SAMPLE

Matrix: urine
Sample preparation: Pack a 110 × 10 mm polypropylene disposable column having support frits with 830 mg aldehyde-activated silica (Clifmar Associates, UK), wash the packed column with 50 mL phosphate buffered saline. Add 5 mL phosphate buffered saline to the column, add 500 μL unpurified antisera (J.Pharm.Biomed.Anal. 1994, 12, 353), close the column, place on a rotamixer for 2 h. Wash the immunocolumn with 10 mL phosphate buffered saline, carefully add 5 mL 1 M pH 6 glycine buffer, rotate the column overnight, wash with 10 mL 0.3% HCl and 20 mL phosphate buffered saline. Dilute 100 μL urine with 900 μL phosphate buffered saline, add 1 mL of the diluted urine to the immunocolumn, wash with 15-20 mL phosphate buffered saline, elute with two 1 mL portions of EtOH:phosphate buffered saline 40:60 (pH 4), collect the second eluted fraction, inject an aliquot of the fraction. (Phosphate buffered saline (pH 7.2-7.4) was 8 g NaCl, 200 mg KH_2PO_4, 200 mg KCl, and 2.9 g K_2HPO_4 dissolved in 1 L water.)

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Oster model 54841) 10 g catfish tissue with 50 mL acetone for 10-20 s, centrifuge at 3000 rpm for 2 min, filter (paper) supernatant. Repeat extraction twice more, combine extracts, add 15 mL n-propanol, evaporate to 15 mL under reduced pressure at 40°. Transfer residue to another container using 20 mL acetone, 30 mL hexane, and 60 mL 3% NaCl. Shake vigorously for 10 s, centrifuge at 3000 rpm for 1 min, discard hexane layer, wash with another 30 mL hexane. Extract the remaining mixture twice with 25 mL portions of chloroform by shaking vigorously for 1 min. Combine the chloroform extracts and add them to 25 mL 100 mM NaOH, shake vigorously for 1 min. Discard the chloroform layer and wash the aqueous layer with 25 mL chloroform with gentle rocking (10 rocks). Add the aqueous layer to 25 mL 75 mM phosphoric acid (pH 6 ± 0.5), extract twice with 25 mL portions of chloroform (vigorous shaking for 1 min). Filter (paper) extracts and evaporate them to dryness under reduced pressure at 40°, add 2 mL MeCN, evaporate to dryness, reconstitute in 1 mL mobile phase, sonicate briefly, filter (0.45 μm), inject a 100 μL aliquot.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

SAMPLE

Matrix: tissue

Sample preparation: Condition a 500 mg Bond Elut silica SPE cartridge with 5 mL EtOH and 5 mL cyclohexane. Homogenize 5 g tissue with 11 mL 40 mM pH 4.1 sodium acetate buffer. Add 500 μL 17 mg/mL β-glucuronidase (type H-5) in acetate buffer, mix. Incubate at 37° overnight. Mix with 5 mL 2 M aqueous tris(hydroxymethyl)aminomethane. Fill an Extrelut cartridge with 25% of an Extrelut 20 sachet, mix the remainder of the sachet with the sample and add it to the cartridge. Rinse the sample tube with 15 mL butan-2-ol:hexane 5:95 and add the rinse to the cartridge. Elute with 100 mL butan-2-ol:hexane 5:95. Extract the eluate with two 10 mL portions of MeCN. Evaporate the combined MeCN extracts to dryness after adding two 2 mL portions of heptane. Reconstitute the residue with 2 mL cyclohexane. Add to the SPE cartridge Wash the tube with two 2 mL and two 1 mL portions of cyclohexane. Add to the SPE cartridge. Wash with 2 mL cyclohexane. Elute with 5 mL acetone:cyclohexane 25:75. Evaporate the eluate and redissolve the residue in 400 μL MeOH and 3.6 mL 85° water. Cool to room temperature and add to an immunoaffinity column (Randox Laboratories, UK). Complete the transfer with three 1 mL portions of hot water, cooled before adding to the column. Wash with 2 mL 1 mM pH 10 carbonate buffer, elute with 4 mL MeOH:water 70:30. Dilute the eluate with 12 mL water. Inject a 4 mL aliquot onto column A and then backflush the contents of column A onto column B with mobile phase. Monitor the effluent from column B.

Add 1 mL plasma or Iso-sensitest broth to the SPE cartridge, wash with 2 mL pH 7.4 phosphate buffer and 4 mL 200 mM pH 9 borate buffer. Dry the cartridge with approximately 30 mL of air, elute with 1 mL MeCN:200 mM pH 10.5 borate buffer 50:50. Adjust the pH value of a 1 mL portion of the eluate to 8.9 by the addition of 200 μL 800 mM boric acid, add 200 μL 7 mM fluorenylmethyl chloroformate in MeCN, let stand at ambient temperature for 15 min, add 50 μL 100 mM glycine, inject a 20 μL aliquot of the mixture. (Prepare pH 7.4 phosphate buffer by mixing appropriate volumes of 20 mM NaH_2PO_4 and Na_2HPO_4 solutions. Prepare borate buffer by adjusting the pH of boric acid solution with 45% KOH.)

SAMPLE
Matrix: blood, dialysate, urine
Sample preparation: Plasma. Condition a 3 mL Baker cyanopropylsilane CN SPE cartridge with 2 mL MeOH, 2 mL water, and 2 mL buffer. 1 mL Plasma + 100 μL 100 μg/mL dibekacin in water, vortex for 15 s, add 1 mL buffer, vortex for 15 s, centrifuge at 3100 g at 4° for 7 min, add to SPE cartridge, wash with 500 μL water, wash with 250 μL mobile phase, elute to dryness. Elute with 250 μL mobile phase, inject an aliquot of the eluate. Urine, dialysate. Dilute 1:100 with water, add 100 μL 100 μg/mL dibekacin per 1 mL of sample, mix well, inject a 100 μL aliquot. (Buffer was 0.94 g sodium hexanesulfonate in 300 mL water, add 500 μL glacial acetic acid, dilute to 500 mL with water.)

HPLC VARIABLES
Guard column: 10 × 4.6 5 μm Hypersil C18

SAMPLE
Matrix: water
Sample preparation: Adjust 50 mL wastewater to pH 6.6 with acetic acid, add 50 mL ethyl acetate, shake vigorously for 5 min, let stand for 1 min, transfer the ethyl acetate layer to a flask, extract the residual aqueous layer with two 20 mL portions of ethyl acetate. Combine the organic layers and evaporate them at 90° to about 500 μL, dissolve the residue in 5 mL 10 mM HCl, make up to 50 mL with water, inject an aliquot.

HPLC VARIABLES

SAMPLE

Matrix: blood, formulations, urine

Sample preparation: Tablets. Powder tablets, dissolve in water, inject a 10 μL aliquot. Injections. Dilute with water, inject a 10 μL aliquot. Plasma, urine. Condition a Lichrolut RP-18 (Merck) SPE cartridge with 3 mL MeOH and 3 mL water. Mix 40 μL plasma or 100 μL urine with twice the volume of MeCN for 2 min, add 100 μL water, centrifuge at 3500 rpm for 15 min, evaporate the supernatant under nitrogen at 45° to remove the organic solvents, add slowly to the SPE cartridge, collect the eluate. Evaporate to dryness under a stream of nitrogen at 45°. Reconstitute the residue with 500 μL MeOH containing 4.2 μg/mL IS. Inject a 10 μL aliquot.

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

SAMPLE
Matrix: eggs
Sample preparation: Condition a 100 mg Bond Elut SPE cartridge (no. 601101) with two 1 mL portions of chloroform:MeCN 80:20 and with 1 mL chloroform, air dry. Stir 1 g homogenized egg and 50 μL 10% acetic acid and slowly add 2.5 mL MeCN, 4 min after the MeCN addition is complete add 0.25 g anhydrous sodium sulfate, stir for 2 min, centrifuge at 1400 g for 2 min, filter the supernatant through glass wool. Re-extract the sediment with 2.5 mL by stirring for 3 min, centrifuge at 1400 g for 2 min, filter the supernatant through glass wool, rinse the glass wool with 1 mL MeCN. Combine the filtrates and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 1 mL hexane:chloroform 50:50, add to the SPE cartridge, rinse the tube with 1 mL hexane:chloroform 50:50, add the rinse to the SPE cartridge, dry the SPE cartridge under vacuum for 1 min, elute with chloroform:MeCN 80:20. Collect the first 2 mL of eluate and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute with 1 mL mobile phase, vortex for 4 min, inject a 50 μL aliquot.

SAMPLE
Matrix: meconium
Sample preparation: Condition a 3 mL C8 SPE cartridge (Backer-Bond, Gross Gerau, Germany) with 5 mL MeOH and 5 mL water. Condition a 3 mL silica SPE cartridge (Backer-Bond) with 5 mL chloroform. Place the C8 SPE cartridge on top of the silica SPE cartridge. Thaw and mix meconium, weigh a 2 g aliquot, add IS, and emulsify in 20 mL 100 mM pH 8.0 phosphate buffer. Vortex, centrifuge, filter the supernatant. Extract the supernatant 3 times with 2 mL portions of chloroform. Evaporate chloroform extracts to dryness and dissolve in 10 mL pH 9.0 boric buffer. Add to the SPE cartridges, remove the C8 column and elute the silica column with 3 mL MeOH:dichloromethane:ammonium hydroxide 30:70:1. Evaporate the eluate to dryness under nitrogen and redissolved in 100 μL water. Inject a 20 μL aliquot.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject

a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

SAMPLE
Matrix: blood, urine
Sample preparation: 2 mL Plasma or 1 mL urine + dihydroxybenzylamine + 20 mg Sigma WA4 alumina + 200 μL 1 M pH 8.6 Tris-EDTA buffer, mix for 10 min, discard plasma. Wash the

alumina three times with 3 mL water and dry it. Add 125 μL 500 mM phosphoric acid, after 1 min inject a 100 μL aliquot. (Ann. Clin. Biochem. 1985, 22, 194-203)

HPLC VARIABLES
Column: 250 × 4.5 5 μm Ultratechsphere
Mobile phase: Per liter 75 mmol citric acid, 58.5 mmol NaH_2PO_4, 0.2 mmol disodium EDTA, and 4.4 mmol heptanesulfonic acid, pH adjusted to 3.4, made up to a final volume of 2 L, add 200 mL MeOH

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

The effluent from the coil mixed with reducing solution pumped at 1 (?) mL/min and this mixture flowed through a 2 m × 0.8 mm ID PTFE coil at 30° to the detector. (Prepare the reactor as follows. Dissolve 75.3 g manganese nitrate in 500 mL water, add 50 g 18-35 mesh silica gel (Macherey-Nagel), stir vigorously, slowly add 31.6 g potassium permanganate in 500 mL water, stir for 30 min, filter (500 μm sieve), wash until no permanganate color is left, dry in a desiccator, pack in a 50 × 2.1 stainless steel tube. The reducing solution was 266 g NaOH, 13.4 g anhydrous sodium sulfite, and 9 mL 2-mercaptoethanol in 1 L water. Note that some Nucleosil 5-C18 column packings do not give separation at pH 4.45. Matrix: blood
Sample preparation: Condition a C18 SPE cartridge with 2 mL MeOH, 2 mL water, and 1 mL 50 mM pH 7.4 sodium phosphate buffer at 1.5 mL/min. Centrifuge rapidly thawed plasma samples. Combine 1 mL plasma with 40 µL 903 ng/mL papaverine free base and 2 mL 50 mM pH 7.4 sodium phosphate buffer, vortex. Add 2.75 mL diluted plasma at a rate of 0.36 ml/min to the SPE cartridge, wash with 1 mL 50 mM pH 7.4 sodium phosphate buffer and 2 mL water. Dry by passing 5 mL of air through the SPE cartridge at 5 mL/min. Elute with 1.5 mL MeCN, evaporate the eluate to dryness under nitrogen at 30°. Reconstitute with 200 µL MeCN, inject a 50 µL aliquot.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

SAMPLE

Matrix: milk

Sample preparation: Condition a 500 mg tC18 SPE cartridge (Waters) with 20 mL MeOH, 20 mL water, and 10 mL 2% NaCl. Centrifuge 30 mL milk at 1500 g for 10 min. Dilute a 10 mL portion of the defatted milk with 20 mL water, add 200 μL 2 μg/mL penicillin V in pH 9.0 buffer, add 6 mL 170 mM sulfuric acid, add 5.6 mL 5% sodium tungstate, shake vigorously for 1 min, allow to stand for 5 min, check that the pH is in the range 4.6-4.8 (if it is outside this range start again using a different volume of sodium tungstate solution), centrifuge at 1500 g for 10 min, adjust the pH of the supernatant to 8.1-8.2 with 5 M and 0.1 M NaOH, filter (glass fiber) the clear liquid phase. Pass the filtrate through the SPE cartridge at 2 mL/min, wash with 2 mL water, dry by pulling air through the cartridge for 1 min, elute with 2 mL MeCN. Add 150 μL pH 9.0 buffer to the eluate and evaporate to about 100 μL under a stream of nitrogen at 45-50°, add 400 μL pH 9.0 buffer, add 75 μL reagent I, vortex for 30 s, let stand at room temperature for 10 min, use 500 μL water to transfer the mixture to a separatory funnel, add 20 mL dichloromethane, add 5 mL pH 2.45 buffer, shake for 1 min, let stand for no more than 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure at 35-40°, dissolve the residue in 500 μL pH 9.0 buffer, add 75 μL reagent I, vortex for 30 s, let stand at room temperature for 10 min, add 450 μL reagent II, vortex for 1 min, heat at 55 ± 1° for 30 min, cool, filter (0.45 μm), inject a 150 μL aliquot. (Prepare pH 9.0 buffer by dissolving 0.34 g KH_2PO_4 in water, adjusting the pH to 9.0 with NaOH, and making up to 100 mL with water. SAMPLE

Matrix: tissue

Sample preparation: Homogenize 1 g tissue with 5 mL acetone, centrifuge, decant and save the supernatant, repeat the extraction. Add 2 mL acetone, 3 mL hexane, and 6 mL 3% NaCl to the combined supernatants, extract, centrifuge, discard the hexane layer. Add the extract to 25 mL chloroform (Caution! Chloroform is a carcinogen!), mix, separate the phases, add 2.5 mL 100 mM pH 9.0 Na_3PO_4 buffer and one drop 1 M NaOH to the chloroform phase, mix, separate the phases, discard the chloroform layer. Wash the aqueous layer with 2.5 mL chloroform, centrifuge the aqueous layer. Dialyze a 740 μL aliquot of the supernatant (in 2 portions) against 3.9 mL 20 mM pH 5.0 sodium phosphate buffer pumped at 0.6 mL/min using a Cuprophan 15000 MW cut-off cellulose acetate membrane. After washing column A with 500 μL MeCN:water 50:50 and 500 μL 20 mM pH 5.0 Na_3PO_4 buffer the dialysate flowed through column A to waste. Wash column A with 500 μL 20 mM pH 5.0 sodium phosphate buffer, elute the contents of column A onto column B with mobile phase, elute with mobile phase, monitor the effluent from column B. (Wash the donor channel with 2 mL 0.01% Triton X-100 in 20 mM pH 5.0 sodium phosphate buffer. Wash the acceptor channel with 3 mL 20 mM pH 5.0 sodium phosphate buffer. SAMPLE

Matrix: solutions
Sample preparation: Mix a 100 μL of a 10 μM solution in MeCN:water:triethylamine 50:50:0.1 with 100 μL 1 mM (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in MeCN, heat in the dark at 65° for 1.5 h, inject an aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL

water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate: benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane: acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as yellow crystals (mp 160-170° d) (Analyst 1995, 120, 385).)

SAMPLE

Matrix: eggs, tissue

Sample preparation: Prepare a metal chelate affinity chromatography (MCAC) column by adding 1.5 mL of thoroughly mixed Chelating Sepharose Fast-Flow suspension in EtOH:water 20:80 (Pharmacia) to a 150 × 10 glass column, allow to drain, wash with three 2 mL portions of water, add 2 mL 10 mM copper(II) sulfate in water, wash with two 2 mL portions of water. Condition an SBD-RPS extraction membrane (3M Company, St. Paul, MN) with 2 mL MeOH and 2 mL 100 mM HCl. Add 20 mL 100 mM pH 4.0 sodium succinate buffer to 3 g pig kidney, pig muscle, cow liver, or whole chicken egg, vortex for 1 min and shake for 10 min on a horizontal shaker. Add 20 mL MeOH, sonicate for 5 min and centrifuge at 2666 g for 10 min at 4°. Filter the supernatant through a Whatman 541 filter paper. Add the clear supernatant to the MCAC column. Wash sequentially with 2 mL 100 mM sodium succinate buffer, 2 mL water, 2 mL MeOH, 2 mL water, and with 500 μL McIlvaine-EDTA-NaCl buffer. Elute with 3 mL McIlvaine-EDTA-NaCl buffer and adjust the eluate to pH 1.3 with 400 μL 4 M HCl. Add the eluate directly to the extraction membrane to prevent crystallization of EDTA. Wash the membrane with 1 mL 100 mM HCl and elute with four 250 μL portions of MeOH:25% ammonia 97:3, evaporate the eluate to dryness under the nitrogen at 40°. Reconstitute the dry residue with 250 μL 10 mM oxalic acid in water, vortex, sonicate. Inject a 100 μL aliquot. (The sodium succinate buffer was 100 mM succinic acid, pH adjusted to 4.0 with 10 M NaOH. Prepare the McIlvaine buffer by dissolving 12.9 g citric acid monohydrate and 10.9 g Na_2HPO_4 in 1 L water. The McIlvaine-EDTA-NaCl buffer was 100 mM EDTA and 500 mM NaCl in McIlvaine buffer. Protect all solutions from light.)

SAMPLE

Matrix: eggs, tissue
Sample preparation: Condition an Anagel-TSK Chelate-SPW column with 25 μL 50 mg/mL copper sulfate in water and 500 μL. Homogenize 2 g sliced chicken liver with 1.2 mL 1 M pH 4 citrate buffer and 12 mL ethyl acetate for 1 min. Homogenize 2 g sliced tissue with 1.2 mL 1 M pH 5 citrate buffer and 12 mL ethyl acetate for 1 min. Shake 2 g blended egg with 1.2 mL 1 M pH 5 citrate buffer and 12 mL ethyl acetate for 15 min. Centrifuge the mixture at 11000 rpm for 10 min, decant the supernatant, reextract the residue with two 12 mL portions of ethyl acetate. Add 10 g anhydrous sodium sulfate to the combined supernatants, swirl, let stand for 5-10 min, filter (Whatman 1PS phase-separating filter paper). Evaporate the filtrate to dryness or to an oily residue on a rotary evaporator under reduced pressure at 40°, reconstitute the residue in 2 mL MeOH by vortexing, filter (0.2 μm syringe filter). Add 1.5 mL of the filtrate to the Anagel column at 0.36 mL/min, wash with 500 μL water, 500 μL MeOH, and 500 μL water. Elute the contents of the Anagel column onto the analytical column with mobile phase A, after 11 min remove the Anagel column from the circuit, elute column B using gradient elution of mobile phase A:B, monitor the effluent from column B. Sample preparation: Prepare a column as follows. Swirl Chelating Sepharose Fast Flow resin (Pharmacia) in its bottle, add it to a polypropylene column to give a bed volume of 1.0-1.2 mL, wash 3 times with 2 mL portions of water, wash with 2 mL 10 mM copper sulfate, wash with two 2 mL portions of water. Centrifuge 5 mL milk at 10° at 1500 g for 15 min, remove the lower layer and add it to 10 mL succinate buffer, mix, centrifuge at 1500 g for 30 min, add the supernatant to the column. Wash with 2 mL succinate buffer, wash with 2 mL water, wash with 2 mL MeOH, wash with 2 mL water, wash with 700 μL citrate/phosphate buffer (be careful not to disturb bed), elute with 2.5 mL citrate/phosphate buffer (column is white and eluate is blue). Filter (Amicon Centricon 30, MW 30000 cut-off; pre-washed by centrifuging with 2 mL water) while centrifuging at 5000 g for 30-90 min, inject a 600 μL aliquot of the ultrafiltrate. (Prepare succinate buffer by dissolving 11.8 g succinic acid in 980 mL water, adjust pH to 4.0 with 10 M NaOH, make up to 1 L. Prepare the citrate/phosphate buffer by dissolving 12.9 g citric acid monohydrate, 10.9 g Na_2HPO_4, 37.2 g disodium EDTA dihydrate, and 29.2 g NaCl in 1 L water.)

SAMPLE
Matrix: milk, tissue
Sample preparation: Wash column A with 20 mL 5 mg/mL aqueous copper sulfate and column B with 100 mL acetone, 100 mL MeOH, and 100 mL water. Sonicate 10 mL milk or 10 g sliced tissue with 40 mL pH 4.0 succinate buffer for 3 min. (Buffer was 5 g succinic anhydride in 1 L water adjusted to pH 4.0 with 1 M NaOH.) Homogenize for 2 min (Ultra-Turrax), centrifuge at 12000 and 24000 rpm for 5 min, filter the supernatant through a Whatman 541 filter paper. Repeat extraction with 40 mL and 20 mL portions of succinate buffer, load the combined filtrates onto column A. Wash column A with 10 mL water, 30 mL MeOH, and two 10 mL portions of water. Elute tetracycline fraction with 40 mL pH 4.0 succinate buffer containing 100 mM disodium EDTA. After elution wash column A with 10 mL pH 4.0 succinate buffer containing 100 mM disodium EDTA. Load 50 mL combined eluate from column A onto column B, wash with two 100 mL portions of water and elute with 100 mL redistilled MeOH, discard the first 10 mL eluate. Evaporate eluate to a small volume on rotary evaporator at 40° and transfer to pear-shaped flask with three 2 mL portions of redistilled MeOH. Add 100 μL 5% β-mercaptopropionic acid in MeOH, evaporate MeOH under reduced pressure at 40°, reconstitute the residue in 500 μL mobile phase, vortex for 15 s and sonicate for 30 s, inject a 10 μL aliquot. (Column A was a 200 × 20 chelating Sepharose column. Prepare column as follows. Thoroughly mix 5 mL chelating Sepharose suspension (Pharmacia AB), place it in a 200 × 20 glass column, let settle to a 15 mm bed height. Remove liquid excess and load the column by passing 20 mL 5 mg/mL copper sulfate through it. Vortex the column after first 10 mL to remove bubbles, then pass 15 mL pH 4.0 succinate buffer through the column. Wash the column with 20 mL water after use, store in MeOH:water 20:80 at 4°. Column B was a 200 × 20 Amberlite XAD-2 resin column. Prepare as follows. Wash Amberlite resin sequentially with 100 mL MeOH and 100 mL water, place the resin in a 200 × 2 0 glass column to 100 mm bed height.)

SAMPLE
Matrix: tissue
Sample preparation: Condition a 3 mL 500 mg Bond Elut C18 SPE cartridge with saturated aqueous disodium EDTA. Blend 5 g tissue with two 20 mL portions and one 10 mL portion of 100 mM pH 4.0 disodium EDTA-McIlvaine buffer at high speed, centrifuge at 850 g for 5 min each time. Combine the supernatants, centrifuge at 850 g for 15 min, filter. Add the filtrate to the SPE cartridge, wash with 20 mL water, air-dry by aspiration for 5 min, elute with 10 mL ethyl acetate followed by 20 mL MeOH:ethyl acetate 5:95, evaporate the eluate to dryness under reduced pressure at 30°, dissolve the residue in 100 μL water, inject a 50 μL aliquot.

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T25) 5 g tissue, 200 μL 125 μg/mL tetracycline in 10 mM HCl, 50 mL 50 mM HCl, and 10 mL hexane for 2 min, sonicate for 3 min, centrifuge at 1920 g for 5 min. Dialyze (Cuprophan cellulose dialysis membrane, 15 kD cutoff) a 530 μL aliquot of the aqueous layer against seven 875 μL aliquots of recipient solution. Pump the recipient solution into the recipient channel at 1.7 mL/min, allow to remain stationary for 36 s, then pump onto column A. Finally, backflush the contents of column A onto the analytical column with mobile phase. After 2 min remove column A from the circuit and flush it with 2 mL recipient solution. Flush the recipient channel with 2 mL recipient solution, flush the donor channel with 2 mL 0.01% Triton X-100. (Recipient solution was 20 mM pH 5 phosphate buffer containing 5 mM sodium heptanesulfonate.)

HPLC VARIABLES

SAMPLE
Matrix: tissue
Sample preparation: Prepare an affinity column by filling a 10 mL column with 5 mL chelating Sepharose, allow to settle, wash with 20 mL 0.5% copper(II) sulfate solution, eliminate air bubbles by agitation, wash with 15 mL 50 mM pH 4 succinate buffer, do not allow to dry. Condition an Analytichem Bond Elut C18 SPE cartridge with 10 mL MeOH and 10 mL water, do not allow to dry. Homogenize 4 g minced kidney with 40 mL 50 mM pH 4 succinate buffer, sonicate for 10 min, centrifuge at 9000 rpm for 10 min, filter the supernatant through paper, repeat the extraction. Combine the supernatants and pass them through the affinity column at 5-7 mL/min, wash with 10 mL water, wash with 30 mL MeOH, wash with 20 mL water, elute with 50 mL 50 mM pH 4 succinate buffer containing 3.7% Titriplex III (ethylenedinitrilotetracacetic acid, disodium salt dihydrate). Add the eluate to the SPE cartridge at 5-7 mL/min, wash with 10 mL water, dry with air aspiration for 10 min, elute with 5 mL MeOH:MeCN 1:1, evaporate the eluate at 40° under a stream of nitrogen, dissolve the residue in 500 μL mobile phase, inject an aliquot. Protect from light through process. (The affinity columns may be reused up to 15 times by washing with 20 mL water then 20 mL EtOH:water 20:80 then conditioning as described above.)
