SAMPLE

Matrix: solutions

Sample preparation: Dissolve in mobile phase at a concentration of 100 μg/mL, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 300 × 2 μBondapak C18
Mobile phase: MeCN:water 30:70 adjusted to pH 3.0 with formic acid
Flow rate: 0.27
Injection volume: 5
Detector: MS, VG TRIO 2000 single quadrupole MS with EI or CI or UV 270

CHROMATOGRAM
Retention time: 9.5

OTHER SUBSTANCES
Simultaneous: butethal, butalbital, talbutal, amobarbital, pentobarbital

KEY WORDS
mass spectra given

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)
Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25
Detector: UV 229

CHROMATOGRAM
Retention time: 5.60 (A), 4.92 (B)

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, acetophenazine, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, antipyrine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clonidine, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene, desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloperidol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen, ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, methadone, methdilazine, methocarbamol, methotrexate, methotrimeprazine, methoxamine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen,

nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone, phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, salicylic acid, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terbutaline, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, xylometazoline, yohimbine, zopiclone

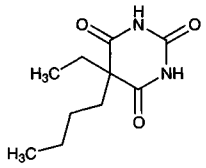
Butethal



Molecular formula: $C_{10}H_{16}N_2O_3$
Molecular weight: 212.25
CAS Registry No.: 77-28-1
Merck Index: 1550
Lednicer No.: 1 268

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 14.858

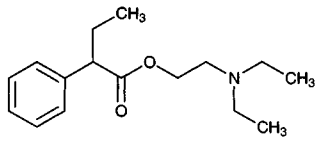
Butethamate



Molecular formula: $C_{16}H_{25}NO_2$
Molecular weight: 263.38
CAS Registry No.: 14007-64-8, 3639-12-1 (citrate)
Merck Index: 1551

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 2.5

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine,

quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

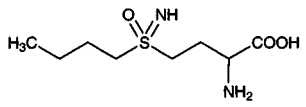
Buthionine sulfoximine



Molecular formula: $C_8H_{18}N_2O_3S$
Molecular weight: 222.31
CAS Registry No.: 5072-26-4
Merck Index: 1556

SAMPLE

Matrix: blood
Sample preparation: 100 μL Plasma + 50 μL 100 μg/mL L-norvaline, add 10% sulfosalicylic acid, mix, centrifuge at 13000 rpm for 5 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 50 μL 400 mM pH 9.53 phosphate buffer, add 50 μL 3 mg/mL dansyl chloride in acetone, heat at 40° for 10 min, inject a 5 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 Zorbax ODS
Mobile phase: MeCN:MeOH:10 mM pH 2.1 phosphate buffer 3:1:8
Column temperature: 40
Flow rate: 1
Injection volume: 5
Detector: F ex 335 em 525

CHROMATOGRAM

Retention time: 5
Internal standard: norvaline (10)
Limit of detection: 10 μg/mL

KEY WORDS

derivatization; rat; plasma; protect from light

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 200 μL Plasma + 200 μL 100 μg/mL L-norleucine in 100 mM HCl, vortex, filter (Millipore 10000 nominal molecular weight limit) while centrifuging at 5000 g for 15 min. Remove a 40 μL aliquot of the ultrafiltrate and add it to 80 μL freshly-prepared EtOH:phenylisothiocyanate:triethylamine 40:1:1, vortex, let stand at room temperature for 15 min, add 10 μL 316 mg/mL L-serine, let stand for 15 min, evaporate to dryness under reduced pressure, reconstitute with 600 μL A, inject a 250 μL aliquot. Urine. Condition a Bond Elut C18 SPE cartridge with 3 mL MeOH and 3 mL water. 100 μL Urine + 100 μL 100 μg/mL L-norleucine in 100 mM HCl, vortex, add to the SPE cartridge, elute with 300 μL 100 mM HCl, elute with 500 μL MeCN:100 mM HCl 30:70, collect all the effluent from the cartridge, vortex thoroughly. Remove a 40 μL aliquot and add it to 80 μL freshly-prepared EtOH:phenylisothiocyanate:triethylamine 40:1:1, vortex, let stand at room temperature for 15 min, add 10 μL 316 mg/mL L-serine, let stand for 15 min, evaporate to dryness under reduced pressure, reconstitute with 600 μL A, inject a 250 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 4.6 5 μm Adsorbosphere c18

Column: 250 × 4.6 5 μm Adsorbosphere C18
Mobile phase: Gradient. A:B 91.5:8.5 for 30 min, to 55:45 over 10 min, to 0:100 over 2 min, maintain at 0:100 for 6 min, return to initial conditions over 2 min, re-equilibrate for 8 min. A was MeCN:140 mM pH 6.40 sodium acetate buffer containing 500 μL/L triethylamine and 200 μL/L 1 mg/mL EDTA 6:94. B was MeCN:water 60:40 containing 200 μL/L 1 mg/mL EDTA.
Flow rate: 1.25
Injection volume: 250
Detector: UV 254

CHROMATOGRAM

Retention time: 26.0 (S), 26.6 (R)
Internal standard: L-norleucine (39.3)
Limit of detection: 1 μg/mL (plasma)
Limit of quantitation: 2 μg/mL (plasma), 10 μg/mL (urine), 6 μg/mL (urine)

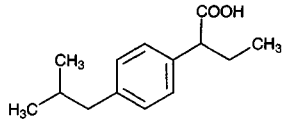
Butibufen



Molecular formula: $C_{14}H_{20}O_2$
Molecular weight: 220.31
CAS Registry No.: 55837-18-8
Merck Index: 1557

SAMPLE

Matrix: bulk, formulations

Sample preparation: Raw materials. Dissolve in MeCN to a concentration of 10 mg/mL, inject a 3 μL aliquot. Microemulsions. Dilute 0.5-2 g microemulsion to 5 mL with MeCN, add this to a previously activated C18 Sep-Pak SPE cartridge, wash four times with MeCN, collect eluate and make up to 10 mL with MeCN, inject a 3 μL aliquot. Cream. 0.5-2 g Cream + 3 mL MeCN, shake vigorously at 55° for 10 min, add 3 mL MeCN, cool, centrifuge at 3500 rpm for 20 min. Remove the supernatant and filter (0.2 μm), repeat extraction three times, make up to 25 mL with MeCN, pass through a previously conditioned Sep-Pak C18 cartridge, inject a 15 μL aliquot. Microencapsulated formulations. Weigh out an amount of microencapsulated formulation corresponding to 50-300 mg butibufen, dilute with 2 mL water, stir at 40° until the coating had dissolved, make up to 10 mL with MeCN, filter (0.45 μm), inject a 3 μL aliquot. Tablets, sachets. Pulverize, weigh out amount containing 250-1500 mg butibufen, add 10 mL water, stir at 40° for 15 min, dilute to 50 mL with MeCN, filter (0.45 μm), inject a 3 μL aliquot.

HPLC VARIABLES

Column: 150 × 3.9 4 μm Novapak C18
Mobile phase: MeCN:water:orthophosphoric acid 472:548:0.4
Column temperature: 40
Flow rate: 1
Injection volume: 3-15
Detector: UV 264

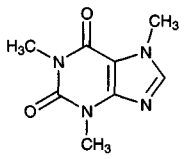
Caffeine



Molecular formula: $C_8H_{10}N_4O_2$
Molecular weight: 194.19
CAS Registry No.: 58-08-2, 5743-12-4 (monohydrate)
Merck Index: 1674
Lednicer No.: 1 111

SAMPLE
Matrix: beverages
Sample preparation: Filter sample.

HPLC VARIABLES
Column: 150 × 4.5 5 μm Hiasil C18 (Higgins)
Mobile phase: MeOH:25 mM phosphate buffer 45:55, pH 3.0
Flow rate: 1.0
Injection volume: 20
Detector: UV 218

CHROMATOGRAM
Retention time: 2.0
Limit of detection: 1.2 mg/mL

OTHER SUBSTANCES
Simultaneous: aspartame, benzoic acid

KEY WORDS
comparison with UV spectrophotometry and capillary electrophoresis; soft drinks

REFERENCE
McDevitt,V.L.; Rodriguez,A.; Williams,K.R. Analysis of soft drinks: UV spectrophotometry, liquid chromatography, and capillary electrophoresis, *J.Chem.Educ.*, **1998**, *75*, 625–629.

SAMPLE
Matrix: beverages, blood, formulations
Sample preparation: Plasma. 100 μL Plasma + 10 μL 1,3-dimethyl-7-(2-hydroxyethyl)xanthine in water, vortex, add 1 mL acetone, vortex for 1 min, centrifuge at 2500 g for 5 min. Filter (0.45 μm) the supernatant, inject a 20 μL aliquot of the supernatant. Beverages. Dilute beverages 4-25 times with water, inject an aliquot. Tablets. Powder tablets, dissolve in water, filter, inject an aliquot of the filtrate.

HPLC VARIABLES
Column: 150 × 6 5 μm 3-aminopropylsilyl silica gel with the amino group derivatized with 1,8-naphthalic anhydride (Bunseki Kagaku 1993, 42, 817)
Mobile phase: MeOH:buffer 50:50 (Prepare buffer by dissolving 6.183 g boric acid and 1.461 g NaCl in 500 mL water, adjust pH to 6.4 with sodium borate solution.)
Column temperature: 30
Flow rate: 1
Injection volume: 20
Detector: UV 270

CHROMATOGRAM
Retention time: 24
Internal standard: 1,3-dimethyl-7-(2-hydroxyethyl)xanthine (12)
Limit of detection: 140 ng/mL

OTHER SUBSTANCES
Simultaneous: hypoxanthine, pentoxifylline, propentofylline, theobromine, theophylline, uric acid, xanthine

KEY WORDS
plasma; tablets; pharmacokinetics

REFERENCE

SAMPLE
Matrix: beverages, syrup
Sample preparation: Dilute syrup ten fold. Filter (0.45 μm) beverages and diluted syrup, inject a 10-20 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:acetic acid:water 20:5:75
Flow rate: 2
Injection volume: 10-20
Detector: UV 254

CHROMATOGRAM
Retention time: 4.5
Limit of detection: 20 ng

OTHER SUBSTANCES
Simultaneous: acesulfame, benzoic acid, dulcin, p-hydroxybenzoic acid, saccharin, vanillin

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Mix 100 μL serum with 50 μL 1 M sodium hydroxide, extract with 1 mL 1.5 μ g/mL IS in isopropanol:chloroform 10:90. Centrifuge at 2000 g for 1 min, decant the organic layer, dry under a gentle air flow at 60°, dissolve the residue in 0.2 mL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 Nova Pak C18
Mobile phase: MeOH:THF:50 mM pH 4.7 ammonium acetate buffer 2:1.5:96.5
Flow rate: 1
Injection volume: 50
Detector: UV 273

CHROMATOGRAM
Internal standard: β-hydroxyethyltheophyline
Limit of quantitation: 200 ng/mL

OTHER SUBSTANCES
Extracted: theobromine, paraxanthine, theophyline

KEY WORDS
pharmakokinetics; serum

SAMPLE
Matrix: blood
Sample preparation: Mix 50 μL plasma with 50 μL 20 μg/mL IS in water, vortex for 10 s, add 20 μL 20% perchloric acid, vortex for 10 s, centrifuge at 2000 g for 5 min, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Spherisorb C18
Mobile phase: MeCN:THF:concentrated acetic acid:water 2:2:0.5:95.5
Column temperature: 35
Flow rate: 1
Injection volume: 50
Detector: UV 273

CHROMATOGRAM
Retention time: 7.5
Internal standard: 7-(β-hydroxypropyl)theophylline (9.2)
Limit of detection: 100 ng/mL
Limit of quantitation: 2 μg/mL

OTHER SUBSTANCES
Extracted: theophylline
Simultaneous: β-hydroxyethyltheophylline, 8-chlorotheophylline, theobromine

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 200 μL Plasma + 200 μL 5 μg/mL IS, extract with 6.0 mL dichloromethane, centrifuge. Aspirate aqueous layer to waste, evaporate organic layer under a stream of nitrogen at 35°. Reconstitute residue in 200 μL MeOH:water 15:85, inject an aliquot.

HPLC VARIABLES
Column: 100 × 4.6 C8 Rainin "Short One"
Mobile phase: Gradient. MeCN:MeOH:25 mM pH 3.0 phosphate buffer 3:15:82 to 15:15:70 over 10 min.
Detector: UV 273

CHROMATOGRAM
Retention time: 4.8
Internal standard: 7-(β-chloroethyl)theophylline (9.6)

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: Mix 250 μL serum with 250 μL 800 mM perchloric acid, vortex, centrifuge at 14000 g for 3-4 min. Remove 350 μL supernatant, adjust to ca. pH 5.0 with 27 μL 4 M NaOH, inject an aliquot.

HPLC VARIABLES
Guard column: 10 × 4.6 Adsorbosphere ODS
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeOH:15 mM pH 4.9 potassium phosphate buffer 15:85 (After each elution flush the column with MeOH:water 80:20 for 5 min and then re-equilibrate with the for 5 min.)
Flow rate: 1.75
Injection volume: 100
Detector: UV 274

CHROMATOGRAM
Retention time: 17.75
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: acetaminophen, aspirin, hydrocortisone, prednisolone, prednisone, phenylbutazone, phenytoin

KEY WORDS
serum

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 0.2 mg/mL β-hydroxyethyltheophylline in buffer + 100 μL 40% aqueous trichloroacetic acid, vortex for 30 s, let stand for 5 min, centrifuge at 2000 g for 15 min, inject a 25 μL aliquot of the supernatant. (Buffer was 10 mM sodium acetate adjusted to pH 4.0 with glacial acetic acid.)

HPLC VARIABLES
Column: 10 μm μBondapak C18
Mobile phase: MeCN:buffer 6:94 (Buffer was 10 mM sodium acetate adjusted to pH 4.0 with glacial acetic acid.)
Column temperature: 40
Flow rate: 2
Injection volume: 25
Detector: UV 274

CHROMATOGRAM
Retention time: 13
Internal standard: β-hydroxyethyltheophylline (9)

OTHER SUBSTANCES
Extracted: dyphylline, theophylline, theobromine

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 50 μL Serum + 50 μL 15 μg/mL β-hydroxyethyltheophylline in MeCN + 2 mL chloroform:isopropanol 95:5, mix for 30 s, centrifuge at 3000 g for 3 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 50 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: μBondapak C18
Mobile phase: MeCN:buffer 9.75:90.25 (Buffer was 100 mM KH_2PO_4 adjusted to pH 4.0 with phosphoric acid.) (At the end of each day clean with water for 20 min and MeOH for 30 min.)
Flow rate: 2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 8.5

Internal standard: β-hydroxyethyltheophylline (5.8)
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Extracted: dyphylline, theophylline
Simultaneous: acetaminophen, aspirin, salicylic acid, procainamide, N-acetylprocainamide
Noninterfering: benzoic acid

KEY WORDS
serum

SAMPLE
Matrix: blood
Sample preparation: 500 μL Serum or plasma + 200 μL 100 mM pH 7.0 phosphate buffer + 3 mL 0.5 μg/mL 8-chlorotheophylline in isopropanol, stir at 40000 rpm for 5 s using dental micromotor with a PTFE mixing head, centrifuge at 3500 g for 2 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 50 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES
Guard column: 50 × 3.2 30-38 μm Co:Pell ODS
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:MeOH:10 mM pH 5.2 sodium acetate buffer 6:3:91
Column temperature: 40
Flow rate: 1.5
Injection volume: 10
Detector: UV 274

CHROMATOGRAM
Retention time: 12.1
Internal standard: 8-chlorotheophylline (8.85)

OTHER SUBSTANCES
Extracted: dyphylline, theophylline, proxyphylline, paraxanthine
Simultaneous: cefoxitin
Noninterfering: carbenicillin, cefoperazone, cephacetril, heparin, penicillin G, phenytoin, phenobarbital

SAMPLE
Matrix: blood
Sample preparation: 100 μL Serum + 1 mL reagent, vortex for 10 min, centrifuge for 2-3 min. Remove the lower organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 200 μL mobile phase, inject a 40 μL aliquot. (Reagent was 1.5 mg β-hydroxyethyltheophylline and 25 μL glacial acetic acid in 100 mL chloroform:isopropanol 95:5.)

HPLC VARIABLES
Guard column: 30 mm long 5 μm Ultrasphere ion-pair
Column: 150 × 4.6 5 μm Ultrasphere ion-pair
Mobile phase: MeCN:MeOH:water:1 M tetra-n-butylammonium hydroxide 3.5:3.5:91:2 containing 1.82 g Trizma base (Tris, tris(hydroxymethyl)aminomethane), pH adjusted to 7.50 ± 0.03 with concentrated HCl
Flow rate: 1.2
Injection volume: 40
Detector: UV 280

CHROMATOGRAM
Retention time: k' 6.3
Internal standard: β-hydroxyethyltheophylline (k' 4.2)

OTHER SUBSTANCES
Extracted: theophylline, theobromine, 1,7-dimethyl xanthine
Simultaneous: acetaminophen, acetazolamide, allopurinol, dimethylurea, dyphylline, 3-methylxanthine, oxypurinol, procainamide, sulfadiazine, sulfamethazine, uric acid
Noninterfering: ampicillin, cefazolin, cephalothin, cephapirin, chlorotheophylline, 1,3-dimethyluric acid, gentamicin, lidocaine, methicillin, methylurea, 3-methyluric acid, quinidine, sulfamerazine, 1,3,7-trimethyluric acid

SAMPLE

Matrix: blood

Sample preparation: 100 μL Serum + 100 μL buffer + 1.5 mL IS in 5% isopropanol in chloroform, vortex for 30 s, centrifuge. Remove the organic layer and evaporate it to dryness under a stream of air at room temperature, reconstitute the residue in 100 μL mobile phase, inject a 6-10 μL aliquot. (Buffer was 13.6 g KH_2PO_4 in 90 mL water, pH adjusted to 6.8 with about 3 mL 10 M NaOH, made up to 100 mL.)

HPLC VARIABLES

Guard column: 20 × 4.6 Supelguard LC-1 (Supelco)
Column: 250 × 4.6 5 μm Supelcosil LC-1 (Supelco)
Mobile phase: MeOH:MeCN:buffer 17.5:17.5:65 (Buffer was 2.72 g KH_2PO_4 in 1.9 L water, pH adjusted to 6.3 with about 2 mL 1 M NaOH, made up to 2 L.)
Flow rate: 2
Injection volume: 6-10
Detector: UV 273

CHROMATOGRAM

Retention time: 2.18
Internal standard: 3-isobutyl-1-methylxanthine (3.15)

OTHER SUBSTANCES

Extracted: acetaminophen, amobarbital, barbital, carbamazepine, chloramphenicol, ethosuximide, mephobarbital, methsuximide, pentobarbital, phenobarbital, phenytoin, primidone, secobarbital, theophylline, thiopental

Also analyzed: acetanilide, N-acetylcysteine, N-acetylprocainamide, ampicillin, aspirin, butabarbital, butalbital, chlorpropamide, cimetidine, codeine, cyheptamide, diazoxide, diflunisal, diphylline, disopyramide, ethchlorvynol, gentisic acid, glutethimide, heptabarbital, hexobarbital, ibuprofen, indomethacin, ketoprofen, mefenamic acid, mephenytoin, methaqualone, methsuximide, methyl salicylate, methyprylon, morphine, naproxen, nirvanol, oxphenylbutazone, phenacetin, phensuximide, phenylbutazone, procainamide, salicylamide, salicylic acid, sulfamethoxazole, sulindac, tolmetin, trimethoprim, vancomycin

Noninterfering: amikacin, gentamicin, meprobamate, netilmicin, quinidine, tetracycline, tobramycin, valproic acid

KEY WORDS

serum

SAMPLE

Matrix: blood

Sample preparation: Prepare an SPE cartridge by plugging the end of a 1 mL disposable pipette tip with glass wool and adding about 100 mg Chromosorb P/NAW. Add 50 μL plasma then 50 μL 10 μg/mL tolylphenobarbital in 200 mM HCl to the SPE cartridge, let stand for 2 min, elute with 1 mL chloroform:isopropanol 6:1. Evaporate the eluate to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL mobile phase, inject a 15 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Supelcosil-LC-8
Mobile phase: MeCN:water 20:80
Flow rate: 3.3
Injection volume: 15

Detector: UV 208

CHROMATOGRAM

Retention time: 0.93
Internal standard: tolylphenobarbital (7.57)
Limit of detection: 50-100 ng/mL

OTHER SUBSTANCES

Extracted: theophylline, barbital, ethosuximide, primidone, carbamazepinediol, phenacemide, methyprylon, nirvanol, phenobarbital, chloramphenicol, butabarbital, carbamazepine epoxide, mephenytoin, pentobarbital, amobarbital, carbamazepine, glutethimide, phenytoin, secobarbital, methaqualone
Noninterfering: acetaminophen, amikacin, amitriptyline, clonazepam, cyclosporine, desipramine, diazepam, digoxin, disopyramide, gentamicin, imipramine, lidocaine, methotrexate, N-acetylprocainamide, netilmicin, nortriptyline, procainamide, quinidine, salicylic acid, sulfamethoxazole, tobramycin, trimethoprim, valproic acid, p-hydroxyphenobarbital, vancomycin

SAMPLE
Matrix: blood
Sample preparation: 50 μL Serum + 10 μL 25 μg/mL lidocaine in 4 mM HCl, mix, add 100 μL 1 M pH 9.0 borate buffer, add 1 mL chloroform:EtOH 82.5:17.5, mix, centrifuge. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 50 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 300 × 2 10 μm μBondapak C18
Mobile phase: MeOH:MeCN:buffer 12:16:72 (Buffer was 31 mM sodium acetate adjusted to pH 5.1 with 40% phosphoric acid containing 0.15 mM tetrabutylammonium phosphate.)
Flow rate: 0.3
Injection volume: 20
Detector: UV 230

CHROMATOGRAM
Retention time: 5
Internal standard: lidocaine (10)
Limit of detection: 12.5 ng/mL

OTHER SUBSTANCES
Extracted: cocaine
Simultaneous: barbital, phenobarbital, flumazepil, mazindol, hexobarbital
Noninterfering: amphetamine, desipramine, tetracaine, methadone, reserpine, buspirone, diazepam, haloperidol, chlordiazepoxide, oxazepam, midazolam, clonazepam, chlorpromazine, pentobarbital
Interfering: nicotine, procaine, cotinine

SAMPLE
Matrix: blood
Sample preparation: 10 µL Plasma + 300 µL 100 mM pH 6.0 KH_2PO_4 buffer + 100 µL 10 µg/mL diprophylline + 2 mL chloroform:isopropanol 50:50, vortex for 30 s, centrifuge at 2000 rpm for 10 min. Remove the organic layer and evaporate it to dryness under a stream of air at 40°, reconstitute the residue in 100 µL mobile phase, inject a 25 µL aliquot.

HPLC VARIABLES
Column: NovaPak C18 radial compression
Mobile phase: MeOH:MeCN:10 mM KH_2PO_4 9:2.5:90
Flow rate: 2
Injection volume: 25
Detector: UV 270

CHROMATOGRAM
Retention time: 17
Internal standard: diprophylline (10)

OTHER SUBSTANCES
Extracted: theophylline, 3-methylxanthine, theobromine

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 100 μL Serum + 100 μL 20 μg/mL hydroxyethyltheophylline in 2 M perchloric acid, vortex, centrifuge 5 min, inject 50 μL aliquot of supernatant.

HPLC VARIABLES
Column: 125 × 4 LiChroSpher RP-8 5 μm
Mobile phase: MeOH:buffer 15:85 (Buffer was 5 mL 2 M sodium acetate + 845 mL water, pH adjusted to 4.0 with acetic acid.)
Column temperature: 45
Flow rate: 1.5
Injection volume: 50
Detector: UV 282

CHROMATOGRAM
Retention time: 9.6
Internal standard: hydroxyethyltheophylline (5.6)

OTHER SUBSTANCES
Simultaneous: theophylline, chloramphenicol

KEY WORDS
serum

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 50 μL 3 μg/mL 8-chlorotheophylline in mobile phase + 100 μL 1 M HCl + 3 mL dichloromethane, vortex for 2 min, centrifuge at 1200 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm TSK gel ODS-80TM (Tosoh)
Mobile phase: MeOH:100 mM NaH_2PO_4 30:70
Flow rate: 0.8
Injection volume: 20
Detector: UV 274

CHROMATOGRAM
Retention time: 8
Internal standard: 8-chlorotheophylline (11.7)
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES
Extracted: theophylline, theobromine, paraxanthine, metabolites
Noninterfering: acetaminophen, phenylbutazone, phenacetin, thiamine, salicylic acid, phenobarbital, chlorpheniramine, trimethadione, hydrocortisone, prednisolone, prednisone, phenytoin, aspirin, ethenzamide

SAMPLE

Matrix: blood

Sample preparation: Condition an Merck Extrelut-3 glass extraction column with 12 mL dichloromethane the day before. 1.5 mL Serum + 100 μL 3 μg/mL N-ethylnorcotinine in water + 1.4 mL 0.5 M NaOH. Add to column, after 15 min elute under gravity with dichloromethane:isopropanol 9:1. Add 300 μL 25 mM HCl in MeOH to the organic phase and evaporate it to dryness under nitrogen. Redissolve in 100 μL water and inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC8DB

Mobile phase: Gradient. A was MeCN:water 3.6:96.4 containing 2 mL/L triethylamine, 12 mM sodium heptanesulfonate, 12 mM K_2HPO_4, 12 mM citric acid adjusted to pH 4.7 with citric acid. B was MeCN:water 19.7:80.3 containing 2 mL/L triethylamine, 12 mM sodium heptanesulfonate, 12 mM K_2HPO_4, 12 mM citric acid adjusted to pH 5.2 with citric acid. A:B 100:0 for 15 min then to 50:50 over 20 min using a concave gradient. Re-equilibrate for 15 min before next injection.

Flow rate: 1.5
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 27
Internal standard: N-ethylnorcotinine (33)

OTHER SUBSTANCES

Simultaneous: nicotine, cotinine-N-oxide, trans-3'-hydroxycotinine, norcotinine, cotinine

KEY WORDS
serum

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Rock 5 mL whole blood + 10 mL water + 8.5 mL Na_2WO_4 in a 50 mL stoppered tube for 1 min, add 6 mL $NiCl_2$, rock for 5 min, add 15 mL dichloromethane: isobutyl alcohol:THF 30:45:25, centrifuge at 2500 g for 15 min. Remove organic phase and repeat the process. Filter all organic phases through a 40-90 μm filter and evaporate to dryness in a 100 mL porcelain dish at a moderate temperature in a sand bath. Take up residue in 500 μL MeCN:water 80:20, inject a 20 μL aliquot. (Na_2WO_4 prepared by mixing 10 g $Na_2WO_4.2H_2O$ in 38 mL of 2 M NaOH and 2.5 g of $NaHCO_3$ and making up to 100 mL. $NiCl_2$ was 17% w/v $NiCl_2$ in water.)

HPLC VARIABLES
Column: 200 × 4.6 5 μm Hypersil C8
Mobile phase: A = MeCN; B = 20 mM n-propylamine adjusted to pH 5 with 85% phosphoric acid. A:B from 15:85 to 20:80 over 5 min to 45:55 over another 15 min to 65:35 over another 5 min
Injection volume: 20
Detector: UV 230

CHROMATOGRAM
Retention time: 5
Limit of detection: 0.10 ppm

OTHER SUBSTANCES
Extracted: buprenorphine, cocaine, codeine, diamorphine, ethylmorphine, lidocaine, methaqualone, morphine, naloxone, noscapine, papaverine, pentazocine, procaine
Also analyzed: bromazepam, clonazepam, diazepam, flunitrazepam, flurazepam, medazepam, nitrazepam, oxazepam

KEY WORDS

SAMPLE

Matrix: blood, CSF

Sample preparation: 200 μL Serum, plasma, or CSF + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, elute the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine hydrochloride and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 30 × 2.1 40 μm preparative grade C18 (Analytichem); B 250 × 4.6 10 μm Partisil C8

Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 15 min, maintain at 30:70 for 4 min.

Column temperature: 50

Flow rate: 1.5

Detector: UV 280 for 5 min then UV 254

CHROMATOGRAM

Retention time: 6.16

Internal standard: heptanophenone (19.2)

OTHER SUBSTANCES

Extracted: acetazolamide, ampicillin, bromazepam, carbamazepine, chloramphenicol, chlorothiazide, diazepam, droperidol, ethionamide, furosemide, isoniazid, methadone, penicillin G, phenobarbital, phenytoin, prazepam, propoxyphene, pyrazinamide, rifampin, trimeprazine, trimethoprim

SAMPLE
Matrix: blood, saliva
Sample preparation: Saliva. Add 3 mg N-acetylcysteine (mucolytic agent) to 200 μL saliva), let stand for 10-15 min. 50 μL Saliva + 50 μL 1 M NaOH, extract with 1 mL 10% (v/v) isopropanol in chloroform (Caution! Chloroform is a carcinogen!) containing 1.5 mg/L β-hydroxyethyl theophylline. Centrifuge at 2000 g for 1 min. Evaporate organic layer to dryness under a gentle airflow at 60°. Dissolve residue in 200 μL mobile phase, inject a 50 μL aliquot. Serum. 50 μL Serum + 50 μL 1 M NaOH, extract with 1 mL 10% isopropanol in chloroform containing 1.5 mg/L β-hydroxyethyl theophylline. Centrifuge at 2000 g for 1 min. Evaporate organic layer to dryness under a gentle airflow at 60°. Dissolve the residue in 200 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 C18 Nova Pak
Mobile phase: MeOH:THF:50 mM pH 4.7 ammonium acetate buffer 2:1.5:96.5
Flow rate: 1
Injection volume: 50

CHROMATOGRAM
Retention time: 10.2
Internal standard: β-hydroxyethyl theophylline (6.6)
Limit of quantitation: 200 ng/L

OTHER SUBSTANCES
Extracted: paraxanthine, theobromine, theophylline

KEY WORDS
serum

REFERENCE

SAMPLE
Matrix: blood, tissue
Sample preparation: Tissue. Homogenize brain in twenty volumes of water, centrifuge at 1500 g, freeze at -20° for 2 h, centrifuge. 200 μL Supernatant + 100 μL pH 7.2 phosphate buffer, mix, add 6 mL dichloromethane:propanol 95:5, mix for 2 min, centrifuge at 1500 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 35°, reconstitute the residue in 200 μL mobile phase, vortex for 1 min, inject a 25 μL aliquot. Serum. 200 μL Serum + 100 μL pH 7.2 phosphate buffer, mix, add 6 mL dichloromethane:propanol 95:5, mix for 2 min, centrifuge at 1500 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 35°, reconstitute the residue in 200 μL mobile phase, vortex for 1 min, inject a 25 μL aliquot.

HPLC VARIABLES
Guard column: 10 μm μBondapak C18

Column: 250 × 4.6 10 μm μBondapak C18
Mobile phase: THF:10 mM Na_2HPO_4 3:97, pH adjusted to 6.5 with phosphoric acid
Flow rate: 2.5
Injection volume: 25
Detector: UV 273

CHROMATOGRAM
Retention time: 7
Limit of detection: 62.5 ng/mL (serum), 62.5 ng/g (tissue)

OTHER SUBSTANCES
Extracted: theophylline, theobromine, paraxanthine

KEY WORDS
serum; rat; brain

REFERENCE

SAMPLE
Matrix: blood, urine
Sample preparation: Urine. 100 μL Urine + 100 μL 1 M NaOH, let stand at room temperature for 10 min, add 100 μL 1 M HCl, make up to 1 mL with mobile phase, vortex, centrifuge at 13000 g for 2 min, inject a 20 μL aliquot. Plasma. 500 μL Plasma + 100 μL 60% perchloric acid, add 200 μL 1 M NaOH to make pH >9, let stand for 10 min, add 200 μL 1 M HCl, add 200 μL 50 μg/mL β-hydroxyethyltheophylline, add 6 mL chloroform: isopropanol 50:50, agitate for 15 min on a rotating mixer, centrifuge at 4000 g. Remove the organic layer and evaporate it to dryness under vacuum, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.5 5 μm ChromSep (Chrompack)
Mobile phase: THF:10 mM sodium acetate 0.8:99.2
Flow rate: 1
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 7.03
Internal standard: β-hydroxyethyltheophylline (4.76)
Limit of quantitation: 1000 ng/mL

OTHER SUBSTANCES
Extracted: 1,3,7-trimethyluric acid, 1,7-dimethylxanthine, 1,3-dimethylxanthine, metabolites

KEY WORDS
plasma

REFERENCE

SAMPLE
Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 205.2

CHROMATOGRAM
Retention time: 6.647

SAMPLE

Matrix: urine

Sample preparation: 500 μL Urine + N-ethylnordiazepam + chlorpheniramine + 100 μL buffer, centrifuge at 11000 g for 30 s, inject a 500 μL aliquot onto column A with mobile phase A, after 0.6 min backflush column A with mobile phase A to waste for 1.6 min, elute column A with 250 μL mobile phase B, with 200 μL mobile phase C, and with 1.15 mL mobile phase D. Elute column A to waste until drugs start to emerge then elute onto column B. Elute column B to waste until drugs started to emerge, then elute onto column C. When all the drugs have emerged from column B remove it from the circuit, elute column C with mobile phase D, monitor the effluent from column C. Flush column A with 7 mL mobile phase E, with mobile phase D, and mobile phase A. Flush column B with 5 mL mobile phase E then with mobile phase D. (Buffer was 6 M ammonium acetate adjusted to pH 8.0 with 2 M KOH.)

HPLC VARIABLES

Column: A 10 × 2.1 12-20 μm PRP-1 spherical poly(styrene-divinylbenzene) (Hamilton); B 10 × 3.2 11 μm Aminex A-28 (Bio-Rad); C 25 × 3.2 5 μm C8 (Phenomenex) + 150 × 4.6 5 μm silica (Macherey-Nagel)

Mobile phase: A 0.1% pH 8.0 potassium borate buffer; B 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid; C MeCN:buffer 40:60 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); D MeCN:buffer 33:67 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); E MeCN:buffer 70:30 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.)

Column temperature: ambient (column A), 40 (columns B and C)

Flow rate: A 5; B-E 1

Injection volume: 500

Detector: UV 210, UV 235

CHROMATOGRAM

Retention time: k' 0.7

Internal standard: N-ethylnordiazepam (k' 2.1), chlorpheniramine (k' 5.9)

Limit of detection: 300 ng/mL

OTHER SUBSTANCES

Extracted: oxazepam, phenobarbital, nordiazepam, diazepam, phenylpropanolamine, phentermine, amphetamine, phenmetrazine, lidocaine, ephedrine, pentazocine, methamphetamine, desipramine, nortriptyline, diphenhydramine, methadone, imipramine, flurazepam, amitriptyline, morphine, codeine, hydromorphone, hydrocodone

Interfering: cotinine, benzoylecgonine, secobarbital

KEY WORDS

column-switching

SAMPLE
Matrix: urine
Sample preparation: Condition a 700 mg Extrelut-1 diatomaceous earth glass SPE cartridge with 6 mL dichloromethane, let stand for 1 day. 200 μL Urine + 200 μL 10 μg/mL N-ethylnornicotine in water + 600 μL 500 mM NaOH, add to the SPE cartridge, let stand for 10 min, elute with 5 mL dichloromethane:isopropanol 90:10. Add the eluate to 100 μL 25 mM HCl in MeOH and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 200 μL water, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm LC8DB (Supelchem)
Mobile phase: MeCN:water 9:80 containing 5 mL/L triethylamine, 670 mg/L sodium heptanesulfonate, 34 mM K_2HPO_4, and 34 mM citric acid, pH 4.4.
Flow rate: 1.6
Detector: UV 254

CHROMATOGRAM
Retention time: 6
Internal standard: N-ethylnornicotine (8.5)

OTHER SUBSTANCES
Extracted: metabolites, cotinine, nicotine

KEY WORDS
SPE

SAMPLE
Matrix: solutions
Sample preparation: Evaporate solution of calcifediol in EtOH, add 1 mL 7.2 μM DMEQ-TAD in dichloromethane, stir at room temperature for 30 min, add EtOH, evaporate, dissolve residue in MeOH, inject an aliquot. (Dichloromethane should be MeOH free. Wash with concentrated sulfuric acid, water, 5% sodium carbonate, water, dry over calcium chloride, and distil from calcium hydride. DMEQ-TAD was 4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]-1,2,4-triazoline-3,5-dione. Synthesis is as follows. Stir 483 g veratrole in 1.45 L acetic acid at 15° for 1 h, add 683 g concentrated nitric acid (d 1.05) over 1 h (maintain the temperature below 40° by cooling and regulating the rate of addition of the nitric acid). Continue stirring and add 2.127 L fuming nitric acid (d 1.50) over 1 h while maintaining the temperature below 30°, let stand for 2 h, pour into a large volume of cold water, filter, wash the solid with water until the washings are neutral, recrystallize from EtOH to give 4,5-dinitroveratrole (mp 129.5-130.5°) (J. Am. Chem. Soc. 1946, 68, 1536). Shake a solution of 910 mg 4,5-dinitroveratrole in 80 mL EtOH with 89 mg platinum(IV) oxide under an atmosphere of hydrogen until the theoretical amount of hydrogen (540 mL) is absorbed, filter under nitrogen into a flask containing 580 mg 2-ketoglutaric acid, reflux this mixture for 1.5 h, cool, collect the precipitate, recrystallize from EtOH to obtain 6,7-dimethoxy-3-oxo-3,4-dihydroquinoxaline-2-propionic acid as a crystalline solid (mp 250-252°). Add a solution of 606 mg 6,7-dimethoxy-3-oxo-3,4-dihydroquinoxaline-2-propionic acid in 20 mL DMF under nitrogen to a suspension of 176 mg NaH in 3 mL DMF stirred at 0°, stir for 30 min, add 455 μL methyl iodide, stir at 0° for 1.5 h, pour into ice-water, stir at room temperature for 30 min, acidify

with 500 mM HCl, collect the precipitate, recrystallize from chloroform/MeOH to obtain 6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxaline-2-propionic acid (mp 239-241°). Add 360 μL triethylamine at room temperature to 500 mg 6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxaline-2-propionic acid in 50 mL DMF, add 550 μL diphenylphosphoryl azide, stir at room temperature for 2.5 h, evaporate to dryness under reduced pressure, dissolve the residue in 20 mL benzene (Caution! Benzene is a carcinogen!), reflux for 1 h, cool to room temperature, add 178 mg ethyl carbazate, reflux for 30 min, evaporate, chromatograph on 90 g silica gel, elute with chloroform to remove a by-product then with chloroform:MeOH 96:4 to obtain 1-ethoxycarbonyl-4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]semicarbazide. Reflux a suspension of 272 mg 1-ethoxycarbonyl-4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]semicarbazide and 190 mg potassium carbonate in 20 mL EtOH for 6 h, evaporate the solvent, dissolve the residue in 30 mL water, acidify with 2 M HCl, extract with chloroform:MeOH 90:10, dry over anhydrous sodium sulfate, evaporate, recrystallize from MeOH/chloroform to obtain 4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]-1,2,4-triazolidine-3,5-dione as pale yellow prisms (mp 250-253°). Add 10 mg iodobenzene diacetate to a stirred suspension of 8.6 mg 4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]-1,2,4-triazolidine-3,5-dione in 1.5 mL MeOH-free dichloromethane, stir at room temperature for 3.5 h, filter, store the filtrate at -20° overnight, filter under argon to obtain 4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]-1,2,4-triazoline-3,5-dione as red needles (mp 200-202° d).)

HPLC VARIABLES

Column: 250 × 4 LiChrospher RP-18(e)
Mobile phase: Gradient. MeOH:water from 60:40 to 80:20 over 40 min
Column temperature: 35
Flow rate: 1

Shake a solution of 910 mg 4,5-dinitroveratrole in 80 mL EtOH with 89 mg platinum(IV) oxide under an atmosphere of hydrogen until the theoretical amount of hydrogen (540 mL) is absorbed, filter under nitrogen into a flask containing 580 mg 2-ketoglutaric acid, reflux this mixture for 1.5 h, cool, collect the precipitate, recrystallize from EtOH to obtain 6,7-dimethoxy-3-oxo-3,4-dihydroquinoxaline-2-

propionic acid as a crystalline solid (mp 250-252°). Add a solution of 606 mg 6,7-dimethoxy-3-oxo-3,4-dihydroquinoxaline-2-propionic acid in 20 mL DMF under nitrogen to a suspension of 176 mg NaH in 3 mL DMF stirred at 0°, stir for 30 min, add 455 μL methyl iodide, stir at 0° for 1.5 h, pour into ice-water, stir at room temperature for 30 min, acidify with 500 mM HCl, collect the precipitate, recrystallize from chloroform/MeOH to obtain 6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxaline-2-propionic acid (mp 239-241°). Add 360 μL triethylamine at room temperature to 500 mg 6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxaline-2-propionic acid in 50 mL DMF, add 550 μL diphenylphosphoryl azide, stir at room temperature for 2.5 h, evaporate to dryness under reduced pressure, dissolve the residue in 20 mL benzene (Caution! Benzene is a carcinogen!), reflux for 1 h, cool to room temperature, add 178 mg ethyl carbazate, reflux for 30 min, evaporate, chromatograph on 90 g silica gel, elute with chloroform to remove a by-product then with chloroform:MeOH 96:4 to obtain 1-ethoxycarbonyl-4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)]ethylsemicarbazide. Reflux a suspension of 272 mg 1-ethoxycarbonyl-4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]semicarbazide and 190 mg potassium carbonate in 20 mL EtOH for 6 h, evaporate the solvent, dissolve the residue in 30 mL water, acidify with 2 M HCl, extract with chloroform:MeOH 90:10, dry over anhydrous sodium sulfate, evaporate, recrystallize from MeOH/chloroform to obtain 4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]-1,2,4-triazolidine-3,5-dione as pale yellow prisms (mp 250-253°). Add 10 mg iodobenzene diacetate to a stirred suspension of 8.6 mg 4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]-1,2,4-triazolidine-3,5-dione in 1.5 mL MeOH-free dichloromethane, stir at room temperature for 3.5 h, filter, store the filtrate at -20° overnight, filter under argon to obtain 4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]-1,2,4-triazoline-3,5-dione as red needles (mp 200-202° d).)

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg Bakerbond C18 SPE cartridge with two 200 μL portions of MeOH and two 200 μL portions of water. 1 mL Plasma + 100 μL 200 mM disodium EDTA + 100 μL 200 mM ascorbic acid + 200 μL 1 μg/mL IS + 400 μL 3 M perchloric acid, mix, centrifuge at 4000 g for 15 min, wash the precipitate three times with 500 μL portions of water. Combine the supernatant and the washings and neutralize (indicator paper) them with 1 M NaOH, add 3 mL 1 M pH 8.2 Tris buffer, add 100 μL 20 μg/mL 1-benzyl-2-chloropyridinium bromide, let stand for 15 min, adjust pH to 2.5-3.0 (indicator paper) with 4 M phosphoric acid, centrifuge, add to the SPE cartridge, wash with 1 mL water, dry under vacuum suction for 10 min, wash with three 100 μL portions of MeCN, dry under vacuum for 5 min, elute with 200 μL MeOH:acetic acid 80:20, elute with two 200 μL portions of MeOH:water 80:20. Combine the eluates and evaporate them to dryness at 60°, reconstitute with 50 μL mobile phase, inject a 20 μL aliquot. To measure total captopril proceed as follows. 1 mL Plasma + 100 μL 200 mM disodium EDTA + 100 μL 200 mM ascorbic acid + 200 μL 1 μg/mL IS + 2 mL 100 mM perchloric acid + 100 μL 40 mg/mL triphenylphosphine in MeCN, mix, heat at 50° for 40 min, cool, add 400 μL 3 M perchloric acid, mix, centrifuge at 4000 g for 15 min, wash the precipitate three times with 500 μL portions of water. Combine the supernatant and the washings and neutralize (indicator paper) them with 1 M NaOH, add 3 mL 1 M pH 8.2 Tris buffer, add 100 μL 20 μg/mL 1-benzyl-2-chloropyridinium bromide, let stand for 15 min, adjust pH to 2.5-3.0 (indicator paper) with 4 M phosphoric acid, centrifuge, add to the SPE cartridge, wash with 1 mL water, dry under vacuum suction for 10 min, wash with three 100 μL portions of MeCN, dry under vacuum for 5 min, elute with 200 μL MeOH:acetic acid 80:20, elute with two 200 μL portions of MeOH:water 80:20. Combine the eluates and evaporate them to dryness at 60°, reconstitute with 50 μL mobile phase, inject a 20 μL aliquot. To measure protein-conjugated captopril proceed as follows. 1 mL Plasma + 100 μL 200 mM disodium EDTA + 100 μL 200 mM ascorbic acid + 200 μL 1 μg/mL IS + 400 μL 3 M perchloric acid, mix, centrifuge at 4000 g for 15 min, wash the precipitate three times with 500 μL portions of water. Suspend the precipitate in 2 mL 100 mM perchloric acid, add 200 μL 1 μg/mL IS, add 100 μL 40 mg/mL triphenylphosphine in MeCN, heat at 50° with occasional shaking for 40 min, cool, add 400 μL 3 M perchloric acid, mix, centrifuge at 4000 g for 15 min, wash the precipitate three times with 500 μL portions of water. Combine the supernatant and the washings and neutralize (indicator paper) them with 1 M NaOH, add 3 mL 1 M pH 8.2 Tris buffer, add 100 μL 20 μg/mL 1-benzyl-2-chloropyridinium bromide, let stand for 15 min, adjust pH to 2.5-3.0 (indicator paper) with 4 M phosphoric acid, centrifuge, add to the SPE cartridge, wash with 1 mL water, dry under vacuum suction for 10 min, wash with three 100 μL portions of MeCN, dry under vacuum for 5 min, elute with 200 μL MeOH:acetic acid 80:20, elute with two 200 μL portions of MeOH:

water 80:20. Combine the eluates and evaporate them to dryness at 60°, reconstitute with 50 μL mobile phase, inject a 20 μL aliquot. (Prepare 1-benzyl-2-chloropyridinium bromide as follows. Add 8.5 g benzyl bromide to 4.5 g 2-chloropyridine with stirring, stir at 60° overnight, cool, filter, wash with acetone, dry under vacuum to give 1-benzyl-2-chloropyridinium bromide (mp 187-191°).)

HPLC VARIABLES
Guard column: 20 × 2.1 5 μm Hypersil
Column: 100 × 2.1 5 μm ODS Hypersil
Mobile phase: Acetone:buffer 25:75 (Buffer was 200 mM pH 2.5 citrate buffer containing 10 mM sodium octanesulfonate and 15 mM NaCl.)
Column temperature: 50
Flow rate: 0.2
Injection volume: 20
Detector: UV 314

CHROMATOGRAM
Retention time: 10
Internal standard: 1-benzyl-2-chloro-4-methylpyridinium bromide-captopril adduct (Preparation is as follows. Add 8.5 g benzyl bromide to 5.1 g 2-chloro-4-methylpyridine (Loba-Chemie, Vienna) with stirring, stir at 60° overnight, cool, filter, wash with acetone, dry under vacuum to give 1-benzyl-2-chloro-4-methylpyridinium bromide. Condition a 1 g C18 SPE cartridge with two 1 mL portions of MeOH and with 1 mL water. Stir 30 mg captopril and 80 mg 1-benzyl-2-chloro-4-methylpyridinium bromide in 5 mL 500 mM pH 8.2 Tris buffer for 1 h, add 1.6 mL 100 mM sodium sulfide, let stand for 10 min, add to the SPE cartridge, wash with two 1 mL portions of water, dry under vacuum for 10 min, wash with three 1 mL portions of MeCN, dry under vacuum for 5 min, elute with 5 mL MeOH:water 80:20. Dilute the eluate to 10 mL with water, dilute with water to an adduct concentration of 3 μg/mL. 2-Chloro-4-methylpyridine can also be prepared as follows. Stir 3.6 g 2-amino-4-picoline (2-amino-4-methylpyridine) in 75 g concentrated HCl at between -15° and -20°, saturate with hydrogen chloride gas, add 3.5 g pulverized sodium nitrite in small portions, let stand overnight, neutralize, steam distil to give 2-chloro-4-methylpyridine as a colorless liquid (bp 194-195°) (Ber. 1924, 57, 791).) Carbadox

Molecular formula: $C_{11}H_{10}N_4O_4$
Molecular weight: 262.22
CAS Registry No.: 6804-07-5
Merck Index: 1825

SAMPLE

Matrix: blood, eggs, tissue

Sample preparation: Blend 10 g muscle, liver, kidney, plasma, or eggs with 40 mL MeCN:MeOH for 3 min (stomacher blender), centrifuge at 2000 g for 5 min, pass the supernatant through a 400 × 10 glass column containing 8 g alumina (Woelm neutral, activity 1, lower layer) and 2 g florisil (75-150 μm, upper layer), collect the eluate. Evaporate 10 mL of the eluate to 0.9-1.1 mL under a stream of nitrogen at 40-50°, dilute to 4 mL with water, mix, extract with 2 mL isooctane, centrifuge at 2000 g for 5 min, inject 1 mL of the aqueous phase onto column A with mobile phase A, after 20 min backflush the contents of column A onto column B with mobile phase B, after 5 min remove column A from the circuit, monitor the effluent from column B.

HPLC VARIABLES

Column: A 10 × 2.1 column was slurry-packed with 55-105 μm material from a C18 Sep-Pak, 20 μm screens were used; B 10 × 2.1 37-50 μm Bondapak C18/Corasil + 100 × 3 5 μm ChromSpher C18 (Chrompack)

Mobile phase: A water; B MeCN:10 mM pH 6 acetate buffer 14:86

Flow rate: A 0.3; B 0.5

Injection volume: 1000

Detector: UV 390 following post-column derivatization. The column effluent was mixed with 0.5 M NaOH pumped at 0.23 mL/min. The mixture flowed through a 2 m × 0.5 mm i.d. knitted PTFE reaction coil to the detector.

CHROMATOGRAM

Retention time: 9

Limit of detection: 1 ng/g

OTHER SUBSTANCES

Extracted: metabolites

Noninterfering: chloramphenicol, chlortetracycline, clopidol, dapsone, decoquinate, dimetridazole, dinitolmide, doxycycline, ethopabate, fenbendazole, furaltadone, furazolidone, furnicozone, halofuginone, ipronidazole, methylbenzoquate, nicarbazin, nifursol, nitrofurantoin, nitrofurazone, nitrovin, olaquindox, oxytetracycline, pyrantel, robenidine, ronidazole, sulfadiazine, sulfanilamide, sulfadimethoxine, sulfadoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfaquinoxaline, tetracycline, thiophanate, trimethoprim

KEY WORDS

plasma; column-switching; post-column reaction; derivatization; use yellow light and amber glassware; muscle; liver; kidney; pig

SAMPLE
Matrix: feed
Sample preparation: Grind feed to pass 20 mesh sieve. 10 g Ground feed + 15 mL water, mix well, let stand for 5 min, add 25 mL MeCN:MeOH 50:50, shake vigorously for 30 min, centrifuge or filter (Whatman glass fiber GFA), pass 15 mL supernatant or filtrate through 4 g alumina in a 10 mm dia column, collect the first 4 mL eluate, inject a 25 μL aliquot. (Prepare alumina as follows. Stir 200 g Fisher neutral alumina (A-950) in 1 L water for 30 min, pour off fines, resuspend, filter (Whatman glass fiber GFA), dry with vacuum, wash 3 times with MeOH, dry at 80° overnight, store in desiccator.)

HPLC VARIABLES
Guard column: 30-40 μm pellicular C18 (Waters)
Column: 100 × 5 C18 radial compression (Waters)
Mobile phase: MeCN:buffer 18:82 (Buffer was 25 mL dibutylamine acetate made up to 1 L with water, pH 3.7. Dibutylamine acetate was prepared by titrating 100 mL dibutylamine to pH 2.5 with acetic acid (ca. 270 mL).)
Flow rate: 2
Injection volume: 25
Detector: UV 365

CHROMATOGRAM
Retention time: 2.4

OTHER SUBSTANCES
Simultaneous: pyrantel (UV 313)

KEY WORDS
protect from light

Lowie,D.M.,Jr.; Teague,R.T.,Jr.; Quick,F.E.; Foster,C.L. High pressure liquid chromatographic determination of carbadox and pyrantel tartrate in swine feed and supplements, *J.Assoc.Off.Anal.Chem.*, **1983**, *66*, 602–605.

SAMPLE

Matrix: feed

Sample preparation: Grind feed to pass 2 mm sieve. 50 g Ground feed + 200 mL extraction solution, shake mechanically for 30 min, centrifuge at 1500 rpm for 5 min. Add 100 mL of the supernatant to a Celite column, rinse apparatus with 70 mL extraction solution, add rinses to Celite column. Collect all the eluates and add them to alumina column A, rinse apparatus with 20-30 mL extraction solution, add rinses to alumina column A. Collect all the eluate and evaporate just to dryness under reduced pressure, take up the residue in 50 mL chloroform. Extract with 10 mL 1 M NaOH (30 s shake), add 12 mL 1 M HCl to the aqueous phase, extract three times with 50 mL chloroform. Combine the extracts and dry them over 35-40 g anhydrous sodium sulfate. Evaporate to dryness and take up the residue in 5 mL DMF, add to alumina column B, rinse apparatus with 10 mL DMF, add rinses to column, wash with three 10 mL portions of DMF, wash with three 25 mL portions of chloroform, elute with chloroform:MeOH 75:25. Evaporate the eluate just to dryness, take up the residue in 2 mL MeOH:water 30:70, inject a 20 μL aliquot. (Extraction solution was chloroform:acidified MeOH 75:25. Acidified MeOH was MeOH containing 1% HCl. The Celite column was a 300 × 22 glass column containing 8-10 g acid-washed Celite 545, prewet with 50 mL extraction solution. Alumina column A was a 400 × 22 glass column containing 15 cm of alumina (Fisher A-540, 80-200 mesh), prewet with 50 mL extraction solution. Alumina column B was a 300 × 22 glass column containing 3 cm of alumina (Fisher A-540, 80-200 mesh), prewet with 25 mL DMF.)

HPLC VARIABLES

Column: 150 × 3.9 5 μm Resolve spherical C18 (Waters)
Mobile phase: MeOH:water 35:65
Column temperature: 40
Flow rate: 1
Injection volume: 20
Detector: UV 305

CHROMATOGRAM

Retention time: 4.7
Limit of quantitation: 10 ppb

OTHER SUBSTANCES

Simultaneous: furazolidone, nitrofurazone
Noninterfering: pyrantel

SAMPLE

Matrix: feed

Sample preparation: Blend 10-100 g feed with 200 mL chloroform:MeOH 75:25 for 3 min, filter through 25 mm Celite 545, re-extract residue with 200 mL chloroform:MeOH 75:25, add 50 mL chloroform:MeOH 75:25 to the residue, filter this mixture, wash the filter cake with several small portions of chloroform:MeOH 75:25. Evaporate the filtrate on a steam bath with a current of air to about 100 mL. Shake the organic layer with 50 mL 10% NaCl in 100 mM NaOH for 1 min, wash the aqueous phase with two or three 50 mL portions of chloroform (until wash is colorless), add 10 mL 1 M KH_2PO_4 solution to the aqueous phase, extract with three 50 mL portions of chloroform. Combine the extracts and filter them through a 25 mm layer of sodium sulfate, evaporate most of the filtrate on a steam bath with a current of air, evaporate the remainder with a current of air. Take

up the residue in 100 mL MeOH, remove a 20 mL aliquot, evaporate most on a steam bath with a current of air, evaporate the remainder with a current of air, dissolve the residue in 100 μL MeOH, make up to 10 mL with MeCN:water 25:75, filter (0.45μm), inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:buffer 25:75 (Buffer was 0.5% acetic acid and 0.05% sodium 1-octanesulfonate.)
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 4.5

OTHER SUBSTANCES
Simultaneous: sulfamethazine

SAMPLE

Matrix: tissue
Sample preparation: Homogenize (Waring blender) 10 g muscle, liver, or kidney in 100 mL EtOH for 5 min, let stand for 5 min, filter through 10 g Celite 545 on top of a sintered

glass filter, rinse blender with 100 mL EtOH and filter rinse. Add 25 mL 3.6% aqueous metaphosphoric acid to the combined filtrates, evaporate to 25 mL under reduced pressure at 45°. Remove residue, rinse out flask with 5 mL hexane and 3 mL water, combine, centrifuge at 0° at 27000 g for 30 min, discard hexane, rinse surface with 5 mL hexane, discard hexane. Remove aqueous layer, rinse out tube twice with 3 mL portions of water, combine, add 10 mL 1 M KH_2PO_4, make up to 100 mL with water, extract three times for 5 min with 50 mL ethyl acetate. Combine the extracts and dry them over 15 g anhydrous sodium sulfate, filter through glass wool, evaporate to dryness under reduced pressure at 45°. Take up residue in 3 mL ethyl acetate and add to alumina column, rinse flask with 2 mL ethyl acetate and add rinse to column. Elute with 20 mL EtOH:MeOH: ethyl acetate 10:10:80 and combine all the eluate. Evaporate to dryness under reduced pressure at 45°, reconstitute in 500 μL mobile phase, inject a 100 μL aliquot. (Prepare alumina column by slurrying 1 g aluminum oxide (Baker) in 20 mL ethyl acetate and adding to a 200 × 6 glass chromatographic column.)

HPLC VARIABLES

Guard column: Brownlee 10 μm RP-GU MPLC C-8
Column: 250 × 4.6 Brownlee RP-10A C-8
Mobile phase: MeCN:EtOH:10 mM ammonium acetate 25:5:70, pH 6.8
Flow rate: 1
Injection volume: 100
Detector: UV 350

CHROMATOGRAM

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 213.4

CHROMATOGRAM

Retention time: 15.763

KEY WORDS

whole blood

SAMPLE

Matrix: blood, CSF, gastric contents, urine
Sample preparation: 200 μL Serum, urine, CSF, or gastric fluid + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine HCl and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 40 μm preparative grade C18 (Analytichem); B 75 × 2.1 pellicular C18 (Whatman) + 250 × 4.6 5 μm C8 end-capped (Whatman)
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 20 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 220

CHROMATOGRAM

Retention time: 12.89
Internal standard: heptanophenone (19)

OTHER SUBSTANCES

Extracted: acetaminophen, allobarbital, azinphos, barbital, brallobarbitone, bromazepam, butethal, caffeine, carbamazepine, cephaloridine, chloramphenicol, chlordiazepoxide, chlorothiazide, chlorvinphos, clothiapine, cocaine, coomassie blue, desipramine, diazepam, diphenhydramine, dipipanone, ethylbromphos, flufenamic acid, formothion, griseofulvin, indomethacin, lidocaine, lorazepam, malathion, medazepam, midazolam, oxazepam, paraoxon, penicillin G, pentobarbital, prazepam, propoxyphene, prothiophos, quinine, salicylic acid, secobarbital, strychnine, sulfamethoxazole, theophylline, thiopental, thioridazine, trimethoprim

SAMPLE

Matrix: food

Sample preparation: 30 g Rice + 50 mL MeOH, let stand for 48 h with occasional manual shaking, inject a 10 μL aliquot of the MeOH layer. Alternatively, remove a 1 mL aliquot of the MeOH layer and evaporate it to near dryness under a stream of nitrogen, add 1 mL hexane, shake, repeat extraction. Combine the hexane layers and add them to a Sep-Pak Florisil SPE cartridge, elute with 3 mL acetone:hexane 40:60. Combine the eluates and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL MeOH, inject a 10 μL aliquot. (Recovery is 97% with direct injection or 30% with sample clean-up.)

HPLC VARIABLES

Guard column: Guard-Pak (Waters)

Column: 250 × 3.9 Nova-Pak C18

Mobile phase: Gradient. MeCN:water from 40:60 to 70:30 over 12 min or Isocratic (1) MeCN:water 60:40 or Isocratic (2) MeCN:water 40:60

Flow rate: 1

Injection volume: 10

Detector: UV 225

CHROMATOGRAM

Retention time: 4 (gradient), 2 (isocratic 1), 7 (isocratic 2)

Limit of detection: 50 ng/g (without clean-up)

SAMPLE

Matrix: food

Sample preparation: Prepare a column by adding 500 mg silanized Celite 545 to a 22 mm ID column, add 5 g Nuchar S-N:silanized Celite 545 20:80, wash with 50 mL MeCN:toluene 75:25, do not allow to go dry. Homogenize (Polytron) 150 g sample with 300 mL MeOH at half speed for 30 s and full speed for 1 min, filter, remove a portion equivalent to 100 g sample, add water so that there is 100 mL water in the flask, concentrate to 75 mL under reduced pressure at 35°, add 15 g NaCl, add 75 mL MeCN, shake for 30 s, extract the aqueous layer with 50 mL MeCN for 20 s. Combine the organic layers and add them to 25 mL 20% NaCl, shake, discard the aqueous layer, wash the MeCN layer with 100 mL petroleum ether, extract the petroleum ether layer with 10 mL MeCN. Combine the MeCN layers and add 50 mL 2% NaCl, extract with 100 mL dichloromethane, extract twice with 25 mL portions of dichloromethane, filter the dichloromethane layers through 5 g anhydrous sodium sulfate, evaporate the dichloromethane extracts to dryness under reduced pressure, immediately reconstitute with 10 mL dichloromethane, add to the column, elute at 5 mL/min, rinse flask with 10 mL dichloromethane, add the rinse to the column, elute with 125 mL MeCN:toluene 75:25, collect all the effluent from the column and evaporate it just to dryness under reduced pressure, reconstitute with 5 mL MeOH, filter (5 μm), inject an aliquot. (Silanize Celite 545 by boiling 150 g Celite 545 in 1 L HCl:water 50:50 for 10 min, cool, filter, wash with water until the filtrate is neutral, wash with 500 mL MeOH, wash with 500 mL dichloromethane, air dry, heat to 120°, cool

in desiccator, add 3 mL dichlorodimethylsilane, mix well, let stand at room temperature for 4 h, add 500 mL MeOH, mix, let stand for 15 min, filter, wash with isopropanol until neutral, air dry, dry at 105° for 2 h, cool in desiccator. Test for total silanization by placing 1 g in 20 mL toluene saturated with methyl red. Silanized Celite should appear yellow. Silanized Celite should also float on water. If silanization is not complete, repeat process. Boil 100 g Nuchar S-N with 700 mL HCl for 1 h, add 700 mL water, boil for 30 min, cool, filter, wash with water until the filtrate is neutral, wash with 500 mL MeOH, wash with 500 mL dichloromethane, air dry, dry at 120° for 4 h, cool in desiccator.) (J. Assoc. Off. Anal. Chem. 1985, 68, 726).

HPLC VARIABLES
Guard column: 20 × 2 30-40 μm Perisorb RP-8
Column: 250 × 4.6 6 μm Zorbax C8
Mobile phase: Gradient. MeCN:water from 20:80 to 70:30 over 25 min, re-equilibrate at initial conditions for 10 min.
Column temperature: 35
Flow rate: 1.5
Injection volume: 20
Detector: E, ESA Model 5100A, Model 5010 dual analytical cell, detector 1 + 0.20 V, detector 2 +0.60 V (monitored), Model 5020 guard cell in NaOH stream at +0.70 V, following post-column reaction. The column effluent mixed with 100 mM NaOH pumped at 0.5 ± 0.02 mL/min and the mixture flowed through a 3 m × 0.48 mm ID stainless-steel coil at 100° to the detector.

CHROMATOGRAM
Retention time: 15
Limit of detection: 0.25 ng
Limit of quantitation: 10 ppb

SAMPLE

Matrix: fruit, grain, vegetables

Sample preparation: Homogenize (Polytron) 150 g high moisture sample and 300 mL MeOH at half speed for 30 s and full speed for 1 min, filter (paper) under vacuum, remove portion of filtrate equal to 100 g sample and make up to 100 mL with water. Homogenize (Polytron) 75 g low moisture sample and 300 mL MeOH at half speed for 30 s and full speed for 1 min, filter (paper) under vacuum, remove portion of filtrate equal to 50 g sample and make up to 100 mL with water. Concentrate samples to 75 mL under reduced pressure at 35°, add 15 g NaCl, add 75 mL MeCN, shake for 30 s, let stand for 5 min. Remove the aqueous phase and add it to 50 mL MeCN, shake for 20 s, let layers separate, discard the aqueous layer. Combine the MeCN layers, wash with 25 mL 20% NaCl, wash with 100 mL petroleum ether, extract petroleum ether layer with 10 mL MeCN. Combine the MeCN layers and add them to 50 mL 2% NaCl, extract with 100 mL dichloromethane, extract twice with 25 mL portions of dichloromethane. Combine the dichloromethane layers and pass them through a 22 mm i.d. column containing 5 g anhydrous sodium sulfate. Evaporate the eluate to dryness under reduced pressure at 35°, reconstitute in 10 mL dichloromethane, add to the charcoal column, rinse flask with 10 mL dichloromethane, rinse flask with 25 mL MeCN:toluene 75:25. Evaporate the eluate to dryness under reduced pressure at 35°, reconstitute with 5 mL MeOH, filter (5 μm), inject a 10 μL aliquot (J. Assoc. Off.Anal. Chem. 1980, 63, 1114). (Charcoal column was 5 g silanized Celite 545: Nuchar S-N 4:1 on top of 0.5 g silanized Celite 545 in a 300 × 22 glass column, wash with 50 mL MeCN:toluene 75:25, do not allow to go dry. Prepare silanized Celite 545 as follows. Boil 150 g Celite 545 in 1 L 6 M HCl with stirring for 10 min, cool, filter, wash with water until filtrate is neutral, wash with 500 mL MeOH, wash with 500 mL dichloromethane, air dry in hood, heat to 120° in a flask, cool in a desiccator, add 3 mL dichlorodimethylsilane, mix well, let stand at room temperature for 4 h, add 500 mL MeOH, mix, let stand for 15 min, filter, wash with isopropanol until neutral, air dry in hood, dry at 105° for 2 h, cool in desiccator, store in stoppered container. Totally silanized Celite should float on water and appear yellow (not pink) in toluene saturated with methyl red (J. Assoc. Off.Anal. Chem. 1980, 63, 1114).)

HPLC VARIABLES

Guard column: 70 × 2.1 25-37 μm Co-Pell ODS
Column: 250 × 4.6 6 μm Zorbax C8
Mobile phase: Gradient. MeCN:water from 12:88 to 70:30 over 30 min, 100:0 for 5 min.
Column temperature: 35
Flow rate: 1.5
Injection volume: 10
Detector: F ex 288 em 330 following post-column reaction. The column effluent mixed with 200 mM NaOH pumped at 0.5 mL/min and flowed through a 3 m × 0.48 mm stainless steel column to the detector.

CHROMATOGRAM

Retention time: 21

Limit of quantitation: 20 ppb

OTHER SUBSTANCES
Extracted: carbofuran, napropamide, phosalone, piperonyl butoxide

Mobile phase: Gradient. MeOH:water from 10:90 to 90:10 over 23 min, to 10:90 over 4 min, re-equilibrate at 10:90 for 10 min

Flow rate: 1

Injection volume: 20

Detector: F ex 340 em 455, following post-column derivatization. The column effluent is mixed with 200 mM NaOH at 0.8 mL/min and the mixture flows through a 1 mL coil at 95° and is mixed with 500 mg/L o-phthalaldehyde and 1 mL/L 2-mercaptoethanol in 50 mM sodium tetraborate pumped at 0.8 mL/min. The mixture flows through a 0.5 mL coil at ambient temperature to the detector.

CHROMATOGRAM
Retention time: 25

Limit of detection: 5-10 ppb

OTHER SUBSTANCES
Extracted: oxamyl, methomyl, aldicarb, propoxur, carbofuran, methiocarb

KEY WORDS
apples; broccoli; cabbage; cauliflower; potatoes; post-column reaction; derivatization

SAMPLE

Matrix: soil

Sample preparation: 100 g Soil + 100 mL water, blend, add 125 mL MeOH, blend for 5 min, centrifuge for 15 min, let stand for 10 min. Remove the supernatant and extract the residue with 50 mL MeOH. Combine the supernatants and extract them three times with 100 mL portions of dichloromethane, dry the organic layers over anhydrous sodium sulfate. Evaporate the dichloromethane under vacuum at 32-35°, take up the residue in mobile phase, clean up further using a Sep-Pak SPE cartridge, inject a 5 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 μBondapak C18
Mobile phase: MeCN:water 60:40
Flow rate: 1
Injection volume: 5
Detector: UV 224

SAMPLE

Matrix: solutions
Sample preparation: Condition a 10 × 4 55 mg 40 μm C18/OH Bondesil SPE cartridge (Varian/Analytichem) with 1 mL MeOH and 1 mL water, pass through 5 mL test water at 1 mL/min, pass through 500 μL pure water, elute the contents of the SPE cartridge onto the analytical column with mobile phase.

HPLC VARIABLES

Guard column: 10 × 4 4 μm Supersphere RP-8 (Merck)
Column: 250 × 4 4 μm Supersphere RP-8 (Merck)
Mobile phase: Gradient. A was MeCN:water 20:80 containing 2.5 mM sodium acetate. B was MeOH:water 20:80 containing 2.5 mM sodium acetate. C was MeCN:water 60:40 containing 2.5 mM sodium acetate. A:B:C 75:25:0 for 5 min, to 0:0:100 over 20 min, maintain at 0:0:100 for 5 min, re-equilibrate at initial conditions for 15 min.
Column temperature: 35
Flow rate: 0.75
Injection volume: 100
Detector: F ex 340 em 445 following post-column reaction. The column effluent flowed through a 50 × 4 Aminex A-27 (Bio-Rad) column at 120-140° and was mixed with reagent pumped at 1 mL/min, this mixture flowed through a 200 × 0.12 PTFE tube to the detector. (Reagent was prepared by adding 2 mL 25 mg/mL o-phthalaldehyde in MeCN and 100 μL 2-mercaptoethanol to 200 mL 5 mg/mL disodium tetraborate in water then making up to 250 mL with water.)

CHROMATOGRAM

Retention time: 24.53
Internal standard: trimethacarb (26.12)
Limit of detection: 0.03-0.05 ng/mL

OTHER SUBSTANCES

Simultaneous: aldicarb, bendiocarb, bufencarb, butocarboxim, carbanolate, carbofuran, cloethocarb, dioxacarb, ethiofencarb, fenobucarb, isoprocarb, methiocarb, methomyl, oxamyl, promecarb, propoxur, thiofanox, tranid

SAMPLE
Matrix: solutions
Sample preparation: Inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 10 × 3 5 μm Kromasil-100-C18 (Akzo Nobel)
Column: 150 × 4 5 μm Kromasil-100-C18 (Akzo Nobel)
Mobile phase: MeCN:buffer 28:72 (Buffer was 820 mg/L sodium tetraborate decahydrate containing 50 μg/mL phthalaldehyde and 0.06 μL/mL 2-mercaptoethanol, adjusted to pH 8.5 with 100 mM HCl.)
Flow rate: 1
Injection volume: 20
Detector: F ex 340 em 460 following post-column reaction. The column effluent flowed through a 3 m × 0.51 mm ID stainless steel tube at 140° to the detector. (Although the reagents are in the mobile phase the derivatization reaction does not take place until the

post-column reactor where the insecticides are hydrolyzed to methylamine that is then derivatized. This procedure avoids the use of a second pump for the post-column reagent.)

CHROMATOGRAM

Retention time: 19
Limit of detection: 700 pg

OTHER SUBSTANCES

Simultaneous: aldicarb, butocarboxim, carbofuran, dioxacarb, methomyl, propoxur

KEY WORDS

post-column reaction

Sabala,A.; Portillo,J.L.; Broto-Puig,F.; Comellas,L. Development of a new high-performance liquid chromatography method to analyse N-methylcarbamate insecticides by a simple post-column derivatization system and fluorescence detection, *J.Chromatogr.A*, **1997**, *778*, 103–110.

SAMPLE

Matrix: tissue
Sample preparation: 21 g Liver + 60 g anhydrous sodium sulfate, mix with spatula, add 200 mL dichloromethane, mix with spatula, homogenize (VirTis 45) for 2 min at medium speed, filter through 5 g anhydrous sodium sulfate, re-extract tissue and sodium sulfate with 100 mL dichloromethane, filter, wash out flask with 25 mL dichloromethane, filter. Combine filtrates and filter them through 2 g anhydrous sodium sulfate, rinse flask with 20 mL dichloromethane, wash filter with 10 mL dichloromethane. Concentrate filtrate to 1-2 mL under reduced pressure at 30° (do not allow to go dry), transfer residue to a tube with 1-2 mL cyclohexane, wash in with dichloromethane:cyclohexane 50:50, make volume in tube 7.5 mL, filter (0.45 μm), add 5 mL to a 600 × 25 tube containing 60 g 200-400 mesh BioBeads SX-3 resin (Analytical BioChemistry Laboratories), pump through at 5 mL/min with dichloromethane:cyclohexane 50:50 mobile phase, collect fraction containing the compound, evaporate under reduced pressure at 30° to about 1 mL, make up to 2 mL with dichloromethane, add 1 mL to 1 mL 100 mg Bond Elut aminopropyl SPE cartridge (previously conditioned with 1 mL dichloromethane), elute with 3-5 mL dichloromethane: MeOH 98.5:1.5, evaporate eluate to dryness at 30° under reduced pressure (do not over dry), reconstitute in 200 μL MeOH, vortex for 5 s, filter (0.45 μm), inject a 20-30 μL aliquot.

HPLC VARIABLES

Guard column: Guard-PAK (Waters no. 88070)
Column: 250 × 4.6 5 μm Zorbax C8
Mobile phase: Gradient. MeCN:water from 12:88 to 70:30 over 30 min, to 80:20 over 1 min, maintain at 80:20 for 8 min, re-equilibrate at initial conditions for 10 min.
Flow rate: 1.5
Injection volume: 20-30
Detector: F ex 340 em 418, following post-column derivatization. The column effluent is mixed with 50 mM NaOH at 0.27 mL/min and the mixture flows through a 1 mL coil at 80° and is mixed with 140 μg/mL o-phthalaldehyde and 1 mL/L mercaptoethanol in 50 mM pH 10.5 potassium borate buffer pumped at 0.27 mL/min. The mixture flows through a 1 mL coil at 40° to the detector.

CHROMATOGRAM

Retention time: 23.1
Limit of quantitation: 5 ppb

OTHER SUBSTANCES

Extracted: methomyl, aldicarb, carbofuran, methiocarb, bufencarb

SAMPLE
Matrix: solutions
Sample preparation: Prepare an aqueous solution, inject a 200 μL aliquot.

HPLC VARIABLES
Guard column: present but not specified
Column: 150 × 4.6 4 μm Micropak SPC-18 C18
Mobile phase: Gradient. MeCN:10 mM orthophosphoric acid from 15:85 to 60:40 over 20 min
Flow rate: 1
Injection volume: 200
Detector: UV 220

CHROMATOGRAM
Retention time: 12

OTHER SUBSTANCES
Simultaneous: dicloxacillin, methicillin, penicillin G, penicillin V, cloxacillin, nafcillin

REFERENCE
Moats,W.A. Effect of the silica support of bonded reversed-phase columns on chromatography of some antibiotic compounds, *J.Chromatogr.*, **1986**, *366*, 69–78.

SAMPLE
Matrix: solutions
Sample preparation: React the antibiotic, triethylamine, and 1-(2,5-dihydroxyphenyl)-2-bromoethanone in a 1:2:4 molar ratio in DMF at 45° for 2 h (use dibenzo-18-crown-6 to make the sodium salt soluble), inject a 10 μL aliquot. (Preparation of 1-(2,5-dihydroxyphenyl)-2-bromoethanone is as follows. Stir 27.6 g 1,4-dimethoxybenzene and 28 mL bromoacetyl bromide at 0°, add 53.4 g aluminum bromide over 10 min (an exothermic reactions ensues), let stand at room temperature for 12 h, add 100 mL 48% HBr, add 100 g ice, stir for 1 h, extract twice with 200 mL portions of diethyl ether. Combine the extracts and wash them 3 times with 200 mL portions of water, dry over 40 g anhydrous magnesium sulfate, evaporate to dryness, recrystallize the product 3 times from EtOH to yield 1-(2,5-dihydroxyphenyl)-2- bromoethanone monobromoacetate (mp 105-107°). Dissolve 11 g 1-(2,5-dihydroxyphenyl)-2-bromoethanone monobromoacetate in 200 mL warm dry MeOH saturated with HBr, stir for 18 h, add 200 mL water, cool to -10°. Collect the yellow solid and dry it under vacuum at 50° for 48 h, recrystallize from toluene:heptane 50:50 then toluene to obtain 1-(2,5-dihydroxyphenyl)-2-bromoethanone as yellow needles (mp 117-119°).)

HPLC VARIABLES
Column: 250 × 4 7 μm RP-18 LiChrocart (Merck)
Mobile phase: MeOH:100 mM pH 6.5 sodium acetate 58:42
Flow rate: 1
Injection volume: 10

Detector: E, Bioanalytical Systems Model LC4B, glassy carbon electrode 0.8 V, Ag/AgCl reference electrode

CHROMATOGRAM

Retention time: 13.7

OTHER SUBSTANCES

Simultaneous: cephapirin, cloxacillin, dicloxacillin, hetacillin, methicillin, nafcillin, oxacillin, penicillin G

KEY WORDS

derivatization

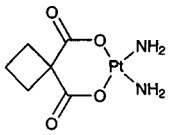
Carboplatin



Molecular formula: $C_6H_{12}N_2O_4Pt$
Molecular weight: 371.25
CAS Registry No.: 41575-94-4
Merck Index: 1870
Lednicer No.: 4 16

SAMPLE

Matrix: blood
Sample preparation: Inject an aliquot of plasma ultrafiltrate directly (Further sample clean up not required when using post-column reaction detection.).

HPLC VARIABLES

Column: 150 × 4.6 3 μm YMC ODS-AQ
Mobile phase: 20 mM NaH_2PO_4
Flow rate: 0.7
Detector: UV 290 following post-column reaction detection. The column effluent mixed with 20 mM pH 5.4 NaH_2PO_4 containing 40 mM sodium bisulfite pumped at 0.7 mL/min and the mixture flowed through a 15.2 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM

Limit of detection: 13 ng/mL
Limit of quantitation: 50 ng/mL

KEY WORDS

plasma; ultrafiltrate; post-column reaction

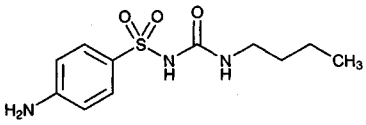
Carbutamide



Molecular formula: $C_{11}H_{17}N_3O_3S$
Molecular weight: 271.34
CAS Registry No.: 339-43-5
Merck Index: 1881
Lednicer No.: 1 138

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 14.547

KEY WORDS

whole blood

Carnitine

Molecular formula: $C_7H_{15}NO_3$
Molecular weight: 161.20
CAS Registry No.: 461-06-3, 541-15-1 (L-form)
Merck Index: 1898

SAMPLE

Matrix: blood

Sample preparation: Condition a 100 mg LiChrolut SCX SPE cartridge (Merck) with 2 mL water. Condition a Toyopak IC-SP S SPE cartridge (Tosoh) with 2 mL water. 50 μL Plasma + 10 μL 400 μM IS in water + 1 mL 25 mM pH 1.0 sodium phosphate buffer, mix, add to the LiChrolut SCX SPE cartridge, wash with 5 mL water, elute with 1 mL isopropanol:150 mM pyridine in water 50:50. Evaporate the eluate under reduced pressure, add 20 μL 2.5 mM 2-(4-hydrazinocarbonylphenyl)-4,5-diphenylimidazole in DMF, add 20 μL 100 mM 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride in DMF, add 10 μL pyridine, vortex, let stand at room temperature for 1 h, add 1 mL DMF:water 40:60, add to the Toyopak IC-SP S SPE cartridge, wash with 1 mL DMF:water 40:60, wash with 10 mL water, wash with 100 μL 600 mM KCl in MeOH:water 50:50, elute with 200 μL 600 mM KCl in MeOH:water 50:50, inject an aliquot of the eluate. (Synthesis of the reagent, 2-(4-hydrazinocarbonylphenyl)-4,5-diphenylimidazole, is as follows. Add 3.15 g benzil and 2.46 g methyl 4-formylbenzoate (terephthalaldehydic acid methyl ester) to 10 g ammonium acetate in 30 mL acetic acid, stir at 80° for 9 h, cool to room temperature, pour into cold water, filter. Wash the precipitate with water and recrystallize it from EtOH to give 4-(4,5-diphenyl-1H-imidazol-2-yl)benzoic acid methyl ester as pale yellow crystals (mp 245-248°). Reflux 1.47 g 4-(4,5-diphenyl-1H-imidazol-2-yl)benzoic acid methyl ester and 15 mL 80% hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) in 100 mL EtOH for 4 h, cool, to room temperature, pour into cold water, filter. Wash the precipitate with water and recrystallize it from EtOH:benzene 50:50 (Caution! Benzene is a carcinogen!) to give 2-(4-hydrazinocarbonylphenyl)-4,5-diphenylimidazole as a colorless powder (mp >300°) (J. Chromatogr. 1993, 619, 1).)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Daisopak SP-120-ODS (Daiso, Osaka)
Mobile phase: Gradient. A was MeCN. B was MeCN:200 mM pH 7.0 Tris-HCl buffer 20:80. A:B 25:75 for 12 min, to 45:55 over 10 min, to 100:0 over 5 min, maintain at 100:0 for 10 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 340 em 475

CHROMATOGRAM

Retention time: 7.3
Internal standard: cyclohexanoylcarnitine (Synthesis of cyclohexanoylcarnitine is as follows. Dissolve 300 mg carnitine in 500 μL trifluoroacetic acid, add 1 mL cyclohexanecarbonyl chloride, protect from moisture with a calcium chloride tube, mix, heat at 40-45° overnight, cool to room temperature, add 5 mL acetone, cool on ice for a couple of h, centrifuge to remove undissolved material, add diethyl ether to incipient cloudiness, when crystallization starts add 10 mL diethyl ether, cool on ice. Dissolve the crystallization products in 1 mL MeOH, add 4-5 mL acetone, add diethyl ether to incipient cloudiness, when crystallization starts add 5 mL diethyl ether (cf. Biochim. Biophys. Acta 1968, 152, 559) to obtain cyclohexanoylcarnitine hydrochloride (mp 159-160°).) (20)
Limit of detection: 240 nM

SAMPLE
Matrix: blood, tissue
Sample preparation: Homogenize (Potter-Elvehjem) 200-300 mg tissue with 8 volumes cold 6% perchloric acid or mix plasma with two volumes of 6% perchloric acid, centrifuge at 5000 g for 10 min, wash pellet with 6% (tissue) or 3% (plasma) perchloric acid, centrifuge again, combine the supernatants, neutralize with KOH, allow to stand on ice for 30 min, centrifuge, filter (0.45 μm, Biofield chromatodisc 13 A). To a total volume of 1 mL add filtrate, 0.5 μmole EDTA, 10 μmole pH 7.5 phosphate buffer, 40 nmole acetylcoenzyme A, and 1 U carnitine acetyltransferase, incubate at 25° for 30 min, adjust pH to 2 with phosphoric acid, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm Unisil QC8 (Gasukuro Kogyo)

Mobile phase: MeOH:190 mM KH_2PO_4 13:87
Flow rate: 0.7
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 8 (of coenzyme A, the product of the reaction)

KEY WORDS
plasma; Guinea pig; liver; kidney; heart; muscle; enzymic reaction

REFERENCE

SAMPLE
Matrix: blood, urine
Sample preparation: Pack a disposable polypropylene chromatography column with 0.5 mL 230-400 mesh Silica gel 60 (Curtin Matheson). 25 μL Urine (or 10 μL urine + 20 μL water or 100 μL plasma) + 25 μL 100 μM IS + 25 μL 1 M KH_2PO_4 + 1 mL MeCN:MeOH 75:25, vortex for 2 s, centrifuge at 13600 g for 5 min, add the supernatant to the silica gel column, wash with 2 mL MeOH, wash with 1 mL 1% acetic acid in MeOH, elute with 4 mL 1% acetic acid in MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 35°, reconstitute the residue in 250 μL MeCN:MeOH 75:25, vortex for 2 s, centrifuge at 13600 g for 5 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 10 μL diisopropylethylamine solution and 20 μL 100 mM 4'-bromophenacyl trifluoromethanesulfonate in MeCN, vortex for 2 s, let stand for 10 min, inject a 6 μL aliquot. (The diisopropylethylamine solution was 25 μL diisopropylethylamine in 10 mL MeOH. Prepare 4'-bromophenacyl trifluoromethanesulfonate as follows. Add 8.8 g p-bromobenzoyl chloride in 40 mL dry ether over 20-30 min to 100 mmoles diazomethane stirred in an ice bath, stir in an ice bath for 8-9 h, let stand at room temperature for 3 h, evaporate the solvent under reduced pressure, recrystallize 4'-bromo-2-diazoacetophenone from ether/hexane (mp 123.5-124° d) (J.Am.Chem.Soc. 1951, 73, 5301). Condense 50 mL anhydrous sulfur dioxide in a flask fitted with a calcium sulfate drying tube, cool in a dry ice/acetone bath, add 2.25 g 4'-bromo-2-diazoacetophenone, stir for 5 min, add 900 μL anhydrous trifluoromethanesulfonic acid from a freshly opened bottle in one portion, stir for 15 min, remove the cooling bath, after 30 min use an ice/water bath to evaporate the solvent. Dissolve the residue in 100 mL boiling dichloromethane, treat twice with 5 g portions of decolorizing carbon, filter, evaporate the filtrate, recrystallize the residue from pentane:dichloromethane 80:20 to give 4'-bromophenacyl trifluoromethanesulfonate as colorless plates (mp 137-8°) (J.Chromatogr. 1984, 299, 365).)

HPLC VARIABLES
Column: 100 × 4.6 3 μm Hypersil (MOS-1) C8
Mobile phase: Gradient. A was MeCN:water 80:20. B was MeCN:water 20:80. C was MeCN:water:phosphoric acid:triethylamine 20:80:0.4:0.5. D was MeCN:water:phosphoric acid:triethylamine 90:10:0.2:0.25. A:B:C:D 100:0:0:0 for 0.2 min, 0:100:0:0 for 0.8 min, then 0:0:100:0 to 0:0:0:100 over 10 min, then 100:0:0:0 for 3 min before next run.
Flow rate: 1.75
Injection volume: 6
Detector: UV 260

CHROMATOGRAM
Retention time: 4.25
Internal standard: 4-(N,N-dimethyl-N-ethylammonio)-3-hydroxybutanoate (Prepare by N-demethylating carnitine and alkylating the resulting 4-(N,N-dimethylamino)-3-hydroxy-

butanoic acid with iodoethane. Perform the reaction under nitrogen and protect from light. Heat 83 g thiophenol and 20 g NaOH in 100 mL EtOH until they dissolve, add 700 mL toluene, distil slowly at atmospheric pressure, add 600 mL toluene in 100 mL portions to keep the volume in the flask at 500-600 mL, continue distillation for 1 h after the distillation head temperature reaches 115°. Sodium thiophenoxide crystallizes out in the flask as the distillation progresses (Anal.Chem. 1968, 40, 125). Filter the product under nitrogen and wash it with boiling toluene, store in the dark under vacuum. Dissolve 2 g l-carnitine chloride in 100 mL DMF with stirring at 80°, cool to room temperature, add 6.6 g sodium thiophenoxide, stir for 20 min, heat at 100° with stirring for 8 h, cool to room temperature, pour into 150 g ice and 4.5 mL concentrated HCl, wash 4 times with 100 mL portions of diethyl ether, evaporate the aqueous phase under reduced pressure at 40°, add more water to the flask until all the DMF is removed. When the volume has been reduced to 5 mL adjust pH to 10 with NaOH, add to a 300 × 20 column of 200-400 mesh Dowex 2X8 (OH^-) made up in 50 mM NaOH, wash with 200 mL 50 mM NaOH at 1.5 mL/min, wash with water until the pH of the effluent is neutral. Place the resin in a beaker containing ice water, slowly add concentrated HCl with stirring until the supernatant reaches pH 1, pour the resin into the column, wash the column with 200 mL 100 mM HCl. Collect all the effluents and concentrate them almost to dryness under reduced pressure, add to a 500 × 20 column of 200-400 mesh Dowex 50X8 (H^+ form), elute with 300 mL 500 mM HCl and 300 mL 2.5 M HCl, collect 10 mL fractions, identify fractions containing compound with iodoplatinate spray reagent. Combine fractions containing compound and lyophilize them to give 4-(N,N-dimethylamino)-3-hydroxybutanoic acid as a colorless glass. Dissolve 50 mg 4-(N,N-dimethylamino)-3-hydroxybutanoic acid and 150 mg barium hydroxide octahydrate in 1 mL water, add iodoethane in 5 mL MeOH, stir for 15 h, evaporate to dryness, reconstitute with 2 mL water, add 500 μL 1 M sulfuric acid, centrifuge, wash the solid with 100 mM sulfuric acid. Combine the aqueous layers and adjust the pH to 7 with KOH, add to a 190 × 12 column of 200-400 mesh Dowex 1X8 (OH^-), elute with water and collect fractions. Adjust the pH of the fractions containing the product to 4 with HCl, evaporate, add the residue to a 190 × 12 column of 200-400 mesh Dowex 50X8 (H^+) form, elute column with 60 mL 1 M HCl and 200 mL 2 M HCl, collect fractions (J.Labelled Cmpds.Radiopharm. 1982, 9, 535, J.Chromatogr. 1984, 336, 271, Clin.Chim.Acta 1992, 212, 55).) (4.5)

Limit of quantitation: 10 nmole/mL

OTHER SUBSTANCES

Extracted: carnitine esters, betaine, butyrobetaine, trimethyllysine

KEY WORDS

plasma; SPE; derivatization; plasma details (see Anal. Biochem. 1993; 212; 510)

Quantification of carnitine and specific acylcarnitines by high-performance liquid chromatography: Application to normal human urine and urine from patients with methylmalonic aciduria, isovaleric acidemia or medium-chain acyl-CoA dehydrogenase deficiency, *J.Chromatogr.*, **1993**, *613*, 203–221.

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 287.8

CHROMATOGRAM

Retention time: 16.058

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 251

CHROMATOGRAM

Retention time: 12.58
Limit of detection: <120 ng/mL

KEY WORDS

whole blood; plasma; interferences may occur—compounds(all of which are extracted) elute in this order tenoxicam; iproniazid; methocarbamol; methotrexate; caffeine; nialamide; colchicine; cytarabine; benzoylecgonine; acetaminophen; diazoxide; dacarbazine; sulfinpyrazole; flumazenil; sulpride; morphine; atenolol; toloxatone; terbutaline; albuterol; phenobarbital; ranitidine; tiapride; phenol; chlormezanone; aspirin; metformin; ritodrine; codeine; sultopride; amisulpride; naltrexone; lisinopril; benzocaine; nizatidine; nalorphine; mephenesin; naloxone; sotalol; carteolol; procainamide; carbamazepine; bromazepam; nalbuphine; nadolol; procarbazine; dihydralazine; omeprazole; strychnine; acebutolol; glutethimide; chlorpropamide; glipizide; triazolam; prazosin; flunitrazepam; clonazepam; metoclopramide; melphalan; estazolam; tolbutamide; ephedrine; clonidine; pindolol; clobazam; minoxidil; disopyramide; nitrazepam; dextromethorphan; tofisopam; zopiclone; debrisoquine; sulindac; alprazolam; cycloguanil; lorazepam; methaqualone; ketamine; piroxicam; metoprolol; nifedipine; quinine; mephentermine; prilocaine; pentazocine; oxazepam; tiaprofenic acid; quinidine; celiprolol; ajmaline; yohimbine; lidocaine; secobarbital; viloxazine; mepivacaine; meperidine; doxylamine; labetalol; temazepam; amodiaquine; benperidol; droperidol; hydroxychloroquine; zolpidem; ketoprofen; alminoprofen; cicletanine; moclobemide; chloroquine; cocaine; timolol; nomifensine; ticlopidine; acenocoumarol; vindesine; mexiletine; dipyridamole; trazodone; pipamperone; pyrimethamine; benazepril; vincristine; metapramine; chlordiazepoxide; oxprenolol; warfarin; clorazepate; flecainide; phencyclidine; thiopental; fenfluramine; metipranolol; triprolidine; naproxen; buprenorphine; verapamil; buspirone; tianeptine; midazolam; bupivacaine; carbinoxamine; loprazolam; cetirizine; chlorpheniramine; moperone; cibenzoline; medifoxamine; astemizole; vinblastine; nicardipine; bisoprolol; diltiazem; glibornuride; reserpine;

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

CHROMATOGRAM

SAMPLE
Matrix: solutions
Sample preparation: Mix a 100 μL of a 10 μM solution in MeCN:water:triethylamine 50:50:0.1 with 100 μL 1 mM (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in MeCN, heat in the dark at 65° for 1.5 h, inject an aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g

powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/ 12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation

under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as yellow crystals (mp 160-170° d) (Analyst 1995, 120, 385).)

SAMPLE
Matrix: bulk
Sample preparation: Dissolve 10 μmole compound (as free base or hydrochloride) in 500 μL MeCN, add 250 μL 5% sodium carbonate (for hydrochlorides only), add 500 μL 100 mM reagent in MeCN, vortex for 1 min, heat at 60° for 2 h, add 100 μmole L-proline, heat at 60° for 30 min. Remove a 100 μL aliquot and dilute it with mobile phase, neutralize with acetic acid, inject a 10 μL aliquot. Prepare the reagent ((R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate) as follows. Add 0.7 mL carbon disulfide to 6 mL (1R,2R)-(-)-1,2-diaminocyclohexane, 12 mL water, and 12 mL EtOH, heat the oil bath to 80°, add 2.8 mL carbon disulfide dropwise (making sure that the product does not start to precipitate), when addition is complete reflux for 1 h, acidify with 500 μL 5 M HCl, reflux for 12 h, cool, filter, wash the solid with a little cold EtOH to give trans-4,5-tetramethyleneimidazolidine-2-thione as a white fluffy solid (mp 148-150°) (Tetrahedron 1993, 49, 4419). Stir 7.97 g 3,5-dinitrobenzoyl chloride in 30 mL dichloroethane at 50°, add a solution of 6 g trans-4,5-tetramethyleneimidazolidine-2-thione in 120 mL dichloroethane containing a catalytic amount of 4-(dimethylamino)pyridine over 15 min, reflux for 2 h, remove the crystals of (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate by filtration, evaporate the filtrate to dryness and dissolve the residue in 60 mL dichloroethane, reflux for 16 h to obtain more (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate (mp >250°, $[\alpha]_{546}$ = -133° (c = 1) in MeCN).

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 150 μL Plasma + 150 μL MeCN, vortex, rotate at 20 rpm for 10 min; centrifuge at 1000 g for 10 min. Transfer supernatant to another tube and add 7 volumes dichloromethane, equilibrate for 10 min; rotate at 20 rpm for 10 min; centrifuge at 1000 g for 10 min, inject an aliquot of the upper aqueous layer (J.Chromatogr. 1987, 413, 109). Urine. Dilute with water, inject an aliquot.

HPLC VARIABLES

Guard column: C18
Column: 150 × 1.6 Spherisorb S5-ODS2 C18
Mobile phase: MeOH:100 mM pH 3 acetate buffer 13:87
Flow rate: 1
Detector: UV 254

CHROMATOGRAM

Limit of detection: 300 ng/mL

KEY WORDS
plasma; rat; pharmacokinetics

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 3.188

Lee,D.K.T.; Wong,C.-Y.; Wang,D.-P. Stability of cefazolin sodium and meperidine hydrochloride, *Am.J.Health-Syst.Pharm.*, **1996**, *53*, 1608–1610.

SAMPLE
Matrix: formulations
Sample preparation: Dilute with water (if necessary), inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 4 μBondapak phenyl
Mobile phase: MeOH:water 30:70 containing 10 mM ammonium acetate
Flow rate: 1.3
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 5.5

OTHER SUBSTANCES
Simultaneous: cephalothin

KEY WORDS
saline; 5% dextrose; stability-indicating

REFERENCE
Das Gupta,V.; Stewart,K.R. Quantitation of carbenicillin disodium, cefazolin sodium, cephalothin sodium, nafcillin sodium, and ticarcillin disodium by high-pressure liquid chromatography, *J.Pharm.Sci.*, **1980**, *69*, 1264–1267.

SAMPLE
Matrix: formulations
Sample preparation: Dilute with water, inject an aliquot.

HPLC VARIABLES
Column: 150 × 3.9 5 μm Nova Pak C18
Mobile phase: MeOH:5 mM pH 7.5 phosphate buffer 20:80
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 2.7

OTHER SUBSTANCES
Simultaneous: degradation products, cefoxitin

KEY WORDS
injections; water; stability-indicating

SAMPLE
Matrix: formulations
Sample preparation: Add theophylline (2 mg/mL), inject a 10 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeCN:acetic acid:water 10:1:89, adjusted to pH 4 with 5 M NaOH
Flow rate: 1.5
Injection volume: 10
Detector: UV 293 (?)

CHROMATOGRAM
Retention time: 8.5
Internal standard: theophylline (4.1)

OTHER SUBSTANCES
Simultaneous: ceftazidime

KEY WORDS
injections; stability-indicating; 5% dextrose

REFERENCE
Bosso,J.A.; Prince,R.A.; Fox,J.L. Compatibility of ondansetron hydrochloride with fluconazole, ceftazidime, aztreonam, and cefazolin sodium under simulated Y-site conditions, *Am.J.Hosp.Pharm.*, **1994**, *51*, 389–391.

SAMPLE
Matrix: formulations
Sample preparation: Dilute with 5% dextrose (if necessary), inject a 20 μL aliquot.

HPLC VARIABLES
Column: Nova Pak C18
Mobile phase: MeOH:100 mM $(NH_4)_2HPO_4$ 20:80, pH 7.80
Flow rate: 1
Injection volume: 20
Detector: UV 322

CHROMATOGRAM
Retention time: 3.3

OTHER SUBSTANCES
Simultaneous: famotidine

KEY WORDS
injections; 5% dextrose; stability-indicating

SAMPLE

Matrix: solutions
Sample preparation: Dissolve sample in a mobile phase to concentration of about 1 mg/mL, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm β-CyD (Advanced Separation Technologies Inc., USA)
Mobile phase: MeOH:buffer 42:58 (Buffer was 5 mM tetraethylammonium acetate adjusted to pH 3.6 with glacial acetic acid.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 10
Detector: UV 230

CHROMATOGRAM

Retention time: 54

OTHER SUBSTANCES

Also analyzed: 7-ACA, 7-ADCA, cefaclor, cefaloridine, cefoperazone, cefotaxime, ceftazidime, cephalosporin C

REFERENCE

Tsou,T.-L.; Wu,J.-R.; Wang,T.-M. The effects of separation of cephalosporins by HPLC with β-cyclodextrin bonded stationary phase, *J.Liq.Chromatogr.Rel.Technol.*, **1996**, *19*, 1081–1095.

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4 OmniPac PCX-500 (Dionex)
Mobile phase: Gradient. A was MeCN:90 mM perchloric acid 13.5:86.5. B was MeCN:300 mM perchloric acid 45:55. A:B from 100:0 to 0:100 over 7 min, maintain at 0:100.
Flow rate: 1
Detector: UV 254

CHROMATOGRAM

Retention time: 7

OTHER SUBSTANCES

Simultaneous: 7-aminocephalosproranic acid, cefadroxil, cefotaxime, cephalexin, cephaloridine, cephalosporin C, cephalothin, cephapirin, D-hydroxyphenylglycine

REFERENCE

Slingsby,R.W.; Rey,M. Determination of pharmaceuticals by multi-phase chromatography: Combined reversed phase and ion exchange in one column, *J.Liq.Chromatogr.*, **1990**, *13*, 107–134.

SAMPLE

Matrix: solutions
Sample preparation: Inject 100 μL onto column A with mobile phase A, after 3 min backflush the contents of column A onto column B with mobile phase B, elute column B with mobile phase B, monitor the effluent from column B.

HPLC VARIABLES
Column: A 30 × 0.3 5 μm ODS C18 (Nomura); B 150 × 0.3 5 μm ODS C18 (Nomura)
Mobile phase: A 10 mM ammonium acetate adjusted to pH 5 with acetic acid; B MeOH: water:acetic acid 40:60:0.5
Flow rate: A 0.1; B 0.004
Injection volume: 100
Detector: UV 262

CHROMATOGRAM
Retention time: 8.50
Limit of detection: 2 ng/mL

OTHER SUBSTANCES
Simultaneous: cefaclor, cephaloridine, ceftizoxime

KEY WORDS
microbore; column-switching

REFERENCE

SAMPLE
Matrix: solutions
Sample preparation: Separate buffer containing drug from human serum albumin by centrifuging at 37° at 700 g for 3 min using a Micropartition System MPS-1 (Amicon) unit, inject a 10-20 μL aliquot of the ultrafiltrate.

HPLC VARIABLES
Guard column: C18/Corasil (Waters)
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeCN:10 mM ammonium acetate 15:85
Flow rate: 1.5
Injection volume: 10-20
Detector: UV 270

OTHER SUBSTANCES
Also analyzed: cefpiramide, cefmenoxime, cefbuperazone, cefoxitin, cefotiam, cephaloridine

REFERENCE

SAMPLE

Matrix: tissue

Sample preparation: Condition a 100 mg Sep-Pak SPE cartridge with 5 mL MeOH and 5 mL water. Homogenize tissue with 4 (liver, lung) or 29 (spleen) volumes of water (Thomas tissue grinder series 3431-D70). 1 mL Homogenate + 20 μL 500 μg/mL cephalexin + 50 μL 8.5% phosphoric acid, vortex for 30 s, centrifuge at 2000 g for 5 min, add to the SPE cartridge, wash with 3 mL water, elute with 2 mL MeOH:water 60:40, inject a 10 μL aliquot of the eluate.

HPLC VARIABLES

Guard column: Nova-Pak C18 guard column
Column: 250 × 4.6 5 μm Econosphere C18
Mobile phase: MeOH:20 mM NaH_2PO_4 23:77, pH 5.0
Flow rate: 1
Injection volume: 100
Detector: UV 270

CHROMATOGRAM

Retention time: 9.5
Internal standard: cephalexin (11.5)
Limit of quantitation: 500 ng/g (spleen), 100 ng/g (liver, lung)

KEY WORDS

rat; liver; spleen; lung; SPE

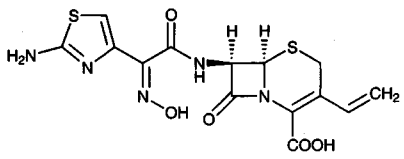
Cefdinir



Molecular formula: $C_{14}H_{13}N_5O_5S_2$
Molecular weight: 395.42
CAS Registry No.: 91832-40-5
Merck Index: 1971

SAMPLE

Matrix: blood
Sample preparation: Mix plasma with an equal volume of MeCN, mix with 3.5 volumes of dichloromethane, inject a 20 μL aliquot of the aqueous phase.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb ODS1
Mobile phase: MeCN:water:perchloric acid:triethylamine 8:90.6:0.7:0.7
Flow rate: 1
Injection volume: 20
Detector: UV 284

CHROMATOGRAM

Retention time: 11
Limit of quantitation: 2 μg/mL

OTHER SUBSTANCES

Also analyzed: captopril, quinapril

KEY WORDS

plasma; pharmacokinetics; rat

REFERENCE

Jacolot,A.; Tod,M.; Petitjean,O. Pharmacokinetic interaction between cefdinir and two angiotensin-converting enzyme inhibitors in rats, *Antimicrob.Agents Chemother.*, **1996**, *40*, 979–982.

SAMPLE

Matrix: solutions
Sample preparation: Dissolve 200 mg cefdinir in 5 mL 2% sodium bicarbonate in water. Dilute 500 μL solution to 200 mL (100 μg/mL) with each 100 mM pH 3-8 phosphate buffer. For pH 9 studies dissolve 20 mg cefdinir in 200 mL 100 mM carbonate buffer. Inject an aliquot.

HPLC VARIABLES

Column: 75 × 4.6 TSK-gel ODS-80 TM (TOSOH, Japan)
Mobile phase: MeOH:dioxane:33 mM citric acid adjusted to pH 2.0 with 10% phosphoric acid 4:1:36 (Caution ! Dioxane is a carcinogen!)
Flow rate: 1.5
Detector: UV 254

CHROMATOGRAM

Retention time: 6.5

OTHER SUBSTANCES

Simultaneous: degradation products

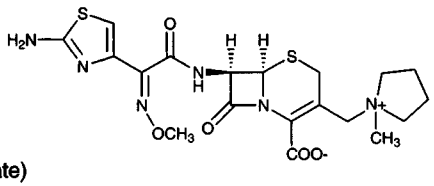
KEY WORDS

details for degradation of cefdinir in paper

REFERENCE

Okamoto,Y.; Kiriyama,K.; Namiki,Y.; Matsushita,J.; Fujioka,M.; Yasuda,T. Degradation kinetics and isomerization of cefdinir, a new oral cephalosporin, in aqueous solution. 1, *J.Pharm.Sci.*, **1996**, *85*, 976–983.

Cefepime



Molecular formula: $C_{19}H_{24}N_6O_5S_2$

Molecular weight: 480.57

CAS Registry No.: 88040-23-7, 123171-59-5 (HCl monohydrate)

Merck Index: 1973

SAMPLE

Matrix: blister fluid, blood

Sample preparation: Serum. 0.5 mL Serum + 2.5 mL MeCN, vortex, centrifuge at 3000 g for 5 min. Remove the supernatant and add it to 5 mL dichloromethane, vortex, inject a 10 μL aliquot of the aqueous layer. Blister fluid. Inject directly.

HPLC VARIABLES

Column: μBondapak C18

Mobile phase: MeCN:100 mM phosphate buffer 7:93

Flow rate: 2

Injection volume: 10

Detector: UV 229

CHROMATOGRAM

Retention time: 5

KEY WORDS

serum; pharmacokinetics

REFERENCE

SAMPLE

Matrix: blood

Sample preparation: 500 μL Serum + 500 μL MeCN, vortex, gently shake by rotation at 20 rpm for 10 min. and centrifuge at 1000 g for 10 min. Remove the supernatant, add 3.2 mL dichloromethane, shake by rotation at 20 rpm for 10 min. and centrifuge at 1000 g for 10 min. Inject a 5 μL aliquot of the upper aqueous layer.

HPLC VARIABLES

Column: 75 × 4.6 3 μm Ultrasphere XL-ODS

Mobile phase: MeCN:20 mM ammonium acetate adjusted to pH 4 with glacial acetic acid 7:93

Flow rate: 1

Injection volume: 5

Detector: UV 254

CHROMATOGRAM

Retention time: 1.8-2.2

Limit of detection: 100 ng/mL

Limit of quantitation: 500 ng/mL

OTHER SUBSTANCES

Noninterfering: amikacin, amoxicillin, ampicillin, calcium folinate, cephalothin cefixime, cefotaxime, ceftazidime, ciprofloxacin, clavulanic acid, cloxacillin, erythromycin, fosfomycin, fusidic acid, gentamycin, hydroxyitraconazole, imipenem, itraconazole, kanamycin, latamoxef, lincomycin, mezlocillin, neomycin, netilmycin, ofloxacin, pefloxacin, penicillin G, piperacillin, pristinamycin, rifampicin, roxithromycin, sulbactam, sulfamethoxazole, tazobactam, teicoplanin, tetracycline, ticarcillin, tobramycin, trimethoprim, vancomycin

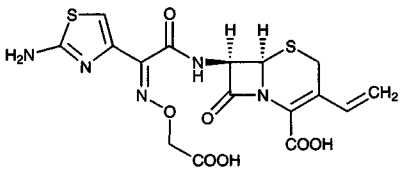
Cefixime



Molecular formula: $C_{16}H_{15}N_5O_7S_2$
Molecular weight: 453.46
CAS Registry No.: 79350-37-1
Merck Index: 1975
Lednicer No.: 4 184,185

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 287.8

CHROMATOGRAM

Retention time: 4.823

KEY WORDS

whole blood

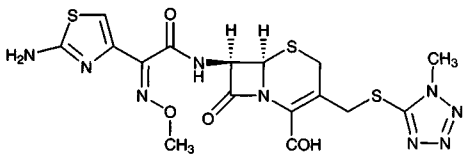
Cefmenoxime



Molecular formula: $C_{16}H_{17}N_9O_5S_3$
Molecular weight: 511.57
CAS Registry No.: 65085-01-0, 75738-58-8 (HCl)
Merck Index: 1976
Lednicer No.: 4 187

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Serum. 0.5 mL serum + 0.5 mL MeCN mix in 7 mL tube on vortex mixer; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; transfer supernatant to another tube, add 7 aliquots dichloromethane; equilibrate 10 min; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; inject aliquot of upper aqueous layer. Urine. Centrifuge urine and dilute 1:20. Bile. Centrifuge bile and dilute 1:10.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Ultrasphere ODS
Mobile phase: 12:88 MeCN:20 mM ammonium acetate adjusted to pH 5 with glacial acetic acid
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 7.6
Limit of detection: 200 ng/mL

OTHER SUBSTANCES

Also analyzed: ampicillin, azlocillin, aztreonam, cefoperazone, cefsulodin, cefotaxime, ceftazidime, ceftriaxone, cloxacillin, desacetylcefotaxime, mezlocillin, penicillin G, piperacillin, ticarcillin

SAMPLE

Matrix: milk
Sample preparation: Mix 10 mL milk with 2 mL 100 mM tetraethylammonium chloride, add 40 mL MeCN slowly with continual stirring, let stand for 10 min, decant the supernatant through a plug of glass wool. Collect 40 mL filtrate, add 2 mL buffer, evaporate to 1-2 mL under reduced pressure at 40-50°, dilute to 4 mL with water, filter (0.45 μm PVDF). Inject a 2 mL aliquot onto a 150 × 4.6 5 μm Supelcosil LC-18 column, elute with MeCN:10 mM KH_2PO_4 0:100 for 3 min, to 60:40 over 37 min at 1 mL/min, collect a 1.5-2 mL aliquot containing the compound (ca. 19.7 min), evaporate to <1 mL under reduced pressure, make up to 1 mL with water, inject an aliquot. (Prepare the buffer by mixing 10 mM KH_2PO_4 and 10 mM Na_2HPO_4 in a 5:1 ratio, pH 6.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Supelcosil LC-18

SAMPLE

Matrix: blood, urine
Sample preparation: 100 μL Plasma or urine + 100 μL (500 μL for urine) 10 μg/mL cefoperazone in 100 mM pH 5 ammonium acetate buffer, vortex for 15 s, centrifuge at 8700 g for 2 min, inject a 20-200 μL aliquot onto column A with mobile phase A, wash with mobile phase A for 2 min then backflush contents of column A onto column B with mobile phase B, monitor effluent from column B.

HPLC VARIABLES

Column: A 20 × 4 35-50 μm C18 Corasil; B 20 × 4 35-50 μm C18 Corasil + 100 × 8 10 μm Radial-Pak μBondapak C18
Mobile phase: A water:triethylamine 1000:4, adjusted to pH 3.0 with orthophosphoric acid; B MeCN:water:triethylamine 750:250:4, adjusted to pH 3.0 with orthophosphoric acid
Flow rate: A 2; B 3.8
Injection volume: 20-200
Detector: UV 270

CHROMATOGRAM
Retention time: 2.33
Internal standard: cefoperazone (3.66)
Limit of detection: 250 ng/mL

OTHER SUBSTANCES
Simultaneous: ceftazidime, ceftriaxone, cefotaxime, cephaloridine, ceforanide, moxalactam, cephalothin
Noninterfering: cefotiam, cefadroxil
Interfering: cefazolin

KEY WORDS
plasma; column-switching

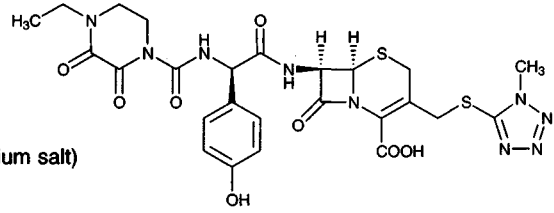
Cefoperazone



Molecular formula: $C_{25}H_{27}N_9O_8S_2$
Molecular weight: 645.68
CAS Registry No.: 62893-19-0, 62893-20-3 (sodium salt)
Merck Index: 1981
Lednicer No.: 4 185, 188-190

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Serum. 0.5 mL serum + 0.5 mL MeCN mix in 7 mL tube on vortex mixer; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; transfer supernatant to another tube, add 7 aliquots dichloromethane; equilibrate 10 min; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; inject aliquot of upper aqueous layer. Urine. Centrifuge urine and dilute 1:20. Bile. Centrifuge bile and dilute 1:10

HPLC VARIABLES

Column: 150 × 4.6 5 μm Ultrasphere ODS
Mobile phase: 20:80 MeCN:20 mM ammonium acetate adjusted to pH 5 with glacial acetic acid
Flow rate: 1
Injection volume: 20
Detector: UV 254

OTHER SUBSTANCES

Also analyzed: ampicillin, azlocillin, aztreonam, cefmenoxime, cefsulodin, cefotaxime, ceftazidime, ceftriaxone, cloxacillin, desacetylcefotaxime, mezlocillin, penicillin G, piperacillin, ticarcillin

SAMPLE

Matrix: blood

Sample preparation: 500 μL Plasma + 50 μL 1 mg/mL sulfacetamide + 100 μL 6% trichloroacetic acid, vortex for 1 min, add 1 mL MeCN, centrifuge at 2500 g for 10 min. Remove the supernatant and add it to 5 mL dichloromethane, vortex for 1 min, shake for 10 min, centrifuge, inject a 100 μL aliquot of the aqueous phase. Analyze for free ceforanide by centrifuging serum at 3000 rpm for 20 min through an Amicon micropartition system with YMT membranes, 200 μL ultrafiltrate + 20 μL 1 mg/mL sulfacetamide, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 mm long C18 (Alltech)
Mobile phase: MeOH:100 mM pH 4.0 sodium acetate buffer 10:90
Flow rate: 2
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Internal standard: sulfacetamide

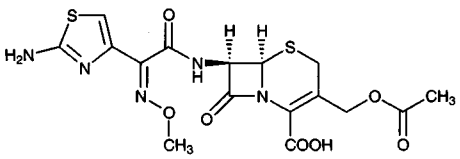
KEY WORDS

plasma; pharmacokinetics

REFERENCE

DiPiro,J.T.; Bayoumi,S.M.; Vallner,J.J.; Nesbit,R.R.; Gokhale,R.; Rissing,J.P. Intraoperative ceforanide pharmacokinetics and protein binding, *Antimicrob.Agents Chemother.*, **1985**, *27*, 487–490.

Cefotaxime



Molecular formula: $C_{16}H_{17}N_5O_7S_2$
Molecular weight: 455.47
CAS Registry No.: 63527-52-6, 64485-93-4 (sodium salt)
Merck Index: 1983
Lednicer No.: 3 216

SAMPLE

Matrix: aqueous humor, blood
Sample preparation: Aqueous humor. Inject a 10 μL aliquot directly. Plasma. Condition a 3 mL C18 SPE cartridge (Varian) with two 3 mL portions of MeCN and 3 mL buffer. Add 2 mL 625 ng/mL ciprofloxacin in buffer to 500 μL of plasma, mix, add to the SPE cartridge. Wash with 3 mL buffer. Remove moisture with vacuum (200 mbar) for 10 min. Elute with two 500 μL portions of MeCN:buffer 40:60. Vortex the eluate, inject a 10 μL aliquot. (Buffer was 100 mM Tris adjusted to pH 5.0 with HCl).

HPLC VARIABLES

Column: 300 × 4.6 5 μm endcapped ODS-Hypersil
Mobile phase: MeCN:DMF:10 mM NaH_2PO_4 15:6:79, adjusted to pH 3.0 with 85% phosphoric acid
Flow rate: 1
Injection volume: 10
Detector: UV 285

CHROMATOGRAM

Retention time: 6.7
Internal standard: ciprofloxacin (12.0)
Limit of detection: 80 ng/mL (aqueous humor), 310 ng/mL (plasma)

OTHER SUBSTANCES

Extracted: metabolites, ofloxacin

KEY WORDS

plasma; SPE

REFERENCE

SAMPLE

Matrix: blood, tissue, urine
Sample preparation: Plasma. 50 μL Plasma + 50 μL MeCN, mix for 30 s, centrifuge at 5000 g for 15 min. Inject an aliquot of the supernatant. Urine. Mix 200 μL MeCN and 100 μL urine for 30 s, centrifuge at 5000 g for 15 min. Inject an aliquot. Tissue. Weight out finely chopped tissue and suspend it in 200 μL water, sonicate for 60 s. Add 200 μL MeCN, vortex for 30 s, centrifuge at 10000 g for 15 min. Inject an aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Newguard C18 (Alltech)
Column: 250 × 4.6 5 μm Alltima C18 (Alltech)
Mobile phase: MeCN:50 mM pH 5.0 sodium dihydrogen phosphate 10:90
Flow rate: 1.0
Detector: UV 215

CHROMATOGRAM
Retention time: 11.6
Internal standard: cefotaxime

OTHER SUBSTANCES
Extracted: ampicillin

KEY WORDS
cefotaxime is IS; plasma; muscle; rat

REFERENCE

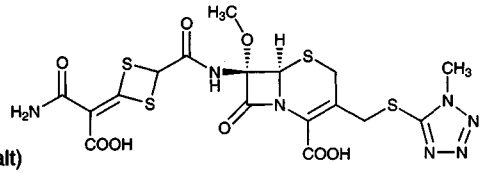
Cefotetan



Molecular formula: $C_{17}H_{17}N_7O_8S_4$
Molecular weight: 575.63
CAS Registry No.: 69712-56-7, 74356-00-6 (disodium salt)
Merck Index: 1984
Lednicer No.: 4 191, 192

SAMPLE

Matrix: blister fluid, blood
Sample preparation: Serum. 0.5 mL Serum + 2 mL MeCN, vortex for 1 min, centrifuge at 3000 g for 5 min. Remove the supernatant and add it to to 5 mL dichloromethane, vortex, centrifuge at 3000 g for 5 min, inject an aliquot of the upper layer. Blister fluid. Inject an aliquot directly.

HPLC VARIABLES

Column: μBondapak C18
Mobile phase: 100 mM phosphate buffer adjusted to pH 3.0 (?, no organic component reported)
Flow rate: 2
Detector: UV 229

CHROMATOGRAM

Retention time: 6
Limit of detection: 300 ng/mL

KEY WORDS

serum

SAMPLE

Matrix: blood, urine
Sample preparation: 200 μL Plasma + 200 μL 100 mM NaH_2PO_4 + 400 μL MeCN, mix for 5 s, let stand at 4° for 15 min, centrifuge at 10500 g for 1 min. Remove the supernatant and add it to 2 mL dichloromethane, mix for 5 min, centrifuge at 4800 g for 10 min, inject a 5-50 μL aliquot of the upper aqueous phase. Urine. Centrifuge urine at 4800 g for 10 min, dilute 1:10 with 50 mM NaH_2PO_4, inject an aliquot.

HPLC VARIABLES

Column: 125 × 4 5 μm LiChrosorb RP-18
Mobile phase: MeCN:water 7.5:92.5 containing 5.50 g/L $NaH_2PO_4.H_2O$, 1.80 g/L $Na_2HPO_4.2H_2O$, and 20 mg/L tetrabutylammonium bromide, pH 6.4 (plasma) or MeCN: water 5:95 containing 5.50 g/L $NaH_2PO_4.H_2O$, 1.80 g/L $Na_2HPO_4.2H_2O$, and 22.5 mg/L tetrabutylammonium bromide, pH 6.4 (urine)
Flow rate: 1
Injection volume: 5-50
Detector: UV 280

CHROMATOGRAM

Retention time: 6.36 (plasma, epimer A), 6.84 (plasma, epimer B), 13.09 (urine, epimer A), 14.40 (urine, epimer B)

Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Extracted: iothalamic acid (UV 254)

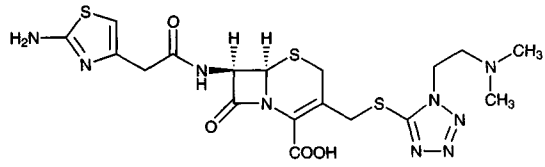
Cefotiam



Molecular formula: $C_{18}H_{23}N_9O_4S_3$
Molecular weight: 525.64
CAS Registry No.: 61622-34-2, 66309-69-1 (HCl)
Merck Index: 1985
Lednicer No.: 3 215

SAMPLE

Matrix: blister fluid, blood
Sample preparation: 200 µL Serum or blister fluid + 200 µL 50 mM pH 6.2 sodium phosphate + 400 µL MeCN, mix, add 2 mL dichloromethane, extract, inject a 50 µL aliquot of the aqueous supernatant. Refrigerate samples before injection.

HPLC VARIABLES

Column: 125 × 4.6 5 µm Spherisorb ODS-2
Mobile phase: MeCN:water:acetic acid 80:1000:2, adjust pH to 5.1 with 10 M NaOH
Column temperature: 30
Flow rate: 1
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 5.4
Limit of detection: 20 ng/mL (serum), 10 ng/mL (blister fluid)
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

serum

SAMPLE

Matrix: blood
Sample preparation: Prepare an anion-exchange SPE cartridge in a 6 mL syringe barrel with a filter paper disc in the bottom. Pack with DEAE-A-25 Sephadex in PBS to a bed volume of 3 mL, wash with PBS, place filter paper on top. Add 500 μL serum to SPE cartridge, add 500 μL PBS to SPE cartridge, wash with 4 mL PBS, elute with 5 mL 1 M NaCl, inject a 100 μL aliquot of the eluate. (PBS was 8 g NaCl, 1.15 g Na_2HPO_4, 0.2 g KCl, and 0.2 g KH_2PO_4 in 1 L water, pH 7.2.)

HPLC VARIABLES

Column: 300 × 4 10 μm octadecylsilane
Mobile phase: MeCN:buffer 13:87 (Buffer was water adjusted to pH 2.8 with acetic acid, about 1.5 mL/min.)
Flow rate: 1.5

Injection volume: 100
Detector: UV 270

CHROMATOGRAM
Retention time: 7.8
Limit of quantitation: 1000 ng/mL

OTHER SUBSTANCES
Extracted: cephapirin
Noninterfering: amikacin, amphotericin B, azathioprine, carbenicillin, chloral hydrate, cimetidine, dopamine, fluphenazine, furosemide, hydrochlorothiazide, insulin, levothyroxine, methylprednisolone, nitroglycerin, oxacillin, prednisone, procainamide, sulfamethoxazole, tolazamide, tolbutamide, triamterene, trimethoprim
Interfering: cefotaxime

KEY WORDS
serum; SPE

SAMPLE
Matrix: blood, tissue
Sample preparation: Blood. Add 25 μL 25 μg/mL cephalothin to 500 μL serum, vortex, place sample in an ultrafree MC filter unit with a 10000 MW cutoff (Millipore), centrifuge at 16000 g for 30 min, inject a 180 μL aliquot of the filtrate. Tissue. Homogenize 100 mg tissue in 1 mL water using a Polytron homogenizer (Brinkman), add 25 μL 25 μg/mL cephalothin, vortex, centrifuge at 1000 g for 15 min, filter (Acrodisc CR PTFE 0.2 μm filter, prewet with water and MeOH) the supernatant, inject a 180 μL aliquot of the filtrate.

HPLC VARIABLES
Guard column: μBondapak C18 Guard-Pak
Column: 100 × 8 10 μm μBondapak C18
Mobile phase: MeCN:5 mM KH_2PO_4:glacial acetic acid 22:77.5:0.5
Flow rate: 2
Injection volume: 180
Detector: UV 235

CHROMATOGRAM
Retention time: 8.75 (serum), 8.55 (tissue)

Internal standard: cephalothin (13.55 (serum), 13.95 (tissue))
Limit of detection: 10 ng/mL (serum), 50 ng/mL (tissue)

KEY WORDS
cat; colon; serum

REFERENCE
Cox,S.K.; Burnette,J.D.; Huss,B.T.; Frazier,D. Determination of cefoxitin in serum and tissue, *J.Chromatogr.B*, **1998**, *705*, 145–148.

SAMPLE
Matrix: blood, tissue
Sample preparation: Homogenize 1 g tissue with 10 mL pH 6.0 100 mM phosphate buffer (Polytron homogenizer), centrifuge at 3000 g for 10 min. 0.5 mL Serum or tissue homogenate supernatant + 2 mL MeCN, vortex for 1 min, centrifuge at 3000 g for 5 min. Remove the supernatant and add it to 5 mL dichloromethane, vortex , centrifuge at 3000 g for 5 min, inject a 50 μL aliquot of the upper layer.

HPLC VARIABLES
Column: 300 mm long μBondapak C18
Mobile phase: MeCN:100 mM sodium phosphate 14:86, adjust pH to 6.0
Flow rate: 2
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 5.5

OTHER SUBSTANCES
Also analyzed: cefoperazone

KEY WORDS
serum

SAMPLE
Matrix: blood, urine
Sample preparation: Blood. Add 500 μL MeOH to 500 μL serum, vortex for 30 s, centrifuge at 10000 g for 15 min, inject a 50 μL aliquot of the supernatant. Urine. Add 4.5 mL 50 mM pH 6.0 potassium phosphate buffer to 500 μL urine, mix vigorously for 15 s, filter 1 mL of this solution (0.45 μm filter, Millex HA, Millipore), inject a 50 μL aliquot of the filtrate.

HPLC VARIABLES
Guard column: 30 × 4.6 5 μm Nucleosil-5 C18
Column: 150 × 4.6 5 μm Nucleosil-5 C18
Mobile phase: A MeCN:100 mM pH 6.0 potassium phosphate buffer 13:87; B MeCN:100 mM pH 6.0 potassium phosphate buffer 20:80 containing 0.1 mM hexadecyltrimethylammonium
Flow rate: 1
Injection volume: 50
Detector: UV 265

CHROMATOGRAM
Retention time: 8.5 (A), 8.0 (B)
Limit of quantitation: 200 ng/mL (serum), 2 μg/mL (urine)

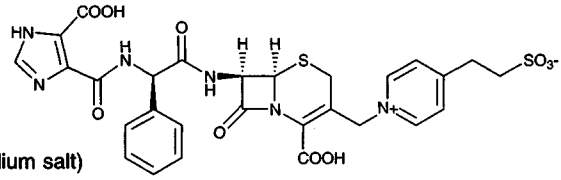
Cefpimizole



Molecular formula: $C_{28}H_{26}N_6O_{10}S_2$
Molecular weight: 670.68
CAS Registry No.: 84880-03-5, 85287-61-2 (sodium salt)
Merck Index: 1988
Lednicer No.: 4 185

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 1 mL Plasma + 1 mL buffer + 4 mL MeCN, mix, let stand at least 2 h at 4°, centrifuge, remove the supernatant, wash the precipitate with 2 mL MeCN:buffer 75:25, centrifuge. Combine the supernatants and add them to 200 μL dichloromethane, let stand at -20°. Remove the aqueous phase and add it to 50 μL 200 μg/mL acetophenone in MeOH, mix, filter (0.45 μm, Gelman Acrodisc-CR), store at 4°, inject an aliquot. Urine. 100 μL Urine + 4 mL 10 μg/mL acetophenone in mobile phase, mix, filter (0.45 μm, Gelman Acrodisc-CR), store at 4°, inject an aliquot. (Buffer was 10 mM EDTA and 50 mM tetrabutylammonium hydroxide, pH 5.0.)

HPLC VARIABLES

Guard column: 50 × 2.1 35 μm Co:Pell ODS
Column: 250 × 4.6 5 μm Supelcosil LC-18
Mobile phase: MeOH:buffer 140:260, pH adjusted to 6.0 with glacial acetic acid (Buffer was 40 mL 100 mM EDTA, 50 mL 400 mM tetrabutylammonium hydroxide, and 2510 mL water.)
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Retention time: 12
Internal standard: acetophenone (18)
Limit of detection: 50 ng/mL (plasma), 1000 ng/mL (urine)
Limit of quantitation: 330 ng/mL (plasma), 16800 ng/mL (urine)

KEY WORDS

plasma; pharmacokinetics

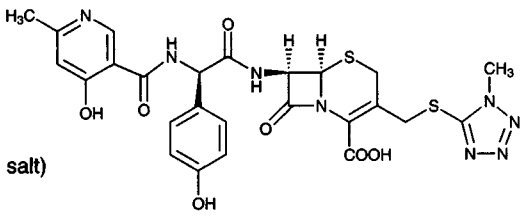
Cefpiramide



Molecular formula: $C_{25}H_{24}N_8O_7S_2$
Molecular weight: 612.65
CAS Registry No.: 70797-11-4, 74849-93-7 (sodium salt)
Merck Index: 1989
Lednicer No.: 4 188

SAMPLE

Matrix: bile, blood, duodenal fluid, tissue, urine
Sample preparation: Serum, bile, duodenal fluid. 500 μL Serum, bile or duodenal fluid + 500 μL MeCN, centrifuge. Remove the supernatant and add it to 3.5 mL dichloromethane, centrifuge, inject a 20 μL aliquot of the supernatant. Urine. Dilute urine 1:10 with MeOH, inject an aliquot. Tissue. Wash gallbladder wall with pH 7 phosphate buffer, dry, weigh, homogenize in 1 mL pH 7 phosphate buffer, filter, microfilter, inject an aliquot of the microfiltrate.

HPLC VARIABLES

Column: reverse phase
Mobile phase: MeCN:water:200 mM ammonium acetate 15:75:10, adjust pH to 5.0 with glacial acetic acid
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Limit of detection: 1000 ng/mL (urine), 500 ng/mL (bile), 50 ng/mL (serum, duodenal juice)

KEY WORDS

serum; gallbladder wall; pharmacokinetics

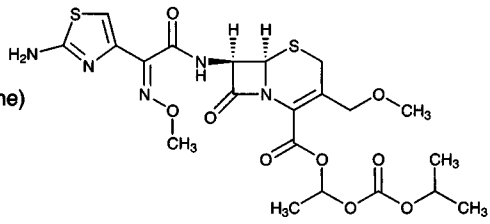
CAS Registry No.: 87239-81-4, 80210-62-4 (cefpodoxime)
Merck Index: 1991
Lednicer No.: 5 158



SAMPLE

Matrix: blood
Sample preparation: Condition a C8 SPE cartridge with 1 mL MeOH:DMF 90:10 and 1 mL 1% phosphoric acid, do not allow to go dry. 200 µL Plasma + 1 mL 1 µg/mL cefaclor in 1% phosphoric acid + 200 µL MeCN:1% phosphoric acid 1:99, add to the SPE cartridge, wash with 1 mL MeOH:1% phosphoric acid 5:95, wash with 500 µL 1% phosphoric acid, elute the contents of the SPE cartridge onto the analytical column with the mobile phase.

HPLC VARIABLES

Guard column: 12 × 4.6 7 µm Newguard C8
Column: 250 × 4.6 5 µm IB-SIL C18 (Phenomenex)
Mobile phase: MeCN:MeOH:50 mM pH 6.0 sodium acetate buffer 4:4:92 (After elution of IS inject 1 mL MeCN:water 90:10 to remove late eluting peaks.)
Flow rate: 2
Detector: UV 254

CHROMATOGRAM

Retention time: 10.8
Internal standard: cefaclor (17)
Limit of detection: 3 ng/mL
Limit of quantitation: 11 ng/mL

OTHER SUBSTANCES

Extracted: caffeine, cefotaxime
Noninterfering: acetaminophen, amikacin, ceftazidime, ceftriaxone, gentamicin, nafcillin, phenytoin, ticarcillin, tobramycin, vancomycin
Interfering: theophylline

KEY WORDS

SPE; plasma

REFERENCE

SAMPLE

Matrix: blood, ear fluid
Sample preparation: 50 µL Plasma or ear effusion + 50 µL 40 µg/mL cefuroxime in water + 2 mL MeCN, vortex briefly, centrifuge at 1500 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 75 µL mobile phase, inject a 25 µL aliquot.

HPLC VARIABLES

Guard column: 10 × 2.1 5 µm Hypersil C18
Column: 250 × 2.1 5 µm Hypersil C18

Mobile phase: MeCN:buffer 7.5:92.5 After elution of IS increase ratio to 50:50 to clean column. (Buffer was 25 mM acetate and 15 mM triethylamine adjusted to pH 4.3 with NaOH.)
Column temperature: 40
Flow rate: 0.35
Injection volume: 25
Detector: UV 254

CHROMATOGRAM
Retention time: 3.5
Internal standard: cefuroxime (5.9)
Limit of detection: 20 ng/mL

KEY WORDS
plasma; chinchilla; middle ear effusion; pharmacokinetics

REFERENCE
Lovdahl,M.J.; Reher,K.E.; Russlie,H.Q.; Canafax,D.M. Determination of cefpodoxime levels in chinchilla middle ear fluid and plasma by high-performance liquid chromatography, *J.Chromatogr.B*, **1994**, *653*, 227–232.

SAMPLE
Matrix: blood, sinus mucosa
Sample preparation: Plasma. Condition a 3 mL 500 mg Bond Elut C8 SPE cartridge with 3 mL MeOH and 2 mL 1% phosphoric acid. 500 μL Plasma + 1 mL 2 μg/mL cefaclor in 1% phosphoric acid, mix, add to the SPE cartridge, wash with 3 mL 1% perchloric acid, elute with 750 μL MeOH, inject a 50 μL aliquot of the eluate. Sinus mucosa. Condition a 1 mL Bond Elut C8 SPE cartridge with 1 mL MeOH and 1 mL 1% phosphoric acid. Chop sample with a scalpel, weigh out 20 mg and add it to 500 μL 10 mM pH 7.0 phosphate buffer, rotate at 4° for 12 h, centrifuge at 800 g for 10 min. 400 μL Supernatant + 1 mL 50 ng/mL cefaclor, mix, add to the SPE cartridge, wash with 1% perchloric acid, elute with 150 μL MeOH, inject a 75 μL aliquot of the eluate.

HPLC VARIABLES
Guard column: 20 × 4.6 5 μm C18 (Shandon)
Column: 250 × 4.6 5 μm Supelcosil LC 18
Mobile phase: MeOH:MeCN:50 mM pH 3.8 acetate buffer 10:3:87 (plasma) or 12:2:86 (sinus mucosa)
Flow rate: 1
Injection volume: 50-75
Detector: UV 235

CHROMATOGRAM
Retention time: 16.8
Internal standard: cefaclor (18.2)
Limit of detection: 10 ng/mL (plasma)
Limit of quantitation: 130 ng/g (sinus mucosa), 50 ng/mL (plasma)

KEY WORDS
plasma; SPE

REFERENCE

SAMPLE
Matrix: blood, tissue, urine

Sample preparation: Serum. 500 μL Serum + 500 μL MeCN, vortex, rotate at 20 rpm for 10 min, centrifuge at 1000 g for 10 min. Remove the supernatant and add it to 3.2 mL dichloromethane, rotate at 20 rpm for 10 min, centrifuge at 1000 g for 10 min, inject a 20 μL aliquot of the upper aqueous layer. Urine. Dilute urine 1:10 with water, inject an aliquot. Tissue. Grind frozen under liquid nitrogen, extract with 3 mL pH 7 phosphate buffer at 4° for 12 h, centrifuge, inject an aliquot of the supernatant.

HPLC VARIABLES

Column: 70 × 4.6 3 μm Ultrasphere XL-ODS
Mobile phase: MeCN:21.5 mM ammonium acetate 7:93, adjusted to pH 5 with glacial acetic acid
Flow rate: 2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 2.6
Limit of detection: 300 ng/mL (urine), 20 ng/mL (serum)

OTHER SUBSTANCES

Noninterfering: aminoglycosides, amoxicillin, ampicillin, aztreonam, carbamazepine, cefadroxil, cefixime, cefotaxime, cefpiramide, ceftazidime, digitoxin, furosemide, lidocaine, phenobarbital, quinidine, quinolones, salicylic acid, theophylline

KEY WORDS

serum; kidney

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 18.628 (peak 1), 18.945 (peak 2)

KEY WORDS
whole blood

SAMPLE
Matrix: urine
Sample preparation: Filter (0.45 μm) urine, inject a 50 μL aliquot onto column A and elute to waste with mobile phase A. After 10 min elute the contents of column A onto column B with mobile phase B, after 5 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. Wash column A with MeOH: water for 2 min then re-equilibrate column A with mobile phase A for 6 min.

HPLC VARIABLES
Column: A 30 × 4.6 5 μm C18 (Brownlee) (Condition a new column with 30 mL MeOH and 30 mL MeOH:water 50:50.); B 250 × 4.6 5 μm IB-SIL C18 (Phenomenex)
Mobile phase: A MeOH:0.2% pH 2.0 phosphoric acid 10:90; B MeCN:50 mM pH 5.2 sodium acetate buffer 7:93
Flow rate: 2
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 19
Limit of detection: 34 ng/mL
Limit of quantitation: 110 ng/mL

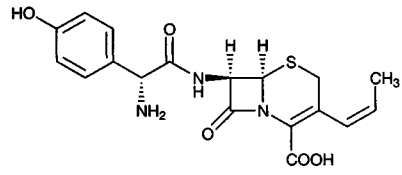
Cefprozil



Molecular formula: $C_{18}H_{19}N_3O_5S$
Molecular weight: 389.43
CAS Registry No.: 92665-29-7, 121123-17-9 (monohydrate)
Merck Index: 1992
Lednicer No.: 5 158

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 1 mL Plasma + 100 μL water + 50 μL 25 μg/mL cefprozil + 100 μL 1 M hydrochloric acid, vortex briefly. Filter (Centrifree micropartition unit) 1 mL mixture while centrifuging at 2000 g for 10 min. Inject a 25 μL aliquot of the ultrafiltrate. Urine. 250 μL urine + 500 μL 250 μg/mL cefprozil + 4.25 mL 10 mM pH 3.5 acetate buffer, vortex briefly. Inject a 10 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Nucleogil C18 (plasma) or 125 × 4.6 5 μm Lichrosorb C18 (urine)
Mobile phase: MeCN:10 mM phosphoric acid (adjusted to pH 3.8 with NaOH) 8:92 (plasma) or MeCN:10 mM phosphoric acid (adjusted to pH 3.8 with NaOH) 10:90 (urine)
Flow rate: 1.2 (plasma), 1.0 (urine)
Injection volume: 25
Detector: UV 260

CHROMATOGRAM

Retention time: 9.2 (plasma), 6.3 (urine)
Internal standard: cefprozil

OTHER SUBSTANCES

Extracted: cephalexin

KEY WORDS

plasma; cefprozil is IS

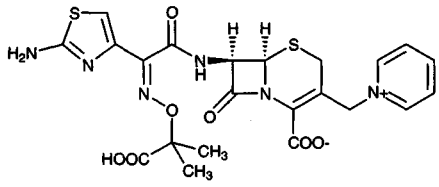
Ceftazidime



Molecular formula: $C_{22}H_{22}N_6O_7S_2$
Molecular weight: 546.58
CAS Registry No.: 72558-82-8, 78439-06-2 (pentahydrate)
Merck Index: 1995
Lednicer No.: 4 192

SAMPLE

Matrix: blood, CSF
Sample preparation: Deproteinize serum or CSF with MeCN, centrifuge, add the supernatant to dichloromethane, inject a 100 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: reversed-phase
Mobile phase: MeCN:100 mM pH 5.0 NaH_2PO_4 buffer 8:92 containing 5 mM pentanesulfonic acid
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Limit of quantitation: 94 ng/mL (serum), 67 ng/mL (CSF)

KEY WORDS

serum; pharmacokinetics

REFERENCE

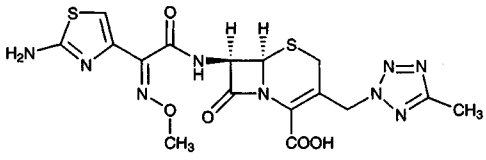
Cefteram



Molecular formula: $C_{16}H_{17}N_9O_5S_2$
Molecular weight: 479.50
CAS Registry No.: 82547-58-8
Merck Index: 1996

SAMPLE

Matrix: blood
Sample preparation: Condition a Bond Elut phenyl SPE cartridge with 3 mL MeOH and 3 mL buffer. 1 mL Plasma + 50 μL 500 μg/mL penicillin G (sodium salt) in MeOH + 2 mL buffer, vortex, add to SPE cartridge, wash with buffer, elute with 500 μL MeOH:10 mM pH 5.2 potassium phosphate buffer 90:10, inject a 25 μL aliquot. (Buffer was 121 g Trizma base in 1 L water, adjust pH to 7.0 with concentrated HCl. Dilute 1:100 to obtain the 10 mM buffer.)

HPLC VARIABLES

Column: 150 × 3.9 4 μm Nova-Pak phenyl
Mobile phase: MeOH:10 mM pH 5.2 potassium phosphate buffer 20:80 (Buffer was 1 M KH_2PO_4 adjusted to pH 5.2 with 5 M KOH, dilute 1:100 with water to give working buffer.)
Column temperature: 50
Flow rate: 0.9
Injection volume: 25
Detector: UV 225

CHROMATOGRAM

Retention time: 4.6
Internal standard: penicillin G (12)
Limit of quantitation: 59.8 ng/mL

KEY WORDS

plasma; SPE; method stated to be applicable to urine (no details)

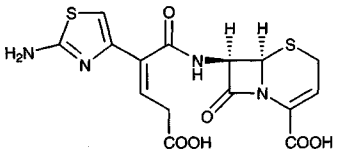
Ceftibuten



Molecular formula: $C_{15}H_{14}N_4O_6S_2$
Molecular weight: 410.43
CAS Registry No.: 97519-39-6
Merck Index: 1998
Lednicer No.: 5 160

SAMPLE

Matrix: blood
Sample preparation: Filter plasma (0.45 μm). Inject 50 μL plasma onto column A with mobile phase A, after 6 min the contents of column A were back-flushed onto column B with mobile phase B, after 3 min column A was removed from the circuit and column B was eluted with mobile phase B. Column A was washed with mobile phase C for 5 min then equilibrated with mobile phase A (1.5 mL/min) for 11 min until next injection.

HPLC VARIABLES

Column: A 35 × 4.6 20 μm TSK BSA-ODS; B 150 × 4.6 5 μm Nucleosil 5C18
Mobile phase: A MeOH:5 mM tetrabutylammonium bromide + 2 mM $(NH_4)H_2PO_4$, pH 5.0 1:50; B MeCN:MeOH:10 mM tetrabutylammonium bromide + 2 mM $(NH_4)H_2PO_4$, pH 5.0 6:3:25; C MeCN:5 mM tetrabutylammonium bromide + 10 mM $(NH_4)H_2PO_4$, pH 7.0 3:10
Flow rate: A 1.2; B 1; C 1.5
Injection volume: 50
Detector: UV 256

CHROMATOGRAM

Retention time: 22.9 (cis), 20.8 (trans)
Limit of detection: 100 ng/mL

KEY WORDS

plasma; column-switching

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: 50 μL Plasma + 50 μL 100 mM ammonium acetate, mix, inject a 100 μL aliquot of the supernatant onto column A with mobile phase A and elute to waste. After 4 min elute column A onto column B with mobile phase A, after 2 min elute column B with mobile phase B. At the end of each day change the guard column and wash column A with mobile phase B overnight.

HPLC VARIABLES

Column: A guard column (unspecified) + 150 × 3.9 μBondapak phenyl; B 300 × 4.6 μBondapak phenyl
Mobile phase: A 100 mM pH 6.5 ammonium acetate; B MeCN:100 mM pH 6.5 ammonium acetate 2:98
Flow rate: 1
Injection volume: 100
Detector: UV 263

CHROMATOGRAM

Retention time: 13 (cis only)

Limit of detection: 50 ng/mL
Limit of quantitation: 100 ng/mL

SAMPLE
Matrix: blood, dialysate, urine
Sample preparation: 100 μL Plasma, urine, or dialysate + 100 μL 200 mM pH 7 phosphate buffer + acyclovir, inject a 5 μL aliquot.

HPLC VARIABLES
Column: μBondapak C18
Mobile phase: MeCN:50 mM ammonium acetate 2:98
Flow rate: 1
Injection volume: 5
Detector: UV 254

CHROMATOGRAM
Internal standard: acyclovir
Limit of quantitation: 500 ng/mL (urine), 100 ng/mL (plasma)

KEY WORDS
plasma; pharmacokinetics; cis and trans isomers separated

REFERENCE

SAMPLE
Matrix: blood, ultrafiltrate
Sample preparation: Denature with EtOH (if necessary), inject a 15 μL aliquot.

HPLC VARIABLES
Column: 150 × 4 Nucleosil 10 C18
Mobile phase: MeCN:MeOH:PIC A 6:3:50 (PIC A is tetrabutylammonium phosphate (Waters).)
Flow rate: 1.2
Injection volume: 15
Detector: UV 256

CHROMATOGRAM
Retention time: 10.7 (cis), 12.3 (trans)
Limit of quantitation: 100 ng/mL

KEY WORDS
serum; isomerization

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 200 μL Plasma + 200 μL 200 mM pH 7.0 sodium phosphate, vortex, allow to sit for 15 min, add 20 μL 100 μg/mL acyclovir, add 800 μL MeCN, vortex for 20 s, centrifuge at 2500 g at 25° for 2 min. Remove the supernatant and add it to 1.6 mL dichloromethane, vortex for 20 s, centrifuge at 2500 g at 25° for 1 min, inject an aliquot of the organic layer. Urine. Dilute urine samples 10-20-fold with water, treat with Nonidet P-40 detergent, let stand for 5 min, inject an aliquot.

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeCN:50 mM ammonium acetate 2:98
Column temperature: 30
Flow rate: 1
Injection volume: 20
Detector: UV 262 (plasma), UV 254 (urine)

CHROMATOGRAM
Internal standard: acyclovir
Limit of quantitation: 500 ng/mL

KEY WORDS
plasma; pharmacokinetics

SAMPLE
Matrix: sputum
Sample preparation: Sputum + 200 μL 100 mM Ammonium acetate, vortex, centrifuge at 9000 g for 10 min, inject a 100 μL aliquot of the supernatant onto column A with mobile phase A and elute to waste. After 4 min elute column A onto column B with mobile phase A, after 2 min elute column B with mobile phase B. At the end of each day change the guard column and wash column A with mobile phase B overnight.

HPLC VARIABLES
Column: A guard column (unspecified) + 150 × 3.9 μBondapak phenyl; B 300 × 4.6 μBondapak phenyl
Mobile phase: A 100 mM ammonium acetate; B MeCN:100 mM ammonium acetate 2:98
Flow rate: 1
Injection volume: 100
Detector: MS, Vestec model 201 LC/MS, thermospray, T1 170°, probe tip 225°, block 312°, vapor 270°; monitor m/z 226

CHROMATOGRAM
Retention time: 8 (cis only, after start of elution with mobile phase B)
Limit of quantitation: 500 ng/mL

KEY WORDS
column-switching; LC-MS

SAMPLE
Matrix: urine
Sample preparation: Dilute 1 mL urine to 10 mL with pH 7.0 phosphate buffer, filter (0.45 μm). Inject 20 μL onto column A with mobile phase A, after 1.5 min the contents of column A were forward-flushed onto column B with mobile phase B, after another 2 min column A was removed from the circuit and column B was eluted with mobile phase B. Column A was washed with mobile phase A (1.5 mL/min) for at least 10 min until next injection.

HPLC VARIABLES
Column: A 50 × 4.6 5 μm Cosmosil 5C18; B 150 × 4.6 5 μm Nucleosil 5C18
Mobile phase: A MeOH:10 mM $(NH_4)H_2PO_4$, pH 5.0 1:10; B MeCN:MeOH:5 mM tetrabutylammonium bromide + 5 mM tetraamylammonium bromide + 8 mM $(NH_4)H_2PO_4$, pH 5.0 25:10:65
Flow rate: A 1; B 1
Injection volume: 20
Detector: UV 256

CHROMATOGRAM
Retention time: 20.0 (cis), 18.6 (trans)
Limit of detection: 1000 ng/mL

KEY WORDS
column-switching

SAMPLE
Matrix: urine
Sample preparation: Dilute urine 1/10 to 1/40 with water, inject a 50 μL aliquot onto column A with mobile phase A, after 5 min elute the contents of column A onto column B with mobile phase B, after 5 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. Re-equilibrate column A with mobile phase A for 2 min.

HPLC VARIABLES
Column: A 30 × 4.6 5 μm Spheri 5 amino; B 20 × 4.6 10 μm Spherisorb C8 + 250 × 4.6 5 μm Spherisorb ODS
Mobile phase: A 30 mM NaH_2PO_4; B MeCN:buffer 2.5:97.5 (Buffer was 17.9 g/L Na_2HPO_4 adjusted to pH 7 with 10% phosphoric acid.)
Column temperature: 50
Flow rate: A 0.6; B 1

Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 6 (cis), 7 (trans)
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES

Noninterfering: norfloxacin, pefloxacin, ofloxacin, amikacin, tobramycin, acyclovir

SAMPLE

Matrix: milk
Sample preparation: Condition a 6 mL 1 g Varian Mega Bond Elut C18 SPE cartridge with 5 mL MeOH and 10 mL 100 mM ammonium acetate. Dilute 2 g milk with 8 mL 100 mM ammonium acetate, shake by hand. Add to the SPE cartridge and apply vacuum to maintain flow rate at 1-2 drops/s. Rinse the tube twice with 5 mL portions of 100 mM ammonium acetate, add the rinses to the SPE cartridge, wash with 5 mL 100 mM ammonium acetate, dry the cartridge under vacuum. Elute quickly with 3 mL MeOH. Evaporate the eluate to ca. 1 mL under a stream of nitrogen. Dilute to 2 mL with 100 mM acetate buffer. Filter (0.2 μm) and inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μm Supelcosil LC-18-DB
Column: 250 × 4.6 5 μm Supelcosil LC-18-DB
Mobile phase: MeCN:100 mM pH 3.3 acetate buffer 80:20 (Prepare buffer as follows. Mix 463 mL 200 mM acetic acid with 37 mL 200 mM sodium acetate and make up to 1 L with water.)

Column temperature: 35
Flow rate: 1.0
Injection volume: 100
Detector: UV 293

CHROMATOGRAM
Retention time: 12.0
Limit of detection: 4 ppb
Limit of quantitation: 7 ppb

OTHER SUBSTANCES
Simultaneous: chloramphenicol, erythromycin, gentamycin, novobiocin, penicillins, spectinomycin, sulfonamides, tetracyclines

KEY WORDS
SPE; cow

SAMPLE
Matrix: milk
Sample preparation: Mix 10 mL milk with 2 mL 100 mM tetraethylammonium chloride, add 40 mL MeCN slowly with continual stirring, let stand for 10 min, decant the supernatant through a plug of glass wool. Collect 40 mL filtrate, add 2 mL buffer, evaporate to 1-2 mL under reduced pressure at 40-50°, dilute to 4 mL with water, filter (0.45 μm PVDF). Inject a 2 mL aliquot onto a 150 × 4.6 5 μm Supelcosil LC-18 column, elute with

MeCN:10 mM KH_2PO_4 0:100 for 3 min, to 60:40 over 37 min at 1 mL/min, collect a 1.5-2 mL aliquot containing the compound (ca. 24.5 min), evaporate to <1 mL under reduced pressure, make up to 1 mL with water, inject an aliquot. (Prepare the buffer by mixing 10 mM KH_2PO_4 and 10 mM Na_2HPO_4 in a 5:1 ratio, pH 6.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Supelcosil LC-18-DB
Mobile phase: MeCN:buffer 28:72 (Buffer was 3.3 mM phosphoric acid containing 6.7 mM potassium dihydrogen phosphate.)
Flow rate: 1
Injection volume: 200
Detector: UV 290

SAMPLE
Matrix: milk
Sample preparation: 10 mL Milk + 2 mL 200 mM tetraethylammonium chloride, stir, slowly add 38 mL MeCN over 30 s, let stand for 5 min, decant the supernatant through a plug of glass wool. 40 mL Filtrate + 1 mL water, evaporate under reduced pressure to 1-2 mL, make up to 4 mL with water, filter (0.45 μm polyvinylidene difluoride). Inject 2 mL into an LC system (150 × 4.6 5 μm Supelcosil LC-18; MeCN:10 mM KH_2PO_4 0:100 for 3 min, to 40:60 over 27 min, to 0:100 over 1 min; 1 mL/min; UV 210 and 295), collect a 1.5 mL fraction at retention time for ceftiofur (23 min), evaporate to 1 mL, inject a 200 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Supelcosil LC-18-DB
Mobile phase: MeCN:buffer 29:71 (Buffer was 3.3 mM phosphoric acid and 6.7 mM KH_2PO_4.)
Flow rate: 1
Injection volume: 200
Detector: UV 295

CHROMATOGRAM
Limit of quantitation: 2-5 ppb

OTHER SUBSTANCES
Also analyzed: ampicillin, amoxicillin, cephapirin, penicillin G, penicillin V, cloxacillin

SAMPLE

Matrix: tissue

Sample preparation: Condition a 6 mL 1 g Mega Bond Elut C18 SPE cartridge with 4 mL MeOH and 5 mL phosphate buffer. Condition a 10 mL 500 mg Bond Elut LRC SAX SPE cartridge with 2 mL MeOH, 2 mL MeOH:100 mM NaCl 25:75, and two 1 mL portions of water. Condition a 10 mL 100 mg Bond Elut LRC SCX SPE cartridge with 1 mL MeOH, 2 mL MeOH:100 mM calcium chloride 25:75, and two 1 mL portions of water. Fat. Homogenize (Waring blender) 10 g fat, 20 mL 0.4% dithioerythritol in borate buffer, and 20 mL hexane at medium speed for 5 min, centrifuge at 3000 g for 10 min. Remove a 2 mL aliquot of the aqueous (bottom) layer and add it to 13 mL 0.4% dithioerythritol in borate buffer, shake at 50° for 15 min, add 3 mL 14% iodoacetamide in phosphate buffer, mix well, let stand at room temperature, adjust pH to 2.5-2.6 with 5% phosphoric acid, centrifuge at 4° at 48000 g for 20 min, add the supernatant to the C18 SPE cartridge, wash with 5 mL phosphate buffer, wash with 3 mL 10 mM NaOH, elute with 3 mL MeCN:water 15:85. Add the eluate to 15 mL water, add this mixture to the SAX SPE cartridge, wash with 1 mL water, elute with 2.5 mL MeCN:5% acetic acid 5:95, inject a 500 μL aliquot of the eluate. Muscle, liver kidney. Homogenize (Waring blender) 10 g tissue and 140 mL 0.4% dithioerythritol in borate buffer at medium speed for 5 min, centrifuge at 3000 g for 10 min. Remove a 15 mL aliquot of the homogenate and shake it at 50° for 15 min, add 3 mL 14% iodoacetamide in phosphate buffer, mix well, let stand at room temperature, adjust pH to 2.5-2.6 with 5% phosphoric acid, centrifuge at 4° at 48000 g for 20 min, add the supernatant to the C18 SPE cartridge, wash with 5 mL phosphate buffer, wash with 3 mL 10 mM NaOH, elute with 3 mL MeCN:water 15:85. Add the eluate to 15 mL water, add this mixture to the SAX SPE cartridge, wash with 1 mL water, elute with 2.5 mL MeCN:5% acetic acid 5:95. Add the eluate to 10 mL water, mix well, add the mixture to the SCX SPE cartridge, wash with 1 mL water, elute with 2.5 mL MeCN:100 mM NaCl 5:95 (muscle, kidney) or 2 mL MeCN:100 mM NaCl 10:90 (liver), inject a 500 μL aliquot of the eluate. (Borate buffer was 19 g sodium borate and 3.7 g KCl in 1 L water, pH 9. Phosphate buffer was 3.4 g KH_2PO_4 in 700 mL water, pH adjusted to 7 with KOH, made up to 1 L with water.)

HPLC VARIABLES

Guard column: BDS Hypersil C18
Column: 250 × 4.6 BDS Hypersil C18
Mobile phase: Gradient. A was 0.1% trifluoroacetic acid in water. B was 0.1% trifluoroacetic acid in MeCN. A:B from 100:0 to 65:35 over 35 min, wash with 50:50 at 1.5 mL/min for 15 min, re-equilibrate for 20 min (muscle, kidney) or A:B 85:15 for 5 min, to 75:25 over 5 min, wash with 50:50 at 1.5 mL/min for 15 min, re-equilibrate for 20 min (liver, fat).
Flow rate: 1
Injection volume: 500
Detector: UV 266

CHROMATOGRAM

Retention time: 7 (liver, fat), 26 (muscle, kidney)
Limit of detection: 10-30 ng/g
Limit of quantitation: 100 ng/g

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL Bond-Elut C18 SPE cartridge with 2 mL MeOH and 2 mL 8.5% phosphoric acid. Condition an NH2 SPE cartridge with 1 mL hexane. 500 μL Plasma + 25 μL 8.5% phosphoric acid + 250 μL 1 mg/mL coumarin-3-carboxylic acid in water, add to the C18 SPE cartridge, wash with 500 μL water, wash with 1 mL 8.5% phosphoric acid, wash with 5% MeOH:8.5% phosphoric acid 20:1, elute with 1 mL MeOH: 8.5% phosphoric acid 60:40 into the NH2 SPE cartridge. Wash the NH2 SPE cartridge with 1 mL hexane, wash with 1 mL MeCN, elute with 1 mL water:10% ammonium sulfate 95:5, inject a 20 μL aliquot of the eluate.

HPLC VARIABLES
Column: 250 × 4.6 C18
Mobile phase: Water:2 mM tetramethylammonium hydroxide in MeOH:acetic acid 60:40: 0.5
Flow rate: 0.8
Injection volume: 20
Detector: UV 262

CHROMATOGRAM
Retention time: 5
Internal standard: coumarin-3-carboxylic acid (13)

OTHER SUBSTANCES
Extracted: cefazolin, cefaclor, cephalexin

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL 50 mg Bond Elut 40 μm cyanopropylsilica SPE cartridge with 1 mL MeOH at 6 mL/min and with 1 mL pH 7.4 buffer at 6 mL/min. Centrifuge plasma, add 1 mL plasma at 0.18 mL/min to the SPE cartridge, wash with 1 mL pH 7.4 buffer at 1.5 mL/min, elute with 250 μL MeOH:2-aminoheptane 99.8:0.2 at 1.5 mL/min, pass 750 μL pH 3.0 buffer through the cartridge at 1.5 mL/min. Mix both eluates, inject a 250 μL aliquot. (pH 7.4 Buffer was 250 mL 100 mM KH_2PO_4 and 195.5 mL 100 mM NaOH, made up to 1 L, if necessary pH adjusted to 7.4. pH 3.0 Buffer was 4 g NaOH in 700 mL water, pH adjusted to 3.0 with 85% phosphoric acid, made up to 1 L with water.)

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChrospher 100 RP-18
Column: 250 × 4 4 μm Superspher 100 RP-18 (Merck)
Mobile phase: MeCN:buffer 25:75 containing 0.5% 2-aminoheptane (Buffer was 4 g NaOH in 700 mL water, pH adjusted to 3.0 with 85% phosphoric acid, made up to 1 L with water.)
Column temperature: 37
Flow rate: 1.2
Injection volume: 250
Detector: F ex 350 em 480

KEY WORDS

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 40 μL 20 μg/mL deacetyldiltiazem in water + 1 mL pH 10 borate buffer + 0.5 g NaCl, vortex for 30 s, add 6 mL hexane:isopropanol 95:5, vortex for 30 s, shake for 10 min, centrifuge at 700 g for 10 min. Remove the organic layer and add it to 200 μL 5 mM sulfuric acid, vortex for 30 s, shake for 10 min, centrifuge at 700 g for 5 min, inject a 40 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18

Mobile phase: MeCN:MeOH:buffer 22.5:22.5:55 (Buffer was 7.5 g sodium acetate trihydrate + 0.6 g 1-heptanesulfonic acid in 1 L water, adjust pH to 4.5 with acetic acid.)
Flow rate: 1.5
Injection volume: 40
Detector: UV 237

CHROMATOGRAM

Retention time: 3.2
Internal standard: deacetyldiltiazem (7)
Limit of detection: 4 ng/mL

OTHER SUBSTANCES

Simultaneous: verapamil, propranolol, diltiazem, desipramine
Noninterfering: atenolol, aspirin, caffeine, ibuprofen, lidocaine, metoprolol, nifedipine

KEY WORDS

plasma

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 233

CHROMATOGRAM

Retention time: 4.36
Limit of detection: <120 ng/mL

KEY WORDS

SAMPLE

Matrix: blood, urine

Sample preparation: 1 mL Plasma or urine + 0.1 (plasma) or 1 (urine) mL 1 μg/mL (R)-(+)-propranolol in buffer + 5 mL dichloromethane:isopropanol 95:5, shake for 15 min, centrifuge at 10° at 2500 g for 20 min. Remove 4 mL of the organic layer, add 4 mL dichloromethane:isopropanol 95:5 to the aqueous layer, shake for 15 min, centrifuge at 10° at 2500 g for 20 min. Combine the organic layers and evaporate them to dryness in a vacuum centrifuge at 30°, reconstitute the residue in 250 μL mobile phase. (Buffer was 3.092 g boric acid, 3.728 g KCl, and 1.756 g NaOH in 1 L water, pH 10.0.)

HPLC VARIABLES

Guard column: 50 × 4.6 10 μm Chiralcel OD
Column: 250 × 4.6 10 μm Chiralcel OD
Mobile phase: n-Hexane:isopropanol:diethylamine 85:20:0.1
Flow rate: 1
Injection volume: 100
Detector: F ex 350 em 480 (celiprolol) or ex 295 em 345 (propranolol)

CHROMATOGRAM

Retention time: 12.7 (S)-(-), 17.0 (R)-(+)
Internal standard: (R)-(+)-propranolol (9.5)
Limit of detection: 2.5 ng/mL (urine), 1.5 ng/mL (plasma)

OTHER SUBSTANCES

Noninterfering: metabolites, acebutolol, amiloride, atenolol, captopril, carteolol, clonidine, dihydralazine, furosemide, hydrochlorothiazide, labetalol, α-methyldopa, metoprolol, nifedipine, oxprenolol, penbutolol, pindolol, reserpine, triamterene, verapamil

KEY WORDS

SAMPLE
Matrix: milk, tissue
Sample preparation: Milk. Mix 10 mL milk with 2 mL 100 mM tetraethylammonium chloride, add 40 mL MeCN slowly with continual stirring, let stand for 10 min, decant the supernatant through a plug of glass wool. Collect 40 mL filtrate, add 2 mL buffer, evaporate to 1-2 mL under reduced pressure at 40-50°, dilute to 4 mL with water, filter (0.45 μm PVDF). Inject a 2 mL aliquot onto a 150 × 4.6 5 μm Supelcosil LC-18 column, elute with MeCN:10 mM KH_2PO_4 0:100 for 3 min, to 60:40 over 37 min at 1 mL/min, collect a 1.5-2 mL aliquot containing the compound (ca. 18.5 min), evaporate to <1 mL under reduced pressure, make up to 1 mL with water, inject an aliquot. Tissue. Blend 5

g tissue, 5 mL water, 2 mL 100 mM tetraethylammonium chloride (for liver and kidney 1 mL 200 mM tetraethylammonium chloride and 1 mL 5 mM KH_2PO_4), and 40 mL MeCN at half power for 1 min, let stand for 10 min, decant the supernatant through a plug of glass wool. Collect 40 mL filtrate (20 mL for liver and kidney), add 2 mL buffer, add 5 mL water, add 5 mL t-butanol, evaporate to 1-2 mL under reduced pressure at 40-50°, dilute to 4 mL with water, filter (0.45 μm PVDF). Proceed as above. (Prepare the buffer by mixing 10 mM KH_2PO_4 and 10 mM Na_2HPO_4 in a 5:1 ratio, pH 6.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Supelcosil LC-18
Mobile phase: MeCN:buffer A 35:65 (milk) or MeCN:buffer B 33:67 (tissue) (Buffer A was 10 mM phosphoric acid containing 5 mM potassium dihydrogen phosphate and 5 mM sodium dodecyl sulfate. Buffer B was 6.7 mM phosphoric acid containing 3.3 mM potassium dihydrogen phosphate and 2.5 mM sodium dodecyl sulfate.)

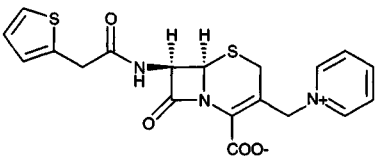
Cephaloridine



Molecular formula: $C_{19}H_{17}N_3O_4S_2$
Molecular weight: 415.49
CAS Registry No.: 50-59-9
Merck Index: 2025
Lednicer No.: 1 417

SAMPLE

Matrix: blood
Sample preparation: Dilute serum with an equal volume of water, inject a 20 μL aliquot onto column A, elute column A to waste with MeOH:10 mM pH 7.0 phosphate buffer 5:95 at 0.3 mL/min, after 1.3 min elute the contents of column A onto column B with mobile phase A or B, elute with mobile phase A or B, monitor the effluent from column B.

HPLC VARIABLES

Column: A 50 × 2.1 40 μm Supelclean LC-NH_2; B 150 × 4.6 3 μm Supelcosil LC-18
Mobile phase: A MeCN:MeOH:10 mM pH 7.0 phosphate buffer 15:20:65 containing 5 mM tetrabutylammonium hydrogen sulfate; B MeOH:10 mM pH 7.0 phosphate buffer 30:70 containing 5 mM tetrabutylammonium hydrogen sulfate
Flow rate: 1
Injection volume: 20
Detector: UV 252

CHROMATOGRAM

Retention time: 4.0 (mobile phase A), 4.7 (mobile phase B)
Limit of detection: 500-2000 ng/mL

OTHER SUBSTANCES

Extracted: cefamandole, cefazolin, cefodizime, cefoperazone, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, cephalothin
Noninterfering: acetaminophen, acyclovir, digoxin, fluconazole, ranitidine, teicoplanin, theophylline, vancomycin

KEY WORDS

column-switching; serum

Bompadre,S.; Ferrante,L.; Leone,L. On-line solid-phase extraction of cephalosporins, *J.Chromatogr.A*, **1998**, *812*, 191–196.

SAMPLE

Matrix: blood
Sample preparation: 300 μL Plasma + 300 μL IS in ice-cold MeOH:100 mM pH 5.2 sodium acetate 70:30, vortex for 30 s, let stand at -20° for 10 min, centrifuge at 1500 g for 10 min, inject a 10 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 10 μm C18
Column: 300 × 4 10 μm μBondapak C18
Mobile phase: MeCN:MeOH:100 mM sodium acetate 11.52:0.48:88, pH 5.2
Flow rate: 2.5
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 5
Internal standard: cefoperazone (7.5)
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Extracted: cefotaxime
Interfering: cefoxitin, cephalexin

KEY WORDS
plasma

REFERENCE
Signs,S.A.; File,T.M.; Tan,J.S. High-pressure liquid chromatographic method for analysis of cephalosporins, *Antimicrob.Agents Chemother.*, **1984**, *26*, 652–655.

SAMPLE
Matrix: blood
Sample preparation: Mix 100 μL plasma + 300 μL 5 μg/mL cefotaxime in pH 3.5 10 mM acetate buffer and keep at 4°. Inject 100 μL onto column A with mobile phase A. After 5 min backflush column A with mobile phase B onto column B for 3 min. Re-equilibrate column A with mobile phase A for 16 min.

HPLC VARIABLES
Column: A 40 × 2 37-50 μm Corasil RP C18; B 20 × 4 25-40 μm Lichrosorb RP-8 + 250 × 4 Partisil ODS-3
Mobile phase: A 10 mM pH 3.5 acetate buffer; B MeCN:20 mM pH 4.3 acetate buffer 15:85
Flow rate: 1
Injection volume: 100
Detector: UV 254

CHROMATOGRAM
Retention time: 10.3
Internal standard: cefotaxime
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Simultaneous: cephalexin, cefoxitin, cefuroxime
Noninterfering: cefotiam, cefadroxil, cefazolin, cefoperazone, cephalothin, cefamandole, aspirin, diclofenac, alclofenac, lonazolac, piroxicam, ibuprofen, indomethacin, ketoprofen, naproxen, phenylbutazone, mefenamic acid, caffeine

SAMPLE
Matrix: blood, CSF, gastric contents, urine
Sample preparation: 200 μL Serum, urine, CSF, or gastric fluid + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine HCl and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 40 μm preparative grade C18 (Analytichem); B 75 × 2.1 pellicular C18 (Whatman) + 250 × 4.6 5 μm C8 end-capped (Whatman)
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 20 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 220

CHROMATOGRAM

Retention time: 9 (broad peak)
Internal standard: heptanophenone (19)

OTHER SUBSTANCES

Extracted: acetaminophen, allobarbital, azinphos, barbital, brallobarbitone, bromazepam, butethal, caffeine, carbamazepine, carbaryl, chloramphenicol, chlordiazepoxide, chlorothiazide, chlorvinphos, clothiapine, cocaine, coomassie blue, desipramine, diazepam, diphenhydramine, dipipanone, ethylbromphos, flufenamic acid, formothion, griseofulvin, indomethacin, lidocaine, lorazepam, malathion, medazepam, midazolam, oxazepam, paraoxon, penicillin G, pentobarbital, prazepam, propoxyphene, prothiophos, quinine, salicylic acid, secobarbital, strychnine, sulfamethoxazole, theophylline, thiopental, thioridazine, trimethoprim

SAMPLE
Matrix: solutions
Sample preparation: React the antibiotic, triethylamine, and 1-(2,5-dihydroxyphenyl)-2-bromoethanone in a 1:2:4 molar ratio in DMF at 45° for 2 h (use dibenzo-18-crown-6 to make the sodium salt soluble), inject a 10 μL aliquot. (Preparation of 1-(2,5-dihydroxyphenyl)-2-bromoethanone is as follows. Stir 27.6 g 1,4-dimethoxybenzene and 28 mL bromoacetyl bromide at 0°, add 53.4 g aluminum bromide over 10 min (an exothermic reactions ensues), let stand at room temperature for 12 h, add 100 mL 48% HBr, add 100

g ice, stir for 1 h, extract twice with 200 mL portions of diethyl ether. Combine the extracts and wash them 3 times with 200 mL portions of water, dry over 40 g anhydrous magnesium sulfate, evaporate to dryness, recrystallize the product 3 times from EtOH to yield 1-(2,5-dihydroxyphenyl)-2- bromoethanone monobromoacetate (mp 105-107°). Dissolve 11 g 1-(2,5-dihydroxyphenyl)-2-bromoethanone monobromoacetate in 200 mL warm dry MeOH saturated with HBr, stir for 18 h, add 200 mL water, cool to -10°. Collect the yellow solid and dry it under vacuum at 50° for 48 h, recrystallize from toluene:heptane 50:50 then toluene to obtain 1-(2,5-dihydroxyphenyl)-2-bromoethanone as yellow needles (mp 117-119°).)

HPLC VARIABLES

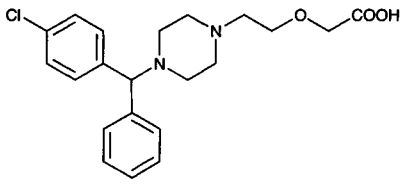
Cetirizine



Molecular formula: $C_{21}H_{25}ClN_2O_3$
Molecular weight: 388.89
CAS Registry No.: 83881-51-0, 83881-52-1 (di HCl)
Merck Index: 2063
Lednicer No.: 4 118

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 50 μL 3 μg/mL IS + 1 mL 1 M pH 5.0 sodium citrate buffer + 3 mL ethyl acetate, vortex 1 min, centrifuge at 4000 rpm for 15 min, remove organic layer, repeat extraction. Combine organic layers and add 200 μL 1.7% phosphoric acid, vortex 1 min, centrifuge 5 min, remove and discard ethyl acetate layer, remove traces of ethyl acetate from aqueous layer using a stream of nitrogen, inject.

HPLC VARIABLES

Column: radial 4 μm NovoPak C18 radial compression
Mobile phase: MeCN:buffer 46:54 (Buffer was 10 mM pH 2.9 KH_2PO_4 + 20 mM sodium 1-decanesulfonate.)
Flow rate: 1.4
Detector: UV 229

CHROMATOGRAM

Retention time: 5.0
Internal standard: P-265, an ethoxy derivative of cetirizine (6.8)
Limit of detection: 2 ng/mL

SAMPLE

Matrix: bile, blood, feces, gastric contents, tissue

Sample preparation: Condition a Sep-Pak C18 cartridge with 2 mL 720 mM MeOH in water and 6 mL 100 mM pH 7.0 potassium phosphate buffer. Serum. 200 μL Serum + 1 mL MeCN, mix, sonicate for 10 min, centrifuge at 17000 g for 15 min. Remove a 600 μL aliquot of the supernatant and evaporate it to dryness under a stream of nitrogen at 75°, reconstitute with 5 mL 100 mM pH 7.0 potassium phosphate buffer. Add to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot. Liver. Homogenize (glass homogenizer) liver in 1 mL 720 mM EtOH in water, add 2 mL 720 mM EtOH in water, heat at 75° for 15 min, centrifuge at 17000 g for 10 min, remove the supernatant, extract the residue twice more. Combine the supernatants and evaporate them to dryness at 75°, reconstitute with 5 mL 100 mM pH 7.0 potassium phosphate buffer. Add to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot. Bile. Dilute 20 μL bile with 10 mL 100 mM pH 7.0 potassium phosphate buffer. Add 1 mL to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot. Gastric juice. Dilute 1 mL gastric juice with 9 mL 100 mM pH 7.0 potassium phosphate buffer, sonicate for 10 min. Add 1 mL to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot. Feces. Dilute 1 g feces with 9 mL MeOH, mix thoroughly, sonicate for 10 min, centrifuge at 17000 g for 10 min. Remove a 1 mL aliquot of the supernatant and evaporate it to dryness, reconstitute with 5 mL 100 mM pH 7.0 potassium phosphate buffer. Add to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere I.P. C18

Mobile phase: Gradient. A was MeCN:MeOH:water 100:50:75. B was MeCN:MeOH 100:50. A:B 100:0 for 7 min, to 70:30 over 0.5 min, maintain at 70:30 for 5 min, to 50:50 over 0.5 min, maintain at 50:50 over 7 min, to 25:75 over 1 min, maintain at 25:75 for 7 min.

Column temperature: 35

Flow rate: 1.7

Injection volume: 100
Detector: F

CHROMATOGRAM
Retention time: 21.3
Internal standard: lauric acid (24.5)
Limit of detection: 0.5 pmole

OTHER SUBSTANCES
Extracted: cholic acid, deoxycholic acid, glycinechenodeoxycholic acid, glycinecholic acid, glycinedeoxycholic acid, glycinelithocholic acid, glycineursodeoxycholic acid, lithocholic acid, ursodiol (ursodeoxycholic acid)

KEY WORDS

SAMPLE
Matrix: bile, formulations

Sample preparation: Bile. Condition a 200 mg Bond Elut C18 SPE cartridge with 5 mL MeOH and 5 mL water. Condition a 500 mg Bond Elut SAX SPE cartridge with 5 mL MeOH, 5 mL water, and 5 mL MeOH. 50 μL Bile + 5 mL 50 mM pH 7.5 phosphate buffer, vortex, add to the C18 SPE cartridge, wash with 5 mL MeOH:40 mM pH 4.3 acetate buffer 40:60, wash with 10 mL water, elute with 2 mL MeOH. Add the eluate to the SAX SPE cartridge, elute with 3.5 mL MeOH, collect all the effluent from the cartridge (J. Pharm. Biomed. Anal. 1990, 8, 235). Evaporate to dryness under a stream of nitrogen, reconstitute with 2 mL MeOH, sonicate at 40° for 3 min, filter (0.2 μm). Add a 500 μL aliquot of the filtrate to 50 μL 0.01% KOH in MeOH, evaporate to dryness, reconstitute with 200 μL MeOH:water 10:90, sonicate at 40° for 3 min, add 300 μL 20 mM tetrahexylammonium bromide in 100 mM pH 7.0 phosphate buffer, add 50 μL 2.1 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, sonicate at 40° for 10 min, add 50 μL 43.6 μg/mL IS in MeOH:water 75:25, add 300 μL MeCN, sonicate at room temperature for 1 min, inject a 50 μL aliquot. Formulations. Powder capsule contents, weigh out amount containing about 25 mg compound, add 100 mL MeOH (water for bile acid salts), stir for 10 min, filter, dilute the filtrate 10-fold with water (or MeOH:water 10:90 for bile acid salts). Evaporate 50 μL 0.01% KOH in MeOH in to a tube, add a 200 μL aliquot of the diluted filtrate, add 300 μL 20 mM tetrahexylammonium bromide in 100 mM pH 7.0 phosphate buffer, add 50 μL 2.1 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, sonicate at 40° for 10 min, add 50 μL 43.6 μg/mL IS in MeOH:water 75:25, add 300 μL MeCN, sonicate at room temperature for 1 min, inject a 50 μL aliquot. (Prepare 2-bromoacetyl-6-methoxynaphthalene by stirring equimolar amounts of 2-acetyl-6-methoxynaphthalene (Janssen Chimica, Belgium) and phenyltrimethylammonium tribromide in THF at room temperature for 3 h (Phosphorus and Sulfur 1985, 25, 357), purify by column chromatography on silica gel with chloroform:petroleum ether 50:50 (mp 109-112°) (Chromatographia 1992, 33, 13).)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Hypersil RP-18

Mobile phase: Gradient. For bile use MeCN:water 60:40 for 10 min, to 80:20 over 10 min, maintain at 80:20 for 25 min, return to initial conditions over 5 min. For formulations use isocratic MeCN:water 78:22.

Flow rate: 1

Injection volume: 50

Detector: F ex 300 em 460

CHROMATOGRAM

Retention time: 26.5 (gradient), 12 (isocratic)

Internal standard: 6-methoxynaphthacyl ester of valproic acid (23 (gradient), 10.5 (isocratic))

Limit of detection: 1-2 pmole

OTHER SUBSTANCES

Extracted: cholic acid, deoxycholic acid, glycochenodeoxycholic acid, glycocholic acid, glycolithocholic acid, glycoursodeoxycholic acid, lithocholic acid, ursodiol

SAMPLE

Matrix: blood

Sample preparation: Condition a BondElut SPE cartridge with 5 mL EtOH and 5 mL water. 100 μL Serum + 250 ng deoxycholic acid 12-propionate + 1 mL 500 mM pH 7.0 phosphate buffer, mix, add to the SPE cartridge, wash with 2 mL water, wash with 1 mL 1.5% EtOH, elute with 2 mL 90% EtOH. Evaporate a 400 μL aliquot of the eluate, add 100 μL 2 mg/mL 1-anthroyl nitrile in MeCN, add 0.16% quinuclidine in MeCN, heat at 60° for 20 min, add 50 μL MeOH, evaporate under nitrogen. Dissolve the residue in 1 mL 90% EtOH, add to a 18 × 6 100 mg column of PHP-LH-20 Sephadex at 0.2 mL/min, wash with 1 mL 90% EtOH, elute with 5 mL 100 mM acetic acid in 90% EtOH (free bile acids), elute with 5 mL 200 mM formic acid in 90% EtOH (glycine-conjugated bile acids), elute with 5 mL 300 mM pH 6.3 acetic acid-potassium acetate in 90% EtOH (taurine-conjugated bile acids). Evaporate each fraction, dissolve the residue in 100-200 μL MeOH, inject a 5-10 μL aliquot. (Preparation of PHP-LH-20 Sephadex is as follows. Suspend 75.7 g Sephadex LH-20 in 200 mL dichloromethane using a glass stirring rod (not a magnetic stirrer) for 30 min, add 19 mL boron trifluoride ethyl etherate, after 15 min add 50 mL 35% epichlorohydrin in dichloromethane at 1-2 mL/min (Caution! Epichlorohydrin is a carcinogen!), stir for another 30 min, filter, wash with EtOH, dry chlorohydroxypropyl Sephadex LH-20 at 50° (J.Chromatogr. 1971, 59, 45). Stir 27.2 g chlorohydroxypropyl Sephadex LH-20 in 100.5 mL piperidine at room temperature for 30 min, add 5.74 g KOH in 302 mL MeOH, heat at 50-60° for 3 h with occasional shaking, filter, wash with EtOH:water 50:50, wash with 200 mM acetic acid in EtOH:water 70:30, wash with EtOH:water 90:10 until washings become neutral, store in EtOH:water 90:10 (Clin. Chim. Acta 1978 87 141). Prepare 1-anthroyl nitrile as follows. Dissolve 50 g benzanthrone in 500 mL concentrated sulfuric acid with gentle warming, pour this solution cautiously into 4 L hot water with vigorous stirring. Boil the suspension and slowly add 200 g chromium(VI) oxide (Caution! Chromium oxide is a carcinogen and highly corrosive!), after 6 h cool the mixture, filter, wash the precipitate with hot water. Dissolve the precipitate in dilute ammonia and precipitate with acid, crystallize from boiling concentrated nitric acid to give anthraquinone-1-carboxylic acid (Ber. 1924, 57, 1775). Warm, on a water bath, anthraquinone-1-carboxylic acid in dilute ammonia with twice the amount of zinc dust, when the reaction has ceased (30 min ?) filter the reaction the reaction mixture, add HCl to the filtrate to obtain anthracene-1-carboxylic acid as yellow needles, recrystallize from EtOH (mp 245°) (Ber 1897, 30, 1118). Stir 1 g anthracene-1-carboxylic acid in 15 mL anhydrous dichloromethane, add 2 mL oxalyl chloride, reflux for 1 h, evaporate to give 1-anthroyl chloride as an oily residue. Dissolve 1-anthroyl chloride in 15 mL dichloromethane, add 3 mL trimethylsilyl cyanide, add 1 mg zinc iodide, stir at room temperature for 2 h, evaporate to dryness, recrystallize from hexane/dichloromethane to give 1-anthroyl nitrile as orange-yellow needles (mp 164-5°) (Anal.Chim.Acta 1983, 147, 397).)

HPLC VARIABLES

Korte,W.D. 9-(Chloromethyl)anthracene: a useful derivatizing reagent for enhanced ultraviolet and fluorescence detection of carboxylic acids with liquid chromatography, *J.Chromatogr.*, **1982**, *243*, 153–157.

SAMPLE
Matrix: solutions
Sample preparation: Mix a 100 μL aliquot of a 1-100 μM solution in 20 mM pH 7.1 phosphate buffer with 10 μL 10 mM tetrabutylammonium hydrogen sulfate in water and 100 μL 1 mM N-(9-acridinyl)bromoacetamide in chloroform, stir at 90° for 20-30 min, cool. Remove a 10 μL aliquot of the organic layer and evaporate it to dryness under reduced pressure, reconstitute with mobile phase, sonicate, inject an aliquot. (Synthesis of N-(9-acridinyl)bromoacetamide is as follows. Dissolve 2.49 g 9-aminoacridine hydrochloride

hydrate in water, add dilute NaOH to precipitate the free base, extract with ethyl acetate, dry over anhydrous magnesium sulfate, filter, evaporate to give 9-aminoacridine as yellow needle-shaped crystals (mp 239-240°). Add 1.01 g bromoacetyl bromide in 20 mL diethyl ether dropwise with stirring to 970 mg 9-aminoacridine dissolved in 50 mL acetone containing 1.02 g triethylamine, filter, wash the solid with acetone. Evaporate the filtrate and chromatograph the residue on a 260 × 30 glass column of 70-230 mesh silica gel 60 (Merck) with chloroform:ethyl acetate 2:1. Collect the strong yellow band and evaporate it to dryness, recrystallize from MeOH to give N-(9-acridinyl)bromoacetamide as light yellow crystals (mp 180-182° d).)

SAMPLE

Matrix: solutions

Sample preparation: Mix 100 μL of a solution in MeOH with 100 μL 2.5 μg/mL IS in MeOH, evaporate to dryness, add 150 μL 0.2% 3-[4-(bromomethyl)phenyl]-7-(diethylamino)-2H-1-benzopyran-2-one (3-(4-bromomethylphenyl)-7-diethylaminocoumarin) in MeCN, add crown ether solution, heat at 60° for 20 min, evaporate to dryness at room temperature, reconstitute with 500 μL chloroform, add to a 55 × 6 column of silica gel, wash with 6 mL chloroform:MeOH 200:1, elute with 5 mL chloroform:MeOH 8:1, evaporate to dryness, reconstitute with 200 μL MeOH, inject a 5 μL aliquot. (Prepare crown ether solution by adding a large excess of solid potassium bicarbonate to a 0.4% 18-crown-6 solution in MeCN, sonicate at room temperature for 10 min, centrifuge at 1000 g for 10 min, use the supernatant. Synthesize 3-[4-(bromomethyl)phenyl]-7-(diethylamino)-2H-1-benzopyran-2-one as follows. Add 18.8 g aluminum trichloride to a solution of 94 mmoles m-diethylaminophenol and 84 g triethyl orthoformate in 185 mL chloroform at room temperature, mix for 10 min, add 50 mL 10% HCl, stir, neutralize with 10% NaOH, filter through a short column of Celite, wash through with chloroform. Wash the organic layer with saturate NaCl and dry it over anhydrous magnesium sulfate, evaporate to dryness under reduced pressure, recrystallize the product from chloroform to give 4-(diethylamino)-2-hydroxybenzaldehyde (Bull.Chem.Soc.Jpn. 1985, 58, 2192). Reflux 90 g α-bromo-p-toluic acid and 25 mL concentrated sulfuric acid in 1 L MeOH for 75 min, concentrate to 200 mL under reduced pressure, dilute with 3 mL water, recrystallize from MeOH to give methyl α-bromo-p-toluate as colorless needles (mp 54-55°). Add 35 g NaCN in 85 mL water over 10 min to a stirred solution of 70 g methyl α-bromo-p-toluate in 350 mL MeOH, heat at 50° for 30 min, dilute to 1 L with cold water, filter, recrystallize from light petroleum:benzene 2:1 (Caution! Benzene is a carcinogen!) with the aid of charcoal to give methyl α-cyano-p-toluate as colorless needles (mp 63-64°). Reflux 500 mg methyl α-cyano-p-toluate in 12 mL 10% NaOH in water for 30 min, filter, acidify the filtrate. Collect the precipitate and recrystallize it from glacial acetic acid to give 4-carboxyphenylacetic acid (homoterephthalic acid) (mp 239-241°) (J. Org. Chem. 1952, 17, 1035). Reflux 4-carboxyphenylacetic acid in MeOH in the presence of sulfuric acid to obtain methyl 4-carbomethoxyphenyl acetate (bp 172-175°/20 mm Hg) (J. Indian Chem. Soc. 1987, 64, 34). Heat 8.69 g 4-(diethylamino)-2-hydroxybenzaldehyde, 15.6 g methyl 4-carbomethoxyphenyl acetate, 2 mL piperidine, and 68 mL pyridine at 100° for 15 h, evaporate to dryness, recrystallize from ethyl acetate/hexane to give methyl 4-[7-(diethylamino)-2-oxo-2H-1-benzopyran-3-yl]benzoate as reddish-yellow prisms (mp 179-180.5). (A second crop can be obtained from the mother liquor by chromatography on silica gel using chloroform:hexane:acetone 20:18:1.) Suspend 7.1 g methyl 4-[7-(diethylamino)-2-oxo-2H-1-benzopyran-3-yl]benzoate in 240 mL 6 M HCl, reflux for 19 h, evaporate most of the solvent under reduced pressure, neutralize the residue with a saturated aqueous solution of sodium bicarbonate, filter, recrystallize from acetone to give 4-[7-(diethylamino)-2-oxo-2H-1-benzopyran-3-yl]benzoic acid as reddish-yellow prisms (mp 282-283.5°). Add 2.2 mL ethyl chloroformate and 3.2 mL triethylamine to a solution of 1.69 g 4-[7-(diethylamino)-2-oxo-2H-1-benzopyran-3-yl]benzoic acid in 200 mL THF, stir at room temperature for 1 h, add a solution of 2.27 g sodium borohydride in 4.8 mL water over 30 min, stir for 1 h, acidify with acetic acid, evaporate the THF under reduced pressure, add chloroform and water to the residue. Remove the organic layer and wash it with water, dry over anhydrous magnesium sulfate, evaporate to dryness, chromatograph on silica gel with chloroform, recrystallize from ethyl acetate/hexane to give 7-(diethylamino)-3-[4-(hydroxymethyl)phenyl]-2H-1-benzopyran-2-one as yellow needles (mp 153-154°). Stir 3.23 g 7-(diethylamino)-3-[4-(hydroxymethyl)phenyl]-2H-1-benzopyran-2-one and 86 mL phosphorus tribromide at 40-50° for 3 days, pour into ice-water, filter. Dissolve the solid in chloroform and wash with saturated aqueous sodium bicarbonate, wash with water, dry over anhydrous magnesium sulfate, evaporate to dryness, recrystallize from ethyl acetate/hexane to give 3-[4-(bromomethyl)phenyl]-7-(diethylamino)-2H-1-benzopyran-2-one as yellow needles (mp 166-167°).)

HPLC VARIABLES
Column: 250 × 4.6 Inertsil C8
Mobile phase: Gradient. A was MeOH:20 mM pH 7.5 Tris-acetate buffer 78:22. B was MeOH:20 mM pH 7.5 Tris-acetate buffer 90:10. A:B 100:0 for 20 min, to 65:35 over 30 min, to 35:65 (step gradient), to 10:90 over 20 min.

Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 2.5
Limit of detection: 90 ng/mL

KEY WORDS

lung; liver; kidney; human; dog; rat; rabbit; pharmacokinetics

REFERENCE

Saah,F.; Wu,W.-M.; Eberst,K.; Marvanyos,E.; Bodor,N. Design, synthesis, and pharmacokinetic evaluation of a chemical delivery system for drug targeting to lung tissue, *J.Pharm.Sci.*, **1996**, *85*, 496–504.

SAMPLE

Matrix: blood, tissue

Sample preparation: Plasma. Plasma + 100 μL phenylpropionic mustard and chlorambucil propyl ester in MeOH + 3 mL MeCN + 1 mL dichloromethane + 2 mL hexane, shake, centrifuge at 2000 g at 4° for 10 min. Remove the top two organic layers and evaporate them to dryness, reconstitute the residue in 200 μL MeOH:hexane 3:1, inject an aliquot. Tissue. Tissue + 5 mL chilled MeCN + 100 μL phenylpropionic mustard and chlorambucil propyl ester in MeOH, sonicate for 30 s on ice, shake vigorously, centrifuge at 2000 g at 4° for 10 min. Remove the top organic layer and evaporate it to dryness, reconstitute the residue in 200 μL MeOH:hexane 3:1, inject an aliquot. (Final concentrations of phenylpropionic mustard should be 2.5 μg/mL and 0.25 μg/g and of chlorambucil propyl ester should be 2.5 μg/mL and 2.5 μg/g in plasma and tissue respectively.)

HPLC VARIABLES

Guard column: pellicular C18 (Waters)
Column: 100 × 4.6 5 μm RAC III Partisil 5 ODS 3
Mobile phase: Gradient. A was water:acetic acid 98:2. B was MeCN:acetic acid 98:2. A:B from 30:70 to 65:35 (sic) over 17 min (Waters curve no. 7), maintain at 65:35 for 7 min

Flow rate: from 1.5 to 2.5 over 17 min, maintain at 2.5 for 7 min
Detector: UV 254

CHROMATOGRAM
Retention time: 13.7
Internal standard: phenylpropionic mustard (12.6), chlorambucil propyl ester (19.0)
Limit of detection: 25 ng/mL

OTHER SUBSTANCES
Extracted: phenylacetic mustard, chlorambucil tert-butyl ester

KEY WORDS
plasma; pharmacokinetics; rat; brain

REFERENCE

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 201.7

CHROMATOGRAM
Retention time: 22.387

KEY WORDS

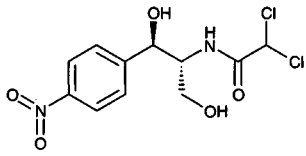
Chloramphenicol



Molecular formula: $C_{11}H_{12}Cl_2N_2O_5$
Molecular weight: 323.13
CAS Registry No.: 56-75-7
Merck Index: 2120

SAMPLE

Matrix: blood
Sample preparation: Mix serum with an equal volume of 250 μg/mL 4'-nitroacetanilide in MeCN:MeOH 90:10, mix, let stand at room temperature for 10 min, mix, centrifuge at 12800 g for 2 min, inject a 25 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: RCSS Guard-Pak (Waters)
Column: 100 × 8 C18 Radial Pak (Waters)
Mobile phase: MeOH:0.75% acetic acid 30:70, pH adjusted to 5.5 with triethylamine
Flow rate: 3
Injection volume: 25
Detector: UV 254, UV 280

CHROMATOGRAM

Retention time: 9.5
Internal standard: 4'-nitroacetanilide (12.4)
Limit of detection: 2 μg/mL

OTHER SUBSTANCES

Extracted: cefamandole, cefazolin, cefotaxime, cefoxitin, cephapirin
Simultaneous: acetaminophen, N-acetylprocainamide, cefaclor, cephalexin, cephalothin, cimetidine, miconazole, moxalactam, procainamide, sulfamethoxazole, theophylline, tobramycin, vancomycin

SAMPLE

Matrix: blood
Sample preparation: 100 μL Serum + 100 μL buffer + 1.5 mL IS in 5% isopropanol in chloroform, vortex for 30 s, centrifuge. Remove the organic layer and evaporate it to dryness under a stream of air at room temperature, reconstitute the residue in 100 μL mobile phase, inject a 6-10 μL aliquot. (Buffer was 13.6 g KH_2PO_4 in 90 mL water, pH adjusted to 6.8 with about 3 mL 10 M NaOH, made up to 100 mL.)

HPLC VARIABLES

Guard column: 20 × 4.6 Supelguard LC-1 (Supelco)
Column: 250 × 4.6 5 μm Supelcosil LC-1 (Supelco)
Mobile phase: MeOH:MeCN:buffer 17.5:17.5:65 (Buffer was 2.72 g KH_2PO_4 in 1.9 L water, pH adjusted to 6.3 with about 2 mL 1 M NaOH, made up to 2 L.)
Flow rate: 2
Injection volume: 6-10
Detector: UV 273

CHROMATOGRAM

Retention time: 3.85
Internal standard: 3-isobutyl-1-methylxanthine (3.15)

OTHER SUBSTANCES

Extracted: acetaminophen, amobarbital, barbital, caffeine, carbamazepine, ethosuximide, mephobarbital, methsuximide, pentobarbital, phenobarbital, phenytoin, primidone, secobarbital, theophylline, thiopental
Also analyzed: acetanilide, N-acetylcysteine, N-acetylprocainamide, ampicillin, aspirin, butabarbital, butalbital, chlorpropamide, cimetidine, codeine, cyheptamide, diazoxide, diflunisal, diphylline, disopyramide, ethchlorvynol, gentisic acid, glutethimide, heptabarbital, hexobarbital, ibuprofen, indomethacin, ketoprofen, mefenamic acid, mephenytoin, methaqualone, methsuximide, methyl salicylate, methyprylon, morphine, naproxen, nirvanol, oxphenylbutazone, phensuximide, phenylbutazone, procainamide, salicylamide, salicylic acid, sulfamethoxazole, sulindac, tolmetin, trimethoprim, vancomycin
Noninterfering: amikacin, gentamicin, meprobamate, netilmicin, quinidine, tetracycline, tobramycin, valproic acid
Interfering: phenacetin

KEY WORDS

serum

SAMPLE
Matrix: blood
Sample preparation: Prepare an SPE cartridge by plugging the end of a 1 mL disposable pipette tip with glass wool and adding about 100 mg Chromosorb P/NAW. Add 50 μL plasma then 50 μL 10 μg/mL tolylphenobarbital in 200 mM HCl to the SPE cartridge, let stand for 2 min, elute with 1 mL chloroform:isopropanol 6:1. Evaporate the eluate to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL mobile phase, inject a 15 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Supelcosil-LC-8
Mobile phase: MeCN:water 20:80
Flow rate: 3.3
Injection volume: 15
Detector: UV 208

CHROMATOGRAM
Retention time: 4.08
Internal standard: tolylphenobarbital (7.57)
Limit of detection: 50-100 ng/mL

OTHER SUBSTANCES
Extracted: theophylline, caffeine, barbital, ethosuximide, primidone, carbamazepinediol, phenacemide, methyprylon, nirvanol, phenobarbital, carbamazepine epoxide, mephenytoin, pentobarbital, amobarbital, carbamazepine, glutethimide, phenytoin, secobarbital, methaqualone
Noninterfering: acetaminophen, amikacin, amitriptyline, clonazepam, cyclosporine, desipramine, diazepam, digoxin, disopyramide, gentamicin, imipramine, lidocaine, methotrexate, N-acetylprocainamide, netilmicin, nortriptyline, procainamide, quinidine, salicylic acid, sulfamethoxazole, tobramycin, trimethoprim, valproic acid, p-hydroxyphenobarbital, vancomycin
Interfering: butabarbital

SAMPLE
Matrix: formulations
Sample preparation: Add capsule contents to water, extract with three 20 mL portions of ethyl acetate. Dry the extracts over potassium carbonate and evaporate them to dryness under reduced pressure. Add 120 mg of this product to 2.5 mL 5% HCl, heat at 95° for 2.5 h, cool to room temperature, adjust pH to 11 with concentrated NaOH, extract five times with 7 mL portions of ethyl acetate. Combine the extracts and dry them over potassium carbonate, evaporate to dryness, prepare a 10 mg/mL solution in MeOH. Add a 50 μL aliquot to 150 μL 10 mg/mL 2,3,4,6-tetra-O-acetyl-β-D-glucopyranosyl isothiocyanate (TAGIT) in MeCN, let stand at room temperature for 20 min, add 2 μL 2-aminoethanol, let stand for 10 min, add 50 μL 300 mM pH 3 ammonium phosphate, inject a 2-5 μL aliquot. (Chloramphenicol is de-acylated to 2-amino-1-(p-nitrophenyl)-1,3-propanediol which is then derivatized. The diastereomer obtained from chloramphenicol (1R,2R) can be resolved from the other possible diastereomers.)

SAMPLE
Matrix: milk, tissue
Sample preparation: Prepare a SPE extraction column by placing 1.2 g silica gel (40 μm, Baker) in a 3 mL filtration column (Baker), condition with 8 mL ethyl acetate:hexane 40:60, do not allow to dry. Tissue. 10 g Ground tissue + 20 mL ethyl acetate, stir thoroughly with a glass rod, sonicate below 40° for 15 min, allow to settle, decant through 5 g anhydrous sodium sulfate on filter paper (S & S 589.1), repeat extraction, wash solids with 10 mL ethyl acetate. Combine all organic layers, add 60 mL hexane, stir thoroughly, allow to stand for 5 min, filter (S & S 589.3 paper), wash filter with 10 mL hexane. Combine all organic layers and pass through the SPE column at 8/10 mL/min, wash with 10 mL hexane, dry in a stream of nitrogen for 20 min, elute with four 1 mL portions of MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 1 mL mobile phase, vortex for 30 s, inject a 50 μL aliquot. Milk. 10 g Homogenized milk + 0.4 g citric acid monohydrate + 30 mL ethyl acetate, shake mechanically for 15 min, centrifuge at 2300 g for 10 min, filter (paper) the organic layer, repeat extraction with 10 mL ethyl acetate, filter (paper), wash filter with 10 mL ethyl acetate, add 60 mL hexane to filtrate, stir thoroughly, allow to stand for 5 min, filter (S & S 589.3 paper), wash filter with 10 mL hexane. Combine all organic layers and pass through the SPE column at 8/10 mL/min, wash with 10 mL hexane, dry in a stream of nitrogen for 20 min, elute with four 1 mL portions of MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 1 mL mobile phase, vortex for 30 s, inject a 50 μL aliquot. (J.Chrom. 1991, 566, 173)

SAMPLE

Matrix: tissue

Sample preparation: Condition a 3 mL silica SPE cartridge with 10 mL ethyl acetate:hexane (4:10 ?). Vortex 3 g fatty liver and 3 mL water for 1 min, add 15 mL hexane, stir at 40 rpm for 10 min. Centrifuge at 2400 g for 5 min and discard the supernatant. Add 12 mL ethyl acetate, vortex twice for 1 min periods at a 15 min interval, centrifuge at 4000 g for 5 min, decant 8 mL organic phase through glass wool covered by 1 g anhydrous sodium sulfate, wash twice with 2 ml portions of ethyl acetate. Add 30 mL hexane to the combined extracts. Add to the SPE cartridge, rinse the flask and sodium sulfate with 10 mL ethyl acetate:hexane 4:10, add the rinse to the SPE cartridge, wash with 10 mL hexane, dry under vacuum for 2 min, elute with 5 mL 50 mM pH 10 potassium phosphate buffer. Add 20 mL ethyl acetate to the eluate, vortex, centrifuge at 2400 g for 10 min. Evaporate 18 mL of the ethyl acetate phase to dryness under reduced pressure, reconstitute the oily residue in 1.2 mL hexane:chloroform 50:50 (Caution! Chloroform is a carcinogen!). Add 800 μL water, stir at 35 rpm for 5 min, centrifuge at 3300 g for 10 min, inject an aliquot.

HPLC VARIABLES

Guard column: 4 × 4 4 μm Nova-Pak C18
Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: MeCN:5 mM pH 7.9 diammonium hydrogen phosphate buffer 19:81
Flow rate: 1
Detector: UV 278

SAMPLE
Matrix: tissue
Sample preparation: Condition a Sep-Pak silica cartridge with 5 mL MeCN:water 20:80, 5 mL MeCN, and 5 mL dichloromethane, then dry with a stream of nitrogen for 30 min. Homogenize tissue (Sorvall Omnimixer). 10 g Homogenized tissue + 30 g anhydrous sodium sulfate + 30 mL MeCN, homogenize for 1 min, centrifuge at 4000 rpm for 10 min, remove the MeCN layer, extract the aqueous layer twice more with 30 mL MeCN. Combine the MeCN layers and wash them twice with 60 mL portions of n-hexane with vigorous shaking for 30 s each time. Evaporate the MeCN layer to dryness under a stream of nitrogen at 50°, dissolve the residue in dichloromethane, add the sample extract to the SPE cartridge, wash with two 5 mL aliquots of dichloromethane, dry cartridge with a stream of nitrogen for 30 min, elute with 5 mL MeCN:water 20:80. Add the eluate to 1 mL ethyl acetate, shake, remove the upper organic layer, repeat the extraction twice more, combine the organic layers and evaporate them to dryness under a stream of nitrogen at 50°, reconstitute the residue in 1 mL mobile phase, inject a 50 µL aliquot.

HPLC VARIABLES
Column: 4 µm Nova-Pak C18 radial compression module
Mobile phase: MeCN:buffer 30:70 (Prepare buffer by diluting 1 M pH 4.8 sodium acetate buffer 1:100 with water.)
Flow rate: 1
Injection volume: 50
Detector: UV 278

SAMPLE
Matrix: tissue
Sample preparation: Homogenize tissue with an Omni-mixer (Sorval). Sonicate 10 g muscle or 5 g liver with 40 mL water for 8 min, centrifuge for 10 min, add 20 mL of the supernatant to a Chem Elut CE 1020 SPE cartridge (Analytichem), allow to equilibrate for 15 min, elute with 50 mL ethyl acetate. Evaporate the eluate to dryness under educed pressure, reconstitute with 500 μL water, add 1 mL toluene, vortex gently, centrifuge, discard the organic layer, repeat wash. Filter (0.45 μm) the aqueous phase, inject a 100 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Hypersil RP-18
Mobile phase: MeCN:50 mM pH 3 triethylamine phosphate buffer 21:79

SAMPLE
Matrix: tissue
Sample preparation: Dry 10 g homogenized (Ultra-Turrax) tissue and 5 g sand at 60° for 5 h, mix with 20 mL MeCN, homogenize (Ultra-Turrax) for 3 min, centrifuge at 2980 g for 5 min, decant the supernatant, repeat the extraction. Combine the extracts and evaporate them to dryness, dissolve the residue in 1 mL MeCN, add to a Sep-Pak C18 cartridge, rinse tube twice with 1 mL portions of MeCN, add rinses to the SPE cartridge, elute with 4 mL MeCN. Evaporate the eluate to dryness and reconstitute the residue in ethyl acetate, pass through a silica SPE cartridge, elute with ethyl acetate. Evaporate the eluate to dryness under reduced pressure, reconstitute in 500 μL n-hexane and 500 μL mobile phase, inject a 50 μL aliquot of the lower aqueous phase onto column A and elute to waste with mobile phase at 0.7 mL/min, divert the fraction containing chloramphenicol onto column B while eluting column B to waste. When all the chloramphenicol has eluted from column A remove column A from the circuit, backflush the contents of column B onto column C with mobile phase at 0.9 mL/min, monitor the effluent from column C.

Matrix: blood
Sample preparation: 500 µL Serum + 20 µL 20 µg/mL IS + 200 µL 1 M potassium carbonate + 3 mL chloroform, mix for 2 min, centrifuge at 1200 g for 5 min, aspirate aqueous phase. Evaporate the organic phase under a stream of nitrogen at 40°. Dissolve the residue in 100 µL mobile phase, inject a 20 µL aliquot. (Caution! Chloroform is a carcinogen!)

HPLC VARIABLES

Column: 100 × 4.6 2 µm TSK gel Super-ODS (A) or 100 × 4.6 5 µm Hypersil ODS-C18 (B)
Mobile phase: MeCN:5 mM pH 6 NaH_2PO_4 45:55
Flow rate: 0.65
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 21.0 (A), 73.1 (B)
Internal standard: diazepam (29.8 (A), 77.5 (B))
Limit of quantitation: 1 ng/mL (A)

OTHER SUBSTANCES

Extracted: bromazepam, clonazepam, estazolam, etizolam, flutazolam, haloxazolam, lorazepam, nitrazepam, oxazolam, triazolam
Simultaneous: alprazolam
Noninterfering: barbital, carbamazepine, cloxazolam, ethosuximide, hexobarbital, mexazolam, oxazepam, pentobarbital, phenobarbital, phenytoin, primidone, trimethadione

KEY WORDS

serum

SAMPLE

Matrix: blood
Sample preparation: 200 µL Serum + 200 µL 50 µg/mL hexobarbital in MeCN + 25 µL glacial acetic acid, vortex for 10 s, centrifuge for 1 min, inject a 30-100 µL aliquot of the supernatant.

HPLC VARIABLES

Column: µBondapak C18
Mobile phase: Gradient. MeCN:7.5 g/L NaH_2PO_4 adjusted to pH 3.2 with phosphoric acid 5:95 to 22:78 over 24 min, to 45:55 over 10 min, maintain at 45:55 for 5 min. Re-equilibrate with 5:95 for 5 min.
Column temperature: 50
Flow rate: 3

Injection volume: 30-100
Detector: UV 210

CHROMATOGRAM

Retention time: 19.6
Internal standard: hexobarbital (20.6)
Limit of detection: 200-2000 ng/mL

OTHER SUBSTANCES

Extracted: acetaminophen, amobarbital, butabarbital, butalbital, diazepam, ethchlorvynol, flurazepam, glutethimide, methaqualone, methyprylon, nitrazepam, pentobarbital, phenobarbital, phenytoin, primidone, salicylic acid, secobarbital, theophylline
Simultaneous: amitriptyline, caffeine, clomipramine, codeine, desipramine, ethotoin, imipramine, lidocaine, mesantoin, methsuximide, nirvanol, nortriptyline, oxazepam, procainamide, phenylpropanolamine, propranolol, quinidine

SAMPLE

Matrix: blood
Sample preparation: 2 mL Plasma + 100 μL 1 μg/mL loxapine in isopropanol:diethylamine 99.9:0.1 + 250 μL 25% potassium carbonate containing 0.1% diethylamine + 5 mL hexane:isoamyl alcohol 97:3, vortex for 30 s, centrifuge at 500 g for 3 min. Remove the organic layer and add it to 100 μL 250 mM HCl, vortex for 30 s, inject a 50 μL aliquot of the aqueous phase.

HPLC VARIABLES

Guard column: 50 × 4.6 40 μm C8 (Supelco)
Column: 250 × 4.6 5 μm Supelcosil C8
Mobile phase: MeCN:water:diethylamine:85% phosphoric acid 53.3:45.1:1:0.4, pH adjusted to 7.2 with NaOH or phosphoric acid
Flow rate: 2
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: k' 2.53
Internal standard: loxapine (k' 7.18)

OTHER SUBSTANCES

Extracted: amitriptyline, chlorpromazine, desipramine, desmethldiazepam, desmethylchlordiazepoxide, diazepam, doxepin, haloperidol, imipramine, nortriptyline, thiothixene
Noninterfering: molindone, perphenazine, trifluoperazine
Interfering: desmethyldoxepin, fluphenazine, oxazepam

KEY WORDS

plasma

REFERENCE

SAMPLE

Matrix: blood

Sample preparation: Inject 100-200 μL plasma onto column A with mobile phase A and elute to waste, after 5 min backflush the contents of column A onto column B with mobile phase B, after 5 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. Wash column A with MeCN:water 60:40 at 1 mL/min for 6 min then re-equilibrate with pH 7.5 buffer for 10 min.

HPLC VARIABLES

Column: A 45 × 4 12 μm TSK-gel G 3 PW (Tosohass); B 75 × 4.6 Ultrasphere ODS C18 3 μm

Mobile phase: A 50 mM pH 7.5 phosphate buffer; B Gradient. A was MeCN. B was 65 mM KH_2PO_4 + 1% diethylamine adjusted to pH 5.4 with phosphoric acid. A:B 22:78 for 5 min, to 25:75 over 10 min, to 60:40 over 15 min.

Flow rate: 1

Injection volume: 100-200

Detector: UV 230

CHROMATOGRAM

Retention time: 22.8

OTHER SUBSTANCES

Extracted: alprazolam, bromazepam, clobazam, clonazepam, clorazepate, clotiazepam, desmethylclobazam, desmethyldiazepam, diazepam, estazolam, flunitrazepam, loflazepate, lorazepam, medazepam, nitrazepam, oxazepam, prazepam, temazepam, tetrazepam, tofisopam, triazolam

Noninterfering: carbamazepine, phenytoin, ethosuximide, phenobarbital, primidone, valproic acid

KEY WORDS

plasma; column-switching

REFERENCE

SAMPLE

Matrix: blood

Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 μL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 μL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES

Guard column: LC-8-DB (Supelco)

Column: 150 × 4.6 LC-8-DB (Supelco)

Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)

Flow rate: 2

Injection volume: 100

Detector: UV 228

CHROMATOGRAM

Retention time: 3.6
Internal standard: protriptyline (4)

OTHER SUBSTANCES

Extracted: acetazolamide, amitriptyline, chlorimipramine, chlorpromazine, dextromethorphan, diazepam, diphenhydramine, doxepin, encainide, fentanyl, flecainide, fluoxetine, flurazepam, haloperidol, hydroxyethylflurazepam, imipramine, lidocaine, maprotiline, methadone, mexiletine, midazolam, norchlorimipramine, nordoxepin, nordiazepam, norfluoxetine, nortriptyline, pentazocine, propoxyphene, propranolol, protriptyline, quinidine, temazepam, trazodone, trimipramine, verapamil

Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin

Interfering: desipramine, ibuprofen, methaqualone, norverapamil, promazine, propafenone

KEY WORDS

plasma; SPE

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 262

CHROMATOGRAM

Retention time: 5.10

Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, saliva, tissue, urine

Sample preparation: Homogenize (Polytron) tissue with 4 (whole brain) or 8 (brain striata) volumes of 100 mM pH 4.5 NaH_2PO_4 containing 0.5% NaF. Add 500 μL brain homogenate or 500 μL plasma, saliva, or urine containing 15 μL saturated NaF solution to 75 μL 150 μg/mL IS, add 50 μL 50% perchloric acid, mix vigorously for 10 s, let stand at room temperature for 10 min, add 1 mL water, mix briefly, centrifuge at 10° at 2500 (?) for 30 min. Remove the supernatant and add it to 750 μL saturated sodium carbonate solution, mix briefly, add 7.5 mL pentane:chloroform 95:5, rock gently for 10 min, centrifuge in a desk-top centrifuge for 2 min, freeze in dry ice/acetone for 2 min. Remove the organic layer and add it to 250 μL 100 mM HCl, mix vigorously for 10 s, centrifuge in a desk-top centrifuge for 1-2 min, freeze in dry ice/acetone for 3-5 min, discard the organic layer. Allow the aqueous layer to thaw, remove any trace of organic solvent with a stream of nitrogen, inject a 75 μL aliquot of the aqueous layer.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Brownlee RP-8

Column: 250 × 4.6 5 μm Zorbax RX-C18

Mobile phase: MeCN:buffer 18:82 (Buffer was 100 mM K_2HPO_4 containing 0.5% triethylamine, adjusted to pH 2.7 with phosphoric acid.)

Flow rate: 2

Injection volume: 75

Detector: UV 235

CHROMATOGRAM

Retention time: 8.3

Internal standard: 2β-carbomethoxy-3β-(4-chlorophenyl)tropane (RTI-31) (Research Biochemical International, Natick MA) (11.4)

OTHER SUBSTANCES

Extracted: clozapine, cocaine, gepirone, methylphenidate, pentazocine, pseudococaine

Simultaneous: acetaminophen, acetophenazine, amoxapine, amphetamine, atropine, benperidol, buspirone, caffeine, carbamazepine, chlorpheniramine, codeine, dextromethorphan, diazepam, diphenhydramine, flupenthixol, flurazepam, haloperidol, hydergine, hydrocodone, hydromorphone, lidocaine, loxapine, mepazine, meperidine, mesoridazine, methaquaalude, 3,4-methylenedioxyamphetamine, 3,4-methylenedioxyethylamphetamine, 3,4-methylenedioxymethamphetamine, morphine, norcocaine, oxazepam, pentobarbital, phenylpropanolamine, procainamide, procaine, propyl benzoylecgonine, quinidine, quinine, salicylic acid, secobarbital, theophylline, trazodone, 3-tropanyl-3,5-dichlorobenzoate, vancomycin, WIN 35428

Noninterfering: amitriptyline, benztropine methanesulfonate, butaperazine, butriptyline, carphenazine, chlorpromazine, clomipramine, cyclobenzaprine, dextropropoxyphene, dronabinol, ephedrine, ethchlorvynol, fluoxetine, fluphenazine, imipramine, meprobam-

ate, methadone, methamphetamine, nicotine, norfluoxetine, nortriptyline, PCP, phenothiazine, pseudoephedrine

Detector: UV 200

CHROMATOGRAM
Retention time: 10.5

OTHER SUBSTANCES
Simultaneous: desalkylflurazepam, diazepam, flurazepam, norchlordiazepoxide, nordiazepam, oxazepam, prazepam

REFERENCE
Rainin Catalog 1991-2, p. 3.26.

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 0.5 mg/mL solution in MeOH, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 150 mM phosphoric acid and 50 mM triethylamine. B was MeCN:water 80:20 containing 150 mM phosphoric acid and 50 mM triethylamine. A:B 100:0 for 2.2 min then to 0:100 over 30 min.
Column temperature: 30
Flow rate: 2
Injection volume: 5
Detector: UV 210

CHROMATOGRAM
Retention time: 13.1

OTHER SUBSTANCES
Simultaneous: acetaminophen, aprobarbital, butabarbital, chloroxylenol, chlorpromazine, clenbuterol, cortisone, danazol, diflunisal, doxapram, estrone, fluoxymesterone, mefenamic acid, methyltestosterone, nicotine, oxazepam, phentermine, phenylpropanolamine, progesterone, sulfamethazine, sulfanilamide, testosterone, testosterone propionate, tranylcypromine, tripelennamine

KEY WORDS
details for purification of triethylamine in paper

SAMPLE
Matrix: urine
Sample preparation: 2 mL Urine + 3 mL 5 M NaOH, vortex 30 s, add 12 mL diethyl ether, rotate for 5 min, centrifuge at 2500 rpm for 5 min. Remove the ether layer and evaporate it to dryness at 40° under a stream of nitrogen, reconstitute in 2 mL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 10 μm Alltech C18
Mobile phase: MeOH:water 50:50 containing 7 mL/L butylamine, adjusted to pH 3.2 with sulfuric acid
Flow rate: 1.8
Injection volume: 50
Detector: E, Bioanalytical Systems Model LC4B, dual glassy carbon working electrode cell half operated in the parallel mode + 1.0 V and +0.9 V, stainless steel auxiliary electrode cell half, Ag/AgCl reference electrode. The detector was preceded by a Photronix Model 816 UV irradiator which irradiated the mobile phase in a 9.144 m length of 0.5 mm i.d. × 1.6 mm o.d. Teflon tubing in a three-dimensional figure eight configuration. The irradiation apparatus was maintained at 0-5° using an ice bath.

CHROMATOGRAM
Retention time: 6
Limit of detection: 2 ppb

OTHER SUBSTANCES
Simultaneous: methylphenidate, phenobarbital, nitrazepam
Interfering: cocaine

SAMPLE
Matrix: bulk
Sample preparation: Prepare a 10 mg/mL solution in MeCN:100 mM pH 5.0 ammonium acetate 20:80.

HPLC VARIABLES
Column: 150 × 4.6 3 μm Nucleosil C18 (A) or 250 × 4.6 5 μm Zorbax RX-C8 (B)
Mobile phase: A was MeCN. B was 100 mM pH 5.0 ammonium acetate. Gradient. A:B from 20:80 to 25:75 over 25 min, to 40:60 over 25 min, to 50:50 over 40 min, return to initial conditions, re-equilibrate for 10 min.
Column temperature: 30
Flow rate: 1
Injection volume: 20
Detector: UV 230

CHROMATOGRAM
Retention time: 45-50 (A) or 45 (B)

OTHER SUBSTANCES
Simultaneous: degradation products

KEY WORDS
comparison of columns

Doub,W.H.; Ruhl,D.D.; Hart,B.; Mehelic,P.R.; Revelle,L.K. Gradient liquid chromatographic method for the determination of chlorhexidine and its degradation products in bulk material, *J.AOAC Int.*, **1996**, *79*, 636–639.

SAMPLE
Matrix: formulations
Sample preparation: Weigh out 1.25 g ground pastilles, add 50 mL mobile phase, stir mechanically until dissolved, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18

Mobile phase: MeCN:100 mM pH 5 potassium phosphate buffer containing 5.9 g/L NaCl and 30 mM tetrabutylammonium hydrogen sulfate
Flow rate: 2
Injection volume: 50
Detector: UV 294

CHROMATOGRAM
Retention time: 10

OTHER SUBSTANCES
Simultaneous: degradation products, n-butyl p-aminobenzoic acid, p-chloroaniline, tetracaine

KEY WORDS
pastilles

SAMPLE
Matrix: saliva
Sample preparation: Centrifuge saliva at 200 g, remove a 200 μL aliquot, add 200 μL 5 M KOH, vortex for 30 s, add 2 mL dichloromethane, shake vigorously on a horizontal shaker for 10 min, centrifuge at 200 g for 10 min. Remove the organic phase and evaporate it under a stream of nitrogen, reconstitute with 100 μL mobile phase, inject a 60 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Ultrasphere ODS C18
Mobile phase: MeCN:50 mM sodium acetate + 5 mM heptanesulfonic acid 40:60 adjusted to pH 5 with glacial acetic acid
Flow rate: 1
Injection volume: 60
Detector: UV 260

CHROMATOGRAM
Retention time: 6.1
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Noninterfering: erythromycin, lidocaine, tetracycline

REFERENCE

SAMPLE
Matrix: saliva
Sample preparation: Collect sample on Periopaper strip (filter paper), add paper to 100 μL MeCN:water:glacial acetic acid 55:44.8:0.2 containing 7 mM sodium lauryl sulfate and 2 μg/mL benzethonium, vortex for 1 min, sonicate for 20 min, vortex, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 100 × 2.1 5 μm C18 ODS-B Exsil (HiChrome)

Mobile phase: MeCN:0.2% acetic acid 55:45 containing 5 mM sodium lauryl sulfate
Flow rate: 0.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 5
Internal standard: benzethonium (7)
Limit of detection: 2000 ng/mL

KEY WORDS

SAMPLE
Matrix: saliva
Sample preparation: 200 μL Saliva + 400 μL 4.5 M NaOH + 400 μL MeCN, vortex for 1 min, centrifuge for 1 min at 14000 g. Remove 200 μL of the organic phase and add it to 370 μL buffer, mix, inject a 20 μL aliquot. (Buffer was 100 mM Na_2HPO_4 containing 5 mM 1-heptanesulfonic acid and 50 mM triethylamine, pH adjusted to 2.5 with phosphoric acid.)

HPLC VARIABLES
Column: 125 × 4 5 μm LiChrospher 100 RP-18
Mobile phase: MeCN:buffer 35:65 (Buffer was 100 mM Na_2HPO_4 containing 5 mM 1-heptanesulfonic acid and 50 mM triethylamine, pH adjusted to 2.5 with phosphoric acid.)
Injection volume: 20
Detector: UV 260

CHROMATOGRAM
Retention time: 2.10
Limit of quantitation: 500 ng/mL

KEY WORDS
pharmacokinetics

SAMPLE
Matrix: solutions
Sample preparation: 9.5 mL Contact lens solution + 0.5 mL 3 mg/mL methylparaben, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 7 μm Nucleosil C18 pre-column
Column: 7 μm Nucleosil C18
Mobile phase: MeOH:100 mM KH_2PO_4 adjusted to pH 3.5 with phosphoric acid 60:40
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 14.9 (chlorhexidine gluconate)
Internal standard: methyl paraben (7.8)
Limit of detection: 200 ng

OTHER SUBSTANCES
Simultaneous: thimerosal, thiosalicylic acid

KEY WORDS
stability-indicating; contact lens solutions

SAMPLE
Matrix: urine
Sample preparation: Direct injection of a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 5 10 μm Partisil silica
Mobile phase: MeOH:2 M ammonia:1 M ammonium nitrate 90:5:5
Flow rate: 3
Injection volume: 20
Detector: UV 260

CHROMATOGRAM
Retention time: 5.5
Limit of quantitation: 1000 ng/mL

KEY WORDS
normal phase; use a 50 mm long column of 27-44 μm silica between pump and injection valve to saturate mobile phase with silica

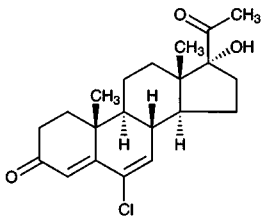
Chlormadinone



Molecular formula: $C_{21}H_{27}ClO_3$
Molecular weight: 362.90
CAS Registry No.: 1961-77-9, 302-22-7 (acetate)
Merck Index: 2152
Lednicer No.: 1 181

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 283.1

CHROMATOGRAM

Retention time: 24.11

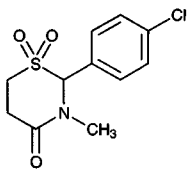
Chlormezanone



Molecular formula: $C_{11}H_{12}ClNO_3S$
Molecular weight: 273.74
CAS Registry No.: 80-77-3
Merck Index: 2155

SAMPLE

Matrix: blood
Sample preparation: 1 mL plasma + 100 mg ammonium sulfate + 2 mL ethyl acetate, vortex for 2 min, sonicate for 3 min, centrifuge at 6000 rpm for 10 min. Remove 1 mL of the supernatant and evaporate it to dryness under vacuum, reconstitute the residue in 500 μL mobile phase, inject a 20-40 μL aliquot.

HPLC VARIABLES

Guard column: 30 × 4 7.5 μm Nucleosil C18
Column: 120 × 4 7.5 μm Nucleosil C18
Mobile phase: MeOH:water:85% orthophosphoric acid 50:50:1
Flow rate: 1
Injection volume: 20-40
Detector: UV 228

CHROMATOGRAM

Retention time: 3.37
Limit of detection: 100 ng/mL
Limit of quantitation: 500 ng/mL

OTHER SUBSTANCES

Simultaneous: acetaminophen
Noninterfering: codeine

KEY WORDS

plasma; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 223

CHROMATOGRAM
Retention time: 3.40
Limit of detection: <120 ng/mL

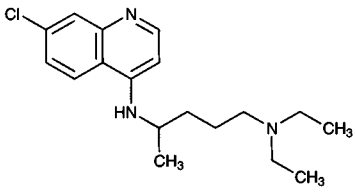
Chloroquine



Molecular formula: $C_{18}H_{26}ClN_3$
Molecular weight: 319.88
CAS Registry No.: 54-05-7, 50-63-5 (phosphate), 3545-67-3 (HCl)
Merck Index: 2215
Lednicer No.: 1 341

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 75 × 7.5 I.D. Progel-TSK Heparin-5PW affinity column (Supelco)
Mobile phase: 20 mM pH 6.0 sodium phosphate buffer
Column temperature: 19
Flow rate: 0.8
Detector: UV 214

CHROMATOGRAM
Retention time: 37 (+), 44 (-)

KEY WORDS
chiral

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 1 mL 1 M NaOH + 30 mL n-heptane, shake for 30 min. Remove 25 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 µL MeOH:100 mM phosphoric acid 50:50, inject a 10 µL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 µm µBondapak C18
Mobile phase: MeCN:20 mM pH 3.4 1-heptanesulfonic acid 34:66 (Aqueous solution was 40 mL Pic B-7 (Waters) + 460 mL water, pH 3.4.)
Flow rate: 1
Injection volume: 10
Detector: UV 340

CHROMATOGRAM
Retention time: 9
Limit of detection: 5 ng

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 1 mL Whole blood or plasma + 1 mL water + 50 μL 10 μg/mL IS in MeOH + 1 mL 60% aqueous KOH, vortex for 1 min, heat for 3 min on a boiling water bath, pass onto a 3 mL Extrelut cartridge. Elute with diethyl ether:dichloromethane 70:30, evaporate eluate to dryness under a stream of air at 40°, vortex in 100 μL initial mobile phase, inject a 40 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: Gradient. A was KH_2PO_4: 1 N phosphoric acid 999:1. B was MeCN. A:B 65:35 for 12 min at 1 mL/min and UV 343 nm then 55:45 at 2 mL/min and UV 242 nm (step gradient).
Flow rate: 1-2
Injection volume: 40
Detector: UV 343, UV 242

CHROMATOGRAM
Retention time: 5.35
Internal standard: papaverine hydrochloride (10.7 min)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, diazepam, monodesethylchloroquine, nordiazepam
Simultaneous: epinephrine, sulfadoxine, quinine, pyrimethamine, mefloquine

KEY WORDS
whole blood; plasma

REFERENCE
Estadieu,M.; Durand,A.; Viala,A.; Rop,P.P.; Fornaris,M.; Quicke,J. A rapid HPLC procedure for the simultaneous determination of chloroquine, monodesethylchloroquine, diazepam, and nordiazepam in blood, *J.Anal.Toxicol.*, **1989**, *13*, 89–93.

SAMPLE
Matrix: blood
Sample preparation: Serum. 200 μL Serum + 50 μL 1 μg/mL IS in water + 50 μL 4 M NaOH + 200 μL MTBE, vortex for 30 s, centrifuge at 9950 g for 2 min, inject 100 μL of the organic layer. Whole blood. 100 μL Whole blood + 500 μL water + 50 μL 1 μg/mL IS in water + 50 μL 4 M NaOH + 200 μL MTBE, vortex for 30 s, centrifuge at 9950 g for 2 min, inject 100 μL of the organic layer. Dried blood. Spread 100 μL whole blood on a 70 × 30 mm piece of filter paper, allow to dry, cut paper into 10 × 5 mm strips, add 100 μL 1 μg/mL IS in water, add 1.5 mL 0.5 M NaOH, vortex for 30 s, let stand for 30 min at room temperature, add 300 μL MTBE, vortex for 30 s, centrifuge at 2000 g for 5 min, inject a 100 μL aliquot of the organic layer.

HPLC VARIABLES
Column: 150 × 5 5 μm Spherisorb S5SCX sulfophenylpropyl-modified silica
Mobile phase: MeOH:water 98.5:1.5 containing 9.41 g/L ammonium perchlorate, adjust apparent pH to 8.0 with 220 mL/L 50 mM NaOH in MeOH
Flow rate: 1.5
Injection volume: 100

Detector: F ex 215 em no filter

CHROMATOGRAM

Retention time: 14
Internal standard: 6,8-dichloro-4-(1-methyl-4-diethylaminobutylamino)quinoline (5)
Limit of quantitation: 5 ng/mL (serum), 10 ng/mL (whole blood, dried blood)

OTHER SUBSTANCES

Extracted: hydroxychloroquine, quinine, metabolites
Simultaneous: acebutolol, N-acetylprocainamide, atenolol, butriptyline, chlorpromazine, desipramine, flecainide, fluoxetine, imipramine, labetalol, maprotiline, mepacrine, metoprolol, mexiletine, norbutriptyline, normaprotiline, procainamide, propranolol, sotalol
Noninterfering: amitriptyline, amodiaquin, carbamazepine, clomipramine, dapsone, diazepam, dothiepin, doxepin, fluvoxamine, lorazepam, mefloquine, nitrazepam, norclomipramine, nordiazepam, nordothiepin, nordoxepin, nortriptyline, primaquine, proguanil, pyrimethamine

KEY WORDS

serum; whole blood; dried blood

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 222

CHROMATOGRAM

Retention time: 4.72
Limit of detection: <120 ng/mL

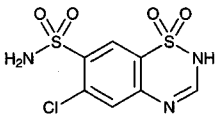
Chlorothiazide



Molecular formula: $C_7H_6ClN_3O_4S_2$
Molecular weight: 295.73
CAS Registry No.: 58-94-6, 7085-44-1 (sodium salt)
Merck Index: 2221
Lednicer No.: 1 321

SAMPLE

Matrix: blood, CSF
Sample preparation: 200 μL Serum, plasma, or CSF + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, elute the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine hydrochloride and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 30 × 2.1 40 μm preparative grade C18 (Analytichem); B 250 × 4.6 10 μm Partisil C8
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 15 min, maintain at 30:70 for 4 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 280 for 5 min then UV 254

CHROMATOGRAM

Retention time: 5.43
Internal standard: heptanophenone (19.2)

OTHER SUBSTANCES

Extracted: acetazolamide, ampicillin, bromazepam, caffeine, carbamazepine, chloramphenicol, diazepam, droperidol, ethionamide, furosemide, isoniazid, methadone, penicillin G, phenobarbital, phenytoin, prazepam, propoxyphene, pyrazinamide, rifampin, trimeprazine, trimethoprim

KEY WORDS

plasma; serum; column-switching

SAMPLE

Matrix: blood, CSF, gastric contents, urine
Sample preparation: 200 μL Serum, urine, CSF, or gastric fluid + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine HCl and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 40 μm preparative grade C18 (Analytichem); B 75 × 2.1 pellicular C18 (Whatman) + 250 × 4.6 5 μm C8 end-capped (Whatman)

Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 20 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 220

CHROMATOGRAM
Retention time: 5.67
Internal standard: heptanophenone (19)

OTHER SUBSTANCES
Extracted: acetaminophen, allobarbital, azinphos, barbital, brallobarbitone, bromazepam, butethal, caffeine, carbamazepine, carbaryl, cephaloridine, chloramphenicol, chlordiazepoxide, chlorvinphos, clothiapine, cocaine, coomassie blue, desipramine, diazepam, diphenhydramine, dipipanone, ethylbromphos, flufenamic acid, formothion, griseofulvin, indomethacin, lidocaine, lorazepam, malathion, medazepam, midazolam, oxazepam, paraoxon, penicillin G, pentobarbital, prazepam, propoxyphene, prothiophos, quinine, salicylic acid, secobarbital, strychnine, sulfamethoxazole, theophylline, thiopental, thioridazine, trimethoprim

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 2 mL 1 M pH 4.1 NaH_2PO_4 + 4 mL ethyl acetate, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic phase and add it to 5 mL 100 mM pH 7.5 Na_2HPO_4, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 µL MeCN:10 mM pH 3.0 phosphate buffer, inject a 5 µL aliquot.

HPLC VARIABLES

Column: 125 × 4 5 µm LiCHrosorb RP-18

Mobile phase: Gradient. MeCN:10 mM pH 3.0 phosphate buffer 10:90 for 1.5 min then to 35:65 over 2 min

Column temperature: 50

Flow rate: 1.5

Injection volume: 5

Detector: UV 271

CHROMATOGRAM

Retention time: 1.8

Limit of quantitation: 1500 ng/mL

OTHER SUBSTANCES

Extracted: hydrochlorothiazide, quinethazone, chlorthalidone, methyclothiazide, clopamide, furosemide, metolazone, mefruside, bendroflumethiazide, cyclopenthiazide, bumetanide

Simultaneous: indapamide, clorexolone, ethacrynic acid

Noninterfering: aspirin, albuterol, allopurinol, alprenolol, atenolol, captopril, carbimazole, clonidine, coloxyl, danthron, diazepam, digoxin, doxepin, glibenclamide, hydralazine, indomethacin, labetalol, metformin, methyldopa, metoprolol, mianserin, minoxidil, nifedipine, nitrazepam, oxazepam, oxprenolol, pindolol, prazosin, propranolol, senokot, theophylline, trifluoperazine

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 µL 50 µg/mL β-hydroxyethyltheophylline in MeOH, inject 5 µL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 µm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)

Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 5

Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 5.37 (A), 6.43 (B)

Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))

Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, acetazolamide, hydrochlorothiazide, quinethazone, triamterene, flumethiazide, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, methyclothiazide, benzthiazide, cyclothiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone

Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

SAMPLE

Matrix: urine

Sample preparation: Buffer urine to 4.9 by mixing with an equal volume of pH 4.9 200 mM sodium phosphate buffer. Inject a 40 μL aliquot onto column A with mobile phase A, after 3 min backflush the contents of column A onto column B with mobile phase B and start the gradient. At the end of the run re-equilibrate for 10 min.

HPLC VARIABLES

Column: A 20 × 4 5 μm Hypersil octadecylsilica ODS; B 200 × 4.6 5 μm Shiseido SG-120 polymer-based C18

Mobile phase: A water; B Gradient. MeCN:buffer from 7:93 to 15:85 over 3.5 min, to 50:50 over 8.5 min, maintain at 50:50 for 11 min (Buffer was 6.9 g $NaH_2PO_4.H_2O$ in 1 L water, pH adjusted to 3.1 with phosphoric acid.)

Flow rate: 1

Injection volume: 40

Detector: UV 230

CHROMATOGRAM

Retention time: 10.8

Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: acetazolamide, amiloride, bendroflumethiazide, benzthiazide, bumetanide, caffeine, carbamazepine, chlorthalidone, clopamide, dichlorfenamide, ethacrynic acid, furosemide, hydrochlorothiazide, metyrapone, probenecid, spironolactone, triamterene, trichlormethiazide

KEY WORDS

column-switching; optimum detection wavelengths vary for each drug

REFERENCE

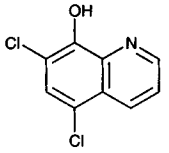
Chloroxine



Molecular formula: $C_9H_5Cl_2NO$
Molecular weight: 214.05
CAS Registry No.: 773-76-2
Merck Index: 2227

SAMPLE

Matrix: formulations
Sample preparation: Weigh out shampoo containing 30 mg of chloroxine, add 40-50 mL MeOH, dissolve with heating, make up to 100 mL with MeOH. Remove a 2 mL aliquot and add it to 1 mL 10 mg/mL nickel chloride in MeOH, add 3 mL 0.4 mg/mL diphenylamine in MeOH, make up to 50 mL with MeOH, filter, inject an aliquot.

HPLC VARIABLES

Column: 300 × 3.9 μBondapak phenyl
Mobile phase: MeCN:MeOH:water 30:20:50 containing 1 mM $NiCl_2$
Flow rate: 1.2
Detector: UV 273

CHROMATOGRAM

Retention time: 6.5
Internal standard: diphenylamine (11)

OTHER SUBSTANCES

Simultaneous: iodochlorhydroxyquin, iodoquinol

KEY WORDS

shampoo; separated as Ni chelates

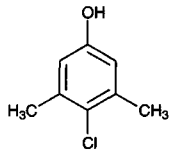
Chloroxylenol



Molecular formula: C_8H_9ClO
Molecular weight: 156.61
CAS Registry No.: 88-04-0
Merck Index: 2228

SAMPLE

Matrix: formulations
Sample preparation: Sonicate an amount of cream or ointment containing 230 μg chloroxylenol with 10 mL DMSO at 40° for 10 min, decant. Sonicate a 200 μL aliquot of the clear solution with 30 μL 60 mM potassium carbonate solution for 10 min. Add 400 μL 2.5 mg/mL 2-chloro-6,7-dimethoxy-3-quinoline carboxaldehyde solution in DMSO. Stir the reaction mixture at 110° for 50 min. Add 60 μL 2 M acetic acid and 800 μL IS in the mobile phase. Sonicate the mixture for 1 min. Inject a 50 μL aliquot. (Details for the preparation of 2-chloro-6,7-dimethoxy-3-quinoline carboxaldehyde are given in Tetrahedron Letters 1978, 23, 2045.)

HPLC VARIABLES

Column: 250 × 4.6 Hypersil 5ODS
Mobile phase: MeCN:THF:50 mM pH 3.0 triethyl ammonium phosphate buffer 49.4:2.6:48
Column temperature: 35
Flow rate: 1.3
Injection volume: 50
Detector: F ex 360 em 500

CHROMATOGRAM

Retention time: 27.8 (4-chloro-3,5-xylenol)
Internal standard: 4-chloro-3-cresol (19.5)
Limit of detection: 1 pmol

KEY WORDS

derivatization; cream; ointment

Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM
Retention time: 8.86
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES
Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, tranylcypromine, trazodone, trihexyphenidyl, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine

KEY WORDS
serum; whole blood; liver

REFERENCE
McIntyre,I.M.; King,C.V.; Skafidis,S.; Drummer,O.H. Dual ultraviolet wavelength high-performance liquid chromatographic method for the forensic or clinical analysis of seventeen antidepressants and some selected metabolites, *J.Chromatogr.*, **1993**, *621*, 215–223.

SAMPLE
Matrix: blood, urine
Sample preparation: 500 μL Serum or urine + 100 μL 2 M NaOH + 2.5 mL chloroform: isopropanol 95:5, shake vigorously for 20 min, centrifuge at 700 g for 5 min. Remove the organic layer and add it to 100 μL 50 mM sulfuric acid, mix vigorously on a shaker for 10 min, inject a 20 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:water 70:30 containing 5 mM sodium heptanesulfonate
Flow rate: 1.2
Injection volume: 20
Detector: UV 260

CHROMATOGRAM
Retention time: 4.9
Internal standard: chlorpheniramine

OTHER SUBSTANCES
Simultaneous: chlorhexidine, p-chloroaniline
Noninterfering: benzyl alcohol, benzoic acid, phosphanilic acid

KEY WORDS
serum; chlorpheniramine is IS

REFERENCE
Brougham,L.R.; Cheng,H.; Pittman,K.A. Sensitive high-performance liquid chromatographic method for the determination of chlorhexidine in human serum and urine, *J.Chromatogr.*, **1986**, *383*, 365–373.

SAMPLE
Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 12.925

KEY WORDS
whole blood

SAMPLE
Matrix: cell incubations
Sample preparation: 40 mL Cell incubation + 50 mL MeOH, shake vigorously for 1 min, centrifuge at 2000 rpm for 10 min, wash the pellet twice with 50 mL portions of MeOH. Combine the supernatants and add 100 mL water, extract three times with 150 mL portions of dichloromethane. Filter the extracts through anhydrous sodium sulfate, evaporate the filtrate to dryness under reduced pressure at 40°, reconstitute with mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm cyano-propyl (Beckman)
Mobile phase: MeCN:buffer 40:60 (Buffer was 10 mM KH_2PO_4 containing 20 mM triethylamine, pH 7.0.)
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 9.4

OTHER SUBSTANCES
Extracted: metabolites
Interfering: brompheniramine, pheniramine

SAMPLE
Matrix: formulations
Sample preparation: Tablets. Powder tablets, weigh out amount equivalent to about 10 mg, add 75 mL mobile phase, sonicate for 20 min, dilute to 100 mL with mobile phase, mix, filter (0.45 μm) (discard first 10 mL of filtrate), inject a 20 μL aliquot of the filtrate. Syrups, elixirs, injectables. Measure out amount equivalent to about 10 mg, add 75 mL mobile phase, sonicate for 20 min, dilute to 100 mL with mobile phase, mix, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak CN
Mobile phase: MeOH:3 mM ammonium acetate 90:10
Flow rate: 1.3
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 4.3

OTHER SUBSTANCES
Also analyzed: cyclizine, doxylamine, mesoridazine, pentazocine, promethazine, protriptyline, pyrilamine, pyrimethamine, tripelennamine

KEY WORDS
tablets; syrups; elixirs; injections

SAMPLE
Matrix: formulations
Sample preparation: Crush tablets, add 100 mL water and 30-40 mL MeCN, dissolve, add N,N-dimethylbenzylamine, make up to 250 or 500 mL with water, centrifuge an aliquot, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 150 × 4.6 Asahipak ODP-50 C18
Mobile phase: MeCN:200 mM pH 7.0 phosphate buffer 27:73
Flow rate: 0.8
Injection volume: 20-100
Detector: Chemiluminescence following post-column reaction. Oxidize a 1 mM tris(2,2'-bipyridine) ruthenium(II) hexachloride solution in 50 mM pH 5.5 acetate buffer to Ru(III) using a Princeton Applied Research polarographic analyzer with a platinum gauze working electrode, platinum wire auxiliary electrode, and a silver wire reference electrode, +950 mV. Pump the reagent solution at 0.28 mL/min and mix with the column effluent, allow to flow through detector. The chemiluminescence detector was a fluorescence detector with the light source removed.

CHROMATOGRAM
Retention time: 7
Internal standard: N,N-dimethylbenzylamine
Limit of detection: 140 ng/mL

OTHER SUBSTANCES
Simultaneous: brompheniramine, diphenhydramine, pyrilamine, pheniramine

KEY WORDS
tablets

REFERENCE

SAMPLE
Matrix: urine
Sample preparation: 500 μL Urine + N-ethylnordiazepam + 100 μL buffer, centrifuge at 11000 g for 30 s, inject a 500 μL aliquot onto column A with mobile phase A, after 0.6 min backflush column A with mobile phase A to waste for 1.6 min, elute column A with 250 μL mobile phase B, with 200 μL mobile phase C, and with 1.15 mL mobile phase D. Elute column A to waste until drugs start to emerge then elute onto column B. Elute column B to waste until drugs started to emerge, then elute onto column C. When all the drugs have emerged from column B remove it from the circuit, elute column C with mobile phase D, monitor the effluent from column C. Flush column A with 7 mL mobile phase E, with mobile phase D, and mobile phase A. Flush column B with 5 mL mobile phase E then with mobile phase D. (Buffer was 6 M ammonium acetate adjusted to pH 8.0 with 2 M KOH.)

HPLC VARIABLES
Column: A 10 × 2.1 12-20 μm PRP-1 spherical poly(styrene-divinylbenzene) (Hamilton); B 10 × 3.2 11 μm Aminex A-28 (Bio-Rad); C 25 × 3.2 5 μm C8 (Phenomenex) + 150 × 4.6 5 μm silica (Macherey-Nagel)
Mobile phase: A 0.1% pH 8.0 potassium borate buffer; B 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid; C MeCN:buffer 40:60 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); D MeCN:buffer 33:67 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); E MeCN:buffer 70:30 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.)
Column temperature: ambient (column A), 40 (columns B and C)
Flow rate: A 5; B-E 1
Injection volume: 500
Detector: UV 210, UV 235

CHROMATOGRAM
Retention time: k' 5.9
Internal standard: N-ethylnordiazepam (k' 2.1)
Limit of detection: 300 ng/mL

OTHER SUBSTANCES
Extracted: caffeine, cotinine, benzoylecgonine, secobarbital, oxazepam, phenobarbital, nordiazepam, diazepam, phenylpropanolamine, phentermine, amphetamine, phenmetrazine, lidocaine, ephedrine, pentazocine, methamphetamine, desipramine, nortriptyline, diphenhydramine, methadone, imipramine, flurazepam, amitriptyline, morphine, hydromorphone, hydrocodone
Interfering: codeine

SAMPLE

Matrix: blood

Sample preparation: 1 mL Plasma + 100 μL 200 ng/mL IS in MeOH + 1 mL 50 mM pH 10 borate buffer, vortex briefly, add to an Extrelut 3 SPE cartridge, let stand for 5 min, elute with 15 mL hexane:dichloromethane 50:50. Add the eluate to 3 mL 50 mM sulfuric acid, mix for 10 min, centrifuge at 3000 g for 10 min. Remove the aqueous layer and add it to 6 mL hexane:dichloromethane 50:50, wash for 5 min, centrifuge. Make the aqueous layer basic with 150 μL 28% ammonia, extract twice with 3 mL hexane:dichloromethane 50:50. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 30 × 4.6 5 μm Spherisorb cyano

Column: 250 × 4.6 5 μm Ultrasphere cyano

Mobile phase: MeCN:buffer 60:40 (Buffer was 50 mM KH_2PO_4 adjusted to pH 6.5 with 28% ammonia.)

Flow rate: 1

Injection volume: 20

Detector: E, 5100 A Coulochem, 5020 guard cell 1.00 V, 5011 analytical cell, detector 1 0.55 V, detector 2 0.80 V, output of detector 2 is monitored

CHROMATOGRAM

Retention time: 26.4

Internal standard: methylrisperidone (R68808) (14.3)

OTHER SUBSTANCES

Extracted: clomipramine, cyamemazine, desipramine, droperidol, flunitrazepam, haloperidol, imipramine, pipamperone, risperidone, trihexyphenidyl

Noninterfering: alprazolam, bromazepam, carbamazepine, chlorazepate, diazepam, diphenylhydantoin, estazolam, ethylbenzatropine, oxazepam, phenobarbital, triazolam, valproic acid

KEY WORDS

plasma; SPE

SAMPLE

Matrix: blood

Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 μL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 μL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES

Guard column: LC-8-DB (Supelco)
Column: 150 × 4.6 LC-8-DB (Supelco)
Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 2
Injection volume: 100
Detector: UV 228

CHROMATOGRAM

Retention time: 7.0
Internal standard: protriptyline (4)

OTHER SUBSTANCES

Extracted: acetazolamide, amitriptyline, chlordiazepoxide, chlorimipramine, desipramine, dextromethorphan, diazepam, diphenhydramine, doxepin, encainide, fentanyl, flecainide, fluoxetine, flurazepam, haloperidol, hydroxyethylflurazepam, ibuprofen, imipramine, lidocaine, maprotiline, methadone, methaqualone, mexiletine, midazolam, nordoxepin, nordiazepam, norfluoxetine, nortriptyline, norverapamil, pentazocine, promazine, propafenone, propoxyphene, propranolol, protriptyline, quinidine, temazepam, trazodone, trimipramine, verapamil
Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin
Interfering: norchlorimipramine

KEY WORDS

plasma; SPE

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8

Injection volume: 50
Detector: UV 256

CHROMATOGRAM

Retention time: 11.50
Limit of detection: <120 ng/mL

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 4 mL water + 1 mL 160 ng/mL thioridazine + 0.8 mL 1 M NaOH + 15 mL n-heptane:isoamyl alcohol 98.5:1.5, shake for 10 min, centrifuge at 700 g, remove the organic layer, repeat the extraction twice more. Combine

the organic layers and evaporate them to dryness, reconstitute the residue in 10 mL 50 mM HCl, add 20 mL diethyl ether, shake for 3 min. Remove the aqueous layer and make it alkaline with 1 mL 5 M NaOH, add 10 mL n-heptane:isoamyl alcohol 98.5:1.5, shake for 10 min, centrifuge at 700 g. Remove the organic layer and evaporate it to dryness, dissolve the residue in 1 mL MeCN, inject a 50 μL aliquot. Urine. 20 mL Urine + 3 mL 1 M HCl + 1 mL 1 μg/mL thioridazine, wash with diethyl ether, make the aqueous layer alkaline with 5 M NaOH, add n-heptane:isoamyl alcohol 98.5:1.5, shake for 10 min, centrifuge at 700 g. Remove the organic layer and evaporate it to dryness, dissolve the residue in 1 mL MeCN, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 150 × 4 5 μm Nucleosil C18
Mobile phase: MeCN:pyridine:THF:100 mM pH 3.5 acetate buffer 68.9:0.1:1:30 containing 20 mM sodium perchlorate
Flow rate: 0.7
Injection volume: 10-50
Detector: E, Yanaco Model VMD-101, glassy carbon working electrode 0.95 V, Ag/AgCl reference electrode

CHROMATOGRAM

Retention time: 8.0
Internal standard: thioridazine (9.5)
Limit of detection: 0.5 ng/mL (urine), 2 ng/mL (plasma)

OTHER SUBSTANCES

Extracted: methotrimeprazine (levomepromazine)

KEY WORDS

plasma

REFERENCE

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 4.4

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen,

procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

SAMPLE
Matrix: tissue
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH and 5 mL water. Homogenize kidney with a kitchen grinder. Weigh out a 5 g sample and add 20 mL MeCN with continuous gentle mixing, mix vigorously on a vibromixer at 1500 rpm for 30 s, sonicate for 2 min, centrifuge at 4000 g for 5 min. Mix 7.5 mL sample extract and 40 mL 10% NaCl and add to SPE cartridge, wash with 1 mL 10 mM sulfuric acid, wash with 2 mL air, elute with 2 mL acidic MeCN. Place eluate in a washed tube and evaporate to 300 μL at 70° under a stream of nitrogen, mix gently, add 1 mL n-hexane, mix on a vibromixer for 30 s, centrifuge at 2000 g, inject a 50 μL aliquot of the aqueous phase. (Acidic MeCN was 1 mL 50 mM sulfuric acid and 100 mL MeCN. The washed tube was prepared by rinsing with concentrated ammonia, water, and acetone and drying under a stream of nitrogen.)

HPLC VARIABLES
Guard column: 10 × 2.1 37-50 μm Bondapak C18
Column: 300 × 3.9 Bondapak C18
Mobile phase: MeCN:water 55:45 containing 2.46 g/L anhydrous sodium acetate, pH adjusted to 6.5 with acetic acid
Flow rate: 1.2
Injection volume: 50
Detector: UV 240

CHROMATOGRAM
Retention time: 25
Limit of detection: 6 ng/g

OTHER SUBSTANCES
Extracted: azaperol, carazolol, acepromazine, xylazine, azaperone, haloperidol, propiomazine

SAMPLE
Matrix: tissue
Sample preparation: Condition a Bond-Elut C18 SPE cartridge with 5 mL MeOH and 5 mL water. Cut pig kidney or liver into small pieces and homogenize. 5 g Homogenate + 10 mL MeCN, shake, vortex for 30 s, sonicate for 3 min, vortex for 30 s, sonicate for 3 min, centrifuge at 10000 g for 20 min. Add 7.5 mL supernatant + 40 mL 10% NaCl to

the SPE cartridge at about 1 mL/min, do not allow cartridge to dry out, wash with 850 µL 10 mM sulfuric acid, dry with air, elute with 3.5 mL acidic MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 300 µL 10 mM sulfuric acid, vortex briefly, add 1 mL hexane, vortex for 30 s, centrifuge at 2000 g for 5 min, inject an aliquot of the aqueous layer. (Acidic MeCN was 1 mL 50 mM sulfuric acid in 100 mL MeCN.)

HPLC VARIABLES

Guard column: Hypersil 5 µm SAS C1
Column: 250 mm long 5 µm Hypersil SAS C1
Mobile phase: MeCN:water 50:50 containing 0.77 g/L ammonium acetate
Flow rate: 2
Detector: E, ESA Model 5100A Coulochem, first electrode +0.4 V, second electrode (which was monitored) +0.7 V, Model 5020 guard cell after pump but before injector at +0.75 V

CHROMATOGRAM

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

SAMPLE

Matrix: solutions

HPLC VARIABLES

Guard column: 30 × 3.2 7 μm SI 100 ODS (not commercially available)
Column: 150 × 3.2 7 μm SI 100 ODS (not commercially available)
Mobile phase: MeCN:buffer 31.2:68.8 (Buffer was 6.66 g KH_2PO_4 and 4.8 g 85% phosphoric acid in 1 L water, pH 2.3.)
Flow rate: 0.5-1
Detector: UV 202, 225, 264, 324

CHROMATOGRAM

Retention time: 6.0
Internal standard: 5-(4-methylphenyl)-5-phenylhydantoin (7.3)

OTHER SUBSTANCES

Also analyzed: aspirin, carbamazepine, chlordiazepoxide, clonazepam, caffeine, diazepam, doxylamine, ethosuximide, furosemide, haloperidol, hydrochlorothiazide, methocarbamol, methotrimeprazine, nicotine, oxazepam, procaine, promazine, propafenone, propranolol, salicylamide, temazepam, tetracaine, thiopental, triamterene, verapamil, zolpidem, zopiclone

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 1 mg/mL solution in MeOH, inject a 5 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Lichrosphere cyanopropyl
Mobile phase: Carbon dioxide:MeOH:isopropylamine 94:6:0.03
Column temperature: 50

Flow rate: 3
Injection volume: 5
Detector: UV 254

CHROMATOGRAM
Retention time: 6.5

OTHER SUBSTANCES
Simultaneous: triflupromazine, carphenazine, methotrimeprazine, promazine, perphenazine, deserpidine, thiothixene, reserpine
Also analyzed: acetophenazine, ethopropazine, promethazine, propiomazine

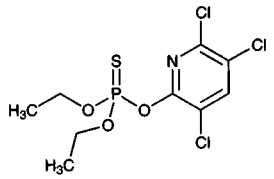
Chlorpyrifos



Molecular formula: $C_9H_{11}Cl_3NO_3PS$
Molecular weight: 350.59
CAS Registry No.: 2921-88-2
Merck Index: 2242

SAMPLE

Matrix: bile, blood, tissue, urine
Sample preparation: Blood. Extract three time with MeCN:phosphoric acid 99:1, centrifuge. Combine the supernatants and evaporate them to dryness under vacuum, reconstitute, inject an aliquot. Urine. Inject directly. Bile. Dilute 1:4 with water, inject an aliquot. Tissue. Homogenize whole fish, extract three times with 10 mL acetone:phosphoric acid 99:1. Combine the supernatants and evaporate them to dryness under vacuum, reconstitute, inject an aliquot.

HPLC VARIABLES

Column: RCM 100 C18 (Waters)
Mobile phase: Gradient. A was MeCN:water:phosphoric acid 10:89:1. B was MeCN:phosphoric acid 99:1. A:B 0:100 for 3 min, to 25:75 over 12 min, maintain at 25:75 for 10 min.
Flow rate: 1.5
Injection volume: 200
Detector: UV 280

CHROMATOGRAM

Retention time: 23

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE
Matrix: food
Sample preparation: 30 g Rice + 50 mL MeOH, let stand for 48 h with occasional manual shaking, remove a 1 mL aliquot of the MeOH layer and evaporate it to near dryness under a stream of nitrogen, add 1 mL hexane, shake, repeat extraction. Combine the hexane layers and add them to a Sep-Pak Florisil SPE cartridge, elute with 3 mL acetone:hexane 40:60. Combine the eluates and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES
Guard column: Guard-Pak (Waters)
Column: 250 × 3.9 Nova-Pak C18

Mobile phase: Gradient. MeCN:water from 40:60 to 70:30 over 12 min or Isocratic MeCN: water 60:40
Flow rate: 1
Injection volume: 10
Detector: UV 225

CHROMATOGRAM
Retention time: 18 (gradient), 10 (isocratic) (for chlorpyrifos-methyl)
Limit of detection: 600 ng/g

OTHER SUBSTANCES
Extracted: methacrifos, fenitrothion, etrimfos, carbaryl, pirimphos-methyl (UV 247)

KEY WORDS
rice; SPE

SAMPLE

Matrix: eggs, tissue
Sample preparation: Prepare a metal chelate affinity chromatography (MCAC) column by adding 1.5 mL of thoroughly mixed Chelating Sepharose Fast-Flow suspension in EtOH: water 20:80 (Pharmacia) to a 150 × 10 glass column, allow to drain, wash with three 2 mL portions of water, add 2 mL 10 mM copper(II) sulfate in water, wash with two 2 mL portions of water. Condition an SBD-RPS extraction membrane (3M Company, St. Paul, MN) with 2 mL MeOH and 2 mL 100 mM HCl. Add 20 mL 100 mM pH 4.0 sodium succinate buffer to 3 g pig kidney, pig muscle, cow liver, or whole chicken egg, vortex for 1 min and shake for 10 min on a horizontal shaker. Add 20 mL MeOH, sonicate for 5 min and centrifuge at 2666 g for 10 min at 4°. Filter the supernatant through a Whatman 541 filter paper. Add the clear supernatant to the MCAC column. Wash sequentially with 2 mL 100 mM sodium succinate buffer, 2 mL water, 2 mL MeOH, 2 mL water, and with 500 μL McIlvaine-EDTA-NaCl buffer. Elute with 3 mL McIlvaine-EDTA-NaCl buffer and adjust the eluate to pH 1.3 with 400 μL 4 M HCl. Add the eluate directly to the extraction membrane to prevent crystallization of EDTA. Wash the membrane with 1 mL 100 mM HCl and elute with four 250 μL portions of MeOH:25% ammonia 97:3, evaporate the eluate to dryness under the nitrogen at 40°. Reconstitute the dry residue with 250 μL 10 mM oxalic acid in water, vortex, sonicate. Inject a 100 μL aliquot. (The sodium succinate buffer was 100 mM succinic acid, pH adjusted to 4.0 with 10 M NaOH. Prepare the McIlvaine buffer by dissolving 12.9 g citric acid monohydrate and 10.9 g Na_2HPO_4 in 1 L water. The McIlvaine-EDTA-NaCl buffer was 100 mM EDTA and 500 mM NaCl in McIlvaine buffer. Protect all solutions from light.)

HPLC VARIABLES

Guard column: 5 × 3.0 PLRP-S (Polymer Laboratories)
Column: 250 × 4.6 8 μ PLRP-S (Polymer Laboratories)
Mobile phase: Gradient. A was 10 mM oxalic acid in water adjusted to pH 2.0 with 4 M HCl. B was MeCN. A:B from 85:15 to 60:40 over 16 min.
Flow rate: 1
Injection volume: 100
Detector: F ex 406 em 515 following post-column reaction. The column effluent mixed with reagent pumped at 1 mL/min and the mixture flowed through a 600 μL reaction coil to the detector. (Reagent was 5% zirconyl chloride octahydrate in water stored at 4°.)

CHROMATOGRAM

Retention time: 19

Limit of detection: 0.92 ng/g (pig kidney), 0.66 ng/g (pig muscle), 1.05 ng/g (cow liver), 0.39 ng/g (chicken egg)
Limit of quantitation: 4 ng/g (pig kidney)

OTHER SUBSTANCES
Extracted: doxycycline, oxytetracycline, tetracycline
Also analyzed: demeclocycline

KEY WORDS
cow; liver; pig; kidney; muscle; chicken; metal chelate affinity chromatography; MCAC; SPE; post-column reaction

REFERENCE

SAMPLE
Matrix: eggs, tissue
Sample preparation: Condition an Anagel-TSK Chelate-SPW column with 25 μL 50 mg/mL copper sulfate in water and 500 μL. Homogenize 2 g sliced chicken liver with 1.2 mL 1 M pH 4 citrate buffer and 12 mL ethyl acetate for 1 min. Homogenize 2 g sliced tissue with 1.2 mL 1 M pH 5 citrate buffer and 12 mL ethyl acetate for 1 min. Shake 2 g blended egg with 1.2 mL 1 M pH 5 citrate buffer and 12 mL ethyl acetate for 15 min. Centrifuge the mixture at 11000 rpm for 10 min, decant the supernatant, reextract the residue with two 12 mL portions of ethyl acetate. Add 10 g anhydrous sodium sulfate to the combined supernatants, swirl, let stand for 5-10 min, filter (Whatman 1PS phase-separating filter paper). Evaporate the filtrate to dryness or to an oily residue on a rotary evaporator under reduced pressure at 40°, reconstitute the residue in 2 mL MeOH by vortexing, filter (0.2 μm syringe filter). Add 1.5 mL of the filtrate to the Anagel column at 0.36 mL/min, wash with 500 μL water, 500 μL MeOH, and 500 μL water. Elute the contents of the Anagel column onto the analytical column with mobile phase A, after 11 min remove the Anagel column from the circuit, elute column B using gradient elution of mobile phase A:B, monitor the effluent from column B. (Prepare 1 M pH 4 or 5 citrate buffer as follows: dissolve 192 g citric acid in approximately 800 mL water, adjust pH value with 1 M NaOH and make up to 1 L with water.)

HPLC VARIABLES
Guard column: 5 × 3 PLRP-S
Column: 150 × 4.6 5 μm Polymer Labs PLRP-S
Mobile phase: Gradient. A:B 100:0 for 11 min, to 0:100 in 10 min, maintain at 0:100 for 10 min. A was buffer. B was MeCN:MeOH:buffer 25:10:65. (Buffer was 100 mM KH_2PO_4 containing 10 mM citric acid, and 10 mM EDTA).
Flow rate: 1
Injection volume: 1500
Detector: UV 350

CHROMATOGRAM
Retention time: 27.3
Limit of detection: 6 ng/g

OTHER SUBSTANCES
Extracted: tetracycline, oxytetracycline, demeclocycline

KEY WORDS

SAMPLE

Matrix: feed

Sample preparation: Weigh out 10 or 20 g feed, add 100 mL acid-acetone solution, shake for 2 min. Adjust the pH to less than 1.2 with HCl, shake, repeat until the pH is stable, shake for 45 min. Centrifuge at 2500 rpm for 5 min and filter. Dilute the filtrate with acid-acetone solution, inject a 20 μL aliquot. (Acid-acetone solution was acetone:water:4 M HCl 65:30:5.)

HPLC VARIABLES

Guard column: C18 Alltima (Alltech)

Column: 150 × 4.6 5 μm C18 Alltima (Alltech)

Mobile phase: Gradient. A was MeOH. B was buffer. A:B 35:65 for 5 min, to 60:40 over 8 min, maintain at 60:40 for 7 min, re-equilibrate at initial conditions for 5 min (Buffer was 100 mM sodium acetate containing 50 mM calcium chloride and 25 mM disodium EDTA, adjusted to pH 6.5 with concentrated HCl or 40% NaOH.)

Flow rate: 1.5

Injection volume: 20

SAMPLE
Matrix: milk
Sample preparation: Fill a disposable polypropylene column (Bio-Rad Econo-Pac column) with Chelating Sepharose Fast Flow (Pharmacia) and condition it with 10 mL water, 1.5 mL 100 mM copper sulfate, and 100 mL water. Condition a 6 mL SupelClean ENVI-Chrom P SPE cartridge with 2 mL MeOH and 5 mL water. Homogenize 10 g tissue with 20-30 mL 100 mM pH 4 succinic acid buffer. Centrifuge the homogenate at 2000 g at 10° for 15-20 min. Add the supernatant to the metal chelate affinity column, wash sequentially with 5 mL 500 mM NaCl, 10 mL water, 10 mL MeOH, 10 mL water, and 3 mL McIlvaine buffer, discard the clear effluent. Elute with 8 mL McIlvaine-EDTA-NaCl buffer. Add the eluate to the SPE cartridge under gravity, rinse the column with 2.5 mL water, add the rinse to the SPE cartridge. Wash the SPE cartridge with 2.5 mL water. Dry the SPE cartridge by drawing air through it for 2-3 min. Elute with 5 mL MeOH. Evaporate the eluate to dryness under nitrogen at 40-50°, dissolve the residue in 1 mL water. Inject a 100 μL aliquot. (McIlvaine buffer was 500 mM NaCl and 100 mM EDTA (Carson, M.C. J. AOAC Int. 1993, 76, 329).)

HPLC VARIABLES

SAMPLE

Matrix: milk

Sample preparation: Place 22 g 40 μm, 18% load, end-capped bulk C18 material (Analytichem) in a 50 mL syringe barrel, wash with 2 column volumes hexane, dichloromethane, and MeOH, vacuum aspirate until dry. 2 g Bulk C18 material + 50 mg disodium EDTA + 50 mg oxalic acid + 500 μL milk + 10 μL MeOH, blend gently in a glass mortar and pestle for 30 s, place the mixture in a 10 mL plastic syringe barrel plugged with a piece of filter paper. Compress column volume to 4.5 mL, add a 100 μL pipette tip on the column outlet to restrict the flow. Wash with 8 mL hexane, remove excess hexane with positive pressure, elute with 8 mL MeCN:ethyl acetate 75:25. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 500 μL mobile phase, sonicate for 5-10 min, centrifuge at 17000 g for 5 min, filter the supernatant (0.45 μm), inject a 20 μL aliquot of the filtrate.

SAMPLE

Matrix: milk

Sample preparation: Prepare a column as follows. Swirl Chelating Sepharose Fast Flow resin (Pharmacia) in its bottle, add it to a polypropylene column to give a bed volume of 1.0-1.2 mL, wash 3 times with 2 mL portions of water, wash with 2 mL 10 mM copper sulfate, wash with two 2 mL portions of water. Centrifuge 5 mL milk at 10° at 1500 g for 15 min, remove the lower layer and add it to 10 mL succinate buffer, mix, centrifuge at 1500 g for 30 min, add the supernatant to the column. Wash with 2 mL succinate buffer, wash with 2 mL water, wash with 2 mL MeOH, wash with 2 mL water, wash with 700 μL citrate/phosphate buffer (be careful not to disturb bed), elute with 2.5 mL citrate/phosphate buffer (column is white and eluate is blue). Filter (Amicon Centricon 30, MW 30000 cut-off; pre-washed by centrifuging with 2 mL water) while centrifuging at 5000 g for 30-90 min, inject a 600 μL aliquot of the ultrafiltrate. (Prepare succinate buffer by dissolving 11.8 g succinic acid in 980 mL water, adjust pH to 4.0 with 10 M NaOH, make up to 1 L. Prepare the citrate/phosphate buffer by dissolving 12.9 g citric acid monohydrate, 10.9 g Na_2HPO_4, 37.2 g disodium EDTA dihydrate, and 29.2 g NaCl in 1 L water.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm PLRP-S (Polymer Labs)
Mobile phase: Gradient. MeCN:MeOH:10 mM oxalic acid 0:0:100 for 1 min, to 22:8:70 over 5 min, maintain at 22:8:70 for 11 min, return to initial conditions.

SAMPLE

Matrix: tissue

Sample preparation: Condition a 6 mL 500 mg Bond-Elut C8 SPE cartridge with 6 mL MeOH, 6 mL water, and 2 mL buffer A. Condition a 6 mL SPE cartridge containing 3 g

wet XAD-2 resin with 10 mL MeOH, 10 mL water, and 2 mL buffer B. Homogenize (Ultra-Turrax) 2 g tissue with 20 mL succinate buffer for 1 min, centrifuge at 30 897 g for 15 min, filter (Whatman No. 1 paper) the supernatant, dilute 12 mL filtrate with 6 mL buffer B. For sheep liver add the diluted filtrate to the C8 SPE cartridge, wash with 10 mL buffer A, wash with 2 mL water, elute with 6 mL MeOH. For cow kidney add the diluted filtrate to the XAD-2 cartridge, wash with 14 mL buffer A, wash with 2 mL water, elute with 6 mL MeOH. Inject 25 μL 50 mg/mL copper sulfate and 500 μL water onto column A then load 1.5 mL of the eluate from the SPE cartridge at 0.36 mL/min onto column A. Wash to waste with 500 μL water, 500 μL MeOH, and 500 μL water then elute the contents of column A onto column B with mobile phase A. After 11 min remove column A from the circuit and elute column B with a linear gradient of A:B from 100:0 to 0:100 over 10 min, maintain at 0:100 for 10 min, re-equilibrate to 100:0. Monitor the effluent from column B. (Buffer A was 100 mM KH_2PO_4 containing 3 g/L pentanesulfonic acid. Succinate buffer was 60 g succinic acid in 1 L water adjusted to pH 4.0 with 1 M NaOH. Buffer B was 37.2 g disodium EDTA and 3 g pentanesulfonic acid in 1 L succinate buffer.)

HPLC VARIABLES

Column: A 10 × 6 10 μm Anagel-TSK-Chelate-SPW (Anachem); B 5 × 3 5 μm Polymer Labs. PLRP-S + 150 × 4.6 5 μm Polymer Labs. PLRP-S
Mobile phase: A was buffer. B was MeCN:MeOH:buffer 25:10:65. (Buffer was 100 mM KH_2PO_4 containing 10 mM citric acid and 10 mM EDTA.)
Injection volume: 1500
Detector: UV 350

CHROMATOGRAM

Retention time: 25
Limit of detection: 20 μg/kg

OTHER SUBSTANCES

Extracted: demeclocycline, oxytetracycline, tetracycline

KEY WORDS

SPE; sheep; cattle; liver; kidney; column-switching

SAMPLE

Matrix: tissue
Sample preparation: Condition a 3 mL 500 mg Bond Elut C18 SPE cartridge with saturated aqueous disodium EDTA. Blend 5 g tissue with two 20 mL portions and one 10 mL portion of 100 mM pH 4.0 disodium EDTA-McIlvaine buffer at high speed, centrifuge at 850 g for 5 min each time. Combine the supernatants, centrifuge at 850 g for 15 min, filter. Add the filtrate to the SPE cartridge, wash with 20 mL water, air-dry by aspiration for 5 min, elute with 10 mL ethyl acetate followed by 20 mL MeOH:ethyl acetate 5:95, evaporate the eluate to dryness under reduced pressure at 30°, dissolve the residue in 100 μL water, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 2 μm TSK Gel Super Octyl (Tosoh)
Mobile phase: MeCN:0.05% aqueous trifluoroacetic acid 20:80
Flow rate: 0.5
Injection volume: 50
Detector: MS, Finnigan MAT TSQ 7000 Triple-Stage Quadrupole, electrospray voltage 4.5 kV, gas sheath flow 483 kPa nitrogen, collision gas argon, collision offset -25 V, m/z 479

CHROMATOGRAM
Retention time: 8.3

OTHER SUBSTANCES
Extracted: doxycycline, oxytetracycline, tetracycline

KEY WORDS
cow; SPE; kidney; liver; muscle

SAMPLE
Matrix: tissue
Sample preparation: Prepare an affinity column by filling a 10 mL column with 5 mL chelating Sepharose, allow to settle, wash with 20 mL 0.5% copper(II) sulfate solution, eliminate air bubbles by agitation, wash with 15 mL 50 mM pH 4 succinate buffer, do not allow to dry. Condition an Analytichem Bond Elut C18 SPE cartridge with 10 mL MeOH and 10 mL water, do not allow to dry. Homogenize 4 g minced kidney with 40 mL 50 mM pH 4 succinate buffer, sonicate for 10 min, centrifuge at 9000 rpm for 10 min, filter the supernatant through paper, repeat the extraction. Combine the supernatants and pass them through the affinity column at 5-7 mL/min, wash with 10 mL water, wash with 30 mL MeOH, wash with 20 mL water, elute with 50 mL 50 mM pH 4 succinate buffer containing 3.7% Titriplex III (ethylenedinitrilotetracacetic acid, disodium salt dihydrate). Add the eluate to the SPE cartridge at 5-7 mL/min, wash with 10 mL water, dry with air aspiration for 10 min, elute with 5 mL MeOH:MeCN 1:1, evaporate the eluate at 40° under a stream of nitrogen, dissolve the residue in 500 µL mobile phase, inject an aliquot. Protect from light through process. (The affinity columns may be re-used up to 15 times by washing with 20 mL water then 20 mL EtOH:water 20:80 then conditioning as described above.)

HPLC VARIABLES
Guard column: Perisorb RP-8
Column: two 300 × 100 5 µm Chromspher C8 columns (cat. no. 28262) in series
Mobile phase: MeCN:10 mM pH 2 oxalic acid 20:80
Flow rate: 0.8
Detector: UV 365

CHROMATOGRAM
Retention time: 7
Limit of quantitation: 30 ng/g

OTHER SUBSTANCES
Simultaneous: tetracycline, oxytetracycline, demethylchlortetracycline, methacycline, doxycycline

SAMPLE
Matrix: tissue

Sample preparation: Condition a 500 mg Separcol SI C18 SPE cartridge (Anapron) with 2 mL MeOH and 4 mL buffer. Homogenize 5 g muscle with 20 mL buffer and 3 mL n-hexane:dichloromethane 1:3 at 4°, centrifuge at 2400 g at 4° for 30 min, remove the supernatant, repeat homogenization with 10 mL buffer. Combine the supernatants, slowly add with constant stirring a volume of 1 g/mL trichloroacetic acid in water equal to 10% of the supernatant volume, stir for another min, keep in ice for 15 min, filter through paper, add to SPE cartridge at no more than 10 mL/min, wash with 2 mL water, elute with 4 mL 10 mM oxalic acid in MeOH, inject a 10 µL aliquot. (Buffer was 15 g $Na_2HPO_4.2H_2O$ + 13 g citric acid monohydrate + 3.72 g EDTA in 1 L water, pH 4.)

HPLC VARIABLES

Guard column: 5 µm LiChrospher 100 RP-18 guard column
Column: 250 × 4 5 µm HP Spherisorb ODS 2
Mobile phase: MeOH:MeCN:10 mM aqueous oxalic acid 20:35:45
Flow rate: 1
Injection volume: 10
Detector: UV 360

CHROMATOGRAM

Retention time: 8.5
Limit of detection: 50 ng/g

OTHER SUBSTANCES

Simultaneous: tetracycline, oxytetracycline

SAMPLE

Matrix: tissue
Sample preparation: Condition a 500 mg Bond Elut cyclohexyl (CH) SPE cartridge with 10 mL MeOH and 10 mL water. Powder (domestic food blender) frozen kidney or muscle. Homogenize (Silverson Machines) 5 g powdered tissue and 45 mL 100 mM glycine in 1 M HCl for 1 min, add 5 g ammonium sulfate, shake for 30 s, let stand for 10 min, centrifuge at 2000 rpm for 15 min, filter (glass wool) the supernatant, repeat the extraction with 50 mL 100 mM glycine in 1 M HCl. Combine the filtrates and centrifuge an aliquot at 2200 rpm for 10 min, add a 20 mL aliquot of the supernatant to the SPE cartridge, wash with 10 mL water, elute with 7 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 65°, reconstitute the residue in 500 µL MeCN:20 mM oxalic acid 20:80, inject a 50 µL aliquot.

HPLC VARIABLES

Guard column: Chromspher C8 (Chrompack)
Column: 200 × 3 5 µm Chromspher C8 glass column (Chrompack)
Mobile phase: Gradient. A was MeCN. B was MeCN:20 mM oxalic acid 10:90. A:B from 10:90 to 20:80 over 2 min, maintain at 20:80 for 8 min, to 25:75 over 1 min, maintain at 25:75 for 9 min, return to initial conditions over 5 min, re-equilibrate for 10 min.
Flow rate: 0.4
Injection volume: 50
Detector: F ex 390 em 490 following post-column reaction. The column effluent mixed with 750 mM aluminum chloride (degas by sonication, store in a brown bottle) pumped at 0.6 mL/min and flowed through a 13.7 m × 0.3 mm i.d. PTFE column at 60° to the detector.

CHROMATOGRAM

Retention time: 20.4
Limit of detection: 70 ng/g (kidney), 30 ng/g (muscle)

OTHER SUBSTANCES

Extracted: oxytetracycline, tetracycline

KEY WORDS

pig; cow; poultry; kidney; muscle; SPE; post-column reaction; complexation

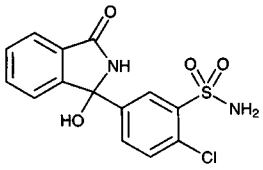
Chlorthalidone



Molecular formula: $C_{14}H_{11}ClN_2O_4S$
Molecular weight: 338.77
CAS Registry No.: 77-36-1
Merck Index: 2246
Lednicer No.: 1 322

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 250 ng xipamide, mix for 10 s, add 10 mL dichloromethane:2-propanol 75:25, shake for 10 min. Centrifuge at 2000 g for 10 min at 4°. Remove the organic phase and evaporate it to dryness under a stream of nitrogen at 50°. Reconstitute the residue in 200 µL mobile phase , mix for 10 s. Centrifuge at 6500 g for 10 min. Inject a 40 µL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 4 × 4 5 µm LiChrospher 100 RP-18
Column: 250 × 4 5 µm Supelcosil LC-18 (Supelco)
Mobile phase: n-Propanol:buffer 5:95 (Buffer was 50 mM sodium dodecyl sulfate in 10 mM pH 5.8 sodium phosphate buffer.)
Flow rate: 1.3
Injection volume: 40
Detector: UV 225

CHROMATOGRAM

Retention time: 6.05
Internal standard: xipamide (8.58)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES

Extracted: albuterol, atenolol

SAMPLE
Matrix: urine
Sample preparation: 2 mL Urine + 2 mL 1 M pH 4.1 NaH_2PO_4 + 4 mL ethyl acetate, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic phase and add it to 5 mL 100 mM pH 7.5 Na_2HPO_4, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL MeCN:10 mM pH 3.0 phosphate buffer, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm LiCHrosorb RP-18
Mobile phase: Gradient. MeCN:10 mM pH 3.0 phosphate buffer 10:90 for 1.5 min then to 35:65 over 2 min
Column temperature: 50
Flow rate: 1.5
Injection volume: 5
Detector: UV 271

CHROMATOGRAM

Retention time: 4.1
Limit of quantitation: 1000 ng/mL

OTHER SUBSTANCES

Extracted: chlorothiazide, hydrochlorothiazide, quinethazone, methyclothiazide, clopamide, furosemide, metolazone, mefruside, bendroflumethiazide, cyclopenthiazide, bumetanide
Simultaneous: indapamide, clorexolone, ethacrynic acid
Noninterfering: aspirin, albuterol, allopurinol, alprenolol, atenolol, captopril, carbimazole, clonidine, coloxyl, danthron, diazepam, digoxin, doxepin, glibenclamide, hydralazine, indomethacin, labetalol, metformin, methyldopa, metoprolol, mianserin, minoxidil, nifedipine, nitrazepam, oxazepam, oxprenolol, pindolol, prazosin, propranolol, senokot, theophylline, trifluoperazine

SAMPLE

Matrix: urine
Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)
Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)
Flow rate: 1
Injection volume: 5
Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 9.0 (A), 9.8 (B)
Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))
Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, hydroflumethiazide, dichlorphenamide, trichloromethiazide, methyclothiazide, benzthiazide, cyclothiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone, flumethiazide
Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

SAMPLE
Matrix: urine
Sample preparation: Make 5 mL urine alkaline (pH 9-10), add 2 g NaCl, extract twice with 6 mL ethyl acetate. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 200 μL MeCN/water, inject a 10-20 μL aliquot.

HPLC VARIABLES
Column: 100 × 4 5 μm SGE 100 GL-4 C18P (Scientific Glass Engineering)
Mobile phase: MeCN:MeOH:water:trifluoroacetic acid 4.5:10.5:85:0.5
Flow rate: 0.8 or 1
Injection volume: 10-20
Detector: MS, ZAB2-SEQ (VG), PSP source coupled to LC, source 250°, probe 240-260°, scan m/z 200-550 or UV 270

CHROMATOGRAM
Retention time: 2.5
Limit of detection: 100 ng (by MS)

OTHER SUBSTANCES
Extracted: amiloride, triamterene, furosemide, benzthiazide, bendroflumethiazide

SAMPLE
Matrix: urine
Sample preparation: Condition a 1 mL 100 mg Bond-Elut C8 SPE cartridge with 500 μL MeOH and 500 μL water. 2 mL urine + 300 μL 1 μg/mL triamterene in MeOH, add to

the SPE cartridge, wash with 500 μL water, elute with 500 μL MeOH, filter (0.45 μm) the eluate, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm HP-LiChrospher 100 RP 18
Mobile phase: Gradient. MeCN:buffer from 0:100 to 30:70 over 5 min, maintain at 30:70. (Buffer was 3.45 g $NaH_2PO_4.H_2O$ + 700 μL propylamine hydrochloride in 500 mL water, adjust pH to 3 with concentrated phosphoric acid.)
Flow rate: 1
Injection volume: 5
Detector: UV 230

CHROMATOGRAM
Retention time: 6.1
Internal standard: triamterene (3.8)
Limit of detection: 6 ng/mL

OTHER SUBSTANCES
Simultaneous: atenolol, oxprenolol, reserpine, spironolactone
Noninterfering: metabolites

KEY WORDS
SPE

SAMPLE
Matrix: urine
Sample preparation: Buffer urine to 4.9 by mixing with an equal volume of pH 4.9 200 mM sodium phosphate buffer. Inject a 40 μL aliquot onto column A with mobile phase A, after 3 min backflush the contents of column A onto column B with mobile phase B and start the gradient. At the end of the run re-equilibrate for 10 min.

HPLC VARIABLES
Column: A 20 × 4 5 μm Hypersil octadecylsilica ODS; B 200 × 4.6 5 μm Shiseido SG-120 polymer-based C18
Mobile phase: A water; B Gradient. MeCN:buffer from 7:93 to 15:85 over 3.5 min, to 50:50 over 8.5 min, maintain at 50:50 for 11 min (Buffer was 6.9 g $NaH_2PO_4.H_2O$ in 1 L water, pH adjusted to 3.1 with phosphoric acid.)
Flow rate: 1
Injection volume: 40
Detector: UV 230

CHROMATOGRAM
Retention time: 13.7
Limit of detection: 1000 ng/mL

OTHER SUBSTANCES
Extracted: acetazolamide, amiloride, bendroflumethiazide, benzthiazide, bumetanide, caffeine, carbamazepine, chlorothiazide, clopamide, dichlorfenamide, ethacrynic acid, furosemide, hydrochlorothiazide, metyrapone, probenecid, spironolactone, triamterene, trichlormethiazide

KEY WORDS
column-switching; optimum detection wavelengths vary for each drug

SAMPLE

Matrix: urine

Sample preparation: 5 mL Urine + 50 μL 100 μg/mL 7-propyltheophylline in MeOH + 200 μL ammonium chloride buffer + 2 g NaCl, extract with 6 mL ethyl acetate by rocking at 40 movements/min for 20 min and centrifuging at 800 g for 5 min, repeat extraction, combine organic layers, evaporate to dryness at 40° under a stream of nitrogen. Reconstitute in 200 μL MeCN:water 15:85 and inject 20 μL aliquots. (Ammonium chloride buffer was 28 g ammonium chloride in 100 mL water with the pH adjusted to 9.5 with concentrated ammonia solution.)

HPLC VARIABLES

Column: 75 × 4.6 3 μm Ultrasphere ODS

Mobile phase: Gradient. MeCN:100 mM ammonium acetate adjusted to pH 3 with concentrated phosphoric acid. From 10:90 to 15:85 over 2 min to 55:45 over 3 min to 60:40 over 3 min. Kept at 60:40 for 1 min, decreased to 10:90 over 1 min and equilibrated at 10:90 for 2 min.

Flow rate: 1

Injection volume: 20

Detector: UV 270

CHROMATOGRAM

Retention time: 4.7

Internal standard: 7-propyltheophylline (4.5)

Limit of detection: 200 ng/mL

OTHER SUBSTANCES

Simultaneous: xipamide, bumetanide, acetazolamide, amiloride, bendroflumethiazide, buthiazide, benzthiazide, canrenone, caffeine, clopamide, cyclothiazide, ethacrynic acid, furosemide, hydrochlorothiazide, mesocarb, piretanide, polythiazide, probenecid, spironolactone, torsemide, triamterene

Interfering: morazone, diclofenamide

SAMPLE

Matrix: urine

Sample preparation: Direct injection into column A with mobile phase A for 1 min then back flush onto column B with mobile phase B.

HPLC VARIABLES

Column: A 20 × 2.1 30 μm Hypersil ODS-C18; B 250 × 4 Hypersil ODS-C18

Mobile phase: A Water; B Gradient. MeCN:buffer 15:85 for 1.5 min then to 80:20 over 8 min. Keep at 80:20 for 2.5 min then re-equilibrate with 15:85. (Buffer was 50 mM NaH_2PO_4 + 1.4 mL propylamine hydrochloride per liter adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 50

Detector: UV 230

CHROMATOGRAM

Retention time: 7.5

Limit of detection: 4 ng/mL.

OTHER SUBSTANCES

Simultaneous: bumetanide, ethacrynic acid, acetazolamide, amiloride, bendroflumethiazide, cyclothiazide, furosemide, hydrochlorothiazide, probenecid, spironolactone, triamterene

REFERENCE

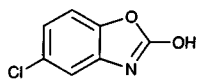
Chlorzoxazone



Molecular formula: $C_7H_4ClNO_2$
Molecular weight: 169.57
CAS Registry No.: 95-25-0
Merck Index: 2249
Lednicer No.: 1 323

SAMPLE

Matrix: blood
Sample preparation: 500 μL Serum + 1 mL 200 mM pH 4.75 sodium acetate buffer + 500 μL 0.2% sodium chloride containing 1000 U β-glucuronidase, vortex, incubate at 37° for 3 h. Add 100 μL 20 μg/mL IS, 400 μL 10% perchloric acid and 4 mL ethyl acetate, vortex for 5 min, centrifuge at 1200 g for 5 min. Remove the organic layer and evaporate it under a gentle stream of nitrogen at 40°. Reconstitute the residue in 50 μL mobile phase, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 2 μm TSK gel Super-ODS (A) or 100 × 4.6 5 μm Hypersil ODS (B)
Mobile phase: MeCN:0.15% pH 5.0 ammonium acetate 10:90
Flow rate: 0.3
Injection volume: 10
Detector: UV 287

CHROMATOGRAM

Retention time: 7 (A), 11 (B)
Internal standard: 5-chloro-2-methylbenzoxazole (12 (A); 19 (B))
Limit of quantitation: 10 ng/mL (A)

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

serum; pharmacokinetics

SAMPLE

Matrix: blood
Sample preparation: Evaporate 100 μL 100 μg/mL phenacetin in MeOH into the bottom of a tube with a stream of nitrogen, add 1 mL plasma, vortex for 1 min, add 1 mL 50 mM sulfuric acid, add four 125 mg portions of ammonium sulfate with vortexing and heating on a steam bath after each addition, add 5 mL ether, vortex, centrifuge at 5000 rpm for 5 min, freeze in dry ice/acetone. Remove the organic layer and filter (0.5 μm) it, evaporate to dryness under a stream of nitrogen on a steam bath, reconstitute the residue in 100 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 10 μm μBondapak C18
Mobile phase: MeOH:water 40:60
Flow rate: 2
Injection volume: 20

Detector: UV 280

CHROMATOGRAM
Retention time: 8.5
Internal standard: phenacetin (6)
Limit of detection: 80 ng

OTHER SUBSTANCES
Extracted: metabolites
Noninterfering: acetaminophen

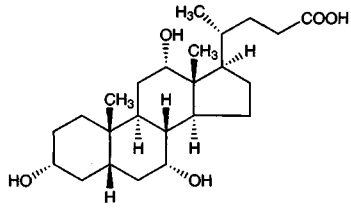
Cholic acid



Molecular formula: $C_{24}H_{40}O_5$
Molecular weight: 408.58
CAS Registry No.: 81-25-4
Merck Index: 2258

SAMPLE

Matrix: bile, blood

Sample preparation: Serum. 100-200 µL Serum + 1 mL MeOH, mix, sonicate for 15 min. Remove a 600 µL aliquot of the supernatant and evaporate it to dryness under a stream of nitrogen, reconstitute with 1 mL 50 mM pH 7.0 phosphate buffer, add to a Sep-Pak C18 SPE cartridge, wash with 2 mL MeOH:water 20:80, elute with 4 mL MeOH:water 80:20. Evaporate the eluate to dryness under reduced pressure at 40°, reconstitute with 1 mL MeOH. Remove a 500 µL aliquot and add it to 50 µL 100 µM lauric acid in MeOH, add 50 µL 0.1 mg/mL KOH on MeOH, evaporate to dryness under a stream of nitrogen, add 100 µL 1 mg/mL dicyclohexyl-18-crown-6 in MeCN, add 100 µL 25 mM 1-bromoacetylpyrene in MeCN, mix, heat at 40° for 30 min, cool, inject an 8 µL aliquot. Bile. Mix 10 µL bile with 10 mL 50 mM pH 7.0 phosphate buffer, add a 1 mL aliquot to a Sep-Pak C18 SPE cartridge, wash with 2 mL MeOH:water 20:80, elute with 4 mL MeOH:water 80:20. Evaporate the eluate to dryness under reduced pressure at 40°, reconstitute with 1 mL MeOH. Remove a 500 µL aliquot and add it to 50 µL 100 µM lauric acid in MeOH, add 50 µL 0.1 mg/mL KOH on MeOH, evaporate to dryness under a stream of nitrogen, add 100 µL 1 mg/mL dicyclohexyl-18-crown-6 in MeCN, add 100 µL 25 mM 1-bromoacetylpyrene in MeCN, mix, heat at 40° for 30 min, cool, inject an 8 µL aliquot.

HPLC VARIABLES

Column: 100 × 8 10 µm Model RCM-100 Radial-Pak A (Waters)
Mobile phase: Gradient. MeCN:MeOH:water 100:50:40 for 30 min then 100:50:20 (step gradient).
Flow rate: 2
Injection volume: 8
Detector: F ex 370 em 440

CHROMATOGRAM

Retention time: 32
Internal standard: lauric acid (56)
Limit of detection: 10 pmole
Limit of quantitation: 50 pmole

OTHER SUBSTANCES

Extracted: chenodiol, deoxycholic acid, glycochenodeoxycholic acid, glycocholic acid, glycodeoxycholic acid, glycolithocholic acid, glycoursodeoxycholic acid, lithocholic acid, ursodiol

KEY WORDS

derivatization; serum; SPE

SAMPLE

Matrix: solutions

Sample preparation: Mix an aliquot of solution (or hydrolyzed bile) with a 50% molar excess of triethylamine in MeCN, warm briefly, add a 50% molar excess of 100 mM 2-bromoacetophenone in MeCN, heat at 80-90° for 45-60 min, evaporate to dryness, reconstitute with dioxane (Caution! Dioxane is a carcinogen!), filter (0.47 μm), inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Partisil 10/25 ODS
Mobile phase: Gradient. n-Heptane:dioxane 90:10 for 3 min then n-heptane:dioxane:isopropanol 70:25:5 (step gradient). (Caution! Dioxane is a carcinogen!)
Flow rate: 1.2
Detector: UV 254

CHROMATOGRAM
Retention time: 26
Limit of quantitation: 5 pmole

OTHER SUBSTANCES
Simultaneous: chenodiol, deoxycholic acid, hyodeoxycholic acid, lithocholic acid, ursodiol

KEY WORDS
derivatization

SAMPLE
Matrix: solutions
Sample preparation: Treat a solution in MeOH with a slight excess of tetramethylammonium hydroxide in MeOH, evaporate to dryness under a stream of nitrogen, reconstitute with MeCN, add a 2-10 fold excess of 9-(chloromethyl)anthracene in cyclohexane, heat at 75° for 15 min, very dilute solutions may require longer times), dilute with MeCN, inject an aliquot.

HPLC VARIABLES
Column: 300 mm long "Fatty Acid" reversed-phase (Waters)
Mobile phase: MeOH:water 88:12 (A) or 82:18 (B)
Flow rate: 0.75
Detector: UV 254

CHROMATOGRAM
Retention time: 20

OTHER SUBSTANCES
Simultaneous: chenodiol, deoxycholic acid, glycochenodeoxycholic acid, glycocholic acid, glycodeoxycholic acid

KEY WORDS
derivatization

SAMPLE
Matrix: solutions

Sample preparation: Mix 200 μL of a solution of bile acids with 50 μL 2.1 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, add 300 μL 10 mM tetrakis(decyl)ammonium bromide in 100 mM pH 7.0 phosphate buffer, heat at 40° for with sonication 10 min, add 300 μL 5.1 μM IS in MeCN, sonicate at room temperature for 1 min, inject a 50 μL aliquot. (Prepare 2-bromoacetyl-6-methoxynaphthalene by stirring equimolar amounts of 2-acetyl-6-methoxynaphthalene (Janssen Chimica, Belgium) and phenyltrimethylammonium tribromide in THF at room temperature for 3 h (Phosphorus and Sulfur 1985, 25, 357), purify by column chromatography on silica gel with chloroform:petroleum ether 50:50 (mp 109-112°) (Chromatographia 1992, 33, 13).)

HPLC VARIABLES

Column: 250 × 4.6 Ultracarb 5 ODS
Mobile phase: Gradient. A was water. B was MeCN:MeOH 60:40. A:B 55:45 for 20 min, to 30:70 over 10 min, maintain at 30:70 for 25 min, return to initial conditions over 5 min.
Column temperature: 35
Flow rate: 1.2
Injection volume: 50
Detector: F ex 300 em 460

CHROMATOGRAM

Retention time: 16
Internal standard: 6-methoxynaphthacyl ester of lauric acid (36)
Limit of detection: 1-2 pmole

OTHER SUBSTANCES

Simultaneous: chenodiol, deoxycholic acid, lithocholic acid, ursodiol

KEY WORDS

derivatization

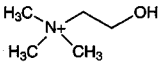
Choline



Molecular formula: $C_5H_{14}NO$

Molecular weight: 107.17

CAS Registry No.: 62-49-7, 67-48-1 (chloride), 4201-78-9 (dehydrocholate), 77-91-8 (dihydrogen citrate), 2016-36-6 (salicylate), 4499-40-5 (theophyllinate), 87-67-2 (bitartrate), 507-30-2 (gluconate)

Merck Index: 2259

SAMPLE

Matrix: CSF, dialysate, tissue

Sample preparation: Dialysate. Inject dialysate directly. Tissue. Homogenize brain tissue with 10 volumes 100 mM perchloric acid (Potter-Elvehjem), let stand on ice for 15 min, centrifuge at 4000 g for 15 min, inject a 0.5 μL aliquot. CSF. Deproteinize by passing through a 0.02 μm Anatop 10 syringe filter (Alltech), inject a 0.5 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 100 × 1 PEEK column packed with Aminex A-9 (Bio-Rad)

Mobile phase: 200 mM pH 8.0 K/Na 3/1 phosphate buffer containing 5 mM NaCl and 0.1% Kathon CG

Column temperature: 25

Flow rate: 0.06 (obtained with a flow splitter)

Injection volume: 0.5

Detector: E, AMOR (Spark Holland), platinum working electrode + 250 mV, carbon composite auxiliary electrode, Ag/AgCl reference electrode, following post-column reaction. The column effluent flowed through a reactor which had 4 U acetylcholine esterase (EC 3.1.1.7 type VI-S from electric eel, 260 IU/mg) and 4 U choline oxidase (EC 1.1.3.17 from Alcaligenes sp., 12.7 IU/mg) enclosed between two 0.01 μm cellulose nitrate filters (Sartorius) (construction details given) to the detector.

CHROMATOGRAM

Retention time: 8

Limit of detection: 10 fmole

OTHER SUBSTANCES

Extracted: acetylcholine

KEY WORDS

use metal-free tubing and connectors; solvent reservoir; column; reactor; and detector maintained at 25; rat; brain; human; post-column reaction; immobilized enzyme reactor

SAMPLE

Matrix: blood

Sample preparation: 250 μL Plasma + 25 μL 0.41 mM IS + 750 μL ice-cold 1 M formic acid in acetone, mix, centrifuge for 15 min. Remove the supernatant and add it to the SPE column, wash with 1 mL 100 mM pH 4.0 ammonium acetate, elute with 1 mL 2 M NaCl in MeOH:water 50:50, force out all liquid under pressure. Evaporate the eluate under a stream of nitrogen and keep under vacuum for 1 h, add 1 mL MeCN to the residue, mix, centrifuge, remove the supernatant, repeat the extraction. Combine the supernatants and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 300 μL freshly prepared 21.7 mM 3,5-dinitrobenzoyl chloride in pyridine (dry

pyridine over KOH), heat at 105° for 1 h, evaporate the pyridine under a stream of nitrogen, extract the residue with 300 μL water then with 200 μL water, combine the extracts, filter (0.3 μm), inject a 100 μL aliquot. (Preparation of SPE column. Let 300 mg AG 50W-X12 cation-exchange resin sit overnight in 1 mL 100 mM pH 4.0 ammonium acetate. Add the mixture to a Pasteur pipette with a glass wool plug, wash column with 1 mL 2 M NaCl in MeOH:water 50:50, activate column with 1 mL 100 mM pH 4.0 ammonium acetate.)

HPLC VARIABLES

Column: Two 300 × 4 10 μm μBondapak C18 in series
Mobile phase: MeCN:water 50:50 containing 5 mM sodium dodecyl sulfate and 0.1% acetic acid
Flow rate: 2-2.3
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Retention time: 13
Internal standard: 3-hydroxy-N,N,N-trimethylpropanaminium iodide (15) (Prepare by adding 18.5 g iodomethane to 10 g 3-hydroxy-N,N-dimethylaminopropane in 24 mL EtOH, stir, filter, add cold diethyl ether to the filtrate, filter. Combine precipitates, recrystallize from EtOH/diethyl ether, mp 203-4°)
Limit of quantitation: 1 nmole/mL

SAMPLE

Matrix: blood
Sample preparation: Add neostigmine and ethylhomocholine to plasma or red blood cells. 150 μL Plasma or red blood cells + 1 mL 400 mM perchloric acid, let stand at 0-4° for 30 min, centrifuge at 5500 g for 1 min. Remove a 750 μL aliquot of the supernatant and add it to 36 μL 10 M potassium acetate, let stand at 0-4° for 5 min, centrifuge at 5500 g for 1 min, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 1.9 Chrompack reversed phase
Column: 100 × 3 Chromspher 5 C18 (Chrompack) (Prepare column by washing with MeOH, MeOH:water 50:50, water, and 5 mg/mL sodium laurylsulfate in water (each wash 20 min at 1 mL/min). Thoroughly wash pump with water (column off line), wash column with water for 5 min and mobile phase for 1 h. Column should be disconnected from the precolumn, reactor, and detector. [Chromatographia, 1987,24,827].)
Mobile phase: 200 mM pH 8.0 potassium phosphate buffer containing 5 mM KCl
Flow rate: 0.6
Injection volume: 100
Detector: E, Spark Holland Amor, Pt working electrode +500 mV, carbon composite auxiliary electrode, Ag/AgCl reference electrode following an enzyme reactor. (Reactor was a 10 × 2.1 Hypersil APS-2 column, activate with glutaraldehyde, equilibrate with mobile phase for 20 min. Inject 80 U acetylcholine esterase (EC 3.1.1.7, type VI-S from electric eel, 260 IU/mg) and 40 U choline oxidase (EC 1.1.3.17 from Alcaligenes sp., 12.7 IU/mg) in 500 μL mobile phase onto the reactor and pump through at 0.05 mL/min for 20 min with mobile phase. [Chromatographia, 1987,24,827])

CHROMATOGRAM

SAMPLE

Matrix: tissue

Sample preparation: Homogenize brain tissue with 3 mL 400 mM perchloric acid containing 2 nmoles ethylhomocholine, centrifuge at 35000 g for 20 min, adjust pH of supernatant to about 4.2 with about 200 μL 7.5 M potassium acetate, centrifuge at 35000 g for 20 min. Add the supernatant to 100 μL 5 mM tetramethylammonium chloride, add 3 mL 2% ice-cold reineckate solution, let stand on ice for 1 h, centrifuge at 1000 g at 0° for 10 min. Remove the supernatant and dry the precipitate under vacuum overnight, add about 1 mL 5 mM silver tosylate in MeCN until the pink color disappears, centrifuge at 1000 g at 0° for 10 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 200 μL 20 mM pH 3.5 citrate-phosphate buffer, inject an aliquot.

HPLC VARIABLES

Guard column: ODS-5 (Bio-Rad)

Column: 150 mm long Bio-Sil ODS-5S (Bio-Rad)

Mobile phase: Buffer (Buffer was 10 mM sodium acetate buffered to pH 5 with 20 mM citric acid, containing 4.5 mg/L sodium octyl sulfate and 1.2 mM tetramethylammonium chloride.)

Flow rate: 0.8

Injection volume: 20

Detector: E, Bio Analytical Systems LC-4A, Pt electrode +0.5 V, Ag/AgCl reference electrode following post-column reaction detection. The column effluent mixed with 1 U/mL choline oxidase and 2 U/mL acetylcholinesterase in 200 mM pH 8.5 phosphate buffer pumped at 0.5 mL/min, the mixture flowed through a 30 m × 0.3 mm i.d. PTFE tube (2.5 min) to the detector

CHROMATOGRAM
Retention time: 3.6
Internal standard: ethylhomocholine (7.2)
Limit of detection: 1 pmole

OTHER SUBSTANCES
Extracted: acetylcholine

KEY WORDS
post-column reaction; rat; brain; immobilized enzyme reactor

SAMPLE
Matrix: tissue
Sample preparation: Sonicate 250 mg rat brain tissue with 6 mL 1 M formic acid containing 10 nmoles IS for 5 min, centrifuge at 4° at 10000 g for 20 min, add the supernatant to an equal volume of diethyl ether, add 5 mL water, shake, centrifuge at 2000 g for 5 min, discard the organic layer. Lyophilize the aqueous layer, dissolve the residue in 400 μL water, filter (0.45 μm). Add 30 μL reagent to the filtrate, mix, centrifuge at 10000 g for 5 min. Dissolve the precipitate in 300 μL water, add 50 mg Dowex 1x8, shake, centrifuge at 10000 g for 5 min, inject a 10 μL aliquot of the supernatant. (Reagent contained 20% KI and 18% iodine in water.)

HPLC VARIABLES
Column: 150 × 4.6 Nucleosil C18
Mobile phase: Buffer (Prepare buffer by dissolving 1.36 g sodium acetate. 3.72 disodium EDTA, 25 mg sodium octyl sulfate, and 1.2 mmoles tetramethylammonium chloride in 900 mL water, adjust pH to 5.0 with 200 mM citric acid, make up to 1 L.)
Column temperature: 37
Flow rate: 0.8
Injection volume: 10
Detector: E, Bioanalytical Systems LC-4B/17, TL-10A platinum electrode +500 mV, Ag/AgCl reference electrode following post-column reaction. The effluent from the column mixed with buffer pumped at 0.5 mL/min and the mixture flowed through an immobilized enzyme reactor to the detector. (Prepare buffer by dissolving 71.6 g $Na_2HPO_4.12H_2O$ and 372 mg disodium EDTA in 900 mL water, adjust pH to 8.5 with NaH_2PO_4, make up to 1 L. Prepare reactor by heating 200-400 mesh porous glass beads (pore size 400 Å, Electronucleonics, Fairfield NJ) in 5% nitric acid, wash with water, dry, add to 10% 3-aminopropyltriethoxysilane in toluene, reflux overnight. Suspend the beads in 2% glutaraldehyde in water at room temperature for 2 h. Dissolve 0.45 mg acetylcholinesterase (type III, EC.3.1.1.7, Sigma) and 16.6 mg choline oxidase (EC.1.1.3.17, Sigma) in 200 μL 50 mM pH 7.0 phosphate buffer containing 10 mM disodium EDTA, add 500 mg activated beads, pack in a 10 × 4 tube.)

CHROMATOGRAM
Retention time: 6
Internal standard: ethylhomocholine (Prepare ethylhomocholine by adding 3-dimethylamino-1-propanol to EtOH, add bromoethane. When reaction is complete add ether, filter off the precipitate and wash it with ether.) (8)
Limit of detection: 100 fmoles

OTHER SUBSTANCES
Extracted: acetylcholine

KEY WORDS
post-column reaction; rat; brain; immobilized enzyme reactor

REFERENCE

SAMPLE
Matrix: tissue
Sample preparation: Sonicate rat brain with ten volumes of 1 M formic acid:acetone 15:85 containing IS, centrifuge at 4° at 20000 g. Remove a 500 μL aliquot of the supernatant and add it to 2 mL heptane:chloroform 80:10, vortex. Remove the aqueous layer and add it to 250 μL 3 mg/mL sodium tetraphenylboron in 3-heptanone, vortex. Remove a 200 μL aliquot of the upper organic layer and add it to 50 μL 1 M HCl, vortex. Remove the aqueous layer and evaporate it to dryness under reduced pressure, reconstitute with mobile phase, inject a 30 μL aliquot.

HPLC VARIABLES
Guard column: C18 (Waters)
Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: 100 mM pH 7 KH_2PO_4 containing 10 μg/mL sodium octane sulfate and 600 μg/mL tetramethylammonium chloride
Flow rate: 1
Injection volume: 30
Detector: E, Chromatofield, Pt electrode +0.5 V following post-column reaction. The column effluent flowed through an immobilized enzyme reactor to the detector. (Prepare reactor by heating 200-400 mesh porous glass beads (pore size 350 Å, Sigma) in 5% nitric acid at 100° for 1 min, wash with water, dry, add to 10% 3-aminopropyltriethoxysilane in toluene, heat at 115° for 12 h. Suspend the beads in 2% glutaraldehyde in water at room temperature for 2 h. Dissolve 100 U acetylcholinesterase (type III, electric eel, Sigma) and 100 U choline oxidase (Alcaligenes, Sigma) in 1 mL 50 mM pH 7 phosphate buffer, add 120 mg activated beads, shake periodically, pack in a 20 × 2 tube.)

CHROMATOGRAM
Retention time: 4.5
Internal standard: ethylhomocholine bromide (Prepare ethylhomocholine by adding 3-dimethylamino-1-propanol to EtOH, add bromoethane, when reaction is complete add ether, filter off the precipitate and wash it with ether.) (7)

OTHER SUBSTANCES
Extracted: acetylcholine

SAMPLE

Matrix: tissue

Sample preparation: Homogenize (Nissei US-300T ultrasonic cell disrupter at 300 W and 20 kHz for 1 min) rat brain striatal tissue with 1 mL 1 μM ethylhomocholine in 50 mM perchloric acid, centrifuge at 4° at 20000 g for 15 min, filter (0.45 μm) the supernatant, inject a 10 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 4 74-149 μm plastic formed carbon (details in paper)

Column: 60 × 4 3 μm Acetylcholine Separation polymeric styrene column (Bioanalytical Systems)

Mobile phase: 50 mM pH 8.40 Phosphate buffer containing 1 mM disodium EDTA and 0.40 mM sodium 1-octanesulfonate

Column temperature: 35 ± 1

Flow rate: 0.7

Injection volume: 10

Detector: E, Bioanalytical Systems LC-4A, dual Pt working electrode +500 mV, Ag/AgCl reference electrode following post-column reaction. The effluent from the column flowed through a 5 × 4 immobilized enzyme reactor containing acetylcholinesterase and choline oxidase (Bioanalytical Systems) to the detector.

CHROMATOGRAM

Retention time: 3.5

Internal standard: ethylhomocholine (6.5)

OTHER SUBSTANCES

Extracted: acetylcholine

Noninterfering: 3,4-dihydroxybenzylamine, dopamine, norepinephrine

Matrix: blood
Sample preparation: Condition an Adsorbex CN SPE cartridge (E. Merck) with 1 mL MeCN. 1 mL Plasma + 1 mL 1/15 M pH 5.0 phosphate buffer (KH_2PO_4 and Na_2HPO_4) + 10 µL 40 IU/mL β-glucuronidase, incubate at 37° for 24 h, add 500 µL 200 mM NaOH, add 200 µL dimethyl sulfate (CAUTION! Highly Toxic!), heat at 37° for 20 min, add 200 µL triethylamine, add 10 mL n-hexane, extract. Add 8 mL of the organic phase to the SPE cartridge, wash with 1 mL toluene, aspirate to dryness under reduced pressure for 3 min, elute with 350 µL mobile phase, evaporate eluate at 40° under nitrogen, dissolve residue in 80 µL mobile phase, inject a 50 µL aliquot.

HPLC VARIABLES

Guard column: 5 µm LiChrospher 100 RP18 in a LiChroCART 4-4
Column: 125 × 4 5 µm LiChrospher 100 RP18
Mobile phase: MeCN:water 40:60
Flow rate: 1
Injection volume: 50
Detector: UV 304

CHROMATOGRAM

Retention time: 7.6
Limit of detection: 15 ng/mL

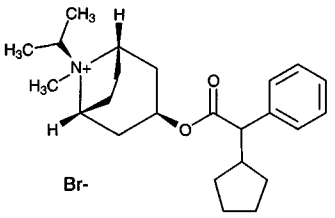
Ciclotropium bromide



Molecular formula: $C_{24}H_{36}BrNO_2$
Molecular weight: 450.46
CAS Registry No.: 85166-20-7

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 4 mL Plasma + 5.5 mL chloroform + 500 µL reagent A + 250 µL 1 M HCl, shake vigorously for 5 min, centrifuge at 10° at 2500 g for 30 min. Remove a 4 mL aliquot of the organic layer and add it to 2.4 mL 100 mM HCl, shake for 15 min, centrifuge at 20° at 2500 g for 10 min. Remove a 2 mL aliquot of the aqueous layer and add it to 1 mL 1 M NaOH, heat at 140-5° for 90 min (to hydrolyse ciclotropium), cool to room temperature, add 500 µL reagent A, adjust pH to 8.5-9.5 with 5 M HCl, add 2.6 mL chloroform, shake for 15 min, centrifuge at 20° at 2500 g for 10 min. Remove a 2 mL aliquot of the chloroform layer and add it to 1.4 mL 100 mM HCl, shake for 15 min, centrifuge at 20° at 2500 g for 10 min. Remove a 1 mL aliquot of the aqueous layer and add it to 1 mL MeOH, evaporate to dryness under reduced pressure, add three 3 mL portions of MeOH and evaporate to dryness each time, take up the residue in 200 µL 10 mg/mL flunoxaprofen chloride in MeCN (freshly prepared), heat at 110° for 15 min, evaporate to dryness under reduced pressure, add 1 mL ethyl acetate, add 1.3 mL 10 mM HCl, shake vigorously for 15 min, centrifuge at 20° at 2500 g for 10 min, discard the organic layer, wash the aqueous layer twice more with ethyl acetate, evaporate the aqueous layer to dryness under reduced pressure, reconstitute with 100 µL MeCN:MeOH: water 1:1:1, inject a 20 µL aliquot. Urine. 1 mL Urine + 100 µL 1 µg/mL IS in water + 2 mL 0.5 M NaOH, heat at 140-5° for 90 min (to hydrolyse ciclotropium), cool to room temperature, add 500 µL reagent B, adjust pH to 8.5-9.5 with 5 M HCl, add 2.6 mL chloroform, shake for 15 min, centrifuge at 20° at 2500 g for 10 min. Remove a 2 mL aliquot of the chloroform layer and add it to 1.4 mL 100 mM HCl, shake for 15 min, centrifuge at 20° at 2500 g for 10 min. Remove a 1 mL aliquot of the aqueous layer and add it to 1 mL MeOH, evaporate to dryness under reduced pressure, add three 3 mL portions of MeOH and evaporate to dryness each time, take up the residue in 200 µL 10 mg/mL flunoxaprofen chloride in MeCN (freshly prepared), heat at 110° for 15 min, evaporate to dryness under reduced pressure, add 1 mL ethyl acetate, add 1.3 mL 10 mM HCl, shake vigorously for 15 min, centrifuge at 20° at 2500 g for 10 min, discard the organic layer, wash the aqueous layer twice more with ethyl acetate, evaporate the aqueous layer to dryness under reduced pressure, reconstitute with 500 µL MeCN:MeOH: water 1:1:1, inject a 20 µL aliquot. (Prepare reagent A by mixing 100 mg dipicrylamine, 600 mg anhydrous sodium carbonate, and 10 mL water. Prepare reagent B by mixing 35 mg dipicrylamine and 10 mL 100 mM NaOH. Prepare dipicrylamine as follows (Caution! Dipicrylamine is potentially explosive and highly toxic, store moistened with 50% water!). Add 50 g 2,4-dinitrodiphenylamine to 420 g nitric acid (36° Bé. 52%, d = 1.33) heated to 62° over 2 h, heat at 62-90° for another 3 h, cool, filter, wash the product until it is free of acid, dry to obtain 2,2',4,4'-tetranitrodiphenylamine as a yellow solid (mp 187.4°). Add 50 g tetranitrodiphenylamine over 1 h to 500 g of a mixture of equal parts 92% sulfuric acid and 93% nitric acid at room temperature, after 4.5 h add to a large volume of ice water, filter, recrystallize the product from acetone to obtain dipicrylamine (2,2',4,4',6,6'-hexanitrodiphenylamine) as yellow crystals (mp 242.9°) (J.Am.Chem.Soc. 1919, 41, 1013). Prepare flunoxaprofen chloride as follows. Dissolve 1 mmole flunoxaprofen in 25 mL toluene, add a trace of DMF (J.Chromatogr. 1990, 528, 55), add 2.5 mL thionyl chloride, reflux for 30 min, remove solvent by evaporation, dry the residue under vacuum over KOH, recrystallize from dichloromethane (mp 73°) (J.Chromatogr. 1988, 427, 131).)

HPLC VARIABLES

Column: 150 × 3.9 5 µm Suplex pkb-100 (Supelco)

Mobile phase: MeCN:water 55:45 containing 1 mL/L 50% phosphoric acid and 0.6 g/L dodecyl sulfate.
Flow rate: 1
Injection volume: 20
Detector: F ex 310 em 365

CHROMATOGRAM

Retention time: 8.0
Internal standard: N-butyltropinium (11.1)
Limit of detection: 0.5 ng/mL (plasma), 10 ng/mL (urine)

SAMPLE
Matrix: solutions
Sample preparation: Mix a 50 μL aliquot of a solution in MeOH:triethylamine 99:1 with 20 μL 0.1% NAPIC in dry toluene, vortex briefly, let stand at room temperature in the dark for 30 min, add 50 μL 1% ethanolamine in MeOH, let stand at room temperature for 15 min, evaporate to dryness under reduced pressure, reconstitute with 100 μL mobile phase, sonicate for 30 s, inject a 20 μL aliquot. (NAPIC is (-)-(S)-naproxen isocyanate; synthesis is as follows (protect from light). Dissolve 1 g (+)-(S)-naproxen in 30 mL acetone, cool to 0°, add a solution of 700 μL triethylamine in 2 mL acetone dropwise, add a solution of 450 μL ethyl chloroformate in 2 mL acetone dropwise, stir at 0° for 15 min, add a solution of 310 mg sodium azide in 1 mL water dropwise (Caution! Sodium azide is highly toxic!), stir for 1 h, pour into 60 mL ice water, stir for 10 min, filter, wash the solid with two 50 mL aliquots of ice-water, dry under reduced pressure to obtain flunoxaprofen azide. Dissolve 100 mg flunoxaprofen azide in 3 mL dry toluene, reflux for 10-15 min, cool to room temperature, filter. Evaporate the filtrate to dryness under reduced pressure and dry under reduced pressure to obtain NAPIC as an oil that crystallized in the desiccator (mp 48°), store in a desiccator under reduced pressure.)

SAMPLE
Matrix: solutions
Sample preparation: Mix a 50 μL aliquot of a solution in MeOH:triethylamine 99:1 with 20 μL 0.1% FLOPIC in dry toluene, vortex briefly, let stand at room temperature in the dark for 30 min, add 50 μL 1% ethanolamine in MeOH, let stand at room temperature for 15 min, evaporate to dryness under reduced pressure, reconstitute with 100 μL mobile phase, sonicate for 30 s, inject a 20 μL aliquot. (FLOPIC is (-)-(S)-flunoxaprofen isocyanate; synthesis is as follows. Dissolve 1 g (+)-(S)-flunoxaprofen in 30 mL acetone, cool to 0°, add a solution of 500 μL triethylamine in 2 mL acetone dropwise, add a solution of 370 μL ethyl chloroformate in 2 mL acetone dropwise, stir at 0° for 15 min, add a solution

of 250 mg sodium azide in 1 mL water dropwise (Caution! Sodium azide is highly toxic!), stir for 1 h, pour into 60 mL ice water, stir for 10 min, filter, wash the solid with two 50 mL aliquots of ice-water, dry under reduced pressure to obtain flunoxaprofen azide. Dissolve 100 mg flunoxaprofen azide in 3 mL dry toluene, reflux for 10-15 min, cool to room temperature, filter. Evaporate the filtrate to dryness under reduced pressure and dry under reduced pressure to obtain FLOPIC as a crystalline solid (mp 93-94°), store in a desiccator under reduced pressure.)

HPLC VARIABLES

Column: 250 × 4.6 7 μm Nucleosil phenyl (A) or 200 × 4.6 5 μm Nucleosil cyano (B)
Mobile phase: MeOH:80 mM NaCl in water 68:32 (A) or n-hexane:isopropanol 88:12 (B)
Flow rate: 1
Injection volume: 20
Detector: F ex 296 em 356

CHROMATOGRAM

Retention time: 18.4 (R (A)), 22.4 (S (A)), 15.9 (R (B)), 18.6 (S (B))

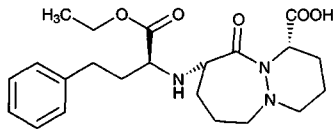
KEY WORDS

derivatization; chiral

REFERENCE

Martin,E.; Quinke,K.; Spahn,H.; Mutschler,E. (-)-(S)-Flunoxaprofen and (-)-(S)-naproxen isocyanate: two new fluorescent chiral derivatizing agents for an enantiospecific determination of primary and secondary amines, *Chirality*, **1989**, *1*, 223–234.

Cilazapril



Molecular formula: $C_{22}H_{31}N_3O_5.H_2O$
Molecular weight: 435.52
CAS Registry No.: 92077-78-6, 88768-40-5 (anhydrous)
Merck Index: 2332
Lednicer No.: 4 170

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

SAMPLE

Matrix: aqueous humor, blood
Sample preparation: Aqueous humor. Inject a 10 μL aliquot directly. Plasma. Condition a 3 mL C18 SPE cartridge (Varian) with two 3 mL portions of MeCN and 3 mL buffer. Add 2 mL buffer to 500 μL of plasma, mix, add to the SPE cartridge. Wash with 3 mL buffer. Remove moisture with vacuum (200 mbar) for 10 min. Elute with two 500 μL portions of MeCN:buffer 40:60. Vortex the eluate, inject a 10 μL aliquot. (Buffer was 100 mM Tris adjusted to pH 5.0 with HCl).

HPLC VARIABLES

Column: 300 × 4.6 5 μm endcapped ODS-Hypersil
Mobile phase: MeCN:DMF:10 mM NaH_2PO_4 15:6:79, adjusted to pH 3.0 with 85% phosphoric acid
Flow rate: 1
Injection volume: 10
Detector: UV 285

CHROMATOGRAM

Retention time: 12.0
Internal standard: ciprofloxacin
Limit of detection: 80 ng/mL (aqueous humor), 310 ng/mL (plasma)

OTHER SUBSTANCES

Extracted: cefotaxime, ofloxacin

KEY WORDS
plasma; SPE; ciprofloxacin is IS

SAMPLE
Matrix: blood, CSF, tissue
Sample preparation: Plasma, CSF. Mix 100 μL Plasma or CSF with 1.0 mL 100 mM phosphate buffer. Extract with 5 mL chloroform (Caution! Chloroform is a carcinogen!) containing 1.0% ethyl chloroformate by shaking with a reciprocal shaker for 10 min. Remove 4 mL organic phase, dry it with rotary evaporator at 40°, reconstitute the residue in 100 μL mobile phase and inject a 20 μL aliquot. Tissue. Homogenize brain sample in 100 mM pH 7.0 phosphate buffer 1:4. Extract 1 mL homogenate with 5 mL dichloromethane by shaking with a reciprocal shaker for 10 min. Remove 4 mL organic phase and back-extract with 4 mL 1 mM sodium hydroxide, extract the aqueous phase as described above for the plasma, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 6 Nucleosil 5C18
Mobile phase: MeOH:5 mM sodium lauryl sulfate 60:40, adjusted to pH 2.5 with phosphoric acid
Column temperature: 50
Flow rate: 1.2
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Internal standard: ciprofloxacin
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Extracted: enoxacin

SAMPLE
Matrix: blood, tissue
Sample preparation: Plasma. Mix 100 μL plasma with 900 μL 100 mM phosphate buffer, 100 μL 10 μg/mL IS and 5 mL chloroform:ethyl chloroformate 99:1, shake for 10 min, centrifuge at 1620 g for 5 min, evaporate the organic phase under reduced pressure, dissolve the residue in 100 μL MeOH:50 mM NaOH 2:1, inject a 20 μL aliquot. Tissue. Homogenate the cerebrum sample with 4 volumes of 100 mM phosphate buffer. Mix 1 mL homogenate with 100 μL 10 μg/mL IS and 5 mL dichloromethane, shake for 10 min, centrifuge at 1620 g for 5 min. Mix 4 mL 1 mM NaOH with 4 mL organic phase, shake for 10 min, centrifuge at 1620 g for 5 min, collect 3 mL aqueous phase and treat in a manner similar to that for the plasma sample, except for the IS addition. Inject a 20 μL aliquot. (Caution! Chloroform is a carcinogen!)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Nucleosil 5 C18
Mobile phase: MeOH:5 mM sodium dodecylsulfate adjusted to pH 2.5 with phosphoric acid

Flow rate: 0.8
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Internal standard: pipemidic acid

OTHER SUBSTANCES
Extracted: foscarnet
Simultaneous: enoxacin

Molecular formula: $C_{22}H_{36}O_8$
Molecular weight: 727.04
CAS Registry No.: 81845-44-5, 81703-55-1 (calcium salt)
Lednicer No.: 4 14

SAMPLE

Matrix: blood

Sample preparation: Condition a 1 mL 100 mg Bond Elut C2 SPE cartridge with two 1 mL portions of MeCN, with 1 mL water, and with 1 mL 1% phosphoric acid, do not allow to dry. Condition a Bond Elut CN SPE cartridge with two 1 mL portions of n-hexane. 250 μL Plasma + 50 μL 375 ng/mL carbacyclin in MeOH + 750 μL 1% phosphoric acid, add to the C2 SPE cartridge, wash with two 1 mL portions of water, wash with two 1 mL portions of MeOH:water 40:60, dry under vacuum for 10 min, wash with two 1 mL portions of n-hexane:MTBE 75:25, elute with 1 mL n-hexane:MTBE 20:80. Evaporate the eluate to dryness under reduced pressure, reconstitute with 100 μL MeOH, evaporate to dryness under a stream of air, add 10 mg solid potassium bicarbonate:sodium sulfate 1:1, add 50 μL 200 μM dibenzo-18-crown-6 in acetone, add 50 μL 1 mM 4-bromomethyl-7-acetoxycoumarin in acetone, stir at 50° for 30 min, cool, add 900 μL n-hexane, vortex, add to the CN SPE cartridge, wash with two 1 mL portions of n-hexane, wash with two 1 mL portions of n-hexane:ethyl acetate 80:20, dry under vacuum for 1 min, elute slowly with 1 mL MeCN. Evaporate the eluate to dryness under a stream of air at 30°, reconstitute the residue in 50 μL MeCN:water:trifluoroacetic acid 50:50:0.1, inject an aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 NewGuard RP18
Column: 250 × 4.6 5 μm Zorbax ODS
Mobile phase: MeCN:water:trifluoroacetic acid 55:44.9:0.1
Column temperature: 45
Flow rate: 1.5
Detector: F ex 370 em 466 following post-column reaction. The column effluent mixed with 100 mM NaOH pumped at 0.5 mL/min and the mixture flowed through a 4 mL knitted coil of PTFE tubing at 80° to the detector.

CHROMATOGRAM

Retention time: 31.3
Internal standard: carbacyclin (23.7)
Limit of quantitation: 5 ng/mL

KEY WORDS

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 214.6

CHROMATOGRAM

Retention time: 14.627

KEY WORDS

whole blood

Andersson,A.; Ehrsson,H. Determination of cisplatin and cis-diammineaquachloroplatinum(II) ion by liquid chromatography using post-column derivatization with diethyldithiocarbamate, *J.Chromatogr.B*, **1994**, *652*, 203–210.

SAMPLE
Matrix: blood
Sample preparation: 400 μL Plasma + 400 μL MeCN, mix, centrifuge at 4° at 3500 g for 5 min. Remove a 200 μL aliquot of the supernatant and add it to 100 μL 10 mM citric acid containing 100 μM cetyltrimethylammonium bromide and 700 μL dichloromethane, rotate for 10 min, centrifuge at 4° at 3500 g for 5 min, inject a 40 μL aliquot of the aqueous layer.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm Polymer RP (Brownlee)
Column: 100 × 4.6 BDS-Hypersil C18 (Before analyses pump 120 mL 50 mM cetyltrimethylammonium bromide in isopropanol:water 5:95 through the column at 30° to coat the column with cetyltrimethylammonium bromide.)
Mobile phase: 10 mM Citric acid containing 100 μM cetyltrimethylammonium bromide, adjusted to pH 5.0 with 5 M NaOH
Column temperature: 25
Flow rate: 0.7

Injection volume: 40
Detector: UV 290 following post-column reaction. The column effluent mixed with 117 μM potassium dichromate pumped at 0.2 mL/min and the mixture flowed through a 200 μL knitted coil of PTFE tubing at 30° and then mixed with 28.16 mM sodium bisulfite pumped at 0.2 mL/min. This mixture flowed through a 1 mL knitted coil of PTFE tubing at 30° to the detector. (The reaction coils were contained in a PCX 5000 Post Column Reaction Module (Pickering Laboratories, Mountain View CA).)

Evidence for their formation in vitro but not in vivo after concomitant administration of cisplatin and glutathione to rats and cancer patients, *J.Chromatogr.B*, **1995**, *669*, 247–263.

SAMPLE

Matrix: blood, formulations
Sample preparation: Whole blood. 5 mL Whole blood + 2 mL 10% trichloroacetic acid in water, mix thoroughly, let stand for 15 min, centrifuge for 20 min. Remove the supernatant and add it to 2 mL concentrated HCl, add 8 mL 10% trichloroacetic acid in water, mix, centrifuge for 15 min. Remove the supernatant and add it to 2 mL concentrated HCl, evaporate to near dryness with heat, dissolve the residue in 3 mL water, adjust the pH to 6, add 2 mL pH 8 sodium bicarbonate buffer, add 2 mL 1% bis(salicaldehyde)tetramethylethylenediamine in EtOH, warm for 15 min, cool, add 4 mL chloroform, mix well. Remove the chloroform layer and evaporate it to dryness, reconstitute with 100 μL MeOH, inject a 5 μL aliquot. Injections. Add 1 g cisplatin injection to 30 mL concentrated HCl, evaporate to dryness with heat, reconstitute with 10 mL water. Remove a 5 mL aliquot, add 2 mL pH 8 sodium bicarbonate buffer, add 2 mL 1% bis(salicaldehyde)tetramethylethylenediamine in EtOH, warm for 15 min, cool, add 4 mL chloroform, mix well. Remove a 2 mL aliquot of the chloroform layer and evaporate it to dryness, reconstitute with 1 mL EtOH, inject a 5 μL aliquot. (Preparation of bis(salicaldehyde)tetramethylethylenediamine is as follows. Stir 44.5 g 2-nitropropane and 84 mL 6 M NaOH with cooling, add 40 g bromine dropwise, add 165 mL EtOH, reflux gently for 3 h, pour into 500 mL ice-water, filter to obtain 2,3-dimethyl-2,3-dinitrobutane. Vigorously stir 17.6 2,3-dimethyl-2,3-dinitrobutane with 150 mL concentrated HCl at 50-60°, slowly add 75 g 20-mesh granular tin, reflux for 15 min, cool, make strongly alkaline with NaOH (Caution! Exothermic!), steam distil, collect 350 mL distillate. Add 100 g solid NaOH to the distillate to obtain 2,3-diamino-2,3-dimethylbutane as a separate layer (mp of oxalate 323-324°) (J. Am. Chem. Soc. 1955, 77, 6689). Stir 20 mmoles salicylaldehyde in 10 mL MeOH, add 10 mmoles 2,3-diamino-2,3-dimethylbutane in 6 mL MeOH dropwise, let stand for several h, collect the precipitate, recrystallize twice from MeOH to obtain bis(salicaldehyde)tetramethylethylenediamine as yellow needles (mp 117°) (Inorg. Chem. 1978, 7, 3389).)

HPLC VARIABLES
Column: 150 × 4.6 3 μm Hypersil ODS
Mobile phase: MeCN:MeOH:water 30:50:20
Flow rate: 0.4
Injection volume: 5
Detector: UV 254

CHROMATOGRAM
Retention time: 7
Limit of detection: 1 μg/mL

SAMPLE
Matrix: tissue
Sample preparation: Homogenize with four volumes saline at 4°, centrifuge at 100000 g at 4° for 1 h. Remove a 450 μL aliquot of the supernatant, filter (Millipore UFC 3GC 10000 molecular mass cut-off) with centrifuging at 4000 g at 4° for 30 min, inject a 20 μL aliquot of the supernatant

HPLC VARIABLES
Guard column: 50 × 4.6 5 μm Hitachi No. 3013-N
Column: 150 × 4.6 5 μm Hitachi No. 3013-N
Mobile phase: MeCN:10 mM NaCl 15:85
Column temperature: 40
Flow rate: 0.9
Injection volume: 100
Detector: UV 290 following post-column derivatization with 0.026 mM potassium dichromate at 0.6 mL/min and 6.6 mM sodium hydrogen sulfite at 0.3 mL/min using a 7000 × 0.5 mm or 30000 × 0.25 mm PTFE tube reactor.

CHROMATOGRAM
Retention time: 9
Limit of detection: 100 ng/g

KEY WORDS
rat; liver; kidney; ultrafiltrate; pharmacokinetics; post-column reaction; derivatization

REFERENCE

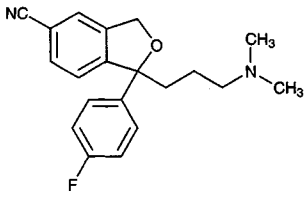
Citalopram



Molecular formula: $C_{20}H_{21}FN_2O$
Molecular weight: 324.40
CAS Registry No.: 59729-33-8, 59729-32-7 (HBr)
Merck Index: 2379

SAMPLE

Matrix: blood
Sample preparation: Condition a 10 mL 100 mg Isolute C2 SPE cartridge (International Sorbent Technology) with 1 mL MeCN and 500 μL 25 mM pH 11.5 phosphate buffer. Add 1 mL MeCN:25 mM pH 11.5 phosphate buffer 5:95, 1 mL plasma, 100 μL 500 ng/mL IS, and 1 mL MeCN:25 mM pH 11.5 phosphate buffer 5:95 to the SPE cartridge reservoir. Suck the solution through the cartridge (15-35 kPa). Wash with 1 mL water, dry under vacuum for 5 min, wash with 1 mL MeCN, dry. Add 2 mL 1% acetic acid in MeOH, leave for 5 min, draw solvent through cartridge with vacuum (15-35 kPa). Evaporate eluate with nitrogen at 70°. Reconstitute with 100 μL mobile phase. Inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 4 μm Nova Pak phenyl
Column: 100 × 8 4 μm Nova Pak phenyl RCM radial compression
Mobile phase: MeCN:70 mmol/L phosphate buffer 40:60
Flow rate: 3
Injection volume: 20
Detector: F ex 235 em 290

CHROMATOGRAM

Retention time: 3.9
Internal standard: LU 10-202-O (5.8)
Limit of detection: 800 pM

OTHER SUBSTANCES

Extracted: metabolites
Noninterfering: alprazolam, amitriptyline, buspirone, clomipramine, clozapine, diazepam, desipramine, desmethylclomipramine, flunitrazepam, flupenthixol, haloperidol, hydroxyzine, imipramine, levopromazine, lofepramine, maprotiline, mianserin, nitrazepam, nortriptyline, oxazepam, paroxetine, perphenazine, propiomazin, thioridazine, zolpidem

KEY WORDS

plasma; SPE

SAMPLE

Matrix: blood
Sample preparation: Take 2 mL plasma, add 2 mL pH 10 Titrisol buffer (Merck), add 8 mL diethyl ether, shake for 15 min, centrifuge at 2800 g for 5 min. Remove the organic phase and shake it with 100 μL 50 mM phosphoric acid for 15 min, centrifuge at 2800 g for 10 s. Remove the aqueous layer and vortex it with 2 mL diethyl ether for 10 s, centrifuge at 2800 g. Discard the organic layer and inject a 10-50 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:25 mM KH_2PO_4:water 45:55:10
Flow rate: 0.6
Injection volume: 10-50
Detector: UV 254

CHROMATOGRAM
Retention time: 10.8
Internal standard: citalopram

OTHER SUBSTANCES
Simultaneous: metapramine
Noninterfering: indalpine, diazepam, amitriptyline, clobazam, levomepromazine, norclobazam, triazolam, monodesmethyltrimipramine, flunitrazepam, alimemazine, alprazolam, amineptine, caffeine, desmethylflunitrazepam, diazepam, dibenzepine, estazolam, ethyl loflazepate, loprazolam, lorazepam, meprobamate, nitrazepam, nordiazepam, nortriptyline, oxazepam, viloxazine
Interfering: carbamazepine

KEY WORDS
plasma; citalopram is IS

SAMPLE
Matrix: blood
Sample preparation: 1-2 mL Plasma + 50 μL 10 μg/mL desipramine in MeOH, make up to 3 mL with 100 mM NaOH, vortex for 1 min, add to a 3 mL Extrelut SPE cartridge, elute with 15 mL diethyl ether. Add the eluate to 50 μL 5 mM phosphoric acid, evaporate under a stream of air at 40°. Add 1 mL diethyl ether to the residual solution, vortex for 20 s, centrifuge at 2800 g for 5 min, inject a 20 μL aliquot of the aqueous layer.

HPLC VARIABLES
Guard column: 5 × 6 μBondapak C18 guard-pak
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:25 mM KH_2PO_4:water 41:50:9
Flow rate: 0.8
Injection volume: 20
Detector: UV 239

CHROMATOGRAM
Retention time: 11.5
Internal standard: desipramine (14.5)
Limit of detection: 0.8 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: metoclopramide, oxazepam, dihydroergotamine, lorazepam, bromazepam, methotrimeprazine, cisapride, clobazam, diazepam, cyamemazine, alimemazine
Noninterfering: heptaminol, meprobamate, caffeine

SAMPLE

Matrix: blood

Sample preparation: 1 mL Plasma + 100 μL 1 μg/mL benzoctamine in 10 mM HCl + 100 μL 1 μg/mL desmethylbenzoctamine in 10 mM HCl + 50 μL 1 M NaOH + 6 mL heptane:isoamyl alcohol 98.5:1.5, shake for 15 min, centrifuge at 8° at 2100 g for 6 min. Remove the organic layer and add it to 1.2 mL 100 mM HCl, shake for 15 min, centrifuge at 8° at 2100 g for 15 min. Discard the organic phase and add 1 mL 1 M pH 9.4 sodium carbonate buffer to the aqueous phase, add 150 μL toluene:isoamyl alcohol 85:15, vortex for 15 min, centrifuge at 8° at 2100 g for 3 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 60 μL mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm acetylated β-Cyclobond (Astec)

Mobile phase: MeCN:1% diethylamine 22:78 adjusted to pH 6.1 with acetic acid

Flow rate: 0.8

Injection volume: 50

Detector: F ex 240 em 296

CHROMATOGRAM
Retention time: 14.6 (S-(+)), 15.8 (R-(-))
Internal standard: benzoctamine (7.3), desmethylbenzoctamine (6.5)
Limit of quantitation: 3 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; chiral

SAMPLE
Matrix: serum
Sample preparation: 1 mL Serum + 500 μL 750 mM pH 10 sodium bicarbonate/carbonate buffer + 50 μL IS in EtOH:water 50:50 + 8 mL heptane:isoamyl alcohol 98:2, shake at 250 cycles/min for 5 min, centrifuge at 1500 g for 10 min, freeze in dry ice/EtOH. Remove the organic layer and add it to 150 μL 22 mM pH 2.5 KH_2PO_4/phosphoric acid buffer, shake at 250 cycles/min for 5 min, centrifuge at 1500 g for 10 min, freeze in dry ice/EtOH. Discard the organic layer, inject a 65 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 250 × 4.6 Supelco C18
Mobile phase: MeCN:buffer 45:55 (Buffer was 44 mM KH_2PO_4 containing 1.5 mL/L triethylamine, adjusted to pH 2.5 with phosphoric acid.)
Flow rate: 1.5
Injection volume: 65
Detector: UV 240

CHROMATOGRAM

Retention time: 5.56
Internal standard: 1-(3-(dimethylamino)propyl)-1-(p-chlorophenyl)-1,3-dihydroisobenzofuran-5-carbonitrile (LU 10-202) (Lundbeck, Copenhagen) (8.33)
Limit of quantitation: 2 ng/mL

OTHER SUBSTANCES

Extracted: metabolites, amitriptyline, nortriptyline
Simultaneous: chlorprothixene, clomipramine, clozapine, flupenthixol, haloperidol, levomepromazine, perphenazine, zuclopenthixol
Noninterfering: benzodiazepines
Interfering: 8-hydroxyclomipramine

KEY WORDS

serum

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 259

CHROMATOGRAM

Retention time: 14.48

Limit of detection: <120 ng/mL

KEY WORDS

whole blood; plasma; interferences may occur—compounds(all of which are extracted) elute in this order tenoxicam; iproniazid; methocarbamol; methotrexate; caffeine; nialamide; colchicine; cytarabine; benzoylecgonine; acetaminophen; diazoxide; dacarbazine; sulfinpyrazole; flumazenil; sulpride; morphine; atenolol; toloxatone; terbutaline; albuterol; phenobarbital; ranitidine; tiapride; phenol; chlormezanone; aspirin; metformin; ritodrine; codeine; sultopride; amisulpride; naltrexone; lisinopril; benzocaine; nizatidine; nalorphine; mephenesin; naloxone; sotalol; carteolol; procainamide; carbamazepine; bromazepam; nalbuphine; nadolol; procarbazine; dihydralazine; omeprazole; strychnine; acebutolol; glutethimide; chlorpropamide; glipizide; triazolam; prazosin; flunitrazepam; clonazepam; metoclopramide; melphalan; estazolam; tolbutamide; ephedrine; clonidine; pindolol; clobazam; minoxidil; disopyramide; nitrazepam; dextromethorphan; tofisopam; zopiclone; debrisoquine; sulindac; alprazolam; cycloguanil; lorazepam; methaqualone; ketamine; piroxicam; metoprolol; nifedipine; quinine; mephentermine; prilocaine; pentazocine; oxazepam; tiaprofenic acid; quinidine; celiprolol; ajmaline; yohimbine; lidocaine; secobarbital; viloxazine; mepivacaine; meperidine; doxylamine; labetalol; temazepam; amodiaquine; benperidol; droperidol; hydroxychloroquine; zolpidem; ketoprofen; alminoprofen; cicletanine; moclobemide; chloroquine; cocaine; timolol; nomifensine; ticlopidine; acenocoumarol; vindesine; mexiletine; dipyridamole; trazodone; pipamperone; pyrimethamine; benazepril; vincristine; metapramine; chlordiazepoxide; oxprenolol; warfarin; clorazepate; flecainide; phencyclidine; thiopental; fenfluramine; metipranolol; triprolidine; naproxen; buprenorphine; verapamil; buspirone; tianeptine; midazolam; bupivacaine; carbinoxamine; loprazolam; cetirizine; chlorpheniramine; moperone; cibenzoline; medifoxamine; astemizole; vinblastine; nicardipine; bisoprolol; diltiazem; glibornuride; reserpine; aconitine; nitrendipine; diazepam; mianserin; ramipril; haloperidol; tetracaine; alprenolol;

SAMPLE
Matrix: tissue
Sample preparation: Add 5 mL 1 M HCl to the tissue, vortex for 1 min, sonicate for 10 min, and centrifuge at 2100 g for 20 min. Remove the supernatant and add 5 mL 1 M EDTA in 4 M NaOH. Adjust the pH to 12.2 ± 0.1 with 10 M NaOH, keep at room temperature for 2 h. Add 5 mL diethyl ether to the sample, vortex for 1 min, shake for 4 min, and centrifuge at 2100 rpm for 2 min. Remove the diethyl ether layer and dry it under nitrogen at 80°. Add another 5 mL of diethyl ether to the aqueous phase, vortex, centrifuge, and add the ether layer to the same vial that contains the residue from the previous extraction. Dry under nitrogen at 80°, dissolve the residue in 200 μL of 1% formic acid, vortex for 5 min, filter (0.2 μm), inject a 50 μL aliquot of the filtrate.

HPLC VARIABLES
Guard column: 5 μm LiChrospher 100 RP-18e

SAMPLE
Matrix: tissue
Sample preparation: Condition a 3 mL 500 mg WCX-SPE weak cation-exchange SPE cartridge (Baker) with 10 mL EtOH, 3 mL water, 3 mL 100 mM pH 6 sodium dihydrogen phosphate, and 3 mL water. Wash a RidaScreen immunoaffinity (IA) cartridge (Bioman Products, Canada) with 2 mL pH 7.4 phosphate buffered saline (PBS). Add 30 mL 10 mM HCl to 6 g tissue, shake for 20 s, sonicate for 15 min. Shake and heat at 80° for 30 min. Cool at -15°, centrifuge at 9200 g at 5° for 20 min. Adjust the pH of the supernatant to 6 with 1 M NaOH. Add to the SPE cartridge, wash with 4 mL water and 4 mL EtOH. Elute with 5 mL 2% ammonium hydroxide in EtOH. Evaporate eluate to 100 μL under a stream of nitrogen at 30°. Dilute to 1 mL with PBS. Add 1 mL to the IA cartridge, wash with 500 μL PBS, wash with 1 mL EtOH:water 20:80. Elute with 2 mL EtOH:water 80:20. Evaporate the eluate to 100 μL under a stream of nitrogen at 30°, dilute to 400 μL with mobile phase B, mix. Inject a 150 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeOH. B was water containing 10 mM acetic-acid ammonium acetate buffer adjusted to pH 4.6 with acetic acid. A:B from 30:70 to 70:30 over 5 min
Flow rate: 0.8
Injection volume: 150
Detector: UV 245

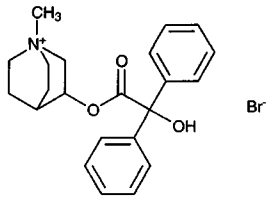
Clidinium bromide



Molecular formula: $C_{22}H_{26}BrNO_3$
Molecular weight: 432.36
CAS Registry No.: 3485-62-9
Merck Index: 2412

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 13.27

SAMPLE

Matrix: formulations
Sample preparation: Dilute with water to a concentration of 850 μg/mL clodronic acid. Inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: AG5 (Dionex)
Column: 250 × 4 15 μm IonPac AS5 (Dionex)
Mobile phase: Gradient. 20 mM NaOH to 100 mM NaOH over 20 min
Column temperature: 45
Flow rate: 1
Injection volume: 20
Detector: Conductivity, Dionex ED40, thermostated DS3 cell in conductivity mode, detection carried out using an Anion Self Regenerating Suppressor (ASRS-1) in recycle mode

CHROMATOGRAM

Retention time: 15

OTHER SUBSTANCES
Simultaneous: carbonylbisphosphonic acid, chloride, diprotic acid, methylenebisphosphonic acid, monochloromethylenebisphosphonic acid, nitrate, phosphate, sulfate, triprotic acid

KEY WORDS
injections

SAMPLE
Matrix: formulations
Sample preparation: Dilute injections 100-fold, inject a 20 μL aliquot. Disintegrate a 5 mg tablet in 100 mL water, sonicate for 5 min, centrifuge an aliquot at 3600 g for 4 min, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 150 × 4.6 10 μm IC-PAK Anion HC (Waters)
Mobile phase: 1.5 mM Nitric acid containing 0.5 mM copper(II) nitrate (Prepare column by pumping ILC Regenerant A (Waters) and 100 mM nitric acid for 30 min.)
Column temperature: 30
Flow rate: 1
Injection volume: 20
Detector: UV 245

CHROMATOGRAM
Retention time: 30.4

OTHER SUBSTANCES
Simultaneous: alendronate, etidronate, neridronate, olpadronate, pamidronate

KEY WORDS
derivatization; complexation

SAMPLE
Matrix: urine
Sample preparation: Inject directly.

HPLC VARIABLES
Guard column: 50 × 4 10 μm HPLC AG7 anion-exchange (Dionex)
Column: 250 × 4 10 μm HPIC AS7 anion-exchange (Dionex)
Mobile phase: 30 mM nitric acid adjusted to pH 2.4 with dilute NaOH
Flow rate: 1
Injection volume: 100
Detector: UV 550 following post-column reaction. Column effluent with reagent pumped at 1 mL/min, allow to flow through 1.2 m × 0.25 mm i.d. PEEK tubing to the detector. (Reagent was 4.5 mL 0.2 mM thorium solution + 100 mL 0.4 mM disodium EDTA in water, mix, add 60 mL buffer, add 1.9 mL 500 μg/mL xylenol orange in water, shake vigorously, adjust pH so that the combined pH of the reagent and the column effluent will be 6.0-6.3, dilute to 500 mL with water, allow to stand for at least 1 h before use. thorium solution was 1.104 g $Th(NO_3)_3.4H_2O$ in 20 mL 2 M nitric acid, dilute to 500 mL with water to give a 4 mM solution, dilute an aliquot further to give a 0.2 mM solution. Buffer was 10.1 mL ethylenediamine in ice-cold water, add 15 mL concentrated HCl slowly with stirring so as to keep the temperature below 20°, adjust pH to 7.3 with dilute HCl, dilute to 250 mL with water.)

CHROMATOGRAM
Retention time: 12
Limit of detection: 1100 ng/mL

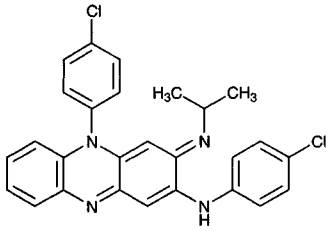
Clofazimine

Molecular formula: $C_{27}H_{22}Cl_2N_4$
Molecular weight: 473.40
CAS Registry No.: 2030-63-9
Merck Index: 2433



SAMPLE

Matrix: blood

Sample preparation: Condition a Prep Sep CN SPE cartridge (Fisher) with 3 mL MeOH, 5 mL water, and 5 mL 100 mM pH 6.0 phosphate buffer, do not allow to go dry. 1 mL Plasma + 100 µL MeOH:water 10:90 + 5 mL 100 mM pH 6.0 phosphate buffer, vortex, let stand, add to the SPE cartridge, air dry for 2 min, add 50 µL 3.4 µg/mL salicylic acid, elute with four 1 mL portions of THF:MeCN:MeOH 40:40:20 containing 0.7 mM hexanesulfonic acid. Evaporate the eluate to dryness under a stream of nitrogen at 37°, reconstitute the residue in 100 µL mobile phase, inject a 20 µL aliquot.

HPLC VARIABLES

Guard column: C18
Column: 150 × 3.9 µBondapak C18
Mobile phase: MeOH:THF:0.5% acetic acid 5:40:55 containing 2.5 mM hexanesulfonic acid
Flow rate: 1.8
Injection volume: 20
Detector: UV 280

CHROMATOGRAM

Retention time: 6
Internal standard: salicylic acid (3.3)
Limit of detection: 3 ng/mL

OTHER SUBSTANCES

Simultaneous: dapsone

KEY WORDS

plasma; SPE; rabbit; pharmacokinetics; human

SAMPLE

Matrix: blood, tissue

Sample preparation: Tissue. Add 2 µg IS in dichloromethane to a glass tube. Evaporate by heating to 40°. Homogenize 100 mg tissue in 1 mL water. Pour the homogenate into the tube coated with IS, add 1 mL 5 M NaOH, add 2 mL dichloromethane, mix on a blood tube mixer for 20 min, sonicate for 5 min, centrifuge at 1800 g for 15 min. Discard the aqueous layer, add 1.5 mL 10% NaOH in EtOH to the organic layer, heat at 80° until the bubbling stopped (indicating complete evaporation of the dichloromethane), add 6 mL cold water, add 2 mL dichloromethane, mix for 5 min on a blood tube mixer, centrifuge at 1400 g for 10 min, discard the aqueous layer, wash the organic layer twice more in the same fashion. Remove a 1.1 mL aliquot of the organic layer and evaporate it to dryness by heating at 40° for 2 h. Reconstitute with 120 µL 0.6% (v/v) acetic acid in THF, inject a 20 µL aliquot. Serum. Add 2 µg IS in dichloromethane to a glass tube. Evaporate by heating to 40°. Add 1 mL serum, 1 mL 5 M NaOH, and 2 mL dichloromethane, mix on a

blood tube mixer for 20 min, sonicate for 5 min, centrifuge at 1800 g for 15 min. Remove a 1.1 mL aliquot of the organic layer and evaporate it to dryness by heating at 40° for 2 h. Reconstitute with 60 μL 0.6% (v/v) acetic acid in THF, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: μBondapak C18
Column: 300 × 3.9 10 μm Bondclone C18 (Phenomenex)
Mobile phase: THF:water:acetic acid 40:59.4:0.6 containing 471 mg/L hexanesulfonic acid
Flow rate: 1.5
Injection volume: 20
Detector: UV 285

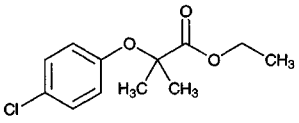
Clofibrate



Molecular formula: $C_{12}H_{15}ClO_3$
Molecular weight: 242.7
CAS Registry No.: 637-07-0
Merck Index: 2436
Lednicer No.: 1 119

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 18.267

KEY WORDS

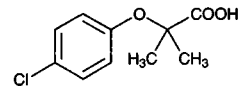
Clofibric acid



Molecular formula: $C_{10}H_{11}ClO_3$
Molecular weight: 214.65
CAS Registry No.: 882-09-7
Merck Index: 2437

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 100 mg C2 SPE cartridge (Analytichem) with 2 mL MeOH and 1 mL water. 100 μL Plasma + 20 μL 200 μg/mL ketoprofen in MeOH + 500 μL 1 M HCl, vortex for 15 s, add to the SPE cartridge, rinse out tube with 1 mL water, add rinse to the SPE cartridge, elute with 1 mL mobile phase, vortex the eluate, inject a 10 μL aliquot.

HPLC VARIABLES

Guard column: 30-40 μm pellicular Vydac Reversed-Phase
Column: 75 × 3.9 4 μm Nova-Pak phenyl
Mobile phase: MeOH:buffer 42:58 (Buffer was 100 mM NaH_2PO_4 adjusted to pH 7.0 with 50% aqueous NaOH.)
Flow rate: 1
Injection volume: 10
Detector: E, Bioanalytical Systems LC-4B, LC-17 thin-layer glassy carbon working electrode +1.10 V, Ag/AgCl reference electrode following post-column reaction. The column effluent flowed through an air-cooled 7.9 m × 0.3 mm ID PTFE coil irradiated by an SC3-9 ultraviolet lamp (UVP, Inc.) to the detector.

CHROMATOGRAM

Retention time: 2
Internal standard: ketoprofen (2.7)
Limit of detection: 200 ng/mL

KEY WORDS

post-column reaction; plasma; SPE; post-column photochemical derivatization

SAMPLE
Matrix: blood, urine
Sample preparation: 200 μL Plasma or 100 μL urine + 500 (plasma) or 300 (urine) mg NaCl + 1 (plasma) or 0.3 (urine) mL pH 4 buffer + 5 mL n-hexane:EtOH 90:10, shake horizontally for 10 min, centrifuge. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 55°, add 50 μL toluene and evaporate it to remove traces of water. Reconstitute the residue in 500 μL dichloromethane, add 50 μL 1 mg/mL 1-hydroxybenzotriazole in dichloromethane:pyridine 99:1, add 50 μL 1 mg/mL 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride in dichloromethane, add 50 μL 1 mg/mL FLOPA, vortex, let stand at room temperature for 2 h, evaporate to dryness, reconstitute in 500 μL mobile phase, inject a 50 μL aliquot. (FLOPA is the corresponding amine hydrochloride from (+)-(S)-flunoxaprofen. Synthesis is as follows (protect from light). 500 mg (+)-(S)-Flunoxaprofen in 50 mL dry toluene, slowly add 5 mL freshly distilled thionyl chloride, reflux for 1 h, evaporate to dryness under vacuum, dry the acyl chloride under vacuum over KOH for 2 days. Dissolve 0.5 mmoles acyl chloride in 5 mL acetone, add 600 mg sodium azide dissolved in ice water with stirring, stir at 0° for 30 min, add 10 mL ice-cold water, filter, dry solid in a desiccator under vacuum. Dissolve the solid in 1 mL toluene or dichloromethane (dried over 3 Å molecular sieve), reflux for 10 min, evaporate, store resulting isocyanate under vacuum over a desiccant. Dissolve 0.5 mmole isocyanate in 5 mL acetone, add 20 mL 8.5% phosphoric acid, heat to 80° for 1.5 h, adjust to pH 13, extract with diethyl ether:dichloromethane 4:1. Wash the organic layer twice with water, dry over anhydrous sodium sulfate, evaporate to dryness, dissolve in 1 mL toluene, evaporate to give crystals (mp 91°). Dissolve in ether, add 0.5 M HCl in ether, filter, dissolve solid in a small volume of MeOH, precipitate with ether, dry FLOPA over phosphorus pentoxide under vacuum (Pharm.Res. 1990, 7, 1262).)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax Sil
Mobile phase: Gradient. A was n-hexane:chloroform:EtOH 100:10:0.75. B was n-hexane:chloroform:EtOH 100:10:20. A:B 100:0 for 10 min, 50:50 for 5 min, 100:0 for 5 min (stepwise).

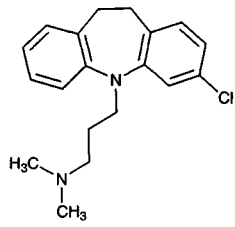
Clomipramine



Molecular formula: $C_{19}H_{23}ClN_2$
Molecular weight: 314.86
CAS Registry No.: 303-49-1, 17231-77-6 (HCl)
Merck Index: 2447

SAMPLE

Matrix: blood
Sample preparation: Add 500 μL 40 ng/mL IS in water to 500 μL plasma. Add to an activated 100 mg Bond-Elut C8 SPE cartridge. Wash with 1 mL water, 1.5 mL MeCN: water 50:50, and 500 μL MeCN. Elute with 1 mL MeOH, dry the eluate under a stream of nitrogen. Reconstitute the residue in 50 μL MeOH. Inject a 20 μL aliquot.

HPLC VARIABLES

Column: 150 × 3.9 4 μm Nova-Pak C18
Injection volume: 20
Detector: E, Coulochem 5100A, 5011 analytical cell +400 mV screen electrode, 700 mV sample electrode

CHROMATOGRAM

Internal standard: imipramine
Limit of quantitation: 2 ng/mL

KEY WORDS

plasma; pharmacokinetics; SPE

REFERENCE

Müller,F.O.; Schall,R.; Mogilnicka,E.M.; Groenewoud,G.; Hundt,H.K.L.; Luus,H.G.; Middle,M.V.; Swart,K.J.; De Vaal,A.C. Relative bioavailability of four clomipramine hydrochloride tablet products, *Biopharm.Drug Dispos.*, **1996**, *17*, 81–90.

SAMPLE

Matrix: blood
Sample preparation: Add 250 μL 2 M sodium carbonate to 500 μL plasma. Add 100 μL 1 μg/mL IS in MeOH, extract with 10 mL n-hexane. Shake for 30 min and centrifuge at 3000 g for 10 min. Cool in a dry ice-acetone bath. Add 200 μL 0.3% phosphoric acid to upper organic layer. Shake for 10 min and centrifuge at 3000 g for 10 min. Separate the organic layer. Inject a 100 μL aliquot of the acidic aqueous layer.

HPLC VARIABLES

Column: 250 × 4.6 5 μm C18 Symmetry (Waters Millipore, USA)
Mobile phase: MeCN:67 mM potassium phosphate buffer adjusted to pH 3.0 with phosphoric acid 35:65 (After each chromatographic session wash the column with 200 mL MeCN:water 50:50.)
Flow rate: 1.2
Injection volume: 100
Detector: UV 226, UV 254, UV 400

CHROMATOGRAM

Retention time: 18.87
Internal standard: clovoxamine (6.504)
Limit of quantitation: 7 ng/mL(UV 226, UV 400); 10 ng/mL(UV 254)

OTHER SUBSTANCES
Extracted: metabolites, amitriptyline, desipramine, fluoxetine, imipramine, maprotiline, nortriptyline
Simultaneous: amineptine, carbamazepine, chlordiazepoxide, chlorpromazine, clonazepam, clorazepate, clozapine, cyamemazine, desmethylmaproptiline, desmethylvenlafaxine, doxepin, flunitrazepam, fluvoxamine, haloperidol, levomepromazine, lorazepam, loxapine, mianserine, sulpiride, trimipramine, venlafaxine, viloxazine, zolpidem, zopiclone
Noninterfering: diazepam, valproic acid

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 100 μL Serum + 100 μL 5 M NaOH, vortex for 30 s, add 2 mL hexane, vortex for 30 s, centrifuge at 3000 g for 3 min. Remove the organic layer and evaporate it under a gentle stream of nitrogen at 20 °, reconstitute the residue in 50 μL mobile phase, vortex for 30 s, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: RP C18 (Brownlee)
Column: 150 × 4.6 5 μm Microsorb MV
Mobile phase: MeCN:water 55:45 containing 10 mM pH triethylamine, adjusted to pH 4.8 with 85% phosphoric acid
Flow rate: 1
Injection volume: 20
Detector: UV 226

CHROMATOGRAM
Retention time: 7.4
Internal standard: clomipramine

OTHER SUBSTANCES
Extracted: fluoxetine, norfluoxetine

SAMPLE
Matrix: blood
Sample preparation: 2 mL Plasma + 800 ng clomipramine in MeOH + 2 mL 1 M NaOH + 5 mL hexane:isoamyl alcohol 99:1, shake mechanically for 15 min, centrifuge at 1686 g for 5 min. Remove the organic phase and add it to 200 μL 0.05% orthophosphoric acid, shake for 15 min, centrifuge for 5 min, inject a 50 μL aliquot of the aqueous phase (J.Liq.Chromatogr. 1981, 4, 849).

HPLC VARIABLES
Guard column: 23 × 3.9 Bondapak/Corasil C 18

Column: 300 × 4.6 10 μm μBondapak C18
Mobile phase: MeCN:buffer 40:60 (Buffer was 13.68 g KH_2PO_4 in 2 L water, adjusted to pH 4.7 with dilute KOH.)
Column temperature: 50
Flow rate: 1.5
Injection volume: 50
Detector: UV 214

CHROMATOGRAM
Retention time: 8.5
Internal standard: clomipramine

OTHER SUBSTANCES
Extracted: maprotiline
Simultaneous: amoxapine, amitriptyline, chlordiazepoxide, chlorpromazine, cimetidine, desipramine, diazepam, doxepin, flurazepam, imipramine, lorazepam, oxazepam, pentobarbital, perphenazine, phenobarbital, phenytoin, prochlorperazine, propoxyphene, secobarbital, thioridazine, trifluoperazine
Noninterfering: acetaminophen, codeine, meperidine
Interfering: nortriptyline

KEY WORDS
clomipramine is IS; plasma

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 37 μL 2 μg/mL IS in MeOH + 500 μL pH 10 borate buffer + 1.5 mL hexane:isoamyl alcohol 95:5, shake for 10 min. Evaporate the organic layer to dryness under a stream of nitrogen, reconstitute in 100 μL MeOH, inject a 50 μL aliquot. (The borate buffer was prepared as follows. Prepare a solution of 61.8 g boric acid and 74.6 g KCl in 1 L water. Add 630 mL of this solution to 370 mL 106 g/L sodium carbonate solution. Adjust pH to 10.0 with 6 M NaOH and store at 35-37°.)

HPLC VARIABLES
Column: 250 × 4.6 Zorbax Sil
Mobile phase: MeOH:ammonium hydroxide 998:2
Flow rate: 1.5
Injection volume: 50
Detector: UV 214

CHROMATOGRAM
Retention time: 4
Internal standard: desipramine hydrochloride (12)
Limit of quantitation: 20 ng/mL

OTHER SUBSTANCES
Extracted: desmethylclomipramine, maprotiline, protriptyline, metabolites
Also analyzed: doxepin, desmethyldoxepin, amitriptyline, nortriptyline, imipramine, 2-hydroxyimipramine, 2-hydroxydesipramine
Noninterfering: chlordiazepoxide, diazepam, flurazepam, oxazepam, thioridazine

SAMPLE
Matrix: blood
Sample preparation: For each 1 mL plasma or serum add 10 µL 14 µg/mL trimipramine in MeOH. Inject serum or plasma directly onto column A with mobile phase A, elute with mobile phase A to waste. After 15 min elute column A onto column B (foreflush) with mobile phase B. After 2 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. Re-equilibrate column A with mobile phase A.

HPLC VARIABLES
Column: A 20 × 4.6 10 µm Hypersil MOS C8; B 20 × 4.6 5 µm Hypersil CPS CN + 250 × 4.6 5 µm Nucleosil 100 CN
Mobile phase: A MeOH:water 5:95; B MeCN:MeOH:buffer 578:188:235 (Buffer was 10 mM K_2HPO_4 adjusted to pH 6.8 with 85% phosphoric acid.)
Flow rate: 1.5
Injection volume: 100
Detector: UV 214

CHROMATOGRAM
Retention time: 8.54
Internal standard: trimipramine (6.5)
Limit of detection: 1 ng/mL (with three injections onto column A before switching), 5-10 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, desipramine, fluvoxamine, imipramine, maprotiline, nortriptyline
Noninterfering: chlordiazepoxide, clobazam, clozapine, diazepam, flurazepam, fluspirilene, haloperidol, nitrazepam, oxazepam, perazine, pimozide, spiroperidol, trifluperidol
Interfering: amitriptyline, doxepin

KEY WORDS

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL BondElut C18 SPE cartridge with 1 mL 1 M HCl, 1 mL MeOH, 1 mL water, and 1 mL 1% potassium carbonate. 700 μL Serum + 50 μL 5 μg/mL protriptyline in 5% potassium bicarbonate + 700 μL MeCN, vortex, centrifuge at 1500 g for 5 min, add supernatant to SPE cartridge (at ca. 1 mL/min). Wash with 2 mL water and 1 mL MeCN, elute with 250 μL MeOH:35% perchloric acid 20:1 by gravity (10 min) then centrifuge for 20 s to remove rest of eluant, inject a 50 μL aliquot of the eluate.

HPLC VARIABLES
Guard column: 15 mm 7 μm Brownlee RP-8
Column: 150 × 4.6 5 μm Ultrasphere Octyl
Mobile phase: MeCN:water 37.5:62.5 containing 0.5 g/L tetramethylammonium perchlorate and 0.5 mL/L 7% perchloric acid
Flow rate: 1.5
Injection volume: 50
Detector: UV 215

CHROMATOGRAM
Retention time: 12.6
Internal standard: protriptyline (6.6)
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES
Extracted: amitriptyline, desipramine, doxepin, fluoxetine, fluvoxamine, imipramine, maprotiline, nortriptyline, trimipramine

Gupta,R.N. An improved solid phase extraction procedure for the determination of antidepressants in serum by column liquid chromatography, *J.Liq.Chromatogr.*, **1993**, *16*, 2751–2765.

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 200 ng/mL IS in MeOH + 1 mL 50 mM pH 10 borate buffer, vortex briefly, add to an Extrelut 3 SPE cartridge, let stand for 5 min, elute with 15 mL hexane:dichloromethane 50:50. Add the eluate to 3 mL 50 mM sulfuric acid, mix for 10 min, centrifuge at 3000 g for 10 min. Remove the aqueous layer and add it to 6 mL hexane:dichloromethane 50:50, wash for 5 min, centrifuge. Make the aqueous layer basic with 150 μL 28% ammonia, extract twice with 3 mL hexane:dichloromethane 50:50. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 5 μm Spherisorb cyano
Column: 250 × 4.6 5 μm Ultrasphere cyano
Mobile phase: MeCN:buffer 60:40 (Buffer was 50 mM KH_2PO_4 adjusted to pH 6.5 with 28% ammonia.)

Flow rate: 1
Injection volume: 20
Detector: E, 5100 A Coulochem, 5020 guard cell 1.00 V, 5011 analytical cell, detector 1 0.55 V, detector 2 0.80 V, output of detector 2 is monitored

CHROMATOGRAM
Retention time: 28.5
Internal standard: methylrisperidone (R68808) (14.3)

SAMPLE

Matrix: blood

Sample preparation: 100 μL Serum + 25 μL MeOH, vortex for 30 s, add 100 μL 5 M NaOH, add 2 mL hexane, vortex for 30 s, centrifuge at 3000 g for 3 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 20°, reconstitute the residue in 50 μL mobile phase, vortex for 30 s, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Microsorb MV octadecyl

Mobile phase: MeCN:10 mM triethylamine 60:40, pH adjusted to 3.0 with 85% phosphoric acid

Flow rate: 1

Injection volume: 20

Detector: UV 260

CHROMATOGRAM
Retention time: 8.3
Internal standard: clomipramine

OTHER SUBSTANCES
Extracted: desipramine, imipramine

KEY WORDS
mouse; serum; clomipramine is IS

REFERENCE
Yoo,S.D.; Holladay,J.W.; Fincher,T.K.; Dewey,M.J. Rapid microsample analysis of imipramine and desipramine by reversed-phase high-performance liquid chromatography with ultraviolet detection, *J.Chromatogr.B*, **1995**, *668*, 338–342.

SAMPLE
Matrix: blood
Sample preparation: 1 mL Serum + 200 μL buffer + 50 μL 8 μg/mL IS in MeOH + 5 mL heptane:ethyl acetate 80:20, mix mechanically for 10 min, centrifuge at 3500 g for 10 min. Remove the organic layer and add it to 1 mL 50 mM sulfuric acid, mix for 10 min, centrifuge at 3500 g for 10 min. Remove the aqueous layer and add it to 400 μL buffer and 5 mL heptane:ethyl acetate 80:20, extract, centrifuge at 3500 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 150 μL mobile phase, inject a 100 μL aliquot. (Prepare buffer by adjusting pH of 8% sodium bicarbonate solution to 10.5 with 100 mM NaOH.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere Si
Mobile phase: MeOH:water 70:30 containing 7 mM butylamine
Flow rate: 1.2
Injection volume: 100
Detector: UV 254

CHROMATOGRAM
Retention time: 6
Internal standard: metabolite I of trimipramine (14)
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Noninterfering: chlorpromazine, flunitrazepam, levomepromazine, lorazepam, nitrazepam, oxazepam

KEY WORDS
serum

SAMPLE
Matrix: blood, erythrocytes
Sample preparation: Evaporate 100 μL 10 μg/mL levallorphan in MeOH into a tube under a stream of nitrogen at 30°, add 1 mL plasma or erythrocytes, add 5 mL hexane:diethyl ether 80:20, shake mechanically for 10 min, centrifuge briefly at 4° at 3000 g, repeat

extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL mobile phase, inject a 25 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm cyanopropylsilane (Societe SGE)
Mobile phase: MeCN:MeOH:10 mM pH 7.0 potassium phosphate 60:15:25
Column temperature: 40
Flow rate: 1.2
Injection volume: 25
Detector: UV 220

CHROMATOGRAM
Retention time: 7.3
Internal standard: levallorphan (6.3)
Limit of detection: 5 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Noninterfering: acetaminophen, amitriptyline, carbamazepine, clonazepam, diazepam, digoxin, fluvoxamine, haloperidol, imipramine, oxazepam, phenytoin, prazepam, salicylic acid, theophylline, thioproperazine, thioridazine, triazolam, valproic acid

SAMPLE
Matrix: blood, tissue
Sample preparation: 100 μL Serum or 200 μL brain homogenate + 100 μL 5.0 M NaOH + 2 mL hexane, vortex for 30 s, centrifuge at 3000 g for 5 min. Evaporate organic layer under a gentle stream of nitrogen at 20°. Reconstitute residue with 50 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: Microsorb MV C18 (Rainin, Woburn, USA)
Mobile phase: MeCN:water 55:45 containing 10 mM triethylamine, pH adjusted to 4.8 with 85% phosphoric acid
Flow rate: 1.0
Injection volume: 20
Detector: UV 226

CHROMATOGRAM
Internal standard: clomipramine

KEY WORDS
serum; brain; mouse; clomipramine is IS

SAMPLE
Matrix: blood, tissue

Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM

Retention time: 32.1
Internal standard: cianopramine (8.93)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, tranylcypromine, trazodone, trihexyphenidyl, trimipramine, triprolidine

Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine

KEY WORDS

serum; whole blood; liver

SAMPLE

Matrix: blood, tissue

Sample preparation: Whole blood. 1 mL Whole blood + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, agitate gently for 30 min, centrifuge at 3500 rpm for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min, inject a 30 μL aliquot of the aqueous layer. Liver. Homogenize 10 g freshly minced liver with 10 mL water, adjust pH to 10 with 1 M NaOH, add 10 mg subtilisin (Sigma), heat at 55° for 1 h, adjust pH to 7.0 ± 0.5 with dilute mineral acid. 500 μL Homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, agitate gently, centrifuge for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate, centrifuge, inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm Newguard RP-18
Column: 100 × 4.6 5 μm Spheri-5 RP-18
Mobile phase: MeCN:buffer 40:60 (Buffer was 100 mM potassium phosphate containing 2.5% diethylamine, pH 8.0.)
Flow rate: 2
Injection volume: 30
Detector: UV 220, UV 254

CHROMATOGRAM

Retention time: 32
Internal standard: cianopramine (8.9 ?)
Limit of detection: <200 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE

Matrix: blood, tissue, urine
Sample preparation: Serum, urine. 500 μL Serum or urine + 100 μL 2 μg/mL diazepam + 200 μL 20% sodium carbonate + 500 μL water + 3 mL n-hexane:isoamyl alcohol 98.5:1.5, mix for 2 min, centrifuge at 1200 g for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 μL mobile phase, inject a 10 μL aliquot. Tissue. Homogenize 1 g sample with 9 mL 100 mM HCl and 100 μL 20 μg/mL diazepam, centrifuge at 15000 g for 10 min. Add 500 μL 20% sodium carbonate and 4 mL n-hexane:isoamyl alcohol 98.5:1.5 to 1 mL of the supernatant, mix for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 μL mobile phase, filter by microconcentrator (Microcon-30, Grace). Inject a 10 μL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 2 μm TSK gel Super-Octyl (A) or 100 × 4.6 5 μm Hypersil MOS-C8 (B), (Yokogawa, Japan)
Mobile phase: MeOH:20 mM pH 7 KH_2PO_4 60:40
Flow rate: 0.6
Injection volume: 10
Detector: UV 254

CHROMATOGRAM

Retention time: 20.6 (A), 40.2 (B)
Internal standard: diazepam (4.4, A)
Limit of quantitation: 50 ng/mL (serum, urine) (A), 500 ng/mL (tissue) (A)

OTHER SUBSTANCES

Extracted: amitriptyline, amoxapine, desipramine, dothiepin, doxepin, imipramine, maprotiline, melitracen, mianserin, nortriptyline
Noninterfering: barbital, carbamazepine, ethosuximide, hexobarbital, lofepramine, pentobarbital, phenobarbital, phenytoin, primidone, sulpiride, trimethadione, trimipramine

KEY WORDS

serum; brain; liver

SAMPLE

Matrix: blood, urine

Sample preparation: 500 μL Urine + 470 μL 3% L-(+)-ascorbic acid in 200 mM KH_2PO_4 + 30 μL β-glucuronidase/arylsulfatase (Boehringer Mannheim), vortex for 2 s, heat at 37° for 16 h to deconjugate, add 50 μL 2 M NaOH. 1 mL Plasma, urine, or deconjugated urine + 1 mL 600 mM pH 11.3 potassium carbonate + 100 μL 5 (plasma) or 20 (urine) μM desipramine in EtOH + 5 mL heptane:MTBE:n-butanol 47.5:47.5:5, vortex for 1 min, centrifuge at 1400 g for 10 min, freeze at -50°. Remove the organic layer and add it to 1 mL 20 mM HCl, vortex for 1 min, centrifuge at 1400 g for 10 min, freeze. Discard the organic layer and add 500 μL 600 mM pH 11.3 potassium carbonate to the thawed aqueous layer. Add 3 mL heptane:MTBE:n-butanol 47.5:47.5:5 to the aqueous layer, vortex for 1 min, centrifuge at 1400 g for 10 min, freeze. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 100 μL MeOH, vortex for 5 s, centrifuge at 1400 g for 1 min, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 4 7 μm 120 Å Nucleosil

Column: 250 × 4 5 μm 100 Å Nucleosil RP-phenyl

Mobile phase: MeCN:buffer 30:70 (Buffer was 14.05 g sodium perchlorate + 1.6 mL 60% perchloric acid in 5 L water, pH 2.5.)

Column temperature: 30

Flow rate: 1

Injection volume: 20

Detector: UV 220

CHROMATOGRAM

Retention time: 25.33

Internal standard: desipramine (14.19)

Limit of detection: 10 nM (urine), 5 nM (plasma)

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 16.442

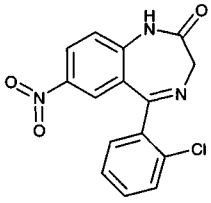
Clonazepam



Molecular formula: $C_{15}H_{10}ClN_3O_3$
Molecular weight: 315.72
CAS Registry No.: 1622-61-3
Merck Index: 2449

SAMPLE

Matrix: blood
Sample preparation: 500 μL Serum + 20 μL 20 μg/mL IS + 200 μL 1 M potassium carbonate + 3 mL chloroform, mix for 2 min, centrifuge at 1200 g for 5 min, aspirate aqueous phase. Evaporate the organic phase under a stream of nitrogen at 40°. Dissolve the residue in 100 μL mobile phase, inject a 20 μL aliquot. (Caution! Chloroform is a carcinogen!)

HPLC VARIABLES

Column: 100 × 4.6 2 μm TSK gel Super-ODS (A) or 100 × 4.6 5 μm Hypersil ODS-C18 (B)
Mobile phase: MeCN:5 mM pH 6 NaH_2PO_4 45:55
Flow rate: 0.65
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 5.3 (A), 18.2 (B)
Internal standard: diazepam (29.8 (A), 77.5 (B))
Limit of quantitation: 5 ng/mL (A)

OTHER SUBSTANCES

Extracted: bromazepam, chlordiazepoxide, estazolam, etizolam, flutazolam, haloxazolam, lorazepam, nitrazepam, oxazolam, triazolam
Simultaneous: alprazolam
Noninterfering: barbital, carbamazepine, cloxazolam, ethosuximide, hexobarbital, mexazolam, oxazepam, pentobarbital, phenobarbital, phenytoin, primidone, trimethadione

SAMPLE

Matrix: blood
Sample preparation: Condition a 100 mg Bond-Elut C18 SPE cartridge with 2 mL MeOH and 2 mL water. Mix 1 mL plasma or serum with 200 μL 512 nM IS in MeOH:water 5:95, add to the SPE cartridge, wash with 2 mL water, wash with 50 μL MeOH. Elute with 200 μL and 100 μL MeOH, evaporate the eluate to dryness under a stream of air at 37°, reconstitute the residue with 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 4 μm Novapak C18
Mobile phase: MeCN:MeOH:10 mM pH 3.7 K_2HPO_4 30:2:10
Flow rate: 1.5
Injection volume: 20
Detector: UV 240

CHROMATOGRAM
Retention time: 7.4
Internal standard: flunitrazepam (9.8)
Limit of detection: 5 nM

OTHER SUBSTANCES
Extracted: alprazolam, nitrazepam
Simultaneous: amobarbital, carbamazepine, citalopram, clobazam, clozapine, diazepam, doxepin, ethosuximide, norclobazam, oxazepam, oxcarbamazepine, pentobarbital, phenobarbital, phenytoin, primidone, valproic acid, zopiclone
Interfering: medazepam, midazolam, nordiazepam, temazepam

KEY WORDS
SPE; plasma; serum

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using

a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A: B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 17.417

KEY WORDS

whole blood

SAMPLE

Matrix: solutions

HPLC VARIABLES

Guard column: Supelguard (Supelco)
Column: 150 × 4.6 5 μm Supelcosil LC-8-DB
Mobile phase: MeCN:MeOH:buffer 19:28:53 (Buffer was 50 mM KH_2PO_4 containing 0.2% triethylamine, pH 2.5.)
Flow rate: 1.5
Injection volume: 10
Detector: UV 254

CHROMATOGRAM

Retention time: 1

OTHER SUBSTANCES

Simultaneous: chlorcyclizine, chlorpheniramine, diphenhydramine, promethazine, pyrilamine, triprolidine

---

REFERENCE

Supelco Catalog, **1994**, 768.

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 50 μg/mL solution in MeCN:water 40:60, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 3 μm silica (Phenomenex)
Mobile phase: MeCN:6.25 mM pH 3.0 phosphate buffer 40:60
Flow rate: 1
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 7.61

OTHER SUBSTANCES
Also analyzed: atenolol, diltiazem, metoprolol, nifedipine, prazosin, propranolol, verapamil

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 150 × 4.6 12 μm 1-myristoyl-2-[(13-carboxyl)-tridecoyl]-sn-3-glycerophosphocholine chemically bonded to silica (Regis)
Mobile phase: MeCN:100 mM pH 7.0 phosphate buffer 20:80
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: k' 2.57

OTHER SUBSTANCES
Also analyzed: acebutolol, alprenolol, antazoline, atenolol, betaxolol, bisoprolol, bopindolol, bupranolol, carteolol, celiprolol, chloropyramine, chlorpheniramine, cicloprolol, cimetidine, cinnarizine, cirazoline, dilevalol, dimethindene, diphenhydramine, doxazosin, esmolol, famotidine, isothipendyl, ketotifen, metiamide, metoprolol, moxonidine, nadolol, naphazoline, nifenalol, nizatidine, oxprenolol, pheniramine, phentolamine, pindolol, pizotyline (pizotifen), practolol, prazosin, promethazine, propranolol, pyrilamine (mepyramine), ranitidine, roxatidine, sotalol, tiamenidine, timolol, tramazoline, tripelennamine, triprolidine, tymazoline, UK-14,304

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)
Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25
Detector: UV 229

CHROMATOGRAM
Retention time: 7.97 (A), 4.25 (B)

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, acetophenazine, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, antipyrine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butabarbital, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene, desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloperidol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen, ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, methadone, methdilazine, methocarbamol, methotrexate, methotrimeprazine, methoxamine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen, nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone, phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, salicylic acid, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terbutaline, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, xylometazoline, yohimbine, zopiclone

SAMPLE

Matrix: solutions
Sample preparation: Inject a 20 μL aliquot of a 100-500 μg/mL solution in mobile phase.

HPLC VARIABLES

Column: 100 × 4.6 5 μm Hypersil C8 MOS 100A coated with phosphatidylcholine (95% pure soybean lecithin, Epikuron, Lucas Meyer & Co.) (Coat column by recycling a 1 mM solution of phosphatidylcholine in MeOH:water 80:20 for 24 h.)
Mobile phase: MeCN:35 mM pH 7.4 sodium phosphate buffer 40:60
Flow rate: 0.5–2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: k' 2.14

OTHER SUBSTANCES

Also analyzed: amoxicillin, antipyrine, carbamazepine, chlorpheniramine, chlorpromazine, codeine, desipramine, diphenhydramine, dipyridamole, ephedrine, flufenamic acid, haloperidol, hydroxyzine, imipramine, indomethacin, lidocaine, megestrol acetate, metoprolol, nabumetone, nadolol, phenobarbital, phenol, promazine, propranolol, pyrilamine, quinidine, ropinirole, testosterone, thioridazine, tolfenamic acid, verapamil

Noninterfering: acetaminophen, aspirin, azathioprine, caffeine, carprofen, chlorambucil, cimetidine, fenoterol, flurbiprofen, ibuprofen, ketoprofen, ranitidine, salicylic acid, sulfamethoxazole, theophylline, thioguanine, tiaprofenic acid, trimethoprim, valproic acid

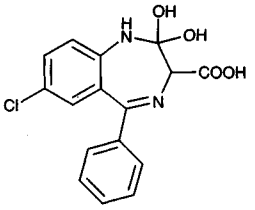
Clorazepate



Molecular formula: $C_{16}H_{13}ClN_2O_4$
Molecular weight: 332.75
CAS Registry No.: 20432-69-3, 57109-90-7 (dipotassium salt), 5991-71-9 (monopotassium slat)
Merck Index: 2465

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 500 μL buffer, vortex, add 10 mL 60 ng/mL diazepam in hexane:ethyl acetate 70:30, shake for 10 min, centrifuge at 320 g for 5 min. Remove 8 mL of the organic phase and evaporate it to dryness at 38° under vacuum, dissolve the residue in 500 μL ethyl acetate, vortex for 20 s, evaporate to dryness, reconstitute in 100 μL mobile phase, inject a 50 μL aliquot. (Buffer was 2 M glycine adjusted to pH 9.0 with 1 m NaOH.)

HPLC VARIABLES

Column: 250 × 4 10 μm LiChrosorb RP-18
Mobile phase: MeCN:buffer 45:55 (Buffer was 800 mL 62.5 mM sodium acetate adjusted to pH 5.0 with 1 M NaOH and made up to 1 L.)
Flow rate: 1.5
Injection volume: 50
Detector: UV 225

CHROMATOGRAM

Retention time: 2.1
Internal standard: diazepam (9.2)
Limit of detection: 1 ng/mL
Limit of quantitation: 2 ng/mL

OTHER SUBSTANCES

Simultaneous: flurazepam, pentobarbital, cimetidine, oxazepam, nordiazepam, prazepam

KEY WORDS

plasma; human; dog

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 2 mL water + 50 μL 3.2 μg/mL estazolam in MeOH + 2 mL 100 mM NaOH, mix gently, add 8 mL diethyl ether, shake for 15 min, centrifuge at 2500 rpm for 5 min. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 100 μL mobile phase, vortex for 30 s, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 50 × 4.6 Shim-pack FLC-C8 (Shimadzu)
Mobile phase: MeOH:buffer 53:47 (Buffer was 5 mM Na_2HPO_4 adjusted to pH 6.0 with phosphoric acid.)
Flow rate: 0.6
Injection volume: 50

Detector: UV 254

CHROMATOGRAM
Retention time: 5.3
Internal standard: estazolam (4)

OTHER SUBSTANCES
Extracted: diazepam, nordiazepam, triazolam
Simultaneous: sulpride, bromazepam, nitrazepam, flunitrazepam
Noninterfering: haloperidol, trihexyphenidyl
Interfering: temazepam, oxazepam

KEY WORDS
serum

SAMPLE
Matrix: blood
Sample preparation: Inject 100-200 μL plasma onto column A with mobile phase A and elute to waste, after 5 min backflush the contents of column A onto column B with mobile phase B, after 5 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. Wash column A with MeCN:water 60:40 at 1 mL/min for 6 min then re-equilibrate with pH 7.5 buffer for 10 min.

HPLC VARIABLES
Column: A 45 × 4 12 μm TSK-gel G 3 PW (Tosohass); B 75 × 4.6 Ultrasphere ODS C18 3 μm
Mobile phase: A 50 mM pH 7.5 phosphate buffer; B Gradient. A was MeCN. B was 65 mM KH_2PO_4 + 1% diethylamine adjusted to pH 5.4 with phosphoric acid. A:B 22:78 for 5 min, to 25:75 over 10 min, to 60:40 over 15 min.
Flow rate: 1
Injection volume: 100-200
Detector: UV 230

CHROMATOGRAM
Retention time: 24

OTHER SUBSTANCES
Extracted: alprazolam, bromazepam, chlordiazepoxide, clobazam, clonazepam, clotiazepam, desmethylclobazam, diazepam, estazolam, flunitrazepam, loflazepate, lorazepam, medazepam, nitrazepam, oxazepam, prazepam, temazepam, tetrazepam, tofisopam, triazolam
Noninterfering: carbamazepine, phenytoin, ethosuximide, phenobarbital, primidone, valproic acid
Interfering: desmethyldiazepam

KEY WORDS
plasma; column-switching

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 229

CHROMATOGRAM

Retention time: 5.19

Limit of detection: <120 ng/mL

KEY WORDS

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 227.5

SAMPLE

Matrix: formulations

Sample preparation: Capsules. Dissolve contents of 4 capsules in 200 mL 10 mM NaOH with sonication for 5 min, make up to 250 mL with 10 mM NaOH, filter (0.4-0.5 μm), if necessary dilute with 10 mM NaOH to obtain a concentration of about 50 μg/mL clorazepate. Dilute 5 mL of this solution + 2 mL 300 μg/mL dimethylaniline hydrochloride in 10 mM NaOH to 10 mL with 10 mM NaOH, inject a 20 μL aliquot. Tablets. Homogenize tablets in 200 mL 10 mM NaOH at 6000 rpm for 3 min, filter (0.4-0.5 μm), if necessary dilute with 10 mM NaOH to give a concentration of 50-60 μg/mL. Dilute 5 mL of this solution + 2 mL 300 μg/mL dimethylaniline hydrochloride in 10 mM NaOH to 10 mL with 10 mM NaOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 4 μBondapak C18

Mobile phase: MeCN: 5 mM tetra-n-butylammonium hydroxide, pH adjusted to 7.5 with phosphoric acid 30:70
Flow rate: 1.8
Injection volume: 20
Detector: UV 230

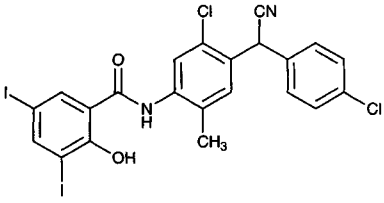
Closantel



Molecular formula: $C_{22}H_{14}Cl_2I_2N_2O_2$
Molecular weight: 663.08
CAS Registry No.: 57808-65-8
Merck Index: 2473

SAMPLE

Matrix: blood, tissue

Sample preparation: Condition a 250mg Bond Elut C18 (18% carbon loaded) SPE cartridge with 5 mL MeCN and 5 mL MeCN:water 10:90 containing 0.1% diethylamine. Mix 3 mL plasma or 3 g ground tissue with 3 mL 0.05% acetic acid in water saturated with NaCl and 10 mL MeCN using a high-speed blender for 3 min, centrifuge at 2400 g for 5 min. Dilute supernatant with 25 mL MeCN, centrifuge, concentrate to 2-3 mL at 50° under vacuum. Add to the SPE cartridge, elute with 5 mL MeCN, concentrate the eluate to 300 µL, inject a 30 µL aliquot.

HPLC VARIABLES

Column: 125 × 4 5µm LiChrospher 100 RP18 ODS1
Mobile phase: MeCN:water 85:15, adjusted to pH 2.5 with phosphoric acid
Flow rate: 1
Injection volume: 30
Detector: UV 254; F ex 335 em 510

CHROMATOGRAM

Retention time: 7.7
Limit of detection: 200-500 µg/kg (UV); 10-50 µg for F

KEY WORDS

fat; kidney; liver; muscle; SPE

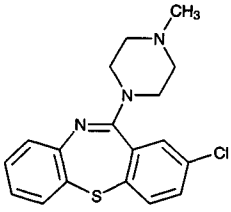
Clothiapine



Molecular formula: $C_{18}H_{18}ClN_3S$
Molecular weight: 343.88
CAS Registry No.: 2058-52-8
Merck Index: 2476

SAMPLE

Matrix: blood
Sample preparation: 2 mL Plasma + 100 μL MeOH + 1 M NaOH, extract with 6 mL hexane:isopropanol 99:1 by rotary mixing for 10 min, centrifuge at 2000 g for 5 min. Add 300 μL 200 mM HCl to the organic layer, mix, centrifuge at 2000 g for 5 min, discard the upper organic layer, inject a 120 μL aliquot of the acidic aqueous phase.

HPLC VARIABLES

Column: 150 × 4.6 Spherisorb C8
Mobile phase: MeCN:triethylamine:Pic B5:60 mM pH 6.4 phosphate buffer 48:0.05:0.15:52, adjusted to pH 6.4 with orthophosphoric acid
Flow rate: 1.6
Injection volume: 120
Detector: UV 214

CHROMATOGRAM

Retention time: 9.6
Internal standard: clothiapine

OTHER SUBSTANCES

Extracted: buprenorphine
Simultaneous: amitriptyline, amoxapine, carpipramine, clomipramine, demexiptilline, desipramine, diazepam, dosulepin, doxepin, imipramine, maprotiline, medifoxamine, metapramine, methadone, mianserine, naloxone, normaprotiline, nortriptyline, opipramol, oxaflozane, paroxetine, quinupramine, tianeptine, trazodone, viloxazine
Noninterfering: codeine, pholcodeine, codethyline, morphine
Interfering: clomipramine

KEY WORDS

plasma; clothiapine is IS

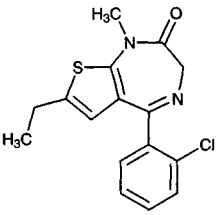
Clotiazepam



Molecular formula: $C_{16}H_{15}ClN_2OS$
Molecular weight: 318.83
CAS Registry No.: 33671-46-4
Merck Index: 2477

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 211.1

CHROMATOGRAM

Retention time: 21.652

KEY WORDS

whole blood

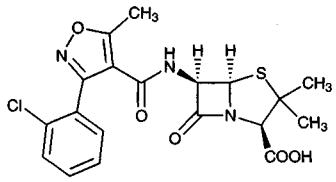
Cloxacillin



Molecular formula: $C_{19}H_{18}ClN_3O_5S$
Molecular weight: 435.89
CAS Registry No.: 61-72-3, 23736-58-5 (benzathine), 7081-44-9 (sodium salt, monohydrate), 642-78-4 (sodium salt)
Merck Index: 2480
Lednicer No.: 1 413

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Serum. 0.5 mL serum + 0.5 mL MeCN mix in 7 mL tube on vortex mixer; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; transfer supernatant to another tube, add 7 aliquots dichloromethane; equilibrate 10 min; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; inject aliquot of upper aqueous layer. Urine. Centrifuge urine and dilute 1:20. Bile. Centrifuge bile and dilute 1:10.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Ultrasphere ODS
Mobile phase: 28:72 MeCN:20 mM ammonium acetate adjusted to pH 5 with glacial acetic acid
Flow rate: 1
Injection volume: 20
Detector: UV 214

CHROMATOGRAM

Retention time: 6.2
Limit of detection: 500 ng/mL

OTHER SUBSTANCES

Also analyzed: ampicillin, azlocillin, aztreonam, cefmenoxime, cefoperazone, cefsulodin, cefotaxime, ceftazidime, ceftriaxone, desacetylcefotaxime, mezlocillin, penicillin G, piperacillin, ticarcillin

SAMPLE

Matrix: milk

Sample preparation: Condition a 6 mL 500 mg Bond Elut C18 SPE cartridge with 10 mL MeOH, 10 mL water, 5 mL 2% NaCl, and 5 mL 100 mM pH 8 phosphate extraction buffer. Add 30 mL 100 mM pH 8 phosphate extraction buffer to 5 mL milk, add 1.65 mL 1 M sulfuric acid to reach pH 4.0-4.5, vortex for 30 s, centrifuge at 2400 g for 10 min, add 600 μL 5 M NaOH to the supernatant to reach pH 8, vortex, centrifuge at 2400 g for 5 min. Add the supernatant to a reservoir attached to the SPE cartridge, pull through the SPE cartridge at 3 mL/min, remove the reservoir and elute with 1 mL MeCN:water 40:60. Add 500 μL derivatizing reagent to the eluate, vortex, heat at 65° for 10 min, cool to room temperature (protect from light), inject a 100 μL aliquot of the derivatized sample. (Prepare the 100 mM pH 8 phosphate extraction buffer as follows. Dissolve 15.6 g K_2HPO_4 dihydrate in 800 mL water, adjust pH to 8 with 10 M NaOH, make up to 1 L. Prepare the derivatizing reagent as follows. Weigh out 13.78 g 1,2,4-triazole, add 60 mL water, stir, add 10 mL 100 mM mercuric chloride solution, mix, adjust pH to 9.0 ± 0.5 with 5 M NaOH, dilute to 100 mL with water.)

HPLC VARIABLES

Column: 150 × 3.9 5 μm Symmetry C8 (Waters)

Mobile phase: MeCN:MeOH:buffer 37:5:58 (Prepare the 100 mM pH 6.5 phosphate buffer containing 15 mM thiosulfate and 30 mM tetrabutylammonium hydrogen sulfate as follows. Weigh 4.969 g anhydrous NaH_2PO_4, 10.139 g Na_2HPO_4 dihydrate, 3.894 g sodium thiosulfate pentahydrate, and 10.186 g tetrabutylammonium hydrogen sulfate, dissolve in 800 mL water, adjust pH to 6.5 with 5 M NaOH, dilute to 1 L with water, mix thoroughly, filter under vacuum (0.45 μm).)

Flow rate: 1

Injection volume: 100
Detector: UV 340

CHROMATOGRAM
Retention time: 12
Limit of detection: 3 ng/mL

OTHER SUBSTANCES
Extracted: oxacillin, dicloxacillin

KEY WORDS
derivatization; SPE

SAMPLE
Matrix: milk
Sample preparation: 50 g Milk + 2 drops penicillinase (Difco Laboratories), let stand 1 h at 37°, add 50 MeCN, shake vigorously for 1 min, centrifuge at 9000 g for 10 min, decant, add 5 g NaCl, swirl to dissolve, add 100 mL dichloromethane, shake for 1 min, centrifuge at 1000 g for 10 min. Remove top aqueous layer and extract organic layer with 25 mL 10% NaCl by shaking and centrifuging as before. Combine aqueous layers, add 1 mL 0.3% mercuric chloride in water, let stand 30 min, add 1 mL 2 M HCl, extract with three 50 mL portions of dichloromethane by shaking each portion for 1 min and centrifuging at 1000 g for 10 min, filter dichloromethane extracts through 30 g anhydrous sodium sulfate, evaporate to dryness under reduced pressure at 35°, if water remains add 5-10 mL MeOH to flask and complete evaporation. Dissolve residue in 1 mL 10% acetic acid, add 0.5 mL 0.08% dansyl hydrazine in 10% acetic acid, let stand 90 min to overnight in the dark, transfer reaction mixture to a separatory funnel with three 25 mL portions of dichloromethane, add 5 mL 2 M HCl, shake for 1 min, wash organic layer with 5 mL 5% $NaHCO_3$ solution, filter through 10-20 g anhydrous sodium sulfate. Extract acid aqueous layer again with 25 mL dichloromethane. Combine dichloromethane layers and evaporate to dryness at 35° under reduced pressure. Dissolve residue in 2 mL IS solution, inject a 20 µL aliquot. (Prepare IS solution by dissolving 10 µL benzaldehyde in 100 mL dichloromethane, evaporate 1 mL to dryness under reduced pressure, dissolve residue in 1 mL 10% acetic acid, add 0.5 mL 0.08% dansyl hydrazine in 10% acetic acid, let stand 90 min to overnight in the dark, transfer reaction mixture to a separatory funnel with three 25 mL portions of dichloromethane, add 5 mL 2 M HCl, shake for 1 min, wash organic layer with 5 mL 5% $NaHCO_3$ solution, filter through 10-20 g anhydrous sodium sulfate. Extract acid aqueous layer again with 25 mL dichloromethane. Combine dichloromethane layers and evaporate to dryness at 35° under reduced pressure. Dissolve residue in 100 mL MeCN then dilute an aliquot 1:4 with MeCN.)

SAMPLE

Matrix: milk

Sample preparation: Condition a 500 mg tC18 SPE cartridge (Waters) with 20 mL MeOH, 20 mL water, and 10 mL 2% NaCl. Centrifuge 30 mL milk at 1500 g for 10 min. Dilute a 10 mL portion of the defatted milk with 20 mL water, add 200 μL 2 μg/mL penicillin V in pH 9.0 buffer, add 6 mL 170 mM sulfuric acid, add 5.6 mL 5% sodium tungstate, shake vigorously for 1 min, allow to stand for 5 min, check that the pH is in the range 4.6-4.8 (if it is outside this range start again using a different volume of sodium tungstate solution), centrifuge at 1500 g for 10 min, adjust the pH of the supernatant to 8.1-8.2 with 5 M and 0.1 M NaOH, filter (glass fiber) the clear liquid phase. Pass the filtrate through the SPE cartridge at 2 mL/min, wash with 2 mL water, dry by pulling air through the cartridge for 1 min, elute with 2 mL MeCN. Add 150 μL pH 9.0 buffer to the eluate and evaporate to about 100 μL under a stream of nitrogen at 45-50°, add 400 μL pH 9.0 buffer, add 75 μL reagent I, vortex for 30 s, let stand at room temperature for 10 min, use 500 μL water to transfer the mixture to a separatory funnel, add 20 mL dichloromethane, add 5 mL pH 2.45 buffer, shake for 1 min, let stand for no more than 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure at 35-40°, dissolve the residue in 500 μL pH 9.0 buffer, add 75 μL reagent I, vortex for 30 s, let stand at room temperature for 10 min, add 450 μL reagent II, vortex for 1 min, heat at 55 ± 1° for 30 min, cool, filter (0.45 μm), inject a 150 μL aliquot. (Prepare pH 9.0 buffer by dissolving 0.34 g KH_2PO_4 in water, adjusting the pH to 9.0 with NaOH, and making up to 100 mL with water. Prepare pH 2.45 buffer by dissolving 2.72 g KH_2PO_4 in water, adjusting the pH to 2.45 with phosphoric acid, and making up to 100 mL with water. Prepare reagent 1 by dissolving 1.13 g benzoic anhydride in MeCN, make up to 25 mL with MeCN. Prepare reagent II by dissolving 6.905 g 1,2,4-triazole in 30 mL water and adding 5 mL 26 mM mercuric chloride in water, adjust pH to 9.0 ± 0.05 with 5 M NaOH, make up to 50 mL. Prepare reagents I and II 1-4 h before use. Silanize glassware with dichlorodimethylsilane.)

SAMPLE
Matrix: milk, tissue
Sample preparation: Milk. Mix 10 mL milk with 2 mL 100 mM tetraethylammonium chloride, add 40 mL MeCN slowly with continual stirring, let stand for 10 min, decant the supernatant through a plug of glass wool. Collect 40 mL filtrate, add 2 mL buffer, evaporate to 1-2 mL under reduced pressure at 40-50°, dilute to 4 mL with water, filter (0.45 μm PVDF). Inject a 2 mL aliquot onto a 150 × 4.6 5 μm Supelcosil LC-18 column, elute with MeCN:10 mM KH_2PO_4 0:100 for 3 min, to 60:40 over 37 min at 1 mL/min, collect a 1.5-2 mL aliquot containing the compound in a tube containing 100 μL Na_2HPO_4 (ca. 28.6 min), evaporate to <1 mL under reduced pressure, make up to 1 mL with water, inject an aliquot. Tissue. Blend 5 g tissue, 5 mL water, 2 mL 100 mM tetraethylammonium chloride (for liver and kidney 1 mL 200 mM tetraethylammonium chloride and 1 mL 5 mM KH_2PO_4), and 40 mL MeCN at half power for 1 min, let stand for 10 min, decant the supernatant through a plug of glass wool. Collect 40 mL filtrate (20 mL for liver and kidney), add 2 mL buffer, add 5 mL water, add 5 mL t-butanol, evaporate to 1-2 mL under reduced pressure at 40-50°, dilute to 4 mL with water, filter (0.45 μm PVDF). Proceed as above. (Prepare the buffer by mixing 10 mM KH_2PO_4 and 10 mM Na_2HPO_4 in a 5:1 ratio, pH 6.)

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax) 25 g tissue with 25 mL MeCN for 1 min, add 5 mL 500 mM pH 2.2 phosphate buffer while the homogenizer is still running, add 65 mL MeCN, homogenize for 1 min, centrifuge at 4000 g for 10 min. Remove the supernatant and add it to 7 g NaCl and 50 mL dichloromethane, shake for 2 min, allow to

stand for 30 min. Remove the upper organic layer and add it to 5 g anhydrous sodium sulfate, shake for 30 s, filter through a cotton-wool plug, evaporate to about 4 mL under reduced pressure at 30°, add 3 mL dichloromethane, evaporate to about 4 mL, add 3 mL light petroleum, evaporate to about 0.5 mL, Suspend this residue with sonication in three 3 mL portions of light petroleum and place these fractions in a separate tube, rinse the original tube with 2 mL pH 7 phosphate buffer. Add the phosphate buffer rinse to the light petroleum extracts, vortex for 30 s, centrifuge, remove the aqueous layer. Extract the light petroleum layer with 2 mL pH 7 phosphate buffer and with two 1.5 mL portions of pH 7 phosphate buffer, combine all the aqueous phase, centrifuge, inject a 200 μL aliquot on to column A and elute to waste with mobile phase B, after 15 min elute to waste with mobile phase C at 2 mL/min, after 10 min elute the contents of column A on to column B with mobile phase D, after 2 min remove column A from the circuit, elute column B with mobile phase D, monitor the effluent from column B. (Wash column A with mobile phase A at 2 mL/min for 7 min, with mobile phase A at 1 mL/min for 5 min, with mobile phase B at 2 mL/min for 8 min, and with mobile phase B at 1 mL/min for 6 min.)

HPLC VARIABLES

Column: A 4 × 4 5 μm LiChrospher 100 RP-18e; B 250 × 4 5 μm LiChrospher 100 RP-18e
Mobile phase: A MeCN:water 50:50; B 20 mM pH 7 phosphate buffer; C MeCN:20 mM pH 3 phosphate buffer 10:90; D MeCN:200 mM pH 3.0 phosphate buffer 35:65 containing 2 mM disodium EDTA
Column temperature: 35
Flow rate: 1 (except where indicated)
Injection volume: 200
Detector: E, Merck Model L3500, glassy carbon working electrode +0.65 V, stainless-steel auxiliary electrode, Ag/AgCl reference electrode following post-column reaction. The column effluent flowed through a 10 m × 0.3 mm ID woven PTFE coil illuminated by a UV 254 low-pressure mercury lamp to the detector.

CHROMATOGRAM

Retention time: 8.9
Limit of detection: 2.5 ng

OTHER SUBSTANCES

Extracted: dicloxacillin, oxacillin, penicillin V, penicillin G

KEY WORDS

post-column reaction; post-column photochemical derivatization; cow; muscle; column-switching

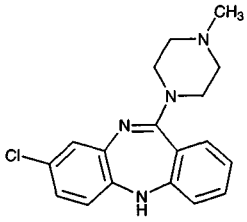
Clozapine



Molecular formula: $C_{18}H_{19}ClN_4$
Molecular weight: 326.83
CAS Registry No.: 5786-21-0
Merck Index: 2484
Lednicer No.: 2 425, 4 212, 220

SAMPLE

Matrix: blood
Sample preparation: 500 µL Serum + 4 µg/mL amoxapine in 100 mM HCl + 400 µL 1 M NaOH + 6 mL ethyl acetate, shake for 15 min, centrifuge at 4000 g for 10 min. Transfer top organic layer to another tube and re-extract the analyte with 3 mL 50 mM HCl. Evaporate organic layer under nitrogen at 45°. Dissolve the residue in 120 µL mobile phase, inject a 30 µL aliquot.

HPLC VARIABLES

Guard column: Perisorb RP-8 (Upchurch)
Column: 100 × 4.6 3 µm Supelco C8-DB
Mobile phase: MeCN:MeOH:buffer 20:18:62 (Buffer was 50 mM monobasic sodium phosphate containing 2.5 mL/L triethylamine adjusted to pH 2.7 with phosphoric acid.)
Flow rate: 1.3
Injection volume: 30
Detector: UV 230

CHROMATOGRAM

Retention time: 6.5
Internal standard: amoxapine (14.3)
Limit of detection: 2 ng/mL

OTHER SUBSTANCES

Extracted: metabolites
Simultaneous: amitryptiline, atenolol, carbamazepine, cogentin, desipramine, desmethylsertraline, diazepam, doxepin, fluoxetine, haloperidol, imipramine, loxapine, medazepam, nortryptiline, oxazepam, paroxetine, phenytoin, propranolol, sertraline, thiothixene, trazadone, trifluoperazine, valproic acid, verapamil
Interfering: bupropion

SAMPLE

Matrix: blood
Sample preparation: Condition a 100 mg Bond-Elut C18 SPE cartridge with 2 mL MeOH and 2 mL water. Mix 1 mL plasma or serum with 200 µL 660 nM IS in MeOH:water 5:95. Add to the SPE cartridge. Wash twice with 2 mL water. Acidify the SPE cartridge with 1 mL MeOH:250 mM HCl 10:90, wash with 500 µL MeCN, elute twice with 500 µL 10 mM acetic acid and twice with 500 µL 5 mM diethylamine in MeOH. Evaporate the eluate to dryness with a gentle stream of air at 37°. Reconstitute the residue with 100 µL mobile phase. Inject a 40 µL aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm Select-B C8 (Merck)
Mobile phase: MeCN:MeOH:10 mM pH 3.7 dipotassium hydrogen phosphate 30:2:100
Flow rate: 1.5
Injection volume: 40
Detector: UV 220

CHROMATOGRAM
Retention time: 5
Internal standard: protriptyline (8.5)
Limit of detection: 15 nM
Limit of quantitation: 50 nM

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: amitriptyline, clomipramine, chlorpromazine, chlorprothixene, citalopram, desipramine, diazepam, doxepin, fluoxetine, haloperidol, imipramine, levomepromazine, maprotiline, medazepam, mianserin, midazolam, nitrazepam, norclomipramine, nordoxepin, norfluoxetine, normaprotiline, nortrimipramine, nortryptiline, thioridazine, thiothixene, trazodone, trimipramine
Noninterfering: carbamazepine, carbamazepine-10-epoxide, carbamazepine-11-epoxide, clobazam, ethosuximide, flunitrazepam, 10-hydroxycarbazepine, norclobazam, oxazepam, oxcarbazepine, pentobarbital, phenobarbital, primidone, temazepam
Interfering: desmethylcitalopram

SAMPLE
Matrix: blood
Sample preparation: Mix 400 μL plasma with 50 μL protein releasing reagent. Dialyze 100 μL of this mixture, using a cellulose acetate (Gilson Cuprophane, molecular weight cut-off 15000) membrane, against 4 mL 2 mM pH 4.0 ammonium acetate buffer pumped through a 175 μL channel at 0.47 mL/min. The dialysate flowed through column A to waste. When dialysis is complete elute the contents of column A onto column B with mobile phase, monitor the effluent from column B. Wash the donor channel of the dialysis apparatus with 5 mL 1 mM dodecylethyldimethyl ammonium bromide and the acceptor channel with 5 mL 2 mM pH 4.0 ammonium acetate buffer. (The protein-releasing reagent was aqueous solution of 1 M HCl, 20 mM dodecylethyldimethyl ammonium bromide (Fluka), and 50% (v/v) glycerol.)

HPLC VARIABLES
Column: A 10 × 2 40 μm BondElut C18 (Varian); B 100 × 4.6 5 μm Brownlee CN (Applied Biosystems)
Mobile phase: MeCN:50 mM pH 3.2 ammonium acetate buffer 22:78
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 4.1
Limit of detection: 50 nM
Limit of quantitation: 250 nM

OTHER SUBSTANCES
Extracted: N-desmethylclozapine

KEY WORDS
plasma; dialysis

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL Clean Screen SPE cartridge (Worldwide Monitoring) with two 2 mL portions of MeOH, with 3 mL water, and with 3 mL 10 mM pH 3.0 phosphate buffer. 1 mL Serum + bupivacaine + 500 μL 10 mM pH 3.0 phosphate buffer, mix, add to the SPE cartridge, air dry for 30 s, wash with 3 mL phosphate buffer, wash with 3 mL 100 mM HCl, wash with 3 mL MeOH, elute with 2 mL chloroform:isopropanol: ammonium hydroxide 22:20.5:2.5. Evaporate the eluate to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.5 SemiPermeable Surface (SPS) C8 (Regis)
Mobile phase: THF:2.5 mM potassium phosphate buffer 3.25:96.75 containing 0.0025% triethylamine, final pH adjusted to 2.7-2.8 with 85% orthophosphoric acid
Flow rate: 0.5
Detector: UV 235

CHROMATOGRAM

Retention time: 15.5
Internal standard: bupivacaine (24)
Limit of detection: 1 ng/mL

OTHER SUBSTANCES

Extracted: acepromazine, atropine, benzoylecgonine, benzoylnorecgonine, ketamine, norcocaine
Noninterfering: benzethonium chloride, benzyl alcohol

KEY WORDS

SPE; serum

REFERENCE

Muztar,J.; Chari,G.; Bhat,R.; Ramaro,S.; Vidyasagar,D. A high-performance liquid chromatographic procedure for the separation of cocaine and some of its metabolites from acepromazine, ketamine, and atropine from serum, *J.Liq.Chromatogr.*, **1995**, *18*, 2635–2645.

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min,

inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 231

CHROMATOGRAM

Retention time: 4.75
Limit of detection: <120 ng/mL

KEY WORDS

whole blood; plasma; interferences may occur—compounds(all of which are extracted) elute in this order tenoxicam; iproniazid; methocarbamol; methotrexate; caffeine; nialamide; colchicine; cytarabine; benzoylecgonine; acetaminophen; diazoxide; dacarbazine; sulfinpyrazole; flumazenil; sulpride; morphine; atenolol; toloxatone; terbutaline; albuterol; phenobarbital; ranitidine; tiapride; phenol; chlormezanone; aspirin; metformin; ritodrine; codeine; sultopride; amisulpride; naltrexone; lisinopril; benzocaine; nizatidine; nalorphine; mephenesin; naloxone; sotalol; carteolol; procainamide; carbamazepine; bromazepam; nalbuphine; nadolol; procarbazine; dihydralazine; omeprazole; strychnine; acebutolol; glutethimide; chlorpropamide; glipizide; triazolam; prazosin; flunitrazepam; clonazepam; metoclopramide; melphalan; estazolam; tolbutamide; ephedrine; clonidine; pindolol; clobazam; minoxidil; disopyramide; nitrazepam; dextromethorphan; tofisopam; zopiclone; debrisoquine; sulindac; alprazolam; cycloguanil; lorazepam; methaqualone; ketamine; piroxicam; metoprolol; nifedipine; quinine; mephentermine; prilocaine; pentazocine; oxazepam; tiaprofenic acid; quinidine; celiprolol; ajmaline; yohimbine; lidocaine; secobarbital; viloxazine; mepivacaine; meperidine; doxylamine; labetalol; temazepam; amodiaquine; benperidol; droperidol; hydroxychloroquine; zolpidem; ketoprofen; alminoprofen; cicletanine; moclobemide; chloroquine; cocaine; timolol; nomifensine; ticlopidine; acenocoumarol; vindesine; mexiletine; dipyridamole; trazodone; pipamperone; pyrimethamine; benazepril; vincristine; metapramine; chlordiazepoxide; oxprenolol; warfarin; clorazepate; flecainide; phencyclidine; thiopental; fenfluramine; metipranolol; triprolidine; naproxen; buprenorphine; verapamil; buspirone; tianeptine; midazolam; bupivacaine; carbinoxamine; loprazolam; cetirizine; chlorpheniramine; moperone; cibenzoline; medifoxamine; astemizole; vinblastine; nicardipine; bisoprolol; diltiazem; glibornuride; reserpine; aconitine; nitrendipine; diazepam; mianserin; ramipril; haloperidol; tetracaine; alprenolol; acepromazine; glibenclamide; chlorophenacinone; doxepin; nimodipine; diphenhydramine; cyclizine; histapyrrodine; phenylbutazone; demexiptiline; clozapine; proguanil; trifluperidol; medazepam; cyamemazine; bumadizone; suriclone; propranolol; acepromazine; dothiepin; dextromoramide; fenoprofen; dextropropoxyphene; loxapine; betaxolol; propafenone; promethazine; thioproperazine; methadone; amoxapine; quinupramine; opipramol; cyproheptadine; brompheniramine; mefenidramine; protriptyline; flurbiprofen; tetrazepam; zorubicin; prazepam; alimemazine; loperamide; imipramine; desipramine; levomepromazine; hydroxyzine; niflumic acid; penbutolol; fluvoxamine; pimozide; daunorubicin; indomethacin; maprotiline; tropatenine; etodolac; fluoxetine; amitriptyline; nortriptyline; tioclomarol; diclofenac; mefloquine; trimipramine; chlorambucil; lidoflazine; ibuprofen; floctafenine; alpidem; loratadine; chlorpromazine; clomipramine; carpipramine; thioridazine; fentiazac; clemastine; mefenamic acid; fluphenazine; prochlorperazine; penfluridol; bepridil; terfenadine; trifluoperazine

SAMPLE

Matrix: blood

Sample preparation: Condition a 300 mg Bond Elut Certify SPE cartridge with 6 mL MeOH, 3 mL water, and 5 mL 10 mM pH 2.0 NaH_2PO_4. 1 mL Plasma + 100 μL 20 μg/mL tropacocaine in water + 3 mL 10 mM pH 2.0 NaH_2PO_4, vortex briefly, add to the SPE cartridge at 0.5 mL/min, dry under vacuum for 1-2 min, wash with 3 mL water at 1 mL/min, dry under vacuum for 3 min, wash with 3 mL 100 mM HCl, dry under vacuum for 3 min, wash rapidly with 6 mL MeOH, dry under vacuum for 5 min, elute with 6 mL dichloromethane:isopropanol:ammonium hydroxide 80:20:2 without vacuum. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 2 mL dichloromethane:isopropanol 80:20. Remove a 1 mL aliquot and evaporate it to dryness under a stream of nitrogen, reconstitute with 300 μL mobile phase, mix for 30 s, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 30 × 4.6 5 μm Brownlee C8

Column: 250 × 4.6 5 μm Nucleosil C18

Mobile phase: MeCN:buffer:triethylamine 18:81.7:0.3 (Buffer was 50 mM citric acid:100 mM Na_2HPO_4 80:20, pH 3.0.)

Flow rate: 1.5

Injection volume: 100

Detector: UV 235

CHROMATOGRAM

Retention time: 17.6

Internal standard: tropacocaine (12.8)

Limit of detection: 75 ng/mL

Limit of quantitation: 220 ng/mL

OTHER SUBSTANCES

Extracted: metabolites, benzoylecgonine, norcocaine

KEY WORDS

rat; plasma; SPE

SAMPLE

Matrix: blood, CSF, gastric contents, urine

Sample preparation: 200 μL Serum, urine, CSF, or gastric fluid + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine HCl and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 40 μm preparative grade C18 (Analytichem); B 75 × 2.1 pellicular C18 (Whatman) + 250 × 4.6 5 μm C8 end-capped (Whatman)

Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 20 min.

Column temperature: 50

Flow rate: 1.5

Detector: UV 220

CHROMATOGRAM
Retention time: 8.97
Internal standard: heptanophenone (19)

OTHER SUBSTANCES
Extracted: acetaminophen, allobarbital, azinphos, barbital, brallobarbitone, bromazepam, butethal, caffeine, carbamazepine, carbaryl, cephaloridine, chloramphenicol, chlordiazepoxide, chlorothiazide, chlorvinphos, clothiapine, coomassie blue, desipramine, diazepam, diphenhydramine, dipipanone, ethylbromphos, flufenamic acid, formothion, griseofulvin, indomethacin, lidocaine, lorazepam, malathion, medazepam, midazolam, oxazepam, paraoxon, penicillin G, pentobarbital, prazepam, propoxyphene, prothiophos, quinine, salicylic acid, secobarbital, strychnine, sulfamethoxazole, theophylline, thiopental, thioridazine, trimethoprim

SAMPLE
Matrix: blood, hair
Sample preparation: Hair. Wash 20-200 mg hair twice with 20 mL aliquots of 0.3% Tween 20 in water, rinse thoroughly with water, dry at 37°, add 2 mL 250 mM HCl, heat at 45° overnight, neutralize with 1 M NaOH, extract twice with Isolute Confirm HCX (from IST, U.K.), combine the organic layers and evaporate them to dryness, reconstitute with 500 μL 50 mM pH 5.2 NaH_2PO_4, inject a 100-200 μL aliquot. Plasma. 200 μL Plasma + 150 μL 100 mM pH 8.9 Na_2HPO_4 + 5 mL chloroform:isopropanol 90:10, vortex for 2 min, centrifuge at 700 g for 10 min. Evaporate 4 mL of the organic phase, reconstitute the residue in 500 μL pH 5.2 50 mM NaH_2PO_4, inject a 100-200 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Bio-Gel PRP 70-5 poly(styrene-divinylbenzene) (Bio-Rad)
Mobile phase: MeOH:THF:100 mM pH 3 potassium phosphate 25:5:70
Flow rate: 0.5
Injection volume: 100-200
Detector: F ex 230 em 315

CHROMATOGRAM
Retention time: 20
Limit of detection: 1 ng/mL

OTHER SUBSTANCES
Noninterfering: acetaminophen, amitriptyline, amobarbital, amphetamine, aprobarbital, atropine, barbital, benzoylecgonine, benztropine, butabarbital, caffeine, carbamazepine, carisoprodol, chlorpheniramine, chlorpromazine, chlorprothixene, cimetidine, codeine, dextromethorphan, diazepam, dihydrocodeine, diphenhydramine, diphenoxilate, disopyramide, doxepin, doxylamine, emetine, erythromycin, ethinamate, ethylmorphine, flurazepam, glutethimide, hydrocodone, hydrocortisone, hydromorphone, hydroxyzine, imipramine, lidocaine, loxapine, meperidine, meprobamate, methadone, methamphetamine, methapyrilene, methaqualone, methocarbamol, methylphenidate, morphine, naloxone, nicotine, nordiazepam, nortriptyline, orphenadrine, oxycodone, papaverine, pentazocine, pentobarbital, phenacetin, phencyclidine, phenmetrazine, phenobarbital, phenolphthalein, phentermine, phenylpropanolamine, phenytoin, phetidine, prazepam, procainamide, procaine, propoxyphene, propranolol, protriptyline, pseudoephedrine, pyrilamine, quinine,

salicylamide, secobarbital, spironolactone, strychnine, terpin hydrate, thioridazine, thiothixene, triamterene, trifluoperazine, triflupromazine, trihexyphenidyl, trimeprazine, trimethoprim, trimetobenzamide

KEY WORDS
plasma

SAMPLE
Matrix: blood, saliva, tissue, urine

Sample preparation: Homogenize (Polytron) tissue with 4 (whole brain) or 8 (brain striata) volumes of 100 mM pH 4.5 NaH_2PO_4 containing 0.5% NaF. Add 500 μL brain homogenate or 500 μL plasma, saliva, or urine containing 15 μL saturated NaF solution to 75 μL 150 μg/mL IS, add 50 μL 50% perchloric acid, mix vigorously for 10 s, let stand at room temperature for 10 min, add 1 mL water, mix briefly, centrifuge at 10° at 2500 (?) for 30 min. Remove the supernatant and add it to 750 μL saturated sodium carbonate solution, mix briefly, add 7.5 mL pentane:chloroform 95:5, rock gently for 10 min, centrifuge in a desk-top centrifuge for 2 min, freeze in dry ice/acetone for 2 min. Remove the organic layer and add it to 250 μL 100 mM HCl, mix vigorously for 10 s, centrifuge in a desk-top centrifuge for 1-2 min, freeze in dry ice/acetone for 3-5 min, discard the organic layer. Allow the aqueous layer to thaw, remove any trace of organic solvent with a stream of nitrogen, inject a 75 μL aliquot of the aqueous layer.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm Brownlee RP-8

Column: 250 × 4.6 5 μm Zorbax RX-C18

Mobile phase: MeCN:buffer 18:82 (Buffer was 100 mM K_2HPO_4 containing 0.5% triethylamine, adjusted to pH 2.7 with phosphoric acid.)

Flow rate: 2

Injection volume: 75

Detector: UV 235

CHROMATOGRAM
Retention time: 6.5

Internal standard: 2β-carbomethoxy-3β-(4-chlorophenyl)tropane (RTI-31) (Research Biochemical International, Natick MA) (11.4)

Limit of detection: 5 ng/g (brain), 5 ng/mL (plasma)

Limit of quantitation: 25 ng/g (brain), 25 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: chlordiazepoxide, clozapine, gepirone, methylphenidate, pentazocine, pseudococaine

Simultaneous: acetaminophen, acetophenazine, amoxapine, amphetamine, atropine, benperidol, buspirone, caffeine, carbamazepine, chlorpheniramine, codeine, dextromethorphan, diazepam, diphenhydramine, flupenthixol, flurazepam, haloperidol, hydergine, hydrocodone, hydromorphone, lidocaine, loxapine, mepazine, meperidine, mesoridazine, methaquaalude, 3,4-methylenedioxyamphetamine, 3,4-methylenedioxyethylamphetamine, 3,4-methylenedioxymethamphetamine, morphine, norcocaine, oxazepam, pentobarbital, phenylpropanolamine, procainamide, procaine, propyl benzoylecgonine, quinidine, quinine, salicylic acid, secobarbital, theophylline, trazodone, 3-tropanyl-3,5-dichlorobenzoate, vancomycin, WIN 35428

Noninterfering: amitriptyline, benztropine methanesulfonate, butaperazine, butriptyline, carphenazine, chlorpromazine, clomipramine, cyclobenzaprine, dextropropoxyphene, dronabinol, ephedrine, ethchlorvynol, fluoxetine, fluphenazine, imipramine, meprobam-

ate, methadone, methamphetamine, nicotine, norfluoxetine, nortriptyline, PCP, phenothiazine, pseudoephedrine

KEY WORDS
rat; cow; plasma; brain

SAMPLE
Matrix: blood, urine
Sample preparation: Urine. Condition a Bond-Elut Certify SPE cartridge with 2 mL MeOH and 2 mL pH 6 phosphate buffer. Mix 2.5 mL urine and 2.5 mL water, add to the SPE cartridge, wash with 3 mL water, wash with 3 mL 100 mM HCl, wash with 9 mL MeOH, wash with 3 mL ammonia, dry column under vacuum for 5 min, elute with 2 mL chloroform:isopropanol 80:20. Evaporate 1.5 mL of the eluate to dryness under a stream of nitrogen at 65°, reconstitute with 500 μL 1 μg/mL methaqualone in mobile phase, inject a 25 μL aliquot. Plasma. Condition a Bond-Elut Certify SPE cartridge with 2 mL MeOH and 2 mL pH 6 phosphate buffer. Mix 1 mL plasma and 2 mL water, add to the SPE cartridge, wash with 3 mL water, wash with 3 mL 100 mM HCl, wash with 9 mL MeOH, wash with 3 mL ammonia, dry column under vacuum for 5 min, elute with 2 mL chloroform:isopropanol 80:20. Evaporate 1.5 mL of the eluate to dryness under a stream of nitrogen at 65°, reconstitute with 100 μL 1 μg/mL methaqualone in mobile phase, inject a 25 μL aliquot. (Prepare pH 6 phosphate buffer by adding 55 mL 100 mM Na_2HPO_4 to 445 mL 100 mM KH_2PO_4.)

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChrospher RP18
Column: 125 × 4 5 μm LiChrospher RP-18
Mobile phase: MeOH:pH 7 phosphate buffer 70:30 (Prepare buffer by adding 320 mL 20 mM K_2HPO_4 to 680 mL 20 mM KH_2PO_4.)
Flow rate: From 0.4 to 0.7 over 6 min, to 1.0 over 2 min, to 0.7 over 2 min, to 0.6 over 1 min, to 0.4 over 1 min
Injection volume: 25
Detector: UV 235

CHROMATOGRAM
Retention time: 8.8
Internal standard: methaqualone (5.8)
Limit of detection: 5 ng/mL (urine), 12.5 ng/mL (plasma)
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES
Extracted: benzoylecgonine
Simultaneous: acetaminophen, amitriptyline, atropine, benzocaine, caffeine, codeine, diazepam, flunitrazepam, imipramine, ketazolam, lidocaine, meperidine, methadone, midazolam, morphine, nordiazepam, oxazepam, pentobarbital, perphenazine, phenobarbital, procaine, propoxyphene, secobarbital, tetracaine, tetrazepam
Noninterfering: amphetamine, clomipramine, haloperidol, maprotiline, mianserin, thioridazine

SAMPLE
Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

Sample preparation: Inject a 200 μL aliquot.

HPLC VARIABLES
Column: 100 × 5 10 μm Radial-Pak C18 radial compression (Waters)
Mobile phase: MeOH:100 mM NaCl:butylamine 50:50:0.7, adjusted to pH 3 with sulfuric acid
Flow rate: 1
Injection volume: 200
Detector: E, Bioanalytical systems LC4B, MF 1000 dual glassy carbon working electrode + 1.1 V and +0.75 V, MF 1018 stainless steel auxiliary electrode, MF 2020 Ag/AgCl reference electrode following post-column reaction. The column flowed through a knitted 9.1 m × 0.5 mm ID PTFE coil irradiated at 254 nm by a Photronix medium-pressure mercury lamp (cooled with ice-water) to the detector.

CHROMATOGRAM
Retention time: k' 0.53
Limit of detection: 500 ppb

OTHER SUBSTANCES
Simultaneous: amylocaine, ascorbic acid, caffeine, chloroprocaine, lidocaine, niacinamide, procaine
Noninterfering: inositol, lactose, mannitol

KEY WORDS
post-column reaction; post-column photochemical derivatization

REFERENCE
Selavka,C.M.; Krull,I.S.; Lurie,I.S. An improved method for the rapid screening of illicit cocaine preparations using high performance liquid chromatography with electrochemical detection, *Forensic Sci.Int.*, **1986**, *31*, 103–117.

SAMPLE
Matrix: bulk
Sample preparation: Weigh out 50 mg of the hydrochloride, dissolve in 2 mL 24 μg/mL meconin and 60 μg/mL n-butyrophenone in MeCN:buffer 20:80, vortex, inject a 150 μL aliquot. (Buffer was 40 mL phosphoric acid and 120 mL 2 mM NaOH in 3480 mL water containing 20 mM sodium dodecyl sulfate, pH 2.0.)

HPLC VARIABLES
Column: 125 × 4.6 HS-5 C18 (Perkin-Elmer)
Mobile phase: Gradient. MeCN:THF:buffer 21.9:1.7:76.4 to MeCN:buffer 44:56 over 12 min (concave gradient), to MeOH:buffer 80:20 over 13 min (linear), maintain at MeOH:buffer 80:20 for 8 min, return to initial conditions over 5 min. (Buffer was 40 mL phosphoric acid and 120 mL 2 mM NaOH in 3480 mL water containing 20 mM sodium dodecyl sulfate, pH 2.0.)
Flow rate: 1.5
Injection volume: 150
Detector: UV 215 and 277

CHROMATOGRAM
Retention time: 15
Internal standard: meconin (2.5), n-butyrophenone (11.5)

OTHER SUBSTANCES
Simultaneous: impurities, benzoylecgonine

REFERENCE
Lurie,I.S.; Moore,J.M.; Cooper,D.A.; Kram,T.C. Analysis of manufacturing by-products and impurities in illicit cocaine via high-performance liquid chromatography and photodiode array detection, *J.Chromatogr.*, **1987**, *405*, 273–281.

SAMPLE
Matrix: bulk
Sample preparation: Prepare a 750 μg/mL solution in 10 mM pH 2.5 orthophosphoric acid, sonicate for 10 min, filter (0.2 μm), inject a 15 μL aliquot.

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChrospher 100
Column: 125 × 4 3 μm Spherisorb ODS-1
Mobile phase: Gradient. A was water containing 5 mL/L 85% orthophosphoric acid and 0.56 mL/L hexylamine. B was MeCN:water 90:10 containing 5 mL/L 85% orthophosphoric acid and 0.56 mL/L hexylamine. A:B from 91:9 to 86:14 over 4 min, maintain at 86:14 for 13 min, to 55:45 over 11 min, maintain at 55:45 for 8 min, re-equilibrate at initial conditions for 20 min.
Flow rate: 0.7
Injection volume: 15
Detector: UV 210

CHROMATOGRAM
Retention time: 26.3

OTHER SUBSTANCES
Simultaneous: acetaminophen, acetylcodeine, benzocaine, caffeine, codeine, diamorphine, lidocaine, 6-monoacetylmorphine, morphine, noscapine, papaverine, procaine

REFERENCE

SAMPLE
Matrix: dialysate
Sample preparation: Inject a 5 μL aliquot of dialysate.

HPLC VARIABLES
Column: 100 × 1 3 μm SepStik (BioAnalytical Systems, West Lafayette, IN)
Mobile phase: THF:50 mM NaH_2PO_4 24:76 containing 0.2 mM disodium EDTA, 3.7 mM 1-decanesulfonic acid, and 4.9 mM triethylamine, pH 5.5
Flow rate: 0.023
Injection volume: 5
Detector: E, (EG & G Princeton Applied, USA), Model MP 1304, glassy carbon electrode, first at +700 mV, second at 0 mV, Ag/AgCl reference electrode (BioAnalytical Systems, Model RE4); UV 225

CHROMATOGRAM
Retention time: 25
Limit of quantitation: 100 nM

OTHER SUBSTANCES
Simultaneous: dopamine

KEY WORDS
rat; brain; microdialysis; pharmacokinetics

SAMPLE
Matrix: leaves
Sample preparation: Reflux 0.05-4 g air-dried coca leaves in 30-100 mL 95% EtOH for 15 min, filter (Whatman No. 4 paper), inject an aliquot.

HPLC VARIABLES
Column: 125 × 4.6 5 μm C8 (R.E.Gourley)
Mobile phase: MeCN:1% triethylamine pH 4 40:60
Flow rate: 1.2
Injection volume: 5
Detector: UV 240

CHROMATOGRAM
Retention time: 2.5
Limit of detection: 5 ng

SAMPLE
Matrix: meconium
Sample preparation: Condition a 1 mL 100 mg Bond Elut strong cation exchange SPE cartridge with 2 mL MeOH, 1 mL water, and 1 mL 250 mM phosphate buffer. 0.5 g Meconium + 2 mL MeOH, vortex for 1 min, centrifuge at 450 g for 5 min. Remove the supernatant and add it to 1 mL 25 mM pH 3 potassium phosphate buffer, add to SPE cartridge, air dry for 30 s, wash with 1 mL phosphate buffer, wash with 100 mM acetic acid, air dry for 30 s, elute with 2 mL 3% ammonia in MeOH, evaporate eluate to dryness under a stream of nitrogen, reconstitute in 50 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 5 × 4.5 C18 Guard Pak (Waters)
Column: 250 × 4.5 5 μm Spherisorb ODS
Mobile phase: MeCN:25 mM potassium phosphate buffer 15:85 containing 25 mL/L diethylamine, final pH adjusted to 2.9 with concentrated orthophosphoric acid
Flow rate: 1.5
Injection volume: 20
Detector: UV 230, 255, 270

CHROMATOGRAM
Retention time: 11.0

OTHER SUBSTANCES
Extracted: benzoylecgonine

KEY WORDS
SPE

REFERENCE

SAMPLE
Matrix: meconium
Sample preparation: Condition a 200 mg Clean-Screen DAU SPE cartridge (Worldwide Monitoring) with two 3 mL portions of MeOH, 3 mL water, and 3 mL pH 3 buffer. 0.5 g Meconium + 2 mL MeOH, vortex, centrifuge. Remove the supernatant and add it to 3 mL pH 3 phosphate buffer and 20 μL 100 ng/mL bupivacaine, mix, add to the SPE cartridge, air dry, wash with 3 mL buffer, wash with 3 mL 100 mM HCl, wash with 3 mL MeOH, elute with three 1 mL portions of chloroform:isopropanol:ammonium hydroxide 78:20:2. Evaporate the eluate to dryness without heating, reconstitute the residue in 100 μL MeOH, inject an aliquot.

HPLC VARIABLES
Guard column: Guard-Pak C18 (Waters)
Column: 300 × 3.9 μBondapak C18 ODS
Mobile phase: MeCN:butylamine:25 mM KH_2PO_4 125:12.5:500, pH adjusted to 2.9 with 85% phosphoric acid
Flow rate: 1.5
Injection volume: 20
Detector: UV 230, UV 255, UV 275

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE

Matrix: urine

Sample preparation: Condition a 3 mL Bond Elut Certify C8/SCX SPE cartridge with 3 mL MeOH and 3 mL 100 mM pH 6 phosphate buffer (all flow rates are 1 mL/min). Mix 2 mL urine, 3 mL water, 2 mL 100 mM pH 6 phosphate buffer, and 100 μL internal standard solution (containing 13 μg/mL of both 2′-methylbenzoylecgonine and 2′-methylcocaine), adjust pH to 4.0-6.0 if necessary, add to the SPE cartridge, wash with 3 mL HPLC water, 3 mL 100 mM HCl, three 3 mL portions of MeOH and three 3 mL portions of MeCN. Elute with 2 mL dichloromethane:2-propanol:25% ammonium hydroxide 80:20:2. Evaporate the eluate at 35° under a stream of nitrogen.

HPLC VARIABLES

Guard column: 7.5 × 4.6 5 μm Hypersil BDS C18

Column: 150 × 4.6 5 μm Hypersil BDS C18

Mobile phase: Gradient. A was MeCN:MeOH:water 10:10:80 containing 45 mM ammonium acetate. B was MeCN:MeOH:water 40:40:20. A:B from 100:0 to 47.2:52.8 in 19 min, maintain at 47.2:57.8 for 2 min, to 100:0 in 1 min, maintain at 100:0 for 5 min.

Flow rate: 1

Injection volume: 50

Detector: UV 230

CHROMATOGRAM
Retention time: 13.7
Internal standard: 2′-methylbenzoylecgonine (9.7), 2′-methylcocaine (17.7) [Synthesis described in paper.]
Limit of detection: 20 ng/mL
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: acetaminophen, acetylcodeine, alprenolol, amphetamine, apomorphine, bromazepam, caffeine, citalopram, codeine, dihydrocodeine, hydrocodone, hydromorphone, methamphetamine, methylephedrine, monoacetylmorphine, morphine, naloxone, nitrazepam, oxycodone, phenobarbital, pholcodine, pindolol, propranolol, viloxazine
Noninterfering: alprazolam, amitriptyline, brotizolam, butryptiline, camazepam, chlordiazepoxide, clobazam, clomipramine, clonazepam, clotiazepam, cloxazolam, desipramine, diazepam, dothiepin, doxepin, ethyl loflazepate, flunitrazepam, fluoxetine, flurazepam, fluvoxamine, halazepam, imipramine, lofepramine, loprazolam, lorazepam, lormetazepam, maprotiline, medazepam, melitracen, mianserin, midazolam, nordazepam, nortriptyline, opipramol, oxazepam, paroxetine, sertraline, temazepam, trazodone, triazolam, trimipramine
Interfering: thebacon

SAMPLE

Matrix: blood, urine
Sample preparation: Condition a 1 mL 100 mg Bond Elut C2 SPE cartridge with one volume MeOH and two volumes of water. Dilute urine with four volumes of water. 500 μL Serum or diluted urine + 50 μL 2 μg/mL demecolcine in water, add to SPE cartridge, wash with 1 mL water, elute with three 350 μL portions of MeOH. Evaporate eluate to dryness under a stream of air at 40-50°, reconstitute in 150 μL water, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 4.6 5 μm C18
Column: 150 × 4.6 5 μm Microsorb C18
Mobile phase: MeCN:MeOH:buffer 13.4:26.6:60, adjusted to pH 6.0 with 100 mM KOH. After 10 min wash with MeCN:water 80:20 for 2 min, re-equilibrate for 12 min. (Buffer was 100 mM KH_2PO_4 containing 5 mM 1-pentanesulfonic acid.)
Flow rate: 1.5
Injection volume: 50
Detector: UV 254 (plasma) or UV 350 (urine)

CHROMATOGRAM

Retention time: 9.41
Internal standard: demecolcine (8.20)
Limit of detection: 4 ng/mL

OTHER SUBSTANCES

Extracted: metabolites, N-desacetylcolchicine

KEY WORDS

serum; SPE

REFERENCE

Ko,R.J.; Li,W.Y.; Koda,R.T. Determination of the antimitotic agents N-desacetylcolchicine, demecolcine and colchicine in serum and urine, *J.Chromatogr.*, **1990**, *525*, 411–418.

SAMPLE

Matrix: blood, urine

Sample preparation: Add tofisopam to whole blood, plasma, or urine, adjust pH to 8.0, extract with dichloromethane.

HPLC VARIABLES

Column: 250 × 1 5 μm C18 Microbore (Alltech)

Mobile phase: MeCN:2 mM pH 3 ammonium formate buffer 75:25

Flow rate: 0.05

Detector: MS, Perkin-Elmer Sciex API-100, ionspray +4 kV, nebulizing gas nitrogen, curtain gas nitrogen, orifice +50 V, electron multiplier +2.2 kV, SIM m/z 400

CHROMATOGRAM

Retention time: 2.70

Internal standard: tofisopam (m/z 383) (4.53)

Limit of detection: 0.6 ng/mL

KEY WORDS

whole blood; plasma; microbore

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 244

CHROMATOGRAM

Retention time: 13.118

KEY WORDS

whole blood

Copovithane

CAS Registry No.: 68045-74-9

SAMPLE

Matrix: blood

Sample preparation: Cool 2 mL plasma on ice for 5 min, add 200 μL 10 M perchloric acid, vortex vigorously, let stand on ice for 5 min, centrifuge at 17000 g for 15 min. Remove the supernatant and add it to 200 μL 10 M KOH, cool on ice for 5 min, centrifuge for 3 min. Remove the supernatant, add 2 mL hot (85°) saturated NaCl solution, add 3 mL chloroform, vortex vigorously, centrifuge at 17000 g for 15 min, repeat extract twice more. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL 5 M HCl, heat at 160° for 16 h, cool on ice, add 1 mL 5 M NaOH, add 3 mL 1 M pH 8.0 sodium bicarbonate buffer, add 750 μL 0.5% trinitrobenzenesulfonic acid in acetone, let stand in the dark for 2.5 h, extract three times with 3 mL portions of ethyl acetate. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 250 μL 200 mM pH 6.4 Na_2HPO_4 in MeCN, inject an aliquot. (Copovithane is hydrolyzed to methylamine and the methylamine is derivatized.)

HPLC VARIABLES

Column: 300 × 3.9 10 μm C18 (Waters)
Mobile phase: MeCN:water 30:70
Flow rate: 2
Detector: UV 340

CHROMATOGRAM

Retention time: 15
Limit of detection: 15 μg/mL

KEY WORDS

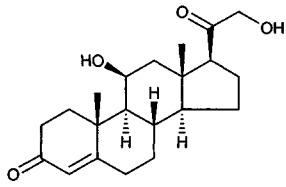
Corticosterone



Molecular formula: $C_{21}H_{30}O_4$
Molecular weight: 346.47
CAS Registry No.: 50-22-6
Merck Index: 2601

SAMPLE

Matrix: urine

Sample preparation: Condition a 10 mL 200 mg MCF Isolute SPE cartridge with two 3 mL portions of EtOH and two 3 mL portions of water. Centrifuge urine at 4000 g for 30 min, filter through a 0.22 μm filter unit. Dilute 0.5-1.5 mL urine to 4 mL with water. Add 40 ng IS. Add to the SPE cartridge. Wash with three 3 mL portions of water, 3 mL MeOH:10 mM NaOH 35:65, twice with 3 mL water and 3 mL MeOH:10 mM HCl 35:65. Elute with 3 mL absolute EtOH. Evaporate effluent under vacuum and reconstitute the residue with 150 μL mobile phase. Inject a 100 μL aliquot.

HPLC VARIABLES

Column: 100 × 3.2 5 μm Nucleosil 120-C18
Mobile phase: MeCN:water 26.5:73.5
Flow rate: 0.5
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Retention time: 13.01
Internal standard: 11-desoxy-17hydroxycorticosterone (15.73)
Limit of detection: 4 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

Corticotropin

CAS Registry No.: 9002-60-2

Merck Index: 136

SAMPLE

Matrix: blood

Sample preparation: Condition a 1 mL Analytichem weak cation-exchange (carboxymethylhydrogen form, CBA) SPE cartridge with 1 mL 1% trifluoroacetic acid in MeOH, 1 mL MeOH, and 2 mL water. Add 1 mL plasma to the SPE cartridge, rinse the tube with 1 mL water, add the rinse to the SPE cartridge, wash with 1 mL 1% trifluoroacetic acid in water, wash with 2 mL water, wash with 2 mL MeOH, elute with 2 mL 1% trifluoroacetic acid in MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH:buffer 50:50, inject a 5-75 μL aliquot. (Buffer was 5.7 g monochloroacetic acid, 2.0 g NaOH, and 0.2 g disodium EDTA in 1 L water, pH 3.2.) [Procedure was not necessarily validated for this compound.]

HPLC VARIABLES

Column: 250 × 2 5 μm Ultrasphere octyl

Mobile phase: Gradient. A was MeOH containing 10 mM sodium octanesulfonate. B was buffer containing 10 mM sodium octanesulfonate. A:B from 45:55 to 70:30 over 30 min, maintain at 70:30 for 1 h. (Buffer was 5.7 g monochloroacetic acid, 2.0 g NaOH, and 0.2 g disodium EDTA in 1 L water, pH 3.2.)

Column temperature: 60

Flow rate: 0.3

Injection volume: 5-75

Detector: F ex 390 em 470 following post-column reaction. The column effluent mixed with 400 mM NaOH pumped at 0.15 mL/min and 0.05% ninhydrin pumped at 0.05 mL/min and the mixture flowed through a 12 m × 0.33 mm i.d. reaction coil at 70° to the detector.

CHROMATOGRAM

Retention time: 45

Limit of detection: 100 fmole

OTHER SUBSTANCES

Simultaneous: angiotensin I, angiotensin II, angiotensin III, atrial natriuretic peptide, bombesin, bradykinin, gonadorelin (LHRH), somatoliberin, vasopressin

SAMPLE

Matrix: amniotic fluid, blood
Sample preparation: Centrifuge serum or amniotic fluid for 10 min. 0.5-1 mL Serum or amniotic fluid + 500 μL MeOH:water 5:95, mix, inject 750 μL onto column A with mobile phase A, after 5 min elute contents of column A onto column B with mobile phase B, monitor effluent from column B.

HPLC VARIABLES

Column: A Serumont-25 (Sekisui); B 260 × 4.6 5 μm Medipola-ODS C18 (Sekisui)
Mobile phase: A water; B MeCN:MeOH:buffer 2:7:20 (Buffer was 6.8 g/L KH_2PO_4, pH adjusted to 3.1 with concentrated phosphoric acid.)
Column temperature: 40
Flow rate: A 0.8; B 1
Injection volume: 750
Detector: UV 245

CHROMATOGRAM

Retention time: 56.8
Limit of detection: 5.8 ng

OTHER SUBSTANCES

Extracted: estetrol, estriol, hydrocortisone
Noninterfering: corticosterone, testosterone, hydroxyprogesterone, androstenedione, progesterone

KEY WORDS

serum; column-switching

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Condition a Sep-Pak C18 SPE cartridge. Mix 1 mL plasma with 134.0 ng hydrocortisone-d_5 and 74.56 ng cortisone-d_5. Add the sample to the SPE cartridge, wash with 8 mL water, elute with 4 mL ethyl acetate, evaporate the eluate to dryness at 70° under a stream of nitrogen, dissolve the residue in 30 μL mobile phase, filter (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.0 4 μm LiChroCART Superspher 100
Mobile phase: A MeOH:THF:50 mM ammonium formate 17:53:180; B MeCN:50 mM ammonium formate 35:65
Flow rate: 0.6 (A); 1.3 (B)

Injection volume: 20
Detector: MS, Shimadzu LCMS-QP1000EX Model 750 B, thermospray, vaporizer control 155°, vaporizer tip 195°, vapor 274°, ion source block 295°, tip heater 305°, m/z 361

CHROMATOGRAM
Retention time: 10 (A)
Internal standard: hydrocortisone-d_5, cortisone-d_5
Limit of detection: 0.50 ng

OTHER SUBSTANCES
Extracted: hydrocortisone, prednisolone, prednisone

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood
Sample preparation: Prepare a Bond-Elut C18 SPE column by washing with 2 mL MeCN, 2 mL acetone:water 2:98, and 4 mL water. Do not allow column to run dry. 2 mL Plasma + 40 μL 5 μg/mL dexamethasone in MeOH, add to SPE cartridge, allow to sit for 15 min, wash twice with 2 mL water, wash twice with 2 mL acetone:water 2:98, pull a vacuum on the column for 15 min, elute with 1 mL MeCN under vacuum. Evaporate the eluate to dryness under a stream of nitrogen at 40°, dissolve the residue in 150 μL dichloromethane, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm LiChrosorb Si-60
Mobile phase: Dichloromethane:water-saturated dichloromethane:THF:MeOH:glacial acetic acid 664.5:300:10:25:0.5
Flow rate: 0.8
Injection volume: 100
Detector: UV 254

CHROMATOGRAM
Retention time: 14
Internal standard: dexamethasone (23.5)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Simultaneous: prednisolone acetate, prednisone, hydrocortisone, prednisolone

KEY WORDS
plasma; normal phase; pig; SPE

SAMPLE
Matrix: blood

Sample preparation: Condition a Tef Elutor C18 cartridge with two 3 mL portions of MeOH then two 3 mL portions of water. 1 mL Plasma + 50 μL 400 ng/mL flumethasone in 5:95 MeOH:water, heat at 50° for 10 min, add to cartridge, wash with 2 mL water, 1 mL MeOH:water 10:90, 4 mL acetone:water 20:80, apply suction to cartridge for 10 min to air dry. Elute with 1 mL MeOH, evaporate eluent at 45° under nitrogen, reconstitute with 50 μL mobile phase, inject 25 μL aliquot.

HPLC VARIABLES

Column: 100 × 2 3 μm C18 Hypersil
Mobile phase: MeCN:THF:water 8:10:82, containing 5 mL/L triethylamine, pH adjusted to 6.5 with citric acid
Flow rate: 0.6
Injection volume: 25
Detector: UV 242

CHROMATOGRAM

Retention time: 2.90
Internal standard: flumethasone (11.50)
Limit of detection: 300 pg/mL

OTHER SUBSTANCES

Simultaneous: prednisone, hydrocortisone, adrenosterone, prednisolone, estriol, corticosterone, methylprednisolone, dexamethasone, hydroxyprogesterone, testosterone, deoxycorticosterone, fluorometholone, spironolactone, equilenin, estrone, estradiol, progesterone, diphenhydramine, propranolol, aspirin, theophylline, imipramine, desipramine, indomethacin, amitriptyline, nortriptyline, nordiazepam, diazepam, chlordiazepoxide
Noninterfering: caffeine, nicotine, cotinine, chlorothiazide, acetazolamide, phenytoin, pheniramine, cephalothin, primidone, acebutolol, hydrochlorothiazide, quinine, acetophenetidine, furosemide, aldosterone, triamcinolone, ephedrine, allopurinol, phenylephrine
Interfering: tripelennamine, carbamazepine, probenecid, phenobarbital

SAMPLE

Matrix: blood
Sample preparation: Condition a 2 mL 200 mg Tef Elutor C18 SPE cartridge (Versa Prep) with 3 mL MeOH and two 3 mL portions of water. 1 mL Plasma + 50 μL 400 ng/mL flumethasone in MeOH:water 5:95, heat at 50° for 10 min, add to SPE cartridge, wash with 2 mL water, wash with 1 mL MeOH:water 10:90, wash with 4 mL acetone:water 20:80, air-dry for 10 min, elute with 1 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue in 50 μL mobile phase, inject a 25 μL aliquot.

HPLC VARIABLES

Column: 100 × 2 3 μm Hypersil
Mobile phase: MeCN:THF:water 8:10:82 containing 5 mL/L triethylamine, pH adjusted to 6.5 with citric acid
Flow rate: 0.6
Injection volume: 25
Detector: UV 242

CHROMATOGRAM

Retention time: 4

Internal standard: flumethasone (13)
Limit of detection: 0.3 ng/mL

OTHER SUBSTANCES

Extracted: hydrocortisone, corticosterone
Simultaneous: acebutolol, acetazolamide, acetophenetidin, adrenosterone, aldosterone, amitriptyline, androsten-3,17-dione, aspirin, cephalothin, chlordiazepoxide, chlorothiazide, dehydrocorticosterone, deoxycorticosterone, deoxycortisol, desipramine, dexamethasone, diazepam, diphenhydramine, equilenin, estradiol, estriol, estrone, fluorometholone, furosemide, hydrochlorothiazide, hydroxycorticosterone, hydroxyprogesterone, hydroxyprogesterone, imipramine, indomethacin, methylhydroxyprogesterone, methylprednisolone, nandrolone, nordiazepam, nortriptyline, pheniramine, phenobarbital, phenytoin, prednisolone, prednisone, primidone, probenecid, progesterone, propranolol, quinine, spironolactone, testosterone, theophylline, triamcinolone
Noninterfering: caffeine, nicotine, cotinine, ephedrine, allopurinol, phenylephrine
Interfering: tripelennamine, carbamazepine

serum; SPE

REFERENCE

Hariharan,M.; Naga,S.; VanNoord,T.; Kindt,E.K. Assay of human plasma cortisone by liquid chromatography: normal plasma concentrations (between 8 and 10 a.m.) of cortisone and corticosterone, *J.Chromatogr.*, **1993**, *613*, 195–201.

SAMPLE

Matrix: blood
Sample preparation: 100 μL Plasma + 10 μL IS in water, extract twice by shaking for 1 min with 1.2 mL dichloromethane, evaporate organic layer below 40° under reduced pressure, dissolve residue in 100 μL MeCN. Add 10 μL reagent 1, add 10 μL reagent 2, heat at 70° for 20 min, cool to room temperature, add 100 μL water, add 200 μL MeOH:water 1:1, add to Sep-Pak C18 cartridge, wash vial with 2 mL MeOH:water 1:1 and add washings to cartridge, wash cartridge with 40 mL MeOH:water 1:1, elute with 5 mL MeOH. Concentrate eluent to 500 μL by evaporation at 40° under reduced pressure, inject 20 μL aliquot. (Reagent 1 was 30 mg 2-(4-carboxyphenyl)-5,6-dimethylbenzimidazole in 3 mL pyridine, add 700 mg 4-piperidinopyridine, dilute to 10 mL with MeCN. Reagent 2 was 700 mg 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide perchlorate in 10 mL MeCN. Prepare 2-(4-carboxyphenyl)-5,6-dimethylbenzimidazole as follows. Add 13 g 4-carboxybenzaldehyde (terephthalaldehydic acid) in 400 mL EtOH dropwise to 4,5-dimethyl-1,2-phenylenediamine in 400 mL EtOH in an ice bath, after 1 h reflux for 8 h, cool to room temperature, collect the precipitate, recrystallize three times from MeOH:water 50:50 to give 2-(4-carboxyphenyl)-5,6-dimethylbenzimidazole as a white amorphous product (mp >300°) (J.Chromatogr. 1991, 585, 219). 4-Piperidinopyridine is not commercially available but 4-dimethylaminopyridine or 4-pyrrolidinopyridine can be used instead although interferences are greater (J. Chromatogr. 1991, 585, 219). Alternatively 4-piperidinopyridine can be synthesized as follows. Add 200 mmoles piperidine dropwise with stirring to 15 g phosphorus pentoxide and 9.51 g 4-hydroxypyridine, heat at 250° for 7 h, cautiously pour onto 200 g ice, add 400 mL 1 M NaOH, add 200 mL ether. Remove the ether layer and extract the aqueous layer three times with 100 mL portions of ether. Combine the organic layers and dry them over anhydrous potassium carbonate, evaporate, distil the residue, recrystallize from petroleum ether (bp 80-100°) to give 4-piperidinopyridine (bp 167-170°/11 mm Hg; mp 79-80°) (Synthesis 1978, 844). Alternatively, add 1.94 g 4-bromopyridine hydrochloride to 5 mL 50% NaOH, add 5 mL piperidine, add 2.72 g benzyltriethylammonium bromide, heat at 100° for 5 h, remove excess piperidine by distillation, add 25 mL water, extract four times with 25 mL portions of benzene. Combine the organic layers and dry them over anhydrous sodium sulfate, boil the residue with petroleum ether to give 4-piperidinopyridine (mp 80°) (Syn. Commun. 1979, 9, 251). Prepare 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide perchlorate as follows. Stir 1.41 moles isopropy-

lisocyanate in 750 mL dichloromethane at 5°, add 144 g 3-dimethylaminopropylamine (N,N-dimethyl-1,3-propanediamine) in 250 mL dichloromethane at such a rate that the temperature does not exceed 10°, add 500 mL triethylamine, add 300 g p-toluenesulfonyl chloride in 300 mL dichloromethane at such a rate that the temperature does not exceed 10°, reflux for 3 h, add 400 g anhydrous sodium carbonate, add 3.5 L ice water, stir vigorously for 30 min, remove the organic phase. Extract the aqueous phase three times with 500 mL portions of dichloromethane. Combine the organic layers and dry them over anhydrous sodium sulfate, evaporate under reduced pressure, distil the residue to give 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide (bp 91-92°/10 mm Hg (Ber. 1941, 74B, 1285)) (cf. Org. Syn. 1973, Coll. Vol. V, 555). Prepare pyridine perchlorate from pyridine and 20% perchloric acid, crystallize from EtOH (Ber. 1926, 59, 446). Add 18 g pyridine perchlorate in portions to 100 mmoles 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide stirred in 200 mL dichloromethane at 0°, let stand for 30 min, filter, add 200 mL anhydrous diethyl ether to the filtrate. Filter off the precipitate and recrystallize it from dichloromethane/diethyl ether to give 1-isopropyl-3-(3-dimethylaminopropyl)carbodiimide perchlorate (mp 88-90°) (Chem. Pharm. Bull. 1985, 33, 5375).)

HPLC VARIABLES

Guard column: 50 × 4.6 7 μm Zorbax ODS
Column: 250 × 4.6 7 μm Zorbax ODS
Mobile phase: MeOH:water 75:25 containing 5 mM tetramethylammonium hydrogen sulfate
Flow rate: 0.4
Injection volume: 20
Detector: F ex 334 em 418

CHROMATOGRAM

Retention time: 25.2
Internal standard: fluocinolone acetonide (40.7)
Limit of detection: 0.6-3 pg/mL

OTHER SUBSTANCES

Simultaneous: aldosterone, corticosterone, hydrocortisone, dexamethasone, triamcinolone

KEY WORDS

plasma; derivatization

SAMPLE
Matrix: blood
Sample preparation: Condition an Empore C8 extraction disc SPE cartridge (3M Co.) by adding 500 μL MeOH and forcing through three drops, discard the remaining liquid, add water, force through three drops, discard the water. 300 μL Serum + 150 μL IS solution, let stand at room temperature for 10 min, add 800 μL saturated sodium borate solution,

mix, centrifuge at 12400 g for 3 min (if necessary), add to SPE cartridge, centrifuge at 100-120 g for 5 min, force through 200 μL water, force through 500 μL MeOH:water 18:82, elute with 50 μL MeCN then 150 μL water, mix the eluates, inject a 20 μL aliquot. (IS solution contained 0.5 mg/L fludrocortisone and 0.75 mg/L methylprednisolone in 400 mM HCl.) (The extraction disc permits use of lower volumes of eluate than a conventional SPE cartridge.)

HPLC VARIABLES
Guard column: 20 × 2 30 μm Permaphase ETH (Du Pont)
Column: 250 × 2 Ultrasphere C18 or 250 × 4.6 Ultrasphere C18
Mobile phase: THF:water 20:80 (Use a 150 × 4.6 37-53 μm silica gel (Whatman) saturating column (held at 55°) between the pump and the injector.)
Column temperature: 55
Flow rate: 0.18 (250 × 2 column) or 0.8 (250 × 4.6 column)
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 11
Internal standard: fludrocortisone (15), methylprednisolone (20)
Limit of detection: 4 ng/mL

OTHER SUBSTANCES
Extracted: hydrocortisone, prednisone, prednisolone, corticosterone
Simultaneous: aldosterone, triamcinolone, metyrapone, 11-deoxycortisol, dexamethasone, 21-deoxycortisone, androsteindione, beclomethasone, 11-deoxycorticosterone, testosterone, 17-hydroxyprogesterone, progesterone, pregnenolone

SAMPLE

Matrix: blood, urine

Sample preparation: Condition a Sep-Pak Plus C18 SPE cartridge with 7 mL MeOH and 14 mL water. Add 40 ng 6β-hydroxycortisone to 400 μL plasma or urine, add the mixture to the SPE cartridge, wash with 6 mL water, 3 mL MeOH:water 12:88, and 3 mL petroleum ether, elute with 5 mL ethyl acetate. Dry the eluate under reduced pressure at 40°, add 200 μL MeCN:triethylamine 90:10 and MeCN:0.1% quinuclidine 20:80 to the residue, vortex. Add 200 μL 0.02% 9-anthroyl nitrile and a few molecular sieves (4A), let stand for 30 min, evaporate under reduced pressure at 40°, dissolve the residue in 200 μL acetone, dilute with 2 mL n-hexane. Add the mixture to a Sep-Pak Plus Silica SPE cartridge, wash with 14 mL 1,2-dichloroethane, elute with 5 mL ethyl acetate. Evaporate the eluate under reduced pressure at 40°, reconstitute the residue in 200 μL mobile phase, inject a 30-60 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Cosmosil 5SL (Nacalai Tesque, Japan)

Mobile phase: Dioxane:ethyl acetate:chloroform:n-hexane:pyridine 58.1:11.6:11.6:16.3:2.4 (Caution! Dioxane and chloroform are carcinogens!)

Flow rate: 1 for 45 min, to 1.2 over 5 min

Injection volume: 30-60

Detector: F ex 360 em 460

CHROMATOGRAM

Retention time: 28

Internal standard: 6β-hydroxycortisone (86)

SAMPLE

Matrix: perfusate

Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 10 mL MeOH and 10 mL water. 3 mL Perfusate + 500 ng 6α-methylprednisolone, add to the SPE cartridge, wash three times with 10 mL aliquots of water, elute with 5 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 35°, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 Newguard RP-18
Column: two 250 × 4.6 Spheri-5 RP-18 columns in series
Mobile phase: MeOH:water 53:47
Column temperature: 40
Flow rate: 1.1
Injection volume: 50
Detector: UV 242

CHROMATOGRAM

Retention time: 16
Internal standard: 6α-methylprednisolone (30)
Limit of detection: 5 nM

OTHER SUBSTANCES

Extracted: hydrocortisone, dihydrocortisone, dihydrocortisol, metabolites
Simultaneous: prednisolone
Noninterfering: acetaminophen, albuterol, betamethasone, bupivacaine, carbamazepine, cholesterol, clonazepam, dehydroepiandrosterone, dexamethasone, diazepam, estradiol, estriol, hydroxyprogesterone, methimazole, phenobarbital, prednisone, progesterone, ritodrine, scopolamine, testosterone

KEY WORDS

SPE

SAMPLE
Matrix: solutions
Sample preparation: Evaporate solution (eluate from preparative HPLC) to dryness under a stream of nitrogen, reconstitute with 10 μL 2 μg/mL 9-anthroylnitrile (Wako) in MeCN and 10 μL triethylamine:MeCN 30:70 under nitrogen, let stand at room temperature for 20 min, add 5 μL water, after 6 min add 50 μL 600 mM acetic acid in MeCN, evaporate to dryness under a stream of nitrogen at 37°, reconstitute with 90 μL MeOH: 0.4 N NaH_2PO_4 60:40, add to a Cyclobond I silica-bonded β-cyclodextrin SPE cartridge (Astec), wash with 1 mL water, wash with 8 mL MeOH:water 25:75 containing 7.5 mM pH 7.0 phosphate buffer, elute with 1 mL MeOH, evaporate to dryness under a stream of nitrogen, reconstitute with mobile phase, inject an aliquot on to column A and elute to waste with mobile phase, after the solvent front has passed through divert the effluent from column A on to column B, monitor the effluent from column B.

HPLC VARIABLES
Column: A 30 × 2.1 silica (Brownlee); B 150 × 2 Hypersil
Mobile phase: Hexane:ethyl acetate 67:33 (half-saturated with water)
Flow rate: 0.5
Detector: F ex 305-395 em 430-470

CHROMATOGRAM
Retention time: 10.2

OTHER SUBSTANCES
Simultaneous: hydrocortisone, prednisolone

KEY WORDS

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 0.5 mg/mL solution in MeOH, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 150 mM phosphoric acid and 50 mM triethylamine. B was MeCN:water 80:20 containing 150 mM phosphoric acid and 50 mM triethylamine. A:B 100:0 for 2.2 min then to 0:100 over 30 min.
Column temperature: 30
Flow rate: 2
Injection volume: 5
Detector: UV 210

CHROMATOGRAM
Retention time: 17.5

OTHER SUBSTANCES
Simultaneous: acetaminophen, aprobarbital, butabarbital, chlordiazepoxide, chloroxylenol, chlorpromazine, clenbuterol, danazol, diflunisal, doxapram, estrone, fluoxymesterone, mefenamic acid, methyltestosterone, nicotine, oxazepam, phentermine, phenylpropanolamine, progesterone, sulfamethazine, sulfanilamide, testosterone, testosterone propionate, tranylcypromine, tripelennamine

SAMPLE

Matrix: meconium

Sample preparation: Condition a 3 mL C8 SPE cartridge (Backer-Bond, Gross Gerau, Germany) with 5 mL MeOH and 5 mL water. Condition a 3 mL silica SPE cartridge (Backer-Bond) with 5 mL chloroform. Place the C8 SPE cartridge on top of the silica SPE cartridge. Thaw and mix meconium, weigh a 2 g aliquot, add IS, and emulsify in 20 mL 100 mM pH 8.0 phosphate buffer. Vortex, centrifuge, filter the supernatant. Extract the supernatant 3 times with 2 mL portions of chloroform. Evaporate chloroform extracts to dryness and dissolve in 10 mL pH 9.0 boric buffer. Add to the SPE cartridges, remove the C8 column and elute the silica column with 3 mL MeOH:dichloromethane:ammonium hydroxide 30:70:1. Evaporate the eluate to dryness under nitrogen and redissolved in 100 μL water. Inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm LiChrosorb C18
Mobile phase: MeCN:MeOH:water:pH 4.66 acetate buffer: acetic acid 2:29:50:20:1, pH adjusted to 4.3 with diethylamine
Flow rate: 1.0
Injection volume: 20
Detector: UV

CHROMATOGRAM

Retention time: 7.29
Internal standard: ephedrine
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES

Extracted: caffeine, nicotine

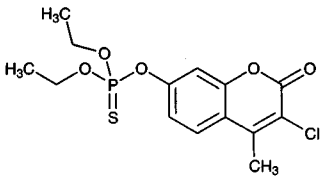
Coumaphos



Molecular formula: $C_{14}H_{16}ClO_5PS$
Molecular weight: 362.77
CAS Registry No.: 56-72-4
Merck Index: 2626

SAMPLE

Matrix: blood, tissue
Sample preparation: Homogenize mouse brain in ten volumes 100 mM pH 7.4 sodium phosphate buffer. 2 mL Plasma or homogenate + 1 g NaCl + 2 mL ethyl acetate, vortex for 30 s, centrifuge at 1000 g for 10 min, repeat extraction. Combine the organic layers and evaporate them under a stream of nitrogen.

HPLC VARIABLES

Column: 300 × 4 μPorasil
Mobile phase: Dichloromethane:glacial acetic acid 100:0.02
Flow rate: 1
Detector: UV 290

CHROMATOGRAM

Retention time: 10.0
Internal standard: coumaphos

OTHER SUBSTANCES

Extracted: parathion, chlorpyrifos

KEY WORDS

plasma; rat; mouse; microsomes; brain; coumaphos is IS

SAMPLE

Matrix: eggs, milk
Sample preparation: Prepare a SPE column from 500 mg silanized Celite 545 followed by 5 g Nuchar S-N:silanized Celite 545 1:4 in a 22 mm i.d. chromatographic column, wash with 50 mL MeCN:toluene 75:25. Eggs. 150 g Chopped eggs + 300 mL MeCN, homogenize (Polytron) at half speed for 30 s and full speed for 1 min, vacuum filter (S & S 597 paper). Remove an aliquot equivalent to 100 g sample, make up to 100 mL with water, add 500 μL hexadecane to reduce foaming, concentrate to 75 mL on a rotary evaporator at 35°. Place mixture in a separatory funnel, add 15 g NaCl, shake until dissolved, wash the original flask with three 25 mL aliquots of MeCN, add the washings to the separatory funnel, shake 30 s, let separate for 5 min, remove the MeCN layer, extract the aqueous layer with 50 mL MeCN. Combine the MeCN layers, wash with 25 mL 20% NaCl, wash with 100 mL petroleum ether, add 50 mL 2% NaCl, extract with 100, 25, and 25 mL portions of dichloromethane. Combine lower organic layers and pass them through a 50 × 22 column of anhydrous sodium sulfate, evaporate eluate to dryness on a rotary evaporator at 35°, reconstitute in 10 mL dichloromethane, add to SPE column, wash in with 10 mL dichloromethane, wash in with 25 mL MeCN:toluene 75:25, elute with 100 mL MeCN:toluene 75:25 at 5 mL/min, evaporate eluate to dryness on a rotary evaporator at 35°, reconstitute in 5 mL MeOH, filter 5 μm, inject a 10 μL aliquot of the filtrate. Milk. 150 g Milk + 300 mL acetone, shake vigorously for 1 min, centrifuge at 1200 rpm for 5

min. Remove 277 mL supernatant and add it to 15 mL water, concentrate to 75 mL on a rotary evaporator at 35°. Place mixture in a separatory funnel, add 15 g NaCl, shake until dissolved, wash the original flask with three 25 mL aliquots of MeCN, add the washings to the separatory funnel, shake 30 s, let separate for 5 min, remove the MeCN layer, extract the aqueous layer with 50 mL MeCN. Combine the MeCN layers, wash with 25 mL 20% NaCl, wash with 100 mL petroleum ether, add 50 mL 2% NaCl, extract with 100, 25, and 25 mL portions of dichloromethane. Combine lower organic layers and pass them through a 50 × 22 column of anhydrous sodium sulfate, evaporate eluate to dryness on a rotary evaporator at 35°, reconstitute in 10 mL dichloromethane, add to SPE column, wash in with 10 mL dichloromethane, wash in with 25 mL MeCN:toluene 75:25, elute with 100 mL MeCN:toluene 75:25 at 5 mL/min, evaporate eluate to dryness on a rotary evaporator at 35°, reconstitute in 5 mL MeOH, filter 5 μm, inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES

Guard column: 70 × 2.1 25-37 μm Co:Pell ODS
Column: 250 × 4.6 6 μm Zorbax C8
Mobile phase: Gradient. MeCN:water 12:88 to 70:30 over 30 min, then 100:0 for 5 min, re-equilibrate for 10 min.
Column temperature: 35
Flow rate: 1.5
Injection volume: 10
Detector: F ex 320 em 385

CHROMATOGRAM

Retention time: 31
Limit of detection: <10 ppb

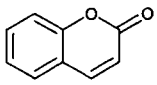
Coumarin



Molecular formula: $C_9H_6O_2$
Molecular weight: 146.15
CAS Registry No.: 91-64-5
Merck Index: 2630

SAMPLE

Matrix: blood, tissue
Sample preparation: Condition a silica Sep-Pak SPE cartridge also containing 2 g sodium sulfate (?) with 5 mL MeOH and 5 mL cyclohexane. Mix 3 mL blood or crushed tissue with 1 mL 20 μg/mL IS, adjust to pH 3-4 with 0.5 M sulfuric acid, extract three times with 10 mL MeOH:chloroform 10:90 (Caution! Chloroform is a carcinogen!). Evaporate at 40°, re-dissolve the residue in 5 mL cyclohexane, sonicate and centrifuge three times. Remove a 5 mL aliquot of the top layer, evaporate at 40°. Reconstitute the residue in 5 mL cyclohexane. Add to the SPE cartridge, elute with 5 mL MeOH, evaporate at 40°, reconstitute the residue in MeOH, inject an aliquot.

HPLC VARIABLES

Column: 200 mm long μBondapak C18
Mobile phase: MeOH:0.8% acetic acid 80:20
Flow rate: 1
Injection volume: 10
Detector: UV 280

CHROMATOGRAM

Retention time: 3.9
Internal standard: N,N-diphenylbenzidine (9.3)
Limit of detection: 20 ng/mL

OTHER SUBSTANCES

Extracted: bromadiolone, brodifacoum, coumatetralyl, warfarin

KEY WORDS

SPE; plasma; heart; lung; liver; kidney; spleen

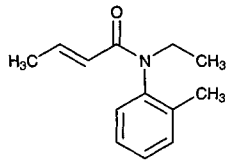
Crotamiton



Molecular formula: $C_{13}H_{17}NO$
Molecular weight: 203.28
CAS Registry No.: 483-63-6
Merck Index: 2661

SAMPLE

Matrix: blood, urine
Sample preparation: Evaporate 40 µL 61 µM IS in MeOH into a tube with a stream of nitrogen, add 1 mL plasma or 150 µL urine, add 1 mL pH 12 buffer (Titrisol, Merck), add 4 mL n-heptane:isoamyl alcohol 99:1, shake for 20 min at 300 rpm, centrifuge at 2500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 500 µL mobile phase, inject a 75 (plasma) or 65 (urine) µL aliquot.

HPLC VARIABLES

Column: 200 × 4.6 5 µm Hypersil ODS
Mobile phase: MeCN:10 mM KH_2PO_4 45:55
Flow rate: 1.5
Injection volume: 65-75
Detector: UV 220

CHROMATOGRAM

Retention time: 6 (trans), 7 (cis)
Internal standard: N-ethyl-N-propionyl-o-toluidine (5)
Limit of quantitation: 320 nM (urine), 43.3 nM (plasma)

KEY WORDS

plasma; pharmacokinetics

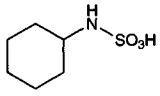
Cyclamic acid



Molecular formula: $C_6H_{13}NO_3S$
Molecular weight: 179.24
CAS Registry No.: 100-88-9, 139-05-9 (sodium salt), 139-06-0 (calcium salt)
Merck Index: 2770

SAMPLE

Matrix: food

Sample preparation: Fruit juice. Centrifuge at 3000 g for 20 min, filter (0.45 μm) the supernatant. Remove a 2 mL aliquot of the filtrate and add it to 1 mL 30% hydrogen peroxide and 300 μL 37% HCl, heat at 100° under a reflux condenser for 1 h, cool to room temperature, neutralize with 400 μL 40% NaOH, make up to 25 mL with pH 10 borate buffer. Remove a 1 mL aliquot and make up to 10 mL with reagent, after 5 min inject an aliquot. Marmalade, preserves. Stir 10 g marmalade or preserve with 50 mL water for 30 min, centrifuge at 3000 g for 20 min, remove the supernatant, suspend the residue in 10 mL water, centrifuge. Combine the supernatants and make up to 100 mL with water. Remove a 2 mL aliquot and add it to 1 mL 30% hydrogen peroxide and 300 μL 37% HCl, heat at 100° under a reflux condenser for 1 h, cool to room temperature, neutralize with 400 μL 40% NaOH, make up to 25 mL with pH 10 borate buffer. Remove a 1 mL aliquot and make up to 10 mL with reagent, after 5 min inject an aliquot. (Prepare borate buffer by dissolving 25 g boric acid in 900 mL water, adjust pH to 10 with KOH. Prepare reagent by dissolving 200 mg o-phthaldialdehyde in 5 mL EtOH, add 1 mL 3-mercaptopropionic acid, make up to 100 mL with borate buffer.)

HPLC VARIABLES

Column: 250 × 4 5 μm Lichrospher 100 RP-18
Mobile phase: MeCN:buffer 64:36 (Prepare buffer by dissolving 3 g $Na_2HPO_4.12H_2O$ and 3 g $NaH_2PO_4.H_2O$ in 1 L water.)
Column temperature: 40

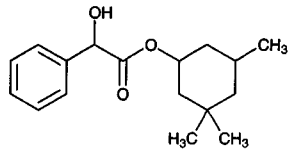
Cyclandelate



Molecular formula: $C_{17}H_{24}O_3$
Molecular weight: 276.38
CAS Registry No.: 456-59-7
Merck Index: 2771
Lednicer No.: 1 94

SAMPLE

Matrix: blood

Sample preparation: 1 mL Plasma + 5 mL 100 mM NaOH + 10 mL chloroform, shake mechanically for 10 min, centrifuge at 600 g for 10 min. Remove the aqueous layer and add it to 1 mL 2 M HCl, shake with 10 mL diethyl ether, centrifuge at 600 g for 10 min. Remove 8 mL of the organic layer and add it to 4 mL 10 mM NaOH, shake for 15 min, centrifuge at 600 g for 10 min. Remove 4 mL of the aqueous layer and add it to 500 µL 1 M HCl, add 2 mL reagent, add 300 µL hexane, shake, centrifuge at 600 g for 10 min, inject a 100 µL aliquot of the hexane layer. (Reagent was 36.8 g $Ce(NH_4)_4(SO_4)_4.2H_2O$ in 1 L 1 M sulfuric acid, stir for 30 min to dissolve, allow to stand overnight, filter.)

HPLC VARIABLES

Column: 250 × 4.6 5 µm Zorbax CN
Mobile phase: Hexane:propanol 1000:1
Flow rate: 1.5
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Retention time: 4.4 (benzaldehyde, oxidation product of the major metabolite, mandelic acid)
Limit of detection: 100 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A: B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 26.383

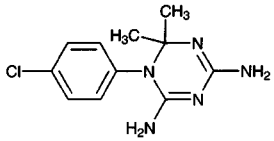
Cycloguanil



Molecular formula: $C_{11}H_{14}ClN_5$
Molecular weight: 251.72
CAS Registry No.: 516-21-2, 609-78-9 (pamoate)
Merck Index: 2790
Lednicer No.: 1 281

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 243

CHROMATOGRAM

Retention time: 4.19
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 µm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg cyclohexyl SPE cartridge (Varian) with two 1 mL portions of MeOH and 1 mL water (pH 4). Add 2 mL serum to 2 mL 25 mM pH 4 phosphate buffer and 400 μL water (pH 4), vortex for 30 s, add four 1 mL portions to the SPE cartridge, let them pass through for 3-4 min, dry the cartridge using full vacuum, wash with 1 mL MeCN:water (pH 4) 10:90, elute with 1 mL MeOH, evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 250 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Spherisorb C8
Mobile phase: MeCN:25 mM pH 4 phosphate buffer 25:75
Flow rate: 1
Detector: UV 195

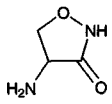
Cycloserine



Molecular formula: $C_3H_6N_2O_2$
Molecular weight: 102.09
CAS Registry No.: 68-41-7
Merck Index: 2820
Lednicer No.: 3 14

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 1 mL Plasma + 250 μL buffer + 30 μL 240 μg/mL 6-aminocaproic acid + 50 μL 6.5 mg/mL 5-methoxyindole-3-acetic acid, filter (Centriflo ultrafilter) while centrifuging at 723 g for 15 min, inject a 20-25 μL aliquot of the ultrafiltrate. Urine. 1 mL Urine + 30 μL 240 μg/mL 6-aminocaproic acid + 50 μL 3 mg/mL α-aminobutylhistidine + 1 mL 200 mg/mL sodium carbonate in water (prepare only 5-6 samples at a time), mix, add 2 mL isopropanol, vortex, centrifuge at 723 g for 5 min, inject a 25 μL aliquot of the top organic layer. (Buffer was 12.4 g boric acid + 100 mL 1 M NaOH diluted to 250 mL with water, pH 9.75.)

HPLC VARIABLES

Guard column: 30-38 μm Co:Pell ODS

Column: 240 × 5 10 μm ODS-Hypersil

Mobile phase: Isopropanol:water:glacial acetic acid:decanesulfonate 75:800:5:0.5 (plasma) or 65:800:5:0.5 (urine), pH adjusted to 4.4 with 1 M KOH

Flow rate: 2.3

Injection volume: 20-25

Detector: F ex 340 em 455 following post-column derivatization. Reagent at 1.2 mL/min is mixed with column effluent, mixture flows through a 250 × 4.5 reactor packed with 50 μm glass beads to the detector. (Reagent was o-phthalaldehyde and 2-mercaptoethanol post-column derivatizing reagent (Fluoraldehyde, Pierce).)

CHROMATOGRAM

Retention time: 5 (plasma), 6 (urine)

Internal standard: 6-aminocaproic acid (9.5), 5-methoxyindole-3-acetic acid (11 (plasma), 8 (urine), detection at UV 313), α-aminobutylhistidine (15)

Limit of quantitation: 300 ng/mL

OTHER SUBSTANCES

Extracted: acetylacetonylcycloserine, metabolites

KEY WORDS

plasma; methoxyindoleacetic acid is IS for acetylacetonylcycloserine (UV 313 detection for both); post-column reaction

REFERENCE

Simultaneous quantification of cycloserine and its prodrug acetylacetonylcycloserine in plasma and urine by high-performance liquid chromatography using ultraviolet absorbance and fluorescence after post-column derivatization, *J.Chromatogr.*, **1987**, *414*, 121–129.

SAMPLE

Matrix: urine

Sample preparation: Filter (0.45 μm) urine. Remove a 1 mL aliquot and add a 20-fold molar excess of 2 mM 9-chloro-10-methylacridinium triflate in MeCN:pH 5.0 phosphate buffer 50:50, vortex for 10 s, heat at 70° for 30 min, add 1 mL glacial acetic acid, mix,

inject a 10 μL aliquot. (Synthesis of 9-chloro-10-methylacridinium triflate is as follows. Dissolve 6.07 g 9-chloroacridine (Eastman) in 55 mL dry dichloromethane, add 5 g methyl trifluoromethanesulfonate, stir for 3 h, filter, wash the solid with cold dichloromethane, dry in air overnight, recrystallize from MeCN to obtain 9-chloro-10-methylacridinium triflate as yellow crystals (mp 227-229°).)

HPLC VARIABLES

Column: 250 × 4.6 Partisil silica
Mobile phase: MeCN:EtOH:glacial acetic acid 50:30:20
Flow rate: 2
Injection volume: 10
Detector: F ex 257 em 475

CHROMATOGRAM

Retention time: 5.3
Limit of quantitation: 150 ng/mL

SAMPLE

Matrix: tissue

Sample preparation: Freeze four 50 μL portions of scales with liquid nitrogen and grind with purified quartz sand. Vortex the mixture in two portions. Vortex each portion twice with 2 mL MeCN for 3 min, centrifuge at 3500 rpm for 5 min. Filter (0.2 μm) the supernatant, evaporate it to dryness under the stream of nitrogen. Reconstitute the residue with 5 mL MTBE. Vortex with 2 mL 100 mM NaOH for 3 min, filter (0.2 μm), and wash the organic phase with 2 mL 100 mM HCl. Evaporate the MTBE under a stream of nitrogen. Dissolve the residue in 300 μL MeCN, dilute with 900 μL water and 200 μL mobile phase A. Filter, wash filter with 500 μL mobile phase A. Inject a 1.9 mL aliquot onto column A, elute with mobile phase A. Divert the effluent having retention time 16-25 min onto column B. Wash column B with 1 mL water, dry with a stream of pure nitrogen. Elute with 1 mL MeCN in the opposite direction. Evaporate the clear eluate to dryness, reconstitute the residue in 100 μL MeCN, add 100 μL water and IS. Inject a 20 μL aliquot onto column C and elute with mobile phase B or C.

HPLC VARIABLES

Column: A 20 × 4 5 :gmm Spherisorb Alumina PC18 purification cartridge (Bischoff Analysentechnik, Germany); B PRP-1 trap cartridge (Bischoff Analysentechnik, Germany); C 4 × 4 5 μm LiChrospher 100 RP-18 + 250 × 4.6 5 μm LiChrospher 100 RP-18

Mobile phase: A MeCN:water 29:71 containing 200 mM NaOH, pH 11; B MeCN:water 71:29; C Gradient. MeCN:water from 75:25 to 85:15 over 10 min

Column temperature: 70

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)

Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 5

Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 13.85 (A), 14.8 (B)
Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))
Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, methyclothiazide, benzthiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone, flumethiazide
Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

SAMPLE

Matrix: urine
Sample preparation: 5 mL Urine + 50 μL 100 μg/mL 7-propyltheophylline in MeOH + 200 μL ammonium chloride buffer + 2 g NaCl, extract with 6 mL ethyl acetate by rocking at 40 movements/min for 20 min and centrifuging at 800 g for 5 min, repeat extraction, combine organic layers, evaporate to dryness at 40° under a stream of nitrogen. Reconstitute in 200 μL MeCN:water 15:85 and inject 20 μL aliquots. (Ammonium chloride buffer was 28 g ammonium chloride in 100 mL water with the pH adjusted to 9.5 with concentrated ammonia solution.)

HPLC VARIABLES

Column: 75 × 4.6 3 μm Ultrasphere ODS
Mobile phase: Gradient. MeCN:100 mM ammonium acetate adjusted to pH 3 with concentrated phosphoric acid. From 10:90 to 15:85 over 2 min to 55:45 over 3 min to 60:40 over 3 min. Kept at 60:40 for 1 min, decreased to 10:90 over 1 min and equilibrated at 10:90 for 2 min.
Flow rate: 1
Injection volume: 20
Detector: UV 270

CHROMATOGRAM

Retention time: 6.6, 6.7 (two peaks)
Internal standard: 7-propyltheophylline (4.5)

OTHER SUBSTANCES

Simultaneous: xipamide, bumetanide, acetazolamide, amiloride, bendroflumethiazide, buthiazide, benzthiazide, canrenone, caffeine, clopamide, chlorthalidone, diclofenamide, ethacrynic acid, furosemide, hydrochlorothiazide, mesocarb, morazone, polythiazide, probenecid, spironolactone, torsemide, triamterene
Interfering: piretanide

SAMPLE

Matrix: urine

Sample preparation: Direct injection into column A with mobile phase A for 1 min then back flush onto column B with mobile phase B.

HPLC VARIABLES

Column: A 20 × 2.1 30 μm Hypersil ODS-C18; B 250 × 4 Hypersil ODS-C18

Mobile phase: A Water; B Gradient. MeCN:buffer 15:85 for 1.5 min then to 80:20 over 8 min. Keep at 80:20 for 2.5 min then re-equilibrate with 15:85. (Buffer was 50 mM NaH_2PO_4 + 1.4 mL propylamine hydrochloride per liter adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 50

Detector: UV 230

CHROMATOGRAM

Retention time: 9.6

Limit of detection: 20 ng/mL.

OTHER SUBSTANCES

Simultaneous: bumetanide, ethacrynic acid, acetazolamide, amiloride, bendroflumethiazide, chlorthalidone, furosemide, hydrochlorothiazide, probenecid, spironolactone, triamterene

REFERENCE

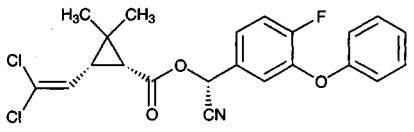
Cyfluthrin



Molecular formula: $C_{22}H_{18}Cl_2FNO_3$
Molecular weight: 434.29
CAS Registry No.: 68359-37-5
Merck Index: 2826

SAMPLE

Matrix: formulations
Sample preparation: Weigh out sample containing 320 mg cyfluthrin, add 25 mL dioxane (Caution! Dioxane is a carcinogen!), add 10 mL 0.65% acetophenone in hexane, shake mechanically for 30 min, add 25 mL hexane, mix well. Dilute an aliquot 1:10 with hexane, mix well, filter (0.45 μm), inject a 25 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Zorbax Sil silica
Mobile phase: Hexane:dioxane 97.5:2.5
Flow rate: 1.5
Injection volume: 25
Detector: UV 230

CHROMATOGRAM

Retention time: 10.7, 11.9, 12.6, 13.7 (diastereomers)
Internal standard: acetophenone (6.7)

KEY WORDS

normal phase

SAMPLE

Matrix: fruit, vegetables
Sample preparation: Prepare a cleanup column by placing 4 g Florisil, 1 g activated charcoal, and a 20 mm layer of anhydrous sodium sulfate in a 400 × 10 glass column, wash with 40 mL toluene, wash with 40 mL toluene:MeCN 99:1. Homogenize 25 g chopped fruit or vegetable with 70 mL MeOH at high speed for 3 min, filter, homogenize solid with 30 mL MeOH, filter. Combine the filtrates and add them to 60 mL toluene and 300 mL 10% NaCl in water, shake well for 3 min, let layers separate. Dry the organic layer by passing it through 20 g anhydrous sodium sulfate in a 20 mm diameter column, concentrate to about 5 mL under reduced pressure at 80°, add to the cleanup column, elute with 40 mL toluene:MeCN 99:1. Evaporate the eluate just to dryness under reduced pressure at 80°, reconstitute with 1 mL MeOH, inject an aliquot. (Reflux activated charcoal (20-40 mesh) with 1 M HCl for 4 h, wash with water until the washings are neutral, dry at 95-100° (J.Assoc.Off.Anal.Chem. 1983, 66, 1013). Heat 60-100 mesh Florisil at 200° for 24 h, cool, add 4% water, mix thoroughly, store in a sealed jar (J.Assoc.Off.Anal.Chem. 1983, 66, 1003).)

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18

Mobile phase: Gradient. MeCN:water from 62:38 to 78:22 over 32 min (Waters curve 6).
Column temperature: 50
Flow rate: 1.5
Detector: UV 206

CHROMATOGRAM
Retention time: 21.05-22.08 (3 peaks)
Limit of detection: 50 ng/g

OTHER SUBSTANCES
Simultaneous: allethrin, biphenthrin, fenpropathrin, fenvalerate, flucythrinate, methothrin, permethrin, Py-115, tetramethrin

SAMPLE
Matrix: solutions
Sample preparation: Inject 100 mL river water on to column A at 5 mL/min and let the effluent flow to waste, backflush the contents of column A on to column B and start the gradient, monitor the effluent from column B. At the end of each run backflush column A with 5 mL water, with 30 mL 100 mM pH 2 sodium citrate buffer, with 10 mL water, with 5 mL MeCN, and with 10 mL hexane:dichloromethane 50:50. Wash new column A with 10 mL water.

HPLC VARIABLES
Column: A 20 × 3 10 μm PRP-1 (Hamilton); B 30 × 4.6 10 μm RP-18 (Brownlee) + 250 × 4.6 5 μm LiChrospher C18
Mobile phase: Gradient. MeCN:water from 5:95 to 90:10 over 1 h, maintain at 90:10 for 4 min, return to initial conditions (?) over 1 min, re-equilibrate for 10 min.
Flow rate: 1 for 64 min, to 1.5 over 1 min, maintain at 1.5 for 5 min, to 1 over 5 min
Injection volume: 100000
Detector: UV 210

CHROMATOGRAM
Retention time: 59.8

Limit of detection: 100 ng/L

OTHER SUBSTANCES

Simultaneous: alachlor, aldicarb, aldicarb oxime, atrazine, carbofuran, chlorobenzilate, chlorothalonil, chlorpyrifos methyl, chlortoluron, p,p'-DDE, DDT, deltamethrin, diazinon, diclofop methyl, dimethoate, diuron, ethofumesate, fenitrothion, fenvalerate, fluazifop butyl, fluometuron, linuron, metalaxyl, metamitron, methomyl, metobromuron, metolachlor, molinate, oxamyl, paraoxon, paraoxon methyl, parathion, parathion methyl, pendimethalin, permethrin, phenmediphan, pirimphos, pirimphos methyl, prometryne, propanil, propiconazole, simazine, terbuthylazine, trifluraline

KEY WORDS

river water; column-switching

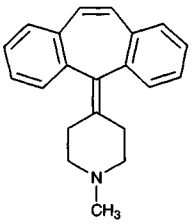
Cyproheptadine



Molecular formula: $C_{21}H_{21}N$
Molecular weight: 287.40
CAS Registry No.: 129-03-3, 41354-29-4 (HCl sesquihydrate), 969-33-5 (HCl)
Merck Index: 2842
Lednicer No.: 1 151

SAMPLE

Matrix: blood
Sample preparation: 100 μL Plasma + 50 μL MeOH:100 mM HCl 50:50 + 50 μL 1 μg/mL desmethyldoxepin hydrochloride in 100 mM HCl + 100 μL 1.5 M NaOH + 3 mL hexane:isoamyl alcohol 99:1, vortex for 2 min, freeze, thaw, centrifuge at 2000 g for 5 min. Remove the organic layer, repeat the extraction. Combine the organic layers and add them to 100 μL 50 mM sulfuric acid, vortex for 2 min, inject a 90 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:MeCN:100 mM pH 4.7 phosphate buffer containing 5 mM pentanesulfonic acid 41:15:44
Flow rate: 1.5
Injection volume: 90
Detector: UV 228

CHROMATOGRAM

Retention time: 9.40
Internal standard: desmethyldoxepin (5.19)
Limit of quantitation: 3 ng

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma; rat

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30

Flow rate: 0.8
Injection volume: 50
Detector: UV 225

CHROMATOGRAM

Retention time: 7.68
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 224

Matrix: blood, tissue

Sample preparation: Tissue. Homogenize (Potter-Elvehjem PTFE-glass homogenizer) tissue in 20 mM EDTA, adjust to 1% (w/v) (kidney) or 2.5% (w/v) (spleen). Remove 100 μL of this solution and add it to 400 μL 100 mM pH 8.5 borate buffer, add 300 μL 0.24 mM N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide in MeCN, add 200 μL IS, heat at 60° for 30 min, cool for 5 min, centrifuge at 4° at 2000 g for 15 min, filter (Millipore 2 μm) the supernatant, inject a 20 μL aliquot of the supernatant. Plasma. Dilute rat plasma to 20% (v/v) with 20 mM EDTA. Remove 100 μL of this solution and add it to 400 μL 100 mM pH 8.5 borate buffer, add 300 μL 0.24 mM N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide in MeCN, add 200 μL IS, heat at 60° for 30 min, cool for 5 min, centrifuge at 4° at 2000 g for 15 min, filter (Millipore 2 μm) the supernatant, inject a 20 μL aliquot of the supernatant. Serum. Dilute human serum to 10% (v/v) with 20 mM EDTA. 1 mL Diluted serum + 200 μL 30% metaphosphoric acid, centrifuge at 2000 g at 4° for 20 min. Remove 500 μL of the supernatant and add it to 240 μL 2 M KOH. Remove 100 μL of this solution and add it to 400 μL 100 mM pH 8.5 borate buffer, add 300 μL 0.24 mM N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide in MeCN, add 200 μL IS, heat at 60° for 30 min, cool for 5 min, centrifuge at 4° at 2000 g for 15 min, filter (Millipore 2 μm) the supernatant, inject a 20 μL aliquot of the supernatant. (Synthesis of N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide is as follows. Add 8.8 g aluminum trichloride to 12.50 g 3-dimethylaminophenol in 185 mL chloroform and 84 g triethyl orthoformate, mix at room temperature for 10 min, when the exothermic reaction ceases add 50 mL 10% HCl, stir to hydrolyze the acetal, neutralize with 10% NaOH, filter through a short column of Celite, wash through with chloroform, wash the filtrate with saturated aqueous NaCl, dry over magnesium sulfate, concentrate under reduced pressure, recrystallize from chloroform to give 4-(dimethylamino)salicylaldehyde (mp 78-79°). Add 400 mg KOH in 3 mL EtOH to a solution of 1 g 4-(dimethylamino)salicylaldehyde and 1.3 g (?) 4-nitrobenzylbromide in 12 mL EtOH, reflux for 7 h, cool, filter to recover the crystals, wash with water, dry under vacuum, recrystallize from EtOH to give 4-dimethylamino-2-(4-nitrobenzyloxy)benzaldehyde (mp 179-180°). Add a solution of 900 mg 4-dimethylamino-2-(4-nitrobenzyloxy)benzaldehyde in 6 mL DMF to a sodium methoxide solution (prepared from 69 mg sodium in 1 mL MeOH), reflux for 20 min, add 1 mL MeOH, filter the crystals, recrystallize from EtOH to give 6-dimethylamino-2-(4-nitrophenyl)benzofuran as red needles (mp 209.5-210.5°). Reflux 1 g 6-dimethylamino-2-(4-nitrophenyl)benzofuran in 20 mL benzene (Caution! Benzene is a carcinogen!) and 18 mL MeOH containing 80 mg active carbon and a catalytic amount of ferric chloride hexahydrate for 10 min, add 2.30 g 98% hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) dropwise, reflux for 7 h, filter, concentrate the filtrate, recrystallize from cyclohexane to give 6-dimethylamino-2-(4-aminophenyl)benzofuran as orange needles (mp 198.5-200°). Stir 605 mg 6-dimethylamino-2-(4-aminophenyl)benzofuran and 230 mg maleic anhydride in 5 mL chloroform at room temperature for 3 h, filter the crystals, wash with a small amount of chloroform, recrystallize from EtOH to obtain N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleamic acid (mp 219.5-221°). Reflux a mixture of 1.17 g N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleamic acid and 30 mg sodium acetate in 18 mL acetic anhydride, cool in an ice bath, collect the crystals of product, wash with water. Neutralize the filtrate with 20% NaOH, extract twice with 30 mL portions of chlo-

roform, wash the organic layers with saturated aqueous NaCl, dry over anhydrous magnesium sulfate, evaporate to give more product. Combine the products and recrystallize them from acetone to give N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide as reddish purple crystals (mp 203-204°) (Bull.Chem.Soc.Jpn. 1985, 58, 2192).)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Toyo Soda ODS-80
Mobile phase: MeCN:10 mM pH 7.7 phosphate buffer 50:50 containing 30 mM tetrabutylammonium bromide
Flow rate: 0.8
Injection volume: 20
Detector: F ex 355 em 457

CHROMATOGRAM
Retention time: 10
Internal standard: disodium 6-amino-1,3-naphthalene disulfonate (3.5)
Limit of detection: 50 fmole

OTHER SUBSTANCES
Extracted: homocysteine, reduced glutathione (GSH), N-acetylcysteine, cysteine, coenzyme A

KEY WORDS
plasma; serum; rat; human; liver; kidney; spleen; derivatization

REFERENCE
Nakashima,K.; Umekawa,C.; Yoshida,H.; Nakatsuji,S.; Akiyama,S. High-performance liquid chromatography-fluorometry for the determination of thiols in biological samples using N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]-maleimide, *J.Chromatogr.*, **1987**, *414*, 11–17.

SAMPLE
Matrix: solutions
Sample preparation: 1 mL Solution + 300 μL reagent solution, let stand at room temperature for 20 min, add 500 μL 300 mM phosphoric acid solution, make up to 10 mL with water, inject a 50 μL aliquot. (Prepare the reagent solution by dissolving 3.5 mg methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate in 10 mL THF, make up to 25 mL with pH 7.5 borate buffer. Prepare methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate as follows. Dissolve 5 g 6'-methoxy-2'-acetonaphthone in warm glacial acetic acid and add 2.5 g glyoxylic acid, reflux for 24 h, evaporate to dryness under reduced pressure. Take up the residue in chloroform and extract it three times with 5% sodium carbonate solution. Combine the aqueous layers and acidify them with concentrated HCl, collect the product by filtration, recrystallize from MeOH/water or acetic acid to give 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoic acid (mp 167-9°) (Farmaco, Ed. Sci. 1982, 37, 171). Reflux 0.5 g 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoic acid, 2.5 mL MeOH, and 2-3 drops sulfuric acid in 25 mL anhydrous benzene (Caution! Benzene is a carcinogen!) for 1 h, add 20 mL water, wash the organic layer with 10 mL 5% sodium bicarbonate solution, wash the organic layer with 20 mL water. Dry the organic layer over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, purify by flash chromatography on silica gel using ethyl acetate:light petroleum (bp 40-70°) 40:60 to give methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate as a pale yellow compound (mp 116-120°).)

HPLC VARIABLES
Column: 150 × 4 5 μm Spherisorb RP-8
Mobile phase: MeOH:50 mM pH 3.0 triethylammonium phosphate 53:47
Flow rate: 1
Injection volume: 50
Detector: F ex 310 em 450

CHROMATOGRAM
Retention time: 5

OTHER SUBSTANCES
Simultaneous: acetylcysteine, cysteine, glutathione, homocysteine, mesna
Noninterfering: bacitracin, biotin, calcium pantothenate, cystine, glycine, magnesium oxide, neomycin, starch, threonine, vitamin E, pyridoxine, riboflavin phosphate

SAMPLE
Matrix: tissue
Sample preparation: Homogenize tissue in ice-cold 6% 5-sulfosalicylic acid to give a 40% tissue homogenate, centrifuge at 10000 g for 10 min. Extract the supernatant with two volumes of ice-cold chloroform:MeOH 50:50, centrifuge. Remove the aqueous layer and evaporate it to the original volume under a stream of nitrogen, adjust the pH to 5.7-6.3 with 10 M KOH, add one volume of tributylphosphine:propanol 10:90 for each 31 volumes of aqueous solution, shake gently for 1 h under a gentle nitrogen flow, adjust pH to 3 with 4% 5-sulfosalicylic acid, dilute with at least an equal volume of buffer, inject a 100 μL aliquot. (Buffer was 25 mM pH 3 monochloroacetate containing 0.5 mM sodium octyl sulfate and 0.015% EDTA.)

HPLC VARIABLES
Guard column: μBondapak C18
Column: 250 × 4.6 5 μm Spherisorb ODS
Mobile phase: MeOH:buffer 2:98 (Buffer was 25 mM pH 3 monochloroacetate containing 0.5 mM sodium octyl sulfate and 0.015% EDTA.)
Flow rate: 1
Injection volume: 100
Detector: E, Bioanalytical Systems LC-4B, gold/mercury amalgam electrode +0.2 V

CHROMATOGRAM
Retention time: 9
Limit of quantitation: 100 nM

SAMPLE
Matrix: urine
Sample preparation: Add 10 μL 50 μm 2-mercaptoethanol and 100 μL 10% trichloroacetic acid containing 10 mM EDTA to 100 μL urine, centrifuge at 760 g at 4° for 10 min. Add 350 μL 1 M pH 10.5 potassium borate buffer, 100 μL 1% tri-n-butylphosphine in water, and 100 μL 0.3% ammonium 7-fluoro-benzo-2-oxa-1,3-diazole-4-sulphonate in water to a 150 μL aliquot of the supernatant yielding a final pH of about 8.5. Incubate the mixture at 60° for 60 min, then put in an ice bath and add 50 μL 4 M HCl, inject a 10 μL aliquot of this solution.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Cosmosil 5C-18AR (Nakarai Tesque, Japan)
Mobile phase: MeOH:75 mM pH 2.9 sodium citrate buffer 2:98
Flow rate: 1
Injection volume: 10
Detector: F ex 386 em 516

CHROMATOGRAM
Retention time: 6.0
Internal standard: 2-mercaptoethanol

OTHER SUBSTANCES
Simultaneous: acetylcysteine, cysteine, cysteinylglycine, γ-glutamylcysteine, glutathione, homocysteine

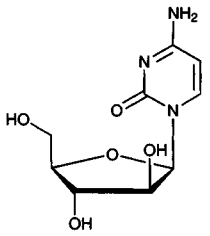
Cytarabine



Molecular formula: $C_9H_{13}N_3O_5$
Molecular weight: 243.22
CAS Registry No.: 147-94-4, 69-74-9 (HCl)
Merck Index: 2853

SAMPLE

Matrix: blood

Sample preparation: Isolate mononuclear cells from 10 mL blood by a standard step-gradient density centrifugation procedure. Wash once with PBS, resuspend in 500 μL water, add 500 μL 800 mM perchloric acid, centrifuge at 400 g for 5 min, wash the pellet with 500 μL 400 mM perchloric acid, centrifuge at 400 g for 5 min. Combine supernatants, neutralize with 10 M KOH, bring to pH 7 with 1 M KOH (Universal indicator paper), cool in ice, centrifuge at 400 g for 5 min, inject a 50-2000 μL aliquot of the supernatant. (PBS was 8.1 g NaCl, 0.22 g KCl, 1.14 g $NaHPO_4$ (sic), 0.27 g KH_2PO_4 in 1 L water, pH 7.4.)

HPLC VARIABLES

Column: 250 × 4.6 10 μm Partisil 10 SAX

Mobile phase: Gradient. A was 5 mM pH 2.8 $(NH_4)H_2PO_4$. B was 750 mM pH 3.5 $(NH_4)H_2PO_4$. A:B from 70:30 to 0:100 over 30 min (concave gradient, Waters no. 9). (At the start of each day pump through 20 mL 2 M $(NH_4)H_2PO_4$ then inject 100 μL 100 mM disodium EDTA into the initial mobile phase.)

Flow rate: 3

Injection volume: 50-2000

Detector: UV 262

CHROMATOGRAM

Retention time: 21 (as triphosphate, ara-CTP)

OTHER SUBSTANCES

Extracted: F-araATP (fludarabine triphosphate), ATP, CTP, UTP, GTP

KEY WORDS

mononuclear cells

Molecular formula: $C_6H_{10}N_6O$
Molecular weight: 182.19
CAS Registry No.: 4342-03-4
Merck Index: 2866
Lednicer No.: 2 254

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 5 mL MeOH:chloroform 3:1, vortex for 60 s, let stand at 4° for 15 min, centrifuge at 4° at 1300 g for 10 min, inject an aliquot of the supernatant. (Caution ! Chloroform is a carcinogen !)

HPLC VARIABLES

Column: 300 × 3.9 10µm. µBondapak phenyl
Mobile phase: Gradient. MeOH:0.1% pH 5.5 ammonium formate buffer:water 5:90:5, for 0.5 min, to 30:40:30 over 1 min, maintain at 30:40:30 for 7.5 min, re-equilibrate at initial conditions for 4 min.
Flow rate: 2
Injection volume: 20–100
Detector: UV 254

CHROMATOGRAM

Retention time: 6.8
Limit of detection: 50 ng/mL

OTHER SUBSTANCES

Extracted: 5-aminoimidazole-4-carboxamide, 2-azahypoxanthine

KEY WORDS

plasma

REFERENCE

Tate,P.S.; Briele,H.A. Reversed-phase high-performance liquid chromatography of 5-(3,3-dimethyl-1-triazeno)imidazole-4-carboxamide and metabolites, *J.Chromatogr.*, **1986**, *374*, 421–424.

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 325

CHROMATOGRAM

Retention time: 3.16
Limit of detection: <120 ng/mL

KEY WORDS

whole blood; plasma; interferences may occur—compounds(all of which are extracted) elute in this order tenoxicam; iproniazid; methocarbamol; methotrexate; caffeine; nialamide; colchicine; cytarabine; benzoylecgonine; acetaminophen; diazoxide; dacarbazine; sulfinpyrazole; flumazenil; sulpride; morphine; atenolol; toloxatone; terbutaline; albuterol; phenobarbital; ranitidine; tiapride; phenol; chlormezanone; aspirin; metformin; ritodrine; codeine; sultopride; amisulpride; naltrexone; lisinopril; benzocaine; nizatidine; nalorphine; mephenesin; naloxone; sotalol; carteolol; procainamide; carbamazepine; bromazepam; nalbuphine; nadolol; procarbazine; dihydralazine; omeprazole; strychnine; acebutolol; glutethimide; chlorpropamide; glipizide; triazolam; prazosin; flunitrazepam; clonazepam; metoclopramide; melphalan; estazolam; tolbutamide; ephedrine; clonidine; pindolol; clobazam; minoxidil; disopyramide; nitrazepam; dextromethorphan; tofisopam; zopiclone; debrisoquine; sulindac; alprazolam; cycloguanil; lorazepam; methaqualone; ketamine; piroxicam; metoprolol; nifedipine; quinine; mephentermine; prilocaine; pentazocine; oxazepam; tiaprofenic acid; quinidine; celiprolol; ajmaline; yohimbine; lidocaine; secobarbital; viloxazine; mepivacaine; meperidine; doxylamine; labetalol; temazepam; amodiaquine; benperidol; droperidol; hydroxychloroquine; zolpidem; ketoprofen; alminoprofen; cicletanine; moclobemide; chloroquine; cocaine; timolol; nomifensine; ticlopidine; acenocoumarol; vindesine; mexiletine; dipyridamole; trazodone; pipamperone; pyrimethamine; benazepril; vincristine; metapramine; chlordiazepoxide; oxprenolol; warfarin; clorazepate; flecainide; phencyclidine; thiopental; fenfluramine; metipranolol; triprolidine; naproxen; buprenorphine; verapamil; buspirone; tianeptine; midazolam; bupivacaine; carbinoxamine; loprazolam; cetirizine; chlorpheniramine; moperone; cibenzoline; medifoxamine; astemizole; vinblastine; nicardipine; bisoprolol; diltiazem; glibornuride; reserpine; aconitine; nitrendipine; diazepam; mianserin; ramipril; haloperidol; tetracaine; alprenolol; acepromethazine; glibenclamide; chlorophenacinone; doxepin; nimodipine; diphenhydramine; cyclizine; histapyrrodine; phenylbutazone; demexiptiline; clozapine; proguanil; trifluperidol; medazepam; cyamemazine; bumadizone; suriclone; propranolol; acepromazine; dothiepin; dextromoramide; fenoprofen; dextropropoxyphene; loxapine; betaxolol; propafenone; promethazine; thioproperazine; methadone; amoxapine; quinupramine; opipramol; cyproheptadine; brompheniramine; mefenidramine; protriptyline; flurbiprofen; tetrazepam; zorubicin; prazepam; alimemazine; loperamide; imipramine; desipramine; levomepromazine; hydroxyzine; niflumic acid; penbutolol; fluvoxamine; pimozide; daunorubicin; indomethacin; maprotiline; tropatenine; etodolac; fluoxetine; amitriptyline; nortriptyline; tioclomarol; diclofenac; mefloquine; trimipramine; chlorambucil; lidoflazine; ibuprofen; floctafenine; alpidem; loratadine; chlorpromazine; clomipramine; carpipramine; thioridazine; fentiazac; clemastine; mefenamic acid; fluphenazine; prochlorperazine; penfluridol; bepridil; terfenadine; trifluoperazine

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 323.5

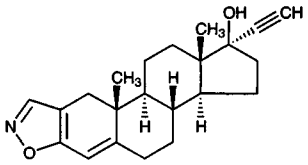
Danazol



Molecular formula: $C_{22}H_{27}NO_2$
Molecular weight: 337.46
CAS Registry No.: 17230-88-5
Merck Index: 2875
Lednicer No.: 2 157

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 100 µL 10 µg/mL IS + 5 mL pentane:dichloromethane 80:20, shake for 10 min on a reciprocal shaker at 150 rpm, centrifuge at 1000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 200 µL mobile phase. Inject an aliquot onto column A and elute to waste with mobile phase, after 1.4 min direct the effluent from column A onto column B, after another 2.6 min remove column A from the circuit. Elute column B with mobile phase and monitor the effluent. Continue to elute column A with mobile phase to remove late-eluting peaks.

HPLC VARIABLES

Column: A 150 × 3.9 5 µm Spherisorb C8; B 150 × 4.6 5 µm Spherisorb ODS-2
Mobile phase: MeCN:water 55:45
Flow rate: 1.6
Detector: UV 285

CHROMATOGRAM

Retention time: 9.5
Internal standard: 1,4-androstadiene-3,17-dione (4.2)
Limit of detection: 1 ng/mL

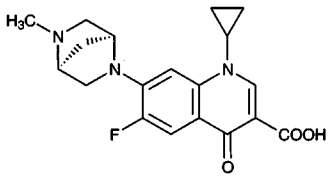
Danofloxacin



Molecular formula: $C_{19}H_{20}FN_3O_3$, $C_{19}H_{20}FN_3O_3.CH_4O_3S$ (monomethane sulfonate)

Molecular weight: 357.38

CAS Registry No.: 112398-08-0, 119478-55-6 (monomethane sulfonate)

Merck Index: 2876

SAMPLE

Matrix: blood, gastric contents; tissue

Sample preparation: Blood. Mix 1 mL plasma with IS and MeCN, centrifuge at 2800 g for 20 min, inject an aliquot. Tissue. Centrifuge 500 mg homogenized lung tissue at 1820 g, separate the sediment, reconstitute it with 500 μL water, vortex for 20 s. Mix with 5 μg/g IS in MeCN (sample:MeCN 40:60). Vortex for 20 s, centrifuge at 1820 g. Collect the supernatant and dilute with water (sample:water 30:70). Centrifuge the mixture and inject an aliquot of the supernatant. Mesenteric lymph node, brain, interdigital skin. Centrifuge 500 mg homogenized tissue at 1820 g, mix sediment with IS, vortex, mix with 1 mL 2 M pH 8.5 K_2HPO_4, vortex, homogenize (Ultraturrax) for 20 s. Add 5 mL ethyl acetate:isopropanol 70:30, mix for 10 min. Centrifuge at 1820 g, remove 3 mL portion, dry at 50° under a stream of nitrogen, reconstitute the residue in mobile phase, inject an aliquot. Intestinal contents. Condition a Sep-Pak C18 SPE cartridge with 3 mL MeOH and 3 mL 25 mM pH 3.0 K_2HPO_4. Centrifuge 1 g gastrointestinal contents at 1820 g, add IS, vortex, mix with 2 M pH 8.5 K_2HPO_4. Add 10 mL ethyl acetate:isopropanol 70:30, mix for 10 min, centrifuge at 1820 g, remove the supernatant, dry at 50° under nitrogen. Reconstitute the residue with 1 mL 25 mM pH 3.0 K_2HPO_4, sonicate for 2 min, vortex for 20 s. Add to the SPE cartridge, wash with 3 mL 35 mM pH 3.0 K_2HPO_4, dry under vacuum, elute with 3 mL MeOH. Dry the eluate under a stream of nitrogen at 50°, reconstitute the residue in mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 5 μm Techsphere C18

Mobile phase: MeCN:10 mM pH 3.0 phosphate buffer

Flow rate: 1

Detector: F ex 280 em 440

CHROMATOGRAM

Internal standard: CP.71.755 (a structural analogue of danofloxacin)

Limit of detection: 10 ng/mL (plasma), 40 ng/g (tissue, all gastrointestinal fluids)

KEY WORDS

SPE; plasma; mesenteric lymph nodes; duodenum; jejunum; ileum; colon; brain; interdigital skin; sheep; pharmacokinetics

REFERENCE

McKellar,Q.A.; Gibson,I.F.; McCormack,R.Z. Pharmacokinetics and tissue disposition of danofloxacin in sheep, *Biopharm.Drug Dispos.*, **1998**, *19*, 123–129.

SAMPLE

Matrix: tissue

Sample preparation: 500 mg Sample + 5 mL extraction solvent, mix at high speed for 10 s, homogenize at high speed (Polytron homogenizer) for 30 s. Re-suspend the tissue by mixing at high speed for 10 s, incubate in a 50 ± 5° water bath for 90 ± 10 min. Centrifuge at 1200 g for 10 min, inject a 20 μL aliquot of the supernatant. (Extraction solvent was 15 mM $HClO_4$ and 15 mM phosphoric acid in MeOH:water 50:50.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Inertsil C8 (GL Sciences, Japan)
Mobile phase: MeCN:50 mM pH 3.5 phosphate buffer 12:88 (Buffer was prepared by dissolving 6.62 g monosodium phosphate in 900 mL water, pH was adjusted to 3.5 with phosphoric acid and solution was diluted to 1 L with water.)
Column temperature: 35 ± 0.5
Flow rate: 1
Injection volume: 20
Detector: F ex 280 em 440

CHROMATOGRAM

Retention time: 18.5
Limit of quantitation: 10 ng/g

OTHER SUBSTANCES

Extracted: metabolites
Simultaneous: ciprofloxacin, enrofloxacin, norfloxacin, ofloxacin

KEY WORDS

liver; muscle; kidney; fat; cow; chicken

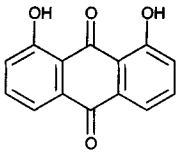
Danthron



Molecular formula: $C_{14}H_8O_4$
Molecular weight: 240.22
CAS Registry No.: 117-10-2
Merck Index: 2878

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, py-

rilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

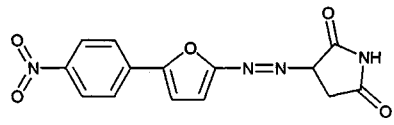
Dantrolene



Molecular formula: $C_{14}H_{10}N_4O_5$
Molecular weight: 314.26
CAS Registry No.: 7261-97-4, 24868-20-0 (sodium salt hemiheptahydrate)
Merck Index: 2879
Lednicer No.: 2 242

SAMPLE

Matrix: blood
Sample preparation: 50 μL Plasma + 100 μL 10 μg/mL methyldantrolene in MeCN, vortex for 30 s, centrifuge at 1500 g for 5 min, inject a 25 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 250 × 4.6 10 μm LiChrosorb RP-18
Mobile phase: MeCN:20 mM glycine 35:45, final pH adjusted to 3.6 with phosphoric acid
Flow rate: 2
Injection volume: 25
Detector: UV 375

CHROMATOGRAM

Retention time: 6.4
Internal standard: methyldantrolene (11.2) (synthesis details in paper)
Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: metabolites
Noninterfering: tetracycline, benzodiazepines

KEY WORDS

plasma; human; rat; pharmacokinetics

Detector: UV 250

CHROMATOGRAM
Retention time: 4.5
Internal standard: m-aminophenyl sulfone (6.2)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Extracted: monoacetyldapsone

KEY WORDS
plasma

REFERENCE
Horai,Y.; Ishizaki,T. Rapid and sensitive liquid chromatographic method for the determination of dapsone and monoacetyldapsone in plasma and urine, *J.Chromatogr.*, **1985**, *345*, 447–452.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 12.583

KEY WORDS
whole blood

SAMPLE
Matrix: eggs, milk, tissue

Sample preparation: Milk. Centrifuge at 2000 g and freeze at -20° to remove the cream. Mix a 5 mL aliquot with 5 mL saline solution and add 1 mL 1% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Meat. Blend 10 g homogenized meat with 20 mL saline, centrifuge, remove a 10 mL aliquot of the clear upper phase and add it to 1 mL 1% sodium azide (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Eggs. Dilute 10 g homogenized whole egg with 10 mL saline, add 3 mL 10% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 60 × 4 50-100 μm XAD-4 (Rohm & Haas); B 250 × 4.6 7 μm Cp TM-Spher C18 (Chrompack)

Mobile phase: MeCN:50 mM pH 6.85 sodium acetate buffer 12.5:87.5

Detector: UV 450 following post-column reaction. The column effluent mixed with 1.5% p-dimethylaminobenzaldehyde in 17% phosphoric acid and the mixture flowed through a 7.5 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM

Retention time: k' 11.0

Limit of detection: 5-10 ng/g

OTHER SUBSTANCES

Extracted: sulfacetamide, sulfachlorpyrazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfanilamide, sulfaquinoxaline, sulfathiazole, sulfatroxazole

Noninterfering: chloramphenicol, trimethoprim

KEY WORDS

post-column reaction; meat; column-switching; dialysis

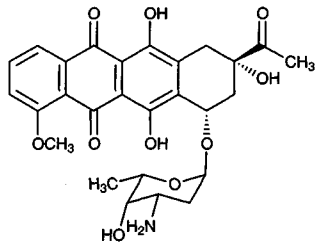
Daunorubicin



Molecular formula: $C_{27}H_{29}NO_{10}$
Molecular weight: 527.53
CAS Registry No.: 20830-81-3, 23541-50-6 (HCl)
Merck Index: 2890

SAMPLE

Matrix: blood
Sample preparation: Plasma + 1 mL pH 8.4 phosphate buffer + 8 mL chloroform:1-heptanol 90:10, shake mechanically for 30 min, centrifuge at 3300 rpm for 10 min. Remove the lower organic layer and evaporate it to 2 mL under a stream of nitrogen. Add the residue to 200 µL 300 mM phosphoric acid, vortex. Remove the aqueous phase and add it to 2 mL n-hexane, vortex, centrifuge, inject a 100-150 µL aliquot of the aqueous phase.

HPLC VARIABLES

Column: 250 × 4 7 µm Lichrosorb RP-18
Mobile phase: MeOH:water 70:30 containing 0.5% acetic acid and 2.5 mM sodium heptanesulfonate
Flow rate: 1.2
Injection volume: 100-150
Detector: UV 254

CHROMATOGRAM

Internal standard: daunorubicin

OTHER SUBSTANCES

Extracted: epirubicin

KEY WORDS

plasma; daunorubicin is IS

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 150 μL Plasma + 150 μL MeCN, vortex for 10 s. Centrifuge at 3000 rpm for 5 min. Remove 200 μL of the organic layer, evaporate under reduced pressure, reconstitute the residue in 100 μL 100 mM pH 3 monobasic phosphate buffer. Inject a 10 μL aliquot. Urine. Directly inject a 10 μL aliquot. (Silanize glassware with 3% dichlorodimethylsilane in toluene, rinse with MeOH before use.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm TSK gel ODS/TM silica (Tosoh Co., Japan)
Mobile phase: MeCN:buffer 35:65 (Buffer was 100 mM monobasic phosphate (sic) containing 0.3% heptafluorobutyric acid, adjusted to pH 3 with NaOH. At the end of the analysis, wash the column with MeOH and MeOH:water 50:50.)
Flow rate: 1
Injection volume: 10
Detector: F ex 460 em 555

CHROMATOGRAM
Retention time: 9.8
Limit of detection: 28 nM
Limit of quantitation: 2.5 μM

OTHER SUBSTANCES
Extracted: doxorubicin

KEY WORDS
plasma

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a C18 Sep-Pak SPE cartridge with 3 mL MeOH, 3 mL MeOH:water 50:50, and 10 mL 50 mM pH 8.9 Na_2HPO_4. 1 mL Plasma or urine + 2 mL 0.9% NaCl, mix, add to the SPE cartridge, wash with 3 mL 50 mM pH 8.9 Na_2HPO_4, elute with four 500 μL aliquots of chloroform:MeOH 2:1. Evaporate the eluates to dryness under vacuum while centrifuging, dissolve the residue in 200 μL MeCN:7 mM pH 2.6 Na_2HPO_4 40:60, vortex gently, centrifuge at 3000 g for 15 min, inject an aliquot of the supernatant.

HPLC VARIABLES
Column: 100 × 8 μBondapak phenyl Radial-Pak
Mobile phase: MeCN:buffer 30:70 (Buffer was 7 mM Na_2HPO_4 adjusted to pH 2.6 with formic acid.)
Flow rate: 3
Detector: F ex 480 em 550

CHROMATOGRAM
Internal standard: daunorubicin

OTHER SUBSTANCES
Extracted: epirubicin

KEY WORDS
plasma; SPE; daunorubicin is IS

SAMPLE
Matrix: blood, urine
Sample preparation: 1 mL Plasma or urine + daunorubicinone + 5 mL chloroform:isopropanol 75:25, shake mechanically for 30 min, centrifuge at 4° at 1200 g for 15 min. Remove the lower organic layer and evaporate it to dryness under a stream of nitrogen at room temperature. Add the aqueous phase to 2 mL 50 (plasma) or 500 (urine) mM pH 8.4 borate buffer, add 5 mL chloroform:isopropanol 75:25, shake mechanically for 30 min, centrifuge at 4° at 1200 g for 15 min. Remove the lower organic layer and add it to the residue from the first extraction, evaporate to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 600 μL MeOH:500 mM phosphoric acid 50:50, vortex for 30 s,

add 2 mL N-hexane, vortex for 30 s, centrifuge, inject an aliquot of the aqueous phase (omit the hexane wash for urine samples).

HPLC VARIABLES
Guard column: 30-38 μm pellicular ODS (Whatman)
Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: MeCN:MeOH:10 mM pH 1.4 phosphate buffer 25:10:65
Flow rate: 0.58
Detector: F ex 480 em 560

CHROMATOGRAM
Retention time: 25
Internal standard: daunorubicin (25), daunorubicinone (35)

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH: acetic acid 80:20, 5 mL MeOH, and 10 mL water. 600 μL Plasma +12 μL 50 mM ferric chloride in water + 600 μL chloroform, vortex for 1 min, centrifuge at 8000 g for 10 min. Remove 500 μL of the upper aqueous layer and add it to the SPE cartridge, wash with three 5 mL portions of water, wash with 400 μL MeOH, elute with 1.5 mL MeOH:acetic acid 80:20. Evaporate the eluate under vacuum, reconstitute in 100 μL mobile phase: acetic acid 80:20, vortex for 30 s, sonicate for 30 s, centrifuge at 8000 g for 2 min, inject an aliquot of the supernatant. Alternatively, 3 mL Plasma + 50 μL 50 mM ferric chloride, saturate with NaCl, vortex for 30 s, add 600 μL benzyl alcohol, vortex twice for 30 s, centrifuge at 2000 g for 15 min, break up layers with glass rod, centrifuge at 2000 g for 15 min, inject an aliquot of the benzyl alcohol layer. Urine. 5 mL Urine + 100 μL 50 mM ferric chloride, saturate with NaCl, extract with 1 mL benzyl alcohol, inject an aliquot of the benzyl alcohol layer.

HPLC VARIABLES

Column: 150 × 3.9 5 μm Resolve spherical porous silica (Waters)

Mobile phase: MeCN:MeOH:n-butanol:water:5 M sodium perchlorate:perchloric acid 500: 300:100:100:1.5:0.05

Injection volume: 20

Detector: UV 435

CHROMATOGRAM
Retention time: 8.70 mL (elution volume as Fe complex)

OTHER SUBSTANCES
Extracted: metabolites

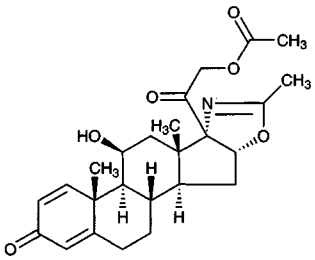
Deflazacort

Molecular formula: $C_{25}H_{31}NO_6$
Molecular weight: 441.52
CAS Registry No.: 14484-47-0
Merck Index: 2916



SAMPLE

Matrix: urine
Sample preparation: 3 mL Urine + 0.25 g NaCl, adjust pH to 9.0 with 0.5 g Na_2HPO_4, add 4 mL dichloromethane, vortex 1 min, centrifuge at 3700 g for 3 min. Remove organic phase and dry it over anhydrous sodium sulfate. Evaporate a 3 mL aliquot to dryness under vacuum, reconstitute residue with 200 µL 5 µg/mL IS in MeOH, inject 20 µL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 µm Hypersil 5-ODS
Mobile phase: THF:water 23:77
Column temperature: 30
Flow rate: 1
Injection volume: 20
Detector: UV 245

CHROMATOGRAM

Retention time: 27
Internal standard: methylprednisolone (22)
Limit of detection: 0.12 ng

OTHER SUBSTANCES

Simultaneous: metabolites, betamethasone, corticosterone, cortisone, deoxycorticosterone, dexamethasone, fludrocortisone, fludrocortisone acetate, fluorocortisone, fluorocortisone acetate, hydrocortisone, 21-hydroxydeflazacort, 11α-hydroxyprogesterone, methylprednisolone, prednisolone, prednisone, triamcinolone acetonide, triamcinolone

KEY WORDS

SPE also discussed

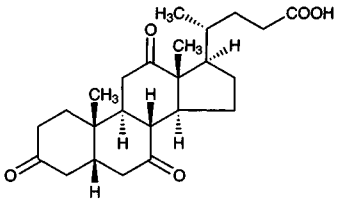
Dehydrocholic acid



Molecular formula: $C_{24}H_{34}O_5$
Molecular weight: 402.53
CAS Registry No.: 81-23-2, 145-41-5 (sodium salt)
Merck Index: 2922

SAMPLE

Matrix: solutions

Sample preparation: Mix sample with 400 µL 5 mM DBD-PZ in MeCn containing 70 mM diethylphosphorocyanidate, react for 6 h, inject a 1 µL aliquot. (Synthesis of 4-(N,N-dimethylaminosulfonyl)-7-N-piperazino-2,1,3-benzoxadiazole (DBD-PZ) is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ tlc plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei (TCI America, Portland OR). Add 123 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to 129 mg piperazine in 20 mL MeCN at room temperature, stir for 30 min, evaporate under reduced pressure, dissolve residue in 50 mL 5% HCl, wash three times with 20 mL ethyl acetate, discard ethyl acetate extracts, adjust pH of aqueous solution to 13-14 with 5% NaOH, extract five times with 50 mL ethyl acetate, combine extracts, wash with 20 mL water, dry over anhydrous sodium sulfate, evaporate under vacuum to give 4-(N,N-dimethylaminosulfonyl)-7-N-piperazino-2,1,3-benzoxadiazole as orange crystals (mp 121-2°).)

HPLC VARIABLES

Column: 150 × 4.6 5 µm Inertsil ODS-2

SAMPLE

Matrix: eggs, tissue

Sample preparation: Condition an Anagel-TSK Chelate-SPW column with 25 μL 50 mg/mL copper sulfate in water and 500 μL. Homogenize 2 g sliced chicken liver with 1.2 mL 1 M pH 4 citrate buffer and 12 mL ethyl acetate for 1 min. Homogenize 2 g sliced tissue with 1.2 mL 1 M pH 5 citrate buffer and 12 mL ethyl acetate for 1 min. Shake 2 g blended egg with 1.2 mL 1 M pH 5 citrate buffer and 12 mL ethyl acetate for 15 min. Centrifuge the mixture at 11000 rpm for 10 min, decant the supernatant, reextract the residue with two 12 mL portions of ethyl acetate. Add 10 g anhydrous sodium sulfate to the combined supernatants, swirl, let stand for 5-10 min, filter (Whatman 1PS phase-separating filter paper). Evaporate the filtrate to dryness or to an oily residue on a rotary evaporator under reduced pressure at 40°, reconstitute the residue in 2 mL MeOH by vortexing, filter (0.2 μm syringe filter). Add 1.5 mL of the filtrate to the Anagel column at 0.36 mL/min, wash with 500 μL water, 500 μL MeOH, and 500 μL water. Elute the contents of the Anagel column onto the analytical column with mobile phase A, after 11 min remove the Anagel column from the circuit, elute column B using gradient elution of mobile phase A:B, monitor the effluent from column B. (Prepare 1 M pH 4 or 5 citrate buffer as follows: dissolve 192 g citric acid in approximately 800 mL water, adjust pH value with 1 M NaOH and make up to 1 L with water.)

HPLC VARIABLES

Guard column: 5 × 3 PLRP-S

Column: 150 × 4.6 5 μm Polymer Labs PLRP-S

Mobile phase: Gradient. A:B 100:0 for 11 min, to 0:100 in 10 min, maintain at 0:100 for 10 min. A was buffer. B was MeCN:MeOH:buffer 25:10:65. (Buffer was 100 mM KH_2PO_4 containing 10 mM citric acid, and 10 mM EDTA).

Flow rate: 1

Injection volume: 1500

Detector: UV 350

SAMPLE
Matrix: milk
Sample preparation: Fill a disposable polypropylene column (Bio-Rad Econo-Pac column) with Chelating Sepharose Fast Flow (Pharmacia) and condition it with 10 mL water, 1.5 mL 100 mM copper sulfate, and 100 mL water. Condition a 6 mL SupelClean ENVI-Chrom P SPE cartridge with 2 mL MeOH and 5 mL water. Homogenize 10 g tissue with

20-30 mL 100 mM pH 4 succinic acid buffer. Centrifuge the homogenate at 2000 g at 10° for 15-20 min. Add the supernatant to the metal chelate affinity column, wash sequentially with 5 mL 500 mM NaCl, 10 mL water, 10 mL MeOH, 10 mL water, and 3 mL McIlvaine buffer, discard the clear effluent. Elute with 8 mL McIlvaine-EDTA-NaCl buffer. Add the eluate to the SPE cartridge under gravity, rinse the column with 2.5 mL water, add the rinse to the SPE cartridge. Wash the SPE cartridge with 2.5 mL water. Dry the SPE cartridge by drawing air through it for 2-3 min. Elute with 5 mL MeOH. Evaporate the eluate to dryness under nitrogen at 40-50°, dissolve the residue in 1 mL water. Inject a 100 μL aliquot. (McIlvaine buffer was 500 mM NaCl and 100 mM EDTA (Carson, M.C. J. AOAC Int. 1993, 76, 329).)

HPLC VARIABLES

Column: 150 × 3.9 5 μm PLRP-S (Polymer Labs, USA)

SAMPLE

Matrix: milk
Sample preparation: Prepare a column as follows. Swirl Chelating Sepharose Fast Flow resin (Pharmacia) in its bottle, add it to a polypropylene column to give a bed volume of 1.0-1.2 mL, wash 3 times with 2 mL portions of water, wash with 2 mL 10 mM copper sulfate, wash with two 2 mL portions of water. Centrifuge 5 mL milk at 10° at 1500 g for 15 min, remove the lower layer and add it to 10 mL succinate buffer, mix, centrifuge at 1500 g for 30 min, add the supernatant to the column. Wash with 2 mL succinate buffer, wash with 2 mL water, wash with 2 mL MeOH, wash with 2 mL water, wash with 700 μL citrate/phosphate buffer (be careful not to disturb bed), elute with 2.5 mL citrate/phosphate buffer (column is white and eluate is blue). Filter (Amicon Centricon 30, MW 30000 cut-off; pre-washed by centrifuging with 2 mL water) while centrifuging at 5000 g for 30-90 min, inject a 600 μL aliquot of the ultrafiltrate. (Prepare succinate buffer by dissolving 11.8 g succinic acid in 980 mL water, adjust pH to 4.0 with 10 M NaOH, make up to 1 L. Prepare the citrate/phosphate buffer by dissolving 12.9 g citric acid monohydrate, 10.9 g Na_2HPO_4, 37.2 g disodium EDTA dihydrate, and 29.2 g NaCl in 1 L water.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm PLRP-S (Polymer Labs)
Mobile phase: Gradient. MeCN:MeOH:10 mM oxalic acid 0:0:100 for 1 min, to 22:8:70 over 5 min, maintain at 22:8:70 for 11 min, return to initial conditions.
Flow rate: 1
Injection volume: 600
Detector: UV 355

CHROMATOGRAM
Retention time: 14.2
Limit of detection: 1.02 ng/mL
Limit of quantitation: 2.18 ng/mL

SAMPLE
Matrix: tissue
Sample preparation: Condition a 6 mL 500 mg Bond-Elut C8 SPE cartridge with 6 mL MeOH, 6 mL water, and 2 mL buffer A. Condition a 6 mL SPE cartridge containing 3 g wet XAD-2 resin with 10 mL MeOH, 10 mL water, and 2 mL buffer B. Homogenize (Ultra-Turrax) 2 g tissue with 20 mL succinate buffer for 1 min, centrifuge at 30 897 g for 15 min, filter (Whatman No. 1 paper) the supernatant, dilute 12 mL filtrate with 6 mL buffer B. For sheep liver add the diluted filtrate to the C8 SPE cartridge, wash with 10 mL buffer A, wash with 2 mL water, elute with 6 mL MeOH. For cow kidney add the diluted filtrate to the XAD-2 cartridge, wash with 14 mL buffer A, wash with 2 mL water, elute with 6 mL MeOH. Inject 25 μL 50 mg/mL copper sulfate and 500 μL water onto column

A then load 1.5 mL of the eluate from the SPE cartridge at 0.36 mL/min onto column A. Wash to waste with 500 μL water, 500 μL MeOH, and 500 μL water then elute the contents of column A onto column B with mobile phase A. After 11 min remove column A from the circuit and elute column B with a linear gradient of A:B from 100:0 to 0:100 over 10 min, maintain at 0:100 for 10 min, re-equilibrate to 100:0. Monitor the effluent from column B. (Buffer A was 100 mM KH_2PO_4 containing 3 g/L pentanesulfonic acid. Succinate buffer was 60 g succinic acid in 1 L water adjusted to pH 4.0 with 1 M NaOH. Buffer B was 37.2 g disodium EDTA and 3 g pentanesulfonic acid in 1 L succinate buffer.)

HPLC VARIABLES

Column: A 10 × 6 10 μm Anagel-TSK-Chelate-SPW (Anachem); B 5 × 3 5 μm Polymer Labs. PLRP-S + 150 × 4.6 5 μm Polymer Labs. PLRP-S

Mobile phase: A was buffer. B was MeCN:MeOH:buffer 25:10:65. (Buffer was 100 mM KH_2PO_4 containing 10 mM citric acid and 10 mM EDTA.)

Injection volume: 1500

Detector: UV 350
