ACKNOWLEDGMENTS

These days the production of a technical book is a complex process requiring the talents of many people. Even by modern standards, however, this was a particularly involved process. The raw data initially consisted of thousands of individual files, one for each abstract. These files were converted into a database that was used to make the CD for the electronic version as well as prepare the coded report that was used to set the galley and page proofs. The people who worked on this project are as follows:

For Synexchem Consulting Services International LLC: Software Developers Peter Baričič and Martin Mackov; Abstracters Elena Belajová, Research Institute of Foods; Alica Čániová, Slovak Technical University, Department of Analytical Chemistry; Katarina Hroboňová, Slovak Technical University, Department of Analytical Chemistry; Gabriela Kristofiková; Pavol Kubalec, Slovak Technical University, Department of Analytical Chemistry; Gabriela Machalová; Martina Nahálková; Mária Tegzová, Drug Research Institute; and Pavol Valachovič, Drug Research Institute

For John Wiley: Betty Sun, Senior Editor; Perry King, Associate Editor, Wiley New Media; and John Sollami, Senior Managing Editor, STM Books

The use of the National Library of Medicine, National Institutes of Health Library, and the FDA Medical Library is greatly appreciated. Although many people have helped with the preparation of this work, the mistakes are my own. I would appreciate hearing from anyone who has corrections, comments, or suggestions. I can be reached at lunng@cder.fda.gov.

The content of this volume does not necessarily reflect the views or policies of the Food and Drug Administration, nor does the mention of trade names, commercial products, or organizations imply endorsement by the U.S. Government.

ABOUT THIS BOOK

SCOPE

A computer search was used to identify relevant references. The search was conducted using Medline, 1980 to date. Since references from the *Journal of Liquid Chromatography* are not included in Medline, these references were manually added to the database.

The search strategy was as follows: HPLC (tw) **or** HPLC (mh) **or** liquid chromatography (mh) **and** USAN drug name (tw or mh), where tw = text word and mh = MESH heading.

In addition to the Medline search, some journals were routinely surveyed for relevant articles. These journals were:

American Journal of Health-System Pharmacy
Analyst
Analytical Chemistry
Antimicrobial Agents and Chemotherapy
Arzneimittelforschung
Biological and Pharmaceutical Bulletin
Biomedical Chromatography
Biopharmaceutics and Drug Disposition
Chemical and Pharmaceutical Bulletin
Chromatographia
Clinical Chemistry
Clinical Pharmacology and Therapeutics
Drug Metabolism and Disposition
Farmaco
Journal of Analytical Toxicology
Journal of AOAC International
Journal of Chromatographic Science
Journal of Chromatography, Part A and Part B
Journal of Clinical Pharmacology
Journal of Forensic Sciences

Journal of Liquid Chromatography and Related Technology
Journal of Medicinal Chemistry
Journal of Pharmaceutical and Biomedical Analysis
Journal of Pharmaceutical Sciences
Journal of Pharmacology and Experimental Therapeutics
Pharmaceutical Research
Pharmazie
Therapeutic Drug Monitoring
Xenobiotica

Many other journals were consulted when relevant articles were identified by computer searches.

CHAPTER STRUCTURE

Each chapter is headed by the name and structure of the target compound as well as other useful data such as the CAS Registry Number, molecular formula, and molecular weight. In general the United States Adopted Name (USAN) is used throughout to identify each drug, although we sometimes use a truncated version of this name, e.g., naproxen for naproxen sodium. Exceptions are clavulanate potassium, which is listed in the "Clavulanic Acid" monograph, EDTA, which is used in preference to edetic acid, hyoscyamine, which is listed in the monograph for its racemate atropine, isotretinoin and tretinoin, which are listed in the monograph "Retinoic Acid," levonorgestrel, which is listed in the "Norgestrel" monograph, and some of the steroids, which are listed for convenience in the monograph "Estrogens, conjugated." Names of derivatives, such as esters, which would have different chromatographic properties, are identified by placing the derivative name in parentheses after the retention time.

Reference is also made at the head of each chapter to the relevant abstract in the *Merck Index*. **Note that these numbers refer to the 12th edition of the Merck Index.**[1] Much useful information, such as melting point, solubility, optical rotation, and references to reviews, can be found in the *Merck Index*. In addition, the relevant sections in the series *Organic Chemistry of Drug Synthesis*, by Lednicer and Mitscher,[2–6] are referenced. These books give valuable information about the syntheses of various drugs and this may be helpful in determining impurities, understanding degradation reactions, and so on.

ABSTRACT STRUCTURE

The detailed procedures given normally contain the following sections. Of course, not all papers give full details, so some sections may be missing.

Matrix
Sample Preparation
Guard Column
Column
Mobile Phase
Flow Rate

Injection Volume	Also
Retention Time	Noninterfering
Detector	Interfering
Internal Standard	Limit of Detection
Column Temperature	Limit of Quantitation
Extracted	Key words
Simultaneous	Reference

ABSTRACT CONVENTIONS

Also	Compounds that can be analyzed at the same time. It is not specified whether they interfere, but they can be extracted. See also Extracted, Simultaneous.
Column	Dimensions are length (mm) × internal diameter (mm), and the material is stainless steel unless otherwise indicated.
Column Temperature	If other than ambient (all temperatures are in degrees C)
Derivatization	Pre-column unless otherwise mentioned (in Key Words)
Detector	Wavelengths in nm
Extracted	Compounds that can be extracted from the matrix in question and analyzed at the same time and do not interfere. See also Also, Simultaneous.
Flow Rates	In mL/min.
Guard Column	Dimensions are length (mm) × internal diameter (mm)
Impurities	If method resolves compound and impurities (in Key Words)
Injection Volume	In microliters (μL). Injection Volume may be either the volume actually injected or the volume of the injection loop. If it is the volume actually injected, this value is also given in the Sample Preparation section. If the actual injection volume is not given in the Sample Preparation section, the Injection Volume given is that of the injection loop.
Interfering	Compounds that interfere with the analysis of the target compound. Compounds which interfere with the chromatography of the internal standard (IS) are listed under simultaneous (another IS can always be selected or an external standard procedure can be used).
Matrix	A controlled vocabulary is used (see below)
Metabolites	If method resolves compound and metabolites (in Key Words)
Mobile Phase	Ratios are v/v and gradients are linear unless otherwise noted. Times given when describing gradient elution, and other procedures such as column switching, are the times for each step, e.g., "MeOH:water 15:85 for 4 min, to 50:50 over 2 min, maintain at 50:50 for 4 min." If we were to include the cumulative times (t) in the example above, it would read: "MeOH:water 15:85 for 4 min (t = 4), to 50:50 over 2 min (t = 6), maintain at 50:50 for 4 min (t = 10)."
Noninterfering	Compounds which do not interfere with the analysis for various reasons, e.g., they are not extracted, they are not detected.

Retention Time	This is frequently estimated from a reproduced chromatogram and so the accuracy may not be great (in minutes).
Simultaneous	Compounds which can be analyzed at the same time and do not interfere. Note that the compound cannot necessarily be extracted from the matrix in question (although it may be). See also Also, Extracted.
SPE	For the sake of consistency, conditioning procedures for solid-phase extraction (SPE) cartridges are always described at the beginning of the sample preparation sections. Bear in mind, however, that the conditioning procedure should be carried out just prior to use. Thus, if sample preparation is a lengthy procedure, it may be necessary to delay SPE cartridge conditioning until the step requiring the cartridge.
Species	If other than human; noun is used instead of adjective, e.g., cow not bovine. In some cases, human may be specified. For example, if **both** human blood and rat blood are analyzed, **both** human and rat will be indicated (in Key Words).

MATRIX

To help with searching, a controlled vocabulary is used to limit the number of terms in the matrix section. For example, the term raw materials is not used, the term bulk is used instead. In a number of cases the matrix is associated with various key words which can be used to narrow the search. For example, the matrix term blood has the key words plasma, serum, and whole blood associated with it. Thus, if you are interested in the determination of the drug in blood in general you should search the matrix field for blood. If, however, you are specifically interested in finding the drug in plasma you should search the key words field for plasma.

Matrix	Associated Key Words
bile	
blood	plasma, serum, whole blood
bulk	
CSF	
formulations	capsules, creams, injections, ointment, tablets, etc.
microsomal incubations	
milk	
perfusate	
reaction mixtures	
saliva	
solutions	buffer, water
tissue	brain, heart, kidney, liver, muscle, spleen, etc.
urine	

ABBREVIATIONS

BHT	2,6-di-tert-butyl-4-methylphenol, butylated hydroxytoluene

CE	capillary electrophoresis
DMSO	dimethyl sulfoxide
E	electrochemical detection
em	emission wavelength
EtOH	ethanol
ex	excitation wavelength
F	fluorescence detection
FW	formula weight
GPC	gel permeation chromatography
h	hour
HPLC	high-performance liquid chromatography
IS	internal standard
L	liter
LOD	limit of detection or some other description indicating that this is the smallest concentration or quantity that can be detected or analyzed for
LOQ	lower limit of quantitation, either given as such in the paper or taken as the lower limit of the linear quantitation range
M	molar (i.e., moles/L)
MeCN	acetonitrile
MeOH	methanol
min	minutes
mL	milliliter
mM	milli-molar (i.e., milli-moles/L)
MTBE	methyl tert-butyl ether
nM	nano-molar (i.e., nano-moles/L)
psi	pounds/sq. in. (1 psi = 6.89476 kPa)
s	seconds
SEC	size exclusion chromatography
SFC	supercritical fluid chromatography
SFE	supercritical fluid extraction
SIM	selected-ion monitoring
SPE	solid phase extraction
Temp	temperature
U	units
UV	ultraviolet detection

WORKING PRACTICES

In general, good working practice, e.g., using high-grade materials, is assumed. Solutions containing compounds should be protected from light and silanized glassware should be used unless you have good reason to believe that these precautions are not necessary. Details of solution preparation are generally not given. It should be remembered that the preparation of a dilute aqueous solution of a relatively water-insoluble compound can frequently be made by dissolving the compound in a small volume of a water-miscible organic solvent and diluting this solution with water. A number of excellent texts[7–9] discuss good working practices and procedures in HPLC and these should be consulted.

It is also assumed that safe working practices are observed. Organic solvents should only be evaporated in a properly functioning chemical fume hood, correct protective equipment should be worn when dealing with potentially hazardous biological materials, and waste solutions should be disposed of in accordance with all applicable regulations.

A number of solvents are particularly hazardous. For example, benzene is a human carcinogen[10]; chloroform,[11] dichloromethane,[12] dioxane,[13] and carbon tetrachloride[14] are carcinogenic in experimental animals; and DMF[15] and MTBE[16,17] may be carcinogenic. Organic solvents are, in general, flammable and toxic by inhalation, ingestion, and skin absorption. Sodium azide is carcinogenic and toxic and liberates explosive, volatile, toxic hydrazoic acid with acid. Sodium azide can form explosive heavy metal azides, e.g., with plumbing fixtures, and so should not be discharged down the drain.[18] Disposal procedures have been described for a number of hazardous drugs and reagents[18] and recent papers describe a procedure for the hydrolysis of acetonitrile in waste solvent to the much less toxic acetic acid and ammonia.[19,20] Recent work has shown that n-hexane is surprisingly toxic.[21]

PIC REAGENTS

These reagents are offered by Waters as buffered solutions containing the following compounds:

PIC A is tetrabutylammonium sulfate
PIC B5 is pentanesulfonic acid
PIC B6 is hexanesulfonic acid
PIC B7 is heptanesulfonic acid
PIC B8 is 1-octanesulfonic acid
PIC D4 is dibutylamine phosphate

SUPPLIERS

Suppliers of critical items such as columns are given in the abstracts but the suppliers for widely available items are not listed. These suppliers are as follows:

Item	Supplier
Adsorbosphere	Alltech Associates
Asahipak	Asahi Chemical
Bakerbond	J.T. Baker
Bond Elut	Varian
μBondapak	Waters
Chiralcel	Daicel
Co:Pell	Whatman
Corasil	Waters
Cyclobond	Advanced Separation Technologies
Econosil	Alltech Associates
Econosphere	Alltech Associates

Extrelut	E. Merck
Hypersil	Shandon
Inertsil	MetaChem
LiChroprep	E. Merck
LiChrosorb	E. Merck
LiChrosphere	E. Merck
Micropak	Varian
Microsorb	Rainin
NewGuard	Applied Biosystems
Nova-Pak	Waters
Nucleosil	Macherey Nagel
Partisil	Whatman
Pecosphere	Perkin-Elmer
Porasil	Waters
Sep-Pak	Waters
Spheri-5	Applied Biosystems
Spheri-10	Applied Biosystems
Spherisorb	Phase Separations
SPICE	Analtech
Supelcosil	Supelco
Ultrasphere	Beckman
Ultremex	Phenomenex
Vydac	The Separations Group
Zorbax	Mac-Mod Analytical

This list is not intended to be definitive. Many other companies supply these pieces of equipment.

PREFACE

This book is a collection of procedures for the analysis of a number of pharmaceuticals using high-performance liquid chromatography (HPLC). This book is a continuation of *HPLC Methods for Pharmaceutical Analysis*, published in 1997. The previous book described analytical procedures for the 170 most commonly used drugs. This book lists procedures for the analysis of the remaining drugs that are used for both medical and veterinary purposes. In addition, a few recent procedures for the analysis of drugs covered in the first volume are described in this volume.

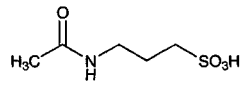
Despite the ready availability of laboratory-based literature searching, this resource is not exploited as much as it might be. One reason for this reluctance is, of course, that a computer search merely produces a listing of possibly relevant references. Tedious and time-consuming searches in the library are necessary to find the most relevant reference that can be turned into a practical analytical procedure in the searcher's own laboratory. The reference finally chosen will, naturally, depend on the individual circumstances, such as the matrix in which the drug is present and availability of equipment. This book circumvents this lengthy process by providing a number of abstracted and evaluated procedures for the analysis of each drug. The analyst can rapidly identify a relevant procedure and put it into practice.

In addition to the analytical matrix, other factors may be important when choosing an analytical procedure. Accordingly, we have noted such features of the analytical procedures as sensitivity, mode of detection, other compounds that interfere with the analysis, and other drugs that may be determined at the same time.

Readers familiar with our previous publications, *HPLC Methods for Pharmaceutical Analysis* (George Lunn and Norman R. Schmuff, John Wiley, New York, 1997) and *Handbook of Derivatization Reactions for HPLC* (George Lunn and Louise C. Hellwig, John Wiley, New York, 1998), will notice many similarities. The abstract structure is very similar and the philosophy that the procedures should be reproducible without reference to the original literature has been continued. Like the previous volumes, this book is also available on a CD in an electronic form. The software is new and hence the appearance on the computer screen is different but the ease of use has been retained. The CD contains all the data from the abovementioned pharmaceutical analysis book as well as the data from this volume, the data from the other two volumes of HPLC methods, and the volume of capillary electrophoresis methods that is being published simultaneously with this volume.

Contents

Acamprosate



Molecular formula: $C_5H_{11}NO_4S$
Molecular weight: 181.21
CAS Registry No.: 77337-76-9

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 2.97

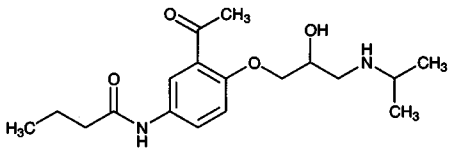
KEY WORDS

whole blood

REFERENCE

Gaillard,Y.; Pépin,G. Use of high-performance liquid chromatography with photodiode-array UV detection for the creation of a 600-compound library. Application to forensic toxicology, *J.Chromatogr.A*, **1997**, *763*, 149–163.

Acebutolol



Molecular formula: $C_{18}H_{28}N_2O_4$
Molecular weight: 336.43
CAS Registry No.: 37517-30-9
Merck Index: 16
Lednicer No.: 2 109

SAMPLE

Matrix: blood
Sample preparation: 200 μL Serum + 50 μL water + 500 μL MeCN, vortex for 1 min. Centrifuge at 6000 rpm for 10 min. Evaporate the supernatant to 200 μL at 40° under a stream of nitrogen, vortex for 30 s. Inject a 30-80 μL aliquot.

HPLC VARIABLES

Column: 100 × 8.0 4 μm Radial-pak Novapak C18
Mobile phase: MeCN:buffer 14:86 (Buffer was 2 g citric acid, 2 g sodium acetate, and 1 mL triethylamine in 1 L water.)
Flow rate: 2.5
Injection volume: 30-80
Detector: F ex 330 em 440

CHROMATOGRAM

Retention time: 7.4

OTHER SUBSTANCES

Extracted: norfloxacin, pefloxacin
Simultaneous: ciprofloxacin, lomefloxacin, ofloxacin

KEY WORDS

acebutolol is IS; serum

REFERENCE

Abanmi,N.; Zaghloud,I.; El Sayed,N.; al-Khamis,K.I. Determination of pefloxacin and its main active metabolite in human serum by high-performance liquid chromatography, *Ther.Drug Monit.*, **1996**, *18*, 158–163.

SAMPLE

Matrix: blood
Sample preparation: Add 1 mL 67 mM pH 7.4 phosphate buffer, 200 μL 1 M NaOH, and 6 mL MTBE to 1 mL plasma. Shake for 10 min, centrifuge at 1300 g at 4° for 5 min, freeze the aqueous layer in acetone/dry ice. Add 200 μL 10 mM HCl to the organic layer, shake for 10 min, centrifuge at 1300 g for 5 min. Freeze the aqueous layer, discard the organic phase, eliminate traces of the organic layer using a stream of cold air over the aqueous layer for 3-4 min. Thaw the aqueous layer, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Spherisorb hexyl
Mobile phase: MeCN:15 mM pH 3.5 KH_2PO_4 containing 0.05% triethylamine 45:55
Flow rate: 1
Injection volume: 20
Detector: UV 238

CHROMATOGRAM

Retention time: 3.3

Internal standard: acebutolol

OTHER SUBSTANCES
Extracted: celiprolol

KEY WORDS
plasma; acebutolol is IS

REFERENCE
Verbesselt,R.; Zugravu,A.; Tjandramaga,T.B.; De Schepper,P.J. Liquid chromatographic determination of total celiprolol or (S)-celiprolol and (R)-celiprolol simultaneously in human plasma, *J.Chromatogr.B*, **1996**, *683*, 231–236.

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 200 μL 1 M NaOH + 5 mL chloroform, vortex for 30 s, centrifuge at 1800 g for 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 200 μL 0.05% S-(+)-1-(1-naphthyl)ethylisocyanate in chloroform, vortex for 30 s, evaporate to dryness under reduced pressure, reconstitute with 200 μL chloroform, inject a 50-175 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Partisil 5 silica
Mobile phase: Hexane:chloroform:MeOH 60:38:2
Flow rate: 2
Injection volume: 50-175
Detector: F ex 220 em 345

CHROMATOGRAM
Retention time: 14.9 (R), 16.5 (S)
Internal standard: (±)-acebutolol

OTHER SUBSTANCES
Extracted: tocainide

KEY WORDS
plasma; derivatization; chiral; acebutolol is IS

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 100 μL 70 mM pH 7 phosphate buffer + 4 mL chloroform:isopentyl alcohol:diethyl ether 71.25:3.75:25, vortex for 30 s, centrifuge at 1800 g for 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 100 μL chloroform:triethylamine 100:1, add 100 μL 1% (S)-(+)-1-(1-naphthyl)ethyl isocyanate in chloroform, after 1 min add 50 μL 2% ethylchloroformate in chloroform, after 30 s add 50 μL 2.5% ethanolamine in chloroform, inject a 20-125 μL aliquot.

HPLC VARIABLES
Column: 100 × 8 4 μm Nova-Pak silica Radial Pak
Mobile phase: Hexane:chloroform:MeOH 64.5:33:2.5
Flow rate: 2
Injection volume: 20-125

Detector: F ex 245 em 420

CHROMATOGRAM
Retention time: 8.5, 9.5 (enantiomers)
Internal standard: acebutolol

OTHER SUBSTANCES
Extracted: lomefloxacin (F ex 280 em 470)

KEY WORDS
plasma; derivatization; chiral; normal phase; acebutolol is IS

SAMPLE
Matrix: blood
Sample preparation: 200 μL Plasma + 50 μL 50 mM pH 7.4 phosphate buffer + 500 μL 2% zinc sulfate in MeOH:water 50:50, mix, centrifuge at 13000 rpm for 5 min, inject an aliquot.

HPLC VARIABLES
Guard column: 40 × 4.6 SynChropak bulk support (Knauer)
Column: 120 × 4.6 5 μm Spherisorb ODS1 C18
Mobile phase: MeCN:MeOH:pH 4.5 acetate buffer (ratio not given)
Flow rate: 1
Detector: UV 233

CHROMATOGRAM
Retention time: 4.68

OTHER SUBSTANCES
Extracted: cyclopropane carboxylic acid ester prodrug

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 235

CHROMATOGRAM

Retention time: 3.80
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 233.4

CHROMATOGRAM

Retention time: 10.233

SAMPLE

Matrix: bulk

Sample preparation: Dissolve 10 μmole compound (as free base or hydrochloride) in 500 μL MeCN, add 250 μL 5% sodium carbonate (for hydrochlorides only), add 500 μL 100 mM reagent in MeCN, vortex for 1 min, heat at 60° for 2 h, add 100 μmole L-proline, heat at 60° for 30 min. Remove a 100 μL aliquot and dilute it with mobile phase, neutralize with acetic acid, inject a 10 μL aliquot. Prepare the reagent ((R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate) as follows. Add 0.7 mL carbon disulfide to 6 mL (1R,2R)-(-)-1,2-diaminocyclohexane, 12 mL water, and 12 mL EtOH, heat the oil bath to 80°, add 2.8 mL carbon disulfide dropwise (making sure that the product does not start to precipitate), when addition is complete reflux for 1 h, acidify with 500 μL 5 M HCl, reflux for 12 h, cool, filter, wash the solid with a little cold EtOH to give trans-4,5-tetramethyleneimidazolidine-2-thione as a white fluffy solid (mp 148-150°) (Tetrahedron 1993, 49, 4419). Stir 7.97 g 3,5-dinitrobenzoyl chloride in 30 mL dichloroethane at 50°, add a solution of 6 g trans-4,5-tetramethyleneimidazolidine-2-thione in 120 mL dichloroethane containing a catalytic amount of 4-(dimethylamino)pyridine over 15 min, reflux for 2 h, remove the crystals of (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate by filtration, evaporate the filtrate to dryness and dissolve the residue in 60 mL dichloroethane, reflux for 16 h to obtain more (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate (mp >250°, $[\alpha]_{546}$ = -133° (c = 1) in MeCN).

SAMPLE
Matrix: solutions
Sample preparation: 100 μL 55 mM N-Benzyloxycarbonyl-L-phenylalanine (N-CBZ-L-Phe) in dichloromethane + 100 μL 14 mM N,N-dimethylaminopyrine (dimethylaminopyridine (?)) in dichloromethane + 100 μL 9-acetylanthracene in dichloromethane, cool in an ice bath, add 500 μL of a solution of acebutolol in dichloromethane, add 100 μL 240 mM dicyclohexylcarbodiimide in dichloromethane, shake mechanically at 0° for 30 min, add 100 μL 1.06 M acetic anhydride in dichloromethane, shake mechanically at 30° for 15 min, add 1 mL MeOH, mix, inject an aliquot.

HPLC VARIABLES
Guard column: 10 μm Nova-Pak C18 precolumn
Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: MeOH:water 60:40
Flow rate: 1.3
Detector: UV 254

CHROMATOGRAM
Retention time: 14.13 (S), 15.74 (R)
Internal standard: 9-acetylanthracene (6.52)

KEY WORDS
derivatization; chiral

SAMPLE
Matrix: solutions
Sample preparation: Mix 20 μL of a 1 mM solution in MeOH or water with 50 μL pH 8 borate buffer and 50 μL 18 mM 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate in acetone, vortex, let stand at room temperature for 30 min, add 100 μL 10 mM trans-4-hydroxy-L-proline in water, mix, let stand for 2 min, add 2 mL dichloromethane, vortex for 30 s. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 100 μL mobile phase, inject an aliquot. Prepare 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate as follows. Stir 1.5 mmoles lithium aluminum hydride in THF, slowly add 2 mmoles (S)-naproxen in 20 mL anhydrous THF, reflux for 1 h, evaporate most of the solvent, cautiously add water with stirring, acidify with 6 N HCl,

extract three times with diethyl ether. Combine the organic layers and dry them over anhydrous sodium sulfate, evaporate to dryness, chromatograph on silica gel with dichloromethane:MeOH 100:2 (flash chromatography), evaporate eluate to dryness, dry under vacuum over KOH to give 2-(6-methoxy-2-naphthyl)propanol as a white solid (mp 92-3°). Stir 0.5 mmoles 2-(6-methoxy-2-naphthyl)propanol and 0.5 mmoles triethylamine in 10 mL dry toluene at 0°, add 1 mL 20% phosgene in toluene (Caution! Phosgene is highly toxic, perform reaction in a chemical fume hood!) (Fluka), stir for 4 h, filter, evaporate to dryness under reduced pressure, dry under vacuum to give 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate (mp 60°). Store under vacuum over phosphorus pentoxide at room temperature.)

HPLC VARIABLES

Column: 250 × 4 5 μm Zorbax-SIL
Mobile phase: n-Hexane:isopropanol 100:5
Flow rate: 1.5
Injection volume: 100
Detector: UV 230, F ex 270 em 365

CHROMATOGRAM

Retention time: k' 20.4, 21.9 (enantiomers)

SAMPLE

Matrix: urine
Sample preparation: 1 mL Urine + 10 mg β-glucuronidase/arylsulfatase (Helix pomatia, Sigma), heat at 37° overnight, add an equal volume of buffer, centrifuge at 2000 g for 5 min, inject an aliquot of the supernatant onto column A with mobile phase A and elute to waste. After 2.5 min backflush the contents of column A onto column B with mobile

phase B, monitor the effluent from column B. For gradient elution, after 15 min re-equilibrate both columns for 12.5 min before the next injection. For isocratic elution, remove column A from the circuit after 1.25 min, re-equilibrate column A for 1.5 min. (Buffer was 200 mM boric acid adjusted to pH 9.5 with 5 M NaOH.)

HPLC VARIABLES

Column: A 10 × 4.6 5 μm Spherisorb cyanopropyl; B 250 × 4.6 Capcell Pak C18 UG-120 (Shiseido)
Mobile phase: A water; B Gradient. MeCN:buffer from 3:97 to 30:70 over 30 min, to 40:60 over 8 min (for screening) or isocratic 22:78 (Buffer was 3.4 mL/L phosphoric acid adjusted to pH 3.0 with 5 M NaOH.)
Flow rate: A 1.25; B 1
Injection volume: 100
Detector: UV 235

CHROMATOGRAM

Retention time: 11.5 (gradient), 6 (isocratic)
Limit of detection: 250 ng/mL

OTHER SUBSTANCES

Extracted: (using gradient elution) metabolites, alprenolol, amphetamine, atenolol, bopindolol, codeine, ephedrine, labetalol, metoprolol, morphine, nadolol, oxprenolol, pindolol, propranolol
Interfering: timolol

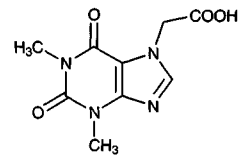
Acefylline



Molecular formula: $C_9H_{10}N_4O_4$
Molecular weight: 238.20
CAS Registry No.: 652-37-9, 837-27-4 (sodium salt)
Merck Index: 22

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 207.5

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 249.9

CHROMATOGRAM

Retention time: 10.763

KEY WORDS

whole blood

SAMPLE

Matrix: tissue

Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH and 5 mL water. Homogenize kidney with a kitchen grinder. Weigh out a 5 g sample and add 20 mL MeCN with continuous gentle mixing, mix vigorously on a vibromixer at 1500 rpm for 30 s, sonicate for 2 min, centrifuge at 4000 g for 5 min. Mix 7.5 mL sample extract and 40 mL 10% NaCl and add to SPE cartridge, wash with 1 mL 10 mM sulfuric acid, wash with 2 mL air, elute with 2 mL acidic MeCN. Place eluate in a washed tube and evaporate to 300 μL at 70° under a stream of nitrogen, mix gently, add 1 mL n-hexane, mix on a vibromixer for 30 s, centrifuge at 2000 g, inject a 50 μL aliquot of the aqueous phase. (Acidic MeCN was 1 mL 50 mM sulfuric acid and 100 mL MeCN. The washed tube was prepared by rinsing with concentrated ammonia, water, and acetone and drying under a stream of nitrogen.)

HPLC VARIABLES

Guard column: 10 × 2.1 37-50 μm Bondapak C18

Column: 300 × 3.9 Bondapak C18

Mobile phase: MeCN:water 55:45 containing 2.46 g/L anhydrous sodium acetate, pH adjusted to 6.5 with acetic acid

Flow rate: 1.2

Injection volume: 50

Detector: UV 240

CHROMATOGRAM

Retention time: 12

Limit of detection: 2 ng/g

OTHER SUBSTANCES

Extracted: azaperol, carazolol, xylazine, azaperone, haloperidol, propiomazine, chlorpromazine

KEY WORDS

SPE; pig; kidney

SAMPLE

Matrix: tissue

Sample preparation: Condition a Bond-Elut C18 SPE cartridge with 5 mL MeOH and 5 mL water. Cut pig kidney or liver into small pieces and homogenize. 5 g Homogenate + 10 mL MeCN, shake, vortex for 30 s, sonicate for 3 min, vortex for 30 s, sonicate for 3 min, centrifuge at 10000 g for 20 min. Add 7.5 mL supernatant + 40 mL 10% NaCl to the SPE cartridge at about 1 mL/min, do not allow cartridge to dry out, wash with 850 μL 10 mM sulfuric acid, dry with air, elute with 3.5 mL acidic MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 300 μL 10 mM sulfuric acid, vortex briefly, add 1 mL hexane, vortex for 30 s, centrifuge at 2000 g for 5 min, inject an aliquot of the aqueous layer. (Acidic MeCN was 1 mL 50 mM sulfuric acid in 100 mL MeCN.)

HPLC VARIABLES

Guard column: Hypersil 5 μm SAS C1

Column: 250 mm long 5 μm Hypersil SAS C1

Mobile phase: MeCN:water 50:50 containing 0.77 g/L ammonium acetate

Flow rate: 2

Detector: E, ESA Model 5100A Coulochem, first electrode +0.4 V, second electrode (which was monitored) +0.7 V, Model 5020 guard cell after pump but before injector at +0.75 V

CHROMATOGRAM

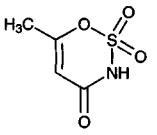
Acesulfame



Molecular formula: $C_4H_5NO_4S$
Molecular weight: 163.15
CAS Registry No.: 33665-90-6

SAMPLE

Matrix: beverages, sweetener
Sample preparation: Sweetener. Dissolve 30 mg powdered tabletop sweetener in water and dilute to 25 mL, filter (0.2 μm PTFE). Beverages. Dilute fruit juice 1:10 with water. Degas carbonated beverages in a ultrasonic bath for 5 min, dilute 1:10 with water, filter. Inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 50 × 4 Dionex IonPak AG4A-SC
Column: 250 × 4 Dionex IonPak AS4A-SC
Mobile phase: Gradient. A was 1 mM sodium carbonate. B was 12.5 mM sodium carbonate. A:B 100:0 for 4.5 min, from 100:0 to 0:100 over 1 min, maintain at 0:100 for 22.5 min, from 0:100 to 100:0 over 0.1 min
Flow rate: 1
Injection volume: 50
Detector: UV 190 for 6 min, UV 206 22 min, then UV 190; Conductivity, Dionex ED40 in conductivity mode preceded by a Dionex ASRS-I suppressor (external water mode, 300 mA)

CHROMATOGRAM

Retention time: 14
Limit of detection: 44 ng/mL (UV), 230 ng/mL (conductivity)

OTHER SUBSTANCES

Simultaneous: aspartame, saccharin

REFERENCE

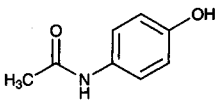
Acetaminophen



Molecular formula: $C_8H_9NO_2$
Molecular weight: 151.16
CAS Registry No.: 103-90-2
Merck Index: 45

SAMPLE

Matrix: bile, blood, gastric contents, tissue, urine
Sample preparation: Chop 5-g tissue and homogenize (Ultra Turrax T25) at 8500, 9500, 13500, 20500, and 24000 rpm for 1 min each. Add homogenate to 20 mL water. Dilute blood, urine, gastric contents, and bile four times with water. Mix 4 mL sample with 10 μL 200 μg/mL IS and 1 mL pH 7.4 phosphate buffer, vortex briefly, add 4 mL diethyl ether and mix for 15 min (Spiramix 10, Denley, UK). Separate the organic layer, add 4 mL diethyl ether to extraction sample, mix. Evaporate combined organic layers to dryness under a stream of dry air at 50°. Purify extracts by partition between 1 mL MeCN and 2 mL heptane, separate MeCN layer, evaporate it to dryness, reconstitute the residue in 1 mL MeOH and inject a 20 μL aliquot of the solution.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μm Apex II ODS
Column: 150 × 4.6 5 μm Apex II ODS
Mobile phase: MeCN:acetic acid:water 10:5:85
Flow rate: 1
Injection volume: 20
Detector: UV 255

CHROMATOGRAM

Retention time: 3.3
Internal standard: 2-acetoamidophenol (6.4)
Limit of quantitation: 2 μg/mL

KEY WORDS

SAMPLE
Matrix: blood
Sample preparation: Inject a 5-20 μL aliquot of serum directly.

HPLC VARIABLES
Column: 100 × 4.6 5-10 μm Silicalite (by sieving Silicalite, 3M Co.(?))
Mobile phase: MeCN:20 mM pH 6.9 phosphate buffer 5:95 (A) or Gradient. MeCN:20 mM pH 6.9 phosphate buffer from 5:95 to 20:80 over 2 min, to 25:75 over 2 min, to 30:70 over 4 min, to 50:50 over 2 min, maintain at 50:50 for 10 min (B)
Flow rate: 1
Injection volume: 5 (A), 20 (B)
Detector: UV 254

CHROMATOGRAM
Retention time: 4.99 (A), 6 (B)

OTHER SUBSTANCES
Extracted: barbital (B), carbamazepine (B), phenobarbital (B), phenytoin (B), primidone (B), sulfapyridine (B), theophylline (A),
Also analyzed: metabolites

KEY WORDS
serum

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 5.592

KEY WORDS
whole blood

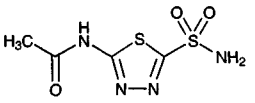
Acetazolamide



Molecular formula: $C_4H_6N_4O_3S_2$
Molecular weight: 222.25
CAS Registry No.: 59-66-5, 1424-27-7 (sodium salt)
Merck Index: 50
Lednicer No.: 1 249, 1 111

SAMPLE

Matrix: blood
Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 μL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 μL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES

Guard column: LC-8-DB (Supelco)
Column: 150 × 4.6 LC-8-DB (Supelco)
Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 2
Injection volume: 100
Detector: UV 228

CHROMATOGRAM

Retention time: 5.8
Internal standard: protriptyline (4)

OTHER SUBSTANCES

Extracted: chlordiazepoxide, chlorimipramine, chlorpromazine, desipramine, dextromethorphan, diazepam, diphenhydramine, doxepin, encainide, fentanyl, flecainide, fluoxetine, flurazepam, haloperidol, hydroxyethylflurazepam, ibuprofen, imipramine, lidocaine, maprotiline, methadone, methaqualone, mexiletine, midazolam, norchlorimipramine, nordoxepin, nordiazepam, nortriptyline, norverapamil, pentazocine, promazine, propafenone, propoxyphene, propranolol, protriptyline, quinidine, temazepam, trazodone, verapamil
Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin
Interfering: amitriptyline, norfluoxetine, trimipramine

KEY WORDS

plasma; SPE

SAMPLE
Matrix: blood, urine
Sample preparation: To 500 μL whole blood, plasma, or urine add 2.5 mL 50% ammonium sulfamate, vortex for 30 s. (Place the tube containing whole blood in boiling water for 30 s and then quickly in cold water.) Add 5 mL ethyl acetate, vortex, centrifuge at 3000 g for 10 min, transfer the organic layer to 5 mL pH 8.0 phosphate buffer, vortex, centrifuge at 3000 g for 10 min, transfer the organic layer to 500 μL pH 10.0 glycine buffer, vortex for 30 s, centrifuge at 3000 g for 5 min. Aspirate and discard the organic layer, add 500 μL ether to the remaining glycine buffer layer, vortex for 1 min, discard the ether phase. Vent the aqueous layer for about 30 min and inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Altima C18 (Alltech)
Mobile phase: MeCN:100 mM pH 4.0 sodium acetate 20:80
Flow rate: 1

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 µL 50 µg/mL β-hydroxyethyltheophylline in MeOH, inject 5 µL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 µm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)

Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 5

Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 4.30 (A); B (5.2)

Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))

Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, flumethiazide, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, methyclothiazide, benzthiazide, cyclothiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone

Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

SAMPLE

Matrix: urine

Sample preparation: Make 5 mL urine alkaline (pH 9-10), add 2 g NaCl, extract twice with 6 mL ethyl acetate. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 200 μL MeCN/water, inject a 10-20 μL aliquot.

HPLC VARIABLES

Column: 100 × 4 5 μm SGE 100 GL-4 C18P (Scientific Glass Engineering)

Mobile phase: MeCN:MeOH:water:trifluoroacetic acid 0.3:0.7:99:0.5

Flow rate: 0.8 or 1

Injection volume: 10-20

Detector: MS, ZAB2-SEQ (VG), PSP source coupled to LC, source 250°, probe 240-260°, scan m/z 200-550 or UV 270

CHROMATOGRAM

Retention time: 3.9

Limit of detection: <10 ng (by MS)

OTHER SUBSTANCES

Extracted: hydrochlorothiazide

REFERENCE

Ventura,R.; Fraisse,D.; Becchi,M.; Paisse,O.; Segura,J. Approach to the analysis of diuretics and masking agents by high-performance liquid chromatography-mass spectrometry in doping control, *J.Chromatogr.*, **1991**, *562*, 723–736.

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g NaH_2PO_4:Na_2HPO_4 99:1 + 0.5 g NaCl (final pH 5-5.5), add 4 mL ethyl acetate, extract in a mechanical agitator for 10 min. Remove the organic layer and add it to 2 mL 5% lead acetate, centrifuge at 1000 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, filter (15 mm nylon Teknokroma 0.45 μm filter), inject a 5 μL aliquot.

HPLC VARIABLES

Column: 250 × 45 μm HP-Hypersil ODS-C18

Mobile phase: Gradient. MeCN:buffer from 12:88 to 15:85 over 3 min, to 40:60 after another 2 min, maintain at 40:60 (Buffer was 3.45 g $NaH_2PO_4.H_2O$ in 500 mL water and 0.7 mL propylamine hydrochloride, pH adjusted to 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 5

Detector: UV 275

CHROMATOGRAM
Retention time: 5.4
Internal standard: β-hydroxyethyltheophylline (4.6)
Limit of detection: 8 ng/mL

OTHER SUBSTANCES
Simultaneous: theobromine, theophylline, 1,7-dimethylxanthine, caffeine

REFERENCE
Herráez-Hernández,R.; Campíns-Falcó,P.; Sevillano-Cabeza,A. Determination of acetazolamide in human urine samples by reversed-phase high-performance liquid chromatography in the presence of xanthines, *J.Chromatogr.*, **1992**, *582*, 181–187.

SAMPLE
Matrix: urine
Sample preparation: Buffer urine to 4.9 by mixing with an equal volume of pH 4.9 200 mM sodium phosphate buffer. Inject a 40 μL aliquot onto column A with mobile phase A, after 3 min backflush the contents of column A onto column B with mobile phase B and start the gradient. At the end of the run re-equilibrate for 10 min.

HPLC VARIABLES
Column: A 20 × 4 5 μm Hypersil octadecylsilica ODS; B 200 × 4.6 5 μm Shiseido SG-120 polymer-based C18
Mobile phase: A water; B Gradient. MeCN:buffer from 7:93 to 15:85 over 3.5 min, to 50:50 over 8.5 min, maintain at 50:50 for 11 min (Buffer was 6.9 g $NaH_2PO_4.H_2O$ in 1 L water, pH adjusted to 3.1 with phosphoric acid.)
Flow rate: 1
Injection volume: 40
Detector: UV 270

CHROMATOGRAM
Retention time: 9.8
Limit of detection: 1000 ng/mL

OTHER SUBSTANCES
Extracted: amiloride, bendroflumethiazide, benzthiazide, bumetanide, caffeine, carbamazepine, chlorothiazide, chlorthalidone, clopamide, dichlorfenamide, ethacrynic acid, furosemide, hydrochlorothiazide, metyrapone, probenecid, spironolactone, triamterene, trichlormethiazide

KEY WORDS
column-switching; optimum detection wavelengths vary for each drug

SAMPLE
Matrix: urine
Sample preparation: 5 mL Urine + 50 μL 100 μg/mL 7-propyltheophylline in MeOH + 200 μL ammonium chloride buffer + 2 g NaCl, extract with 6 mL ethyl acetate by rocking at 40 movements/min for 20 min and centrifuging at 800 g for 5 min, repeat extraction, combine organic layers, evaporate to dryness at 40° under a stream of nitrogen. Reconstitute in 200 μL MeCN:water 15:85 and inject 20 μL aliquots. (Ammonium chloride buffer was 28 g ammonium chloride in 100 mL water with the pH adjusted to 9.5 with concentrated ammonia solution.)

HPLC VARIABLES

Column: 75 × 4.6 3 μm Ultrasphere ODS
Mobile phase: Gradient. MeCN:100 mM ammonium acetate adjusted to pH 3 with concentrated phosphoric acid. From 10:90 to 15:85 over 2 min to 55:45 over 3 min to 60:40 over 3 min. Kept at 60:40 for 1 min, decreased to 10:90 over 1 min and equilibrated at 10:90 for 2 min.
Flow rate: 1
Injection volume: 20
Detector: UV 270

CHROMATOGRAM

Retention time: 2.2
Internal standard: 7-propyltheophylline (4.5)
Limit of detection: 2000 ng/mL

OTHER SUBSTANCES

Simultaneous: xipamide, bumetanide, amiloride, bendroflumethiazide, benzthiazide, buthiazide, caffeine, canrenone, chlorthalidone, clopamide, cyclothiazide, diclofenamide, ethacrynic acid, furosemide, hydrochlorothiazide, mesocarb, morazone, piretanide, polythiazide, probenecid, spironolactone, torsemide, triamterene

SAMPLE

Matrix: urine
Sample preparation: Inject a 5 μL aliquot directly onto column A with mobile phase A and elute to waste, after 0.3 min elute from column A onto column B with mobile phase A for 1.2 min then remove column A from the circuit and elute column B with mobile phase B, starting the gradient. Three minutes after the start change mobile phase A to MeCN:mobile phase A buffer 50:50 over 2 min to clean column A.

HPLC VARIABLES

Column: A 20 × 2.1 30 μm Hypersil ODS C18; B 125 × 4 5 μm HP-LiChrospher 100 RP 18
Mobile phase: A 3.45 g $NaH_2PO_4.H_2O$ in 500 mL water, pH adjusted to 3 with concentrated phosphoric acid; B Gradient. MeCN:water 0:100 for 2 min then to 50:50 over 2 min, maintain at 50:50
Injection volume: 5
Detector: UV 275

CHROMATOGRAM

Retention time: 5.27
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Noninterfering: caffeine, theophylline, theobromine, 1,7-dimethylxanthine

KEY WORDS

column-switching; heart-cut

REFERENCE

SAMPLE

Matrix: urine

Sample preparation: Direct injection into column A with mobile phase A for 1 min then back flush onto column B with mobile phase B.

HPLC VARIABLES

Column: A 20 × 2.1 30 μm Hypersil ODS-C18; B 250 × 4 5 μm Hypersil ODS-C18

Mobile phase: A Water; B Gradient. MeCN:buffer 15:85 for 1.5 min then to 80:20 over 8 min. Keep at 80:20 for 2.5 min then re-equilibrate with 15:85. (Buffer was 50 mM NaH_2PO_4 + 1.4 mL propylamine hydrochloride per liter adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 50

Detector: UV 230

CHROMATOGRAM

Retention time: 5.4

Limit of detection: 40 ng/mL.

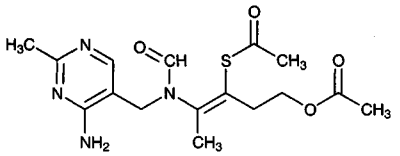
OTHER SUBSTANCES

Simultaneous: bumetanide, ethacrynic acid, amiloride, bendroflumethiazide, chlorthalidone, cyclothiazide, furosemide, hydrochlorothiazide, probenecid, spironolactone, triamterene

REFERENCE

Campíns-Falco,P.; Herráez-Hernández,R.; Sevillano-Cabeza,A. Column-switching techniques for screening of diuretics and probenecid in urine samples, *Anal.Chem.*, **1994**, *66*, 244–248.

Acetiamine



Molecular formula: $C_{16}H_{22}N_4O_4S$
Molecular weight: 366.44
CAS Registry No.: 299-89-8, 28008-04-0 (HCl)
Merck Index: 51

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 11.78

KEY WORDS

whole blood

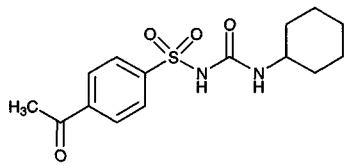
Acetohexamide



Molecular formula: $C_{15}H_{20}N_2O_4S$
Molecular weight: 324.40
CAS Registry No.: 968-81-0
Merck Index: 59
Lednicer No.: 1 138

SAMPLE

Matrix: blood, urine
Sample preparation: Dilute urine 5 times with water. 200 μL Plasma or diluted urine + 2 mL 100 mM pH 5.0 phosphate buffer + 5 mL cyclohexamide in benzene:ethyl acetate 1:1 (Caution! Benzene is a carcinogen!), shake, centrifuge at 3000 rpm for 20 min. Remove 4 mL of the organic layer and evaporate it to dryness under vacuum at 40°, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 Cosmosil 5 C18
Mobile phase: MeCN:0.2% acetic acid 50:50
Flow rate: 1.2
Injection volume: 20
Detector: UV 240

CHROMATOGRAM

Internal standard: cyclohexamide

OTHER SUBSTANCES

Extracted: metabolites, hydroxyhexamide

KEY WORDS

plasma; rat; guinea pig; rabbit

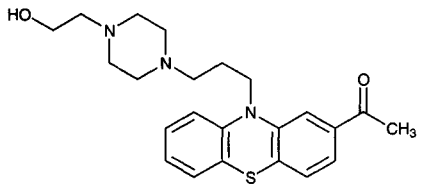
Acetophenazine



Molecular formula: $C_{23}H_{29}N_3O_2S$
Molecular weight: 411.57
CAS Registry No.: 2751-68-0, 5714-00-1 (dimaleate)
Merck Index: 70

SAMPLE

Matrix: blood
Sample preparation: 10 mL Plasma or whole blood + 1 mL 1 M NaOH, extract twice with 10 mL hexane for 30 min. Remove the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL 100 mM HCl, add 5 mL chloroform, vortex for 1 min, centrifuge. Remove a 4.5 mL aliquot of the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot. (It is implied, but not explicitly stated in the paper, that this extraction procedure works for this compound.)

HPLC VARIABLES

Column: 10 μm Micropak CN (Varian)
Mobile phase: MeCN:20 mM ammonium acetate 90:10
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 7.4
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Simultaneous: amitriptyline, benztropine, butaperazine, carphenazine, chlorpromazine, fluphenazine, haloperidol, imipramine, mesoridazine, nortriptyline, orphenadrine, piperacetazine, promazine, promethazine, thioridazine, thiothixene, trifluoperazine, trifluopromazine, trimeprazine
Interfering: trihexyphenidyl

KEY WORDS

plasma; whole blood

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)
Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25

Detector: UV 229

CHROMATOGRAM

Retention time: 9.83 (A), 4.89 (B)

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, antipyrine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butabarbital, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clonidine, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene, desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloperidol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen, ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, methadone, methdilazine, methocarbamol, methotrexate, methotrimeprazine, methoxamine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen, nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone, phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, salicylic acid, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terbutaline, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, xylometazoline, yohimbine, zopiclone

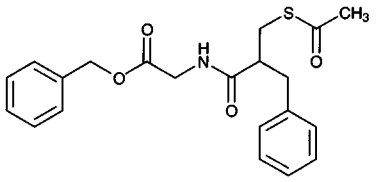
Acetorphan



Molecular formula: $C_{21}H_{23}NO_4S$
Molecular weight: 385.48
CAS Registry No.: 81110-73-8
Merck Index: 72

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 22.495

SAMPLE

Matrix: tissue
Sample preparation: Homogenize kidney in 30 volumes of 50 mM pH 7.4 Tris-HCl buffer (Ultra-Turrax homogenizer), filter through a GF/B filter presoaked in 0.3% polyethylenimine, wash filter three times with 4 mL 50 mM pH 7.4 Tris-HCl buffer. Extract filter with 1 mL EtOH, centrifuge extract, inject an aliquot.

HPLC VARIABLES

Column: μBondapak C18
Mobile phase: MeCN:100 mM pH 6.2 ammonium acetate 70:30
Flow rate: 1
Detector: UV 210

OTHER SUBSTANCES

Extracted: metabolites, thiorphan

KEY WORDS

mouse; kidney

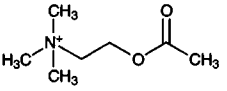
Acetylcholine



Molecular formula: $C_7H_{16}ClNO_2$ (chloride)
Molecular weight: 181.66 (chloride)
CAS Registry No.: 51-84-3, 60-31-1 (chloride), 66-23-9 (bromide)
Merck Index: 87

SAMPLE

Matrix: CSF, dialysate, tissue
Sample preparation: Dialysate. Inject dialysate directly. Tissue. Homogenize brain tissue with 10 volumes 100 mM perchloric acid (Potter-Elvehjem), let stand on ice for 15 min, centrifuge at 4000 g for 15 min, inject a 0.5 μL aliquot. CSF. Deproteinize by passing through a 0.02 μm Anatop 10 syringe filter (Alltech), inject a 0.5 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 100 × 1 PEEK column packed with Aminex A-9 (Bio-Rad)
Mobile phase: 200 mM pH 8.0 K/Na 3/1 phosphate buffer containing 5 mM NaCl and 0.1% Kathon CG
Column temperature: 25
Flow rate: 0.06 (obtained with a flow splitter)
Injection volume: 0.5
Detector: E, AMOR (Spark Holland), platinum working electrode + 250 mV, carbon composite auxiliary electrode, Ag/AgCl reference electrode, following post-column reaction. The column effluent flowed through a reactor which had 4 U acetylcholine esterase (EC 3.1.1.7 type VI-S from electric eel, 260 IU/mg) and 4 U choline oxidase (EC 1.1.3.17 from Alcaligenes sp., 12.7 IU/mg) enclosed between two 0.01 μm cellulose nitrate filters (Sartorius) (construction details given) to the detector.

CHROMATOGRAM

Retention time: 12
Limit of detection: 10 fmole

OTHER SUBSTANCES

Extracted: choline

SAMPLE

Matrix: blood
Sample preparation: Add neostigmine and ethylhomocholine to plasma or red blood cells. 150 μL Plasma or red blood cells + 1 mL 400 mM perchloric acid, let stand at 0-4° for 30 min, centrifuge at 5500 g for 1 min. Remove a 750 μL aliquot of the supernatant and add it to 36 μL 10 M potassium acetate, let stand at 0-4° for 5 min, centrifuge at 5500 g for 1 min, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 1.9 Chrompack reversed phase

Column: 100 × 3 Chromspher 5 C18 (Chrompack) (Prepare column by washing with MeOH, MeOH:water 50:50, water, and 5 mg/mL sodium laurylsulfate in water (each wash 20 min at 1 mL/min). Thoroughly wash pump with water (column off line), wash column with water for 5 min and mobile phase for 1 h. Column should be disconnected from the pre-column, reactor, and detector. [Chromatographia, 1987,24,827].)
Mobile phase: 200 mM pH 8.0 potassium phosphate buffer containing 5 mM KCl
Flow rate: 0.6
Injection volume: 100
Detector: E, Spark Holland Amor, Pt working electrode +500 mV, carbon composite auxiliary electrode, Ag/AgCl reference electrode following an enzyme reactor. (Reactor was a 10 × 2.1 Hypersil APS-2 column, activate with glutaraldehyde, equilibrate with mobile phase for 20 min. Inject 80 U acetylcholine esterase (EC 3.1.1.7, type VI-S from electric eel, 260 IU/mg) and 40 U choline oxidase (EC 1.1.3.17 from Alcaligenes sp., 12.7 IU/mg) in 500 μL mobile phase onto the reactor and pump through at 0.05 mL/min for 20 min with mobile phase. [Chromatographia, 1987,24,827])

CHROMATOGRAM
Retention time: 9
Internal standard: ethylhomocholine (5)
Limit of detection: 10 nM

OTHER SUBSTANCES
Extracted: choline

KEY WORDS
plasma; red blood cells; human; mouse

SAMPLE
Matrix: dialysate
Sample preparation: Inject a 10 μL aliquot of dialysate onto a 55 × 1 reactor containing immobilized choline oxidase and catalase (BAS). (The enzymes destroy choline but not acetylcholine. Acetylcholine is eluted from the reactor onto the analytical column.)

HPLC VARIABLES
Column: 530 × 1 10 μm ACh (BAS)
Mobile phase: 28 mM pH 8.5 Na_2HPO_4 containing 0.5% of 1% Kathon antimicrobial solution (BAS)
Flow rate: 0.1
Injection volume: 10
Detector: E, Pt electrode +0.5 V, Ag/AgCl reference electrode following post-column reaction. The column effluent flowed through a 50 × 1 reactor packed with immobilized acetylcholine oxidase and choline oxidase (BAS) to the detector. (Acetylcholine was converted to hydrogen peroxide which was then detected.)

SAMPLE
Matrix: tissue
Sample preparation: Homogenize brain tissue with 3 mL 400 mM perchloric acid containing 2 nmoles ethylhomocholine, centrifuge at 35000 g for 20 min, adjust pH of supernatant to about 4.2 with about 200 μL 7.5 M potassium acetate, centrifuge at 35000 g for 20 min. Add the supernatant to 100 μL 5 mM tetramethylammonium chloride, add 3 mL 2% ice-cold reineckate solution, let stand on ice for 1 h, centrifuge at 1000 g at 0° for 10 min. Remove the supernatant and dry the precipitate under vacuum overnight, add about 1 mL 5 mM silver tosylate in MeCN until the pink color disappears, centrifuge at 1000 g at 0° for 10 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 200 μL 20 mM pH 3.5 citrate-phosphate buffer, inject an aliquot. Alternatively (for acetylcholinme only), homogenize brain tissue with 400 μL 20 mM pH 3.5 citrate-phosphate buffer, add 4.8 nmoles ethylhomocholine, boil for 10 min, add 40 μL 250 mM zinc sulfate while vortexing, add 40 μL 250 mM barium hydroxide while vortexing, centrifuge at 35000 g for 15 min, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Guard column: ODS-5 (Bio-Rad)
Column: 150 mm long Bio-Sil ODS-5S (Bio-Rad)
Mobile phase: Buffer (Buffer was 10 mM sodium acetate buffered to pH 5 with 20 mM citric acid, containing 4.5 mg/L sodium octyl sulfate and 1.2 mM tetramethylammonium chloride.)
Flow rate: 0.8
Injection volume: 20
Detector: E, Bio Analytical Systems LC-4A, Pt electrode +0.5 V, Ag/AgCl reference electrode following post-column reaction detection. The column effluent mixed with 1 U/mL choline oxidase and 2 U/mL acetylcholinesterase in 200 mM pH 8.5 phosphate buffer pumped at 0.5 mL/min, the mixture flowed through a 30 m × 0.3 mm i.d. PTFE tube (2.5 min) to the detector

CHROMATOGRAM

SAMPLE
Matrix: tissue
Sample preparation: Sonicate 250 mg rat brain tissue with 6 mL 1 M formic acid containing 10 nmoles IS for 5 min, centrifuge at 4° at 10000 g for 20 min, add the supernatant

to an equal volume of diethyl ether, add 5 mL water, shake, centrifuge at 2000 g for 5 min, discard the organic layer. Lyophilize the aqueous layer, dissolve the residue in 400 μL water, filter (0.45 μm). Add 30 μL reagent to the filtrate, mix, centrifuge at 10000 g for 5 min. Dissolve the precipitate in 300 μL water, add 50 mg Dowex 1x8, shake, centrifuge at 10000 g for 5 min, inject a 10 μL aliquot of the supernatant. (Reagent contained 20% KI and 18% iodine in water.)

HPLC VARIABLES

Column: 150 × 4.6 Nucleosil C18

Mobile phase: Buffer (Prepare buffer by dissolving 1.36 g sodium acetate. 3.72 disodium EDTA, 25 mg sodium octyl sulfate, and 1.2 mmoles tetramethylammonium chloride in 900 mL water, adjust pH to 5.0 with 200 mM citric acid, make up to 1 L.)

Column temperature: 37

Flow rate: 0.8

Injection volume: 10

Detector: E, Bioanalytical Systems LC-4B/17, TL-10A platinum electrode +500 mV, Ag/AgCl reference electrode following post-column reaction. The effluent from the column mixed with buffer pumped at 0.5 mL/min and the mixture flowed through an immobilized enzyme reactor to the detector. (Prepare buffer by dissolving 71.6 g $Na_2HPO_4.12H_2O$ and 372 mg disodium EDTA in 900 mL water, adjust pH to 8.5 with NaH_2PO_4, make up to 1 L. Prepare reactor by heating 200-400 mesh porous glass beads (pore size 400 Å, Electronucleonics, Fairfield NJ) in 5% nitric acid, wash with water, dry, add to 10% 3-aminopropyltriethoxysilane in toluene, reflux overnight. Suspend the beads in 2% glutaraldehyde in water at room temperature for 2 h. Dissolve 0.45 mg acetylcholinesterase (type III, EC.3.1.1.7, Sigma) and 16.6 mg choline oxidase (EC.1.1.3.17, Sigma) in 200 μL 50 mM pH 7.0 phosphate buffer containing 10 mM disodium EDTA, add 500 mg activated beads, pack in a 10 × 4 tube.)

CHROMATOGRAM

Retention time: 10

Internal standard: ethylhomocholine (Prepare ethylhomocholine by adding 3-dimethylamino-1-propanol to EtOH, add bromoethane. When reaction is complete add ether, filter off the precipitate and wash it with ether.) (8)

Limit of detection: 100 fmoles

OTHER SUBSTANCES

Extracted: choline

KEY WORDS

post-column reaction; rat; brain; immobilized enzyme reactor

REFERENCE

Asano,M.; Miyauchi,T.; Kato,T.; Fujimori,K.; Yamamoto,K. Determination of acetylcholine and choline in rat brain tissue by liquid chromatography/electrochemistry using an immobilized enzyme post column reactor, *J.Liq.Chromatogr.*, **1986**, *9*, 199–215.

SAMPLE

Matrix: tissue

Sample preparation: Sonicate rat brain with ten volumes of 1 M formic acid:acetone 15:85 containing IS, centrifuge at 4° at 20000 g. Remove a 500 μL aliquot of the supernatant and add it to 2 mL heptane:chloroform 80:10, vortex. Remove the aqueous layer and add it to 250 μL 3 mg/mL sodium tetraphenylboron in 3-heptanone, vortex. Remove a 200 μL aliquot of the upper organic layer and add it to 50 μL 1 M HCl, vortex. Remove the aqueous layer and evaporate it to dryness under reduced pressure, reconstitute with mobile phase, inject a 30 μL aliquot.

HPLC VARIABLES

Guard column: C18 (Waters)

Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: 100 mM pH 7 KH_2PO_4 containing 10 μg/mL sodium octane sulfate and 600 μg/mL tetramethylammonium chloride
Flow rate: 1
Injection volume: 30
Detector: E, Chromatofield, Pt electrode +0.5 V following post-column reaction. The column effluent flowed through an immobilized enzyme reactor to the detector. (Prepare reactor by heating 200-400 mesh porous glass beads (pore size 350 Å, Sigma) in 5% nitric acid at 100° for 1 min, wash with water, dry, add to 10% 3-aminopropyltriethoxysilane in toluene, heat at 115° for 12 h. Suspend the beads in 2% glutaraldehyde in water at room temperature for 2 h. Dissolve 100 U acetylcholinesterase (type III, electric eel, Sigma) and 100 U choline oxidase (Alcaligenes, Sigma) in 1 mL 50 mM pH 7 phosphate buffer, add 120 mg activated beads, shake periodically, pack in a 20 × 2 tube.)

CHROMATOGRAM

Retention time: 9.5
Internal standard: ethylhomocholine bromide (Prepare ethylhomocholine by adding 3-dimethylamino-1-propanol to EtOH, add bromoethane, when reaction is complete add ether, filter off the precipitate and wash it with ether.) (7)

OTHER SUBSTANCES

Extracted: choline

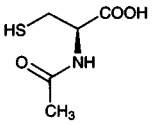
Acetylcysteine



Molecular formula: $C_5H_9NO_3S$
Molecular weight: 163.20
CAS Registry No.: 616-91-1
Merck Index: 89

SAMPLE

Matrix: blood

Sample preparation: Add 90 μL cold 10% trichloroacetic acid (containing 1 mM disodium EDTA) to 10 μL blood. Centrifuge at 1850 g at 0° for 5 min. Dilute a 10 μL aliquot of the supernatant with 2 mL water. Mix a 200 μL aliquot of the supernatant with 100 μL 100 μM o-phthalaldehyde reagent and 100 μL 200 μM N-(4-aminobutyl)-N-ethylisoluminol reagent, vortex thoroughly. Let stand for about 2 min. Inject a 20 μL aliquot of the reaction mixture. (Prepare reagents as follows. Dissolve o-phthalaldehyde in 50 mM pH 9.0 sodium borate buffer containing 100 mM potassium dihydrogen phosphate to give a 100 μM solution. Prepare a 1 mM solution of N-(4-aminobutyl)-N-ethylisoluminol (chemiluminescence-grade, Tokyo Kasei) in MeOH containing 5 mM HCl. Dilute with MeOH to give a 200 μM solution.)

HPLC VARIABLES

Guard column: 4 × 4 5 μm LiChrosorb RP-18
Column: 150 × 4.6 5 μm Cosmosil 5C18-AR (Nacalai Tesque)
Mobile phase: MeOH:THF:100 mM pH 7.5 phosphate buffer 25:5:70
Flow rate: 1
Injection volume: 20
Detector: Chemiluminescence, TOA Electronics ICA-3070 detector following post-column reaction. The column effluent mixed with 150 mM hydrogen peroxide pumped at 0.2 mL/min and 25 μM hematin in 150 mM sodium carbonate buffer pumped at 3 mL/min and this mixture flowed through a 200 × 0.5 mm PTFE reaction coil to the detector.

CHROMATOGRAM

Retention time: k' 3.1

SAMPLE

Matrix: blood, tissue
Sample preparation: Tissue. Homogenize (Potter-Elvehjem PTFE-glass homogenizer) tissue in 20 mM EDTA, adjust to 1% (w/v) (kidney) or 2.5% (w/v) (spleen). Remove 100 μL of this solution and add it to 400 μL 100 mM pH 8.5 borate buffer, add 300 μL 0.24 mM N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide in MeCN, add 200 μL IS, heat at 60° for 30 min, cool for 5 min, centrifuge at 4° at 2000 g for 15 min, filter (Millipore 2 μm) the supernatant, inject a 20 μL aliquot of the supernatant. Plasma. Dilute rat plasma to 20% (v/v) with 20 mM EDTA. Remove 100 μL of this solution and add it to 400 μL 100 mM pH 8.5 borate buffer, add 300 μL 0.24 mM N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide in MeCN, add 200 μL IS, heat at 60° for 30 min, cool for 5 min, centrifuge at 4° at 2000 g for 15 min, filter (Millipore 2 μm) the supernatant, inject a 20 μL aliquot of the supernatant. Serum. Dilute human serum to 10% (v/v) with 20 mM EDTA. 1 mL Diluted serum + 200 μL 30% metaphosphoric acid, centrifuge at 2000 g at 4° for 20 min. Remove 500 μL of the supernatant and add it to 240 μL 2 M KOH. Remove 100 μL of this solution and add it to 400 μL 100 mM pH 8.5 borate buffer, add 300 μL 0.24 mM N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide in MeCN, add 200 μL IS, heat at 60° for 30 min, cool for 5 min, centrifuge at 4° at 2000 g for 15 min, filter (Millipore 2 μm) the supernatant, inject a 20 μL aliquot of the supernatant. (Synthesis of N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide is as follows. Add 8.8 g aluminum trichloride to 12.50 g 3-dimethylaminophenol in 185 mL chloroform and 84 g triethyl orthoformate, mix at room temperature for 10 min, when the exothermic reaction ceases add 50 mL 10% HCl, stir to hydrolyze the acetal, neutralize with 10% NaOH, filter through a short column of Celite, wash through with chloroform, wash the filtrate with saturated aqueous NaCl, dry over magnesium sulfate, concentrate under reduced pressure, recrystallize from chloroform to give 4-(dimethylamino)salicylaldehyde (mp 78-79°). Add 400 mg KOH in 3 mL EtOH to a solution of 1 g 4-(dimethylamino)salicylaldehyde and 1.3 g (?) 4-nitrobenzylbromide in 12 mL EtOH, reflux for 7 h, cool, filter to recover the crystals, wash with water, dry under vacuum, recrystallize from EtOH to give 4-dimethylamino-2-(4-nitrobenzyloxy)benzaldehyde (mp 179-180°). Add a solution of 900 mg 4-dimethylamino-2-(4-nitrobenzyloxy)benzaldehyde in 6 mL DMF to a sodium methoxide

solution (prepared from 69 mg sodium in 1 mL MeOH), reflux for 20 min, add 1 mL MeOH, filter the crystals, recrystallize from EtOH to give 6-dimethylamino-2-(4-nitrophenyl)benzofuran as red needles (mp 209.5-210.5°). Reflux 1 g 6-dimethylamino-2-(4-nitrophenyl)benzofuran in 20 mL benzene (Caution! Benzene is a carcinogen!) and 18 mL MeOH containing 80 mg active carbon and a catalytic amount of ferric chloride hexahydrate for 10 min, add 2.30 g 98% hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) dropwise, reflux for 7 h, filter, concentrate the filtrate, recrystallize from cyclohexane to give 6-dimethylamino-2-(4-aminophenyl)benzofuran as orange needles (mp 198.5-200°). Stir 605 mg 6-dimethylamino-2-(4-aminophenyl)benzofuran and 230 mg maleic anhydride in 5 mL chloroform at room temperature for 3 h, filter the crystals, wash with a small amount of chloroform, recrystallize from EtOH to obtain N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleamic acid (mp 219.5-221°). Reflux a mixture of 1.17 g N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleamic acid and 30 mg sodium acetate in 18 mL acetic anhydride, cool in an ice bath, collect the crystals of product, wash with water. Neutralize the filtrate with 20% NaOH, extract twice with 30 mL portions of chloroform, wash the organic layers with saturated aqueous NaCl, dry over anhydrous magnesium sulfate, evaporate to give more product. Combine the products and recrystallize them from acetone to give N-[4-(6-dimethylamino-2-benzofuranyl)phenyl]maleimide as reddish purple crystals (mp 203-204°) (Bull.Chem.Soc.Jpn. 1985, 58, 2192).)

HPLC VARIABLES

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. Condition CF50A Centriflo ultrafiltration cones (Amicon) by immersing in water for 1 h and centrifuging at 1000 g for 5 min. 3 mL Plasma + 1 mL water + 500 μL 5 mg/mL dithiothreitol, vortex for 10 s, incubate at 37° for 30 min, add 1 mL 2% sodium bicarbonate, add 350 μL 5% 2,4-dinitro-1-fluorobenzene in EtOH, vortex for 10 s, incubate at 60° for 30 min, place in ultrafiltration cone, centrifuge at 1000 g at 20° for 20 min. Remove 1 mL of the ultrafiltrate and add it to 5 mL water and 10 mL ether, shake mechanically in the dark at 250 cycles/min for 5 min, centrifuge at 1000 g at 10° for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 75 μL mobile phase. Urine. 100 μL urine + 1 mL water + 500 μL 5 mg/mL dithiothreitol, vortex for 10 s, incubate at 37° for 30 min, add 1 mL 2% sodium bicarbonate, add 350 μL 5% 2,4-dinitro-1-fluorobenzene in EtOH, vortex for 10 s, incubate at 60° for 30 min. Remove 1 mL and add it to 5 mL water and 10 mL

ether, shake mechanically in the dark at 250 cycles/min for 5 min, centrifuge at 1000 g at 10° for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 1 mL mobile phase.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: MeOH:50 mM trisodium citrate and 1 mM EDTA adjusted to pH 7.0 with citric acid solution 30:70 (plasma) or 35:65 (urine)
Flow rate: 1
Injection volume: 50
Detector: UV 360

CHROMATOGRAM
Retention time: 13
Limit of detection: 50 ng/mL

KEY WORDS
plasma; derivatization; ultrafiltration

SAMPLE

Matrix: solutions
Sample preparation: Mix 1 mL of a 2 μM solution of thiols in 100 mM pH 8.0 sodium borate buffer containing 2 mM disodium EDTA with 1 mL 1 mM ABD-F in 100 mM pH 8.0 sodium borate buffer, vortex, heat at 50° for 5 min, cool in ice, add 600 μL 100 mM HCl, inject a 10 μL aliquot. (Synthesis of ABD-F is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is

a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°). Add 1 g CBD-F dropwise to 100 mL 6% ammonium hydroxide, neutralize with 10% HCl, evaporate under reduced pressure, add 200 mL MeCN to the residue, filter. Evaporate the filtrate and chromatograph on a 300 × 20 column of 100-200 mesh silica with chloroform, collect the appropriate fractions and evaporate them to give ABD-F (4-(aminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole) as white needles (mp 145-6°) after recrystallization from n-hexane/benzene (Caution! Benzene is a carcinogen!).

SAMPLE

Matrix: solutions

Sample preparation: Mix 400 μL 2.5 μg/mL acetylcysteine in buffer with 100 μL 55 μg/mL N-(ferrocenyl)maleimide in acetone, let stand at 0° for 30 min, wash with three 2 mL portions of diethyl ether:hexane 50:50, inject an aliquot of the aqueous layer. (Buffer was 67 mM pH 6.8 phosphate buffer containing 1 mM EDTA. Prepare N-(ferrocenyl)maleimide as follows. Stir 13 g ferrocene in 200 mL anhydrous THF at -30° under nitrogen, add 160 mL 1.3 M butyllithium in ether dropwise over 25 min, stir at 0° for 2 h, stir at room temperature for 4 h. Stir at -20° and add 10.3 g methoxylamine in 75 mL anhydrous ether dropwise over 30 min, allow to warm gradually to room temperature, stir for 4 h, slowly add 10% HCl with stirring until the pH of the aqueous layer is 2, discard the organic layer. Make the aqueous layer strongly basic with KOH, extract with ether, extract the ether layer with 2 M HCl. Make the aqueous layer basic with KOH, extract with ether, dry over anhydrous magnesium sulfate, evaporate to dryness, recrystallize from ether/petroleum ether to obtain ferrocenylamine (8%, mp 140-145°) (J. Org. Chem. 1959, 24, 1487). Dissolve 300 mg ferrocenylamine in the minimum amount of chloroform, add 150 mg maleic anhydride in a little chloroform. Collect the compound that crystallizes and heat 300 mg with 1.5 g acetic anhydride and 60 mg anhydrous sodium acetate at 50-60° for 3 h with the exclusion of moisture (Chem. Zvesti 1963, 17, 21), recrystallize the product from diethyl ether to give N-(ferrocenyl)maleimide as deep purple prisms (mp 151-152°).

HPLC VARIABLES

Column: 150 × 4.6 5 μm YMC-GEL C8 (Yamamura, Kyoto)

SAMPLE
Matrix: solutions
Sample preparation: 1 mL Solution + 300 μL reagent solution, let stand at room temperature for 20 min, add 500 μL 300 mM phosphoric acid solution, make up to 10 mL with water, inject a 50 μL aliquot. (Prepare the reagent solution by dissolving 3.5 mg methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate in 10 mL THF, make up to 25 mL with pH 7.5 borate buffer. Prepare methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate as follows. Dissolve 5 g 6'-methoxy-2'-acetonaphthone in warm glacial acetic acid and add 2.5 g glyoxylic acid, reflux for 24 h, evaporate to dryness under reduced pressure. Take up the residue in chloroform and extract it three times with 5% sodium carbonate solution. Combine the aqueous layers and acidify them with concentrated HCl, collect the product by filtration, recrystallize from MeOH/water or acetic acid to give 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoic acid (mp 167-9°) (Farmaco, Ed. Sci. 1982, 37, 171). Reflux 0.5 g 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoic acid, 2.5 mL MeOH, and 2-3 drops sulfuric acid in 25 mL anhydrous benzene (Caution! Benzene is a carcinogen!) for 1 h, add 20 mL water, wash the organic layer with 10 mL 5% sodium bicarbonate solution, wash the organic layer with 20 mL water. Dry the organic layer over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, purify by flash chromatography on silica gel using ethyl acetate:light petroleum (bp 40-70°) 40:60 to give methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate as a pale yellow compound (mp 116-120°).)

SAMPLE
Matrix: solutions
Sample preparation: Mix 250 μL of a solution in 50 mM pH 9.3 borate buffer containing 1 mM disodium EDTA with 250 μL 1 mM SAOX-Cl in MeCN, let stand in the dark at room temperature for 1 h, add 500 μL MeCN:1 M HCl 50:50, inject an aliquot. (Prepare SAOX-Cl as follows. Gently reflux 21 g benzoin and 45 g urethane (Caution! Urethane is a carcinogen!) in 300 mL DMF for 6 h, cool, pour into water, filter, recrystallize to give 4,5-diphenyl-2-oxazolone (mp 211°) (Ber. 1956, 89, 1749). Carefully add 60 mL dimethylsulfamoyl chloride (?) to 7.3 g 4,5-diphenyl-2-oxazolone at 0°, heat at 55-60° for 4 h, cool, add dropwise to 500 g ice-water, filter, wash the solid with 4 L water. Add 100 mL dry benzene (Caution! Benzene is a carcinogen!) to 2 g of the crude material (4,5-bis(p-N,N-dimethylaminosulfonylphenyl)-2-oxazolone) and evaporate to dryness to remove traces of moisture, suspend the residue in 30 mL phosphorus oxychloride, stir at 0°, add 610 μL triethylamine dropwise, heat at 100° for 7 h, remove excess phosphorus oxychloride using a rotary evaporator. Dissolve the residue in dichloromethane and wash with cold saturated sodium bicarbonate, dry the organic layer over anhydrous magnesium sulfate, evaporate to dryness, chromatograph on 100 g silica gel with dichloromethane:ethyl acetate 90:10 to give SAOX-Cl (2-chloro-4,5-bis(p-N,N-dimethylaminosulfonylphenyl)oxazole) as a white solid (mp 222-224°) (Analyst 1993, 118, 257).)

SAMPLE

Matrix: urine

Sample preparation: Mix 5 mL urine with 200 μL 130 mM disodium EDTA, adjust pH to 9.8-10.0 with 5 M ammonia, make up to 6 mL with water, add 1 mL thiopropyl-Sepharose 6-B suspension, shake mechanically for 30 min, acidify to pH 3.5-4.0 with 1 mL 4 M acetic acid, centrifuge, add a 3-5 mL aliquot of the supernatant (containing up to 2 μmoles thiol) to a 13 × 7 p-acetoxymercurianiline Sepharose 4-B column, wash with 2 mL water, elute with 3 mL 10 mM cysteine hydrochloride. Add the eluate to a 25 × 5 column of 100-200 mesh AG 50 W-X8 (hydrogen form, Bio-Rad), elute with 1 mL 10 mM HCl, collect all the effluent (Clin. Chim. Acta 1979, 95, 189), add 200 μL 180 mM disodium EDTA. Remove a 250 μL aliquot and neutralize it with 25 μL 100 mM NaOH, add 5 mL 50 mM pH 9.0 carbonate buffer containing 10 mM disodium EDTA, add 500 μL 500 μM N-(7-dimethylamino-4-methyl-3-coumarinyl)maleimide in acetone, heat at 37° for 20 h, dilute 1:5 with mobile phase, inject a 100 μL aliquot. (Thiopropyl-Sepharose 6-B suspension contains 20 μmoles thiol/mL. Before use convert to free thiol form with dithiothreitol according to the manufacturer's instructions. Prepare p-acetoxymercurianiline-Sepharose 4B as follows. Mix 100 g Sepharose 4B with an equal volume of water, for each 1 mL Sepharose add 100 mg cyanogen bromide in an equal volume of water, adjust pH to 11 with 4 M NaOH, maintain at pH 11 with 4 M NaOH (Proc. Natl. Acad. Sci. USA 1968, 61, 636), at the end of the reaction (about 8 min), wash with 1.5 L 100 mM pH 9.0 sodium bicarbonate. Suspend in 100 mL DMSO:water 10:90 at 0°, slowly add 1.3 g 4-aminophenylmercuric acetate in 20 mL DMSO, stir slowly at 0° for 20 h, warm to 30°, filter, resuspend in 130 mL DMSO:water 20:80 at 35° for 5 min, filter, repeat this procedure 4 times, pack in a column, slowly wash with DMSO:water 20:80 until no mercury appears in the effluent (about 500 mL), store as a slurry in DMSO:water 20:80 (Biochim. Biophys. Acta 1970, 200, 593).)

HPLC VARIABLES

Column: 250 × 4 5 μm LiChrosorb RP-8

Mobile phase: MeOH:buffer 15:85 (Buffer was 2 mM sodium phosphate buffer containing 11.8 mM tetramethylammonium hydroxide, pH adjusted to 7.4 with 6 M HCl.)

Flow rate: 0.75

Injection volume: 100

Detector: F ex 400 em 480

CHROMATOGRAM

Retention time: 20

Limit of detection: 53 fmole

OTHER SUBSTANCES

Extracted: mercaptoacetate

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg methyl-C1 Accubond SPE cartridge (J&W) with three 1 mL portions of MeOH and three 1 mL portions of 1% ammonium acetate. 500 μL Plasma + 20 μL MeCN containing 10 mM BHT + 1 mL 10 mM BHT in isopropanol, vortex, rotate for 15 min, centrifuge at 16000 g for 10 min. Remove the supernatant and add it to 11 mL 1% ammonium acetate, add to the SPE cartridge, wash with 1 mL 0.1% ammonium acetate, wash with 1 mL MeOH:0.1% ammonium acetate 50:50, dry under vacuum for 30 s, elute with 1.5 mL 10 mM BHT in MeCN. Add 10 μL pentafluorobenzyl bromide and 10 μL 10 mg/mL potassium carbonate in MeCN:water 50:50 to the eluate, vortex, let stand at room temperature for 1 h, evaporate to dryness under reduced pressure for 2 h, reconstitute with 20-100 μL 10 mM BHT in MeCN, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 Nova-Pak C18 + 75 × 3.9 Nova-Pak C18 (in series)

Mobile phase: Gradient. MeCN:buffer 80:20 for 10 min, to 90:10 (step gradient). (Buffer was 100 mM ammonium acetate adjusted to pH 5.0 with acetic acid.)
Column temperature: 40
Injection volume: 20
Detector: UV 369, MS Hewlett-Packard model 5988A, particle beam interface nebulizer 60°, helium 35 psi, m/z 325

CHROMATOGRAM
Retention time: 16
Internal standard: acitretin

OTHER SUBSTANCES
Extracted: isotretinoin (m/z 299), tretinoin (m/z 299), 9-cis-retinoic acid (m/z 299)

KEY WORDS
plasma; protect from light; derivatization; SPE; acitretin is IS

REFERENCE
Lehman,P.A.; Franz,T.J. A sensitive high-pressure liquid chromatography/particle beam/mass spectrometry assay for the determination of *all-trans*-retinoic acid and 13-*cis*-retinoic acid in human plasma, *J.Pharm.Sci.*, **1996**, *85*, 287–290.

SAMPLE
Matrix: blood, tissue
Sample preparation: Plasma. 300-1000 μL Plasma + 100 μL pH 7 Titrisol buffer + IS in MeOH + 2 mL diethyl ether:ethyl acetate 1:1, extract. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 25°, reconstitute the residue in 30-50 μL MeOH, inject an aliquot. Tissue. Add IS, homogenize skin sample with 6 mL ethyl acetate:diethyl ether 1:1 with an 8 mm cutter at 24000 rpm below 21° (Ultra Turrax T25), centrifuge at 2000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen below 21°, reconstitute the residue in 30-50 μL, inject an aliquot. (Protect all samples from light.)

HPLC VARIABLES
Column: 250 × 4.2 5 μm Nucleosil C18
Mobile phase: MeOH:MeCN:1.5% acetic acid 59.5:25.5:15
Flow rate: 1.2
Detector: UV 350

CHROMATOGRAM
Retention time: 6 (13-cis), 6.9 (all-trans)
Internal standard: arotinoid methyl sulfone (Ro 15-1570) (7.8)
Limit of quantitation: 1 ng/mL

KEY WORDS
plasma; skin

REFERENCE

SAMPLE
Matrix: culture media
Sample preparation: 100 μL Culture media + 200 μL ice-cold EtOH, mix thoroughly, let stand for 15 min, centrifuge at 12000 g for 15 min, inject an aliquot of the supernatant.

HPLC VARIABLES
Guard column: Whatman CO:PELL ODS guard column
Column: 100 × 8 5 μm Nova-Pak C18 (radial-packed)
Mobile phase: MeOH:100 mM pH 7.0 ammonium acetate 90:10
Flow rate: 1
Detector: UV 340

CHROMATOGRAM
Retention time: 7.00
Limit of detection: 2 ng

OTHER SUBSTANCES
Extracted: isotretin, motretinid, all-trans-retinoic acid, Vitamin A (retinol), retinal, etretinate

REFERENCE

SAMPLE
Matrix: perfusate
Sample preparation: 500 μL Perfusate + 1 mL acetone + 20 μL 26 μg/mL retinyl acetate, vortex for 1 min, centrifuge at 4° at 1300 g for 15 min, inject an aliquot of the supernatant.

HPLC VARIABLES
Guard column: LC-18 pellicular (Supelco)
Column: 150 × 4.6 5 μm Supelcosil C18
Mobile phase: MeCN:water 84:16 containing 0.8 g/L ammonium acetate and 10 mL/L glacial acetic acid
Flow rate: 1.5
Detector: UV 350

CHROMATOGRAM
Internal standard: retinyl acetate

OTHER SUBSTANCES
Extracted: etretinate

KEY WORDS
do not use PTFE or plastic; rat

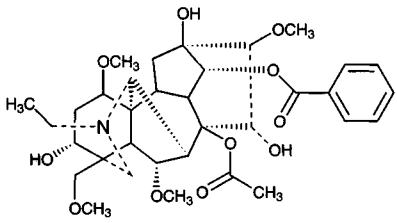
Aconitine



Molecular formula: $C_{34}H_{47}NO_{11}$
Molecular weight: 645.75
CAS Registry No.: 302-27-2
Merck Index: 120

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 233

CHROMATOGRAM

Retention time: 5.95

Limit of detection: <120 ng/mL

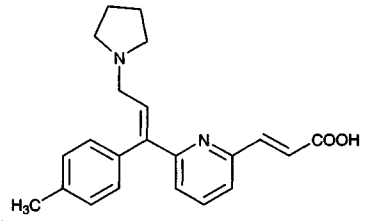
Acrivastine



Molecular formula: $C_{22}H_{24}N_2O_2$
Molecular weight: 348.44
CAS Registry No.: 87848-99-5
Merck Index: 129
Lednicer No.: 4 105

SAMPLE

Matrix: urine

Sample preparation: Condition a C18 SepPak SPE cartridge with 5 mL MeOH and 10 mL water. Urine. Centrifuge, add 0.1-7 mL to the SPE cartridge, wash with 2 mL water, elute with 2 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen in a warm water bath, reconstitute the residue in 200 μL MeOH, filter (0.45 μm), inject an aliquot. Feces. Lyophilize, grind to powder, weigh out 0.22-1.28 g, add 10 mL MeOH:water 80:20, vortex vigorously, sonicate using a microtip probe for 15 s, shake vigorously for 30 min, centrifuge, remove supernatant, repeat extraction (without sonication) twice. Combine extracts and dilute them with water to 20% MeOH concentration. Add to two SPE cartridges connected in series, wash with 3 mL water, elute with 4 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen in a warm water bath, reconstitute the residue in 300 μL MeOH, filter (0.45 μm), inject an aliquot. Plasma. 700 μL Plasma + 700 μL water, add to SPE cartridge, wash with 2 mL water, elute with 2 mL MeOH. Evaporate the eluate to dryness, reconstitute the residue in 200 μL MeOH, filter (0.45 μm), inject an aliquot.

HPLC VARIABLES

Guard column: 5 μm C8 Spherisorb Octyl
Column: 150 × 4 5 μm Econosphere C8
Mobile phase: Gradient A. A was MeCN:100 mM ammonium acetate 5:95. B was MeCN: 100 mM ammonium acetate 50:50. A:B from 100:0 to 80:20 over 10 min then to 0:100 over 10 min, maintain at 0:100 for 5 min.
Flow rate: 0.9
Detector: UV 235

CHROMATOGRAM

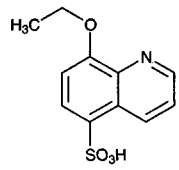
Actinoquinol



Molecular formula: $C_{11}H_{11}NO_4S$
Molecular weight: 253.28
CAS Registry No.: 15301-40-3, 7246-07-3 (sodium salt)
Merck Index: 143

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 202.8

CHROMATOGRAM

Huszár,.; Bart,E.; Kollai,M. Isocratic high-performance liquid chromatographic determination of plasma adenosine, *Chromatographia*, **1996**, *42*, 318–322.

SAMPLE
Matrix: blood
Sample preparation: Add 4 mL cold 600 mM perchloric acid to 2 mL blood, let stand at 4° for 10 min, centrifuge. Neutralize a 3 mL aliquot of the supernatant by adding 300 µL 2.5 M potassium carbonate dropwise while stirring, centrifuge. Mix 200 µL of the supernatant with 5′-nucleotidase (from *Crotatus atrox* venom, activity 67 units/mg protein), keep at room temperature, inject 25 µL aliquot.

HPLC VARIABLES
Column: 100 × 8 5 or 10 µm Radial-Pak C18 Resolve cartridge (uncapped) (Waters)
Mobile phase: MeCN:25 mM pH 6.9 potassium phosphate buffer:triethylamine 3.5:94.5:2, adjusted to pH 6.9 with phosphoric acid.
Column temperature: 24-26
Flow rate: 2.0
Injection volume: 25
Detector: UV 254

CHROMATOGRAM
Retention time: 10.22
Limit of detection: 10-50 pmole

OTHER SUBSTANCES
Extracted: ATP, ADP, AMP

KEY WORDS
whole blood

SAMPLE
Matrix: blood
Sample preparation: Inject 10 μL plasma onto column A and column B in series with mobile phase A, elute with mobile phase A for 4 min then elute the contents of column B onto column C with mobile phase B, monitor the effluent from column C.

HPLC VARIABLES
Column: A 30 × 4.6 44-88 μm Butyl-Toyopearl 650-M (Tosoh); B 30 × 4.6 5 μm Develosil ODS-5 (Nomura); C 250 × 7.6 5 μm Asahipak GS-320H
Mobile phase: A MeCN:2 mM pH 7.4 phosphate buffer 5:95; B MeCN:50 mM bromoacetaldehyde + 150 mM NaCl 15:85, containing 25 mM citrate, pH 5.0
Column temperature: 40° (column C)
Flow rate: A 0.3; B 0.5
Injection volume: 10
Detector: F ex 254 em 400 following post-column heating at 115° in a 15 m × 0.25 mm i.d. reaction coil (Jasco RU-150F unit)

CHROMATOGRAM
Retention time: 25

OTHER SUBSTANCES
Extracted: adenine
Noninterfering: adenosine triphosphate, adenosine monophosphate, cyclic adenosine monophosphate, adenosine diphosphate

KEY WORDS
plasma; hamster; human; column-switching; post-column reaction; derivatization

SAMPLE
Matrix: blood
Sample preparation: 360 μL Blood + 40 μL stopping solution, centrifuge at 14000 g for 1 min. 100 μL Plasma + 10 μL 50% trichloroacetic acid, centrifuge for 5 min. Remove 75 μL of the supernatant and add it to 10 μL 2.3 M KOH, add 50 μL 1 M zinc sulfate, add 100 μL saturated barium hydroxide, vortex for 10 s, centrifuge at 14000 g for 5 min. Remove 100 μL supernatant (pH 5.4) and add it to 10 μL chloroacetaldehyde (45% in water (Fluka)), heat at 80° for 1 h, inject an aliquot. (Stopping solution was 1 mM dialazep, 10μM erythro-9-(2-hydroxy-3-nonyl)adenine, 2 μg/mL indomethacin (final concentrations).)

HPLC VARIABLES
Column: 150 × 3.9 10 μm μBondapak C18

Mobile phase: Gradient. A was MeOH:10 mM pH 3.5 KH_2PO_4 12:88. B was MeOH:10 mM pH 3.5 KH_2PO_4 50:50. A for 8 min then B for 8 min, re-equilibrate for 4 min.
Flow rate: 1.5
Detector: F ex 280 em 380

CHROMATOGRAM
Retention time: 4.8
Limit of detection: 0.2 pmole

SAMPLE
Matrix: blood
Sample preparation: 70 μL Serum + 10 μL 1 mM D-glucosamine.HCl + 20 μL 1 M K_2HPO_4 + 10 μL benzoyl chloride + 25 μL 8 M NaOH, vortex at 2500 vibrations/min for 5 min, add 10 μL 1.4 M phosphoric acid and 100 μL ethyl acetate, vortex at 2500 vibrations/min for 1 min. Remove 25 μL of the ethyl acetate phase and add it to 100 μL MeCN:water 70:30, inject an aliquot.

HPLC VARIABLES
Guard column: 5 μm Kromasil 100 C18
Column: 250 × 4 5 μm Kromasil 100 C18
Mobile phase: Gradient. MeCN:water from 70:30 to 95:5 over 30 min.
Flow rate: 1
Injection volume: 50
Detector: UV 228 or MS, electrospray, Finnigan MAT, TSQ 700, flow rate 1 μL/min, 2.8 kV, drying gas 140

CHROMATOGRAM
Retention time: 10.9
Internal standard: D-glucosamine (9.7)
Limit of detection: 1-5 pmol

OTHER SUBSTANCES
Extracted: benzyl alcohol, dextrose, mannitol, 2-desoxy-D-glucose, cytidine, myoinositol, sucrose

KEY WORDS
serum; derivatization; fetal bovine serum

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wave-

length for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 206.4

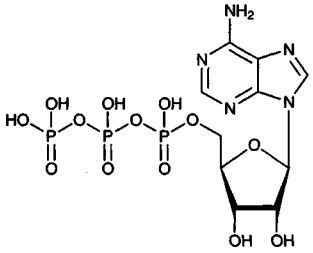
Adenosine triphosphate



Molecular formula: $C_{10}H_{16}N_5O_{13}P_3$
Molecular weight: 507.18
CAS Registry No.: 56-65-5
Merck Index: 154

SAMPLE

Matrix: blood

Sample preparation: Isolate mononuclear cells from 10 mL blood by a standard step-gradient density centrifugation procedure. Wash once with PBS, resuspend in 500 μL water, add 500 μL 800 mM perchloric acid, centrifuge at 400 g for 5 min, wash the pellet with 500 μL 400 mM perchloric acid, centrifuge at 400 g for 5 min. Combine supernatants, neutralize with 10 M KOH, bring to pH 7 with 1 M KOH (Universal indicator paper), cool in ice, centrifuge at 400 g for 5 min, inject a 50-2000 μL aliquot of the supernatant. (PBS was 8.1 g NaCl, 0.22 g KCl, 1.14 g $NaHPO_4$ (sic), 0.27 g KH_2PO_4 in 1 L water, pH 7.4.)

HPLC VARIABLES

Column: 250 × 4.6 10 μm Partisil 10 SAX

Mobile phase: Gradient. A was 5 mM pH 2.8 $(NH_4)H_2PO_4$. B was 750 mM pH 3.5 $(NH_4)H_2PO_4$. A:B from 70:30 to 0:100 over 30 min (concave gradient, Waters no. 9). (At the start of each day pump through 20 mL 2 M $(NH_4)H_2PO_4$ then inject 100 μL 100 mM disodium EDTA into the initial mobile phase.)

Flow rate: 3

Injection volume: 50-2000

Detector: UV 262

SAMPLE
Matrix: perfusate
Sample preparation: 1 mL Perfusate (Krebs solution) + 40 μL chloroacetaldehyde + 360 μL buffer + 100 μL 600 nM vidarabine in water, heat at 80° for 40 min, cool on ice, inject an aliquot. (Krebs solution contained 113 mM NaCl, 4.8 mM KCl, 2.5 mM calcium chloride, 1.2 mM KH_2PO_4, 1.2 mM magnesium sulfate, 25 mM sodium bicarbonate, and 5.5 mM glucose. Prepare buffer by mixing 400 mL 100 mM citric acid with 245 mL 200 mM Na_2HPO_4, pH 4.0. (Prepare chloroacetaldehyde as follows. Cautiously add 1 mL concentrated sulfuric acid to 9 mL water (using eye protection and other protective equipment), add to 10 mL chloroacetaldehyde dimethyl acetal, distil slowly and collect the fraction boiling at 80-85° which contains 1-1.15 M chloroacetaldehyde, store at 0° (Anal. Biochem. 1984, 137, 93).)

HPLC VARIABLES
Guard column: 10 × 4.6 10 μm Ultron N-phenyl (Shinwa, Kyoto)
Column: 150 × 4.6 5 μm Ultron N-phenyl (Shinwa, Kyoto)
Mobile phase: MeCN:buffer 1.5:98.5, adjusted to pH 4.5 with 2-diethylaminoethanol (Prepare buffer by mixing 400 mL 100 mM citric acid with 245 mL 200 mM Na_2HPO_4, pH 4.0.)
Flow rate: 1
Detector: F ex 305 em 420

CHROMATOGRAM
Retention time: 3.5
Internal standard: vidarabine (17)
Limit of detection: 0.1 pmole

OTHER SUBSTANCES
Extracted: adenosine, adenosine diphosphate, adenosine monophosphate

KEY WORDS
derivatization

SAMPLE

Matrix: perfusate, tissue

Sample preparation: Homogenize (glass to glass) tissue with 1 mL ice-cold 400 mM perchloric acid, centrifuge at 10000 g for 10 min, dilute the supernatant 10-fold with Krebs solution. Mix 1 mL (?) perfusate (Krebs solution) or tissue homogenate with 25 (perfusate) or 50 (tissue) μL chloroacetaldehyde, heat at 80° for 40 min, cool on ice, inject an aliquot. (Krebs solution contained 113 mM NaCl, 4.8 mM KCl, 2.5 mM calcium chloride, 1.2 mM KH_2PO_4, 1.2 mM magnesium sulfate, 25 mM sodium bicarbonate, and 5.5 mM glucose. Prepare buffer by mixing 400 mL 100 mM citric acid with 245 mL 200 mM Na_2HPO_4, pH 4.0. (Prepare chloroacetaldehyde as follows. Cautiously add 1 mL concentrated sulfuric acid to 9 mL water (using eye protection and other protective equipment), add to 10 mL chloroacetaldehyde dimethyl acetal, distil slowly and collect the fraction boiling at 80-85° which contains 1-1.15 M chloroacetaldehyde, store at 0°.)

HPLC VARIABLES

Column: 5 μm Radial-Pak C18

Mobile phase: Gradient. A was 100 mM pH 6.0 phosphate buffer. B was MeOH:100 mM pH 6.0 phosphate buffer 25:75. A:B from 100:0 to 0:100 over 15 min (Waters concave curve 8), maintain at 0:100 for 5 min, re-equilibrate at initial conditions for 5 min.

Flow rate: 2

Detector: F ex 300 em 420

SAMPLE

Matrix: solutions

Sample preparation: 10 μL Solution + 200 μL buffer + 10 μL 100 mM 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide in buffer + 40 μL 50 mM dansylethylenediamine in DMSO, mix, let stand in the dark at 27° for 18 h, inject a 10 μL aliquot. (Buffer was 100 mM pH 7.5 1-methylimidazole buffer. Synthesis of dansylethylenediamine is as follows. Add a solution of dansyl chloride in DMF to a 10% molar excess of ethylenediamine in DMF, evaporate to dryness, dissolve the residue in pH 10 carbonate buffer, purify by TLC, extract with MeOH.)

HPLC VARIABLES

Column: 250 × 4.6 Finepak ODP-50 octadecyl-bonded polyvinyl alcohol gel (Asahikasei, Tokyo)

Mobile phase: Gradient. A was MeCN:10 mM pH 10.3 phosphate buffer 12:88. B was MeCN:10 mM pH 10.3 phosphate buffer 22:78. C was MeCN:10 mM pH 10.3 phosphate buffer 40:60. A:B:C 100:0:0 for 10 min, to 0:100:0 over 18 min, to 0:0:100 (step gradient), maintain at 0:0:100 for 10 min.

Column temperature: 40

Flow rate: 0.6

Injection volume: 10
Detector: F ex 270 em 546

CHROMATOGRAM
Retention time: 11
Limit of detection: 4.7-20.3 pmole

OTHER SUBSTANCES
Simultaneous: adenosine diphosphate, adenosine monophosphate, cytidine monophosphate, guanosine diphosphate, guanosine monophosphate, guanosine triphosphate, uridine monophosphate

SAMPLE
Matrix: microsomal incubations
Sample preparation: Place 1.5 mL microsomal incubation in a boiling water bath for 2 min, add to a Sep-Pak C18 SPE cartridge, add mebendazole to the SPE cartridge, wash with water, elute with MeOH, inject an aliquot of the eluate.

HPLC VARIABLES
Column: Nucleosil C18
Mobile phase: Gradient. MeCN:0.5% acetic acid 35:65 for 5 min, 70:30 for 5 min, re-equilibrate at initial conditions for 5 min.
Flow rate: 1 for 5 min, 1.5 for 5 min, re-equilibrate at 1
Detector: UV 292

CHROMATOGRAM
Retention time: 8.2
Internal standard: mebendazole (7.3)
Limit of detection: 20 pg/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
rat; intestine; SPE

SAMPLE
Matrix: milk

Sample preparation: 1 mL Milk + 100 μL 400 mM NaOH, extract with 8 mL ethyl acetate, vortex at high speed for 3 s, centrifuge at 4000 g for 2 min. Remove a 6 mL aliquot of the clear supernatant, add 2 mL water, vortex for 10 s, centrifuge at 1000 g for 30 s. Remove the organic layer and evaporate it to dryness under nitrogen at 40°. Reconstitute the residue in 500 μL mobile phase, filter (0.2 μm), inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Nucleosil 120 C18
Mobile phase: MeCN:10 mM phosphoric acid 20:80 containing 5 mM tetrabutylammonium hydrogen sulfate
Column temperature: 50
Flow rate: 1
Injection volume: 100
Detector: UV 292

CHROMATOGRAM

Retention time: 12.5
Limit of detection: 5 ng/mL
Limit of quantitation: 1.6 ng

OTHER SUBSTANCES

Extracted: metabolites
Noninterfering: amoxicillin, ampicillin, chlortetracycline, cloxacillin, febantel, febendazole, febendazole hydroxide, febendazole sulfone, gentamicin, kanamycin, mebendazole, neomycin, oxacillin, oxfendazole, oxibendazole, oxytetracycline, penicillin G, penicillin V, streptomycin, tetracycline, thiabendazole, thiabendazole hydroxide, triclabendazole

KEY WORDS

milk; cow; pharmacokinetics

SAMPLE

Matrix: tissue

Sample preparation: Wash 22 g bulk 40 μm 18% load end-capped C18 material (Analytichem) in a syringe barrel with 100 mL hexane, with 100 mL dichloromethane, and with 100 mL MeOH and dry under vacuum aspiration. Gently blend 2 g C18 material, 0.5 g liver, and 10 μL 40 μg/mL mebendazole in DMF in a glass pestle for 1 min until homogeneous in appearance. Place in a 10 mL syringe barrel plugged with filter paper (Whatman No. 1), cover with filter paper, compress to 4.5 mL, place a 100 μL pipette tip on the barrel to restrict flow, wash with 8 mL hexane, elute with 8 mL MeCN. Pass the eluate through 0.5 g activated alumina (EM Science Type F-20 80-200 mesh) between filter paper in a 10 mL syringe barrel (wash column with 4 mL MeCN just before use). Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH and 400 μL 17 mM phosphoric acid, sonicate for 5-10 min, centrifuge at 17000 g for 5 min, filter the supernatant (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 4 10 μm Micro Pak ODS (Varian)
Mobile phase: MeCN:17 mM phosphoric acid 40:60
Column temperature: 45
Flow rate: 1
Injection volume: 20
Detector: UV 290

CHROMATOGRAM

Retention time: 9.5
Internal standard: mebendazole (9)
Limit of detection: 100 ng/g

OTHER SUBSTANCES

Extracted: thiabendazole, oxfendazole, fenbendazole

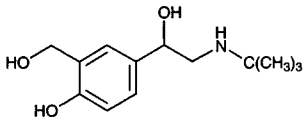
Albuterol



Molecular formula: $C_{13}H_{21}NO_3$
Molecular weight: 239.31
CAS Registry No.: 18559-94-9, 51022-70-9 (sulfate)
Merck Index: 217
Lednicer No.: 2 43

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 10 mL dichloromethane:2-propanol 75:25, shake for 10 min. Centrifuge at 2000 g for 10 min at 4°. Remove the organic phase and evaporate it to dryness under a stream of nitrogen at 50°. Reconstitute the residue in 200 μL mobile phase , mix for 10 s. Centrifuge at 6500 g for 10 min. Inject a 40 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 4 × 4 5 μm LiChrospher 100 RP-18
Column: 250 × 4 5 μm Supelcosil LC-18 (Supelco)
Mobile phase: n-Propanol:buffer 5:95 (Buffer was 50 mM sodium dodecyl sulfate in 10 mM pH 5.8 sodium phosphate buffer.)
Flow rate: 1.3
Injection volume: 40
Detector: F ex 222 em 300

CHROMATOGRAM

Retention time: 20.6
Internal standard: albuterol

OTHER SUBSTANCES

Extracted: atenolol
Noninterfering: chlorthalidone, xipamide

KEY WORDS

plasma; albuterol is IS

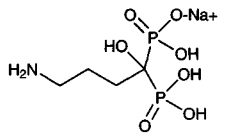
Alendronate sodium



Molecular formula: $C_4H_{12}NNaO_7P_2$
Molecular weight: 271.08
CAS Registry No.: 121268-17-5 (trihydrate), 66376-36-1 (free acid)
Merck Index: 228

SAMPLE

Matrix: blood, urine

Sample preparation: Urine. Condition an Analytichem 3 mL 500 mg diethylamine SPE cartridge with 3 mL water. 5 mL Urine + 50 µL 2.5 M calcium chloride, vortex, add 50 µL or more (as needed) 1 M NaOH to form a slight white precipitate, centrifuge. Discard supernatant and dissolve pellet in 50 µL 1 M HCl, add 5 mL water, precipitate by adding 50 µL 1 M NaOH, centrifuge. Discard the supernatant and dissolve the pellet in 50 µL 1 M HCl, add 1 mL 10 mM EDTA, add 2 mL 100 mM pH 4.0 sodium acetate buffer, add to the SPE cartridge, wash with 3 mL water, elute with 3 mL buffer. Remove 250 µL of the eluate and add it to 250 µL 100 mM pH 9.1 sodium borate buffer, vortex, add 10 µL 50 mM KCN, add 10 µL 2 mg/mL 2,3-naphthalenedicarboxaldehyde in MeOH, let stand for 15 min, inject a 100 µL aliquot. Plasma. Condition an Analytichem 3 mL 500 mg diethylamine SPE cartridge with 3 mL water. 1 mL Plasma + 1 mL 10% trichloroacetic acid, vortex, centrifuge at 5300 g for 10 min. Remove the supernatant and add it to 50 µL 100 mM sodium pyrophosphate in water, add 50 µL 2.5 M calcium chloride, vortex, add 50 µL or more (as needed) 1 M NaOH to form a slight white precipitate, centrifuge. Discard supernatant and dissolve pellet in 50 µL 1 M HCl, add 5 mL water, precipitate by adding 50 µL 1 M NaOH, centrifuge. Discard the supernatant and dissolve the pellet in 50 µL 1 M HCl, add 1 mL 10 mM EDTA, add 2 mL 100 mM pH 4.0 sodium acetate buffer, add to the SPE cartridge, wash with 3 mL water, elute with 3 mL buffer. Remove 250 µL of the eluate and add it to 250 µL 100 mM pH 9.1 sodium borate buffer, vortex, add 10 µL 50 mM KCN, add 10 µL 2 mg/mL 2,3-naphthalenedicarboxaldehyde in MeOH, let stand for 15 min, inject a 100 µL aliquot. (Buffer was 50 mM sodium citrate:50 mM pH 8.5 sodium phosphate buffer 1:1.)

HPLC VARIABLES

Guard column: 20 × 4.6 Hamilton PRP-1
Column: 150 × 4.6 5 µm 100 Å PLRP-S polymeric reversed-phase
Mobile phase: MeOH:buffer 40:60 (Buffer was 25 mM sodium citrate and 25 mM dihydrogenphosphate adjusted to pH 8.5 with 10 mM NaOH.)
Flow rate: 1
Injection volume: 100
Detector: F ex 420 em 490

CHROMATOGRAM

Retention time: 5
Limit of quantitation: 5 ng/mL (urine)

SAMPLE

Matrix: blood
Sample preparation: Dilute 100 μL urine to 1 mL with water. 1 mL PLasma, whole blood, or diluted urine + 10 μL 5 μg/mL IS in water + 1 mL 100 mM NaOH + 7 mL diethyl ether, shake for 30 min, centrifuge at 4° at 1000 g for 5 min. Remove 6.5 mL of the upper organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 870 μL MeCN:20 mM pH 2.5 KH_2PO_4 10:90, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Spherisorb ODS
Mobile phase: MeCN:20 mM pH 2.5 KH_2PO_4 60:40
Flow rate: 1
Injection volume: 500
Detector: F ex 334 em 378

CHROMATOGRAM

Retention time: 4.4
Internal standard: N-[3-[(4-amino-6,7-dimethoxy-2-quinazolinyl)amino]propyl]-N-methyltetrahydro-2H-pyran-2-carboxamide hydrochloride (5.6)
Limit of detection: 0.5 ng/mL

KEY WORDS
plasma; whole blood

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 20 μL 2 μg/mL IS in MeOH + 1 mL 100 mM NaOH + 7 mL dichloromethane:diethyl ether 3:4, shake for 25 min, centrifuge at 1000 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 30°, reconstitute the residue in 80 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 100 × 4 5 μm chiral-AGP (ChromTech)
Mobile phase: MeCN:buffer 6:94, pH 7.4 (Buffer was 0.667 g KH_2PO_4, 4.587 g $K_2HPO_4.3H_2O$, and 8.060 g tetrabutylammonium bromide in 1 L water.)
Flow rate: 0.9
Injection volume: 20
Detector: F ex 265 em 400

CHROMATOGRAM
Retention time: 5.32 (R), 6.58 (S)
Internal standard: N-[3-[(4-amino-6,7-dimethoxy-2-quinazolinyl)methylamino]propyl]-4,5-dihydro-2-furancarboxamide (9.75)
Limit of detection: 1 ng/mL

OTHER SUBSTANCES
Simultaneous: furosemide, zolpidem
Noninterfering: betaxolol, captopril, diazepam, enalapril, metoprolol, piroxicam, propranolol, warfarin

KEY WORDS
chiral; plasma; pharmacokinetics

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 244

CHROMATOGRAM
Retention time: 10.37

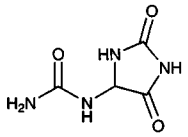
Allantoin



Molecular formula: $C_4H_6N_4O_3$
Molecular weight: 158.12
CAS Registry No.: 97-59-6
Merck Index: 255

SAMPLE

Matrix: blood
Sample preparation: Cool 1 mL plasma in an ice bath, add 100 μL 1.1 mM allopurinol in water, add 100 μL 4 M perchloric acid, vortex for 1 min, cool in an ice bath for 10 min, centrifuge at 10000 g for 5 min. Remove the supernatant and adjust the pH to 6-7 with ice-cold 4 M KOH using bromothymol blue as an indicator, let stand for 10 min, centrifuge at 2000 g for 10 min, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Spherisorb ODS-5
Mobile phase: Gradient. A was 10 mM $(NH_4)H_2PO_4$, adjusted to pH 6.0 with phosphoric acid. B was MeCN:12.5 mM $(NH_4)H_2PO_4$, adjusted to pH 6.0 with phosphoric acid 20:80. A:B at 100:0 for 5 min, to 98:2 over 2 min, to 0:100 over 23 min, re-equilibrate at 100:0 for 20 min.
Flow rate: 0.8
Detector: UV 205

CHROMATOGRAM

Retention time: 3
Internal standard: allopurinol (16)
Limit of detection: 0.06 nmole

OTHER SUBSTANCES

Extracted: metabolites, uric acid, xanthine, hypoxanthine

KEY WORDS

plasma; sheep

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: 300 μL Plasma + 600 μL MeCN, mix vigorously, centrifuge at 2500 g for 10 min, remove the supernatant, add 600 μL MeCN:water 2:1 to the residue, mix vigorously, centrifuge. Combine the supernatants and add them to the SPE cartridge, recover the eluate, elute with 2 mL MeCN:1 mM phosphoric acid 50:50. Combine the eluates and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 400 μL 100 mM NaOH, heat on a boiling water bath for 20 min, cool, add 600 μL 1.5 mM 2,4-dinitrophenylhydrazine in 2.5 M HCl, heat at 50° for 1 h, centrifuge at 10000 g for 30 min, inject a 50 μL aliquot of the supernatant. (Prepare the SPE cartridges by making a slurry of AG1-X8 (chloride form) strong ion-exchange resin (Bio-Rad) in water, let stand for 30 min, add 0.5 mL of the slurry to a 65 × 5 polypropylene column fitted with a 20 μm polyethylene frit, add another frit to the top, wash the column with water until no chloride ions are eluted, equilibrate with 3 mL MeCN:1 mM phosphoric acid 50:50. Test for the presence of chloride ions by adding 1 mL eluate to 300 μL 300 mM silver nitrate solution, a white precipitate indicates the presence of chloride ions.

Regenerate columns by washing with 5 mL 1 M HCl, wash with 20 mL water until no chloride ions are detected.)

HPLC VARIABLES

Guard column: Reversed-phase guard column (Whatman)
Column: 100 × 4.6 Partisphere C18 (Whatman)
Mobile phase: Gradient. A was MeCN:100 mM pH 6.0 KH_2PO_4 5:95. B was MeCN:100 mM pH 6.0 KH_2PO_4 50:50. A:B 100:0 for 1 min, to 84:16 over 20 min, to 0:100 over 9 min, re-equilibrate at the initial conditions for 10 min.
Flow rate: 1
Injection volume: 50
Detector: UV 360

CHROMATOGRAM

Retention time: 16.6
Limit of quantitation: 4 μM

SAMPLE

Matrix: blood, urine
Sample preparation: Add 3 mL 10% trichloroacetic acid (cooled to 2-4°) to 3 mL plasma (cooled to 0-4°) or urine acidified to pH ≤3 with 1 M sulfuric acid and diluted 20 or 40 times with water, centrifuge at 4000 g at 4° for 15 min. Add a 500 μL aliquot of the supernatant to 50 μL 0.04% thymol blue pH indicator. If the reaction mixture color is orange (pH about 1.3) add 50 μL 600 mM NaOH, if the color fails to change to blue add more 600 mM NaOH. When the color changes to blue (pH 9.3-11) heat the reaction mixture at 85° for 60 min. Add 200 μL derivatizing solution (the color becomes orange-yellow), continue the heating for 20 min, filter (0.2 μm), inject an aliquot of the filtrate. (Prepare the derivatizing solution by dissolving 100 mg 2,4-dinitrophenylhydrazine in 100 mL 2 M HCl and by filtering through a membrane filter.)

HPLC VARIABLES

Guard column: 10 × 6 30-40 μm C18 pellicular material (Waters)
Column: two 250 × 4.6 4 μm Nova-Pak C18 columns in series
Mobile phase: Gradient. A was 2.5 mM ammonium dihydrogen phosphate adjusted to pH 3.5 with 10% H_3PO_4. B was MeCN:2.5 mM pH 3.5 ammonium dihydrogen phosphate 20:80. A:B 100:0 for 7.7 min, to 0.8:99.2 in 0.6 min, from 0.8:99.2 to 0.4:99.6 in 8.7 min, from 0.4:99.6 to 100:0 in 31.5 min, maintain at 100:0 for 11.5 min.
Flow rate: 0.9 for 17.1 min, 1 for 3.9 min, 1.2 for 39 min
Injection volume: 10
Detector: UV 205 for 9 min, UV 254 for 16 min, then UV 360

CHROMATOGRAM

Retention time: 37.6
Limit of detection: 4 pmol

OTHER SUBSTANCES

Extracted: uric acid, hypoxanthine, xanthine

SAMPLE

Matrix: blood, urine

Sample preparation: Urine. Adjust pH to < 3 with 1 M sulfuric acid, dilute so that the concentration of allantoin was 0.03-0.32 mM. 500 μL + 50 μL indicator + 100 μL 600 mM NaOH, if the color did not change to blue (pH > 9.2) add 600 mM NaOH in 50 μL increments, heat at 85° for 1 h, add 200 μL reagent, heat at 85° for 20 min, cool, centrifuge at 35000 g for 15 min, inject a 10 μL aliquot of the supernatant. Plasma. 2 mL Plasma + 2 mL 10% trichloroacetic acid, centrifuge at 35000 g for 20 min. 500 μL supernatant + 50 μL indicator + 100 μL 600 mM NaOH, if the color did not change to blue (pH > 9.2) add 600 mM NaOH in 50 μL increments, heat at 85° for 1 h, add 200 μL reagent, heat at 85° for 20 min, cool, centrifuge at 35000 g for 15 min, inject a 10 μL aliquot of the supernatant. (Indicator was 600 mM NaOH and 0.04% thymol blue in water, filter (Whatman No. 1 paper). Reagent was 1 g/L 2,4-dinitrophenylhydrazine in 2 M HCl, filter (Whatman No. 1 paper).)

HPLC VARIABLES

Guard column: 25 × 2 30-40 μm pellicular reversed-phase C18

Column: 150 × 3.9 4 μm Nova-Pak C18

Mobile phase: Gradient. A was MeCN:10 mM acetic acid, pH adjusted to 6.1 with ammonia 15:85. B was MeCN. A:B from 100:0 to 82:18 over 3 min (Waters concave no. 7) to 18:82 over 2 min (Waters concave no. 7), stay at 18:82 for 3 min, to 100:0 over 1 min (linear), re-equilibrate at 100:0 for 15 min.

Flow rate: 1

Injection volume: 10

Detector: UV 360

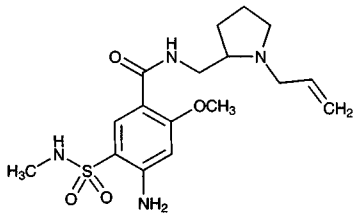
Alpiropride

Molecular formula: $C_{17}H_{26}N_4O_4S$
Molecular weight: 382.48
CAS Registry No.: 81982-32-3
Merck Index: 319



SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. Condition a 3 mL C8 Analytichem SPE cartridge with 1 volume (2.7 mL) MeOH and 1 volume buffer A, do not allow to dry. Mix 1 mL plasma + 100 µL 10 µg/mL amisulpride in 10 mM HCl + 1 mL buffer A, add to SPE cartridge, rinse the sample container with 1 mL buffer A and add the rinse to the SPE cartridge, wash with 1 volume water, wash with 2 mL buffer B, dry the column for 1 min, wash with 200 µL acetone, dry for 30 s, elute with 1 mL buffer C, add 50 µL buffer D, evaporate to dryness under a stream of air, reconstitute in 200 µL mobile phase, sonicate for 1 min, inject an aliquot. Urine. Connect a Baker 3 mL ion exchange quaternary aminesilicane-bonded silica gel SPE cartridge on top of a 3 mL Baker carboxylic acid-bonded silica gel SPE cartridge, condition with 1 volume (2.7 mL) buffer D, 1 volume of water, 1 volume of MeOH, and 1 volume of water. Mix 1 mL urine + 100 µL 10 µg/mL amisulpride in 10 mM HCl + 1 mL water, add to SPE cartridges, rinse the sample container with 2 mL water and add the rinse to the SPE cartridges, wash with 1 mL water, remove the top column, wash the bottom column with 1 volume of water and 2 volumes of MeOH, dry the column for 1 min, elute with 1 mL buffer D, evaporate the eluate to dryness under a stream of air at 45°, reconstitute in 200 µL mobile phase, sonicate for 1 min, inject an aliquot. (Buffer A was 10 mL triethylamine in 1 L water, pH adjusted to 7.00 with acetic acid. Buffer B was MeOH:water 20:80. Buffer C was 10 mL triethylamine + 7 mL acetic acid in 1 L MeOH. Buffer D was 2.10 mL concentrated HCl in 250 mL MeOH (100 mM).)

HPLC VARIABLES

Guard column: 10 cm long Chrompack reverse-phase pellicular material
Column: 250 × 4.6 10 µm LiChrosorb RP-8
Mobile phase: MeCN:MeOH:buffer 160:80:760 (Buffer was 10 mL triethylamine + 760 mL water adjusted to pH 6.8 with acetic acid (about 4.2 mL).)
Flow rate: 2
Injection volume: 175
Detector: UV 230

CHROMATOGRAM

Retention time: 6.0
Internal standard: amisulpride (4.9)

OTHER SUBSTANCES

Simultaneous: metoclopramide, alizapride, aspirin, theophylline, acetaminophen, caffeine, isosorbide-5-mononitrate, acenocoumarol, carbamazepine, nitrazepam, clonazepam, codeine, nitrofurantoin
Noninterfering: indomethacin, orphenadrine, furosemide, cisplatin, amitriptyline, isosorbide dinitrate, propranolol

KEY WORDS

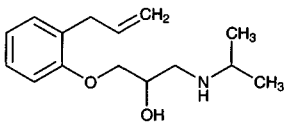
Alprenolol



Molecular formula: $C_{15}H_{23}NO_2$
Molecular weight: 249.35
CAS Registry No.: 13655-52-2, 13707-88-5 (HCl)
Merck Index: 321
Lednicer No.: 1 177

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 270

CHROMATOGRAM

Retention time: 6.18
Limit of detection: <120 ng/mL

SAMPLE

Matrix: solutions

Sample preparation: Mix a 100 μL of a 10 μM solution in MeCN:water:triethylamine 50:50:0.1 with 100 μL 1 mM (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in MeCN, heat in the dark at 65° for 1.5 h, inject an aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-

10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as yellow crystals (mp 160-170° d) (Analyst 1995, 120, 385).)

SAMPLE

Matrix: blood

Sample preparation: 10 μL Serum + 44 μL MeOH + 1 μL pyridine, sonicate for 5 min, add 25 μL 100 mM reagent in DMF, add 20 μL 400 mM 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide in MeOH, let stand at 25° for 2 h, centrifuge, inject an aliquot. (Reagent

was 2-(5-hydrazinocarbonyl-2-furyl)-5,6-dimethoxybenzothiazole which was synthesized as follows. Pass dry hydrogen chloride into a mixture of 12.6 g methyl 2-furoate, 4.5 g paraformaldehyde, and 3.4 g anhydrous zinc chloride in 50 mL dry chloroform for 3 h while holding the reaction temperature at 30°. After cooling pour the contents of the flask into 100 mL cold water, remove the chloroform layer, extract the aqueous layer with chloroform (cf Coll. Czech. Chem. Commun. 1960, 25, 1058). Combine the chloroform layers, neutralize, dry over anhydrous calcium chloride, evaporate, distil to give 5-chloromethyl furyl-2-carboxylic acid methyl ester (bp 108°/4 mm Hg). Reflux 10 g 5-chloromethyl furyl-2-carboxylic acid methyl ester and 25 g silver carbonate in 100 mL THF: water 70:30 for 5 h, filter through Celite, concentrate the filtrate under reduced pressure, chromatograph the product on silica gel with chloroform to give 5-hydroxymethyl furyl-2-carboxylic acid methyl ester as a light yellow oil. Add a solution of 2.9 g 5-hydroxymethyl furyl-2-carboxylic acid methyl ester in 30 mL dichloromethane to 12 g pyridinium chlorochromate in 100 mL, dichloromethane, stir at room temperature for 4 h, evaporate to dryness under reduced pressure, chromatograph on silica with dichloromethane to give 5-formyl furyl-2-carboxylic acid methyl ester as a light yellow powder. Add 10 mL concentrated nitric acid dropwise to 20 g 4-bromoveratrole in 60 mL acetic acid while keeping the temperature at 10-30° with occasional cooling, when the addition is complete pour the reaction mixture into ice-water. Collect the precipitate and dissolve it in 500 mL hot EtOH, add activated charcoal, filter, add 40 mL water to the filtrate to give 4,5-dimethoxy-2-nitrobromobenzene as a light yellow crystalline solid (mp 121-122°). Prepare sodium sulfide by melting together 5 g sodium sulfide nonahydrate and 700 mg sulfur, add this mixture to 5 g 4,5-dimethoxy-2-nitrobromobenzene in 50 mL EtOH:water 95:5, reflux for 30 min, pour into ice-water, collect the solid, recrystallize from dichloromethane to give di(4,5-dimethoxy-2- nitrophenyl)sulfide as yellow needles (mp 231-232°). Add 15 mL concentrated HCl dropwise to 1.5 g di(4,5-dimethoxy-2-nitrophenyl)sulfide and 4.5 g tin powder stirred at 40-50° in 150 mL EtOH, reflux for 1 h, cool to room temperature, filter, add 1.17 g 5-formyl furyl-2-carboxylic acid methyl ester to the filtrate, reflux for 1 h, cool, filter, chromatograph the solid on silica gel with dichloromethane, recrystallize from EtOH to give 5-(5',6'-dimethoxybenzothiazolyl)-N-furan-2-carboxylic acid methyl ester as a yellow powder (mp 192-202°). Add 2 mL hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen and may expplode when distilled in air!) to 800 mg 5-(5',6'-dimethoxybenzothiazolyl)-N-furan-2-carboxylic acid methyl ester in 20 mL EtOH, reflux for 30 min, collect the solid, wash with MeOH, dry under vacuum over phosphorus pentoxide to give 2-(5-hydrazinocarbonyl-2-furyl)-5,6-dimethoxybenzothiazole as a light yellow solid (mp 226-228°).)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Wakosil-II 5C18 HG
Mobile phase: Gradient. MeCN:water from 70:30 to 75:25 over 25 min, to 100:0 over 15 min, maintain at 100:0.

SAMPLE
Matrix: seminal fluid
Sample preparation: 1-5 μL Seminal fluid + 100 μL 5 μM IS in MeOH, mix, add 3 mL water to the supernatant, acidify to pH 3-4 with 100 mM HCl, extract with 7 mL ethyl acetate. Remove the ethyl acetate layer and evaporate it to dryness, reconstitute with MeOH. Evaporate to dryness in a clean tube, add 10 mg finely-powdered potassium bicarbonate:sodium sulfate 50:50, add 50 μL 0.4-1 mM 4-bromomethyl-7-acetoxycoumarin in acetone, add 50 μL 200 μM dibenzo-18-crown-6 in acetone, heat in the dark at 80° for 1 h, cool, inject a 20-40 μL aliquot. (Prepare 4-bromomethyl-7-acetoxycoumarin as follows. Reflux 50 g 7-hydroxy-4-methylcoumarin (β-methylumbelliferone) and 100 mL acetic anhydride for 1 h, cool, pour into 500 mL cold water, filter, dry the solid, recrystallize from EtOH to give 4-methyl-7-acetoxycoumarin. Reflux 10 g 4-methyl-7-acetoxycoumarin, 9 g N-bromosuccinimide, a little 2,2'-(azobis(2-methylpropionitrile) (α,α'-azobisisobutyronitrile, Eastman), and 100 mL carbon tetrachloride for 20 h, cool, evaporate under reduced pressure to remove the solvent, wash the residue with water, filter, dry, recrystallize from ethyl acetate/cyclohexane to give 4-bromomethyl-7-acetoxycoumarin (mp 184-185°) (J. Chromatogr. 1982, 234, 121).)

HPLC VARIABLES
Column: 250 × 4 5 μm LiChrosorb RP-18
Mobile phase: Gradient. MeCN:water from 30:70 to 90:10 over 99 min (Concave 1 curve (64 min) using a Japan Spectroscopic Model GP-A30 solvent programmer).
Column temperature: 50
Flow rate: 1
Injection volume: 20-40
Detector: F ex 365 em 460 following post-column reaction. The effluent from the column mixed with 100 mM NaOH pumped at 0.4 mL/min and the mixture flowed through a 10 m × 0.5 mm ID stainless steel coil at 50° to the detector. (The prostaglandins are chromatographed as the coumarin derivatives then hydrolyzed in the post-column reactor to fluorescent 7-hydroxy-4-hydroxymethylcoumarin.)

CHROMATOGRAM
Retention time: 47
Internal standard: 16-methylprostaglandin $F_{1\alpha}$ (49)
Limit of detection: 10 fmole

SAMPLE
Matrix: seminal fluid
Sample preparation: Mix 50 μL seminal fluid with 500 μL dilute HCl (pH 3.0) and 500 μL ethyl acetate, vortex. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 200 μL water, add to a Toyopak-ODS SPE cartridge, elute with 200 μL MeOH. 100 μL Eluate + 100 μL 100 mM 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide in water + 100 μL 1% aqueous pyridine + 100 μL 15 mM 2-(5-hydrazinocarbonyl-2-thienyl)-5,6-methylenedioxybenzofuran in DMF, heat at 37° for 1 h, inject a 10 μL aliquot. (Synthesis of 2-(5-hydrazinocarbonyl-2-thienyl)-5,6-methylenedioxybenzofuran is as follows. Slowly add 153 g freshly distilled phosphorus oxychloride to 73 g anhydrous DMF with stirring at room temperature, add 125 g sesamol in portions over 4 h, stir at room temperature overnight, pour into ice water, filter. Dissolve the solid in ether and wash with water, dry over anhydrous magnesium sulfate, evaporate to dryness, recrystallize from EtOH to give 2-hydroxy-4,5-methylenedioxybenzaldehyde as slightly-yellow crystals (mp 125-126°). Pass HCl gas into 15.6 g ethyl 2-thiophenecarboxylate, 4.5 g paraformaldehyde, and 3.4 g zinc chloride in 50 mL chloroform with stirring at 30° over 4 h. Pour into ice water and extract with 50 mL chloroform. Wash the chloroform layer 3 times with water, wash twice with aqueous sodium bicarbonate solution, dry over anhydrous sodium sulfate, evaporate to remove the solvent, distil at 86-94°/0.15 mm Hg to yield ethyl 5-chloromethyl thiophene-2-carboxylate as a colorless oil. Heat 3 g 2-hydroxy-4,5-methylenedioxybenzaldehyde, 3.68 g ethyl 5-chloromethyl thiophene-2-carboxylate, and 2.49 g potassium carbonate in 100 mL anhydrous DMF at 110° for 16 h, filter, evaporate the filtrate to dryness under reduced pressure, chromatograph the residue on silica gel with chloroform, recrystallize from chloroform:hexane 25:75 to give 2-(5-ethoxycarbonyl-2-thienyl)-5,6-methylenedioxybenzofuran as yellow crystals (mp 124-126°). Heat 1.5 g 2-(5-ethoxycarbonyl-2-thienyl)-5,6-methylenedioxybenzofuran and 1.2 g hydrazine hydrate in 15 mL DMF at 70° for 1 h (Caution! Hydrazine hydrate is a carcinogen and explodes on distillation in air!), add 10 g hydrazine hydrate, add 20 mL water, filter. Wash the solid with MeOH and dry it under reduced pressure to give 2-(5-hydrazinocarbonyl-2-thienyl)-5,6-methylenedioxybenzofuran as a yellow powder (mp 262-263°).)

SAMPLE
Matrix: solutions
Sample preparation: Dissolve compound in 1 mL MeCN:THF 80:20, add 70 μg panacyl bromide, add 1.025 μL N,N-diisopropylethylamine, mix, let stand at room temperature for 3 h, inject an aliquot onto column A (pre-equilibrated with 10 mL dichloromethane) and elute to waste with 15 mL dichloromethane, elute the contents of column A onto column B with the mobile phase and start the gradient, monitor the effluent from column B. (Synthesize panacyl bromide (p-(9-anthroyloxy)phenacyl bromide) as follows. Add 3.04 g benzyltrimethylammonium dichloroiodate to a solution of 500 mg 4'-hydroxyacetophenone in 50 mL dichloroethane and 20 mL MeOH, reflux for 10 h, remove the solvent by distillation, add 20 mL 5% sodium bisulfite to the residue, extract four times with 40 mL portions of ether, dry over anhydrous magnesium sulfate, evaporate to dryness under reduced pressure to give p-hydroxyphenacyl chloride (mp 151-152°) (Synthesis 1988, 545). Purify p-hydroxyphenacyl chloride by suspending 100 g in 1 L boiling toluene, filter, cool to obtain white crystals of p-hydroxyphenacyl chloride. Repeat this process a number of times to obtain more pure product. Reflux 10 g 9-anthracenecarboxylic acid in 150 mL redistilled thionyl chloride for 2 h, evaporate to dryness under reduced pressure at 30°, dissolve the residue in 150 mL dry toluene containing 11.5 g p-hydroxyphenacyl chloride, reflux for 2 h, evaporate to dryness under reduced pressure, recrystallize from 200 mL hot MeCN to give p-(9-anthroyloxy)phenacyl chloride as deep yellow crystals (mp 159.8-161.6°). Dissolve 2.5 g p-(9-anthroyloxy)phenacyl chloride in 25 mL THF:MeCN 20:80,

add 8 g anhydrous LiBr, reflux briefly, cool to room temperature, filter, wash the solid with water to obtain p-(9-anthroyloxy)phenacyl bromide as deep yellow crystals (mp 173.3-173.6°).)

Nimura,N.; Kinoshita,T.; Yoshida,T.; Uetake,A.; Nakai,C. 1-Pyrenyldiazomethane as a fluorescent labeling reagent for liquid chromatographic determination of carboxylic acids, *Anal.Chem.*, **1988**, *60*, 2067–2070.

SAMPLE

Matrix: solutions

Sample preparation: Mix 200 μL of a 10 μM solution in DMF containing 140 mM diethylphosphorocyanidate with 200 μL 10 mM DBD-PZ in MeCN, let stand at room temperature for 6 h, inject a 1 μL aliquot. (Synthesis of 4-(N,N-dimethylaminosulfonyl)-7-N-piperazino-2,1,3-benzoxadiazole (DBD-PZ) is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ tlc plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei (TCI America, Portland OR). Add 123 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to 129 mg piperazine in 20 mL MeCN at room temperature, stir for 30 min, evaporate under reduced pressure, dissolve residue in 50 mL 5% HCl, wash three times with 20 mL ethyl acetate, discard ethyl acetate extracts, adjust pH of aqueous solution to 13-14 with 5% NaOH, extract five times with 50 mL ethyl acetate, combine extracts, wash with 20 mL water,

dry over anhydrous sodium sulfate, evaporate under vacuum to give 4-(N,N-dimethylaminosulfonyl)-7-N-piperazino-2,1,3-benzoxadiazole as orange crystals (mp 121-2°).)

SAMPLE

Matrix: solutions

Sample preparation: Mix 100 μL of a 100 μM solution of the carboxylic acid in water with 100 μL 100 mM 1-(3-methylaminopropyl)-3-ethylcarbodiimide in water, 100 μL 1% pyridine in water, and 100 μL 15 mM 2-(5-hydrazinocarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran in DMF, heat at 37° for 1 h, inject a 10 μL aliquot. (Synthesis of 2-(5-hydrazinocarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran is as follows. Add ethyl oxalyl chloride in ether to a solution of diazomethane in ether at 0° to give ethyl diazopyruvate (Caution! Diazo compounds are explosive and toxic!) (cf. Buehler,C.A.; Pearson,D.E. Survey of Organic Syntheses, Wiley, New York, 1970, p. 179). Heat 100 mg ethyl diazopyruvate, a few mg copper(II) acetylacetonate, and 400 μL chloroacetonitrile in benzene at 60° overnight (Caution! Benzene is a carcinogen!), cool, add to sodium bicarbonate solution, extract with ether, dry the organic layer, evaporate, chromatograph on silica with petroleum ether:ethyl acetate 90:10, distil the product at 90°/12 mm Hg to give ethyl 2-chloromethyl-5-oxazolecarboxylate as an oil in 18% yield (US Patent 4 603 209 (July 29, 1986)). Add 2 mL phosphorus oxychloride dropwise to a solution of 2 g sesamol in 3 mL DMF at 0°, heat on a steam bath with frequent shaking for 1 h, cool in ice, add 50 mL saturated sodium acetate solution, heat on a steam bath for 30 min, cool, filter, recrystallize the solid from EtOH to give 2-hydroxy-4,5-methylenedioxybenzaldehyde as colorless needles (mp 125-126°) (Bull. Chem. Soc. Jpn. 1962, 35, 1321). Stir 1.4 g ethyl 2-chloromethyl-5-oxazolecarboxylate, 1.5 g 2-hydroxy-4,5-methylenedioxybenzaldehyde, 2 g potassium carbonate, and 50 mL anhydrous DMF at 120° overnight, cool, filter. Evaporate the filtrate to dryness under reduced pressure to give 2-(5-ethoxycarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran as a colorless crystalline powder (mp 186°) (yield 39%). Reflux 260 mg 2-(5-ethoxycarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran, 100 mg KOH, 20 mL EtOH, and 30 mL water for 2 h, concentrate under reduced pressure, dissolve the residue in 100 mL water, wash with ethyl acetate, treat the aqueous layer with activated carbon, acidify the aqueous layer to pH 2 with 2 M HCl. Filter the precipitate and recrystallize it from EtOH to give 2-(2-oxazole-5-carboxylic acid)-5,6-methylenedioxybenzofuran as a colorless crystalline powder (mp 294-295°). Reflux 150 mg 2-(2-oxazole-5-carboxylic acid)-5,6-methylenedioxybenzofuran and 5 mL thionyl chloride for 2 h, pour the reaction mixture into 300 mL petroleum ether. Filter the precipitate and

dry it over KOH to give 2-(5-chlorocarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran (mp 290°) (Anal. Sci. 1989, 5, 525). 2-(5-Chlorocarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran is also available from Dojindo, Kumamoto, Japan. Add 2 mL hydrazine hydrate to a stirred solution of 2 g 2-(5-chlorocarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran in 20 mL anhydrous DMF (Caution! Hydrazine hydrate is a carcinogen!), stir at room temperature for 4 h, add 20 mL benzene (Caution! Benzene is a carcinogen!). Collect the precipitate and wash it with water and MeCN, recrystallize from DMF:benzene 50:50 to give 2-(5-hydrazinocarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran as an off-white crystalline solid (mp >220° d).)

Saito,M.; Chiyoda,Y.; Ushijima,T.; Sasamoto,K.; Ohkura,Y. 2-(5-Hydrazinocarbonyl-2-oxazolyl)-5,6-methylenedioxybenzofuran as a fluorescence derivatization reagent for carboxylic acids in high-performance liquid chromatography, *Anal.Sci.*, **1994**, *10*, 679–681.

SAMPLE

Matrix: solutions
Sample preparation: 100 μL 10 mM compound in MeOH + 100 μL 1% pyridine in MeOH + 100 μL 15 mM reagent in DMSO, 100 μL 100 mM 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide in MeOH, heat at 37° for 1 h, inject a 10 μL aliquot. (Reagent was 2-(5-hydrazinocarbonyl-2-oxazolyl)-5,6-dimethoxybenzothiazole which was synthesized as follows. Add 10 mL concentrated nitric acid dropwise to 20 g 4-bromoveratrole in 60 mL acetic acid while keeping the temperature at 10-30° with occasional cooling, when the addition is complete pour the reaction mixture into ice-water. Collect the precipitate and dissolve it in 500 mL hot EtOH, add activated charcoal, filter, add 40 mL water to the filtrate to give 4,5-dimethoxy-2-nitrobromobenzene as a light yellow crystalline solid (mp 121-122°). Prepare sodium sulfide by melting together 5 g sodium sulfide nonahydrate and 700 mg sulfur, add this mixture to 5 g 4,5-dimethoxy-2-nitrobromobenzene in 50 mL EtOH:water 95:5, reflux for 30 min, pour into ice-water, collect the solid, recrystallize from dichloromethane to give di(4,5-dimethoxy-2-nitrophenyl)sulfide as yellow needles (mp 231-232°) (Anal. Sci. 1995, 11, 103). Add ethyl oxalyl chloride in ether to a solution of diazomethane in ether at 0° to give ethyl diazopyruvate (Caution! Diazo compounds are explosive and toxic!) (cf. Buehler,C.A.; Pearson,D.E. Survey of Organic Syntheses, Wiley, New York, 1970, p. 179). Heat 100 mg ethyl diazopyruvate, a few mg copper(II) acetylacetonate, and 400 μL chloroacetonitrile in benzene at 60° overnight (Caution! Benzene is a carcinogen!), cool, add to sodium bicarbonate solution, extract with ether, dry the organic layer, evaporate, chromatograph on silica with petroleum ether:ethyl acetate 90:10, distil the product at 90°/12 mm Hg to give ethyl 2-chloromethyl-5-oxazolecarboxylate as an oil in 18% yield (US Patent 4 603 209 (July 29, 1986)). Reflux 5.0 g ethyl 2-chloromethyl-5-oxazolecarboxylate and 11.7 g NaI in 80 mL acetone for 1 h, partition the

reaction mixture between ethyl acetate and water. Wash the organic layer with water and dry it over anhydrous sodium sulfate, evaporate to give ethyl 2-iodomethyl-5-oxazolecarboxylate as a reddish-brown oil. Reflux 7.4 g ethyl 2-iodomethyl-5-oxazolecarboxylate and 21.5 g silver carbonate in 100 mL THF:water 70:30 for 4 h, filter through Celite, evaporate under reduced pressure, chromatograph on silica gel using benzene:ethyl acetate 95:5 to give ethyl 2-hydroxymethyl-5-oxazolecarboxylate (mp 60.5-62°). Stir 2.04 g oxalyl chloride in 15 mL dichloromethane at -50° under nitrogen, add 1.54 g DMSO in 3 mL dichloromethane, after 5 min add 1.4 g ethyl 2-hydroxymethyl-5-oxazolecarboxylate in 6 mL dichloromethane, stir for 15 min at -50°, add 5.7 mL triethylamine, allow to warm to room temperature, dilute with dichloromethane, wash with water, dry over anhydrous sodium sulfate, concentrate under reduced pressure, chromatograph on silica gel using benzene:ethyl acetate 95:5 to give ethyl 2-carboxaldehyde-5-oxazolecarboxylate (mp 71.5-73°). Add 11.3 mL concentrated HCl to 750 mg di(4,5-dimethoxy-2-nitrophenyl)sulfide stirred in 100 mL EtOH, add 3.3 g tin powder at 40-45°, stir for 1 h at 40-45°, dilute with 100 mL water, pass hydrogen sulfide gas through this solution (Caution! Hydrogen sulfide is highly toxic!), filter, concentrate the filtrate under reduced pressure to give 4,5-dimethoxy-2-aminothiophenol. Take up this compound in 30 mL EtOH:acetic acid 2:1 and add 750 mg ethyl 2-carboxaldehyde-5-oxazolecarboxylate, reflux for 1 h, collect the precipitate and recrystallize it from EtOH to give 2-(5-ethoxycarbonyl-2-oxazolyl)-5,6-dimethoxybenzothiazole as yellow needles (mp 200-201°). Add 381 mg 2-(5-ethoxycarbonyl-2-oxazolyl)-5,6-dimethoxybenzothiazole to 20 mL EtOH containing 3 mL DMF and 5 mL hydrazine hydrate, reflux for 1 h, collect the precipitate and wash it with EtOH, dry under vacuum to give 2-(5-hydrazinocarbonyl-2-oxazolyl)-5,6-dimethoxybenzothiazole as a yellow powder (mp 255.5-280° (d)).)

Matrix: blood, urine

Sample preparation: Add NaOH to plasma and urine so that the final NaOH concentration is 50 mM. Wash column A with 400 μL MeCN, with 400 μL 1 mM sodium dodecyl sulfate in MeCN:water 40:60, and with 400 μL 5 mM sodium dodecyl sulfate in water. Inject a 50 μL aliquot of plasma or urine at 0.36 mL/min, inject 50 μL 5 mM sodium dodecyl sulfate in water at 0.36 mL/min, after 3 min wash column A with 400 μL 5 mM sodium dodecyl sulfate in water, backflush the contents of column A onto column B with mobile phase and start the gradient, after 15 s remove column A from the circuit and wash it with 400 μL MeCN, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 27 × 2.1 polymeric reagent; B reverse-phase (not otherwise specified) (Prepare polymeric reagent as follows. Prepare a porous rigid resin using a divinylbenzene:ethylstyrene:styrene 24:6:70 mixture with trimethylsilyl modified silica (102 Å average pore size, 1.08 mL/g pore volume, 366 m^2/g surface area, 16-20 μm irregular particle shape, IMPAQ RG 1020 Si silica, PQ Co., Valley Forge PA). Further preparation details are not given but a typical procedure given in the cited reference is as follows. Aerate a mixture of 10 g modified silica in 100 mL water with nitrogen for 15 min, add 10 mL styrene:80% divinylbenzene:t-butyl peroxybenzoate 49:49:2 (remove preservative by passing through a butylcatechol remover (Scientific Polymer, Ontario NY), shake vigorously at room temperature for 4 h, add 150 mL 0.75% polyvinyl alcohol, shake for 4 h, heat at 120° for 24 h while shaking on a Parr instrument, cool to room temperature, filter, wash with 100 mL water, wash with 50 mL MeOH. Add the solid to 500 mL 3 M NaOH in MeOH:water 40:60, shake at room temperature for 14 h (to dissolve the silica), filter, wash with water until the washings are neutral, wash with 100 mL MeOH, dry at 60°. The polymer has similar properties to the template silica (US Pat. 4 933 372 (1990)). Soxhlet extract the resin with dioxane for 8 h (Caution! Dioxane is a carcinogen!). Add 25 g aluminum trichloride in 300 mL dry nitrobenzene to 50 g resin and 100 g 4-chloro-3-nitrobenzoyl chloride, stir mechanically at 60° for 5 h, pour into a mixture of 150 mL DMF, 100 mL concentrated HCl, and 150 g ice, filter. Wash the solid with 300 mL portions of DMF:water 75:25 until the washings are colorless, wash with warm (60°) DMF, wash with six 300 mL portions of dichloromethane:MeOH 2:1. Stir the product in 130 mL 40% benzyltrimethylammonium hydroxide in water, 130 mL water, and 260 mL dioxane at 90° for 8 h, filter, repeat the process. Wash the product with four portions of warm (60°) dioxane. Stir the solid with 30 mL acetic acid for 15 min, filter. Wash the solid with dioxane until the washings are neutral, wash with six 300 mL portions of dichloromethane:MeOH 2:1 to give a nitrobenzophenol-substituted polymer (J. Org. Chem. 1984, 49, 924). Heat 4 g 9-fluoreneacetic acid, 3.9 mL oxalyl chloride, 30 mL benzene (dried over anhydrous sodium sulfate, Caution! Benzene is a carcinogen!), and 3 drops of triethylamine at 55° for 1 h, evaporate under reduced pressure to remove oxalyl chloride, dissolve the product in 35 mL dichloromethane to give a 120 mg/mL solution of 9-fluoreneacetyl chloride, dilute to obtain a 2 mM solution. Stir 1.3 g nitrobenzophenol-substituted polymer, 4.2 mL 2 mM 9-fluoreneacetyl chloride solution, 300 μL triethylamine, and 20 mL dichloromethane at room temperature for 1 h, filter, wash with three 20 mL portions of MeCN to obtain the reagent, polymer-bound nitrobenzophenol 9-fluoreneacetate (J. Chromatogr. 1992, 609, 103).)

Mobile phase: Gradient. MeCN:water 55:45 for 1.5 min, to 85:15 over 4 min, maintain at 85:15 for 5 min, return to initial conditions over 1 min, re-equilibrate for 2 min.

SAMPLE

Matrix: solutions
Sample preparation: Wash 70 mg polymeric reagent with 500 μL MeCN, heat at 75°, inject 50 μL of an amantadine solution in 50 mM NaOH, let stand at 75° for 3 min, flush contents of the reactor onto the column with mobile phase. Flush reactor with MeCN between runs. (Prepare polymeric reagent as follows. Prepare a porous rigid resin using a divinylbenzene:ethylstyrene:styrene 24:6:70 mixture with trimethylsilyl modified silica (102 Å average pore size, 1.08 mL/g pore volume, 366 m^2/g surface area, 16-20 μm irregular particle shape, IMPAQ RG 1020 Si silica, PQ Co., Valley Forge PA). Further preparation details are not given but a typical procedure given in the cited reference is as follows. Aerate a mixture of 10 g modified silica in 100 mL water with nitrogen for 15 min, add 10 mL styrene:80% divinylbenzene:t-butyl peroxybenzoate 49:49:2 (remove preservative by passing through a butylcatechol remover (Scientific Polymer, Ontario NY), shake vigorously at room temperature for 4 h, add 150 mL 0.75% polyvinyl alcohol, shake for 4 h, heat at 120° for 24 h while shaking on a Parr instrument, cool to room temperature, filter, wash with 100 mL water, wash with 50 mL MeOH. Add the solid to 500 mL 3 M NaOH in MeOH:water 40:60, shake at room temperature for 14 h (to dissolve the silica), filter, wash with water until the washings are neutral, wash with 100 mL MeOH, dry at 60°. The polymer has similar properties to the template silica (US Pat. 4 933 372 (1990)). Soxhlet extract the resin with dioxane for 8 h (Caution! Dioxane is a carcinogen!). Add 25 g aluminum trichloride in 300 mL dry nitrobenzene to 50 g resin and 100 g 4-chloro-3-nitrobenzoyl chloride, stir mechanically at 60° for 5 h, pour into a mixture of 150 mL DMF, 100 mL concentrated HCl, and 150 g ice, filter. Wash the solid with 300 mL portions of DMF:water 75:25 until the washings are colorless, wash with warm (60°) DMF, wash with six 300 mL portions of dichloromethane:MeOH 2:1. Stir the product in 130 mL 40% benzyltrimethylammonium hydroxide in water, 130 mL water, and 260 mL dioxane at 90° for 8 h, filter, repeat the process. Wash the product with four portions of warm (60°) dioxane. Stir the solid with 30 mL acetic acid for 15 min, filter. Wash the solid with dioxane until the washings are neutral, wash with six 300 mL portions of dichloromethane:MeOH 2:1 to give a nitrobenzophenol-substituted polymer (J. Org. Chem. 1984, 49, 924). Heat 4 g 9-fluoreneacetic acid, 3.9 mL oxalyl chloride, 30 mL benzene (dried over anhydrous sodium sulfate, Caution! Benzene is a carcinogen!), and 3 drops of triethylamine at 55° for 1 h, evaporate under reduced pressure to remove oxalyl chloride, dissolve the product in 35 mL dichloromethane to give a 120 mg/mL solution of 9-fluoreneacetyl chloride, dilute to obtain a 2 mM solution. Stir 1.3 g nitrobenzophenol-substituted polymer, 4.2 mL 2 mM 9-fluoreneacetyl chloride solution, 300 μL triethylamine, and 20 mL dichloromethane at room temperature for 1 h, filter, wash with three 20 mL portions of MeCN to obtain the reagent, polymer-bound nitrobenzophenol 9-fluoreneacetate (J. Chromatogr. 1992, 609, 103).)

HPLC VARIABLES

SAMPLE
Matrix: urine
Sample preparation: 100 μL Urine + 200 μL 50 nM n-decylamine in benzene + 100 μL 1 M NaOH (Caution! Benzene is a carcinogen!), shake mechanically for 15 min, centrifuge at 6400 rpm for 6 min. Remove a 20 μL aliquot of the organic layer and add it to 10 μL 250 μM 3-(4,6-difluorotriazinyl)amino-7-methoxycoumarin in benzene, heat at 140° for 15 min, cool to room temperature, inject a 10 μL aliquot. (Synthesis of 3-(4,6-difluorotriazinyl)amino-7-methoxycoumarin is as follows. Heat 2-hydroxy-4-methoxybenzaldehyde with 0.5 equivalents glycine, 1.25 equivalents fused sodium acetate, and 5 parts freshly distilled acetic anhydride at 140° for 1 h and at 160° for 1 h, cool to 100°, pour into water containing cracked ice, let stand overnight. Wash the solid with very dilute NaOH, cold water, and a few mL of hot MeOH. Crystallize from acetic acid to obtain 3-acetamido-7-methoxycoumarin (mp 230°). Suspend 1 g 3-acetamido-7-methoxycoumarin in 25 mL acetic acid and 25 mL 50% sulfuric acid, heat at 50-60° for 30-45 min, pour into an equal volume of cold water, neutralize with sodium bicarbonate, recrystallize from EtOH/water to obtain 3-amino-7-methoxycoumarin (mp 154°) (J. Ind. Chem. Soc. 1971, 48, 371). Stir 300 mg 3-amino-7-methoxycoumarin in 100 mL anhydrous ether, slowly add 1 mL cyanuric fluoride (Fluka), stir at room temperature for 1 h, evaporate to dryness under reduced pressure, recrystallize from n-hexane to give 3-(4,6-difluorotriazinyl)amino-7-methoxycoumarin as colorless prisms (mp 212-215°). 3-(4,6-Difluorotriazinyl)amino-7-methoxycoumarin reacts with primary and secondary alkyl amines but not with aromatic amines or alcohols.)

SAMPLE

Matrix: urine

Sample preparation: Prepare a derivatization vial by adding 160 μL 300 mM cetyltrimethylammonium bromide in MeOH to a vial (Eppendorf no. 3813) and evaporating the MeOH at room temperature. 5 mL Urine adjusted to about pH 11 with 10 M NaOH, centrifuge at 3000 g for 10 min. Add 450 μL supernatant and 50 μL 400 mM pH 11 sodium borate buffer to a derivatization vial, vortex for 15 s, add 25 μL 800 mM 2,4-dinitrofluorobenzene in acetone, mix. Remove a 100 μL aliquot and allow it to pass back and forth through a 100 mm length of 0.5 mm i.d. PTFE tubing at 60° for 4 min, inject a 25 μL aliquot. Backflush PTFE tubing with 1 mL MeCN and 1 mL water.

SAMPLE

Matrix: blood
Sample preparation: Add 50 μL 1 μg/mL prazosin in MeOH to 1 mL plasma, add 500 μL 5 M NaOH and 5 mL ethyl acetate, extract. Centrifuge at 700 g for 10 min, evaporate 4 mL of the organic phase to dryness under nitrogen at 60°, reconstitute the residue in 200 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Nucleosil C18
Mobile phase: MeCN:buffer 69:31 (Mobile phase was 690 mL MeCN, 310 mL water, and 9 mL glacial acetic acid, adjusted to pH 5.0 with 5 M NaOH.)
Flow rate: 1.5
Injection volume: 20
Detector: F ex 362 em 414

CHROMATOGRAM

Retention time: 1.8
Internal standard: prazosin (3.8)
Limit of detection: 250 pg/mL
Limit of quantitation: 500 pg/mL

KEY WORDS

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 25 μL 10 mg/mL hydroflumethiazide in water + 1 mL 1 M pH 10 sodium carbonate-bicarbonate buffer + 5 mL ethyl acetate, vortex 1 min, centrifuge at 1250 g for 5 min. Remove the ethyl acetate layer and evaporate at 45° under nitrogen. Dissolve in 100 μL mobile phase, inject 50 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.6 5 μm Spherisorb ODSII
Mobile phase: MeCN:MeOH:buffer 10:9:100 (Buffer was 15.54 g tetraethylammonium hydroxide and 2.9 g 89% orthophosphoric acid in 500 mL water, pH was 2.8.)
Flow rate: 1.2
Injection volume: 50
Detector: F ex 368 em 415

CHROMATOGRAM

Retention time: 3.67
Internal standard: hydroflumethiazide (7.94)
Limit of detection: 0.5 ng/mL

OTHER SUBSTANCES
Simultaneous: hydrochlorothiazide (detection by UV)

KEY WORDS
plasma

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 214.6

CHROMATOGRAM
Retention time: 3.608

SAMPLE
Matrix: urine
Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)
Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)
Flow rate: 1
Injection volume: 5
Detector: UV 230, UV 275

CHROMATOGRAM
Retention time: 3.1 (A), 4.0 (B)
Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))
Limit of detection: 5000 ng/mL

OTHER SUBSTANCES
Extracted: furosemide, metolazone, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, flumethiazide, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, methyclothiazide, benzthiazide, cyclothiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone
Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

SAMPLE

Matrix: urine

Sample preparation: Basify 2.5 mL urine to pH 12 with 100 mg potassium carbonate, extract twice with 5 mL ethyl acetate. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 50°, reconstitute the residue in 300 μL 15 μg/mL triamterene in MeOH:HCl 99:1, inject a 10 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 2.1 30 μm HP ODS Hypersil

Column: 200 × 4.6 5 μm HP ODS Hypersil C18

Mobile phase: Gradient. A was 6.9 g $NaH_2PO_4.H_2O$ and 1.59 g propylamine hydrochloride in 1 L water, pH adjusted to 3.2 with concentrated phosphoric acid. B was MeCN. A:B at 85:15 for 2 min then to 20:80 over 18 min

Flow rate: 1

Injection volume: 10

Detector: UV 363

CHROMATOGRAM

Retention time: 3.7

Internal standard: triamterene (7.5)

Limit of detection: 120 ng/mL

KEY WORDS

pharmacokinetics

SAMPLE

Matrix: urine

Sample preparation: 5 mL Urine + 50 μL 100 μg/mL 7-propyltheophylline in MeOH + 200 μL ammonium chloride buffer + 2 g NaCl, extract with 6 mL ethyl acetate by rocking at 40 movements/min for 20 min and centrifuging at 800 g for 5 min, repeat extraction, combine organic layers, evaporate to dryness at 40° under a stream of nitrogen. Reconstitute in 200 μL MeCN:water 15:85 and inject 20 μL aliquots. (Ammonium chloride buffer was 28 g ammonium chloride in 100 mL water with the pH adjusted to 9.5 with concentrated ammonia solution.)

HPLC VARIABLES

Column: 75 × 4.6 3 μm Ultrasphere ODS

Mobile phase: Gradient. MeCN:100 mM ammonium acetate adjusted to pH 3 with concentrated phosphoric acid. From 10:90 to 15:85 over 2 min to 55:45 over 3 min to 60:40 over 3 min. Kept at 60:40 for 1 min, decreased to 10:90 over 1 min and equilibrated at 10:90 for 2 min.

Flow rate: 1

Injection volume: 20

Detector: UV 270

CHROMATOGRAM

Retention time: 1.6

Internal standard: 7-propyltheophylline (4.5)
Limit of detection: 20 ng/mL

OTHER SUBSTANCES

Simultaneous: xipamide, bumetanide, acetazolamide, bendroflumethiazide, benzthiazide, buthiazide, caffeine, canrenone, chlorthalidone, clopamide, cyclothiazide, diclofenamide, ethacrynic acid, furosemide, hydrochlorothiazide, mesocarb, morazone, piretanide, polythiazide, probenecid, spironolactone, torsemide, triamterene

SAMPLE

Matrix: amniotic fluid, blood, CSF, urine

Sample preparation: Plasma. Condition a 100 mg Bond Elut SCX (propylbenzenesulfonic acid, H^+ form) SPE cartridge with 1 mL 50 mM HCl, 1 mL MeOH, 2 mL water, and 1 mL 50 mM HCl. 100 μL Plasma + 100 μL 250 μM norleucine in 100 mM HCl + 10 mg solid sulfosalicylic acid + 800 μL acetone or MeOH, mix, centrifuge, add a 50 μL aliquot to the SPE cartridge, wash with 2 mL water, elute with two 500 μL portions of MeOH:water:triethylamine 40:40:20, dry the eluate under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 100 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Dried blood. Add 25 μL 250 μM norleucine in 100 mM HCl to a 6 mm filter paper disc containing dried blood, add 100 μL MeCN, let stand for 30 min, centrifuge, remove a 75 μL aliquot of the supernatant, evaporate to dryness under reduced pressure, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 2 min, evaporate to dryness under vacuum, reconstitute with 50 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Amniotic fluid, CSF. Mix amniotic fluid or CSF with an equal volume of 250 μM norleucine in 100 mM HCl, filter (Centrifree 10000 MW cutoff) while centrifuging at 2200 g. Evaporate a 50 μL aliquot of the ultrafiltrate to dryness under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:

triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 50 (CSF) or 100 (amniotic fluid) μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Urine. Dilute urine with water to a creatinine concentration of 1 mM, mix an aliquot with an equal volume of 250 μM norleucine in 100 mM HCl, filter (Centrifree 10000 MW cutoff) while centrifuging at 2200 g. Evaporate a 50 μL aliquot of the ultrafiltrate to dryness under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 100 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 Pico-Tag amino acid column (Waters)
Mobile phase: Gradient. A was MeCN:70 mM pH 6.55 sodium acetate 2.5:97.5. B was MeCN:MeOH:water 45:15:40. A:B 100:0 for 13.5 min, to 97:3 (step gradient), to 94:6 over 10.5 min (Waters curve 8 (slightly concave)), to 91:9 over 6 min (Waters curve 5 (slightly convex)), to 66:34 over 20 min, maintain at 66:34 for 12 min, to 0:100 over 0.5 min, maintain at 0:100 for 4 min, return to initial conditions over 0.5 min.
Column temperature: 46
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 2.97 (phosphoserine), 3.08 (cysteic acid), 3.36 (aspartic acid), 3.80 (glutamic acid), 5.23 (α-aminoadipic acid), 6.83 (hydroxyproline), 7.21 (phosphoethanolamine), 8.70 (serine), 8.98 (galactosamine), 9.03 (aspartylglucosamine), 9.09 (asparagine), 9.75 (glycine), 9.91 (glucosamine), 10.46 (glutamine), 11.84 (β-alanine), 12.12 (homoserine), 12.12 (sarcosine), 12.56 (glycylglycine), 13.82 (taurine), 15.92 (histidine), 16.63 (gamma-aminobutyric acid), 17.02 (ammonia), 17.18 (citrulline), 18.23 (glycylhistidine), 18.83 (threonine), 19.88 (alanine), 21.26 (β-aminoisobutyric acid), 22.14 (carnosine), 22.25 (β-amino-n-butyric acid), 23.07 (arginine), 23.40 (methionine sulfone), 26.10 (proline), 26.71 (δ-amino-n-valeric acid), 27.48 (1-methylhistidine), 27.98 (anserine), 28.31 (homocitrulline), 28.36 (3-methylhistidine), 29.35 (4-aminobenzoic acid), 31.00 (ethanolamine), 31.89 (homoarginine), 33.59 (cysteine), 34.03 (gamma-amino-n-butyric acid), 34.03 (glutathionine (oxidized)), 34.14 (levodopa), 34.47 (Tris), 38.55 (4-aminophenylacetic acid), 40.37 (4-aminohippuric acid), 40.70 (glycyltyrosine), 42.29 (tyrosine), 45.38 (valine), 46.97 (methionine), 47.47 (3-hydroxyanthranilic acid), 48.74 (cystathionine), 48.90 (3-hydroxykynurenine), 50.28 (ethylamine), 50.83 (cystine), 51.05 (α-aminophenylacetic acid), 51.71 (glycylleucine), 51.77 (3-amino-3-phenylpropionic acid), 53.14 (isoleucine), 53.42 (alloisoleucine), 53.80 (leucine), 53.97 (cysteine-homocysteine (mixed disulfide)), 54.19 (ethionine), 54.79 (glycylphenylalanine), 56.12 (kynurenine), 56.12 (homocystine), 57.11 (phenylalanine), 57.99 (tryptophan), 58.43 (ornithine), 62.89 (lysine), 65.92 (serotonin)
Internal standard: norleucine (55.07)

OTHER SUBSTANCES

Noninterfering: cadaverine, 2-phenylethylamine

KEY WORDS

derivatization; SPE; ultrafiltrate; plasma; dried blood

SAMPLE

Matrix: ascitic fluid, blood

Sample preparation: 100 μL Plasma or ascitic fluid + 400 μL MeOH, shake gently, let stand at 4° for 10 min, centrifuge at 11600 g for 5 min, remove the supernatant, wash the precipitate with 100 μL MeOH:water 80:20, centrifuge at 11600 g for 5 min, remove the supernatant, wash the precipitate twice more. Combine the supernatants and evaporate them to 30-50 μL at 80°, make up to the original volume with water. Remove a 100 μL aliquot and add it to 100 μL 40 mM pH 9.5 lithium carbonate buffer, add 100 μL 20 mM dansyl chloride in MeCN, stir, let stand at room temperature for 1 h, inject a 10 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm New Guard RP-18

Column: 150 × 4.6 5 μm Supelcosil LC-18

Mobile phase: Gradient. A was MeOH. B was 0.6% acetic acid containing 0.008% triethylamine in water. A:B 30:70 for 20 min, to 40:60 over 5 min, to 50:50 over 25 min, maintain at 50:50 for 5 min, to 65:35 over 10 min, to 75:25 over 5 min, maintain at 75:25 over 5 min.

Flow rate: 1 for 25 min, to 1.5 for 25 min, to 2 over 5 min

Injection volume: 10

Detector: UV 254

CHROMATOGRAM

Retention time: 3 (Cys), 3.5 (Cya), 4.5 (Tau), 12 (Asn), 15 (Gln), 17 (ammonia), 18.5 (Ser), 20 (Asp), 22 (Glu), 25 (Gly), 28 (Thr), 29 (β-alanine), 30 (Ala), 31.5 (GABA), 35.5 (α-ABA), 38 (Pro), 41 (Met), 43 (Val), 46 (Arg), 49 (Trp), 52 (Ile, Phe), 53.5 (Leu), 61 (Cis (bis-derivative)), 65 (Orn (bis-derivative)), 66 (Lys (bis-derivative)), 68 (His (bis-derivative)), 70 (Tyr (bis-derivative))

SAMPLE

Matrix: beverages

Sample preparation: Filter (0.5 μm) wine, add 10 μL filtrate to 90 μL 200 mM pH 8.0 borate buffer containing 4 mM disodium EDTA, add 50 μL 50 mM 4-fluoro-7-nitrobenzofurazan in MeCN, heat at 60° for 5 min, add 850 μL MeOH:acetic acid 99:1, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: C18 (Tosoh)

Column: 250 × 4.6 5 μm Sumichiral OA-2500(R) or OA-2500(S) (1-naphthylglycyl-3,5-dinitrophenylamide silica) (Sumika)

Mobile phase: MeOH containing 4-5 mM citric acid

Flow rate: 0.8

Injection volume: 50

Detector: F ex 470 em 530

CHROMATOGRAM

Limit of detection: 2 nM

OTHER SUBSTANCES
Simultaneous: alanine, asparagine, aspartic acid, glutamic acid, glutamine, isoleucine, leucine, lysine

KEY WORDS
wine; chiral; derivatization

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 1 mL acetone, shake thoroughly, centrifuge at 5000 rpm for 10 min. Remove the supernatant and add it to 1 mL buffer and 5 μL phenylisothiocyanate, heat at 40° for 1 h, add 2 mL benzene (Caution! Benzene is a carcinogen!), shake, centrifuge at 3000 rpm for 3 min, discard the organic phase. Add 1 mL 1 M hydrogen chloride in acetic acid to the aqueous phase and flush the tube with nitrogen, heat at 80° for 50 min, cool, extract with two 10 mL aliquots of dichloromethane. Combine the extracts and evaporate them to dryness, reconstitute the residue with 5 mL dichloro-

methane and evaporate to dryness with a stream of nitrogen, reconstitute with 270 μL mobile phase, shake thoroughly, centrifuge at 3000 rpm for 3 min, inject a 200 μL aliquot of the supernatant. (Prepare the buffer by adding 2 mL 2 M acetic acid to 1.2 mL triethylamine and diluting with 96.8 mL acetone:water 50:50.)

HPLC VARIABLES

Column: 500 × 6 5 μm Lichrosorb Si 100
Mobile phase: n-Hexane:dichloromethane:saturated dichloromethane 25:55:20 (Prepare saturated dichloromethane by stirring 885 mL dichloromethane, 75 mL EtOH, and 40 mL water for 2 h, let stand for 2 h. The organic phase is saturated dichloromethane.)
Flow rate: 2.5
Injection volume: 200
Detector: UV 268

CHROMATOGRAM

Retention time: 4.8 (proline), 5.2 (leucine), 6.0 (valine), 6.2 (phenylalanine), 8.4 (alanine), 9.5 (tryptophan), 11.2 (glycine), 22.0 (tyrosine)

SAMPLE

Matrix: blood
Sample preparation: 50 μL Serum or plasma + 450 μL cold MeOH + 10 μL 1 mM L-α-aminoadipate, vortex, centrifuge at 8700 g for 1 min. Remove the supernatant and evaporate it to dryness under reduced pressure at 45° over 1 h, reconstitute the residue in 25 μL water, 25 μL triethylamine, and 50 μL EtOH, evaporate to dryness under high vacuum over 30 min. Dissolve the residue in 70 μL EtOH, 10 μL water, 10 μL triethylamine, and 10 μL phenylisothiocyanate, let stand at room temperature for 20 min, evaporate to dryness under high vacuum over 1 h, reconstitute with 50 μL buffer, inject a 10 μL aliquot. (Buffer was MeCN:7 mM Na_2HO_4 5:95, adjusted to pH 7.4 with phosphoric acid.)

HPLC VARIABLES

Column: 250 × 4 Bio-sil ODS-5S (Bio-Rad)
Mobile phase: Gradient. A was 50 mM ammonium acetate adjusted to pH 6.8 with phosphoric acid. B was MeCN:100 mM pH 6.8 ammonium acetate 50:50. A:B from 100:0 to 92:8 over 40 min, to 40:60 over 40 min, wash with 0:100 for 15 min, re-equilibrate at initial conditions for 10 min.
Flow rate: 1
Injection volume: 10
Detector: UV 254

CHROMATOGRAM

Retention time: 6 (Asp), 7.5 (Glu), 12.5 (S-carboxmethyl-L-cysteine), 16.5 (OH-Pro), 20 (Ser), 21.5 (Gly), 23 (Asn), 27 (Glu), 35 (Thr), 37 (Ala), 40 (His), 45 (Pro), 49.5 (Arg), 59.5 (Tyr), 60 (Val), 62.5 (Met), 63 (Cys), 67 (Ile), 68 (Leu), 71 (Phe), 73 (Trp), 76 (Lys)
Internal standard: α-aminoadipate (14)
Limit of quantitation: 10 pmole

SAMPLE

Matrix: blood

Sample preparation: Mix plasma with an equal volume of 5% trichloroacetic acid, centrifuge at 12000 rpm for 5 min. Evaporate the supernatant to dryness, reconstitute with 2-methoxyethanol:0.15 N pH 2.65 sodium citrate 7:93, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4 ISC-07/S1504 Li type (strongly acidic cation-exchange resin of styrene-divinylbenzene copolymer with 10% crosslinkage) (Shimadzu)

Mobile phase: Gradient. A was 2-methoxyethanol:0.15 N pH 2.65 sodium citrate 7:93. B was 0.3 N pH 10.0 sodium citrate. C was 200 mM NaOH. A:B:C from 100:0:0 to 95:5:0 over 50 min, to 85:15:0 over 20 min, to 75:25:0 over 10 min, to 55:45:0 (step gradient), maintain at 55:45:0 for 15 min, to 50:50:0 over 10 min, to 40:60:0 (step gradient), to 30:70:0 over 20 min, to 10:90:0 (step gradient), maintain at 10:90:0 for 15 min, to 0:0:100 (step gradient), maintain at 0:0:100 for 5 min. (Parameters are approximate.)

Column temperature: 38° for 40 min, 52° for 65 min, 55° for 20 min, 58° for 10 min, 38° for 50 min

Flow rate: 0.4

Detector: F ex 348 em 450 following post-column reaction. The column effluent mixed with the reagent solution pumped at 0.2 mL/min and the mixture flowed through a 200 × 0.5 stainless steel or PTFE coil at 55°. The effluent from the coil mixed with the fluorescence solution pumped at 0.2 mL/min and flowed through a 2 m × 0.5 mm stainless steel or PTFE coil at 55° to the detector. (Prepare reagent solution by adding 400 μL NaOCl solution (chlorine concentration 10%) to 1 L buffer, discard after 2 weeks. Prepare fluorescence solution by adding 15 mL EtOH containing 1.6 g o-phthalaldehyde and 2.0 g N-acetyl-L-cysteine and 4 mL 10% Brij 35 in water to 980 mL buffer, discard after 1 month. Buffer contained 384 mM sodium carbonate, 216 mM boric acid, and 108 mM potassium sulfate, pH 10.0.)

CHROMATOGRAM

Retention time: 3.5 (phosphoserine), 5 (taurine), 5.5 (phosphoethanolamine), 16.5 (Asp), 22 (Thr), 24 (Ser), 27 (Asn), 28 (Glu), 33.5 (Sar), 40 (aminoadipic acid), 42 (Pro), 45 (Gly), 47 (Ala), 48 (citrulline), 49.5 (aminobutyric acid), 51.5 (Val), 62 (Met), 64 (Cys), 71 (Ile), 74 (Leu), 75 (cystathionine), 76.5 (Tyr), 80 (Phe), 87 (β-alanine), 88 (aminoisobutyric acid), 102.5 (His), 104 (3-methylhistidine), 105.5 (1-methylhistidine), 107.5 (carnosine), 109.5 (anserine), 125.5 (ornithine), 127 (ammonia), 131 (Lys), 145 (Arg)

Limit of quantitation: 10 pmole

SAMPLE

Matrix: blood

Sample preparation: Dried blood. Add paper containing about 20 μL dried blood to 200 μL 500 μM norvaline in MeCN:triethylamine:water 50:25:15, rotate at 60-100 rpm for 30-60 min. Add 20 μL phenylisothiocyanate to the liquid, let stand at room temperature for 20-30 min, add 500 μL 100 mM pH 6.5 sodium acetate buffer, vortex for 30 s, add 2.5

mL dichloromethane, centrifuge, inject a 50 μL aliquot of the aqueous layer. Serum. 20 μL Serum + 200 μL 500 μM norvaline in MeCN:triethylamine:water 50:25:15, mix, centrifuge at 1500 g for 5 min. Add 20 μL phenylisothiocyanate to the supernatant, let stand at room temperature for 20-30 min, add 500 μL 100 mM pH 6.5 sodium acetate buffer, vortex for 30 s, add 2.5 mL dichloromethane, centrifuge, inject a 50 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Zorbax C18
Mobile phase: Gradient. MeCN:100 mM pH 6.5 sodium acetate buffer 15:85 for 1 min, to 28:72 over 7 min, to 60:40 (step gradient), maintain at 60:40 for 5 min, return to initial conditions over 2 min.
Column temperature: 45
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 3 (tyrosine), 8 (phenylalanine)
Internal standard: norvaline (4.5)
Limit of detection: <10 μM

OTHER SUBSTANCES
Noninterfering: other amino acids, bilirubin, lipids, carbamazepine, ethosuximide, phenobarbital, phenytoin, primidone

SAMPLE
Matrix: blood
Sample preparation: 100 μL Plasma + 5 μL 2.5 M homoserine, make up to 500 μL with 2 μL/mL 2-mercaptoethanol in MeCN, vortex, centrifuge for 4 min (Beckman microfuge). Remove a 40 μL aliquot of the supernatant and add it to 40 μL reagent and 20 μL 3.7% iodoacetic acid in 400 mM pH 9.5 sodium borate buffer, mix, let stand for 1 min, make up to 200 μL with 100 mM pH 4 potassium phosphate buffer, mix, inject a 20 μL aliquot. (Reagent was 50 mg o-phthaldialdehyde in 1 mL MeOH added to 11 mL 400 mM pH 9.5 sodium borate buffer, 50 μL 2-mercaptoethanol, and 10 mg nitrilotriacetic acid. Filter (0.2 μm), store in the dark at 4°, add 20 μL 2-mercaptoethanol each week to maintain the level of this reagent.

HPLC VARIABLES
Guard column: 5 μm LiChrospher 100 RP-18
Column: 150 × 4.6 5 μm Dynamax Microsorb C18 (Rainin)
Mobile phase: Gradient. A was MeOH:100 mM pH 6.8 sodium acetate buffer 95:5. B was MeOH:100 mM pH 6.8 sodium acetate buffer 5:95. A:B from 15:85 to 30:70 over 15.5 min, to 55:45 over 9 min, to 60:40 over 2 min, to 100:0 over 8 min, maintain at 100:0 for 3 min, to 0:100 over 4 min, maintain at 0:100 for 3 min, to 15:85 over 1 min, stay at 15:85 for 2 min.
Column temperature: 35
Flow rate: 1.5 for 37.5 min, 1 for 10 min
Injection volume: 20
Detector: F ex 338 em 425

CHROMATOGRAM

Retention time: 6.37 (aspartic acid), 7.72 (glutamic acid), 10.81 (asparagine), 12.25 (serine), 14.20 (glutamine), 15.11 (histidine), 17.75 (glycine), 18.56 (threonine), 20.83 (arginine), 22.60 (taurine), 24.58 (alanine), 25.88 (tyrosine), 31.25 (tryptophan), 31.41 (methionine), 31.90 (valine), 32.75 (phenylalanine), 34.31 (isoleucine), 34.88 (leucine), 36.92 (lysine)
Internal standard: homoserine (16.31)
Limit of quantitation: 31 μM

KEY WORDS

plasma; derivatization

SAMPLE

Matrix: blood
Sample preparation: Filter (Amicon Centrifree) while centrifuging at 1500 g for 15 min, mix 2.5 μL ultrafiltrate with 2.5 μL reagent, add 1 μL 1 mg/mL 9-fluorenylmethyl chloroformate in MeCN, mix, let stand for 2.5 min, inject the whole amount. (Prepare reagent by dissolving 3 mg o-phthalaldehyde in 50 μL MeOH, add 450 μL 0.5 M pH 10.2 sodium borate buffer, add 5 μL 3-mercaptopropionic acid. Derivatization was performed automatically and took 5 min. o-Phthalaldehyde derivatized primary amino acids and 9-fluorenylmethyl chloroformate derivatized secondary amino acids (proline and hydroxyproline).)

HPLC VARIABLES

SAMPLE
Matrix: blood
Sample preparation: 5 μL Plasma + 200 μL 20 mM pH 8.0 phosphate buffer, filter (Advantec Q0100, molecular mass cutoff), inject a 20 μL aliquot of the ultrafiltrate.

HPLC VARIABLES
Column: 150 × 4 5 μm Capcell C18 SG120
Mobile phase: 20 mM pH 7.5 phosphate buffer
Column temperature: 50
Flow rate: 0.4
Injection volume: 20
Detector: chemiluminescence following post-column reaction. The column effluent mixed with 5 mM niacinamide adenine dinucleotide in 20 mM pH 7.0 phosphate buffer pumped at 0.15 mL/min and 5 mM luminol in carbonate buffer pumped at 0.15 mL/min and this mixture flowed through an immobilized-enzyme reactor at 50°. The effluent from the re-

actor mixed with 20 mM potassium hexacyanoferrate(III) in water pumped at 0.4 mL/min and this mixture flowed through a 90 cm × 0.5 mm ID tube to the detector. (The carbonate buffer was 400 mM sodium carbonate containing 400 mM sodium bicarbonate, pH 10.5. Prepare the immobilized enzyme reactor as follows. Wash 1 g 13 μm poly(vinyl alcohol) beads (GS-520, Showa Denko, Tokyo) with 50 mL dry acetone, suspend in 20 mL dry acetone:pyridine 50:50 with vigorous stirring, add 1 mL 2,2,2-trifluoroethanesulfonyl chloride dropwise over 2 min, stir for 10 min, wash beads with 10 mL acetone, wash beads with 20 mL 1 mM HCl, slurry pack in a 50 × 4 column, circulate enzyme solution through the column at 0.2 mL/min for 4 h, monitor the immobilization process at 380 nm. The enzyme solution consisted of 5 mg (325 U) LeuDH (from Bacillus stearothermophilus, Unitika, Osaka) and 5 mg (280 U) NAOD (from Bacillus megaterium, Unitika, Osaka) in 10 mL 100 mM pH 7.0 phosphate buffer. When not in use store the reactor in 5 mM nicotinamide adenine dinucleotide in 20 mM pH 7.0 phosphate buffer at 5°.)

SAMPLE

Matrix: blood, CSF, tissue
Sample preparation: Blood. Mix plasma or whole blood with an equal volume of 0.5% sodium dodecyl sulfate, let stand for 15 min, add 2 volumes of 6% perchloric acid, add norleucine, centrifuge. Remove a 100 μL aliquot of the supernatant and add it to 25 μL buffer, add 125 μL freshly-prepared 2.5 μL/mL 1-naphthyl isocyanate in acetone, mix, let stand for 45 s, add 1 mL cyclohexane, vortex vigorously, discard the cyclohexane layer, repeat the wash twice more, centrifuge the aqueous layer, inject a 20 μL aliquot of the supernatant. CSF. Mix 1 volume of 60% perchloric acid with 20 volumes of CSF, centrifuge. Remove a 100 μL aliquot of the supernatant and add it to 25 μL buffer, add 125 μL freshly-prepared 2.5 μL/mL 1-naphthyl isocyanate in acetone, mix, let stand for 45 s, add 1 mL cyclohexane, vortex vigorously, discard the cyclohexane layer, repeat the wash twice more, centrifuge the aqueous layer, inject a 20 μL aliquot of the supernatant. Tissue. Homogenize brain tissue with 9 volumes 3% perchloric acid, centrifuge at 9000 g for 3 min. Remove the supernatant and neutralize it with NaOH, add 3 volumes of water, add norleucine. Remove a 100 μL aliquot and add it to 25 μL buffer, add 125 μL freshly-prepared 2.5 μL/mL 1-naphthyl isocyanate in acetone, mix, let stand for 45 s, add 1 mL cyclohexane, vortex vigorously, discard the cyclohexane layer, repeat the wash twice more, centrifuge the aqueous layer, inject a 5 μL aliquot of the supernatant. (Prepare buffer by adjusting the pH of 1 M boric acid to 6.25 with NaOH. Dry acetone over anhydrous sodium sulfate.)

SAMPLE
Matrix: blood, juice, urine
Sample preparation: Serum, urine. 400 μL Serum or urine + 50 μL 30% 5-sulfosalicylic acid + 50 μL 0.52 mM L-homo-Arg, centrifuge at 6000 g. Remove a 2 μL aliquot and add it to 5 μL 0.4 N pH 10.4 sodium borate buffer and 1 μL reagent, mix for 2 min, inject a 7 μL aliquot. Juice. Centrifuge filtered (paper) apple juice at 1650 g, remove a 1 mL aliquot and add it to 31.3 μL 1.6 mM L-homo-Arg in 100 mM HCl, adjust pH to 2.0 with 2 M HCl, add to a 50 × 10 column of Dowex 50W-X8 cation-exchanger, wash with water, elute with 30 mL 4 M aqueous ammonia, evaporate eluate to dryness, dissolve the residue in 2 mL 100 mM HCl. Remove a 2 μL aliquot and add it to 5 μL 0.4 N pH 10.4 sodium borate buffer and 1 μL reagent, mix for 2 min, inject a 7 μL aliquot. (Reagent was 260 mM N-isobutyryl--L-cysteine and 170 mM o-phthaldialdehyde in 1 M pH 10.4 potassium borate buffer (fluoraldehyde, Pierce) (Chromatographia 1991, 32, 383).)

HPLC VARIABLES
Guard column: 20 × 2.1 5 μm Hypersil ODS

SAMPLE

Matrix: blood, protein

Sample preparation: Plasma. Mix plasma vigorously with 3 volumes MeCN, centrifuge at 12000 g for 3 min, evaporate an aliquot of the supernatant to dryness under reduced pressure, reconstitute with buffer. Remove a 5 μL aliquot and add it to 5 μL 4.16 mg/mL 9-fluorenylmethyl chloroformate in MeCN, mix, let stand for 1.5 min, add 5 μL reagent, mix, let stand for 3.5 min, add 5 μL MeCN:water:acetic acid 80:12:8, mix, inject an aliquot. Protein. Hydrolyse protein with 500 μL 6 M HCl at 110° for 24 h, evaporate to dryness under reduced pressure, add 10 μL triethylamine:EtOH:water 40:40:20, evaporate to dryness, reconstitute with 5 μL buffer, add 5 μL 4.16 mg/mL 9-fluorenylmethyl chloroformate in MeCN, mix, let stand for 1.5 min, add 5 μL reagent, mix, let stand for 3.5 min, add 5 μL MeCN:water:acetic acid 80:12:8, mix, inject an aliquot. (Buffer was 200 mM boric acid adjusted to pH 8.5 with 5 M NaOH. Prepare reagent by mixing 170 μL 850 mM NaOH, 75 μL 500 mM hydroxylamine hydrochloride, and 5 μL 2-(methylthio)ethanol.)

HPLC VARIABLES

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 400 μL Plasma + 100 μL 100 mM dithiothreitol, heat at 37° for 15 min, add 100 μL 150 mg/mL sulfosalicylic acid, mix, let stand at room temperature for 30 min, centrifuge at 4000 g for 15 min, inject a 30 μL aliquot. Urine. 400 μL Urine + 30 μL 100 mM dithiothreitol + 70 μL 300 mM pH 8.5 Tris buffer, mix, heat at 37° for 15 min, add 100 μL 100 mg/mL sulfosalicylic acid, mix, let stand at room temperature for 30 min, centrifuge at 4000 g for 15 min, inject a 30 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 3.2 7 μm G18-013 C18 (Brownlee)

Column: 100 × 3.2 3.2 Velosep RP-18 (Brownlee, Applied Biosystems)

Mobile phase: MeOH:buffer 4.3:100 (Buffer was 16 mM NaH_2PO_4, 19 mM phosphoric acid, and 8 mM octyl sulfate, pH 2.36 ± 0.02. Use a 30 × 3.2 5 μm Brownlee SS-GU silica column before the injector.)

Flow rate: 0.8

Injection volume: 30

Detector: UV 324 following post-column reaction. The effluent from the column mixed with the reagent pumped at 0.4 mL/min and the mixture flowed through a 2 m × 0.5 mm stainless steel coil to the detector. (Prepare reagent by mixing (at 4°) 3 mL 10 mM 4,4'-

dithiopyridine in MeOH:10 mM HCl 3:97 with 300 mL 300 mM Tris base containing 1 mM EDTA (adjusted to pH 8.5 with phosphoric acid). Sparge with helium before use, keep in an ice bath during use.)

CHROMATOGRAM

Retention time: 5.4 (cysteine), 7.2 (glutathione), 10.4 (gamma-glutamylcysteine), 13.2 (cysteinylglycine), 15.9 (homocysteine)

Limit of detection: 50 nM

KEY WORDS

derivatization; plasma; post-column reaction

SAMPLE

Matrix: bulk

Sample preparation: Dissolve 1 mmole amino acid in 10 mL diethyl ether, add 20 mL 1 M NaOH, stir vigorously at 0°, add 2 mmole (1S)-(+)-10-camphorsulfonyl chloride in 30 mL ether dropwise, stir at room temperature for 1 h. Remove the aqueous layer and wash it twice with diethyl ether, acidify the aqueous layer with concentrated HCl, extract with diethyl ether. Dry the organic extract over anhydrous sodium sulfate, evaporate to dryness, reconstitute with 10 mL DMF, add 1 drop trimethylamine, add 1.1 mmole p-nitrobenzyl bromide, heat at 55° for 2 h, dilute with 40 mL chloroform, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness, reconstitute with chloroform, inject an aliquot.

HPLC VARIABLES

Column: 250 × 2.2 10 μm MicroPak-NH2

Mobile phase: Isooctane:dichloromethane:isopropanol 79:16:5

Flow rate: 0.4

Detector: UV 254

CHROMATOGRAM

Retention time: 3.9 (L-leucine), 4.4 (L-isoleucine, D-leucine), 5.0 (D-isoleucine), 6.2 (L-phenylalanine), 7.2 (L-alanine), 7.4 (L-methionine), 9.3 (D-alanine), 8.5 (D-phenylalanine), 10.0 (D-methionine), 12.8 (L-glutamic acid), 16.8 (D-glutamic acid), 29.2 (L-tryptophan), 33.2 (L-tyrosine), 47.2 (D-tyrosine), 49.6 (D-tryptophan)

KEY WORDS

derivatization; chiral; comparison with other derivatizing reagents; details of chromatography with other mobile phases and with a β-cyclodextrin column are also given in the paper

REFERENCE

Tang,Y.; Zukowski,J.; Armstrong,D.W. Investigation on enantiomeric separations of fluorenylmethoxycarbonyl amino acids and peptides by high-performance liquid chromatography using native cyclodextrins as chiral stationary phases, *J.Chromatogr.A*, **1996**, *743*, 261–271.

SAMPLE

Matrix: bulk

Sample preparation: Treat 0.2-10 μmoles amino acids with 50-100 μL MeOH:thionyl chloride 95:5 at 60° for 2 h, evaporate to dryness, reconstitute with 35 μL 28% diisopropylethylamine in DMF, shake at room temperature for 10 min, add 25 μL 200-1000 mM N-α-(9-fluorenylmethyloxycarbonyl)leucine-N-carboxyanhydride in DMF, mix, let stand at room temperature for 10 min, add 200 μL 250 mM pH 8 sodium glycinate, mix, let stand for 5 min, add 300 μL chloroform, extract, dilute 10000-50000-fold with n-hexane, inject a 20 μL aliquot. (Synthesis of N-α-(9-fluorenylmethyloxycarbonyl)leucine-N-carboxyanhydride is as follows. Dry all solvents over 4 Å molecular sieve. Stir 20 mmoles L-leucine in 67 mL THF under nitrogen at 2° in an ice bath, add 22 mmoles 9-fluorenylmethyl chloroformate at once, slowly add 29 mmoles dry 4-methylmorpholine (N-methylmorpholine), stir at 2-5° for 2 h, slowly add 4 M HCl in dioxane (Caution! Dioxane is a carcinogen!) until the pH of a sample diluted with water reaches 4-5, filter, wash the solid with dry THF, concentrate the filtrate under reduced pressure, dissolve the resulting oil in the minimum volume of dry diisopropyl ether (Caution! Diisopropyl ether readily forms explosive peroxides!), add dry hexane until the solution just turns cloudy, let stand at -20° overnight, filter. Wash the solid with dry hexane and dry it under vacuum to obtain N-α-(9-fluorenylmethyloxycarbonyl)leucine-N-carboxyanhydride (mp 118-120°; $[\alpha]^{25}_{D}$ = +38.0°) (J. Am. Chem. Soc. 1990, 112, 7414).)

SAMPLE
Matrix: cell suspensions
Sample preparation: Centrifuge 350 μL cell suspensions at 1470 g for 1 min, add 20 μL 16% trichloroacetic acid to the supernatant, freeze. Thaw the supernatant and adjust its pH to 7.0 with 1 M NaOH, remove a 300 μL aliquot and make up to 400 μL with water, add 100 μL 1 M pH 6.2 boric acid, add 40 μL 10 μM dihydrokainic acid in MeCN:water 10:90, vortex for 10 s, add 500 μL 15 mM 9-fluorenylmethyl chloroformate, mix for 45 s, add 1 mL ethyl acetate, mix for 10 s, centrifuge at 10500 g for 2 min, repeat the ethyl acetate wash, inject an aliquot of the aqueous layer.

HPLC VARIABLES
Column: 250 × 4.6 C18 (Phenomenex)
Mobile phase: Gradient. A was 0.1% trifluoroacetic acid in MeCN. B was 0.1% trifluoroacetic acid in water. A:B from 30:70 to 50:50 over 15 min, to 100:0 over 2 min, maintain at 100:0 for 5 min, return to initial conditions over 2 min, re-equilibrate for 12 min (cf. Int. J. Environ. Anal. Chem. 1990, 38, 351).
Column temperature: 55
Flow rate: 1
Injection volume: 25
Detector: F ex 264 em 313

CHROMATOGRAM
Retention time: 3.5 (taurine), 11 (glutamine), 12.5 (glutamate), 13 (aspartate)
Internal standard: dihydrokainic acid (21)

SAMPLE
Matrix: cheese
Sample preparation: Homogenize (Ultra-Turrax T25) 16 g cheese with 30 mL water at room temperature for 2 min, centrifuge at 4° at 8650 g for 20 min, remove the water and fat layers. Homogenize the pellet in 30 mL water, centrifuge, remove the water and fat layers, repeat this process. Combine the fat layers and homogenize them with 20 mL water, centrifuge, remove the water layer. Combine all the water layers, filter (Whatman No. 42 paper) at 4°, filter (0.45 μm) at 4°, purify on a 200 × 4 Sephadex G-25 column with water at 84 mL/min with detection at UV 206, collect 84 mL fractions. Evaporate a 200 μL aliquot to dryness under reduced pressure, reconstitute with 200 μL 500 mM pH 7.8 borate buffer, add 200 μL 5.8 mM 9-fluorenylmethyl chloroformate in acetone, vortex for 45 s, wash with 400 μL pentane:ethyl acetate 80:20, inject an aliquot of the aqueous phase.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Nucleosil C18

Mobile phase: Gradient. A was MeCN:100 mM pH 3.8 ammonium acetate buffer 20:80. B was MeCN:100 mM pH 4.2 ammonium acetate buffer 80:20. A:B 70:30 for 10 min, to 20:80 over 50 min, to 0:100 (step gradient), maintain at 0:100 for 10 min.
Column temperature: 40
Flow rate: 1
Detector: UV 214

SAMPLE

Matrix: collagen

Sample preparation: Hydrolyze protein with 6 M HCl under nitrogen at 108° for 24 h, evaporate to dryness under reduced pressure, reconstitute with 100 mM sodium bicarbonate to give a hydrolysate concentration of 1 μg/mL. Remove a 5 μL aliquot and dilute it to 200 μL with 100 mM sodium bicarbonate, add 200 μL 4 mM fluorenylmethyl chloroformate in dry acetone, shake quickly, let stand at room temperature for 10 min, wash twice with 600 μL portions of pentane:ethyl acetate 90:10, inject a 20 μL aliquot of the lower aqueous phase.

HPLC VARIABLES

Column: 150 × 4.6 MicroPak ODS-80TM

Mobile phase: Gradient. A was buffer. B was MeOH:buffer adjusted to pH 4.5 with phosphoric acid 20:80. C was MeCN. A:B:C 72.5:0:27.5 for 4.1 min, to 60:0:40 over 11.5 min, to 0:64:36 over 0.1 min, to 0:62:38 over 6.3 min, to 0:30:70 over 7 min, to 0:25:75 over 5 min, return to initial conditions, re-equilibrate for 11 min. (Buffer was 20 mM sodium citrate containing 5 mM tetramethylammonium chloride, pH 2.85.)

Column temperature: 30

SAMPLE
Matrix: dialysate, tissue
Sample preparation: Homogenize (Kontes micro-ultrasonic cell disrupter) rat brain with 100 μL 50 mM ice-cold perchloric acid and 10 ng homoserine for 5 s, centrifuge at 4° at 13000 g for 5 min, filter (0.2 μm) the supernatant. Mix 25 μL of the filtrate from the tissue or dialysate (Ringer's) with 50 (tissue) or 12.5 (dialysate) μL working reagent, let stand for 2 min, inject an aliquot. (Prepare the reagent stock solution by dissolving 27 mg o-phthalaldehyde in 1 mL MeOH, add 5 μL β-mercaptoethanol, add 9 mL 100 mM pH 9.3 sodium tetraborate, discard after 5 days. Prepare the working reagent by diluting 1 mL stock solution with 3 mL 100 mM sodium tetraborate, let stand for 24 h before use.)

HPLC VARIABLES
Column: 80 × 4.6 3 μm C18 HR-80 (ESA)
Mobile phase: MeOH:water 28:72 containing 100 mM Na_2HPO_4 and 0.13 mM disodium EDTA adjusted to pH 6.00 (tissue) or pH 6.40 (dialysate) with phosphoric acid. (Prepare by dissolving 14.2 g Na_2HPO_4 and 50 mg disodium EDTA in 720 mL water, add 280 mL MeOH, adjust pH. Recycle mobile phase.)
Flow rate: 1.2
Injection volume: 20
Detector: E, ESA Model 5100A coulometric, model 5011 dual electrode analytical cell preceded by a 0.2 μm carbon filter at -0.4 V and +0.6 V

SAMPLE

Matrix: fermentation solutions
Sample preparation: Wash 7.5 g broth on a 150 μm nylon mesh with ice-cold 0.8% NaCl, float cells in saline, wash cells with ice water, cool cells in ice, add 5 mL water, add 500 μL 1 M 4-morpholinepropanesulfonic acid buffer, sonicate for 15 s, shake for 30 s, sonicate for 15 s, filter 0.45 μm, filter (10 000 MW cutoff filter) while centrifuging. Add a 200 μL aliquot of the filtrate to a 15 × 8 column of quaternary ion-exchange resin, wash with 10 mL water, elute with 10 mL 1 M acetic acid, freeze dry, reconstitute with 200 μL water. Mix 20 μL solution with 5 μL reagent, let stand for 2-3 min, add 475 μL 50 mM pH 5.2 sodium acetate (Anal.Biochem. 1984, 137, 405), filter (0.45 μm), inject an aliquot of the filtrate. (Prepare reagent by dissolving 4 mg o-phthaldialdehyde in 300 μL MeOH, add 250 μL 400 mM pH 8.0 borate buffer, add 390 μL water, add 60 μL 1 M N-acetyl-L-cysteine (adjusted to pH 5.0-6.0 with NaOH). Store at 4°, discard after 3 weeks (Anal.Biochem. 1984, 137, 405).)

HPLC VARIABLES

Column: 150 × 5 3 μm Hypersil ODS
Mobile phase: Gradient. A was 50 mM pH 5.9 sodium acetate. B was MeOH:50 mM pH 5.9 sodium acetate 80:20. A:B from 100:0 to 0:100 over 50 min (?).
Flow rate: 1
Detector: F ex 330-375 em 418 (cut-off filter)

CHROMATOGRAM

Retention time: 3.5 (glutathione), 4 (L-Asp), 4.5 (L-Glu), 5.8 (L-Ser), 9.5 (L-α-aminoadipic acid), 10.5 (D-α-aminoadipic acid), 11 (L-His), 11.5 (L-Thr), 12 (Gly), 19 (L-Arg), 22.5 (A-Ala), 27 (cephalosporin C), 28 (L-Tyr), 28 (penicillin N), 28.5 (isopenicillin N), 32.5 (L-Val), 34.5 (L-Met), 35 (D-Val), 39 (L-Phe), 40 (L-Ile), 47.5 (L-Leu), 49 (L-Lys)

SAMPLE
Matrix: formulations
Sample preparation: Dissolve formulations in 10-100 mM HCl, filter, analyze an aliquot. Peptides not containing Cys or Trp. Mix 500 μg peptide with 500 μL 6 M HCl, flush tube with nitrogen, heat at 110 ± 1° for 24 h, evaporate to dryness under a stream of nitrogen, reconstitute with 1 mL 100 mM HCl. Add a 2 μL aliquot to 5 μL 200 mM pH 10.4 borate buffer and 1 μL reagent, mix for 2 min, inject the whole amount. Peptides containing Trp. Hydrolyze 500 μg peptide with 500 μL 4 M methanesulfonic acid at 110° for 24 h, cool, add 500 μL water. Add a 2 μL aliquot to 5 μL 200 mM pH 10.4 borate buffer and 1 μL reagent, mix for 2 min, inject the whole amount. Peptides containing Cys. Dissolve 500 μg peptide in 1 mL formic acid, add 500 μL MeOH, cool to -10°, add 2.5 mL performic acid, let stand at -10° for 2.5 h, evaporate to dryness under reduced pressure, reconstitute with 500 μL 6 M HCl, flush tube with nitrogen, heat at 110 ± 1° for 24 h, evaporate to dryness under a stream of nitrogen, reconstitute with 1 mL 100 mM HCl. Add a 2 μL aliquot to 5 μL 200 mM pH 10.4 borate buffer and 1 μL reagent, mix for 2 min, inject the whole amount. (Prepare performic acid immediately before use by mixing 98% formic acid and 30% hydrogen peroxide in a 98:2 ratio, let stand for 2 h. Reagent was 260 mM N-isobutyryl-L-cysteine and 170 mM o-phthaldialdehydein 1 M potassium borate buffer (Pierce fluoraldehyde diluent).)

SAMPLE
Matrix: hair, protein

Sample preparation: Suspend 10 mg protein or hair in 10 mL 6 M HCl, seal tube under vacuum, heat at 110° for 20 h. Remove a 1 mL aliquot and evaporate it to dryness, dissolve the residue in 1 mL 100 mM HCl, make up to 10 mL with water, filter (Adovantex DISMIC-13cp), dilute the filtrate 10-fold with water. Place a 100 μL aliquot of 100 μg/mL solution of 1-methoxycarbonylindolizine-3,5-dicarbaldehyde in ethyl acetate in the bottom of a tube, evaporate to dryness under reduced pressure, add 100 μL reaction buffer, sonicate for 30 s, add 20 μL protein hydrolysate, mix well, let stand for 20 min in the dark, inject a 10 μL aliquot. (Prepare phosphate-borate buffer by mixing equal volumes of 20 mM NaH_2PO_4 and 20 mM sodium tetraborate, adjust pH to 10 with 1 M NaOH. Prepare reaction buffer by mixing equal volumes of EtOH and phosphate-borate buffer. Prepare reagent (1-methoxycarbonylindolizine-3,5-dicarbaldehyde) as follows. Reflux 21.4 g 2-pyridinecarboxaldehyde, 24 mL ethylene glycol, 10 g p-toluenesulfonic acid, and 300 mL benzene (Caution! Benzene is a carcinogen!) under a Dean-Stark separator for 64 h, pour into concentrated sodium carbonate solution. Remove the organic layer and extract the aqueous layer 4 times with benzene. Combine the organic layers and wash them with water, dry over anhydrous magnesium sulfate, evaporate, distil the residue to give 2-(1,3-dioxolan-2-yl)pyridine (bp 122°/4 mm Hg) (J.Org.Chem. 1963, 28, 83). Reflux 15.1 g 2-(1,3-dioxolan-2-yl)pyridine and 19.5 g tert-butyl bromoacetate in 100 mL dry acetonitrile for 7 h,let stand overnight at room temperature, filter, wash the precipitate with diethyl ether to give 1-(tert-butoxycarbonylmethyl)-2-(1,3-dioxolan-2-yl)pyridinium bromide (mp 110-2° from MeCN). Suspend 51.9 g of this compound in 1.5 L THF with stirring, add 62.1 g potassium carbonate, add 15.12 g methyl propiolate, stir at room temperature for 9 days, filter, evaporate the filtrate to dryness under reduced pressure, chromatograph the residue on silica gel with hexane:ethyl acetate 20:1-10:1, collect fractions and evaporate to dryness to give methyl 3-tert-butoxycarbonyl-5-(1,3-dioxolan-2-yl)indolizine-1-carboxylate (mp 138-9° from hexane). Reflux 20.82 g of this compound in 600 mL THF and 60 mL 10% HCl for 6 h, concentrate to one quarter of the original volume, add water, extract with chloroform. Wash the chloroform layer with water and dry it over anhydrous sodium sulfate, evaporate, chromatograph on silica gel with hexane:ethyl acetate 10:1 to give 1-methoxycarbonylindolizine-5-carbaldehyde (mp 135-7° from MeOH). Stir 12.18 g of this compound in 116 mL dry DMF at 0° under argon, add 17 mL phosphorus oxychloride, stir at room temperature for 1 h, pour into water, adjust pH to 9.0 with 5% potassium carbonate, extract with chloroform. Wash the organic layer with water and dry it over anhydrous sodium sulfate, concentrate until a precipitate forms, filter to obtain the product, concentrate the filtrate and chromatograph the residue on silica gel with hexane:ethyl acetate 5:1 to obtain more product. The product was 1-methoxycarbonylindolizine-3,5-dicarbaldehyde (mp 164-5° from methyl acetate).)

SAMPLE

Matrix: peptides

Sample preparation: Heat 60 nmole peptide with 100 μL acetic anhydride at 50° for 10 min, evaporate to dryness under reduced pressure, reconstitute with 100 μL water:triethylamine 98:2, let stand at 25° for 5 min, evaporate to dryness under reduced pressure, reconstitute with 40 μL anhydrous MeCN, add 10 μL pyridine, add 60 μL 1 mM diphenyl phosphoroisothiocyanate in MeCN, heat at 50° for 30 min, evaporate to dryness under reduced pressure, reconstitute with 100 μL 0.1% trifluoroacetic acid in water, inject an aliquot. (Synthesis of diphenyl phosphoroisothiocyanate is as follows. Add 50.1 g diphenyl chlorophosphate to a solution of 19.3 g potassium thiocyanate in 200 mL MeCN, shake for 3 h, let stand for 3 h, dilute with 300 mL dry benzene (Caution! Benzene is a carcinogen!), filter, evaporate the filtrate, distil the residue to give diphenyl phosphoroisothiocyanate (bp 105°/0.1 mm Hg) (J. Chem. Soc. 1953, 673).)

HPLC VARIABLES

Column: 250 × 2.0 3 μm Reliasil C18 (Column Engineering, Ontario CA)

Mobile phase: Gradient. A was 0.1% trifluoroacetic acid in water. B was MeCN:MeOH: water 80:10:10. A:B 100:0 for 2 min, to 96:4 over 3 min, to 65:35 over 35 min, to 50:50 over 10 min, return to initial conditions over 2 min.

Detector: UV 265

CHROMATOGRAM

Retention time: 7 (asparagine), 8 (glycine), 10 (aspartic acid), 12.5 (glutamine), 13.5 (histidine), 14 (alanine), 15.5 (glutamic acid), 17 (serine), 19 (arginine), 21 (cysteine), 23 (lysine), 23.5 (threonine), 26 (valine), 28 (tyrosine), 28.5 (methionine), 35.5 (isoleucine), 38 (leucine), 41 (phenylalanine), 44 (tryptophan)

SAMPLE

Matrix: peptides

Sample preparation: Dry a solution containing 1 μg peptide under vacuum, add 200 μL 0.06% phenol in constant-boiling HCl, evacuate and purge with nitrogen 3 times, evacuate and seal, heat at 114° for 22 h, cool, evaporate to dryness under reduced pressure, reconstitute with 20 μL 20 mM HCl, add 60 μL 200 mM pH 8.8 sodium borate containing 5 mM EDTA, add 20 μL 3 mg/mL 6-aminoquinolyl-N-hydroxysuccinimidyl carbamate) in MeCN, inject an aliquot. (6-Aminoquinolyl-N-hydroxysuccinimidyl carbamate can be purchased from Waters or synthesized as follows. Reflux 3 g N,N'-succinimidyl carbonate in

100 mL dry MeCN, add 1.5 g 6-aminoquinoline in 50 mL dry MeCN dropwise over 30 min, reflux for 30 min, evaporate to half volume under reduced pressure, cool for 24 h, filter, wash the solid with cold MeCN, recrystallize from MeCN to obtain 6-aminoquinolyl-N-hydroxysuccinimidyl carbamate as off-white crystals (mp 210-215° (d)) (Anal. Biochem. 1993, 211, 279).)

HPLC VARIABLES

Column: 150 × 3.9 Nova-Pak C18

Mobile phase: Gradient. MeCN:buffer:water 0:100:0 for 0.5 min, to 1:99:0 (step gradient), to 5:95:0 over 17.5 min, to 9:91:0 over 1 min, to 17:83:0 over 10.5 min, to 32:68:0 over 3.5 min, to 60:0:40 (step gradient), maintain at 60:0:40 for 3 min, re-equilibrate at initial conditions for 9 min. (Buffer was 140 mM sodium acetate containing 17 mM triethylamine and 3 mM EDTA, adjusted to pH 5.05 with phosphoric acid.)

Column temperature: 37

Flow rate: 1

Detector: F ex 250 em 395

CHROMATOGRAM

Retention time: 14 (Asp), 15 (Ser), 16 (Glu), 17 (Gly), 17.5 (His), 19 (ammonia), 21.8 (Arg), 22 (Thr), 23 (Ala), 24 (Pro), 26.8 (Cys), 27 (Tyr), 28.3 (Val), 28.7 (Met), 30.7 (Lys), 31.8 (Ile), 32.5 (Leu), 33.5 (Phe)

Limit of detection: 38-794 fmole

KEY WORDS

derivatization; procedure can also be used to derivatize peptides; changes to the gradient are required.

SAMPLE

Matrix: peptides

Sample preparation: Lyophilize 100 μL peptide solution, add 100 μL 6 M HCl, heat at 105° in a sealed glass tube for 16 h, lyophilize 50 μL of the hydrolyzate, reconstitute with 15 μL 200 mM pH 8.5 sodium bicarbonate solution, add 15 μL 0.015% acenaphthene-5-sulfonyl chloride in dry acetone, mix, heat at 47° for 30 min, cool, add 100 μL 2% ethylamine, inject a 20 μL aliquot. (Preparation of acenaphthene-5-sulfonyl chloride is as follows. Dissolve 20 g acenaphthene in 100 g nitrobenzene, cool to 0°, add 9 mL chlorosulfonic acid dropwise with stirring, maintain the temperature below 5°, when the addition is complete allow the temperature to rise to 20° over 30 min, add 500 mL water. Remove the aqueous layer and neutralize it with solid sodium carbonate, heat and add NaCl until precipitation occurs, cool in an ice bath for 1 h, filter, heat at 140° to remove traces of water and nitrobenzene to give acenaphthene-5-sulfonic acid sodium salt as a pale yellow solid (mp >300°). Grind 10 g acenaphthene-5-sulfonic acid sodium salt with 3.5 g phosphorus pentachloride in a mortar for 3 min, add ice and water, extract with 100 mL ethyl acetate. Wash the ethyl acetate layer with 5% sodium bicarbonate and with water until neutral, dry over anhydrous sodium sulfate, evaporate the ethyl acetate under a stream of nitrogen, chromatograph on a 300 × 20 column of silica gel H with toluene to give acenaphthene-5-sulfonyl chloride (mp 98-101°) as the first yellow band to elute.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Hypersil C18

Mobile phase: Gradient. A was THF:10 mM pH 4.2 acetate buffer 5:95. B was THF:MeCN 10:90. A:B from 90:10 to 60:40 over 30 min, maintain at 60:40 for 15 min, 0:100 for 3 min.

SAMPLE

Matrix: peptides
Sample preparation: Vortex 10 μL of a 50-100 μM solution of a dipeptide in pyridine: water 50:50 with 10 μL 20 mM 7-N,N-dimethylaminosulfonyl-4-(2,1,3-benzoxadiazolyl)

isothiocyanate in pyridine:water 50:50, heat at 50° for 15 min, wash 3 times with 100 μL portions of n-heptane:dichloromethane 80:20. Evaporate the aqueous layer to dryness at 50° for 15 min, add 30 μL 1% boron trifluoride in dichloromethane containing 0.02% ethanethiol, heat at 50° for 5 min, evaporate to dryness under a stream of nitrogen, add 20 μL water, add 100 μL n-heptane:dichloromethane 70:30, mix, centrifuge at 1000 g for 5 min, repeat the extraction 3 times. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in MeCN, inject an aliquot. (Synthesis of 7-N,N-dimethylaminosulfonyl-4-(2,1,3-benzoxadiazolyl) isothiocyanate is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ tlc plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Add 100 μL 28% ammonia in water to 50 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 15 mL MeCN, stir at room temperature overnight, filter, evaporate the filtrate to dryness under reduced pressure, recrystallize from MeCN to give 4-amino-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as pale yellow needles (mp 214-217°). Add 1 mL 30% thiophosgene in benzene dropwise to 200 mg 4-amino-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 15 mL MeCN, reflux for 5 h, concentrate under reduced pressure, extract the residue twice with 20 mL portions of chloroform. Combine the chloroform layers, filter, evaporate the filtrate to dryness, chromatograph the residue on 15 g silica gel G-200 with chloroform. Collect the fraction containing the product and evaporate it to dryness under reduced pressure, recrystallize from benzene/n-hexane to obtain 7-N,N-dimethylaminosulfonyl-4-(2,1,3- benzoxadiazolyl) isothiocyanate as pale yellow-white crystals (mp 122-124°; yield 26%) (Biomed. Chromatogr. 1993, 7, 56).)

SAMPLE
Matrix: perfusate
Sample preparation: Add L-norvaline to a concentration of 750 μM, remove a 1 mL aliquot and add it to 75 μL ice-cold 60% perchloric acid, centrifuge, neutralize supernatant with 200 mM potassium carbonate, add (?) 0.5 M potassium carbonate:potassium hydrogen carbonate 30:70, adjust pH to 9.40-9.50 with 5 M KOH. Remove a 200 μL aliquot and add it to 100 μL 1.25 mg/mL dansyl chloride in MeCN, let stand at room temperature in the dark for 1 h, add 6 μL 0.2% triethylamine in water, add acetic acid to a final concentration of 3%, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 Biosil ODS-5S microguard refill cartridge (Biorad)
Column: 250 × 4 Biosil C18 ODS-5S (Biorad)
Mobile phase: Gradient. A was MeOH:water 15:85 containing 1% glacial acetic acid and 0.030% triethylamine. B was MeOH:MeCN 70:30 containing 3% glacial acetic acid and

0.030% triethylamine. A:B from 70:30 to 50:50 over 52 min, to 25:75 over 21 min, maintain at 25:75 for 5 min, reset to initial conditions over 7 min.

SAMPLE

Matrix: protein

Sample preparation: Treat 10 nmoles protein immobilized on 5 mg p-phenylenediisothiocyanate glass with 20 mg thio-acetylated glass beads (Sigma), 500 μL 10% thioacetylthioglycolic acid in MeOH, and 200 μL 20% triethylamine in MeOH with constant agitation at 45° for 30 min, wash with 2 mL 20% triethylamine in MeOH, wash with 3 mL MeOH, wash with 3 mL dichloromethane, dry under vacuum for 15 min, add 500 μL trifluoroacetic acid, let stand at room temperature for 15 min. Remove the acid, wash the solid three times with 200 μL portions of dichloromethane. Combine the acid and the washes and add 100 μL 4-nitrobenzenesulfonyl chloride (2.5 eq) in dichloromethane. Evaporate to dryness under a stream of nitrogen at 35°, reconstitute the residue in 500 μL dichloromethane, add 50 μL 20% triethylamine in dichloromethane, concentrate immediately under reduced pressure, reconstitute, inject a 20 μL aliquot. (Synthesis of thioacetylthioglycolic acid is as follows. Reflux 8.8 g acetaldehyde, 30 mL piperidine, and 9.6 g sulfur for 1 h, cool, add water, acidify with concentrated HCl, crush the solid, wash with water, recrystallize from 200 mL EtOH to give thioacetylpiperidine (mp 55-56°). Dissolve 10 g thioacetylpiperidine in 50 mL dry benzene (Caution! Benzene is a carcinogen!), add 10.7 g bromoacetic acid, let stand at room temperature for 24 h, add 150 mL dry ether, recrystallize from EtOH/ether to give S-carboxyethylthiomethylpiperidinium bromide (mp 168-169°). Dissolve 10.1 g S-carboxyethylthiomethylpiperidinium bromide in 40 mL EtOH, cool in ice, pass hydrogen sulfide through the solution at 2-3 bubbles/s for 3-4 h (Caution! Hydrogen sulfide is highly toxic!), let stand overnight at 0°, remove EtOH by evaporation under reduced pressure, repeatedly extract the residue with ether until it is colorless. Evaporate the ether solution to dryness under reduced pressure, recrystallize from light petroleum (bp 60-100°) to obtain thioacetylthioglycolic acid (mp 80-81°) (Acta Chem. Scand. 1961, 15, 1087). 4-Acetylmorpholine can also be used as the starting reagent (Anal. Biochem. 1989, 181, 113).)

HPLC VARIABLES

Column: 150 × 4.6 5 μm IBM C18

Mobile phase: Gradient. MeCN:MeOH:buffer from 35:0:65 to 42:0:58 over 4.9 min, to 36:9:55 over 0.1 min, to 60:15:25 over 10 min, maintain at 60:15:25 for 2 min, to 35:0:65 over 0.1 min, maintain at 35:0:65 for 3.9 min. (Prepare buffer by dissolving 10 mL acetic acid, 4 mL triethylamine, and 2 mL trifluoroacetic acid, pH 3.1.)

Flow rate: 1.5

SAMPLE

Matrix: protein
Sample preparation: Dissolve 1 mg protein in 2 mL 6 M HCl, heat in a sealed tube at 90° for 12 h, evaporate to dryness under reduced pressure, reconstitute with 2 mL water. Mix 25 μL hydrolyzate, 25 μL pH 9.1 saturated sodium borate, 25 μL 20 mM cetyltrimethylammonium bromide, 12.5 μL MeCN, and 10 mg polymeric reagent, heat at 70° for 10 min, elute with 1 mL MeCN:water 70:30, inject a 20 μL aliquot of the eluate. (Prepare polymeric reagent as follows. Soxhlet extract styrene-divinylbenzene copolymer (12% cross-linked, 60 Å templated, 10-20 μm, Supelco) with dioxane for 8 h (Caution! Dioxane is a carcinogen!). Add 25 g aluminum trichloride in 300 mL dry nitrobenzene to 50 g resin and 100 g 4-chloro-3-nitrobenzoyl chloride, stir mechanically at 60° for 5 h, pour into a mixture of 150 mL DMF, 100 mL concentrated HCl, and 150 g ice, filter. Wash the solid with 300 mL portions of DMF:water 75:25 until the washings are colorless, wash with warm (60°) DMF, wash with six 300 mL portions of dichloromethane:MeOH 2:1. Stir the product in 130 mL 40% benzyltrimethylammonium hydroxide in water, 130 mL water, and 260 mL dioxane at 90° for 8 h, filter, repeat the process. Wash the product with four portions of warm (60°) dioxane. Stir the solid with 30 mL acetic acid for 15 min, filter. Wash the solid with dioxane until the washings are neutral, wash with six 300 mL portions of dichloromethane:MeOH 2:1 to give a nitrobenzophenol-substituted polymer (J. Org. Chem. 1984, 49, 924). Heat 4 g 9-fluoreneacetic acid, 3.9 mL oxalyl chloride, 30 mL benzene (dried over anhydrous sodium sulfate, Caution! Benzene is a carcinogen!), and 3 drops of triethylamine at 55° for 1 h, evaporate under reduced pressure to remove oxalyl chloride, dissolve the product in 35 mL dichloromethane to give a 120 mg/mL solution of 9-fluoreneacetyl chloride, dilute to obtain a 2 mM solution. Stir 1.3 g nitrobenzophenol-substituted polymer, 4.2 mL 2 mM 9-fluoreneacetyl chloride solution, 300 μL triethylamine, and 20 mL dichloromethane at room temperature for 1 h, filter, wash with three 20 mL portions of MeCN to obtain the reagent, polymer-bound nitrobenzophenol 9-fluoreneacetate (J. Chromatogr. 1992, 609, 103).)

SAMPLE
Matrix: protein
Sample preparation: Heat 50 μg protein with 200 μL 6 M HCl and 1 crystal of phenol at 153° for 1 h, evaporate to dryness under reduced pressure, reconstitute with water. Mix 25 μL hydrolyzate, 25 μL saturated sodium borate, 25 μL 20 mM cetyltrimethylammonium bromide, 12.5 μL MeCN, and 15 mg polymeric 6-aminoquinoline reagent, heat at 70° for 10 min, elute with 1 mL MeCN:water 70:30, inject a 20 μL aliquot of the eluate. (Prepare polymeric 6-aminoquinoline reagent as follows. React 10 g 4-chloro-3-nitrobenzyl alcohol, 10 g dried 16-20 μm styrene-divinylbenzene copolymer (12% cross-linked, 102 Å templated, Supelco), and 10 g anhydrous aluminum chloride in 50 mL nitrobenzene at 65-70° for 3 days, cool to room temperature, filter, wash with three 50 mL portions of 1 M HCl in dioxane (Caution! Dioxane is a carcinogen!), wash with three 50 mL portions of DMF, wash with three 50 mL portions of MeOH, wash with three 50 mL portions of dichloromethane, dry under reduced pressure at 100°. Reflux 19 g of this polymer in 60 mL hydrazine hydrate:2-ethoxyethanol 40:60 for 20 h, cool to room temperature, filter, wash thoroughly with water, suspend the polymer in 100 mL concentrated aqueous HCl: dioxane 50:50, reflux for 20 h, filter, wash with five 100 mL portions of water, wash with three 100 mL portions of MeOH, wash with three 50 mL portions of ether, dry under reduced pressure at 80° to obtain polymeric benzotriazole reagent (Eur. J. Biochem. 1975, 59, 55). Heat 1.6 g quinoline-6-carboxylic acid (ICN Biomedicals, Costa Mesa CA) with 2.7 mL thionyl chloride in 55 mL dry benzene at 65-75° for 1 h (Caution! Benzene is a carcinogen!), remove the benzene by evaporation under reduced pressure, add 21 mL acetic acid, stir strongly for several min, slowly add 600 mg sodium azide at room temperature, stir for 1 h, add 53 mL triethylamine, add 100 mL water, stir for 30 min, filter, wash ten times with 25 mL portions of water, dry under vacuum overnight to obtain quinoline-6-acyl azide. Heat 3.3 g polymeric benzotriazole reagent and 2 g quinoline-6-acyl azide in 150 mL toluene (dried over calcium hydride) at 60-65° for 2 h, wash with 600 mL warm (40°) dichloromethane, wash with 50 mL MeCN, dry under vacuum overnight to obtain polymeric 6-aminoquinoline reagent.)

HPLC VARIABLES
Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: Gradient. A was 140 mM sodium acetate containing 17 mM triethylamine, adjusted to pH 5.05 with phosphoric acid. B was MeCN:water 60:40. A:B from 100:0 to 50:50 over 30 min, to 0:100 (step gradient), maintain at 0:100 for 5 min, return to initial conditions, re-equilibrate at initial conditions for 10 min.

SAMPLE

Matrix: solutions

Sample preparation: Mix amino acid solution with 2 mL freshly-prepared buffer, add 5 mL 10 ppm p-N,N-dimethylaminophenylisothiocyanate in acetone, purge tube with nitrogen, heat at 50° for 20 min, add 5 mL acid solution, purge with nitrogen, heat at 50° for 20 min, let stand for 20 min, evaporate to dryness under reduced pressure, wash the residue several times with isooctane, reconstitute with 100 mM pH 2 phosphate buffer, inject a 10 μL aliquot. (Prepare the buffer by mixing 50 mL water, 50 mL acetone, 5 mL 200 mM acetic acid, 1 mL triethylamine, and enough pyridine to adjust the pH to 9.5. Prepare the acid solution by mixing equal volumes of water and glacial acetic acid saturated with HCl. Synthesis of p-N,N-dimethylaminophenylisothiocyanate is as follows. Add 150 mL water containing 33 g sodium carbonate and 24 g thiophosgene to 60 mmoles N,N-dimethyl-1,4-phenylenediamine (p-N,N-dimethylaminoaniline) in 100 mL EtOH:water 50:50 with vigorous stirring, stir at room temperature for 2 h, extract with dichloromethane. Dry the organic layer and evaporate it to dryness under reduced pressure to obtain p-N,N-dimethylaminophenylisothiocyanate as an oil.)

HPLC VARIABLES

Column: 250 × 4.6 10 μm RP-8 (Hewlett-Packard)

Mobile phase: MeCN:18.13 g/L KH_2PO_4 25:75, adjusted to pH 2 with sulfuric acid or KOH

Flow rate: 2.5

Injection volume: 10

Detector: E, Bioanalytical Systems LC-4, TL-5 glassy carbon flow-cell 0.85 V, Ag/AgCl reference electrode

CHROMATOGRAM

Retention time: 4 (Cys), 5 (Asp), 6 (CysCys), 7 (Asn), 9.5 (Ser), 10 (Glu), 10.5 (Gln), 15 (Thr), 18 (Gly), 19 (His), 20 (Ala), 22 (Arg), 25 (Met), 29 (Pro), 34 (Val), 42 (Trp), 49 (Phe), 53 (Tyr), 61 (Lys), 70 (Ile), 74 (Leu)

Limit of detection: 0.2-0.6 ng

SAMPLE

Matrix: solutions

Sample preparation: Add 50 μL of a 50 mM solution in water to 100 μL 1% Nα-(2,4-dinitro-5-fluorophenyl)-L-alaninamide (Marfey's Reagent) in acetone, mix, add 20 μL 1 M sodium bicarbonate, mix at 30-40° for 1 h, cool to room temperature, add 10 μL 2 M HCl, mix, dry in a vacuum desiccator over NaOH, reconstitute with 500 μL DMSO, inject a 5-10 μL aliquot.

HPLC VARIABLES

Column: 100 × 8 C18 (Waters)

Mobile phase: Gradient. MeCN:50 mM pH 3.0 triethylammonium phosphate from 10:90 to 50:50 over 1 h.

Flow rate: 2

Injection volume: 5-10

Detector: UV 340

CHROMATOGRAM

Retention time: 17.68 (L-Asp), 19.40 (L-Glu), 20.28 (D-Asp), 21.40 (L-Ala), 22.71 (D-Glu), 26.72 (D-Ala), 28.21 (L-Met), 34.66 (D-Met), 35.82 (L-Phe), 41.22 (D-Phe)

SAMPLE
Matrix: solutions
Sample preparation: Evaporate a 500 μL aliquot of an aqueous solution containing 25 μmoles amino acids to dryness under a stream of air at 37°, reconstitute with 250 μL 1 M sodium bicarbonate solution, add 500 μL 1% 2,4-dinitrofluorobenzene in acetone, mix, heat at 50° for 1 h, cool to room temperature, add 200 μL 2 M HCl, dry in a vacuum desiccator over NaOH, reconstitute in 1 mL MeOH, pass dry HCl gas through the solution for 5 min, cap the vial, let stand for 3 h, evaporate to dryness, dry in a vacuum desiccator over NaOH, reconstitute in 400 μL DMSO. Remove a 50 μL aliquot and add it to 200 μL 50 mM pH 7.5 HEPES buffer, add 50 μL 10.6 mg/mL carboxypeptidase-Y (Carlsberg Biotechnology) in water, mix, let stand at room temperature for 3 h, add 300 μL DMSO, inject a 25 μL aliquot. (All amino acids are converted to their dinitrophenyl methyl ester derivatives. The enzyme hydrolyses only L-amino acid methyl esters (at the α-position) and so D-amino acids (methyl ester at the α-position) can be distinguished from L-amino acids (carboxylic acid at the α-position). Methyl esters of carboxylic acid groups other than α are not affected. No racemization occurs during derivatization and so the procedure can be used to assess racemization reactions.)

HPLC VARIABLES
Column: 100 × 8 radial compression C18 (Waters)
Mobile phase: Gradient. MeCN:50 mM pH 3.0 triethylammonium phosphate buffer from 25:75 to 50:50 over 40 min.
Flow rate: 2
Injection volume: 25
Detector: UV 350

CHROMATOGRAM
Retention time: 8.10 (β-methoxy-L-Asp), 8.76 (L-Ala), 9.93 (gamma-methoxy-L-Glu), 15.93 (L-Met), 20.91 (dimethoxy-D-Asp), 22.75 (methoxy-D-Ala), 23.78 (L-Phe), 24.68 (dimethoxy-D-Glu), 32.58 (methoxy-D-Met), 39.59 (methoxy-D-Phe)

SAMPLE

Matrix: solutions

Sample preparation: Mix 500 μL of a 10 μM solution of amino acids in 100 mM pH 9.3 borax buffer containing 1 mM disodium EDTA with 500 μL 20 mM DBD-F in MeCN, heat at 50° for 30 min, cool in ice, inject a 1-10 μL aliquot. (Synthesis of DBD-F is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 60F_{254} tlc plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei (TCI America, Portland OR).)

SAMPLE

Matrix: solutions

Sample preparation: Mix 50 μL of a 200 ppm solution in MeCN:50 mM NaOH 80:20 with 30 mg reagent, after 2 min elute with 500 μL MeCN, add 500 μL water to the eluate,

mix, inject a 20 μL aliquot. (The reagent was dinitrobenzoylbenzotriazole polymeric reagent, synthesized as follows. (Caution! Chloroform, dichloromethane, dioxane, and hydrazine are carcinogenic in experimental animals! DMF may be carcinogenic! 3,5-Dinitrobenzoyl chloride and aluminum chloride are corrosive! Nitrobenzene is toxic!) 10 g Dried macroporous polystyrene (Xe-305, Rohm and Haas) + 10 g 3-nitro-4-chlorobenzyl alcohol + 10 g anhydrous aluminum chloride + 50 mL nitrobenzene, heat at 65-70° for 3 days, cool, filter, wash polymer with three 50 mL portions of 1 M HCl in dioxane, with three 50 mL portions of DMF, with three 50 mL portions of MeOH, and with three 50 mL portions of dichloromethane, dry under vacuum at 100°. Reflux 19 g of this polymer in 60 mL hydrazine hydrate:ethylene glycol monoethyl ether 40:60 for 20 h, cool to room temperature, filter off the polymer and wash it thoroughly with water. Suspend the polymer in 100 mL concentrated HCl:dioxane 50:50, reflux for 20 h, filter the polymer and wash it with five 100 mL portions of water, with three 100 mL portions of MeOH, and with three 50 mL portions of ether, dry under vacuum at 80°. Functionalization was 1.17 mmoles/g (Eur.J.Biochem. 1975, 59, 55). Add a portion of polymer to dry chloroform, add a three-fold excess of 3,5-dinitrobenzoyl chloride and pyridine, stir at 0-10° for 30 min, filter off polymer, wash with chloroform to give the reagent (J.Org.Chem. 1984, 49, 922).)

SAMPLE
Matrix: solutions
Sample preparation: Mix 250 μL of a solution of amino acids in 50 mM pH 9.3 borate buffer containing 1 mM disodium EDTA with 250 μL 1 mM DIFOX in MeCN, let stand in the dark at room temperature for 1 h, add 500 μL MeCN:1 M HCl 50:50, inject an aliquot. (Prepare DIFOX as follows. Gently reflux 21 g benzoin and 45 g urethane (Caution! Urethane is a carcinogen!) in 300 mL DMF for 6 h, cool, pour into water, filter, recrystallize to give 4,5-diphenyl-2-oxazolone (mp 211°), treat with phosphorus oxychloride to give 2-chloro-4,5-diphenyloxazole (Ber. 1956, 89, 1749). Add 3 g anhydrous KF to 1.62 g 2-chloro-4,5-diphenyloxazole in 60 mL MeCN, add 1.5 g 18-crown-6/MeCN complex, reflux for 24 h, cool, filter. Concentrate the filtrate and add 50 mL hexane, stir for 10 min, filter rapidly, repeat the extraction. Combine the filtrates and concentrate them to give a yellow oil, distil to give DIFOX (2-fluoro-4,5-diphenyloxazole) (bp 130°/0.02 mm Hg) (Analyst 1993, 118, 257). Prepare 18-crown-6/MeCN complex by heating 50 g 18-crown-6 in 125 mL MeCN until a homogeneous solution is obtained (use a calcium sulfate drying tube), stir the solution vigorously as it cools to room temperature, cool in a dry ice/acetone bath, filter rapidly, dry under high vacuum at ≤40° over 2-3 h to give 18-crown-6/MeCN complex (mp 36.5-38°) (Caution! The complex is hygroscopic!) (J. Org. Chem. 1974, 39, 2445). No experimental details are given for the phosphorus oxychloride reaction above but a procedure for the p-N,N-dimethylaminosulfonyl analogue proceeds as follows. Suspend 2 g dried 4,5-bis(p-N,N-dimethylaminosulfonylphenyl)-2-oxazolone in 30 mL phosphorus oxychloride, stir at 0°, add 610 μL triethylamine dropwise, heat at 100° for 7 h, remove the excess phosphorus oxychloride on a rotary evaporator. Dissolve the residue in dichloromethane and wash with cold saturated sodium bicarbonate, dry the organic layer over anhydrous magnesium sulfate, evaporate to dryness, chromatograph on silica gel to give 2-chloro-4,5-bis(p-N,N-dimethylaminosulfonylphenyl)oxazole (Analyst 1993, 118, 257).)

HPLC VARIABLES
Column: 250 × 4.6 5 μm LC-8 (Supelco)
Mobile phase: Gradient. A was MeCN:50 mM pH 7.0 phosphate buffer 25:75. B was MeCN: 50 mM pH 7.0 phosphate buffer 50:50. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 30 min.
Flow rate: 1
Detector: F ex 320 em 420

CHROMATOGRAM
Retention time: 6 (aspartic acid), 6.5 (glutamic acid), 9.5 (hydroxyproline), 13.5 (arginine), 15 (proline), 15.5 (glycine), 16 (alanine), 17.5 (tyrosine), 20 (valine), 20.5 (methionine), 21.5 (leucine, isoleucine), 23.5 (tryptophan, phenylalanine), 35 (lysine)
Limit of detection: 19-64 fmole

SAMPLE

Matrix: solutions
Sample preparation: Evaporate a solution of amino acids in 10 mM HCl under a stream of nitrogen at 50°, add 50 μL MeCN, evaporate under a stream of nitrogen, add 50 μL MeCN:MeOH:triethylamine 10:5:2, sonicate for 1 min, add 3 μL butyl isothiocyanate, cap the vial with a septum, heat at 40° for 30 min. Pass nitrogen into the vial with one needle and apply a vacuum with another needle until solvent is removed (ca. 15 min), add 100 μL MeCN, remove MeCN in a similar fashion. Dissolve the residue in 500 μL 200 mM ammonium acetate, filter (0.20 μm), inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 300 × 3.9 4 μm Nova-Pak C18
Mobile phase: Gradient. A was 50 mM ammonium acetate adjusted to pH 6.7 with phosphoric acid. B was MeCN:50 mM ammonium acetate adjusted to pH 6.7 with phosphoric acid 50:50. C was MeCN:water 70:30. A:B:C from 100:0:0 to 85:15:0 over 8 min, to 70:20:10 over 6 min, to 60:20:20 over 6 min, to 20:0:80 over 5 min, to 0:0:100 over 5 min, maintain at 0:0:100 for 5 min.
Column temperature: 40
Flow rate: 1
Injection volume: 10
Detector: UV 250

SAMPLE
Matrix: solutions
Sample preparation: Mix 20 μL of an amino acid solution with 100 μL 500 mM pH 9.0 sodium borate buffer and 250 μL 5 mM 4-phenylazobenzyloxycarbonyl chloride in MeCN, let stand for 5 min, add 250 μL 40 mM 1-aminoadamantane in acetone:water 75:25, mix, let stand for 5 min. Remove an 80 μL aliquot and add it to 320 μL MeCN:500 mM pH 4.0 sodium acetate buffer 50:50, inject a 20 μL aliquot. (4-Phenylazobenzyloxycarbonyl chloride can be purchased from Bachem, Bubendorf, Switzerland. Synthesis is as follows. Dissolve 10 g 4-nitrobenzylalcohol in 100 mL MeOH, add 1 mL triethylamine, add 2 g Raney nickel, hydrogenate at room temperature and atmospheric pressure, filter. Evaporate the filtrate to dryness, add benzene (Caution! Benzene is a carcinogen!), evaporate to dryness to remove water, repeat this step to obtain 4-aminobenzyl alcohol as crystals. Mix 7.7 g 4-aminobenzyl alcohol with a solution of 7.4 g nitrosobenzene in 40 mL acetic acid with stirring at 0°, after 3 h filter, wash the solid with dilute acetic acid to obtain 4-phenylazobenzylalcohol (mp 142.5-143°). Dilute the filtrate with a lot of water, filter, extract with hot carbon tetrachloride, crystallize from carbon tetrachloride to obtain more p-phenylazobenzyl alcohol. Dissolve 10.9 g phosgene in 40 mL dioxane, add 5 g p-phenylazobenzylalcohol at 0°, stir at 0° for 15 min, let stand at room temperature for 3 h, filter, evaporate the filtrate to dryness under reduced pressure. Recrystallize the residue from petroleum ether to give 4-phenylazobenzyloxycarbonyl (mp 82-83°) (Helv. Chim. Acta 1958, 41, 491).)

SAMPLE

Matrix: solutions

Sample preparation: Mix Vortex 10 μL peptide solution in pyridine:water 50:50 and 10 μL 20 mM reagent in pyridine:water 50:50, heat at 50° for 15 min, wash 3 times with 100 μL porions of n-heptane:dichloromethane 90:10. Remove the aqueous phase and dry it in a centrifugal evaporator at 50° for 15 min, add 30 μL trifluoroacetic acid to the residue, heat at 50° for 10 min, evaporate to dryness under a stream of nitrogen, reconstitute with 20 μL water, extract 3 times with n-heptane:dichloromethane 80:20 (retain the aqueous phase for the next cycle). Combine the extracts and evaporate them to dryness under a stream of nitrogen, reconstitute in MeCN, inject an aliquot. (Perform all reactions under nitrogen. N-Terminal amino acid is derivatized and sequenced. Reagent

was 7-[(N,N- dimethylamino)sulfonyl]-2,1,3-benzoxadiazol-4-yl isothiocyanate and it was prepared as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm ,Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ tlc plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei (TCI America, Portland OR). Stir 50 mg DBD-F in 15 mL MeCN and add 100 μL 28% ammonia in water, stir at room temperature overnight, evaporate under reduced pressure, recrystallize from MeCN to give 4-amino-7-N,N-dimethylaminosulfonyl-2,1,3-benzoxadiazole as pale yellow needles (DBD-NH2) (mp 214-7°). Add 1 mL 30% thiophosgene in benzene dropwise to 200 mg DBD-NH2 in 15 mL MeCN, reflux for 5 h, evaporate under reduced pressure, extract the residue twice with 20 mL portions of chloroform. Filter the extracts and evaporate them to dryness, dissolve the residue in chloroform and chromatograph on 15 g silica gel (G-200) with chloroform. Evaporate the eluate to dryness and recrystallize 7-[(N,N-dimethylamino)sulfonyl]-2,1,3-benzoxadiazol-4-yl isothiocyanate from benzene-n-hexane to give yellow-white crystals (mp 122-4°) (Biomed.Chromatogr. 1992, 7, 56).)

SAMPLE
Matrix: solutions
Sample preparation: Mix 10 μL of an amino acid solution in MeCN:water:triethylamine 50:50:2 with 10 μL 5 mM (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole in MeCN, heat at 55° for 10 min, add 480 μL 1 M acetic acid in MeCN:water 50:50, dilute 10-fold with MeCN, inject a 5 μL aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole is as follows. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei (TCI America, Portland OR). Add 100 mg 4-fluoro-7-nitro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL water, extract 4 times with 80 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-nitro- 2,1,3-benzoxadiazole as dark red crystals (mp 178-181°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole as red crystals (mp 165-170°) (Analyst 1995, 120, 385).

SAMPLE
Matrix: solutions
Sample preparation: Mix a 40 μL aliquot of a solution of amino acids in 100 mM HCl with 100 μL 500 mM pH 9.0 potassium borate buffer and 250 μL 0.5 mM 4-phenylazobenzyloxycarbonyl chloride in MeCN, let stand for 5 min, add 100 μL reagent, mix, let stand for 5 min. Remove an 80 μL aliquot and add it to 320 μL MeCN:500 mM pH 4.0 sodium acetate buffer 20:80, mix, inject a 20 μL aliquot. (Prepare reagent by mixing 3 mL n-heptylamine, 15 mL MeCN, and 175 mL 100 mM HCl, pH 7-8. 4-Phenylazobenzyloxycarbonyl chloride can be purchased from Bachem, Bubendorf, Switzerland. Synthesis is as follows. Dissolve 10 g 4-nitrobenzylalcohol in 100 mL MeOH, add 1 mL triethylamine, add 2 g Raney nickel, hydrogenate at room temperature and atmospheric pressure, filter. Evaporate the filtrate to dryness, add benzene (Caution! Benzene is a carcinogen!), evaporate to dryness to remove water, repeat this step to obtain 4-aminobenzyl alcohol as crystals. Mix 7.7 g 4-aminobenzyl alcohol with a solution of 7.4 g nitrosobenzene in 40 mL acetic acid with stirring at 0°, after 3 h filter, wash the solid with dilute acetic acid to obtain 4-phenylazobenzylalcohol (mp 142.5-143°). Dilute the filtrate with a lot of water, filter, extract with hot carbon tetrachloride, crystallize from carbon tetrachloride to obtain more p-phenylazobenzyl alcohol. Dissolve 10.9 g phosgene in 40 mL dioxane, add 5 g p-phenylazobenzylalcohol at 0°, stir at 0° for 15 min, let stand at room temperature for 3 h, filter, evaporate the filtrate to dryness under reduced pressure. Recrystallize the residue from petroleum ether to give 4-phenylazobenzyloxycarbonyl chloride (mp 82-83°) (Helv. Chim. Acta 1958, 41, 491). Alternatively, recrystallize in the cold from n-hexane/ethyl acetate.)

HPLC VARIABLES
Column: 250 × 4 5 μm Grom-Sil 120 ODS-3 CP porous encapsulated polymer-coated spherical particles (Grom, Herrenberg, Germany)
Mobile phase: Gradient. A was MeCN:THF:100 mM pH 6.7 sodium acetate buffer 20:2:78. B was MeCN:THF 98:2. A:B from 100:0 to 95:5 over 15 min, to 85:15 over 18 min, to 75:25 over 24 min, to 50:50 over 10 min, to 0:100 over 1 min, maintain at 0:100 for 7 min, return to initial conditions over 0.1 min, re-equilibrate for 10 min.
Column temperature: 45
Flow rate: 1 for 5 min, to 1.25 over 0.1 min, maintain at 1.25

SAMPLE

Matrix: soybean meal
Sample preparation: Mix 200 mg soybean meal with 15 mL 0.1% phenol in 6 M HCl, pump out the tube then flush with nitrogen 3 times, heat at 145° for 4 h, filter, evaporate to dryness under reduced pressure at 50°, reconstitute with 50 mL 10 mM HCl. Add a 5 mL aliquot to a 100 × 13 Dowex 5X8 cation exchange column, elute with 4 M ammonia. Evaporate the eluate to dryness under reduced pressure at 50°, reconstitute with 50 mL 10 mM HCl. Evaporate a 500 μL aliquot to dryness under a stream of nitrogen at 50°, add 30 μL MeCN, evaporate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 50 μL 2.5 mM L-norleucine in MeCN:MeOH:triethylamine 10:5:2, add 3 μL benzylisothiocyanate, heat at 50° for 30 min, evaporate to dryness under a stream of nitrogen with simultaneous vacuum pump evacuation at room temperature, reconstitute the residue in 50 μL MeCN, evaporate to dryness as before, reconstitute the residue in 1 mL initial mobile phase, filter (0.2 μm), inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 300 × 3.9 4 μm Nova-Pak C18
Mobile phase: Gradient. A was MeOH:THF:20 mM NaH_2PO_4 5:1.5:93.5, adjusted to pH 6.8 with phosphoric acid. B was MeCN:MeOH:THF:20 mM NaH_2PO_4 50:2.5:0.75:46.75, adjusted to pH 6.8 with phosphoric acid. C was MeCN:water 70:30. A:B:C from 100:0:0 to 80:20:0 over 10 min, to 76:20:4 over 5 min, to 70:20:10 over 5 min, to 50:30:20 over 10 min, to 30:35:35 over 10 min, to 0:0:100 (step gradient), maintain at 0:0:100 for 20 min.

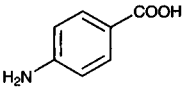
Aminobenzoic acid



Molecular formula: $C_7H_7NO_2$
Molecular weight: 137.14
CAS Registry No.: 150-13-0
Merck Index: 443

SAMPLE

Matrix: blood
Sample preparation: 100 μL Plasma or urine + 200 μL MeCN, vortex for a few s, centrifuge at 800 g for 5 min, inject a 5 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:0.04% pH 2.5 ± 0.05 phosphoric acid 3.5:96.5
Flow rate: 1.5
Injection volume: 5
Detector: UV 254

CHROMATOGRAM

Retention time: 8
Internal standard: p-aminobenzoic acid

OTHER SUBSTANCES

Extracted: iothalamate, p-aminohippuric acid

KEY WORDS

plasma; dog; human; p-aminobenzoic acid is IS

REFERENCE

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 125 × 4 5 μm endcapped LichroCART RP18
Mobile phase: MeCN:7.5 mM pH 7.3 phosphate buffer 10:90
Column temperature: 40
Flow rate: 0.8
Injection volume: 30
Detector: E, ESA Coulochem II coulometric cell 5011, first electrode +450 mV, second electrode +630 mV; UV 254

CHROMATOGRAM
Retention time: 1.2

OTHER SUBSTANCES
Simultaneous: hydrochlorothiazide

REFERENCE
Richter,K.; Oertel,R.; Kirch,W. New sensitive method for the determination of hydrochlorothiazide in human serum by high-performance liquid chromatography with electrochemical detection, *J.Chromatogr.A*, **1996**, *729*, 293–296.

SAMPLE
Matrix: solutions
Sample preparation: Add 500 μL of a solution in MeCN to 100 mg finely powdered potassium carbonate, add 250 μL 3.8 mM 18-crown-6 in MeCN, add 250 μL 0.8 mM reagent in MeCN, heat at 80° in the dark for 20 min, cool, inject a 5 μL aliquot. (Synthesize the reagent, 3-bromomethyl-6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone, as follows. Stir 483

g veratrole in 1.45 L acetic acid at 15° for 1 h, add 683 g concentrated nitric acid (d 1.05) over 1 h (maintain the temperature below 40° by cooling and regulating the rate of addition of the nitric acid). Continue stirring and add 2.127 L fuming nitric acid (d 1.50) over 1 h while maintaining the temperature below 30°, let stand for 2 h, pour into a large volume of cold water, filter, wash the solid with water until the washings are neutral, recrystallize from EtOH to give 4,5-dinitroveratrole (mp 129.5-130.5°) (J. Am. Chem. Soc. 1946, 68, 1536). Reflux 5 g 4,5-dinitroveratrole in 200 mL benzene (Caution! Benzene is a carcinogen!), add 100 g 60 mesh iron powder and 20 mL concentrated HCl in small portions over 1 h, reflux for 4 h, add 10 mL water, reflux for 2 h, cool, make alkaline with 2.5 M NaOH, extract several times with 200 mL portions of benzene. Combine the organic layers and evaporate them to dryness, add 10 mL concentrated HCl, recrystallize from EtOH to give 1,2-diamino-4,5-dimethoxybenzene monohydrochloride as very slightly pink needles (mp 240°) (Anal. Chim. Acta 1982, 134, 39). Heat 2.5 mmoles 1,2-diamino-4,5-dimethoxybenzene hydrochloride and 2.4 mmoles pyruvic acid in 30 mL 500 mM HCl on a boiling water bath for 2 h, cool with ice-water, filter. Wash the precipitate with water and dry it under vacuum, recrystallize from MeOH:water 90:10 to give 6,7-dimethoxy-3-methyl-2(1H)-quinoxalinone as yellow needles (mp 255°) (Chem. Pharm. Bull. 1985, 33, 3493). Treat 1 g 6,7-dimethoxy-3-methyl-2(1H)-quinoxalinone dissolved in 50 mL anhydrous MeOH with a solution of diazomethane in ether, evaporate to dryness under reduced pressure, dissolve the residue in 5 mL ethyl acetate, chromatograph on a 250 × 35 column filled with 130 g 70-230 mesh silica gel 60 (Merck) using n-hexane:ethyl acetate 25:75 to give 6,7-dimethoxy-1,3-dimethyl-2(1H)-quinoxalinone as yellow needles (mp 170-171°). Dissolve 350 mg 6,7-dimethoxy-1,3-dimethyl-2(1H)-quinoxalinone in 3 mL acetic acid, add 350 mg anhydrous sodium acetate, add 2 mL 1.5 M bromine in acetic acid, heat at 100° for 15 min, cool, add 10 mL ether, filter, wash the solid 2 or 3 times with small portions of ether. Combine the filtrate and washings and evaporate them to dryness, dissolve the residue in 5 mL ethyl acetate, chromatograph on a 250 × 35 column filled with 130 g 70-230 mesh silica gel 60 (Merck) using ether, evaporate the main fraction to dryness, recrystallize the residue from n-hexane:ethyl acetate 50:50 to give 3-bromomethyl-6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone as yellow needles (mp 161-163°).)

HPLC VARIABLES

Column: 100 × 4 10 μm Radial-Pak C18 (Waters)
Mobile phase: Gradient. MeOH:water from 30:70 to 70:30 over 30 min
Flow rate: 2
Injection volume: 5
Detector: F ex 370 em 450

CHROMATOGRAM

Retention time: 17
Limit of detection: 0.3-1 fmole

OTHER SUBSTANCES

Simultaneous: arachidic acid, arachidonic acid, benzoic acid, butyric acid, capric acid, caproic acid, caprylic acid, deoxyuridine, glucuronic acid, imidazole-4-acetic acid, lauric acid, linoleic acid, linolenic acid, margaric acid, 1-methyl-4-imidazoleacetic acid, myristic acid, myristoleic acid, oleic acid, palmitic acid, palmitoleic acid, propionic acid, salicylic acid, stearic acid, thymidine, uridine, valeric acid

KEY WORDS

derivatization

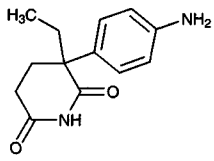
Aminoglutethimide



Molecular formula: $C_{13}H_{16}N_2O_2$
Molecular weight: 232.28
CAS Registry No.: 125-84-8
Merck Index: 460
Lednicer No.: 1 257

SAMPLE

Matrix: blood, saliva, urine
Sample preparation: 300 μL Plasma, urine, or saliva + 150 μL 50 μg/mL IS in MeOH + 300 μL 100 mM pH 5.6 acetate buffer + 5 mL dichloromethane, vortex for 1 min, centrifuge at 1760 g for 15 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 300 μL MeOH, vortex for 1 min, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: Guard-Pak Resolve silica (Waters)
Column: two Chiralcel OD cellulose tris(3,5-dimethylphenyl)carbamate columns in series
Mobile phase: Hexane:MeOH:isopropanol 65:17.5:17.5 0.7
Flow rate: 0.7
Injection volume: 50
Detector: UV 245

CHROMATOGRAM

Retention time: 32.65 (R), 43.66 (S)
Internal standard: (4'-aminophenyl)-3-methyl-1-methylpyrrolidine-2,5-dione (one enantiomer only) (37.74)
Limit of detection: 320 ng/mL

OTHER SUBSTANCES

Extracted: metabolites
Simultaneous: acetaminophen, carmustine, codeine, dexamethasone, hydrocortisone, ibuprofen, mitomycin, morphine, prednisone, tamoxifen, vincristine
Noninterfering: aspirin, busulfan, cyclophosphamide, indomethacin, methotrexate, vincristine

HPLC VARIABLES

Column: 250 × 4.6 Zorbax RX

Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.

Column temperature: 30

Flow rate: 2

Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine,

phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

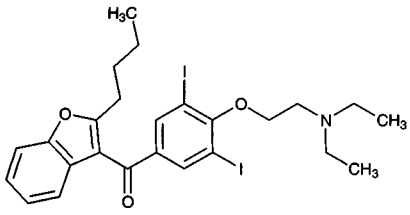
Amiodarone



Molecular formula: $C_{25}H_{29}I_2NO_3$
Molecular weight: 645.32
CAS Registry No.: 1951-25-3
Merck Index: 504
Lednicer No.: 4 127, 156

SAMPLE

Matrix: blood
Sample preparation: Precipitate 100 µL serum with 200 µL 5 µg/mL IS in MeCN, centrifuge at 12 000 g for 5 min. Inject a 50 µL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 4 × 4 5 µm LiChroCART LiChrospher 60 RP Select B
Column: 125 × 4 5 µm LiChroCART LiChrospher 60 RP Select B
Mobile phase: MeCN:buffer 10:90 (Buffer was 25 mM pH 3.0 triethylammonium phosphate containing 2% MeCN.)
Flow rate: 1
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 4.58
Internal standard: promazine (3.39)
Limit of detection: 90 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

serum

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL cyano-bonded silica (J.T.Baker) SPE cartridge with 1 mL MeOH and three 1 mL portions of water. Mix 100 µL serum with 100 µL 2 µg/mL IS in MeOH:water 70:30 and 500 µL water. Add to the SPE cartridge, allow to pass through under gravity. Wash three times with 1 mL portions of water and with 1 mL MeOH:water 50:50. Elute with 1 mL MeOH containing 1 mL/L triethylamine. Evaporate the eluate under a stream of nitrogen at 40°, reconstitute the residue in 100 µL mobile phase. Inject a 20 µL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 µm Zorbax cyano bonded silica
Mobile phase: MeCN:MeOH:phosphate buffer 23:37:40, adjusted to pH 3.5
Column temperature: 45
Flow rate: 0.8
Injection volume: 20
Detector: UV 241

CHROMATOGRAM
Retention time: 7.92
Internal standard: tamoxifen (5.57)
Limit of detection: 5 ng

OTHER SUBSTANCES
Extracted: desethylamiodarone, bepridil, L8040 (Sanofi Recherche), trifluoperazine
Simultaneous: aprindine, bromocriptine, captopril, carbamazepine, chlorpromazine, diltiazem, dimefline, dipyridamole, disopyramide, flecainide, flurazepam, furosemide, imipramine, labetalol, miconazole, nifedipine, norverapamil, procainamide, propafenone, propranolol, quinidine, tocainide, trifluoropromazine, verapamil, warfarin

SAMPLE
Matrix: blood
Sample preparation: Mix 200 µL serum with 20 µL 25 µg/mL IS in MeOH and 100 µL 500 mM KH_2PO_4. Add 4 mL hexane, shake for 3 min, centrifuge, freeze at -20°. Evaporate the organic layer to dryness under a stream of argon in a 37° water bath, reconstitute in 100 µL MeOH, inject a 50 µL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 5 µm Supelguard LC-CN
Column: 150 × 4.6 5 µm Supelcosil LC-CN
Mobile phase: MeCN:MeOH:water: 500 mM KH_2PO_4 13.6:48:36:2.4
Flow rate: 1.5
Injection volume: 50
Detector: UV 240

CHROMATOGRAM
Retention time: 6.7
Internal standard: L8040 (8.0)
Limit of detection: 10 ng/mL
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Extracted: metabolite
Noninterfering: acebutolol, aprobarbital, atenolol, bupranolol, celiprolol, clobazam, debrisoquine, diazepam, diltiazem, flecainide, gallopamil, hexobarbiltal, lidocaine, mephenytion, metopolol, mexiletine, nadolol, pentobarbital, phenacetin, prazosin, procainamide, progesterone, propafenone, propranolol, quinidine, sotalol, theophylline, verapamil

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 204

CHROMATOGRAM
Retention time: 21.915

Molecular weight: 305.37
CAS Registry No.: 56824-20-5, 60414-06-4 (HCl)
Merck Index: 506

SAMPLE

Matrix: blood

Sample preparation: 250 μL Plasma + 100 μL 120 μg/mL IS in water, vortex for 1 min, add 200 μL 100 mM NaOH, add 6 mL dichloromethane, rotate for 15 min. Remove the lower organic layer and evaporate it to dryness under a stream of nitrogen, add 75 μL 26.67 mg/mL 2-chloro-1-methylpyridinium iodide in MeCN, add 200 μL 2.5 mg/mL 1,8-naphthalic dicarboxylic acid in MeCN containing 6 μL/mL triethylamine, heat at 65° overnight, cool, inject a 20 μL aliquot. (Prepare 1,8-naphthalic dicarboxylic acid by hydrolyzing 1,8-naphthalic anhydride with 5% NaOH (cf. Org. Syn. 1973, Coll. Vol. V, 813).)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere ODS (Altex)
Mobile phase: MeOH:1 M ammonium acetate:N,N-dimethyloctylamine:water 65:2.5:0.03:32.5
Flow rate: 1
Injection volume: 20
Detector: F ex 280 em 340

CHROMATOGRAM

Retention time: 21 (main peak, a minor peak due to the other conformer is also seen)
Internal standard: 1,2-O-isopropylidene-3-O-[3'-(N,N-diisopropylamino)ethyl]-α-D-glucofuranose (28)
Limit of quantitation: 185 ng/mL

KEY WORDS

SAMPLE

Matrix: blood
Sample preparation: Add 250 μL 2 M sodium carbonate to 500 μL plasma. Add 100 μL 1 μg/mL IS in MeOH, extract with 10 mL n-hexane. Shake for 30 min and centrifuge at 3000 g for 10 min. Cool in a dry ice-acetone bath. Add 200 μL 0.3% phosphoric acid to upper organic layer. Shake for 10 min and centrifuge at 3000 g for 10 min. Separate the organic layer. Inject a 100 μL aliquot of the acidic aqueous layer.

HPLC VARIABLES

Column: 250 × 4.6 5 μm C18 Symmetry (Waters Millipore, USA)

Mobile phase: MeCN:67 mM potassium phosphate buffer adjusted to pH 3.0 with phosphoric acid 35:65 (After each chromatographic session wash the column with 200 mL MeCN:water 50:50.)
Flow rate: 1.2
Injection volume: 100
Detector: UV 226, UV 254, UV 400

CHROMATOGRAM
Retention time: 11.53
Internal standard: clovoxamine (6.5)
Limit of quantitation: 5 ng/mL (UV 226, UV 400); 7 ng/mL (UV 254)

OTHER SUBSTANCES
Extracted: metabolites, clomipramine, desipramine, fluoxetine, imipramine maprotiline, nortriptyline
Simultaneous: amineptine, carbamazepine, chlordiazepoxide, chlorpromazine, clonazepam, clorazepate, clozapine, cyamemazine, desmethylmaproptiline, desmethylvenlafaxine, doxepin, flunitrazepam, fluvoxamine, haloperidol, lorazepam, loxapine, mianserine, sulpiride, trimipramine, venlafaxine, viloxazine, zolpidem, zopiclone
Noninterfering: diazepam, valproic acid
Interfering: levomepromazine

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL 30 mg Oasis HLB SPE cartridge with 1 mL MeOH and 1 mL water. Acidify (?) mL serum with 20 μL phosphoric acid, vortex for 5 s, add to the SPE cartridge, wash with 1 mL MeOH :water 5:95, elute with 1 mL MeOH. Evaporate the eluate to dryness at 40° under a stream of nitrogen. Reconstitute the residue with 200 μL MeOH:20 mM pH 7 phosphate buffer 20:80, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 3.9 Sentry
Column: 150 × 3.9 5 μm Symmetry C18 (Waters)
Mobile phase: MeOH:20 mM pH 7 potassium phosphate 70:30
Column temperature: 35
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 21
Internal standard: nordoxepin (4.9)

OTHER SUBSTANCES
Simultaneous: metabolites, doxepin, nortriptyline

KEY WORDS
pig; serum; SPE

REFERENCE
Cheng,Y.-F.; Phillips,D.J.; Neue,U.; Bean,L. Solid-phase extraction for the determination of tricyclic antidepressants in serum using a novel polymeric extraction sorbent, *J.Liq.Chromatogr.Rel.Technol.*, **1997**, *20*, 2461–2473.

SAMPLE
Matrix: blood, gastric contents, tissue
Sample preparation: Blood. Mix 200 μL blood with 200 μL pH 11 borate buffer and 40 μL aqueous trimipramine solution. Extract with 800 μL hexane:2-butanol 98:2, centrifuge at 740 g for 10 min, evaporate the organic phase under vacuum at 40° (Buchler Vortex Evaporator, USA). Dissolve the residue in 100 μL mobile phase, inject an aliquot. Tissue, gastric contents. Homogenize tissue in pH 11 borate buffer to a final concentration 200 mg tissue/mL homogenate (Ultraturrax T5 homogenizer, IKA, Germany), dilute gastric contents 1:9 with water. Mix 200 μL tissue homogenate or diluted gastric contents with 40 μL aqueous trimipramine solution. Extract with 800 μL hexane:2-butanol 98:2, centrifuge at 740 g for 10 min, evaporate the organic phase under vacuum at 40° (Buchler Vortex Evaporator, USA). Dissolve the residue in 100 μL mobile phase, inject a 20 μL aliquot. (Buffer was saturated aqueous sodium tetraborate adjusted to pH 11 with 6 M NaOH.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelcosil LC-Si
Mobile phase: MeCN:25 mM ammonium acetate 90:10
Flow rate: 3
Injection volume: 20
Detector: UV 230

CHROMATOGRAM
Internal standard: trimipramine maleate
Limit of detection: 40 nmol/kg (blood), 200 nmol/kg (tissue)

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS

SAMPLE
Matrix: blood, microsomal incubations
Sample preparation: Vortex 1 mL plasma or microsomal incubation with 200 μL 1 μg/mL desipramine and 100 μL 5 M NaOH for 10 s, add 5 mL butan-1-ol:hexane 2:98, vortex for 1 min, centrifuge at 2000 g and 4° for 5 min, evaporate the organic phase to dryness at 40° using a vacuum vortex evaporator, reconstitute the residue in 200 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 5 μm Nova-Pak C18
Mobile phase: MeCN:buffer 30:70 (Buffer was water containing 1% triethylamine, adjusted to pH 3 with orthophosphoric acid.)
Flow rate: 2
Injection volume: 50

Detector: UV 240

CHROMATOGRAM
Retention time: 10.5
Internal standard: desipramine (6.3)
Limit of quantitation: 2 ng/mL

OTHER SUBSTANCES
Extracted: nortriptyline
Simultaneous: ketoconazole
Noninterfering: diazepam, furafylline, hydroxyamitriptyline, hydroxynortriptyline, quinidine, mephenytoin, triacetyloleandomycin

KEY WORDS
human; liver; rat; plasma

SAMPLE
Matrix: blood, tissue, urine
Sample preparation: Serum, urine. 500 μL Serum or urine + 100 μL 2 μg/mL diazepam + 200 μL 20% sodium carbonate + 500 μL water + 3 mL n-hexane:isoamyl alcohol 98.5:1.5, mix for 2 min, centrifuge at 1200 g for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 μL mobile phase, inject a 10 μL aliquot. Tissue. Homogenize 1 g sample with 9 mL 100 mM HCl and 100 μL 20 μg/mL diazepam, centrifuge at 15 000 g for 10 min. Add 500 μL 20% sodium carbonate and 4 mL n-hexane:isoamyl alcohol 98.5:1.5 to 1 mL of the supernatant, mix for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 μL mobile phase, filter by microconcentrator (Microcon-30, Grace). Inject a 10 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 2 μm TSK gel Super-Octyl (A) or 100 × 4.6 5 μm Hypersil MOS-C8 (B)
Mobile phase: MeOH:20 mM pH 7 KH_2PO_4 60:40
Flow rate: 0.6
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 16.2 (A), 28.5 (B)
Internal standard: diazepam (4.4, A)
Limit of quantitation: 50 ng/mL (serum, urine) (A), 500 ng/mL (tissue) (A)

OTHER SUBSTANCES
Extracted: amoxapine, clomipramine, desipramine, dothiepin, doxepin, imipramine, maprotiline, melitracen, mianserin, nortriptyline
Noninterfering: barbital, carbamazepine, ethosuximide, hexobarbital, lofepramine, pentobarbital, phenobarbital, phenytoin, primidone, sulpiride, trimethadione, trimipramine

KEY WORDS
serum; brain; liver

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 206.4

CHROMATOGRAM
Retention time: 15.878

KEY WORDS
whole blood

SAMPLE
Matrix: serum
Sample preparation: 1 mL Serum + 500 μL 750 mM pH 10 sodium bicarbonate/carbonate buffer + 50 μL IS in EtOH:water 50:50 + 8 mL heptane:isoamyl alcohol 98:2, shake at 250 cycles/min for 5 min, centrifuge at 1500 g for 10 min, freeze in dry ice/EtOH. Remove the organic layer and add it to 150 μL 22 mM pH 2.5 KH_2PO_4/phosphoric acid buffer, shake at 250 cycles/min for 5 min, centrifuge at 1500 g for 10 min, freeze in dry ice/EtOH. Discard the organic layer, inject a 65 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 250 × 4.6 Supelco C18
Mobile phase: MeCN:buffer 45:55 (Buffer was 44 mM KH_2PO_4 containing 1.5 mL/L triethylamine, adjusted to pH 2.5 with phosphoric acid.)
Flow rate: 1.5
Injection volume: 65
Detector: UV 240

CHROMATOGRAM

Retention time: 11.5
Internal standard: 1-(3-(dimethylamino)propyl)-1-(p-chlorophenyl)-1,3-dihydroisobenzofuran-5-carbonitrile (LU 10-202) (Lundbeck, Copenhagen) (8.33)

OTHER SUBSTANCES

Extracted: citalopram, nortriptyline
Simultaneous: chlorprothixene, clomipramine, clozapine, flupenthixol, haloperidol, levomepromazine, perphenazine, zuclopenthixol
Noninterfering: benzodiazepines
Interfering: didesmethylclomipramine, levomepromazine

KEY WORDS

serum

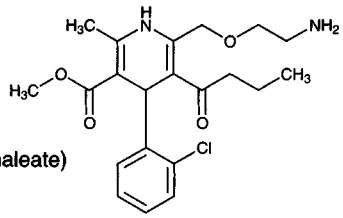
Amlodipine



Molecular formula: $C_{20}H_{25}ClN_2O_5$
Molecular weight: 408.88
CAS Registry No.: 88150-42-9, 111470-99-6 (besylate), 88150-47-4 (maleate)
Merck Index: 516
Lednicer No.: 4 108

SAMPLE

Matrix: blood

Sample preparation: Mix 5.0 mL plasma with 250 ng chloroamlodipine, add 250 μL 1 M sodium hydroxide and 5 mL chloroform, shake for 10 min, centrifuge at 3500 g. Dry the organic layer in a vacuum centrifuge, wash the tube twice with 500 μL chloroform and dry again. Dissolve the extract in 70 μL MeOH:pH 4.5 acetic buffer 60:40, inject a 50 μL aliquot. (For added sensitivity each eluting enantiomer may be trapped separately on 20 × 4.6 5 μm Supelcosil LC8 columns and eluted from these columns with MeCN:10 mM pH 4.5 acetate buffer 45:55 and chromatographed on 150 × 4.6 4 μm Symmetry C 8 columns.)

HPLC VARIABLES

Column: 150 × 4 Chiral AGP (ChromTech, Haegerstern, Sweden)
Mobile phase: 1-Propanol:10 mM pH 4.5 acetate buffer 1:99
Column temperature: 30
Flow rate: 0.9
Injection volume: 50
Detector: UV 240

CHROMATOGRAM

Retention time: 11. 5 (R-(+)-), 15.4 (S-(-)-)
Internal standard: chloroamlodipine (29.2 (R-(+)), 36.6 (S-(-))

SAMPLE
Matrix: blood
Sample preparation: Prepare an SPE cartridge by plugging the end of a 1 mL disposable pipette tip with glass wool and adding about 100 mg Chromosorb P/NAW. Add 50 µL plasma then 50 µL 10 µg/mL tolylphenobarbital in 200 mM HCl to the SPE cartridge, let stand for 2 min, elute with 1 mL chloroform:isopropanol 6:1. Evaporate the eluate to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 µL mobile phase, inject a 15 µL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 µm Supelcosil-LC-8
Mobile phase: MeCN:water 20:80
Flow rate: 3.3
Injection volume: 15
Detector: UV 208

CHROMATOGRAM
Retention time: 9.64
Internal standard: tolylphenobarbital (7.57)
Limit of detection: 50-100 ng/mL

OTHER SUBSTANCES
Extracted: theophylline, caffeine, barbital, ethosuximide, primidone, carbamazepinediol, phenacemide, methyprylon, nirvanol, phenobarbital, chloramphenicol, butabarbital, carbamazepine epoxide, mephenytoin, pentobarbital, carbamazepine, glutethimide, phenytoin, secobarbital, methaqualone

Noninterfering: acetaminophen, amikacin, amitriptyline, clonazepam, cyclosporine, desipramine, diazepam, digoxin, disopyramide, gentamicin, imipramine, lidocaine, methotrexate, N-acetylprocainamide, netilmicin, nortriptyline, procainamide, quinidine, salicylic acid, sulfamethoxazole, tobramycin, trimethoprim, valproic acid, p-hydroxyphenobarbital, vancomycin

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 16.617

KEY WORDS
whole blood

SAMPLE
Matrix: bulk, formulations
Sample preparation: Bulk quantities. Dissolve 25 mg bulk quantities in 25 mL MeCN, dilute 1:10 with MeCN, inject an aliquot. Tablets. Crush tablet, add 46 mg to 10 mL MeCN, shake for 24 h, dilute 1 mL clear supernatant 1:10 with MeCN, inject an aliquot. Capsules. Powder capsule, add 35 mg to 1 mL 10% sulfuric acid, shake, make up to 10 mL with MeCN, shake for 24 h, dilute 1 mL clear supernatant 1:10 with MeCN, inject an aliquot.

HPLC VARIABLES
Guard column: 20 × 2 37-53 μm Whatman pellicular ODS
Column: 250 × 4.6 5 μm Econosphere C18 (Alltech)
Mobile phase: MeCN:water 30:70
Flow rate: 1.2
Detector: UV 198

SAMPLE
Matrix: solutions
Sample preparation: Evaporate a solution in water, MeOH, or diethyl ether to dryness, add a 3-fold molar excess of triethylamine, add 0.5-3 mL MeCN, add a 3-fold molar excess of N-chloromethyl-4-nitrophthalimide, heat at 60° for 1 h, inject an aliquot. (Preparation of N-chloromethyl-4-nitrophthalimide is as follows. Suspend 130 g 4-nitrophthalimide in 80 mL 40% formaldehyde solution, add 200 mL water, reflux for 4 h, filter while hot, N-(hydroxymethyl-4-nitrophthalimide crystallizes on cooling (cf. J. Am. Chem. Soc. 1922, 44, 817). Mix a suspension of 2.26 g N-hydroxymethyl-4-nitrophthalimide in 10-15 mL ether with a suspension of 2.1 g phosphorus pentachloride in 10-15 mL ether, after 10 min heat on a water bath, cool in an ice-salt mixture, add ice-water dropwise with shaking, filter to obtain N-chloromethyl-4-nitrophthalimide, dry under vacuum (cf. Chem. Ber. 1959, 9, 1258).)

HPLC VARIABLES
Column: 7 μm LiChrosorb RP8
Mobile phase: MeCN:water 60:40
Flow rate: 1.5
Detector: UV 254

CHROMATOGRAM
Retention time: 7.2
Limit of detection: 4 ng

OTHER SUBSTANCES
Extracted: secobarbital
Simultaneous: cyclobarbital, methylphenobarbital, phenobarbital

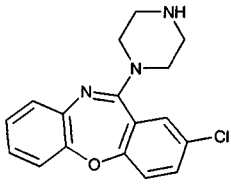
Amoxapine



Molecular formula: $C_{17}H_{16}ClN_3O$
Molecular weight: 313.79
CAS Registry No.: 14028-44-5
Merck Index: 616
Lednicer No.: 2 428

SAMPLE

Matrix: blood
Sample preparation: 500 µL Serum + 50 µL 100 mM HCl + 400 µL 1 M NaOH + 6 mL ethyl acetate, shake for 15 min, centrifuge at 4000 g for 10 min. Transfer top organic layer to another tube and re-extract the analyte with 3 mL 50 mM HCl. Evaporate organic layer in water bath under nitrogen at 45°. Dissolve the residue in 120 µL mobile phase, inject a 30 µL aliquot.

HPLC VARIABLES

Guard column: Perisorb RP-8 (Upchurch)
Column: 100 × 4.6 3 µm Supelco C8-DB
Mobile phase: MeCN:MeOH:buffer 20:18:62 (Buffer was 50 mM sodium monobasic phosphate, contains 2.5 mL/L triethylamine, pH adjusted to 2.7 with phosphoric acid.)
Flow rate: 1.3
Injection volume: 30
Detector: UV 230

CHROMATOGRAM

Retention time: 14.3
Internal standard: amoxapine

OTHER SUBSTANCES

Extracted: metabolites, clozapine
Simultaneous: amitryptiline, atenolol, bupropion, cogentin, desipramine, diazepam, doxepin, fluoxetine, haloperidol, imipramine, loxapine, medazepam, nortryptiline, oxazepam, paroxetine, phenytoin, propranolol, sertraline, thiothixene, trazadone, trifluoperazine, valproic acid, verapamil
Interfering: carbamazepine, desmethylsertraline

KEY WORDS

serum; amoxapine is IS

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: 2 mL Plasma + 800 ng clomipramine in MeOH + 2 mL 1 M NaOH + 5 mL hexane:isoamyl alcohol 99:1, shake mechanically for 15 min, centrifuge at 1686 g for 5 min. Remove the organic phase and add it to 200 µL 0.05% orthophosphoric acid, shake for 15 min, centrifuge for 5 min, inject a 50 µL aliquot of the aqueous phase (J.Liq.Chromatogr. 1981, 4, 849).

HPLC VARIABLES

Guard column: 23 × 3.9 Bondapak/Corasil C 18

Column: 300 × 4.6 10 μm μBondapak C18
Mobile phase: MeCN:buffer 40:60 (Buffer was 13.68 g KH_2PO_4 in 2 L water, adjusted to pH 4.7 with dilute KOH.)
Column temperature: 50
Flow rate: 2
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 4
Internal standard: clomipramine (8.5)
Limit of detection: 2 ng

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: amoxapine, amitriptyline, chlordiazepoxide, chlorpromazine, cimetidine, desipramine, diazepam, doxepin, flurazepam, imipramine, lorazepam, oxazepam, pentobarbital, perphenazine, phenobarbital, phenytoin, prochlorperazine, propoxyphene, secobarbital, thioridazine, trifluoperazine
Noninterfering: acetaminophen, codeine, meperidine
Interfering: nortriptyline

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: Inject 200 μL serum onto column A and elute with mobile phase A for 10 min then back-flush column A onto column B with mobile phase B for 4 min. Elute column B with mobile phase B and monitor the effluent. Remove column A from circuit and wash with MeCN:water 60:40 for 6 min then with mobile phase A for 10 min.

HPLC VARIABLES
Column: A 40 × 4 TSKprecolumn PW (Tosoh); B 150 × 4 TSKgel ODS-80TM (Tosoh)
Mobile phase: A 50 mM pH 7.5 potassium phosphate; B MeCN:100 mM pH 2.7 potassium phosphate 32.5:67.5, containing 0.2 g/L sodium 1-heptanesulfonate
Flow rate: 1
Injection volume: 200
Detector: UV 210

CHROMATOGRAM
Retention time: 9
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Simultaneous: amitriptyline, clomipramine, doxepin, desipramine, imipramine, maprotiline, nortriptyline, trimipramine

KEY WORDS
serum; column-switching; use gradient to determine metabolites

REFERENCE

SAMPLE

Matrix: blood

Sample preparation: 2 mL Plasma + 100 μL 1 μg/mL 2-hydroxydesmethylimipramine, mix, add 300 μL 2 M pH 9.7 carbonate buffer, mix, add 4 mL heptane:isopentyl alcohol 93:7, shake mechanically for 20 min, centrifuge at 1600 g for 5 min. Remove the organic layer and add it to 250 μL 7 mM orthophosphoric acid, vortex vigorously, centrifuge at 1600 g for 10 min, inject a 100 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Spherisorb C6

Mobile phase: 105 μM nonylamine in MeCN:5 mM KH_2PO_4 + 14 mM orthophosphoric acid 23:77

Column temperature: 35

Flow rate: 2.2

Injection volume: 100

Detector: UV 210

CHROMATOGRAM

Retention time: 22

Internal standard: 2-hydroxydesmethylimipramine

Limit of detection: 2 ng/mL

OTHER SUBSTANCES

Extracted: metabolites, loxapine

Simultaneous: propranolol, doxepin, desmethylimipramine, haloperidol, protriptyline, imipramine, amitriptyline

Noninterfering: chlorpromazine, clomipramine, maprotiline, nortriptyline, thioridazine, trimipramine, trifluoperazine

KEY WORDS

plasma

SAMPLE

Matrix: blood

Sample preparation: 1 mL Plasma + 1 mL 0.6 M pH 9.8 carbonate buffer + 40 μL 5 μg/mL maprotiline in 10 mM HCl + 5 mL 200 g/L ethyl acetate in n-heptane, mix by rocking for 10 min, centrifuge at 1500 g for 10 min. Remove organic layer and add it to 150 μL 100 mM HCl, mix 10 min, centrifuge at 1500 g for 10 min. Discard organic layer and evaporate aqueous layer at 45° in a vacuum centrifuge for 1 h. Take up residue in 50 μL 1 M pH 10.3 carbonate buffer and 25 μL 10 mg/mL dansyl chloride in MeCN, vortex, allow to react at room temperature for 45 min, evaporate at 45° in a vacuum centrifuge for 20 min, reconstitute in 125 μL MeCN:water 75:25, vortex, centrifuge for 3-5 min, inject a 25-40 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-18

Mobile phase: MeCN:25 mM KH_2PO_4 75:25 + 500 μL/L orthophosphoric acid + 600 μL/L n-butylamine
Flow rate: 2
Injection volume: 25-40
Detector: F ex 235 em 470 (cut-off)

CHROMATOGRAM
Retention time: 11.18
Internal standard: maprotiline (12.8)

OTHER SUBSTANCES
Simultaneous: fluoxetine, propranolol, clovoxamine, fluvoxamine, fenfluramine, desipramine, protriptyline, nortriptyline, sertraline, norfluoxetine
Noninterfering: amitriptyline, imipramine, clomipramine, trimipramine, mianserin, chlordiazepoxide, trazodone, cyclobenzaprine, nomifensine, bupropion, metoprolol, atenolol, pindolol, tranylcypromine, moclobemide, thioridazine, citalopram, clozapine, carbamazepine, doxepin, loxapine

SAMPLE
Matrix: blood
Sample preparation: 2 mL Serum + 75 μL MeCN containing 4 mg/mL loxapine + 2 mL 250 mM NaOH + 400 μL isoamyl alcohol, vortex vigorously, let stand for 5 min, add 10 mL heptane, shake vigorously for 1 h, centrifuge at >2000 g for 30 min. Remove the upper heptane layer and add it to 1 mL 100 mM pH 3 glycylglycine buffer, shake vigorously for 1 h, centrifuge at >2000 g for 30 min. Discard the heptane layer, add 1 mL 250 mM NaOH to the aqueous layer, add 5 mL n-pentane, shake for 1 h, centrifuge at 2000 g for 30 min. Remove the organic layer and evaporate it to dryness under educed pressure, reconstitute the residue in 70 μL mobile phase, vortex vigorously, centrifuge at 2000 g for 2-3 min, inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 40 μm pellicular silica (CEL Associates, Houston)
Column: 100 × 6 3 μm silica 80 Å (CEL Associates, Houston)
Mobile phase: MeCN:buffer 20:80 containing 21 mM n-nonylamine, pH 7.4-7.8 (Buffer was 25 mM Na_2HPO_4 adjusted to pH 3 with concentrated phosphoric acid.)
Flow rate: 1.6
Injection volume: 50
Detector: UV (wavelength not specified)

CHROMATOGRAM
Retention time: 9.63
Internal standard: loxapine (22.68)

OTHER SUBSTANCES
Extracted: doxepin
Simultaneous: amitriptyline, chlorpromazine, clomipramine, desipramine, fluoxetine, imipramine, mianserin, nortriptyline, thioridazine, trimipramine
Noninterfering: diazepam

SAMPLE

Matrix: blood, tissue, urine

Sample preparation: Serum, urine. 500 μL Serum or urine + 100 μL 2 μg/mL diazepam + 200 μL 20% sodium carbonate + 500 μL water + 3 mL n-hexane:isoamyl alcohol 98.5:1.5, mix for 2 min, centrifuge at 1200 g for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 μL mobile phase, inject a 10 μL aliquot. Tissue. Homogenize 1 g sample with 9 mL 100 mM HCl and 100 μL 20 μg/mL diazepam, centrifuge at 15 000 g for 10 min. Add 500 μL 20% sodium carbonate and 4 mL n-hexane:isoamyl alcohol 98.5:1.5 to 1 mL of the supernatant, mix for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 μL mobile phase, filter by microconcentrator (Microcon-30, Grace). Inject a 10 μL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 2 μm TSK gel Super-Octyl (A) or 100 × 4.6 5 μm Hypersil MOS-C8 (B), (Yokogawa, Japan)

Mobile phase: MeOH:20 mM pH 7 KH_2PO_4 60:40

Flow rate: 0.6

Injection volume: 10

Detector: UV 254

CHROMATOGRAM

Retention time: 5.6 (A), 7.8 (B)

Internal standard: diazepam (4.4, A)

Limit of quantitation: 50 ng/mL (serum, urine) (A), 500 ng/mL (tissue) (A)

OTHER SUBSTANCES

Extracted: amitriptyline, clomipramine, dothiepin, doxepin, imipramine, melitracen, mianserin, nortriptyline

Noninterfering: barbital, carbamazepine, ethosuximide, hexobarbital, lofepramine, pentobarbital, phenobarbital, phenytoin, primidone, sulpiride, trimethadione, trimipramine

Interfering: desipramine, maprotiline

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 211.1

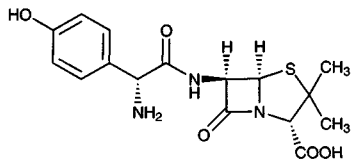
Amoxicillin



Molecular formula: $C_{16}H_{19}N_3O_5S$
Molecular weight: 365.41
CAS Registry No.: 26787-78-0 (anhydrous), 61336-70-7 (trihydrate)
Lednicer No.: 4 179, 180

SAMPLE

Matrix: blood
Sample preparation: Vortex plasma sample for 15 s, centrifuge at 4000 rpm for 10 min at 4 °. 250 µL Plasma + 250 µL 5 µg/mL cefadroxil in 100 mM pH 2.5 KH_2PO_4, centrifuge at 4800 g for 30 min. Inject a 150 µL aliquot of the clear supernatant onto column A and elute to waste with mobile phase B, after 15 min elute the contents of column A onto column B with mobile phase A, after 5 min remove column A from the circuit, elute column B with mobile phase A, monitor effluent from column B. Re-equilibrate column A with mobile phase B.

HPLC VARIABLES

Column: A 40 × 4.6 10 µm Nucleosil 100 C18; B 250 × 4.6 5 µm Spherisorb ODS II
Mobile phase: A MeOH:10 mM sodium heptanesulfonate and 30 mM NaH_2PO_4 25:75 adjusted to pH 2.5 with phosphoric acid; B MeOH:10 mM sodium heptanesulfonate and 30 mM NaH_2PO_4 8:92 adjusted to pH 2.5 with phosphoric acid
Flow rate: 1.5
Injection volume: 150
Detector: UV 230

CHROMATOGRAM

Retention time: 34.8-38.8
Internal standard: cefadroxil (31.8-32.8)
Limit of quantitation: 50.1 ng/mL

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 3.067

SAMPLE
Matrix: milk
Sample preparation: Mix 10 mL milk with 2 mL 100 mM tetraethylammonium chloride, add 40 mL MeCN slowly with continual stirring, let stand for 10 min, decant the supernatant through a plug of glass wool. Collect 40 mL filtrate, add 2 mL buffer, evaporate to 1-2 mL under reduced pressure at 40-50°, dilute to 4 mL with water, filter (0.45 μm PVDF). Inject a 2 mL aliquot onto a 150 × 4.6 5 μm Supelcosil LC-18 column, elute with MeCN:10 mM KH_2PO_4 0:100 for 3 min, to 60:40 over 37 min at 1 mL/min, collect a 1.5-2 mL aliquot containing the compound (ca. 12.5 min), evaporate to <1 mL under reduced pressure, add 200 μL 10 mM KH_2PO_4 containing 10 mM phosphoric acid and 10 mM sodium decanesulfonate, make up to 1 mL with water, inject an aliquot. (Prepare the buffer by mixing 10 mM KH_2PO_4 and 10 mM Na_2HPO_4 in a 5:1 ratio, pH 6.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Supelcosil LC-18
Mobile phase: MeCN:buffer 32:68 (Buffer was 15 mM phosphoric acid containing 7.5 mM sodium dodecyl sulfate.)
Flow rate: 1
Injection volume: 200
Detector: UV 215

REFERENCE

SAMPLE
Matrix: milk
Sample preparation: Condition a 500 mg tC18 SPE cartridge (Waters) with 20 mL MeOH, 20 mL water, and 10 mL 2% NaCl. Centrifuge 30 mL milk at 1500 g for 10 min. Dilute a 10 mL portion of the defatted milk with 20 mL water, add 200 μL 2 μg/mL penicillin V in pH 9.0 buffer, add 6 mL 170 mM sulfuric acid, add 5.6 mL 5% sodium tungstate, shake vigorously for 1 min, allow to stand for 5 min, check that the pH is in the range 4.6-4.8 (if it is outside this range start again using a different volume of sodium tungstate solution), centrifuge at 1500 g for 10 min, adjust the pH of the supernatant to 8.1-8.2 with 5 M and 0.1 M NaOH, filter (glass fiber) the clear liquid phase. Pass the filtrate through the SPE cartridge at 2 mL/min, wash with 2 mL water, dry by pulling air through

the cartridge for 1 min, elute with 2 mL MeCN. Add 150 μL pH 9.0 buffer to the eluate and evaporate to about 100 μL under a stream of nitrogen at 45-50°, add 400 μL pH 9.0 buffer, add 75 μL reagent I, vortex for 30 s, let stand at room temperature for 10 min, use 500 μL water to transfer the mixture to a separatory funnel, add 20 mL dichloromethane, add 5 mL pH 2.45 buffer, shake for 1 min, let stand for no more than 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure at 35-40°, dissolve the residue in 500 μL pH 9.0 buffer, add 75 μL reagent I, vortex for 30 s, let stand at room temperature for 10 min, add 450 μL reagent II, vortex for 1 min, heat at 55 ± 1° for 30 min, cool, filter (0.45 μm), inject a 150 μL aliquot. (Prepare pH 9.0 buffer by dissolving 0.34 g KH_2PO_4 in water, adjusting the pH to 9.0 with NaOH, and making up to 100 mL with water. Prepare pH 2.45 buffer by dissolving 2.72 g KH_2PO_4 in water, adjusting the pH to 2.45 with phosphoric acid, and making up to 100 mL with water. Prepare reagent 1 by dissolving 1.13 g benzoic anhydride in MeCN, make up to 25 mL with MeCN. Prepare reagent II by dissolving 6.905 g 1,2,4-triazole in 30 mL water and adding 5 mL 26 mM mercuric chloride in water, adjust pH to 9.0 ± 0.05 with 5 M NaOH, make up to 50 mL. Prepare reagents I and II 1-4 h before use. Silanize glassware with dichlorodimethylsilane.)

HPLC VARIABLES

Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: Gradient. A as MeCN:buffer 10:90. B was MeCN:buffer 30:70. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 13 min, return to initial conditions over 2 min, re-equilibrate at initial conditions for 5 min. (Prepare buffer by dissolving 9.938 g Na_2HPO_4, 17.938 g $NaH_2PO_4.H_2O$, and 4.964 g sodium thiosulfate in water, make up to 2 L with water, pH 6.5.)
Column temperature: 30
Flow rate: 1
Injection volume: 150
Detector: UV 323

SAMPLE

Matrix: tissue
Sample preparation: Condition a 500 mg Isolute SCX SPE cartridge (Jones Chromatography, Hengoed, UK) with MeOH and water. Condition a 100 mg PGC (porous graphitic carbon) SPE cartridge (Shandon, Runcorn, UK) with acetone and pH 7.7 borate buffer. Add 20 mL water to 5 g tissue, homogenize, add 5 mL 170 mM sulfuric acid and 5 mL 5% aqueous sodium tungstate, mix well, centrifuge at 14000 g for 5 min. Discard pellet, add six drops orthophosphoric acid to the supernatant to adjust the pH to 2-2.5. Add it to the SCX SPE cartridge, allow to flow through the cartridge under vacuum at 2 mL/min, wash with 5 mL 10 mM sulfuric acid, elute with 10 mL pH 7.7 borate buffer. Add the eluate to the PGC SPE cartridge. Wash with 5 mL water, place in-line filter (0.2 μm, Anotop) below cartridge, elute with 20 mL acetone. Evaporate to dryness. Add 500 μL water to the dry residue, add 20 μL 2% acetic anhydride in MeCN and let stand for 3 min. Add 500 μL triazole/mercuric chloride derivatizing reagent and heat the mixture at 65° for 20 min. Inject a 100 μL aliquot. (Borate buffer was 200 mM boric acid adjusted to pH 7.7 with 40% NaOH solution. Triazole/mercuric chloride reagent was prepared by mixing 34.45 g 1,2,4-triazole with 150 mL water and 25 mL 10 mM mercuric chloride, adjusted to pH 9.0 with 1 M NaOH and made up to 250 mL with water.) GL –5 μm Kromasil KR 100 C8 (Hichrom)

HPLC VARIABLES

Column: 250 × 3.2 5 μm Kromasil KR 100 C8 (Hichrom)
Mobile phase: MeCN:buffer 20:80 (Buffer was 15 mM potassium dihydrogen phosphate and 15 mM sodium thiosulfate)

SAMPLE
Matrix: tissue
Sample preparation: Condition a 3 mL 500 mg Sep-Pak C18 SPE cartridge with 5 mL MeOH, 2 mL water, and 2 mL 2% trichloroacetic acid. Homogenize (Ultra-Turrax T25) 5 g blended tissue with 20 mL 10 mM pH 4.5 phosphate buffer at 10000 rpm for 1.5 min, centrifuge at 4500 rpm for 10 min, decant supernatant, homogenize residue with another 20 mL buffer, centrifuge. Combine the supernatants and filter them through glass wool, add 1 mL 75% trichloroacetic acid to the filtrate, vortex for 30 s, centrifuge at 4500 rpm for 20 min, filter the supernatant through glass wool. Add the filtrate to the SPE cartridge at 1-2 mL/min, wash with 2 mL 2% trichloroacetic acid, wash with 2 mL water, elute with 1.5 mL MeCN at 0.7 mL/min. Add the eluate to 500 μL water and 3 mL ethyl ether, vortex gently for 30 s, centrifuge at 2000 rpm for 3 min, discard the organic layer. Add 200 μL 20% trichloroacetic acid solution to the aqueous phase, vortex for 15 s, add 200 μL 7% formaldehyde in 400 mM citric acid, vortex for 30 s, heat in boiling water bath for 30 min, cool to room temperature, add 500 mg NaCl, mix briefly, add 3 mL ethyl ether, vortex for 1 min, centrifuge at 2000 rpm for 3 min, repeat extraction twice more. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue in 500 μL mobile phase, vortex thoroughly, inject a 50 μL aliquot.

HPLC VARIABLES

CAS Registry No.: 300-62-9, 139-10-6 (phosphate), 60-13-9 (sulfate), 1407-85-8 (d-form tannate)
Merck Index: 623
Lednicer No.: 1 37, 70; 2 47

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 1 mL 100 mM NaOH + 3 mL n-hexane, shake for 20 min, centrifuge for 10 min. Remove 2 mL of the organic layer and evaporate it to dryness using a vacuum centrifuge, reconstitute the residue in 500 µL 100 µg/mL (S)-(+)-benoxaprofen chloride in dried dichloromethane, let stand at room temperature for 30 min, inject a 10 µL aliquot. (Synthesis of benoxaprofen chloride is as follows. Dissolve 600 mg benoxaprofen in 50 mL toluene, slowly add 5 mL freshly-distilled thionyl chloride, reflux for 30 min, evaporate to dryness, recrystallize benoxaprofen chloride from dichloromethane.)

HPLC VARIABLES

Column: 250 × 4.6 7 µm Zorbax-Sil
Mobile phase: Cyclohexane:dichloromethane:THF 50:10:10
Flow rate: 1
Injection volume: 10
Detector: F ex 312 em 365

CHROMATOGRAM

Retention time: 8.0 (R-(-)), 9.5 (S-(+))

OTHER SUBSTANCES

Extracted: methamphetamine, tranylcypromine

KEY WORDS

plasma; derivatization; normal phase; chiral

SAMPLE
Matrix: blood, urine

Sample preparation: Serum. 1 mL Serum + 1 mL 120 mM sodium dodecyl sulfate in 100 mM NaOH, homogenize, filter (45 μm). Inject on to column A at 180 μL/min 200 μL 60 mM sodium dodecyl sulfate in MeCN:water 50:50, 25 μL filtrate, and 25 μL 60 mM sodium dodecyl sulfate in MeCN:water 10:90, wait for 1 min, inject 100 μL 60 mM sodium dodecyl sulfate in MeCN:water 10:90, inject 200 μL 10 mM sodium dodecyl sulfate in MeCN:water 10:90, backflush the contents of column A on to column B with mobile phase, after 18 s remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Wash column A with 300 μL 60 mM sodium dodecyl sulfate in MeCN:water 50:50 and 300 μL 10 mM sodium dodecyl sulfate in MeCN:water 80:20. Urine. 5 mL Urine + 4.5 mL MeCN + 500 μL 1 M KOH, centrifuge at 2500 rpm for 10 min, filter (45 μm) the supernatant. Inject on to column A at 180 μL/min 25 μL 50 mM KOH in MeCN:water 20:80, 50 μL filtrate, 25 μL 50 mM KOH in MeCN:water 20:80, and 200 μL MeCN:water 20:80, backflush the contents of column A on to column B with mobile phase, after 18 s remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Wash column A with 400 μL MeCN.

HPLC VARIABLES

Column: A 20 × 2 polymeric reagent; B 250 × 4.6 5 μm Supelcosil LC-18-DB (with a guard column) (Prepare polymeric reagent as follows. Prepare a porous rigid resin using a divinylbenzene:ethylstyrene:styrene 24:6:70 mixture with trimethylsilyl modified silica (102 Å average pore size, 1.08 mL/g pore volume, 366 m^2/g surface area, 16-20 μm irregular particle shape, IMPAQ RG 1020 Si silica, PQ Co., Valley Forge PA). Further preparation details are not given but a typical procedure given in the cited reference is as follows. Aerate a mixture of 10 g modified silica in 100 mL water with nitrogen for 15 min, add 10 mL styrene:80% divinylbenzene:t-butyl peroxybenzoate 49:49:2 (remove preservative by passing through a butylcatechol remover (Scientific Polymer, Ontario NY), shake vigorously at room temperature for 4 h, add 150 mL 0.75% polyvinyl alcohol, shake for 4 h, heat at 120° for 24 h while shaking on a Parr instrument, cool to room temperature, filter, wash with 100 mL water, wash with 50 mL MeOH. Add the solid to 500 mL 3 M NaOH in MeOH:water 40:60, shake at room temperature for 14 h (to dissolve the silica), filter, wash with water until the washings are neutral, wash with 100 mL MeOH, dry at 60°. The polymer has similar properties to the template silica (US Pat. 4 933 372 (1990)). Soxhlet extract the resin with dioxane for 8 h (Caution! Dioxane is a carcinogen!). Add 25 g aluminum trichloride in 300 mL dry nitrobenzene to 50 g resin and 100 g 4-chloro-3-nitrobenzoyl chloride, stir mechanically at 60° for 5 h, pour into a mixture of 150 mL DMF, 100 mL concentrated HCl, and 150 g ice, filter. Wash the solid with 300 mL portions of DMF:water 75:25 until the washings are colorless, wash with warm (60°) DMF, wash with six 300 mL portions of dichloromethane:MeOH 2:1. Stir the product in 130 mL 40% benzyltrimethylammonium hydroxide in water, 130 mL water, and 260 mL dioxane at 90° for 8 h, filter, repeat the process. Wash the product with four portions of warm (60°) dioxane. Stir the solid with 30 mL acetic acid for 15 min, filter. Wash the solid with dioxane until the washings are neutral, wash with six 300 mL portions of dichloromethane:MeOH 2:1 to give a nitrobenzophenol-substituted polymer (J. Org. Chem. 1984, 49, 924). Heat 4 g 9-fluoreneacetic acid, 3.9 mL oxalyl chloride, 30 mL benzene (dried over anhydrous sodium sulfate, Caution! Benzene is a carcinogen!), and 3 drops of triethylamine at 55° for 1 h, evaporate under reduced pressure to remove oxalyl chloride, dissolve the product in 35 mL dichloromethane to give a 120 mg/mL solution of 9-fluoreneacetyl chloride, dilute to obtain a 2 mM solution. Stir 1.3 g nitrobenzophenol-substituted polymer, 4.2 mL 2 mM 9-fluoreneacetyl chloride solution, 300 μL triethylamine, and 20 mL dichloromethane at room temperature for 1 h, filter, wash with three 20 mL portions of MeCN to obtain the reagent, polymer-bound nitrobenzophenol 9-fluoreneacetate (J. Chromatogr. 1992, 609, 103).)

Mobile phase: Gradient. MeCN:water 50:50 for 3.5 min, to 70:30 over 12 min, maintain at 70:30 for 2.5 min, return to initial conditions over 1 min. (Place a 100 × 4.6 30-40 μm silica column before the injector.)

Column temperature: 60 (column A only)

Injection volume: 25-50

Detector: F ex 254 em 305-395

CHROMATOGRAM
Retention time: 9
Limit of quantitation: 25 ng/mL (urine), 600 ng/mL (serum)

OTHER SUBSTANCES
Extracted: methamphetamine (only in urine)

SAMPLE
Matrix: bulk, formulations
Sample preparation: Bulk. Dissolve 10 mg bulk drug in 5 mL dichloromethane, add 5 mL 20% NaOH, add 10 mL 10 mM 2-naphthoyl chloride in dichloromethane, shake for 1 min. Remove the organic phase and wash the aqueous phase with 5 mL dichloromethane. Combine the organic layers and wash them with 5 mL 10 mM sulfuric acid. Filter the organic layer through a syringe containing a glass wool plug and anhydrous sodium sulfate, inject a 10 μL aliquot. Capsules. Sonicate 1 capsule in 5 mL 20% NaOH for 45 min or until dissolved, filter, add 5 mL dichloromethane to filtrate, add 10 mL 10 mM 2-naphthoyl chloride in dichloromethane, shake for 1 min. Remove the organic phase and wash the aqueous phase with 5 mL dichloromethane. Combine the organic layers and wash them with 5 mL 10 mM sulfuric acid. Filter the organic layer through a syringe containing a glass wool plug and anhydrous sodium sulfate, inject a 10 μL aliquot.

SAMPLE
Matrix: solutions
Sample preparation: 2 mL THF + 1 mL 33.5 mM reagent in THF (freshly prepared) + 1 mL 1 mg/mL amphetamine in water + 700 μL 10% sodium bicarbonate in water, heat at 65° for 1 h, cool, extract three times with 10 mL aliquots of chloroform. Combine the extracts and wash them with 10 mL water, dry over anhydrous magnesium sulfate, evaporate to dryness, reconstitute with 2.5 mL mobile phase, inject a 5 μL aliquot. (Prepare reagent (1-[(4-nitrophenyl)sulfonyl]prolyl chloride) as follows. Mix 40-45 mmoles L-(-)-proline, 40 mL THF, and 200 mL 10% potassium carbonate, add 37-43 mmoles 4-nitrobenzenesulfonyl chloride in 40 mL THF dropwise, heat at 50° and maintain at pH 8 or above for 3 h, cool, acidify to pH 2, extract with chloroform. Extract the organic layers with potassium carbonate in water. Acidify the aqueous layer and extract it with chloroform. Dry the chloroform layer and evaporate it to dryness, recrystallize the resulting 1-[(4-nitrophenyl)sulfonyl]proline from petroleum ether and benzene (Caution! Benzene is a carcinogen!). Stir 15 mmoles 1-[(4-nitrophenyl)sulfonyl]proline in 100 mL benzene and add 75 mmoles thionyl chloride in 50 mL benzene dropwise, heat at 35-40° until the

reaction is complete (about 48 h; monitor by IR), evaporate to dryness, recrystallize from n-heptane to give 1-[(4-nitrophenyl)sulfonyl]prolyl chloride (Anal.Chem. 1984, 56, 958) (mp 110-110.5°).)

SAMPLE
Matrix: solutions

Sample preparation: Inject a 10 μL aliquot of a 100 ppm solution in MeCN:dichloromethane:triethylamine 50:50:0.05 into the mobile phase. The mobile phase flows through a 27 × 2.2 reactor packed with reagent at 72° to the column. (Reagent was dinitrobenzoyl-o-nitrobenzophenone polymeric reagent, prepared as follows. (Caution! Dioxane is carcinogenic in experimental animals! DMF may be carcinogenic! 3,5-Dinitrobenzoyl chloride and aluminum chloride are corrosive! Nitrobenzene is toxic!) Soxhlet extract 200-400 mesh polystyrene cross-linked with 4% divinylbenzene (Fluka) with MeCN for 48 h. Add 25 g aluminum trichloride in 300 mL dry nitrobenzene to a mixture of 50 g of the polystyrene resin and 100 g 4-chloro-3-nitrobenzoyl chloride, stir the mixture mechanically at 60° for 5 h, pour into a mixture of 150 mL DMF, 100 mL concentrated HCl, and 150 g ice. Wash the beads with 300 mL portions of DMF:water 75:25 until the washings are colorless, wash with warm DMF (60°), wash with six 300 mL portions of dichloromethane:MeOH 2:1, dry. Add the polymer to 130 mL 40% benzyltrimethylammonium hydroxide in water, 130 mL water, and 260 mL dioxane, heat at 90° for 8 h, filter, repeat the process, filter, wash the beads with four portions of warm (60°) dioxane, add 30 mL acetic acid, stir for 15 min, wash with dioxane until the washings are neutral, wash with six 300 mL portions of dichloromethane:MeOH 2:1. Add a portion of polymer to dry chloroform, add a three-fold excess of 3,5-dinitrobenzoyl chloride and pyridine, stir at 0-10° for 30 min, filter off polymer, wash with chloroform to give the reagent (J.Org.Chem. 1984, 49, 922).)

REFERENCE
Herráez-Hernández,R.; Campíns-Falcó,P.; Sevillano-Cabeza,A. On-line derivatization into precolumns for the determination of drugs by liquid chromatography and column switching: Determination of amphetamines in urine, *Anal.Chem.*, **1996**, *68*, 734–739.

SAMPLE
Matrix: solutions, urine
Sample preparation: Add 20 μL of a solution of amphetamine in MeCN:water 50:50 to a cartridge containing 30 mg reagent, heat at 60° for 5 min, elute with 500 μL MeCN, inject a 20 μL aliquot of the eluate. Alternatively, inject 10 μL of urine (adjusted to pH 10 with 100 mM NaOH and filtered) into a 27 × 3 reactor filled with reagent held at 60°, after 5 min elute the contents of the reactor on to the column with mobile phase, elute the column with mobile phase, monitor the effluent from the column. (Prepare reagent as follows. Add 3 g aluminum trichloride to 5 g 60-90 μm macroporous polystyrene-divinylbenzene

copolymer (Fluka) and 10 g 4-chloro-3-nitrobenzoyl chloride stirred in 100 mL dry nitrobenzene, stir at 60° for 5 h, pour into a mixture of 75 mL DMF, 50 mL concentrated HCl, and 50 g ice, filter. Wash the solid with three 50 mL portions of DMF:water 75:25, wash with 30 mL warm (60°) DMF, wash with five 50 mL portions of dichloromethane:MeOH 2:1. Stir the product in 15 mL 40% benzyltrimethylammonium hydroxide in water, 15 mL water, and 30 mL dioxane (Caution! Dioxane is a carcinogen!) at 90° for 8 h, filter. Wash the product with four 50 mL portions of warm (60°) dioxane. Stir the solid with 30 mL acetic acid for 15 min, filter. Wash the solid with three 50 mL portions of dioxane until the washings are neutral, wash with four 50 mL portions of dichloromethane:MeOH 2:1. Stir 1 g of the yellow product in 10 mL dichloromethane and 500 μL pyridine, add 1.24 g 9-fluorenylmethyl chloroformate, stir at room temperature for 30 min, filter. Wash the solid with three 20 mL portions of DMF, three 20 mL portions of dichloromethane, and three 20 mL portions of dry diethyl ether, dry under vacuum to give the reagent (polymer bound o-nitrobenzophenone fluorenylmethyl carbonate) Store in the freezer, good for at least a year.)

SAMPLE
Matrix: urine
Sample preparation: Condition a 100 mg Adsorbex SCX cation-exchange SPE cartridge (Merck) with 2 mL MeOH, 1 mL water, and 1 mL 17 mM KH_2PO_4, do not allow to dry. Centrifuge urine at 2000 g for 5 min. 1 mL Urine + 500 μL 50 mM KH_2PO_4, sonicate for 1 min, add to the SPE cartridge, rinse vial with 50 μL 50 mM KH_2PO_4 and add to cartridge, dry cartridge for 1 min, wash with three 500 μL portions of 17 mM KH_2PO_4, wash with 1 mL MeOH, dry under vacuum for 1 min, elute with four 500 μL portions of MeOH: 7.3% HCl (97.5:2.5) at a flow rate of 0.5 mL/min, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 3 μm Spherisorb ODS-1
Mobile phase: Gradient. A was water containing 5 mL (8.5 g) 85% orthophosphoric acid and 280 μL (0.22 g) hexylamine per liter. B was MeCN containing 100 mL water, 5 mL (8.5 g) 85% orthophosphoric acid, and 280 μL (0.22 g) hexylamine per liter. A:B 94.5:5.5 for 10.6 min, then to 61:39 over 11 min.
Column temperature: 40
Flow rate: 0.8
Injection volume: 10
Detector: UV 198

CHROMATOGRAM
Retention time: 6
Limit of detection: 30 ng/mL

OTHER SUBSTANCES
Extracted: 3,4-methylenedioxyamphetamine, methamphetamine, 4-methoxyamphetamine, phentermine, 3,4-methylenedioxymethamphetamine, 5-methoxy-3,4-methylenedioxyamphetamine, 3,4,5-trimethoxyamphetamine, 3,4-methylenedioxyethylamphetamine, 2,5-dimethoxyamphetamine, 4-bromo-2,5-dimethoxyphenylethylamine, 2,5-dimethoxy-4-methylamphetamine, 4-bromo-2,5-dimethoxyamphetamine, 2,5-dimethoxy-4-ethylamphetamine, mescaline, methoxamine

SAMPLE
Matrix: urine
Sample preparation: Condition a 130 mg Bond Elut Certify SPE cartridge with 3 mL MeOH and 3 mL 100 mM pH 6.0 phosphate buffer, do not allow to go dry. 2 mL Urine +

800 μL 100 mM pH 6.0 phosphate buffer + 200 μL 10 μg/mL 1-methyl-3-phenylpropylamine in MeOH, if necessary adjust pH to 5-7 with 1 M KOH or 1 M HCl (with pH paper), add the mixture to the SPE cartridge, wash with 1 mL 1 M acetic acid, wash with 3 mL water, dry for 5 min under vacuum, wash with 6 mL MeOH, dry for 2 min under vacuum, elute with 2 mL ethyl acetate:30% ammonium hydroxide 98:2 at a flow rate of 4-6 drops/sec. Evaporate the eluate for 2 min under a stream of nitrogen, add 100 μL 1 M HCl in diethyl ether, evaporate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 125 μL MeCN:water:triethylamine 90:8.6:1.4. Add the entire volume to 50 ± 5 mg reagent in a 1 mL plastic pipette tip plugged with a Kimwipe, react for 30 s, elute with 500 μL MeCN under pressure, inject a 10-20 μL aliquot. (The reagent was dinitrobenzoylbenzotriazole polymeric reagent, synthesized as follows. (Caution! Chloroform, dichloromethane, dioxane, and hydrazine are carcinogenic in experimental animals! DMF may be carcinogenic! 3,5-Dinitrobenzoyl chloride and aluminum chloride are corrosive! Nitrobenzene is toxic!) 10 g Dried macroporous polystyrene (Xe-305, Rohm and Haas) + 10 g 3-nitro-4-chlorobenzyl alcohol + 10 g anhydrous aluminum chloride + 50 mL nitrobenzene, heat at 65-70° for 3 days, cool, filter, wash polymer with three 50 mL portions of 1 M HCl in dioxane, with three 50 mL portions of DMF, with three 50 mL portions of MeOH, and with three 50 mL portions of dichloromethane, dry under vacuum at 100°. Reflux 19 g of this polymer in 60 mL hydrazine hydrate:ethylene glycol monoethyl ether 40:60 for 20 h, cool to room temperature, filter off the polymer and wash it thoroughly with water. Suspend the polymer in 100 mL concentrated HCl:dioxane 50:50, reflux for 20 h, filter the polymer and wash it with five 100 mL portions of water, with three 100 mL portions of MeOH, and with three 50 mL portions of ether, dry under vacuum at 80°. Functionalization was 1.17 mmoles/g (Eur.J.Biochem. 1975, 59, 55). Add a portion of polymer to dry chloroform, add a three-fold excess of 3,5-dinitrobenzoyl chloride and pyridine, stir at 0-10° for 30 min, filter off polymer, wash with chloroform to give the reagent (J.Org.Chem. 1984, 49, 922).)

HPLC VARIABLES

Guard column: 20 mm long Microsorb octadecyldimethylsilyl silica (Rainin)
Column: 10 (sic)x 4.6 5 μm Microsorb octadecyldimethylsilyl silica (Rainin)
Mobile phase: MeCN:10 mM pH 2.5 phosphate buffer 45:55
Flow rate: 0.7
Injection volume: 10-20
Detector: UV 220

CHROMATOGRAM

Retention time: 16.3
Internal standard: 1-methyl-3-phenylpropylamine (23.0)
Limit of detection: 14 ng/mL
Limit of quantitation: 47 ng/mL

OTHER SUBSTANCES

Noninterfering: benzoylecgonine, cocaine, codeine, glutethimide, imipramine, meperidine, methadone, methamphetamine, methaqualone, morphine, nortriptyline, oxazepam, phencyclidine, propoxyphene, quinine

SAMPLE

Matrix: urine

Sample preparation: Condition an Extra-Sep C18 SPE cartridge (Teknokroma) with 1 mL MeOH and 1 mL buffer. Adjust pH of 2 mL urine to ca. 10 with 100 μL concentrated ammonium hydroxide, add 5 μg β-phenylethylamine, add to the SPE cartridge, wash with 5 mL water, wash with 1 mL MeCN, elute with 2 mL MeOH. Add 100 μL EtOH:concentrated HCl 6:1 to the eluate, evaporate to dryness. Reconstitute with 1 mL buffer and 1 mL 0.5% 1,2-naphthoquinone-4-sulfonic acid sodium salt, let stand at room temperature for 10 min, add 2 mL n-hexane:ethyl acetate 50:50, shake for 2 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 500 μL MeCN:water 50:50, inject a 50 μL aliquot. (Buffer was 1% aqueous sodium bicarbonate adjusted to pH 10 with 5 M NaOH.)

HPLC VARIABLES
Column: 250 × 4 5 μm Hypersil ODS-C18
Mobile phase: Gradient. MeCN:0.5% propylamine in water from 40:60 to 50:50 over 2.5 min, to 70:30 over 1 min, maintain at 70:30.
Flow rate: 1
Injection volume: 50
Detector: UV 280

CHROMATOGRAM
Retention time: 4.7
Internal standard: β-phenylethylamine (4.1)
Limit of detection: 4 ng/mL
Limit of quantitation: 10 ng/mL

SAMPLE
Matrix: blood
Sample preparation: Extract a 200-300 μL aliquot of whole blood with DMSO:MeOH 2:1 or chloroform:MeCN:DMSO 30:30:40 containing IS. Mix for 30 s, allow the mixture to sit for 1 hour and repeat mixing. Centrifuge, filter (0.45 μm) and inject a 50-100 μL aliquot of the supernatant. (Caution! Chloroform is a carcinogen!)

HPLC VARIABLES
Column: 150 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:water adjusted to pH 4.2 with EDTA 36:64
Flow rate: 1
Injection volume: 50-100
Detector: UV 405

CHROMATOGRAM
Internal standard: N-acetyl-amphotericin B
Limit of quantitation: 75 ng/mL

KEY WORDS
pharmacokinetics; whole blood

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 *g* for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 *g* for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 346.2

SAMPLE
Matrix: milk
Sample preparation: Condition a 3 mL 500 mg Bond Elut C18 SPE cartridge with 20 mL MeOH, 20 mL water, and 10 mL 2% NaCl, do not allow to go dry. 5 mL Milk + 500 μL 30% trichloroacetic acid, vortex thoroughly for 10 s, centrifuge at 0° at 3300 g for 30 min. Remove the liquid supernatant and add it to 100 μL 4 M NaOH (to pH 5.2), vortex for 10 s, add 1 mL 20% NaCl, vortex for 10 s, add to the SPE cartridge at 3 mL/min, wash with 1 mL 2% NaCl, wash with 1 mL water, elute with 1 mL MeCN:100 mM pH 6.5 phosphate buffer 40:60. Add 20 μL 2 M NaOH to the eluate and vortex for 10 s (pH 8), add 10 μL 200 mM acetic anhydride in MeCN, let stand for 3 min, add 500 μL reagent,

vortex, heat at 65° for 10 min, cool to room temperature, inject a 200 μL aliquot. (Prepare reagent by dissolving 13.78 g 1,2,4-triazole in 60 mL water, add 10 mL 100 mM mercuric chloride solution, mix, adjust pH to 9.0 ± 0.5 with 4 M NaOH, make up to 100 mL with water.)

HPLC VARIABLES

Column: 150 × 3.9 4 μm Nova-Pak C18

SAMPLE

Matrix: milk
Sample preparation: Condition a 500 mg tC18 SPE cartridge (Waters) with 20 mL MeOH, 20 mL water, and 10 mL 2% NaCl. Centrifuge 30 mL milk at 1500 g for 10 min. Dilute a 10 mL portion of the defatted milk with 20 mL water, add 200 μL 2 μg/mL penicillin V in pH 9.0 buffer, add 6 mL 170 mM sulfuric acid, add 5.6 mL 5% sodium tungstate, shake vigorously for 1 min, allow to stand for 5 min, check that the pH is in the range 4.6-4.8 (if it is outside this range start again using a different volume of sodium tungstate solution), centrifuge at 1500 g for 10 min, adjust the pH of the supernatant to 8.1-8.2 with 5 M and 0.1 M NaOH, filter (glass fiber) the clear liquid phase. Pass the filtrate through the SPE cartridge at 2 mL/min, wash with 2 mL water, dry by pulling air through the cartridge for 1 min, elute with 2 mL MeCN. Add 150 μL pH 9.0 buffer to the eluate and evaporate to about 100 μL under a stream of nitrogen at 45-50°, add 400 μL pH 9.0 buffer, add 75 μL reagent I, vortex for 30 s, let stand at room temperature for 10 min, use 500 μL water to transfer the mixture to a separatory funnel, add 20 mL dichloromethane, add 5 mL pH 2.45 buffer, shake for 1 min, let stand for no more than 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure at 35-40°, dissolve the residue in 500 μL pH 9.0 buffer, add 75 μL reagent I, vortex for 30 s, let stand at room temperature for 10 min, add 450 μL reagent II, vortex for 1 min, heat at 55 ± 1° for 30 min, cool, filter (0.45 μm), inject a 150 μL aliquot. (Prepare pH 9.0 buffer by dissolving 0.34 g KH_2PO_4 in water, adjusting the pH to 9.0 with NaOH, and making up to 100 mL with water. Prepare pH 2.45 buffer by dissolving 2.72 g KH_2PO_4 in water, adjusting the pH to 2.45 with phosphoric acid, and making up to 100 mL with water. Prepare reagent 1 by dissolving 1.13 g benzoic anhydride in MeCN, make up to 25 mL with MeCN. Prepare reagent II by dissolving 6.905 g 1,2,4-triazole in 30 mL water and adding 5 mL 26 mM mercuric chloride in water, adjust pH to 9.0 ± 0.05 with 5 M NaOH,

make up to 50 mL. Prepare reagents I and II 1-4 h before use. Silanize glassware with dichlorodimethylsilane.)

HPLC VARIABLES
Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: Gradient. A as MeCN:buffer 10:90. B was MeCN:buffer 30:70. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 13 min, return to initial conditions over 2 min, re-equilibrate at initial conditions for 5 min. (Prepare buffer by dissolving 9.938 g Na_2HPO_4, 17.938 g $NaH_2PO_4.H_2O$, and 4.964 g sodium thiosulfate in water, make up to 2 L with water, pH 6.5.)

SAMPLE
Matrix: tissue
Sample preparation: Condition a 500 mg Isolute SCX SPE cartridge (Jones Chromatography, Hengoed, UK) with MeOH and water. Condition a 100 mg PGC (porous graphitic carbon) SPE cartridge (Shandon, Runcorn, UK) with acetone and pH 7.7 borate buffer. Add 20 mL water to 5 g tissue, homogenize, add 5 mL 170 mM sulfuric acid and 5 mL 5% aqueous sodium tungstate, mix well, centrifuge at 14000 g for 5 min. Discard pellet, add six drops orthophosphoric acid to the supernatant to adjust the pH to 2-2.5. Add it to the SCX SPE cartridge, allow to flow through the cartridge under vacuum at 2 mL/min, wash with 5 mL 10 mM sulfuric acid, elute with 10 mL pH 7.7 borate buffer. Add the eluate to the PGC SPE cartridge. Wash with 5 mL water, place in-line filter (0.2 μm, Anotop) below cartridge, elute with 20 mL acetone. Evaporate to dryness. Add 500 μL water to the dry residue, add 20 μL 2% acetic anhydride in MeCN and let stand for 3 min. Add 500 μL triazole/mercuric chloride derivatizing reagent and heat the mixture at 65° for 20 min. Inject a 100 μL aliquot. (Borate buffer was 200 mM boric acid adjusted to pH 7.7 with 40% NaOH solution. Triazole/mercuric chloride reagent was prepared by mixing 34.45 g 1,2,4-triazole with 150 mL water and 25 mL 10 mM mercuric chloride, adjusted to pH 9.0 with 1 M NaOH and made up to 250 mL with water.) van Leeuwen,W.; Wilhelmus van Gend,H. Determination of amprolium in egg yolk and muscle tissue (chicken) by HPLC with post-column reaction and fluorometric detection, using on-line sample clean-up and pre-concentration steps, *Z.Lebensm.Unters.Forsch.*, **1988**, *186*, 500–504.

SAMPLE

Matrix: feed, premix

Sample preparation: Feed. 1 g Feed + 2 mL 5 μg/mL thiamine monophosphate + 10 mL 5% sulfosalicylic acid + 10 mL hexane, vortex for 1 min, centrifuge at 2400 g for 10 min. Remove the aqueous layer and filter it (0.45 μm, Gelman Acro LC 13). Inject a 360 μL aliquot onto a 300 × 6 glass column packed with 200-400 mesh Dowex AG 2-X8 anion exchange resin, elute with 100 mM HCl at 1.2 mL/min, after about 2 min collect a 6-10 mL fraction, neutralize with 1 M NaOH (pH 7.0 ± 0.5), inject a 500 μL aliquot of this fraction (J.Agric.Food Chem. 1980, 28, 1145). After 15-20 samples clean the sulfosalicylic acid from the column by backflushing with 700 mM NaCl containing 100 mM HCl and 2% ferric chloride at 1.2 mL/min, flush for 20-30 min after the last of the iron chelate has gone (about 3 h). Re-equilibrate for 30 min. Premix. 0.8 mg Premix + 0.1 mg pyrithiamine + 10 mL water, grind (Omni-Mixer), add 10 mL hexane, grind for 5 min, centrifuge at 2400 g at 4° for 10 min. Filter the aqueous layer (0.45 μm, Millipore), dilute 20 times, inject an aliquot.

HPLC VARIABLES

Guard column: 30 × 4.6 5 μm Rainin RP-18 guard column

Column: 30 × 3 3 μm Perkin-Elmer C18

Mobile phase: Feed. Gradient. 100 mM pH 5.5 sodium phosphate buffer for 6 min then 100 mM pH 2.6 sodium phosphate buffer for 19 min, re-equilibrate with original buffer for 15 min. Premix. Isocratic. 100 mM pH 2.6 Sodium phosphate buffer.

Flow rate: 1

Injection volume: 10

Detector: F ex 339 em 432, following post-column reaction with 0.01% potassium ferricyanide in 15% NaOH pumped at 1 mL/min. The reagent is mixed with the column effluent and passed through a 7 m × 0.4 mm i.d. PTFE tube, kept at 32°, to the detector.

CHROMATOGRAM

Retention time: 13.98 (feed), 4.03 (premix)

Internal standard: thiamine monophosphate (5.26), pyrithiamine (1.62)

OTHER SUBSTANCES

Simultaneous: thiamine diphosphate, thiamine

SAMPLE

Matrix: blood
Sample preparation: Mix plasma or serum (minimum 50 μL) with an equal volume MeCN, vortex for 15 s. Incubate at ambient temperature for 15 min, vortex for 15 s, centrifuge at 39 000 g for 2 min, inject a 25 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 100 × 2.1 5 μm C18 narrow-bore (Hewlett-Packard)
Mobile phase: Gradient. A was MeCN. B was 100 mm pH 6.0 phosphate buffer. A:B from 5:95 to 10:90 over 13.5 min. (Buffer was prepared by mixing 2 L 100 mm monobasic sodium phosphate with 280 mL 100 mM dibasic sodium phosphate.)
Flow rate: 0.4
Injection volume: 25
Detector: UV 320, UV 345

CHROMATOGRAM

Retention time: 3.7
Limit of detection: 100 μg/L (320 nm), 500 μg/L (345 nm)

OTHER SUBSTANCES

Extracted: metabolites
Noninterfering: acetaminophen, bumetanide, carbamazepine, cefamandole, cefonicid, cefotaxime, cefoxitin, cefprozil, ceftazidime, ceftriaxone, ceftibuten, ceftizoxime, cefuroxime, cephalexin, cephalothin, desipramine, diazepam, digoxin, dobutamine, dopamine, doxepin, epinephrine, ethosuximide, fentanyl, furosemide, gentamicin, imipramine, methotrexate, midazolam, morphine, norepinephrine, phenobarbital, phenytoin, primidone, salicylic acid, theophylline, tobramycin, valproic acid, vancomycin (Monitoring at 345 nm may be necessary to avoid interference by cephalosporins.)

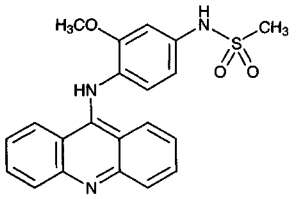
Amsacrine



Molecular formula: $C_{21}H_{19}N_3O_3S$
Molecular weight: 393.47
CAS Registry No.: 51264-14-3
Merck Index: 635

SAMPLE

Matrix: blood
Sample preparation: Add 100 µL 20 µM IS in MeOH to a glass tube and evaporate the MeOH to dryness under a stream of nitrogen at 35°, add 500 µL plasma, adjust pH to 3.0-4.0 with 120 µL 500 mM HCl, vortex gently, add 5 mL hexane, shake for 20 min, centrifuge at 1720 g for 10 min. Remove the aqueous layer and adjust the pH to 9.0 with 500 µL saturated sodium tetraborate, add 6 mL diethyl ether, shake for 15 min, centrifuge at 1720 g for 15 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 35°, reconstitute the residue in 100 µL MeOH, inject a 20-40 µL aliquot.

HPLC VARIABLES

Column: 100 × 8 10 µm Radial-Pak C18 (Waters)
Mobile phase: MeCN:water:buffer 396:594:10 (Buffer was 13.9 mL triethylamine in 60 mL water, adjust pH to 3.0 with phosphoric acid, dilute to 100 mL with water.)
Flow rate: 7
Injection volume: 20-40
Detector: UV 254

CHROMATOGRAM

Retention time: 3.4
Internal standard: 4'-(3-methyl-9-acridinylamino)methanesulfonanilide (4.3)
Limit of detection: 50 nM

OTHER SUBSTANCES

Noninterfering: doxorubicin, chlorambucil, cytosine arabinoside, 5-fluorouracil, lomustine, melphalan, methotrexate, prednisolone, 6-thioguanine, vincristine, vinblastine, degradation products

KEY WORDS

plasma; pharmacokinetics

SAMPLE

Matrix: blood, cells
Sample preparation: 500 µL Plasma, whole blood, or cells + 100 µL 5 µg/mL IS in 5% dextrose, adjust pH to 3.0-4.0 with 500 mM HCl, extract with hexane. Remove the aqueous layer and adjust the pH to 9.0 with saturated sodium tetraborate, extract with anhydrous diethyl ether. Remove the organic layer and evaporate it to dryness under a stream of air at 37°, reconstitute the residue in 200 µL MeOH:148 mM phosphoric acid 50:10, centrifuge at 6000 g for 10 min, inject an aliquot.

HPLC VARIABLES

Guard column: 50 × 4.6 LiChrosorb RP-8
Column: 150 × 4.6 8 µm Cp-Spher C8 (Chrompack)

Mobile phase: MeCN:water:buffer 396:594:10 (Buffer was 13.9 mL triethylamine in 60 mL water, adjust pH to 3.0 with 85% phosphoric acid, dilute to 100 mL with water.)
Flow rate: 1.5
Injection volume: 100
Detector: UV 265

CHROMATOGRAM
Retention time: 2.8
Internal standard: N-5-dimethyl-9-[(2-methoxy-4-methylsulfonylamino)phenylamino]-4-acridinecarboxamide (CI-921) (3.5)
Limit of detection: 6 ng/mL

KEY WORDS
whole blood; plasma; pharmacokinetics

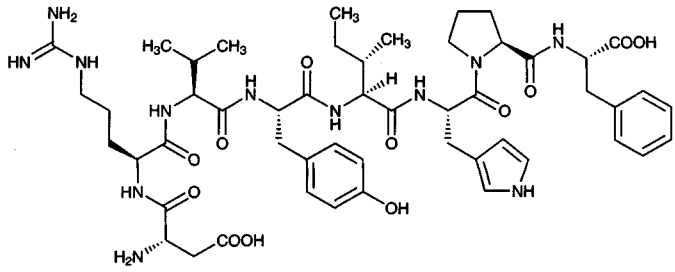
Angiotensin II

Molecular formula: $C_{50}H_{71}N_{13}O_{12}$
Molecular weight: 1046.19
CAS Registry No.: 4474-91-3
Merck Index: 689



SAMPLE

Matrix: blood
Sample preparation: 10 μL Serum + 240 μL 100 mM pH 7.5 potassium phosphate buffer containing 30 mM NaCl + 30 μL 1 M HCl, filter (0.2 μm), inject a 50 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Spherisorb ODS-C18
Mobile phase: MeOH:0.1% trifluoroacetic acid 60:40
Column temperature: 22
Flow rate: 1.5
Injection volume: 50
Detector: UV 220

CHROMATOGRAM

Retention time: 5.6
Limit of quantitation: 0.16 nmole

OTHER SUBSTANCES

Extracted: angiotensin I

KEY WORDS

serum; rat

REFERENCE

Santos,R.A.S.; Krieger,E.M.; Greene,L.J. An improved fluorometric assay of rat serum and plasma converting enzyme, *Hypertension*, **1985**, *7*, 244–252.

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL Analytichem weak cation-exchange (carboxymethylhydrogen form, CBA) SPE cartridge with 1 mL 1% trifluoroacetic acid in MeOH, 1 mL MeOH, and 2 mL water. Add 1 mL plasma to the SPE cartridge, rinse the tube with 1 mL water, add the rinse to the SPE cartridge, wash with 1 mL 1% trifluoroacetic acid in water, wash with 2 mL water, wash with 2 mL MeOH, elute with 2 mL 1% trifluoroacetic acid in MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH:buffer 50:50, inject a 5-75 μL aliquot. (Buffer was 5.7 g monochloroacetic acid, 2.0 g NaOH, and 0.2 g disodium EDTA in 1 L water, pH 3.2.) [Procedure was not necessarily validated for this compound.]

HPLC VARIABLES

Column: 250 × 2 5 μm Ultrasphere octyl
Mobile phase: Gradient. A was MeOH containing 10 mM sodium octanesulfonate. B was buffer containing 10 mM sodium octanesulfonate. A:B from 45:55 to 70:30 over 30 min,

maintain at 70:30 for 1 h. Alternatively isocratic at A:B 55:45 (Buffer was 5.7 g monochloroacetic acid, 2.0 g NaOH, and 0.2 g disodium EDTA in 1 L water, pH 3.2.)
Column temperature: 60
Flow rate: 0.3
Injection volume: 5-75
Detector: F ex 390 em 470 following post-column reaction. The column effluent mixed with 400 mM NaOH pumped at 0.15 mL/min and 0.05% ninhydrin pumped at 0.05 mL/min and the mixture flowed through a 12 m × 0.33 mm i.d. reaction coil at 70° to the detector.

CHROMATOGRAM
Retention time: 21 (gradient), 66 (isocratic)
Limit of detection: 100 fmole

OTHER SUBSTANCES
Simultaneous: adrenocorticotropin, angiotensin I, angiotensin III, atrial natriuretic peptide, bombesin, bradykinin, gonadorelin (LHRH), somatoliberin, vasopressin

KEY WORDS
plasma; SPE; post-column reaction

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg Bond Elut phenyl SPE cartridge with 1 mL MeOH and 1 mL water. 6-8 mL Blood + 500 μL inhibitor solution, cool in ice, centrifuge at 4°, add 2 mL plasma to the SPE cartridge, wash with 1 mL water, elute with 500 μL MeOH then 100 μL MeOH in to coated tubes, evaporate to dryness in a vacuum centrifuge evaporator, reconstitute with 140 μL 100 mM acetic acid, centrifuge at 4° at 3000 g for 15 min, inject a 30-100 μL aliquot of the supernatant. (Inhibitor solution was EtOH:water 2:98 containing 25 mM phenanthroline, 125 mM disodium EDTA, 2 g/L neomycin, 1 mM enalaprilat, and 10 μM pepstatin. Coat polypropylene tubes by filling with 5 g/L bovine serum albumin in 100 mM pH 7.5 Tris buffer containing 200 mg/L sodium azide overnight.)

HPLC VARIABLES
Guard column: 5 μm Lichrospher RP-18 end-capped
Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: MeCN:86 mM pH 3.0 triethylammonium phosphate 21:79 (After 20 injections wash column with MeCN:water 80:20 for 100 min.)
Column temperature: 45
Flow rate: 1
Injection volume: 30-100
Detector: UV 210 or immunoassay

CHROMATOGRAM
Retention time: 6.4

OTHER SUBSTANCES
Simultaneous: angiotensin III

KEY WORDS
rat; SPE; plasma

SAMPLE
Matrix: blood
Sample preparation: Add enalaprilat, 1,10-phenanthroline, and tripotassium EDTA to blood to give final concentrations of 3.6 μM, 2.5 mM, and 1.5 mg/mL respectively, separate plasma by centrifuging at 4°. 2 mL Plasma + ^{125}angiotensin II, add to a hexane-washed, conditioned 500 mg Bond Elut C8 SPE cartridge, elute with two 1 mL portions of MeCN: water 50:50 containing 0.1% trifluoroacetic acid, filter the eluate, inject an aliquot of the filtrate.

HPLC VARIABLES
Column: 150 × 4.6 Dynamax C8 (Rainin)
Mobile phase: Gradient. A was MeCN:water 20:80 containing 0.1% trifluoroacetic acid, adjusted to pH 4.0 with ammonium hydroxide. B was MeCN:water 35:65 containing 0.1% trifluoroacetic acid, adjusted to pH 4.0 with ammonium hydroxide. A:B from 100:0 to 0: 100 over 20 min.
Column temperature: 45
Flow rate: 1
Detector: RIA

CHROMATOGRAM
Retention time: 11.9
Internal standard: ^{125}angiotensin II (16)

OTHER SUBSTANCES
Simultaneous: angiotensin I, angiotensin III

KEY WORDS
plasma; SPE

REFERENCE
Goldberg,M.R.; Tanaka,W.; Barchowsky,A.; Bradstreet,T.E.; McCrea,J.; Lo,M.-W.; McWilliams,E.J.,Jr.; Bjornsson,T.D. Effects of losartan on blood pressure, plasma renin activity, and angiotensin II in volunteers, *Hypertension*, **1993**, *21*, 704–713.

SAMPLE
Matrix: enzyme incubations
Sample preparation: 5 μL Serum + 70 μL 200 mM pH 7.5 phosphate buffer containing 30 mM NaCl + 20 μL 800 μM angiotensin I + 10 μL water, heat at 37° for 15 min, add 100 μL 500 mM perchloric acid, centrifuge at 800 g for 5 min. Remove a 100 μL aliquot of the supernatant and cool in ice-water, add 50 μL 5 mM benzoin in 2-methoxyethanol, add 50 μL mercaptoethanol solution, add 100 μL 0.8 M KOH, heat on a boiling water bath for 1.5 min, add 100 μL 1.2 M HCl:1 M pH 8.5 Tris-HCl buffer 50:50 (?) to adjust pH to 8.5, inject a 100 μL aliquot. (Prepare mercaptoethanol solution by dissolving 780 mg β-mercaptoethanol and 2.52 g sodium sulfite in 80 mL water, make up to 100 mL with water. The procedure measures the activity of angiotensin-converting enzyme in serum. The enzyme converts angiotensin I to angiotensin II which is then determined by HPLC.)

HPLC VARIABLES
Column: 250 × 4 5 μm TSK gel ODS-120T (Toyo Soda)
Mobile phase: MeOH:48 mM pH 8.5 phosphate buffer 33:67
Flow rate: 0.8
Injection volume: 100

Detector: F ex 325 em 435

Limit of detection: 27 fmole

OTHER SUBSTANCES

Simultaneous: angiotensin I, angiotensin III, gonadorelin, leupeptin acid, substance P, tuftsin

KEY WORDS

derivatization

REFERENCE

Kai,M.; Miyazaki,T.; Sakamoto,Y.; Ohkura,Y. Use of benzoin as pre-column fluorescence derivatization reagent for the high-performance liquid chromatography of angiotensins, *J.Chromatogr.*, **1985**, *322*, 473–477.

SAMPLE

Matrix: solutions

Sample preparation: 200 μL Solution + 100 μL chloroform + 50 μL 3 M KOH, heat at 60° for 10 min, cool in ice-water for 1 min, add 50 μL 14 M acetic acid, add 300 μL freshly prepared 265 μg/mL 1,2-diamino-4,5-dimethoxybenzene monohydrochloride in water (with cooling in ice-water), heat at 60° for 18 min, cool, inject a 100 μL aliquot. (Prepare 1,2-diamino-4,5-dimethoxybenzene monohydrochloride as follows. Stir 483 g veratrole in 1.45 L acetic acid at 15° for 1 h, add 683 g concentrated nitric acid (d 1.05) over 1 h (maintain the temperature below 40° by cooling and regulating the rate of addition of the nitric acid). Continue stirring and add 2.127 L fuming nitric acid (d 1.50) over 1 h while maintaining the temperature below 30°, let stand for 2 h, pour into a large volume of cold water, filter, wash the solid with water until the washings are neutral, recrystallize from EtOH to give 4,5-dinitroveratrole (mp 129.5-130.5°) (J. Am. Chem. Soc. 1946, 68, 1536). Reflux 5 g 4,5-dinitroveratrole in 200 mL benzene (Caution! Benzene is a carcinogen!), add 100 g 60 mesh iron powder and 20 mL concentrated HCl in small portions over 1 h, reflux for 4 h, add 10 mL water, reflux for 2 h, cool, make alkaline with 2.5 M NaOH, extract several times with 200 mL portions of benzene. Combine the organic layers and evaporate them to dryness, add 10 mL concentrated HCl, recrystallize from EtOH to give 1,2-diamino-4,5-dimethoxybenzene monohydrochloride as very slightly pink needles (mp 240°) (Anal. Chim. Acta 1982, 134, 39).)

HPLC VARIABLES

Column: 150 × 4 5 μm LiChrosorb RP-18

Mobile phase: MeCN:buffer:50 mM sodium 1-hexanesulfonate 26:64:10 (Prepare buffer by dissolving 14.9 g KCl in 950 mL water, adjusting pH to 2.2 with concentrated HCl, and making up to 1 L with water.)

Flow rate: 0.8

Injection volume: 100

Detector: F ex 350 em 425

CHROMATOGRAM

Retention time: 14.5

Limit of detection: 11.3 pmole

OTHER SUBSTANCES

Simultaneous: angiotensin I, angiotensin III, leucine enkephalin, methionine enkephalin

KEY WORDS

derivatization; specific for tyrosine-containing peptides

REFERENCE

Ishida,J.; Kai,M.; Ohkura,Y. High-performance liquid chromatography of tyrosine-containing peptides by pre-column derivatization involving formylation followed by fluorescence reaction with 1,2-diamino-4,5-dimethoxybenzene, *J.Chromatogr.*, **1986**, *356*, 171–177.

SAMPLE

Matrix: solutions

Sample preparation: Inject a 10-50 μL aliquot.

HPLC VARIABLES

Column: 200 × 4 5 μm TSKgel ODS-120T (Toyo Soda)

Mobile phase: Gradient. A was MeCN:200 mM pH 2.3 sodium phosphate buffer 5:95. B was MeCN:200 mM pH 2.3 sodium phosphate buffer 40:60. A:B 100:0 for 5 min, to 68.6:31.4 step gradient), to 35.7:64.3 over 45 min.

Flow rate: 1

Injection volume: 10-50

Detector: F ex 325 em 435 following post-column reaction. The column effluent mixed with reagent A pumped at 1 mL/min and the mixture flowed through a 15 m × 0.3 mm ID

PTFE coil at 76°. The effluent from this coil mixed with reagent B pumped at 0.4 mL/min and this mixture passed through a 10 × 4 column packed with 40 mg glass wool. (Prepare reagent A by mixing equal volumes of 6 mM benzoin in 2-methoxyethanol, 4.8 M KOH, and 2.1 M β-mercaptoethanol. Prepare reagent B by mixing equal volumes of 1 M Tris and 4.2 M HCl.)

CHROMATOGRAM
Retention time: 20
Limit of detection: 5-15 pmole

OTHER SUBSTANCES
Simultaneous: angiotensin I, angiotensin III, kallidin, kyotorphin, β-melanocyte stimulating hormone, substance P
Noninterfering: estriol, estrone-3-sulfate, methionine enkephalin, phenylalanine, phenylpyruvic acid, propionic acid, sorbic acid, tryptophan, tyrosine

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 75 × 4.6 5 μm Hypersil WP 300-octyl
Mobile phase: Gradient. A was 0.1% trifluoroacetic acid in water. B was 0.1% trifluoroacetic acid in n-propanol. A:B 100:0 for 2.5 min, to 90:10 over 2.5 min, to 10:90 over 112 min.
Flow rate: 1
Detector: UV 225

CHROMATOGRAM
Retention time: 15

OTHER SUBSTANCES
Simultaneous: bombesin, bovine growth hormone, bovine serum albumin, catalase, lysozyme, L-tryptophan

REFERENCE
Supelco Catalog, **1993,** p. 602.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 TSKgel ODS-120T
Mobile phase: Gradient. A was MeOH:water 20:80 containing 0.05% trifluoroacetic acid. B was MeOH:water 50:50 containing 0.05% trifluoroacetic acid. A:B from 100:0 to 0:100 over 1 h.
Flow rate: 1
Detector: UV 220

CHROMATOGRAM
Retention time: 12

OTHER SUBSTANCES
Simultaneous: angiotensin I, calcitonin (human), α-endorphin, β-endorphin, gonadorelin (LH-RH), protirelin (TRH), somatostatin

REFERENCE
Varian Catalog, **1993,** p. 182.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 10 μm Vydac 228TP
Mobile phase: Gradient. A was 0.25% trifluoroacetic acid in water. B was 0.25% trifluoroacetic acid in MeCN:water 70:30. A:B from 95:5 to 0:100 over 30 min.
Flow rate: 1.5
Detector: UV 220

CHROMATOGRAM
Retention time: 11

OTHER SUBSTANCES
Simultaneous: angiotensin I, bradykinin, eledosin, insulin, lysozyme, myoglobin, neurotensin, ovalbumin, oxytocin

REFERENCE
Supelco Catalog, **1993,** p. 581.

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 1 mM solution in 100 mM pH 6 morpholinoethanesulfonic acid/NaOH buffer. Remove a 20 μL aliquot and add it to 5 μL 25 mM 5-carboxytetramethylrhodamine succinimidyl ester (Molecular Probes, Eugene OR) in DMF, let stand at room temperature overnight, add 50 μL 1 M pH 8 Tris-HCl buffer, inject a 5 μL aliquot.

HPLC VARIABLES
Guard column: reversed-phase
Column: reversed-phase
Mobile phase: Gradient. A was MeCN containing 0.1% trifluoroacetic acid. B was water containing 0.1% trifluoroacetic acid. A:B from 5:95 to 55:45 "applied just after application of a sample".
Flow rate: 1
Injection volume: 5
Detector: UV 280

CHROMATOGRAM
Retention time: 38

OTHER SUBSTANCES
Simultaneous: angiotensin I

SAMPLE

Matrix: amniotic fluid, blood
Sample preparation: Condition a 3 mL Bond Elut C18 SPE cartridge with 2 mL MeOH and 2 mL water. 50 μL Plasma or amniotic fluid + 50 μL 5 μg/mL 3-hydroxyacetamidophenol in water, add to SPE cartridge, wash twice with 2 mL portions of water, elute with 2 mL MeOH. Evaporate the eluate under vacuum, reconstitute the residue in 100 μL MeCN:water 6:94, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere ODS C18
Mobile phase: Gradient. A was MeCN:pH 4.0 ammonium phosphate buffer 6:94. B was MeCN:pH 4.0 ammonium phosphate buffer 25:75. A:B from 100:0 to 100:0 over 20 min, to 100:0 over 5 min, re-equilibrate for 10 min.
Flow rate: 1
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Limit of quantitation: 400 ng/mL

OTHER SUBSTANCES

Extracted: didanosine

KEY WORDS

plasma; monkey; pharmacokinetics; SPE

SAMPLE

Matrix: amniotic fluid, blood
Sample preparation: Condition a 3 mL Bond Elut C18 SPE cartridge with 2 mL MeOH and two 2 mL portions of water. 100 μL Plasma or amniotic fluid + 20 μL 10 μg/mL 3-hydroxyacetamidophenol in water, mix, add to the SPE cartridge, wash with two 2 mL portions of water, elute with 2 mL MeOH. Evaporate the eluate to dryness under reduced pressure, reconstitute with 100 μL MeCN:50 mM pH 3.3 ammonium phosphate buffer 6:94, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: Gradient. A was MeCN:50 mM pH 3.3 ammonium phosphate buffer 6:94. B was MeCN:50 mM pH 3.3 ammonium phosphate buffer 25:75. A:B from 100:0 to 0:100 over 17 min, maintain at 0:100 for 5 min, return to initial conditions over 3 min, re-equilibrate for 17 min.
Flow rate: 1
Injection volume: 50

Detector: UV 266

CHROMATOGRAM
Limit of quantitation: 400 ng/mL

OTHER SUBSTANCES
Extracted: stavudine

KEY WORDS
monkey; plasma; pharmacokinetics; SPE

REFERENCE
Odinecs,A.; Nosbisch,C.; Keller,R.D.; Baughman,W.L.; Unadkant,J.D. In vivo maternal-fetal pharmacokinetics of stavudine (2',3'-didehydro-3'-deoxythymidine in pigtailed macaques (*Macaca nemestrina*), *Antimicrob.Agents Chemother.*, **1996**, *40*, 196–202.

SAMPLE
Matrix: blood
Sample preparation: 0.5 mL Plasma + 0.5 mL water + 0.5 mL 0.25 M NaOH, vortex, allow to stand at room temperature for 20 min, add 20 μL of 100 μg/mL phenacetin and 3 μg/mL flunitrazepam, vortex, add 5 mL diethyl ether, vortex for 30 s, centrifuge at 900 g for 5 min, freeze in acetone/dry ice for 5 min. Remove the supernatant and dry it under nitrogen. Reconstitute in 115 μL MeCN:0.1% pH 3 sodium phosphate buffer 30:70, inject an aliquot.

HPLC VARIABLES
Guard column: 23 × 3.9 37-50 μm μBondapak phenyl
Column: 300 × 3.9 10 μm μBondapak phenyl
Mobile phase: Gradient. A was MeCN:0.1% pH 3 sodium phosphate buffer 5:95. B was MeCN:0.1% pH 3 sodium phosphate buffer 70:30. A:B 80:20 for 2.5 min, then to 45:55 over 20 min, then to 25:75 over 3 min, then to 80:20 over 3 min, equilibrate at 80:20 for 7 min.
Column temperature: 40
Flow rate: 2
Injection volume: 200
Detector: UV 254

CHROMATOGRAM
Retention time: 5.08
Internal standard: phenacetin (7.09)
Limit of quantitation: 5500 ng/mL

OTHER SUBSTANCES
Simultaneous: lorazepam (at 229 nm)
Noninterfering: acetaminophen, trimethoprim, sulfamethoxazole, allopurinol, indocyanine green

KEY WORDS
plasma

SAMPLE
Matrix: blood

Sample preparation: 0.5 mL Plasma +10 μL 250 μg/mL 1-acetamidopyrene in MeOH + 200 μL 1 M ammonium sulfate + 800 μL cold MeCN, vortex for 30 s, store at -20° for at least 30 min, vortex, centrifuge at 1500 g for 30 min. Remove 400 μL of the upper organic layer and evaporate it under a stream of nitrogen. Reconstitute with 100 μL mobile phase, vortex for 30 s, inject a 75 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:buffer 47:53 (Buffer was 6.805 g potassium monophosphate in 1 L water, adjust pH to 6.00 with 10 M NaOH.)
Flow rate: 1
Injection volume: 75
Detector: UV 214

CHROMATOGRAM

Retention time: 4.2
Internal standard: 1-acetamidopyrene (9.7)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Simultaneous: lorazepam, indocyanine green
Noninterfering: adenosine, albuterol, alphenal, aspirin, caffeine, carbamazepine, cefazolin, cephalexin, cephalothin, cimetidine, ciprofloxacin, claforan, desipramine, enoxacin, fleroxacin, furosemide, hydralazine, hydrochlorothiazide, minoxidil, norfloxacin, phenytoin, propafenone, sulindac, teicoplanin, theophylline, vancomycin
Interfering: some indocyanine green impurities

KEY WORDS

plasma

SAMPLE

Matrix: blood

Sample preparation: 200 μL Serum + 200 μL mobile phase, filter (Millipore Millex 0.45 μm), inject a 25 μL aliquot.

HPLC VARIABLES
Guard column: 40 × 4 C18 Corasil II
Column: 300 × 4 10 μm μBondapak phenyl
Mobile phase: Propanol:6 mM C_{12} DAPS (Fluka) 3:97 (C_{12} DAPS is 3-(dimethyldodecylammonio) propanesulfonate.)
Injection volume: 25
Detector: UV 273

CHROMATOGRAM
Retention time: 8
Internal standard: antipyrine

OTHER SUBSTANCES
Simultaneous: theophylline, β-hydroxytheophylline, caffeine, theobromine, albendazole, albendazole sulfoxide, nimorazole, flubendazole, mercaptopurine, aminophylline, amyleine, procaine
Interfering: metronidazole, tinidazole, dipropyline

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. Mix 500 μL plasma with 25 μL 15 μg/mL IS in MeOH, 500 μL 750 mM pH 5.0 sodium acetate buffer containing 40 mg/mL sodium metabisulfite, and 10 mg of a mixture of β-glucuronidase and arylsulfatase (Limpet acetone powder Type I: Platela vulgata, Sigma). Heat at 37° for 2 h, add 100 mg NaCl, extract with 1.2 mL chloroform:EtOH 90:10 for 2 min (Caution! Chloroform is a carcinogen!). Centrifuge at 1800 g for 20 min, add the organic phase to 50 μL 100 mM HCl, evaporate to dryness under a stream of nitrogen, dissolve the residue in 75 μL mobile phase, wash with 25 μL n-hexane, inject a 20 μL aliquot of the lower phase. Urine. Mix 500 μL urine with 25 μL 500 μg/mL IS in MeOH, 500 μL 750 mM pH 5.0 sodium acetate buffer containing 40 mg/mL sodium metabisulfite, and 10 mg of a mixture of β-glucuronidase and arylsulfatase

(Limpet acetone powder Type I: Platela vulgata, Sigma). Heat at 37° for 2 h, add 200 mg sodium chloride, extract with 2 mL dichloromethane:isopropanol 90:10 for 90 s, centrifuge at 1800 g for 30 min, evaporate the organic phase under a stream of nitrogen. Dissolve the residue in 200 μL mobile phase, vortex for 15 s, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 Nova-Pak C18
Mobile phase: MeOH:250 mM pH 5.0 sodium acetate buffer 30:70
Flow rate: 1.0
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 4.5
Internal standard: phenacetin (10)

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)
Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25
Detector: UV 229

CHROMATOGRAM

Retention time: 5.39 (A), 4.54 (B)

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, acetophenazine, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butabarbital, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clonidine, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene, desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloperidol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen, ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, methadone, methdilazine, methocarbamol, methotrexate, methotrimeprazine, methoxamine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen, nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone,

phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, salicylic acid, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terbutaline, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, xylometazoline, yohimbine, zopiclone

SAMPLE
Matrix: urine
Sample preparation: Condition a C18 AASP SPE cartridge (Varian) with 1 mL MeOH and 1 mL water. 100 μL Urine + 100 μL 50 mM pH 4.5 KH_2PO_4 + 20 mg limpet acetone powder (type I, contains β-glucuronidase and sulfatase, from Sigma), + 16 mg sodium metabisulfite, vortex for 15 s, heat at 40° with mild agitation for 3 h. Cool to room temperature, add 10 μL 1 mg/mL 4-dimethylaminoantipyrine in water, vortex, centrifuge at 500 g for 20 min. Remove 100 μL supernatant and add it to 900 μL pH 4.5 100 mM TRIS. Remove 500 μL and add it to 500 μL 50 mM pH 4.5 KH_2PO_4, add to SPE cartridge, wash with four 1 mL portions of 50 mM pH 4.5 phosphate buffer, allow to dry completely, elute with three 100 μL volumes of MeCN:dichloromethane 20:80. Evaporate eluate at 40° under vacuum while vortexing, reconstitute the residue in 100 μL 50 mM pH 4.5 phosphate buffer, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 2 40 μm Corasil phenyl
Column: 100 × 4.6 5 μm Spherisorb phenyl
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeOH. A:B from 90:10 to 60:40 over 14 min, to 40:60 over 7 min, to initial conditions over 0.1 min, re-equilibrate for 7.9 min.
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 17.8
Internal standard: 4-dimethylaminoantipyrine (19.9)
Limit of quantitation: 2000 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
SPE

Antitrypsin

Molecular formula: indeterminate
CAS Registry No.: 9041-92-3
Merck Index: 760

SAMPLE

Matrix: blood
Sample preparation: Dialyze 2 mL plasma against 30 mM pH 7.0 sodium phosphate buffer overnight, chromatograph on 20 mL Blue-Sepharose (equilibrated with 30 mM pH 7.0 sodium phosphate buffer) at 40 mL/h. Dialyze non-retained fraction (20-30 mL) against 30 mM pH 5.8 sodium acetate buffer overnight, chromatograph on 10 mL Red-Sepharose (equilibrated with 30 mM pH 5.8 sodium acetate buffer). Concentrate non-retained fraction (30-50 mL) to 2-3 mL with Amicon PM-10 and freeze dry, dissolve freeze-dried sample in 300 μL 10 mM pH 7.0 sodium phosphate buffer containing 100 mM NaCl, inject into HPLC.

HPLC VARIABLES

Column: 100 × 6 KB-column hydroxy-apatite (Koken)
Mobile phase: Gradient. A was 10 mM pH 7.0 sodium phosphate buffer containing 100 mM NaCl. B was 200 mM pH 7.0 sodium phosphate buffer containing 100 mM NaCl. A:B from 100:0 to 50:50 over 1 h.
Flow rate: 1
Detector: UV 280

CHROMATOGRAM

Retention time: 22.3

OTHER SUBSTANCES

Extracted: α1-acid glycoprotein

KEY WORDS

plasma

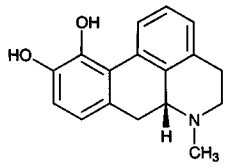
Apomorphine



Molecular formula: $C_{17}H_{17}NO_2$
Molecular weight: 267.33
CAS Registry No.: 58-00-4, 41372-20-7 (HCl)
Merck Index: 787

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 206.4

CHROMATOGRAM

Retention time: 8.962

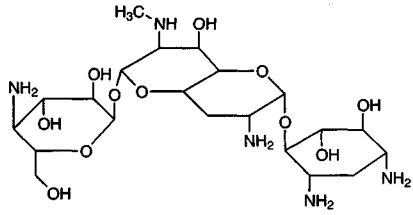
Apramycin



Molecular formula: $C_{21}H_{41}N_5O_{11}$
Molecular weight: 539.58
CAS Registry No.: 37321-09-8
Merck Index: 792

SAMPLE

Matrix: fermentation solutions
Sample preparation: 5 mL Fermentation broth + 5 mL saturated aqueous solution of Tris + 20 mL MeCN, centrifuge at 3000 rpm for 10 min. Remove a 1 mL aliquot of the supernatant and add it to 3 mL 150 mM 2,4-dinitrofluorobenzene in MeOH, heat at 100° under a reflux condenser for 45 min, make up to 4 mL with mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 200 × 4.6 10 μm LiChrosorb RP-8
Mobile phase: MeCN:water:acetic acid 55:45:0.15
Flow rate: 1.2
Injection volume: 20
Detector: UV 350

CHROMATOGRAM

Retention time: 9.56

OTHER SUBSTANCES

Extracted: kanamycin B, tobramycin

KEY WORDS

derivatization

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeCN:10 mm KH_2PO_4 + 5 mM 1-decanesulfonic acid 30:70, adjusted to pH 3.2 with 85% phosphoric acid
Flow rate: 1
Injection volume: 10
Detector: UV 214

CHROMATOGRAM
Retention time: 5.8
Internal standard: methyl paraben (7.0)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Simultaneous: allobarbital, barbital, butalbital, mephobarbital, pentobarbital, phenobarbital, secobarbital, talbutal, vinbarbital

KEY WORDS
stability-indicating

SAMPLE
Matrix: solutions
Sample preparation: Dissolve in mobile phase to a concentration of 50 μg/mL.

HPLC VARIABLES
Column: 250 × 4 β-cyclodextrin polymer-coated silica (Chromatographia 1993, 36, 373)
Mobile phase: MeOH:water 50:50
Flow rate: 0.6
Injection volume: 20
Detector: UV 240

CHROMATOGRAM
Retention time: k' 0.398

OTHER SUBSTANCES
Simultaneous: pentobarbital, amobarbital, butabarbital, butalbital, secobarbital, thiopental, phenobarbital

REFERENCE
Forgács,E.; Cserháti,T. Retention behaviour of barbituric acid derivatives on a β-cyclodextrin polymer-coated silicon column, *J.Chromatogr.A*, **1994**, *668*, 395–402.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES
Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine,

eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

Aprotinin

Molecular formula: $C_{284}H_{432}N_{84}O_{79}S_7$
Molecular weight: 6511.53
CAS Registry No.: 9087-70-1
Merck Index: 796

SAMPLE

Matrix: blood, urine
Sample preparation: Prepare an affinity column with porcine pancreatic kallikrein bound to cyanogen bromide-activated Sepharose 4B according to the method of the manufacturer (Pharmacia). Use prolonged washing cycles of high and low pH. Immediately acidify urine to pH 2.0. Adjust pH of plasma to 8.3 with 100 mM pH 8.3 Tris-HCl buffer containing 500 mM NaCl. Adjust pH of urine to 8.3 with 2 M NaOH. Centrifuge sample at 4390 g for 10 min, pump onto affinity column, pump eluate twice onto column. Wash column with ten bed volumes 100 mM pH 8.3 Tris-HCl buffer containing 500 mM NaCl. Elute with 800 μL 1 M phosphoric acid and 800 μL 10 mM pH 2.2 phosphoric acid in 200 mM sodium perchlorate, mix, inject a 1000 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 7 μm LiChrosorb RP-18
Mobile phase: MeCN:200 mM pH 2.2 sodium perchlorate containing 10 mM phosphoric acid 30:70
Column temperature: 25
Flow rate: 1
Injection volume: 1000
Detector: UV 200

CHROMATOGRAM

Retention time: 9.3
Limit of detection: 50 ng/mL

KEY WORDS

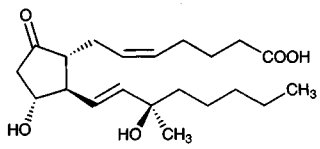
Arbaprostil



Molecular formula: $C_{21}H_{34}O_5$
Molecular weight: 366.50
CAS Registry No.: 55028-70-1
Merck Index: 808
Lednicer No.: 3 8

SAMPLE

Matrix: blood

Sample preparation: Condition a 3 mL 200 mg and a 1 mL 100 mg Bond-Elut C18 SPE cartridge with 4 mL MeOH and 4 mL water. 3 mL Plasma + 12 μL 32.5 ng/mL IS in MeCN + 300 μL 5% formic acid, vortex, centrifuge at 4° at 1500 g for 15 min, add the supernatant to the 3 mL SPE cartridge, wash with two 2 mL portions of water, wash with two 2 mL portions of MeOH:water 10:90, wash with 2 mL toluene, elute with 1 mL ethyl acetate. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute with 610 μL MeOH, vortex for 30 s, add 1.42 mL 0.01% formic acid, inject a 1.8 mL aliquot onto a 30 × 4.6 5 μm Brownlee RP-8 column and elute to waste with MeCN:water:formic acid 40:60:0.01 at 2 mL/min, after 2.5 min backflush the contents of this column onto a 250 × 4.6 5 μm Supelcosil LC-18 column eluted with MeCN:water:formic acid 40:60:0.01 at 2 mL/min, after about 6.5-7 min collect a fraction containing the prostaglandins. Dilute this fraction with an equal volume of water, add to the 1 mL SPE cartridge, wash with 1 mL hexane, elute with two 500 μL portions of ethyl acetate. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 250 μL 100 μg/mL panacyl bromide in THF:MeCN 20:80, vortex for 30 s, add 3 μL N,N-diisopropylethylamine, heat at 40° for 1 h (Anal. Chem. 1984, 56, 1866). Evaporate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 230 μL isooctane:ethylene dichloride:isopropanol 70:30:1, sonicate for 10 min, inject a 200 μL aliquot onto column A and elute to waste with mobile phase A, after 3 min divert the effluent from column A onto column B and elute both to waste, after 1.5 min remove column A from the circuit, continue to elute column B to waste with mobile phase A, after 7.5 min collect the effluent from column B in a 2.2 mL sample loop, after 2 min inject the contents of this sample loop onto column C with mobile phase B, elute column C with mobile phase B, monitor the effluent from column C. (Synthesize panacyl bromide (p-(9-anthroyloxy)phenacyl bromide) as follows. Add 3.04 g benzyltrimethylammonium dichloroiodate to a solution of 500 mg 4'-hydroxyacetophenone in 50 mL dichloroethane and 20 mL MeOH, reflux for 10 h, remove the solvent by distillation, add 20 mL 5% sodium bisulfite to the residue, extract four times with 40 mL portions of ether, dry over anhydrous magnesium sulfate, evaporate to dryness under reduced pressure to give p-hydroxyphenacyl chloride (mp 151-152°) (Synthesis 1988, 545). Purify p-hydroxyphenacyl chloride by suspending 100 g in 1 L boiling toluene, filter, cool to obtain white crystals of p-hydroxyphenacyl chloride. Repeat this process a number of times to obtain more pure product. Reflux 10 g 9-anthracenecarboxylic acid in 150 mL redistilled thionyl chloride for 2 h, evaporate to dryness under reduced pressure at 30°, dissolve the residue in 150 mL dry toluene containing 11.5 g p-hydroxyphenacyl chloride, reflux for 2 h, evaporate to dryness under reduced pressure, recrystallize from 200 mL hot MeCN to give p-(9-anthroyloxy)phenacyl chloride as deep yellow crystals (mp 159.8-161.6°). Dissolve 2.5 g p-(9-anthroyloxy)phenacyl chloride in 25 mL THF:MeCN 20:80, add 8 g anhydrous LiBr, reflux briefly, cool to room temperature, filter, wash the solid with water to obtain p-(9-anthroyloxy)phenacyl bromide as deep yellow crystals (mp 173.3-173.6°) (Anal. Biochem. 1987, 165, 220).)

HPLC VARIABLES

Column: A 10 × 4.6 Co:Pell PAC; B 150 × 4.6 6 μm Zorbax CN; C 240 × 4.6 6 μm Zorbax Sil

Mobile phase: A Hexane:dichloromethane:isopropanol 70:30:1; B Hexane:dichloromethane:THF:isopropanol 60:20:20:1
Flow rate: 1
Injection volume: 200
Detector: F ex 375 em 470

CHROMATOGRAM
Retention time: 36 (arbaprostil), 39.5 (15S epimer)
Internal standard: 5,6-trans-(15R)-15-methylprostaglandin E_2 (U-67205) (37.5)
Limit of quantitation: 10 pg/mL

KEY WORDS
derivatization; SPE; plasma; column-switching; normal phase

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL 100 mg Bond-Elut phenyl SPE cartridge with 1 mL MeOH and 1 mL 1 M acetic acid. Add 1 mL plasma to the SPE cartridge, wash with two 1 mL portions of 1 M acetic acid, wash with 1 mL MeOH:1 M acetic acid 20:80, elute with two 1 mL portions of ethyl acetate:butyl chloride 20:80. Remove any portion of aqueous phase from the eluate and evaporate the organic portion to dryness under a stream of nitrogen at 40°, reconstitute the residue in 200 μL mobile phase, inject a 50-75 μL aliquot.

HPLC VARIABLES
Guard column: Symmetry C8 (Waters)

Column: 150 × 3.9 5 μm Symmetry C8 (Waters)
Mobile phase: MeCN:buffer 50:50 (Buffer was 40 mL 1 M acetic acid and 60 mL 1 M sodium acetate per liter, pH 4.8.)
Flow rate: 0.7
Injection volume: 50-75
Detector: UV 290 following post-column reaction. The column effluent mixed with 1.2 M KOH MeOH:water 90:10 pumped at 0.3 mL/min and the mixture flowed through a 1 mL reaction coil (Waters) at 69° to the detector.

CHROMATOGRAM
Retention time: 13

OTHER SUBSTANCES
Extracted: artesunic acid, α-dihydroartemisinin, β-dihydroartemisinin

KEY WORDS
artemisinin is IS; post-column reaction; plasma; SPE

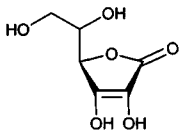
Ascorbic acid



Molecular formula: $C_6H_8O_6$
Molecular weight: 176.13
CAS Registry No.: 50-81-7
Merck Index: 867

SAMPLE

Matrix: beverages, vegetables
Sample preparation: Blend 5 g food with 25 mL 300 mM trichloroacetic acid for 1 min, make up to 50 mL with 300 mM trichloroacetic acid. Dilute 5 g beverage to 50 mL with 300 mM trichloroacetic acid. Filter (paper) these solutions, dilute with 300 mM trichloroacetic acid to a ascorbic acidoncentration of 1-40 μg/mL. Remove a 3 mL aliquot ,and add it to 400 μL 4.5 M pH 6.2 sodium acetate buffer, add an ascorbate oxidase spatula (Boehringer Mannheim), heat at 37° for 2 min, mix, heat at 37° for 3 min, remove the spatula (?), add 500 μL 0.1% o-phenylenediamine (freshly prepared), mix, heat at 37° in the dark for 30 min, inject a 30 μL aliquot.

HPLC VARIABLES

Guard column: 20 mm long RP-18 (Bischoff)
Column: 125 × 4.6 3 μm ODS-Hypersil
Mobile phase: MeOH:80 mM KH_2PO_4 20:80, pH 7.8
Flow rate: 1
Injection volume: 30
Detector: F ex 365 (filter) em 418 (filter)

CHROMATOGRAM

Retention time: 8 (ascorbic acid), 10 (isoascorbic acid)
Limit of detection: 200 ng/g

KEY WORDS

derivatization; protect from light; avocado; brussels sprouts; cabbage; cauliflower; kale; lemon juice; lettuce; orange juice; paprika; parsley; peas

SAMPLE

Matrix: beverages, vegetables
Sample preparation: 500 μL Juice or homogenized vegetables + 5 mg pyrogallol + 10 mL 100 mM citric acid, vortex under nitrogen for 1 min, add an equal volume of dichloromethane, vortex for 1 min, centrifuge at 4° at 1200 g for 10 min, repeat dichloromethane wash (if necessary to remove excess fat). Filter (0.45 μm) the aqueous layer, pass a 2 mL aliquot through a conditioned Sep-Pak C18 (?) SPE cartridge, inject an aliquot of the eluate.

HPLC VARIABLES

Column: 150 × 5 DA-X8-11 anion-exchange resin (Dionex)
Mobile phase: 100 mM pH 3.8 Citrate buffer containing 10 mM NaCl and 5 mM EDTA
Flow rate: 0.5
Injection volume: 100
Detector: F ex Corning 7-60 filter em Wratten 2-E following post-column reaction. The column effluent mixed with the oxidizer pumped at 0.5 mL/min and this mixture flowed

through a 32 cm × 0.25 mm ID stainless-steel coil. The effluent from this coil mixed with the reagent pumped at 0.5 mL/min and this mixture flowed through a 45.7 m × 0.25 mm ID stainless-steel coil at 70° then a 1.5 m × 0.25 mm ID stainless-steel coil at 20° to the detector. (Oxidizer was 2.5 mM mercuric chloride or copper sulfate in mobile phase. Reagent was 3.1 mM o-phenylenediamine in mobile phase.)

CHROMATOGRAM
Retention time: 23
Limit of detection: 20 ng

OTHER SUBSTANCES
Extracted: dehydroascorbic acid

KEY WORDS
post-column reaction; bean sprouts; beets; broccoli; grape juice; orange juice; potatoes; tomatoes; SPE

SAMPLE

Matrix: blood, food, formula, perfusate

Sample preparation: Serum, perfusate. Vortex 1.5 mL plasma or perfusate with 160 μL 400 mg/mL metaphosphoric acid in water for 15 s, add 400 μL MeCN vortex for 15 s, centrifuge at 4° at 1000 g for 30 min, inject an aliquot (Clin.Chem. 1988, 34, 2217). Infant formula. Mix 5 g formula with 40 mL 50 mM monobasic potassium phosphate in water containing 1 g/L dithiothreitol, allow to dissolve. Add 10 mL 500 g/L metaphosphoric acid in water and 20 mL MeCN, mix, centrifuge at 1000 g for 15 min at 5°. Remove a 4 mL aliquot of the clear lower layer, dilute with 50 mM monobasic potassium phosphate in water containing 1 g/L dithiothreitol, inject an aliquot. Food (for total ascorbic acid). Suspend 1 g pureed food in 5 mL water, vortex for 15 s, add 1 mL 500 mM dibasic potassium phosphate in water containing 100 g/L dithiothreitol, vortex for 15 s, let stand at room temperature for 30 min, add 1 mL 400 g/L metaphosphoric acid in water, add 2 mL MeCN, vortex for 15 s, centrifuge at 1000 g for 30 min at 5°, inject an aliquot of the clear lower layer.

HPLC VARIABLES

Column: 250 × 4.6 Capcell Pak NH2 (Shiseido, Japan)

Mobile phase: MeCN:buffer 80:20 (Prepare mobile phase as follows. Dissolve 680 mg monobasic potassium phosphate in 200 mL water, add 800 mL MeCN and 7.5 mL concentrated phosphoric acid.)

Column temperature: 40

Flow rate: 1

Detector: E, Model 400 (EG & G, Princeton Applied Research, USA), 700 mV

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 3 mL 10 g/L metaphosphoric acid, mix, centrifuge at 1500 g. Mix a 500 μL aliquot of the supernatant with 50 μL IS solution, inject a 20 μL aliquot. Urine. Dilute 1 mL urine with 3 mL 10 g/L metaphosphoric acid. Mix a 500 μL aliquot with 50 μL IS solution, inject a 20 μL aliquot. (IS solution was 100 mg/L D-isoascorbic acid in 10 g/L metaphosphoric acid containing 2 mM EDTA (nitrogen-saturated).)

HPLC VARIABLES

Guard column: 70 × 2 10 μm PRP-1 (Hamilton)
Column: 75 × 4.6 3 μm Ultrasphere ODS
Mobile phase: 0.15 mM Hexadecyltrimethylammonium bromide containing 0.5 mM sodium acetate and 0.15 mM disodium EDTA, adjusted to pH 4.0 with acetic acid. (Condition system with twenty 20 μL aliquots of 10 g/L metaphosphoric acid.)
Flow rate: 0.5
Injection volume: 20
Detector: F ex 365 em 440 following post-column reaction. The column effluent mixed with the reagent pumped at 1.5 mL/min and flowed through a 20 m × 0.55 mm ID PTFE coil at 65° then a 1.5 m × 0.55 mm ID PTFE coil at 20° to the detector. (Reagent was 2.5 mM cupric sulfate containing 52 mM citric acid and 0.5 mM 4,5-dimethyl-o-phenylenediamine dihydrochloride, adjusted to pH 4.1 with saturated NaOH. Prepare fresh each day. Prepare 4,5-dimethyl-o-phenylenediamine dihydrochloride by dissolving 4,5-dimethyl-o-phenylenediamine in a minimum volume of diethyl ether, pass anhydrous hydrogen chloride through the solution for 20 min, precipitate the salt with diethyl ether. Wash the salt three times with diethyl ether.)

CHROMATOGRAM

Retention time: 15.5
Internal standard: isoascorbic acid (19.9)
Limit of detection: 10 ng

SAMPLE
Matrix: formulations
Sample preparation: Tablets without iron. Grind 5 tablets to a fine powder, add 10 mL monothioglycerol and 800 mL buffer, sonicate for 30 min, add 150 mL MeOH, make up to 1 L with buffer, filter (GF/C paper), discard first few mL, remove a 10 mL aliquot, make up to 25 mL with mobile phase, inject an aliquot. Tablets with dioctyl sodium sulfosuccinate. Grind 5 tablets to a fine powder, add 10 mL 2-monothioglycerol and 1 g barium chloride, make up to 1 L with buffer, stir vigorously for 30 min, filter (GF/C paper), discard first few mL, inject an aliquot. Capsules with iron. Contents of one capsule + 5 mL 2-monothioglycerol + 2 mL glacial acetic acid + 75 mL buffer, sonicate for 5 min, make up to 100 mL with buffer, stir vigorously for 30 min, filter (GF/C paper), add 300 mg cupferron, stir for 10 min, let stand for 1 h at room temperature, filter (GF/C paper), let stand for 30 min, filter again (if necessary), discard first few mL, inject an aliquot. (Buffer was 48 mL glacial acetic acid and 10 mL triethylamine in 1 L water, adjust pH to 3.6 ± 0.05 with acetic acid or triethylamine, make up to 1.7 L with water.)

HPLC VARIABLES
Column: 100 × 8 Radial Pak A C18 (Waters)
Mobile phase: MeOH:buffer 15:85 (Buffer was 2.20 g sodium heptanesulfonate, 100 mg EDTA, 48 mL glacial acetic acid, and 10 mL triethylamine made up to 1.7 L with water, adjust pH to 3.6 ± 0.05 with acetic acid or triethylamine.)
Flow rate: 2

Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 1.3

OTHER SUBSTANCES
Simultaneous: niacinamide (UV 280), thiamine (UV 280), riboflavin (UV 280), pyridoxine (UV 280)

KEY WORDS
multi-vitamin; protect from light; tablets; capsules

SAMPLE
Matrix: urine
Sample preparation: Prepare a column by suspending 200-400 mesh Dowex 50W-X8 resin in water and pouring it into a 100 × 7 column, allow to settle, wash with 10 mL 2 M HCl, wash with water until the washings are neutral. Mix urine with an equal volume of 5% metaphosphoric acid containing 0.5% β-thiodiglycol. Add a 1 mL aliquot to the column, wash with 3.95 mL 2 mM tartaric acid containing 0.05% β-thiodiglycol, collect all the effluent from the column in a tube containing 50 μL 5% disodium EDTA cooled in ice, filter (0.45 μm) the eluate, inject a 50-250 μL aliquot.

HPLC VARIABLES
Column: two 50 × 7.6 Asahipak GS-320 hydrophilic gel columns in series
Mobile phase: 2.25 g/L Tartaric acid containing 0.75 g/L disodium EDTA and 0.5 g/L β-thiodiglycol, adjusted to pH 3.00-3.03 with 4 M NaOH
Column temperature: 30
Flow rate: 1
Injection volume: 50-250
Detector: F ex 325 em 400 following post-column reaction. The column effluent mixed with 20 mM benzamidine hydrochloride pumped at 0.36 mL/min and with 750 mM pH 10 potassium borate buffer containing 200 mM potassium sulfite pumped at 0.36 mL/min and the mixture flowed through a 50 m × 0.5 mm ID PTFE tube at 90° to the detector.

CHROMATOGRAM
Retention time: 48

OTHER SUBSTANCES
Extracted: isoascorbic acid
Simultaneous: dehydroascorbic acid, diketogluconic acid, diketogulonic acid

SAMPLE

Matrix: formulation
Sample preparation: Weigh 500 mg homogenized analgesic powder, transfer to 100 mL volumetric flask, add ca. 50 mL mobile phase, swirl and dilute to volume with mobile phase. Dilute an aliquot of this solution 1:10 with mobile phase, filter (0.20 μm Cameo nylon filter, MSI, Westboro, MA) an aliquot, inject an aliquot of the filtrate.

HPLC VARIABLES

Column: 100 × 2.1 5 μm Hypersil ODS

Mobile phase: MeCN:triethylamine:acetic acid:water 5.5:0.2:0.2:94.1 (Prepare mobile phase as follows. Mix 110 mL MeCN, 4 mL triethylamine, 4 mL glacial acetic acid and make up to 2 L with water.)
Flow rate: 1.5
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 1.4

OTHER SUBSTANCES
Extracted: acetaminophen, caffeine
Interfering: salicylic acid

KEY WORDS
powder

SAMPLE
Matrix: formulations
Sample preparation: Weigh out powdered sample containing 68 mg aspirin, add 80 mL MeOH, sonicate for 10 min, dilute to 100 mL with MeOH, centrifuge. Remove a 5 mL aliquot of the supernatant and add it to 1 mL 2 mg/mL resorcinol, add 2 mL MeOH, make up to 20 mL with 50 mM pH 3.0 triethylamine phosphate, inject an aliquot.

HPLC VARIABLES
Column: 150 × 3.2 5 μm Hypersil ODS
Mobile phase: THF:50 mM pH 3.0 triethylamine phosphate 12:88
Flow rate: 0.6
Injection volume: 20
Detector: UV 275 following post-column reaction. The column effluent flowed through a 10 m × 0.3 mm ID crocheted PTFE coil irradiated with an 8 W low-pressure mercury lamp at 254 nm to the detector.

CHROMATOGRAM
Retention time: 15
Internal standard: resorcinol (9)

OTHER SUBSTANCES
Simultaneous: acetaminophen (post-column irradiation gives little increase in peak height), caffeine (post-column irradiation gives little increase in peak height), propyphenazone (post-column irradiation gives a decrease in peak height)

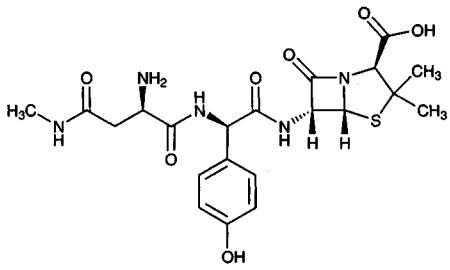
Aspoxicillin

Molecular formula: $C_{21}H_{27}N_5O_7S$
Molecular weight: 493.54
CAS Registry No.: 63358-49-6
Merck Index: 887



SAMPLE

Matrix: blood, tissue, urine

Sample preparation: Serum, plasma. Dilute serum or plasma 1:2 to 1:10 with buffer, centrifuge, inject a 20 μL aliquot of supernatant. Urine. Dilute urine 1:10 to 1:100 with buffer, centrifuge, inject a 20 μL aliquot of supernatant. Tissue (lung, gut). Cut tissue with a scalpel, homogenize with 1-3 mL buffer, centrifuge at 9600 g for 5 min three times, inject a 20 μL aliquot. Tissue (chondral). Cut tissue with a scalpel, homogenize with 3-6 mL buffer in an ice bath for 2-3 min, centrifuge at 9600 g for 5 min four or five times, inject a 100 μL aliquot. Dilute human pleural samples with buffer, centrifuge, inject a 20 μL aliquot. (Buffer was 66.6 mM K_2HPO_4 adjusted to pH 7.40 with KH_2PO_4.)

HPLC VARIABLES

Column: 200 × 4 5 μm Nucleosil C18

Mobile phase: MeOH:buffer 8:92, adjusted to pH 5.8 with phosphoric acid (Buffer was 57.4 mM K_2HPO_4 adjusted to pH 5.8 with phosphoric acid.)

Flow rate: 1

Injection volume: 20-100

Detector: UV 220

CHROMATOGRAM

Retention time: 12

Limit of detection: 500 ng/mL

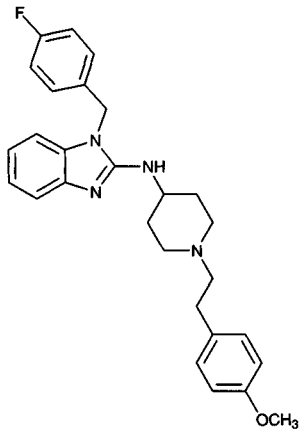
Astemizole

Molecular formula: $C_{28}H_{31}FN_4O$
Molecular weight: 458.58
CAS Registry No.: 68844-77-9
Merck Index: 891
Lednicer No.: 3 177



SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

SAMPLE
Matrix: bulk
Sample preparation: Dissolve 10 μmole compound (as free base or hydrochloride) in 500 μL MeCN, add 250 μL 5% sodium carbonate (for hydrochlorides only), add 500 μL 100 mM reagent in MeCN, vortex for 1 min, heat at 60° for 2 h, add 100 μmole L-proline, heat at 60° for 30 min. Remove a 100 μL aliquot and dilute it with mobile phase, neutralize with acetic acid, inject a 10 μL aliquot. Prepare the reagent ((R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate) as follows. Add 0.7 mL carbon disulfide to 6 mL (1R,2R)-(-)-1,2-diaminocyclohexane, 12 mL water, and 12 mL EtOH, heat the oil bath to 80°, add 2.8 mL carbon disulfide dropwise (making sure that the product does not start to precipitate), when addition is complete reflux for 1 h, acidify with 500 μL 5 M HCl, reflux for 12 h, cool, filter, wash the solid with a little cold EtOH to give trans-4,5-tetramethyleneimidazolidine-2-thione as a white fluffy solid (mp 148-150°) (Tetrahedron 1993, 49, 4419). Stir 7.97 g 3,5-dinitrobenzoyl chloride in 30 mL dichloroethane at 50°, add a solution of 6 g trans-4,5-tetramethyleneimidazolidine-2-thione in 120 mL dichloroethane containing a catalytic amount of 4-(dimethylamino)pyridine over 15 min, reflux for 2 h, remove the crystals of (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate by filtration, evaporate the filtrate to dryness and dissolve the residue in 60 mL dichloroethane, reflux for 16 h to obtain more (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate (mp >250°, $[\alpha]_{546}$ = -133° (c = 1) in MeCN).

SAMPLE
Matrix: solutions
Sample preparation: Mix 300 μL of a 30 μM solution in dichloromethane with 10 μL 20 mM 1-(6-methoxy-2-naphthyl)ethyl isothiocyanate in anhydrous dichloromethane and 50 μL 0.1% triethylamine in dichloromethane, vortex thoroughly, heat at 50° for 1.5 h, inject an aliquot. (Synthesize 1-(6-methoxy-2-naphthyl)ethyl isothiocyanate as follows (protect from light). Dissolve 500 mg (S)-(+)-naproxen in 50 mL dry toluene, slowly add 5 mL freshly distilled thionyl chloride, reflux for 1 h, evaporate to dryness under vacuum, dry the acyl chloride (mp 87.5°) under vacuum over KOH for 2 days. Dissolve 0.5 mmoles acyl chloride in 5 mL acetone, stir at 0°, add 0.6 mmoles sodium azide dissolved in ice water, stir at 0° for 30 min, add 10 mL ice-cold water, filter, dry solid in a desiccator under vacuum. Dissolve the solid in 1 mL toluene or dichloromethane (dried over 3 Å molecular sieve), reflux for 10 min, evaporate, store resulting isocyanate (mp 51°) under vacuum over a desiccant. Dissolve 0.5 mmole isocyanate in 5 mL acetone, add 20 mL 8.5% phosphoric acid, heat to 80° for 1.5 h, adjust to pH 13, extract with diethyl ether:dichloromethane 4:1. Wash the organic layer twice with water, dry over anhydrous sodium sulfate, evaporate to dryness, dissolve in 1 mL toluene, evaporate to give the amine from naproxen as crystals (mp 53°) (Pharm.Res. 1990, 7, 1262). Dissolve 1 mmole 1,1-thiocarbonyldiimidazole in 15 mL ice-cold chloroform, stir at 0°, add dropwise 1 mmole of the amine dissolved in 10 mL chloroform, stir at room temperature for 1.5 h, evaporate to dryness, reconstitute with carbon tetrachloride (Caution! Carbon tetrachloride is a carcinogen!), filter, evaporate the filtrate to dryness, store the resulting oil in a desiccator, purify on a short silica gel column with dichloromethane:light petroleum 50:50 to give 1-(6-methoxy-2-naphthyl)ethyl isothiocyanate as a slightly yellow liquid (store in the freezer under argon).)

SAMPLE

Matrix: solutions

Sample preparation: Mix a 100 μL of a 10 μM solution in MeCN:water:triethylamine 50:50:0.1 with 100 μL 1 mM (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in MeCN, heat in the dark at 65° for 1.5 h, inject an aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry

over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as yellow crystals (mp 160-170° d) (Analyst 1995, 120, 385).)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Inertsil ODS-80A
Mobile phase: MeCN:water:trifluoroacetic acid 35:65:0.1
Column temperature: 40
Flow rate: 1
Detector: F ex 460 em 550

CHROMATOGRAM

Retention time: 26.7, 32.8 (enantiomers)
Limit of detection: 96-116 fmole

SAMPLE
Matrix: formulations
Sample preparation: Tablets, capsules. Powder tablets or remove contents of capsules, weigh out amount equivalent to about 600 μg hyoscyamine sulfate-atropine sulfate, add 25 mL 25 mM sulfuric acid, shake for 15 min, centrifuge at 3000 rpm for 5 min. Remove 5 mL of the supernatant and extract it twice with 30 mL portions of dichloromethane, discard the organic phase, add 2 mL buffer to the aqueous phase, extract with four 30 mL portions of dichloromethane, filter extracts through dichloromethane-rinsed glass wool, add 3 mL 2.25 μg/mL theophylline in dichloromethane, distil off the dichloromethane through a Snyder column by using a steam bath, when the volume reaches 10 mL rinse the column with 1-2 mL dichloromethane, continue distillation to 0.5-1 mL, remove the column and rinse the concentrator tube-column junction with 1 mL dichloromethane, evaporate to 1 mL with a stream of air at 40°, add 100 μL 1% concentrated HCl in MeOH, mix, evaporate to dryness with a stream of air at 40°, rinse the sides of the concentrator tube with 500 μL MeOH, evaporate to dryness with a stream of air at 40°, dissolve the residue in 300 μL water, inject a 20 μL aliquot. Elixirs. Add an amount equivalent to about 600 μg hyoscyamine sulfate-atropine sulfate to a 150 mL beaker, warm at 40° with a current of air for 30 min to remove alcohol, cool, make up to 25 mL with water, remove 5 mL of this solution, add 2 mL 100 mM sulfuric acid, extract twice with 30 mL portions of dichloromethane, discard the organic phase, add 2 mL buffer to the aqueous phase, extract with four 30 mL portions of dichloromethane, filter extracts through dichloromethane-rinsed glass wool, add 3 mL 2.25 μg/mL theophylline in dichloromethane, distil off the dichloromethane through a Snyder column by using a steam bath, when the volume reaches 10 mL rinse the column with 1-2 mL dichloromethane, continue distillation to 0.5-1 mL, remove the column and rinse the concentrator tube-column junction with 1 mL dichloromethane, evaporate to 1 mL with a stream of air at 40°, add 100 μL 1% concentrated HCl in MeOH, mix, evaporate to dryness with a stream of air at 40°, rinse the sides of the concentrator tube with 500 μL MeOH, evaporate to dryness with a stream of air at 40°, dissolve the residue in 300 μL water, inject a 20 μL aliquot. (Buffer was 5.3 g anhydrous sodium carbonate and 4.2 g sodium bicarbonate in 100 mL water, pH 9.4. Pass dichloromethane through 75 g basic aluminum oxide, Brockmann Activity Grade 1, store over 25 g alumina/4 L.)

HPLC VARIABLES
Column: 250 × 4 5 μm Spherisorb ODS
Mobile phase: MeOH:buffer 250:525 (The 50 mM tetramethylammonium phosphate buffer was prepared from 500 mL water + 23 mL 20% tetramethylammonium hydroxide in MeOH + 10 mL concentrated phosphoric acid, adjust to pH 2.0 with concentrated phosphoric acid, make up to 1 L with water.)

Flow rate: 0.8
Injection volume: 20
Detector: UV 220

CHROMATOGRAM
Retention time: 7.5
Internal standard: theophylline (6.5)

OTHER SUBSTANCES
Simultaneous: phenobarbital, scopolamine, atropine

KEY WORDS
tablets; capsules; elixirs

REFERENCE
Pennington,L.J.; Schmidt,W.F. Belladonna alkaloids and phenobarbital combination pharmaceuticals analysis I: High-performance liquid chromatographic determinations of hyoscyamine-atropine and scopolamine, *J.Pharm.Sci.*, **1982**, *71*, 951–953.

SAMPLE
Matrix: formulations
Sample preparation: Grind tablets to a fine powder, weigh out amount containing 25 μg atropine, extract with 40 mL chloroform, filter, wash filter with chloroform, make up filtrate to 50 mL with chloroform, mix. Remove a 1 mL aliquot and evaporate it to dryness under reduced pressure at 40°, reconstitute with 500 μL 4 mg/mL quinuclidine in acetone, add 500 μL 2 mg/mL 1-anthroylnitrile in acetone, heat at 30° for 10 min, add 1 mL 2% phosphoric acid, cool to room temperature, make up to 10 mL with acetone, inject a 10 μL aliquot. (1-Anthroylnitrile is available from Wako Chemicals, Richmond VA. Synthesis is as follows. Dissolve 50 g benzanthrone in 500 mL concentrated sulfuric acid with gentle warming, pour this solution cautiously into 4 L hot water with vigorous stirring. Boil the suspension and slowly add 200 g chromium(VI) oxide (Caution! Chromium oxide is a carcinogen and highly corrosive!), after 6 h cool the mixture, filter, wash the precipitate with hot water. Dissolve the precipitate in dilute ammonia and precipitate with acid, crystallize from boiling concentrated nitric acid to give anthraquinone-1-carboxylic acid (Ber. 1924, 57, 1775). Warm, on a water bath, anthraquinone-1-carboxylic acid in dilute ammonia with twice the amount of zinc dust, when the reaction has ceased (30 min ?) filter the reaction the reaction mixture, add HCl to the filtrate to obtain anthracene-1-carboxylic acid as yellow needles, recrystallize from EtOH (mp 245°) (Ber 1897, 30, 1118). Stir 1 g anthracene-1-carboxylic acid in 15 mL anhydrous dichloromethane, add 2 mL oxalyl chloride, reflux for 1 h, evaporate to give 1-anthroyl chloride as an oily residue. Dissolve 1-anthroyl chloride in 15 mL dichloromethane, add 3 mL trimethylsilyl cyanide, add 1 mg zinc iodide, stir at room temperature for 2 h, evaporate to dryness, recrystallize from hexane/dichloromethane to give 1-anthroylnitrile as orange-yellow needles (mp 164-5°) (Anal.Chim.Acta 1983, 147, 397).)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Cosmocil 5C-18 (Nacalai Tesque, Tokyo)
Mobile phase: MeCN:buffer 60:40 (Buffer was 20 mM sodium dodecyl sulfate adjusted to pH 3.5 with phosphoric acid.)
Column temperature: 40
Flow rate: 1
Injection volume: 10
Detector: F ex 255 em 474

CHROMATOGRAM
Retention time: 12
Limit of detection: 10 ng/mL
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Noninterfering: albumin, amomum seed, caffeine, chlorpheniramine, cinnamon bark, cloves, fennel, geranium herb, glycyrrhiza, lysozyme, swertia herb, thiamine, riboflavin

KEY WORDS
derivatization; tablets

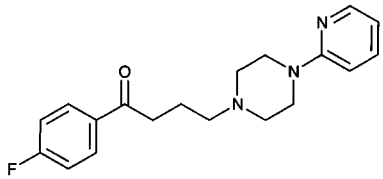
Azaperone



Molecular formula: $C_{19}H_{22}FN_3O$
Molecular weight: 327.40
CAS Registry No.: 1649-18-9
Merck Index: 931
Lednicer No.: 2 300

SAMPLE

Matrix: tissue

Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH and 5 mL water. Homogenize kidney with a kitchen grinder. Weigh out a 5 g sample and add 20 mL MeCN with continuous gentle mixing, mix vigorously on a vibromixer at 1500 rpm for 30 s, sonicate for 2 min, centrifuge at 4000 g for 5 min. Mix 7.5 mL sample extract and 40 mL 10% NaCl and add to SPE cartridge, wash with 1 mL 10 mM sulfuric acid, wash with 2 mL air, elute with 2 mL acidic MeCN. Place eluate in a washed tube and evaporate to 300 μL at 70° under a stream of nitrogen, mix gently, add 1 mL n-hexane, mix on a vibromixer for 30 s, centrifuge at 2000 g, inject a 50 μL aliquot of the aqueous phase. (Acidic MeCN was 1 mL 50 mM sulfuric acid and 100 mL MeCN. The washed tube was prepared by rinsing with concentrated ammonia, water, and acetone and drying under a stream of nitrogen.)

HPLC VARIABLES

Guard column: 10 × 2.1 37-50 μm Bondapak C18
Column: 300 × 3.9 Bondapak C18
Mobile phase: MeCN:water 55:45 containing 2.46 g/L anhydrous sodium acetate, pH adjusted to 6.5 with acetic acid
Flow rate: 1.2
Injection volume: 50
Detector: UV 240

CHROMATOGRAM

Retention time: 7.5
Limit of detection: 1 ng/g

OTHER SUBSTANCES

Extracted: azaperol, carazolol, acepromazine, xylazine, haloperidol, propiomazine, chlorpromazine

KEY WORDS

SPE; pig; kidney

SAMPLE
Matrix: urine
Sample preparation: 2 mL Urine + 200 μL 5 μg/mL 8-chloroazatadine in water + 1 mL 1 M NaOH + 6 mL diethyl ether, shake in a reciprocal shaker for 10 min, centrifuge at 1600 g for 5 min, freeze in dry ice/acetone. Remove the organic layer and add it to 500 μL 50 mM sulfuric acid, shake on a reciprocal shaker for 10 min, centrifuge at 1600 g for 5 min, freeze in dry ice/acetone, discard the organic layer. Add the aqueous layer to 1 mL 1 M NaOH, extract with 6 mL hexane, centrifuge, freeze in dry ice/acetone. Remove the organic layer and add it to 100 μL concentrated ammonium hydroxide. Evaporate to dryness under a stream of nitrogen at 45°, dissolve the residue in 500 μL mobile phase, inject a 200 μL aliquot.

HPLC VARIABLES
Guard column: silica Guard-Pak (Waters)
Column: 300 × 3.9 10 μm μBondapak CN
Mobile phase: MeCN:50 mM pH 7.5 KH_2PO_4 90:200
Flow rate: 2
Injection volume: 200
Detector: UV 214

CHROMATOGRAM
Retention time: 7.5
Internal standard: 8-chloroazatadine (10.5)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: chlorpheniramine, brompheniramine
Noninterfering: pseudoephedrine, phenylpropanolamine

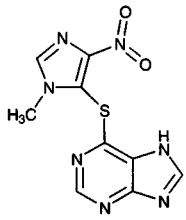
Azathioprine



Molecular formula: $C_9H_7N_7O_2S$
Molecular weight: 277.27
CAS Registry No.: 446-86-6
Merck Index: 935
Lednicer No.: 2 464

SAMPLE

Matrix: blood
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 2.5 mL MeOH and 5 mL 0.2% acetic acid. Mix 1 mL plasma with 40 μL saturated EDTA solution, add to the SPE cartridge. Wash with 2 mL 0.2% acetic acid, centrifuge at 2200 g for 5 min to remove excess water, elute with 2 mL MeOH, evaporate to dryness under a stream of nitrogen at 37°. Reconstitute the residue with 200 μL mobile phase, vortex for 30 s, centrifuge at 11000 g for 5 min, inject an 80 μL aliquot of the supernatant. (Prepare saturated EDTA solution by vortexing 2.5 g disodium (?) EDTA in 25 mL water for 5 min.)

HPLC VARIABLES

Guard column: 12.5 × 4 Zorbax ODS
Column: 200 × 4.6 5 μm Hypersil ODS
Mobile phase: Gradient. A was MeCN:1 mM triethylamine 0.8:99.2, adjusted to pH 3.2 with phosphoric acid. B was MeCN:1 mM triethylamine 20:80, adjusted to pH 3.2 with phosphoric acid. A:B 100:0 for 5 min, to 50:50 over 2.5 min, maintain at 50:50 for 11.5 min to 100:0 over 2 min, re-equilibrate at initial conditions for 9 min
Flow rate: 1.5
Injection volume: 80
Detector: UV 340

CHROMATOGRAM

Retention time: 15
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES

SAMPLE

Matrix: blood, feces, urine
Sample preparation: Serum. 1 mL Serum + 50 μg sebacic acid, acidify to pH 1 with 1 M HCl, saturate with NaCl, extract three times with 10 mL warm (40°) ethyl acetate. Combine the extracts and dry them over anhydrous sodium sulfate, evaporate to dryness under vacuum below 40°, take up the residue in 1 mL MeCN:MeOH 80:20, add 3 mg of p-bromophenacyl bromide in MeCN, add 6 μL N,N-diisopropylethylamine, heat at 50-60° for 10-15 min, evaporate some solvent, add reaction mixture to a TLC plate (Carlo Erba Stratocrom SI-AP, 0.25 mm silica gel, activated at 120° for 20 min), develop plate in benzene:hexane 3:1 (CAUTION! Benzene is a carcinogen!), remove material remaining at origin, extract three times with 1 mL MeCN, evaporate solvent to 500 μL, inject a 20-50 μL aliquot. Urine, feces. 20-50 μL Urine or feces diluted with water + 50 μg sebacic acid, acidify to pH 1 with 1 M HCl, extract five times with 3 volumes of warm (40°) ethyl acetate. Combine the extracts and dry them over anhydrous sodium sulfate, evaporate to

dryness under vacuum below 40°, take up the residue in 1 mL MeCN:MeOH 80:20, add 3 mg of p-bromophenacyl bromide in MeCN, add 6 μL N,N-diisopropylethylamine, heat at 50-60° for 10-15 min, evaporate some solvent, add reaction mixture to a TLC plate (Carlo Erba Stratocrom SI-AP, 0.25 mm silica gel, activated at 120° for 20 min), develop plate in benzene:hexane 3:1 (CAUTION! Benzene is a carcinogen!), remove material remaining at origin, extract three times with 1 mL MeCN, evaporate solvent to 500 μL, inject a 20-50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm RP 18 (Brownlee)
Mobile phase: Gradient. MeCN:water adjusted to pH 3.10 with phosphoric acid 60:40 for 5 min then to 100:0 over 60 min.
Column temperature: 40
Flow rate: 1
Injection volume: 20-50
Detector: UV 255

CHROMATOGRAM
Retention time: 32.2
Internal standard: sebacic acid (35.9)
Limit of detection: 0.5 ng

OTHER SUBSTANCES

SAMPLE

Matrix: formulations

Sample preparation: Ointment, lotion. Weigh out ointment or lotion equivalent to about 15 mg azelaic acid, dissolve in 100 mL MeOH, dilute an aliquot 1:5 with water. 200 μL Sample + 150 μL 20 mM tetrahexylammonium bromide in 100 mM pH 7.0 phosphate buffer + 100 μL 4.2 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, stir for 33 min at 70°, add 150 μL 20 μg/mL IS in MeCN, sonicate for 1 min, inject a 50 μL aliquot into mobile phase A. Ointment. Dissolve in MeCN to give a concentration of 18 μg/mL. 100-200 μL Sample + 100 μL 4.2 mg/mL 2-bromoacetyl-6-methoxynaphthalene in MeCN + 100 μL 1% triethylamine in MeCN, heat at 40° for 40 min, reconstitute in 150 μL 40 μg/mL IS in Mobile Phase B and 450 μL mobile phase B, sonicate for 1 min, inject a 50 μL aliquot into mobile phase B. Powder. Weigh out powder equivalent to about 15 mg azelaic acid, dissolve in 100 mL MeOH, sonicate for 10 min, centrifuge at 4000 rpm for 20 min, filter the supernatant, dilute an aliquot of the filtrate 1:5 with water. 200 μL Sample + 150 μL 20 mM tetrahexylammonium bromide in 100 mM pH 7.0 phosphate buffer + 100 μL 4.2 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, stir for 33 min at 70°, add 150 μL 20 μg/mL IS in MeCN, sonicate for 1 min, inject a 50 μL aliquot into mobile phase A. (Synthesis of 2-bromoacetyl-6-methoxynaphthalene is as follows. Stir

equimolar amounts of 2-acetyl-6-methoxynaphthalene (6'-methoxy-2'-acetonaphthone, Aldrich) and methyltriphenylphosphonium tribromide in anhydrous THF under nitrogen at room temperature for 1 h, dilute the reaction mixture with ether, wash with sodium bisulfite solution, wash with water (Phosphorus and Sulfur 1985, 25, 357). [Bromination can also be achieved with phenyltrimethylammonium tribromide over 3 h but the reaction is less selective.] Purify the crude product by column chromatography on silica gel using chloroform:petroleum ether 50:50 to give 2-bromoacetyl-6-methoxynaphthalene (mp 109-112°) (Chromatographia 1992, 33, 13).)

HPLC VARIABLES

Column: 250 × 4.6 Hypersil 5 ODS

Evaporate the MTBE layer to dryness at 37°, reconstitute the residue in 200 μL mobile phase, mix for 20 min, centrifuge, inject an 80 μL aliquot.

HPLC VARIABLES

Column: 150 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:50 mM pH 7.5 phosphate buffer 55:45
Flow rate: 1
Injection volume: 80
Detector: E, ESA Coulochem 5100 A, ESA 5010 dual electrode analytical cell at +680 mV and +780 mV, ESA 5020 guard cell +1.0 V

CHROMATOGRAM

Internal standard: clarithromycin
Limit of detection: 10 ng/mL

KEY WORDS

plasma; pharmacokinetics

REFERENCE

Patel,K.B.; Xuan,D.; Tessier,P.R.; Russomanno,J.H.; Quintiliani,R.; Nightingale,C.H. Comparison of bronchopulmonary pharmacokinetics of clarithromycin and azithromycin, *Antimicrob.Agents Chemother.*, **1996**, *40*, 2375–2379.

SAMPLE

Matrix: blood, bronchoalveolar lavage fluid
Sample preparation: Blood. Centrifuge 10 mL blood at 2500 g, separate the serum. Peripheral blood monocytes (PBM). Expose the PBM pellet to several freeze-thaw cycles, dilute the cell pellet in 1 mL saline with 1 mL serum and saline to volume 5 mL. Bronchoalveolar lavage (BAL) fluid. Expose the BAL pellet to several freeze-thaw cycles, dilute sample with water to volume 50 mL, freeze and thaw.

HPLC VARIABLES

Column: 50 × 4.6 5 μm Chromegabond Alkylphenyl aluminum oxide (E.S. Industries, N.J.)
Mobile phase: MeCN:20 mM pH 10 Na_3PO_4 75:25
Flow rate: 1.5
Detector: E, Bioanalytical Systems, dual glassy carbon electrodes 600 and 850 mV, Ag/AgCl reference electrode

CHROMATOGRAM

Limit of detection: 2 ng/mL (BAL and leucocytes), 10 ng/mL (serum)

KEY WORDS
serum; pharmacokinetics

REFERENCE

SAMPLE
Matrix: blood, gastric juice, gastric mucosa, saliva, vitreous humor
Sample preparation: Homogenize 5-20 mg gastric mucosa in 300 μL 10 mM pH 7.4 sodium phosphate buffer with sonication. Add 500 ng roxithromycin in MeOH:water 50:50 to 500 μL plasma, serum, saliva, gastric juice, leucocytes lysate, vitreous humor, or 300 μL gastric mucosa homogenate, vortex, add 200 μL 100 mM sodium carbonate and 3 mL MTBE, shake thoroughly (5 × 2 s in an SMI Multi-tube vortexer), centrifuge at 1000 g for 5 min, freeze the aqueous layer in liquid nitrogen or in a freezer at -70° for 15 min. Evaporate the upper organic layer to dryness in a centrifugal vacuum evaporator (Jouan RC 10.22), reconstitute the residue in 250 μL MeOH:water 50:50, inject a 20-50 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Zorbax SB CN
Mobile phase: MeCN:MeOH:50 mM Na_2HPO_4 and NaH_2PO_4 buffer 52.2:4.3:43.5 (pH 6.8) (The mobile phase was a mixture of 600 mL MeCN, 50 mL MeOH and 500 mL 50 mM Na_2HPO_4 and NaH_2PO_4 buffer.)
Column temperature: 30
Flow rate: 1
Injection volume: 20-50
Detector: E, ESA Coulochem II, guard cell +1.0 V, screening cell E1 +0.50 V, analytical cell E2 +0.80 V

CHROMATOGRAM
Retention time: 12
Internal standard: roxithromycin (5.5), clarithromycin (10)
Limit of detection: 10 ng/mL

KEY WORDS

SAMPLE
Matrix: tears
Sample preparation: Add 10 μL 20 μ g/mL IS and 500 μL of 60 mM sodium carbonate to 50 μL tears. Extract with 5 mL of MTBE. Evaporate the organic layer to dryness under a stream of nitrogen at room temperature. Reconstitute the sample in 100 μL MeCN: water 50:50, inject an 80 μL aliquot.

HPLC VARIABLES
Guard column: 4 μm Nova-Pak C18
Column: 100 × 8 4 μ m Nova-Pak C18 radial compression
Mobile phase: MeCN:MeOH:buffer 19:9:75 (Buffer was 35 mM Na_2HPO_4 containing 5 mM tetrabutylammonium phosphate and 5 mM sodium perchlorate, adjusted to pH 7.0 with phosphoric acid. Mobile phase was recycled and the buffer was prepared fresh every other day.)

Column temperature: 26
Flow rate: 4.0
Injection volume: 80
Detector: E, Coulochem 11, 5021 conditioning cell 0.7 V, 5011 analytical cell at 0.85 V

CHROMATOGRAM

Internal standard: n-propylazithromycin
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

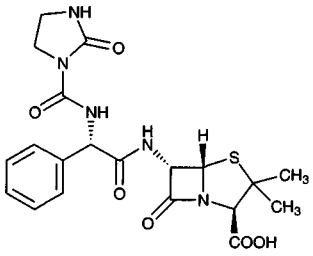
Azlocillin



Molecular formula: $C_{20}H_{23}N_5O_6S$
Molecular weight: 461.50
CAS Registry No.: 37091-66-0, 37091-65-9 (monosodium salt)
Merck Index: 947
Lednicer No.: 3 206

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Serum. 0.5 mL serum + 0.5 mL MeCN mix in 7 mL tube on vortex mixer; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; transfer supernatant to another tube, add 7 aliquots dichloromethane; equilibrate 10 min; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; inject aliquot of upper aqueous layer. Urine. Centrifuge urine and dilute 1:20. Bile. Centrifuge bile and dilute 1:10.

HPLC VARIABLES

Column: 75 × 4.6 3 μm octadecylsilane
Mobile phase: 20:80 MeCN:20 mM ammonium acetate adjusted to pH 5 with glacial acetic acid
Flow rate: 1
Injection volume: 5
Detector: UV 214

CHROMATOGRAM

Retention time: 2.2
Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Also analyzed: ampicillin, aztreonam, cefmenoxime, cefoperazone, cefsulodin, cefotaxime, ceftazidime, ceftriaxone, cloxacillin, desacetylcefotaxime, mezlocillin, penicillin G, piperacillin, ticarcillin

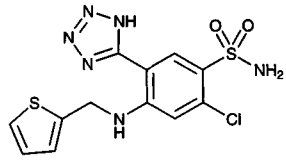
Azosemide



Molecular formula: $C_{12}H_{11}ClN_6O_2S_2$
Molecular weight: 370.84
CAS Registry No.: 27589-33-9
Merck Index: 953
Lednicer No.: 3 27

SAMPLE

Matrix: blood, tissue, urine
Sample preparation: Plasma, urine. 50 µL Plasma or urine + 125 µL MeCN, vortex, centrifuge at 9000 g for 10 min, inject 50 µL of the supernatant. Tissue. Homogenize with four volumes of 0.9% NaCl (Tissuemizer), centrifuge at 9000 g for 10 min. Remove 50 µL of the supernatant and add it to 125 µL MeCN, vortex, centrifuge at 9000 g for 10 min, inject a 50 µL aliquot of the supernatant.

HPLC VARIABLES

Column: 300 × 3.9 10 µm C18 (Waters)
Mobile phase: MeCN:30 mM phosphoric acid 40:50
Flow rate: 1.5
Injection volume: 50
Detector: UV 240

CHROMATOGRAM

Retention time: 6.0
Limit of detection: 50 ng/mL

OTHER SUBSTANCES

Extracted: metabolites
Noninterfering: furosemide, bumetanide, hydrochlorothiazide, amiloride, spironolactone

SAMPLE

Matrix: blood, urine
Sample preparation: Urine. Filter (0.45 µm). Remove a 300 µL aliquot and add it to 300 µL water and 50 µL 412 µg/mL phenobarbital in EtOH, vortex, inject a 10 µL aliquot. Serum. 300 µL (?) Serum + 20 µL 412 µg/mL phenobarbital in EtOH + 400 µL MeCN, mix, centrifuge. Remove the supernatant and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 50-100 µL buffer, inject a 5-20 µL aliquot.

HPLC VARIABLES

Guard column: 70 × 2.1 CO:Pell ODS (Whatman)
Column: 250 × 4.6 5 µm Zorbax ODS C18
Mobile phase: Gradient. MeCN:buffer from 10:90 to 40:60 over 10 min, maintain at 40:60 for 2 min, re-equilibrate for 5 min. (Buffer was 0.6 mL glacial acetic acid in 1 L water, adjust pH to 4.05 with 4 M NaOH.)
Flow rate: 2
Injection volume: 5-20

Detector: UV 239

CHROMATOGRAM
Retention time: 10
Internal standard: phenobarbital (11)
Limit of detection: 50 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

CHROMATOGRAM

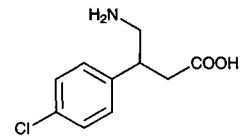
Baclofen



Molecular formula: $C_{10}H_{12}ClNO_2$
Molecular weight: 213.66
CAS Registry No.: 1134-47-0
Merck Index: 967
Lednicer No.: 2 121

SAMPLE

Matrix: CSF

Sample preparation: Prepare a 100 × 7 column of Dowex 50X4-400, treat with an excess of aqueous ammonia, wash with water until the washings are neutral, wash with an excess of 4 M HCl, wash with water until the washings are neutral, rinse with 8 mL water. Add 200 μL CSF to the column, wash with 8 mL water, elute with 2 mL 10% ammonia. Lyophilize the eluate, reconstitute the residue with 1 mL pH 7.4 phosphate buffer, extract twice with 1 mL portions of 1-butanol. Combine the organic layers and evaporate them to dryness, add 10-50 μL EtOH:water:triethylamine 50:25:25, evaporate to dryness, add 20 μL reagent, let stand at room temperature for 20 min, evaporate to dryness, reconstitute with pH 7.4 sodium phosphate buffer, inject a 5-25 μL aliquot. (Reagent was EtOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, store at -20° (Anal.Biochem. 1989, 176, 269).)

HPLC VARIABLES

Column: 150 × 3.9 Pico-Tag
Mobile phase: Gradient. A was sodium acetate adjusted to pH 6.4 with glacial acetic acid. B was MeCN:water 60:40. A:B from 100:0 to 60:40 over 10 min, to 0:100 over 1 min, maintain at 0:100 over 3 min.
Column temperature: 38
Injection volume: 5-25
Detector: UV 254

CHROMATOGRAM

Retention time: 13.2
Limit of detection: 5-10 ng/mL

KEY WORDS

derivatization; SPE; pharmacokinetics

REFERENCE

SAMPLE

Matrix: blood

Sample preparation: Condition a 1 mL Bond Elut SCX strong cation exchange SPE cartridge with 2 mL hexane, 2 mL MeOH, 2 mL water, and 3 mL saturated NaCl solution. 1 mL Plasma + 100 μL water + 1 mL citrate buffer, mix, add to the SPE cartridge, wash with 4 mL water, wash with 1 mL saturated NaCl solution, dry the SPE cartridge, elute with 1.5 mL pH 10.4 borate buffer. Mix a 200 μL aliquot of the eluate and add it to 50 μL reagent, mix, inject a 20 μL aliquot. (Prepare citrate buffer by diluting 89 mL 100 mM citric acid to 100 mL with 200 mM Na_2HPO_4, pH 2.6. Prepare pH 10.4 borate buffer by mixing 54 mL 200 mM boric acid in 100 mM NaOH with 46 mL 100 mM NaOH. Prepare pH 9.3 borate buffer by mixing 87 mL 200 mM boric acid in 100 mM NaOH with

13 mL 100 mM NaOH. Prepare reagent daily by mixing 75 mg o-phthalaldehyde, 5 mL MeOH, 50 μL tert-butanethiol, and 5 mL pH 9.3 borate buffer.)

HPLC VARIABLES
Column: 150 × 3.9 4 μm Novapak
Mobile phase: MeOH:buffer 74:36 (Prepare buffer by adjusting the pH of 60 mM Na_2HPO_4 to 7 with 60 mM KH_2PO_4.)
Flow rate: 0.8
Injection volume: 20
Detector: E, ESA Coulochem II, Model 5020 guard cell +1.2 V, Model 5011 glassy carbon working cell, screen electrode +0.2 V, quantifying electrode +0.7 V

CHROMATOGRAM
Retention time: 26
Limit of detection: 2.5 ng/mL
Limit of quantitation: 10 ng/mL

SAMPLE
Matrix: blood, CSF, dialysate, tissue
Sample preparation: Dilute dialysate and CSF. Homogenize brain tissue with 4 volumes of MeOH:water in an ice bath, let stand at -20° for 8 h. 30 μL Plasma + 60 μL MeOH, mix, let stand at -20° for 1 h, centrifuge at 4° at 10000 rpm for 5 min, dilute the supernatant with water. Mix an aliquot of tissue homogenate, deproteinized plasma, diluted dialysate, or diluted CSF with an equal volume of the reagent, let stand for 1.5 min, inject a 30 μL aliquot. (Prepare reagent by mixing 50 mg o-phthalaldehyde, 900 μL MeOH, 100 μL 400 mM pH 9.2 borate buffer, and 50 μL 2-mercaptoethanol.)

HPLC VARIABLES
Guard column: μBondapak C18 Guard-Pak
Column: 250 × 4.6 5 μm Finepak SIL C18S ODS (Jasco)
Mobile phase: MeOH:THF:100 mM pH 6.95 acetate buffer 45.5:2:52.5 (dialysate, CSF, plasma) or 43:2:55 (tissue)
Flow rate: 1
Injection volume: 30
Detector: F ex 368 em 434

SAMPLE
Matrix: blood, urine

Sample preparation: 500 μL Plasma + 2 mL MeOH, centrifuge. 1 mL Supernatant or 100 μL urine + 500 μL pH 9 sodium tetraborate buffer + 250 μL 0.2% 4-chloro-7-nitrobenzofurazan in MeOH, heat at 60° for 45 min, acidify with 100 mM HCl, extract with 5 mL ethyl acetate. Evaporate 3 mL of the extract to about 500 μL, dry with anhydrous sodium sulfate, pass through SPE column, elute with ethyl acetate to give a final volume of 2 mL. Evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 1 mL mobile phase, inject a 10 μL aliquot. (Prepare the 25 × 6 SPE column with 0.063-0.200 mm silica gel (Merck), wet it with ethyl acetate.)

HPLC VARIABLES
Column: 300 × 3.9 10 μm Bondapak C18
Mobile phase: MeOH:water 45:55
Flow rate: 0.4

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 207.5

CHROMATOGRAM

Retention time: 10.288

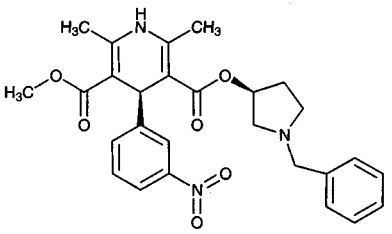
Barnidipine



Molecular formula: $C_{27}H_{29}N_3O_6$
Molecular weight: 491.54
CAS Registry No.: 104713-75-9
Merck Index: 1031

SAMPLE

Matrix: bile, urine
Sample preparation: Inject urine and bile directly. Hydrolyse urine or bile by heating a 1 mL aliquot with 200 µL 200 mM pH 5.5 sodium acetate buffer and 20 µL 100 U/mL β-glucuronidase at 37° for 24 h, add to a Sep-Pak C18 SPE cartridge, elute with MeOH. Evaporate the eluate, reconstitute the residue with MeOH:50 mM pH 5.0 sodium acetate buffer 5:95, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Nucleosil 5C18
Mobile phase: Gradient. MeOH:50 mM pH 5.0 sodium acetate buffer 5:95 for 5 min, to 50:50 over 95 min
Flow rate: 0.8
Detector: UV

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

SAMPLE

Matrix: blood, urine
Sample preparation: 200 μL Plasma or 100 μL urine + 500 (plasma) or 300 (urine) mg NaCl + 50 μL 1 μg/mL clofibric acid in MeOH + 1 (plasma) or 0.3 (urine) mL pH 4 buffer + 5 mL n-hexane:EtOH 90:10, shake horizontally for 10 min, centrifuge. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 55°, add 50 μL toluene and evaporate it to remove traces of water. Reconstitute the residue in 500 μL dichloromethane, add 50 μL 1 mg/mL 1-hydroxybenzotriazole in dichloromethane: pyridine 99:1, add 50 μL 1 mg/mL 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride in dichloromethane, add 50 μL 1 mg/mL FLOPA, vortex, let stand at room temperature for 2 h, evaporate to dryness, reconstitute in 500 μL mobile phase, inject a 50 μL aliquot. (FLOPA is the corresponding amine hydrochloride from (+)-(S)-flunoxaprofen. Synthesis is as follows (protect from light). 500 mg (+)-(S)-Flunoxaprofen in 50 mL dry toluene, slowly add 5 mL freshly distilled thionyl chloride, reflux for 1 h, evaporate to dryness under vacuum, dry the acyl chloride under vacuum over KOH for 2 days. Dissolve 0.5 mmoles acyl chloride in 5 mL acetone, add 600 mg sodium azide dissolved in ice water with stirring, stir at 0° for 30 min, add 10 mL ice-cold water, filter, dry solid in a desiccator under vacuum. Dissolve the solid in 1 mL toluene or dichloromethane (dried over 3 Å molecular sieve), reflux for 10 min, evaporate, store resulting isocyanate under vacuum over a desiccant. Dissolve 0.5 mmole isocyanate in 5 mL acetone, add 20 mL 8.5% phosphoric acid, heat to 80° for 1.5 h, adjust to pH 13, extract with diethyl ether:dichloromethane 4:1. Wash the organic layer twice with water, dry over anhydrous sodium sulfate,

evaporate to dryness, dissolve in 1 mL toluene, evaporate to give crystals (mp 91°). Dissolve in ether, add 0.5 M HCl in ether, filter, dissolve solid in a small volume of MeOH, precipitate with ether, dry FLOPA over phosphorus pentoxide under vacuum (Pharm.Res. 1990, 7, 1262).)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Zorbax Sil
Mobile phase: Gradient. A was n-hexane:chloroform:EtOH 100:10:0.75. B was n-hexane: chloroform:EtOH 100:10:20. A:B 100:0 for 10 min, 50:50 for 5 min, 100:0 for 5 min (stepwise).
Flow rate: 2
Injection volume: 50
Detector: F ex 305 em 355

CHROMATOGRAM

Retention time: 6 (-), 6.5 (+)
Internal standard: clofibric acid (8)
Limit of detection: 25 ng/mL

Foe,K.; Cheung,H.T.A.; Tattam,B.N.; Brown,K.F.; Seale,J.P. Degradation products of beclomethasone dipropionate in human plasma, *Drug Metab.Dispos.*, **1998**, *26*, 132–137.

SAMPLE

Matrix: blood
Sample preparation: 200 μL Plasma + 300 μL water + 6 mL diethyl ether, shake for 5 min, centrifuge at 1000 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen. Dissolve in 100 μL MeOH. Add 20 μL copper acetate solution and let stand at room temperature for 1 h. Add 80 μL diaminophthalhydrazide solution, heat at 80° for 110 min, cool, inject a 20 μL aliquot. (Prepare copper acetate solution by dissolving 700 mg copper(II) acetate in 10 mL water, dilute to 100 mL with MeOH, discard after 1 month. Diaminophthalhydrazide solution was 7.5 mM 4,5-diaminophthalhydrazide in 3.5 M hydrochloric acid containing 625 mM β-mercaptoethanol, discard after 5 h. Prepare 4,5-diaminophthalhydrazide dihydrochloride as follows. Reflux 316 g 4-nitrophthalic acid and 50 mL concentrated sulfuric acid in 500 mL MeOH for 10 h, recrystallize the product (dimethyl 4-nitrophthalate) from MeOH (mp 64-65E). Hydrogenate 47.8 g dimethyl 4-nitrophthalate in 300 mL MeOH over 13 g 5% platinum on carbon at an initial hydrogen pressure of 50 psi. When the calculated amount of hydrogen has been absorbed remove the catalyst and evaporate to dryness under reduced pressure, recrystallize the residue from aqueous MeOH to give dimethyl 4-aminophthalate (mp 83-84E). Stir 146.3 g dimethyl 4-aminophthalate in 1.4 L acetic anhydride at 60-70E for 2 h then leave over-

night, precipitate product with MeOH. Dry the product and rinse it with sodium carbonate solution, re-dry, recrystallize from benzene/MeOH (Caution! Benzene is a carcinogen!) to give dimethyl 4-acetamidophthalate (mp 138-140E). Add 100.4 g to 600 mL fuming (90%) nitric acid at 0-5E over 30 min, stir at 5-10E for 2.5 h, mix the reaction mixture with 800 mL cold dichloromethane, shake with crushed ice. Remove the organic layer and extract the aqueous layer with 200 mL cold dichloromethane. Combine the organic layers and wash them with ice water, cold sodium bicarbonate solution, and cold water. Dry over anhydrous magnesium sulfate, evapor ate to dryness under reduced pressure and, recrystallize repeatedly from MeOH to give dimethyl 4-acetamido-5-nitrophthalate (mp 123-124.5E). Hydrolyze dimethyl 4-acetamido-5-nitrophthalate to dimethyl 4-amino-5-nitrophthalate. Hydrogenate 20.3 g dimethyl 4-amino-5-nitrophthalate in 250 mL MeOH over 1 g 5% platinum on carbon at an initial hydrogen pressure of 50 psi, remove the catalyst, evaporate to dryness under reduced pressure at 25E, recrystallize from chloroform/dichloromethane to give dimethyl 4,5-diaminophthalate (mp 111.5-113E). Add 1.1 g dimethyl 4,5-diaminophthalate to 3 mL hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) and 3 mL triethylamine in 20 mL MeOH, concentrate the resulting solution, triturate with benzene/MeOH, recrystallize from N,N'-dimethylacetamide/acetic acid to give 4,5-diaminophthalhydrazide (6,7-diamino-2,3-dihydrophthalazine-1,4-dione) (mp 407E) (J. Heterocycl. Chem. 1973, 10, 891), mix 4,5-diaminophthalhydrazide with a small amount of concentrated HCl, recrystallize from EtOH to give 4,5-diaminophthalhydrazide dihydrochloride.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm TSKgel ODS-120T (Tosoh, Japan)
Mobile phase: MeCN:tetrahydrofuran:100 mM pH 7.0 phosphate buffer 24:3:73
Flow rate: 1.0
Injection volume: 20
Detector: Chemiluminiscence following post-column reaction. The column effluent mixed with 20 mM hydrogen peroxide in water pumped at 1.0 mL/min and then with 30 mM potassium hexacyanoferrate(III) in 3.0 M NaOH pumped at 2.0 mL/min and flowed to the detector.

CHROMATOGRAM

Retention time: 52
Internal standard: beclomethasone

OTHER SUBSTANCES

Extracted: dexamethasone
Simultaneous: aldosterone, corticosterone, cortisone, 11-deoxycortisol, hydrocortisone, 18-hydroxycorticosterone, 18-hydroxydeoxycorticosterone, prednisolone, prednisone
Noninterfering: androstendione, cholesterol, estrone, estradiol, estriol, pregnenolone, progesterone
Interfering: betamethasone.

SAMPLE
Matrix: blood, tissue
Sample preparation: Acidify plasma or lung tissue homogenate to pH 2 with 500 mM HCl, add 100 μL 20 μg/mL IS, extract with 8 mL dichloromethane. Evaporate the organic layer to dryness under vacuum, reconstitute in 120 μL MeOH:5% acetic acid 50:50, inject an 80 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax ODS C18
Mobile phase: MeCN:MeOH:water 44:11:45
Flow rate: 1
Injection volume: 80
Detector: UV 242 or radioactivity

CHROMATOGRAM
Internal standard: hydrocortisone 21-S-propionate (JO 498)

OTHER SUBSTANCES
Extracted: metabolites, budesonide

KEY WORDS
for beclomethasone dipropionate; plasma; rat; lung; radiolabeled; pharmacokinetics

REFERENCE
Chanoine,F.; Grenot,C.; Heidmann,P.; Junien,J.L. Pharmacokinetics of butixocort 21-propionate, budesonide, and beclomethasone dipropionate in the rat after intratracheal, intravenous, and oral treatments, *Drug Metab.Dispos.*, **1991**, *19*, 546–553.

SAMPLE
Matrix: ileostomy effluent
Sample preparation: Dilute ileostomy effluent 1:2 by weight with water and mix with 100 µL 11 µg/mL 17-hydroxyprogesterone. Extract 3 g aliquot three times with 10 mL dichloromethane by shaking for 1 min and centrifuging at 2000 rpm for 2 min. Wash combined extracts successively with 2 mL 0.1 M NaOH and 4 mL water by shaking for 30 s and centrifuging for 1 min then dry the organic layer under air at 40°. Take up the extract in 1 mL MeOH, add 1.1 mL water and apply to C18 Bond Elut SPE cartridge. Wash with 10 mL water, wash with 5 mL MeOH:water 45:55, elute with 2 mL MeOH. Add 50 µL 20 µg/mL progesterone to the eluate, dry at 40°, take up in 100 µL MeOH, inject 10 µL aliquot.

HPLC VARIABLES
Guard column: Bondapak C18/Corasil
Column: 300 × 3.9 µBondapak C18
Mobile phase: MeOH:50 mM pH 3.0 sodium phosphate buffer 55:45
Flow rate: 3
Injection volume: 10
Detector: UV 254 and 238

CHROMATOGRAM
Retention time: 21.3 (beclomethasone dipropionate)
Internal standard: 17-Hydroxyprogesterone (6.0) and progesterone (11.6)

OTHER SUBSTANCES
Extracted: beclomethasone alcohol, beclomethasone 17-monopropionate

KEY WORDS
SPE

SAMPLE
Matrix: tissue
Sample preparation: 100 mg Tissue + 2 mL Ringer's pH 6.8 phosphate buffer + 2 mL EtOH, centrifuge, wash residue twice. Pool supernatant and washings and evaporate to dryness, take up in 400 µL EtOH, inject an aliquot.

HPLC VARIABLES
Guard column: Used but not specified

Column: μBondapak C18
Mobile phase: Gradient. MeOH:water 40:60 to 80:20, time not specified
Flow rate: 1.5
Detector: UV 254

OTHER SUBSTANCES

Extracted: beclomethasone monopropionate, beclomethasone, cyclomethasone

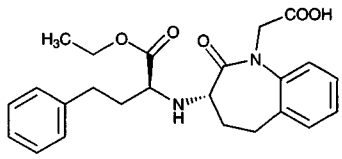
Benazepril



Molecular formula: $C_{24}H_{28}N_2O_5$
Molecular weight: 424.50
CAS Registry No.: 86541-75-5, 86541-74-4 (HCl)
Merck Index: 1058
Lednicer No.: 5 135

SAMPLE

Matrix: formulations
Sample preparation: Add MeOH:water 50:50 to powdered capsules or tablets so as to give a benazepril concentration of ca. 20 μg/mL, stir for 15 min, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.5 5 μm Hypersil ODS
Mobile phase: MeCN:THF:20 mM pH 2.5 sodium heptanesulfonate 45.6:2.4:52
Flow rate: 1
Injection volume: 20
Detector: UV 215

CHROMATOGRAM

Retention time: 15.5

OTHER SUBSTANCES

Simultaneous: ramipril

KEY WORDS

capsules; tablets

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30
Detector: UV 205.2

CHROMATOGRAM
Retention time: 17.003

KEY WORDS
whole blood

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)

Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 5

Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 15 (A), 15.4 (B)

Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))

Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, methyclothiazide, benzthiazide, cyclothiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone, flumethiazide

Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

Interfering: polythiazide

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 1 mL 10 mM HCl + 2000 ng bendroflumethiazide, extract with 5 mL ethyl acetate, centrifuge at 3000 rpm for 5 min. Remove the organic layer and dry it under a stream of nitrogen at 40°. Reconstitute with 100 μL MeOH, inject a 2 μL aliquot.

HPLC VARIABLES

Column: 100 × 2.1 5 μm Hypersil ODS

Mobile phase: Gradient. MeOH: 50 mM ammonium acetate from 10:90 to 60:40 over 10 min, maintain at 60:40 for 10 min.
Column temperature: 40
Flow rate: 0.3
Injection volume: 2
Detector: F ex 223 em 415 or UV 230

CHROMATOGRAM
Retention time: 8.6
Internal standard: bendroflumethiazide

OTHER SUBSTANCES
Extracted: bumetanide (F ex 231 em 426 or UV), furosemide (UV), piretanide (UV), cyclopenthiazide (UV), etozolin (UV), canrenone (UV)

KEY WORDS
bendroflumethiazide is IS

REFERENCE

SAMPLE
Matrix: urine
Sample preparation: Make 5 mL urine alkaline (pH 9-10), add 2 g NaCl, extract twice with 6 mL ethyl acetate. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 200 µL MeCN/water, inject a 10-20 µL aliquot.

HPLC VARIABLES
Column: 100 × 4 5 µm SGE 100 GL-4 C18P (Scientific Glass Engineering)
Mobile phase: MeCN:MeOH:water:trifluoroacetic acid 4.5:10.5:85:0.5
Flow rate: 0.8 or 1
Injection volume: 10-20
Detector: MS, ZAB2-SEQ (VG), PSP source coupled to LC, source 250°, probe 240-260°, scan m/z 200-550 or UV 270

CHROMATOGRAM
Retention time: 9.2

OTHER SUBSTANCES
Extracted: amiloride, chlorthalidone, triamterene, furosemide, benzthiazide

REFERENCE
Ventura,R.; Fraisse,D.; Becchi,M.; Paisse,O.; Segura,J. Approach to the analysis of diuretics and masking agents by high-performance liquid chromatography-mass spectrometry in doping control, *J.Chromatogr.*, **1991**, *562*, 723–736.

SAMPLE
Matrix: urine
Sample preparation: Direct injection.

HPLC VARIABLES
Guard column: 35 × 4 5 µm Spherisorb ODS-2
Column: 120 × 4 5 µm Spherisorb ODS-2
Mobile phase: MeOH:50 mM sodium dodecyl sulfate 5:95

Column temperature: 50
Flow rate: 1
Injection volume: 20
Detector: UV 224

CHROMATOGRAM
Retention time: 15.2
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Simultaneous: chlorthalidone

SAMPLE
Matrix: urine
Sample preparation: Buffer urine to 4.9 by mixing with an equal volume of pH 4.9 200 mM sodium phosphate buffer. Inject a 40 μL aliquot onto column A with mobile phase A, after 3 min backflush the contents of column A onto column B with mobile phase B and start the gradient. At the end of the run re-equilibrate for 10 min.

HPLC VARIABLES
Column: A 20 × 4 5 μm Hypersil octadecylsilica ODS; B 200 × 4.6 5 μm Shiseido SG-120 polymer-based C18
Mobile phase: A water; B Gradient. MeCN:buffer from 7:93 to 15:85 over 3.5 min, to 50:50 over 8.5 min, maintain at 50:50 for 11 min (Buffer was 6.9 g $NaH_2PO_4.H_2O$ in 1 L water, pH adjusted to 3.1 with phosphoric acid.)
Flow rate: 1
Injection volume: 40
Detector: UV 270

CHROMATOGRAM
Retention time: 18.8
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Extracted: acetazolamide, amiloride, benzthiazide, bumetanide, caffeine, carbamazepine, chlorothiazide, chlorthalidone, clopamide, dichlorfenamide, ethacrynic acid, furosemide, hydrochlorothiazide, metyrapone, probenecid, spironolactone, triamterene, trichlormethiazide

KEY WORDS
column-switching; optimum detection wavelengths vary for each drug

REFERENCE
Saarinen,M.; Sirén,H.; Riekkola,M.-L. A column switching technique for the screening of diuretics in urine by high performance liquid chromatography, *J.Liq.Chromatogr.*, **1993**, *16*, 4063–4078.

SAMPLE
Matrix: urine
Sample preparation: 5 mL Urine + 50 μL 100 μg/mL 7-propyltheophylline in MeOH + 200 μL ammonium chloride buffer + 2 g NaCl, extract with 6 mL ethyl acetate by rocking at 40 movements/min for 20 min and centrifuging at 800 g for 5 min, repeat extraction, combine organic layers, evaporate to dryness at 40° under a stream of nitrogen. Recon-

stitute in 200 μL MeCN:water 15:85 and inject 20 μL aliquots. (Ammonium chloride buffer was 28 g ammonium chloride in 100 mL water with the pH adjusted to 9.5 with concentrated ammonia solution.)

HPLC VARIABLES

Column: 75 × 4.6 3 μm Ultrasphere ODS
Mobile phase: Gradient. MeCN:100 mM ammonium acetate adjusted to pH 3 with concentrated phosphoric acid. From 10:90 to 15:85 over 2 min to 55:45 over 3 min to 60:40 over 3 min. Kept at 60:40 for 1 min, decreased to 10:90 over 1 min and equilibrated at 10:90 for 2 min.
Flow rate: 1
Injection volume: 20
Detector: UV 270

CHROMATOGRAM

Retention time: 7.0
Internal standard: 7-propyltheophylline (4.5)
Limit of detection: 50 ng/mL

OTHER SUBSTANCES

Simultaneous: xipamide, bumetanide, acetazolamide, amiloride, benzthiazide, buthiazide, caffeine, canrenone, chlorthalidone, clopamide, cyclothiazide, diclofenamide, furosemide, hydrochlorothiazide, mesocarb, morazone, piretanide, probenecid, spironolactone, torsemide, triamterene
Interfering: polythiazide, ethacrynic acid

REFERENCE

Ventura,R.; Nadal,T.; Alcalde,P.; Pascual,J.A.; Segura,J. Fast screening method for diuretics, probenecid and other compounds of doping interest, *J.Chromatogr.A*, **1993**, *655*, 233–242.

SAMPLE

Matrix: urine
Sample preparation: Direct injection into column A with mobile phase A for 1 min then back flush onto column B with mobile phase B.

HPLC VARIABLES

Column: A 20 × 2.1 30 μm Hypersil ODS-C18; B 250 × 4 5 μm Hypersil ODS-C18
Mobile phase: A Water; B Gradient. MeCN:buffer 15:85 for 1.5 min then to 80:20 over 8 min. Keep at 80:20 for 2.5 min then re-equilibrate with 15:85. (Buffer was 50 mM NaH_2PO_4 + 1.4 mL propylamine hydrochloride per liter adjusted to pH 3 with concentrated phosphoric acid.)
Flow rate: 1
Injection volume: 50
Detector: UV 230

CHROMATOGRAM

Retention time: 9.8
Limit of detection: 20 ng/mL.

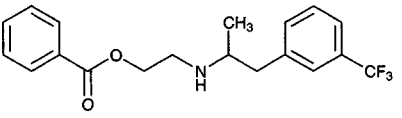
OTHER SUBSTANCES

Simultaneous: bumetanide, ethacrynic acid, acetazolamide, amiloride, chlorthalidone, cyclothiazide, furosemide, hydrochlorothiazide, probenecid, spironolactone, triamterene

REFERENCE

Campíns-Falco,P.; Herráez-Hernández,R.; Sevillano-Cabeza,A. Column-switching techniques for screening of diuretics and probenecid in urine samples, *Anal.Chem.*, **1994**, *66*, 244–248.

Benfluorex



Molecular formula: $C_{19}H_{20}F_3NO_2$
Molecular weight: 351.37
CAS Registry No.: 23602-78-0, 23642-66-2 (HCl)
Merck Index: 1066

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 16.378

KEY WORDS

whole blood

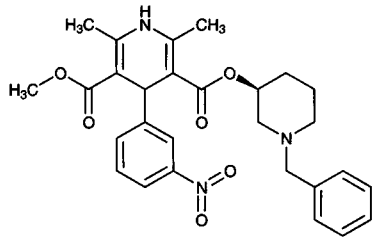
Benidipine



Molecular formula: $C_{28}H_{31}N_3O_6$
Molecular weight: 505.57
CAS Registry No.: 105979-17-7
Merck Index: 1071

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Urine, bile. Inject urine and bile directly. Plasma. Add an equal volume of MeCN, centrifuge, remove supernatant and evaporate it to dryness. Reconstitute residue in MeCN:10 mM pH 5 ammonium acetate 20:80.

HPLC VARIABLES

Column: 300 × 8 Unisil Q5C18 (Gaschro Kogyo)
Mobile phase: Gradient. A was MeCN:10 mM pH 5 ammonium acetate 20:80. B was MeCN:10 mM pH 5 ammonium acetate 80:20. A:B from 100:0 to 92:8 over 4 min, to 83:17 over 4 min, to 75:25 over 4 min, to 63:37 over 4 min, to 55:45 over 8 min, to 50:50 over 8 min, to 42:58 over 4 min, to 0:100 over 9 min, hold at 0:100 for 25 min.
Flow rate: 2 for 36 min, then 3
Detector: Radioactivity

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma; semi-preparative; rat; dog; radiolabelled

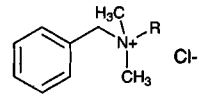
Benzalkonium chloride



R = alkyl

CAS Registry No.: 8001-54-5
Merck Index: 1086

SAMPLE
Matrix: formulations
Sample preparation: Dilute with water, inject an aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak CN
Mobile phase: MeCN:buffer 50:50 (Buffer was 13.6 g/L sodium acetate, pH adjusted to 4.5 with glacial acetic acid.)
Flow rate: 1.5
Detector: UV 254

CHROMATOGRAM
Retention time: 8 (C12), 11 (C14), 14 (C16)

OTHER SUBSTANCES
Simultaneous: demecarium

KEY WORDS
ophthalmic solution

REFERENCE

SAMPLE
Matrix: formulations
Sample preparation: Condition a C18 Sep-Pak SPE cartridge with THF:mobile phase 70:30 then with water. Add 10 mL formulation to the SPE cartridge, wash with water, elute with 3 mL THF:mobile phase 70:30 then with 3 mL mobile phase, mix the eluates, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Zorbax Stablebond CN
Mobile phase: THF:water:triethylamine 150:250:2, pH adjusted to 3.0 ± 0.1 with phosphoric acid
Column temperature: 40
Flow rate: 2
Injection volume: 100
Detector: UV 215

CHROMATOGRAM
Retention time: 3.5 (C12), 6.5 (C14), 10 (C16)

KEY WORDS
SPE; eye

SAMPLE
Matrix: formulations
Sample preparation: Condition a 1 mL Supelcoclean cyano SPE cartridge with 2 mL MeCN and 2 mL water. Add 4 mL formulation to the SPE cartridge, wash with 2 mL MeCN:buffer 30:70, elute with 5 mL mobile phase, make up eluate to 10 mL with water, inject a 100 μL aliquot. (Buffer was 6 mL concentrated phosphoric acid in 1950 mL water, adjust pH to 5.0 with 50% NaOH, make up to 2 L with water.).

HPLC VARIABLES
Column: 150 × 4.6 5 μm Ultrasphere cyano
Mobile phase: MeCN:buffer 60:40 (Buffer was 6 mL concentrated phosphoric acid in 1950 mL water, adjust pH to 5.0 with 50% NaOH, make up to 2 L with water.)
Flow rate: 2
Injection volume: 100
Detector: UV 210

CHROMATOGRAM
Retention time: 4.5 (C10), 5.5 (C12), 6.5 (C14), 7.5 (C16), 8.5 (C18)

OTHER SUBSTANCES
Also analyzed: tyloxapol

KEY WORDS
ophthalmic solutions; eye; SPE

SAMPLE
Matrix: formulations
Sample preparation: 2 mL Sample + 1 mL 200 μg/mL emetine hydrochloride in water, make up to 10 mL with mobile phase, filter (0.45 μm), inject a 50-100 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 5 μm Technosphere RP C-8 (HPLC Technology)
Mobile phase: MeCN:40 mM tetramethylammonium bromide:1 M acetic acid 80:15:5 (apparent pH 4.5)
Flow rate: 1.5
Injection volume: 50-100
Detector: UV 260

CHROMATOGRAM
Retention time: 3.15 (C12), 4.21 (C14), 5.78 (C16)
Internal standard: emetine (1.75)
Limit of quantitation: 10 μg/mL

OTHER SUBSTANCES
Simultaneous: naphazoline, tetrahydrozoline

KEY WORDS
nasal; ophthalmic

REFERENCE
Santoni,G.; Medica,A.; Gratteri,P.; Furlanetto,S.; Pinzauti,S. High-performance liquid chromatographic determination of benzalkonium and naphazoline or tetrahydrozoline in nasal and ophthalmic solutions, *Farmaco*, **1994**, *49*, 751–754.

SAMPLE
Matrix: formulations
Sample preparation: Inject a 50 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak phenyl
Mobile phase: MeCN:buffer 65:35 (Buffer was 50 mM KH_2PO_4 and 57 mM sodium hexanesulfonate, adjusted to pH 6.3 with 1 M NaOH.)
Flow rate: 1.8
Injection volume: 50
Detector: UV 215

CHROMATOGRAM
Retention time: 7.5 (C12), 12.1 (C14)

OTHER SUBSTANCES
Noninterfering: phenylephrine

KEY WORDS
ophthalmic solution; stability-indicating

SAMPLE
Matrix: sewage
Sample preparation: Condition a C18ec SPE cartridge (Macherey-Nagel) with three bed volumes of MeOH and three bed volumes of water. Allow sewage to settle, add an 8 mL aliquot of the supernatant to the SPE cartridge, wash with 3 bed volumes of water, wash with 2 bed volumes of ethyl acetate, elute with 2 bed volumes of 1% calcium chloride in MeOH:ethyl acetate 50:50, inject a 15 μL aliquot of the eluate. (For all steps involving the SPE cartridge the flow rate should be 3 mL/min.)

HPLC VARIABLES
Column: 250 × 4 5 μm Partisil PAC CN-NH2
Mobile phase: Chloroform:MeOH 80:20
Column temperature: 15
Flow rate: 1
Injection volume: 15
Detector: F ex 383 em 459 following post-column extraction. The column effluent mixed with 37 μg/mL sodium 9,10-dimethoxyanthracene-2-sulfonate in water pumped at 0.3 mL/min and the mixture flowed to a phase separator. The organic phase flowed to the detector and the aqueous phase was discarded. (9,10-Dimethoxyanthracene-2-sulfonate forms a hydrophobic fluorescent ion-pair with benzalkonium chloride.)

CHROMATOGRAM
Retention time: 2.49
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Simultaneous: dimethyldidecylammonium chloride (DDMAC)

KEY WORDS
post-column reaction; post-column extraction; SPE

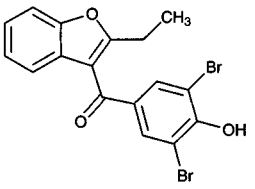
Benzbromarone



Molecular formula: $C_{17}H_{12}Br_2O_3$
Molecular weight: 424.09
CAS Registry No.: 3562-84-3
Merck Index: 1093
Lednicer No.: 2 354

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 204

CHROMATOGRAM

Retention time: 26.075

KEY WORDS

whole blood

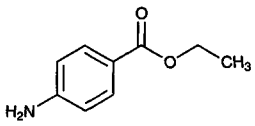
Benzocaine



Molecular formula: $C_9H_{11}NO_2$
Molecular weight: 165.19
CAS Registry No.: 94-09-7
Merck Index: 1116
Lednicer No.: 1 9

SAMPLE

Matrix: bile, blood, tissue

Sample preparation: Plasma, bile. Add three 250 μL portions of MeOH to 250 μL plasma and three 150 μL portions of MeOH to150 μL bile, centrifuge. Remove MeOH from the supernatant using vacuum centrifugal evaporation. Dilute the residue to 1 mL with sample solvent. Filter (0.22 μm) and inject a 100 μL aliquot. Tissue. Homogenize 1.1.g white muscle, 640 mg liver, 250 mg trunk, or 170 mg head kidneys with 5 volumes of 100 mM acetic acid. Homogenize 500 mg red muscle and 320 mg skin with 5 volumes of 100 mM and 25 mM sodium acetate at pH 4.5, respectively. Add five volumes of MeOH to the homogenates, shake horizontally for 15 min. Centrifuge at 3000 g at 15° for 15 min and remove MeOH using vacuum centrifugal evaporation. Acidify the residue with 10% acetic acid to a final acetic acid concentration of 1% (skin to 2.5% acetic acid concentration) and add to a 3 mL Cyanopropyl (Supelco) SPE cartridge, elute with MeOH. Evaporate the MeOH under nitrogen at 40°. Reconstitute the residue with 500 μL sample solvent. Filter (0.22 μm) and inject a 100 μL aliquot. (Sample solvent was MeOH:water:acetic acid 15:84:1.)

HPLC VARIABLES

Guard column: 10 × 4.6 5 μm Lichrosorb Diol
Column: 150 × 4.6 3 μm LC-18-DB Supelco
Mobile phase: Gradient. A was MeOH:water:acetic acid 5:94:1. B was MeOH:water:acetic acid 55:44:1. A:B 100:0 for 3 min, to 0:100 over 5 min, maintain at 0:100 for 15 min, return to 100:0 over 1 min.
Injection volume: 100
Detector: UV 286

CHROMATOGRAM

Retention time: 15.5
Limit of quantitation: 1 nM

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 291

CHROMATOGRAM

Retention time: 3.51
Limit of detection: <120 ng/mL

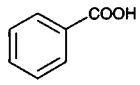
Benzoic acid



Molecular formula: $C_7H_6O_2$
Molecular weight: 122.12
CAS Registry No.: 65-85-0
Merck Index: 1122

SAMPLE
Matrix: beverage
Sample preparation: Sonicate 25 mL beverage for 15-20 min, filter (0.45 μm) if necessary, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:MeOH:water:acetic acid 10:20:70:1
Flow rate: 1.5
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 12

OTHER SUBSTANCES
Simultaneous: hydroquinine, quinine, saccharin

KEY WORDS
tonic water; soft drinks

REFERENCE
Valenti,L.P. Liquid chromatographic determination of quinine, hydroquinine, saccharin, and sodium benzoate in quinine beverages, *J.Assoc.Off.Anal.Chem.*, **1985**, *68*, 782–784.

SAMPLE
Matrix: beverages
Sample preparation: Filter sample.

HPLC VARIABLES
Column: 150 × 4.5 5 μm Hiasil C18 (Higgins)
Mobile phase: MeOH:25 mM phosphate buffer 45:55, pH 3.0
Flow rate: 1.0
Injection volume: 20
Detector: UV 218

CHROMATOGRAM
Retention time: 6.0
Limit of detection: 0.57 mg/mL

OTHER SUBSTANCES
Simultaneous: aspartame, caffeine

KEY WORDS
comparison with UV spectrophotometry and capillary electrophoresis; soft drinks

REFERENCE
McDevitt,V.L.; Rodriguez,A.; Williams,K.R. Analysis of soft drinks: UV spectrophotometry, liquid chromatography, and capillary electrophoresis, *J.Chem.Educ.*, **1998**, *75*, 625–629.

SAMPLE
Matrix: beverages, syrup
Sample preparation: Dilute syrup ten fold. Filter (0.45 μm) beverages and diluted syrup, inject a 10-20 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:acetic acid:water 20:5:75
Flow rate: 2
Injection volume: 10-20
Detector: UV 254

CHROMATOGRAM
Retention time: 9.5
Limit of detection: 100 ng

OTHER SUBSTANCES
Simultaneous: acesulfame, caffeine, dulcin, p-hydroxybenzoic acid, saccharin, vanillin

REFERENCE
Veerabhadrarao,M.; Narayan,M.S.; Kapur,O.; Sastry,C.S. Reverse phase liquid chromatographic determination of some food additives, *J.Assoc.Off.Anal.Chem.*, **1987**, *70*, 578–582.

SAMPLE
Matrix: bile, blood
Sample preparation: Blood, plasma. 250 μL Blood or plasma + 50 μL 16 μg/mL methoxybenzoic acid in water + 800 μL MeCN, mix, centrifuge. Remove the supernatant and dry it under a stream of nitrogen, reconstitute the residue in 200 μL MeCN:0.5% acetic acid 10:90, centrifuge, inject an aliquot. Bile. Inject bile directly.

HPLC VARIABLES
Guard column: 22 × 3.4 37-50 μm C18 (Waters)
Column: 300 × 3.9 10 μm Ultrasphere
Mobile phase: Gradient. MeCN:0.5% acetic acid 10:90 for 10 min then to 72.5:27.5 over 2 min, maintain at 72.5:27.5 for 8 min, return to initial conditions over 1 min, re-equilibrate for 4 min.
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 17.8
Internal standard: methoxybenzoic acid (19.1)

OTHER SUBSTANCES
Extracted: hippuric acid, benzoyl glucuronide

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg Bond Elut C18 SPE cartridge with 2 mL MeCN and 2 mL pH 3 aqueous acetic acid. Dilute 1 mL serum with 1 mL pH 3 aqueous acetic

acid, add to SPE cartridge, wash with 500 μL pH 3 aqueous acetic acid, elute with 1 mL MeCN acidified to pH 2.5 with acetic acid, inject a 20 μL aliquot of the eluate.

HPLC VARIABLES
Column: Capcell Pak C-18 AG-120 (Shiseido)
Mobile phase: MeCN:water 20:80
Flow rate: 1.2
Injection volume: 20
Detector: UV 250

CHROMATOGRAM
Retention time: 5.8

KEY WORDS
serum; dental material; methyl methacrylate polymer; plexiglass; horse; SPE

SAMPLE
Matrix: bulk, formulations
Sample preparation: 100 mg Bulk drug or formulation containing 100-120 mg drug + 10 mL 1 (bulk) or 4 (formulations) mg/mL benzoic acid in MeOH:water 50:50 + 20 mL 5 mg/mL p-nitroacetophenone in MeOH, make up to 100 mL with water, inject an aliquot.

HPLC VARIABLES
Column: 300 × 4 10 μm μBondapak C18
Mobile phase: MeCN:MeOH:water:glacial acetic acid 20:5:74:1 containing 0.05-0.08% sodium 1-heptanesulfonate, pH 3.1
Flow rate: 2
Injection volume: 5
Detector: UV 278

CHROMATOGRAM
Retention time: 6
Internal standard: benzoic acid, p-nitroacetophenone (12)

OTHER SUBSTANCES
Simultaneous: 4-amino-2-chlorobenzoic acid, impurities, chloroprocaine

KEY WORDS
benzoic acid is IS

REFERENCE
Menon,G.; Norris,B.; Webster,J. Simultaneous determination of chloroprocaine hydrochloride and its degradation product 4-amino-2-chlorobenzoic acid in bulk drug and injection solutions by high-performance liquid chromatography, *J.Pharm.Sci.*, **1984**, *73*, 251–253.

SAMPLE
Matrix: food
Sample preparation: 5 g Food + 2 mL 1 mg/mL 4-hydroxyacetanilide in MeOH, make up to 15 mL with MeOH, mix, centrifuge at 1500 g for 10 min, filter an aliquot of the supernatant (0.45 μm), inject a 15 μL aliquot.

HPLC VARIABLES
Guard column: RP18 (Brownlee)

Column: 10 μm Spheri RP-18 (Brownlee)
Mobile phase: MeOH:30 mM pH 6.5 phosphate buffer 5:95
Flow rate: 2
Injection volume: 15
Detector: UV 227

CHROMATOGRAM
Retention time: 4.24
Internal standard: 4-hydroxyacetanilide (14.57)

OTHER SUBSTANCES
Simultaneous: sorbic acid

KEY WORDS
beverages; fruit; seafood; vegetables; sauces; dairy products

REFERENCE
Bui,L.V.; Cooper,C. Reverse-phase liquid chromatographic determination of benzoic and sorbic acids in foods, *J.Assoc.Off.Anal.Chem.*, **1987**, *70*, 892–896.

SAMPLE
Matrix: food
Sample preparation: 2 g Soy sauce or 1 g sugared fruit or roast beef + 10 g NaCl, make up to 50 mL with acetone, swirl vigorously, let stand for 30 min, filter, wash the solid with acetone, make up filtrate to 50 mL with acetone, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm monomeric C18 (Shoko, Kyoto)
Mobile phase: MeCN:50 mM pH 4.5 α-hydroxyisobutyric acid in water 22:34 containing 2.5 mM hexadecyltrimethylammonium bromide
Flow rate: 1
Injection volume: 20
Detector: UV 233

CHROMATOGRAM
Retention time: 24

OTHER SUBSTANCES
Simultaneous: acesulfame-K, 3-t-butyl-4-hydroxyanisole, butyl p-hydroxybenzoate, t-butylhydroxyquinone, dulcin, ethyl p-hydroxybenzoate, isobutyl p-hydroxybenzoate, isopropyl p-hydroxybenzoate, methyl p-hydroxybenzoate, saccharin, sodium dehydroacetate, sorbic acid

KEY WORDS
soy sauce; roast beef; sugared fruit

Chen,B.H.; Fu,S.C. Comparison of extraction methods and column types for the determination of additives by liquid chromatography, *J.Liq.Chromatogr.Rel.Technol.*, **1996**, *19*, 625–643.

SAMPLE
Matrix: formulations
Sample preparation: 5 mL Formulation + 5 mL IS solution, make up to 50 mL with MeOH, inject 10 μL aliquot. (IS solution was 0.2 mg p-nitroacetophenone and 2.5 mg isobutyrophenone per mL of MeOH.)

HPLC VARIABLES
Column: 300 × 4 10 μm μBondapak C18
Mobile phase: MeCN:water:reagent 25:60:15, pH 2.6 (Reagent was MeOH containing 0.06% sulfuric acid, 0.5% sodium sulfate, and 0.02% sodium heptanesulfonate.)
Flow rate: 2
Injection volume: 10
Detector: UV 257

CHROMATOGRAM
Retention time: 3.5
Internal standard: p-nitroacetophenone (6) and isobutyrophenone (13)

OTHER SUBSTANCES
Simultaneous: benzyl alcohol, hydroxyzine, benzaldehyde, p-chlorobenzoic acid, p-chlorobenzaldehyde, p-chlorobenzophenone

KEY WORDS
injections; stability-indicating

REFERENCE
Menon,G.N.; Norris,B.J. Simultaneous determination of hydroxyzine hydrochloride and benzyl alcohol in injection solutions by high-performance liquid chromatography, *J.Pharm.Sci.*, **1981**, *70*, 697–698.

SAMPLE
Matrix: formulations
Sample preparation: Leach 200 or 300 mg ground capsule or tablet with water or mobile phase and dilute to 50 mL, sonicate for 5 min, centrifuge at 2500 rpm for 5 min, inject an aliquot. Dilute 4-25 mL of liquid formulations to 250 mL with water, inject an aliquot.

HPLC VARIABLES
Column: Partisil-10 C8
Mobile phase: MeOH:MeCN:water:PIC-B5 50:170:755:25 (PIC-B5 (Waters) is 200 mM sodium pentanesulfonate in glacial acetic acid.)
Flow rate: 2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 14.5

OTHER SUBSTANCES
Simultaneous: phenylephrine, phenylpropanolamine, guaifenesin, impurities, degradation products

KEY WORDS
tablets; capsules; liquid formulations; stability-indicating

SAMPLE

Matrix: solutions

Sample preparation: Add 500 μL of a solution in MeCN to 100 mg finely powdered potassium carbonate, add 250 μL 3.8 mM 18-crown-6 in MeCN, add 250 μL 0.8 mM reagent in MeCN, heat at 80° in the dark for 20 min, cool, inject a 5 μL aliquot. (Synthesize the reagent, 3-bromomethyl-6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone, as follows. Stir 483 g veratrole in 1.45 L acetic acid at 15° for 1 h, add 683 g concentrated nitric acid (d 1.05) over 1 h (maintain the temperature below 40° by cooling and regulating the rate of addition of the nitric acid). Continue stirring and add 2.127 L fuming nitric acid (d 1.50) over 1 h while maintaining the temperature below 30°, let stand for 2 h, pour into a large volume of cold water, filter, wash the solid with water until the washings are neutral, recrystallize from EtOH to give 4,5-dinitroveratrole (mp 129.5-130.5°) (J. Am. Chem. Soc. 1946, 68, 1536). Reflux 5 g 4,5-dinitroveratrole in 200 mL benzene (Caution! Benzene is a carcinogen!), add 100 g 60 mesh iron powder and 20 mL concentrated HCl in small portions over 1 h, reflux for 4 h, add 10 mL water, reflux for 2 h, cool, make alkaline with 2.5 M NaOH, extract several times with 200 mL portions of benzene. Combine the organic layers and evaporate them to dryness, add 10 mL concentrated HCl, recrystallize from EtOH to give 1,2-diamino-4,5-dimethoxybenzene monohydrochloride as very slightly pink needles (mp 240°) (Anal. Chim. Acta 1982, 134, 39). Heat 2.5 mmoles 1,2-diamino-4,5-dimethoxybenzene hydrochloride and 2.4 mmoles pyruvic acid in 30 mL 500 mM HCl on a boiling water bath for 2 h, cool with ice-water, filter. Wash the precipitate with water and dry it under vacuum, recrystallize from MeOH:water 90:10 to give 6,7-dimethoxy-3-methyl-2(1H)-quinoxalinone as yellow needles (mp 255°) (Chem. Pharm. Bull. 1985, 33, 3493). Treat 1 g 6,7-dimethoxy-3-methyl-2(1H)-quinoxalinone dissolved in 50 mL anhydrous MeOH with a solution of diazomethane in ether, evaporate to dryness under reduced pressure, dissolve the residue in 5 mL ethyl acetate, chromatograph on a 250 × 35 column filled with 130 g 70-230 mesh silica gel 60 (Merck) using n-hexane:ethyl acetate 25:75 to give 6,7-dimethoxy-1,3-dimethyl-2(1H)-quinoxalinone as yellow needles (mp 170-171°). Dissolve 350 mg 6,7-dimethoxy-1,3-dimethyl-2(1H)-quinoxalinone in 3 mL acetic acid, add 350 mg anhydrous sodium acetate, add 2 mL 1.5 M bromine in acetic acid, heat at 100° for 15 min, cool, add 10 mL ether, filter, wash the solid 2 or 3 times with small portions of ether. Combine the filtrate and washings and evaporate them to dryness, dissolve the residue in 5 mL ethyl acetate, chromatograph on a 250 × 35 column filled with 130 g 70-230 mesh silica gel 60 (Merck) using ether, evaporate the main fraction to dryness, recrystallize the residue from n-hexane:ethyl acetate 50:50 to give 3-bromomethyl-6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone as yellow needles (mp 161-163°).)

HPLC VARIABLES

Column: 100 × 4 10 μm Radial-Pak C18 (Waters)

Mobile phase: Gradient. MeOH:water from 57:43 to 100:0 over 20 min, maintain at 100:0 for 12 min

Flow rate: 2

Injection volume: 5

Detector: F ex 370 em 450

CHROMATOGRAM

Retention time: 9.4

Limit of detection: 0.3-1 fmole

OTHER SUBSTANCES

Simultaneous: p-aminobenzoic acid, arachidic acid, arachidonic acid, butyric acid, capric acid, caproic acid, caprylic acid, deoxyuridine, glucuronic acid, imidazole-4-acetic acid, lauric acid, linoleic acid, linolenic acid, margaric acid, 1-methyl-4-imidazoleacetic acid, myristic acid, myristoleic acid, oleic acid, palmitic acid, palmitoleic acid, propionic acid, salicylic acid, stearic acid, thymidine, uridine, valeric acid

KEY WORDS

derivatization

SAMPLE

Matrix: solutions
Sample preparation: Dissolve in MeOH:water 1:1 at a concentration of 50 μg/mL, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:acetic acid:triethylamine:water 40:1.5:0.5:58
Flow rate: 1.5
Injection volume: 10
Detector: UV 261

CHROMATOGRAM

Retention time: 9

OTHER SUBSTANCES

Simultaneous: ascorbic acid, salicylic acid, quinine, dihydroquinine

REFERENCE

Roos,R.W.; Lau-Cam,C.A. General reversed-phase high-performance liquid chromatographic method for the separation of drugs using triethylamine as a competing base, *J.Chromatogr.*, **1986**, *370*, 403–418.

SAMPLE

Matrix: solutions
Sample preparation: Prepare an aqueous solution, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Nucleosil C18
Mobile phase: MeCN:MeOH:buffer:triethylamine 4:4:92:0.01 (Buffer was 0.05% sodium octanesulfonate adjusted to pH 2.2 with 3 M phosphoric acid.)
Flow rate: 1.5
Injection volume: 10
Detector: UV 215

CHROMATOGRAM

Retention time: 2.4

OTHER SUBSTANCES

Simultaneous: p-aminobenzoic acid, benzaldehyde, benzyl alcohol, protirelin

REFERENCE

Rao,G.N.; Sutherland,J.W.; Menon,G.N. High-performance liquid chromatographic assay for thyrotropin releasing hormone and benzyl alcohol in injectable formulation, *Pharm.Res.*, **1987**, *4*, 38–41.

SAMPLE

Matrix: solutions
Sample preparation: React the carboxylic acid, triethylamine, and 1-(2,5-dihydroxyphenyl)-2-bromoethanone in a 1:2:4 molar ratio in MeCN at 45° for 2 h, inject a 10 μL aliquot. (Preparation of 1-(2,5-dihydroxyphenyl)-2-bromoethanone is as follows. Stir 27.6 g 1,4-dimethoxybenzene and 28 mL bromoacetyl bromide at 0°, add 53.4 g aluminum bromide over 10 min (an exothermic reactions ensues), let stand at room temperature for

12 h, add 100 mL 48% HBr, add 100 g ice, stir for 1 h, extract twice with 200 mL portions of diethyl ether. Combine the extracts and wash them 3 times with 200 mL portions of water, dry over 40 g anhydrous magnesium sulfate, evaporate to dryness, recrystallize the product 3 times from EtOH to yield 1-(2,5-dihydroxyphenyl)-2-bromoethanone monobromoacetate (mp 105-107°). Dissolve 11 g 1-(2,5-dihydroxyphenyl)-2-bromoethanone monobromoacetate in 200 mL warm dry MeOH saturated with HBr, stir for 18 h, add 200 mL water, cool to -10°. Collect the yellow solid and dry it under vacuum at 50° for 48 h, recrystallize from toluene:heptane 50:50 then toluene to obtain 1-(2,5-dihydroxyphenyl)-2-bromoethanone as yellow needles (mp 117-119°).)

HPLC VARIABLES
Column: 250 × 4 7 μm RP-18 LiChrocart (Merck)
Mobile phase: MeOH:100 mM pH 6.5 sodium acetate 58:42
Flow rate: 1
Injection volume: 10
Detector: E, Bioanalytical Systems Model LC4B, glassy carbon electrode 0.6 V, Ag/AgCl reference electrode

CHROMATOGRAM
Retention time: 5
Limit of detection: 1 pmole

OTHER SUBSTANCES
Simultaneous: quinoxaline-2-carboxylic acid, salicylic acid

KEY WORDS
derivatization

SAMPLE

Matrix: solutions

Sample preparation: Mix a 100 μL aliquot of a 5-1000 nM solution of a carboxylic acid in MeCN with 100 μL 18-crown-6 solution, add 100 μL 100 μM dansyl-BAP in MeCN, mix, let stand at room temperature (aliphatic acids) or 55° (aromatic acids) for 30 min, add 100 μL 3 mM thymine in MeCN, add 5 mg potassium bicarbonate, vortex for 30 s, let stand for 30 min, evaporate to dryness under a stream of nitrogen. Reconstitute with dichloromethane, add to a Bond-Elut silica SPE cartridge, elute with 1.5 mL MeCN:dichloromethane 50:50. Evaporate the eluate to dryness and reconstitute the residue with 500 μL mobile phase, inject a 25 μL aliquot. (Prepare 18-crown-6 solution by sonicating a 1 mg/mL solution of 18-crown-6 in MeCN containing 1 mg/mL potassium bicarbonate for 20 min. Prepare dansyl-BAP (N-(bromoacetyl)-N'-[5-(dimethylamino)naphthalene-1-sulfonyl]piperazine) as follows. Slowly add a solution of 135 mg dansyl chloride in 30 mL acetone to a 10-fold molar excess of piperazine in acetone:water 75:25, stir at 50° for 1 h, evaporate the acetone. Acidify the remaining aqueous layer with concentrated nitric acid, wash 3 times with 15 mL portions of dichloromethane, adjust the pH of the aqueous layer to 11 with concentrated NaOH, extract three times with 15 mL portions of dichloromethane. Combine the extracts and dry them over anhydrous calcium chloride, concentrate to about 5 mL, chromatograph on a 400 × 25 column of 60-200 μm silica gel Si-60, wash with about 20 mL dichloromethane:MeOH 99:1 to remove a small fluorescent band, elute with about 30 mL dichloromethane:MeOH 95:5-94:6 to obtain a solution of dansylpiperazine, determine the concentration by UV absorption at 340 nm (extinction coefficient = 4300 in MeOH). Stir a solution of 700 mg bromoacetic acid and 1.1 g dicyclohexylcarbodiimide in 100 mL MeCN at room temperature for 1 min, slowly add 470 μmoles dansylpiperazine in MeCN, stir for 1 h, evaporate to dryness, reconstitute the residue with 10 mL dichloromethane, filter. Chromatograph the filtrate on a 400 × 25 column of 40-60 μm Si-60 silica gel with dichloromethane, when the first-eluting, strongly-fluorescent yellow band reaches the outlet change the eluent to dichloromethane:MeOH 99:1, collect about 50 mL eluate to obtain dansyl-BAP.)

HPLC VARIABLES

Column: 150 × 3.1 5 μm LiChrosorb RP-18

Mobile phase: MeCN:water 60:40, containing 2.5 mM pH 7.0 imidazole buffer

Flow rate: 0.5

Injection volume: 25

Detector: F ex 246 em 490 (cut-off filter) following post-column reaction. The column effluent mixed with 50 mM hydrogen peroxide in MeCN containing 5 mM bis(2-nitrophenyl)oxalate pumped at 0.3 mL/min and the mixture flowed immediately to the detector. (Prepare bis(2-nitrophenyl)oxalate by dissolving 13.9 g 2-nitrophenol in 250 mL benzene (Caution! Benzene is a carcinogen!), remove 50 mL benzene by azeotropic distillation, cool to 10°, add 10.1 g freshly distilled triethylamine, add 7 g oxalyl chloride dropwise, allow to warm to room temperature, let stand overnight, evaporate to dryness under reduced pressure, recrystallize to give bis(2-nitrophenyl)oxalate (J. Chem. Educ. 1974, 51, 529).)

CHROMATOGRAM

Retention time: 24

Limit of detection: 0.8-1 pmole

OTHER SUBSTANCES

Simultaneous: 2,4-dichlorobenzoic acid, ibuprofen, lipoic acid, 2-methoxybenzoic acid, naproxen, octanoic acid

KEY WORDS
derivatization; post-column reaction; SPE

Molecular weight: 239.36
CAS Registry No.: 156-08-1, 5411-22-3 (HCl)
Merck Index: 1151
Lednicer No.: 1 70

SAMPLE

Matrix: solutions
Sample preparation: Dissolve in MeOH at a concentration of 1 mg/mL, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 5 Spherisorb S5W
Mobile phase: MeOH:buffer 90:10 (Buffer was 94 mL 35% ammonia and 21.5 mL 70% nitric acid in 884 mL water, adjust the pH to 10.1 with ammonia.)
Flow rate: 2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 1.52

OTHER SUBSTANCES

Simultaneous: phendimetrazine, methylphenidate, phenelzine, epinephrine, pipradol, phenylpropanolamine, fencamfamin, chlorphentermine, norpseudoephedrine, phentermine, fenfluramine, methylenedioxyamphetamine, amphetamine, normetanephrine, 4-hydroxyamphetamine, bromo-STP, STP, prolintane, 2-phenethylamine, tyramine, trimethoxyamphetamine, phenylephrine, pseudoephedrine, ephedrine, methylephedrine, dimethylamphetamine, methamphetamine, mescaline, mephentermine, norpipanone, levallorphan, hydroxypethidine, normethadone, meperidine, dipipanone, diamorphine, pentazocine, acetylcodeine, monoacetylmorphine, thebacon, oxycodone, thebaine, norlevorphanol, methadone, benzylmorphine, ethylmorphine, morphine-N-oxide, codeine, codeine-N-oxide, morphine, ethoheptazine, morphine-3-glucuronide, pholcodeine, norpethidine, hydrocodone, dihydrocodeine, dihydromorphine, levorphanol, norcodeine, normorphine
Noninterfering: dopamine, levodopa, methyldopa, methyldopate, norepinephrine
Interfering: pemoline, diethylpropion, mazindol, tranylcypromine, caffeine, fenethyline, buprenorphine, dextromoramide, phenoperidine, fentanyl, etorphine, piritramide, noscapine, papaverine, naloxone, dextropropoxyphene, nalorphine, phenazocine

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7

Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 1.9

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4.6 Zorbax RX

Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

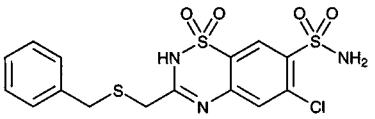
Benzthiazide



Molecular formula: $C_{15}H_{14}ClN_3O_4S_3$
Molecular weight: 431.94
CAS Registry No.: 91-33-8
Merck Index: 1155

SAMPLE

Matrix: blood, feces, urine

Sample preparation: Plasma. 3 mL Plasma + 500 µL 1 µg/mL polythiazide in 10 mM NaOH + 1 mL 10 mM NaOH + 800 µL 100 mM HCl + 10 mL dichloromethane, shake on a platform shaker for 20 min, centrifuge at -10° at 3000 rpm for 15 min, repeat extraction twice more. Combine all organic layers and evaporate them to dryness under a stream of nitrogen at 50°, reconstitute the residue in 50 µL, vortex, inject whole amount. Urine. 5 mL Urine + 1 mL 2 µg/mL polythiazide in 10 mM NaOH + 1 mL 10 mM NaOH + 2 mL 0.68% KH_2PO_4 adjusted to pH 6.1 + 10 mL dichloromethane, shake on a platform shaker for 20 min, centrifuge at -10° at 3000 rpm for 15 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 100 µL, vortex, inject a 20 µL aliquot. Feces. Extract 20 g feces with 350 mL acetone, filter (Whatman No. 1 paper), evaporate to ca. 50 mL, make up to 100 mL with acetone. Remove a 10 mL aliquot and add it to 1 mL 300 µg/mL polythiazide in acetone, evaporate to dryness under nitrogen, dissolve in 10 mL MeOH, inject a 10 µL aliquot.

HPLC VARIABLES

Column: µBondapak C18

Mobile phase: MeCN:glacial acetic acid:water 35:2:63 (plasma, feces) or MeCN:water 40:60 (urine)

Flow rate: 2

Injection volume: 10-50

Detector: UV 280

CHROMATOGRAM

Retention time: 7 (plasma), 5 (urine)

Internal standard: polythiazide (9 (plasma), 8 (urine))

Limit of detection: 10 ng/mL (plasma)

Limit of quantitation: 50 ng/mL (urine), 20 ng/mL (plasma)

KEY WORDS

plasma; pharmacokinetics

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)

Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 5

Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 13.5 (A), 14.3 (B)

Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))

Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, methyclothiazide, cyclothiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone, flumethiazide

Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

SAMPLE
Matrix: urine
Sample preparation: Buffer urine to 4.9 by mixing with an equal volume of pH 4.9 200 mM sodium phosphate buffer. Inject a 40 μL aliquot onto column A with mobile phase A, after 3 min backflush the contents of column A onto column B with mobile phase B and start the gradient. At the end of the run re-equilibrate for 10 min.

HPLC VARIABLES
Column: A 20 × 4 5 μm Hypersil octadecylsilica ODS; B 200 × 4.6 5 μm Shiseido SG-120 polymer-based C18
Mobile phase: A water; B Gradient. MeCN:buffer from 7:93 to 15:85 over 3.5 min, to 50:50 over 8.5 min, maintain at 50:50 for 11 min (Buffer was 6.9 g $NaH_2PO_4.H_2O$ in 1 L water, pH adjusted to 3.1 with phosphoric acid.)
Flow rate: 1
Injection volume: 40
Detector: UV 230

CHROMATOGRAM
Retention time: 17.6
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Extracted: acetazolamide, amiloride, bendroflumethiazide, bumetanide, caffeine, carbamazepine, chlorothiazide, chlorthalidone, clopamide, dichlorfenamide, ethacrynic acid, furosemide, hydrochlorothiazide, metyrapone, probenecid, spironolactone, triamterene, trichlormethiazide

KEY WORDS
column-switching; optimum detection wavelengths vary for each drug

SAMPLE
Matrix: urine
Sample preparation: 5 mL Urine + 50 μL 100 μg/mL 7-propyltheophylline in MeOH + 200 μL ammonium chloride buffer + 2 g NaCl, extract with 6 mL ethyl acetate by rocking at 40 movements/min for 20 min and centrifuging at 800 g for 5 min, repeat extraction, combine organic layers, evaporate to dryness at 40° under a stream of nitrogen. Reconstitute in 200 μL MeCN:water 15:85 and inject 20 μL aliquots. (Ammonium chloride buffer was 28 g ammonium chloride in 100 mL water with the pH adjusted to 9.5 with concentrated ammonia solution.)

HPLC VARIABLES
Column: 75 × 4.6 3 μm Ultrasphere ODS

Mobile phase: Gradient. MeCN:100 mM ammonium acetate adjusted to pH 3 with concentrated phosphoric acid. From 10:90 to 15:85 over 2 min to 55:45 over 3 min to 60:40 over 3 min. Kept at 60:40 for 1 min, decreased to 10:90 over 1 min and equilibrated at 10:90 for 2 min.
Flow rate: 1
Injection volume: 20
Detector: UV 270

CHROMATOGRAM

Retention time: 6.5
Internal standard: 7-propyltheophylline (4.5)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Simultaneous: xipamide, bumetanide, acetazolamide, amiloride, bendroflumethiazide, buthiazide, caffeine, canrenone, chlorthalidone, clopamide, cyclothiazide, diclofenamide, ethacrynic acid, furosemide, hydrochlorothiazide, mesocarb, morazone, piretanide, polythiazide, probenecid, spironolactone, torsemide, triamterene

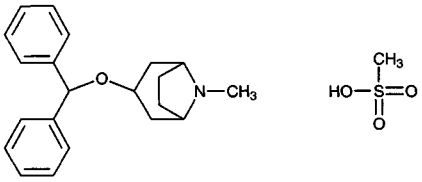
Benztropine mesylate

Molecular formula: $C_{22}H_{29}NO_4S$
Molecular weight: 403.54
CAS Registry No.: 132-17-2, 86-13-5 (free base)
Merck Index: 1156



SAMPLE

Matrix: blood

Sample preparation: 10 mL Plasma or whole blood + 1 mL 1 M NaOH, extract twice with 10 mL hexane for 30 min. Remove the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL 100 mM HCl, add 5 mL chloroform, vortex for 1 min, centrifuge. Remove a 4.5 mL aliquot of the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot. (It is implied, but not explicitly stated in the paper, that this extraction procedure works for this compound.)

HPLC VARIABLES

Column: 10 μm Micropak CN (Varian)
Mobile phase: MeCN:20 mM ammonium acetate 90:10
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 13.2
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Simultaneous: acetophenazine, amitriptyline, butaperazine, carphenazine, chlorpromazine, fluphenazine, haloperidol, imipramine, mesoridazine, nortriptyline, orphenadrine, piperacetazine, promazine, promethazine, thioridazine, thiothixene, trifluoperazine, triflupromazine, trihexyphenidyl, trimeprazine

KEY WORDS

plasma; whole blood

Liquid chromatographic assay of phenothiazine, thioxanthene and butyrophenone neuroleptics and antihistamines in blood and plasma with conventional and radial compression columns and UV and electrochemical detection, *J.Chromatogr.*, **1982**, *231*, 361–376.

SAMPLE

Matrix: blood

Sample preparation: 2 mL Plasma + 150 μL 200 ng/mL desipramine hydrochloride + 150 μL 5 M NaOH, vortex, add 1 mL ethylene glycol, vortex, add 10 mL hexane, shake on a rotary shaker at 30 rpm for 30 min, centrifuge at 1000 g at 4°. Remove the organic layer and add it to 300 μL 100 mM HCl, shake at high speed for 20 min, centrifuge, inject a 200 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 150 × 3.9 5 μm Spherisorb C8

Mobile phase: MeCN:buffer 60:40 (Buffer was 1.5 mL triethylamine in 1 L water adjusted to pH 3.0 with 85% phosphoric acid.)
Flow rate: 1.5
Injection volume: 200
Detector: UV 199

CHROMATOGRAM

Retention time: 7.0
Internal standard: desipramine hydrochloride (5.3)
Limit of quantitation: 0.25 ng/mL

OTHER SUBSTANCES

Simultaneous: hyoscyamine, orphenadrine, bromocriptine, biperiden
Noninterfering: amantadine, carbidopa, levodopa

KEY WORDS

plasma

SAMPLE

Matrix: blood, tissue
Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM

Retention time: 22.75
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES

Simultaneous: amoxapine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, tranylcypromine, trazodone, trihexiphenidyl, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine
Interfering: promethazine, trimipramine, amitriptyline

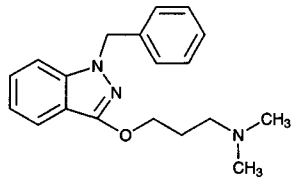
Benzydamine



Molecular formula: $C_{19}H_{23}N_3O$
Molecular weight: 309.41
CAS Registry No.: 642-72-8, 132-69-4 (HCl)
Merck Index: 1157
Lednicer No.: 1 323

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 215.8

CHROMATOGRAM

Retention time: 14.955

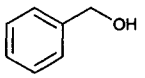
Benzyl alcohol



Molecular formula: C_7H_8O
Molecular weight: 108.14
CAS Registry No.: 100-51-6
Merck Index: 1159

SAMPLE

Matrix: bulk

Sample preparation: Dissolve 600 μg 7-[(imidazolemethanoyl)methoxy]-4-methylcoumarin in 2.5 mL toluene and 750 μL MeCN, add 20 μL benzyl alcohol, add 150 μL 93.3 μg/mL 4-dimethylaminopyridine in MeCN, mix vigorously, heat at 60° for 1.5 h, cool, evaporate to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 300 μL mobile phase, inject a 5 μL aliquot. (Preparation of 7-[(imidazolemethanoyl)methoxy]-4-methylcoumarin is as follows. Stir 102.3 mg 7-(carboxymethoxy)-4-methylcoumarin in 7 mL THF, add 70.9 mg 1,1'-carbonyldiimidazole in one portion, reflux for 30 min, stir at room temperature for 5 h. Filter and dry the solid under reduced pressure to obtain 7-[(imidazolemethanoyl)methoxy]-4-methylcoumarin as a white solid (mp 161-162°). Fluorescence detection can also be used.)

HPLC VARIABLES

Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: MeCN:MeOH:100 mM pH 5.5 ammonium acetate buffer 50:1.5:48.5
Flow rate: 0.7
Injection volume: 5
Detector: MS, Hewlett-Packard 5989A, thermospray interface, filament-assisted ionization mode, ion source 280°, probe stem 112°, probe tip 235-245°

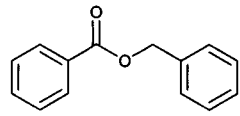
Benzyl benzoate



Molecular formula: $C_{14}H_{12}O_2$
Molecular weight: 212.25
CAS Registry No.: 120-51-4
Merck Index: 1162

SAMPLE

Matrix: formulations
Sample preparation: Dilute 0.5 mL of nanocapsules suspension 1:200 with MeCN, filter, inject an aliquot. Alternatively, evaporate 5 mL of a nanocapsule suspension to dryness and dissolve the residue in 150 mL dichloromethane or ethyl acetate, dry over anhydrous sodium sulfate. Evaporate to dryness under reduced pressure, take up the residue in 50 mL MeOH, dilute 1:20 with MeOH, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4 5 μm Nucleosil C18
Mobile phase: MeCN: water 75:25
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 4.71

OTHER SUBSTANCES

Simultaneous: progesterone
Noninterfering: poly-ϵ-caprolactone

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 202.8

CHROMATOGRAM

Retention time: 19.503

KEY WORDS

whole blood

SAMPLE

Matrix: formulations

Sample preparation: Weigh out ground tablets or capsules equivalent to 150 mg bepridil.HCl, add 150 mL MeCN, shake for 30 min, dilute to 200 mL with MeCN, filter (Schleicher & Schüll paper, grade 588), inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 4.6 10 μm μBondapak C18
Mobile phase: MeCN:buffer 580:405 (Buffer was 1.1 g sodium 1-heptanesulfonate in 405 mL water, adjust to pH 2.37 with glacial acetic acid (ca. 15 mL).)
Column temperature: 35
Flow rate: 1.3
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 6.8

OTHER SUBSTANCES
Simultaneous: impurities, benzaldehyde, N-benzylaniline, benzoic acid

KEY WORDS
stability-indicating; rugged; capsules; tablets

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 100 μM solution in buffer, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 column containing riboflavin binding proteins (Prepare as follows. Add riboflavin to saturate protein of egg yolk, homogenize with 3 volumes buffer, centrifuge, add the supernatant to a 500 × 30 column of DEAE-cellulose (Whatman) equilibrated with buffer, wash extensively with buffer to remove bound protein, elute riboflavin binding proteins (RFBP) with buffer containing 200 mM NaCl (RFBP has intense yellow color, absorption at 455 nm). Purify RFBP on a Sephadex G-100 column with 50 mM pH 7.5 Tris-HCl buffer as eluent, remove the bound riboflavin by extensive dialysis at pH 3.0. Add 4.5 g N,N-disuccinylimidyl carbonate to 3 g Nucleosil 5NH2 slurried in MeCN, filter, wash with MeCN, wash with 50 mM pH 7.5 phosphate buffer. Suspend 300 mg RFBP in 50 mM phosphate buffer, add the activated silica, mix gently for 2 h using a rotary evaporator, filter, wash with sterile water, wash with isopropanol:water 1:2, pack in a 100 × 4.6 column.) (Buffer was 100 mM pH 5.3 sodium acetate.)

Mobile phase: EtOH:50 mM pH 5.5 KH_2PO_4 5:95
Flow rate: 0.8
Injection volume: 20
Detector: UV

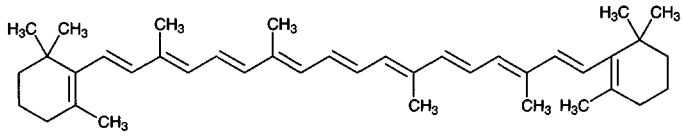
Beta-carotene

Molecular formula: $C_{20}H_{56}$
Molecular weight: 536.88
CAS Registry No.: 7235-40-7
Merck Index: 1902



SAMPLE

Matrix: blood

Sample preparation: Centrifuge 200 µL serum, add 200 µL IS and 200 µL EtOH, mix on orbital shaker for 5 min, add 200 µL water and 500 µL hexane, mix for 10 min, centrifuge at 2000 g for 10 min at 17°, remove 300 µL upper organic layer. Re-extract with 300 µL hexane, mix for 10 min, centrifuge at 4000 g for 10 min at 17°, remove 300 µL upper organic layer. Combine the organic layers, and evaporate them to dryness under vacuum in 15 min. Reconstitute the residue with 300 µL MeOH:EtOH:hexane 88:10:2, vortex for 10 min, inject a 40 µL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 3 µm Adsorbosphere HS C18 + 150 × 4.6 3 µm Adsorbosphere HS C18 in series

Mobile phase: Gradient. A was MeCN:MeOH 60:40 containing 0.05% acetic acid. B was MeCN:MeCN:dichloromethane 45.6:30.4:24 containing 0.04% acetic acid. A:B 100:0 for 7 min then 0:100 for 10.4 min (step gradient), re-equilibrate at initial conditions for 5.6 min.

Column temperature: 37

Flow rate: 0.9

Injection volume: 40

Detector: UV 450

CHROMATOGRAM

Retention time: 16.5

Internal standard: tocol (UV 292) (10.1), echinenone (UV 450) (12.8)

Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Extracted: canthaxanthine (UV 473), α-carotene (UV 450), β-cryptoxanthine (UV 450), lutein (UV 450), lycopene (UV 473), vitamin A (UV 325), vitamin E (UV 292), zeaxanthin (UV 450), nonidentified carotenoids

KEY WORDS

serum

SAMPLE
Matrix: blood
Sample preparation: 200 μL Plasma or serum + 200 μL 850 ng/mL retinyl acetate in EtOH, mix for 1 min, add 1 mL 0.4 g/L BHT (2,6-di-tert-butyl-4-methylphenol) in n-hexane, shake on a mechanical shaker for 10 min, centrifuge at 2000 g for 5 min, remove 800 μL of the supernatant, evaporate to dryness at 40° under a stream of nitrogen, reconstitute in 100 μL MeCN:THF:MeOH 68:22:7, inject a 15 μL aliquot.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm Lichrosorb RP18
Column: 250 × 4.6 5 μm Nucleosil 100-5 C18
Mobile phase: MeCN:THF:MeOH 68:22:7 made up to 100 with 1% ammonium acetate
Flow rate: 1.5
Injection volume: 15
Detector: UV 325 for 3 min, UV 450 for 1.9 min, UV 290 for 2.5 min, UV 470 for 4.6 min, UV 450 for 3 min, then UV 325 for rest of run

CHROMATOGRAM
Retention time: 13
Internal standard: retinyl acetate (2.7)
Limit of detection: 20 ng/mL

OTHER SUBSTANCES
Extracted: vitamin A (retinol), vitamin E (α-tocopherol), lutein, lycopene, α-carotene, zeaxanthin, trans β-carotene, δ-tocopherol

KEY WORDS
plasma; serum; protect from sunlight

REFERENCE
Bui,M.H. Simple determination of retinol, α-tocopherol and carotenoids (lutein, all-*trans*-lycopene, α- and β-carotenes) in human plasma by isocratic liquid chromatography, *J.Chromatogr.B*, **1994**, *654*, 129–133.

SAMPLE
Matrix: blood
Sample preparation: 200 μL Serum + 200 μL nonapreno-β-carotene and retinyl butyrate in EtOH, vortex for 10 s, add 1 mL hexane, vortex for 30 s, centrifuge at 1500 g for 5 min. Remove 900 μL of the hexane layer and evaporate it to a waxy or glassy consistency (not dryness) under vacuum, dissolve in 100 μL EtOH, add 100 μL MeCN, vortex, filter (0.45 μm), inject a 30 μL aliquot.

HPLC VARIABLES
Column: 1540 × 4.6 5 μm Ultramex C18 (Phenomenex)
Mobile phase: MeCN:EtOH 50:50 containing 0.1 mL/L diethylamine
Column temperature: 29
Flow rate: 0.9
Injection volume: 30
Detector: UV 450

CHROMATOGRAM
Retention time: 8.10
Internal standard: nonapreno-β-carotene (9.5, UV 450), retinyl butyrate (3.5, UV 300)
Limit of detection: 13 nM

OTHER SUBSTANCES
Extracted: vitamin A (retinol), vitamin E (α-tocopherol), lutein, zeaxanthin, β-cryptoxanthin, lycopene, α-carotene, retinyl linoleate, retinyl oleate, retinyl palmitate, retinyl stearate

KEY WORDS
serum; use gold fluorescent lamps; hold sample at 4° before injection

SAMPLE
Matrix: cheese
Sample preparation: 500 mg Cheese + 2 mL 60% KOH + 2 mL 95% EtOH + 1 mL 1% NaCl + 5 mL 6% pyrogallol in EtOH, flush tube with nitrogen, seal, heat at 70° for 30 min, cool in ice water, add 15 mL 1% NaCl, extract twice with 15 mL portions of n-hexane:ethyl acetate 90:10. Combine the organic layers and evaporate them to dryness, dissolve the residue in 2 mL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere Si
Mobile phase: Gradient. A was n-hexane:isopropanol 99:1. B was n-hexane. A:B 50:50 for 7 min; to 90:10 over 4 min, maintain at 90:10 for 7 min, to 50:50 over 1 min, maintain at 50:50 for 4 min. (About every 100 injections recondition column with 50 mL dichloromethane, 50 mL isopropanol, and 50 mL dichloromethane.)
Flow rate: 1.5
Injection volume: 20
Detector: UV 450 (β-carotene) and F ex 325 em 475 for 3.5 min, ex 280 em 475 for 10.5 min, ex 325 em 475 for 9 min (others)

CHROMATOGRAM
Retention time: 2
Limit of detection: 0.16 ng

OTHER SUBSTANCES
Extracted: vitamin E (α-tocopherol), vitamin A (all-trans-retinol), β-tocopherol, gamma-tocopherol, δ-tocopherol, 13-cis-retinol

KEY WORDS
normal phase; cheese

SAMPLE

Matrix: fruit, juice, oil, vegetables
Sample preparation: Squash, peach. Homogenize (Waring blender) 10-30 g finely chopped squash or peach with 100 mL acetone and 10 g Hyflo supercel for 3 min, filter. repeat extraction of the solids until all the pigment was removed, extract with petroleum ether, wash the organic layer with water, pass it through a short column containing anhydrous sodium sulfate, concentrate under reduced pressure, inject an aliquot. Orange juice, palm tree oil. Homogenize (Waring blender) 10-30 g orange juice or palm tree oil with 100 mL acetone and 10 g Hyflo supercel for 3 min, filter. repeat extraction of the solids until all the pigment was removed, extract with petroleum ether, add 10% KOH in MeOH, let stand overnight, wash the organic layer with water, pass it through a short column containing anhydrous sodium sulfate, concentrate under reduced pressure, inject an aliquot.

HPLC VARIABLES

Column: 250 × 2.2 $Ca(OH)_2$ laboratory packed ($Ca(OH)_2$ from Nakarri Chemicals.)
Mobile phase: Isooctane (squash, palm tree oil) or Gradient. Isooctane:acetone from 100:0 to 80:20 over 1 h. (orange juice, peach)
Flow rate: 0.5
Injection volume: 10
Detector: UV 450

CHROMATOGRAM

Retention time: 10 (13-cis), 15 (trans), 22 (9-cis) (isocratic mobile phase)

KEY WORDS

squash; peach; orange juice; palm tree oil; normal phase

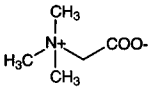
Betaine



Molecular formula: $C_5H_{11}NO_2$

Molecular weight: 117.15

CAS Registry No.: 107-43-7, 590-46-5 (HCl), 590-47-6 (monohydrate), 93227-64-6 (sodium aspartate)

Merck Index: 1225

SAMPLE

Matrix: solutions

Sample preparation: Mix 600 µL solution with 60 µL IS solution, vortex, add a 550 µL aliquot to a 70 × 5 column of Dowex 1-X8 (OH^-) form in a Pasteur pipette, elute with 2 mL water, evaporate the eluate to dryness under a stream of air, reconstitute with 100 µL 2 mM N,N-diisopropylethylamine in MeCN, add 100 µL 5 mM 4'-bromophenacyl trifluoromethanesulfonate in MecN, vortex for 10 min, add 100 µL 10 mM hydroxyacetic acid N,N-diisopropylethylammonium salt in MeCN, vortex for 2 min, inject a 15 min aliquot. (Prepare 4'-bromophenacyl trifluoromethanesulfonate as follows. Add 8.8 g p-bromobenzoyl chloride in 40 mL dry ether over 20-30 min to 100 mmoles diazomethane stirred in an ice bath, stir in an ice bath for 8-9 h, let stand at room temperature for 3 h, evaporate the solvent under reduced pressure, recrystallize 4'-bromo-2-diazoacetophenone from ether/hexane (mp 123.5-124° d) (J.Am.Chem.Soc. 1951, 73, 5301). Condense 50 mL anhydrous sulfur dioxide in a flask fitted with a calcium sulfate drying tube, cool in a dry ice/acetone bath, add 2.25 g 4'-bromo-2-diazoacetophenone, stir for 5 min, add 900 µL anhydrous trifluoromethanesulfonic acid from a freshly opened bottle in one portion, stir for 15 min, remove the cooling bath, after 30 min use an ice/water bath to evaporate the solvent. Dissolve the residue in 100 mL boiling dichloromethane, treat twice with 5 g portions of decolorizing carbon, filter, evaporate the filtrate, recrystallize the residue from pentane:dichloromethane 80:20 to give 4'-bromophenacyl trifluoromethanesulfonate as colorless plates (mp 137-8°) (J. Chromatogr. 1984, 299, 365).)

HPLC VARIABLES

Guard column: 50 × 4 Co:Pell ODS

Column: 100 × 8 5 µm Radial-PAK C18

Mobile phase: MeCN:buffer 70:30 (Prepare by dissolving 70 mg sodium dodecyl sulfate, 140 mg $NaH_2PO_4.H_2O$, and 300 µL 3-dimethylamino-1-propanol in 150 mL water, adjusting pH to 6.5 with 85% phosphoric acid, and adding 350 mL MeCN.)

Flow rate: 5

Injection volume: 15

Detector: UV 254

CHROMATOGRAM

Retention time: 7

Internal standard: (4-bromophenyl)carboxymethyl (6-trimethylammonium)hexanoate (Add an aqueous solution of 6-(trimethylammonium)hexanoic acid (Cl^- salt, prepared by methylation of 6-aminohexanoic acid) to a column of Dowex 1-X8 (OH^- form), elute with 4 column volumes of water. Evaporate the eluate to dryness, dissolve the residue in DMF, add 1.1 equivalents of triethylamine, add 1.1 equivalents of 2,4'-dibromoacetophenone, stir at 40° for 3 h, add ethyl acetate. Collect the precipitate by filtration and recrystallize it from ethanol/acetone to obtain (4-bromophenyl)carboxymethyl (6-trimethylammonium)hexanoate.) (8)

SAMPLE

Matrix: blood
Sample preparation: Add 5 mL chloroform:2-propanol:n-heptane 60:14:26, 1.5 mL saturated pH 9.5 ammonium chloride, and 40 μL 100 μg/mL prazepam to 2.0 mL postmorten blood. Shake horizontally for 20 min, centrifuge at 2800 g for 15 min. Evaporate organic phase under reduced pressure at 45°, dissolve the residue in 100 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 4 μm Nova-Pak C18
Mobile phase: MeOH:tetrahydrofuran:100 mM pH 2.6 KH_2PO_4 65:5:30
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 220

CHROMATOGRAM

Retention time: 4.32
Internal standard: prazepan (8.81)
Limit of quantitation: 100 ng/mL

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL 50 mg Bond Elut 40 μm cyanopropylsilica SPE cartridge with 1 mL MeOH at 6 mL/min and with 1 mL pH 7.4 buffer at 6 mL/min. Centrifuge plasma, add 1 mL plasma at 0.18 mL/min to the SPE cartridge, wash with 1 mL pH 7.4 buffer at 1.5 mL/min, elute with 300 μL MeOH:2-aminoheptane 99.7:0.3 at 1.5 mL/min, pass 700 μL pH 3.0 buffer through the cartridge at 1.5 mL/min. Mix both eluates, inject a 250 μL aliquot. (pH 7.4 Buffer was 250 mL 100 mM KH_2PO_4 and 195.5 mL 100 mM NaOH, made up to 1 L, if necessary pH adjusted to 7.4. pH 3.0 Buffer was 4 g NaOH in 700 mL water, pH adjusted to 3.0 with 85% phosphoric acid, made up to 1 L with water.)

HPLC VARIABLES

Guard column: 4 × 4 5 μm LiChrospher 100 RP-18
Column: 250 × 4 4 μm Superspher 100 RP-18 (Merck)
Mobile phase: MeCN:buffer 30:70 containing 0.5% 2-aminoheptane (Buffer was 4 g NaOH in 700 mL water, pH adjusted to 3.0 with 85% phosphoric acid, made up to 1 L with water.)
Column temperature: 37

Flow rate: 1.2
Injection volume: 250
Detector: F ex 230 em 300

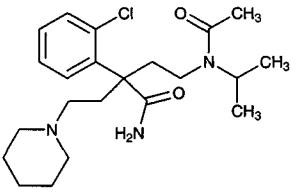
Bidisomide



Molecular formula: $C_{22}H_{34}ClN_3O_2$
Molecular weight: 407.98
CAS Registry No.: 103810-45-3
Merck Index: 1251

SAMPLE

Matrix: blood
Sample preparation: Alkalinize plasma with 1 M sodium hydroxide and extract with 1 mL chloroform (Caution! Chloroform is a carcinogen !). Centrifuge, transfer organic layer into tube and evaporate to dryness under a stream of dry nitrogen. Reconstitute samples with 200 µL mobile phase, inject a 50 µL aliquot.

HPLC VARIABLES

Column: Brownlee 5 µm CN
Mobile phase: MeCN:20 mM pH 4.0 monosodium phosphate 50:50
Flow rate: 1.0
Injection volume: 50
Detector: UV 207

CHROMATOGRAM

Internal standard: disopyramide
Limit of detection: 50 ng/mL

KEY WORDS

plasma; human; dog; pharmacokinetics

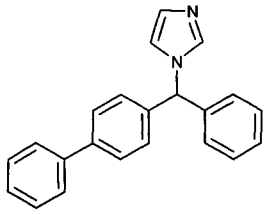
Bifonazole



Molecular formula: $C_{22}H_{18}N_2$
Molecular weight: 310.40
CAS Registry No.: 60628-96-8
Merck Index: 1260
Lednicer No.: 4 93

SAMPLE

Matrix: formulations

Sample preparation: Tablets. Powder tablets, weigh out amount equivalent to about 30 mg, add 100 mL MeOH, sonicate for 5 min, filter. Add a 2 mL aliquot of filtrate to 5 mL of 100 μg/mL ketoconazole in MeOH, make up to 25 mL with MeOH, inject 20 μL aliquot. Cream. Condition a 500 mg Bond-Elut diol cartridge with 6 mL dichloromethane. Weigh out cream equivalent to about 5 mg of drug, add 30 mL dichloromethane, sonicate for 3 min, make up to 100 mL with dichloromethane, filter. Add a 2 mL aliquot to the cartridge, wash with 2 mL dichloromethane:methanol 4:1, wash with 1 mL MeOH, elute with 3 mL mobile phase. Add eluate to 0.5 mL 100 μg/mL ketoconazole in MeOH, make up to 5 mL with MeOH, inject 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb CN
Mobile phase: THF:buffer 30:70 (Buffer was 50 mM triethylamine adjusted to pH 3.0 with phosphoric acid.)
Flow rate: 1
Injection volume: 20
Detector: UV 230

CHROMATOGRAM

Retention time: 11
Internal standard: ketoconazole (7)

OTHER SUBSTANCES

Simultaneous: clotrimazole, ketoconazole, fenticonazole, tioconazole, isoconazole, econazole, miconazole

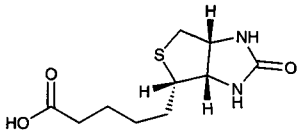
Biotin



Molecular formula: $C_{10}H_{16}N_2O_3S$
Molecular weight: 244.31
CAS Registry No.: 58-85-5
Merck Index: 1272

SAMPLE

Matrix: blood, formulations

Sample preparation: Serum. Condition a Sep-Pak C18 SPE cartridge with 10 mL MeOH, 10 mL water, and 5 mL 1% acetic acid in water. 1 mL Serum + 1 mL 10% trichloroacetic acid, mix, centrifuge at 2000 g for 5 min, add a 1.5 mL aliquot of the supernatant to the SPE cartridge, wash with 10 mL 1% acetic acid in water, wash with 1 mL water, elute with 10 mL MeOH. Evaporate the eluate to dryness, reconstitute with 100 µL MeOH, sonicate, add 100 µL 1 mg/mL 1-pyrenyldiazomethane in ethyl acetate, heat at 40° for 1 h, cool to room temperature, add 300 µL MeOH, inject a 10 µL aliquot. Tablets. Powder tablets, weigh out amount containing 500 µg biotin, add 30 mL MeOH, sonicate for 10 min, shake for 10 min, centrifuge at 3000 rpm for 5 min, remove the supernatant, repeat the extraction three times. Combine the supernatants and make up to 100 mL with MeOH. Remove a 200 µL aliquot and add it to 200 µL 5 mg/mL 1-pyrenyldiazomethane (Molecular Probes, Eugene OR) in ethyl acetate, heat at 40° for 1 h, cool to room temperature, add to a Sep-Pak silica SPE cartridge, wash with 5 mL hexane, elute with 10 mL MeOH. Evaporate the eluate to dryness, reconstitute with 1 mL MeOH, inject a 5 µL aliquot.

HPLC VARIABLES

Column: 150 × 4 5 µm LiChrosorb Si60
Mobile phase: MeCN:water 43:57 (or 57:43 (?))
Flow rate: 1
Injection volume: 5-10
Detector: F ex 340 em 395, UV 240

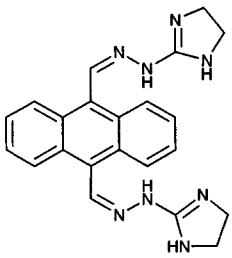
Bisantrene



Molecular formula: $C_{22}H_{22}N_8$
Molecular weight: 398.47
CAS Registry No.: 78186-34-2, 71439-68-4 (di HCl)
Merck Index: 1284
Lednicer No.: 4 62

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Incubate 500 μL Bile or urine +50 μL 1 M pH 4.0 sodium acetate + 10 U/mL glucuronidase overnight. 2 mL Plasma or a lesser volume of urine or bile diluted to 1 mL with water + an equal volume of 1 M pH 10 sodium phosphate buffer + 1 μg IS + 8 mL ethyl acetate, extract. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 300 μL MeOH with gentle warming, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 mm long 5 μm LiChrosorb RP-2 C2
Mobile phase: Gradient. MeOH:500 mM pH 5.3 sodium perchlorate from 5:95 to 100:0 over 15 min. (Purify sodium perchlorate solution by passing through a bed of silica gel and activated charcoal before use.)
Flow rate: 2
Injection volume: 100
Detector: UV 430 for bisantrene, UV 500 for IS

CHROMATOGRAM

Retention time: 7
Internal standard: 1-[2-(2-hydroxyethyl-1-amino)ethylamino]-4-hydroxy-9,10-anthracenedione
Limit of detection: 50 ng/mL (human plasma), 25 ng/mL (rabbit plasma)

KEY WORDS

plasma; rabbit; pharmacokinetics; human

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 300 × 4.6 μBondapak C18
Mobile phase: MeOH:water 50:50 containing 5 mM heptanesulfonic acid, adjust pH to 8.3 with concentrated ammonium hydroxide
Flow rate: 1.5
Detector: UV 290

CHROMATOGRAM
Retention time: 6 (bleomycin B2), 12 (bleomycin A2)
Limit of detection: 10 pmole

REFERENCE
Sakai,T.T. Paired-ion high-performance liquid chromatography of bleomycins, *J.Chromatogr.*, **1978**, *161*, 389–392.

SAMPLE
Matrix: solutions
Sample preparation: Dissolve in water, add a slight molar excess of copper sulfate, inject a 10-20 μL aliquot.

HPLC VARIABLES
Guard column: 23 × 3.9 30-38 μm Corasil C18
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: Gradient. A was 5 mM sodium pentanesulfonate in 0.5% glacial acetic acid in water, adjusted to pH 4.3 with concentrated ammonium hydroxide. B was MeOH containing 5 mM sodium pentanesulfonate and 0.5% glacial acetic acid. A:B from 72:28 to 52:48 over 45 min.
Flow rate: 1.5
Injection volume: 10-20
Detector: UV 280

CHROMATOGRAM
Retention time: 5 (bleomycinic acid), 10 (bleomycin B'1), 11.5 (bleomycin A2), 12.5 (bleomycin A5), 17.5 (bleomycin B2), 22.5 (bleomycin B4), 25.5 (bleomycin B6), 29 (bleomycin CHP), 32 (bleomycin PEPP), 35 (demethylbleomycin A2)
Limit of detection: 50 pmole

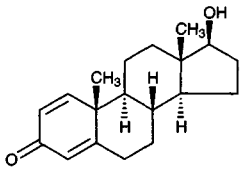
Boldenone



Molecular formula: $C_{19}H_{26}O_2$
Molecular weight: 286.41
CAS Registry No.: 846-48-0, 13103-34-9 (undecylenate)
Merck Index: 1354
Lednicer No.: 2 153

SAMPLE

Matrix: formulations
Sample preparation: Oils. 1 mL Sample + 25 mL MeOH:water 90:10, shake vigorously for 5 min, centrifuge, inject a 10 μL aliquot of the supernatant. Tablets. Grind a tablet to a fine powder, add 25 mL MeOH, sonicate for 5-10 min, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate. Suspensions (aqueous). Make up 5 mL to 50 mL with MeOH, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Zorbax ODS
Mobile phase: MeOH:water 75:25
Flow rate: 1.5
Injection volume: 10
Detector: UV 240

CHROMATOGRAM

Retention time: 4.8
Limit of detection: 5 μg/mL

OTHER SUBSTANCES

Simultaneous: methandrostenolone, nandrolone, norgestrel, testosterone, dehydroepiandrosterone (UV 210), mibolerone, methyltestosterone, methandriol (UV 210), norethindrone acetate, calusterone, mesterolone (UV 210), norethandrolone, trenbolone acetate, benzyl benzoate, nandrolone acetate, testosterone acetate, stanozolol, oxymetholone, nandrolone propionate, methenolone acetate, testosterone propionate, aspirin, caffeine, formebolone, benzyl alcohol, testolactone, cortisone
Interfering: fluoxymesterone, norethindrone, oxandrolone (UV 210), ethisterone

KEY WORDS

SAMPLE
Matrix: urine
Sample preparation: Condition a 200 mg 40 μm C18 SPE cartridge (J.T.Baker model 7020-2) with 2 mL MeOH and 1 mL 25 mM pH 5.5 ammonium acetate (A). Condition a 200 mg 40 μm C18 SPE cartridge (J.T.Baker model 7020-2) with 2 mL MeOH and 1 mL water (B). 2 mL Urine + 2 mL MeOH:650 mM pH 5.4 ammonium acetate 20:80 + 75 μL 25.3 μM 19-nortestosterone sodium sulfate in water, sonicate for 15 min, centrifuge at 1000 g for 5 min, add to SPE cartridge (A), wash with 1 mL 25 mM pH 5.5 ammonium acetate, wash with 2 mL MeOH:25 mM pH 5.5 ammonium acetate 40:60, wash with 3 mL water, elute with 2 mL MeOH:water 35:65. Add 2 mL MeOH to the eluate and evaporate it under a stream of nitrogen at 60°, dissolve the residue in 100 μL MeOH, add 5 mL ethyl acetate saturated with 2.2 M sulfuric acid (one tenth volume), heat at 50° for 50 min, cool, wash twice with 2 mL 940 mM pH 10.3 sodium carbonate (pH adjusted with sodium bicarbonate), wash with 3 mL water. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, transfer the residue with three 200 μL portions of MeOH:water 50:50 to SPE cartridge (B), wash with 1 mL water, wash with 2 mL MeOH:water 55:45, elute with 2 mL MeOH:water 80:20. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot. (Boldenone sulfate, isolated using SPE cartridge (A), is solvolysed to boldenone which is purified using SPE cartridge (B).)

HPLC VARIABLES
Column: 83 × 4.6 3 μm Pecosphere-3C C18
Mobile phase: MeCN:MeOH:25 mM pH 5.5 ammonium acetate 7:50:43
Flow rate: 1.1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 6.2
Internal standard: 19-nortestosterone sodium sulfate (7.2) (chromatographed as 19-nortestosterone)
Limit of detection: 64 ng/mL
Limit of quantitation: 212 ng/mL

KEY WORDS
horse; pharmacokinetics; SPE

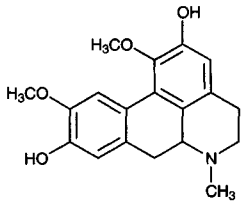
Boldine



Molecular formula: $C_{19}H_{21}NO_4$
Molecular weight: 327.38
CAS Registry No.: 476-70-0
Merck Index: 1355

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 218.1

CHROMATOGRAM

Retention time: 8.068

KEY WORDS

whole blood

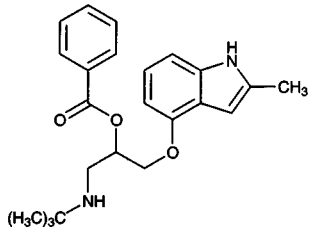
Bopindolol

Molecular formula: $C_{23}H_{28}N_2O_3$
Molecular weight: 380.49
CAS Registry No.: 62658-63-3
Merck Index: 1362



SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 50 µL 80 ng/mL mepindolol in 100 mM acetic acid + 100 µL 1 M NaOH, vortex for 10 s, centrifuge at 1400 g for 4 min, add the supernatant to a 1 mL Extrelut R SPE cartridge, wait for 15 min, elute with 6 mL heptane:isoamyl alcohol 95:5. Add 200 µL 100 mM acetic acid to the eluate, shake for 15 min, centrifuge at 1400 g for 5 min, remove the aqueous phase and keep it at 4°, inject a 100 µL aliquot of the aqueous phase.

HPLC VARIABLES

Column: 83 × 4.6 3 µm Nucleosil ODS
Mobile phase: MeOH:30 mM pH 2.2 KH_2PO_4 30:70
Column temperature: 40
Flow rate: 1
Injection volume: 100
Detector: E, ESA Model 5100 A, 5020 guard cell at +1 V (between pump and injector), 5011 dual analytical cell +160 and +450 mV, +450 mV cell monitored

CHROMATOGRAM

Retention time: 4.7 (for bopindolol hydrolysis product, 4-(2-hydroxy-3-tert-butylaminopropyl)-2-methylindole)
Internal standard: mepindolol (3.3) (structure shown is 3-methylpindolol, not 2-methylpindolol=mepindolol)
Limit of detection: 0.05 ng/mL

OTHER SUBSTANCES

Noninterfering: digoxin, phenprocoumon, chlorthalidone

KEY WORDS

plasma; SPE; pharmacokinetics

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 70 µL 1 M NaOH + 25 µL 83.2 ng/mL IS in 100 mM acetic acid, vortex for 5 s, add 5 mL heptane:isoamyl alcohol 95:5, shake for 15 min on a horizontal shaker, centrifuge at 1400 g for 10 min. Remove 4.2 mL of the organic phase and add it to 150 µL 100 mM acetic acid, shake for 15 min on a horizontal shaker, centrifuge at 1400 g for 10 min, inject a 50 µL aliquot of the aqueous phase.

HPLC VARIABLES

Guard column: 15 × 3.2 7 µm Pierce RP-18
Column: 150 × 4.6 5 µm Ultrasphere ODS C18

Mobile phase: MeOH:30 mM potassium phosphate, adjusted to pH 2.2 with phosphoric acid
Flow rate: 1
Injection volume: 50
Detector: E, ESA Coulochem Model 5100A, model 5010 analytical cells, detector 1 +150 mV, detector 2 +550 mV, monitor cell 2

CHROMATOGRAM
Retention time: 14 (as hydrolysis product)
Internal standard: 2-hydroxy-N-isopropyl-3-(3-methyl-1H-indol-4-yloxy)-1-propylamine (17-895, 3-methylpindolol) (9)
Limit of detection: 250 ng/mL

OTHER SUBSTANCES
Noninterfering: allopurinol, amphogel, aspirin, azathioprine, calcitonin, calcitriol, captopril, cimetidine, cloxacillin, cyclosporine, digoxin, diltiazem, ergoloid, furosemide, glyburide, loperamide, nifedipine, nitroglycerin, prazosin, prednisone, propranolol, sulfinpyrazone, tolbutamide

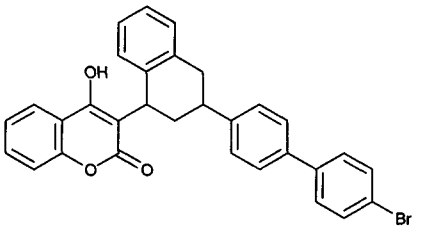
Brodifacoum



Molecular formula: $C_{31}H_{23}BrO_3$
Molecular weight: 523.43
CAS Registry No.: 56073-10-0
Merck Index: 1400

SAMPLE

Matrix: blood, tissue

Sample preparation: Condition a silica Sep-Pak SPE cartridge also containing 2 g sodium sulfate (?) with 5 mL MeOH and 5 mL cyclohexane. Mix 3 mL blood or crushed tissue with 1 mL 20 μg/mL IS, adjust to pH 3-4 with 0.5 M sulfuric acid, extract three times with 10 mL MeOH:chloroform 10:90 (Caution! Chloroform is a carcinogen!). Evaporate at 40°, re-dissolve the residue in 5 mL cyclohexane, sonicate and centrifuge three times. Remove a 5 mL aliquot of the top layer, evaporate at 40°. Reconstitute the residue in 5 mL cyclohexane. Add to the SPE cartridge, elute with 5 mL MeOH, evaporate at 40°, reconstitute the residue in MeOH, inject an aliquot.

HPLC VARIABLES

Column: 200 mm long μBondapak C18
Mobile phase: MeOH:0.8% acetic acid 80:20
Flow rate: 1
Injection volume: 10
Detector: UV 280

CHROMATOGRAM

Retention time: 17.8
Internal standard: N,N-diphenylbenzidine (9.3)
Limit of detection: 25 ng/mL

OTHER SUBSTANCES

Extracted: bromadiolone, coumarin, coumatetralyl, warfarin

KEY WORDS

SPE; plasma; heart; lung; liver; kidney; spleen

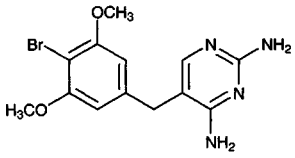
Brodimoprim



Molecular formula: $C_{13}H_{15}BrN_4O_2$
Molecular weight: 339.19
CAS Registry No.: 56518-41-3
Merck Index: 1401

SAMPLE

Matrix: blood, urine
Sample preparation: Dilute urine 1:10 with water. 200 μL Plasma, blood, or diluted urine + 50 μL 5 μg/mL IS in MeOH + 500 μL 400 mM borate buffer + chloroform, vortex for a few s, centrifuge at 1700 g at 4° for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 200 μL mobile phase, let stand for at least 1 h at room temperature, inject a 20-50 μL aliquot. (Deconjugate 200 μL plasma or diluted urine with 100 μL 68 U/mL β-glucuronidase in 500 mM pH 5.0 sodium acetate buffer, heat at 37° for 4 h, add 100 μL 400 mM pH 10 borate buffer, add 50 μL 5 μg/mL IS in MeOH, extract as before.) (Use chloroform stabilized with EtOH.)

HPLC VARIABLES

Guard column: 10 × 3 30 μm Chrompack guard column
Column: 33 × 4.6 3 μm Pecosphere-3 × 3 CR C18
Mobile phase: MeCN:25 mM phosphate buffer 23:77 + 0.1% triethylamine, adjusted to pH 7.5 with 10 M KOH
Flow rate: 1
Injection volume: 20-50
Detector: F ex 290 em 340

CHROMATOGRAM

Retention time: 1.1
Internal standard: 2,4-diamino-5-(4'-(2-propenyl)-3',5'-dimethoxybenzyl)pyrimidine (Ro-11-3296) (4.2)
Limit of detection: 5 ng/mL

OTHER SUBSTANCES

Extracted: metabolites
Simultaneous: flecainide
Noninterfering: trimethoprim, β-blockers

KEY WORDS

plasma; use UV detection with clonazepam IS and LOD 100 ng/mL

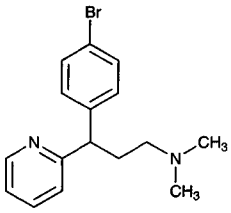
Brompheniramine



Molecular formula: $C_{16}H_{19}BrN_2$
Molecular weight: 319.3
CAS Registry No.: 86-22-6, 132-21-8 (d-form), 980-71-2 (maleate), 2391-03-9 (d-form maleate)
Merck Index: 1467
Lednicer No.: 1 77

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 50 μL 0.5 ng/mL (sic) antazoline hydrochloride in water + 5 mL freshly distilled ether, vortex for 1-2 s, add 200 μL 10% KOH, vortex for 15 s, centrifuge for 3-3 min, freeze in MeOH/dry ice. Remove the organic layer and add it to 100 μL 0.5% phosphoric acid, vortex for 15 s, freeze in MeOH/dry ice. Discard the organic layer, remove the last traces of ether with nitrogen for 2-3 min, inject a 100 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 5 mm CN Microbond pak radial compression (Waters)
Mobile phase: MeCN:buffer 28:72 (Buffer was 75 mM phosphate and 20 mM dibutylamine, adjusted to pH 3.2.)
Flow rate: 1
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Retention time: 5.5
Internal standard: antazoline hydrochloride (6.3)
Limit of detection: 2 ng/mL

KEY WORDS

serum; pharmacokinetics

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50

Detector: UV 226

CHROMATOGRAM

Retention time: 7.78
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, tissue

Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for

5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM

Retention time: 10.76
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES

Simultaneous: amitriptyline, amoxapine, benztropine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, tranylcypromine, trazodone, trihexyphenidyl, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine
Interfering: doxepin, methadone

KEY WORDS

serum; whole blood; liver

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30

Detector: UV 200.5

CHROMATOGRAM
Retention time: 13.935

SAMPLE
Matrix: cell incubations
Sample preparation: 40 mL Cell incubation + 50 mL MeOH, shake vigorously for 1 min, centrifuge at 2000 rpm for 10 min, wash the pellet twice with 50 mL portions of MeOH. Combine the supernatants and add 100 mL water, extract three times with 150 mL portions of dichloromethane. Filter the extracts through anhydrous sodium sulfate, evaporate the filtrate to dryness under reduced pressure at 40°, reconstitute with mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm cyano-propyl (Beckman)
Mobile phase: MeCN:buffer 40:60 (Buffer was 10 mM KH_2PO_4 containing 20 mM triethyamine, pH 7.0.)
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 9.5

OTHER SUBSTANCES
Extracted: metabolites
Interfering: chlorpheniramine, pheniramine

SAMPLE

Matrix: solutions

Sample preparation: Dissolve in MeOH:water 1:1 at a concentration of 50 μg/mL, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18

Mobile phase: MeOH:acetic acid:triethylamine:water 50:1.5:0.5:48

Flow rate: 1.5

Injection volume: 10

Detector: UV 254

CHROMATOGRAM

Retention time: 9

OTHER SUBSTANCES

Simultaneous: thonzylamine, pheniramine, tripelennamine, chlorpheniramine, phenindamine, phenyltoxamine, clemizole

REFERENCE

Roos,R.W.; Lau-Cam,C.A. General reversed-phase high-performance liquid chromatographic method for the separation of drugs using triethylamine as a competing base, *J.Chromatogr.*, **1986**, *370*, 403–418.

SAMPLE

Matrix: solutions

Sample preparation: Inject 5 mg ±brompheniramine maleate onto analytical system. After separation on the analytical column use valve switching to collect the enantiomers on two 100 × 10 recovery columns of 12-20 μm Hamilton PRP-1 styrene-divinylbenzene columns. When sufficient material has been collected (60 mg), flush the recovery columns with 180 mL MeOH:water 5:95, and elute the enantiomers with MeOH (analytical column out of circuit). Each enantiomer can be purified by a second pass through the system.

HPLC VARIABLES

Column: 250 × 10 5 μm Spherisorb S5CN cyanopropyl

Mobile phase: MeOH:buffer 5:95 containing 12 mg/mL β-cyclodextrin hydrate (Buffer was 0.85% triethylamine adjusted to pH 4 with acetic acid.)

Flow rate: 3.5

Injection volume: 100

Detector: UV 285

CHROMATOGRAM

Retention time: 5.5 (+), 6.5 (-)

KEY WORDS
semi-preparative; chiral

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 1 mg/mL solution in MeOH, inject a 5 µL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 µm Lichrosphere cyanopropyl
Mobile phase: Carbon dioxide:MeOH:isopropylamine 90:10:0.05
Column temperature: 50
Flow rate: 3
Injection volume: 5
Detector: UV 220

CHROMATOGRAM

Retention time: 1.65

OTHER SUBSTANCES
Simultaneous: benactyzine, hydroxyzine, perphenazine, thioridazine, amitriptyline, desipramine, imipramine, nortriptyline, protriptyline

KEY WORDS
SFC; pressure 200 bar

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM
Retention time: 1.4

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pi-

zotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

Merck Index: 1489

SAMPLE

Matrix: solutions

Sample preparation: Mix 100 µL of a 10 µM solution in MeCN:water:triethylamine 50:50:0.1 with 100 µL 1 mM (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in MeCN, heat in the dark at 65° for 1.5 h, inject an aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 60F_{254} TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmeth-

yl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as yellow crystals (mp 160-170° d) (Analyst 1995, 120, 385).)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Inertsil ODS-80A
Mobile phase: MeCN:water:trifluoroacetic acid 37:63:0.1
Column temperature: 40
Flow rate: 1
Detector: F ex 460 em 550

SAMPLE
Matrix: bulk
Sample preparation: Inject a 5 μL aliquot of a solution in EtOH.

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: EtOH:water 48:52 or 43:57
Flow rate: 1
Injection volume: 5

Detector: UV 254

CHROMATOGRAM
Retention time: 10, 11 (48:52), 18, 25 (43:57) (two epimers)

OTHER SUBSTANCES
Simultaneous: impurities, 16α-hydroxyprednisolone

REFERENCE
Roth,G.; Wikby,A.; Nilsson,L.; Thalén,A. High-performance liquid chromatographic determination of epimers, impurities, and content of the glucocorticoid budesonide and preparation of primary standard, *J.Pharm.Sci.*, **1980**, *69*, 766–770.

SAMPLE
Matrix: solutions
Sample preparation: Mix 250 µL of a solution of budesonide in MeOH with 625 µL 9% trifluoromethanesulfonic acid in MeOH, immediately add 625 µL 160 µm dansyl hydrazine in MeOH, after 12 h inject a 100 µL aliquot onto column A and elute to waste with mobile phase A, after 100 s backflush the contents of column A onto column B with mobile phase B, elute with mobile phase B, monitor the effluent from column B. (Caution! Trifluoromethanesulfonic acid is highly toxic! Decontaminate surplus solutions with an equal volume of 2 M aqueous ammonia for 1 h!)

HPLC VARIABLES
Column: A 10 × 4.6 5 µm Vydac C18; B 150 × 4.6 5 µm Nucleosil C18
Mobile phase: A MeCN:7.7 mM pH 7 phosphate buffer 6:94; B MeCN:7.7 mM pH 7 phosphate buffer 65:35
Flow rate: 1
Injection volume: 100
Detector: F ex 350 em 520

CHROMATOGRAM
Retention time: 8, 10 (syn and anti isomers of 3-keto derivative)
Limit of detection: 1.5 pmole

KEY WORDS
derivatization; column-switching

REFERENCE

SAMPLE
Matrix: tissue
Sample preparation: Homogenize tissue in ice cold saline for 30 s. 100 µL Homogenate + 4 mL EtOH:10 mM acetic acid 70:30, shake for 30 min, centrifuge at 1000 g for 15 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 250 µL EtOH:water 30:70, add 5 mL 10 mM acetic acid, add to a conditioned Sep-Pak C18 SPE cartridge, wash with 5 mL 10 mM acetic acid, elute with 5 mL EtOH:water 70:30. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute in 250 µL EtOH:water 30:70, inject a 200 µL aliquot.

HPLC VARIABLES
Column: 250 × 5 5 µm Nucleosil C18
Mobile phase: EtOH:water 50:50 for 12 min then EtOH for 10 min
Flow rate: 1

Injection volume: 200
Detector: UV 254

CHROMATOGRAM
Retention time: 11-13

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS

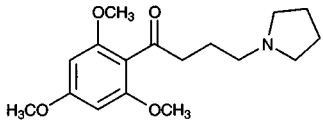
Buflomedil



Molecular formula: $C_{17}H_{25}NO_4$
Molecular weight: 307.39
CAS Registry No.: 55837-25-7, 35543-24-9 (HCl)
Merck Index: 1498

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 201.7

CHROMATOGRAM

Retention time: 11.3

KEY WORDS

whole blood

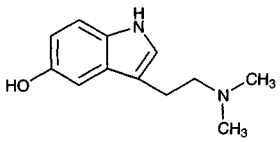
Bufotenine



Molecular formula: $C_{12}H_{16}N_2O$
Molecular weight: 204.27
CAS Registry No.: 487-93-4
Merck Index: 1502

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 3.5

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine,

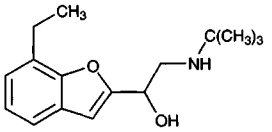
Bufuralol



Molecular formula: $C_{16}H_{23}NO_2$, $C_{16}H_{23}NO_2$.HCl (hydrochloride)
Molecular weight: 261.36
CAS Registry No.: 54340-62-4, 59652-29-8 (HCl), 57704-10-6 ((-), HCl), 57704-11-7 ((+), HCl)
Merck Index: 1504

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL plasma with 500 µL immobilized antibody (details of preparation in paper), wash with 5 mL 1 M NaCl, wash with 10 mL water, elute with 5 mL MeOH:10 mM pH 5.0 ammonium acetate buffer 95:5, inject an aliquot of the eluate.

HPLC VARIABLES

Column: 150 × 4.6 5 µm Ultron ES-OVM (Shinwa, Osaka, Japan)
Mobile phase: MeCN:0.3% pH 6.7 ammonium acetate buffer from 1:14 to 1:2 over 40 (?) min
Flow rate: 1
Detector: UV 248

CHROMATOGRAM

Retention time: 32

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma; chiral separation of the metabolites but not necessarily of bufuralol

REFERENCE

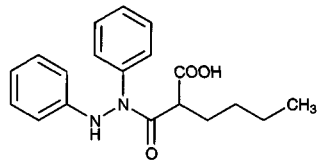
Bumadizon



Molecular formula: $C_{19}H_{22}N_2O_3$
Molecular weight: 326.40
CAS Registry No.: 3583-64-0, 69365-73-7 (calcium salt hemihydrate)
Merck Index: 1507

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 235

CHROMATOGRAM

Retention time: 6.72
Limit of detection: <120 ng/mL

KEY WORDS

SAMPLE
Matrix: urine
Sample preparation: Inject 5 μL urine onto column A and elute to waste with mobile phase A, after 1 min backflush the contents of column A onto column B with mobile phase B. Monitor the effluent from column B.

HPLC VARIABLES
Column: A 20 × 2.1 30 μm Hypersil ODS-C18; B 125 × 4 5 μm LiChrospher 100 RP 18
Mobile phase: A 50 mM pH 3 phosphate buffer; B MeCN:50 mM pH 3 phosphate buffer 60:40 (Prepare buffer as follows. Dissolve 3.45 g NaH_2PO_4 monohydrate in 500 mL water containing 750 μL propylamine hydrochloride, adjust to pH 3 with concentrated phosphoric acid.)
Flow rate: 1
Injection volume: 5
Detector: UV 254, F ex 228 em 418

CHROMATOGRAM
Retention time: 8.9
Limit of detection: 100 pg/mL

OTHER SUBSTANCES
Extracted: amiloride, furosemide, triamterene

KEY WORDS
column-switching; pharmacokinetics

SAMPLE
Matrix: urine
Sample preparation: 2 mL Urine + 2 mL 1 M pH 4.1 NaH_2PO_4 + 4 mL ethyl acetate, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic phase and add it to 5 mL 100 mM pH 7.5 Na_2HPO_4, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL MeCN:10 mM pH 3.0 phosphate buffer, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm LiCHrosorb RP-18
Mobile phase: Gradient. MeCN:10 mM pH 3.0 phosphate buffer 10:90 for 1.5 min then to 35:65 over 2 min
Column temperature: 50
Flow rate: 1.5
Injection volume: 5
Detector: UV 271

CHROMATOGRAM
Retention time: 9.3
Limit of quantitation: 1500 ng/mL

OTHER SUBSTANCES
Extracted: chlorothiazide, hydrochlorothiazide, quinethazone, chlorthalidone, clopamide, methyclothiazide, furosemide, metolazone, mefruside, cyclopenthiazide, bendroflumethiazide
Simultaneous: indapamide, clorexolone, ethacrynic acid
Noninterfering: aspirin, albuterol, allopurinol, alprenolol, atenolol, captopril, carbimazole, clonidine, coloxyl, danthron, diazepam, digoxin, doxepin, glibenclamide, hydralazine, indomethacin, labetalol, metformin, methyldopa, metoprolol, mianserin, minoxidil, nifedipine, nitrazepam, oxazepam, oxprenolol, pindolol, prazosin, propranolol, senokot, theophylline, trifluoperazine

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)

Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 5

Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 15.25 (A), 15.8 (B)

Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))

Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, methyclothiazide, benzthiazide, cyclothiazide, polythiazide, bendroflumethiazide, probenecid, spironolactone, canrenone, flumethiazide

Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

Interfering: ethacrynic acid

SAMPLE
Matrix: urine
Sample preparation: Buffer urine to 4.9 by mixing with an equal volume of pH 4.9 200 mM sodium phosphate buffer. Inject a 40 μL aliquot onto column A with mobile phase A, after 3 min backflush the contents of column A onto column B with mobile phase B and start the gradient. At the end of the run re-equilibrate for 10 min.

HPLC VARIABLES
Column: A 20 × 4 5 μm Hypersil octadecylsilica ODS; B 200 × 4.6 5 μm Shiseido SG-120 polymer-based C18
Mobile phase: A water; B Gradient. MeCN:buffer from 7:93 to 15:85 over 3.5 min, to 50:50 over 8.5 min, maintain at 50:50 for 11 min (Buffer was 6.9 g $NaH_2PO_4.H_2O$ in 1 L water, pH adjusted to 3.1 with phosphoric acid.)
Flow rate: 1
Injection volume: 40
Detector: UV 230

CHROMATOGRAM
Retention time: 19.5

Limit of detection: 500 ng/mL

OTHER SUBSTANCES

Extracted: acetazolamide, amiloride, bendroflumethiazide, benzthiazide, caffeine, carbamazepine, chlorothiazide, chlorthalidone, clopamide, dichlorfenamide, ethacrynic acid, furosemide, hydrochlorothiazide, metyrapone, probenecid, spironolactone, triamterene, trichlormethiazide

KEY WORDS

column-switching; optimum detection wavelengths vary for each drug

SAMPLE

Matrix: urine

Sample preparation: 5 mL Urine + 50 μL 100 μg/mL 7-propyltheophylline in MeOH + 200 μL ammonium chloride buffer + 2 g NaCl, extract with 6 mL ethyl acetate by rocking at 40 movements/min for 20 min and centrifuging at 800 g for 5 min, repeat extraction, combine organic layers, evaporate to dryness at 40° under a stream of nitrogen. Reconstitute in 200 μL MeCN:water 15:85, inject a 20 μL aliquot. (Ammonium chloride buffer was 28 g ammonium chloride in 100 mL water with the pH adjusted to 9.5 with concentrated ammonia solution.)

HPLC VARIABLES

Column: 75 × 4.6 3 μm Ultrasphere ODS

Mobile phase: Gradient. MeCN:100 mM ammonium acetate adjusted to pH 3 with concentrated phosphoric acid from 10:90 to 15:85 over 2 min to 55:45 over 3 min to 60:40 over 3 min, maintain at 60:40 for 1 min, decrease to 10:90 over 1 min, equilibrate at 10:90 for 2 min.

Flow rate: 1

Injection volume: 20

Detector: UV 270

CHROMATOGRAM

Retention time: 7.2

Internal standard: 7-propyltheophylline (4.5)

Limit of detection: 20 ng/mL

OTHER SUBSTANCES

Extracted: acetazolamide, amiloride, bendroflumethiazide, benzthiazide, buthiazide, caffeine, canrenone, chlorthalidone, clopamide, cyclothiazide, diclofenamide, ethacrynic acid, furosemide, hydrochlorothiazide, mesocarb, morazone, piretanide, polythiazide, probenecid, spironolactone, torsemide, triamterene

Interfering: xipamide

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL BondElut C18 SPE cartridge once with 1 M HCl, twice with MeOH, and once with water, remove the liquid completely with suction each time. Add 250 μL IS solution and 250 μL serum to the column at 1 mL/min, wash twice with water and once with MeCN draining the column completely after each wash, elute with 250 μL eluting solution, centrifuge for 20 s to remove last of eluate, inject a 5 μL aliquot of the eluate. (Prepare IS solution by adding 40 μL 1 mg/mL N-pentyl-2,6-pipecoloxylidide (1-pentyl-N-(2,6-dimethylphenyl)-2-piperidinecarboxamide, pentyl-PPX) in MeOH to 10 mL 100 mM NaH_2PO_4. Eluting solution was 2.5 mL 35% perchloric acid in 100 mL MeOH.)

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP-8 (Applied Biosystems)
Column: 150 × 4.6 5 μm Ultrasphere octyl
Mobile phase: MeCN:10 mM KH_2PO_4 25:80, pH 5.2
Flow rate: 1.5
Injection volume: 5
Detector: UV 205

CHROMATOGRAM

Retention time: 7.2
Internal standard: N-pentyl-2,6-pipecoloxylidide (1-pentyl-N-(2,6-dimethylphenyl)-2-piperidinecarboxamide, pentyl-PPX) (14.5)
Limit of detection: 25 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, mepivacaine, meperidine, fentanyl
Noninterfering: acetaminophen, codeine, epinephrine, morphine, diazepam

KEY WORDS
serum; SPE

REFERENCE
Gupta,R.N.; Dauphin,A. Column liquid chromatographic determination of bupivacaine in human serum using solid-phase extraction, *J.Chromatogr.B*, **1994**, *658*, 113–119.

SAMPLE
Matrix: blood
Sample preparation: 200 μL Plasma + 100 μL 2 M NaOH, vortex briefly, add 5 mL anhydrous ethyl ether, vortex for 30 s, rotate for 10 min, centrifuge at 1000 g for 5 min. Remove 4.5 mL ether and add to 250 μL 12.5 mM sulfuric acid, vortex for 30 s, rotate for 10 min, centrifuge for 5 min, inject a 50 μL aliquot of the lower aqueous phase.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Octyl 1B (Keystone)
Mobile phase: MeCN:50 mM Na_2HPO_4 27:73 pH adjusted to 5.8 with 50% phosphoric acid
Flow rate: 1
Injection volume: 50
Detector: UV 210

CHROMATOGRAM
Retention time: 9.18
Internal standard: bupivacaine

OTHER SUBSTANCES
Extracted: lidocaine, prilocaine, o-toluidine

KEY WORDS
plasma; pig; bupivacaine is IS

SAMPLE
Matrix: blood
Sample preparation: 450 μL Plasma + 50 μL pentycaine in 10 mM pH 7 ACES buffer, vortex, filter (0.22 μm nylon syringe filter), inject a 10 μL aliquot onto column A with mobile phase A, after 3 min elute contents of column A onto column B with mobile phase B, monitor the effluent from column B. After 3 min remove column A from the circuit and re-equilibrate with mobile phase A. (ACES is N-(2-acetamido)-2-aminoethanesulfonic acid.)

HPLC VARIABLES
Column: A 10 × 4.6 5 μm Regis semi-permeable surface (SPS) guard cartridge; B 100 × 3.2 7 μm Hypercarb pH (Shandon)
Mobile phase: A Isopropanol:buffer 3:97 (Buffer was 10 mM ACES adjusted to pH 7.0 with 5 M ammonia solution. ACES is N-(2-acetamido)-2-aminoethanesulfonic acid.); B 10 mM Acetic acid and 4 mM triethylamine in MeOH
Flow rate: A 0.8; B 0.5
Injection volume: 10

Detector: UV 254

CHROMATOGRAM
Retention time: 5
Internal standard: pentycaine (6)
Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Extracted: ropivacaine

KEY WORDS
plasma; column switching

REFERENCE
Yu,Z.; Abdel-Rehim,M.; Westerlund,D. Determination of amide-type local anaesthetics by direct injection of plasma in a column-switching high-performance liquid chromatographic system using a pre-column with a semipermeable surface, *J.Chromatogr.B*, **1994**, *654*, 221–230.

SAMPLE
Matrix: blood
Sample preparation: Adjust pH of plasma to 7.4 with carbon dioxide gas. Filter (Amicon MPS-1 with YMT 30 membrane) while centrifuging at 37° at 500 g for 15 min, inject a 150 μL aliquot of the ultrafiltrate on to column A and elute to waste with mobile phase A, collect the eluate containing the compound in a 1 mL loop and inject it onto column B with mobile phase B, elute column B with mobile phase B and monitor the effluent.

HPLC VARIABLES
Column: A 125 × 4 4 μm Superspher RP-select B (Merck); B 150 × 4.6 5 μm Nucleosil 5 SA
Mobile phase: A MeCN:buffer 30:70 (Buffer was 3.1 mL 1 M phosphoric acid and 20 mL 1 M NaH_2PO_4 made up to 1 L with water, pH 3.); B MeCN:buffer 40:60 (Buffer was 149 mL 2 M ammonium hydroxide and 348 mL 1 M phosphoric acid made up to 1 L with water, pH 2.6.)
Column temperature: 27
Flow rate: 1
Injection volume: 150
Detector: UV 210

CHROMATOGRAM
Retention time: 12
Limit of detection: 10 nM

OTHER SUBSTANCES
Extracted: ropivacaine (elutes in a different fraction from column A)

KEY WORDS
plasma; ultrafiltrate; column-switching; rugged

REFERENCE
Arvidsson,T.; Eklund,E. Determination of free concentration of ropivacaine and bupivacaine in blood plasma by ultrafiltration and coupled-column liquid chromatography, *J.Chromatogr.B*, **1995**, *668*, 91–98.

SAMPLE
Matrix: blood
Sample preparation: Condition a 3 mL Clean Screen SPE cartridge (Worldwide Monitoring) with two 2 mL portions of MeOH, with 3 mL water, and with 3 mL 10 mM pH 3.0

phosphate buffer. 1 mL Serum + 500 μL 10 mM pH 3.0 phosphate buffer, mix, add to the SPE cartridge, air dry for 30 s, wash with 3 mL phosphate buffer, wash with 3 mL 100 mM HCl, wash with 3 mL MeOH, elute with 2 mL chloroform:isopropanol:ammonium hydroxide 22:20.5:2.5. Evaporate the eluate to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.5 SemiPermeable Surface (SPS) C8 (Regis)
Mobile phase: THF:2.5 mM potassium phosphate buffer 3.25:96.75 containing 0.0025% triethylamine, final pH adjusted to 2.7-2.8 with 85% orthophosphoric acid
Flow rate: 0.5
Detector: UV 235

CHROMATOGRAM

Retention time: 24
Internal standard: bupivacaine
Limit of detection: 5 ng/mL

OTHER SUBSTANCES

Extracted: acepromazine, atropine, benzoylecgonine, benzoylnorecgonine, cocaine, ketamine, norcocaine
Noninterfering: benzethonium chloride, benzyl alcohol

KEY WORDS

SPE; serum; bupivacaine is IS

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 10 μg/mL lidocaine in 25 mM sulfuric acid + 1 mL 1 M NaOH + 5 mL diethyl ether, shake or rotate for 15 min, centrifuge at 1000 rpm for 5 min, freeze at -20°. Remove the organic layer and add it to 250 μL 25 mM sulfuric acid, shake for 15 min, centrifuge at 1000 rpm for 5 min, freeze, discard the organic layer. Thaw the aqueous layer, pass air over the aqueous phase at room temperature to remove traces of ether, adjust pH to 5.0-6.5 by adding 10 μL 1 M NaOH, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 4 μm LiChroCART Superspher 60 RP Select B (Merck)
Column: 125 × 4 4 μm LiChroCART Superspher 60 RP Select B (Merck)
Mobile phase: MeCN:buffer 30:70 (Buffer was 7.0 g/L K_2HPO_4 in water adjusted to pH 5.8 with 1 M NaOH.)
Column temperature: 40
Flow rate: 1
Injection volume: 50
Detector: UV 202

CHROMATOGRAM

Retention time: 10
Internal standard: lidocaine (5)
Limit of quantitation: 100 ng/mL

KEY WORDS

plasma

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform: isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 264

CHROMATOGRAM

Retention time: 5.43

Limit of detection: <120 ng/mL

SAMPLE

Matrix: solutions

Sample preparation: Mix 100 μL of a 10 μM solution in MeCN:water:triethylamine 50:50:0.1 with 100 μL 1 mM (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in MeCN, heat in the dark at 65° for 1.5 h, inject an aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the mini-

mum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as yellow crystals (mp 160-170° d) (Analyst 1995, 120, 385).)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Inertsil ODS-80A

SAMPLE

Matrix: blood, hair, urine

Sample preparation: Blood, urine. Mix 2 mL whole blood, plasma, or urine with 10 ng IS, 1.5 mL saturated pH 8.4 ammonium hydrogen phosphate buffer, and 5 mL chloroform: isopropanol:n-heptane 25:10:65. (Caution! Chloroform is a carcinogen!) Agitate, centrifuge at 3500 g for 10 min, evaporate the organic layer at 45° for 30 min (Speed Vac Concentrator). Reconstitute the dry extract in 20 μL mobile phase, centrifuge at 10000 g for 5 min, inject a 2 μL aliquot of the supernatant. Hair. Decontaminate hair with two portions of dichloromethane for 2 min, pulverize for 5 to 10 min (Retsch MM2 ball mill). Mix 40 mg powdered hair with 1 ng IS and incubate in 1 mL 100 mM HCl overnight at 56°. Neutralize 1 mL hair homogenate using 1 mL 100 mM NaOH, add 1.5 mL saturated pH 8.4 ammonium hydrogen phosphate, extract with 5 mL chloroform:isopropanol:n-heptane 25:10:65. Agitate mixture, centrifuge at 3500 g for 10 min, evaporate the organic layer at 45° for 30 min (Speed Vac Concentrator). Reconstitute the dry extract in 20 μL mobile phase, centrifuge at 10000 g for 5 min, inject a 2 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 15 × 1.0 5 μm Opti-Guard C18 (Interchim)
Column: 150 × 2.0 4 μm NovaPak C18 (Waters)
Mobile phase: MeCN:2 mM pH 3.0 ammonium acetate buffer 80:20
Flow rate: 0.2
Injection volume: 2
Detector: MS, Perkin Elmer Sciex API-100, ionspray interface, a post column split 1:3 reduces the flow rate to 50 μL/min for infusion into HPLC/MS interface, nebulizing gas nitrogen (99.95%, 40 psi, FR 1.16 L/min) and curtain gas (FR 1.08 L/min). Ion sampling at +50 V, electron multiplier +2400 V, mass range m/z 260-475, MIM at m/z 414 (norbuprenorphine), 468 (buprenorphine), and 472 (buprenorphine-d4)

CHROMATOGRAM

Retention time: 5.84
Internal standard: buprenorphine-d4 (Radian) (5.79)
Limit of detection: 100 pg/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma; whole blood

SAMPLE

Matrix: blood, urine

Sample preparation: Condition a 1 mL 40 μm Supelclean SPE cartridge with 4 mL MeOH and 4 mL water. Add 5 mL serum, plasma, or urine to the SPE cartridge, add 400 μL 50 mM borate buffer adjusted to pH 9.1 with 1 M NaOH, wash with 600 μL MeCN:50 mM NaH_2PO_4 20:80, elute slowly with 3 mL chloroform. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 500 μL 50 mM NaH_2PO_4 in MeCN:water 50:50 (pH adjusted to 2.5 with phosphoric acid) by shaking at 70° for 20 min, dilute with 3 mL water, add 500 μL 50 mM borate buffer adjusted to pH 9.1 with 1 M NaOH, inject a 2 mL sample onto column A with mobile phase A, after 2 min backflush the contents of column A onto column B with mobile phase B, elute column B with mobile phase B for 8 min and monitor the effluent. At the end of the process backflush column B with mobile phase B for 8 min.

HPLC VARIABLES

Column: A 4 × 4 5 μm RP-18 (E. Merck); B 30 × 4 5 μm C18 (Macherey & Nagel)
Mobile phase: A MeCN:50 mM phosphate buffer adjusted to pH 8.5 with 1 M NaOH 20:80 (Use a 250 × 4 column of 40 μm silica between pump and injector to protect column A.); B MeCN:50 mM NaH_2PO_4 25:75
Flow rate: A 2; B 0.8
Injection volume: 2000
Detector: E, ESA Coulochem 5100 A detector, Model 5020 guard cell 500 mV, Model 5010 analytical cell, detector 1 160 mV, detector 2 480 mV, monitor detector 2

CHROMATOGRAM

Retention time: 5
Limit of detection: 0.04 ng/mL

Column-switching solid-phase trace-enrichment high-performance liquid chromatographic method for measurement of buprenorphine and norbuprenorphine in human plasma and urine by electrochemical detection, *J.Chromatogr.*, **1993**, *614*, 275–283.

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 212.2

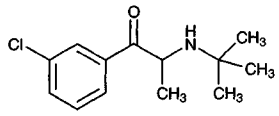
Bupropion



Molecular formula: $C_{13}H_{18}ClNO$
Molecular weight: 239.76
CAS Registry No.: 34911-55-2, 31677-93-7 (HCl)
Merck Index: 1523
Lednicer No.: 2 124

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 150 ng IS + 1 mL 600 mM pH 9.5 carbonate buffer + 10 mL n-heptane:isoamyl alcohol 98.5:1.5, shake for 15 min, centrifuge at 1500 g for 10 min. Remove the organic layer and add it to 250 μL 100 mM HCl, mix for 10 min, centrifuge at 1500 g for 10 min, inject an aliquot of the aqueous phase.

HPLC VARIABLES

Column: 250 × 4.6 5 μm LC-1 (Supelco)
Mobile phase: MeCN:buffer 20:80 (Buffer was 50 mM KH_2PO_4 containing 7 mM sodium heptanesulfonate and 10 mM triethylamine, adjust pH to 3.0 with phosphoric acid.)
Column temperature: 30
Flow rate: 2.3
Detector: UV 254 (UV 214 for metabolites)

CHROMATOGRAM

Retention time: 11.5
Internal standard: 2-(tert-butylamino)-4'-fluorovalerophenone hydrochloride (15.5)
Limit of detection: 5 ng/mL

OTHER SUBSTANCES

Extracted: metabolites
Noninterfering: amitriptyline, amoxapine, chlorimipramine, chlorpromazine, desipramine, desmethyldoxepin, doxepin, fluphenazine, haloperidol, imipramine, loxapine, maprotiline, mianserin, nortriptyline, perphenazine, thioridazine, trazodone

KEY WORDS

plasma

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma or serum + 20 μL 1 μg/mL IS in 100 mM HCl + 400 μL 100 mM KOH, vortex for 5 s, add 5 mL hexane:isoamyl alcohol 96:4, vortex for 20 s, centrifuge at 2000 rpm for 6 min. Remove the organic layer and add it to 100 μL MeOH: 4 M HCl 99:1, evaporate to dryness under a stream of air at 30-35°, reconstitute the residue in 200 μL MeCN, inject a 60 μL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 3 μm Econosphere silica
Mobile phase: MeOH:buffer 95:5 (Buffer was 50 mM $(NH_4)H_2PO_4$ adjusted to pH 3.2 with 50 mM phosphoric acid.)

Flow rate: 0.9
Injection volume: 60
Detector: UV 248

CHROMATOGRAM

Retention time: 4.29
Internal standard: 2-(tert-butylamino)-4'-fluorobutyrophenone (234U66) (4.04)
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES

Extracted: metabolites
Simultaneous: amitriptyline, amoxapine, benzphetamine, chlorpromazine, clozapine, desipramine, diethylpropion, diphenhydramine, haloperidol, imipramine, loxapine, nortriptyline, promethazine, propiomazine, sertraline, thioridazine, trazodone, trifluprom azine, trimeprazine
Noninterfering: chlorpheniramine, mesoridazine, thiothixene, trifluoperazine, trihexyphenidyl
Interfering: fluoxetine

SAMPLE

Matrix: blood, tissue
Sample preparation: Plasma. 1 mL Plasma + 500 μL saturated sodium borate, vortex briefly, add 5 mL MTBE, vortex briefly then mix on a reciprocating shaker for 10 min, centrifuge at 220 g for 10 min. Remove the organic phase and add it to 75 μL 10 mM phosphoric acid, vortex, centrifuge, inject a 50 μL aliquot of the aqueous layer. Tissue. Weigh whole brain and homogenize with 10 mL 340 mM perchloric acid containing 0.01 mM EDTA for 20 s (Brinkman PT 10/35). Remove a 1 mL aliquot and add 500 μL 600 mM sodium carbonate and 3 mL hexane:isoamyl alcohol 98:2 to it. Shake on a reciprocating shaker for 10 min, centrifuge at 220 g for 10 min, remove the organic layer and repeat the extraction. Combine the organic layers and add them to 75 μL 10 mM phosphoric acid, vortex, centrifuge, inject a 50 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 250 × 4.6 5 μm IBM reverse phase (trimethyl silane)
Mobile phase: MeCN:pH 3.0 phosphate buffer 27:73 containing 20 mM heptanesulfonic acid and 40 mM triethylamine
Flow rate: 1.5
Injection volume: 50
Detector: UV 214

CHROMATOGRAM

Retention time: 10.6
Internal standard: bupropion

SAMPLE

Matrix: blood
Sample preparation: 200 μL Serum + 200 μL 50 μg/mL hexobarbital in MeCN + 25 μL glacial acetic acid, vortex for 10 s, centrifuge for 1 min, inject a 30-100 μL aliquot of the supernatant.

HPLC VARIABLES

Column: μBondapak C18
Mobile phase: Gradient. MeCN:7.5 g/L NaH_2PO_4 adjusted to pH 3.2 with phosphoric acid 5:95 to 22:78 over 24 min, to 45:55 over 10 min, maintain at 45:55 for 5 min. Re-equilibrate with 5:95 for 5 min.
Column temperature: 50
Flow rate: 3
Injection volume: 30-100
Detector: UV 210

CHROMATOGRAM

Retention time: 15.0
Internal standard: hexobarbital (20.6)
Limit of detection: 200-2000 ng/mL

OTHER SUBSTANCES

Extracted: acetaminophen, amobarbital, butalbital, chlordiazepoxide, diazepam, ethchlorvynol, flurazepam, glutethimide, methaqualone, methyprylon, nitrazepam, pentobarbital, phenobarbital, phenytoin, primidone, salicylic acid, secobarbital, theophylline
Simultaneous: amitriptyline, caffeine, clomipramine, codeine, desipramine, ethotoin, imipramine, lidocaine, mesantoin, methsuximide, nirvanol, nortriptyline, oxazepam, procainamide, phenylpropanolamine, propranolol, quinidine

KEY WORDS

serum

SAMPLE

Matrix: blood
Sample preparation: Prepare an SPE cartridge by plugging the end of a 1 mL disposable pipette tip with glass wool and adding about 100 mg Chromosorb P/NAW. Add 50 μL plasma then 50 μL 10 μg/mL tolylphenobarbital in 200 mM HCl to the SPE cartridge, let stand for 2 min, elute with 1 mL chloroform:isopropanol 6:1. Evaporate the eluate to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL mobile phase, inject a 15 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Supelcosil-LC-8

Mobile phase: MeCN:water 20:80
Flow rate: 3.3
Injection volume: 15
Detector: UV 208

CHROMATOGRAM
Retention time: 4.18
Internal standard: tolylphenobarbital (7.57)
Limit of detection: 50-100 ng/mL

OTHER SUBSTANCES
Extracted: theophylline, caffeine, barbital, ethosuximide, primidone, carbamazepinediol, phenacemide, methyprylon, nirvanol, phenobarbital, carbamazepine epoxide, mephenytoin, pentobarbital, amobarbital, carbamazepine, glutethimide, phenytoin, secobarbital, methaqualone
Noninterfering: acetaminophen, amikacin, amitriptyline, clonazepam, cyclosporine, desipramine, diazepam, digoxin, disopyramide, gentamicin, imipramine, lidocaine, methotrexate, N-acetylprocainamide, netilmicin, nortriptyline, procainamide, quinidine, salicylic acid, sulfamethoxazole, tobramycin, trimethoprim, valproic acid, p-hydroxyphenobarbital, vancomycin
Interfering: chloramphenicol

KEY WORDS
plasma; SPE

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4 OmniPac PAX-500 (Dionex)
Mobile phase: Gradient. A was MeCN:5 mM sodium carbonate 9:81. B was MeCN:20 mM sodium carbonate 20:80. A:B from 100:0 to 0:100 over 10 min.
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 9

OTHER SUBSTANCES
Simultaneous: allobarbital, amobarbital, barbital, barbituric acid, mephobarbital, methabarbital, methohexital, phenobarbital, phenytoin, secobarbital, thiamylal

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 0.5 mg/mL solution in MeOH, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX

Mobile phase: Gradient. A was 150 mM phosphoric acid and 50 mM triethylamine. B was MeCN:water 80:20 containing 150 mM phosphoric acid and 50 mM triethylamine. A:B 100:0 for 2.2 min then to 0:100 over 30 min.
Column temperature: 30
Flow rate: 2
Injection volume: 5
Detector: UV 210

CHROMATOGRAM
Retention time: 15.3

OTHER SUBSTANCES
Simultaneous: acetaminophen, aprobarbital, chlordiazepoxide, chloroxylenol, chlorpromazine, clenbuterol, cortisone, danazol, diflunisal, doxapram, estrone, fluoxymesterone, mefenamic acid, methyltestosterone, nicotine, oxazepam, phentermine, phenylpropanolamine, progesterone, sulfamethazine, sulfanilamide, testosterone, testosterone propionate, tranylcypromine, tripelennamine

KEY WORDS
details for purification of triethylamine in paper

SAMPLE
Matrix: solutions
Sample preparation: Dissolve in mobile phase to a concentration of 50 μg/mL.

HPLC VARIABLES
Column: 250 × 4 β-cyclodextrin polymer-coated silica (Chromatographia 1993, 36, 373)
Mobile phase: MeOH:water 50:50
Flow rate: 0.6
Injection volume: 20
Detector: UV 240

CHROMATOGRAM
Retention time: k' 1.66

OTHER SUBSTANCES
Simultaneous: aprobarbital, pentobarbital, amobarbital, butalbital, secobarbital, thiopental, phenobarbital

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30

Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES
