution, as is supposed. A juxtaposition of many passages of this papyrus (edited by A. Gardiner, under the name "Admonitions of an Egyptian Sage", 1909) with passages from the Scriptures dealing with the story of the plagues and the escape from Egypt, proves that both sources describe the same events.

8. The Papyrus Ipuwer comprises a text which originated shortly after the close of the Middle Kingdom; the original text was written by an eyewitness to the plagues and the Exodus.

9. The plagues were the forerunners and aftermaths of a great cataclysm the nature of which will be discussed in a work dealing with the natural history of the world. Earthquakes, eruptions of volcanoes, changes of the sea profile, were some of the results of that catastrophe.

10. The tenth plague, during which the houses were struck down, was an earthquake. The clay huts of the "dwellers of the marshes" suffered less than the structures of stone.

11. The “firstborn” (b’khorim) is erroneously used instead of the original “chosen” (b’chorim), and the tenth plague originally narrated the destruction of all the choice people among the Egyptians.

12. The naos (shrine) of el-Arish, now in the Museum of Ismailia, describes the plague of darkness and the death of the pharaoh in a whirlpool. The place of the last event is at Pi-Kharoti, which is Pi-ha-Kiroth of the Book of Exodus.

13. Tom-Taoui-Toth was the Pharaoh of the Exodus.

14. The Exodus took place at the close of the Middle Kingdom: the natural catastrophe caused the end of this period in the history of Egypt. This was in the middle of the second millennium before the present era.

15. The Israelites left Egypt a few days before the invasion of the Hyksos (Amu).

II

16. The Israelites met the Hyksos (Amu) on their way from Egypt. The Hyksos were the Amalekites.

17. The Arabic authors of the Middle Ages related traditions which reflect actual historical events, about the Amalekites who left Mekka amidst catastrophes and plagues, the invasion of Palestine and Egypt by the Amalekites, and the Amalekite pharaohs.

18. The catastrophes and plagues of these traditions are part of the cataclysm which is described in the Scriptures, the Papyrus Ipuwer, and the naos of el-Arish. The flood, which drowned many Amalekites who escaped from Arabia, was simultaneous with the upheaval of the sea on the day of the Passage.

19. Because of the occupation of southern Palestine (Negeb) by the Hyksos, the Israelites escaping from Egypt were forced to roam in the desert. The Desert of the Wanderings stretched deep into the Arab Peninsula.

20. The Hyksos stronghold Auaris was situated at the el-Arish of today. (Its other names are Tharu and Rhinocorura).

21. Its builder Latis, mentioned in the Arabic sources, is identical with the Hyksos King Salitis of Josephus-Manetho.

22. The Hyksos King whose name is read Apop (I) is the Agog (I) of the Scriptures. Similarly Apop II is the biblical Agog II.

23. Amalekite fortresses were built in Palestine. One of them was at Pirathon in

Ephraim.

24. The Amalekites employed the same tactics in their devastating raids on Palestine and Egypt, choosing the time before the harvest.

25. The process of the conquest of Palestine by the Israelites was slowed down and reversed when the Canaanites allied themselves with the Hyksos-Amalekites. The wars of the Judges were intended to free the people from the yoke of the Hyksos.

26. The cataclysm which caused a migration of peoples brought the Philistines from Cyprus to the shores of Palestine. They intermarried with the Amalekites and produced a hybrid nation.

27. The Manethonian tradition about the later Hyksos Dynasty of a "Hellenic" origin reflects the period when the Philistine element became rather dominant in the Amalekite Empire.

28. The "Amalekite city" which was captured by Saul was Auaris.

29. As the result of his victory at Auaris, Saul freed Egypt and the entire Near East.

30. In the siege of Auaris, Saul was assisted by Kamose and Ahmose, the vassal princes of Thebes.

31. Manetho's story about the Hyksos leaving Auaris by agreement reflects the scriptural incident concerning the Kenites leaving the besieged Amalekite fortress.

32. The invasion of southern Palestine by the escaping remnants of the Hyksos is reflected in I Samuel 30; and their further destruction at Sheruhen, in the Talmudic story of Joab's war against the capital of the Amalekites.

33. This last bastion of the Amalekites was probably on one of the rocks of Petra.

34. Manetho confused Sheruhen with Jerusalem, and the Israelites, the redeemers of Egypt, with the Hyksos.

35. This confusion spread in the Ptolemaic time and became the cause of the rise of anti-Semitism which, fed from different channels, survived until today.

36. The period of the Wanderings in the Desert, of Joshua, and of the Judges, corresponds to the time of Hyksos domination in Egypt and the Near East. The period of the Hyksos lasted for more than four hundred years. The archaeological findings of the Hyksos period in Palestine appertain to the time of the Conquest and the Judges.

37. Two kingdoms rose on the ruins of the Hyksos Empire: the kingdom of Israel under David, and the New Kingdom of Egypt under the Eighteenth Dynasty. The beginnings of these two dynasties are not separated by six centuries; they started simultaneously.

38. The Egyptian Queen Tahpenes, the sister-in-law of Hadad the Edomite, was a wife of Ahmose.

39. Thutmose I attacked Gezer of the Philistines and gave it to Solomon, his son-in-law.

40. Queen Sheba is identical with Queen Hatshepsu.

41. The information of Josephus that the queen-guest ruled Egypt and Abyssinia, is correct.

42. The theories which place Punt and God's Land in either South Arabia or Africa are equally wrong. Hatshepsu's expedition, pictured in the temple of Deir el Bahari near Thebes, went to Palestine-Phoenicia.

43. By the time of the Old Kingdom, Palestine was already known as God's Land or Holy Land. The tribe of Menashe lived in Palestine already at the time of the Old Kingdom in Egypt.

44. A preliminary expedition dispatched by Hatshepsu to prepare the way for the main expedition, was met by Peruha, the biblical Paruah, governor of Ezion-Geber.

45. The correction of the verses I Kings 4, 16-17 which place Aloth in the domain of the son of Paruah, is well founded.

46. Queen Hatshepsu participated personally in the main expedition to Ezion-Geber, Jerusalem, and Phoenicia. Her intention was to see what she had known "by hearsay" only.

47. The return voyage was made by sea from the Palestinian shore to Thebes on the Nile, and a second fleet was used. In the days of Hatshepsu there was no canal connecting the Nile with the Red Sea.

48. Jewish officers in the service of Solomon are portrayed on the walls of Deir El Bahari.

49. Exotic animals and plants, including the algum-trees "never seen before", which Queen Hatshepsu received as gifts in God's Land, had been brought by the navy of Hiram and Solomon from Ophir. They are seen in the pictures of the expedition.

50. Gifts were also presented to Hatshepsu by messengers of Hiram.

51. Solomon was not an obscure prince, as he is often represented. The riches of his kingdom astounded the Egyptians under their most magnificent monarch.

52. Silver-covered floors in the Jerusalem of Solomon were an actual feature; such floors were also built in the palaces of the viziers of Hatshepsu.

53. The architecture and ordinances of the Temple of Solomon were copied in the Temple of Amon at Deir El Bahari. The plan of this structure and its terraces can help in the reconstruction of the plan of the Temple of Solomon.

54. The Songs of Mounting, which are included among the Psalms, were sung by priests while ascending the terraces.

55. The office of High Priest was introduced into the Egyptian service in imitation of a similar post in the service in Jerusalem. The word pontifex is derived ultimately from the word Punt. The last word means Phoenicia.

56. The Abyssinian tradition preserved the name of the Queen of the South as Makeda, which is derived from the personal name of Hatshepsu (Make-Ra).

57. The Arabic claim that Queen Sheba was their Queen Bilkis, is unfounded.

58. The traditional origin of some Hebrew legends concerning Queen Sheba can be traced in the life and appearance of Hatshepsu.

IV

59. Thutmose III is the scriptural Shishak; he lived not during the fifteenth, but during the latter part of the tenth and the beginning of the ninth century.

60. Thutmose III refers in his inscription in Karnak to the state of disagreement and war among the Jewish tribes of Palestine after the death of Solomon.

61. The disintegration of the empire of Solomon was planned for by Thutmose III and carried out by him. He was also the author of the division of Palestine into two kingdoms.

62. Jeroboam, the first king of the ten tribes, is pictured during his stay in Egypt on a bas-relief in Thebes, together with a small son of his, as the prince of Dunip (Tunip), which is Dan.

63. Baalbek is the ancient Dan.

64. The list of the Palestinian cities inscribed by Thutmose III in Karnak comprises the names of the cities of Rehoboam in his fifth year. The city-fortresses built or fortified by Rehoboam, Etam, Beth-Zur, Shocco, Gath, Ziph, and Adoraim, can be identified in their Egyptian transcription.

65. The chief fortress besieged and captured before the Pharaoh came to Jerusalem, was Megiddo. Megiddo was defended by Rehoboam personally, and he eluded captivity when the fortress fell.

66. The city Kadesh, the most important among the Palestinian cities, and the first in the list of Thutmose III, is Jerusalem.

67. The submission of Rehoboam and the princes of the land, and their “becoming servants” to the Pharaoh is described in the annals of Thutmose III.

68. The vessels and furniture of the Temple of Solomon sacked by Thutmose III, are pictured on a bas-relief of Karnak. They can be seen in detail: altars, tables, candlesticks, etc.

69. The ornaments of “a crown of gold round about”, “buds among flowers” and “lily-work” described in the Scriptures, are shown on the bas-relief.

70. The showbreads had a conical form. The candlesticks had three branches on either side of the stem, or seven branches on either side [*altogether*]. The fountains for perfume were vessels ornamented with figures of animals.

71. The copper covered doors and chains of gold were actual features of the Temple of Solomon.

72. Golden chariots, like those mentioned in the Song of Songs, were carried from Palestine as tribute, and are pictured in the sepulchral chambers of Rekhmire, the vizier of Thutmose III.

73. The theory about the supreme artisanship of the Canaanites in the pre-Israelite period is without foundation.

74. Jewish artists brought to Egypt introduced their fine arts and influenced the aesthetic conceptions of the Egyptians.

75. Animals and plants of Palestine of the days of Rehoboam are pictured in the temple of Karnak. They comprise the collections of Solomon.

76. “Arzenu” (our land), by which the Scriptures mean Palestine, was its name in the Egyptian tongue (“Rezenu”), a geographical equivalent of the name “God’s Land”.

77. The name of Israel is found in the annals of Thutmose III as that of a people bringing tribute. The assertion that the name of Israel is met for the first and only time in the inscription of Merneptah is wrong.

78. Rehoboam, “the king of Kadesh”, is pictured on a bas-relief in the tomb of Merneptah in Thebes.

79. The people of Gubath in the inscription of Thutmose III, is the people of the scriptural Gubath, son of Hadad the Edomite.

80. Sesonk, the Pharaoh of the Libyan dynasty, was not Shishak of the Scriptures.

V

81. Amenhotep II lived not in the fifteenth but in the ninth century, and was the scriptural Zerah.

82. The theory that the Ethiopian Zerah came from Arabia is wrong; equally wrong is the theory that he is a mythological figure.

83. The battle of Ain-Reshet, referred to by Amenhotep II, is the battle of Mareshet-Gath, which was lost by Amenhotep II and won by Asa.

84. This intrusion of Amenhotep II-Zerah is also narrated in the poem of Keret found in Ras Shamra.

85. The theory that Terah of the Poem, who invaded the south of Palestine with millions of soldiers, is the father of Abraham, is wrong.

86. The Shemesh-Edom of the war-annals of Amenhotep II is the Edomite city of Shaphesh (Shemesh) referred to in the Poem of Keret.

87. In the days of Thutmose IV, Palestine again became a protectorate of Egypt in fear of a menacing conquest by Assurnasirpal (885-860), father of Shalmanassar.

88. Shishak mentioned in the Ras Shamra texts is Thutmose IV.

89. The texts found in Ras Shamra are not of the fifteenth, but of the ninth century.

90. The close resemblance of the texts of Ras Shamra with diverse books of the Scriptures repudiates most of the assertions of the Bible criticism (late origin of the texts), as well as the modern theory about the Canaanite heritage in the Scriptures (early origin of the texts).

91. The theory that alphabetic writing was perfected in the sixteenth century cannot be supported by the Ras Shamra texts of the ninth century.

92. As the alphabetic writing of Hebrew in cuneiform of Ras Shamra is contemporaneous with the stela of Mesha written in Hebrew alphabetic characters, the alphabet most probably did not originate in Phoenicia but in Palestine.

93. The theory that the Ras Shamra texts contain mention of Ionians, and of their city Didyme, is correct, but it concerns the ninth century Ionians.

94. The Khar of the Egyptian and Ras Shamra texts were not Hurrites or Troglodytes, but Carians.

95. The statement by classical authors that the Carians migrated from Crete is corroborated by the name of Keret of the Ras Shamra texts.

96. The Khari (Cari) of the Scriptures were the Khar or Carians from Ras Shamra.

97. The Carian language is studied in the disguise of the Hurrian (or Hurrite) language. The reading of the cuneiform Khar can be helped by a comparative study of the Carian inscriptions in Greek letters found in Egypt.

98. The reading of Carian will contribute to the decipherment of the Cyprian and Cretan hieroglyphics and may aid in reconstructing the early history of the West.

99. The name of the city Ugarit (Ras Shamra) is probably the equivalent of Euagoras, the Carian-Ionian name of a number of Cyprian kings.

100. The name Nikmed of the Ras Shamra texts is the Ionian-Carian name Nikomed (es).

101. The city of Ras Shamra was destroyed in the days of the King Nikmed by Shalmanassar (in 856 B. C. E). Its destruction is recorded by Shalmanassar and the city is called "the city of Nikdem". A proclamation telling about the expulsion of Nikmed, found in the city, refers to the same event.

102. It is highly probable that King Nikmed (Nikdem) fled to Greece, and that this man of learning there introduced alphabetic writing. Therefore, he might have been Cadmos of the Greek tradition.

103. Minoan inscriptions of the Mycenaean Age may comprise alphabetic writings following in principle the cuneiform alphabet of Ras Shamra Hebrew.

104. The vaults of the necropolis of Ras Shamra and similar vaults in Cyprus are contemporaneous, and not separated by six centuries.

105. The tombs of Enkomi on Cyprus, excavated by A. S. Murray in 1896, were correctly assigned by him to the eighth-seventh century.

106. The time table of the Minoan and Mycenaean culture is distorted by almost six hundred years, because it is dependent upon the wrong Egyptian chronology.

107. No “Dark Age” of six centuries duration intervened in Greece between the Mycenaean Age and the Ionian Age of the seventh century.

108. The large buildings and fortifications of Mycenae and Tiryns in the Argive Plain date from the time of the Argive Tyrants, who lived in the eighth century.

109. The Heraion of Olympia was built in the “Mycenaean” age, in the first millennium

110. The so-called Mycenaean ware was mainly of Cypriote (Phoenician) manufacture. It dates from the tenth to the sixth century.

111. The so-called Geometric ware is not a later product than the Mycenaean ware; they were products of the same age.

112. The entire archaeology of the eastern Mediterranean, based upon the assumption that the Mycenaean culture belongs to the fifteenth-thirteenth centuries, is built upon a misleading principle.

VI

113. The el-Amarna Letters were written not in the fifteenth-fourteenth century, but in the middle of the ninth century.

114. Among the correspondents of Amenhotep III and Akhnaton are biblical personages: Jehoshaphat (Abdi-Hiba), King of Jerusalem; Ahab (Rib Addi), King of Samaria; Ben-Hadad (Abdi-Ashirta), King of Damascus; Hazael (Azaru), King of Damascus; Aman (Aman-appa), Governor of Samaria; Adaja (Adaja), Adna (Adadanu), Amasia, son of Zihri (son of Zuhru), Jehozabad (Jahzibada), military governors of Jehoshaphat; Obadia, the chief of Jezreel; Obadia (Widia), a city governor in Judea; the Great Lady of Shunem (Baalath Nesse); Naaman (Janhama), the captain of Damascus; and others. Arza (Arzaja), the courtier in Samaria, is referred to in a letter.

115. Mesha, King of Moab, is often mentioned in the Letters by his name (Mesh). The omission of the name of the rebel king by the translators of the Letters is not warranted.

116. The King of Hatti, who for years invaded and harassed Syria, was Assurnasirpal and after him Shalmanassar.

117. The following correspondents of Amenhotep and Akhnaton are known from the inscriptions of Shalmanassar; Adima, Prince of Siana and Irqata; Mut-Balu (Matinu-Bali), Prince of Arvad.

118. Burnaburias is the Babylonian name of Shalmanassar, and under this name he corresponded with Amenhotep III and Akhnaton. In the Letters he is also referred to as Shalmajati.

119. The military chief who opposed Shalmanassar at Karkar was the governor of MegiddoBiridri (Biridia), one of the Pharaohs correspondents. The identification of Ben Hadad with Biridri is wrong.

120. Sumur of the Letters is Samaria; Gubia is Jezreel. The new residence of the king of Israel was named in honor of his wife Jezebel.

121. Jarimuta or Rimuta of the Letters is Ramoth in Gilead; Sigati is Sukkoth; Ambi - Moab; Durnui - Edom; Rubuti - Raboth in Ammon; Kilti - vadi Kelt.

122. "Elippe" in a number of el-Amarna Letters means "a man over a thousand" or a chief, and not a "ship". Several cities (Sumur being one of them) are incorrectly located on the seashore because of the mention of "elippe".

123. The scriptural penman also confused "elippe", the chief, with the same word meaning a thousand, and thus a correction of the text is required in the story of twenty-seven thousands killed by the wall of Aphek.

124. Ahab was faithful to the Egyptian protectorate. Ben Hadad, supported by Shalmanassar, inspired Mesha to revolt.

125. The capture of Ben Hadad and a covenant signed between him and the King of Samaria are events also related in the Letters.

126. The sieges of Samaria, the negotiation about sending Egyptian detachments, and the flight of the Syrians at the spreading of a rumor about the arrival of the Egyptian troops, can also be read in the Letters.

127. King Ahab was not killed at Ramoth in Gilead, but merely wounded. He survived Jehoshaphat by two years. The version 2 Kings 3, 2 is erroneous, and the rival version 2 Kings 1, 17 is correct.

128. Many events ascribed by the Scriptures to Jehoram, son of Ahab, or to the undefined "king of Israel", happened in the days of Ahab. Ahab is the author of more

than sixty letters found in the el-Amarna collection.

129. Jehoram of Israel and Jehoram of Judea were probably one and the same person, a son-in-law of Ahab.

130. The insurrection of Mesha took place during the life-time of Ahab, after the defeat at Ramoth in Gilead.

131. The K-r-k-h (the capital) of the Mesha Stela means Samaria. The Moabites succeeded in entering Samaria. The Ophel of K-r-k-h is the Ophel of Samaria. The fall of Samaria signified the “everlasting humiliation” and the “great indignation” in the Scriptures and the Stela.

132. By “cuttings” of K-r-k-h, the ivory work of the palace of Samaria is meant.

133. Samaria was the center of the Egyptian administration in Palestine. Possessing and building it was the privilege of the first among the chiefs.

134. Jehoshaphat’s position was of comparative independence, as there was no permanent Egyptian governor in Jerusalem. Adaja was the deputy over Edom and he was subordinate to Jehoshaphat.

135. The expedition of three kings against Moab preceded the invasion of Palestine by tribes of Transjordan and Seir. The sequence in Josephus is wrong.

136. The invasion of the Moabites, Ammonites, and the tribes of Seir is described in the Letters. Khabiru means bandits.

137. The prayer of Jehoshaphat is authentic, being similar in spirit and content to his letters addressed to the Pharaoh.

138. The monotheism of Jehoshaphat is proved by his letters. The notion that Akhnaton was a monotheist (“the first monotheist”) is wrong.

139. The letters of Jehoshaphat’s generals and city-chiefs substantiate the complaint of the scriptural writer that idolatry was not eradicated in Judea in the days of Jehoshaphat.

140. The el-Amarna Letters provide ample material for elucidation of the feudal system in Palestine in the ninth century.

141. The failing of water sources, the drought and the great famine of seven years duration in Israel are described in many of the letters of the King of Samaria.

142. Ramoth in Gilead was a subject of rivalry because it was not afflicted by drought

and famine.

143. The existence of a Great Lady of Sunem called Baalat Nesse (“Wonder occurred to her”), throws a side-light on the life and acts of Elisha.

144. The change in the attitude of Janhama, the captain of Damascus, toward the King of Samaria, throws another sidelight on the biblical narrative about Elisha.

145. The story about sending assassins against Ahab and about his repeated escapes is also narrated in the Letters.

146. The sickness of Ben Hadad, and his being killed while sick, is confirmed by the Letters. Hazael, his murderer, was his son by a harem woman.

147. The biblical dialogue of Hazael is truly transmitted, as his letters and letters about him prove. In his writing, he used the very same expressions ascribed to him in the Scriptures.

148. Hazael burnt the towns of Israel and occupied most of their land; this is verified by the Letters.

149. Hazael, after leaning toward Shalmanassar, was acknowledged King of Damascus by Akhnaton on the condition that he oppose Shalmanassar.

150. Shalmanassar’s inscriptions and the letters of Hazael (Azaru) give coordinated records about their war and other conditions in Syria.

151. The theory of a Mizri kingdom in Syria is wrong. The soldiers of Mizri at Karkar were Egyptians. The gifts sent by the King of Mizri to Shalmanassar are those enumerated by Akhnaton in his letter to the King of Hatti.

152. Ahab, under pressure from Hazael, went to Beirut. He was not permitted by his brother to return to Jezreel. He went from Beirut to Sidon, to the family of his wife Jezebel. In his lifetime, rumors about his death were spread, and they contributed to the confusion of later chronographers.

153. Sawardatta of the Letters was a prince of the Sodomites who lived at Vadi-Kelt.

154. Labaja of the Letters was a rebellious prince of Libna.

155. The letter addressed by Subliliuma to Hurria does not belong to the el-Amarna collection. It was written in the seventh century and addressed to Tirhaka-Hurria, the Ethiopian. It should be a matter of further investigation, whether any other letters are wrongly ascribed to the el-Amarna archive.

156. The ivories of Samaria of the time of Ahab are not late imitations of the ivories of the time of Amenhotep III, Akhnaton and Tuthenkhamon, but are contemporaneous products.

VII

157. Between the Eighteenth and the Nineteenth Dynasties there was a period of about 150 years, during which Egypt was ruled by the Libyans and the Ethiopians (Twenty-second to Twenty-fifth Dynasties).

158. The period of the Libyans in Egypt lasted not over 200 years but about 100 years only, and its termination is correctly fixed at the end of the eighth century.

159. The only period of ancient Egypt which is correctly placed in time, is the short Ethiopian period. But this retention of its proper place at the end of the eighth and the beginning of the seventh century caused a still greater chaos in historiography; generations which actually followed became progenitors, ancestors became descendants.

160. Osorkon I was not Zerah of the Scriptures, nor did he invade Palestine. Osorkon II was not a contemporary of Omri and Ahab.

161. Hebrew letters on the statues of Osorkon and Sosenk made by the Phoenician kings Elibaal and Abibaal represent the characters of the eighth century, not the tenth century.

162. The ostraca of Samaria were not written in the days of Ahab, but close to the end of the kingdom of Israel, in the days of Jehoram [*Jeroboam*] II. These ostraca, written in characters similar to those of the Siloam inscription of Hezekiah, do not signify an abnormal development of the Hebrew script.

163. Pharaoh So who received gifts from Hoshea was Sosenk IV, and his bas-relief scene pictures this tribute. Sosenk regularly placed as I (first) was IV (last).

164. Osorkon, the priest who caused a civil war and was expelled from Egypt, was the historical prototype of Osarsiph of Manetho, whom he wrongly identified with Moses.

165. After the battle of Eiteka, Egypt became a vassalage of Sennaherib.

166. Psammetich-Seti I, King of Egypt and an ally of the Ethiopians, was deposed by his brother Haremhab, who was in charge of the government during the king's absence because of the war. Haremhab went over to the Assyrians. The legend about Harmais (Josephus-Manetho), who deceived his brother, is the story of Haremhab.

167. Haremhab was King of Egypt under Sennaherib, and in this service made war against the Ethiopians. His laws were made on the Assyrian model, as were also the punishments involved.

168. Harsiese, the priest of Ammon at the end of the Libyan Dynasty, was the man who reared Haremhab.

169. Haremhab was expelled by Tirhaka, the Ethiopian, and probably fled to Cyprus.

170. The 59th year of some reckoning mentioned in a document written in [*referring to*] the days of Haremhab, is the 59th year of the era of Nabonassar, which started in 747 B. C.E.

171. A cartouche of Haremhab on the inner wall of a sepulchral chamber cut in the days of the Ethiopians, does not constitute an enigma.

VIII

172. The so-called Nineteenth and Twenty-sixth Dynasties are substantially one and the same.

173. Ramses I is identical with, Necho 1. He was one of the viceroys under Essarhadon. After the death of Essarhadon, when the viceroys took sides with Tirhaka the Ethiopian and were killed by Assurbanipal, Ramses I, pardoned by the Assyrian King, was installed by him as the king of Egypt.

174. Shamash Shum Ukin, King of Babylon, and brother of Assurbanipal, corresponded with Tirhaka and allied himself with him.

175. Psammetich-Seti II, son of Ramses I, rose from vassal to the position of an ally of Assurbanipal in his war against Shamash Shum Ukin.

176. Psammetich-Seti II (Seti the Great) repeatedly invaded northern Palestine. He mentions smaller conflicts with Manasseh, referring to the latter by his name.

177. The city Pekaon to which he laid siege and which he captured was a fortress-capital of Peka, King of Israel, who lived two generations earlier. Being a capital, it was probably Samaria.

178. Beth-Shan-Scythopolis was the city where Seti met the vanguard of the Scythians. He occupied the city, as he reported on his stela found there.

179. Seti built a fortress on the Orontes, at Tell Nebi Mend; it is Riblah of the Scriptures.

180. Seti participated in the war in the valley of the Euphrates on the side of Assurbanipal and against Nabopolassar. The Egyptian army referred to by Nabopolassar in his annals was that of Seti.

181. Greek soldiers sent by Gyges of Sardis to Egypt in the days of Seti became the first Greek settlers there.

IX

182. There was no Empire of the Hittites in the fourteenth-thirteenth centuries. The archive found at Boghazkoi belongs in its larger part to the Neo-Babylonian Empire of the seventh-sixth centuries.

183. These documents reflect the political, religious and juridical activities of the Chaldeans.

184. In the seventh century the Chaldeans were centered in Asia Minor, in an area bounded by the Black Sea, the Euphrates, and the Halys.

185. The “Hittite” hieroglyphics are the Chaldean script.

186. The presumed “Hittite” art of the fourteenth-thirteenth centuries is the Chaldean art of the seventh-sixth centuries, and is coeval with and subsequent to late Phrygian art. The bas-relief of Yasilikaya dates from the time of the Neo-Babylonian Empire. Greek sculptures with “Hittite” (Chaldean) signs present no problem, neither does the silence of Greek authors about the “Hittites” of the “post-Empire” period.

187. The “Hittite” stela in the palace of Nebukhadnezar in Babylon is a contemporary Chaldean document. The lead tablets from Asaur with “Hittite” hieroglyphics, date from the last centuries before the present era.

188. The succession of the kings of the Neo-Babylonian Empire was: Nabopolassar, Nergilissar, Labash-Marduk, Nebukhadnezar, Evil Marduk, Nabonides. Berosus, according to whom Nergilissar and his son followed Nebukhadnezar, is wrong.*

189. The treaties of Subliliumas with Azaru of Damascus, with a patricide prince of Mitanni, and with the widow of Tirhaka, make plausible his identity with Shamash Shum Ukin. This would signify also that Nabopolassar was a son of Shamash Shum Ukin.

190. The people and the kingdom of Mitanni did not “disappear” in the thirteenth century. Mitanni is another name for Medes; the northwest part of Medes retained this name as Matiane (Herodotus).

191. Mursilis of the Boghazkoi texts (Merosar of the Egyptian texts), also known as

Bijassili, is Nabopolassar of the Babylonian texts, Belesys of Diodorus or Bussalossor of Abydenos. Bel-shum-ishkun is another name of Nabopolassar.

192. The annals of Nabopolassar from his tenth until his seventeenth year (now in the British Museum), can be supplemented by the "Hittite" annals of his from the first to the tenth year (two variants) and from the nineteenth year on, as they survived in the Boghazkoi archive.

193. The presence of the Scythians (Umman-Manda) in Asia Minor, who in the days of Essarhaddon arrived from behind the Caucasus, is also reflected in the Boghazkoi texts dealing with the Umman-Manda.

194. The Assyro-Egyptian alliance against which Mursilis conducted a long war in the valley of the Euphrates, was the alliance of Assurbanipal and Seti (see §180).

195. Assuruballit in Harran, against whom Mursilis marched, was the younger brother of Assurbanipal.

196. The capture of Manassehand his release are recorded in the annals of Mursilis.

197. The Median prince and ally of Mursilis-Nabopolassar was his brother-in-law, known in the texts by the name of Mattiuza.

198. The sickness of Nabopolassar, his subsequent inability to head the army, his invalid condition and his death, as described by Berosus, find their confirmation in the report of Mursilis-Nabopolassar about the first and second strokes of paralysis that befell him.

199. Nergilissar who called himself son of Bel-shum-ishkun, King of Babylon, was a son of Nabopolassar. He was the second son of Nabopolassar; his elder brother died before being crowned.

200. Nergilissar followed the policy of his father in signing international protective treaties, with Chaldea playing the part of the protector.

201. The name of one of his allies, Alexandus (Alexandos) of Wilusa, who came to Alasia (Cyprus), does not imply that the name Alexandos or Alexandros was already in use in the fourteenth century. (Alexandus of Wilusa might have been identical with Alexandros, son of Akamas and father of Chytros, who was connected with the city of Chitroi on Cyprus.)

202. The Aiavolos mentioned in the Boghazkoi texts and identified as Aioles, and connected in the texts with Lesbos, were the colonists from Boeothia on Lesbos (Thukidides I, 12ff.). This process of migration is reflected in the Boghazkoi texts.

203. Nebukhadnezar left an autobiography found among the Boghazkoi texts (the autobiography of Hattusilis-Khetasar). Like other documents of Boghazkoi it is incorrectly ascribed to a period seven centuries earlier.

204. Nebukhadnezar was the third son of Nabopolassar. Of feeble health, he was reared in a temple of Ishtar. When his elder brother died, he was given the name of the deceased.

205. Nergilissar appointed Nebukhadnezar as chief of the army and governor of Assyria. In this capacity he battled the Egyptians under Ramses II, in the second year of the latter; in the fifth year of Ramses II, raised to the station of King of Assyria, Nebukhadnezar again battled the Egyptians, at Kadesh-Carchemish.

X

206. Ramses II (of the Nineteenth Dynasty) and Pharaoh-Necho (of the Twenty-sixth Dynasty) of the Scriptures or Necos of Herodotus are one and the same person.

207. The theories that make Ramses II the Pharaoh of Oppression or the Exodus are wrong.

208. For nineteen years Ramses II was in a state of war with Nebu-khadnezar.

209. The defeat of Josiah is portrayed in a mural fragment, now in the Metropolitan Museum of Art.

210. The tribute imposed upon Judea and the imprisonment of Jehoahaz are referred to on an obelisk of Tanis.

211. The first march of Necho-Ramses II toward the Euphrates is related on the obelisk of Tanis and on the rock inscription of Nahr el Kalb near Beirut, written in his second year. The rock inscriptions of Ramses II are not as old as that of Essarhadon on the same rock.

212. The second campaign which Ramses II led toward the Euphrates is narrated in his annals and in the Pentaur-poem and has a parallel record in Jeremiah 46.

213. The Shardana mercenaries were the people of Sardis (Lydians), and not of Sardinia.

214. The city Kadesh the Old of the battle was Carchemish.

215. The remnants of the fortifications and the double moats of Kadesh-Carchemish pictured by Ramses II are recognizable in situ.

216. Hieropolis the Old was situated on the site of Carchemish.

217. The river 'N-r-t or 'R-n-t was the Egyptian name of the Euphrates.

218. Bab and Aranime mentioned by Ramses II in the course of the battle are Bab and Arime on the road from Aleppo to Carchemish.

219. At the beginning of the battle, Ramses II, with the division of Amon, was northwest of Carchemish; the division of Re was between Sadjur and Carchemish; the division of Ptah and Sutekh were south of Bab. The army of Re was driven northward away from its base, and, together with the division of Amon, was thrown into the Euphrates.

220. After the defeat at Carchemish, Ramses II lost dominion over Syria and Palestine for three years, until the eighth year of Jehoiakim.

221. A fragment of a clay tablet, dealing with the battle of Carchemish, is preserved in the archive of Boghazkoi.

222. Nebukhadnezar returned from the pursuit of Ramses II because he was accused before Nergilissar of intending to usurp the imperial crown.

223. The person of his accuser, Arma, a very aged relative, whom he ultimately put to death, is intimated in the rabbinical literature and in the Fathers of the Church as that of Hiram, King of Tyre, old relative and accuser of Nebukhadnezar.

224. Nergilissar exacted an oath from Nebukhadnezar that he would be faithful to his son and heir, Labash-Marduk (Lamash or Labu in the Boghazkoi texts). After Nergilissar's death, Nebukhadnezar crowned his nephew, but nine months later, he arrested him. A letter of Nebukhadnezar (Hattusilis) to his minor nephew, containing a denunciation, is preserved.

225. The repairs of the palace and the temple of Ezagila in Babylon made by Nergilissar antedate those made by Nebukhadnezar.

226. The queen of Nebukhadnezar was a daughter of a priest of Ishtar. She was not an Egyptian or Median princess, as related by early authors.

227. Nebukhadnezar became King of Babylon five years after Ramses II became King of Egypt.

228. In his ninth year Ramses II occupied Askalon and the Philistine shore. Marching through the valley of Jezreel, his troops reached Beth Shan.

229. In the twelfth year of Ramses II, Palestine was again subdued by Nebukhadnezar.

230. During the interval between two sieges of Jerusalem in the days of Zedekiah, a treaty was concluded between Ramses II and Nebukhadnezar; its text is extant.

231. Jewish fugitives in Egypt were extradited in accordance with the treaty.

232. The “Fossae Temple” of Lachish was built in the days of Solomon and rebuilt in the days of Jehoshaphat and Amenhotep III; the city was captured by Sennaherib, and destroyed by Nebukhadnezar. The “Fossae Temple”, burnt in the days of Ramses II, and the city-walls, burnt in the days of Nebukhadnezar, are remains of one and the same fire.

233. Nebukhadnezar did not invade Egypt. The only historical inscription which is ascribed to Nebukhadnezar and which deals with a march toward Egypt, has a counterpart in the Marriage Stela of Ramses II.

234. Ramses II married a daughter of Nebukhadnezar. The bas-relief of Abu-Simbel portrays the visit of Nebukhadnezar bringing his daughter to Ramses II.

235. “Bit-Niku” outside the wall of Babylon was the palace built for Ramses II who used to visit there.

236. Nebukhadnezar’s daughter had a palace at Daphneh-Tahpanhes.

237. Red baked bricks of the Ramses period in Tahpanhes were an innovation introduced from the Babylon of Nebukhadnezar.

238. The Bentresh Stela deals with the mental disease of the elder daughter of Nebukhadnezar, and was written by the priests of Khons a few decades thereafter. This daughter was married to a prince of Damascus.

239. The paranoiac character of Nebukhadnezar is fully reflected by his autobiography and other texts of Boghazkoi, notably dealing with exorcisms. The biblical record about his suffering from nightmares and about his mental disease is substantiated.

240. The tomb of Ahiram found at Bybios dates not from the thirteenth century, but from about 600 B.C.E. The Cyprian pottery of the end of the seventh century and the vases of Ramses II found in this grave are contemporaneous.

241. Itobaal, son of Ahiram, the builder of the tomb, was probably the defender of Tyre against Nebukhadnezar, as mentioned by Josephus.

242. The inscriptions of Ahiram’s tomb are of the same age as the ostraca of Lachish. The development of the Hebrew letters went through a normal process without falling

into archaisms.

243. The dispute as to whether Ramses II or Necho built the canal connecting the Mediterranean with the Red Sea, deals with a spurious problem.

244. Greek armor found in Daphneh (Daphnoi), as well as iron tools and ingots, are coeval with the temple of Ramses II there, and are products of the Greek mercenaries in the service of the pharaohs of the Nineteenth (Twenty-sixth) Dynasty.

245. Tiles of buildings erected by Ramses II (in Kantir) which have Greek letters on the back, are products of Greek laborers in the service of the pharaoh. The letters are genuine Greek letters of the sixth century.

XI

246. Pharaoh Marneptah is the biblical Hophra and Apries of the Greek authors. Marneptah was not the Pharaoh of the Exodus, but the Pharaoh of the Exile. His royal name usually read Hotepirma, must be read Hophra-Mat.

247. That part of the population of Palestine which escaped deportation to Babylon, went to Egypt, and this migration through the fortress city of Takhu was recorded by the officials of Marneptah.

248. The fortress and palace station Takhu on the frontier, is the biblical Tahpanhes (Daphnoi).

249. The mention of Israel in the "Israel Stela" of Marneptah as an unsettled people refers to their status of exiles.

250. Marneptah used metaphors similar to Jeremiah's in describing the plight of Palestine and Israel.

251. The incursion of Marneptah into Syria is echoed in Diodorus I, 68. This could have taken place during the mental illness of Nebukhadnezar.

252. The city Kaditis in Palestine, referred to by Herodotus, is Jerusalem, and not Gaza.

253. The Libyan campaign of Marneptah was caused by the migration of the Greeks to Cyrenae. It was not an archaic invasion of Hellenic peoples in the thirteenth century, but the mass migration encouraged by the Pythian oracle and described by Herodotus (IV, 159).

254. Amasis deposed Marneptah. There were not seven centuries between Marneptah and Amasis; the latter was a general in the service of the former. Amasis kept his

prisoner for a while as co-ruler on the throne.

255. The violent death of Apries-Marneptah at the hands of the assassins was caused by a lethal wound of the head, as the perforation of the skull of his mummy shows.

XII

256. The overthrow of Egypt, which Ramses III referred to as having occurred a number of generations before his own days, is the conquest of Egypt by Cambyses in the year of Amasis' death.

257. The Palestinian Irsa who taxed Egypt is Ezra, the scribe; he taxed Egypt in accordance with the decree of Artaxerxes.**

258. Ramses III is identical with Nectanebo I of the Greek authors. He lived not in the twelfth but in the fourth century.

259. In Herodotus there can be no reference to Ramses III, because the historian lived before the pharaoh. The history of Egypt by Herodotus, though defective in details, is more nearly accurate than that of the later and modern historians, because he placed the history of the Eighteenth, the Ethiopian, and the Nineteenth Dynasties in fairly accurate order.

260. "Invasion of Egypt by the archaic Greeks" in the twelfth century is a fallacy. The Greeks who participated in the wars of Ramses III and who are shown as changing sides, were at first soldiers of Chabrias, assisting Egypt, and then troops of Iphicrates, opposing Ramses III.

261. Agesilaus, the King of Sparta, had already arrived in Egypt in the days of Nectanebo I (Ramses III), [*Tachos (Ramses IV)*] and Ramses III, who referred to his arrival, mentioned also his notably small stature.

262. The Pereset, with whom Ramses III was at war, were the Persians of Artaxerxes II under the satrap Pharnabazus, and not the Philistines.

263. The war described by Ramses III, and by Diodorus and other classical authors (the war of Nectanebo 1), is one and the same war of 374 BCE

264. A camp was set up by Pharnabazus in Acco in preparation for an attack against the Egypt of Ramses III.

265. A naval invasion against Egypt was undertaken by forcing the Mendesian mouth of the Nile, fortified by Ramses III.

266. Flame throwers were used on the Persian ships forty years before their use by

the Tyrians at the siege of Tyre by Alexander.

267. The Egyptian bas-reliefs of the temple at Medinet Habu show Sidonian ships and Persian carriages comparable to the pictures of ships and carriages on the Sidonian coins minted during the years of the invasion.

268. The bas-reliefs of Medinet Habu show the reform of Iphicrates in lengthening the swords and spears and reducing the armor intended for defense.

269. The Jewish military colony at Elephantine still existed in 374 BCE and participated in the defense of the eastern border of Egypt. These professional soldiers were called Marienu by Ramses III, which is the Aramaic Marenu.

270. Semitic languages and the Palestinian cult of Baal made headway in Egypt at the time of Ramses III.

271. The Greek letters of classical form incised on the tiles of Ramses III during the process of manufacture (found at Tell-el-Yahudieh in the Delta) present no problem. They are Greek letters of the fourth century.

272. The inlay work and glazing of the tiles of Ramses III are innovations introduced from Persia.

273. The hunting motifs in the art of Ramses III were inspired by Assyrian and Persian bas-reliefs; some motifs of the Greek art also made their influence felt in the murals of Ramses III.

274. Other kings known by the name of Ramses, from Ramses IV to Ramses XII, are identical with the kings of the Twenty-ninth and Thirtieth Dynasties and their order of succession is confused.

275. The papyrus of Wenamon describes the conditions in Syria during the late Persian or early Greek times. In the days when the Testament of Naphtali was composed, the Barakel Shipowners Company mentioned in this papyrus was still in existence and owned by a son of Barakel.

276. The so-called Twenty-first Dynasty flourished not in the twelfth-eleventh century, but in the fifth-fourth century; it was established by the Persians as a dynasty of priestly princes in the oases of the Libyan desert for strategic purposes. It existed before, during and after the Twentieth (Twenty-ninth and Thirtieth) Dynasty.

277. The so-called Stela of the Exiled is the Egyptian record of the visit of Alexander the Great to the oracle of Amon in the oasis. The question about the exiles refers to the exiles from Chios; the question about the punishment of the murderers refers to the murderers of Philip.

278. The narration of Greek and Latin authors concerning this visit of Alexander is historical and true in many details; such is, e. g., the episode of the priest applying the word “son” to Alexander, or the oracle’s manner of answering questions by nodding.

XIII

279. The history of the ancient world, confused for a period of over one thousand years, reaches the end of its confusion with the time of Alexander the Great. Since then it is rendered in a synchronized form.***

280. The problem of the beginning of the Iron Age in diverse countries is confused by wrong chronology. The Iron Age developed simultaneously in Egypt and Palestine.

281. The often made assumption that the royal signs (scarabs with cartouches) of the Egyptian kings do not present a valid argument for the time valuation of the strata in which they are found, is erroneous. In most cases they were neither heirlooms deposited at a later date, nor late counterfeits, but genuine gems as old as the strata in which they are found.

282. Archaeological work in the Near East is misled by the erroneous chronology of Egypt. In the excavations where the strata were carefully distinguished, as in Beth Shan, no strata of the Israelite period above the stratum of Rames II could be found.

283. The astronomical computation of chronology made by calculation of the Sothic periods is entirely arbitrary in many aspects. The Egyptian New Year followed the planet Isis, which is Venus, and not Sirius. The Canopus Decree of the priests of Ptolemy III Euergetes was concerned with the transfer of the New Year from the heliacal rising of Venus to a date regulated by the rising of Sirius (Sothis).

284. After the end of the Middle Kingdom, a change in cosmic scenery caused a reform in the calendar. During the time of the Libyan Dynasty (between the Eighteenth and Nineteenth Dynasties) another change was made in the calendar.

* Velikovsky later concluded that there were two Nergilissars, the second reigning after Evil Marduk.

** Velikovsky later rejected Irsa being Ezra, and identified him as the Persian official Arsames. Cf. *Peoples of the Sea*, n. 8 on page 27.

*** Velikovsky later found that the confusion persists until the time of Ptolemy II. Cf. *Peoples of the Sea*.

COSMOS WITHOUT GRAVITATION

ATTRACTION, REPULSION AND ELECTROMAGNETIC CIRCUMDUCTION IN THE SOLAR SYSTEM

Synopsis

BY

IMMANUEL VELIKOVSKY

1946

CONTENTS

III.

Attraction, Repulsion, and Electromagnetic Circumduction in the Solar System

IV.

I

THE FUNDAMENTAL theory of this paper is: Gravitation is an electromagnetic phenomenon. There is no primary motion inherent in planets and satellites. Electric attraction, repulsion, and electromagnetic circumduction⁽¹⁾ govern their movements. The moon does not “fall,” attracted to the earth from an assumed inertial motion along a straight line, nor is the phenomenon of objects falling in the terrestrial atmosphere comparable with the “falling effect” in the movement of the moon, a conjecture which is the basic element of the Newtonian theory of gravitation.

Aside from several important facts discovered in the study of cosmic upheavals, which are not illuminated here and only enumerated at the end of this paper, and which are discussed at length in a work of research entitled *Worlds In Collision* now being prepared for publication, the following facts are incompatible with the theory of gravitation:

1.

The ingredients of the air—oxygen, nitrogen, argon and other gases—though not in a compound but in a mixture, are found in equal proportions at various levels of the atmosphere despite great differences in specific weights. The explanation accepted in science is this: “Swift winds keep the gases thoroughly mixed, so that except for water-vapor the composition of the atmosphere is the same throughout the troposphere to a high degree of approximation.”⁽²⁾ This explanation cannot be true. If it were true, then the moment the wind subsides, the nitrogen should stream upward, and the oxygen should drop, preceded by the argon. If winds are caused by a difference in weight between warm and cold air, the difference in weight between heavy gases high in the atmosphere and light gases at the lower levels should create storms, which would subside only after they had carried each gas to its natural place in accordance with its gravity or specific weight. But nothing of the kind happens.

When some aviators expressed the belief that “pockets of noxious gas” are in the air, the scientists replied:

“There are no ‘pockets of noxious gas.’ No single gas, and no other likely mixture of gases, has, at ordinary temperatures and pressures, the same density as atmospheric air. Therefore, a pocket of foreign gas in that atmosphere would almost certainly either bob up like a balloon, or sink like a stone in water.”⁽³⁾

Why, then, do not the atmospheric gases separate and stay apart in accordance with the specific gravities?

2.

Ozone, though heavier than oxygen, is absent in the lower layers of the atmosphere, is present in the upper layers, and is not subject to the “mixing effect of the wind.” The presence of ozone high in the atmosphere suggests that oxygen must be still higher: “As oxygen is less dense than ozone, it will tend to rise to even greater heights.”⁽⁴⁾ Nowhere is it asked why ozone does not descend of its own weight or at least why it is not mixed by the wind with other gases.

3.

Water, though eight hundred times heavier than air, is held in droplets, by the millions of tons, miles above the ground. Clouds and mist are composed of droplets which defy gravitation.

4.

Even if perfect elasticity is a quality of the molecules of all gases, the motion of the molecules, if effected by a mechanical cause, must subside because of the gravitational attraction between the particles and also because of the gravitational pull of the earth. There should also be a loss of momentum as the result of the transformation of a part of the energy of motion into vibration of molecules hit in the collisions.⁽⁵⁾ But since the molecules of a gas at a constant temperature (or in a perfect insulator) do not stop moving, it is obvious that a force generated in collisions drives them. The molecules of gases try to escape one another. Repulsion between the particles of gases and vapors counteracts the attraction.

5.

The weight of the atmosphere is constantly changing as the changing barometric pressure indicates. Low pressure areas are not necessarily encircled by high pressure belts. The semidiurnal changes in barometric pressure are not explainable by the mechanistic principles of gravitation and the heat effect of solar radiation. The cause of these variations is unknown.

“It has been known now for two and a half centuries, that there are more or less daily variations in the height of the barometer, culminating in two maxima and two minima during the course of 24 hours. Since Dr. Beal’s discovery (1664-65), the same observation has been made and puzzled over at every

station at which pressure records were kept and studied, but without success in finding for it the complete physical explanation. In speaking of the diurnal and semidiurnal variations of the barometer, Lord Rayleigh says: 'The relative magnitude of the latter [semidiurnal variations], as observed at most parts of the earth's surface, is still a mystery, all the attempted explanations being illusory.'" [\(6\)](#)

One maximum is at 10 a.m., the other at 10 p.m.; the two minima are at 4 a.m. and 4 p.m. The heating effect of the sun can explain neither the time when the maxima appear nor the time of the minima of these semidiurnal variations. If the pressure becomes lower without the air becoming lighter through a lateral expansion due to heat, this must mean that the same mass of air gravitates with changing force at different hours.

The lowest pressure is near the equator, in the belt of the doldrums. Yet the troposphere is highest at the equator, being on the average about 18 km. high there; it is lower in the moderate latitudes, and only 6 km. high above the ground at the poles.

6.

Laplace, pondering the shape of the atmospheric envelope of the earth, came to the conclusion that the atmosphere, which rotates with the same angular velocity as the earth and which behaves like a fluid, must be lenticular in form; its polar and equatorial axes must be about 35,000 and 52,000 miles respectively; at the equator the atmosphere must extend more than 21,000 miles above the ground. At these distances from the ground the gravitational force of the earth is just equal to the centrifugal force due to rotation.

From the measurement of the pressure of the earth's atmosphere, measurement based also on the principles of gravitation, it has been deduced that the atmosphere is but 17 (not 21,000) miles high.

Observations of the flight of meteorites and of the polar auroras lead to the conjecture that the atmosphere reaches to a height of 130 miles (meteorites) or over 400 miles (polar auroras). Radio measurements yield about 200 miles for the upper layer recognizable through this method of investigation.

Two computations, both based on the principle of gravitation, differ in the proportion of 17 and 21,000. Direct observations do not justify either of the computed figures.

7.

Cyclones, characterized by low pressure and by winds blowing toward their

centers, move counterclockwise in the northern hemisphere and clockwise in the southern hemisphere. This movement of air currents in cyclonic vortices is generally explained as the effect of the earth's rotation.

Anticyclones, characterized by high pressure and by winds blowing from their centers move clockwise in the northern hemisphere and counterclockwise in the southern hemisphere. The movement of anticyclones has not been explained and is regarded as enigmatic.

Cyclones and anticyclones are considered a problem of fluidal motion with highest or lowest pressure in the center. As the movement of anticyclones cannot be explained by the mechanistic principles of gravitation and rotation, it must be concluded that the rotation of cyclones is also unexplained.

8.

The area of land in the northern hemisphere of the earth is to the area of land in the southern hemisphere as three is to one. The mean weight of the land is two and three-quarter times heavier than that of water; assuming the depth of the seas in both hemispheres to be equal, the northern hemisphere up to sea level is heavier than the southern hemisphere, if judged by sea and land distribution; the earth masses above sea level are additional heavy loads. But this unequal distribution of masses does not affect the position of the earth, as it does not place the northern hemisphere with its face to the sun. A "dead force" like gravitation could not keep the unequally loaded earth in equilibrium. Also, the seasonal distribution of ice and snow, shifting in a distillation process from one hemisphere to the other, should interfere with the equilibrium of the earth, but fails to do so.

9.

Mountainous masses do not exert the gravitational pull expected by the theory of gravitation. The influence of the largest mass on the earth, the Himalaya, was carefully investigated with plumb line on the Indian side. The plumb line is not deflected as calculated in advance.⁽⁷⁾ "The attraction of the mountain-ground thus computed on the theory of gravitation, is considerably greater than is necessary to explain the anomalies observed. This singular conclusion, I confess, at first surprised me very much." (G. B. Airy.⁽⁸⁾) Out of this embarrassment grew the idea of isostasy. This hypothesis explains the lack of gravitational pull by the mountains in the following way. The interior of the globe is supposed to be fluid, and the crust is supposed to float on it. The inner fluid or magma is heavier or denser, the crust is lighter. Where there is a mountainous elevation, there must also be a protuberance beneath the mountains, this immersed protuberance being of lesser mass than the magma of equal volume. The way seismic waves travel, and computations of the

elasticity of the interior of the earth, force the conclusion that the earth must be as rigid as steel; but if the earth is solid for only 2000 miles from the surface, the crust must be more rigid than steel. These conclusions are not reconcilable with the principle of isostasy, which presupposes a fluid magma less than 60 miles below the surface of the earth. There remains “a contradiction between isostasy and geophysical data.” ⁽⁹⁾

10.

Over the oceans, the gravitational pull is greater than over the continents, though according to the theory of gravitation the reverse should be true; the hypothesis of isostasy also is unable to explain this phenomenon. ⁽¹⁰⁾ The gravitational pull drops at the coast line of the continents. Furthermore, the distribution of gravitation in the sea often has the peculiarity of being stronger where the water is deeper. “In the whole Gulf and Caribbean region the generalization seems to hold that the deeper the water, the more strongly positive the anomalies.” ⁽¹¹⁾

As far as observations could establish, the sea tides do not influence the plumb line, which is contrary to what is expected. Observations on reservoirs of water, where the mass of water could be increased and decreased, gave none of the results anticipated on the basis of the theory of gravitation. ⁽¹²⁾

11.

The atmospheric pressure of the sun, instead of being 27.47 times greater than the atmospheric pressure of the earth (as expected because of the gravitational pull of the large solar mass), is much smaller: the pressure there varies according to the layers of the atmosphere from one-tenth to one-thousandth of the barometric pressure on the earth; ⁽¹³⁾ at the base of the reversing layer the pressure is 0.005 of the atmospheric pressure at sea level on the earth; ⁽¹⁴⁾ in the sunspots, the pressure drops to one ten-thousandth of the pressure on the earth.

The pressure of light is sometimes referred to as to explain the low atmospheric pressure on the sun. At the surface of the sun, the pressure of light must be 2.75 milligrams per square centimeter; a cubic centimeter of one gram weight at the surface of the earth would weigh 27.47 grams at the surface of the sun. Thus the attraction by the solar mass is 10,000 times greater than the repulsion of the solar light. Recourse is taken to the supposition that if the pull and the pressure are calculated for very small masses, the pressure exceeds the pull, one acting in proportion to the surface, the other in proportion to the volume. ⁽¹⁵⁾ But if this is so, why is the lowest pressure of the solar atmosphere observed over the sunspots where the light pressure is least?

12.

Because of its swift rotation, the gaseous sun should have the latitudinal axis greater than the longitudinal, but it does not have it. The sun is one million times larger than the earth, and its day is but twenty-six times longer than the terrestrial day; the swiftness of its rotation at its equator is over 125 km. per minute; at the poles, the velocity approaches zero. Yet the solar disk is not oval but round: the majority of observers even find a small excess in the longitudinal axis of the sun. ⁽¹⁶⁾ The planets act in the same manner as the rotation of the sun, imposing a latitudinal pull on the luminary.

Gravitation that acts in all directions equally leaves unexplained the spherical shape of the sun. As we saw in the preceding section, the gases of the solar atmosphere are not under a strong pressure, but under a very weak one. Therefore, the computation, according to which the ellipsoidity of the sun, that is lacking, should be slight, is not correct either. Since the gases are under a very low gravitational pressure, the centrifugal force of rotation must have formed quite a flat sun.

Near the polar regions of the sun, streamers of the corona are observed, which prolong still more the axial length of the sun.

13.

If planets and satellites were once molten masses, as cosmological theories assume, they would not have been able to obtain a spherical form, especially those which do not rotate, as Mercury or the moon (with respect to its primary).

14.

The Harmonic Law of Kepler views the movements of the planets as depending only on their distance from the sun. According to Newton, the masses of the sun and the planets must also enter the formulas. The Newtonian orbits differ from the Keplerian, found empirically. The Newtonian formula has a sum of masses (instead of a product of masses), and in view of the largeness of the sun, the Newtonian orbits are supposed to not deviate substantially from the Keplerian. ⁽¹⁷⁾

15.

Perturbations of planets due to their reciprocal action are pronounced in repulsion as well as attraction. A perturbation displacing a planet or a satellite by a few seconds of arc must direct it from its orbit. It is assumed that the

orbits of all planets and satellites did not change because of perturbations. A regulating force emanating from the primary appears to act. In the gravitational system there is no place left for such regulating forces.

16.

The perturbing activity appears unstable in the major planets, Jupiter and Saturn: Between the minimum of the year 1898-99 and the maximum of the 1916-17 there was found an 18 percent difference.⁽¹⁸⁾ As these planets did not increase in mass in the meantime, this change is not understandable from the point of view of the theory of gravitation, which includes the principle of the immutable gravitational constant.

17.

The pressure of light emanating from the sun should slowly change the orbits of the satellites, pushing them more than the primaries, and acting constantly, this pressure should have the effect of acceleration: the pressure of light per unit of mass is greater in relation to the satellites than in relation to their primaries. But this change fails to materialize; a regulating force seems to overcome this unequal light pressure on primaries and secondaries.

18.

The sun moves in space at a velocity of about twenty kilometers a second (in relation to the nearby stars). This motion, according to Lodge, must change the eccentricities of some of the planetary orbits to an extent which far exceeds the observed values.⁽¹⁹⁾

19.

The motion of the perihelia of Mercury and Mars and of the nodes of Venus differ from what is computed with the help of the Newtonian law of gravitation. Einstein showed how his theory can account for the anomaly of Mercury; however, the smaller irregularities in the movements of Venus and Mars cannot be accounted for by Einstein's formulas.

20.

Unaccounted for fluctuations in the lunar mean motion were calculated from the records of lunar eclipses of many centuries and from modern observations. These fluctuations were studied by S. Newcomb, who wrote: "I regard these fluctuations as the most enigmatic phenomenon presented by the celestial motions, being so difficult to account for by the action of any known causes, that we cannot but suspect them to arise from some action in nature hitherto

unknown.” [\(20\)](#) They are not explainable by the forces of gravitation which emanate from the sun and the planets.

21.

It was found that “the strength of radio reception was nearly doubled with the passing of the moon from overhead to underneath the observer ... It does not appear reasonable that the relatively small gravitational tide in the earth’s atmosphere, which changes the barometric pressure by less than half of one percent, could account for a sufficient change in altitude of the ionized layer to produce such marked changes in the intensity of reception.” [\(21\)](#)

The lifting of the ionosphere generally results in better radio reception, and the small tidal action by the moon when overhead should improve reception a little, not impair it; in any event, the moon cannot have a marked effect on the ionosphere without being itself a charged body. But if the moon is charged, it cannot behave in its motion as though the gravitational force alone acts between it and the earth.

22.

The tails of the comets do not obey the principle of gravitation and are repelled by the sun. “There is beyond question some profound secret and mystery of nature concerned in the phenomenon of their tails” ; enormous sweep which it (the tail) makes round the sun in perihelion, in the manner of a straight and rigid rod, is in defiance of the law of gravitation, nay, even of the recorded laws of motion” (J. Herschel). [\(22\)](#)

“What has puzzled astronomers since the time of Newton, is the fact that while all other bodies in the sidereal universe, as far as we are aware, obey the law of gravitation, comets’ tails are clearly subject to some strong repulsive force, which drives the matter composing them away from the sun with enormously high velocities” (W.H. Pickering)

23.

The change in the angular velocity of comets (especially of the comet Encke) is not in accord with the theoretical computations based on the theory of gravitation. [\(23\)](#)

24.

Meteors, after entering the terrestrial atmosphere at about 200 km. above the ground, are violently displaced toward the east. These displacements of the

meteors are usually ascribed to winds blowing in the upper atmosphere. ⁽²⁴⁾
The atmospheric pressure at a height of 45 km. is supposed to be but “a small fraction of one millimeter of mercury.” ⁽²⁵⁾ On the other hand, the velocity with which the meteors approach the earth is between 15 and 75 km. per second, on the average about 40 km. per second or over 140,000 km. per hour. If winds of 150 km. per hour velocity were permanently blowing at the height where the meteors become visible, it would not be possible for such winds of rarefied atmosphere to visibly deflect stones falling at the rate of 140,000 km. per hour.

Approaching the earth, the meteorites suddenly slow down and turn aside, and some are even repelled into space. “A few meteors give the appearance of penetrating into our atmosphere and then leaving it, ricocheting as it were.” ⁽²⁶⁾

25.

The earth is a huge magnet; it has electric currents in the ground and is enveloped by a number of layers of electrified ionosphere. The sun possesses an electric charge and magnetic poles; also the sunspots are found to be powerful magnets. The ionosphere is permanently charged by particles arriving from the sun; sunspots actively influence terrestrial magnetism, ground currents, the ionosphere’s charge, and auroras. As the principle of gravitation leaves no room for the participation of other forces in the ordinary movements of the celestial mechanism, these obvious and permanent influences of the electromagnetic state of the sun on the magnetic field of the earth, the ionosphere, the auroras, and the earth currents are not allowed to have more than zero effect on the astronomical position of the earth, and this for the sake of maintaining the integrity of the gravitational principle.

Sun and moon, comets, planets, satellites, and meteorites - all the heavenly host - air and water, mountain massifs and sea tides, each and all of them ⁽²⁷⁾ disobey the “law of laws” which is supposed to know no exception.

* * *

To the empirical evidences of the fallacy of the law of gravitation four well known difficulties of the gravitational theory can be added:

a.

Gravitation acts in no time. Laplace calculated that, in order to keep the solar system together, the gravitational pull must propagate with a velocity at least fifty million times greater than the velocity of light. A physical agent requires time to cover distance. Gravitation defies time.

b.

Matter acts where it is not, or *in abstentia*, through no physical agent. This is a defiance of space. Newton was aware of this difficulty when he wrote in a letter to Bentley: “That gravity should be innate, inherent, and essential to matter, so that one body can act upon another at a distance through a vacuum without the mediation of anything else, by and through which their action and force may be conveyed from one to another, is to me so great an absurdity that I believe no man, who has in philosophical matters a competent faculty of thinking, can ever fall into it.” Leibnitz opposed the theory of gravitation for this very reason.

c.

Gravitational force is unchangeable by any and all agents or by any medium through which it passes, always propagating as the inverse square of the distances. “Gravitation is entirely independent of everything that influences other natural phenomena” (De Sitter⁽²⁸⁾). This is a defiance of the principles governing other energies.

d.

Every particle in the universe must be under a tendency to be pulled apart because of the infinite mass in the universe: it is pulled to all sides by all the matter in space.

A few additional remarks about the motion of bodies in the universe which bear upon the theory of gravitation are added here:

1.

The notion of the tangential escape or inertia of the primary motion of the planets and satellites, being adopted by all cosmogonical theories of post-Newtonian days, led all of them into insurmountable difficulties. The retrograde motion of some satellites is one of these difficulties.

2.

The principle of gravitation demands an ultimate balling of all matter in the cosmos. This is not in harmony with spectral observations, which suggest even an “expanding universe”

3.

“An atom differs from the solar system by the fact that it is not gravitation that makes the electrons go round the nucleus, but electricity.” (B. Russell). Different principles are supposed to govern the motion of the planetary bodies in the macrocosm and microcosm. [\(29\)](#)

* * *

Newton explained the principle underlying the motion of the planets and the satellites by the example of a stone thrown horizontally from a mountain with such force that gravitation bends its flight so that it revolves around the earth, coming back to exactly the same place, once again to repeat the course of its flight. But he admits “It is not to be conceived that mere mechanical causes could give birth to so many regular motions,” and invokes an act of Providence in providing each satellite with a tangential push of a strength which, together with the pull of the primary, creates an orbit. (General Scholium to Book III of the *Principia*) The inertia of the tangential (instantaneous) push has not exhausted itself in all the eons despite the tidal friction between a satellite and its primary, or the sun pulling the satellite away from the primary, or the resistance of matter (meteorites) in space, though all these forces act permanently and therefore with acceleration.

* * *

Newton’s gravitational theory is regarded as proved by the action of the tides. But studying the tides, Newton came to the conclusion that the moon has a mass equal to one fortieth of the earth. Modern calculations, based on the theory of gravitation (but not on the action of the tides), ascribe to the moon a mass equal to 1/81 of the earth’s mass. [\(30\)](#)

The greatest triumph of the theory of gravitation was the discovery of the planet Neptune, the position of which was calculated simultaneously by Adams and Leverrier from the perturbations experienced by Uranus. But in the controversy which ensued concerning the priority in announcing the existence of Neptune, it was stressed that neither of the two scholars was the real discoverer, as both of them calculated very erroneously the distance of Neptune from the orbit of Uranus. [\(31\)](#) Yet, even if the computations were correct, there would be no proof that gravitation and not another energy acts between Uranus and Neptune. The gravitational pull decreases as the square of the distance. Electricity and magnetism act in the same way. Newton was mistaken when he ascribed to magnetism a decrease that follows the cube of the distance. [\(32\)](#)

Building his System of the World, Newton put before his readers “Rules of Reasoning in Philosophy.” The First Rule is: “We are to admit no more causes of natural things than such as are both true and sufficient to explain their appearances.” Rule II is : “Therefore, to the same natural effects we must, as far as possible, assign the same causes.”

II

Thorough theoretical and experimental investigations will be necessary to build a new theory in place of the now accepted theory of gravitation. For the present we shall offer only general suggestions.

1.

Attraction between two neutral atoms. Each atom is made up of positive and negative electricity and, though neutral as a whole, may form an electric dipole when subjected to an electric force. Thus, in the theory presented here, this attraction is not due to “inherent gravitational” properties of mass, but instead to the well known electrical properties of attraction. Two dipoles arrange themselves so that the attraction is stronger than their mutual repulsion.

2.

Inertia, or the passive property of matter. “The equality of active and passive, or gravitational and inertial mass was in Newton’s system a most remarkable accidental coincidence, something like a miracle. Newton himself decidedly felt it as such” (W. DeSitter). [\(33\)](#)

In Einstein’s explanation, inertia and gravitation are not two different properties, but one and the same property viewed from different points in space. According to his illustration, a man in an elevator that is being continuously pulled up by a rope invisible to the man will feel his feet pressed against the bottom of the elevator and will think that he gravitates toward the floor. But someone else observing the situation from the outside in space will judge that there is a fact of inertia; the pulled elevator has to overcome the inertia of the man standing on its floor. If the man in the elevator lets an object fall from his hand, it will approach the floor at an accelerated speed because the elevator is being continuously pulled upward; to the observer on the outside it rises with acceleration.

By this illustration Einstein tried to explain the equivalence of inertia and gravitation. But it is impossible to adopt this explanation for the gravitational effect of the globe: the observer from outside cannot perceive the globe as moving simultaneously in all directions. Einstein sees the difficulty and says: “It is, for instance, impossible to choose a body of reference such that, as judged from it, the gravitational field of the earth (in its entirety) vanishes.” [\(34\)](#)

In our explanation the active property is due to one kind of charge in the atom - the attracting (attracted) charge; the passive property, to the opposite charge,

which repels (is repelled). Both exist in equal quantities in a neutral atom; this explains the equality of the gravitating and inertial properties of matter.

However, the charges must arrange themselves in such a manner that attraction proceeds: the attracting force overcomes the repelling force because the attracting poles of the dipoles are closer to one another than the repelling poles; when the repelling poles are closer, the atoms (or their combinations in molecules) repel each other, as is the case with gases.

A charged body attracts more strongly than a neutral body because of the presence of free electrons; in dipoles the charges rearrange themselves only a little, but free electrons can rearrange themselves much more.

3.

Attraction of bodies toward the earth. The ionosphere is strongly charged with respect to the “neutral” earth; a potential difference of 100 volts per meter altitude exists near the ground, or a difference in potentials which forces the current through the electric lamps. Does any relation exist between the difference in voltage in the lower atmosphere and the difference in weight (“at the ceiling of a room 3 meters high a kilogram weighs about one milligram less than at the floor”)?

With the altitude a voltage difference per meter is not the same as near the ground, but it accumulates to a high figure: “Between a point ten miles high and the surface of the earth there is an electrical pressure difference of about a hundred and fifty thousand volts.” [\(35\)](#)

Neutral bodies consist of both positive and negative charges. Neutral atoms form dipoles along the lines of force of the electric field with poles turned toward the earth and the ionosphere. Is the fall of objects due to their “dipole attraction” and to their movement in an electrical field as dipoles? The proximity to the ground gives its action preference over that of the ionosphere as far as the attracting force is concerned, since the distance between the opposite electric poles of the atomic dipole is much smaller in comparison to its total distance from the ionosphere than from the ground. This means, however, that when objects reach a certain altitude, they would be attracted upward. Meteorites, repelled into space, are apparently charged identically with the upper layer of the ionosphere.

This part of the theory (concerning falling bodies) requires experimentation and exact calculation. It is probable that besides carrying a charge, the ground turns all of its atoms as dipoles toward the ionosphere. [\(36\)](#)

4.

“In contrast to electric and magnetic fields, the gravitational field exhibits a most remarkable property, which is of fundamental importance ... Bodies which are moving under the sole influence of a gravitational field receive an acceleration, which does not in the least depend either on the material or the physical state of the body.” (Einstein)⁽³⁷⁾

This law is supposed to hold with great accuracy. The velocity of the fall is generally explored with the help of a pendulum; it appears to us that a charged object must fall with a different velocity than a neutral object. This is generally denied. But the denial is based on the observation that there is no difference in the number of swings of a pendulum in a unit of time, in the case where a charged or neutral bob is used. This method may produce inaccurate results. *In an accurate method, the falling time and the time of ascent of the pendulum must be measured separately.* In the case of a charged body, the increase in the velocity of descent of the pendulum may be accompanied by a decrease in the velocity of ascent, and thus the number of swings in a unit of time would remain the same for charged and non-charged bobs.

In a charged body the attracting and the inertial properties are not equal. It appears also that the weight of a body increases after it is charged. An experiment made with a piece of hard rubber (ten grams), neutral and again charged by rubbing, on a scale with a sensitivity of one-tenth of a milligram, showed a change in weight of over ten milligrams. This appears to be the result of an induced charge in the bottom (ebony) of the balance (placed on a thick plate of glass). A grounded wire held over the scale with the charged rubber raises the scale. If “gravitation” is an electrical phenomenon, attraction by induced electricity is not an entirely different phenomenon. Nevertheless, this experiment cannot be regarded as conclusive for the present problem.

In the oil-drop experiment the action of the charges may be made equal to the “gravitational” pull: One and the same action is ascribed to two fundamentally different principles.

A photograph may provide the answer to the question of how much a charged drop revolving around a pole of a magnet is influenced by the terrestrial pull.

Would a metal container filled with gas fall (in a vacuum) with the same velocity as a solid piece of metal?

III

Attraction, repulsion, and electromagnetic circumduction act in the solar system. Sun, planets, satellites, comets are charged bodies. As charged bodies they are interdependent.

The solar surface is charged negatively in relation to the charge of the earth, as the spectral lines (with the dominant red line in the spectrum of hydrogen) reveal. The sun carries a charge and rotates: it is an electromagnet.

The spots of the sun are magnetic, and the filaments of hydrogen on the sun's surface arrange themselves as iron particles in a magnetic field.⁽³⁸⁾ Besides the spots, the sun as a whole is a magnet. "The form of the corona and the motion of the prominences suggest that it is a magnet," wrote G.E. Hale when he undertook to detect the Zeeman effect.⁽³⁹⁾ The Zeeman effect proved to be most pronounced at 45° in both hemispheres of the sun; Hale found the displacement of lines decreases to zero at the equator and near the poles of rotation; and also that "a first approximate value for the vertical intensity of the sun's general field at the poles is 50 gaussses." Thus, it was confirmed that the sun is a magnet, but the magnetic field was found not to be strong.

This result is questioned here. The lines of the corona suggested the existence of a magnetic field on the sun to the scholar who discovered it. But the form of the corona suggests a powerful magnetic field.⁽⁴⁰⁾ Visible coronal bands and streamers reach a distance equal to ten and more diameters from the disc of the sun—Mercury is only forty solar diameters from the sun and Earth 108 solar diameters. More recent investigation by Stevens, who photographed the streamers from 25,000 feet, disclose a globular corona more extensive than any known from ground photographs.

Disturbances in filaments and vortices of the sun affect the ionosphere of the earth and prove the existence of a powerful charge on the sun; rotating at the speed of the solar rotation, a strong charge must produce a strong magnetic field.

A revised investigation of the magnetic power of the field around the sun is here suggested. It should be kept in mind that the observations have been made from the solar magnetic field, in which the earth is embedded, if our concept is correct. It is possible also that the strongest Zeeman effect will show itself in latitudes higher than 45°. As is well known, the angle of observation must be taken into consideration in observing the Zeeman effect.

The sun is a rotating charged body, and it creates a magnetic field. We assume the solar charge to be large enough to produce a magnetic field with lines of force reaching the orbit of Pluto. The charged planets move at right angles to the sun's magnetic lines of force and describe the usual circular motion to which moving charged bodies are subjected in a magnetic field. Satellites, in turn, revolve in smaller magnetic fields produced by the rotation of the charged planets. The non-rotating planets have no satellites, for they do not produce magnetic fields. If there are rotating satellites, they may be able to revolve trabants around them.

"The origin of the earth's main magnetic field has so far defied all attempts of solution."⁽⁴¹⁾ The cause of the earth's magnetic field is in (1) the magnetic field of

the sun, and (2) the rotation of the charged earth around its axis.

It has been calculated⁽⁴²⁾ that if the earth is a magnet because of the rotating charge on its surface, the charge must be so great as to “enter as a serious factor in planetary perturbations,” and therefore the theory was dropped.⁽⁴³⁾ But this is exactly what happens: the electromagnetic fields of the earth and of other planets are the causes of the planetary perturbations.

We have constructed a theory according to which the members of the solar system are charged bodies; electric attraction and repulsion, and electromagnetic circumduction act in the system; the origin of the magnetic field around the sun is in its charge—the sun is an electromagnet; planetary motion is due to the electromagnetic force exerted on the planets by the sun. The planets as charged bodies create magnetic fields by their rotation. It follows that (a) gravity, depending on electrical charge, varies with the charge, (b) the masses of the planets are inaccurately calculated, (c) the positive and negative charges are manifested only in relation to the charge of the earth.

One of the differences between the conception of celestial mechanism expounded here and the theories of gravitation of Newton and Einstein is that in our understanding the revolution of the moon is a process of a different order from that of the falling of objects near the terrestrial ground. The revolution of the moon is a phenomenon of circumduction of a charge by a magnetic field and is not a fall combined with inertia; the primary motion of planets and satellites along a straight line is a fallacious notion. At the distance of the moon the electromagnetic field of the earth causes circumduction while in the terrestrial atmosphere the electric field between the earth and the ionosphere causes the movement of the dipoles. Like the moon, the earth and other planets and satellites are subject to electromagnetic circumduction.

IV

“Universal gravitation” is an electromagnetic phenomenon, in which the charges in the atoms, the free charges, the magnetic fields of the sun and the planets play their parts.

In the frame of this theory the following phenomena become explainable:

1.

All planets revolve in approximately one plane. They revolve in a plane perpendicular to the lines of force of the sun’s magnetic field.

2.

The planets have a greater aggregate energy of motion than the sun. The

revolution of the planets did not originate in the angular velocity of rotation of the sun; the magnetic field of the sun effected their revolution. Also, the fact that one of the satellites of Mars revolves with an angular speed greater than that of the rotation of this planet is explained here by electromagnetic circumduction.

3.

The retrograde revolution of a number of satellites. It is due either to retrograde rotation of the primary with inversed magnetic poles or to a difference of charges. The fact that the retrograde satellites of Jupiter and Saturn are the most remote from their primaries poses the problem whether their remoteness from the primaries and their relative closeness to the sun play a role in their being of a presumably different charge than the other satellites of Jupiter and Saturn. ⁽⁴⁴⁾

In the case of Uranus, the retrograde revolution of its satellites follows the retrograde rotation of the planet and its magnetic field. (One of the magnetic poles of Uranus can be readily investigated because it faces the ecliptic.)

4.

The rotation of the earth. The tidal theory fails to account for the rotation of the planets. The position of the magnetic poles of the earth at a distance of about 20 degrees from the geographical poles may be related to the rotation of the earth. Once each day the magnetic poles of the earth occupy the southernmost and the northernmost positions in the lines of the magnetic field of the sun.

5.

Perturbations among the members of the solar system are actions of attraction as well as of repulsion and depend on the charges of the planets and satellites and their magnetic properties. The fact that after perturbations, the planets resume their normal courses is due to the regulating action of the sun's magnetic field. Similarly, the satellites are regulated in their motion by the electromagnetic fields of the primaries.

6.

The anomalies in the motion of Mercury and other planets. The velocities of revolution of the planets depend on their charges. A strongly charged body is carried across the lines of the magnetic field more swiftly than a weakly charged body. If the charge of a planet increases, the velocity of revolution of such a planet must increase too. Positive as well as negative charges arrive

from the sun in an uninterrupted flow.

The planet Mercury moves faster and faster. *This must be the result of an increasing charge of the planet.* Also, the anomalies in the motion of other inner planets may be attributed to a changing charge; other irregularities in the motion of the planets can be attributed to the fact that the electrical charge of the sun is not equally distributed on the solar surface.

7.

The deflection of a ray of light passing close to the sun. Before attributing the deflection to the gravitational field of the sun, the influence of the magnetic field of the sun on the rotation of light should be calculated. (The influence of the moon on a ray of light by creating a ripple in the atmosphere during a solar eclipse must not be overlooked; an investigation of the trajectory of a stellar ray passing close to the moon in a lunar eclipse is suggested here.)

8.

The repulsion of a comet's tail by the sun. The head of a comet and its tail are charged under a great potential difference, accounting for the manifest repulsion of the tail and attraction of the head. The neck of the comet is probably composed of positive and negative elements in equal proportion, thus forming a neutral zone between the head and the tail. Under the influence of the temperature in space the charges change and the comet returns on its orbit.

9.

The displacement of the meteorites in the higher atmosphere. It is caused not by the winds, but by the electromagnetic effect of the ionosphere. The light of the meteorites is caused by electric discharges. Consequently, the passage of meteorites disturbs radio reception.

10.

The influence of the moon on radio reception. The charged moon on its hourly stations exerts an attracting-repelling action on the electrified layers of the atmosphere (ionosphere) to a greater degree than on the "insulating layer" of the earth's atmosphere.

11.

The semi-diurnal variations of the barometric pressure. These variations with maxima at 10 a.m. and 10 p.m. have their cause in the semi-diurnal changes of the charge of the ionosphere at the same hours, 10 a.m. and 10 p.m. The

barometric pressure reflects the degree of attraction exerted by the ground and the ionosphere on the gaseous envelope.

12.

The defiance of gravity by water and cloud building. The ground and the ionosphere induce secondary charge-layers in the atmosphere. In such a secondary layer cloud-building takes place. Generation of electricity in clouds is due not to the friction of neutral clouds on mountain ridges, or to the friction of neutral clouds among themselves, or to the friction of droplets by the gravitational pull on them, but to the fact that droplets rise already charged toward the charged layer of the atmosphere, and clouds are further subjected to induction by the ground and the ionosphere. This explains also the segregation of the charges in the upper and lower levels of the clouds.

13.

Defiance of gravity experienced in the cumulo-nimbus clouds. This defiance recorded by airplane pilots is the result of charges and electromagnetic effects prevailing in these clouds.

14.

The direction of the cyclonic and anticyclonic whirls. Their direction on the earth, as well as on the sun, depends on the electromagnetic fields and not on the rotation of these bodies.

15.

Increased gravity over the sea. The increase of gravity over the sea as compared with that over the continent may be explained by the higher charge of salt water.

* * *

There were a few attempts made to unite the electromagnetic and gravitational field theories; but as far as I know nobody has tried to solve the problem of planetary movement around the sun as a motion of charged bodies in a magnetic field; my explanation implies that the measurement of the solar magnetic field by Hale is not correct.

If the sun has a sufficiently strong magnetic field so as to reach the farthest of the planets, the quantitative elements are dictated by the charge of the sun, the strength of its magnetic field, and the charge of the planets.

The theory of the Cosmos without Gravitation given here in synopsis is written also in a comprehensive form (1941-43). I arrived at this concept early in 1941 as a result of my research in the history of cosmic upheavals as they affected the earth and other members of the solar system. A number of facts proved to me that the sun, the earth and other planets, the satellites, and the comets, are charged bodies, that the planets and their satellites have changed their orbits repeatedly and radically, and that gravitational attraction or the weight of objects has changed during human history. I thus recognized the fact that not gravitation, but electric attraction and repulsion and electromagnetic circumduction govern the solar system.

In construction the electromagnetic theory of the solar system, I am indebted to Miss Shulamith Velikovsky for valuable suggestions on the dipole explanation of attraction between the atoms and the dipole concept of inertia.

36. In connection with this, attention should be paid to the following: "When measurements of the earth's magnetic field are used to evaluate the magnetic line-integral around any chosen area on the earth's surface, the result generally differs from zero. This, according to a fundamental principle of electromagnetism, is to be taken as evidence that an electric current flows vertically across the area ... The average current-density is about 10,000 times that of the air-earth current that is derived from atmospheric-electricity measurements, so that it seems inadmissible to interpret either this aspect of the earth's magnetism or the currents observed in telegraph-lines of mountain slopes as manifestations of vertical electrical currents in the atmosphere unless there is involved here some principle or some mode of electrical transport that is yet unknown to physics... A problem that may be of fundamental importance to physical science." O.H. Gish, "Atmospheric electricity" in Fleming, *op.cit.*

Introduction

The pages that follow deal with the marvelous and the miraculous. On the pages of the Old Testament and in Hebrew lore stories are told of unusual phenomena. They intrigued me by the fact that so many of them reappear in the fields of modern paleontology, physics, and psychology. In almost every instance the gap could be bridged by an association - from archaic and miraculous to modern and self-understood, but still miraculous. Is not the phenomenon of magnetism well-known, yet still miraculous? And the same is with many other phenomena in the natural sciences. Thus a miracle of ancient lore is explained, yet the miraculous in the natural event remains.

As I proved in *Ages in Chaos* the letters found in the Egyptian State Archive of el-Amarna originated in the ninth century, and a very considerable portion of them was written in Palestine, by Ahab king of Israel, Jehoshaphat, king of Jerusalem, and their generals. The corresponding texts of the Scriptures prove a very high grade of trustworthiness, even in transmission of orations and dialogues, ascribed to historical personages. This fact encourages to approach with credence the stories of Elijah and Elisha, interwoven in the same parts of the Book of Kings.

Notes and Themes

Themes for *Shamir*

(mostly from the Old Testament; miracles-ancient lore)

Genesis

Serafim
Sanverim
Sulfur (brimstone)
Interplanetary travel
Giants
“Smoke of furnace”
Deluge
Giant animals—also Ziz bird, (mammals)
Struggling with the angel?
Angels visit Abraham
Dream interpretation

Exodus

Manna—hydroc. combin.

Numbers

Radiation disease-Tzaarat—“leprosy”—Hair fell out

Joshua

Wild ducks (meat of fowl)—radioactivity in exposed animals—case of radiated engineer.
The death after eating the wild ducks (irradiated).
Phosphorescence—hand white after being kept in dark
Karnaim—the horns or rays of Moses
(rays of Venus—like horns)
Finding water
Diamonds
Petroleum
Vermin plague
Jordan running back
Deluge of fire
Serpent and Baal worship
Leveling of mountains

Judges & Kings

Magnet
Mouth-to-mouth breathing
Weather forecast
Telepathy and hypnosis. Since 1740?
Necromancy
Shamir-radium
“Oil-enzyme”?

“Leprosy” and sulfur baths
Ball of fire (left cloth);
Sennacherib (burnt but cloth)
Sword over Jerusalem
Glilim
“Terrible ones”
Music in psychiatry
Even shetia (Mars?) (also Mecca)
Daniel & his friends
Mene Tekel - writing on the wall
Sun’s shadow returned

Elias & Elisha

Sanverim
Magnetism
Static electricity
Artificial breathing
Meteorology
Galvanism
Chariot of fire

Interplanetary Travel

The story told in Genesis 6, about the sons of God (B’nei Elim) coming to the daughters of men, is usually explained as referring to the aristocrats that mingled with common people.

In my understanding this is a literary relic dealing with the visit of intelligent beings from another planet. Actually in the rabbinical literature is preserved the story of 36(?) persons led by that descended on Mount Hermon. The new arrivals, all males, were probably of gigantic stature; their progeny with women of the earth were giants (Genesis 6). I thought that trilithon of Baalbek, near Hermon, was the work of their hands.

The planet from which they came I would not know to determine. El would refer to Saturn. The great size of the visitors would suggest a smaller body. Because of the strangeness of the idea, I thought to never publishing it. But since I came to it in about 1940-1941, the space age started, UFO were claimed to be vehicles of visitors from other planets (which idea does not find any credence in me), and previous visits to the earth by guests from other systems (other star systems) were expressed without calling for ridicule.

It appears to me that the visitors in expectation of some great catastrophe, moved out from their planet. Actually, their story precedes the story of the Deluge in the Scriptures.

Angels visit Abraham

The time of the events connected with the story of the patriarch Abraham is, in my understanding, the end of the Early Bronze or Old Kingdom in Egypt. The catastrophe of Sodom and gomorra—the overturning of the plain, the origin of the Dead Sea, was a catastrophe that ended an era; the origin of the Great (African) Rift or its greater expansion, coincided with those events. The age of the Dead Sea when measured by the amount of salts in its waters and in the supplying sources—is of the order 5,000 years, but could be even less, all depending the various factors (submarine sources, change in concentration of salts in the Jordan, the contribution of the sources on the shores of the sea, besides the main tributaries.)

The visit of “angels”—or B’nei El—to the ten of Abraham would suggest that the interplanetary

visitors were still around at the end of the Old Kingdom in Egypt, or Early Bronze. To me this appears a misplaced memory. I would think that the “visitors” would be suggestive of an earlier time.

But in recent years I chanced to find my old idea concerning Genesis 6, expressed by a Russian astronomer, though he seems to be unaware of the landing at Hermon, he associated a not removed stone in the quarry near Baalbek with “their” effort to leave the earth; he also suggested that the turning of the plain was the work of their hands (atomic explosion) which might be true, considering the element of the “punishment” told in the story of Sodom.

Horn Blowing on Yom Kippur

The blowing of the horn on the New Year and on Yom Kippur (Day of Atonement) is a recreation of the noise that like blowing of the horn was heard at the day of Lawgiving—all over the world. The twisted strata of the earth produced this noise, and as I remarked in *Worlds in Collision*, the noise could also have been produced by the approach of a charged body (Teremin effect).

Hamon

I read these days (April 1967) that infra-acoustic waves can cause death. I thought of the expression that the Assyrians before their death were “permitted to hear the music of the sphere”; also the expression “Hamon” in the prophets relating to the phenomenon; also the Egyptian name of a divinity Hemon.

As I demonstrated in *Worlds in Collision*, Mars was the instrument of the debacle of the Assyrian host. Hamon must be another name for Mars, Maadim, or Aritz, from which is derived the Greek Ares.

Giant Animals in Hebrew Lore

It is remarkable that travellers of the second and possibly the first millennium before the present era, brought home these stories:

The ruler over the sea animals is Leviathan. His fins radiate brilliant light, its smell is foul.⁽¹⁾ Leviathan spouts out water.⁽²⁾ This description, one may guess, is of a whale.

Ziz is the ruler over the birds; it is monstrous in size; its wings are so huge that unfurled they darken the Sun. "Great bird Ziz slaps his wings and utters his cry, so that the birds of prey, the eagles and the vultures, blench."⁽³⁾ The span of the wings of the pterosaurs ranged from 27 feet upwards to an incredible 69 feet, whereas the span of the wings of the large eagles is less than 10 feet.

Behemot (not to be confused with the animal that bears this name at present) is the most notable representative of the mammal kind. Behemot matches Leviathan in strength. It had to be prevented from multiplying and increasing, "else the world could not have continued to exist." It is deprived of the desire to propagate its kind.

As the above-mentioned travellers could not have visited the American Museum of Natural History on their voyages, nor any other museum of paleontology, nor could they have read modern books on dinosaurs and all their classes, it is puzzling to read their description of the monstrous animals and of their behavior, and also of the weapon used by the largest land animal. In mortal combat between the gigantic beasts, Leviathan kills by a blow of its fins, and Behemot kills by a lash of its tail.⁽⁴⁾ The modern paleontologists wondered at the largest land animal's lack of weapons for attack or defense, which would have made it easy prey for every attacker, and supposed that the animal used its tail as its weapon.

Equally interesting is the description of the gigantic female Reem when heavy with young. "Leviathan, Ziz, and Behemot are not the only monsters; there are many others, and marvellous ones, like reem, a giant animal, of which only one couple, male and female, is in existence The act of copulation occurs but once in seventy years between them . . . The act of copulation results in the death of the male. He is bitten by the female and dies of the bite. The female becomes pregnant and remains in this state for no less than twelve years. At the end of this long period she gives birth to twins, a male and a female. The year preceding her delivery she is not able to move . . . For a whole year the animal can but roll from side to side, until finally her belly bursts, and the twins issue forth. Their appearance is thus the signal for the death of the mother reem."⁽⁵⁾

The problem of the statics of the dinosaurs, with their pillar-like legs, vexed modern scholars. The larger species are classified as amphibians, though no adaptation for life in water is found in their fossilized remains; they are classified so because, by wading in water, they would have a lesser load of body to carry. That this does not solve the question is shown above. The animals were apparently not adapted to the life conditions and did not survive.

To be more exact, the animals adapted themselves to conditions, but the Earth changed these conditions completely, and more than once. The variations of the force of gravitation became, more than anything else, fatal to the large dinosaurs.

The Burning Bush

It is told in the Book of Exodus that, in advance of the great catastrophes that preceded and accompanied the flight of the Israelites from Egypt, the first sign of the things to come was the experience of Moses in the wasteland of Midian? Sinai? when he saw a burning bush. The bush, to his amazement, was burning, yet the flame did not consume it (Exodus 3:2-4). Should we assume that it was some natural phenomenon, interpreted by Moses as a miracle, we would be put before the choice: either it was a phenomenon of phosphorescence, or some similar radiation, or it was a phenomenon of an electrical nature, such as that known to us as St. Elmo fire. In the first instance a desert bush could glow in the dusk of the day if covered by phosphorus dust; and the desert of Sinai, like southern Israel, abounds in deposits of phosphorus. Irradiated by light during the day, phosphorus continues to glow in the dusk. St. Elmo fire is the visible electrical glow on the tops and extremities of masts of ships, or at the summits and ends of branches of trees; this electrical phenomenon is especially apparent when the atmosphere is charged more than usual by electricity. Neither phosphorescence nor St. Elmo fire are consuming flames; and the miracle of the revelation was the miracle of one of these phenomena, because they are revelations of nature which human genius tries to understand and has succeeded in this until now only very incompletely.

The “miracle” with the bush was followed, according to the story, by more phenomena of a related nature. Moses observed that his hand temporarily turned white, as if afflicted by leprosy, upon keeping it in the dark recess of his clothing. This, too, sounds like luminosity of phosphorescent or radioactive nature.

Assuming that what is described in Exodus 3:2-4 and 4: were phenomena that really did occur, we would think that in these unusual signs the cosmic events that were soon to take place had already their first foreboding. Moses felt an inner call to return to Egypt to announce great happenings and to demand the right of worship for his people there, not yet the permit for them to emigrate. He himself was not yet aware of the great disturbances to come. In *Worlds in Collision* and *Ages in Chaos* I offered evidence that the Earth entered the fabric of a great comet at the time that these events took place. Most probably the celestial prodigy made itself known by irradiating the Earth with the electrical glow of its dispersed trail of thin dust or gases. A great train of meteorites was to follow; but already the precursor of the great and swiftly-moving masses, the thin dust of charged particles, could make the phenomena of phosphorescence and St. Elmo fire rather pronounced. And the future leader of the bondsmen escaping from Egypt, impressed by the glow that does not consume, felt an inner call to return to the land of his birth and to bring there the message of upheavals approaching in swift succession.

It is known that comets glow chiefly by their own light, rather than by the reflected light of the Sun: the spectral analysis of the glow coming from the tails of the comets shows that the light originates there; it shows the so-called lines of emission, whereas reflected glow would produce lines of absorption. Electrical light shining in vacuum, upon meeting some obstacles, may also produce X-rays.

The great discharges exchanged between the head and tail of the comet, retarded in its motion; the terrifying “crashes” (*kolot*) of the bolides (*barad*) on entering the Earth’s atmosphere; the magnetic disturbances; and the electrical phenomena caused by the irregularities of the terrestrial motions—all must have contributed to the increased tensions between the ground and the upper atmosphere, and the radiations, some of them of harmful nature, that filled the air of the entire world. Thus a passage of the Earth through the tail of a comet would result in phenomena the intensity of which would clearly depend on the size and mass of the comet and of its trailing tail, and the closeness of the approach.

It is narrated that when Moses came from hiding in the cloud on Mount Sinai, his face shone (Exodus 34:30,35). This was regarded as a sign of holiness, and actually in Christian times the saints are represented with a halo around their heads. Of Zarathustra it is also said that he was burned by fire, but not consumed by it, during his stay on a mountain. ⁽¹⁾ Mountains themselves often possess a “halo” ; and actually, Charles Beke went to Arabia in 1874 in search of Mount Sinai, and believed to have discovered it in Mount Seir, a mountain with an electrical halo. Michelangelo portrayed Moses on his famous statue, presently in Rome, with horns over his forehead. As many artists, he was misled by the translation of the word *keren* (plural *karnaim*), which in Hebrew can mean both “horn” and “ray.” What the scriptural writer had in mind when he described Moses descending from Mount Sinai was most certainly a halo of rays of light. In the *aggadic* or legendary material not included in the Scriptures, Moses and Aaron, appearing before the Pharaoh, had already faces that were illuminated, or glowed in the dark. The Biblical narrative renders the story of Moses’ descent from the mountain after the lawgiving as the time when he impressed the people in the plain by his head shining in the dark: it was surrounded by rays of light, understood by Michelangelo, and by many others, as “horns” protruding from his head.

As we can gather from the material collected in *Worlds in Collision*, the comet that shone at the end of the Middle Kingdom in Egypt—and caused its downfall—appeared to the peoples of the world at one time as a dragon with a flaming body, at another moment as the head of a bull with horns stretched out towards the earth; these were horns of light. This explains why the Hebrew word “horns” and the word “rays” is the same (*keren*, plural *karnaim*) can be understood in terms of the phenomena attending the Exodus.

It is also very probable that the great discharges that accompanied the terrestrial catastrophes caused radiation diseases. The great role that leprosy (*zaarath*) took in

the medical concern of the priests during the wandering in the desert, and the very description of this so-called “leprosy” that was cured by time and no other medicine, lets surmise that this disease was of radioactive nature. I will discuss the subject of radiation disease separately.

Matza

The most important item of the ceremonial of Passover is unleavened bread called matza; the feast itself is called the feast of the unleavened bread. Matza is not just one of several equally important other regulations of the festival of Passover: it is the main ceremonial (together with the reading of the Haggada), almost *the* symbol of the chief holiday of the Israelites. The observing of the command to eat only the unleavened cakes during the feast of Passover is ordained in the following terms: “For whosoever eateth leavened bread from the first day until the seventh day, that same shall be cut off from Israel” (Exodus 12: 15). The Book of Exodus explains this bread by the command given on the eve of the departure of the Children of Israel from Egypt:

And this day shall be unto you for a memorial; and ye shall keep it a feast to the Lord throughout your generations... Seven days shall ye eat unleavened bread. (Exodus 12:14)

After they left Rameses and came to Succoth,

And they baked unleavened cakes of the dough which they brought forth out of Egypt, for it was not leavened; because they were thrust out of Egypt and could not tarry, neither had they prepared for themselves any victuals. (Exodus 12:39)

The fact that the Israelites left Egypt in such a hurry that that night the dough did not leaven, could hardly be the only motif for a command to which the religion of Israel affords such importance. The speed of the Exodus from Egypt was not complemented with the speed of an entry into the Promised Land, but was followed by forty years of aimless wandering in the desert; the haste which saved a few hours needed for the dough to leaven was lost completely in the events of the slow-moving years that followed; the rashness of the Exodus did not even help the Israelites to run away from the pursuing Egyptian army and they would have been destroyed were it not for the sea that parted and let the Israelites pass, only to return then to its strength and engulf the Egyptian hosts. For its part, the haste of the Exodus could have been much more aptly remembered by some act symbolizing the haste of leaving one's domicile or swiftness of retreat, or celebration of reaching a water barrier and the like; weary loins and the staff of a wanderer would express better the leaving of Egypt; and if the swift going away should be symbolized in food, uncooked victuals or eating while standing could better symbolize the speed than unleavened cakes eaten in a reclining position, as prescribed by the ritual. And the seven-day-long observance of eating

unleavened bread hardly harmonizes with the explanation that makes a one-time hurried preparation of bread the motive of it.

The other explanation of the origin of the custom of eating of matza during Passover is found in the Haggada read during the Seder, the evening meal of the first (in diaspora the first two) evenings of the feast. There it is said: "This is the bread of misery that our forefathers ate in Egypt." This explanation makes matza the replica of the poor bread eaten in the misery of serfdom. Though less popular, it sounds better rationalized. A nation that preserves the memory of the long years of affliction may institute the observance of eating—one week each year—the bread of affliction, *lakhmo anio*. It must, however, be noted that the replica of the bread of affliction is not made to taste unpleasantly and is enjoyed by adults and by children alike. There is another symbolic piece of edibles on the Seder plate, the bitter root, which is supposed to commemorate the bitterness of the days of bondage; it is eaten, however, dipped in honey.

The two explanations contradict each other: according to one of them the unleavened bread was eaten during the many decades of the sojourn in Egypt where the children of Israel were subjugated and carried the yoke of bondage; according to the other explanation this bread was eaten only on the very last night of the sojourn and possibly not even then, but was, for lack of time, made in preparation of the suddenly-undertaken migration.

Being contradictory, the two traditional explanations invite a re-examination of the motives underlying this ancient usage.

The major festivals of the Jewish calendar are connected with the memories of the Exodus, Lawgiving and living in huts during their migration in the desert. Was not some unusual phenomenon connected with the time of the Exodus of the Israelites from Egypt that could be regarded as more compelling for the origin of the custom than the above-stated motives? A usage of such persistence, predominance and antiquity, must have been instituted, so it seems, to honor some unusual and impressive occurrence. Such an occurrence was the fall of manna.

During the years when the Israelites wandered in the desert after having left Egypt manna fell from the sky. It served as their nourishment in the years when they roamed in the wasteland, in the shadow of death, when nothing budded. The customary explanation of manna as the seed of the tamarisk bush growing in the desert was refuted in *Worlds in Collision*, section "Ambrosia." Manna is called "the bread of heaven," the bread that fell from the clouds, (Exodus 16: 4) or even from the starry sky.¹ It was found by the Israelites daily in enormous quantities, and the Midrashic sources state that "the quantity that fell every day would have sufficed to nourish the people for two thousand years."² It was ground between stones and baked in pans (Exodus 16:14-34), Numbers 11:7-8). It had the shape of coriander seed, a yellowish color and oily taste.

And the people went round about, and gathered it, and ground it in mills, or beat it in a mortar, and baked it in pans, and made cakes of it. (Numbers II: 8)

The fall of manna was also not confined to the desert of wandering. It is said that all the peoples of the East and the West could see it.³ And actually we could trace the same memory to many nations of the world. The Scandinavian peoples were destroyed almost to the last in a catastrophe, and in the Fimbul winter that followed, the survivors subsisted on the morning dew.⁴ The Scriptures also have it that “When the dew fell upon the camp in the night, the manna fell upon it.” (Numbers 11:9) The Greeks preserved the memory of manna as that of ambrosia—and it is described in the very same terms as manna. Ambrosia had the taste of oil and barley, or honeycomb; and so did manna.

It is significant in this connection that according to old rabbinical sources, matza is described as having the taste of manna.⁵ From this alone one could deduce that the custom of eating matza was first established in memory of the phenomenon of manna—yet, strangely, this has not yet been done. The fall of manna was a phenomenon of no mean significance. After the catastrophe of the days of the Exodus and in the years of its aftermath, the Israelites roaming in the desert had no leaven and they lacked salt; and until this day the unleavened bread is produced without salt being added. In the Seder night, when the great miracles are told that accompanied the Exodus and the upheaval in the physical nature, the greatest—the fall of bread from the sky—must be especially honored, it being the food of the multitude that left Egypt, and it would be strange if it would have remained without a memorial in the main feast commemorating the deliverance from Egypt and the preservation of the people, almost brought to complete annihilation by man and by elements alike.

A similar feast was celebrated in Athens during the spring month of Anthesteria—honey and flower were poured into a fissure in the earth. And since the phenomenon of manna was ubiquitous all over the earth, it is of interest and significance to note that also in India, in the *Rig-Veda*, it is said that honey (*madhu*) comes from the clouds.⁶

In that book is described how edible substances precipitated for a long period of time after the passage of the Earth through the trailing part of the planet Venus, then a comet.⁷

The planet Venus was deified by all races of antiquity and in *Worlds in Collision* I brought together reports of its being described as a comet from ancient Mexico, where it was called *la estrella que humeava*, “the star that smoked,”⁸ from Babylon, from China and from many other lands and peoples. Manna was a derivative of Venus. To eat it was like eating a portion of the god. Many ancient religions had this mystery of swallowing the god. The Christian religion, too, in the mystery of

communion, had the participants eating of their god. Here it is shown how this strange idea originated; it was an element of ancient mysteries that were inherited and then incorporated in the Christian faith. The eating of the body of the god, the miracle of food falling from the sky, the food that sustained life in the wanderers in the desert—these are the wonders that impressed the ancient world and that survived in the ancient cult of matza, and also in the bread of communion, and in the custom of offering cakes to the Queen of Heaven in ancient pre-exilic Israel.

There must have been a special reason why the cakes of unleavened bread should not be implicitly connected with manna. It appears that these cakes became a part of an astral worship. It transpired to the instructed priests of the northern kingdom of Israel that it was the planet Venus that was an instrument, or as they may also have thought, the cause of the disturbances and upheaval that enabled the Israelite slaves to leave Egypt. In the northern kingdom Jeroboam, by erecting an image of a calf in the temple of Dan and another in Beth-el, said “here are the gods that brought you out of Egypt” and he initiated the Passover service in Dan which in his plan should have served as the gathering place for the Passover week, not only for the population of the northern kingdom, but also for the people of Judah. Thus we see that Passover was a feast also in the worship of Baal; and in *Worlds in Collision* we have shown that the calf was the image of the planet Venus and that Baal was also her name.

At the end of the sixth century before the present era, shortly before the Babylonian Exile, Jeremiah accused the population of Jerusalem: “The women knead dough to make cakes to the queen of heaven, that they may provoke me to anger.” (7:18) The Queen of Heaven, we are informed by many authorities, was the planet Venus. Apparently the knowledge that Venus had something to do with the Exodus made the people of the Northern Kingdom, that of Israel, and then also of Judah, to bake cakes in honor of Venus, the planet, the role of which in the catastrophe of the days of the Exodus is described in detail in *Worlds in Collision*. And when Jerusalem fell to the Babylonians, the Jews who escaped to Egypt spoke of the incense and offerings that were given to the queen of heaven by themselves, and also by their fathers, their kings, and their princes “in the cities of Judah, and in the streets of Jerusalem.” “And when we burned incense to the queen of heaven, and poured out drink offerings unto her, did we make her cakes to worship her, and pour out drink offerings unto her without our men?(44:19)”

The heavenly bread coming from the clouds that were deposited by the comet Venus, the cakes made by the women of Jerusalem to her honor, were in memory and in thankfulness for the miracle she performed for their ancestors: Therefore the women of Jerusalem regarded the prohibition of this usage by the king Josiah and probably also by his son Zedekiah, under the influence of Jeremiah, as an offense for which their temple was destroyed; they went into refuge in Egypt, when the other remnants of the people were carried into Exile in Babylonia.

The custom of bringing bread (flour) and honey to the queen of heaven was practiced also by the Syrians in the second century before the present era, as Lucian tells in his

book *De Dea Syria*. And in Greece, on the spring feast of libations of flour and honey were poured into a crevice in the ground, in memory of the flood of Deukalion, in which the population of Greece was destroyed almost to the last; this flood of Deukalion, according to tradition conserved by the fathers of the Church, occurred in the days of the Exodus (Eusebius)

Also in the Western Hemisphere the spring feast in honor of Quetzalcoatl or the planet Venus was observed once in eight years—every eight years the planet Venus presently returns to the same position in relation to the sun and the earth—the synodic cycle of Venus consists of eight terrestrial years. Venus years were rigorously observed by the Mayas in Yucatan, Aztecs in Mexico, and Incas in Peru.

During the feast of in honor of Venus, bread was baked without salt, with water alone—and Sahagun, the Spanish author who studied the life of the Mayas in the sixteenth century, wrote:

Every eighth year these natives celebrated a feast which they called Atamalqualiztli, which means “feast of bread and water.” For eight days preceding the festival they ate nothing but tamales prepared without salt, nor did they drink anything else but clear water. ... They did not mix anything else with the dough of which they make them (tamali) not even salt...⁹

Here we see the feast of unleavened bread in America dedicated to Venus and was observed on its every return on its synodical cycle. Among the Mayas the feast of the bread was dedicated to the planet Venus, as it was among the women of Jerusalem in the days of Jeremiah and before him.

The word “matza” may mean “to find”; the corn of heaven was actually found on the ground.

The people of Israel in gratitude for their salvation in the desert, amidst the outraged elements, in a desert clouded by twilight, burning and waterless, observe the feast of salvation and eat the unleavened bread.

The connection by the people of Judea in the days of Jeremiah of manna and matza with Venus contributed to the separation between the custom and its cause, when religion became a monotheistic form of Judaism. Thus the root of the custom was lost and other explanations were devised and survived for many centuries, despite their obvious inadequacy.

Shamir

In the Talmud and the Midrashim there are many references to *Shamir*—unusual qualities were ascribed to it. For instance it reportedly could disintegrate anything, even hard, durable stones. The rabbinical literature describes it as being employed in engraving the breast plate of the High Priest. Among Solomon’s possessions it was the most wondrous. King Solomon was eager to possess the Shamir because he had heard about it from earlier days; knowledge of the Shamir is in fact ascribed by rabbinical sources to Moses. After much search a grain of Shamir the size of a barley-corn was found in a distant country, in the depths of a well, and brought to Solomon. But strangely, it lost its abilities and became inactive several centuries later, about the time the Temple of Solomon was destroyed by Nebuchadnezzar.

What was *Shamir*?

In the opinion of medieval authors, Rashi, Maimonides and others *Shamir* was a living creature, a worm.¹ It was argued that *Shamir* could not have been a mineral because it was active. The Talmud transmits in the name of Rabbi Nehemiah the following description of the engraving on precious stones: The names of the twelve tribes were inscribed on the twelve semi-precious stones of the Urim and Tummim, the breastplate of the High Priest, not by carving, but by writing with a certain fluid and “showing” them to *Shamir*, or exposing them to its action. In the opinion of modern authors, the expression “was shown to *Shamir*”—“clearly shows it was the glance of a living being which effected the splitting of wood and stones.”² It is admitted, however, that “in the Talmudic-Midrashic sources it is never explicitly stated that the *Shamir* was a living creature.”³ An old source. *The Testament of Solomon*, a work written in Greek, probably in the early third century of the present era,⁴ refers to *Shamir* as a “green stone.” But how could a greenish stone cut the hardest of diamonds with its glance?

“The Shamir is as large as a barley-corn. It was created in the six days of Genesis. There is no substance hard enough to withstand its action”⁵

Over a hundred and twenty-five years ago a Jewish scholar in Germany published a paper to prove that *Shamir* is a mineral,⁶ but more modern authorities agree with the medieval rabbis and say that they were “undoubtedly correct.”⁷

The manner in which *Shamir* was kept secure may give us some clue “The *Shamir*

may not be put in an iron vessel for safe-keeping, nor in any metal vessel: it would burst such a receptacle asunder.”⁸ “It is kept wrapped in wool inside a box of lead filled with barley-bran.” This sentence is quoted from the Tractate Sotah 48b of the Babylonian Talmud. “*Oferet*” in the text is properly translated as “lead.” It contains an important clue: folkloristic fantasy would not make a leaden box of a greater resistance than an iron or a gold one: lead is a soft metal. Therefore, this must be a description based on fact. And with the knowledge of our age we may easily guess who or what was *Shamir*: It was a radioactive substance; radium salts, for example, acting upon certain other chemical substances, can emit a luminescence with a yellow-green hue.

The breastplate of the High Priest was engraved in the following manner. The letters were written with ink, and the stones were exposed, one after another, to the “glance” or radiation of the *Shamir*. This ink must have contained powdered lead or lead oxides.⁹ The parts of the stones which were unprotected by lead were disintegrated without leaving any dust particles which, according to the Tractate Sotah 48b, appeared especially wondrous. Those parts protected by leaden ink stood up in relief on the surface of the gems.

The most precious possession of Solomon, his *Shamir*, did not survive. With time it became inactive. The usual version of the story—the *Shamir* “disappeared,” does not correspond to the Hebrew text. The word *batel* used to describe the end, or demise, of *Shamir*¹⁰ has only one meaning: “To become inactive.” Therefore, when occasionally it is said that the *Shamir* “vanished” at about the Temple was destroyed, this is incorrect.¹¹ The Hebrew term for a paralyzed member is *ever batel*; a loafer is *batlan*; inactivity is *batala*; all these words come from the root *batel*. In the four hundred years that passed from the building of the first Temple to its destruction by Nebuchadnezzar in -587, a radioactive substance could become inactive.¹²

In 1896, one year after Wilhelm Konrad Roentgen of Wuerzburg discovered X-rays, Antoine Henri Becquerel, son and grandson of the great physicists, discovered radioactivity by accidentally placing a photographic plate near a uranium salt.

Uranium at ordinary temperatures emits an invisible radiation which resembles X-rays, and can affect a photographic plate protected by a thin layer of metal.

Marie and Pierre Curie, led by the conviction that in the midst of pitchblende, their source of uranium, there must be still another element of a much greater radioactivity, dedicated themselves to its isolation and in 1898 they succeeded in bringing forth the new element as its bromide salt—radium.

A new era in physics began with these discoveries. And because of the dramatic circumstances under which the Curies pursued their goal—and the story of the illuminating substance they found one evening when they came to their cold and

poorly-equipped laboratory—the last of the three discoveries, radium, captured the imagination of people everywhere.

Radioactivity is used in the treatment of neoplasms, while the destructive work of the uranium bomb thrown on Hiroshima also goes back to the discoveries of Roentgen, Becquerel, and the Curies.

Uranium and radium are elements—the original substances of which the universe is built; they were discovered, not invented. Therefore they were present in nature since the beginning; and since radioactive elements have a limited life-time because of disintegration through radioactivity, there must have been more radioactive elements in the past; and actually, a “radium clock” is used to measure the age of rocks. Radium itself is continuously decaying, yet continuously being replenished from the decay of thorium, of which it is a byproduct. The end result of the decay of radium is an isotope of lead. This lead differs from regular lead, and from the ratio of such lead to uranium in rocks, the age of these rocks can be determined. Lead is also the substance that protects best against the damaging effect of radium or other radionuclide irradiation; and thus laboratory radium is preserved in a lead receptacle when not in use for medical or technological purposes.

The information found in ancient sources—that *Shamir* was a greenish mineral, that it was as large as a barley-corn; that it could damage anything, even metals and other minerals, save lead, and the only protection could be found by placing *Shamir* in a leaden box; that it had a “glance” which disintegrated things without leaving filings or dust; that it became inactive after a period of four hundred years—all reveal the true nature of *Shamir*.

Magnetism

It would appear that the action of the lodestone must have been discovered very early; a legend tells how a young herdsman in the hills of Magnesia felt the nails of his shoes kept glued to the rock, and thus discovered the phenomenon of magnetism. Since magnetic rock is found in many places, the discovery of its action must have been made in more than one place; yet apparently knowledge of the phenomenon was confined to the initiated, whether the medicine man, yogi, or shaman.

Is it for certain that the phenomenon has no reference in the Hebrew Scriptures? One instance, it seems, points to its use by the seer Elisha. In the Book of Kings where the story of his deeds is given, apparently culled from some ancient source no longer extant, the following episode is described:

So he [Elisha] went with them. And when they came to Jordan, they cut down wood.

But as one was felling a beam, the ax head fell into the water: and he cried, and said, Alas, master! for it was borrowed.

And the man of God said, Where fell it? And he shewed him the place. And he cut down a stick, and cast it in thither; and the iron did swim. therefore said he, Take it up to thee. And he put it in his hand, and took it. [\(1\)](#)

Nothing is said as to whether a lodestone was attached to the twig. The onlookers could think that the twig was a wonder wand, and that a stone tied to its end was only for the purpose of approaching the twig to the sunken ax. But we know that a twig would not attract and lift iron, whereas a lodestone would—and much more easily in water than in air, because the weight of the ax would be that much lighter in water. Preoccupation with things electrical and magnetic was a trademark of Elijah and his apprentice and successor Elisha.

There remains a margin of surmise in this our explanation of the phenomenon. But should today primitives of Africa or Australia ask a missionary to perform the miracle and lift iron drowned in a stream or a lake, he would impress them greatly if he should repeat the miracle as reconstructed here. Miracle it is, but not of the one who long ago knew its use: magnetism is a miracle with which the Universe is created, and its true nature is still not known, and therefore belongs in the fold of the miraculous.

Radiation Sickness

The upheaval of the days of the Exodus caused by interplanetary perturbations and discharges, was of an intensity of many thousands of hydrogen bombs. Some of the many consequences were transmutation of elements, nuclear fission, and radiation sickness. A permanent bombardment of the Earth by cosmic rays is going on, resulting in fission of atoms, especially those of nitrogen. But the comparative rarity of cosmic rays makes the results, though spectacular in every case or collision of a ray-particle with an atom or a gene, lacking, in an overall picture, the dramatic element of massive change or transformation. In the abnormal conditions of interplanetary stress and discharges, the elements could go through transformations on a grand scale, the living organisms through the process of somatic changes, and their reproductive cells through mutations that would impress themselves on the formation of the generations to follow.

In the travelogue of the fugitives from Egypt which was ruined in the catastrophe, we read the strange story of the people's asking for meat, their request having been answered, yet the wrath of the Lord causing them to die as a consequence of eating the flesh of the quail, a large flock of which was flung towards their camp (Numbers 11:31-33). It could have been the consequence of eating meat contaminated by fallout; the flesh of the flock of wild geese could have been so contaminated, and the description of what happened to those who feasted on them in the desert supports such an interpretation.¹

Since antiquity a story was spread that the refugees were people sick with leprosy. Manetho, an author of the third pre-Christian century, equated them with the lepers that were expelled from Egypt with the high priest Osarsiph—yet this story does not refer to the time of the Exodus but, as I will show elsewhere, belongs into the period of Libyan domination over Egypt. It is based on the story of Osorkon,² whose expulsion in the late eighth century took place in the midst of another series of catastrophes, during which portions of the Earth's ozone layer were stripped away, resulting in the penetration of dangerous amounts of radiation from space, and widespread radiation disease.

We must be impressed with the many regulations concerning the diagnosis, the isolation, the quarantine, and the symptoms of *zaraath* found in Leviticus, and related by the text of that book to the time of the wandering in the desert. It appears from the importance given to the regulations concerning those stricken with *zaraath* that it was a widespread disease in the days of the wandering in the desert. Actually, this disease occupied the minds of the priests to the extent that the code of hygiene for the purpose of preventing disease deals chiefly with *zaraath*.

A recently published report on the contamination of a group of physicists at a research laboratory tells that one of the physicists who was exposed to a larger dose of irradiation contaminated his apartment, his family, and the rugs and furniture; that the rugs and the furniture were burned, yet the neighbors continued to evade the members of the family; and though the physicist after several months was again able to work, the fear of his co-workers was so great that he was coerced to look for a place of work far away from his community, and at the time of the publication of the report was still without a job and could not find a buyer for his house.

Similarly in the Book of Leviticus (Ch. 13) we read of the fear of the community with respect to those affected with *zaraath* and of their banishment from the camp. The fear of the ancients of radiation sickness was not smaller.

Zaraath being understood in later times as leprosy, the fear of radiation disease of those times was transferred to those sick with leprosy. Today we read the reports of medical men who work with the leprous, and we find that this disease is one of the less contagious; yet through the ages the lepers were the outcasts, kept outside the camps or any other human settlements, urban or rural. It seems as if the ancient fear of radiation disease was manifesting itself in the later fear of leprosy.

Leprosy does not break out in sudden symptoms. Yet the description we have of *zaraath* in the Scriptures ascribes to this disease a sudden outbreak.³

A famous case of *zaraath* is narrated in II Chronicles, ch. 26. It affected the king Uzziah.⁴ In *Worlds in Collision* I narrated in short the episode that preceded the outbreak of the affliction. It was during the planetary upheavals of the eighth century, namely in -747.

According to the Midrashim and Talmud, on the west side of Jerusalem a mountain was split and one of its halves was hurled to the east.⁵ Flaming seraphim leaped in the air.⁶ The population fled from Jerusalem in advance of the catastrophe; Uzziah burned incense in the Temple and addressed himself to the Lord in the name of the nation. This was interpreted by the priests as an appropriation of their priestly duties. The punishment that followed was ascribed to Uzziah's having committed a sin by burning incense in the Temple. The Temple itself was badly damaged by a great breach that rent its wall. This shows that Uzziah was appearing before the Lord in the very moment of great danger. Flaming seraphim, or tongues of fire leaped in the air. The king was stricken with *zaraath*. According to the Book of Chronicles, the signs of *zaraath* "shone on the king's forehead"⁷ in these very circumstances when the king was in the Temple usurping the duties of the official intermediary between men and God. It would appear more probable that the sickness which we would be inclined to recognize as radiation sickness, showed itself soon thereafter. The sudden outbreak of the symptoms of leprosy would be even less likely than a sudden outbreak of a

sickness which we would think not entirely unexpected under the circumstances.

In Assyria, and in the entire ancient world, a new era was counted from the year -747; in Assyria it was the “era of Nabonassar,” still used many centuries later in astronomical computations. In the Scriptures, too, we find that the time was counted from the days when “the people escaped from before the *raash* (commotion) of the days of Uzziah.”⁸

The fact that the king who prayed for his people and realm was struck by a disease was regarded as a sign of the Lord’s displeasure. Uzziah was placed in seclusion; and still today on the slopes of the Mount of Olives, close to the bottom of the Valley of Jeshoshaphat, or of the Lord’s Judgment, in Jerusalem, tourists are shown the artificial grotto that looks like an enclosed balcony with supporting columns where, according to the tradition, king Uzziah spent the rest of his reign, within sight of Jerusalem and the Temple’s hill Moriah yet barred from entering.

Zaraath covered also the term for leprosy, at least in later times. And it took three thousand years to separate leprosy from the fear of contamination it carried among all peoples.

7. II Chronicles 26: 19. The King James version renders this: “He was leprous in his forehead,” but the Hebrew text has: “*ha-zaraath zarkha*”, meaning “the zaraath shone.”
8. Amos 1:1; Zechariah 14:5.

Diamonds

Diamond is a form of carbon, differing from common graphite only in its molecular structure. Using extremes of heat and pressure, artificial diamonds have been produced from graphite. By implication it is concluded that naturally found diamonds might have originated from coal, but under what conditions is not known.

Diamonds are regularly found as single crystals with no signs of previous attachment to any other mineral. They are found in several places in the world, in sands and gravels; in South Africa they are found in the “blue ground.” The nature and origin of the “blue ground” is not known; it contains splinters of minerals some of which are of the nature of the rocks in the neighborhood, and some of which cannot be traced to the surrounding formations. But in the neighboring rocks diamonds are not found. Similarly with the gravel and sands: they are only partly related to the rock formations in their vicinity; and diamonds are not found in these formations. Diamond is a form of carbon foreign to the surroundings in which it is found. Thus it is spoken of the “mystery which surrounds the natural origin of this remarkable mineral.”⁽¹⁾

The clouds which encompassed the Earth at the time of the Exodus contained carbon in abundance. There were frequent discharges of potentials at that time between the clouds and the ground. Let us make a surmise: did not diamonds originate in these clouds?

In the Tractate Yoma it is said that precious stones fell every morning with manna from the clouds.⁽²⁾

Did diamonds drop from the sky? In this connection significant is the fact that diamonds are occasionally found in meteorites.⁽³⁾

The “blue ground” of South Africa was thrown together in a catastrophe: this is well recognized. But the catastrophe appears to have been of cosmic nature.

If we are to believe the Talmud, diamonds were found in the Desert of Wandering.⁽⁴⁾ So far no diamonds are known to have been discovered in the desert of Arabia. If transformation of the carbon of the clouds into diamonds, through powerful electrical discharges, whether originating in the clouds themselves or from other planets, was facilitated by the atmospheric conditions over the desert. Possibly diamonds will yet

be found in the desert of Arabia, and also possibly in the sands of the Sahara.⁽⁵⁾

Timbs, *Curiosities of Science* (London, 1859), pp. 122f. The same conclusion was reached by Sir Roderick I. Murchison in his *Siluria*.]

The Chariot of Fire

Asking one day a friend of mine, Horace Kallen, the well-known humanist scholar, educator and philosopher who lived in New York, which of the wonders of the Old Testament seemed to him the least plausible, he answered me, who was expecting to hear about Joshua and the sun that stood still, "The carrying of Elijah by a flaming chariot into the sky."

In the ninth century, as a result of cosmic events, the electrical charge of this planet was highly affected. The ionosphere above the earth was charged to such an extent that leaps of discharge occurred from a cloudless sky. As I proved in *Ages in Chaos*, the letters found in the Egyptian State Archive of el-Amarna originated in the ninth century, and a very considerable portion of them was written by Ahab king of Israel, Jehoshaphat king of Jerusalem, and their generals. The corresponding texts of the Scriptures prove a very high grade of trustworthiness, even in transmission of orations and dialogues, ascribed to historical personages. This fact encourages to approach with credence the stories of Elijah and Elisha, interwoven in the same parts of the Book of Kings. Incidentally I could show that the change of attitude of Captain Naaman towards the king of Samaria, from bad to good, is substantiated also by texts of the Letters. The Book of Kings ascribes this change to a rather natural cure of the captain by Elisha, who prescribed to the diseased seven baths in the Jordan river: the Jordan is rich with sulfur, magnesium, and brom salts, which enter the river at the Sea of Tiberias, and constitute, after evaporation of water in the Dead Sea, its deposits. Another instance which throws a side-light on the activity of Elisha is the fact that, as I could show, two letters of the collection were written to the Pharaoh by the Great Lady of Shunem (Kings). She wrote from that city, and signed "Baalat-Ness", or "the Lady to whom a wonder had occurred". Elisha revived her child employing artificial breathing and a "four-cells" contact of his own body with the body of the infant.

The wonders of Elijah were of a peculiar nature: it seems that most or all of them have to do with atmospheric electricity. When a prolonged drought endured for a number of years, he sat on top of Mount Carmel with his head between his knees and from time to time asked his servant whether there was a cloud already seen over the sea. After a while a cloud appeared, approached, and burst into abundant rain.

When a detachment of the king Ahaziah was sent to interrogate him, Elijah, again "on top of the hill" invoked a lightning bolt out of an apparently cloudless sky to strike this group of men. According to the story he repeated this with a second detachment. Characteristically Elijah made all his meteorological and electrical "wonders" from the top of a hill.

Elijah was an “electrical” man, occasionally a living barometer, looking for electrical and magnetic “wonders” to employ in his miracles; in modern times and in modern attire I think of Nikola Tesla, who introduced alternating current and measured the Earth’s electrical charge; he too was a recluse who hardly published anything (of Elijah no prophetic book is known to exist). Tesla was attracted to electricity, was as if sought out by electrical phenomena. Some of his exploits may well be compared to those of Elijah—his most famous were performed from the top of a hill.

Attention should be paid to the fact that summits of certain mountains have an electrical halo, and that there is a permanent flow of electricity as can be demonstrated by a wire that connects two points at different altitudes on the slope of a hill, and that a charged electroscope is quickly discharged by ions, supposedly drifting from above. The enigmatic coolness of mountain tops is caused by an electrical process as I show elsewhere.

The death of Elijah also takes place under circumstances that suggest an electrical phenomenon. The occurrence of the phenomenon known as ball lightning was denied until very recent time, actually measured in decades. Today, the phenomenon belongs into textbooks. A ball of fire is seen sometimes moving rather slowly and then exploding.

In the Second Book of Kings, in its second chapter, the story is told how Elijah had crossed the Jordan with Elisha, his apprentice, when “behold, a chariot of fire and horses of fire . . . parted them both asunder; and Elijah went up by a whirlwind into heaven . . . And Elisha saw him no more . . . he took up also the mantle of Elijah that fell from him, and went back . . .”

The disciples looked for several days “lest peradventure the spirit of the Lord hath taken him and cast him upon some mountain, or into some valley,” but they found him not.

The detail about the mantle of Elijah that was left behind, instead of detracting from the verisimilitude of the Biblical episode, tends to support it. It is a well-known phenomenon that a wire may evaporate when an electrical discharge strikes it, yet its envelope of fabric (an insulator) remains intact. Here is what may have happened:

Traveling afoot on the east side of the Jordan, Elijah and Elisha were approached by a lightning ball that separated them; next it exploded, consuming Elijah, yet leaving his mantle unscathed, thus making it appear that it was a fiery chariot that approached them and then carried Elijah “by a whirlwind into heaven.”

It is not claimed here that this was the end of Elijah, only that such a phenomenon could be natural, though very unusual.

Resuscitation by Mouth-to-Mouth Breathing

When I was a medical student at the University of Moscow (1915-1921), we were taught the art of reviving the drowned or suffocated, or people in shock, by artificial breathing. The patient who had stopped breathing was put in the proper position (in the case of drowning on his stomach, with his tongue pulled out and held by a cloth) and his arms were lifted and then pressed to his ribs, pressure thus being rhythmically applied to his chest.

Once, years later, on a crowded beach, the body of a drowned man was brought from the sea surf. I happened to be in the crowd, and together with another doctor we desperately toiled for almost an hour, until an ambulance arrived. The doctor in the ambulance pronounced him dead—he did not breathe, nor did his heart beat.

After that incident I thought of Elisha's method of artificial breathing; but many years passed before I read in the American press of a new method—resuscitation by mouth-to-mouth breathing. Since then, the method of mouth-to-mouth breathing has become widely known, and in very many cases people were revived who otherwise would be dead. Only yesterday (of my writing this) I read of a boy of ten who was discovered by his father with his neck caught by the sling of a rope; the father cut the rope and the mother, who happened to be a nurse, applied mouth-to-mouth breathing, keeping him alive until the ambulance arrived. The boy was saved.

In the time of Elijah there lived in Shunem “a great woman.” After years of childlessness she bore a boy.

And when the child was grown, it fell on a day that he went out to his father to the reapers. And he said unto his father. My head, my head. And he said to the lad, Carry him to his mother. And when he had taken him and brought him to his mother, he sat on her knees till noon, and then died.¹

The mother put him on a bed and hurried on a donkey driven by a servant, and came to the man of God, Elisha, and begged him to hurry with her to her son. Elisha followed to Shunem, entered the house.

A staff brought in by the seer's servant, Gehazi, who arrived first, and put it on the child, did not produce any effect. Gehazi “went again to meet him [his master], and told him, saying. The child is not awakened.” Then Elisha entered the house and

“found the child was dead.”

And he went up, and lay upon the child and put his mouth upon his mouth, and his eyes upon his eyes, and his hands upon his hands; and he stretched himself upon the child; and the flesh of the child vexed warm. Then he returned and walked in the house to and fro; and went up and stretched himself upon him: and the child sneezed seven times, and the child opened his eyes.²

He called the Shunamite and said: “Take up thy son.”

The description of Elisha’s miracle makes clear that he did not resurrect the child by a gesture or a word, but by a prolonged procedure, with the seer’s mouth upon the child’s mouth; the exercise was interrupted, the seer, after straightening his body by walking in the house, repeated the procedure, and then the child repeatedly sneezed and the breathing reflex was re-established, and the child was alive again.

The description of the child’s sudden illness makes it appear that he suffered from sun-stroke when in the field with the reapers. A strong headache preceded the lapse into unconsciousness.

The mouth-to-mouth breathing accompanied by rhythmic movements of the body of the healer stretched out on the child’s body, who kept his hands on the child’s hands, and also warmed him by his own body warmth (and the flesh of the child vexed warm”), is an even better method than mouth-to-mouth breathing alone, and should be recommended in emergencies.

The story is apparently not fiction. In *Ages in Chaos* I have quoted from two letters of the great lady of Shunem. These two letters of the el-Amarna collection are the only ones written from Israel by a woman; she must have been a “great lady” if she corresponded directly with the pharaoh. As I could show conclusively, these two letters were written from Shunem; and the woman signed them Baalat-Ness, or “she to whom a miracle happened.” From the appellation used in her letters to the pharaoh it appears that the fame of the healing reached also the palace of Egypt.

Sanverim

The book from which I learned the history and practice of hypnosis treated it: as a rather recent discovery, crediting F.A. Mesmer with inventing hypnosis, or “animal magnetism” as he called it.¹ But it is very improbable that this natural phenomenon could have evaded the ancients and remained unknown through all the centuries and millennia of recorded history: too simple is the application and in no proportion to the mystery of the phenomenon. Many of the practices of the Hindu yogis that go back to ancient times belong to the category of autohypnosis.

In a deep hypnosis it is possible to provoke by a mere verbal order a cataleptic state, hysteria-like paralysis, and illusions. An order can be given that the person in the experiment not be able to lift his arms; in the case of a person subjected to a deeper hypnosis—that he will not be able to see; or if led to some destination, that he should believe that he is in different surroundings.

In the Hebrew Scriptures I find two instances where supposed “miracles” can be recognized as inflicted hypnotical states, consisting of paralysis and somnambulistic illusions. In both of these examples the expression *hikku b’ sanverim*—he (or they) smote with sanverim”—is used to describe the phenomenon.

The first story is found in Genesis, in the narrative of the event shortly preceding the destruction of Sodom and Gomorrah. Lot had in his house as guests two of the Lord’s messengers, or *malakhim*, a word usually translated as “angels” ; but they are called also “men” in the body of the story. When the depraved people of the town demanded the delivery of the guests for their sexual debauchery and tried to force their way inside. Lot vainly negotiated with the people at the door. The messengers opened the door, stretched out their arms, brought Lot inside, and smote the assailants at the door with *sanverim*. Those smitten with *sanverim* groped for the door, unable to find it. The next morning Lot with his family hastily left the city and fled to Zoar. Then followed the destruction of Sodom and Gomorrah.

The second case where the word *sanverim* is used in the Scriptures is in the Book of Kings. King Ben-Hadad of Damascus conspired to kill the king of Samaria in an ambush, hiding his assassins near a road where the king was to pass. But the king of Samaria was warned repeatedly by the seer Elisha, and would each time select a different route and thus escape the peril. The king of Damascus spoke to his captains and expressed the belief that somebody among them had disclosed their plans to the king of Samaria. They answered him by saying that the seer in Samaria knows what he. King Ben-Hadad, says in his bedroom; in other words, that the king of Samaria is

warned by his seer, who is endowed with the gift of telepathy. On hearing this, the king of Damascus sent a detachment to fetch the seer. They found him in the village of Dothan. They were under orders to bring him to Damascus; but the seer smote them with *sanverim* and commanded them to follow him, saying that he would lead them to the man they were seeking. He led them to Samaria. There he opened their sight by ordering them to see again, and they saw; “and behold, they were in the midst of Samaria,” the king’s city. Then Elisha had bread and water set before them and sent them back to Damascus.

The usual translation of the word *sanverim* is “blindness.” Yet in these instances if blindness was meant, the regular word for blindness, *ivaron* should have been used. *Iver* signifies a blind person in many Biblical texts. The Old Testament also knows the ways a person may become blind—slowly as in the case of the patriarch Isaac, or suddenly, as in the case of King Zedekiah, blinded by Nebuchadnezzar. The translation of *sanverim* as blindness is given on the basis of the fact that in both instances the effect was a transient inability to see. But in the story of Lot we have a case of blindness obviously induced by hysteria, affecting simultaneously more than one person.² In the story of Elisha it is even more obvious that the term refers to hypnotical blindness or illusion. It was inflicted by verbal means, and it was also relieved by verbal means. The fact that the soldiers of Ben-Hadad were made to travel to Samaria believing that they were going to a different destination is also an act that a good hypnotist can perform with a select group of people. Their being sent to remove the seer, whose fame had reached foreign countries, made the men of the detachment well prepared (conditioned) for this feat.

References

1. Its first use is often placed in 1840 when a surgeon working in India applied it for its anaesthetic effect before there was any other method of painless surgery. Ether was introduced for narcosis by C.W. Long in 1842 and chlorophorm by J.Y. Simpson in 1847. Even today there are physicians who apply hypnosis in childbirth.
2. The word *sanverim* is probably not of Hebrew origin; there is no word in Hebrew that is built on the same root. [A Syriac commentary on Genesis interprets the word *sanverim* as “phantasies.” Abraham Levene, *The Early Syrian Fathers on Genesis* (London, 1951) p. 92.—JNS]

The Secret of Baalbek

THE TEMPLE AT DAN

The story of Jeroboam, son of a widow of Zereda, an Ephraimite and Solomon's servant, begins with this passage:

Solomon built Millo, and repaired the breaches of the city of David, his father.

And the man, Jeroboam, was a mighty man of valor; and Solomon, seeing the young man that he was industrious, made him ruler over all the charge of the house of Joseph.¹

The ambitious servant was not satisfied with this honor of administering the land of Menashe (Manasse) and Ephraim, or even the entire northern half of the kingdom; he wished to be a king himself. When Jeroboam's plans became known to Solomon, the king intended to kill him, but Jeroboam ran away to the Pharaoh of Egypt. When Solomon died, he returned; he tore the ten tribes' land from Rehoboam, son of Solomon. Solomon's realm was split in two: Jeroboam became king of Israel in the north, and Rehoboam retained the kingdom of Judah in the south. To make the rift permanent Jeroboam had to keep the people from going to Jerusalem and its new temple.

And Jeroboam said in his heart, Now shall the kingdom return to the house of David.

If this people go up to do sacrifice in the house of the Lord at Jerusalem, then shall the heart of this people turn again unto their lord, even unto Rehoboam, king of Judah, and they shall kill me, and go again to Rehoboam, king of Judah.²

From the viewpoint of serving his own ends, it was a sound idea to build on some ancient sites places for folk gathering which would compete with Jerusalem.

Whereupon the king [Jeroboam] took counsel, and made two calves of gold, and said unto [his people]. It is too much for you to go up to Jerusalem . . .

And he set the one in Beth-el, and the other put he in Dan.³

Beth-El was in the south of his kingdom, close to Jerusalem, Dan in the north of his kingdom. In order to attract pilgrims from the land of Judah, Jeroboam also made

Beth-El the site of a new feast, “like unto the feast that is in Judah”.⁴ Setting up the image of the cult in Dan, Jeroboam proclaimed: “Behold thy gods, O Israel, that brought thee up out of the land of Egypt.”⁵ Thus, Dan in the north competed with Jerusalem in the days of Passover and Tabernacles. The temple of Dan was a much larger edifice than the temple in Bethel, and it became a great place for pilgrimage, attracting people even from the southern kingdom.

And this thing became a sin; for the people went to worship before the one [of the two calves], even unto Dan.⁶

The temple of Dan was called a “House of High Places” : “And he made an house of high places . . .”⁷ The Temple of Jerusalem was also called a “House” in Hebrew.

For centuries the temple of Dan in the north successfully contested with the Temple of Jerusalem, and attracted throngs of pilgrims.

Jeroboam, the man who supervised under Solomon the building of Millo, the fortress of Zion with its strong wall, and who, in recognition of his ability demonstrated in this work, was appointed governor of the northern provinces, now, when king, must have desired to erect in Dan a temple surpassing the magnificent Temple of Solomon in Jerusalem. Only in offering a more imposing building could he hope not only to turn the people from going to Jerusalem, but make the people of Judah elect a pilgrimage to Dan over one to Jerusalem. Meanwhile, Jeroboam had seen the temples and palaces of Egypt, and his ambition was, of course, to imitate all the splendor he had seen in Jerusalem, in Karnak, and in Deir el-Bahari. Or would this “mighty man of valor”, industrious constructor of Zion’s citadel, and a shrewd politician, try to contest the Temple of Jerusalem by means of an ignoble chapel? That he succeeded in his challenge is a testimony to the size and importance of the temple at Dan.

It was not enough that Dan and Beth-El were ancient places of reverence: magnificence was displayed in the capital of Solomon, and magnificence had to prevail in the temple cities of the Northern Kingdom.

The temple of Beth-El, the smaller of the two Israelite temples, was demolished three centuries later by King Josiah, a few decades before the Temple of Jerusalem was destroyed by Nebuchadnezzar. It was trampled into smithereens by the king, jealous for his God.⁸ There is no mention of a destruction of the temple in Dan. Where was Dan and its “House of High Places” ?

THE SEARCH FOR DAN

Dan was the northernmost point of the Israelite settlement where one of the twelve tribes chose its domicile. A familiar expression was: “From Dan even to Beer-

Sheba.”⁹

Students of biblical geography have agreed to place Dan in the Arab village of el-Kadi, on the upper flow of the Jordan, which is there but a rivulet. In recent years very insignificant ancient ruins have been found on this place.¹⁰ This is in accord with what the biblical archaeologists expect, for they think the temple of Dan to have been a very modest structure of which, most probably, hardly any ruins would have remained.

The biblical Dan is placed on the upper flow of the Jordan because of a passage in Josephus Flavius. In his *Jewish Antiquities*, Josephus says that Dan was on “a spot not far from Mount Libanus and the sources of the lesser Jordan”.¹¹ Commentators of Josephus deduced that by the “lesser Jordan” the upper flow of the Jordan, above the Lake of Huleh, or above the Lake of Tiberias, is meant; however, this interpretation is not supported by the words “not far from Mount Libanus” since, from the surroundings of el-Kadi and the sources of the Jordan, the snow-capped Hermon or Anti-Lebanon can be seen in the distance, but not Lebanon, far behind the Anti-Lebanon.

After having chosen the source of the Jordan as the area where to look for Dan, this ancient city was located at el-Kadi for the following reason: the name Dan is built of the Hebrew root that signifies “to counsel” or “to judge”. El-Kadi means in Arabic “the judge”. There was no other reason, beside this philological equation of Hebrew and Arabic terms, to locate the site of the ancient temple city in the small village of el-Kadi, since—until quite recently—no ruins, large or small, were found on the site.

The aforementioned reference in Josephus makes one wonder whether by “the lesser Jordan” the river Litani was meant. This river begins in the valley between Mount Lebanon and Mount Anti-Lebanon, flows to the south in the same rift in which farther to the south the Jordan flows, and towards the source of that river, but changes its course and flows then westwards and empties itself into the Mediterranean. Its source being near Mount Lebanon, it appears that the Litani was meant by “the lesser Jordan”.

However, Josephus, who wrote in the first century of the Christian era, was not necessarily well-informed concerning the location of Dan - the temple city of the Northern Kingdom - a state whose history ended with the capture of Samaria by Sargon II in -722.¹²

Therefore, it is only proper to go back to the Scriptures in trying to locate Dan.

THE PORTION OF THE CHILDREN OF DAN

When the Israelites, after the Exodus from Egypt, roamed in the wilderness, they sent scouts to Canaan to investigate the land and to report. The scouts passed the land through its length “from the wilderness of Zin unto Rehob, as men come to Hamath”.¹³ These were also destined to be the southern and northern borders of the land: “Your south quarter shall be from the wilderness of Zin” and in the north “your border [shall be] unto the entrance of Hamath”.¹⁴

The expressions “as men come to Hamath”, or “unto the entrance of Hamath” signify that Rehob, the northern point of the land visited by the scouts, was at a place where the road began that led to the city of Hamath in Syria.

In the days of conquest under Joshua son of Nun, when the land was partitioned by lot, the tribe of Dan received its portion in the hilly country on the road from Jerusalem to Jaffa. The tribe was opposed by the Philistines, also invading the same country. When the population of Philistia increased through the arrival of new immigrants from the Mediterranean islands, the tribe of Dan, being the advance guard of the Israelites, had to suffer not mere resistance, but strong counter-pressure. The Samson saga reflects this struggle. Tired of continuously opposing the increasing influx of the Philistines, the Danites migrated to the north.

They . . . came unto Laish, unto a people who were quiet and secure; and they smote them with the edge of the sword, and burned the city with fire.

And there was no deliverer, because it was far from Zidon, and they had no business with any man; and it was in the valley that lieth by Beth-Rehob. And they built a city, and dwelt therein.

And they called the name of the city Dan . . . howbeit, the name of the city was Laish at the first.¹⁵

Here we meet again the northern point Rehob or Beth-Rehob. We are also told that it was situated in a valley. Next to it was the city of Laish, and the Danites burned the city and then erected there a new city, Dan.

Beth-Rehob, or House of Rehob, is the place we met—in the story of the scouts sent by Moses—as the most remote point they visited going to the north.

The place was “far from Zidon” ; if it were where it is looked for today—at the source of the Jordan—it would not have been proper to say “far from Zidon”. but rather “from Tyre”. But if Zidon (Sidon) is named as the nearest large city. Tyre must have been still farther from Laish-Dan, and the latter city must have been more to the north, in the valley between Lebanon and Anti-Lebanon.

The Danites were in contact with the Zidonians already at the time when they fought

with the Philistines for the possession of territory. Because of want of land, they sent many of their sons as sailors on Phoenician ships.¹⁶ In their new place of abode the Danites became kindred with the Phoenicians.

In Dan-Laish, “the children of Dan set up the graven image” of Micah.¹⁷ The story of this holy image is connected with the migration of the Danites to the north. Before migrating they sent a few men to find for them “an inheritance to dwell in”.¹⁸ These men traversed, on their errand, the mountainous land of Ephraim. Micah was an Ephraimite who built a private chapel in Mount Ephraim, where he placed “a graven image and a molten image”, and hired a Levite to serve there as a priest.¹⁹ The men of Dan, dispatched on the errand to find a new domicile for the tribe, heard an oracle from the priest. After having spied the place of Laish, they returned to their tribe that dwelt in the hilly borderland of Zarah, and with six hundred warriors went to the north. Passing again Mount Ephraim, they took with them the image and the priest, despite the bitter protests of Micah. When they conquered Laish “the children of Dan set up the graven image”.²⁰ Since then, there was an oracle in Dan.

The name Dan-jaan, found in the Scriptures,²¹ is apparently a synonym for Dan: it means “Dan of answer”, or “of oracle”.

Dan became the site of the temple built by Jeroboam. It was a holy place long before he built his temple there, since the story of the oracle of Micah is conspicuously narrated in the Book of Judges; it is rather probable that Rehob was a sacred place even before the Danites built their city on the ruins of Laish close by.

It cannot be said of the present village of el-Kadi that it lies on the road “as men come to Hamath” ; to satisfy this description, Rehob must be looked for farther to the north.

THE SUCCESSORS OF JEROBOAM

Being located in an outstretched part of the Israelite kingdom, Dan was often the subject of wars between the kings of Damascus and of Israel. Shortly after the death of Jeroboam, the temple city was conquered by the king of Damascus.²² It appears that, at the time of the revolution of Jehu, three generations later, in the ninth century, Dan was still in the hands of the kings of Damascus; but it is said that Jehu, who destroyed the temple of Baal in Samaria, did not destroy the temple of Dan, nor did he abolish its cult, “the sin of Jeroboam”. This implies that Dan came back into the hands of the Israelites in the days of Jehu. In any case, the population of the northern kingdom -that of Israel—but also of the southern kingdom - that of Judah-continued to go to Dan on the feasts of Passover and Tabernacles, preferring it to Jerusalem.

Jehu, jealous of the God Yahweh, did nothing to keep the people from going to Dan, and obviously even encouraged them to do so; the cult of Dan was one of Yahweh,

though in the guise of a calf, or Apis.

In the eighth century the prophet Amos, one of the earliest prophets whose speeches are preserved in writing, spoke of the worship at Dan:

They that swear by the sin of Samaria, and say, Thy god, O Dan liveth; and, The manner of Beer-Sheba liveth; even they shall fall, and never rise up again.²³

For a time Amos prophesied at Beth-El, the other sacred site of the Northern Kingdom. In his time the place had a royal chapel; and in view of the statement that, of the two places where Jeroboam placed the calves, the people went to worship in Dan,²⁴ apparently the chapel of Beth-El remained a minor sacrarium and did not attract many worshippers.

Hosanna, another prophet who lived in the eighth century, admonished: “Let not Judah offend . . . neither go ye up to Beethoven.”²⁵ He prophesied also that the “inhabitants of Samaria shall fear because of the calves of Beethoven”, and that the glory of that place will depart from it.²⁶

It is generally agreed that Hosea, speaking of Beth-Aven (“the House of Sin”), referred to Beth-El This is supported by the verse in the Book of Joshua which tells: “And Joshua sent men from Jericho to Ai, which is beside Beth-Aven, on the east side of Beth-El”²⁷

It appears that the name Beth-Aven, or “The House of Sin” was applied to both places where Jeroboam built temples for the worship of the calf. It is possible that, in another verse of his, Hosea had in mind the temple of Dan; he said: “The high places also of Aven, the sin of Israel, shall be destroyed . . .”²⁸

“The sin of Israel” is the usual term for the cult of Dan; and the “high places”, according to the quoted story of Jeroboam placing calves in Dan and Beth-El,²⁹ were built in Dan.

At the beginning of the Book of Amos, the following sentence appears: “I will break also the bar of Damascus, and cut off the inhabitant from the plain of Aven (*me'bik'at Aven*) . . . and the people of Syria shall go into captivity unto Kir . . .”³⁰

I shall return later to this passage and to the accepted interpretation of “the plain of Aven”.

During the wars of the eighth century, the temple city of Dan may have taken part in the struggle of the Northern Kingdom for its existence, being oppressed first by Syria, and then by Assyria. Dan may have been besieged, and may have changed hands

during these wars, but nothing is known of its destruction.

In the latter part of the eighth century the population of the Northern Kingdom was deported by Sargon II to remote countries, from where it did not return. More than a century later Jeremiah referred to the oracle of Dan: “For a voice declareth from Dan”,³¹ which shows that the oracle of Dan was still in existence after the end of the Northern Kingdom.

An oracle venerated since ancient times, a magnificent temple where the image of a calf was worshipped, a place where the tribes of Israel gathered in the days of the feasts, and the people of Judea used to come, too—this was the cult.

On the way to Hamath, on the northern frontier of the Northern Kingdom, closer to Zidon (Sidon) than to Tyre, and strategically exposed to Damascus—this was the place. Would no ruins help to identify the site?

BAALBEK

In the valley that gives birth to two rivers of Syria—the Orontes flowing to the north, and the Litani flowing to the south and west, between the mountains of Lebanon and Anti-Lebanon, where roads from Palestine in the south, Damascus in the east, and the sea-coast on the west meet and run from there to Hamath in Upper Syria—lie the ruins of Baalbek.

“When we compare the ruins of Baalbek with those of many ancient cities which we visited in Italy, Greece, Egypt, and in other parts of Asia (and Africa), we cannot help thinking them to be the remains of the boldest plan we ever saw attempted in architecture. Is it not strange then, that the age and the undertaker of the works, in which solidity and duration have been so remarkably consulted, should be a matter of such obscurity. . . ?³²

From the time when this was first written, in the fifties of the eighteenth century, and till today, nothing was added to dispel the obscurity which envelops the origin of this temple city.³³ The excavations undertaken there brought no solution to the problem of its origin or the nature of its cult.³⁴ No early inscriptions were found.

Throngs of travelers who spend their day wandering among the ruins of a magnificent acropolis go away without having heard what the role of the place was in ancient times, when it was built, or who was the builder. The pyramids, the temples of Kamak and Luxor, the Forum and Circus Maximus in Rome were erected by builders whose identity is generally known. The marvellous site in the valley on the junction of roads running to Hamath is a work of anonymous authors in unknown ages. It is as if some mysterious people brought the mighty blocks and placed them at the feet and

in front of the snow-capped Lebanon, and went away unnoticed. The inhabitants of the place actually believe that the great stones were brought and put together by Djenoun, mysterious creatures, intermediate between angels and demons.³⁵

SOLOMON'S BAALBEK

Local tradition, which may be traced to the early Middle Ages, points to a definite period in the past when Baalbek was built: the time of Solomon.

Ildrisi, the Arab traveler and geographer (1099-1154), wrote: "The great (temple-city) of astonishing appearance was built in the time of Solomon."³⁶ Gazwini (d. 1823 or 4) explained the origin of the edifices and the name of the place by connecting it with Balkis, the legendary Queen of the South, and with Solomon.³⁷

The traveler Benjamin of Tudela wrote in the year 1160 of his visit to Baalbek: "This is the city which is mentioned in Scripture as Baalath in the vicinity of the Lebanon, which Solomon built for the daughter of Pharaoh. The place is constructed with stones of enormous size."³⁸

Robert Wood, who stayed at Baalbek in the 1750's, and who published an unsurpassed monograph on its ruins, wrote: "The inhabitants of this country, Mohomedans, Jews and Christians, all confidently believe that Solomon built both, Palmyra and Baalbek."³⁹ Another traveler who visited Syria in the eighties of the eighteenth century recorded: "The inhabitants of Baalbek assert that this edifice was constructed by Djenoun, or genies in the service of King Solomon."⁴⁰

ON - AVEN

The identification of Bikat Aven, referred to in Amos 1:5 with the plain of Coele-Syria is generally accepted.⁴¹ The text, already quoted, reads: "I will break also the bar of Damascus, and cut off the inhabitant from the plain of Aven . . ."

The Septuagint, the Greek translation of the Bible by the Seventy, renders the above text as "the valley of On," written the same as On (or Heliopolis) in Egypt. The Hebrew spellings of Aven and On do not differ in consonants; and vocals were inserted in the texts by the Masoretes in a late period. On is the Hebrew name of Heliopolis in Egypt, pronounced also as Aven, as in Ezekiel 30:17; Bikat Aven is the name of the plain of Baalbek in Amos. Tradition has it also that the cult of Baalbek was brought there from Heliopolis in Egypt.⁴²

Hosea, however, called by the name of Aven (Beth-Aven) the cities of Bethel and

Dan;⁴³ and he spoke of “high places” there, and in the instance where he referred to “the sin of Israel” he obviously meant Dan.⁴⁴

Amos, who in the eighth chapter speaks against the worshippers at Dan, in chapter one speaks against the plain of Aven—and thus, comparing Hosea and Amos, one wonders whether Amos 1:5 speaks of Baalbek or of Dan.

The expression Bikat Aven, or the Valley (Plain) of Aven in Amos impelled the exegetes and commentators to refer the place to Coele-Syria, and this because Bi’qa is the specific name of the Coele-Syrian plain—still in use today. The very name Baalbek is generally explained as the Baal of Bi’qa or Bekaa—of the valley.

Baalbek is situated in the valley between Lebanon and Hermon. Of Dan it is also said that it was situated in a valley:

”. . . And it was in the valley that lieth by Beth-Rehob. And they built a city, and dwelt therein.”⁴⁵

BAALATH, BAAL GAD, BAAL ZAPHON, BAAL MELECH

Is Baalbek the Scriptural Baalath, as Benjamin of Tudela thought? About Baalath it is said: “And Solomon built . . . Baalath, and Tadmor in the wilderness.”⁴⁶ Tadmor is Palmyra, far to the northeast of Baalbek. Baalath is said to have belonged to the tribe of Dan.⁴⁷

Or, is Baalbek the Scriptural Baal Gad? deliberated a few scholars.⁴⁸ It is said: “Baal Gad in the valley of Lebanon under mount Hermon.”⁴⁹ In the valley of Lebanon under mount Hermon lies Baalbek. If this identification is correct then Baalbek was inside the Israelite kingdom. However, against this supposition of Baal Gad in the valley of Lebanon it was argued that the Israelite kingdom never embraced the area of Coele-Syria, or the valley between Lebanon and Hermon (Anti-Lebanon).⁵⁰

Some writers would regard Baalath and Baal Gad as two names of one place and would locate it at Baalbek.⁵¹

If Solomon built in Palmyra in the desert between Syria and Mesopotamia, the region of Coele-Syria between Lebanon and Hermon could certainly be in the area of his building activity, argued these scholars. But placing Baal Gad in Coele-Syria, where would they place Dan, the northernmost point of the Kingdom of Israel? To keep Dan in Galilee and to place Baal Gad, an Israelite city, one hundred fifty kilometers farther to the north will not stand up against the indisputable fact that Dan was the northernmost city in Israel.

Some scholars, looking for Baalbek in the Scriptures, identified it with Baal-Hamon, referred to in the *Song of Songs*.⁵² And again, Baal Hamon is supposed to be another name for Baalath and Baal Gad.⁵³

Also Baal Zaphon, or Zeus Cassius, was proposed as Baalbek.⁵⁴ In this connection it can be said that, according to the Talmud, Gad was the name of the planet Jupiter;⁵⁵ and Zeus Cassius signifies Jupiter of Lebanon; and Hamon was supposed to be a Syrian form of the name Amon⁵⁶ who, according to the Greek authors, was Zeus-Jupiter.⁵⁷

All this together, if correct, points toward the cult of Jupiter in Baalbek, a matter to which we shall return in one of the next sections.

Besides Baal Gad, Baal Zaphon or Zeus Cassius, Baal Hamon, and Baalath, one more name is identified as Baalbek: Baalmelech, or “the royal Baal”.⁵⁸

THE TRILITHON

Already in the last century it was observed that the Acropolis of

Baalbek and the temples built on it date from different epochs. The massive substratum—the great base of the acropolis—appears to be of an earlier date; the three temples on the substratum, of a later date.

It is even probable that the wall of the acropolis did not originate in one epoch. Among the stones of which it is built there are three of an unusual size—almost twenty meters long. Each of them weighs about one thousand tons. These huge monoliths are incased in the wall. The question arises whether they are not the survivals of the original cyclopean structure—that which carried the name Rehob, or Beth-Rehob, and which served as a landmark for the scouts dispatched by Moses in their survey of Canaan, and for the emissaries of the tribe of Dan in their search for the territory in the north. Like Stonehenge in Great Britain, or Tiahuanaco in the Andes, it may have originated in an early time—not necessarily neolithic, since it appears that these stones are subjected to hewing by metal tools.

In the quarry a mile away is found another stone of comparable size, cut out of the rock from all but one side; it appears that this stone of more perfect cut was quarried in a later time, possibly in the days of Jeroboam, or even later; but, for probably mechanical considerations, the work was not finished and the stone not removed, and the emulation of the early builders not completed.⁵⁹

In another place I intend to return to the problem of the Trilithon of Baalbek, when treating cyclopean buildings and the mechanical means of quarrying and transporting these monoliths.

THE EMBOSSED QUADERS

Aside from the incased trilithon, the attention of the visitor to Baalbek who inspects the wall of the acropolis is drawn to stones of a bossed shape with an indented rim on all four sides of the face of the stone.

O. von Richter in 1822⁶⁰ and S. Wolcott in 1843⁶¹ drew attention to the fact that the quaders of the wall of the temple area of the acropolis of Baalbek have the same form as the quaders of the Temple of Solomon, namely, of the surviving western (outer) wall, or Wailing Wall. The Roman architects, wrote Wolcott, never built foundations or walls of such stones; and of the Israelite period it is especially the age of Solomon that shows this type of stone shaping (chiseling). The photograph of the outer wall of Baalbek's temple area illustrates that the same art of chiseling was employed in the preparation of stones for its construction. Whatever the time of construction of other parts of Baalbek's compound—neolithic, Israelite, Syrian, Greek, or Roman—this fundamental part of the compound must have originated in the same century as the surviving (western) wall of the area of Solomon's temple.

THE TEMPLES OF THE ACROPOLIS

The buildings on the flat plateau of the Acropolis have columns with capitals of Corinthian style. The time of the origin of these temples is disputed. An author of the last century⁶² brought forth his arguments against a late date for the temples atop the acropolis; he would not agree to ascribe them to the Roman period, or Greek period; he dated them as originating in an early Syrian period: the Romans only renovated these buildings in the second century of the present era.

The opinions of scholars are divided over whether these buildings can be ascribed to Roman times, though the source of the designs on the doorways and the ceiling and in the capitals of the columns speak for a Roman origin. When the Roman authorship of the buildings is denied, the Romans are credited only with renovating the structures.

The Emperor who is sometimes said to have built the largest of the temples in the temple area—that of Jupiter—is Aelius Antoninus Pius (138-161). The source of this information is the history of John of Antioch, surnamed Malalas, who lived not earlier than in the seventh century of this era, and wrote that Antoninus Pius built a temple for Jupiter at Heliopolis, near the Lebanon in Phoenicia, which was one of the wonders of the world.⁶³

Julius Capitolinus, who wrote the annals of Antoninus Pius and enumerated the buildings he erected, offers no material support for the assertion made by the Syrian writer of the early Middle Ages. Though Antoninus Pius did build in Baalbek, as is evidenced by his inscriptions found there,⁶⁴ his activity was restricted to reparation of the temples or the construction of one of the edifices in the temple area.⁶⁵ The work in its entirety could not have been his because Lucian, his contemporary, calls the sanctuary of Baalbek already ancient, and because Pompey had already found it in existence and Trajan consulted its oracle.

The style of the temples caused the same divergence of opinion as the style of the surviving ruins of Palmyra. Some regard them as Roman,⁶⁶ others as Hellenistic and Oriental.⁶⁷ They are sometimes called East-Roman.⁶⁸ In the case that only the ornamentation is of the Roman period the question may arise whether the walls and the columns of these buildings could be of as early a period as the seventh century before the present era, or the time of Manasseh, of whom Pseudo-Hippolytus says that he reconstructed Baalbek, built originally in the time of Solomon.⁶⁹

THE CALF

It was almost a common feature in all places where pilgrims gathered to worship at a local cult that diminutive images of the deity were offered for sale to them. Also small figures of the god or of his emblem in precious or semi-precious metals were brought by worshippers as a donation to the temple where the large scale figure had its domicile.

In Baalbek archaeological work produced very few sacred objects or figures that could shed light on the worship of the local god. "It was a disappointment, next to the brilliant success of so rich an excavation, that nothing was learned of the nature of the deity and the history of its worship."⁷⁰

Figures of Jupiter Heliopolitanus standing between two bullocks or calves have been found at Baalbek, dating from Roman times.⁷¹ In addition, an image of a calf was also found.

The only figure of an earlier time found in Baalbek is an image of a calf. Since it is to be expected that images found in an ancient temple are reproductions of the main deity worshipped in the holy enclosure, it is significant that the holy image in the temple of Baalbek was that of a calf, and of no other animal.

The name Baal-Bek (Baal-Bi'qa) is sometimes transmitted by Arab authors as *Baal bikra*, or Baal of the Steer or Calf, which is the way of folk etymology to adapt the name to the form of the worship practiced in the temple. This, together with the finding of the images of the calf in the area of the temple, strengthens the impression

that the god of Baalbek was a calf.

THE ORACLE OF BAALBEK

Baalbek or, as the Romans called it, Heliopolis, was venerated in the Roman world as the place of an old cult of an ancient oracle, and it rivalled successfully other venerated temples of the Roman Empire.

It is known that the Emperor Trajan, before going to war against the Parthians in the year 115, wrote to the priests of Baalbek and questioned its oracle. The oracle remained in high esteem at least as late as the fourth century of the present era, when Macrobius in his *Saturnalia* wrote of Baalbek: “This temple is also famous for its oracles.” ⁷²

Was it the ancient oracle of Micah? In the words of Jeremiah, shortly before the Babylonian exile of -586 in which he spoke of “a voice . . . from Dan”, ⁷³ we had the last biblical reference to the oracle of Micah. In the days of Jeremiah the oracle must have been seven or eight hundred years old. Did it survive until the days of Trajan and even later, until the days of Macrobius?

In the Tractate Pesahim of the Babylonian Talmud is written the following sentence: “The image of Micah stands in Bechi.” ⁷⁴ Bechi is known as the Hebrew name for Baalbek in the time of the Talmud. As we have seen, in the Book of Exodus it is recounted that the Danites, migrating to the North, took with them Micah and his idol, and that it was placed in Dan of the North. The Talmud was composed between the second and the fifth centuries of the present era.

This passage in the Tractate Pesahim is a strong argument for the thesis of this essay, namely that Baalbek is the ancient Dan. ⁷⁵

TWO PROBLEMS: A SUMMARY

The problems will be put side by side. Dan was the abode of the old oracle of Micah. Jeroboam built there a “house of high places”, or a temple. Previously, he was the builder of Jerusalem’s wall under Solomon; before becoming king of the Northern Kingdom he lived as an exile in Egypt. He introduced the cult of the calf in Dan.

The new temple was built to contest and to surpass the temple of Jerusalem. It became the gathering place of the Ten Tribes, or “the sin of Israel”, and pilgrims from Judah also went there.

The prophets, who opposed the cult of Dan, called the place Aven, like Aven, or On

(Heliopolis) in Egypt.

Its oracle was still active in the days of Jeremiah, in the beginning of the sixth century.

Dan was the northernmost city of the Kingdom of the Ten Tribes, and the capital of the tribe of Dan. It was situated in a valley. If Baal Gad, between the Lebanon and the Anti-Lebanon was not the same place, Dan must have been more to the north.

The place was at the point where the roads meet that run toward Hamath.

No ruins of this temple-city are found. Where was Dan and its temple?

* * *

Remains of a great temple-city are preserved in Baalbek. At the beginning of the present era it was described as already ancient. It bore the name of Heliopolis, like the Egyptian On, or Aven (Ezekiel); and Amos, who spoke against the worshippers at Dan, prophesied the desolation of Bikat-Aven, or the Valley of Baalbek.

Its cult was introduced from Egypt. During excavations, the figure of a calf was unearthed.

The temple possessed an old oracle. The Talmud contains the information that the oracle of Micah (which according to the Book of Judges was in Dan) stands in Baalbek.

Local tradition assigns the building of the temple of Baalbek to the time of Solomon. The wall of the temple area is built of great stone blocks of the same peculiar shape as those of the Wailing Wall in Jerusalem, the remains of the outer wall of the temple area erected by Solomon.

Baalbek lies in a valley (Bi'qa) between the Lebanon and the Anti-Lebanon, and on the junction of the roads that connect Beirut from the west and Damascus from the east with Hamath in the north.

The history of the temple-city of Baalbek in pre-Roman times is not known, neither is its builder known, nor the time when it was built.

* * *

Two problems—when was Baalbek built and who was its builder, and where was Dan and what was the fate of its temple—have a common answer.

The tradition as to the age of the acropolis and temple area of Baalbek is not wrong. Only a few years after Solomon's death the house of the high places of Dan-Baalbek

was built by Jeroboam.* Possibly, Solomon had already built a chapel for the oracle, besides the palace for his Egyptian wife.

The *Djenoun* who, according to Arab tradition, built Baalbek for Solomon were apparently the tribesmen of Dan. In the Hebrew tradition, too, the tribesmen of Dan, because of the type of worship in their capital, were regarded as evil spirits. In the corrupted name of Delebore, who, according to Macrobius, was the king who built Baalbek and introduced there the cult of Heliopolis from Egypt, it is possible to recognize the name of Jeroboam who actually returned from Egypt before he built “the house of the high places”.

* * *

EDITORIAL POSTSCRIPT:

Velikovsky's essay on Baalbek was planned to include a discussion of the names by which this place was known in Egyptian texts. This part was not written, but a few notes of his, scattered among his papers, may help us to follow his reasoning. One note reads: “Dunip (Tunip) of the el-Amarna letters and other ancient sources was Dan. It was also Kadesh of Seti's conquest. Finally, the place is known as Yenoam ('Yahwe speaks') which refers to the oracle.”

Tunip: *As Velikovsky noted in “From the End of the Eighteenth Dynasty to the Time of Ramses II” (KRONOS III.:3, p. 32) certain scholars (e.g., Gauthier) have identified Tunip with Baalbek, though others (e.g., Astour) have disputed the link. Thutmose III recorded the capture of Tunip in the 29th year of his reign; an inscription recounts the Egyptian king's entering the chamber of offerings and making sacrifices of oxen, calves, etc. to Amon and Harmachis. The el-Amarna letters indicate that the same gods were worshipped at Tunip as in Egypt.*

On the walls of a Theban tomb of the time of Thutmose III (that of Menkheperre-Seneb), among paintings of foreigners of various nations, there is one of a personage from Tunip, carrying a child in his arms. Velikovsky thought that, possibly, it was a depiction of Jeroboam, and that the painting illustrated the passage in the First Book of Kings (II :40): “And Jeroboam arose, and fled into Egypt, unto Shishak, king of Egypt. . .”

Among the considerations which led Velikovsky to identify Tunip with Dan-Baalbek were (1) Tunip was located in the general area of Baalbek, with some scholars asserting that the two were one and the same. (2) There was a temple of Amon at Tunip; the Roman equivalent of Amon - Jupiter - was worshipped at Baalbek.

Kadesh of Seti's Conquest: *This identification was given in brief in Velikovsky's*

article in *KRONOS III:3*, mentioned above. The relevant passage reads: “There is a mural that shows Seti capturing a city called Kadesh. Modern scholars recognized that this Kadesh or Temple City was not the Kadesh mentioned in the annals of Thutmose. Whereas the Kadesh of Thutmose was in southern Palestine, the Kadesh of Seti was in Coele-Syria. The position of the northern city suggested that it was Dunip, the site of an Amon temple built in the days of Thutmose III. Dunip, in its turn, was identified with Baalbek.”

Pseudo-Hippolytus (Sermo in Sancta Theophania in J. -P. Migne, Patrologiae Cursus Completus [Graeca] Vol. 10, col. 705) gives the information that Manasseh, son of Hezekiah, restored Baalbek. In his forthcoming *Assyrian Conquest*, Velikovsky suggests that this could have been a reward for Manasseh for his “loyalty to the Assyrian-Egyptian axis”.

Yenoam: Regarding Yenoam, I find only the following among Velikovsky’s notes: “Yenoam-Dan (Yehu probably introduced the cult of Yahwe at Dan).” Yenoam, read in Hebrew, could be interpreted as “Ye [Yahwe] speaks”; Velikovsky evidently saw in the name a reference to the oracle at Dan. Yenoam is mentioned among the towns taken by Thutmose III (he captured it soon after taking Megiddo). In the el-Amarna letter no. 197 there is a reference to a town named Yanuammu. Later, Seti recorded the despatching of an army against Yenoam, in the first year of his reign. Yenoam is once again mentioned on Merneptah’s so-called Israel Stele; the claim is that it was “made non-existent.” In Ramses II and His Time this deed is ascribed to Nebuchadnezzar.

 75. The readers of this passage probably understood it in the sense that Micah's oracular image, after being removed from the temple of Dan, was placed in Baalbek. Baalbek being Dan, such an interpretation is superfluous.
-

The “Great and Terrible Wilderness”

In *Ages in Chaos* I brought together evidence from Hebrew and Egyptian sources which enabled me to establish the identity of the Hyksos with the Amalekites. I found that the time, the place, and the circumstances corresponded in both sources. In comparing the two sources and seeking to complement them, I looked also into the ancient Arabian traditions and found there plenty of material in support of my view. I lighted upon an old pre-Islamic story describing the wandering of the tribes under Moses, a story which until now has not been recognized as such. Yet the Arabian sources speak so clearly about these events that one wonders why no heed was paid to them before. For me they were not the starting point, but merely a welcome confirmation of what I was able to establish from a comparison of the Egyptian and Hebrew histories.

Outhman, son of Sadj, recites in his history that a torrent once penetrated the Ka'aba and overthrew the structure.⁽¹⁾ This catastrophe did not influence the people of Mecca, and they persisted in their vicious ways. The signs of heavenly wrath inspired the king, Mondad, son of Amur (grandson of Mondad, the father-in-law of Ishmael) to address his people with these words:

Remember what happened to the Amalekites in the time of your fathers. They treated with scorn the Haram [the sacred dominion]; they did not respect what was sacred. The Lord expelled them from the holy place and dispersed them among the foreign countries.

You have seen how the Lord dealt with the Amalekites.

The narrator continued as follows:

The tradition reports that the Amalekites violated the privileges of the sacred territory and that the Almighty God sent against them ants of the smallest variety which forced them to desert Mecca.

Afterwards the Lord sent drought and famine and showed them the clouded sky at the horizon. They marched without rest toward those clouds which they saw near them, but were not able to reach them; they were pursued by the drought which was always at their heels.

The Lord led them to their native land, where He sent against them the

Our interest is aroused by this last statement—that it was a deluge that took the tribe of the Amalekites by surprise when they reached their old native land.

Evidently the disturbance in the accustomed flow of events was experienced not only in Egypt, but in Arabia, too. Mecca, like Memphis, was visited by plagues: the shock that overthrew the cities of Egypt brought the Amalekites, at that time conquerors of Mecca, into disorder and tumult. They became like herds of animals brought to a state of excitement by an earthquake, and their fugacious troops reached Mount Seir (the Old Testament designates Mount Seir as their “native land”) and arrived at the shores of the Red Sea as the Israelites were escaping from Egypt.

The catastrophe was obviously greater than a rupture of a dyke may cause. Not only the region of Seba, but Mecca, and all the shore of the sea—Tehama—were shattered. Could it be that Arim was not a “dyke” but something different? Massoudi wrote: “All persons versed in tradition among those peoples agree that the word ‘Arim’ designates a solidly built dam.” The meaning of the word “Arim” was not entirely certain if it required interpretation.

The same great catastrophe, when mountain-high waves rushed onto the land, became a theme of tradition and legends of many nations.

A Greek legend personified this upheaval in a battle of Zeus and Typhon, which took place over the sea, between Egypt and Syria. The origin of the legend and its historical background are clarified in *Worlds in Collision*. Strabo quoted Pindar: “It was father Zeus who once among the Arimi, by necessity, alone among the gods, smote monstrous Typhon of the fifty heads.” Strabo added: “But some understand the Syrians are Arimi.” This is the Greek legendary version of what happened at the Sea of Passage. The Arimi were Hebrews, who were called Arameans: Their origin was from Aram. Toufan of the Arabian author is the same as Typhon of the Greek author; Arim of the Arabian author is Arimi of the Greek author. The “flood of Arim” of the Arabian tradition was originally not the “rupture of the dyke” but the “flood of the Hebrews,” the flood which got their name because they found in it their salvation, whereas for other nations it meant destruction.

The Arab historian did not suspect any link between his story and the events of the Exodus, and he did not bring them into any connection; had he done so, it could be suspected that he was merely transmitting a passage of the Bible in an arbitrary form; but he seems unaware of the significance of his report.

A sudden inundation in which a whole country was destroyed, a land devastated, and in which a multitude of people perished is related in one of the earliest Arab pre-Islamic traditions.⁽³⁾ “The Flood of the Dyke” was an event which fixed itself indelibly in the memory of the Arabs. This flood was known also as the Deluge of Marib. Marib was the former capital of the Sabeans in Yemen, in the south of Arabia. Near this place a dam was constructed to gather the water which flowed in the wadi of Dhenne (or Adana) that divides the Balak hills. During the summer the bed of the wadi is often dry; in the winter, after rains, it often becomes so swollen as to be impossible to cross. An earthen dam, the remains of which, some 600 meters long, are still to be seen, was used for collecting and storing the water; in the rainless months an irrigation system supplied it to the gardens and to the pastures of the valley beneath.

Al-Masudi in his *Meadows of Gold and Mines of Gems*⁽⁴⁾ gives a description of what he supposed the dam of Marib to have been like before its destruction. In a dyke one parasang (ca. 2.2 kilometers) long were thirty openings which provided for the distribution of water throughout the land.

The rich fantasy of the oriental writers tells of a country in South Arabia whose beauty was proverbial far and wide. A whole month one could ride on his mule across this land (situated within the tropic of Cancer) without leaving the shade above his head. An empty basket on the head of the traveler would fill itself with fruits falling down from the trees.

The rupture of the dam turned this blessed country into ruin: the land was submerged, the structures were overthrown, the trees broken, the population drowned: the catastrophe ruined the entire kingdom.

The inhabitants of the Arabian desert preserved through centuries the memory of a remote past when the catastrophe of Marib occurred. A migration of tribes in South and North Arabia was connected with this cataclysm.

Different variants of this catastrophe were kept in the memory of generations, adorned with fancy and transmitted up to the time when Islamic writers recorded them in their histories. The catastrophe that transformed a fertile plain into a barren quarter is related in the Koran (sura 34):

Seba had in their dwellings a sign: two gardens on the right hand and on the left. Eat from the provision of your Lord, and give thanks to him! a good country and a forgiving Lord! but they turned away, and we sent against them the flood of the dyke; and we changed for them their two gardens into two gardens that grew bitter fruit and tamarisk and some few lote trees.

In other narratives referring to the flood of the Dyke, and in commentaries to the

Koran, the devastation is said to have spread over all the inhabited land of South Arabia.

The story of the rupture of the dyke is one of the few recollections of ancient times in the Islamic tradition not compiled from the sacred books of the Hebrews, but received from native Arabian sources.

No one knows exactly when the dam of Marib was built. The oldest parts of the work were estimated to have been executed in the period of 1,000 to 700 B.C.E.,⁽⁵⁾ but most scholars consider this period to be too early. No one knows when it was destroyed: suppositions only were uttered.⁽⁶⁾ Neither is the cause of the destruction established with certainty. Possibly, the devastation by the water of the dam occurred more than once.⁽⁷⁾

The quoted Al-Masudi, who in general was not disinclined to render here and there a fantastic tale, gives a naturalistic explanation for this catastrophe: "The waters undermined in an imperceptible way the foundations of the dam, and its strength was sapped little by little by time and the action of the waters."⁽⁸⁾

Modern researchers also ascribe the destruction of the dyke to the action of wind and rain, which gradually disjoined the construction.⁽⁹⁾ Marib was neglected and the dam fell into disrepair.

If it is true that the dam was gradually and not suddenly destroyed and abandoned, and thus the service it rendered to the cultivation of the land ceased, how then did the many stories about the catastrophe come into existence? And if at some time a collapse really occurred, how could it be that it destroyed the whole country, even the high-lying fields and places far away? A quantity of water which a barrage of the wadi Dhenne could assemble would, at a bursting of the construction, cause a local calamity, but not a "deluge" of South Arabia. And if really only a few gardens were destroyed, how could it be that "there is hardly any historical event of pre-Islamic history that has become embellished with so much that is fanciful and related in so many different versions"⁽¹⁰⁾ as the bursting of the dam?

Were a great catastrophe that remained in the memory of the Arabs to occur at a time when Hebrew, Hellenistic, Roman and Christian historians were writing their annals, could it possibly have escaped their attention? And why does the old tradition place the catastrophe in the third or fourth generation after Ishmael, son of Abraham? Why do the old Arabian traditions connect that time with a general migration of tribes and especially with the migration of the Amalekites in the direction of Egypt and Canaan?

Could it be that the legend does not relate to the Sabeian irrigation system, but to some tremendous upheaval, when not a reservoir of rain-water, but the depths of a sea threw their volume across a dam in a plain whose ground disappeared in a rupture of

geological strata?

The catastrophe was obviously greater than a rupture of a dyke (Arim) may cause. Not only the region of Seba, but Mecca, and all the sea shore-Tehama, were shattered.

May be Arim signifies not a “dyke,” but something different?

Masoudi: All Persons versed in tradition among those peoples agree that the word Arim designates a solidly built dam.

The meaning of the word Arim was not entirely sure: it required interpretation.

* * *

The same great catastrophe, when mountain high waves rushed on land, became a theme of tradition and legends of many nations.

A Greek legend personified this upheaval in a battle of Zeus and Typhon. The origin of the legends and its historical background are put into light on a page of *Worlds in Collision*.

Strabo quoted Pindar: “It was father Zeus who once among the Arimi, by necessity, alone of the gods, smote monstrous Typhon of the fifty heads.” Strabo added “But some understand that the Syrians are Arimi.” This is the Greek legendary version of what happened at the Red Sea. The reader must look for argument in above-mentioned work of the author.

Arimi were the Hebrews, who were called Arameans: their origin was from Aram.

Toufan of the Arabian authors is the same as the Typhon of the Greeks.

MARIB

What does the designation Marib mean? “Various attempts to explain the etymology of Marib are not satisfactory.” ⁽¹¹⁾ Marib was identified with Saba by the Arab geographers. ⁽¹²⁾ It was supposed to be the name of a castle occupied by the rulers of Saba. ⁽¹³⁾

Does the name Marib occur in the Scriptures of the Hebrews? In the stony valley of Rephidim near Horeb, the Israelites met the Amalekites, more exactly at a point called Massa and Meriba (Exodus 17:7-8): “And he called the name of the place Massa and Meriba. Then came Amalek and fought with Israel in Rephidim.” This

was shortly after the Israelites had passed to the eastern shore of the Sea of Passage escaping from their persecutors.

The Amalekites, we are told by the Arab historians, when escaping from the plagues of Mecca, arrived at their native site at a time when a sudden flood overran the land; many of them perished. Their native land, according to the Old Testament, was Mount Seir, which stretches along the gulf of Aqaba and the Red Sea.

It becomes conceivable that the flood overtook a part of them near the place where the Egyptian host drowned, and where the Hebrews escaped the depths. According to al-Masudi, "the waters covered the lands . . . ruined the habitations, and let perish all the troops." The Amalekites migrated, ready for attack and battle. Why should an inundation of the Sabean gardens by the waters of the reservoir destroy all the troops?

All the troops did not perish. It is not recorded in the Scriptures that the Sea of Passage swallowed a part of the Amalekites, but the catastrophe surely was not restricted only to the place where the Israelites were: the shores of Aqaba and the slopes of Mount Seir were surely involved, and besides the Egyptians there must have been other victims.

Arabian sources also retained a recollection of some tribes that succeeded in escaping the catastrophe, being saved in a miraculous way. We are to become attentive. The story we shall hear is in no way attributed by the Arabian tellers of legends to the history of the Israelites escaping from Egypt, or to their leader. The Koran and Arabian literature generally are full of stories related to Moses (Nabi Musa), but all of them are obviously culled from Biblical or Aggadic tradition. Therefore a narration which is related by the Arab historians to the time and place of the bursting of the dyke in Merib in the Sabean realm is of value exactly because of the absence of any signs of its having been borrowed from Hebrew sources.

In the region of Marib (Meriba) was staying a tribe that had arrived there only a short time before. According to al-Masudi,

The king [in other sources the ruler of the tribe] was Amr the son of Amir; he had the surname Mozaikiya. He had a divine brother whose name was Amran. The ruler had for wife a woman skilful in the art of divination; her name was Zarifah. ⁽¹⁴⁾

This family of three persons stood at the head of the nation: two men and one woman—a ruler, his divine brother, and his wife, the prophetess. Similarly, a family of three led the Israelites according to their tradition: a ruler, his divine brother, and a sister, the prophetess. The leaders of the Israelites were sons of Amram. The leaders of the tribe rescued at Marib were sons of Amir. The divine brother of Moses was Aharon; the divine brother of the ruler of the nomads at Marib was Amran. The sister of Moses was Miriam, his wife was Zipora; the prophetess at Marib was Zeripha. If

the second and the third syllables are reversed the names become identical.

The peculiar name *Mozaikiya*, the surname of Amr, son of Amir, was an object of surmise for Arab philologists from early times. A word which sounds similar in Arabic is *mazak*, “a piece,” and folk etymology construed a forced story: the ruler was called by this surname because he was accustomed, when going to his nightly rest, to tear to pieces the garment he wore during the day.

It seems to me that the name is not an Arabic one, but rather is of Egyptian design. *Mose-ika-ya* could be a name arranged similarly to *Smenkh-ka-re*, the last syllable being the name of a divinity—god Re (or Ra) in the case of *Smenkare*; in the case of *Mosaikaya*—the God Ya (as in the names *Isa iah*, *Jerem iah*, and the like), the syllable *ka* being the Egyptian word for “soul.” If this archaic Arabian tradition brought down to us the name of the leader correctly, we may at last have the Semitic name of the great deliverer, and also his Egyptian name. The name “the soul of Yahweh” would surely be a fitting name for the man who, according to the Scriptures, was the first to whom the Divine name was revealed.

In the Arabian story the rupture of the dam and the catastrophe were foreseen by the prophetess Zerifa. As told by al-Masudi, she had a dream:

A great cloud covered the earth and ejected lightnings and flashes. Then the thundercloud burst, and thunderbolt fell and consumed everything in its path; reaching the ground it reduced to ashes all it touched in its fall. “After this,” said the prophetess, “it will happen that everything will submerge.”

On the eve of the day when the sea burst, a dreadful cloud—not in a dreamy vision, but in the sight of a multitude—darkened the heavens, and flashes of lightning intersected the darkness. “And it came between the camp of the Egyptians and the camp of Israel; and it was a cloud and darkness, but it gave light by night.” (Exodus 14:20) The *Aggada* adds that “the Lord discharged hailstones and coals of fire.”

The spirit that inspired the prophetess *Zaripha* rescued the people. She predicted “a calamity of calamities, a momentous thing, a misfortune without precedent.” A tempest would ruin the entire country.

It was the prophetic woman in the camp of the Israelites whose exaltation is especially mentioned when on the shore of the Sea of Passage, and this time she is called “the prophetess” (Exodus 15:20-21):

And *Miriam* the prophetess, the sister of *Aharon*, took a timbrel in her hand and all the women went out after her with timbrels and with dances.

And Miriam answered them, "Sing ye to the Lord, for he hath triumphed gloriously: the horse and the rider hath he thrown into the sea."

The Arab authors have embellished the story with the inevitable oriental addenda of palmy days in a paradise garden and of a suzerain enchanted by houries, but these are characteristic elaborations on the part of the tale tellers and do not belong the story of the dyke broken at the sea, nor to the description of a spoiled irrigation system.

Not only the prophetess Zeripha, but also her husband and his brother had prophetic dreams. According to one source it was the "divine brother Amran who was the first to receive the revelation concerning the impending catastrophe." This brother was gifted with magical knowledge of the right way. Thus forewarned, Mozaikiya disposed of all his possessions and emigrated with all his people (Nuwairi).

It was Aharon in the camp of the Israelites who with the help of the Urim and the Tumim oracle determined the way to go and the deed to undertake.

In the Arabian tradition, in the variants I had before me, there was no allusion to a persecuting host and no knowledge of the way the tribes passed before they reached Marib.

The Arabian philologists did not succeed in explaining the origin of the name Marib. In the books of Exodus and Numbers two similar events are recounted which occurred in two places called Meriba: in both instances the tribes complained about the absence of water; the first time at the beginning of their march through the wilderness; the second time in the last years of the wandering. The etymology of the name is explained to be "the water of discord."

Wells in an arid region were almost always waters of dispute. That the Israelite tribes many times suffered thirst in the desert is recorded in short but dramatic sentences. In the violent changes in the different strata of that region water sources disappeared; they were blocked and diverted; thermal springs appeared, such as the spring Mara. An inspired dowsing might be able to find hidden water sources in the blocks of split-apart rocks by striking one with a rod.

It even seems to me possible that the Sabeian region of Arabia was before the catastrophe "a garden across which the traveller could voyage a month on his mule without leaving the shade," similar to India, rich in water and on the same degree of latitude, where the vehement sun lets the soil sprout abundant vegetation. The southern and northern fringes of Arabia attained a high level of culture at a very early time, which would hardly be possible if these parts of Arabia had been as poor in water as they are today.

It was not the rupture of the dyke that caused the dwindling of the fortunes of the country, but drought and the disappearance of water sources, of which records are

preserved both in the Hebrew Scriptures and in the Arab annals.

The construction of the dyke in the Sabean region could have been a remedial measure to keep alive the gardens in this plain, ten days' march from the Red Sea and from the Gulf of Aden alike. The disasters—with a field of destruction that embraced not only the other plains of Arabia but also far-removed lands—were remembered as “the deluge of Marib,” and as a sudden torrent that overthrew the sanctuary at Mecca, and as a time of drought and famine and also of plagues, and as a time when whole countries were destroyed, left desolate and abandoned, while armies perished, and tribes migrated. But with the passing of centuries the real place and cause were forgotten and a deserted dyke in the south of Arabia was supposed to have been the main theater of events. Its ruined remnants were supposed to be coeval witnesses of days recollected as days of terror, when land and sea were shaken in spasms. Possibly this place had been called Marib since ancient times—what place of water is not a place of strife? Likewise the oil wells of today, being rare, are wells of strife. Or perhaps the deluge of Meriba at the sea was only later connected connected with the visible remains of the abandoned dam, the name Marib being given to it subsequently.

The drought, followed by famine and by different plagues, compelled the Amalekites to leave their ancestral home in Mecca and to migrate toward the clouds far away in the sky and “toward their native land,” where they, or a part of them, were drowned in the flood, according to *Kitab-alaghaniy*.

And then—we return to the scriptural narration—they met the migrants coming from Egypt. The latter advanced, following the mist that covered the desert in these latter days of in-the-beginning; it was like the vapor which arose from the darkness “upon the face of the deep.”

In the place where the cloud abode, there the children of Israel pitched their tents. Whether it was by day or by night that the cloud was taken up, they journeyed. And the cloud rested in the wilderness of Paran.
(Numbers 9:17, 21; 10:12)

The clouds are repeatedly mentioned in the history of the wandering. According to the *Kitab-alaghaniy*, “the Amalekites journeyed in the direction of the cloud.”

If these were the same clouds which were followed by the Israelites, the two groups must have encountered each other. And this encounter in fact took place by Rephidim. (Exodus 17:8)

Jewish tradition retained a memory of the encounter in the mist: “Joshua did not at first want to expose himself to danger and leave the protection of the cloud . . . then he set forth against Amalek.” [\(15\)](#)

The author of *Kitab-alaghaniy* did not know what befel the Amalekites after they left, following the cloud. He supposed that they found their end in a sudden flood.

At Rephidim the Israelites took up arms against the vanguard of the roaming Amalekites. When, after a prolonged sojourn at Mount Horeb, they attempted to reach Canaan from the south, the scouts they had sent out brought them the ill tidings that the Amalekites already occupied the south of Canaan (Numbers 13:29). It was a hard blow to the Israelites and their hearts grew faint. They made a desperate and unsuccessful attempt to reach the land from the south, daring to attack the Amalekites: “For the Amalekites and the Canaanites are there before you, and ye shall fall by the sword.” (Numbers 14:23). They were discomfited and driven to Horma. They proceeded on their thorny way in the land of flint, in the untrodden desert, in the labyrinthine sandy ravines, upon old basalt and limestone. As a Jewish legend relates, “When they saw the vast, extensive, utterly barren wilderness before them, their courage gave way.” After the highest pitch of expectation their hopes were revealed as vain. “He tortures us with famine,” they complained.

“With the name of a new settlement he has deceived this great multitude; after he had succeeded in leading us from a well-known to an uninhabited land, he now plans to send us to the underworld, the last road of life.” [\(16\)](#)

We are at the crossing point in the desert where the Israelites coming from Egypt met the Amalekites coming from Mecca. We followed the Scripture describing the way of the Israelites and the old Arabian traditions describing the way of the Amalekites. From this point on we shall follow the Isrealites’ wandering in the desert, according to the Biblical and Arabian traditions.

MIDIAN

Mount Seir extends along the length of the Red Sea and includes the area known as Hedjaz. The mountainous chain of volcanic formations stretches along the western border of the plateau called the Arabian Desert, and constitutes a barrier opposite the depression which composes the bed of the Red Sea. When it is said that the tribes of Israel “turned and took our journey into the wilderness by way of the Red Sea [Yam Suf]” or that they “compassed Mount Seir many days” (Deuteronomy 2:1) it means just what is said, that they went southward along the mountainous chain not far from the shore of the Red Sea in the region of Hedjaz. It is difficult to understand why the historians and Bible exegetes agreed that the decades of wandering of the tribes were confined to a very small area which may be crossed in one week or two.

Arabia is wide; nomads with cattle, looking for water and pasture, drive great distances. Defeated by the hostile Amalekites in the south of Canaan, the fugitives

from Egypt had no other choice but to return to Egypt or to move by way of the Red Sea.

Midian was the land where, according to the Scripture, Moses had spent his manhood when a fugitive from Egyptian justice; there he also became the son-in-law of a priest named Jethro. (Exodus 2:15-21) The habitation of the Midianite priest was to the south or to the east of Mount Horeb. (Exodus 3:1) Midian was not in the Negev or on the coast of the Aqaba Gulf: in order to escape Egyptian justice Moses needed to go farther than the Sinai peninsula.

The abode of the Midianites is to be looked for near the place where the city of Medina is today. This name Medina may likely be a remnant of the habitation of the Midianites there. The identification of Midian and Medina may be further substantiated by the name of the Midianite priest, Jethro. The old Arabian name of Medina is Yathrib.

But even here the Israelites did not pause, but continued on their way south. They were strangers in this land and they begged the Midianites to give them a guide for the way through the desert. “We went through all that great and terrible wilderness,” they said at the end of the way.

Would the so-called Sinai Peninsula be called “that great and terrible wilderness” in face of the Arabian desert, fifty times as great? Did the Israelite tribes really tramp one decade after another in the narrow and short strip that runs from the south shore of the Dead Sea to the Aqaba Gulf? The desert of the forty-year wandering was not the Sinai Peninsula, but a much larger area. The inclination of the historians is generally to deny the ancients long itineraries. Midian being the Medina of Moslem times, actually deep in the Arabian Peninsula, all indications in the Old Testament are for a deep penetration of the Arabian Peninsula by the wandering Israelites who escaped the land of Egypt, destroyed by the catastrophe in the mid-fifteenth century before the present era.

A wandering of nomads with their animals in years of drought would encompass large areas. Overcome by the Amalekites of southern Canaan and driven to the Red Sea, they would scarcely remain in the same region. Their path led them to the south.

MECCA

Ka’aba, the holy spot in Mecca, was a sanctuary long before the time of Mohammed. The Ka’aba has the form of a cube or chamber, and the name is interpreted as meaning “a cube.” In the immediate vicinity of this small structure—inside the walls that encircle an open-to-the-sky court—a spring enclosed in a deep well provides the faithful with health-restoring water; once it was a well of oracular decision and it is certain that the spring was held in reverence at a very early period and that the fount

determined the building of the sanctuary and the foundation of the city. It is called the well of Zam-Zam.

Zam-Zam is explained to mean in Arabic “to drink with small gulps,” or also “water in abundance.” But it may be a reminiscence of the former prehistoric dwellers in Arabia. Concerning the eastern boundaries of the land of Ammon, lost in the sand of the desert, which the tribes approached at the end of their wandering, it is said (Deut. 2:20): “Giants dwelt therein in old time; and the Ammonites call them Zam-Zum (im).”

The Israelite tribes apparently visited the plains and hills where the generation of the Zamzum lived and died away in a gray antiquity. Most probably the Israelite tribes, roaming about in a thirsty land with their little ones and with their flocks, were attracted to every well yielding drink.

Let us proceed with the annals of *Kitab-alaghaniy*, which I cited up to the point when the Amalekites, driven out of Mecca by ants and drought and famine, migrated and moved toward the clouds on the horizon and came to their native land of Marib, where a flood overcame them. When they left Mecca a tribe called the Djorhomites entered the place and took care of the sanctuary neglected by the Amalekites. But they also were mindless of the holy duties imposed on them and, as they did not listen to the admonitions of their king, they were visited by warning signs; a sudden torrent of rainy flood ruined the Ka'aba. A number of years passed and the Amalekites were not heard of. The *Kitab-alaghaniy* continues:

Meanwhile arrived the tribes, brought in a disorderly retreat by the rupture of the dam of Marib; with them was the prophetess Tarickah [Zaripha] who had announced to them the disaster, and at their head Mozaikiya, the same as Amr, son of Amir, son of Thalabah. . . . On reaching the gates of Mecca, the tribes stopped, and Amr [Mozaikiya] their leader, sent to the inhabitants his son Thalabah, who spoke to them in the name of the emigrant tribes: “Departed from our native land and going in search of another, we have not found a land the inhabitants of which will agree to restrict themselves a little as to let us have a place and to grant us hospitality until our explorers will return; for we have sent on errand some of our men to explore a territory proper for our establishing ourselves on it.

“Will you cede to us a small space of your lands and allow us to remain there for a while to rest until we shall learn from our scouts whether we must go to the north or to the east? As soon as we shall learn on what site we have more chances for relief, we shall direct ourselves without delay from this place. We do hope that our sojourn with you will be very short.”

The tribe of Djorhom refused:

“No, in God’s name, we shall not put ourselves aside, we and our cattle, for having the pleasure of receiving you. Go along wherever you like to go; we have nothing to do with you.”

Mozaikiya, informed of this answer, sent them a second message worded thus:

“It is absolutely necessary that I spend at your place a whole year awaiting the answer of the messengers that I sent to explore the north and the east. If you let me take hold here and if you will receive me with good will, I will be in accord with you and we shall divide the use of the pastures and of the water; but if you will refuse this adjustment, I will establish myself with you despite you. And then, when you will send your herds to graze on the grassland, you will find only what remains after our animals; and if you will like to drink at the well it will be measured for you by a vessel. If you will attempt to repel me by force, I will battle against you, and if I shall be the victor, I shall take your wives and kill your men; and these that may escape I shall forbid the approach to the sacred territory.”

These passages resemble another passage, in Numbers 20:14f. There is a similarity of situation, but not identity of events.

And Moses sent messengers from Kadesh unto the king of Edom,
“Thus saith thy brother Israel, Thou knowest all the travail that hath befallen us . . . we have dwelt in Egypt a long time. The Lord . . . brought us forth out of Egypt: and behold, we are in Kadesh, a city in the uttermost of thy border. Let us pass, I pray thee, through thy country: we will not pass through the fields, or through the vineyards, neither will we drink of the water of the wells: we will go by the king’s high way, we will not turn to the right hand nor to the left, until we have passed thy borders.”

And Edom said unto him, “Thou shalt not pass by me, lest I come out against thee with the sword.”

And the children of Israel said unto him, “We will go by the high way: and if I and my cattle drink of thy water, then I will pay for it . . .”

And he said, “Thou shalt not go through.” And Edom came out against him with much people and with a strong hand.

Thus Edom refused to give Israel passage through his border.

The Hebrew record cites similar approaches to Moab and Ammon, also refused.

Of these two accounts, the Hebrew record relates to an episode near the end of the wandering of the tribes in the desert; the Arabian record relates to a moment during the wandering of some tribes and before the land of settlement was explored by men sent on this errand. In one case the negotiation is about a temporary stay, and in the other case about passage. And still the correspondences are conspicuous, as they repeat the plight of the Israelites in the desert and their way of dealing with the tribes through whose land they had to pass.

Upon a cursory reading of the Arabian recollections it seems as if the tribes were looking for land for themselves towards the north or the east. It is true that mention is made of some men of the tribes sent to the north and east to look for a temporary settlement; but it is also recounted about another land of which an explorers' report is awaited.

The spies were sent from the desert of Pharan (Numbers 13:3). The desert of Pharan according to the old Arabian sources, neglected by Biblical research, is in the mountainous area of Hedjaz.⁽¹⁷⁾ The spies returned to Pharan into Kadesh and brought their report (Numbers 13:26).

The name Kadesh was given to many different places. Jerusalem was called Kadesh, as was Carchemish on the Orontes; there was a Kadesh in Galilee, Kadesh Naphtali, mentioned a few times in the Scriptures. The word means "sanctuary" and every venerated place was called Kadesh.

Difficulties were laid before the exegetes concerning the locality called Kadesh, a station on the wandering of the Israelites. Kadesh was at the beginning of the march, Kadesh was at its end: "And the space in which we came from Kadesh-barnea, until we were come over the brook Zered, was thirty and eight years." (Deut. 2:14). Accordingly it was surmised that for 38 out of the 40 years of the wandering the tribes were settled in Kadesh. The reason for the long stay of the Israelites at Kadesh-barnea was in the existence there of sources of water, while in the desert most of the rare sources became bitter. At Mecca there are sources of water, considered sacred and many legends are preserved about them. These water springs, not destroyed in the catastrophe, were the main incentive for the Israelites to congregate there.

May it be that these were two different holy spots, both called Kadesh? In one place in the Bible Kadesh is said to be situated in the wilderness of Pharan, and another time in the wilderness of Zin. Sometimes Kadesh is called by a fuller name, Kadesh-barnea. This designation is not consistently applied.

The place in the desert is called in the Scriptures "a city" (). This caused surprise. Usually the place is looked for in the northern part of the Sinai desert, and since Kadesh-barnea has been located in , about 18 miles south of el-Arish on the Mediterranean coast. This place never played any important role in the subsequent history of the nation. If this or another place located inside the borders of the future

Jewish Kingdom had been the scene of many events during the wandering in the desert, would it not have been venerated in later centuries? The place where the tabernacle stood, where the judgment court was established, where Miriam died and was buried, should have been marked if only by the slightest sign of national veneration, if at any time in history it was at the borders of Jewish land. But it was never in its boundaries.

In 1964, more than a score of years after I came to this conclusion, Bar Droma, the author of *Negeb*, independently brought arguments to show that Kadesh-barnea was Medain-Salib, formerly El-Hejr, about 450 km southeast of Petra.⁽¹⁸⁾ As explained above, I identify Kadesh-barnea with Mecca.

The Hebrews wandered in the great desert, and not in the small one. Their way from Horma was at first southeastward. Correspondingly their camps moved: the eastern camp was the first, followed by the southern camp, and then the other two (). The southern camp was called “one that is turned to Yemen.” This description appears more proper for a camp which is in the Arabian peninsula rather than the Sinaitic triangle.

In the Arabian record we read that the tribes under Mozaikiya succeeded to enter Mecca and occupy it. The Djorhomites sent an army against Mozaikiya. The ensuing battle lasted for three days; both sides were courageous. It ended with the Djorhomites being put to a disorderly retreat, only a few of them escaping death.

Another author, al-Masudi, wrote that the Djorhomites had been expelled earlier by the children of Ismael:

The Lord sent against the Djorhomites swift clouds, ants, and other signs of his rage, and many of them perished. The children of Ismael, when grown in number, expelled the Djorhomites from Mecca. These established themselves near the land of Djohainah, where an sudden torrent drowned all of them in a single night. The theater of this catastrophe is known under the name Idam (Fury). Omeyah of the tribe Takif made an allusion to this event in a the following verse: “In the time of yore the Djorhomites took the ground at Tehamah and a furious current swept all of them away.”⁽¹⁹⁾

That an earthquake was the cause of the havoc is to be inferred from the already quoted passage of Masudi:

From el-Hadjoun up to Safa⁽²⁰⁾ all became desert; in Mecca the nights are silent, no voice of pleasant talks. We dwelt there, but in a most resounding night and in the most terrible of devastations we were destroyed.

Loud sounds often accompany an earthquake. Din and roaring became linguistic substitutes for the phenomenon itself. Mecca was abandoned by the Amalekites when, shortly before its occupation by the Israelites, it was shattered by earthquakes. This was the same catastrophe that ruined the Middle Kingdom of Egypt. The Amalekites moved toward Palestine and Egypt, and soon built their fortress-capital Avaris at el-Arish. The Israelites, who were unable to break through to Palestine from the south, reached the former capital of the Amalekites.

After occupying Mecca the conquerors allowed the Ismaelite tribes, which had not participated in the battle against them, to visit the sanctuary.

THE PROMISED LAND

The tribes under Mozaikiya did not remain in Mecca. According to Masudi, after a number of years

They continued on their way and came to camp between the land of the Aharites and Akk, near a pool named Gassan, between two valleys called Zebid and Rima, and they drank the water of the pool.

In the book of Deuteronomy it is said (2:1,3): “We compassed Mount Seir many days . . . And the Lord spake . . . turn you northward.” They reached the border of Edom and Moab (Deuteronomy 2:10-13):

The Emim dwelt therein in times past . . . which also were accounted giants, as the Anakim; but the Moabites call them Emim. The Horim also dwelt in Seir before time; but the children of Esau succeeded them . . . And we went over the brook Zerid.

According to the book of Numbers (21:12-17):

From thence they removed [i.e., from the wilderness which is before Moab, toward the sunrising], and pitched in the valley of Zared. From thence they removed and pitched on the other side of Arnon . . . and at the stream of the brooks that goeth down to the dwelling of Ar, and lieth upon the border of Moab. And from thence to Beer [pool]: that is, the well whereof the Lord spake unto Moses, Gather the people together, and I will give them water. Then Israel sang this song, Spring up, O well; sing ye unto it . . .

Then follows the song rewritten by the redactor of Numbers from “The book of the wars of the Lord” (Numbers 21:14). The pool where the migrants camped and drank and exalted themselves in praise seems to be the same pool as that mentioned by

Masudi. The Aharites and the Horites are quite surely the same. Akk would stand for Anak. The valley of Zebid accordingly would be named in the Hebrew sources the valley of Zered.

Let me finish the story of al-Masudi:

They halted in that land and established their domicile in the plain, on the heights, and at all the neighboring places. This mountainous area borders upon Syria, and divides it from Hedjaz, keeping close to the territory of Damascus, the province of Jordan and Palestine, and comes to an end at the mountain of Moses. The place designated here is that part of the Promised Land that was conquered in the days of Moses, according to the Scriptures.

The author of the tenth century of our era, bringing down the record he received in his time from old sources, did not suspect any affinity of this story with the story of Moses. Therefore he designated the Mount of Moses as the border in the conquest of the tribes under Mozaikiya, tribes which escaped from a deluge and came into the depth of the great desert, and departed from there into the land between Damascus and Mount Nebo.

The Arabian tradition tells that some parts of these tribes when in the desert departed from the main stock. A similar story is preserved in the Aggada. Until recently Hebrew sects were living in the desert among the Arabs.

Is the old Arabian tradition, handed down by the Islamic historians, an authentic story of the wandering of Israel in the desert? The material is dealt with quite differently in this pre-Islamic tradition from the way the Biblical legends are repeated in the Koran. So possibly, Moses and his tribes enjoy a double existence in the Arabic tradition.

One of these two stories knows but the segment of time from the flood at Marib up to the conquest of Transjordan. In both traditions the events are ascribed to a time separated from the epoch of the patriarchs by a few generations. In both accounts destructions occurred, plagues came in abundance, water sources vanished, and an earthquake destroyed human dwellings at night. Both ages were times of the migrations of tribes. In both accounts, due to famine and drought, the migrants followed clouds through the desert. A sudden flood—in which many troops perished, having been brought to migration by former plagues—happened in both sequences of events. The places of the last occurrence were at Idam, at Tehama in one account, and at Edom and Pi-Tehom in the other. In both cases some tribes escaped with their lives from the flood. These tribes were under the leadership of a ruler, his divine brother and sister (or a wife), all of them prophetically gifted. Their names and the name of their father are not dissimilar in the two accounts. They migrated with their treasures and cattle; they sent spies to explore a land for their settlement; in peculiar expressions they asked local rulers permission for a temporary stay; they were ready to do battle in case they were refused; they had a temporary abode in some venerated

places. They did not remain there but after a stay for a year or more departed. According to the Arabian story they marched through the land of the Ahorites and Akk and “came to a well” situated “between two valleys” and “drank water of it.” The same information is given in the Hebrew story, except that the places are called “land of the Horites” and “Anak.” They conquered the land of the Jordan from Damascus to mount Nebo.

Are these two different renderings about different tribes that had similar experiences? Or two different stories of the same tribes and the same events?

Both took place at the time when the Amalekites (called by name in both accounts) left their paternal home and came to roam about. And, from what is said in the Scriptures about the desert (“all that great and terrible wilderness”); and from the description of the way (along the Red Sea, around Mount Seir) and of the plain of their encampment; and because of the political stimuli to depart from the place of defeat; and because of the necessity of going through vast spaces away from the arid quarters—it may be concluded: the desert of wandering was the immense plateau of Arabia.

The pre-Islamic traditions of the wandering of the Tribes in the Wilderness, having been written down much later than the Hebrew text, cannot claim to be the better or more correct version; but they may cast light on many issues.

18. *Palestine Exploration Quarterly*, July-December 1964. [In Deuteronomy (1:2) it is said that the distance between Mount Horeb and Kadesh-barnea, by way of Mount Seir, is eleven days. In antiquity a day of march was a unit of distance very close to 40 km. This would mean that Kadesh-barnea was not more than about 440 km from Mount Horeb. Assuming Mount Horeb to be located somewhere in the Sinai peninsula, the distance from there to Mecca is between 800 and 900 km. Possibly the biblical figure of eleven days of march should be understood as *days and nights* of march, in which case the distance would be ca. 880 km.]
19. Masudi, *Murudij al-Dhabab* III, chap. XXXIX. Tehamah is the stretch of land along the Arabian coast of the Red Sea. The Aggada calls Pi ha-Khiroth by the name Pi-Tehom. The first means “abyss” ; the second “entrance to the abyss.” Idam may recall Edom on the borders of which the catastrophe of the Sea of Passage took place.
20. Safa may recall the name Yam Suf (Sea of the Torrent). Also in this version we read about clouds, various plagues, and a sudden flood.

Beyond the Mountains of Darkness

This short discourse is not a part of the chronological problem discussed in the work of reconstruction of ancient history; it deals with historical geography—the whereabouts of the places of exile of the Ten Tribes of Israel.

The sentence (II Kings 17:6) which relates how the King of Assyria took Samaria and carried Israel away into Assyria and “placed them in Halah and in Habor by the river Gozan, and in the cities of the Medes,” caused much deliberation among the historians. The mystery of the Ten Lost Tribes produced also fantastic convictions such as the belief that the Britons are the descendants of the Lost Tribes who, after much wandering, reached Albion.

The sentence in II Kings 17:6 is repeated almost verbatim in 18:11. In I Chronicles 5:26, the exile of the Transjordan tribes—Reuben, Gad and the half-tribe Manasseh—to Halah, and Habor and Hara, and to the river Gozan is ascribed to “Pul king of Assyria” and to “Tilgath-pileser king of Assyria.” Modern scholars consider Pul and Tiglath-pileser to be one and the same king, Pul having been his name in Babylonia.⁽¹⁾

It is generally agreed that the location of Halah (in Hebrew with two letters *kheth*, transcribed as h in scholarly texts), or Khalakh, is not given to identification.⁽²⁾ As to Gozan, the texts of II Kings 17:6 and 18:11 speak of Habor by the river Gozan; also I Chronicles 5:26 speaks of the river Gozan. In Isaiah 37:12 it can be understood as a region or a people of a region. The correct translation of the two passages in the Second Book of Kings is “to the confluence (*habor*)⁽³⁾ of the river Gozan.”

Biblical scholars who sought for the place of exile of, first, the two and a half tribes of Israel by Tiglath-Pileser and then of all the tribes of Israel by Sargon upon the fall of Samaria, decided that the river’s name was Habor and Gozan was the region. They have therefore identified Gozan with Guzana, modern Tell Halaf in northeastern Syria. But this interpretation is a violation of the texts. Looking for a river Habor, they thought to identify it with the tributary of the river Euphrates mentioned in Ezekiel I:3 “the word of the Lord came . . . unto Ezekiel . . . in the land of the Chaldeans by the river Chebar.” However the spellings in Hebrew of Habor and Chebar are different, the river Khvor (Chebar) is not Habor, and the latter is not a river at all. Furthermore, the co-called river Chebar is actually an irrigation canal.⁽⁴⁾

In explaining why the misfortune of exile befell the population of the Northern Kingdom, the Book of Kings says that the Children of Israel “worshipped all the host

of heaven and served Baal,” and “caused their sons and their daughters to pass through the fire, and used divination and enchantments,” and therefore “the Lord was very angry with Israel, and removed them out of his sight: there was none left but the tribe of Judah only” (II Kings 17:17, 18).

“Removed them out of his sight” seems to signify that the people of Israel were removed far away, out of every contact with the remnant Judah, not even by a chance messenger.

When one hundred and thirty-eight years later, in the beginning of the sixth century, the people of Judah were also led into exile—by Nebuchadnezzar, king of Babylon—they did not find the exiled tribes of Israel in Babylonia, though they dwelt by the river Chebar (Khvor, i.e., Khabur), which flows in the central region of that country.

It appears that the places to which the Ten Tribes were removed by the Assyrian kings must have been far more remote than northeastern Syria.

Assyria, with its capital cities of Nimrud (Calah), Dur Sharrukin (Khorsabad), and Nineveh—all on the Tigris—expanded greatly in the days of its warrior kings Tiglath-Pileser, Sargon, and Sennacherib. Repeatedly, the Assyrian kings led their troops across the Caucasus northward. Not satisfied with the passage along the coastal road of the Caspian Sea, they also explored the mountainous passes. Sargon, the conqueror of Samaria, wrote in his annals:

I opened up mighty mountains, whose passes were difficult and countless, and I spied out their trails.

Over inaccessible paths in steep and terrifying places I crossed . . . [\(5\)](#)

The descriptions of Tiglath-pileser and Sargon of their campaigns in the north lead us to recognize that they passed the mountains of the Caucasus and reached the steppes between the Don and the Volga. When the barrier of the mountains was overcome, they could proceed northward in a scarcely populated area barren of natural defenses, where they would have met less resistance than in the foothills of the mountains. It is unknown how far they may have let their armies of conquest march across the steppes, but probably they did not give the order to return homeward until the army brought its insignia to some really remote point: it could be as far as the place of the confluence of the Kama with the Volga, or even of the Oka, still farther north. The middle flow of the Volga would be the furthestmost region of the Assyrian realm.

The roads to the Russian steppes along the Caspian and Black seas were much more readily passable than the narrow path along the river Terek and the Daryal Canyon that cut the Caucasus and wind at the foot of Mount Kazbek, over sixteen thousand feet high.

The fact that the “confluence of the river Gozan” is considered a sufficient designation suggests that it must have been a great stream.

A large river in the plain behind the crest of the Caucasus is the Don, and a still larger river—the largest in Europe—is the Volga. If the Assyrians did not make a halt on the plain that stretches immediately behind the Caucasus and moved along the great rivers without crossing them to conquer the great plain that lies open behind the narrow span where the rivers Don and Volga converge—then the most probable place of exile might be reckoned to be at the middle Volga. The distance from Dur Sharrukin to this region on the Russian (Scythian) plain is in fact much less than the distance from Nineveh to Thebes in Egypt, a path taken by Assurbanipal several decades later. Under Esarhaddon and Assurbanipal, Assyrian armies repeatedly invaded “Patursi and Kusi” —Upper Egypt and Ethiopia (Sudan). But Assyrian occupation of Scythia is not a mere conjecture: it is confirmed by archaeological evidence. “The earliest objects from Scythia that we can date,” writes a student of the region’s antiquities, “referred to the VIIth and VIth centuries B.C., are under overwhelming Assyrian influence. . .” ⁽⁶⁾

The exiles who were removed from Samaria, a city of palaces and temples, no doubt, bewailed the capital they had heroically defended for three years against the army of what was, in its time, the world’s most powerful nation. Accordingly they might have called their new settlement Samaria (in Hebrew Shemer or Shomron; Sumur in the el-Amarna letters).

On the middle flow of the Volga, a city with the name Samara exists and has existed since grey antiquity. It is situated a short distance downstream from the point where the Volga and the Kama join. Russian conquerors of the ninth century found this city in existence. The medieval Arab geographer Yakubi, basing himself on accounts of the ninth-century traveller Ibn Fadlan, speaks of the Khazars who dwelt in Samara. ⁽⁷⁾

This people dominated southern and eastern Russia possibly as early as the third, ⁽⁸⁾ but especially during the tenth and eleventh centuries. They passed the Caucasus mountains to participate in the wars of the Romans and the Persians, dominated the Ukraine as far as Kiev, concluded treaties with the emperors of Byzantium, and their influence and suzerainty sometimes reached as far west as Sofia. ⁽⁹⁾

The ruling class of the Khazars used Hebrew as its language, and the Hebrew faith was the official religion in the realm of the Khazars. There was a system of great tolerance, unique in the Middle Ages, in respect to other religions; the Supreme Court was composed of two persons of Jewish faith, two Moslems, two Christians, and one idolater of the Russian population; but it was not a confusion of creeds as it had been in old Samaria, which tolerated many creeds, the monotheism of Yahweh being a protesting ingredient of the confusion.

Were the Khazars or their ruling aristocracy converted to Judaism in a later age? This

position was based on what was said in a letter of the Khazar king Joseph, written about the year 961, to the Jewish grandee, Hasdai ibn-Shaprut, at the court of Cordoba. 'Abd-al-Rahman al-Nasir, the Moorish ruler of Spain, had asked the King of the Khazars to provide any available information about his people, Hasdai's brothers in religion. In the letter of reply the Khazar king recited a tradition or a legend; advocates of three religions came to some prior king of the Khazars, and he picked the Jewish faith because the Christian and the Mohammedan alike gave preference to the Jewish religion above that of their respective rival. [\(10\)](#)

The story exposes its mythical character. In the seventh or eighth centuries of the present era, the adepts of the Jewish faith were persecuted by the Christians and also by the Moslems, and would hardly be chosen to become the religion of the state. A similar legend of "choosing" a religion is told about Vladimir of Kiev: in this legend the Khazars were the delegates representing the Jewish faith.

Had the Khazars been converted to Judaism, it would be almost incredible that they would call their city by the name Samara. Samaria was a sinful city from the point of view of the nation that survived in Palestine after the fall of Samaria, and out of which eventually grew the rabbinical Judaism of later centuries.

The conversion to the Jewish religion would also not imply the adoption of the Hebrew language. It is remarkable that the state language of the Khazars was Hebrew; the king of the Khazars was quite capable of reading and answering a Hebrew letter.

Long before the correspondence between Joseph and Hasdai of the tenth century, the Khazar monarchs had Hebrew names. The dynasts previous to king Joseph were in the ascending order: Aaron, Benjamin, Menahem, Nisi, Manasseh II, Isaac, Hannukah, Manasseh, Hezekiah, and Obadiah. A conversion to Judaism in the seventh or eighth century of the present era would bring with it names common to Hebrews in the early Middle Ages, like Saadia or Nachman; the Judaism of the early Christian age was rich in names like Hillel, Gamliel, while Hellenistic names like Alexander, or Aristobul were not infrequent. Again, the Biblical names of an early period would give prominence to names like Joab, Gideon, or Iftach, and still an older group of names would be Gad, Issahar, Zwulun or Benjamin.

It is peculiar that some of the king of the Khazars were called by the names used in Israel at the time that Samaria was captured by the Assyrians. Hezekiah is said to have been the king of Jerusalem at that time (II Kings 18:10), and the name of his son and successor was Manasseh. Obadiah was one of the most common names at that time and in the preceding century. It seems not arbitrary to assume that the Khazars absorbed, or even originally were, the remnants of some of the tribes of Israel.

It is most probable that the religious reform among the Khazars, about which some tradition was preserved until the tenth century, is to be interpreted as an act of

purification of the half-pagan religion that the exiles from Samaria brought into and developed in their new abodes on the Volga, and as an act of return to the old Hebrew religion of Yahweh. This might have been performed with the help of some Hebrews who perchance left the schools of Sura and Pumbedita, where the Babylonian Talmud was composed. Old Jewish authors⁽¹¹⁾ actually mention the fact that teachers of rabbinical Judaism were invited to the kingdom of the Khazars as early as the eighth century. Possibly, the name “Khazars,” despite a difference in writing, is to be interpreted as “Those Who Return.” A long, probably illiterate period, when Hebrew was used only in speech, may have preceded the period of revival of learning and purification of faith.

I would like to express here the belief that excavation in or around Samara on the Volga may disclose Hebrew signs of the eighth and seventh centuries before the present era. Other sites of old settlements on the Volga, too, may disclose remnants of old Hebrew culture.

The Hebrew (most probably also Assyrian) name for the Volga, Gozan, seems to have survived in the name Kazan. The city Kazan is located to the north of Samara, a very short distance beyond the place of confluence of the Volga and the Kama, two equally large streams. A tributary by the name Kazanka, or “small Kazan,” flows there into the Volga.

In the days of the Khazar realm, the river Volga was called not by its Assyrian, nor by its present name, but by the name Etel (the name is given also as Itil or Atil). This name appears to derive from a Semitic root; it is also used by the medieval Arab geographers.

Many place names in southern Russia seem to be of Hebrew derivation. The name of the river Don may go back to the name of the Israelite temple-city Dan. The Caspian Sea is best explained as “The Silver Sea” from the Hebrew *caspi* (of silver). Rostov means “The Good Harbor” in Hebrew. Orel, read in Hebrew, would mean “uncircumcised” ; Saratov may mean “to make an incision.”⁽¹²⁾ With our identification of Gozan—one of the places of exile of the Ten Tribes—as the Volga, we may now investigate the question, what place is Khalakh, the other place of exile mentioned in II Kings 17:6? This place name is generally regarded as unidentifiable.

The eastern coast of the Black Sea was the goal of the Argonaut expedition in its search for the Golden Fleece. This expedition, engineered by Jason, was undertaken on the boat Argo. The land on the eastern coast of the Black Sea was called Colchis in ancient times, and the region is still known by this name. In Russian literature it is called Kolkhida.

I consider western Georgia—to which Colchis belongs, to be the Biblical Khalakh. Those of the expatriates of Samaria whose destination was Khalakh arrived there some decades after the Argonaut expedition, which was regarded by the later Greeks

as an historical event and chronologically placed two or three generations before the Trojan War.⁽¹³⁾

In the mountainous region of western Georgia, adjacent to the Colchian coast, live the so-called Georgian, or Mountain Jews. They claim to be of the Ten Tribes of Israel, their ancestors having been exiled there upon the destruction of the kingdom of Israel by the Assyrians. Ben Zvi (the second president of the modern state of Israel) tells of these people and their claims.⁽¹⁴⁾ He writes that “there is no reason to doubt the existence of a continuous Jewish settlement in both the north and south of Caucasia, whose roots were laid in very ancient times, perhaps as early as the days of the Second Temple, perhaps even earlier.” Yet he does not express any suspicion that Khalakh may have been Colchis.

The third place of exile of the Ten Tribes according to the Book of Kings were the “cities of the Medes.” Is it possible to locate also this last destination? The Medes first appear in Assyrian annals in the time of Shalmaneser III: it was in his days that they started to penetrate across the mountains of Iran to infringe on the boundaries of the Assyrian kingdom. They appear once again in the annals of Sargon II, who claims to have repelled “the distant Medes on the edge of the Bikni mountain.”⁽¹⁵⁾ Some scholars maintain that the homeland of the Medes before their occupation of the Iranian plateau in the seventh and sixth centuries was in Turan, that is, West Turkestan. Sargon’s reference to “distant Medes” would then designate their homeland in Turan.

In this context it is interesting to note that the Jews of Bukhara, the great trading city and metropolis of West Turkestan, (Turan) claim direct descent from the Ten Tribes.⁽¹⁶⁾ Some writers are even prepared to admit the possible veracity of this claim,⁽¹⁷⁾ though no one so far seems to have attempted to place the “cities of the Medes” in this region. While the greater part of the Jewish community of Bukhara may well be descended from migrants from the time of the Babylonian Exile or the Diaspora of Roman times or even later, it is not excluded that the oldest group among them are remnants of those tribes dispatched by Sargon to the “cities of the Medes.”

Introduction

A student of Greek lore on the one hand and on the other of the Old Testament and of rabbinical books and their description of the calamities that first visited Egypt, but later also the tribes of Israel for their iniquities, cannot but see the great difference in the attitude of the gods of the Greek pantheon that cause disturbances on Earth, but omit to connect them with any moral imperatives. Mount Sinai and Mount Olympus are two different, almost opposite symbolic structures.

Notes and Themes

Malki-Zedek

The name of the High Priest of Jerusalem in the days of the Patriarch Abraham indicates that Jupiter's (in Hebrew "Zedek") was the cult of that city. Malki-Zedek means "Jupiter is my lord (king)". The story of a ram in the scene of the purported sacrifice of Isaac, points also to Jupiter, ram being the animal representing that planet. Malki-Zedek, the High Priest of the Highest, plays an important role in Christian catechism.

The time of the Middle Bronze I and II was the age of Jovian dominion; and probably also the Early Bronze.

Siwa-Shiva

The oracle of Zeus-Ammon was the oracle of Jupiter (Herodotus IV.181). The name "Siwa Oasis" must have been attached to the oasis by the Macedonians, like Ptolemy I, returning from the invasion of India, Shiva or Siva being the name of Amon there. The salts of ammonia in the neighborhood of the Siwa Oasis resulted from an electrical discharge. The oracle was established in memory of the event and in honor of the deity. Jupiter has ammonia in the atmosphere. Is it not strange that ammonia was found in the neighborhood of the oasis of Amon-Zeus?

Zeus-Amon

Zeus of the Greeks, Jupiter of the Romans, Mazda of the Iranians, Amon of the Egyptians, Shiva of the Hindus, were all the same planetary god, optimus maximus. The Io, Jahwe coorelation to Io, Jupiter was already made, I assume, so obvious it is.

The Planetary Gods

Hinduism is not one but three relations closely connected. In one, Brahma is the supreme deity, in another Shiva, and in still another Vishnu. The worshippers of Agni and of Shiva were also in conflict. Equally so the worshippers of Mitra in Iran, who were in conflict with the worshippers of Mazda; and in Palestine the worshippers of El (Saturn) were in conflict with the worshippers of Jupiter and of Venus (Astarte); in Babylonia the worshippers of Enlil, of Marduk, of Ishtar, of Nergal.

The Astral Religion of Egypt

When J. Wilson writes (volume to honor Albright) that it is an admission of failure that the chief cultural content of Egyptian civilization—the religion, with its mythology again and again narrated and alluded in texts and pictured in statues and temple reliefs, is not understood—he is right. The astral meaning of Egyptian deities was not realized and the cosmic events their activities represent was not thought of.

Amon was Jupiter—and this we know from classical writers.

Another cult—Isis is Jupiter and Osiris is Saturn. The death of Osiris and its return to life; the birth of

Venus-Horus, the fight of Horus and Seth (the head of the Venus comet and its tail)—all refer to celestial drama played before the peoples of the world—and of Egypt.

Monotheism

In the days of Menashe—understanding that the sun is the supreme planetary body. In the days of Jeremiah, that the Supreme Deity is no planetary body. Is there any opposition to the worship of planetary bodies in the prophets before Jeremiah? Only Abdi-Ashirta sounds like a monotheist in his letters. Yet according to the book of Jeremiah, the Jews of Israel worshipped the planet Venus and brought her cakes till the close of the time of Josiah, the grandson of Menashe.

Many passages in the psalms and in the prophets are monolatrous, not monotheistic. Hillel ben Shazar (Hillel son of the Morning Dawn) in Isaiah, was the planet Venus. Many of the psalms reflect astral religion. The psalms “Hallel” may have been adopted from the “pagan” worship of the Morning Star. The visions of the Lord traversing the sky with rays streaming from his body, as in Habbakuk, are not monotheistic. These passages, and on the other hand, the passages in the books of law that establish a worship of sacrifices to the Supreme Being are not enhancing the sacred value of the Old Testament. To expose these alien motifs may be necessary to ruin the idolatrous Christian church, built on the Old Testament.

Tragic is for ethical relation between man and his God that when the Israelite nation conceived a God not an astral being but a Supreme Creator and ruler of the world, and this in the days of Jeremiah and King Josiah, the destruction of the state was only years away.

Whereas Nebukhadnezzar was a worshipper of astral deities, a monolator, who changed his protective deity several times in his life, Josiah was a monotheist, whose God was abstracted from anything material. To experience the collapse of the state and the destruction of the temple must have been [experienced as] a great letdown of man by his God.

Menashe's Iniquity

In the days of the King Menashe, accused of reverting to idolatry and the worship of celestial bodies, a great advance in the understanding of celestial processes took place, a change comparable to that of the Copernican revolution. It was understood that the Sun is not a body dependent on the will of the planets, especially Jupiter, but that it is the central body.

In cataclysmic events, the disturbance in the motion of the Sun was ascribed to the planet at a close approach, Jupiter, Venus, or Mars, as the case would be. The Sun played a very little role on the Greek Olympus, dominated by Zeus. In global catastrophes, the Sun seemed to be powerless—at the approach of a celestial body (planet or comet) to the Earth, the Sun was disturbed in its motion, and therefore appeared to be subservient to planets of violent temper, like Jupiter. The name of the sun—shamash (Akkadian) or shemesh—the servant—reflects this understanding of the ancients.

In the ninth and eighth and seventh centuries before the present era, the understanding that the Sun may be the most powerful started to penetrate the oriental mind, possibly first in Egypt. To understand its central role was the achievement of the seventh-century astrologers in Judea and also in other countries of the Near East. Menashe, son of Hezekiah, built solar chariots for the temple of Jerusalem, which points toward a Copernican revolution in that period of history.

The realization of the leading position of the Sun, though itself never the cause of a cataclysmic event on earth, was a major step forward. A greater step was made in the next generation, when the Supreme Being was abstracted from planetary or solar body. But the idea of the invincible sun, “sol invictus” continued to live into the Roman times.

Menashe actually returned to the faith of Moses, when he killed Isaiah, opponent of Moses. At that time in Egypt was resurgence of Set's cult. However Menashe called his son Amon.

Isaiah and Moses

The complete absence of references to Moses in Isaiah I leads to the thought that Isaiah was not at all reverent to Moses's memory. The fact mentioned in the Book of Kings that, urged by Isaiah, king Hezekiah destroyed the brazen serpent made by Moses, an object of worship three centuries of a millennium after Moses, strengthens the impression that Isaiah was antagonistic toward Moses and his cult. Also in the rest of the prophets Moses is mentioned very rarely and mostly not at all. Compare with this the references to Moses in the Koran. There is hardly a sura where Moses is not mentioned, and mostly more than once.

Moses-Zarathustra-Quetzalcoatl

In the times following the global cataclysms the survivors banding into groups of migrants looked in their despair for leaders. Such a figure was Moses—for the migrant masses that retreated from Egypt toward Asia. Such a leader was also Quetzalcoatl in Mexico. Zoroaster of the Persians arose in a similar role, possibly, after the same catastrophe. These leaders became lawgivers. However, it is hardly possible that the temple or traveling sacrarium regulations were authored by such leaders in the form the tradition ascribes to them.

Of Moses' monotheism more proofs are needed. The battles in the sky were visualized by all men as contests of the gods; in such times to abstract the religion from the visual planetary gods must have been near impossible. The making of the serpent carried on a pole by Moses and the making of the golden calf by Aharon, appear to be not dissimilar actions. It is remarkable that the prophets of the Israelites hardly ever referred to Moses. It is possible that Ezra, returning from Persia to Palestine, ascribed to Moses many laws and beliefs that were actually of a later date. A prophet of uncompromising monotheism is Jeremiah.

Sukkoth

The holiday of Sukkoth with building of sukka and palm branches was instituted in the days of Ezra; in his book it is said that it was not observed this way since the days of Joshua, son of Nun. It must have been a Persian custom and I saw a reference to a Persian festival when palm leaves were a part of the ceremonial.

Four Span in the Sky

The vision in the sky in the days of Joshua was that of a chariot with a driver and a span of four horses. The four horses idea repeats itself in apocalyptic literature, but also in Olympic charioteering and can be traced in ancient folklore and usage, with its mythic undertone.

Maccabees' revolt, Hannukkah

The revolt of the Hashmanaim (better known by the name of one of his sons Judah Maccabi) coincides with the conquest of Greece by Rome ca -160. It appears that the Romans fomented the revolt in the Hellenized provinces at the time of their conquest of Greece. The introduction of Hannukkah feast seems to be an adaptation of the Roman Saturnalia, and the way of praying with covered head, a taking over of the Roman usus, while the Greek usus was to pray with uncovered head. Some hundred years later, with Pompey, the Romans wished to terminate the alliance, making Judea into a province.

Hannukkah was introduced to the memory of Saturn and the Deluge, by the time Israelites looked for alliance with Rome against Greece and Antiochus dynasty. Christmas, like Hannukkah, are memories of seven days of light that preceded the Deluge when Saturn became a nova.

The seven-branch candlestick was to serve the seven planets. But the "shamash" with a special

position—is to serve the sun. It gives light to all other candles, it has also a special position; and its name indicates that it obtained that position on realization of the role of the sun.

The Ball Play

In Egypt religious observations had a counterpart in Mexico. It probably symbolized the change in the direction of the sun across the firmament.

Illumination of Bel

Compare with “Illumination of Osiris” (hayes 328) Ch. VI of the Book of the Dead.
(Explosion of Saturn: nova)

Shaddai

Shaddai may mean “breasts,” or the heavenly breasts that supplied the wanderers in the desert with nectar and ambrosia. The Lord of the Breasts, the God of compassion and motherly love for mankind, received this appellative. For the Indians (Hindu) it was a holy heavenly cow.

Ashera

The worship of Ashera or a tree goes back to the time when the world was covered by an envelope of clouds that let food fall on the ground. The idea of a tree covering the entire earth was born in the experiences of that period when only from the heaven came food and nothing grew on the ground.

Circumcision

Behind the story of Saturn swallowing his children there must be a factual story of satellites absorbed by the body of the giant planet.

Behind the story of Saturn emasculating his father Uranus there might have been a scene in the sky. The similar story of Jupiter emasculating his father Saturn may be “transfer” or borrowing, but may be a reflection in mythology of similar events.

Circumcision might have originated as an emulation (but *pars pro toto*) of the acts displayed in the sky—of Uranus being emasculated by Saturn, or Saturn by Jupiter. Having been “commanded” in the days of the patriarch Abraham, it may reflect the latter event. Circumcision has a hygienic value; it could have been found out and sanctified by the astral events.

Christianity

The Christian religion and its mysteries originated in Osirian death and resurrection, and also in the flood of fire caused by the Morning Star.

The first century’s world expected a repetition of cataclysmic events and the end of the world—Sibylline literature, the Apocrypha and other such books, the Gospels and the book of Revelation.

It is possible that the upsurge of such fear was motivated by the fact that between the 15th century catastrophes of the days of the Exodus and of the time of Joshua (Phaethon’s story) and the catastrophes caused by the close approaches of Mars to the Earth in the last act of the theomachy, ca. 700 years passed. After another span of 700 years the fear was intensified.

The Christian religion appealed partly because it could in visual demonstration—painting and sculpture—respond to so many instincts in man and woman—

- adoration of a newborn child
- young mother and child

- a wonder healer
- a young dead
- a mother dolorosa

but also the bi-sexual nature of Jesus (with hair of a woman and beard of a man), whatever was his appearance in life, and especially the masochistic-sadistic tendencies and expressions and experiences of his story, found an echo in many a soul.

A Hebrew Cosmogony

This world came into existence out of a chaos of fluid driven by a divine blast: This is the epic beginning of the Book of Genesis.

The earth was chaotic and void; and darkness was upon the face of the deep; and God's wind moved upon the face of the fluid.

From this primeval matter, in a process of subsequent creations, was born the home of the living.

Already before the birth of our earth, worlds were shaped and brought into existence, only to be destroyed in the course of time.

Nor is this world, inhabited by man, the first earth created by God. He made several earths before ours, but he destroyed them. But even this land would have no permanence if God had executed his original plan of ruling it according to the principle of strict justice. It was only when He saw that justice by itself would undermine the world that He associated mercy with justice, and made them to rule jointly.

This earth, too, was not created from the beginning to satisfy the Divine plan. It underwent re-shaping: Six consecutive remouldings; the primeval creation did not delight the Creator; destruction was called upon the ungainly world of flesh and when it did not ameliorate, another destruction was sent to chastise it and still another.

Six times this earth was rebuilt - without entire extirpation of life upon it, but with major catastrophes New conditions were created after each of these catastrophes; new chances were given to men to improve their inclinations, evil from the beginning.

This is the seventh creation, the time in which we live.

*Several heavens were created, seven in fact.
Seven earths were created: the most removed
the seventh Erez,
the sixth Adamah,
the fifth Arka,
the fourth Harabah,
the third Yabbashah,
the second Tebel,*

and our own land called Heled, and like the others, it is separated [from the foregoing] by abyss, chaos, and waters.

The description permits an interpretation that all the seven heavens and earths exist simultaneously; but a deeper insight will allow us to recognize that the original idea did not admit seven concurrent and separate firmaments and worlds in space but only consecutive in time, and built one out of another:

The seven heavens form a unity, the seven kinds of earth form a unity, and the heavens and the earth together also form a unity.

The separation of one world from another by abyss and chaos primarily means, it seems, the fiery nearness to the precipice and primeval matter which it encountered and into which it could be—by only a hairbreadth—reduced forever.

The heavens and the earth were changed at every catastrophe. This idea is concealed in the legend of the wandering of Man (Adam).

When Adam was cast out of Paradise, he first reached the lowest of the seven earths, the Erez, which is dark, without a ray of light, and utterly void. Adam was terrified, particularly by the flames of the ever-turning sword.

After he had done penance. God led him to the second earth, the Adamah, where is light reflected from its own sky.

After the murder of Abel, Cain was sent back to the Erez. Accepting his penitence, God permitted him to ascend to the third earth, the Arka, which receives some light from the sun.

In the Ge, the fourth earth, live the generation of the tower of Babel and their descendants - it is not far from Gehenna, close to the flaming fire.

The inhabitants of the Ge are skilful in all arts, and accomplished in all sciences, and their abode overflows with wealth.

When an inhabitant of our earth visits them, they give him the most precious thing in their possession, but then they lead him to the Neshiah, the fifth earth, where he becomes oblivious of his origin and his home.

The inhabitants of Neshiah have no memory [Neshiah = forgetting].

The fourth and fifth earths are like the Arka; they have trees, but neither wheat nor any other of the seven species.

The sixth earth, the Ziah, is inhabited by handsome men, who are the owners of abundant wealth, and live in palatial residences, but they lack water, as the name of their territory, Ziah, 'drought' indicates. They hasten to any waterspring that is discovered. They are men of steadfast faith, more than any other class of mankind.

Adam passed all these earths, and came to the Tebel, the seventh earth,

the earth inhabited by men.

In the myth of Man (Adam) travelling through all the seven earths is a transparent allegory of the physical and human history of the earth. It is even provided with a suggestion which makes it possible to recognize the periods.

The generation which built the Tower of Babel inhabited the fourth earth; but it goes over to the fifth earth, where the men became oblivious of their origin and their home: those who built the Tower of Babel after the catastrophe are told to forget their language.

In accordance with this scheme the catastrophe which destroyed Babel and dispersed the nations was the fourth one. How are the three previous ones pictured or symbolized?

The first catastrophe was symbolized by the expulsion of Man from the blessed land of Eden. It was not a single human pair; the tradition ascribes to Adam the invention of seventy languages.

Hebrew mythology ascribes to the period preceding Adam's expulsion different physical and biological conditions.

The sun was shining permanently on the earth and the Garden of Eden, placed in the East, it must be conceived, was under the permanent rays of the dawn. The earth was not watered by rain, but mist was ascending from the earth and falling as dew upon the leaves.

The plants looked only to the earth for nourishment.

Man was of exceedingly great stature.

The dimensions of Man's body were gigantic.

His appearance was unlike that of the later men.

The body was overlaid with a horny skin.

But Man did not keep the precepts of his Creator and a day came, and

The sun had grown dark the instant Adam became guilty of disobedience.

The flames of the ever-turning sword terrified Adam. In another legend it is told that celestial light shone a little while in the darkness. And then

The celestial light ceased, to the consternation of Adam, who feared that the serpent would attack him in the dark.

The illumination of the first period never returned.

Anticipating the wickedness of the sinful generations of the deluge and the Tower of Babel, who were unworthy to enjoy the blessing of such light. God concealed it, but in the world to come it will appear to the pious in all its pristine glory.

The sky that Man saw never appeared before him again.

The firmament is not the same as the heavens of the first day.

The moon was bigger before, and suddenly grew smaller,

“because he spake ill of the sun.” “As a punishment thou mayest keep but one sixtieth of thy light.”

The moon, says the Aggada, was envious and desired to be brighter than the sun. According to another legend:

The moon alone laughed when all the celestial beings were grieved by the transgressions of Adam, wherefore God obscured her light. Instead of shining steadily she must be born and reborn again and again.

The earth, too, had to suffer punishment.

Independent before, she was hereafter to wait to be watered by the rain from above. She must produce all sorts of noxious vermin; thenceforth she was to be divided into valleys and mountains; she must grow barren trees, bearing no fruit; thorns and thistles sprout from her; much is sown in the earth, but little is harvested.

Man (Adam) shrank in size.

A vast difference between his later and his former state—between his supernatural size then and his shrunken size now.

The punishment of Adam was manifold:

The food he ate was to be turned from good into bad; his children were to wander from land to land; his body was to exude sweat,

and he lost his horny skin.

It was but since the fall of Man, according to the Aggada, that the sun set for the first time.

The first time Adam witnessed the sinking of the sun he was seized with anxious fears. All the night he spent in tears. When day began to dawn, he understood that what he had deplored was but the course of nature.

It was also since the same time that the days began to grow shorter and again longer. And this is told in the following story:

Cast out of the Garden of Eden, Adam and Eve sat in great distress, mourning and lamenting.

Adam noticed that the days were growing shorter and feared lest the world be darkened on account of his sin, and go under soon.

But after the winter solstice, when he saw that the days grew longer again, he spent eight days in rejoicing.

The narrator adds: "This is why the heathens celebrate the calends and the saturnalia in honor of their gods, though Adam had consecrated those days to the honor of God."

The myth presents the foe of Man in the form of a fallen angel, Satan, who was dismissed from the heavenly host, and whose representative on earth, and the cause of the disgrace, was the serpent.

The serpent had previously another appearance.

Before the fall of Man it stood upright, had feet, and was of extraordinary size.

The mouth of the serpent was closed, his hands and feet were hacked off. "Because thou becomest the vessel of the Evil one: Upon thy breast and thy belly shall thou go, and of thy hands and thy feet thou shalt be deprived, Thou shalt not remain in possession of thy ears, nor of thy wings."

Not only the dragon and Man, whom he had brought into distress altered their ways, but the whole of nature as well. Thistles and thorns were generated by the soil. The variety of species diminished. The change was brought about partly in connection with the sin of Cain.

Earth quaked under Cain. The ground changed and deteriorated at the very moment of Abel's violent death.

The trees and the plants in the part of the earth whereon the victim lived, refused to yield their fruits, and only at the birth of Seth they began to bear again. But never did they resume their former power. While, before, the wine had borne nine hundred and twenty-six different varieties of fruit, it now brought forth but one kind. And so it was with all other species.

The third generation—that of Enosh—was also told to have been visited by disgrace.

God caused the sea to transgress its bounds, and a portion of the earth was flooded. This was the time also when the mountains became rocks, and the dead bodies of man began to decay.

For the sin of idolatry the following generations were no longer in the likeness and image of God: they resembled apes.

Since that time came a greater change in the habits of human beings:

The remnants of men began to trespass against the birds, beasts, reptiles, and fishes, eating their flesh and drinking their blood.

It was in the celestial harmony and disharmony that the secrets of the upheavals were conceived to lie; this was known to mankind already in the Adamite age, according to the Aggada.

In Hebrew mystic teachings there is the story of the book of the Angel Raziel.

After Adam's expulsion from the Garden of Eden he prayed to God: "Grant me knowledge and understanding, that I may know what shall befall me, and my posterity, and all the generations that come after me, and what shall befall me on every day and in every month." There appeared to him the angel Raziel, bearing a book in his hand.

"Thy words were heard. I have received the charge to teach thee pure words and deep understanding, to make thee wise through the contents of the sacred book in my hand.

And all thy descendants and all the later generations, if they -will but read this book in purity, with a devout heart and an humble mind, will, too, foreknow what things shall happen, and in what month and on what day or in what night. All will be manifest to them -they will know and understand whether a calamity will come..." At the moment when Adam took the book, a flame of fire shot up and the angel rose heavenward with it.

Adam of the Aggada invented seventy languages, Cain his son built cities and monuments and ruled over kings. They were representatives of generations. It is also said that the measure of the Genesis—"a day"—is meant to be a God's day, or a thousand years. Thus Adam, who lived 930 years, did not live even one day:

“Now, ye know not what manner of day I meant—one of My days of a thousand years, or one of your days.”

The science about the times in which calamity could return and fall on our earth was cultivated among populations that had a vivid remembrance of days of misfortune or of lucky escape.

It is told about the children of Seth, the son of Adam that

they were the inventors of that peculiar sort of wisdom which is concerned with the heavenly bodies and their order. And that their inventions might not be lost before they were sufficiently known, they made two pillars upon Adam’s prediction that the world was to be destroyed at one time by the force of fire and at another time by the violence and quantity of water. The one was of brick, the other of stone, and they inscribed their discoveries on both, that in case the pillar of brick should be destroyed by the flood, the pillar of stone might remain, and exhibit these discoveries to mankind, and also inform them that there was another pillar, of brick, erected by them.

This means that stelae with calendric and astronomical calculations were made public knowledge in the second or third era. According to the Aggada it was the pious Enoch (the seventh generation) who achieved the deepest knowledge of the celestial secret. He was the man who

walked with God: and he was not; for God took him. (Genesis 5:24)

In this ascension to heaven was taken away the man who more than any other knew the plan of the world, and of its creation. He had already visited heaven in his vision

Once before he had been permitted to see all there is on earth and in the heavens. Once, a time when he was sleeping, a great grief came upon his heart and he wept in his dream, not knowing what the grief meant, nor what would happen to him.

Two men, their faces shone like the sun, their wings were brighter than gold, their hands whiter than snow, said to him: “Be of good cheer, be not afraid; the everlasting God hath sent us to thee, and lo! to-day thou shalt ascend with us into heaven. And tell thy sons and thy servants, and let none see thee, till the Lord bring thee back to them.”

He saw all the seven heavens.

He saw the fifteen myriads of angels who go out with the sun and attend him during the day, and the thousand angels who attend him by night.

Each angel has six wings, and they go before the chariot of the sun, while one hundred angels keep the sun warm, and light it up...

They showed him also the six gates in the east by which the sun goes forth, and the six gates where he sets, and also the gates by which the moon goes out, and those by which she enters.

In another variant of the *Book of Enoch* it is said:

I went to the West to the end of the earth. And I saw a burning fire which ran without resting, and paused not from its course day or night, but ran regularly.

And I asked saying: "What is this which rests not?" Then Raguel, one of the holy angels who was with me, answered me and said unto me:

"This course of fire which thou hast seen is the fire in the west which persecutes all the luminaries of heaven." —The Book of Enoch, p. 23

Enoch in his prophetic vision reached the seventh

In the seventh heaven he saw the seven bands of archangels who arrange and study the revolutions of the stars and the changes of the moon and the revolution of the sun, and superintend the good and evil conditions of the world.

After he had received all the instructions from the archangel. God revealed unto him the great secret, which even the angels do not know. He told him how, out of the lowest darkness, the visible and the invisible were created, how he formed heaven, light, water, and earth, and also the fall of Satan and the creation and sin of Adam He narrated to him, and further revealed to him that the duration of the world will be seven thousand years, and the eighth millennium will be a time when there is no computation, no end, neither years, nor months, nor weeks, nor days, nor hours.

Go upon the earth, and tell thy sons what things I have said to thee. Give them the works written out by thee and the writings of thy fathers, and they shall read them, and shall distribute the books to their children's children and from generation to generation and from nation to nation.

The account of what I shall do may not be lost in thy family in the deluge to come. For on account of the wickedness and iniquity of men, I will bring a deluge upon the earth.

A numerous generation will rise again, I will show them the books of thy writings and of thy father, and the guardians of them on earth will show them to men who are true and please me. And they shall tell to another generation.

The *Book of Enoch* recites the vision that visited him,

“I had laid me down in the house of my grandfather when I saw a vision how the heaven collapsed and was borne off and fell to the earth.

And when it fell to the earth, I saw how the earth was swallowed up in a great abyss, and mountains were suspended on mountains, and hills sank down on hills, and high trees were rent from their stems, and hurled down and sunk in the abyss.” —The Book of Enoch 83: 3-5

Enoch assembled his sons and instructed them faithfully about all the things he had seen, heard, and written down, and he gave his books to his sons, to keep them and read them, admonishing them not to conceal the books, but tell them to all desiring to know.

After thirty days the Lord sent darkness upon the earth, and there was gloom, and it hid the men standing with Enoch. And the angels hastened and took Enoch, and carried him to the highest heaven. And the people saw, and did not understand how Enoch was taken.

He was a great man in his generation.

Kings and princes, no less than one hundred and thirty in number, assembled about him, and submitted themselves to his dominion, to be taught and guided by him. Peace reigned thus over the whole world for all the two hundred and forty-three years during which the influence of Enoch prevailed.

The story of his ascension is drawn also in these features: Enoch predicted the disaster.

Enoch was carried into the heavens in a fiery chariot drawn by fiery chargers. The day thereafter, the kings who had turned back in good time sent messengers to inquire into the fate of the men who had refused to separate themselves from Enoch, for they had noted the number of them. They found snow and great hailstones upon the spot whence Enoch had risen, and, when they searched beneath, they discovered the bodies of all who had remained behind with Enoch; he alone was not among them; he was on high in heaven.

What the Aggada means to tell is that a human being -and one gifted with the greatest “wisdom concerning the heavenly bodies and their order”, was brought away in a fiery storm, which killed many, brought snow and meteorites, and which had been predicted by that one who disappeared.

In this story the seven heavens correspond to seven millennia; the six changes, those that have occurred or are still to occur, correspond to the six gates of the sun and the moon; the eighth revolution and the eighth millennium will have no end, no years, no time; this millennium means endlessness in chaos.

Some exact knowledge of the revolutions of the bodies in the sky is ascribed here to the antediluvian generations.

The myth says that Enoch was transformed into one of the celestial host.

His body was turned into celestial fire—his flesh became fire, his bones glimmering coals, the light of his eyes heavenly brightness, his eyeballs torches of fire, his hair a flaring blaze, all his limbs and organs . burning sparks, and his frame a consuming fire. To the right of him sparkled flames of fire, to the left of him burned torches of fire, and on all sides he was engirdled by storm and whirlwind, hurricane and thundering.

It was with the last day of the long age of Methuselah, the long-living son of Enoch, that the next catastrophe began. Seven days before the deluge

The people heard a great commotion in the heavens, and saw as if nine hundred of celestial mourners in the sky were deploring the end of the age.

After these “seven days of grace” when frightful sights and sounds were seen and heard, began the deluge. The deluge and its time had already been predicted by Enoch, and even more ancient generations were said to have erected tablets with calendric and astronomical calculations predicting the catastrophe. ⁽¹⁾

It is said that the real period of grace endured for 120 years. During this time the flood was over mankind as a threat.

But men did not abandon their evil ways; the very favorable conditions under which they lived contributed to their sinfulness.

They knew neither toil nor care, and as a consequence of their extraordinary prosperity, they grew insolent.

In the last seven days before the deluge, when the terrifying signs and commotion filled the heavens, in those “last days of respite.” God changed the way of nature—as already stated.

“After seven days” [Gen. 7:4, 10] - in these seven days the Holy One changed the order of the creation and the sun was rising in the west

and setting in the east.—Talmud Sanhedrin, Fol. 108b:

Then began the deluge.

All the fountains of the great deep were broken, and the windows of heaven were opened. (Genesis 7:11)

The water was extracted from the earth and driven to the surface, and at the same time a rain poured—not out of the clouds, but out of heaven, even out of a definite direction.

The upper waters rushed through the space left when God removed two stars out of the constellation Pleiades.

These upper waters were hot, not as waters of a common rain.

The sinners were hot (in their sin) and were punished by a hot rain, God bade each drop pass through Gehenna before it fell to earth.—Talmud Sanhedrin Fol. 108b

Since the day when the waters flooded through the “windows of heaven” and during the deluge, the sun was veiled, and the earth trembled and volcanoes erupted.

The Lord shook that day the whole earth, the sun was darkened, and the foundation of the earth trembled, and all the earth vomited lava, lightnings flashed, thunders roared, and a loud din grew all over the earth, as never known before to its inhabitants.⁽²⁾
All the time the deluge lasted the sun and the moon shed no light.

The story of the ark is well known from the biblical tale. The Aggada adds details; The waters were in no way quiet; it was dark outside; the inside of the ark was illuminated by a precious stone.

The flood began to toss the ark from side to side. All inside of it were shaken up like lentils in a pot. The lions began to roar, the oxen lowed, the wolves howled, and all the animals gave vent to their agony.

The duration of the flood is described differently—forty days and also much longer.⁽³⁾

Like the former catastrophe of the fall of man, this catastrophe of the deluge, according to the Hebrew cosmogony, changed the nature of herb, animal, and man. The prosperity of the time before the great flood was gone without return; the world lay in ruins. The earth was changed—even the sky was not the same.

The continents changed their places in the former and in this catastrophe. The areas where now the shores of the Mediterranean sea are, were once the shores of an open ocean: this may be concluded from the following statement, if true:

Before Noah, the sea was in the habit of transgressing its bounds twice daily, morning and evening. Afterwards, it kept within its confines.

The constellations of the sky in this part of the world, it seems, moved after the deluge from their place.

To put a stop to the flood. God had to transfer two stars from the constellation of the Bear to the constellation of the Pleiades. That is why the Bear runs after the Pleiades. She wants her two children back, but they will be restored to her only in the future world.

Before the deluge there were peoples of gigantic size. The first man grew smaller after the fall, but his dimensions were still great, and after each catastrophe the giants became increasingly rare.

A myth of the Hebrews and of many other peoples knows to recite the story of some beings called ‘the sons of God’ who came from the universe, or from another planet, and whose offspring with the women of the earth were giants.

*The sons of God saw the daughters of men that they were fair; and they took them wives of all which they chose.
There were giants in the earth in those days; and also after that when the sons of God came in unto the daughters of men, and they bare children to them, the same became mighty men which were of old, men of renown. (Genesis 6: 2, 4)*

‘There is nothing new under the sun.’ The fancy about the men from Mars of modern novelists was already a legend and a tradition of old. Enoch was brought away in a cyclone of stones. The sons of God of the heaven reached the earth.

The Emim, Rephaim, Zamzumim or Anakim, races of giants, were supposed to be the descendants of these sons of heaven. Few of them succeeded to survive the later catastrophes, those that followed the deluge, and were destroyed entirely shortly afterwards.

From the huge species that were found on the earth in former times, fewer and fewer specimens survived through the ages» and those only in remote countries, where they were still said to be seen, and were described by the travellers of Biblical times. Their fantasy was impressed especially by the greatest sea-animal, leviathan, the greatest mammal “Behemoth,”⁽⁴⁾ the greatest of the reptiles “reem,” and the greatest among volata, “ziz.”

Leviathan is more than merely large and strong. His fins radiate brilliant light. His food consists of the fish which go between his jaws of their own accord. When he is hungry a hot breath blows from his nostrils. "So enormous is leviathan that to quench his thirst he needs all the water that flows from the Jordan into the sea." As leviathan is the most notable representative of the fishkind, so behemoth is the most notable representative of the mammal kind.

Behemoth matches leviathan in strength, and he had to be prevented, like leviathan, from multiplying and increasing, else the world could not have continued to exist; after God had created him male and female He at once deprived him of the desire to propagate his kind.

Formidable though behemoth is, he feels insecure until he is certain that leviathan has satisfied his thirst.

When the leviathan and the behemoth will enter a duel with each other

the issue will be that both will drop dead, behemoth slaughtered by a blow of leviathan's fins, and leviathan killed by a lash of behemoth's tail.

With these descriptions (sometimes exaggerated like all travelers' stories), the cosmogony and natural science of the Hebrews belabor a field which seems to be restituted by the excavations of fossils.

The combat of the monsters was verified by the finding of their bones together, from the position of which a duel and a devouring of one by the other was imagined.

The question was asked, what could have been the defensive or offensive weapon of the brontosaurus, the largest of these animals? ; no horns, no strong teeth, no nails to attack. In the above description the answer, and a plausible one, is delivered: they struck with their mighty tails, about thirty feet long.

The peer of the leviathan and behemoth between the reptiles was reem, a giant animal which was so rare in the time it was described that the traveler stated: "only one couple, male and female, was in existence".

The act of copulation results in the death of the male. He is bitten by the female and dies of the bite. At the end of a long period she gives birth to twins, a male and a female. The year preceding her delivery she is not able to move. For a whole year the animal can but roll from side to side, until finally her belly bursts, and the twins issue forth. Their appearance is thus the signal for the death of the mother reem. Its horns measure one hundred ells, and their height is a great deal more.

In the realm of birds ziz is the king.

When, at the time of the autumnal equinox, it uses to flap its -wings and utter its cry, the birds of prey, the eagles and the vultures blench.

The travelers reported that:

“Its wings are so huge that unfurled, they darken the sun.”

Even greater exaggerations were composed, e.g., that it is able to protect the earth against the storm of the south. The huge animal, the narrator agrees, could not be placed in the Ark of Noah. The survival of one of them is explained in a childish manner: it was tied to the ark and swam behind it.

Other animals were described. In the name of Enoch was told about the existence of

flying creatures, wonderful and strange in appearance, with the feet and tails of lions, and the heads of crocodiles; their appearance is of a purple color like the rainbow.

Leaving aside the color, which cannot be proved from the fossils, the bones of an animal of this description may be identified with the fossils of the Pterodactyl.

Through time only a few of these huge animals remained, and these even were “deprived of the desire to propagate their kind” ; they were not equipped to bear their monstrous mass upon the earth, when the conditions of gravitation changed with the change of the orbit. Only with great difficulty could they support themselves on their hind legs; in a state of pregnancy they were not able any more to erect themselves.

The places from where the travelers brought the stories of these animals were situated beyond the ocean.

*The ocean is situated to the west, and it is dotted with islands upon islands, inhabited by many different peoples. Beyond it, in turn, are the boundless steppes full of serpents and scorpions...
To the north of it are the supplies of snow, hail, ice, darkness and windstorms.*

The Hebrew history of developments in the animal knows also to relate about other changes, occurrence of which belongs to the period of the deluge.

Before the catastrophe of the deluge

the dog united with the wolf, the cock with the pea-fowl, and many

others paid no heed to sexual purity.

The “impurity” was abandoned; but the sentiment of repulsion of one species against other species grew, and developed into cruelty.

*Cats and mice, foes now, were friends originally.
Similarly, dogs and cats maintained a friendly relation to each other,
and only later on became enemies.*

A legend connected with the sojourn of the animals in the ark brings the belief that

*Even the physical peculiarities of certain animals were not original
features with them, but owed their existence to something that occurred
subsequent to the creation.*

It was asserted that the mole lost its eyes, the frog its teeth, and the mouth of the mouse became widened, and a fable connected with the sojourn in the ark was appropriated to this alleged metamorphosis.

Lesser changes in the haircover of the steer were described in another tale.

Before the deluge the animals that are impure (for food) were in large majority; after the deluge the proportion was inverted. This tradition might be the source of the legend about the presence of seven pairs of pure and only one pair of impure animals in the ark.

As in animals, so in the human being, the sexual inclination to unite himself with not of his kind was said to have been changed into a hostile attitude towards his own kind and sex.

*The descendants of Noah began to quarrel and slay, eat blood, wage
wars, people against people, and nations against nations and cities
against cities and do all manner of evil.*

According to this cosmogony and natural history, the hunger for flesh and the thirst for blood was an obvious result of the catastrophe. Was it a sudden anemia, due to changes in the atmosphere, the oxygen of which, with the exogenous hydrogen became the water of the flood? It is said:

After the flood each and all began to bite.

*And the fear of you and the dread of you shall be upon every beast of
the earth, and upon every fowl of the air. (Geensis)*

And every moving thing that liveth became meat of the human being like the green

herb of the soil.

Restriction was to be put upon the vampirous lust:

But flesh with the life thereof, which is the blood thereof, shall ye not eat.

And surely your blood of your lives will I require. (Genesis 9:4-5)

Those animals and men who escaped the catastrophe with their lives were rescued, only to start a struggle of annihilation among themselves.

This stimulated lust of sadism is a corollary of the inversion of the sexual impulse. The story is told in Genesis. Ham tried to execute on his father the act of castration, or an indefinite act also belonging to the complex of inversion.

But another Aggadic story ascribes the carnivorous lust to the impulse implanted in the generations of the giants by their forefathers, who had once come as “sons of God” from the sky to this earth. Together with the longing for blood they are said to have brought their knowledge in every field of science, and especially in astronomy and astrology. This legend is in discord with the legend about the book of the angel Raziel brought to the first generation.

With the spread of mankind, corruption increased.

A civilization was destroyed the real value of which is incalculable. In the next age the whole population of the earth amounted to a few millions. Even this number if brought forth from a few rescued families is very large, but the Aggadist admits this amount:

Ten years before Noah's death, the number of subjects to the three princess Nimrod, Joktan and Phenech amounted to millions.

The knowledge of astronomy and the secrets of its reckoning were rescued and it is said in this manner and variant:

God gave to Adam the book of the angel Raziel, which he studied day and night...

Upon the death of Adam, the holy book disappeared, but later the cave in which it was hidden, was revealed to Enoch in a dream.

It was from this book that Enoch drew his knowledge of nature, of the earth and of the heavens; and he became so wise through it, his wisdom exceeded the wisdom of Adam.

Once he had committed it to memory Enoch hid the book again.

When God resolved upon bringing the flood on the earth. He sent the archangel Raphael to Noahs “I give thee the holy book, that all the

*secrets and mysteries written therein may be made manifest unto thee.
Noah took the book, and when he studied it, the holy spirit came upon
him, and he knew all things needful for the building of the ark.
The book, which was made of sapphires, he took with him into the ark,
having first enclosed it in a golden basket.
All the time he spent in the ark it served him as a time-piece, to
distinguish night from day.
Before his death he entrusted it to Shem, and he in turn to Abraham.
From Abraham it descended through Jaacob, Levi, Mose and Joshua to
Solomon.*

This might even have been the knowledge of months, years and periods of comets that the remote generations had acquired—and the hope grew into faith that no such or similar destruction would come any more to decimate mankind.

A new and till then unknown atmospheric phenomenon was said to be the rainbow. In this colored reflection of the sun in small and suspended drops of water the rescued believed to see the divine promise not to repeat the flood.

The next destruction was that of the tower of Babel. A strong commotion caused that a part of the tower sank into the earth; another part was consumed by fire. Remained only a rest...

*[The builders of the tower] were scattered from thence upon the face of
all the earth... The Lord did there confound the language of all the
earth. (Genesis 11:8-9)*

(In Arabic traditions the destruction and the subsequent confusion of memory was related to the south of Arabia: it was a paramount catastrophe).

In the Aggadic cosmogony this generation is called “the people of men who lost their memory” ; the earth they inhabited was “the fifth earth”, that of oblivion.

Whether the Hebrew cosmogony reckoned one more destruction of universal character to occur between the time of the deluge and the Exodus depends on the following:

Altogether six catastrophes are supposed to have occurred, and we live on “the seventh earth”. The later catastrophe of the time of Joshua is not reckoned. The catastrophes of the Exodus could be numbered as two: one in Egypt and one at the shores of the Red Sea. If they were thought of as one, the fifth catastrophe would have been either in the time of Abraham, when in an upheaval the earth swallowed the tetrapolis, or, more probably, in the time of Peleg, about whom it is said: “in his days was the earth divided.” (Genesis 10:25.) The meaning is likely to be: “when the continents were separated”.

It is some lost knowledge that is concealed in these few words. In antiquity the traditions were vivid, were guarded as precious knowledge, and transmitted from generation to generation. It is said that Serug son of Reu taught his son Nahor the arts of the Chaldeans and the signs of the heavens; a legend told that when Abraham was born “one great star came from the east and ran athwart the heavens and swallowed up the four stars at the four corners.” It is said that in the days of Abraham the planet Jupiter appeared in the east instead of in the west;⁽⁵⁾ it is said that Abraham during his sojourn in Egypt

taught the inhabitants of that country astronomy and astrology, unknown in Egypt before his time.

The sixth earth is called Ziah, the earth which thirsts for water; her inhabitants rush to any place where they hope to find a well. This description is in accord with the stories of the patriarchs, the wells being the object of dispute. But with even more justification the earth Ziah or the sixth earth would fit the time following the Exodus, when brooks disappeared, the populations of entire countries wandered to find pastures.

The description of the catastrophe of the Exodus was narrated *in extenso* in *Worlds in Collision*; here it will be only mentioned in short.

The destruction of the world in the days of the Exodus was not smaller than in the days of the deluge. It closed, in the conception of the Hebrews, the age of creation. The hurricane that twice during five or six weeks crossed the orbit of our earth signified the end of the time when the earth and men were to be shaped and reshaped;

the old covenant was kept only in its promise not to bring a paramount flood upon the earth: a flood of fire came instead of the flood of water. The covenant, according to the moral conception of the Hebrews, was a reciprocal deed. The one partner, that who was obliged not to shed the blood of the fellow-man was in no way a fair accomplisher of his part of the covenant.

The Israelites were tortured in Egypt. More than one legend insists that the Israelites when behind the imposed number of bricks, were punished in a cruel manner which had to horrify them and keep them in a steady check: Israelite children were put into the mortar and inserted into the walls, between the rows of bricks. There is nothing improbable in this story.

The world was shattered, and it reeled to and fro as a reed in the wind. In a crescendo came the ten plagues.

First came the thin red coloring dust; the hot blast brooded the insects and small reptiles, quick in multiplying. Unquietude seized all creatures, and they began to migrate. Then, when the earth was deeper in the trail of the comet, meteorites flew

and killed everything in the field; then followed the neck of the comet and a “touchable darkness” that endured for three days; when the head of the comet passed just at its closest approach to the surface of our earth in darkness of charcoal and night, an earthquake of immense power ruined every house everywhere.

When six weeks later the Hebrews were .at the Red Sea the head of the comet was approaching on its return from perihelion. The last night before its arrival darkness again draped the world.

It was a cloud and darkness but it gave light by night. (Exodus 14:20)

The Aggada says: the darkness at the Red Sea was the same darkness of Egypt that returned once more.

The atmospheric and hydrospheric parts of the planet are the most likely to be driven towards a new gravitational field. Just as in the days of the deluge when the waters of the deep and lava were driven out of the core of the planet to its surface, the waters of the ocean and of every sea were heaped high in double tides; on the other side of the planet the waters ran asunder to find the nearest possible place to the celestial body that was passing close by; and the air moved still swifter, tossed and driven in the encounter of two celestial bodies: it was a hurricane, this “strong East wind all the night” (Exodus 14:21).

Lava flowed like in the days of the deluge; the earth trembled; the mountains melted; lands rose and others submerged; springs disappeared in one place and appeared in another; cultivable land, desert and sea, all changed their places. The desert was showered with inflammable fluid, and months and years later ignited over and again; the earth cracked and swallowed men and beasts.

The Hebrew tradition ascribes to Moses the prediction of most of these phenomena, especially of those which took place in Egypt. The Hebrew legends ascribe to him also the knowledge of the celestial movements and the art of prediction. If the periods were known to him, he could prophesy guided not only by his spirit, but also by his knowledge.

In the pitiless destruction by tempest and fire the Israelite refugees were graced; they saw nature keep the old faith and old covenant with them; not only were they graced, they were saved by the destructions. A few weeks later they stood around the mountain of Horeb and heard in a stormy night of a roaring desert the ten commandments. A new covenant was closed between the Creator of the universe and a people roaming around in a trackless desert, in a time when the entire world became once more void and waste. For them it was a rebirth of freedom.

The work of creation and the repeated reshaping of the earth and man were accomplished. It began the seventh day which lasts up to today and will last up to the final destruction.

According to the initial Hebrew conception of the creation, which I tried to reconstruct here, the six ages were terminated by six destructions; the world of today is the result of six metageneses. The story of the first chapters of the Bible is of a later, mythological, and very probably alien origin. The “six-day creation” is a mythological remodeling of an historical knowledge or belief. The whole of ancient history preceding the Exodus is the time of genesis, and therefore is also included in the book of Genesis.

With the Exodus, the end of Genesis, and the new flow of time, a new calendar was to be established.

And the Lord spake unto Moses and Aaron in the land of Egypt, saying, This month shall be unto you the beginning of months; it shall be the first month of the year to you. (Exodus 12:1-2)

The seventh age which started since then shall not be interrupted until the end of the world; the world in the perception of the remainder was by a hair breadth near to peril, and the next time it would not survive.

The sabbath, the seventh day, is a symbol and an assurance that no other metagenetic catastrophe will come. In keeping this solemn day of rest on the seventh day, the creator is implored to refrain from reshaping the earth similarly.

The seventh day was simultaneously the symbol of the grace displayed by Providence to slaves chased by their pursuers and a memorial to the Exodus. It had to become the day of freedom to all who work, man and animal.

The prayer of the Jews on the evening of Saturday, composed of two old fragments, brings together: the end of creation and the final harmony among the heavenly host, stars and planets; the beginning of a new time-reckoning from the last act of genesis, and the leaving of Egypt, house of bondage.

The sixth day. Accomplished were heaven and earth and all their host. And God accomplished at the seventh day all work He did, and abstained in the seventh day from all work He did. And God blessed the seventh day.

Blessed be God, Lord of the universe, who sanctified us by his ordinances and who was benevolent to us, and in love and good will gave us the day of rest, the memorial to the act of genesis, because this day is the beginning of the reckoning of days, memory of the Exodus from Egypt. Thou didst choose us, and didst sanctify us from amidst all the peoples. And the sabbath, thy holy one, in love and good will thou endowest us. Blessed be the Lord, who sanctifies the day of rest.

The assembling of three different causes for the establishment of the sabbath would seem to be a confusion, had they not been simultaneous occurrences: the last act of creation, the new flow of time, the Exodus from Egypt.

Some fifty years passed since the morning at the Red Sea. The world was once more in flames. Once more it was brought out of its path. But what happened in the days of Joshua, when the sun and the moon stood in the heaven and hot stones in myriads fell on this earth -was minimized in the Hebrew tradition. A combustion of the world was an episode, though a main episode, in the life of this disciple of Moses, who was said to be the successor of the knowledge of Enoch, and who could know what may happen after the rain of stones announced the approached of the still unvanishing errant planet; on his grave was inserted a memorial inscription to the event, which was emphasized as of no equals the Lord listened to the wish of a mortal who ordered the sun and the moon to stop and fulfilled his wish.

But this time the Israelites were the offenders; therefore the link of ethos and pathos lacked between the cosmic event and the assault by the Israelites.

2. *Sefer Hayashar*, new edition by L. Goldschmidt.
3. It appears that the tradition of “a year” of the deluge led to confusion in calculations, and the traces of this confusion seem to be found in the double redaction of the story of the deluge. The age of Noah when he married is told by the Aggada to have been 498 years; this would indicate that the year was shorter; it could still consist of a number of months, but not of months of thirty days; the days themselves could have been shorter.
4. *Talmud*, Shabbat 156.
5. Behemoth means the “huge animal” or “animals”—not to be identified with the behemoth of today.

Astrology

Astrology interested itself chiefly with the relative positions of planets and with their conjunctions. Diodorus of Sicily, after recording the Chaldeans assert that planets change their velocities and periods of time, says: “These stars exert the greatest influence for both good and evil upon the nativity of men; and it is chiefly from the nature of these planets and the study of them that they know what is in store for mankind.”⁽¹⁾

It is perfectly correct to say as Diodorus did because of the great changes which were brought upon mankind and the nature of everything living on this planet by encounters with other planets. But from the truth of this belief of the Chaldeans and to the wrong conclusions was but a short distance. If the planets at their different encounters caused flood, hurricane, or conflagration, destruction of animals, or appearance of new plants, man could easily conclude that this or that consequence is the result of a special character of this or that planet.

The Chaldeans tried to build their astrology empirically: they noticed every year the movements of the stars, the conjunctions that took place and the political and natural changes in the realm. Very many such observations were made and written down.⁽²⁾ From the idea that the position of planets influences the nature and the life of nations and kings, to the idea that it influences a single individual, was but one step. A fiery character of some men could be compared with the fiery character of Venus or Mars. In the *Tractate Sanhedrin* of the *Babylonian Talmud* it is said that “He who is born under Venus will be wealthy and unchaste. What is the reason? Because fire was created therein. . . He who is born under Mars will be a shedder of blood.”⁽³⁾

It was supposed that the position of planets in the hour of conception is fateful for the building of the character and also for the future of the individual. So for example in the book of Hindi; astrology. *The Bri-hajgatakam* of Varaha Mihira, it is said: “When Venus and Saturn are in one sign, persons become short-sighted, earn money, and increase it through their wives or young women, are authors and painters . . .”⁽⁴⁾ Sahagun reports that among the Aztecs “soothsayers who tell the good or bad fortune children are going to have, according to the date, time or signs of their birth.”⁽⁵⁾

Amen and Aten

Amenhotep IV, who is better known by the name he adopted—Akhnaton, is described in books on Egyptian history and in those books on the development of religion as a great heretic and also as the “first monotheist.” These claims are built upon the fact that he abrogated the cult of Amon or Amen, until then the chief deity in the Egyptian pantheon, and substituted it by the worship of Aton or Aten, a reform audible in the change of names—from Amenhotep to Akhnaton. The reform was carried on with great zeal—the name of the god Amon was erased from the inscriptions of the capital Thebes and the name of Aten substituted. The name of Akhnaten’s father—Amenhotep III—was subjected to the same mutilation. Akhnaten built a new capital to the north of Thebes and called it Akhetaten, the place where Aten rises. The claim of being the “first monotheist” of world history was made for Akhnaten on the basis of his hymn to that deity, by Egyptologists and then turned again in books of authors writing on religion or history in general. The question of whether Akhaten was the first monotheist (or even a monotheist in general) requires revision already because of the fact that Akhnaten lived not in the 14th but in the 18th century. But, first of all, the identity of the rejected deity and that of the substituted require elucidation.

One is usually told that Amon was a solar deity and that Aten was also a solar deity. thus it comes to a rather unclear reform: one deity that symbolized the sun was rejected and another deity that symbolized also the sun was elected. In this presentation the revolutionary character of the reform is hardly obvious: it amounts, actually to only little more than to a change of names. It would be, actually not a greater reform that substitution in a modern Christian creed of a Madonna of Lourdes by a Madonna of Guadalupe. In this example, the chapel at a place where an apparition of the deity took place and the cult connected with it, are in competition with the cult and a chapel at another location, with similar claims. But hardly would the name of a deity of one place be erased and its cult debased in the second place. Therefore there is something unexplained in the violence with which the votaries of the Aten cult exterminated all what pertained to the Amen cult. If Amen and Aten were both solar deities, then the passions that accompanied the change of the cult—first from Amen to Aten and, after Akhnaten, back from Aten to Amen—must have had their origin in something that is yet unexplained.

Actually the statement that Amen was the divine personification of the sun, or the sun itself, is based on nothing known from any Egyptological source. Just because Amen was the supreme deity and the sun is the supreme luminary in the sky it is assumed without any further inquest, that Amen was the sun. Following this kind of logic, Zeus must have been a solar deity, too. However we know that Zeus was the Roman

Jupiter, was the god of that planet; Helios—the solar deity, was certainly not the highest deity; and even in the form of Apollo, the sun was not supreme on the Greek Olympus. Actually, we have statements of Greek authors that Amen was the Egyptian Zeus-Jupiter. Thus the authors who describe the visit of Alexander to the sanctuary of Amon in the oasis of Siwa in the western desert identified Amen with Zeus-Jupiter. Thus we see that the identification of Amen with Helios or the sun is not built on anything but a priori thinking, as expressed by E. Renan, who wrote that the only astral religion that appears natural is the worship of the sun, the great luminary, the giver of light and warmth, and life itself.

The cult of Jupiter was abrogated by the king-heretic and in its place was elevated the cult of Aten. Which deity was worshipped in the Aten?

The famous hymn composed by Akhnaton or by a royal poet, ⁽¹⁾ says in parts:

Thou appearest beautifully on the horizon of heaven,
Thou living Aton, the beginning of life!
When thou art rise on the eastern horizon,
Thou has filled every land with they beauty....
Thy rays encompass the lands to the limit of all that thou hast made....
When thou settest in the western horizon,
The land is in darkness in the manner of death...
At daybreak, when thou arisest on the horizon,
When thou shinest as the Aton by day,
Thou drivest away the darkness...

This description is strongly suggestive of Aten being the sun. Additional indirect argument for this identification can be found in the way the Palestinian potentates used to address the pharaoh: “You shine like the sun in the heavens.” The king being compared to the sun, the sun must been considered the highest deity. However, already Amenhotep II , the father of Akhnaton, was compared with the sun in the letters of these potentates. Yet these very letters disclose which was the supreme deity of the correpondents from Palestine.

The most prolific writer of letters form Palestine was the king whose name is usually read Rib Addi, but in translation into Hebrew would be the “eldest brother (or son) of the father,” or equivalent of Ahab. The identification of Rib Addi with Ahab was offered and substantiated by us in *Ages in Chaos*, Vol. I, by a very extensive and detailed analysis. More than sixty letters of this king of Sumura (Shemer or Shomron-Samaria) were preserved in the archive of el-Amarna to Akhetaten the capital of Akhnaten. He usually opened his letter with this blessing: “May Belith of Gubla...” In *Ages in Chaos* we identified the deity Belith with the female consort of the god Belus, of which Josephus Flavius wrote that it was brought to Israel from Phoenicia by Jezebel, the chief wife of Ethbaal. ⁽²⁾ We have also identified Gubla with the name of Jezreel until Jezebel’s death.

From the Scriptures we know of the great and passionate struggle which went on in the days of Ahab in Palestine. At a time when the southern kingdom, that of Judah, the chief deity was Yahwe, in the Northern Kingdom, that of Israel, the chief deity was Baal and according to the testimony of Josephus, Baalith, which is the female form of the name. We have also the multiple testimony that Belith or Baalith was the planet Venus, or the Queen of Heaven in the language of Jeremiah, two and a half centuries later. The planet Venus or Ishtar of the Babylonian cult, as we have shown in *Worlds in Collision*, was worshipped in the Greek world as Athene. Athene was second only to Zeus and in Athens, the city called by her name, she was the most honored deity. Athene being recognized as the offspring of Zeus, that sprang fully armed from his head, it was not antagonistic to Zeus, already because of the polytheistic character of Greek religion that made it possible to worship many astral deities simultaneously. A century or two after the time we describe here, the time of Akhnaton and Ahab, the celestial conflict between Athene and Ares (Mars) made the tribes on earth to take sides and in the time the Achaeans (the Greeks) had chosen Athene for their protecting deity, the Trojans of Priam had Ares as their protector. In another description of Athena's birth, the Greeks had it being cleaved out of a pillar of cloud by Zeus. In Palestine, however, the protracted debate—which was the astral deity that was dominating the scene in the days of the Exodus-Passage and theophany on Mt. Sinai, caused a long and bitter schism its beginning can be seen in the dispute that made Moses and Aaron...

Eliahu.

Again the hymn of Akhnaton.

Venus rivalled the sun in light.

Similarity to Ishtar hymns.

Solar cult only with Menasseh.

Aten=Athene.

Struggle also in Mazda & Mithra

Josephus, *Jewish Antiquities* 8:316 (Whiston translation): "Ahab... also took to wife the daughter of Ethbaal, king of the Tyrians and Sidonians, whose name was Jezebel, of whom he learned to worship her own gods. This woman was active and bold, and fell into so great a degree of impurity and madness, that she built a temple to the god of the Tyrians, which they call Belus, and planted a grove of all sorts of trees; she also appointed priests and false prophets to this god."

World Catastrophes as Punishment

In his great fright and looking back on what did happen to a former generation, the thinking man imagined that the catastrophe must have been provoked by the iniquity of the ancestors, their vices and evils. Such thought could provide a hope for a non-repetition of catastrophes: should humankind abstain from wretched acts, it would be spared. By this, man assumed that the planetary gods could be kept at bay by his own decency - and if he already formulated for himself what is good and what is evil, or ate already from the tree of knowledge of good and evil, he needed a covenant with the outraged deity and commandments for behavior.

Whether the catastrophes were really provoked by sinful behavior or not - the answer is not easily provided: is always a good deed rewarded and a sinful behavior punished?

Rabbi Abuya, surnamed Acher, one of the greatest rabbinical authorities of the second century of the present era, became an agnostic when his pious colleagues were flayed of skin and burned alive; and millions of the martyrs that were gassed in our time have raised the question of whether mercy and righteousness save from doom, and the tens of thousands of their tormentors living to a good old age raise the same question from its other side.

The saying of the sage, "I have reached an old age and I have not seen a pious man given to evil fate," is most certainly self-deception and actually an injustice and mockery: it adds insult to injury. It is an assertion to justify the unseen power, that must be wise, good, and omnipotent; if such attributes are not the qualities of the deity, then all hope for an insurance against evil by righteousness is dissipating. But if the power against which man is pitted, is sensitive to the distinction of good and evil, then the only hope is to placate it by abstention from evil and furtherance of good.

When the chronicler tells us that the Deluge was caused by the population of the world growing evil and that the Lord repented of his act of creation and decided to destroy it, he needs to ascribe to the animal world the same depravity and moral wretchedness that he ascribed to man. G. Couvier, paleontologist and catastrophist, asked with sarcasm: Was the fish free from ardent passions that it was spared in the common destruction? (But, to a great extent, it perished, too).

Man grew evil, a catastrophe destroyed him, but did the few survivors come purified by the disaster and by their own miraculous salvation? The biblical story of the deluge tells us that as soon as the waters subsided, Noah drank himself drunk, and his son, Ham, committed some act of indecency, the Midrashic version of the act being

castration of his drunken father; and this scene on the large stage of the devastated world, does not convey the thought that the worth-while ones were the object of salvation, nor does it lend support to the conviction that a global catastrophe is called for to rejuvenate humankind.

It is asserted that the Lord made a covenant with the survivors - Noah and his descendants - as he made another one, more detailed, with the survivors of the holocaust of the days of the Exodus - the deluge of fire - when, amid the groaning nature, Moses interpreted the groans as commandments. It is clearly in the domain of a psychological truth - this imposition of self-restraint, an awakening of the sense of good and evil. Man and the animal kingdom - all on this earth together - are bound by a common bond to placate the great power by self-restraint in pursuit of pleasures, by suppression of instincts, and by sacrificing pleasurable things to the all-powerful deities.

The deity must have created man good, if it, itself, is good; if it created man bad, then there is no point in punishing him for the nature with which he was endowed from the beginning. Where is left room for absolving the deity from being unjust? Obviously, in the self-accusation by man of having lost his innate purity and of having selected evil when he was free not to do so. Here again, man, by accusing himself of degeneration, grasps for the only hope of mollifying the Great Power, or great powers; he accuses his free will and behavior for what happened in the past and ascribes to the Deity a good plan, a perfect creation, a just attitude towards its creatures, though not a merciful one. Therefore, the Lord has to repent of having created man and animal; but where is, then, the prescience of Omnipotent?

And what particular sinfulness can be ascribed to animals? If one insect places its eggs into the body of another creature and the larvae when hatched will devour the host from the inside of his body - and if the Creator is not responsible for this arrangement, is the animal kingdom to be rightly accused of cruelty and insensitivity to the sufferings of others?

But the catastrophes did not eradicate or change such cruel urges, and witness to this is any book on zoology, especially on insects and their most cruel parasitic schemes needed for survival and procreation, or on the widespread urge to suck blood, and the almost omnipresent need to devour. With the last of these urges man is endowed, too; but strangely, the talmudic tradition tells us that only after the Deluge did man become carnivorous. Can this be regarded as a change from vice to holiness? Then is the belief that the world's population was nearly completely destroyed because its nature and behavior became unchaste or violent, only an invention to justify the act of uncontrollable powers? Was it invented to give solace and hope in the face of the unchained terrors of the past and equally horrifying prospects for the future? If bad inclination and outrage did bring chastisement, would not an upright spirit and good acts assuage the powers and avert the repetition of the act that carried the world to the brink of annihilation?

The Birth of Monotheism

Zeigt es sich so, dass die Religion Israels auch in der Gottesidee selbst dem Wandel unterworfen war, so kann das nur dem befremdlich order anstössig erscheinen, der an den Fortschritt menschlichen Denken nicht glaubt.

H. Torzyner, *Die Bundeslade und die Anfänge der Religion Israels*, (2nd ed., 1930), p. ii

The Israelites lived on the same planet as the other peoples; the same world catastrophes impressed them as the other peoples. The cause of the catastrophes, as far as it was known to the Babylonians or Egyptians, must have been known also to them. Since the world catastrophes were caused by planets, each of these planets must have been deified not by a single people, but by all peoples, without exception. The fact that the ancient Hebrew word for God, *Elohim*, is plural can be accounted for by this. The Bible critics since Julius Wellhausen⁽¹⁾ paid much attention to the fact that in diverse parts of the Bible God is named by diverse names: Adonai, Elohim, Jahwe. Accordingly the Bible critics discern those parts which were composed by the followers of the cult of Elohim, who supposedly lived in the Northern Kingdom (Israel) from those which were composed by the adepts of the cult of Jahwe, whose religious center was in Jerusalem (Judah). Then, in the opinion of these critics, at a later date the literary remnants of these two cults, together with the material composed by—and in the interest of—the priesterly cast (Priesterly codex) were edited together and thus the syncretized Bible came into being. No doubt, there are sections in the Biblical narrative where one or another name of God is persistently used to the exclusion of other of the Lord's names. The origin of this syncretized religion which eventually brought the Jewish people, and then through them a large portion of the human kind to monotheism is sought in local and regional deities which became gods of single tribes, then rising to the status of protective national gods; thus Jahwe is sometimes described as the local deity of the Sinai volcano who became the god of Israel; similarly Chemosh of Moab or Chiun of Amalek were local gods of those nations.

The historical facts are different. Gods of all nations were planetary gods, and actually the same gods. For one or another reason one or another tribe or people chose one or another deity as its protector and paid especial tribute to it. A new world catastrophe caused by another member of the planetary family would easily raise it to the position of the supreme deity; on the other hand the fidelity to the protective deity of the previous age would cause one or another tribe to remain faithful to the old cult;

religions and gods are tenacious contents of the human soul and peoples do not part easily from them. Thus we see how the worship of Jupiter superceded that of Saturn; the worship of Venus (Minerva, Athena, Astarte, Baal) in many regions eclipsed the worship of Jupiter; and the advent of Mars and its participation in celestial wars brought new schisms into religious thinking and caused new religious wars. Thus the Greeks battled under the patronage of the planet Venus (Athena) whereas the Trojans battled under the protection of Mars (Ares); but Ares was also recognized as god by the Greeks and Athena as a goddess by the Trojans. Similarly the Toltecs, faithful to the cult of Quetzalcoatl, the planet Venus, warred and succumbed in the war against the Aztecs, the younger race that proclaimed Mars (Huitzilopochtli) as their god. The Romans regarded Mars as their protective deity but their main sacrarium was dedicated to Jupiter and Minerva (Athena). Egyptians also regarded Amon as their supreme deity and Ra was its other name. In another cult center of Egypt Osiris and Isis were worshipped as supreme gods; in early times they represented Saturn and Jupiter; at a later time Isis became synonymous with Astarte-Athena, the planet Venus.⁽²⁾

A few peoples through consecutive planetary ages kept fidelity to the ancient Kronos (Saturn), whose age was previous to that of Jupiter. Thus the Scythians were called Umman-Manda by the Chaldeans,⁽³⁾ and Manda is the name of Saturn.⁽⁴⁾ The Phoenicians regarded El-Saturn as their chief deity; Eusebius informs us that El, a name used also in the Bible as a word for God, was the name of Saturn.⁽⁵⁾

The different names for God in the Bible reflect the process of going through the many ages in which one planet superceded another and was again superceded by the next one in the celestial war. El was the name of Saturn: Adonis of the Syrians, the bewailed deity, was also, like Osiris, the planet Saturn; but in the period of the contest between two major planets, Adonai, which means “my lords” became the appellation of the dual gods; then, with the victory of Jupiter, it came to be applied to him alone; thus Adonai and also Zedek was the name of Jupiter, and in the days of the patriarch Abraham, the cult of Jupiter was prominent in Jerusalem of the high priest Melchizedek (my king is Zedek).⁽⁶⁾ Zedek remained the name of Jupiter in the astronomy of the Jews in later ages and is used as such in the Talmud.⁽⁷⁾ There we find also the legend that in order to teach Abraham not to believe in astrology God reversed rising of the planet Zedek (Jupiter) and it began to move towards the west.⁽⁸⁾ In another passage of the Talmud it is said that “the planet Zedek made the night bright for him (Abraham)”⁽⁹⁾ meaning that his time was under the aegis of the planet Jupiter.

We recognize in the reversion of the revolution of Jupiter the cause of great catastrophes in the solar system which affected also the earth in the age of the patriarchs, or at the close of the Old Kingdom in Egypt. In that period Jupiter became the supreme deity having removed Saturn from its orbit. Meichizedek was the priest of the “Most High”—the name by which Jupiter was known to the Greeks: “all-

highest, mighty Zeus.”⁽¹⁰⁾

The end of the Middle Kingdom in Egypt was caused by a new world catastrophe: a period of a few centuries only intervened between this catastrophe and the previous one caused by Jupiter. Actually it was caused again by Jupiter, because the comet Venus was expelled from its body; this expulsion followed the contact of Saturn and Jupiter, and the fantasy of the peoples regarded Venus as a child of Jupiter, conceived to him by Saturn. But more than this origin of Venus, the fact that the peoples of the entire earth were confused and in many instances regarded Zeus-Jupiter as the planetary god that battled with the pillar of smoke or the trail of the comet, was of far-reaching consequences for the development of religion and the progress toward monotheism.

Yahwe was the name of the deity that caused the Middle Kingdom of Egypt to fall into ruins, bringing equally great or greater disasters to the rest of the world. The name of the deity became known only a little time before the catastrophe, and this is asserted in the Book of Genesis.

The sound “yahwe” heard, amidst the catastrophe was understood as the revelation of the name of the superior deity,⁽¹¹⁾ and since and since other planets were submissive to and dependent on the planet Jupiter it grew to the position of the supreme god, other gods being its messengers; angels or archangels. It is probable that Moses in his time, as Plato eleven hundred years later understood the supreme deity as existing above and beyond the planets, regulating them, ordering them, but not one of them; Plato speaks of God and also of gods or planets; and characteristically Numenius calls Plato “Moses speaking in an Attic dialect.”⁽¹²⁾ The fact that the Decalogue contains the prohibition to make an image of the god is a strong support to this idea of Moses being aware of a Supreme Power behind the terrible planets. According to the Biblical tradition Aaron made an image of a calf (Apis) at Mount Sinai, which is the image of Venus for many centuries to come; but due to the confusion concerning the agent of the catastrophe, Zeus is also often figured as a bull. As a bull it carries the Evening land to the east⁽¹³⁾—a reversal of the poles about which we spoke at an appropriate place.⁽¹⁴⁾ The cult of Apis actually started after the end of the Middle Kingdom, in the days of the Hyksos⁽¹⁵⁾ or, according to my reconstruction of ancient history (Ages in Chaos) in the very days which followed the Exodus of the Israelites from Egypt.

But it should not go unnoticed that Moses also built an image in the desert, the image of a serpent, and though there is found a rationalistic explanation of this his deed in the assumed fact that the contemplation of the serpent was a remedy for those who were bitten by snakes—an interesting psychosomatic idea—and though an abundance of reptiles, and especially snakes, was observed also in other places at that time—so in China of the Emperor Yahu,⁽¹⁶⁾ and the Arabian desert abounded with snakes still in the time of Esarhaddon in the seventh century,⁽¹⁷⁾ yet we are not persuaded that the

serpent made by Moses was not a religious symbol, a competitor of the calf image. It could have been the image of the pillar of smoke that went before the camp when the Israelites left Egypt. The Hyksos who at the same time invaded Egypt deified the snake deity known as Seth, Apopi, identified by the Greeks with on Typhon.⁽¹⁸⁾

Chiun, in the words of Amos: “Chiun, your images, the star of your god”⁽¹⁹⁾ denoting Saturn, in the opinion of Max Seligsohn,⁽²⁰⁾ is identified by Jerome as Lucifer⁽²¹⁾ or Venus; being an image of a star carried in the desert, it could be this serpent. The fact that Moses made an image—in violation of the second commandment of the Decalogue — is not necessarily inconsistent with his being a monotheist: there are many churches today where symbolic and even human figures are deified by people who profess to be monotheists. But as time passed, the presence of the serpent of Moses in the Temple of Jerusalem became so objectionable to the spirit of the prophets that in the days of Isaiah the serpent was broken into pieces.⁽²²⁾ Even though its original purpose may have been curative, it being the image of the angel who was sent in the pillar of fire and cloud to save the people of Israel from slavery, the brazen serpent with the lapse of time became an object of worship.

Whatever the sublime height to which the spirit of Moses carried him in the days of a cosmic catastrophe, with the passing of time the Jewish people reverted. to idolatry—and the pages of the Bible are full of testimony to this fact.⁽²³⁾

There were no images of the deity in the Temple of Solomon as there were in Egyptian and Babylonian temples, full of statues of the planetary gods. The ark of the covenant contained the tablets with the ten commandments and the holy spirit; the holy spirit, a metaphysic nebula of the theologians, may have partaken a little of the divine clouds that surrounded the Israelites in the desert and which were of extraneous origin; it was a portion of the deity, its emanation. Also a jar with manna of the same origin was preserved in the sacrum.

The god Yahwe was the supreme Deity of the Judeans and they excluded all other rival deities from their pantheon. But in the four odd centuries of the time of Wandering and the Judges the astronomical science made progress. Soon after the sky of the desert of Wandering became free from the carbogenous clouds and the Israelites emerged from the desert they saw the comet Venus, Noga, illuminating the sky. In the days of Joshua it caused the second derailment of the earth from its path in the short interval of fifty-two years. The Israelites could believe that it was still the old and furious planet Jupiter that descended close to the earth. But as time passed, and the new orientation of the sky became better known, and the old constellations were recognized in their new positions, and the planets in their new orbits, the astronomers of Babylon, Egypt and Palestine became aware that Jupiter is not the comet Venus. During the time of the Judges the name Baal was often applied to the deity of the most popular cult, as the names of many Israelites of that period attest.

When in the fifth year after the death of Solomon the Northern part of the kingdom was separated from Judah, Benjamin, Simeon and part of Levi a temple was built in Dan to compete with the temple in Jerusalem;⁽²⁴⁾ this temple of Dan was called “the house of High Places,”⁽²⁵⁾ which translates that it served also as an observatory or center for the cult of astral deities. Jeroboam actually renewed there the cult of Aaron: a calf was worshipped, at Dan.⁽²⁶⁾ On the Phoenician coast the deity Baal, or Belith (Baalith), which is Baal in its female form, or Ishtar (Astarte), which was also a male and a female deity⁽²⁷⁾ was worshipped, this being also the comet Venus.

The supremacy of Yahwe in the Jerusalem cult rose to monotheism. Elijah was its apostle in the Northern Kingdom, and he was in strife with the priests of Venus. The spreading of the cult of Venus (Baal, Baalith, Ishtar) in the Northern Kingdom was due not only to the external influence of the Phoenicians or Babylonians, but in the first place to the fact that Venus was the most conspicuous object in the sky, which illuminated as brightly as the sun,⁽²⁸⁾ and also to the fact that it threatened the world with new catastrophes, and finally to the fact that like the Babylonians, Egyptians or Brahmans, the Israelites could find out that it was Venus, not Jupiter, that caused the catastrophes in the middle of the second millennium, which in terms of the Israelite history meant that Venus is the celestial body which had ruined the Egypt of oppression and opened the way through the Sea of Passage. This astronomical understanding of facts, together with the brilliancy of Venus, caused many to fall away from “the God of the fathers,” or from the deity of the ancient age that, after all, was not the deliverer from the yoke of Egypt. This explains the long struggle between the adherents of Yahwe and the adherents of Baal. The adherents of the cult of the “God of our fathers,” pressed by the revelations of astronomical science, ceded so far as to say that if it was not the ancient Lord who caused the deliverance from Egypt, then it was his messenger, or angel. And though Jupiter became a modest looking object in the sky when compared with Venus, it is still the stronger one. Similarly in Greece the planet Jupiter (Zeus), which looks less imposing than Venus, was recognized as the stronger deity; although in the beginning there was also a confusion as to who had battled Typhon-Pallas, the pillar of cloud—Zeus or Athena—already in the days of Homer the supremacy of the planet Jupiter which is able to remove all other planets, the earth included, from their orbits, was recognized fact.⁽²⁹⁾

In Palestine, like in Mexico and in other places, Venus was appeased every fifty years, the sending of a goat to Azazel, or Venus, into the desert⁽³⁰⁾ was not a sacrifice to a worshipped deity but. the removal of a threatening and vicious deity. It seems that the Day of Atonement was observed in the beginning only once in fifty years, at the beginning of the year when Venus was expected on its cometary orbit. A number of instances in the Scriptures can be referred to to substantiate this point.⁽³¹⁾ And that Azazel is Venus is clear from the fact that Azazel was regarded as a fallen star-angel, which is Lucifer, another name of Satan. Set, the Egyptian name of the damaging comet, is the origin of the very name Satan. Uzza, the other form of Azza,⁽³²⁾ was

“thrown into the Red Sea”⁽³³⁾ which implies that the authors of this legend knew the role of Venus in the cataclysm of the Sea of Passage. Also in the Arab pantheon el-Uzza is the planet Venus,⁽³⁴⁾ and as late as the Middle Ages it was venerated in Mecca, and Mohammed also paid homage to it.⁽³⁵⁾ Thus Azazel to whom the scapegoat was sent was Venus.

When in the eighth pre-Christian century Mars supplanted Venus as the threatening planet the Hebrew prophets did not regard it as a deity by itself, but as a messenger of the Supreme Deity: “Behold, the Lord hath a mighty and strong one, which is a tempest, hail and a destroying storm, as a flood of mighty waters overflowing, shall cast down to the earth with the hand,”⁽³⁶⁾ said Isaiah. And Amos spoke of the Lord who makes Khima and Kesil, or Saturn and Mars.⁽³⁷⁾

It can easily be that hymns to Baal found place in the Scriptures, and only the name of the Hebrew God was substituted instead of Baal, though I would not vouch for this.⁽³⁸⁾ The chapter of Habakkuk makes the impression of describing an apparition of the comet Venus:

“His glory covered the heavens...and his brightness was as the light; he had horns coming out of his hand... burning coals went forth at his feet ... [he] drove asunder the nations; and the everlasting mountains were scattered... Was thine anger against the rivers? Was thy wrath against the sea, that thou didst ride upon thine horses and thy chariots of salvation...? Thou didst cleave the earth with rivers. The mountains saw thee, and they trembled: the overflowing of the water passed by: the deep uttered his voice... The sun and moon stood still in their habitation: at the sight of thy arrows they went, and at the shining of thy glittering spear. Thou didst march through the land in indignation, though didst thresh the heathen in anger... Thou didst walk through the sea with thine horses, through the heap of great waters.”⁽³⁹⁾

In Judea Jupiter by-and-by became the Supreme God, not connected with any planet, a process that can be traced also in the writings of Greek philosophers, Plato in the first place, some five hundred years later. Thus religion was at odds with astronomy of the age. But in the Northern Kingdom the process of disassociating the deity from the celestial object had not yet been completed when the Kingdom was destroyed (-723 or -722), and its population was led away into captivity, from which they did not return. “And they [the tribes of the Northern Kingdom] left all the commandments of the Lord their God, and made them molten images, even two calves, and made a grove, and worshiped all the host of heaven and served Baal” (II Kings 17:16).

Since the day when Israel became a people, this Earth was severely threatened at two periods: in the days of the Red Sea passage with an epilogue at Gibeon and in the days of Jerusalem and Sennacherib, with prologues in the days of Ussiah and on the

burial day of Ahaz. At the Red Sea as well as at Jerusalem heavenly wrath destroyed the host of a cruel oppressor.

Great was the wonder at the natural phenomenon which took place at the sea, but it had its physical cause. Really wondrous was the coincidence: Escaped slaves, encircled by a pursuing foe, stood before the stormy sea, when it was rent asunder before the persecuted ones, and shortly thereafter swallowed up the pursuing host of the tyrant.

When, some seven hundred years later, the Earth was again drawn out of its path, once more the wonder lay not in the retrograde rotation of the Earth for a few hours or minutes, but in the coincidence: the army of the despot before whom the whole world trembled, who had just blasphemed against the Lord of Heaven and Earth, was encamped on its way to storm Jerusalem, and the very night before the attack could begin it was scorched by a heavenly blast of combusting gases. In the morning the army was but a heap of one hundred eighty five thousand dead bodies.

Two great catastrophes, two great salvations—how could a people fail to believe that it was preserved for some great destiny?

After -687, one hundred years passed by. Not only did Hezekiah receive a period of grace, but also the people of Jerusalem—from -687 to -587.

The result of the great wonder in the days of Hezekiah was the reverse of what it should have been. Only a few years after the deliverance of Judea from the hand of Sennacherib, Manasseh, son of Hezekiah, who at the age of twelve succeeded his father Hezekiah on the throne of Jerusalem, came under the influence of diviners hostile to Isaiah, and alienated himself from the spirit that dominated the palace in the days of his father. He “observed times,” which means that he followed the advice of the astrologers, who read in the constellation of the planets orders and vetoes for kings and their peoples. During the greater part of Manasseh’s reign, which endured for more than half a century, planets were officially worshipped in Jerusalem. Manasseh “built altars for all the host of heaven in the two courts of the house of the Lord” (II Kings 21 : 5). “For he [Manasseh] built again high places which Hezekiah his father had broken down, and he reared up altars for Baalim, and he made groves, and worshipped all the host of heaven, and served them” (II Chronicles 33 : 3). This was actually a realistic interpretation of the matter.

It was in the time of Josiah, grandson of Manasseh, and shortly before the exile of Judah to Babylon, that a pure monotheism emerged as an outcome of the progress the Jewish people had made during its long struggle for national existence, on the one hand, and for purification of its concept of God, on the other. “And the king [Josiah] commanded Hilkiyah the High Priest ... to bring forth out of the Temple of the Lord all the vessels that were made for Baal and for the grove, and for all the host of heaven: and he burned them without Jerusalem in the fields of Kidron, and carried the ashes of them into Bethel. And he put down the idolatrous priests, whom the kings of Judah

had ordained to burn incense in the high places in the cities of Judah, and in the places round about Jerusalem; them also that burned incense unto Baal, to the sun, and to the moon, and to the planets, and to all the host of heaven” (II Kings 23 : 4-5).

In the last passage the division of the astral gods is the same as that used by Democritus, who spoke of “Venus, sun, and moon, and the planets, thus affording to Venus a special position, a fact that surprised the commentators.”⁽⁴⁰⁾

Jeremiah had a clear conception of a God who is over the entire creation. “Do not I fill heaven and earth? saith the Lord” (Jeremiah 23:24).

The Scriptures do not hide the fact that in Judea, as well as in Israel, the planetary cult was the official cult with the priests and with kings, with many prophets and with the people. Thus Jeremiah, contemporary of King Josiah, says: “At that time, saith the Lord, they shall bring out the bones of the kings of Judah, and the bones of his princes, and the bones of the priests, and the bones of the prophets, and the bones of the inhabitants of Jerusalem, out of their graves: and they shall spread them before the sun, and the moon, and all the host of heaven, whom they have loved, and whom they have served, and after whom they have walked, and whom they have sought, and whom they have worshipped” (Jeremiah 8 : 1-2). And again he says: “And the houses of Jerusalem, and the houses of the kings of Judah, shall be defiled as the place of Tophet, because of all the houses upon whose roofs they have burned incense unto all the host of heaven” (Jeremiah 19 : 13).

In the days of Jeremiah and King Josiah, a scroll was found in a chamber of the Temple (II Kings 22). It is generally thought that it was the book of Deuteronomy, the last book of the Pentateuch. The text of the scroll made a strong impression on the king (Deuteronomy 4:19):

And lest thou lift up thine eyes unto heaven, and when thou seest the sun, and the moon, and the stars, even all the host of heaven, shouldest be driven to worship them, and serve them, which the Lord thy God hath divided unto all nations under the whole heaven.”.

The scroll continued: “Thou shalt not make thee any graven image, or any likeness of any thing that is in heaven above, or that is in the earth beneath...” (5:8), which is a passage of the Decalogue (Exodus 20 : 4) verbatim.

If there be found among you...man or woman, that hath wrought wickedness... and hath gone and served other gods, and worshipped them, either the sun, or moon, or any of the host of heaven, which I have not commanded... then shalt thou bring forth that man or that woman... and shall stone them with stones, till they die. (17: 2-5).

Thus we see the centuries-long struggle for the Jewish God, Creator and not

unanimated planet, itself a creation, being carried on in the closing decades before the exile to Babylon with the help of the book whose authorship was ascribed to Moses.

In -587 Jerusalem underwent a long siege by the host of the Chaldeans. Nebuchadnezzar, a fourth-generation descendent of Sennacherib, beleaguered Jerusalem. Jeremiah did not tell the king and the people, as did Isaiah a century before, that the Lord would save them from the hand of the conqueror. Jerusalem heroically defended itself for eighteen months; at last its walls were broken through and soon thereafter the temple and the city were destroyed by the host of Nebuchadnezzar, and became a desolation. The people was dragged into slavery.

When the people of Jerusalem were exiled to Babylon, and group of refugees succeeded in escaping to Egypt, taking with them Jeremiah, they said to him: "But we will certainly ... burn our incense unto the queen of heaven, and to pour out drink offerings unto her, as we have done, we, and our fathers, our kings, and our princes, in the cities of Judah, and in the streets of Jerusalem: for then had we plenty of victuals and were well, and saw no evil. But since we left off to burn incense to the queen of heaven, and to pour out drink offerings unto her, we have wanted all things, and have been consumed by the sword and by the famine" (Jeremiah 44:17-18).

It is apparent from this passage that the population of Jerusalem that sought refuge in Egypt thought the national catastrophe fell upon their people, not because they had left the Lord God, but because in the days of Josiah and his sons they had ceased to worship the planetary gods of Manasseh and especially the Queen of Heaven, the planet Venus.

Of this remnant of the people that went to Egypt in the beginning of the sixth century a military colony was established in Ebb (Elephantine) in southern Egypt. Documents (papyri) of this colony were unearthed in the beginning of this century. The Jewish colony in Elephantine faithfully worshipped Yahu (Yahwe), the Lord of the sky, as the theophoric names of many members of the colony testify. Scholars were puzzled, however, to find on one of the papyri the name Anat-Yahu; they were uncertain whether it belonged to a goddess or a place or a person. "Anat is the familiar name of the Canaanite goddess identified with Athene in a Cyprian inscription."⁽⁴¹⁾ The historical facts revealed in the present research make the understanding of such cult easier. The dark tradition that it was the planet Venus that played such an important role in the days when the forebears of these refugees in Egypt left that land and passed through cataclysms of fire and water, sea and desert, was responsible for this syncretism of names.

But at that time the ideas of Jeremiah and other prophets of monotheism grew to a strong flame in the soul of the people, and the moral code of the Jewish people was carried with the exile towards the east, and only a few decades after the destruction of the Temple of Jerusalem by Nebuchadnezzar, Buddha in India and Laotze and Confucius in China started their gospels.

The idea of some Bible critics that the Jewish people obtained their idea of monotheism in the Exile of Babylon is wrong. The Assyrians and Babylonians, according to the inscriptions which survived in abundance, worshipped simultaneously all planets. Marduk or Jupiter was the Supreme God, but in various times or even in single periods in the life of a single person, this or that deity was obtaining preeminence. So we see that Nebuchadnezzar in his younger years worshipped Astarte (Ishtar)-Venus and in later years Marduk-Jupiter; and his name indicates a reverence for Mercury (Nebo).

The Jewish people did not obtain all of its “supremacy”⁽⁴²⁾ in that one day at the Mountain of Lawgiving; this people did not receive the message of monotheism as a gift. It struggled for it; and step by step, from the smoke rising from the overturned valley of Sodom and Gomorrah, from the furnace of affliction of Egypt, from the deliverance at the Red Sea amid the sky-high tides, from the wandering in the cloud-enshrouded desert burning with naphtha, from the centuries-long battle for freedom against the Amalekite-Hyksos tyranny, from the internal struggle, from the search for God and for justice between man and man, from the desperate and heroic struggle for national existence on its narrow strip of land against the overwhelming empires of Assyria and Egypt, it became a nation chosen to bring a message of the brotherhood of man to all the peoples of the world.

In years to come, one from their midst was made god by many from among the most cultured peoples of the world; the Jews dispersed in exile among the nations were required to believe that one of their midst was god, or God’s “only son.” After having achieved pure monotheism seven hundred years earlier they would not retreat to worship god in the effigy of man. Which other people would reject the demand to believe in one of their own as the god for all nations and the lord of the universe? How much preference they could draw from it, being the nation from which God’s only son had sprung? Probably every nation of the world would have exploited such an opportunity for its own benefit, becoming priests of the world. But the Jewish people achieved its idea of God through too many sacrifices, and it was too conscious of this fact to make a deal and to succumb to this temptation; and it went to all sufferings, consciously, for the right to proclaim the faith in the only God. With this sentence they went on the *auto da fé* of the Inquisition of the Church of Love: “Hear, O Israel, there is but One God.” With these words on their lips, no doubt, most of the six million Jews who were murdered in our days ended their lives in the gas chambers built by Germans or on the gallows built by the British. The Jewish people did not invent monotheism, nor did it receive it in an easy way: it struggled to come to it, and when it came to it, it carried the message to all corners of the globe, suffering everywhere for not abandoning its conviction in an only God and one mankind.

Anaxagoras

Science started in the shadow of prison bars. Anaxagoras, who was born on the western shore of Asia Minor about the year 500 before the present era, taught “the moon has a light which is not its own, but comes from the sun.” From this it followed: “The sun is eclipsed at the new moon through the interposition of the moon.” ⁽¹⁾

“He was the first to set out distinctly the facts about the eclipses and illuminations,” wrote Hippolytus, a father of the Church, in his *Refutation of All Heresies*.

In the first century of the present era Plutarch gave this account:

Anaxagoras was the first to put in writing, most clearly and most courageously of all men, the explanation of the moon’s illumination and darkness. . . . His account was not common property, but was [still] a secret, current among only a few . . . For in those days they refused to tolerate the physicists and stargazers, as they were called, who presumed to fritter away the deity into unreasoning causes, blind forces, and necessary properties. Thus Protagoras was exiled, and Anaxagoras was imprisoned and with difficulty saved by Pericles. ⁽²⁾

Anaxagoras was accused of impiety and sentenced for holding that the sun is a red-hot stone and the moon is of earthy nature. This was in disagreement with the view that these luminaries were deities. He taught: “The sun, the moon, and all the stars are stones of fire, which are carried round by the revolution of the aether.” ⁽³⁾

Anaxagoras was put in prison and was marked for death, but Pericles barely succeeded to release him from the death house and set him free. ⁽⁴⁾ According to another account he was fined the heavy fine of five talents of silver and banished. ⁽⁵⁾ Possibly, the fine and expatriation were imposed upon him in lieu of capital punishment, by Pericles’ endeavor.

According to Theophrastus, Anaxagoras held that the moon was sometimes eclipsed by the interposition of other bodies (besides the earth) traveling below the moon. ⁽⁶⁾ Modern science does not know of such occultations of the moon and therefore denies such an explanation. Only large swarms of meteorites or comets, if interspersed between the earth and the moon, could cause the phenomenon.

Anaxagoras taught also that the terrestrial axis changed its direction in the past.⁽⁷⁾ But if to give credence to Hippolytus, he thought that “the earth is flat in form.”⁽⁸⁾ However, he believed that there are many earths like ours. According to a fragment of his,

Men were formed and other animals which have life; the men too have inhabited cities and cultivated fields as we do; they have also a sun and a moon and the rest (of the stars) as we have, and their earth produces for them many things of various kinds.⁽⁹⁾

In this there was already an initial departure from the belief in the uniqueness of the earth and its central position in the universe.

Aristarchus

The first of the Greek philosophers and mathematicians to unravel the celestial plan and announce the discovery was Aristarchus of the isle of Samos. Others before him assumed that the Earth is a sphere and that it moves, but he was the first to formulate plainly the heliocentric theory, the scheme which has the Sun in the center.

Aristarchus lived from about the year 310 before the present era to about 230, and among the geometers he succeeded Euclid and preceded Archimedes. In -288 or -287 he followed Theophrastus as the head of the Peripatetic School established by Aristotle.

Aristarchus' only extant treatise is "On the Sizes and Distances of the Sun and Moon." In it he calculated the diameter of the Sun as about seven times the diameter of the Earth, thus estimating the Sun's volume as about 300 times the volume of the Earth (the actual diameter of the Sun is about 300 times the diameter of the Earth; the solar volume is equal to 1,300,000 volumes of the Earth). In this work of Aristarchus there is nothing indicating his heliocentric theory. It was probably this his realization of the superior mass of the Sun that brought him to his discovery. Or should a celestial body three hundred times larger than the Earth revolve around it each day?

Aristarchus' book on the planetary system with the Sun in the center did not survive, and we know of it only through references to its content, chiefly by Archimedes. Archimedes, who was twenty-five years his junior, wrote: "Aristarchus brought out a book consisting of certain hypotheses. . . . His hypotheses are that the fixed stars and the Sun remain unmoved, and that the Earth revolves about the Sun in the circumference of a circle, the Sun lying in the middle of the orbit." He also added that according to Aristarchus who is in contradiction to "the common account" of astronomers, the universe is many times larger than generally assumed by astronomers, and the fixed stars are at an enormous distance from the Sun and its planets.⁽¹⁾ Aristarchus regarded the Sun as one of the fixed stars, the closest to the Earth. "Aristarchus sets the Sun among the fixed stars and holds that the Earth moves round the sun's circle (i.e., ecliptic)" referred another author, centuries later.⁽²⁾

As Archimedes said, the view of Aristarchus conflicted with the common teaching of the astronomers, and he also quoted it only to put it aside disapprovingly. One of the contemporaries of Aristarchus, Cleanthes, wrote a treatise "Against Aristarchus."⁽³⁾ Whatever his scientific argument may have been, he accused Aristarchus of an act of impiety. Plutarch wrote in his book *Of the Face in the Disc of the Moon* (*De facie in orbe lunae*) that Cleanthes "thought it was the duty of the Greeks to indict

Aristarchus of Samos on the charge of impiety for putting in motion the Hearth of the Universe, this being the effect of his attempt to save the phenomena by supposing heaven to remain at rest and the Earth to revolve in an oblique circle, while it rotates, at the same time, about its own axis.” (4)

We do not know whether there was any actual court action and verdict; however, we know that a verdict of judges, even if unanimous, could not make the Sun a satellite of the Earth. Not even a scientific tribunal can do this, not even if it is presided over by Archimedes and the most illustrious men of the generation sit as judges.

The spokesman of the scholarly world was Dercyllides, who announced that “we must assert the Earth, the Hearth of the house of the Gods, according to Plato, to remain fixed, and the planets with the whole embracing heaven to move and reject the view of those who brought to rest the things which move and set in motion the things which by their nature and position are unmoved, such a supposition being contrary to the theories of mathematicians.” (5)

Aristarchus had no followers in his generation, nor in the next generation. About a century after Aristarchus, Seleucus, a Chaldean of Seleucia on the Tigris, who lived and wrote about the year 150 before the present era, adopted the teaching of Aristarchus.

Hipparchus was a contemporary of Seleucus. Hipparchus is thought to be the greatest astronomer of antiquity, and even today there are worshippers of his among the members of the faculties. But he rejected the heliocentric system of Aristarchus, and this he did not on a religious ground, but on a scientific one. A system with the Sun in the center of circular orbits could not account for the peculiarities in the visible motions of the planets, but the theory of epicycles could, and this theory had the Earth immobile in the center of the universe.

Thus the religious dogma and the mathematical analysis, both, condemned Aristarchus and his teaching that the Earth circles around the Sun.

Plato

In -399 Socrates was made to drink poison to expiate his crimes by the verdict of an Athenian court. Following his death, Plato, his disciple then about twenty-eight years old, left Athens for a short sojourn at Megara, followed by a longer stay in Italy and Sicily (Syracuse); he also traveled to the Middle East. Only very little is known of this travel.

When a boy of about ten, Plato heard the story of Atlantis from his friend and playmate Critias the younger, what the latter was told by his grandfather, Critias the older, who in his turn had heard it from his friend Solon, who came to Sais in Egypt to learn wisdom and hear the ancient lore. From a very old priest he learned that in the past there had occurred several global catastrophes; in one of them Atlantis was swallowed by the waters of the Atlantic Ocean; in another—the one which the Greeks associated with Phaethon—there was a great conflagration caused by “a deviation of the bodies that revolve in heaven round the earth.” [\(1\)](#)

On his travels, Plato, too, endeavored to learn wisdom from the wise men of the East. But since the time of Solon’s visit in Egypt that country went through a spiritual debasement and it is questionable whether anyone of the priestly class there could be counted as a spiritual peer of Ezra, or a worthy teacher of Plato in search of wisdom.

Later Greek philosophers regarded Plato as influenced by Mosaic teaching. “Plato derived his idea of God from the Pentateuch. Plato is Moses translated into the language of the Athenians,” wrote Numenius and was quoted by Eusebius. [\(2\)](#)

If one considers Plato’s monotheism, his concept of an invisible and supreme spiritual Being, so different from the prevalent polytheism of other Greek philosophers and so remote from the pantheon of Homer and its scandalous Olympians with their permanent strife and marital and extra-marital affairs with mortal women, one is inclined to think that Plato, at the time of his travel to Egypt thirty years old, happened to sit at the feet of Ezra. A late Greek tradition has it that Aristotle on his travel to the lands of the eastern Mediterranean met a very wise Jew from whom he learned much wisdom. [\(3\)](#) However, it is not known whether Aristotle ever went to Palestine and Egypt. Besides, in Aristotle, a pupil of Plato, one feels a return to a polytheistic astral religion. Could it be that the indebtedness of Greek thought in the days of Plato to the Semitic idea of one and single invisible Creator stemmed from Ezra? We also don’t know of any “wise and knowledgeable man” approximating Ezra’s stature in the next few generations. All this belongs to the

realm of the possible but unproven, and the probable presence of Ezra in Jerusalem after -398 (in the days of Artaxerxes II) is of interest for this intriguing problem. [\(4\)](#)

Cicero and Seneca

Cicero in the last century before the present era, the statesman and philosopher of republican Rome, declared the stars to be gods. The divinity of the planets he explained by their occupying the sublime positions and by their following unerringly their paths.

Since the stars come into existence in the aether, it is reasonable that they possess sensation and intelligence. And from this it follows that the stars are to be reckoned as gods. For it may be observed that the inhabitants of those countries in which the air is pure and rarefied have keener wits and greater powers of understanding than persons who live in a dense and heavy climate. . . . It is therefore likely that the stars possess surpassing intelligence, since they inhabit the ethereal region of the world.

Again, the consciousness and intelligence of the stars is most clearly evinced by their order and regularity . . . the stars move of their own free will and because of their intelligence and divinity. . . . Not yet can it be said that some stronger force compels the heavenly bodies to travel in a manner contrary to their nature, for what stronger force can there be? It remains therefore that the motion of the heavenly bodies is voluntary. . .

Therefore the existence of the gods is so manifest that I can scarcely deem one who denies it to be of sound mind.

This dogmatic thinking, changing the statute of faith but not the mode of thinking, existed in all ages: in the Rome of Cicero and Caesar, in the Rome of the Catholic Church, in modern observatories. The categorical manner in which the dissidents are castigated as being of unsound and vicious mind can be seen again in the burning of Giordano Bruno, in the compelling of Galileo to recant on his knees, in the coercing of the publisher of *Worlds in Collision* to give up the publication.

The notion expressed by Cicero that planets are divine bodies endowed with divine intelligence was deduced not from the fact of their occupying the ethereal heights and moving unerringly—these attributes were only called upon to prove the existing idea of planets and stars being gods. And the source of this belief, deep-rooted and widespread, was in natural phenomena and extraordinary events of the past that grew dimmer with every passing generation.

Pliny, the Roman naturalist of the first century, knew to tell of interplanetary discharges: “Heavenly fire is spit forth by the planet as crackling charcoal flies from a burning log.” Interplanetary thunderbolts, according to him, have been caused in the past by each of the three upper planets—Mars, Mercury and Saturn.

Seneca, the contemporary of Pliny, mentor of Nero and philosopher, was no mathematician and no astronomer; however, he rose to a clearer concept of comets as members of the planetary system. The prevailing view was that of Aristotle, according to whom the comets are exhalations of the earth in sublunar space, something of the nature of rainbows. Seneca regards them as bodies akin to planets, yet not planets, on very elongated orbits, and he knows that the Chaldeans have determined their orbits: “Apollonius of Myndus asserts that comets are placed by the Chaldeans among the number of the wandering stars (i.e., planets) and that their orbits have been determined.” ⁽¹⁾ He knows that comets are seen only when they come close to the sun, or when they reach the lowest portion of their course. He opposes the view that the comets are unsubstantial bodies; the argument is brought forward that the sight can penetrate through comets and see the stars behind; Seneca answers that this is the case with the tails of the comets, not with their heads, through which one cannot see. He knows the view expounded by Artemidorus that “the five planets are not the only stars with erratic courses, but merely the only ones of the class that have been observed. But innumerable others revolve in secret, unknown to us, either by the faintness of their light, or the situation of their orbit being such that they become visible only while they reach its extremities.”

“The day will yet come,” wrote Seneca in his treatise *De Cometis*,

when the progress of research through long ages will reveal to sight the mysteries of nature that are now concealed. A single lifetime, though it were wholly devoted to the study of the sky, does not suffice for the investigation of problems of such complexity. And then we never make a fair division of the few brief years of life as between study and vice. It must, therefore, require long successive ages to unfold all. The day will yet come when posterity will be amazed that we remained ignorant of things that will to them seem so plain. The five planets are constantly thrusting themselves on our notice; they meet us in all the different quarters of the sky with a positive challenge to our curiosity.

The man will come one day who will explain in what regions the comets move, why they diverge so much from the other stars, what is their size and their nature.

Many discoveries are reserved for the ages still to be when our memory shall have perished. The world is a poor affair if it does not contain matter for investigation for the whole world in every age . . . Nature does not reveal all her secrets at once. We imagine we are initiated in her mysteries. We are, as yet, but hanging around her outer courts.

Seneca was compelled to take his own life when accused of plotting against Nero, his pupil. He was born in the same year as Jesus of Nazareth. In less than three hundred years Rome was to become the citadel of the new religion. Three forces kept science from progressing and brought about the dark ages: the invasion of the hordes coming from the east and north; the influence of the Church that imposed dogmas and made the human spirit unfree; and the scientific dogma that petrified itself in a thousand-year-long worship of Aristotle—through all the years of the Middle Ages, with their crusades, scholasticism, and Black Death.

A strange amalgam of the Christian dogma and Aristotelianism became the credo of the Church, that regarded the world as finite, the earth as the center of the universe, and also immovable. The codification in the science of astronomy was performed by a distant pupil of Aristotle, Claudius Ptolemy, an Alexandrian astronomer and mathematician, the greatest authority in those sciences for his own age—he lived in the second century—and for all successive centuries until the time of de Brahe and Kepler, almost fifteen hundred years later, it was the undisputed dogma.

Newton

In the year Galileo died (1642), Newton was born. At the age of twenty-four, when a plague was ravaging the cities of England, he secluded himself at his parental home in Lincolnshire and there contemplated the motions of the heavenly bodies. This work of his was put aside for two decades; it was not until the year 1686 that the first edition of *Philosophiae Naturalis Principia Mathematica* was published. A testimony is preserved that says the figures Newton had of the size of the earth and thus of the terrestrial radius were rather inexact—and consequently his computations of the Earth's gravitational pull did not agree with observations. And, it is said, when the French savant, J. Picard upon measuring the meridian in Lapland, came to the correct result, that Newton became confident of his formula for inertia and gravitation. ⁽¹⁾

Life—claims (Hooke, Flamsteed, Leibnitz). Light corp.; space empty; how does gravitation act? nature of gravitation; law of simplicity.

When explaining his theory of celestial mechanics, Newton used the following example. A projectile—a stone—is thrown horizontally from the top of a high mountain; because of its weight it is

forced out of the rectilinear path, which by the initial projection alone it should have pursued, and made to describe a curved line in the air; and through that crooked way is at last brought down to the ground; and the greater the velocity is with which it is projected, the farther it goes before it falls to the earth. We may therefore suppose the velocity to be increased, that it would describe an arc of 1, 2, 5, 10, 100, 1000 miles before it arrived at the earth till at last, exceeding the limits of the earth, it should pass into space without touching it. ⁽²⁾

At a very definite curve, the result of a very precise and definite velocity of projection, the stone would follow the circumference of the earth and “return to the mountain from which it was projected” without falling to the ground or flying off into space.

For the sake of this example, “let us suppose that there is no air about the earth or at least that it is endowed with little or no power of resisting,” and that only the weight of the projectile causes it to bend its path.

One can observe that these two figures differ by seven percent, and that therefore complete correspondence is an exaggeration. There are other, much more close

correspondences involving our moon, and they still belong in the domain of coincidences. The moon, for instance, is placed so on its orbit that it appears nearly the same size as the sun, and actually, during the full eclipses, the moon chances so to cover the sun that only the solar corona is seen over the dark zone of the moon. Also the already mentioned fact that the moon's mean distance is very nearly equal to sixty terrestrial semi-diameters, the number of seconds in a minute; or the fact that light travels 186,000 miles in a second, and the diameter off.

At the age of fifty, when the biological process of involution generally sets in in man, Newton became ill and depressed. The excessive exploitation of his brain, his unrelenting search for answers to nature's unsolved problems undermined and disturbed the mental balance of the genius. When Newton was forty-five years old, his *Principia* was published. Then he worked on optics. The story goes that he left his manuscript on the table close to a burning candle and went out of the room to look at a procession; a pet overturned the candle and the manuscript burned. This misfortune started his depression. It is questionable whether this is a true story. In a young man mental depression usually sets in when the person faces a big task and is afraid to fail; in the second half of life, the person becomes depressed mostly as the result of slighting and humiliation. It would be wrong to think that a person who is great is protected by his greatness from the feeling of slighting and humiliation. Newton's experiences with Hooke, with Leibnitz, and with Flamsteed could have been the real cause.

Edlestone, *Correspondence*, p. LXIII.

Brewster, *Life of Newton*, II, 142.

Dr. Ferd. Rosenberger, *Isaac Newton und seine physikalischen Prinzipien* (Leipzig, 1895).

Letter to Pepys (p. 278 in Rosenberger)

It is possible and even probable that if Newton lived in our time he would not support his theory of the mechanical movement of the planets. At the end of the *Principia* he wrote:

But hitherto I have not been able to discover the cause of those properties of gravity from phenomena, and I have no hypotheses; for whatever is not deduced from the phenomena is to be called an hypothesis; and hypotheses, whether metaphysical or physical, whether of occult qualities of mechanical, have no place in experimental philosophy.

Thus he felt that he left his theory of gravitation unjustified because he was unable to explain the cause of gravity and the nature of this phenomenon. However, he must have had some intuitive inkling of where to look for explaining gravitation, because

on the same page, which is at the end of the third book of *Principia*, he wrote:

Descartes

In 1633 Rene Descartes, philosopher and geometer, then thirty-seven years old, was preparing for publication a great work, *Le Monde et le Traite de l'Homme*, when at the end of November of that year the news arrived at Deventer, Holland where Descartes was staying at that time, of the persecution to which Galileo had been subjected in Rome. Not desirous of coming into conflict with the Catholic Church, Descartes decided against the publication of his work and, being also a practicing Catholic, he wrote to the mathematician Marin Mersenne:

This [the condemnation of Galileo] came as so much of a surprise to me that I have all but made up my mind to burn my papers in their entirety, or at least not allow them to be seen by anyone. For I could not imagine that Galileo would have been prosecuted for anything else but that, no doubt, he must have wanted to establish the motion of the Earth which, I am well aware, was at one time censured by several cardinals; but I thought I heard it said that even afterwards the public teaching of it was not discontinued, not even in Rome; and I confess that if it is wrong, so are the entire foundations of my philosophy, for it [i.e., the motion of the Earth] is demonstrated by them, evidently. And it is so closely tied to all parts of my treatise that I would not know how to separate it without making the rest defective. But since I would not for anything in the world want that from me should come so much as a word disapproved of by the Church, I would prefer to suppress it, rather than to let it appear mangled. . . . I beg you also to send me whatever you know about the Galileo affair.

Descartes never again picked up the manuscript, and it was not published until decades later, long after his death. Instead, in 1644, Descartes published his *Principes de la Philosophie*, in which he developed his theory of the mechanism of planetary motions. The universe is filled with subtle matter, some kind of effluvium, not much different from the ether of later authors; the sun by its rotation causes this effluvium to be concentrated in vortices that carry the planets around the sun on their orbits.

Whatever was the manner whereby matter was first set in motion, the vortices into which it is divided must now be so disposed that each turns in the direction in which it is easiest for it to continue its movement for, in accordance with the laws of nature, a moving body is easily deflected by meeting another body.

Descartes' theory of vortices soon became the accepted teaching about the

mechanism of the solar system.

Descartes himself proved, however, that philosophers who solve the mysteries of the world can commit fatal mistakes. After some deliberation and wavering, he accepted the insistent invitations to teach philosophy to Queen Christina of Sweden. As so many shallow persons, she was flattered to have the most famous philosopher of Europe at her feet—and actually at her bedside—for she ordered him to appear every morning at five to start the lesson. He cared for nothing more in his habits as for a late rising. The cold nights and early morning hours in the winter of Sweden broke his health, and four months after arrival in Sweden he died there from pneumonia.

Cartesian philosophy finds many followers until today. But his scheme of things celestial has long been regarded as discredited: this teaching prevailed on the continent in his lifetime and still in the lifetime of Newton, but not much longer.

Laplace

On February 10, 1773, Pierre Simon Laplace, a twenty-three years old scientist, read before the Academy of Sciences in Paris a paper in which, on the basis of the Newtonian theory of gravitation, he announced the invariability of planetary mean motions. "This was the first step in the establishment of the stability of the solar system," says the *Encyclopaedia Britannica* (14th ed.). A mathematical genius, Laplace showed in a mathematical analysis that the planets must proceed on their paths to the end of time and that, accordingly, they have been on their present orbits since the very beginning. In a series of papers Laplace and Lagrange, another mathematical genius whose ideas went in the same direction, vied in a complete substantiation of this thesis of invariability of the planetary mean motions. No planet could ever have joined the family of the planets; no planet has ever changed its orbit. It was a work of stability in the cosmos carried through to the very eve of the French Revolution. In 1796, in a note to the *Exposition du systeme du monde*, Laplace offered his idea of the origin of the solar system. it was a large nebula, it rotated, and because of the gravitation of the mass to its center, a sun formed itself in the middle, and condensed. The outer parts of the nebula broke into rings, and the rings rolled themselves into globes—the planets. He insisted that there could be no accident in the fact that the sun, all known planets, all known satellites, roll in the same direction, counterclockwise. And, being a master of the theory of probabilities, he concluded that there are four billion chances against one that this plan is not the result of chance. Even the best known historical events have not been authenticated at the same ratio of four billion against one. By today we known that Laplace was wrong: with the discovery of the first retrograde satellite—and today more than ten retrograde satellites are known. The rotation of Venus is also retrograde, as is that of Uranus, discovered in 1781. The four billion against one odds became zero against one: there may still be a common plan in the arrangement, but this plan was no more evident.

Nevertheless, the estimate of the twenty-three year old Laplace that the planetary orbits are eternal became the principal statute of faith, or the supreme dogma of the astronomers of the nineteenth and twentieth centuries. On it is based the astronomy of today.

According to Laplace, gravitation, in order to keep this system together, must propagate with a velocity that, compared to the velocity of light, is at least fifty million times greater. And since light propagates with the velocity of 300,000 kilometers in a second (186,000 miles), the velocity with which gravitation must propagate in order that the solar system should not fall apart must be infinite, or instantaneous. This last postulate of Laplace was sometimes silently dropped out of his theory; and the permanency of the celestial orbits remained, and served as alpha

and omega of all subsequent thinking.

Voltaire

Francois Marie Arouet de Voltaire (1694-1778), wit, liberal, and freethinker, at the age of thirty-one was insulted by Chevalier de Rohan and answered with a biting sarcasm. A little time later, when dining at the table of the Duc de Sully, he was asked to step out and was beaten by the servants of Rohan, who looked on. For three months Voltaire postponed to challenge Rohan to a duel; then he challenged, but on the morning set for the encounter, he was arrested and put into the Bastille; after two weeks there he, in accordance with his own wish, was deported to England. there he stayed for three years, from 1726-1729.

When Voltaire returned to France, he was a self-appointed agent of all things British. In the world of thought the supreme point of difference between the French and the British lay in the conflict of views of Descartes and Newton on the mechanics of the universe. Descartes was long dead, and Newton died in 1727, during Voltaire's stay in England. The French scientists in general kept to the teaching of Descartes about the vortices that compel the planets to follow their paths; the British scientists adopted the Newtonian teaching of universal gravitation, and the debate was going on upon Voltaire's return to France. In the years that Voltaire spent at Cirey as a guest of Madame du Chatelet, he wrote, with her assistance, a long treatise on the Newtonian system of the world. The singular influence Voltaire gained in France, in Germany, and in the rest of Europe was responsible for the early acceptance of the Newtonian system and the rejection of the Cartesian. Although himself no mathematician, Voltaire set himself up as the supreme judge and decided in favor of Newton and against his compatriot. He actually stopped the debate. His influence was also responsible, more than anything else, for making the deeply Catholic France into a nation of freethinkers, thus paving the road to the French Revolution of 1789, that took place eleven years after his death.

Nicolas Boulanger

The name Nicolas Boulanger is not found in most encyclopedias and is known only to a few scholars. He was a contemporary of Jean-Jacques Rousseau, Voltaire, and Diderot, illustrious names in the history of French letters. He lived only thirty-seven years, from 1722 to 1759. I came across the name very late in my research,¹ actually in 1963 and read in his works a few years later. I found that in some aspects he was not only my predecessor, but also a predecessor of Jung and Freud, actually solving the problem Freud and Jung left unsolved. Namely, he understood that the irrational behavior of the human species together with all the heritage of religious rites and much of the political structure of his own and other ages, were engendered in cataclysmic experiences of the past, in the Deluge, or deluges, of which there could have been more than one.

In Boulanger's time geology as a science was in a prenatal stage. But as a road engineer he made observations in the valley of the Marne that made him draw conclusions which he substantiated in reading the then existing books of folklore and sacred writings; also classical writers were available to Boulanger, either in originals or in translation. He was convinced that the Deluge was a global occurrence, but this was no innovation on his part, because it was an accepted notion in his time: actually, he was the author of the entry "Deluge" in the great French *Encyclopédie*, edited by Diderot. In his books he referred sometimes to the Deluge as to a singular occurrence, but then he spoke of multiple cataclysms. He seems not to have had an idea from where the water of the universal flood could come, and did not show awareness of any extraterrestrial agent as causing the world-wide calamity. Thus Saturn does not figure as connected with the upheaval. Human beings witnessed the catastrophes and the human race suffered one or several traumatic experiences; the scars the human psyche sustained are buried deep in the souls of all of us.

"We still tremble today as a consequence of the deluge and our institutions still pass on to us fears and the apocalyptic ideas of our first fathers. Terror survives from race to race... The child will dread in perpetuity what frightens his ancestors."²

Boulanger's works were published after his premature death by Diderot, but his geological observations were not included in the printed volumes; extracts from these observations and selections appear in a recent work on Boulanger,³ and do not impress as compelling. But one has to keep in mind that the age of geology as a science did not start but after Boulanger's death. In the broad realization that our society as well as the savage society still lived in the shadow of the traumatic experience of the past, Boulanger not only preceded Jung and Freud but also spelled

out the nature of the traumatic experience or experiences that caused the memory of them to submerge in the racial mind.. Thus he not only could claim priority in the understanding of the phenomenon of racial memory and collective amnesia, but also could claim the fact, unrecognized by Freud, that catastrophic events served as the trauma. Neither Jung nor Freud knew anything of Boulanger, and his name is not found in the psychological literature. Not so much his claim that catastrophic events took place in the past deserves attention—such view was already found in the writings of William Whiston; again, Buffon, Boulanger’s contemporary thought that a massive comet hit the sun and caused the origin of the planetary family; and after Boulanger the scientific thought of the eighteenth century and of the first half of the nineteenth again and again sought for the cause of the global upheavals. However Boulanger’s distinction lay in his contemplating the consequences of such upheavals for the human psyche.

Adams

The greatest triumph of the celestial mechanics built on gravitation and inertia to the exclusion of any other forces took place in 1846 when Neptune was discovered in the place in the sky calculated by Adams and Leverrier independently of each other; they indicated the direction where the planet would be found with the exactness of one degree; they calculated its position by considering the unaccounted for perturbations of Uranus. The story of its discovery is an exciting chapter in the history of astronomy: how the poor student Adams stood in the antechambers of the Royal Astronomer Airy and was sent away by the valet because Sir Airy was at the table, and how he tried to convince the powerful astronomer of the existence of an eighth planet by sending in his calculations; and how the Frenchman Leverrier was much more fortunate by having performed very similar calculations and by having sent them to the observatory at Potsdam where the young astronomer Galle, the very first night at the very first look at the indicated direction found the new planet. The excited scientific community in Europe was soon plunged into the debate who of the two was the true discoverer, or better prognosticator, since Galle was the discoverer of the planet; the passions were divided by the national line, with the French and British rivalries inflamed, and the Royal Astronomer had to defend his behavior; there exists quite a literature on the subject. The French insisted on their priority and even named the new planet “Leverrier,” and it took some time before its new name Neptune prevailed. Till today the case is debated and the pride of Britannia, in any event deprived of priority, of the greatest discoveries, is still not completely healed.

The discovery was hailed by the British and the French—and by everyone—as the greatest triumph of the Newtonian theory of gravitation. Uranus showed certain irregularities in its motion unaccounted for by the gravitational pull of the known planets, and the existence and the position of a planet not yet seen was claimed by Adams and Leverrier alike. This was possibly the best prognostication in the annals of science. But was it really so precise and was it such a triumph for Newton as always asserted?

The so-called Bode’s Law is the empirically established regularity, covered by a simple formula, in the mean distances of the planets from the sun. This regularity can be traced through the planetary system from Mercury to Uranus (the one vacant place, between the orbits of Mars and Jupiter, was filled in, when in the first night of the nineteenth century Ceres, the first of the many asteroids was discovered by Piazzi Smyth). Adams and Leverrier alike assumed that the planet which causes unaccounted perturbations in Uranus must be located at a distance dictated by Bode’s Law. And since Saturn, the sixth planet, is smaller than Jupiter, the fifth, and Uranus, the seventh, is smaller than Saturn, it would be quite logical to expect a planet smaller

than Uranus at a distance of 1,750,000,000 miles from its orbit. But next the calculations showed that the distance of the two planets when in conjunction is not 1,750,000,000 miles but only roughly 1,000,000,000; and with the gravitational attraction decreasing with the distance as the inverse square of the latter, the mass of the newly discovered planet was grossly overestimated: it was supposed to exert the influence from a much greater distance than one actually found. It was not enough to show the direction where the planet would be found; it was necessary, in order that the prediction should be true, that the planet would be at the distance predicted, and it was not with Adams, nor with Leverrier, both of whom committed the same error. Therefore, when the great controversy raged between the supporters of Adams and those of Leverrier, some voices were heard that neither of them was a true prognosticator and there was no point in the rivalry. To make a distance error of 75 percent was equal to a threefold overestimate of the mass of the planet. In order to produce the effects from its true distance Neptune needed to be three times as massive as it actually is. Bode's Law broke down with the discovery of Neptune. And though Neptune is a little more massive than Uranus, the discrepancy between what was expected and what was found in no manner can be regarded as a rigid confirmation of the Newtonian celestial mechanics with an exact formula of attraction between masses at changing distances. The story is not yet at its end, and we need to tell of the discovery of Pluto, the ninth planet, which should have explained what Neptune left unexplained, but failed to do so, either, and by a still larger margin.

Yet in 1846 the discovery of Neptune was acclaimed, and because of the inertia of the human mind, is still acclaimed as the greatest proof of the truth of Newtonian celestial laws of gravitational mechanics.

Nicola Tesla

In the beginning of this century a Croatian* engineer, emigrant to America, Nikola Tesla, measured the electrical charge of the planet Earth and found it of a very high potential. He made his observation during thunder storms.

My instruments were affected stronger by discharges taking place at great distances than by those near by. This puzzled me very much. . . . No doubt whatever remained: I was observing stationary waves. As the source of the disturbances [thunderstorm] moved away, the receiving circuit came successively upon their nodes and loops. Impossible as it seemed, this planet, despite its vast extent, behaved like a conductor of limited dimensions. The tremendous significance of this fact in the transmission of energy by my system had already become quite clear to me. Not only was it practicable to send telegraphic messages to any distance without wires, as I recognized long ago, but also to impress upon the entire globe the faint modulations of the human voice, far more still, to transmit power, in unlimited amounts, to any terrestrial distance and almost without loss.⁽¹⁾

Nikola Tesla was a pioneer in many fields of electrical theory and technology. He was the first to utilize alternating current, conceiving an effective system for its generation, transmission, and utilization. Edison appealed to the public, warning that the alternating current of Tesla would cause great harm to its users, being dangerous, and that only direct current can be harmlessly used. Tesla referred to Edison as an inventor, to himself as a discoverer. Today everyone knows that alternating current, with the help of the polyphase induction motor, can be converted into mechanical energy more effectively and economically than direct current. He invented new forms of dynamos, transformers, condensers, and induction coils. He discovered the principle of the rotary magnetic field, upon which the transmission of power from the Niagara Falls and other waterfalls and dams is carried on. A regal recluse, he despised the short-seeing men of science. Many of his pioneer inventions he carried with him to his grave. But he believed in the destiny of man who, in his words, “searches, discovers and invents, designs and constructs, and covers with monuments of beauty, grandeur and awe, the star of his birth.”

This teaches us that not only have the contemporaries of a revolutionary idea in science repeatedly rejected the idea, but also that a rejection of such an idea even by the best qualified men in the field in the generation of the revolutionary, and often still in the following generations, has occurred not once or twice, but many times. Archimedes rejected the heliocentric system of Aristarchus; Brahe rejected the system of

Copernicus; and Galileo was deaf and blind to the discoveries of Kepler, just as Edison warned against the alternating current developed by Tesla. And who was more competent to judge than Archimedes, in his time, Brahe in his, Galileo in his, and Edison in his?

* [Tesla was in fact a Serb who was born in the Croatian village of Smiljane in the Lika region, which at the time was part of Austrian monarchy. His father was an orthodox priest.— Eds.]

Einstein

Einstein was born in 1879, the year Maxwell died. It was the year when Michelson made the first in the series of his experiments in investigating the velocity of light. Einstein was born in Ulm, the town in which Kepler, his favorite scientist of earlier times, had spent some of the last months of his life, before dying in 1630. In high school the geography teacher declared Einstein to be moronic; in the Zurich Polytechnic his physics professor, as Einstein told me, once said to him: "In this college the poorest class is of experimental physics, and the poorest pupil are you." Upon graduation he was unable to secure a teaching position and, after years of private tutoring of students deficient in mathematics, he was happy to receive the position of a patent examiner in the Bern Patent Office. There he profited in learning to express himself in short and exact terms. At the age of twenty-six, in 1905, he offered the theory of relativity, later called the "special" or "restricted" theory of relativity, in distinction from the theory he offered eight years later, the "general" theory of relativity.

Should I try to put into one single sentence the gist of the theory in 1905, I would do it thus:

Space and time, regarded as absolute and unvariable entities (hour is always an hour, a meter is everywhere a meter), were declared to be relative, or changing, entities; the speed of light in a vacuum, thought to be a relative quantity (depending on the relative motion of the light source and the observer) was declared to be an absolute, unvarying entity.

A second is no longer a second for all observers. A second of time is of different duration for observers in motion and at rest; but 186,000 miles per second, whatever miles or whatever seconds, was always true.

A mile-long spaceship travels and overtakes our earth. A light signal is sent in the very middle of the spaceship; for the traveler in the spaceship the light will arrive simultaneously at both of its ends; for the observer on earth (assuming he could observe such small differences) the light will come first to the rudder that travels toward the light and then to the bow that travels away from the light. Thus the very notion of simultaneity was emptied of real content.

The theory of Fitzgerald made the matter shorter when crossing through ether and thus masked the change in velocity of light; Einstein, however, made the velocity of light in a vacuum an immutable quantity, or a constant for all observers in whatever

relative motion to the source of light they might be.

This is a sentence that can be expressed mathematically; but it is not easy to visualize it by reason. A light leaves its source and whatever object it meets in motion, toward or away from the source of light, the relative velocity of light and the object is always 186,000 miles per second.

Thus a ray of light speeds from the place of explosion in Coventry with the velocity of 186,000 miles per second to Birmingham and with the same velocity in the opposite direction toward Rugby; but the two photons of light speeding in opposite directions have a relative speed of 186,000 miles per second, not of 392,000 miles per second: nothing can be swifter than 186,000 miles per second, the velocity of light.

In those early years of Einstein's career, he spent often his time in discussions with another mathematical genius, W. Ritz. The latter could not see that the velocity of the source would not add itself to the velocity of light: in mechanics, a stone thrown by a passenger in a train acquires not only the velocity of throw but also the velocity of the train that carries the passenger. Ritz printed a paper to oppose the notion of Einstein. De Sitter answered Ritz and proved his point on an astronomical reasoning. There are double stars so placed in space that one partner eclipses the other at regular intervals. If the velocity of the retreating star would reduce from the speed of light reaching the observer and the velocity of the advancing star would add to the speed of light emitted by it, the system would appear to deviate from Keplerian motions. Such is definitely not the case.⁽¹⁾ the earth would be such that the reduction in the speed of light would let the light of one star of the binary arrive to the earth when the star would appear to be in the same place where its companion would appear at the same time. [phrase better].

The special theory of relativity explained why an ether drift cannot be detected through the experiment with the velocity of light; but it went a step farther and disclaimed any necessity of an ether. This makes a very great difference—probably the next question after the perennial “Is there a God?” is “Does a medium fill all space or is space between the material masses empty?” And not just *between* material masses—ether is supposed to fill everything, all space and all matter. Between the electrons and protons of an atom there is comparatively very wide space, as it is between the sun and the planets. Is the space all filled or is it empty?

On Prediction in Science

In order to bring into proper focus the significance of correct prediction in science, I offer at the start a short survey of the most celebrated cases, and it is not by chance that almost all of them come from the domain of astronomy. These cases are spectacular and, with one or two exceptions, are well known.

The story of scientific “clairvoyance” in modern astronomy starts with Johannes Kepler, a strange case and little known. When Galileo, using the telescope he had built after the model of an instrument invented by a Danish craftsman, discovered the satellites circling Jupiter, Kepler became very eager to see the satellites himself and begged in letters to have an instrument sent to Prague; Galileo did not even answer him. Next, Galileo made two more discoveries, but before publishing them in a book, he assured himself of priority by composing cryptograms, not an uncommon procedure in those days: statements written in Latin were deliberately reduced to the letters of which the sentences were composed, or, if the author of the cryptogram so wished, the letters were re-assembled to make a different sentence. The second way was chosen by Galileo when he thought he had discovered that Saturn is “a triple” planet, having observed appendices on both sides of Saturn, but not having discerned that they were but a ring around the planet, a discovery reserved for Christian Huygens in 1659, half a century later. Kepler tried to read the cryptogram of letters recombined into a non-revealing sentence, but did not succeed. He offered as his solution: “Salute, fiery twin, offspring of Mars” (“Salve, umbistineum geminatum Martia proles”). Of this, Arthur Koestler in *The Sleepwalkers* (1959) wrote (p. 377): “He [Kepler] accordingly believed that Galileo had discovered two moons around Mars.” But Galileo did not discover them and they remained undiscovered for more than two hundred fifty years. Strangely, Koestler passes over the incident without expressing wonder at Kepler’s seeming prescience.

As I have shown in *Worlds in Collision* (“The Steeds of Mars”) the poets Homer and Virgil knew of the trabants of Mars, visualized as his steeds, named Deimos (Terror) and Phobos (Rout). Kepler referred to the satellites of Mars as being “burning” or “flaming”, the same way the ancients had referred to the steeds of Mars.

Ancient lore preserved traditions from the time when Mars, Ares of the Greeks, was followed and preceded by swiftly circling satellites with their blazing manes. “When Mars was very close to the earth, its two trabants were visible. They rushed in front of and around Mars; in the disturbances that took place, they probably snatched some of Mars’ atmosphere, dispersed as it was, and appeared with gleaming manes” (*Worlds in Collision*, p. 230).

Next, Galileo made the discovery that Venus shows phases, as the Moon does. This time he secured his secret by locking it in a cryptogram of a mere collection of letters —so many A's, so many B's, and so on. Kepler again tried to read the cryptogram and came up with the sentence: "Macula rufa in Jove est gyratur mathem etc." which in translation reads: "There is a red spot in Jupiter which rotates mathematically."

The wondrous thing is: how could Kepler have known of the red spot in Jupiter, then not yet discovered? It was discovered by J. D. Cassini in the 1660's, after the time of Kepler and Galileo. Kepler's assumption that Galileo had discovered a red spot in Jupiter amazes and defies every statistical chance of being a mere guess. But the possibility is not excluded that Kepler found the information in some Arab author or some other source, possibly of Babylonian or Chinese origin. Kepler did not disclose what the basis of his reference to the red spot of Jupiter was — he could not have arrived at it either by logic and deduction or by sheer guesswork. A scientific prediction must follow from a theory as a logical consequence. Kepler had no theory on that. It is asserted that the Chinese observed solar spots many centuries before Galileo did with his telescope. Observing solar spots, the ancients could have conceivably observed the Jovian red spot, too. Jesuit scholars traveled in the early 17th century to China to study Chinese achievements in astronomy.

Kepler was well versed in ancient writings, also knowledgeable in medieval Arab authors; for instance, he quoted Arzachel to support the view that in ancient times Babylon must have been situated two and a half degrees more to the north, and this on the basis of the data on the duration of the longest and shortest days in the year as registered in ancient Babylon.¹

Jonathan Swift, in his *Gulliver's Travels* (1726) tells of the astronomers of the imaginary land of the Laputans who asserted they had discovered that the planet Mars has "two lesser stars, or satellites, which revolve about Mars, whereof the innermost is distant from the center of the primary planet exactly three of [its] diameters, and the outermost Five; the former revolves in the space of ten hours, and the latter in twenty-one-and-a-half; so that the squares of their periodical times are very near in the same proportion with the cubes of their distance from the center of Mars, which evidently shows them to be governed by the same law of gravitation that influences the other heavenly bodies."

About this passage a literature of no mean number of authors grew in the years after 1877, when Asaph Hall, a New England carpenter turned astronomer, discovered the two trarbants of Mars. They are between five and ten miles in diameter. They revolve on orbits close to their primary and in very short times: actually the inner one, Phobos, makes more than three revolutions in the time it takes Mars to complete one rotation on its axis; and were there intelligent beings on Mars they would need to count two different months according to the number of satellites (this is no special case — Jupiter has twelve moons and Saturn ten*), and also observe one moon ending its month three times in one Martian day. It is a singular case in the solar system among the natural satellites that a moon completes one revolution before its

primary finishes one rotation.

Swift ascribed to the Laputans some amazing knowledge—actually he himself displayed, it is claimed, an unusual gift of foreknowledge. The chorus of wonderment can be heard in the evaluation of C. P. Olivier in his article “Mars” written for the *Encyclopedia Americana* (1943):

“When it is noted how very close Swift came to the truth, not only in merely predicting two small moons but also the salient features of their orbits, there seems little doubt that this is the most astounding ‘prophecy’ of the past thousand years as to whose full authenticity there is not a shadow of doubt.”

The passage in Kepler is little known—Olivier, like other writers on the subject of Swift’s divination, was unaware of it, and the case of Swift’s prophecy appears astounding: the number of satellites, their close distances to the body of the planet, and their swift revolutions are stated in a book printed one hundred and fifty years to the year before the discovery of Asaph Hall.

Let us examine the case. Swift, being an ecclesiastical dignitary and a scholar, not just a satirist, could have learned of Kepler’s passage about two satellites of Mars; he could also have learned of them in Homer and Virgil where they are described in poetic language (actually, Asaph Hall named the discovered satellites by the very names the flaming trabants of Mars were known by from Homer and Virgil); and it is also not inconceivable that Swift learned of them in some old manuscript dating from the Middle Ages and relating some ancient knowledge from Arabian, or Persian, or Hindu, or Chinese sources. To this day an enormous number of medieval manuscripts have not seen publication and in the days of Newton (Swift published *Gulliver’s Travels* in the year Newton was to die), as we know from Newton’s own studies in ancient lore, for every published tome there was a multiplicity of unpublished classical, medieval, and Renaissance texts.

That Swift knew Kepler’s laws, he himself gave testimony, and this in the very passage that concerns us: “. . . so that the squares of their periodical times are very near in the same proportion with the cubes of their distance from the center of Mars” is the Third Law of Kepler.

But even if we assume that Swift knew nothing apart from the laws of Kepler to make his guess, how rare would be such a guess of the existence of two Martian satellites and of their short orbits and periods? As to their number, in 1726 there were known to exist: five satellites of Saturn, four of Jupiter, one of Earth, and none of Venus. Guessing, one could reasonably say: none, one, two, three, four, or five. The chance of hitting on the right Figure was one in six, or the chance of any one side of a die’s coming up in a throw. The smallness of the guessed satellites would necessarily follow from their not having been discovered in the age of Newton. Their proximity to the parent planet and their short periods of revolution were but one guess, not two,

by anybody who knew of the work of Newton and Kepler. The nearness of the satellites to the primary could have been assumed on the basis of what was known about the satellites of Jupiter and Saturn, Io, one of the Galilean (or Medicean) satellites of Jupiter, revolves around the giant planet in 1 day 18.5 hours (the satellite closest to Jupiter was discovered in 1892 by Barnard and is known as the “fifth satellite” in order of discovery; it revolves around Jupiter, a planet ten thousand times the size of Mars, in 1 1.9 hours). The three satellites of Saturn discovered by Cassini before the days of Swift - Tethys, Dione and Rhea - revolve respectively in 1 day 21.3 hours, 2 days 17 hours, and 4 days 12.4 hours. (Mimas and Enceladus, discovered by Herschel in 1789, revolve in 22.6 hours and 1 day 8.9 hours.) The far removed satellites of Jupiter were not yet discovered in the days of Newton and Swift.

It remains to compare the figures of Swift with those of Hall: there was no true agreement between what the former wrote in his novel and what the latter found through his telescope. For Deimos, Swift’s figure, expressed in miles from the surface of Mars, is 18,900 miles; actually it is 12,500 miles; Swift gave its revolution time as 21.5 hours—actually it is 30.3 hours. For Phobos, Swift’s figures are 10,500 miles from the surface and 10 hours revolution period, whereas the true figures are 3,700 miles and 7.65 hours. Remarkable remains the fact that for the inner satellite Swift assumed a period of revolution, though not what it is, but shorter than the Martian period of rotation, which is true. However, Swift did not know the rotational period of Mars and therefore he was not aware of the uniqueness of his figure. If he were to calculate as an astronomer should, he would either have decreased the distance separating the inner satellite from Mars - a distance for which he gave thrice its true value - or increased its revolution period to comply with the Keplerian laws by assuming the specific weight of Mars as comparable with that of Earth. But Swift had no ambitions toward scientific inquiry in his satirical novel.

H. H. Hess and My Memoranda

On August 25, 1972, three years elapsed since the death of Professor Harry Hammond Hess. He died of a heart attack while presiding over a meeting (convened at Woods Hole, Massachusetts) of the Space Science Board of the National Academy of Sciences. The Board had the task of overseeing the activities of the National Aeronautics and Space Administration, with its multi-billion dollar spending. At the Woods Hole meeting Hess had intended to discuss the role of thermoluminescence (TL) tests in the lunar programs, an issue I had discussed with him.

When I moved from Manhattan to Princeton in the early summer of 1952, I became steeped in library work for *Earth in Upheaval*, and the library of Guyot Hall (Princeton's geology department) was a place I frequented. Already known for my *Worlds in Collision* and the discussion it provoked, I caused some curiosity among the numerous faculty members of the department. I do not remember my first contact with Hess, but from our first meeting something in both of us attracted each other.

Hess was the chairman of the department. Once when I mentioned the Vening Meinesz submarine expedition for gravitational measurements in the Caribbean in the 1930's, during which, paradoxically, a positive anomaly was regularly detected and the greater it was the deeper was the sea, or the less mass there was, Hess surprised me by telling that he participated in that expedition.

Another highlight of his career took place during World War II. In command of a naval vessel in the Pacific with certain exploratory assignments, he utilized the opportunity to explore the bottom of the ocean in a certain area. Under the water he discovered flat-topped mountains, which he named "guyots," honoring the late Princeton professor of geology, Arnold Henry Guyot (1807-84),

By the end of the war, Hess was retired from active duty with the rank of a rear admiral. In the university he taught mineralogy and crystallography, but marine geology remained his favored subject.

In November, 1955, *Earth in Upheaval* was published. Soon it was made required reading in paleontology under Professor van Houten at Princeton — along with an antidote: Loren Eiseley's *The Firmament of Time*. Hess several times during those years gave me the opportunity to address the faculty and graduate students of his department. Since from 1953 (when I spoke before the Graduate College Forum of Princeton University) to 1963 practically no college or university or scientific society extended to me an invitation to speak, those appearances at the behest of Hess meant much to me.

He gave me his published paper on guyots. Upon reading it I wrote a rather merciless criticism of his idea that the accumulation of sediment caused the submergence of the sea bottom and with it the submergence of the flat-topped guyots. In his response he showed graciousness.

By mid-1956 preparations for the International Geophysical Year were gaining momentum. On December 5, 1956, I gave to Hess a memo describing, in brevity, several projects for inclusion in the IGY. (The Year, due to start July 1, 1957, would continue until the end of 1958.) There was not yet a Space Science Board, so I gave the memo to Hess in his capacity as chairman of the geology department. Hess sent the memo to Dr. Joseph Kaplan, one of the scientific organizers of the Year. The answer came from Edward O. Hulburt, another scientist in charge of the program, and it was addressed to the “chairman of the department of physics” at Princeton. The first of the suggested projects — to investigate the earth’s magnetic field above the ionosphere — had been, according to Hulburt, considered by the planning committee. (In my Forum Lecture [October 14, 1953] I had already claimed the existence of a magnetosphere above the ionosphere — the lecture was printed as a supplement to *Earth in Upheaval*.)

Three months after the beginning of the IGY the Russians startled the world by launching the first Sputnik (October 4, 1957), opening the Space Age. I was then on a visit to Israel, my second since I came to the States in July, 1939.

Although Hulburt referred to the plan of measuring the strength of the magnetic field above the ionosphere as considered for the program, the fact is that the discovery of the van Allen belts, the main achievement of IGY, was not anticipated or considered: when no charged particles were registered at a certain altitude, van Allen of the University of Iowa was startled, but one of his co-workers suggested that possibly the recording apparatus was jammed by too many charged particles; the apparatus was modified and the belts were discovered. At the beginning they were featured in the form of two halves of a doughnut; only much later was it recognized that the half on the anti-solar side is stretched far out. But in my memo as also in the Forum lecture, I visualized a magnetosphere reaching as far as the lunar orbit.

Another claim made in my Forum Lecture of 1953 — namely, that Jupiter could be a source of radio signals — was already confirmed in the spring of 1955. I never came out with “claims confirmed” until I read in the *New York Times* that nobody ever thought of Jupiter as a source of radio noises before they were discovered by chance. I turned to Lloyd Motz, Columbia University astronomer, and V. Bargmann, Princeton University physicist, both of whom were entrusted by me with the script of my Forum Lecture soon after its delivery. They wrote a joint letter to *Science*, which published it in the December 21, 1962 issue, concurrent with the yearly convention of the American Association for the Advancement of Science, publisher of *Science*. It almost coincided with the first reports of Mariner II, which had passed its rendezvous with Venus a week earlier, on December 14. The high temperature of Venus was

confirmed.

This last announcement was made by Dr. Homer Newell for NASA in February, 1963. The presence of hydrocarbons in the clouds surrounding Venus was also announced as confirmed — this on the basis of the work of Dr. L. D. Kaplan (Jet Propulsion Laboratory): only compounds containing the radical CH (polymerized) could lend to the 15-mile thick cloud the same properties at the -25° F temperature at the top of the cloud and at the $+200^{\circ}$ F temperature at the bottom of the cloud separated by 45 kilometers of lower atmosphere from the sizzlingly hot ground surface of the planet.

I wrote an article, “Venus — A Youthful Planet,” and sent it to the editor of *Science*. I found it back in my mailbox less than 48 hours later, returned unread.

I discussed the case with Hess, and he decided to offer it for publication in the American Philosophical Society *Proceedings*. As a member of the society he was entitled to sponsor a paper by a nonmember. The paper was submitted, and its fate was related by *Yale Scientific Magazine* (April, 1967, p. 8): “The paper was discussed at the editorial board meeting of the Society and caused prolonged and emotional deliberations, with the Board split between those favoring the publication and those opposed to it. For several months a decision could not be reached ... the decision was made, in order to safeguard the very existence of the Board, to delegate the decision on the article to three members of the society, not members of the Board. Their names were not disclosed but on January 20, 1964, Dr. George W. Corner, Executive Officer of the Society and the editor of the *Proceedings*, informed Dr. Hess that the decision had been made to reject the article.

“Subsequently it was also rejected by the *Bulletin of Atomic Scientists*. In that magazine in April, 1964, an abusive article was published by a Mr. Howard Margolis, attacking Velikovsky and his work. The editor of the *Bulletin*, Dr. Eugene Rabinowitch, in a letter to Professor Alfred de Grazia, editor of the *American Behavioral Scientist*, offered Velikovsky an opportunity to reply with an article ‘not more abusive’ than that of Margolis, or, instead, to have some of his views presented in the *Bulletin* by some scientist of repute. Then Professor H. Hess submitted the article “Venus — A Youthful Planet,” to Dr. Rabinowitch. The latter returned it with the statement that he did not read Velikovsky’s book, nor the article.”

In July *Harper’s* printed an article by Eric Larrabee calling for an “agonizing reappraisal” of my work. Menzel of Harvard College Observatory, who not so long previously had revoked his earlier estimate of Venus’ temperature as much too high, now wrote in *Harper’s* that “hot” is a relative term and liquid helium is hot in relation to liquid hydrogen. As to my claim concerning the magnetosphere, Menzel argued that since I claimed that the magnetosphere reaches as far as the lunar orbit, I made a wrong prediction. The magnetosphere, he said, does not reach more than a few terrestrial radii, whereas the moon is 60 terrestrial radii distant.

Hess was adversely impressed by the attitude of the scientific community toward me and my work; still subscribing to the accepted uniformitarian doctrine, he had sympathy for my independent stand. He wrote a letter that was intended for public record and which Doubleday incorporated in its "Report on the Velikovsky Controversy," printed in the Book Review Section of the *New York Times* (August 2, 1964).

While a debate was going on in several issues of *Harper's*, the Australian physicist/cosmologist, V. A. Bailey, joined the fracas and accused Menzel of pre-space age thinking.

Hess, now president of the American Geological Society and chairman of the Space Science Board, suggested that I put together a program for space investigation. I responded without delay; the memo of September, 1963, resulted.

About that time de Grazia published a special issue of the *American Behavioral Scientist* dealing, with the reception of my work. When he came to see me, Hess came too.

Once or twice I asked Hess to organize a panel of members of various faculties of Princeton University that would investigate what was right and what was wrong in my theory and what was proper or improper in the attitude of my critics. Before he decided whether to follow this course (perhaps, expecting a negative attitude by faculty members, he tarried), an initiative came from Dr. Franklin Murphy, at that time chancellor of the University of California at Los Angeles. He asked UCLA's geophysicist, Professor Louis Slichter, to organize a committee for the same kind of inquiry I had proposed to Hess. Murphy's initiative, however, foundered and the story needs to be told separately. It embraced the period from January to November, 1964.

In January, 1965, Hess took the initiative to organize the Cosmos and Chronos Study and Discussion Group, and he placed in the Bulletin of the University an announcement of the first open discussion. Originally we planned a debate on evolution based on the uniformitarian principle vs. evolution based mainly on cataclysmic events. My opponent was to have been Princeton professor of biology, Colin Pittendrigh. "There was a mutual respect between us (earlier he had visited me and also inscribed to me a biology text which he co-authored with G. G. Simpson, my early antagonist), but Pittendrigh insisted that the problem of extinction in the animal kingdom should not be a part of the debate. I could not see how the two parts of the evolutionary problem — the evolution of new species and the extinction of the old — could be separated in a meaningful debate. It appeared that the friendly relations between us were in jeopardy. Hess, without fanfare, offered to be my opponent.

The debate took place in the auditorium of Guyot Hall and fared well. Next, Professor Lloyd Motz came from Columbia University to debate me on astronomical subjects. The third open debate was between me and philosopher Walter Kaufmann of the

Princeton faculty. Other study groups spontaneously organized themselves on various campuses. The story of the first four or five years of Cosmos and Chronos and what changes in the structure of the organization I had to demand is a story by itself;

In the fall of 1966 I spoke in the new auditorium of the Wilson School of Princeton University, under the aegis of the Princeton chapter of the American Institute of Aeronautics and Astronautics. The lecture was described by Walter Sullivan, science editor of the *New York Times*, in his column of October 2, 1966. As he described it, he first visited Hess to find out whether Velikovsky is a person of integrity. Hess assured him of my complete integrity and added something about my memory, ascribing to me more than I deserve.

An unusual memory was actually one of Hess' own characteristics. Things spoken or letters read were remembered by him years later. Once, when I exhorted him to reread a chapter in *Earth in Upheaval*, he replied that he knew the book by heart. His many very large tables that served him as desks were covered with stacks of papers, but it seemed that he could always find the necessary document; he was helped by a devoted secretary, Mrs. Knapp, who, it seems, also relied on his memory.

Despite his heavy schedule (he never stopped teaching crystallography), Hess was available for many a demand on his time. I remember the case of an uneducated but dedicated man who, living in Michigan, collected many rocks, obviously burned, and wrote me regularly of his belief that the lake was scooped out by an asteroid impact. He mailed me, at intervals, boxes with stones. I sent some of them to a scientist at the University of Pittsburgh whom I knew, and brought some others to Hess. The former did not answer; the latter took a few of them to investigate their possible meteoritic nature.

Hess ascribed the reversal of the rocks' magnetic orientation to a spontaneous process in the minerals, as he had claimed in debate with me at my occasional lectures at the geology department. But when he finally realized that such spontaneous reversals could not occur simultaneously in rocks of various compositions, he volunteered to tell me that he was wrong.

When, years after my first memo of December 5, 1956, he read or heard a paper concerning the reversal of the direction of winding in fossil vines and shells from both southern and northern hemispheres, he was pleased to let me know that the claims the IGY would not investigate were confirmed by independent research.

In 1967 I gave him a memorandum on radioactivity hazards for astronauts in several localized areas of the moon and Mars, results of interplanetary discharges. Dr. Homer Newell of NASA sent the memo to scientists on the staff who he thought would be the ones to consider the subject. By that time Hess and I started to call one another by our first names.

In 1968 Hess was named by the Italian government and Academy of Sciences the

recipient of a major prize (in monetary value, approaching the Nobel prize) for his old work on the guyots. Despite all the distinctions he received, he remained a quiet and humble man. I never heard him speak in a loud voice. He did not pull or push and, which was unusual in the academic atmosphere of the time, he was sought out for his fairness.

Not long before his death he purchased a new home. Until then he had lived in a university house on Fitzrandolph Street, The house, built with its gables like a chalet, was occupied by Woodrow Wilson when he was president of Princeton University. At one of my rare visits, Hess drew my attention to the book cases built at Wilson's behest.

The last and possibly the most exciting event was quickly approaching. Hess, usually shy of publicity, made himself available to the press to state his belief that water in quantity would be found under the lunar surface. I remember how he showed me a winding rill or rift photographed on the moon and wished me to agree with him that it was caused by running water. I discussed with him my views, namely that the moon was once showered by water of the universal Deluge, but that all of it or almost all of it dissociated before the later cosmic catastrophes. The face of the moon we see was formed in those later catastrophes.

On May 19 I wrote down a few of my advanced claims concerning the moon and handed it to Hess' research assistant, who strongly supported the view that large water reservoirs lay under the moon's surface. Hess said to me, "this time you will be wrong." Until then, closely following my record, he found that all my expectations ("predictions") turned out to be true. Once, on our way from Guyot Hall to our respective homes, he ascribed my record to intuition. When I asked which of my claims does not follow from my thesis, he replied, "noises from Jupiter." He was right, but only to the extent that I have not yet published the story of the earlier cataclysms, promised in the final chapter of *Worlds in Collision*.

The events surrounding the first manned landing on the moon had a dramatic urgency, and they, too, need to be recorded separately. My two telephone conversations in which I tried to obtain Hess' support for thermoluminescence tests of lunar core extracts, as also envisioned in my article in the *New York Times* on the evening of the first lunar manned landing, can be read in the correspondence.

I saw Hess once more — he was with his secretaries and assistants, preparing for the Woods Hole meeting. He was not in a cheerful mood — that morning the news came that hydrocarbons (petroleum derivatives) were discovered on the moon, but no water yet. (Now, almost three years later, signs of the one-time presence of water have been detected.) He was, it appeared to me, gloomy.

About half a year earlier he had suffered a heart attack. He was always a chain smoker. The load of work, the excitement of the last few weeks, and possibly a discouragement, but quite probably his premonition that he would not be able to

witness the entire lunar program of many landings, must have weighed heavily on him.

On the morning of August 26, 1969, I picked up a newspaper at the Princeton Junction railway station and saw Hess' friendly face on a page carrying a eulogy.

The day the university arranged a memorial service in its chapel, I was delivering a lecture to the faculty of the Ocean County College. I spoke of Hess.

On October 21, exactly three months after the first landing on the moon, at my initiative, the geophysical department (the new name for the geology department), together with the Cosmos and Chronos Study Group, arranged a memorial lecture at the auditorium of Guyot Hall. The opening part of my lecture, "From Sputnik to Apollo XI," was dedicated to Hess.

In Hess' passing I lost the only member of the scientific elite who demanded a fair treatment for me and my work. When in November the assistant to the president of the university came to see me, I spoke of Hess and could not hide the tears in my eyes. For the rest of 1969 I felt depressed.

Of people who were prominent in their fields and who, since the beginning of my work and through the years showed me more than casual interest and sympathy, I name Robert Pfeiffer, orientalist and Biblical scholar (d. 1958); Horace M. Kallen, philosopher and educator; Walter S. Adams, astronomer (d. 1956); Albert Einstein (d. 1955); and Harry Hess, who died in his sixty-fourth year, three years ago. Kallen alone of all of them is alive, having these days reached the venerable age of ninety, still active as writer and lecturer, with time having dimmed none of his mental abilities.

They were few, but each of them was great as a human being.

The Ocean

SEDIMENTS

Poseidon, lord of the Ocean, was the first to come to my defense. A basic assumption of geology for the past century has been that, though the sea may encroach on land by covering coastal areas with shallow water, the continents and the oceans are primeval; what is now ocean was always ocean and the continents were always land masses, independent of whether they do or do not move slowly, as a certain theory (continental drift) proposes.

In *Worlds in Collision*, the permanency of land and sea was denied. In the presence of external forces, with attendant pulling and shearing, land submerged into the depths of the sea, and sea bottom rose to become land. Prior to certain catastrophes, earlier than those described in *Worlds in Collision*, the highest mountain ridges of the Himalayas must have been under sea, as the fossil content of their rock formations testifies.

Stupendous meteorite showers occurred in the past, and the red clay on the bottom of the sea must have iron and nickel content of meteoric origin. Speaking of the cataclysm that closed the period known as the Middle Bronze II (Middle Kingdom in Egypt), I wrote in *Worlds in Collision* (p. 48):

“One of the first visible signs of this encounter was the reddening of the earth’s surface by a fine dust of rusty pigment. In sea, lake and river this pigment gave a bloody coloring to the water. Because of these particles of ferruginous or other soluble pigment, the world turned red.”

In paroxysms of nature, especially during the catastrophe of the fifteenth century before the present era, ash fell on land and sea.

“Following the red dust, a ‘small dust,’ like ‘ashes of the furnace,’ fell ‘in all the land of Egypt’ (*Exodus* 9:8), and then a shower of meteorites flew toward the earth. Our planet entered deeper into the tail of the comet. The dust was a forerunner of the gravel.” (*Worlds in Collision*, p. 51).

The ash must be still found on the bottom of the ocean, its final repository.

The Earth was “in a vise” — in the grip of external forces, which altered the terrestrial rotation; the sphere was twisted, and the Atlantic ridge and African rift are

only two of the visible signs of the strain to which the Earth was subjected.

“The earth groaned: for weeks now all its strata had been disarranged, its orbit distorted, its world quarters displaced, its oceans thrown upon its continents, its seas turned into deserts, its mountains upheaved, its islands submerged, its rivers running upstream — a world flowing with lava, shattered by meteorites, with yawning chasms, burning naphtha, vomiting volcanoes, shaking ground, a world enshrouded in an atmosphere filled with smoke and vapor. Twisting of strata and building of mountains, earthquakes and rumbling of volcanoes joined in an infernal din.” (*Worlds in Collision*, P. 97).

In *Earth in Upheaval*, I discussed the problem in two chapters, “Poles Displaced” and “Axis Shifted” . In “The Bottom of the Atlantic” and “The Floor of the Seas” I discussed sedimentary rock: it was not deposited evenly through the geological ages but erratically, most rapidly following natural disturbances on land. Further, the sedimentary layers were displaced in global catastrophes. Thus, it follows that the relative thicknesses of the sedimentary layers are not true indices for measuring the age of the oceans.

With such heretical ideas, my work flew in the face of accepted notions in oceanography and marine geology.

The book, *Worlds in Collision*, though already three years in the hands of Macmillan, was not yet off the press when Maurice Ewing, the Columbia University marine geologist, published an account of an expedition to the Atlantic Ocean and the mid-Atlantic ridge. This ridge runs north-south the entire length of the ocean. More than one surprise was in store for the expedition.

Whereas its members expected to find a uniform layer of sediment, the bottom of the ocean revealed no such uniformity, and I quoted from the record of the finds (*Earth in Upheaval*, p. 101: M. Ewing, “New Discoveries on the Mid-Atlantic Ridge,” *National Geographic Magazine*, Vol. XCVI, No. 5 [November 1949]):

“Always it had been thought the sediment must be extremely thick, since it had been accumulating for countless ages. . . . But on the level basins that flank the Mid-Atlantic Ridge our signals reflected from the bottom mud and from the bedrock came back too close together to measure the time between them. . . . They show the sediment in the basins is less than 100 feet thick.”

The absence of thick sediment on the level floor presents ‘another of many scientific riddles our expedition propounded’ .” The bottom of the Atlantic Ocean on both sides of the Ridge must have been formed only in recent times.

But even more unexpected was the find of beach sand at a great depth and far away from any land. “One [of the ‘new scientific puzzles’] was the discovery of prehistoric

beach sand . . . brought up in one case from a depth of two and in the other nearly three and one half miles, far from any place where beaches exist today.” One of these sand deposits was found twelve hundred miles from land.

Ewing recognized the uncomfortable dilemma: “Either the land must have sunk two to three miles, or the sea once must have been two to three miles lower than now. Either conclusion is startling. If the sea was once two miles lower, where could all the extra water have gone?” I shall return to the problem of the fallen ocean level, which I consider to have been the result of rapid evaporation due to catastrophic heating.

Five months after the publication of *Worlds in Collision*, another marine expedition — led by Professor Hans Pettersson, director of the Goteborg Oceanographic Institute (Albatross Expedition of 1947) — made a preliminary report of the findings of its fifteen-month exploratory voyage. Writing in *Scientific American* (August 1950: “Exploring the Ocean Floor”), Professor Pettersson spoke of evidence of “great catastrophes that have altered the face of the earth.”

“Climatic catastrophes, which piled thousands of feet of ice on the higher latitudes of the continents, also covered the oceans with icebergs and ice fields at lower latitudes and chilled the surface waters even down to the Equator. Volcanic catastrophes cast rains of ash over the sea.” Also, “tectonic catastrophes raised or lowered the ocean bottom hundreds and even thousands of feet, spreading huge ‘tidal’ waves which destroyed plant and animal life on the coastal plains.” Pettersson also found, in addition to the ash, a “lava bed of geologically recent origin covered only by a thin veneer of sediment.”

In the red clay on the bottom of the ocean Pettersson found “a surprisingly high content of nickel” (Pettersson, “Chronology of the Deep Ocean Bed,” *Tellus* 1, 1949). Nickel is not present in sea water and therefore could not have been deposited by water. “Nickel is a very rare element in most terrestrial rocks and continental sediments, and it is almost absent from the ocean waters. On the other hand, it is one of the main components of meteorites.” But the quantity of nickel in the clays in the bottom of the ocean was prodigious. Pettersson assumed very copious falls of meteorites in the geological past. He wrote in his account of the expedition, *Westward Ho with the Albatross* (1953), p. 150:

“Assuming the average nickel content of meteoric dust to be two percent, an approximate value for the rate of accretion of cosmic dust to the whole Earth can be worked out from these data. The result is very high — about 10,000 tons per day, or over a thousand times higher than the value computed from counting the shooting stars and estimating their mass.”

In other words, at some time or times there was such a fall of meteoric dust that, apportioned throughout the entire *assumed* age of the ocean, it would increase a thousandfold the daily accumulation of meteoric dust since the birth of the ocean based upon the estimated present potential rate of accretion; but since the shower of

meteorites was most likely an event of short duration, measured in days or weeks only, the “thousandfold” must be changed to some astronomical figure — a figure also dependent upon ascertaining the correct age of the ocean.

In a subsequent publication (“Manganese and Nickel on the Ocean Floor” in *Geochimica et Cosmochimica Acta*, 1959, Vol. 17), Pettersson wrote: “Of all the elements found in deep-sea deposits few have a more puzzling distribution than the two ferrides, manganese and nickel.” Not only their high concentration, much higher than in continental rocks, but especially their vertical distribution appear “most enigmatic.” Pettersson concluded that “the former being largely due to sub-oceanic volcanic action, the latter [was] due to contributions from the cosmos.” It must have occurred by “an unusually heavy incidence from the cosmos.”

In a still more recent paper, Professor Pettersson discussed “The Accretion of Cosmic Matter to the Earth” (*Endeavor*, July 1960): “We found surprisingly large numbers of typical cosmic spherules in deep-sea sediments.” These magnetic particles (in diameter between 0.03 to 0.25 mm.) were not only found in very great numbers in the red clay of the oceanic bed, in the equatorial region of the Pacific, but also all over the world. In the Pacific, “their number varied from about one hundred up to several thousands per kilogram of sediment.” “In general the number of spherules is greatest in the more recent sediments.”

Pettersson observed ash on the bottom of the ocean, and such ash had already been observed by the famous expedition of the last century, that of H. M. S. *Challenger* (see Sir C. Wyville Thompson, *Voyage of the Challenger*) between the year 1873 and 1876. However, Pettersson failed to observe that the layer of ash is not just distributed here and there on the bottom of the oceans and therefore possibly attributable to volcanic eruptions, but is spread quite uniformly—and the account of an expedition led by J. Lamar Worzel, of Columbia University’s Lamont Geological Observatory, brought out this fact. The expedition of the vessel *Verna*, made in 1958, covered 500,000 square miles of the southwestern Pacific and found white ash between about 750 miles north and 850 miles south of the equator.

Writing in the *Proceedings of the National Academy of Sciences* in its March 15, 1959 issue (vol. 45, pp. 349-355), Worzel made the surmise:

“Since the layer is fairly near the surface and is not discolored and contains nothing but the glassy ash material it must have been laid down fairly quickly.” It must have been deposited in a single act, over a short period, “perhaps within a year or so.”

“The white ash immediately suggests a volcanic origin and the proximity of the Andes suggests the source. However, the great extent of the ash and its shallow cores would imply such a great amount of recent activity for a short time that it may be difficult to ascribe it to the Andes.” “. . . It may be necessary to attribute the layer to a world-wide volcanism or perhaps to the fiery end of bodies of cosmic origin.”

Maurice Ewing, as director of the Lamont Geological Observatory, joined Worzel in describing and evaluating the layer of ash; and on the basis of the random detection of similar ash in other parts of the oceanic world, he wrote (pp. 355-361):

“A single ash layer of 5 to 30 cm. thickness over such a wide area must record a notable event in the history of the area. It could hardly be without some recorded consequence of global extent.

“A re-examination of the file of Vema echograms is now in progress. It shows that sub-bottom echoes, similar to those found in the eastern Pacific, have also been recorded in the South Atlantic and Indian Oceans, [as well as] the Gulf of Mexico.

“The remarkable uniformity of thickness of the Worzel ash layer within the large area which has been cored is additional evidence suggesting that the layer may well have great extent.

“. . . The total volume of ash must be so great and the mechanism of dispersal so effective that the possibility of world-wide coverage must be considered.

“. . . Such an event could hardly fail to produce a variety of significant effects global in scale conceivably a cometary collision.”

In the New York *Herald Tribune* of March 31, 1959 Dr. Worzel was quoted as saying that this ash may represent “the remains of a fantastic collision of heavenly bodies from outer space.”

A collision of the Earth with a huge comet was postulated or, at least, preferred to a huge and simultaneous eruption of a multitude of volcanoes, because of the evenness of the layer of white ash. Its position, very close to the surface, almost touching the water layer, makes it appear that the time elapsed since the deposit is very short, geologically speaking.¹

But only five or six years earlier, the consensus of scientific opinion — and it was expressed in no indefinite terms by my critics—insisted that there never was any collision of the Earth with a comet; furthermore, if such a collision were to occur, there would be no noticeable results. After all, the Earth passed through the tail of Halley’s comet in 1910 and there was no major phenomenon to register, not even flashes of shooting stars (e.g., I. Asimov).

In order to cover the expanse of the oceans with Worzel ash—this is its given name—some more significant collision must have taken place than that which occurred during the approach of Halley’s comet in 1910. A phenomenon observed in the bottom of the oceans bespeaks a collision in which the Earth would have hardly

proceeded undisturbed on its path.

RIFTS

In *Worlds in Collision*, it is claimed that the terrestrial sphere underwent great stresses—with resulting rifts and mountain formations—during the global catastrophism that occurred 3400 and 2700 years ago.

Professor T. Y. H. Ma of the National Taiwan University in Formosa published an article in the journal *Oceanographia Sinica* (Vol. II, No. I, September, 1955), in which he claimed a sudden shift in the oceanic bottom several times in the geological past. He found that changes in the sedimentary strata on the sea bottom must be attributed to “changes in latitude due to the sudden total displacements of the solid earth shell and the intermittent readjustments.” The last disturbance of the ocean bottom “ended only 2,600 years ago,” judging from the cores taken at the bottom of the Atlantic, while samples taken in the Pacific allow the displacement to be estimated at about “2,800 years ago.” These figures closely resemble the date of the last cosmic catastrophe fixed in *Worlds in Collision* as 27 centuries ago.

In 1960 Bruce C. Heezen of the Lamont Geological Observatory made known the results of an expedition that, in the previous months, had traversed all the longitudes and, going up and down the latitudes, had discovered a huge and strange formation twice encompassing the globe.

The structure has the form of a large and high ridge, split along its length by a deep canyon.

In a preliminary report published in *Scientific American* of October 1960, Heezen described it thus:

“It is a submarine mountain ridge that runs for 40,000 miles across the bottom of all the oceans and covers an area equal to that of all the continents. The existence of the mid-ocean ridge is a recent discovery of oceanography, and the mapping of it still far from complete. But the stretches that have been charted show a most curious aspect. Down most of its length the ridge is split by a deep canyon, or rift, in which many earthquakes originate. The ridge is apparently the locus of a crack in the crust that runs nearly twice around the earth. The discovery at this late date of the mid-ocean ridge and rift has raised fundamental questions about basic geological processes and the history of the Earth and has even had reverberations in cosmology.”

The Earth was, for some agonizing moments of its past, in a vise; and its coupling action wrenched the Earth and welled up the ridge and split it with a deep rift. The mid-Atlantic ridge known from before is but a segment of the entire serpentine formation. The area of the ridge is so great that it was estimated to equal the area of the five continents.

In *Earth in Upheaval* (1955), I wrote of the shearing action to which the Earth's crust was subjected when caught in force fields of extraneous origin. In *Worlds in Collision* (1950), I described the same occurrence as reflected in the sundials and water clocks of antiquity that certify to a changed length of the day on solstices, and thus to changed latitudes and a changed inclination of the terrestrial axis to the plane of the ecliptic (Chapter 7). The fact that the Moon does not circle the Earth on its equatorial plane and that this plane is inclined by over 23 degrees to the plane of the ecliptic - whereas the plane of the lunar orbit almost coincides with the plane of the ecliptic — made H. Jeffreys (*The Earth*, 2nd ed., 1929) speculate that the Earth was once, or several times, in a vise that turned its axis in a new direction; and I quoted him in the chapter "Axis Shifted" of *Earth in Upheaval*.

THE OCEAN LEVEL

The stress which resulted in the formation of the immense undersea rifts must have been accompanied by widespread volcanic activity, irruptions of the sea, and changes in the level of the land and in the bottom of the sea. The level of the ocean must have also changed suddenly as a consequence of such upheaval; and in *Worlds in Collision* (Chapter 4), I cited various sources in support of the fact that the sea bottom was heated and rivers and parts of the ocean evaporated ca. 1500 before the present era.

Professor Cecilia Payne-Gaposchkin, astronomer of Harvard University, wrote: "There is no evidence of a wholesale disturbance of the ocean level near 1500 B. C.," or 3500 years ago (*The Reporter*, March 14, 1950). However, Professor Reginald Daly, geologist of the same university, had claimed since the 1920's that "a recent worldwide sinking of ocean level" of twenty feet occurred "about 3500 years ago" (Daly, *Our Mobile Earth*, 1926, pp. 177-179).

Subsequent to the publication of *Worlds in Collision* and this first of a series of articles by Gaposchkin on the book, Professor Philip H. Kuenen of Leyden University made the following statement: "In thirty-odd years following Daly's first paper many further instances have been recorded by a number of investigators the world over, so that this recent shift is now well established." As to the time of this sudden drop of the ocean level, Kuenen wrote: ". . . the time can be fixed at roughly 3000 to 3500 years ago" (*Marine Geology*, 1950, p. 538).

In a paper that Dr. Rhodes Fairbridge of Columbia University read before the International Oceanographic Congress on September 7, 1959, he brought evidence from many parts of the world that 6000 years ago the oceans rose forty-five feet; he even expressed the belief that the Great Flood described in *Genesis* is an echo of that oceanic rise.

Dr. Fairbridge found in many places along the eastern coast of the United States, from Maine to North Carolina, drowned forests which had lived 2830 years ago, with

a possible error of 200 years. This points to the 8th century before the present era. In *Worlds in Collision*, Part 2, are described global catastrophes of the eighth and beginning of the seventh centuries (-776 to -687) which, while being worldwide, were less violent when compared with the one that occurred in the middle of the second millennium, ca. 3500 years ago, or earlier ones. Such submerged forests are found all around England and Wales and are described in *Earth in Upheaval* (1955), pp. 185ff.

Volcanic activity on the bottom of the oceans and seas must have been stupendous; likewise island building. On the latter we have the testimony of earlier centuries passed on in the writings of classical authors. For example, the origin of many islands as well as changes in the coastline of the Mediterranean are recorded in *Pliny's Natural History*. But, in *Worlds in Collision* I did not cite this and many other ancient chronicles, having presented only a fraction of the historical material I had before me; and again, the material I had before me and left unused is but a fraction of what is to be found in the ancient literature of the world. In *Earth in Upheaval*, however, I was careful not to include any historical or literary material at all, the work being built on the records of modern geology and paleontology.

CONCLUSION

The oceans as we know them are not tens of millions or hundreds of millions years old, as the accepted view assumes. In a sequel to *Worlds in Collision*, dealing with the catastrophic events preceding the second millennium before the present era, I shall discuss the origin of the oceans and shall try to show that their expanse grew greatly after the event known as the Universal Deluge, when cosmic water descended on Earth following the disruption of Saturn.

If this unsupported statement sounds unbelievable, the reader may rest assured that I shall underpin this thesis with as much essential documentation as I did my thesis of the youthful Venus, a newcomer to the planetary family. The provenance of the water will also explain the origin of chlorine in sea water — a problem that plagues marine geologists. For, while the land could provide sodium through erosion by rain, terrestrial rocks do not contain the requisite quantity of chlorine and are quite poor in that element. Some chlorine could have been added from volcanic eruptions but not as much as is needed to form the salt content of oceans and seas. The source of the greater part of the chlorine in oceans is of cosmic origin, and a few more words on this subject are contained in the pages of my book dealing with Saturn.

To the claims in my published work, the ocean responded with invariable support: the sediment on the bottom was not formed uniformly; the nickel content of the red clay in the sediment is of meteoric origin — cosmic dust that rained furiously on the Earth; the Worzel ash also came from cosmic sources; the Heezen ridge and rift are signs of the external torque applied to the Earth, probably more than once; the violent displacement of marine sediment layers, the changing level of the sea, coastal beach at great depths—all speak of catastrophic events temporally so close to us that our

minds refuse comprehension.

Mercury

Mercury, the planet closest to the sun, is like Venus, a morning and evening star. But whereas Venus circles the sun in 224.7 terrestrial days, Mercury completes its orbital revolution in 88 days. Being so close to the sun it is rarely visible. Copernicus never saw it in the murky sky of Pomerania and wrote of it in his *De Revolutionibus* from what he learned in Claudius Ptolemy, the by then fourteen century old authority. Mercury is smaller than Venus and its mass was computed to be less than one eighteenth of the mass of the earth, whereas Venus is more than four-fifths of it. Mercury's diameter is by one half larger than our moon's diameter. Its orbit is a rather stretched ellipse whose perihelion, the point closest to the sun, and aphelion, the furthest point, are in the approximate ratio of two to three.

As the moon is locked with one side to the earth, its primary, so, and for the same reason, Mercury was thought to be locked permanently with one side to its primary, the sun. It was estimated that when the planet was in the process of formation, the sun must have caused in it tides, and this, in turn, must have exerted a tidal friction, and breaking of axial rotation. Thus the planet, so close to the sun for billions of years, must be permanently locked with one face to the sun.

In 1845 Adams and, independently, Leverrier, calculated in advance of its discovery, from perturbations of Uranus, the existence and the position of Neptune, thus supplying the world of physics and astronomy with what was (and often still is) regarded as the best confirmation of the scheme in which only gravitation and inertia direct the run of the celestial bodies. But in the same year Leverrier also calculated that the perihelion of Mercury advances in the direction of the planet's motion; it is the precession of the perihelion, or what is the same, a slow rotation of the long axis of the Mercurial orbit.

Laplace, who preceded Leverrier by half a century, acquired fame at the age 23 by showing that all kinds of irregularities in the celestial motions that have the appearance of "running down" and were so viewed by Newton himself who thought that Divine intervention is needed from time to time to rewind the mechanism, all these irregularities are not of a kind that accumulate, but are temporary, are actually swings or oscillations that after certain intervals reverse their direction and that therefore the celestial mechanism will never need rewinding.

Mercury's anomaly was obviously continually accumulating, and therefore not of an oscillating nature, not a swing. The anomaly was actually very minute. The observed precession amounts to 570 seconds of the arc in a century; of this amount, over 530 seconds of the arc of precession was attributed by Leverrier to the action of the

planets perturbing Mercury; but some 35 seconds of the arc were unaccounted for, a figure increased by later investigation to 43 seconds. Since Mercury revolves in 88 terrestrial days around the sun, it makes more than 400 revolutions in a century and the anomaly amounts to as little as circa one tenth of a second of an arc of unaccounted precession at each revolution. How small this angle of deviation is one may perceive if one imagines a penny, 1.9cm, nearly three-quarters of an inch in diameter, viewed without magnification from a distance of about thirty miles. But so proud was the world of the mathematics of the first half of the nineteenth century, with its achievements, that such an unaccounted discrepancy in the Mercurial motions was paraded to show the acumen of science.

Leverrier, who predicted the existence of Neptune, a planet on an extreme orbit, thought that the residue of the Mercurial precession would be accounted for if yet another planet, still undiscovered, revolves inside the Mercurial orbit; because of the proximity of the sun it would not be easily observed, but Leverrier thought he had detected it. No confirmation came in the decades that followed. Other conjectures were made, such as a surmise that the mass of the Sun is not uniformly distributed, or that the Sun is a slightly “loaded” body; but there was nothing to support this particular claim apart from the fact that the anomaly of Mercury needed to be accounted for. Thus Leverrier in the same year 1845, by discovering Neptune confirmed the gravitational theory of Newton, and by discovering the anomaly of Mercury he cast doubt on the theory’s infallibility.

Seventy years after Leverrier calculated the anomaly, Einstein offered his explanation of it in his General Theory of Relativity (1911-1915) Ten years earlier he had published his Special Theory of Relativity (so named when the General Theory was adduced). In the Special Theory (1905) he deprived space and time, or their units, of the attribute of constancy--a second or a meter on a body moving in relation to an observer is no longer exactly a second or a meter, and he attributed constancy to the velocity of light, independently of whether the source of light is or is not in motion in relation to an observer. In the General Theory Einstein tackled the nature of gravitation. Space not being endowed with the attribute of constancy, Einstein visualized it as curved in the presence of a mass.

For the General Theory of Relativity Einstein offered three observational cases as proofs. The Mercurial anomaly is almost exactly what his theory would presuppose of a planet that moves in the curved space caused by the proximity of the huge mass of the sun. The next observational evidence accountable by the General Theory was the shifting towards the red (red shift) in the spectrum of light emanating from the sun, compared with the light of laboratory sources, a phenomenon in Einstein’s explanation resulting too from bending of space by the presence of heavy mass (sun).

The third phenomenon would be in light emitted by a star and passing near the solar disk (bending of the ray).

Einstein did not make “three predictions” for the validation of the General Theory of

Relativity as it is often said; Sir James Jeans in his article on Relativity in the Encyclopedia Britannica refers in such terms to the three phenomena:

Einstein, knowing the mass of the sun, found himself in a *position to predict absolutely* what the motion of the perihelion of Mercury must be. It was found to be 42.9" a century, a figure which agreed with observation to well within the limits of errors of the observation The theory makes one further prediction which admits of experimental test: The light received from a calcium atom situated in the intense gravitational field near the sun's surface ought to be of slower period, and therefore of redder colour than the similar light emitted by terrestrial atoms . . . W. S. Adams found an actual shift of 0.32 A. It is hardly possible any longer to doubt that the spectral shift predicted by Einstein really exists . . .

A star or other massive body distorts the continuum [of space] in its neighborhood . . . in the neighborhood of such a body a ray of light does not travel in a straight line; it is deflected by the gravitational field of the body . . . None of the expeditions had of course measured the deflections of the stars actually at the sun's limb; most of the stars were several diameters away from the limb, the observed deflections being corrected so as to bring them to the limb. The deflection of stars at all distances were found to agree well with the predictions of Einstein's theory.

Actually in a paper published in 1911 Einstein, claiming redshift in solar light writes in a footnote:

L. F. Jewel (*Journal de Physique*, VI (1897), 84), and especially Ch. Fabry and H. Boisson *Compt. rend.* 148 (1909), 688-90) have actually established noticeable shifts of fine spectral lines from the sequence(?) here calculated, but have ascribed them to the effect of pressure in the absorbing layer.¹

As to the Mercury's anomaly, it was announced by Leverrier in 1845 and often discussed since. Thus only the bending of light passing near a mass was in the category of prediction. A paper was printed by Soldner in the Bode's Annual but Einstein evidently did not know of that paper. Soldner calculated that following Newton's concepts of light as a stream of particles the ray of light passing near the Sun is deflected by a small angle; Einstein, however, claimed a deflection twice as large.

Every textbook on astronomy used to relate that Mercury is locked with one and the same face in relation to the Sun as the Moon is in relation to the Earth; tidal forces must have produced such effect.

With one side turned to the Sun and the other facing the cold space, it was estimated that Mercury must be as extremely hot on the lit side while the temperature on the other side must be very close to absolute zero.

Space probes have obtained the surprising result that the non-illuminated side of Mercury is comfortably warm, actually is 60 degrees F., or of room temperature. In order to explain such phenomenon it was assumed that Mercury, thought to be without atmosphere, actually has one consisting of gases of heavy atoms; the atmosphere could carry the temperature from one side of Mercury to the other. Mercury had been thought to be void of any atmosphere because the small planet could not keep the molecules of gases from dissipating into space; first, lighter gases, but then also heavier would need to be lost to space; but in view of the observed temperature on the night side of Mercury, the assumption was made that heavy gases must have still survived on it. Great was, however, the surprise when Nicholas Kozyreff, investigating Mercury on presence of an atmosphere, announced the detection of hydrogen, the lightest of all gases. This was in sheer conflict with all theoretical computations. In the effort of finding the cause of the Mercurial temperature on the side turned away from the Sun, a new riddle that instead of explaining a phenomenon needed its own explanation, and this was not forthcoming because Mercury, millions or billions of years on its orbit, could not preserve an atmosphere of hydrogen.

In further search of the cause of Mercurial thermal “anomaly,” the evident thing was undertaken and the planet was investigated by radar. There was another surprise lying in wait. The planet was rotating. This, too, was in conflict with the theoretical computations. Mercury had to be locked with one face to the Sun. But it is not. The rate of rotation was found to be once in 58.65 days, whereas one orbital rotation of the planet equals 88 terrestrial days. The heated state of the night side of Mercury appeared to have now an explanation, though a more careful analysis must show that rotating once in 58 days, Mercurial surface temperature must drop far below 60 degrees F. It is, for instance, observed that the surface temperature of the Moon warmed by the Sun precipitously falls when during lunar eclipses Earth interposes itself between the Sun and the Moon—and the duration of an eclipse is counted in minutes, not days, as in the case of Mercury’s rotation.

With the discovery of the Mercurial rotation, not sufficient to explain the thermal question, the question of why Mercury is not locked with one face to the sun became a matter of new perplexity. The observation was made by a team of Cornell University scientists. Thomas Gold speaking for the team announced that Mercury could not have been stationed on its orbit for long—400,000 years was, in the opinion of Gold, the longest stretch of time that could be allowed for Mercury to remain unlocked. On the assumption that the solar system is six or nine billion years old, 400,000 years represent only 1/10,000 of the time since the planets, following the accepted view, obtained their positions and acquired their rotational rates—and this is the upper limit. Neither the tidal nor the nebular theories can square with the newly discovered fact.

Mercury is beset by riddles: it should not have a hydrogen atmosphere, but, if Kozyrev is right, it has such atmosphere. It should not rotate, but it rotates. It should have the night side much cooler than 60 degrees F. but it has this temperature.

Actually all three unexplained phenomena point toward an adventurous past, a past counted by thousands of years, but not by millions. Mercury has heat of its own, not just reflected heat of the Sun; Mercury has still an atmosphere of hydrogen, the last vestiges of a more extensive halo and trail (caduceus) seen by our ancestors in the fourth or third millennium before the present era; Mercury rotates because it is on its orbit for only several thousands of years. It is on a stretched orbit—a relic of its recent arrival at its present orbital path. As to the last point, I would reserve an opinion because magnetic forces near the Sun need to be calculated in any motion of the planet. These forces are most probably also responsible, in our understanding for the precession of the perihelion of the planet, and Leverrier's discovery of this precession does not require a geometric curvature of space.

Mercury, Hermes of the Greeks, was thought to keep well his secrets. The ancient writings not intended for circulation but for the study of the initiated only were called hermetic books. In our days Mercury disclosed four secrets: first that it is warm on the darkened side; then that it has a hydrogen atmosphere; next, that its axis is wobbling, and finally that it is not locked with one and the same face toward the Sun. Each of the four revealed facts is in conflict with accepted solutions. All together offer a solution—a planet on a new position since, in astronomical sense, recent times.

In the story as told in the volume *Worlds in Collision* the planet Mercury plays no role; however in the projected volume about earlier events on the celestial screen, Mercury was a participant and was not an idle spectator of the theomachy, the battle of the gods. It had an epoch of its own, or an act in which it was the principle actor, in the early historical times, in an age antecedent to the events in the solar system, dominated (as seen by man from the earth) first by Venus, then by Mars. But despite my not having introduced Mercury into the narrative of those later times (15th-7th century before this era) it could not remain even then as a completely inactive member of the planetary family. Especially if planets are charged bodies, the entrance of a new planet (Venus) into the system must have caused much havoc also on planets not in collision or near collision. One should think of the changes which the entire solar system would undergo and also keep in mind what the entrance of a new proton or electron would signify for an atom—the result could amount to the transmutation of an element.

The Romans as well as the Greeks pictured Mercury with wings, either on his headgear or at his ankles, and with an emblem, caduceus, twin snakes winding. The Babylonian name of the planet was Nebo, and he was an important deity, as the name of the mountain Nebo, on which tradition lets Moses die (Sinai, by the way, was consecrated to the Moon, Sin in Babylonian); Nebo in the names of the Kings Nabopolassar and Nebukhadnezzar testifies to its significance in the Babylonian

pantheon as late as the seventh and sixth centuries. Equally pronounced was the role of Thoth, the planet Mercury of the Egyptian pantheon, the theophoric part of the name Thutmose or Tut-ankh-amen.

Mercury, or Hermes of the Greeks, was a swift messenger of the gods that speeded on his errand sent by Jupiter or Zeus.

In my understanding Mercury was once a satellite of Jupiter or of Saturn and under circumstances not understood by me, was directed toward the sun and caught there in an orbit still elliptical. It could, however, have been a comet passing near Jupiter and the entwined snakes of the caduceus may memorialize the appearance it had when seen by the inhabitants of the Earth. There are indices that point toward Mercury's involvement in the catastrophe that is described in Genesis as the confusion of the builders of the Tower of Babel, something that in modern medical terms seems like a consequence of a deep electrical shock.

The claim is that Mercury travels on its present orbit only since some five or six thousand years. This view conflicts with both standard alternatives—of nebular and of tidal theories of the origin of the planetary family and with the assumption that the planets occupy the same orbits since billions of years. Since the early days of modern science, actually since Aristotle, it was considered undisputable that since the origin of the solar system, Mercury has been moving on the very same path. The study of ancient texts convinced me that there was nothing to this belief besides wishful thinking: the entire solar system was repeatedly rearranged. Mercury does not occupy its orbit since six billion years—the assumed age of the universe (which by the way was repeatedly re-assessed from 2 billion when I started my studies till by now 10 and 12 billion years are occasionally heard).

Already before the publication of *Worlds in Collision* I considered (and let it be set in print) a system of the world in which the sun, being a charged body in rotation, creates a magnetic field; the planets, being charged bodies, move in that magnetic field and are compelled to proceed on their orbits; to this phenomenon I gave the name “circumduction” (see my *Cosmos Without Gravitation*, 1946), borrowed from J. Kepler. I considered Mercury's precession, discovered by Leverrier in 1846, as resulting from such an effect, and, possibly, from a growing charge on Mercury (besides its not having completely settled after the celestial “battles”). I considered Einstein's use of Mercury's precession as an *ad hoc* argument for the General Theory of Relativity (certainly not a prediction, as James Jeans wrote in *The Encyclopedia Britannica*).

In my debate with Einstein, already early, in a letter written in August or September, 1952, I drew his attention to charges and consequences for Mercury, traveling in the extended corona of the sun. I returned to this also later in our correspondence.

Dr. Dicke came up with an oblate sun as a partial cause of the Mercurial anomaly. I drew his attention to the fact that he disregarded the by then discovered solar plasma

and the magnetic field centered on the sun and permeating the solar system. He gave me a strange answer: "That is something we have to disregard."

In my paper at the San Francisco Symposium, "Velikovsky's Challenge to Science," I once more drew attention to the problem and its consistent evasion in discussions of the General Theory of Relativity. Even in the days of Einstein he must have known of the general magnetic field of the sun, discovered by Hale a few years before Einstein used the argument for his theory; the magnetism of the solar spots was discovered earlier by Hale. Einstein corresponded with Hale on other matters.

As a matter of methodology it appeared to me improper that Einstein selected the case of Mercurial anomaly (precession of the perihelion) for the support of the General Theory of Relativity, without eliminating first the possible effect of the solar magnetic field on the precession of Mercury.

According to Newton an inverse cube effect when superimposed on an inverse square effect would result in a precession. A regular dipole magnetic field would produce an inverse cube effect when superimposed on an inverse square effect, due to gravitation.

The general magnetic field of the Sun was made known by G. E. Hale in 1912 at the time when Einstein was constructing his General Theory. The magnetic property of solar spots had been discovered at the beginning of the century by the same Hale.

On the 14th of October, 1913, Einstein wrote to Hale on the issue of another of his advance claims, actually the only one that could put claim to this definition. In his letter he inquired whether there was a possibility to observe in broad daylight, very close to the rim of the sun, some fixed star, this with the help of the powerful telescope that Hale built (Mt. Wilson 100-inch telescope). It was a naive inquiry; however, it was suggested to Einstein by another physicist in Zurich and he followed the advice—the idea was that if the answer were positive there would be no need to wait for a full solar eclipse for observing whether the sun (or any large mass) deflects a ray of light from its rectilinear path. Writing to Hale, Einstein showed much respect—but where he had to take into account Hale's great discoveries, he omitted to do so. Only by excluding the possibility that magnetic fields deflect a ray of light from rectilinear passage, would Einstein have cleared the way for offering an explanation based on a new principle in science.

In my understanding that goes back to the forties, the Sun being a rotating charged body creates a magnetic field that stretches far into interplanetary space. This field rotates with the Sun on which it is centered; at the distance of any planet, the field travels the length of the planetary orbit in the same time it needs for one axial rotation, or one turn of the Sun on its axis.

Mercury is a charged body and it moves in the solar magnetic field that rotates swifter than Mercury proceeds on its orbit.

In August 1952 I started my long debate with Einstein on the question whether inertia and gravitation are the only forces responsible for all the movements of the celestial clock, or whether electricity and magnetism, to whatever extent, need to be considered, too. I put the problem of Mercury squarely before him on this issue. I wrote:

Now the visible streamers of the sun that conveyed to Hale the idea that the sun is a magnet reach a long way towards Mercury, almost half the way. Was the electromagnetic state of the sun ever considered as the cause of the anomaly? The effect of the electromagnetic action must have been reckoned, and possibly excluded, but not disregarded.... Also the fact that the sun radiates at the expense of splitting (or building-up) of atoms was never followed through to the inevitable conclusion that the sun *is* a charged body in motion. At least the action of the magnetic spots of the sun with a field intensity reaching four or five thousand gauss should have been, if only once, taken into computation for its influence on planetary motion, Mercury in the first place, if only for the purpose of showing it as ineffective.

When, nine years later, Prof. H. H. Hess, upon being appointed, or elected, chairman of the Science Space Board of the National Academy of Sciences, wished to hear from me some suggestions for the activities of NASA (National Aeronautics and Space Administration), I offered, on September 11, 1963, a program for a series of investigations; concerning Mercury I wrote:

The cause of the precession of the perihelion should be re-examined in the light of the presence of a magnetic field of solar origin and solar plasma through which Mercury ploughs. An artificial satellite with a perihelion close to the sun could be tracked as to the precession of its perihelion.

Since I wrote this suggestion for experiment more than twelve years have passed. I have not heard or read of such a satellite having been dispatched.

At the symposium “Velikovsky’s Challenge to Science” organized by the AAAS in San Francisco in February 1974, in my paper, entitled “My Challenge to Conventional Views in Science,” I returned to the problem of the electromagnetic nature of the solar system and of the universe in general, and said concerning Mercury’s anomaly:

It was, of course, known since Gilbert that the Earth is a magnet and G. E. Hale discovered that solar spots are magnetic and that the Sun possesses a general magnetic field. But this did not keep Einstein, a few years later, from accounting for the Mercurial precession by a new principle instead of first eliminating the effect of the newly discovered

solar magnetic field on Mercury's movement.

If I was completely at odds with the cosmogony that had the solar system without history since creation, I was also carrying my heresy into a most sacred field, the holy of holies of science, to celestial mechanics. I had a chapter on the subject at the end of *Worlds in Collision*, but I kept those galleys from inclusion in the book and instead I included only one or two paragraphs—and the only italicized words in the book are found in them—namely: “The accepted celestial mechanics, notwithstanding the many calculations that have been carried out to many decimal places, or verified by celestial motions, stands only *if* the sun, the source of light, warmth, and other radiation produced by fusion and fission of atoms, *is as a whole an electrically neutral body*, and also if the planets, in their usual orbits, are neutral bodies.” I showed how the events I reconstructed could have occurred in the frame of classical celestial mechanics, but coming from the field of studying the working of the brain—I was the first to claim that electrical disturbances lie at the basis of epileptic seizures—I was greatly surprised to find that astronomy, the queen of sciences, lives still in the pre-Faraday age, not even in the time of kerosene lamps, but of candles and oil. It was, of course, known since Gilbert that the earth is a magnet and G. E. Hale discovered that solar spots are magnetic and that the Sun possesses a general magnetic field. But this did not keep Einstein, a few years later, for accounting for the Mercurial precession by a new principle, instead of first eliminating the effect of the newly discovered solar magnetic field on Mercury's movement.

Thus I did not omit once more to challenge the accepted view that Mercury's anomaly serves as confirmation of Einstein's concept of space curved in the presence of a mass, independently of whether Einstein was right or not in the theory itself. But if the Mercurial precession has a different cause than that which Einstein envisaged, the absence of the effect expected by him could not but be damaging to his theory of the nature of gravitation.

It did not take long after the symposium in San Francisco and the Mariner X probe passing upon passing and surveying Venus, approached Mercury.

Even from a great distance the photographs of Mercury taken by the unmanned probe showed a surface that attested to a very stormy past of the planet and as the probes came closer, the features grew in detail. It revealed itself as a battered world. Its surface features were never before observed by a telescope from the Earth; but after the scientific world accustomed itself to the Martian photographs of American and Russian space probes, there was no outcry of surprise anymore, though this planet closest to the sun was the least known as to its surface features. But the explanations applied to Mars and Moon for the phenomenon of cratered surface, namely, that these celestial bodies are in travelling, Mars more, the Moon less, in the zone of the

asteroids that supposedly by collisions with Mars and the Moon have caused these features, could not well be applied to Mercury, out of reach of almost all asteroids. And there were other features on the Mercurial surface that bespoke a violent past.

Very shortly after the February, 1974 symposium, Mariner X, passing near Mercury, established to the great surprise of all scientists, that it possesses a magnetosphere. Since it rotates slowly, in my opinion the magnetosphere results from the speedy relative motion of the space satellite and Mercury on its orbit. On the second passage, and third, of the satellite, the existence of the magnetic field around Mercury (magnetosphere) was confirmed. Now it becomes possible to abstain from considering the effect of the Mercurial magnetosphere traveling with the planet through the magnetic field lines centered on the sun.

“The accepted celestial mechanics, notwithstanding the many calculations that have been carried out to many decimal places, or verified by celestial motions, stands only *if* the sun, the source of light, warmth, and other radiation produced by fusion and fission of atoms, *is as a whole an electrically neutral body*, and also if the planets, in their usual orbits, are neutral bodies.” (*Worlds in Collision*, Epilogue, p. 387). “In the Newtonian celestial mechanics, based on the theory of gravitation, electricity and magnetism play no role.”

The precession of Mercury, the planet closest to the sun, is claimed by the General Relativity theory as one of the proofs of the curvature of space around mass; but since Mercury moves close to the charged sun and actually in the outer reaches of the solar corona, the magnetic field of the sun must act on its motion; therefore the claim of the relativity theory needs reexamination as to its validity. (Already Laplace showed that should a celestial body attracted by its primary as inverse square of distance be subject to another attraction that changes as the inverse cube of distance, a precession by that body would result.)

Things axiomatic need to be repeated again and again over a score of years; the omission to take into account physical realities and calculate their effects should not be placed solely at Einstein's door; in over sixty years since the publication of the General Theory nobody was disturbed by this situation and in nearly a score of years since the space investigation started, with by now probably a thousand artificial satellites having been launched, an experiment intended to observe the behavior of a satellite on the Mercurial orbit and on an orbit perpendicular to it have not been performed or even planned.

An electromagnetic effect must be incalculated in the celestial mechanics, whether its action equals to a substantial part of the gravitational attraction, or to only a minute part: the precision of the celestial motions and the advance knowledge of planetary positions to a small degree of a fraction of a second of the arc, raises the question as to the part the electromagnetic interrelation must account for.

The discovery by John H. Nelson of certain dependence of the radio transmission and

reception on the relative position of the planets (March 1951 issue of *RCA Review*) points in the same direction of an electromagnetic interdependence of planetary bodies. If an electromagnetic effect is present between these bodies, the exact masses of the planets must be recalculated, in order to leave also for the newly detected forces a role, small, however yet detectable, in the phenomenon of perturbation, or attraction of a planet by another.

Jupiter's Radio Noises

One of the major deductions from the study of ancient civilizations was the recognition that the planetary and cometary bodies are charged objects and the solar system itself is regulated not solely by the law of gravitation; that electromagnetic interactions must exist and where following the inverse square law must be unrecognizable in their effects on the calculations of celestial mechanics - charge can, so to say, be hidden in or masked by the mass. Thus the problem of Pluto influencing Uranus and Neptune more than its mass can account for is a case of a substantial charge on a small planet. But where the less pronounced electromagnetic inverse cube relations take place, like in Mercury's precession of its perihelion, divergences from the celestial computations are registered as anomalies. Mercury moves through a general magnetic field of the Sun that influences it more strongly than it influences the remoter planets besides the influence on it and on them of the magnetic solar spots and solar wind.

In catastrophic conditions, with two celestial bodies approaching one another closely, the electromagnetic interactions may become most pronounced - the cometary protoplanet Venus produced a display of discharges between its head and its trailing part when the orbital movement of the protoplanet was disrupted by the close approach to the Earth; in the latter, eddy currents were generated with the effects due to such phenomenon (see *Worlds in Collision*, "Epilogue"). Interplanetary discharges took place when Mars and Earth came into close contact (*Worlds in Collision*, "Synodus"). The projected volumes dealing with catastrophes preceding those that took place at the end of the Middle Kingdom in Egypt carry the titles "Saturn and the Flood" and "Jupiter of the Thunderbolt".

The planet-god Jupiter (Zeus, Ormuzd, Shiva, Marduk) was pictured with a thunderbolt because of the spectacles witnessed by the inhabitants of the Earth —like a discharge that was directed toward Venus when it approached its parental body (*Worlds in Collision*, "Blazing Star"), or when the Earth itself might have been the target, as the content of the volume "Jupiter of the Thunderbolt" will reveal.

The understanding that the solar system is not neutral in its components but possibly neutral as a whole led me to the conclusion that the charge of the Sun may be equal to the combined charge of the planetary bodies and that quite possibly in Jupiter is assembled the major portion of it; thus, being ca. 1000 times smaller than the Sun it is charged to a very substantial potential.

Its potential could have been greater in the past; certainly planetary bodies exchanging discharges neutralized themselves to some degree; Mars, for instance,

must have been much more charged in the past before the events of the first half of the first millennium before the present era. The charge of the planet, I thought, may even be decisive in the position the planet occupies in the planetary system. I even considered theoretically a system in which gravitation is completely supplanted by electromagnetic effects with the charged planets traveling in the magnetic field of the Sun, itself being a charged body that by its rotation creates the magnetic field permeating the solar system; I also contemplated the existence of magnetic shells that would be the determinative of the planetary distances (Bode's Law).

Since 1941, I insisted that electromagnetic interrelations in the solar system cannot be ignored - this was the theme of my long debate, in writing and oral, with Einstein - from August 1952 to his death in April of 1955. At some point in our debate (in a letter written in June 1954) I offered to stake our debate on whether Jupiter sends out radio noises (of non-thermal nature, as I already claimed in my Forum Lecture of 14 October, 1954), to which he reacted skeptically, yet was greatly surprised when nine days before his death I brought to him the news (New York Times of April 6, 1955) that such radio noises were accidentally detected.

It has been long known that Jupiter possesses an angular momentum that is superior to the angular momentum of the Sun, even of the Sun with the rest of the planets combined. This appeared to me not without a definite role of charges accumulated in Jupiter.

Jupiter was believed to be a cold planet - since the 19th century it was thought to be covered by a frozen mantle of ices over ten thousand miles thick. To me, however, from the knowledge of its activities in ancient times, it did not appear as an inert gravitational body; I thought also of Jupiter as a dark star (*Worlds in Collision*, p. 373); but the radio noises that I expected it to be sending out I considered as of non-thermal origin and so I also expressed myself in the mentioned Forum Lecture. But whereas I expressed myself in October 1952: "The planet is cold, yet its gases are in motion. It appears probable to me that it sends out radio noises as do the sun and the stars. I suggest that this be investigated," in June 1954 in a letter to Einstein, I took a most definite stand: "Of course, I am a heretic, for I question the neutral state of celestial bodies. There are various tests that could be made. For instance, does Jupiter send out radio-noises or not? This can easily be found if you should wish." This claim was also vindicated in the announcement made by Burke and Franklin on April 6 of 1955.

The relevance of the orbital periods of Jupiter and Saturn to the sunspot cycle appeared to me, if real, based on electromagnetic, interdependence. The highly charged Jupiter must create a powerful magnetosphere; it may even create magnetic shells, for distribution of its satellites, a thing not yet proven; but certainly the large satellites of Jupiter, and especially the innermost of the Jovian satellites, must be much affected by its magnetic field. Jupiter itself appeared to me to be of contrasting charges on various levels which would account for the potential difference observed in celestial battles by the ancients between the head and the trailing part of the Jovian

progeny - protoplanet Venus (*Worlds in Collision*, "The Battle in the Sky"), the head having been expelled from Jupiter's deeper parts, the trailing part of debris and gases from a more superficial layer.

Thus discharges on Jupiter could be dictated by potential difference. The closest of the Galilean satellites must be acting as a target independent of whether a spark discharge actually takes place or a stream of charged particles is directed toward it and to a lesser extent toward other satellites (the fifth, however is only 112,000 miles mean distance from the planet). A purely gravitational relationship between Jupiter and its satellites appeared to me unthinkable; and on this phenomenon, in my estimate, the purely gravitational system of the World must stumble, as also on the case of the behavior of the comets when approaching, then circling the Sun in their perihelia a subject much discussed by me with Einstein in my effort to convince him of the fallibility of a purely gravitational system of the solar system (and of the universe in general).

The discovery of the Jovian noises (1955), and of the terrestrial magnetosphere (1958), claimed by me also in the Forum Lecture of 1953, and of the interplanetary magnetic field centered on the Sun and rotating with it (1960), and of the solar wind or uninterrupted streams of plasma (1960), made the purely gravitational system of the World untenable. Yet among astronomers, as late as 1971, the full significance of the fact for the understanding of the structure of the universe only very slowly finds its way, as can be exemplified by a paper by Prof. Ivan King, "The Dynamics of Star Clusters", where no mention is found of any electromagnetic participation in the mechanics of the galaxies.

The realization that Jupiter, which participated in a vigorous way in the theomachy (celestial battles), is not inert and cold led me to the conclusion that Jupiter must be also hot under its cloud cover, at some depth. This afterthought made me also claim that Jupiter is hot in a discussion with Prof. I. I. Shapiro of M.I.T., well-known authority in astrophysics, who denied such a possibility. This claim was confirmed recently by probes of the temperature underlying the surface clouds.

This leads me to the necessity to discuss some other aspects of the recent history of Jupiter, which all ancient peoples of the World elevated to the role of the supreme deity, the role it took over from Kronos-Saturn. But such a discussion I will undertake separately and at some length.

Saturn

Of Saturn I intended, already for some two decades, to write in a volume “Saturn and the Flood,” in which, as the title discloses, I would endeavor to identify this planet as the prime cause of the greatest of all catastrophes in human memory—the universal flood, or Deluge. This part of *Worlds in Collision* was conceived and drafted together with the parts dealing with Venus and Mars, but the elaboration of details was postponed and other labors claimed my attention and I am still before work unfinished. I will, however, disclose in a few sentences what is the subject of that part of reconstruction of world history.

The age that man later called the Age of Cronos (Saturn) was remembered with nostalgia as the age of bliss. It was the the earliest age of which man retained some, however dim, memories, but farther into the past, the dimness amounts almost to darkness. Saturn was also a more massive body than it is now, possibly of the volume of Jupiter, $\frac{1}{7}$ whereas now the proportion is approximately 7 to 13.

At a date that I would be hard put to task to identify even with approximation, but possibly about ten thousand years ago, Saturn was disturbed by Jupiter and exploded, actually became a nova. The solar system and reaches beyond it were illuminated by the exploded star, and in a matter of a week the earth was enveloped in waters of Saturnian origin.

Told in such brevity, the story sounds fantastic. I had the choice not to mention these events here at all or to refer to them and ask indulgence on the part of the readers for having said something unusual, and at the same time ask them to wait for a detailed narrative at some indeterminate time. I selected the latter. I have already mentioned that the major planets were in some way connected with the earlier cataclysms, one of which was the Deluge (*Worlds in Collision*, p. 373).

When in 1946 the manuscript of *Worlds in Collision* was first offered to the publishers (Macmillan and Co., New York), it contained the story of the Deluge and of the catastrophe that terminated the Old Kingdom in Egypt. But, at the suggestion of the reader for the publishing company, the book should have concentrated on one event; we compromised and presented in the published volume two series of catastrophes—those that took place in the fifteenth century before the present era and were caused by near approaches of Venus, and those which occurred in the eighth century before this era, and were caused by close approaches of Mars. The unused material was left for elaboration in two volumes: “Saturn and the Flood” and “Jupiter of the Thunderbolt.”

With this hardly even a summary, as told on this page, I should possibly dispel any misconception as to what is the design of my manuscript, too slow in the making. As to “predictions,” I could make several and I offer them cognizant of the fact that a prediction in science needs to be elaborated on the reasons that led to it.

I assumed, in the first place, that the planet Saturn must contain water to the extent that it is a “water planet.” It is also possible that water that enveloped the earth following the explosion of Saturn was at least partly formed by hydrogen combining with the oxygen of the terrestrial atmosphere—and there are indications that I intend to discuss in my book on the Deluge which point toward a sudden drop in oxygen content in the terrestrial atmosphere. But the fact that comets were observed consisting of water (ice), according to their spectral picture, permits the conclusion that water “ready-made” came from the planetary “nova.” Actually, in years subsequent to my concept of *Worlds in Collision*, water was identified as present on Saturn.

Further, I assumed that sodium chloride, or common salt, is an ingredient of the Saturnian atmosphere. Geophysicists have long wondered as to the origin of salt in the ocean. Sodium could have been derived from terrestrial rocks; but they are poor in chlorine. To some extent chlorine in oceans could have come from volcanic eruptions but it would require eruptions on an almost unimaginable scale to produce all of the chlorine locked in the salt of the oceans. The ancient traditions of Deluge refer also to the water arriving from space as salty and warm.

I have thought also of free chlorine (not combined into salt) on Saturn; but it is possible that vegetable life, at least, is present on Saturn, and free chlorine would interfere with vegetation; the reasons, though not compelling, for this assumption of vegetation on Saturn are also reserved for the detailed discussion. The tradition found in ancient texts refers to innumerable new forms of life in animal and plant kingdom following the Flood, which could have been solely a result of multiple mutations. But there exists in ancient lore an ever recurring association of seeds and new plant forms, with Saturn, Osiris, Tammus, Cronos, all of whom I understand as personifications of the planet Saturn.

In recent years I have chanced to read the view of Josif Shklovsky, a Russian astrophysicist, that a nova would be a source of cosmic rays even thousands of years after the explosion. Shklovsky and his collaborators offered the suggestion that at some past time the earth, or the entire solar system, passed through clouds of cosmic rays, resulting from a nova star, that caused the extinction of various forms of life on earth, dinosaurs and others. This thought found an echo in me because the same thoughts had been put on paper by me two decades earlier. But their assumption that cosmic rays may be discharged by a nova thousands of years after the explosion led me to think that if such is the case, Saturn may still emit cosmic rays, if, by now, only of low energy. Therefore when asked at some college gatherings what new “prediction” I would make, and desirous to tell something that in case of detection could not be ascribed to a lucky guess, I volunteered to suggest that there is a good chance that Saturn emits low energy cosmic rays. This on the assumption that the

Russians were right in saying that a nova would still be sending out such radiation after so long a period.

Finally, Saturn must emit more heat than it receives from the Sun. Reasons for such conditions of Saturn are at least two: first, the residual heat of the catastrophe in which Saturn was derailed from its orbit; second, the radioactivity that resulted from the catastrophe must still be pronounced on Saturn. In addition, Saturn can be regarded as a star and may have some mechanisms that make our sun burn with intense light. Because the surface clouds of Saturn are cold and the distance of Saturn from the sun renders the heat from this source very limited, the conclusion was drawn that Saturn must be very cold, frozen to its core. We came to a different conclusion also concerning the temperature of Saturn below the surface cloud layer.

In 1966 Dr. K. I. Kellermann described in *Icarus* the surprising fact that Saturn, at the wavelength of 21.3 cm. shows a temperature of 90 degrees F., which cannot be explained by solar radiation. It will be found of still higher temperature.

The rings of Saturn are formations of less than ten or twelve thousand years old. They must consist largely of water in the form of ice, but since the ancient lore all around the world tells that it was Jupiter who put these rings around Saturn, they may have some other components, too. Since these lines were written, spectroscopic study of the Saturnian rings has revealed that they consist mainly of water in the form of ice (1966).

Sodium chloride and cosmic rays are two phenomena still waiting to be investigated. Therefore, when I presented to Dr. H. H. Hess in his capacity as chairman of the Space Board of the National Academy of Science, a memorandum (dated September 11, 1963), subsequently submitted also to Dr. Homer Newell in his capacity as Director of NASA, I included these lines concerning Saturn:

“Saturn. Tests should be devised for detection of low-energy cosmic rays emanating from Saturn, especially during the weeks before and after a conjunction of Earth-Jupiter-Saturn.”

“Chlorine should be looked for in the Saturnian spectrum of absorption.”

Shapley's Scientific Record

In 1920 a debate on “The Scale of the Universe” took place between two astronomers, the older and respected Heber D. Curtis, and the young and ambitious, but little known, Harlow Shapley.⁽¹⁾ Curtis argued that the many spirals and nebulae visible through telescopes are galaxies or universes outside the Milky Way, which with its billions of stars is but another nebula to a viewer from a distant galaxy. Shapley argued that the solar system is located in an off-center position in the Milky Way, but that the Milky Way is the only galaxy in the entire universe, the spirals and nebulae being some nebular formations on its periphery.

A. Pannekoek described the position taken by these two astronomers in this way:

Curtis held that they [spiral nebulae] were ‘island universes’, separate stellar systems outside and comparable to the galactic system. . . . Shapley on the other hand, pointing to the accumulation of the spirals at the galactic poles, considered them not as distant galaxies but as belonging to our galactic system, itself regarded as larger, a ‘continent universe’. The fact that no stars were visible in these not very distant nebulae, though the spectrum was continuous, he ascribed to strongly scattering nebulous matter within them; and he held as a tentative hypothesis that the ‘spirals’ are not composed of typical stars at all but are truly ‘nebulous objects’. His chief argument, however—their accumulation at the poles and their absence in the Milky Way—lost its validity when it was found to be only an appearance produced by the absorption in the galactic plane.⁽²⁾

It is known today that there are many billions of galaxies in the Universe, not just the one galaxy of the Milky Way, as Shapley argued. He also grossly overestimated the size of the Milky Way, assessing it at 100,000 parsecs. “The figure is certainly too large,”⁽³⁾ as Pannekoek notes.

Forty years later Otto Struve concluded an article describing that debate thus:

To summarize the historic debate, I believe it correct to state that our present picture of the universe’s structure is a blend of the ideas of Shapley and Curtis. Shapley had correctly concluded that our solar system is located far from the center of our galaxy, and that the latter is considerably larger than previously believed. Curtis was correct in advocating that the spirals are other Milky Ways, comparable with our

own galaxy.⁽⁴⁾

This seems to be said with tongue in cheek, because hardly anyone would justly evaluate the outcome of the debate as a draw. Shapley's claim that there exists only one galaxy, the Milky Way, whereas it is known that billions or hundreds of billions of galaxies like the Milky Way exist, is a much greater deviation from the truth than Curtis' misjudging of the non-central position of the solar system in the Milky Way. Nevertheless, exploiting the fact that Curtis soon died, Shapley was left to claim the victory for himself and the story was worked up to his having been a second Copernicus: as Copernicus had demonstrated that this world of ours is not in the center of the solar system, so Shapley was said to have demonstrated that our solar system is not located in the center of the galaxy, but more toward the periphery. Several times I read and heard this proclamation being made on Shapley's behalf. Once it was on television, said so in his presence, and he basked in the halo of a genius before the multitudes of viewers.

The actual picture that emerges from this debate is a far cry from the story familiar from books, articles, radio and television, which repeats the same theme that while Copernicus discovered that the Earth is not in the center of the solar system, Shapley discovered that the Solar System is not positioned in the center of the Milky Way. Such a story gives Shapley credit for a discovery—and victory in the debate—both of which were undeserved.

Not even the claim that the solar system is located off-center in the Milky Way can be credited to Shapley. Immanuel Kant in his *Universal Natural History and Theory of the Heavens* (1755) wrote: “But perhaps it is reserved for future times to discover hereafter the region at least where is to be found the centre of the system of the fixed stars to which our sun belongs. . . .”⁽⁵⁾

Kant observed that “the zone of the Milky Way is broadest in the part that lies between the constellations of the Swan and Sagittarius,”⁽⁶⁾ and offered the surmise that “this will be the side where the place of our sun is nearest the outermost periphery of the circular system.”⁽⁷⁾

Moreover, Kant realized that the Milky Way is not the only galaxy. He wrote:

It is far more natural and conceivable to regard them [“nebulous stars”] as being not such enormous single stars but systems of many stars, whose distance presents them in such a narrow space that the light which is individually imperceptible from each of them, reaches us, on account of their immense multitude, in a uniform pale glimmer. Their analogy with the stellar system in which we find ourselves, their shape, which is just what it ought to be according to our theory, the feebleness of their light which demands a pre-supposed infinite distance: all this is in perfect harmony with the view that these

elliptical figures are just universes and, so to speak, Milky Ways

[\(8\)](#)

Kant cited as a source for some of these views Mr. Wright of Durham, an Englishman.

As for Shapley, in the years following his debate with Curtis, he did not produce any work of importance, and this was also pointed out in the literature. Forty-five years later he persistently claimed this great “discovery” as his own accomplishment and triumph.^{[\(9\)](#)}

Worlds in Collision and the Natural Sciences

Although many articles were written against the theory of *Worlds in Collision*, and its author was called many names, there are but two arguments that are of real significance and with which the theory of “worlds in collision” stands or falls. One argument is of astronomical, the other of geological nature. Astronomers believe that the Earth and the entire solar system have been moving unperturbed for billion-years-long eons, every planet and every satellite on the same unchanging orbit. Geologists believe that the earth passed through a process of slow evolution, and that no vast catastrophe occurred in the age of man, if at all.

Since these two beliefs are the foundation of these two sciences, a theory that opposes them threatens to overturn the entire edifice. It is branded as heresy and is summarily rejected as being incompatible with the basic notions of natural sciences as taught in all textbooks and from all professorial chairs of natural sciences in general, not only astronomy and geology. If celestial mechanics went astray, the physics upon which it is built contains some basic error, and if the accepted view of geology is wrong, the theory of evolution that excludes past catastrophes must be based on a wrong notion. But astronomy is said to be the most exact of all sciences, being almost the embodiment of mathematics, and modern physics is the mainstay of all natural sciences, and the theory of evolution is the cornerstone of modern biology now for more than ninety years. No wonder that a theory that would contradict so much had to be rejected even without attention being paid to it; then it is also no wonder that *Worlds in Collision* was paid an unusual amount of attention.

It was the cumulative weight of the historical, literary, and folkloristic material from almost every culture of the past and every region of the world, or the collective memory, that made “worlds in collision” to a contention that could not have been disposed of without being answered. The emotional outbursts and the efforts to suppress the book in the hands of its first and, then, the second publisher, were no arguments; and the fact that now for over three years, again and again, the theory is “disproved” for “the first time” proves only that it was not sufficiently disproved at all, and that ever new efforts are necessary to discredit a theory which, if right, dislocates the very foundations of the natural sciences, and with them, of humanistic studies—history, archaeology, folklore, history of religion.

Aware of the consequences of the theory of cosmic disturbances in a recent past, I explained in the concluding chapter of my first book the various problems that come up. It could easily have happened that the author of a work based on ancient literary

sources would not feel himself capable or willing to go out of the pale of his particular field, and would let the scholars and scientists take up the problem in their fields. If the cumulative evidence of the book is strong enough to give to the events detected the validity of historical facts, then scholars of other fields are under the obligation to re-examine their tenets and try to find how a harmony between facts and laws can be brought about. And if the laws and the facts conflict, should the facts be annulled, or the man-made laws revised?

But a revolutionary revision of our heritage and the detection of unexpected but omnipresent records of frightening events in the history of human, animal and plant populations of the globe, and of the globe itself, and of other celestial bodies of the solar system, makes it most probable that under accepted contentions of eventless geology and astronomy, these sciences would not be found prepared to accommodate their views to a new theory in a foreign field. Therefore, it can be expected that either this field must be invaded and cleansed from the newly detected “facts,” if this is possible, or other fields must defend their contentions. Nobody invaded the field examined in *Worlds in Collision* to show that the thousands of coordinated references there could be torn apart or all of them given a different interpretation—and such a work would be almost unthinkable. Therefore the line of combat moved into other fields. And not expecting that natural sciences, or even archaeology, would revamp their views in response to a work in collective human memory, I took upon myself to carry the conclusions of my work in this field into other fields, too.

In order to be able to do this, I decided to postpone the presentation of the story of the earlier world catastrophes—of the third and fourth millennia before the present era—and dedicate myself to the exploration of the ensuing problems in astronomy and geology. And before this I had the obligation to elaborate on the problems of chronology and cultural history of the peoples of antiquity. This I had to do first, because in *Worlds in Collision* I asked the permission of the reader to use a synchronical scale of Egyptian and Hebrew histories which is not orthodox. And though *Ages in Chaos* was not written as historical argument for *Worlds in Collision*, being a work of its own purpose, it answers the argument the my synchronization of stories about catastrophes, especially the catastrophe of the days of the Exodus and the fall of the Middle Kingdom in Egypt, was arbitrary. It was not arbitrary, and a reconstruction of the history of the ancient East for twelve centuries, until the days of Alexander the Great and even beyond, was built upon the premise of a simultaneity of the fall of the Middle Kingdom and the Exodus, both events having taken place during a great natural catastrophe.

The Acceptance of Correct Ideas in Science

Should the question be asked why my books caused such great enmity and agitation (several writers have compared it with the violent natural events I described), the answer should not be simplified into the formula—“because the theories argued in them run counter to the established views.” Such an explanation requires elaboration within a larger historical perspective.

Fundamentally, it has been true that any new concept that carried seeds of truth and dispensed with many accepted tenets was apt to provoke some opposition. But this is not all. There must be deeper reasons for the extraordinary outburst on the part of the scientific community that greeted and pursued my works. This manifested itself in immense efforts to make me appear to be unscientific or unscholarly, an outcast, and my work of no worth.

The cases of Galileo, Darwin, and Pasteur were often brought into comparison by many reviewers and numerous correspondents. But, without losing historical perspective, the attacks in these cases were far less vituperative, far more mixed with praise, than the attacks made on the substance of *Worlds in Collision* and *Earth in Upheaval*, and personally upon their author.

Galileo was received in many honorary assemblies with great pomp, even by the Pope himself: the initial unwillingness to believe what Galileo saw through the telescope soon turned into great admiration for his achievement. A case in point is Clavius, author of the Gregorian calendar reform. At first a vehement opponent of Galileo, Christopher Clavius, with other Jesuits of the Roman College, repeated Galileo's observations in 1611, a year after Galileo published his *Sidereus Nuncius*. “John Adam Schall von Bell, later to be the first European director of the Chinese Bureau of Astronomy, was present as a young man in the hall of the Roman College in May 1611 when Galileo received a triumphant welcome from Clavius and his mathematicians after their confirmation of his discoveries.”⁽¹⁾ It was the scorn to which Galileo exposed the Pope, putting his views on cosmology into the mouth of Simplicius, that caused Galileo's brush with the Inquisition.

From the beginning, Darwin had many followers among scientists; and actually not he as much as his opponents were the targets of emotionally charged abuse. It was Huxley, not Bishop Wilberforce—the main opponent of Darwin—who in their famous encounter lost his temper and used insulting language.

Pasteur had envious and disbelieving colleagues, and some scientists in exalted positions, like Virchow, did not hurry to his side; yet Lord Lister did so. Before long Pasteur's name rang throughout Europe, and people traveled to his laboratory — this despite the fact that Pasteur had no formal medical training, as Darwin had no formal training in natural history. Darwin's only degree was that of Bachelor of Theology.

Galileo, Darwin and Pasteur, the standard examples of the persecution to which innovators are subjected, did not experience nearly as much abuse, either in sheer quantity (though the comparative scarcity of the press in the seventeenth and nineteenth centuries needs to be taken into account), or in its intensity, as became the lot of the author of *Worlds in Collision*.

In the history of science only the case of Copernicus caused a comparable objection and agitation. But Copernicus spared himself the abuse by the intentional postponement of the publication of his book until his very death. In his last days he was persuaded by his only pupil, Rheticus, to permit him to publish his work, *De Revolutionibus*, which he dedicated to Pope Paul III. On May 24, 1543, a few hours before Copernicus died, the first copy was put in his hands. In it he said:

“I can easily conceive . . . that as soon as some people learn that in this book which I have written concerning the revolutions of the heavenly bodies, I ascribe certain motions to the Earth, they will cry out at once that I and my theory should be rejected. Accordingly, when I considered in my own mind how absurd a performance it might seem to those who know that the judgement of many centuries has approved the view that the Earth remains fixed as center in the midst of heaven, if I should on the contrary assert that the Earth moves — when I considered this carefully, the contempt which I had to fear because of the novelty and apparent absurdity of my view, nearly induced me to abandon the work I had begun. How did it occur to me to venture, contrary to the accepted view of the mathematicians, and well-nigh contrary to common sense, to form any conception of any terrestrial motion whatsoever?”

The only opposition Copernicus experienced in his lifetime was not from the Catholic Church, but from Martin Luther who, having heard of the theory of the Canon of Frauenburg, spoke against the “new astrologer who wanted to prove that the earth was moving and revolving rather than the heaven and the firmament, sun and moon. . . . This fool wants to turn the whole area of astronomy upside down. But as the Holy Scripture testifies, Joshua ordered the sun to stand still, not the earth!”

The Copernican theory was, as its author saw in advance, silenced for almost a hundred years' scientists were afraid to study or to teach it the only exception being Giordano Bruno. After nine months in the dungeon of the Venetian Inquisition and seven years in the cell of the Roman Inquisition, Bruno was burned at the stake in Rome for his denial of the Immaculate Conception—a theological heresy—and for

his teaching of the Copernican theory, which he extended by claiming the plurality of worlds. For Bruno, the fixed stars were not lights attached to an enormous sphere that bounded the universe, as Copernicus thought them to be. They were suns, like our Sun, encircled by planets, and some of these he believed were populated by intelligent beings. “You are perchance more afraid to pronounce your judgement,” Bruno said at the last hearing of the tribunal, “than I am to hear it.” On February 17, 1600, from the pile of faggots kindled in Campo dei Fiori in Rome, he was sent to the Inferno by the Inquisition.

These were no longer the dark Middle Ages. It was an illustrious time. The same year, 1600, Shakespeare wrote his *Hamlet*, Bacon had published his *Essays* in 1597, and both of them remained steadfast adherents of the Ptolemaic, geocentric system of the world, almost one hundred years after Copernicus. Bruno had spent his time and zeal in England, having made only one convert—William Gilbert, who published his great opus, *De Magnete*, in the same 1600. But when I said that Bruno was despised and pursued by both the Church and by scientists, I had in my mind that Galileo, whose later (1633) detention by the Inquisition was of a much shorter duration, in no book and in no letter of his enormous extant correspondence mentioned Bruno. Johannes Kepler, whose great discoveries became known as Kepler’s Laws, himself wrote of Bruno’s concept of the plurality of worlds as that “horrible theory.”

It was this that Bruno feared most: and though Bruno’s ideas are acknowledged to have been the greatest influence on Spinoza’s (17th Century) pantheism, he otherwise was all but forgotten for fully two hundred years and rediscovered only in the nineteenth century. God’s mills grind slowly. In August of 1597, Galileo wrote to Kepler:

“Many years ago I became a convert to the opinions of Copernicus, and by that theory have succeeded in fully explaining many phenomena which on the contrary hypothesis are altogether inexplicable. I have drawn up many arguments and confutations of the opposite opinions, which however I have not hitherto dared to publish, fearful of meeting the same fate as our master Copernicus who, although he has earned for himself immortal fame amongst a few, yet amongst the greater number appears as only worthy of hooting and derision: so great is the number of fools.”

Galileo became bolder only when, having observed Jupiter and its satellites through his telescope, he recognized a structure similar to that described by Copernicus: a sun encircled by planets. But his open defense of the Copernican theory caused a storm of opposition.

What was so unacceptable in the heliocentric system? Most generally it threatened humankind’s psychological need for the feeling of security, itself most probably based on a deep hidden insecurity. A moving Earth is a less secure place than an unmoveable one. Additionally, mankind was denied the central role in the universe.

This not only was injurious to his ego but was also interpreted to be in conflict with the tenets of the Christian Church. Did Jesus come just to a very secondary planet, one of many? But more than these considerations, the awakened feeling of insecurity was the basis of the great anguish that greeted the belated announcement of the Copernican theory.

Man as a species needs security from the elements, from the beasts; and not until he aggregated into communities and built shelters and walls could he feel himself protected from the outrages of nature and from the predatory animals. But it was not the daily vicissitudes of the ever-lurking predators that put such deep-seated fear into his soul: it was the great derailment of this planet on its travels that left its deepest impression on him; and as the deepest traumas are put in oblivion in the soul of an individual, so also is the case with humankind.

It was very unpleasant, therefore, to find out that the Earth, the whole Earth under our feet, moves. (How spontaneously and instinctively correct when the entire population of a city runs outside in panic at the first rumblings of an earthquake.) Later it was also very unpleasant to be told by the biologists that animal species are not immutable, that there is change and evolution in the animal kingdom, and that these natural mechanisms had produced humankind itself. Still more recently, it was markedly unpleasant to learn from psychoanalysis that man's motives are not always those that he thinks; that in his instincts he is much more primitive and animal than he wishes to admit: and that consciousness thus has understructures of an unconscious mind, and that these are quaking and uncontrollable domains, ruling over his conscious acts and motives.

But nothing of this compares with the insecurity engendered (especially if one is a scientist) when it comes to understanding that the planet on which we travel has been involved in cosmic accidents: even more if it seems that the plan of propagation and evolution has made the role of such accidents of collision not incidental but a precondition of evolutionary progress and destruction alike.

This is, in my view, the main cause of the emotional outbursts that have followed *Worlds in Collision*. The idea of a great fear living in man since the days of the great catastrophes presented itself early to me I was a student of psychology before I became a student of history, natural history, and folklore: and I was aware that there is some "blocking," in the psychoanalytic sense, to see obvious things. Why have students of mythology failed to discover why the gods of the pantheons of all ancient races should have been identified with the planets? Why do the traditions of all races speak of celestial *theomachy*, of great natural perturbations, with the Sun, stars, and meteors taking part? Or, why do modern students of religion not wonder at the grandiose natural events described in the holy books and the concepts of eschatology so prominent in the Gospels and the Koran? Why do students of geology strain themselves to explain, or explain away, catastrophically-formed phenomena they observe on the bottoms of the seas, in mountain ridges, in great fields of lava, and great deserts?

I have called this psychological phenomenon *collective amnesia*. and I have explained the term elsewhere: it is not that we have no historical evidence: it is rather the inability to read the texts as they are—Mars for Mars, Jupiter for Jupiter, fire for fire, hurricane for hurricane, and deluge for deluge.

To elaborate on this subject and to show how the unconscious mind works in all areas of our activities, even in our many sporadic wars, I have written *Mankind in Amnesia*. If Jung was right in his concept of a collective unconscious mind, then its probing must reveal the persistent racial memories of great catastrophes of the past when the sea, the sky, and the earth competed in destruction—for we are “survivors of survivors.”

Are there no other reasons for the outcry and concerted opposition to the reconstruction offered in *Worlds in Collision*? True, most scholars have a vested interest in accepted theories. There is also a psychological urge to reject anything contrary to what we have learned.

But these are additional reasons; vested interests and resistance to change one’s thinking are both secondary to the great and primary reason: the fear of the repetition of the events, grown in the racial memory of the survivors of these crises, when the Earth was carried to the brink of destruction. It is this hidden fear which is behind the scientists’ vehement denial of the available evidence for global catastrophes in historical times. The same fear manifests itself in many forms of irrational behavior—directed, above all, against *anyone* whose findings threaten to bring the archaic trauma into the open.

Precursors

Nicolaus Copernicus had a passage in the manuscript of his *De Revolutionibus* in which he gave credit to Aristarchus of Samos as his predecessor in announcing the heliocentric view of the solar system. Archimedes and Plutarch, widely read in the Middle Ages, as well as other writers of antiquity referred to this teaching of

Aristarchus:⁽¹⁾ the Sun, not the Earth is the center of the solar system, and the Earth with the other planets revolves around the Sun. But Copernicus suppressed this mention of Aristarchus in his manuscript, and it did not appear in the printed *De Revolutionibus*.⁽²⁾

Galileo Galilei proved that all objects, independent of their weight, fall with the same velocity and the small difference is due only to the resistance of the air through which the objects fall. But already Lucretius in the first century before the present era wrote: “All things that fall through the water and thin air . . . must needs quicken their fall in proportion to their weights, just because the body of water and the thin nature of air cannot check each thing equally, but give place more quickly when overcome by heavier bodies. But, on the other hand, the empty void cannot on any side or at any time support anything, but rather, as its own nature desires, it continues to give place; wherefore all things must needs be borne through the calm void, moving at equal rate with unequal weights.”⁽³⁾

In 1605, Simon Stevin of Bruges published a book in which he described his experiment: he let fall two balls of lead, one ten times the weight of the other, and they landed evenly.⁽⁴⁾

Isaac Newton explained that gravity attracts the Moon to the Earth and calculated this basic notion of his theory assuming that “the mean distance of the moon is equal to sixty semi-diameters of the earth”.⁽⁵⁾ “*The moon gravitates towards the earth, and by the force of gravity is continually drawn off from a rectilinear motion and retained on its orbit.*”⁽⁶⁾ Thus he concluded that the Moon, like terrestrial objects, is governed by universal gravitation. Now Plutarch already in the first century wrote: “They who place the moon lowest say that her distance from us contains six and fifty of the earth’s semi-diameters, that is, that she is six and fifty times as far from us as we are from the center of the earth: which is forty-thousand stadia, according to those that take their calculations moderately. Therefore the sun is above forty millions and three hundred thousand stadia distant from the moon; so far is she from the sun by reason of gravity, and so near does she approach the earth. So that if substances are to be distinguished by places, the portion and region of the earth challenges to itself the moon, which, by reason of neighborhood and proximity, has the right to be reputed

and reckoned amongst the terrestrial natures of bodies.”⁽⁷⁾

Classical authors referred to the belief of the Chaldeans that comets move on orbits and return at periodic intervals.⁽⁸⁾ However, it is Edmund Halley who is credited with the discovery of the periodic return of comets.

Thus, the authors of basic discoveries of the laws of nature borrowed from the ancients or rediscovered the truths known to the ancients, but kept the ancients' names out of their discourses.

The conclusions of my own research, that the Earth underwent successive catastrophes of a cosmic nature and that the constitution of the solar system changed in historical times, are actually based on testimonies of the ancients. The idea of a cosmic catastrophe in historical times came to me one evening in October 1940: it was inspired by the chapter in the Book of Joshua where it is told about the stasis of the Sun and Moon, and the stones that fell from the sky. In a few weeks the major part of the theory presented in *Worlds in Collision* was conceived. The first impulse after reading the Book of Joshua was to investigate Chinese records in order to see whether anything is known about the stasis of the Sun; then I addressed myself to authors who narrate the ancient history of the New World.

In the Friar Charles Etienne Brasseur de Bourbourg (1814-1874), I found an author who was very much impressed by the constant references in old sources to the fact that the continent of the New World underwent great catastrophes each of which terminated a world age. He was on an absolutely right track when he posed the principle which I had in my own mind, that of looking for references to a stasis of the Earth in Mexican traditions. “In order to rediscover the remotest history of the earth it is necessary to compare the ancient traditions of Asia and Egypt with those of the primitive peoples of America.”⁽⁹⁾ But, strangely enough, the reverend author did not feel that the Scriptures contain any parallels to the Mexican traditions; and the Egyptian material in which he looked for comparisons was insufficiently known in his time. And, therefore, all his efforts to find parallels were repaid with no success. Nor did he understand the cause of the continental catastrophes, leaving to scholars in the natural sciences the task of dealing with the problem, which he felt they were compelled to do on the basis of the traditions of pre-Columbian days.

There are three more authors whom I feel obliged to mention, although I did not find in them more than one or another quotation which I could trace and re-employ, since my theory was ready when I came across their books, and it went far beyond the ideas of these authors.

The first of them is William Whiston (1667-1752), professor at Cambridge, who succeeded Newton there. Newton chose him as his successor but later opposed his being admitted as a member of the Royal Society of which Newton was the first president. In 1696 Whiston wrote a book, *A New Theory of the Earth from its*

Original to the Consumption of All Things, in which he tried to prove that the Earth had contacted a comet which was the cause of the Deluge. He did not explain how a comet could cause a flood, and apparently ascribed this to the displacement of the seas. The idea that the Deluge was caused by a comet was not his: it is mentioned in the Talmud and used by Rashi (Rabbi Isaac ben Solomon), a Mediaeval rabbinical author often quoted by Christian authors during the Renaissance. [\(10\)](#)

A mention of the presence of a comet in the sky during the Deluge, though not described as its cause, is found also in the works of the chronographers of the sixteenth and seventeenth centuries who preceded Whiston: Abraham Rockenbach, Henricus Eckstormius and David Herlicius; and he refers to them as the factual sources for the basic assumptions of his theory. Whiston supposed that before the Deluge the year was equal to 360 days, and that the Earth had its pole of daily rotation perpendicular to the plane of its yearly revolution. He thought that this was the only world upheaval of which any memory survived and, not recognizing cosmic catastrophes in such events as the story described in Joshua 10:12, wrote: “The sun and moon, as if they were two globes of fire and light pendulous in our air, and hanging over certain places, are ordered to stand still, the one upon Gibeon, the other in the valley of Aijalon. . . . All which expressions, with many others through the whole Bible, plainly shew that the Scripture did not intend to teach men philosophy, or accommodate itself to the true and Pythagorick system of the world. The holy writers did not consider the heavenly bodies absolutely, as they are great and noble in themselves, main and glorious parts of the universe, very distant from our earth, placed at various and immense distances from it, and from one another ... disposed in a regular order, in proportionate and harmonious periods and revolutions. Under such consideration we might have expected another sort of presentation of the heavenly bodies, their original, designs, courses, and circumstances, than the foregoing texts, or other parallels, everywhere afford us.” [\(11\)](#)

Whiston did not see natural disturbances of world dimensions in the descriptions of Scripture, the Deluge excluded. He believed that the comet which caused the Deluge has a period of 575½ years and that it was the same comet which appeared in September -44 after Julius Caesar was killed, in the year 531 in the consulate of Lampadius and Orestes, in February 1 106, and at the end of the year 1680; and he believed that it will return again in 2256. He also came to the idea that the Earth was a comet before it became a planet. He did not recognize the role of the planets in historical cataclysms.

The second author whom I would like to mention is Baron Georges Cuvier (1769-1832). He is regarded as the father of the paleontology of the vertebrates. Investigating the strata of the ground, he came to the conclusion that the Earth underwent a series of cataclysms: “We discover in the midst of even the oldest strata of marine formation, other strata replete with animal and vegetable remains of terrestrial and fresh-water productions; and amongst the more recent strata, or, in other words, those that are nearest the surface, there are some in which land animals are buried under heaps of marine productions. When the traveller passes over those

fertile plains where gently flowing streams nourish in their course an abundant vegetation, and where soil, inhabited by a numerous population, adorned with flourishing villages, opulent cities, and superb monuments, is never disturbed, except by the ravages of war, or by the oppression of the powerful, he is not led to suspect that Nature also had her internecine wars, and that the surface of the globe has been broken up by revolutions and catastrophes. But his ideas change as soon as he digs into that soil which now presents so peaceful an aspect. . . . If there is anything certain in geology, it is that the surface of our globe has been the victim of a great and sudden revolution, whose date cannot go back more than five or six thousand years.

“But these countries which today are inhabited, and which the last revolution has turned into dry land, have already been inhabited formerly, if not by men, then by land animals; consequently, a previous revolution had, at the least, brought them under water; and if one can judge by the different orders of animals whose remains one finds in them, they have perhaps undergone as many as two or three irruptions of the sea.”⁽¹²⁾

But he confessed that he was unable to find the cause of these cataclysms, and wrote: “It is these alterations which now appear to me to be the problem in geology that it is of the greatest importance to solve or, rather, to define, or even to circumscribe; for in order to resolve it satisfactorily it would be necessary to discover the cause of these events - an undertaking which presents a difficulty of quite a different kind.”⁽¹³⁾

“*In fine*, it is in those events that approach nearer to our own times, that we may hope to find some traces of more ancient events, and of their causes; if, indeed, after so many fruitless attempts as have already been made, one may be permitted to flatter himself with such a hope.”⁽¹⁴⁾

“These ideas have haunted, I may almost say, have tormented me, during my researches among fossil bones.”⁽¹⁵⁾

In a single passage Cuvier mentioned the idea of Whiston and mocked it, saying: “Whiston fancied that the earth was created from the atmosphere of one comet and that it was deluged by the tail of another. The heat which remained from its first origin, in his opinion, excited the whole antediluvian population to sin, for which they were all drowned in the deluge, excepting the fish, whose passions were apparently less violent.” He was thus supporting the attitude of Voltaire against the ideas of Whiston. As it is known, Lamarck before Cuvier, and Lyell and Darwin after him, “proved” that there were no cataclysms, and thus Cuvier was put on dusty shelves.

Ignatius Donnelly (1831-1901), a member of the American Congress in the days of Lincoln (1863-1869), ran in 1900 as a candidate for the Vice-Presidency on the “middle-of-the-road-populists” ticket. In between his political activities he wrote a few books which brought him the title the “Prince of U. S. Cranks” . In one of the

books he tried to solve the authorship of the Shakespearian plays, ascribing them to Bacon; in another he tried to locate Atlantis; and in a third (the second in order of chronology), called *Ragnarok*, he came upon the idea that the Earth in the past met a mighty comet, and he attributed the deposits of clay, gravel, and silt on the Earth's surface to contact in some bygone age with this comet. He supposed, for the sake of his theory, that clay, gravel, and silt cover only one half of the Earth, that which was facing the comet when it passed; thus China and eastern Siberia would have no clay or gravel.

Donnelly's assumption regarding the distribution of clay and gravel is not based on any source or authority, and is entirely erroneous. He did, however, ascribe the catastrophe to the period when man already peopled the Earth; and I found in his book a number of references, especially to a few of those quoted by Brasseur, which I already possessed. The section in his book titled "Legends of the Age of Darkness" provides an abundance of references to a period of gloom. Nevertheless, Donnelly drew almost none of the conclusions to which he was obliged by his theory. He did not mention Whiston as his predecessor, and apparently was ignorant of him.

I do not know of any other modern authors who anticipated one or another point in my reconstruction of planetary disturbances in historical times.

HOERBIGER'S THEORY To the Editor of The New York Times:

One of my teachers in my adult life, a wise man, made the following observations: a newly discovered truth is first attacked as being false; but when it is finally accepted as true it is attacked as not being new.

During my writing of "Worlds in Collision" "I often told my friends that I should like to arrive rather early at the time when my theory would be attacked as not original; it would be a sign that it was starting to become accepted.

R. Heymanson in a letter to The New York Times published on May 7 accuses me of offering what he says are "ideas which have long been old stuff to educated people in England and on the Continent of Europe" ; in his opinion my work does not possess "the virtue of originality. " More specifically, he says that "everything" in my book is to "be found" in Hoerbiger's theory.

Hoerbiger's theory of cosmic ice is as follows: the space between the stars is not empty but is filled with thin ice; this ice offers a very minute obstacle to the movement of planets; every movement is thus slowed down; there were at least half a dozen small planets on concentric orbits between earth and Mars. The planet closest to earth was captured because of the slow-down movement and became a moon. After millions of years, again because of the obstacle presented by the cosmic ice, this moon on its orbit around the earth came so close to the earth that it was pulled down

and crashed on the ground. This caused a world catastrophe. After millions of years another planet was captured, after more millions of years it also crashed on the earth and so on.

The present moon is at least our sixth moon and will also fall on the earth in some millions of years to which, according to Hoerbiger and his followers, the Book of Revelation of John carries testimony. Then Mars will be captured and will become our next moon.

The geological ages, according to Hoerbiger, must have been much longer than accepted by the geological scientists — in the range of billions of years; and for tens of millions of years human beings have existed and also carried their traditions.

The views expressed in “Worlds in Collision,” which hold that the geologic ages must have been much shorter (with all the implications for the theory of evolution), are diametrically opposed to Hoerbiger’s theory.

In two or three instances where I used a source learned by me from Hoerbiger or Bellamy, his interpreter, I gave the proper credit by indicating book and page.

Foreword to Alice Miller's *Index to the Works of Immanuel Velikovsky**

Mrs. Alice Miller, unknown to me, worked for over six years on the composition of this Index. In December of 1970 she wrote me a letter expressing her appreciation of my work and her desire to be of assistance, vaguely mentioning her ability to work on indexing. I am not certain that I have answered her letter, since through the years I was unable to reply to every one of my readers-correspondents.

Then, a few months ago, I was surprised by the arrival of a large envelope, containing the 278-page Index. I was unaware that through all the six intervening years Mrs. Miller labored on the project she had faintly indicated in her letter of 1970. It came at a time when I discussed with a few of my close collaborators the necessity of a work of preparation of an "Index of Deviations" (or "Innovations") that would serve as a guide to those who would undertake the ambitious project of preparing material for a thorough overhaul of the existing encyclopedias and textbooks in numerous fields touched upon by the heresy born in the first years of World War II and brought to the attention of the scholarly world and of the literati (the reading and thinking public) between 1950 and 1960.

Today the heresy of that decade is occasionally found as accepted truth in conventional texts, but usually without a reference to the iconoclast who first offered it - and did so not in a piecemeal way, but in the course of a reconstruction of events in nature and history not of grey antiquity, but of the times when man could record the events and did so in many languages; actually all the ancient civilizations left records of the same events, as did also nature in records of bones and stones.

The oneness of these great fields, of natural and cultural histories, came to light, and so to the consciousness of the readers. In this process many an enshrined law proved to be only an assumption - and often a wrong assumption at that: and what was considered as ancient history down to Hellenistic times showed itself to be but a web of baseless speculations.

The work of Alice Miller will be of inestimable value to researchers in various topics dealt with in my published books and articles, and, as I just said, is already preparing the way for the summation of that achieved synthesis - by itself only a beginning of a new world view.

Joseph and Potiphar

The story of Joseph is one of the best known in the Bible: Joseph who dreamed prophetic dreams, and wore a shirt of many colors—a distinction of his father—and was sold into Egypt by his brothers. There he became housekeeper in the household of a high official, but later was thrown in the dungeon. Then, after he had interpreted the dreams of Pharaoh about the seven years of plenty and seven years of famine, he was freed and was appointed to gather and store the produce during the good years and distribute it during the lean years.

The person of Joseph was searched for by the historians among the grandees of Syro-Canaanite origin at the court of the Egyptian Pharaohs. He was identified with Dudu, the courtier in the palace of Akhnaton; or with Iaanhamu, who was in care of the food supply in the same reign: his name is often mentioned in the el-Amarna letters as that of an official who sold food to the people of Canaan on behalf of the Pharaoh.

In *Ages in Chaos* it was demonstrated that Dudu was probably a grandson of Hadad—mentioned in I Kings 2; that the letters of el-Amarna described the famine, also known from the Scriptures, that occurred in the days of Ahab, King of Israel.

In *Ages in Chaos* and in *Worlds in Collision* I was able to establish the fact that the Exodus took place on the day when the Middle Kingdom of Egypt had its end. Thus we are carried to the conclusion that the sojourn of the Israelites in Egypt falls in the period of the Middle Kingdom. This sojourn begins, according to the Scriptures, with the arrival of Joseph, son of Jacob, who at the same time is the only figure of discern in the Egyptian Jewry before the time of Moses and Exodus. Thus, realizing that the sojourn of the Israelites in Egypt took place not during the New Kingdom but during the preceding Middle Kingdom, in order to find out whether the personality of Joseph or the patron of the early stage of his career, Potiphar, is referred to in the historical documents, we have to look into those of the Middle Kingdom. The task appears simple. According to the Book of Genesis Potiphar was “an officer of Pharaoh, captain of the guard.” In the register of the private names to the *Ancient Records of Egypt* by James Breasted, we find the name Ptahwer.

Ptahwer was at the service of the Pharaoh Amenemhet III of the Twelfth Dynasty of the Middle Kingdom. According to an inscription of Ptahwer at Sarbut el-Khadem in Sinai dated in the forty-fifth year of Amenemhet III, his office was that of “master of the double cabinet, chief of the treasury.” Ptahwer’s text reads:

I was one sent to bring plentiful _____ from the land of _____, ready in his reports to his lord, delivering Asia to him who is in the palace,

bringing Sinai at his heels, traversing inaccessible valleys, bringing unknown extremities (of the world), the master of the double cabinet, chief of the treasury, Ptahwer, triumphant, born of Yata.

The inscription records the successful accomplishment of some peaceful expedition. Since there is only one Ptahwer in the historical documents, and since he lived in the time when we expect to find him, we are probably not wrong in identifying the biblical Potiphar with the historical Ptahwer.

This being the conclusion concerning Potiphar, we are curious to find whether any mention of Joseph is found in historical documents, too. The fact that from the great and glorious age of the Middle Kingdom only a very few historical inscriptions are extant. Since a great famine took place in the days of Joseph, it is, of course, important to trace such a famine in the age of which we speak. In the days of Amenemhet III there occurred in Egypt a famine enduring nine long years. Of this period we have a revealing document, which reads:

With these expressions the words of the Scriptures can be compared (Genesis 41:54):

And the seven years of dearth began to come, according as Joseph had said; and the dearth was in all lands; but in the land of Egypt there was bread.

Thus it seems that the Pharaoh in whose days was the seven years' famine was the successor of the Pharaoh in whose days began the rise of Joseph's career (if Yatu is Joseph). Potiphar, who lived under Amenemhet III, probably lived also under his successor.

The inscription which deals with Ptahwer mentions a man whose name is transliterated by Breasted as Y-t-w. Among the monuments of Amenemhet III's reign is one of the Storekeeper who was honored together with two other persons, and, with a royal If we remember that according to the Scriptural narrative Joseph was appointed storekeeper of the State (Gen. 41:40-41) in anticipation of the seven lean years, with the powers of a chief Minister of State or Vice-King, we may suspect in Yatu the Biblical Joseph. In the Scriptures it is said that his name was changed by Pharaoh to Zaphnath-paaneah, but still his original name may have been in use until he became next to the Pharaoh in importance.

The inscription that mentions Ptahwer refers to his activity in the mines of the Sinai peninsula. In this respect it is of interest to find that the Jewish traditions connect Joseph with the area of the Sinai Peninsula saying that he kept a large quantity of treasuries near Baal Zaphon, the scene of the Passage of the Sea.
