Maloney,J.A.; Awni,W.M. High-performance liquid chromatographic determination of isepamicin in plasma, urine and dialysate, *J.Chromatogr.*, **1990**, *526*, 487–496.

SAMPLE

Matrix: blood, urine
Sample preparation: 1 mL Plasma or urine + 0.5-5 μg dibekacin + 2 mL EtOH, mix, add 7 mL dichloromethane, add 1 mL water, centrifuge, inject an aliquot of the aqueous supernatant on to column A and elute to waste with mobile phase A, after 4 min elute the contents of column A on to column B with mobile phase B, monitor the effluent from column B.

HPLC VARIABLES

Column: A 3.9 × 4 10 μm Guard Pak with Cyano insert; B 150 × 4.6 5 μm Hypersil C18
Mobile phase: A 17 mM Acetic acid containing 10 mM hexanesulfonate; B MeOH:buffer 14.3: 85.7 (Mobile phase contained 100 mM sodium acetate, 17 mM acetic acid, 10 mM hexanesulfonate, and 3.53 M MeOH.)
Detector: F ex 338 (band-pass filter) em 418-700 and 450 cut-off filters following post-column reaction with o-phthalaldehyde derivatizing reagent pumped at 0.2 mL/min.

CHROMATOGRAM

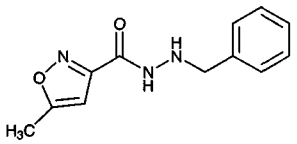
Internal standard: dibekacin
Limit of quantitation: 100 ng/mL

KEY WORDS

plasma; pharmacokinetics; post-column reaction; column-switching

REFERENCE
Lin,C.-C.; Radwanski,E.; Korduba,C.; Cayen,M.; Affrime,M. Pharmacokinetics of intravenously administered isepamicin in men, *Antimicrob.Agents Chemother.*, **1995**, *39*, 2774–2778.

Isocarboxazid



Molecular formula: $C_{12}H_{13}N_3O_2$
Molecular weight: 231.25
CAS Registry No.: 59-63-2
Merck Index: 5172
Lednicer No.: 1 233

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 200 µL 1.5 M NaOH + 10 µL 200 µg/mL IS in 100 mM HCl, vortex, add 5 mL hexane:ethyl acetate 80:20, shake mechanically at low speed for 10 min, centrifuge at 10° at 1100 g for 10 min. Remove the organic layer and add it to 500 µL 2 M HCl, shake mechanically for 5 min, centrifuge at 10° at 1100 g for 5 min. Remove the aqueous phase and add it to 200 µL saturated K_2HPO_4, vortex, inject a 50 µL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 µm LC-18 (Supelco)
Mobile phase: MeOH:5 mM octanesulfonic acid 50:50
Flow rate: 1
Injection volume: 50
Detector: UV 230

CHROMATOGRAM
Retention time: 6.4
Internal standard: 5-methyl-3-isoxazolecarboxylic acid 2-(2-propyl-1-phenyl)hydrazide (Ro 5-1226) (15.5)
Limit of quantitation: 100 ng/mL

KEY WORDS
plasma; dog; pharmacokinetics

REFERENCE
Powell,M.L.; Town,C.; Henderson,L.; Buck,C. Determination of marplan in human plasma using high-performance liquid chromatography, *J.Chromatogr.*, **1990**, *529*, 237–244.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

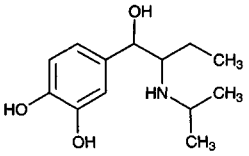
Isoetharine



Molecular formula: $C_{13}H_{21}NO_3$
Molecular weight: 239.31
CAS Registry No.: 530-08-5, 2576-92-3 (HCl), 7279-75-6 (mesylate)
Merck Index: 5185
Lednicer No.: 2 9

SAMPLE

Matrix: blood
Sample preparation: 25-150 μL Plasma + 100 μL 50 ng/mL colterol mesylate in 25 mM sulfuric acid + 2 mL 2% boric acid + 2 g ammonium sulfate + 10 mL 0.5% di(2-ethylhexyl)phosphoric acid in benzene (Caution! Benzene is a carcinogen!), shake, centrifuge. Remove the organic phase and add it to 130 μL 25 mM sulfuric acid, shake, centrifuge, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeOH:buffer 12.5:87.5 (Buffer was 100 mM sodium sulfate adjusted to pH 2.8 phosphoric acid then adjusted to pH 3.0 with NaOH.)
Flow rate: 1.2
Injection volume: 100
Detector: E, Bioanalytical Systems LC-4, TL-5 glassy carbon electrode +0.60 V, Ag/AgCl reference electrode

CHROMATOGRAM

Retention time: 9.3
Internal standard: colterol mesylate (7.5)
Limit of quantitation: 0.5 ng/mL

KEY WORDS

plasma; rat; pharmacokinetics

REFERENCE

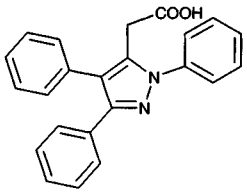
Isofezolac



Molecular formula: $C_{23}H_{18}N_2O_2$
Molecular weight: 354.41
CAS Registry No.: 50270-33-2
Merck Index: 5188

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 1 mL 100 mM pH 4.4 citrate buffer + 100 μL 40 μg/mL IS in MeOH + 15 mL diethyl ether, agitate, centrifuge at 3000 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 0.5-3 mL mobile phase, inject a 20 μL aliquot. Urine. 100 μL Urine + 1 mL 100 mM pH 4.4 citrate buffer + 100 μL 40 μg/mL IS in MeOH + 100 μL enzyme solution containing 100000 U/mL β-glucuronidase and 1000000 U/mL arylsulfatase (I.B.F.), heat at 37° for 16 h, add 15 mL diethyl ether, agitate, centrifuge at 3000 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 1-2 mL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm LiChrosorb RP 8
Mobile phase: MeCN:water:200 mM pH 3 phosphate buffer 65:15:20
Flow rate: 1.5
Injection volume: 20
Detector: F ex 273 em 335 or UV 265

CHROMATOGRAM

Retention time: 2.7
Internal standard: 1-phenyl-3,4-di-p-chlorophenylpyrazole-5-acetic acid (4.5)
Limit of detection: 10 ng/mL (F)

KEY WORDS

plasma; pharmacokinetics

REFERENCE

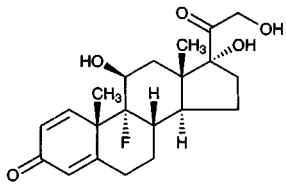
Isoflupredone



Molecular formula: $C_{21}H_{27}FO_5$
Molecular weight: 378.44
CAS Registry No.: 338-95-4, 338-98-7 (acetate)
Merck Index: 5190

SAMPLE

Matrix: bulk, formulations
Sample preparation: Cream. Weigh out cream containing 1 mg diflorasone diacetate, add 30 mL 40 μg/mL isoflupredone acetate in water-saturated chloroform, shake for 30 min, centrifuge at 2000 rpm for 15 min, inject a 10 μL aliquot of the lower chloroform layer. Ointment. Weigh out ointment containing 0.5 mg diflorasone diacetate, add 15 mL 40 μg/mL isoflupredone acetate in water-saturated chloroform, shake for 30 min, centrifuge at 2000 rpm for 15 min, inject a 10 μL aliquot of the lower chloroform layer. Bulk. Dissolve 1.5 mg bulk drug in 50 mL 40 μg/mL isoflupredone acetate in water-saturated chloroform, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 3 μm silica gel (Perkin-Elmer part 0258-1500)
Mobile phase: Butyl chloride:dichloromethane:THF:acetic acid 70:25:2:3 (Butyl chloride and dichloromethane were saturated with water.)
Flow rate: 2.5
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 24 (isoflupredone acetate)
Internal standard: isoflupredone acetate

OTHER SUBSTANCES
Simultaneous: related compounds, diflorasone diacetate

KEY WORDS
cream; ointment; normal phase; isoflupredone acetate is IS

REFERENCE

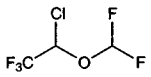
Isoflurane



Molecular formula: $C_3H_2ClF_5O$
Molecular weight: 184.49
CAS Registry No.: 26675-46-7
Merck Index: 5191

SAMPLE
Matrix: solutions
Sample preparation: Mix 50 μL phosphate buffer containing isoflurane and 50 μL 0.05 mM toluene in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: RCSS Guard-Pak μBondapak C18 precolumn cartridge
Column: 100 × 8 4 μm Nova-Pak C18 Radial Compression Module
Mobile phase: MeOH:water 50:50
Flow rate: 3.5
Injection volume: 20
Detector: UV 203

CHROMATOGRAM
Retention time: 5
Internal standard: toluene (12)
Limit of detection: 0.2 mM

OTHER SUBSTANCES
Simultaneous: enflurane, halothane

KEY WORDS
buffer

REFERENCE

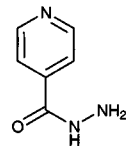
Isoniazid



Molecular formula: $C_6H_7N_3O$
Molecular weight: 137.14
CAS Registry No.: 54-85-3
Merck Index: 5203
Lednicer No.: 1 254

SAMPLE
Matrix: blood
Sample preparation: 2 mL Plasma + 100 μL 30μg/mL IS in water, mix, add 2 g ammonium sulfate, add 40 mL water saturated n-butanol:chloroform 30:70, shake for 10 min, centrifuge at 500 g for 10 min. Transfer the organic layer into a tube, add 1 mL 1 M sulfuric acid, shake for 10 min, centrifuge at 500 g for 10 min, inject a 250 μL aliquot of the upper aqueous layer. (Caution! Chloroform is a carcinogen !)

HPLC VARIABLES
Guard column: 10μm μBondapak C18
Column: 115 × 8 5 μm μBondapak C18 radial compression
Mobile phase: EtOH:1 mM dioctyl sulfosuccinate 45:55, adjusted to pH 2.50
Flow rate: 4
Injection volume: 250
Detector: UV 254

CHROMATOGRAM
Retention time: 10.7
Internal standard: 1-benzoyl-2-isonicotinoylhydrazine (8.9)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Extracted: acetylisoniazid

KEY WORDS
plasma

REFERENCE
Holdiness,M.R. High pressure liquid chromatographic determination of isoniazid and acetylisoniazid in human plasma, *J.Liq.Chromatogr.*, **1982**, *5*, 707–714.

SAMPLE
Matrix: blood
Sample preparation: 2 mL Plasma + 50 μL 50 μg/mL phenelzine + 400 μL 10% acetic acid + 7 mL diethyl ether:dichloromethane 2:1, shake, centrifuge at 2059 g for 10 min. Remove the aqueous layer and add it to 600 μL 10% acetic acid, add 300 μL 0.1% salicaldehyde in EtOH, heat at 60° for 30 min, cool to room temperature, add 1 mL 1 M K_2PO_4 (sic), extract with 7 mL diethyl ether, centrifuge at 2059 g for 10 min, repeat extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue in 200 μL buffer, inject a 20 μL aliquot. (Buffer was 5 mM heptanesulfonic acid in MeCN:water: triethylamine 70:30:0.4.)

HPLC VARIABLES
Guard column: 50 × 4.6 30 μm C8
Column: 250 × 4.6 Spherisorb S5 ODS2 C18
Mobile phase: Gradient. MeCN:buffer:water 0:75:25 for 5 min, 15:85:0 for 12 min (step gradient). (Buffer was 5 mM heptanesulfonic acid in MeCN:water:triethylamine 70:30:0.4.)
Flow rate: 1
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 4.68
Internal standard: phenelzine (11.09)
Limit of detection: 250 ng/mL

OTHER SUBSTANCES
Extracted: hydrazine, monoacetylhydrazine

KEY WORDS
derivatization

SAMPLE
Matrix: blood, CSF
Sample preparation: 200-500 μL Plasma or CSF + 50 μL 50 μg/mL phenelzine sulfate + 100 μL 10% (?) aqueous acetic acid + 5 mL n-hexane, shake for 30 min, centrifuge at 1870 g for 10 min. Discard the organic layer. Add 300 μL 0.1% salicaldehyde in EtOH and 400 μL 10% aqueous acetic acid to the aqueous layer, heat at 60° for 30 min, cool, add 1 mL 1 M pH 6.5 K_2HPO_4, shake for 10 s, add 5 mL diethyl ether, shake for 10 min, centrifuge at 1870 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 50 μL mobile phase, inject a 25 μL aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 30 μm C8 (Waters)
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:water:triethylamine 70:30:0.4 containing 5 mM heptanesulfonic acid, pH adjusted to 6.0 with acetic acid
Flow rate: 1
Injection volume: 25
Detector: UV 320

CHROMATOGRAM
Retention time: 1.6
Internal standard: phenelzine sulfate (3)
Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Extracted: hydrazine
Noninterfering: p-aminosalicylic acid, pyrazinamide, rifampin

KEY WORDS
plasma; rabbit; derivatization

REFERENCE
Walubo,A.; Chan,K.; Wong,C.L. Simultaneous assay for isoniazid and hydrazine metabolite in plasma and cerebrospinal fluid in the rabbit, *J.Chromatogr.*, **1991**, *567*, 261–266.

SAMPLE
Matrix: blood, CSF
Sample preparation: 200 μL Serum, plasma, or CSF + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, elute the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine hydrochloride and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES
Column: A 30 × 2.1 40 μm preparative grade C18 (Analytichem); B 250 × 4.6 10 μm Partisil C8
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 15 min, maintain at 30:70 for 4 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 280 for 5 min then UV 254

CHROMATOGRAM
Retention time: 3.10

Internal standard: heptanophenone (19.2)
Limit of quantitation: 2500 ng/mL

OTHER SUBSTANCES
Extracted: acetazolamide, ampicillin, bromazepam, caffeine, carbamazepine, chloramphenicol, chlorothiazide, diazepam, droperidol, ethionamide, furosemide, methadone, penicillin G, phenobarbital, phenytoin, prazepam, propoxyphene, pyrazinamide, rifampin, trimeprazine, trimethoprim

KEY WORDS
plasma; serum; column-switching

SAMPLE
Matrix: blood, CSF, urine
Sample preparation: Centrifuge 1.5 mL whole blood, CSF, or urine at 3000 g for 3 min, add 500 μL of the supernatant to 500 μL 10% trichloroacetic acid, centrifuge at 10000 g for 1 min. Remove a 200 μL aliquot and add it to 20 μL water, add 40 μL 1% trans-cinnamaldehyde in MeOH, let stand at room temperature for 10 min, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Partisil 5 C8
Mobile phase: Gradient. A was 50 mM KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 60:40 for 1 min, to 30:70 over 9 min, maintain at 30:70 for 4.5 min, re-equilibrate at initial conditions for 4 min.
Column temperature: 50
Flow rate: 1
Injection volume: 20
Detector: UV 340

CHROMATOGRAM
Retention time: 7
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Extracted: hydrazine

KEY WORDS
whole blood; derivatization

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a 3 mL CN-bonded maxi-clean cartridge (Alltech) with 5 mL MeOH and 2 mL 1% aqueous acetic acid. 2 mL Plasma or urine + 1 mL isopropanol:chloroform 50:50 + 1 μg rifampin, shake for 30 s, add to the SPE cartridge with rinses, collect the eluate, inject an aliquot of the eluate.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Excalibar C18-CN (Alltech)
Mobile phase: MeOH:5 mM tetra-n-butylammonium hydroxide 80:20 adjusted to pH 3.0 with phosphoric acid
Flow rate: 1.5

Injection volume: 20
Detector: UV 265

CHROMATOGRAM
Retention time: 2.7
Internal standard: rifampin (4.3)
Limit of detection: 250 ng/mL (urine), 200 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: pyrazinamide

KEY WORDS
plasma; SPE

SAMPLE
Matrix: milk
Sample preparation: Condition a 3 mL 500 mg C18 SPE cartridge (J.T. Baker) with 6 mL MeOH and 6 mL water. 80 mL milk + 20 mL 20% trichloroacetic acid in water, mix, let stand at room temperature for 5 min, centrifuge at 5500 g for 15 min. Filter (0.45 μm) 75 mL of the liquid, add 1 mL 1% cinnamaldehyde in MeOH to the filtrate, mix for a few s, let stand at room temperature for 15 min, add to the SPE cartridge at 5 mL/min, dry for 10 min, wash with 3 mL mobile phase at 0.2 mL/min, wash with 5 mL n-hexane at 0.3 mL/min, dry for 10 min, elute with 6 mL MeOH. Evaporate the eluate under reduced pressure at 35-40°, reconstitute the residue with 200 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChrospher 100-CN
Column: 250 × 4 5 μm LiChrospher 100-CN
Mobile phase: MeOH:water 40:60 containing 0.41 g/L sodium acetate trihydrate and 10 mL/L glacial acetic acid
Flow rate: 1
Injection volume: 100
Detector: UV 330

CHROMATOGRAM
Retention time: 7.4
Limit of detection: 0.1 ng/mL

KEY WORDS
cow; SPE; derivatization

SAMPLE
Matrix: milk
Sample preparation: Condition a 3 mL 500 mg 40 μm phenyl SPE cartridge (J.T. Baker) with 6 mL MeOH and 6 mL water. 80 mL Milk + 20 mL 20% trichloroacetic acid in water, let stand at room temperature for 5 min, centrifuge at 5500 g for 15 min, filter (0.45 μm cellulose acetate) a 75 mL aliquot. Add the filtrate to 1 mL 1% cinnamaldehyde in MeOH, mix for a few s, let stand at room temperature for 15 min. Add 70 mL of the sample to the SPE cartridge at 3 mL/min, wash with 3 mL MeOH:water 40:60 at 3 mL/min, dry under vacuum for 1 min, wash with 3 mL MeOH:water 46:54 at 3 mL/min, dry under vacuum for 1 min, wash with 3 mL n-hexane at 3 mL/min, dry under vacuum for 1 min, elute with 6 mL MeOH. Evaporate the eluate under vacuum, reconstitute in 233 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChrosphere 100 RP18
Column: 250 × 4 5 μm LiChrosphere 100 RP18
Mobile phase: MeCN:MeOH:buffer 41:13:46 (Buffer was 1% ammonium acetate adjusted to pH 5.5 with acetic acid.)
Flow rate: 1
Injection volume: 100
Detector: UV 330

SAMPLE
Matrix: blood
Sample preparation: Plasma. 1 mL Plasma + 1 mL buffer + 5 mL n-heptane containing 4.6 mM tetraoctylammonium bromide and 10 mL/L 1-octanol, shake for 2 min, centrifuge at 1000 g for 5 min, freeze in dry ice/acetone. Remove the organic phase and add it to 2 mL 1-octanol (saturated with 80 mM acetic acid) and 200 μL 80 mM acetic acid, shake, centrifuge at 1000 g for 5 min. Freeze the aqueous layer and remove the organic layer. Add 1 mL 10 mM HCl, 1 mL buffer, and 5 mL n-heptane containing 4.6 mM tetraoctylammonium bromide and 10 mL/L 1-octanol to the aqueous phase. Shake, centrifuge, freeze, remove the organic layer and add it to 2 mL 2 M pH 8.6 ammonia-ammonium chloride buffer containing 13.4 mM EDTA (but no complex). Freeze, remove the organic layer and add it to 2 mL 1-octanol and 150 μL 80 mM acetic acid, shake, centrifuge at 1000 g for 5 min. Freeze, remove the organic layer and add the aqueous layer to 200 μL MeCN, 50 μL 1.75 M pH 6.95 bicine buffer containing 1% EDTA, 100 μL 100 mM 1,2-diphenylethylenediamine in 100 mM HCl, and 20 μL 20 mM potassium ferricyanide in water. Heat at 37° in the dark for 1 h, inject a 50 μL aliquot (keep it in the dark in the autosampler). Urine. 100 μL Urine + 1 mL 10 mM HCl + 1 mL buffer + 5 mL n-heptane containing 4.6 mM tetraoctylammonium bromide and 10 mL/L 1-octanol, shake for 2 min, centrifuge at 1000 g for 5 min, freeze in dry ice/acetone. Remove the organic phase and add it to 2 mL 1-octanol (saturated with 80 mM acetic acid) and 200 μL 80 mM acetic acid, shake, centrifuge at 1000 g for 5 min. Freeze the aqueous layer and remove the organic layer. Add 1 mL 10 mM HCl, 1 mL buffer, and 5 mL n-heptane containing 4.6 mM tetraoctylammonium bromide and 10 mL/L 1-octanol to the aqueous phase. Shake, centrifuge, freeze, remove the organic layer and add it to 2 mL 1-octanol and 150 μL 80 mM acetic acid, shake, centrifuge at 1000 g for 5 min. Freeze, remove the organic layer and add the aqueous layer to 200 μL MeCN, 50 μL 1.75 M pH 6.95 bicine buffer containing 1% EDTA, 100 μL 100 mM 1,2-diphenylethylenediamine in 100 mM HCl, and 20 μL 20 mM potassium ferricyanide in water. Heat at 37° in the dark for 1 h, inject a 20 μL aliquot (keep it in the dark in the autosampler). (Buffer was a 2 M pH 8.6 ammonia-ammonium chloride buffer containing 8.9 mM diphenyl borate-ethanolamine complex and 13.4 mM EDTA.)

HPLC VARIABLES
Column: 100 × 4.6 3 μm Spherisorb ODS2
Mobile phase: Gradient. A was MeCN:MeOH:50 mM pH 7.0 sodium acetate buffer 20:20:60. B was MeCN:MeOH:50 mM pH 7.0 sodium acetate buffer 60:10:30. A:B 52:48 for 6 min, go to 0:100 over 0.1 min, stay at 0:100 for another 10 min. Equilibrate at initial conditions for 4 min before next sample.
Flow rate: 1
Injection volume: 20-50
Detector: F ex 350 em 480

CHROMATOGRAM
Retention time: 9
Internal standard: isoproterenol

OTHER SUBSTANCES
Simultaneous: dobutamine, epinephrine, dopamine, epinine, norepinephrine, metabolites
Interfering: α-methyldopa

KEY WORDS
plasma; isoproterenol is IS; derivatization

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Mix plasma and N-methyldopamine, add to a TOYOPAK SP strong cationic exchange SPE cartridge (Tosoh), elute with MeCN:600 mM KCl 50:50 containing 0.6 mM potassium hexacyanoferrate (III), derivatize eluate with 1,2-diphenylethylenediamine, inject an aliquot.

HPLC VARIABLES
Column: 150 × 4.6 Nucleosil 5C18
Mobile phase: MeOH:50 mM Tris-HCl buffer 80:20, adjusted to pH 7.0
Flow rate: 1
Detector: F

KEY WORDS
plasma; guinea pig; SPE; derivatization; pharmacokinetics

REFERENCE
Ohtani,H.; Yamamoto,K.; Sawada,Y.; Iga,T. Antibronchospasmic, tachycardiac, and hypokalaemic effects of L-isoproterenol in guinea-pigs, *Biopharm.Drug Dispos.*, **1995**, *16*, 745–753.

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a Toyopak IC-SP S sulfopropyl resin, H^+ form, SPE cartridge (Tosoh) with 10 mL water and 2 mL 200 mM pH 5.0 sodium phosphate buffer. Plasma. 700 μL Plasma + 50 μL 7 μM 3,4-dihydroxyphenylpropanoic acid + 350 μL 2 M perchloric acid, mix, centrifuge at 4° at 1000 g for 15 min. Remove a 700 μL aliquot of the supernatant and adjust the pH to 1.5-2.0 with about 150 μL 2 M potassium carbonate, centrifuge at 4° at 1000 g for 5 min, add the supernatant to the SPE cartridge, wash with 10 mL water, elute with 300 μL MeOH:2 M sodium perchlorate 7:93, filter (cellulose acetate membrane), inject a 100 μL aliquot of the filtrate. Urine. Collect human urine for 24 h in the presence of 10 mL 6 M HCl. 500 μL Urine + 25 μL 800 μM 3,4-dihydroxyphenylpropanoic acid + 500 μL 1 M perchloric acid, mix, centrifuge at 4° at 1000 g for 15 min. Remove a 700 μL aliquot of the supernatant and adjust the pH to 1.5-2.0 with about 130 μL 2 M potassium carbonate, centrifuge at 4° at 1000 g for 5 min, add the supernatant to the SPE cartridge, wash with 1.5 mL water, wash with 500 μL EtOH:water 50:50, wash with 5 mL water, elute with 500 μL 1.5 M KCl in MeOH:100 mM HCl 7:93, filter (cellulose acetate membrane), inject a 100 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 250 × 4.6 5 μm TSK-gel ODS-80TM (Tosoh)
Mobile phase: MeOH:buffer 7:93 (Buffer was 30 mM pH 2.5 citrate buffer containing 0.4 mM sodium octanesulfonate.)
Flow rate: 0.8
Injection volume: 100
Detector: F ex 350 em 480 following post-column reaction. The column effluent mixed with reagent A pumped at 0.3 mL/min and the mixture flowed through a 3 m × 0.5 mm ID stainless steel coil at 90°. The effluent from this coil mixed with reagent B pumped at 0.3 mL/min and the mixture flowed through a 10 m × 0.5 mm ID stainless steel coil at 90° and through a 1 m × 0.5 mm ID stainless steel cooling coil to the detector (Anal. Sci. 1991, 7, 257). (Reagent A was 10 mM sodium periodate containing 3 mM potassium ferricyanide. Reagent B was 30 mM

meso-1,2-diphenylethylenediamine in EtOH:water 70:30 containing 130 mM sodium methylate.)

CHROMATOGRAM
Retention time: 60
Internal standard: isoproterenol

OTHER SUBSTANCES
Extracted: dopamine, epinephrine, levodopa, metanephrine, 3-methoxytyramine, norepinephrine, normetanephrine

KEY WORDS
post-column reaction; plasma; SPE; isoproterenol is IS

SAMPLE
Matrix: formulations
Sample preparation: Tablets. Grind tablets, weigh out a portion, dissolve in 50 mL mobile phase, sonicate, filter (No. 4 sintered glass plate), dilute, inject an aliquot. Capsules. Dissolve 10 capsules (without opening) in 100 mL mobile phase, sonicate, inject an aliquot. Injections, ampules, sprays. Dilute, inject an aliquot.

HPLC VARIABLES
Column: 120 × 4.6 Spherisorb C18 ODS-2
Mobile phase: Isopropanol:buffer 5:95 (Buffer was 100 mM sodium dodecyl sulfate containing 25 mM Na_2HPO_4, pH adjusted to 3.0 with HCl.)
Flow rate: 1
Injection volume: 20

Detector: UV 280

CHROMATOGRAM
Retention time: 6
Limit of detection: 16 ng/mL

OTHER SUBSTANCES
Simultaneous: carbidopa, dopamine, epinephrine, hydrochlorothiazide, levodopa, methyldopa, norepinephrine, phenylephrine

KEY WORDS
tablets; capsules; injections; ampules; sprays

SAMPLE
Matrix: perfusate
Sample preparation: 30 μL Perfusate (artificial CSF) + 10 μL 200 mM perchloric acid. Mix a 25 μL aliquot with 12.5 μL reagent, let stand for 2 min, inject an aliquot. (Prepare a stock solution by dissolving 27 mg o-phthalaldehyde in 1 mL MeOH, add 5 μL β-mercaptoethanol, add 9 mL 100 mM pH 9.3 sodium tetraborate containing 10 μM EDTA. This solution is good for 5 days in a sealed amber bottle at room temperature. Prepare the working reagent by diluting 1 mL of the stock solution with 3 mL 100 mM pH 9.3 sodium tetraborate containing 10 μM EDTA, allow to stand for 24 h before use.)

HPLC VARIABLES
Column: two columns 150 × 4.6 5 μm M.S. Gel C18 (ESA)
Mobile phase: MeOH:buffer 8:92 adjusted to pH 3.0 with phosphoric acid (Buffer was 54 mM NaH_2PO_4 containing 1.24 mM sodium heptanesulfonate.)
Column temperature: 33
Flow rate: 1.2
Detector: E, ESA Coulochem Electrode Array System Model 5500, detector temp 33°, oxidation potential 70 mV

CHROMATOGRAM
Retention time: 8.90
Limit of quantitation: 0.5 ng/mL

OTHER SUBSTANCES
Extracted: apomorphine, dopamine, hydralazine, methoxamine, morphine, norepinephrine, phenylephrine

KEY WORDS
rat; derivatization

Matrix: blood
Sample preparation: 3 mL Plasma + 30 μL 1 μg/mL nitroglycerin in n-hexane + 12 mL dichloromethane:ethyl acetate 1:1, shake mechanically at 250 cycles/min for 5 min, centrifuge at 550 g at 4° for 5 min. Remove the organic phase and evaporate it to about 20 μL under a stream of nitrogen at room temperature, inject.

HPLC VARIABLES
Column: 250 × 4 10 μm Zorbax NH_2
Mobile phase: n-Hexane:MeOH 95:5
Flow rate: 5
Injection volume: 20
Detector: Thermal energy analyzer, Thermo Electron Corp. Model 502A, furnace temp 575°, argon 15 mL/min, oxygen 25 mL/min, MeOH/dry ice slush bath

CHROMATOGRAM
Retention time: 5.8 (2-isomer), 8.4 (5-isomer)
Internal standard: nitroglycerin (5.0)
Limit of detection: 1-1.2 ng/mL (5-isomer), 0.5-0.8 ng/mL (2-isomer)
Limit of quantitation: 1.66 ng/mL (5-isomer), 0.86 ng/mL (2-isomer)

OTHER SUBSTANCES
Simultaneous: isosorbide dinitrate

KEY WORDS
plasma

REFERENCE
Maddock,J.; Lewis,P.A.; Woodward,A.; Massey,P.R.; Kennedy,S. Determination of isosorbide dinitrate and its mononitrate metabolites in human plasma by high-performance liquid chromatography-thermal energy analysis, *J.Chromatogr.*, **1983**, *272*, 129–136.

SAMPLE
Matrix: bulk, formulations
Sample preparation: Prepare a 500 μg/mL aqueous solution, filter, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 200 × 2.1 5 μm Hypersil ODS
Mobile phase: MeOH:water 20:80
Flow rate: 0.4 for 3 min, to 0.6 over 0.5 min, maintain at 0.6 for 9.5 min, return to 0.4 over 0.5 min
Injection volume: 5
Detector: UV 210

CHROMATOGRAM
Retention time: 3.06 (2 isomer), 3.49 (5 isomer)

OTHER SUBSTANCES
Simultaneous: isosorbide dinitrate
Noninterfering: lactose

REFERENCE
Azcona,T.; Martin-Gonzalez,A.; Zamorano,P.; Pascual,C.; Grau,C.; Garcia de Mirasierra,M. New methods for the assay of 5-isosorbide mononitrate and its validation, *J.Pharm.Biomed.Anal.*, **1991**, *9*, 725–729.

SAMPLE
Matrix: formulations
Sample preparation: Weigh out an amount of finely powdered tablets or capsules equivalent to about 25 mg of drug. Add 50 mL buffer, shake for 30 min, add 10 mL 5 mg/mL nitroglycerin in MeOH, make up to 100 mL with buffer, filter (0.45 μm), inject a 20 μL aliquot. If the sample clumps when the buffer is added, agitate with a stirring rod and sonicate. (Buffer was MeOH: 200 mM ammonium acetate buffer:water 55:10:35.)

HPLC VARIABLES
Guard column: 50 × 6.4 25-37 μm Whatman Co-Pell ODS
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: A MeOH:200 mM ammonium acetate buffer:water 55:10:35; B MeOH:200 mM ammonium acetate buffer:water 20:10:70
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 3.1 (mobile phase A), 7.20 (2-isomer, mobile phase B), 8.55 (5-isomer, mobile phase B), 46.2 (dinitrate, mobile phase B)
Internal standard: nitroglycerin (8, mobile phase A)

OTHER SUBSTANCES
Simultaneous: saccharin, isosorbide dinitrate, pentaerythritol tetranitrate

KEY WORDS
tablets; capsules

SAMPLE
Matrix: solutions

HPLC VARIABLES
Guard column: 10 mm long reversed-phase pellicular (Chrompack)
Column: 250 × 4.6 10 μm LiChrosorb RP-8
Mobile phase: MeCN:MeOH:buffer 16:8:76 (Buffer was 10 mL triethylamine in 760 mL water adjusted to pH 6.8 with acetic acid.)
Flow rate: 2
Injection volume: 175
Detector: UV 230

CHROMATOGRAM
Retention time: 3.6 (5 isomer)

OTHER SUBSTANCES
Simultaneous: acenocoumarol, acetaminophen, alizapride, alpiropride, amisulpride, aspirin, caffeine, carbamazepine, clonazepam, codeine, metoclopramide, nitrazepam, nitrofurantoin, theophylline
Noninterfering: amitriptyline, cisplatin, furosemide, indomethacin, isosorbide dinitrate, orphenadrine, propranolol

KEY WORDS
plasma; SPE

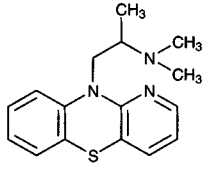
Isothipendyl



Molecular formula: $C_{16}H_{19}N_3S$
Molecular weight: 285.41
CAS Registry No.: 482-15-5, 1225-60-1 (HCl)
Merck Index: 5248
Lednicer No.: 1 430

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 248.8

CHROMATOGRAM
Retention time: 13.467

KEY WORDS
whole blood

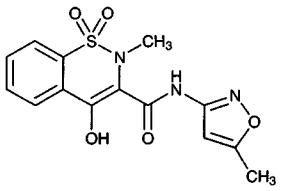
Isoxicam



Molecular formula: $C_{14}H_{13}N_3O_5S$
Molecular weight: 335.34
CAS Registry No.: 34552-84-6
Merck Index: 5258
Lednicer No.: 2 394

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Plasma. 500 μL Plasma + 250 μL 1 M HCl + 5 mL diethyl ether, shake at 240 rpm on an orbital shaker for 6 min, centrifuge at 900 g at 4° for 10 min. Remove the organic phase and evaporate it to dryness at 37° under nitrogen. Reconstitute the residue in 250 μL MeCN:water 1:1, vortex for 1 min, inject a 50 μL aliquot. Urine, bile. 500 μL Urine or bile + 250 μL 1 M HCl + 5 mL diethyl ether, shake at 240 rpm on an orbital shaker for 6 min, centrifuge at 900 g at 4° for 10 min. Remove the organic phase, wash it with 2 mL pH 4.9 citric acid-phosphate buffer, and evaporate it to dryness at 37° under nitrogen. Reconstitute the residue in 250 μL MeCN:water 1:1, vortex for 1 min, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: Techsil C10 CN guard column

Column: 200 × 3.9 10 μm Techsil C10 CN (HPLC Technology)
Mobile phase: MeCN:water 22:78 (10:90 for bile analyses) containing 50 mM NaH_2PO_4, final pH 3.5
Flow rate: 2.5
Injection volume: 50
Detector: UV 365

CHROMATOGRAM
Retention time: 7.6, 17 (for bile)
Internal standard: isoxicam

OTHER SUBSTANCES
Simultaneous: piroxicam, 5-hydroxypiroxicam

CHROMATOGRAM

Retention time: 15.1 (plasma), 16.3 (blood)
Internal standard: isoxsuprine hydrochloride

OTHER SUBSTANCES

Extracted: ritodrine
Simultaneous: fenoterol

Sample preparation: Condition a 6 mL Bond Elut C18 SPE cartridge with 5 mL MeOH and 5 mL water. Filter 30 mL microsomal incubation, add filtrate to SPE cartridge, elute with MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 10 μm C18 (Alltech)
Mobile phase: Gradient. MeCN:200 mM pH 6.5 ammonium acetate 10:90 for 5 min, to 20:80 over 5 min, maintain at 20:80 for 10 min, to 50:50 over 10 min.
Flow rate: 1
Detector: UV 254, UV 362

CHROMATOGRAM

Retention time: 35

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

rabbit; liver; SPE

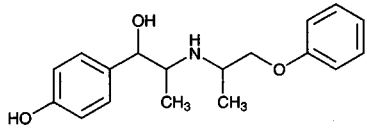
Isoxsuprine



Molecular formula: $C_{18}H_{23}NO_3$
Molecular weight: 301.39
CAS Registry No.: 395-28-8, 579-56-6 (HCl)
Merck Index: 5259
Lednicer No.: 1 69

SAMPLE

Matrix: blood
Sample preparation: Dilute blood with an equal volume of water. 1 mL Plasma or 900 μL diluted blood + 0.9-1 mL buffer + 5 mL freshly distilled ethyl acetate, vortex for 1 min, centrifuge at 1750 g for 7 min. Remove the organic layer and evaporate it almost to dryness under a stream of nitrogen at 57°, evaporate the final 500 μL at room temperature, reconstitute the residue in 100 μL MeCN, vortex for 15 s, inject the whole amount. (Buffer was 26.5 g sodium carbonate and 21 g sodium bicarbonate in 500 mL water, pH 9.48.)

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak phenyl (plasma) or 200 × 4.6 5 μm Spheri-5 RP-18 (blood)
Mobile phase: MeCN:0.05% orthophosphoric acid 17:83 (plasma) or 63:37 (blood)
Flow rate: 2
Injection volume: 100
Detector: F ex 200 no emission filter or UV 254

CHROMATOGRAM

Retention time: 15.1 (plasma), 16.3 (blood)
Internal standard: isoxsuprine hydrochloride

OTHER SUBSTANCES

Extracted: ritodrine
Simultaneous: fenoterol

Noninterfering: acetaminophen, albuterol, betamethasone, bupivacaine, caffeine, chloral hydrate, dexamethasone, diazepam, lignocaine, meperidine, metoclopramide, morphine, nitrazepam, terbutaline

KEY WORDS
isoxsuprine is IS; plasma; whole blood

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + nylidrin + 500 μL buffer, mix briefly, add 50-75 mg resin, mix at 10-25 rpm for 30 min, discard the supernatant, wash twice with 1 mL buffer, add 500 μL 50 mg/mL KOH in MeOH:water 50:50, mix for 30 min, inject a 20 μL aliquot of the eluate. (Buffer was 100 mM citric acid:200 mM Na_2HPO_4 29:71, pH 6.5 (McIlvaine buffer) Wash 20-50 mesh Dowex HCR-S resin twice with water and allow it to equilibrate in buffer).

HPLC VARIABLES
Guard column: 25 × 4.6 5 μm Spherisorb ODS-I
Column: 250 × 4.6 5 μm Spherisorb ODS-I
Mobile phase: MeCN:MeOH:buffer 30:18:52 containing 1.8 mM octanesulfonic acid (Buffer was 30 mM KH_2PO_4 adjusted to pH 3.0 with concentrated orthophosphoric acid.)
Flow rate: 1
Injection volume: 20
Detector: E, Gynotek M20, glassy carbon working electrode 950 mV, Ag/AgCl reference electrode

CHROMATOGRAM
Retention time: 8.5
Internal standard: nylidrin (11)
Limit of detection: 1 ng/mL (from 2 mL plasma)
Limit of quantitation: 5 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

CHROMATOGRAM

SAMPLE

Matrix: cells, culture medium

Sample preparation: Cells. To 100 μL containing 40 × 10^6 cell suspension add 100 μL of a methanolic solution of p-phenoxyphenol and benzoylated spermine so as to give concentrations of 10.63 μm and 2815 nM, respectively. Vortex for 1 min, sonicate for 3 min, add 200 μL MeOH, vortex for 1 min, centrifuge at 2000 g for 5 min, inject a 50 μL aliquot of the supernatant. Culture medium. To 5 mL culture medium add 200 μL of a methanolic solution of p-phenoxyphenol and benzoylated spermine so as to give concentrations of 10.63 μm and 2815 nM, respectively. Adjust the pH to 8.0 with 1 M NaOH, add 5 mL chloroform (Caution! Chloroform is a carcinogen!), mix at 30 rpm for 30 min, centrifuge at 1000 g for 5 min, remove the chloroform layer. Adjust the aqueous phase to pH 3.0 with 1 M HCl, add 1 mL 100 mM pH 3 citrate buffer and 1 mL 37 mM tetrabutylammonium hydrogen sulfate. Extract the aqueous phase with 5 mL chloroform at 30 rpm for 30 min, centrifuge at 1000 g for 5 min. Combine the chloroform layers and evaporate them to dryness under a stream of nitrogen, dissolve the residue in 300 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 5 μm Chromspher C8 (Chrompack)

Mobile phase: MeOH:THF:buffer 43.6:1:55.4 (Buffer was water containing 160 mM NaH_2PO_4 and 17 mM tetrabutylammonium hydrogen sulfate, pH 3.0.)

Flow rate: 1

Injection volume: 50

Detector: UV 240

CHROMATOGRAM
Retention time: 37
Internal standard: p-phenoxyphenol (19), benzoylated spermine (33)

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 1 mL 50 mM sodium borate + 100 μL 10 μg/mL IS in MeOH + 200 μL MeOH, extract twice with 4 mL aliquots of heptane:isoamyl alcohol 95:5 in a rotary mixer. Combine the organic phases and add them to 2 mL 1 M sulfuric acid, extract. Discard the organic phase and add 600 μL concentrated ammonium hydroxide to the aqueous phase. Extract the aqueous phase twice with 2.5 mL portions of heptane:isoamyl alcohol 95:5. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL MeCN:water 60:40, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: C18
Column: 100 × 4.5 3 μm Hypersil octadecylsilane
Mobile phase: MeCN:water 40:60 containing 0.03% diethylamine adjusted to pH 7.8 with dilute orthophosphoric acid
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: k' 7.4
Internal standard: cis-4-[4-[4-[4-[[2-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-1-piperazinyl]phenyl]-2,4-dihydro-5-methyl-2-(3-methylbutyl)-3H-1,2,4-triazol-3-one (R51012) (k' 10.8)
Limit of quantitation: 20 ng/mL

OTHER SUBSTANCES

Extracted: metabolites, hydroxyitraconazole

SAMPLE
Matrix: milk
Sample preparation: Prepare a SPE cartridge by adding 2 g 40 μm Bondesil C18 18% load endcapped (Varian) to a 25 mL syringe barrel fitted with a 20 μm frit, wash with 5 mL petroleum ether, 5 mL acetone, and two 5 mL aliquots of MeOH, aspirate with full vacuum for <5 s (A). Condition a 500 mg Bond Elut LRC silica SPE cartridge with 3 mL hexane:ethyl acetate 60:40 (B). Condition a 500 mg Bond Elut LRC silica SPE cartridge with 4 mL chloroform (C). 25 mL Milk + 200 μL 500 ng/mL abamectin (avermectins) in MeOH, mix, add 5 mL to the SPE cartridge (A), mix milk with C18 material, let stand for 2 min, wash spatula with water, wash with two 5 mL portions of water, elute with 10 mL ethyl acetate, allow eluate to pass through a 5 cm layer of anhydrous sodium sulfate. Evaporate the eluate to dryness under a stream of nitrogen below 50°, add 2 mL hexane:ethyl acetate 60:40 to the oily residue, vortex, sonicate for 1 min, add mixture to SPE cartridge (B), rinse in with 1 mL hexane:ethyl acetate 60:40, wash with 5 mL hexane:ethyl acetate 60:40, elute with 5 mL MeOH:ethyl acetate 50:50. Evaporate the eluate to dryness under a stream of nitrogen below 60° (this residue should have no moisture in it), reconstitute the residue in 100 μL reagent, vortex gently for a few s, heat at 95° for 1 h, cool, add 1 mL chloroform, vortex, add to SPE cartridge (C), wash in with three 1 mL portions of chloroform, elute with 2 mL chloroform. Collect all the eluate and evaporate it to dryness under a stream of nitrogen below 60°, reconstitute in 500 μL MeOH, inject a 50 μL aliquot. (Prepare reagent by sequentially mixing 900 μL DMF, 300 μL acetic anhydride, and 200 μL N-methylimidazole just before use.)

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX

Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

SAMPLE

Matrix: tissue
Sample preparation: Condition a 3 mL 500 mg Isolute C8 end-capped SPE cartridge (International Sorbent Technologies) with 5 mL MeCN and 5 mL MeCN:water 1:2 containing 0.1% triethylamine. Condition a 3 mL 500 mg Isolute silica SPE cartridge (International Sorbent Technologies) with 5 mL ethyl acetate:hexane 40:60. Homogenize (Tissuemizer) 5 g tissue in 25 mL MeCN, centrifuge at 3000 rpm for 5 min, decant supernatant into 50 mL water and 75

μL triethylamine. mix, pass through the C8 SPE cartridge at 2 mL/min, discard eluate, dry column under vacuum for 5 min, elute with 5 mL MeCN. Dry the eluate under a stream of nitrogen at 50-55°, resolubilize dry residues in 5 mL of ethyl acetate:hexane 40:60, vortex briefly, pass through the silica SPE cartridge at 2 mL/min. Rinse the reservoir with 5 mL ethyl acetate:hexane 40:60, add the rinse to the SPE cartridge. Dry the SPE cartridge for 5 min, elute with 5 mL MeOH:ethyl acetate 50:50, dry the eluate under a stream of nitrogen at 50-55°. Reconstitute the extract with 200 μL of fresh methylimidazole:MeCN 50:50, vortex briefly, add 300 μL of fresh trifluoroacetic anhydride:MeCN 1:2, vortex briefly, dry under a stream of nitrogen at 50-55° for 15 min. Add 500 μL MeOH:ammonium acetate:molecular sieves 4:1:1), vortex briefly, dry under a stream of nitrogen at 50-55°. Add 1 mL MeCN, vortex thoroughly, filter (0.45 μm), inject a 50 μL aliquot.

HPLC VARIABLES
Column: 200 × 4.6 5 μm Hypersil ODS (C18)
Mobile phase: MeCN-water 90:10
Column temperature: 65
Flow rate: 1.0
Injection volume: 50
Detector: F ex 272 em 465

CHROMATOGRAM
Retention time: 11 (B1b), 12.5 (B1a)
Limit of detection: 0.25 ppb

OTHER SUBSTANCES
Extracted: doramectin

KEY WORDS
SPE; derivatization; salmon; muscle

SAMPLE
Matrix: tissue
Sample preparation: Condition a C8 Bond-Elut SPE cartridge with 5 mL MeCN and 5 mL MeCN:water 30:70 containing 0.1% triethylamine. Mix 5 g muscle with 15 mL MeCN in a high speed blender for 1 min. Centrifuge at 3000 rpm for 5 min. Dilute 15 mL of the supernatant with 35 mL water, add 50 μL triethylamine, add to the SPE cartridge, elute with 5 mL MeCN, evaporate the eluate to dryness under a stream of nitrogen at 60°. Dissolve the residue in 1 mL MeOH, filter (0.45 μm Millipore filter). Transfer a 500 μL aliquot to a silanized 3 mL reaction vial, evaporate to dryness. Add 100 μL derivatization reagent, heat at 95° for 1 h. Cool to room temperature, add 1 mL chloroform, vortex, add quantitatively to a Sep-Pak silica SPE cartridge with 3-4 mL chloroform. Elute with 9 mL chloroform, evaporate the combined chloroform eluates to dryness. Dissolve the residue in 500 μL MeOH, filter (0.45 μm Millipore filter), inject a 50 μL aliquot. (Caution! Chloroform is a carcinogen! Derivatization reagent was 1-methylimidazole:acetic anhydride:DMF 2:6:9, freshly prepared.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Shandon ODS Hypersil C18
Mobile phase: MeOH:water 97:3
Column temperature: 30
Flow rate: 1
Injection volume: 50
Detector: F ex 364 em 470

CHROMATOGRAM
Retention time: 14
Limit of detection: 500-1000 ng/kg

SAMPLE
Matrix: tissue
Sample preparation: Add 15 mL MeOH to 5 g ' homogenized liver, shake thoroughly by hand and again using a shaking apparatus at medium speed for 1 h. Adjust the volume to 20 mL with MeOH, shake, centrifuge at 2000 g for 5 min. Mix 10 mL supernatant with 40 mL phosphate buffer A, add to immunoaffinity column (column preparation described in detail in paper) at 1.2 mL/min, wash with 40 mL MeOH:phosphate buffer B 10:90 and 10 mL MeOH:water 20:80. Elute with 3 mL MeOH, evaporate the eluate to less than 1 mL on a rotary evaporator at 55°, vortex with 5 mL ethyl acetate for 15 s. Collect the organic layer, evaporate to dryness at 55°, redissolve the residue in 1 mL mobile phase by vortexing for 15 s, filter (0.45 μm filter), inject a 100 μL aliquot of the filtrate. (Phosphate buffer A was 200 mg KH_2PO_4, 2900 mg Na_2HPO_4, 200 mg KCl, and 8800 mg NaCl in 900 mL water adjusted to pH 7.4 with 2 M NaOH and diluted to 1 L with water. Phosphate buffer B was 200 mg KH_2PO_4, 2900 mg Na_2HPO_4, 200 mg KCl, and 29.3 g NaCl in 900 mL water adjusted to pH 7.4 with 2 M NaOH and diluted to 1 L with water.)

SAMPLE
Matrix: tissue
Sample preparation: Condition a 6 mL 500 mg Bond Elut C18 SPE cartridge with 5 mL MeCN and 5 mL MeCN:water:triethylamine 30:70:0.1. Homogenize (Polytron) 5 g tissue and 15 mL MeCN for 20 s, rinse probe with 5 mL MeCN, shake mechanically at high speed for 5 min, centrifuge at 2000 g for 5 min. Re-extract the solid with 10 mL MeCN. Add the supernatants to the alumina column. Combine the eluates, add 70 mL water, add 100 μL triethylamine, mix, add to the C18 SPE cartridge, pull air through the SPE cartridge for 3 min, elute with 5 mL MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL freshly prepared reagent, vortex for 15 s, heat at 95-100° for 45 min, cool, add 1 mL chloroform, vortex, add to a 2.8 mL 500 mg Bond Elut silica SPE cartridge, elute with three 3 mL aliquots of chloroform. Combine the eluates and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 1 mL MeOH, filter, inject a 40 μL aliquot. (Prepare alumina column as follows. Shake 94 g Brockman Activity I neutral alumina (Fisher) and 6 mL water for 45 min, add 4.5 g alumina to an 8 mL column with a frit. Reagent was 200 μL 1-methylimidazole, 600 μL acetic anhydride, and 900 μL DMF.)

SAMPLE
Matrix: tissue
Sample preparation: Condition a 6 mL 500 mg Bakerbond C18 SPE cartridge with three 5 mL portions of MeOH, 5 mL MeCN, and three 5 mL portions of MeCN:water:triethylamine 30:70:0.1. Condition a Waters silica SPE cartridge with 8 mL chloroform. Homogenize (Ultraturrax) 5 g minced tissue with 15 mL MeCN at high speed for 3 min, rinse blade with 2 mL MeCN, sonicate for 15 min, centrifuge at 3000 rpm for 5 min, filter (paper), extract the residue again with 10 mL MeCN, wash the filter with 3 mL MeCN. Combine the organic layers and add 70 mL water and 100 μL triethylamine, stir thoroughly, add to the C18 SPE cartridge, wash with two 5 mL portions of MeCN:water 50:50, elute with 7 mL MTBE at 2 mL/min. Store the eluate overnight at -20°, remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 3 mL MeOH, add 100 μL water, add 3 mL hexane, vortex, remove the hexane layer, repeat the hexane wash. Extract the combined hexane layers with 1 mL MeOH. Combine the MeOH layers and evaporate them to dryness under a stream of nitrogen at 50°, heat in a vacuum oven at 50° for 30 min, reconstitute the residue in 150 μL 1-methylimidazole:acetic anhydride:DMF 2:3:9 (freshly prepared), vortex for 30 s, heat at 100° for 1 h, cool, add 1 mL chloroform, vortex, add to the silica SPE cartridge, elute with three 3 mL portions of chloroform. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 400 μL MeOH, vortex, inject a 20 μL aliquot.

SAMPLE
Matrix: tissue
Sample preparation: Condition a 500 mg Bond Elut SCX SPE cartridge (Varian) with 5 mL MeOH and 10 mL 100 mM pH 4.4 KH_2PO_4 buffer. Homogenize 5 g tissue with 100 mL MeOH: 0.3% metaphosphoric acid 30:70 at high speed for 2 min, filter through 2 mm Hyflo Super-Cel coated on a suction funnel (when filtering liver or kidney add several grams of Hyflo Super-Cel to the homogenized solution before filtration). Evaporate the filtrate to ca. 20 mL under reduced pressure at 45°, add to the SPE cartridge, wash with 10 mL distilled water and 5 mL 100 mM pH 8.9 K_2HPO_4 buffer, elute with 10 mL MeOH, evaporate the eluate to dryness under reduced pressure at 45°, dissolve the residue in 1 mL MeCN:50 mM pH 4.5 NaH_2PO_4 buffer 30:70, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Puresil 5C18 (Waters)
Mobile phase: Gradient. A:B from 60:40 to 0:100 over 16 min. A was buffer. B was MeCN:buffer 40:60 (Buffer was 2.5 g KH_2PO_4 dihydrate and 0.65 mL 85% phosphoric acid dissolved in 1 L distilled water, pH 2.5.)

Column temperature: 35
Flow rate: 1
Injection volume: 10
Detector: UV 232 for 9 min, UV 287 for 2 min, UV 232 for 4 min

CHROMATOGRAM
Retention time: 13.73
Limit of detection: 50 ng/g

OTHER SUBSTANCES
Extracted: leucomycin (kitasamycin), mirosamicin, spiramycin, tylosin

KEY WORDS
meat; SPE

SAMPLE
Matrix: tissue
Sample preparation: Blend (Virtis model 45 with U-shaped blades) 2.5 g tissue with 20 mL MeCN:10 mM pH 6.0 phosphate buffer 65:35 for 10 min, centrifuge at 5° at 8500 g for 5 min. Remove the supernatant and adjust the volume to 25 mL with MeCN:10 mM pH 6.0 phosphate buffer 65:35. Remove a 1.5 mL aliquot and add it to 5 mL isooctane, shake for 10 min, centrifuge at 5° at 3000 g for 5 min, discard the organic layer. Add 500 μL reagent to the aqueous layer, mix, heat at 90° for 2 h, cool, inject a 100 μL aliquot. (Prepare reagent by dissolving 1 g cyclohexa-1,3-dione and 25 g ammonium acetate in 60 mL water and 8 mL concentrated HCl, make up to 100 mL with water. Store at 5°, discard after 1 month.)

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChrospher 100 RP-18 end capped
Column: 125 × 4 5 μm LiChrospher 100 RP-18 end capped
Mobile phase: MeCN:MeOH:10 mmole pH 6.0 phosphate buffer 45:5:50
Column temperature: 45
Flow rate: 1.5
Injection volume: 100
Detector: F ex 375 em 450

CHROMATOGRAM
Retention time: 10.3
Limit of detection: 25 ng/g

OTHER SUBSTANCES
Simultaneous: spiramycin, tylosin
Noninterfering: acetaldehyde, benzaldehyde, erythromycin, formaldehyde

Kanamycin

Molecular formula: $C_{18}H_{36}N_4O_{11}$ (A)
Molecular weight: 484.51 (A)
CAS Registry No.: 8063-07-8, 25389-94-0 (A sulfate), 59-01-8 (A), 4696-78-8 (B)
Merck Index: 5293

	R	R'
Kanamycin A	NH_2	OH
Kanamycin B	NH_2	NH_2
Kanamycin C	OH	NH_2

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 300 μL Plasma + 30 μL water + 100 μL 2 M perchloric acid, vortex for 2-3 s, centrifuge at 1000 g for 5 min. Remove the supernatant and neutralize it with 1.5 M NaOH, add 300 μL buffer, add 400 μL DMSO, add 100 μL 2% 2,4-dinitrofluorobenzene in EtOH, vortex, heat at 64° for 30 min, add 3 mL toluene, vortex, centrifuge, discard the upper toluene layer, add 3 mL MeCN:toluene 50:50, vortex for 5-10 s. Remove the upper organic layer and evaporate it to dryness under a stream of nitrogen at 30-40°, reconstitute the residue in 1 mL MeCN:water 50:50, inject a 20 μL aliquot. Urine. Dilute urine 100-fold with water. 300 μL Diluted urine + 30 μL water + 300 μL buffer + 400 μL DMSO + 100 μL 2% 2,4-dinitrofluorobenzene in EtOH, vortex, heat at 64° for 30 min, add 3 mL toluene, vortex, centrifuge, discard the upper toluene layer, add 3 mL MeCN:toluene 50:50, vortex for 5-10 s. Remove the upper organic layer and evaporate it to dryness under a stream of nitrogen at 30-40°, reconstitute the residue in 1 mL MeCN:water 50:50, inject a 20 μL aliquot. (Prepare buffer by mixing 80 mL 100 mM Na_2HPO_4 and 20 mL 100 mM NaH_2PO_4, adding 1 g Tris HCl, and adjusting the pH to 7.8 with 6 M HCl.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Zorbax SB-C18
Mobile phase: MeOH:water 64:36, adjusted to pH 3.0 with phosphoric acid
Column temperature: 50
Flow rate: 2
Injection volume: 10-20
Detector: UV 350

CHROMATOGRAM

Retention time: 24.0 (kanamycin B)
Internal standard: kanamycin B (24.0)

OTHER SUBSTANCES

Extracted: paromomycin

SAMPLE
Matrix: blood
Sample preparation: Activate two 130 mg Sep-Pak Light C18 SPE cartridges with 1 mL MeOH and 1 mL water. Add 1 mL plasma onto SPE cartridge, wash with 1 mL water, 2 mL 5 mM pH 9.6 ammonium sulfate buffer containing 3% MeCN, and 1 mL 5 mM pH 9.6 ammonium sulfate buffer containing 20% MeCN. Displace washing solution with 200 μL 20 mM pH 2.1 phosphoric acid buffer containing 25% MeCN and elute with 500 μL of the same solution. Mix eluate with 1 mL 40 mM pH 11.5 sodium hydroxide. Add the mixture onto the second SPE cartridge, wash with 2 mL 5 mM pH 9.6 ammonium sulfate buffer containing 3% MeCN and with 1 mL 5 mM pH 9.6 ammonium sulfate buffer containing 20% MeCN. Displace washing solution with 200 μL 20 mM pH 2.1 phosphoric acid buffer containing 25% MeCN and elute with 500 μL of the same solution. Evaporate the eluate in a vacuum centrifuge to about 150 μL, add 12 μL 1 mM sodium hydroxide immediately before injection, inject the whole volume on the column. (Buffers were adjusted with ammonia. SPE flow-rate at all steps was approximately 1.5 mL/min.)

HPLC VARIABLES
Column: 150 × 4.0 5 μm Chiral AGP (Chrom Tech, Sweden)
Mobile phase: MeOH:10 mM pH 7.0 KH_2PO_4 16:84 (Buffer was adjusted with potassium hydroxide.)
Column temperature: 40
Flow rate: 1
Injection volume: 162
Detector: UV 220

CHROMATOGRAM
Retention time: 12 (S), 14 (R)
Limit of detection: 1.7 ng/mL (S), 2.0 ng/mL (R)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES
Extracted: metabolite

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 202.8

CHROMATOGRAM
Retention time: 9.637

KEY WORDS
whole blood

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL Bond-Elut C18 SPE cartridge with 1 mL MeOH. 1 mL Serum + 1 mL water + 20 μL saturated ammonium sulfate solution + 60 μL concentrated HCl, vortex for 3 min, add to the SPE cartridge, wash with three 1 mL portions of water, allow to dry for 3 min, elute with five 500 μL portions of MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 1 mL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 5 μm Spheri-5 cyano
Mobile phase: MeCN:MeOH:water:phosphoric acid 21:22:56.5:0.5
Flow rate: 0.5
Injection volume: 100
Detector: F ex 248 em 335 (filter) following post-column reaction. The column effluent flowed through a knitted 7.9 m × 0.3 mm ID PTFE coil irradiated with an SC3-9 UV lamp (UVP, San Gabriel CA) and cooled with a fan to the detector.

CHROMATOGRAM
Retention time: 6.5
Internal standard: ketoprofen

OTHER SUBSTANCES
Extracted: fenbufen

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 19.628

KEY WORDS
whole blood

SAMPLE
Matrix: solutions
Sample preparation: Mix 50 μL of a 0.001-5 mM solution in MeCN with 50 μL 1 mM DNS-APy in MeCN containing 50 mM 2,2'-dipyridyl disulfide and 50 mM triphenylphosphine, let stand at room temperature for 30 min. Remove a 10 μL aliquot and dilute it to 100 μL with MeCN, inject a 2 μL aliquot. (Synthesis of DNS-APy, 1-(5-dimethylamino-1-naphthalenesulfonyl)-(S)-3-aminopyrrolidine, is as follows. Cool a solution of 16.4 g (R)-(+)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3R)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3R)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3S)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3S)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3S)-(+)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). (3S)-(+)-Aminopyrrolidine dihydrochloride is also reported to be available from Tokyo Kasei. Stir 800 mg (3S)-(+)-3-aminopyrrolidine dihydrochloride and 2 mL triethylamine in 800 mL MeCN at 0-10°, add a solution of 440 mg dansyl chloride in 80 mL MeCN dropwise, stir in the dark for 30 min, evaporate to dryness under reduced pressure, dissolve the residue in 200 mL 5% HCl, wash twice with 40 mL portions of dichloromethane. Adjust the pH of the organic layer to 13-14 with 5% NaOH, extract twice with 10 mL portions of dichloromethane. Combine the organic layers and wash them with 80 mL water. Dry the organic layer over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, dissolve the residue in dichloromethane:MeOH 90:10, chromatograph on silica gel with dichloromethane:MeOH 90:10. Collect the greenish-yellow fluorescent band and evaporate it under reduced pressure to obtain DNS-APy as a greenish-yellow oil.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm TSK gel ODS-80TM (Tosoh)
Mobile phase: MeCN:water 50:50

Flow rate: 1
Injection volume: 2
Detector: F ex 340 em 530

CHROMATOGRAM

SAMPLE
Matrix: formulations, urine
Sample preparation: Urine. Condition a Bond Elut Certify LRC SPE cartridge with 6 mL water. Mix 3.75 mL urine with 750 μL 1 M pH 9.0 borate buffer, centrifuge at 734 g for 5 min. Add a 3 mL aliquot to the SPE cartridge. Wash with 2 mL water, 1 mL 100 mM pH 4.0 acetate buffer, and 2 mL MeOH using vacuum (5 mmHg). Dry the SPE cartridge under vacuum (<150 mmHg) for 5 min. Elute with 2 mL 2% ammonia in chloroform:isopropanol 60:40 using vacuum (2 mmHg) (Caution! Chloroform is a carcinogen!). Evaporate the eluate to dryness under a gentle stream of nitrogen at 60°. Dissolve the residue in 1 mL mobile phase, inject an aliquot. Tablets. Crush and mix tablets to a fine powder, weigh, dissolve in water, shake for 20 min,

filter (Whatman No. 41 filter-paper), wash, make up to a fixed volume. Dilute an aliquot with mobile phase and inject an aliquot.

HPLC VARIABLES
Guard column: μ-Bondapak C18
Column: 250 × 4.6 5 μm Supelcosil ABZ + Plus
Mobile phase: MeCN:water 30:70 containing 5 mM acetate buffer adjusted to pH 4.5 with acetic acid or 1 M KOH

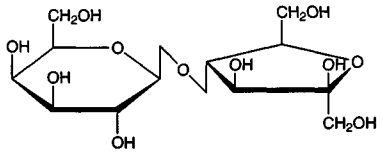
Guard column: 30 × 4.6 30-40 μm RP-8 (Merck)
Column: 60 × 4.6 3 μm Hypersil ODS
Mobile phase: MeCN:MeOH:water 6:66:28
Column temperature: 40
Flow rate: 1
Injection volume: 82
Detector: UV 300 or RIA

CHROMATOGRAM
Retention time: 4.5
Limit of detection: 0.5 ng/mL

KEY WORDS
plasma; human; dog; rat; horse; protect from light; pharmacokinetics; SPE; automation of this procedure reported (see J. Chromatogr. B 1995; 669; 383)

REFERENCE
Pellegatti,M.; Braggio,S.; Sartori,S.; Franceschetti,F.; Bolelli,G.F. Validation of a high-performance liquid chromatographic-radioimmunoassay method for the determination of lacidipine in plasma, *J.Chromatogr.*, **1992**, *573*, 105–111.

Lactulose



Molecular formula: $C_{12}H_{22}O_{11}$
Molecular weight: 342.30
CAS Registry No.: 4618-18-2
Merck Index: 5360

SAMPLE
Matrix: beverages, juice, milk
Sample preparation: Orange juice. Dilute orange juice 100-fold with water, filter (Millipore HV, 0.45 μm), dilute filtrate 10-fold, inject an aliquot. Beverages. Dilute soft drinks 1000-fold with water, inject an aliquot. Milk. Dilute 5 mL milk to 100 mL with mobile phase, filter (Millipore HV, 0.45 μm), dilute filtrate 50-fold, inject an aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 Cation H (Bio-Rad)
Column: 300 × 3.8 9 μm HPX 87-H Aminex (Bio-Rad)
Mobile phase: 10 mM Sulfuric acid
Column temperature: 50
Flow rate: 0.5
Injection volume: 40
Detector: E following post-column reaction, Hewlett-Packard 1049A programmable electrochemical detector, Metrohm detector cell, cuprous oxide working electrode +550 mV, glassy carbon auxiliary electrode, Ag/AgCl (3 M KCl) reference electrode. The column effluent mixed with 200 mM NaOH pumped at 0.4 mL/min, the mixture flowed through a 220 × 0.8 single-bead string reactor packed with 0.6 mm glass beads to the detector. (Prepare cuprous oxide electrode as follows. Stir 300 mg conductive carbon cement (Gerhard Neubauer, Münster), 60 mg cuprous oxide (Fluka), and 300 μL acetone until a thick paste forms as the acetone evaporates. Pack conductive carbon cement into the base of a 3 mm diameter cavity carbon paste electrode base (Metrohm), allow to dry, polish with dry emery paper (grade 2/0, Oakey), remove surface layer with an acetone-soaked tissue, pack the paste into the cavity, allow to dry overnight, polish with dry emery paper (grade 2/0), 3 μm imperial micro finishing film sheet (3M), 0.3 μm imperial micro finishing film sheet (3M), and 0.05 μm alumina particles on a Buehler pad, sonicate for 2 min in water (Anal. Chim. Acta 1995, 300, 5).)

CHROMATOGRAM
Retention time: 9.50
Limit of detection: 2 μM

OTHER SUBSTANCES
Also analyzed: arabinose, cellobiose, dextrose, fructose, fucose, galactitol, galactose, galacturonic acid, lactose, lyxose, maltose, mannitol, mannose, myo-inositol, raffinose, rhamnose, ribose, sorbose, sucrose, xylose

KEY WORDS
orange juice; soft drinks; post-column reaction; fruit

SAMPLE
Matrix: blood, urine
Sample preparation: Urine. Dilute urine 1:10 to 1:40 with water, add a 1 mL aliquot to 1 mL 250 μg/mL melibiose, add Amberlite IR-120 H^+ to occupy one third of the volume, inject a 25 μL aliquot of the supernatant. Plasma. 200 μL Plasma + 200 μL 250 μg/mL melibiose, mix, add 200 μL ice cold 35 mg/mL 5-sulfosalicylic acid, let stand on ice for 20 min, centrifuge at 9000 g for 5 min, mix with Amberlite IR-120 H^+:Amberlite IRA 400 Cl^- 40:60, centrifuge, inject a 25 μL aliquot of the supernatant.

HPLC VARIABLES
Guard column: Carbopac PA-1 (Dionex)
Column: 250 × 40 Carbopac PA-1 (Dionex)
Mobile phase: 120 mM NaOH containing 0.5 mM zinc acetate (urine) or 160 mM NaOH containing 0.675 mM zinc acetate (plasma) (At the end of each plasma sample wash with 1 M NaOH for 4 min.)
Flow rate: 1
Injection volume: 25
Detector: E, Dionex pulsed electrochemical detector, detection potential -0.01 V (0-0.5 s), oxidation potential +0.75 V (0.51-0.64 s), reduction potential -0.75 V (0.65-0.75 s), integration period 0.05-0.5 s

CHROMATOGRAM
Retention time: 5.9 (plasma), 6.9 (urine)
Internal standard: melibiose (4.0 (plasma), 4.6 (urine))
Limit of detection: 400 ng/mL

OTHER SUBSTANCES
Extracted: mannitol, 3-O-methylglucose, dextrose

KEY WORDS
plasma

SAMPLE

Matrix: urine

Sample preparation: Condition a 600 mg Maxi-Clean C18 SPE cartridge with 5 mL MeOH and 5 mL water. Add 2-3 mL urine to the SPE cartridge and pass it through the cartridge. Discard the first 1 mL, collect the residual volume and dilute it 1:1 with water. Dilute a 200 μL aliquot with 1.8 mL water containing 75 μm/mL cellobiose, add 400 g/L Amberlite IRA-400 resin Cl^- form (Fluka). Vortex for 10 s, centrifuge at 3000 g for 2 min. Filter (Micro-spin centrifuge cartridge, Nylon 66, 0.2 μm, Alltech) a 400 μL aliquot of the supernatant while centrifuging at 3000 g for 5 min. Inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: Benson Carbohydrate BC-100 Ca^{2+} (Alltech)
Column: 300 × 6.5 10 μm Alltech 700 CH Carbohydrate (Alltech)
Mobile phase: Water
Column temperature: 85
Flow rate: 0.5
Injection volume: 50
Detector: ELSD, Varex MKIII (Alltech), drift tube temperature 120°, carrier gas flow (air) 41.67 cm^3/s

CHROMATOGRAM

Retention time: 8.88
Internal standard: cellobiose (7.55)
Limit of detection: 820 ng/mL

OTHER SUBSTANCES

Extracted: dextrose, mannitol
Simultaneous: fructose, galactose

KEY WORDS

SPE; pharmacokinetics

SAMPLE

Matrix: urine
Sample preparation: 10 μL Urine + 200 μL reagent, heat at 65° for 16 h, cool to room temperature, inject a 5 μL aliquot of the clear supernatant. (Prepare reagent by dissolving 5 mg Fmoc-hydrazine in 1 mL MeCN, add 10 μL buffer. Buffer was 1.44 M formic acid containing 600 mM NaOH. Prepare Fmoc-hydrazine as follows. Dissolve 1 g 9-fluorenylmethyl chloroformate in 100 mL EtOH, add this solution dropwise with stirring to 10 mL hydrazine hydrate (Caution!

Hydrazine hydrate is a carcinogen!), stir for 30 min, filter off the precipitate, wash it twice with 20 mL portions of ice-cold EtOH, dry at room temperature.)

HPLC VARIABLES
Guard column: 10 × 4.6 3 μm Spherisorb ODS II
Column: 125 × 4.6 3 μm Spherisorb ODS II
Mobile phase: Gradient. Isopropanol:isobutyl alcohol:water 6:6:88 for 13 min, to 80:0:20 (step gradient), maintain at 80:0:20 for 6 min, re-equilibrate at initial conditions.
Column temperature: 50

SAMPLE

Matrix: blood
Sample preparation: Mix 550 μL plasma with 100 μL 500 mM monochloroacetic acid in 500 mM pH 2.5 ammonium orthophosphate buffer. Dialyze two 300 μL aliquots against 5 mM pH 7.0 potassium phosphate buffer pumped at 0.25 mL/min for 4 min each using a 15 kD Cuprophan membrane. The dialysate passed through column A and was washed through with 500 μL 1 mM pH 7.0 potassium phosphate buffer. Elute the glucuronide metabolite from column A onto column B with mobile phase. After 30 s remove column A from the circuit, elute column B with mobile phase, elute column A with 200 μL MeCN:water 10:90 and 500 μL 1 mM pH

7.0 potassium phosphate buffer to waste, at the 4 min mark elute lamotrigine and the methylated metabolite from column A onto column B with mobile phase, elute column B with mobile phase, monitor the effluent from column B. (At the end of the process flush the donor channel with 1.5 mL 1 mM pH 7.0 potassium phosphate buffer and flush column A with 500 μL 5 mM pH 7.0 potassium phosphate buffer.)

HPLC VARIABLES

Column: A 70 mg 10 μm Hypersil ODS (Shandon) in a Prelute cartridge; B 150 × 4.6 5 μm Kromasil C8 (Technicol, UK)
Mobile phase: Gradient. A was 50 mM pH 4.15 ammonium phosphate buffer containing 20 mM diethylamine hydrochloride. B was MeCN:500 mM pH 4.15 ammonium phosphate buffer containing 200mM mM diethylamine hydrochloride buffer:water 60:10:30. A:B 86:14 for 3 min, to 69:31 over 0.2 min, maintain at 69:31 for 10.2 min, to 0:100 over 0.1 min, maintain at 0:100 for 1.5 min, return to 86:14 over 0.2 min, re-equilibrate at initial conditions for 3.8 min
Flow rate: 1.5
Detector: UV 270 for 12.5 min, then UV 215

CHROMATOGRAM

Retention time: 9.6
Limit of quantitation: 40 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE
Matrix: blood, urine
Sample preparation: Whole blood. Condition a 100 mg C18 SPE cartridge (Burdick and Jackson/Baxter) with 2 mL MeOH, 2 mL water, and 1 mL 50 mM pH 1.2 phosphoric acid buffer. 250 µL Whole blood + 750 µL pH 1.2 phosphoric acid buffer containing 15 mM sodium dodecyl sulfate + 50 µL 30 µg/mL IS in MeOH:water 50:50, vortex for 15 s, centrifuge at 13000 g for 7 min, add the supernatant to the SPE cartridge, wash with 300 µL 50 mM phosphoric acid buffer, elute with 1 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen below 40°, reconstitute the residue in 250 µL mobile phase, filter (0.45 µm), inject a 50 µL aliquot. Urine. Acidify urine with 20% acetic acid, filter (0.45 µm). 1 mL Urine + 1 mL 1 M pH 11.0 NaH_2PO_4 + 50 µL 15 µg/mL IS in MeOH:water 50:50, extract twice with 3 mL ethyl acetate:MTBE 50:50. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue in 250 µL mobile phase, inject an aliquot. (To analyze glucuronide mix 100 µL urine with 400 µL 50 mM pH 1.2 phosphoric acid buffer containing 15 mM sodium dodecyl sulfate, inject a 10-50 µL aliquot (MeCN:buffer 30:70).)

HPLC VARIABLES
Column: 250 × 4.6 5 µm Spherisorb C8
Mobile phase: MeCN:buffer 33:67 (whole blood) or 40:60 (urine) (Buffer was 50 mM pH 2.2 phosphoric acid containing 10 mM sodium dodecyl sulfate.) (After each injection flush with MeCN:buffer 67:33 for 5 min, re-equilibrate for 5 min.)
Column temperature: 40
Flow rate: 1.5
Injection volume: 50
Detector: UV 277

CHROMATOGRAM
Retention time: 19.9 (whole blood), 9.8 (urine)
Internal standard: 3,5-diamino-6-(2-methoxyphenyl)-1,2,4-triazine (BW A725C) (11.9 (whole blood), 7.0 (urine))
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: carbamazepine, cyheptamide, desmethyldiazepam, diazepam, ethosuximide, felbamate, lorazepam, oxazepam, phenobarbital, phenytoin, temazepam, tolybarbital

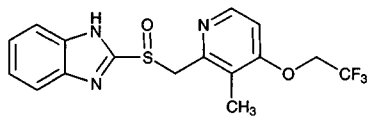
Lansoprazole



Molecular formula: $C_{16}H_{14}F_3N_3O_2S$
Molecular weight: 369.37
CAS Registry No.: 103577-45-3
Merck Index: 5373
Lednicer No.: 5 115

SAMPLE

Matrix: blood
Sample preparation: 500 μL Serum + 100 μL 25 μg/mL isobutyl p-hydroxybenzoate in dichloromethane + 3 mL diethyl ether:dichloromethane 70:30, extract, centrifuge, repeat extraction. Add 500 μL diethyl ether:dichloromethane: propylene glycol 70:30:0.5 to the supernatants, evaporate to dryness with a stream of nitrogen, reconstitute in 500 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm TSK gel ODS-120T (Tosoh)
Mobile phase: MeCN:water:n-octylamine 38:62:0.1 adjusted to pH 7 with 85% phosphoric acid
Column temperature: 40
Flow rate: 1
Injection volume: 100
Detector: UV 285

CHROMATOGRAM

Retention time: 11.5
Internal standard: isobutyl p-hydroxybenzoate (23)
Limit of detection: 5 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 20 μg/mL n-butyl p-hydroxybenzoate + 100 μL MeOH, vortex for a few s, add 7 mL MTBE, vortex for 45 s, centrifuge at 4° at 1500 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 30°, rinse the tube with 1 mL MTBE, evaporate to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL MeOH, vortex for 1 min. Dilute a 100 μL aliquot 10-fold with water, inject 1 mL water then the diluted plasma extract onto column A, wash with 1 mL water, elute the contents of column A onto column B with the mobile phase, elute with the mobile phase and monitor the effluent from column B.

HPLC VARIABLES

Column: A 10 mm long 10 μm Nucleosil CN (SFCC); B 10 mm long 5 μm Nucleosil C18 + 250 × 4.6 5 μm Nucleosil C18
Mobile phase: MeCN:phosphoric acid:250 mM KH_2PO_4:acetic acid:triethylamine:water 36:10.5:4:0.15:0.15:49.2
Flow rate: 2
Detector: UV 285

CHROMATOGRAM
Retention time: 11
Internal standard: n-butyl p-hydroxybenzoate (23)
Limit of quantitation: 2 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Noninterfering: acebutolol, allopurinol, amiloride, atenolol, phenobarbital, pindolol, prazosin, quinidine, ranitidine, sotalol

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 150 μL 4 μg/mL omeprazole in water + 5 mL diethyl ether:dichloromethane 70:30, vortex for 5 min, centrifuge at 6° at 300-850 g for 10 min. Remove 4 mL of the organic layer and evaporate to dryness under reduced pressure at room temperature, reconstitute the residue in 500 μL buffer, refrigerate until injection, inject a 100 μL aliquot. (Buffer was MeCN:water 35:65 containing 1 mL/L n-octylamine and 5 mM N-acetohydroxamic acid, pH adjusted to 7.5 with 85% phosphoric acid.)

HPLC VARIABLES
Column: 150 or 250 × 4.6 5 μm Hi-Chrom Reversible octadecylsilane (Regis)
Mobile phase: MeCN:water 35:65 containing 1 mL/L n-octylamine and 5 mM N-acetohydroxamic acid, pH adjusted to 7.0 with 85% phosphoric acid
Column temperature: 40-43
Flow rate: 1 for 15 min then 2.5
Injection volume: 100
Detector: UV 285

CHROMATOGRAM
Retention time: 13.2
Internal standard: omeprazole (7.6)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 16.613

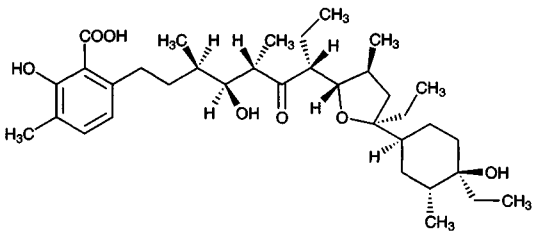
Lasalocid A



Molecular formula: $C_{34}H_{54}O_8$
Molecular weight: 590.80
CAS Registry No.: 25999-31-9
Merck Index: 5384

SAMPLE

Matrix: blood

Sample preparation: Cow, dog. 10 mL Whole blood + 1 mL 1 M NaOH, shake vigorously for 10-15 s, let stand at room temperature for 5 (cow) or 20 (dog) min, add 20 mL ethyl acetate, shake vigorously by hand for 50-60 s, centrifuge at 350 g for 10-15 min. Remove 1-10 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 1 mL mobile phase, vortex vigorously for 1 min, inject an aliquot. Chicken. 10 mL Whole blood + 20 mL ethyl acetate, shake vigorously by hand for 10-15 s, shake on a reciprocal shaker at high speed for 5 min, centrifuge at 350 g for 10-15 min. Remove 1-10 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 1 mL mobile phase, vortex vigorously for 1 min, inject an aliquot. Rat, mouse. 1 mL Whole blood + 10 mL ethyl acetate, shake vigorously by hand for 30-40 s, shake on a reciprocal shaker at high speed for 5 min, shake vigorously by hand for 10-15 s, centrifuge at 350 g for 10-15 min. Remove 9 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 1 mL mobile phase, vortex vigorously for 1 min, inject an aliquot.

HPLC VARIABLES

Column: 250 mm long 5 μm Partisil PXS 5/25

Mobile phase: Hexane:THF:MeOH:triethylamine:ammonium hydroxide 81:14:2:2:1 shake for 30-40 s, let stand for 25-30 min, discard the lower phase, add 10 mL/L THF, do not degas or filter. (Place a 10 μm Partisil column before the injector. Flush system with hexane for 30 min at 2 mL/min at the end of each day.)

Flow rate: 0.9

Injection volume: 42-100

Detector: F ex 310 em 430

CHROMATOGRAM

Retention time: 6-8

Limit of detection: <5 ppb

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Tissuemizer) 10 g tissue and 25 mL solvent for 1 min, wash blades with 3-4 mL solvent, combine with homogenate, shake for 30 min, centrifuge at 800 g for 15 min, decant. Add 25 mL solvent to residue, mix thoroughly, shake vigorously for 1 min, centrifuge at 800 g for 15 min, add supernatants to a 75 × 20 column of 80-200 mesh alumina (Fisher), rinse container onto column with 25 mL solvent, add 100 mL solvent to the column. Combine all the eluates and add 100 mL 5% NaCl, shake vigorously, let stand 2-3 min, add 30 mL dichloromethane, shake vigorously for 30 s, repeat extraction twice. Combine the dichloromethane layers and evaporate them to dryness under reduced pressure at 48-50°, reconstitute the residue in 1 mL solvent, add to a 75 × 20 column of 25-100 μm Sephadex LH-20, rinse flask with two 3.5 mL portions of solvent and add the rinses to the column, add 10 mL solvent to the column, discard the first 18 mL of eluate, add 10 mL solvent to the column, collect this fraction, evaporate to dryness under a stream of nitrogen at 48-50°, make up to 1 mL with solvent, mix, add 500 μL 9-anthryldiazomethane solution, let stand in the dark for

30 min, evaporate to dryness under a stream of nitrogen at 48-50°, reconstitute in 1 mL hexane. Condition a Baker-10 silica SPE cartridge with 5-10 mL hexane, do not allow to dry. Add the hexane solution to the SPE cartridge, rinse tube with 9 mL hexane, add rinse to the SPE cartridge. Wash SPE cartridge with 10 mL hexane:dichloromethane 50:50, with 10 mL hexane: dichloromethane 20:80, with 10 mL dichloromethane, and with 1 mL MeOH. Elute with 1 mL MeOH, inject a 20 μL aliquot of the eluate. (Solvent was MeOH:water 80:20. Prepare 9-anthryldiazomethane solution as follows. Add 1100 g manganous sulfate tetrahydrate in 1.5 L water and 1170 mL 40% NaOH over 1 h to a hot stirred solution of 960 g potassium permanganate in 6 L water, stir for 1 h, centrifuge, wash solid with water until washings are colorless, dry solid at 100-120°, grind the activated manganese dioxide to a fine powder. Add 8.5 g 85% hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) to 8.8 g 9-anthraldehyde dissolved in 150 mL EtOH, stir at room temperature for 3 h, filter off solid, dry under vacuum, recrystallize from EtOH to give 9-anthraldehyde hydrazone as red-yellow crystals, mp 124-6°. Dissolve 220 mg 9-anthraldehyde hydrazone in 100 mL anhydrous ethyl ether, add 800 mg activated manganese dioxide, add 600 μL EtOH saturated with KOH, stir vigorously for 30 min, filter (glass fiber), wash solid with 20 mL anhydrous ethyl ether, evaporate to reduce volume, make up to 100 mL with anhydrous ethyl ether, store in a dark flask in the dark in a refrigerator. Discard after 30 days (J.Assoc.Off.Anal.Chem. 1985, 68, 1149).)

HPLC VARIABLES
Guard column: pellicular C18 (Alltech)
Column: 200 × 4.6 5 μm RP-C8 (Hewlett-Packard)
Mobile phase: Gradient. A was MeCN. B was MeCN:water 10:90. A:B 20:80 for 9 min, 10:90 for 7 min, 20:80 for 1 min.
Column temperature: 40
Flow rate: 1
Injection volume: 20
Detector: F ex 365 em 418 (filter)

CHROMATOGRAM
Retention time: 12.6
Limit of detection: 0.15 ppm

Molecular weight: 461.50
CAS Registry No.: 86273-18-9
Merck Index: 5460

SAMPLE
Matrix: blood
Sample preparation: 0.5 mL Plasma + 1 mL MeOH, stir for 5 min, centrifuge at 2400 g for 10 min. Remove 1 mL supernatant, add 2 μg cefazolin, inject an aliquot.

HPLC VARIABLES
Column: 300 × 3.9 5 μm μBondapak C18
Mobile phase: MeOH:67 mM KH_2PO_4 20:80
Flow rate: 1.5
Injection volume: 50
Detector: UV 225

CHROMATOGRAM
Retention time: 9 (measured as ampicillin peak)
Internal standard: cefazolin (14)
Limit of detection: 500 ng/mL

KEY WORDS
plasma

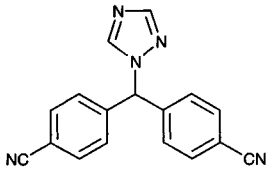
Letrozole



Molecular formula: $C_{17}H_{11}N_5$
Molecular weight: 285.31
CAS Registry No.: 112809-51-5
Merck Index: 5474

SAMPLE
Matrix: blood
Sample preparation: Mix plasma with 50 μL 6.12 μM IS, adjust to pH 13.0, add to an Extrelut SPE cartridge. Elute with 6 mL and 5 mL portions of dichloromethane:diethyl ether 40:60, evaporate the eluates to dryness, dissolve the residue in 500 μL pH 7.0 phosphate buffer, wash with 2 mL hexane, inject a 120 μL aliquot of the aqueous phase.

HPLC VARIABLES
Column: 5 μm LiChrospher RP 8
Mobile phase: MeCN:pH 7.0 phosphate buffer 42:58
Flow rate: 1
Injection volume: 120
Detector: UV 234

CHROMATOGRAM
Internal standard: CGS 18320 B (4,4'-[1H-1,3-diazol-1-ylmethylene]bis-benzonitrile)
Limit of quantitation: 8.9 nM

KEY WORDS
plasma; pharmacokinetics; SPE

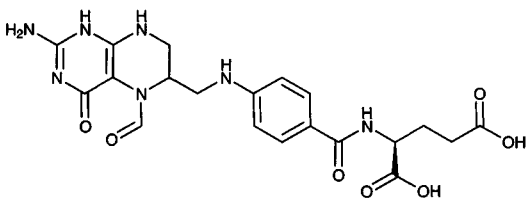
Leucovorin



Molecular formula: $C_{20}H_{23}N_7O_7$
Molecular weight: 473.45
CAS Registry No.: 58-05-9, 1492-18-8 (Ca salt), 6035-45-6 (Ca salt pentahydrate)
Merck Index: 4254

SAMPLE
Matrix: blood
Sample preparation: Mix 20 μL serum with 20 μL 2 M perchloric acid, vortex for a few seconds, centrifuge at 10000 g for 2 min. Inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Inertsil ODS-2 (GL Sciences, Japan)
Mobile phase: MeCN:25 mM pH 7.0 sodium phosphate buffer 8:92 containing 25 mM hydrogen peroxide
Flow rate: 1
Injection volume: 20
Detector: F ex 379 em 457 following post-column reaction. The column effluent flowed through a 5 m × 0.5 mm i.d. stainless-steel reaction coil at 160° and a 3 m × 0.5 mm i.d. stainless-steel coil at 15° to the detector.

CHROMATOGRAM
Retention time: 10

OTHER SUBSTANCES
Extracted: methotrexate

KEY WORDS
serum; post-column reaction

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond Elut RP-18 SPE cartridge with four 2 mL portions of MeOH and three 2 mL portions of 100 mM pH 4.7 TrisP buffer. Add 1 mg/mL ascorbic acid to plasma. Dilute 500 μL plasma six fold with 9 mg/mL NaCl containing 1 mg/mL ascorbic acid, add 200 μL 8.5 mg/mL phosphoric acid, add to the SPE cartridge, wash with 500 μL 10 mM pH 4.7 TrisP buffer, elute with 1.5 mL eluant. Evaporate the eluate to dryness under a stream of nitrogen at 37° for 30 min, reconstitute the residue in 250 μL 9 mg/mL NaCl containing 1 mg/mL ascorbic acid, inject a 40 μL aliquot onto column A and elute with mobile phase, collect 600 μL effluent (monitor with detector A) in a sample loop and inject it onto column B, elute with mobile phase and monitor the effluent from column B with detector B. (TrisP was tris(hydroxyethyl)methylaminomethane phosphate. Eluant was MeOH:10 mM TrisP buffer 75:25, pH 7 containing 150 μg/mL ascorbic acid.)

HPLC VARIABLES
Column: A 119 × 2 4 μm Superspher RP-8 (Merck) (Condition column with MeOH:water 30:70 every 100-200 injections.); B 150 × 4.5 7 μm chiral protein 2 HSA-BP human serum albumin (Société Française Chromato Colonne)

Mobile phase: 1-Propanol:200 mM Na_2HPO_4 2:98 adjusted to pH 6.2 with 8.5 g/L phosphoric acid
Column temperature: 35 (column B)
Flow rate: A 0.25; B 1
Injection volume: 40
Detector: A UV 313; B E, ESA Coulochem 5100 A, Model 5020 guard cell, Model 5010 analytical cell, E1 0.30 V, E2 0.55 V (monitored), guard cell is placed before second injection valve

SAMPLE
Matrix: blood, urine
Sample preparation: Serum. 500 μL Serum + 250 μg ascorbic acid + 750 μL MeCN, vortex, centrifuge at 400 g for 1 min, add 7 mL chloroform, mix, centrifuge at 400 g for 1 min. 400 μL Aqueous phase + 2 mL mobile phase A, inject the whole amount through a 125 × 4 40 μm silica (Supelco) column on to column A and elute to waste with mobile phase A, backflush the contents of column A on to column B and elute to waste with mobile phase B, collect the fraction containing leucovorin in a 1 mL sample loop, inject this fraction on to column C and elute with mobile phase C, monitor the effluent from column C. Urine. Condition a 1 mL C18 SPE cartridge (Supelco) with 2 mL water, 2 mL MeOH, and 2 mL mobile phase A. Dilute urine with 4 volumes of mobile phase A, add to the SPE cartridge, wash with 2 mL mobile phase A, elute with 2 mL MeCN:water 50:50. Wash the eluate with chloroform, filter (Waters ultrafiltration cartridge) the aqueous layer while centrifuging, dilute 400 μL of the ultrafiltrate with 2 mL mobile phase A, inject the whole amount through a 125 × 4 40 μm silica (Supelco) column on to column A and elute to waste with mobile phase A, backflush the contents of column A on to column B and elute to waste with mobile phase B, collect the fraction containing leucovorin in a 1 mL sample loop, inject this fraction on to column C and elute with mobile phase C, monitor the effluent from column C.

HPLC VARIABLES
Column: A 30 × 4 5 μm C18; B 250 × 2 3 μm C18 (Macherey-Nagel); C 150 × 4.6 7 μm Resolvosil BSA-7
Mobile phase: A 5 mM tetrabutylammonium phosphate (low-UV Pic A) adjusted to pH 6.5 with phosphoric acid; B Isopropanol:buffer 7.5:92.5 adjusted to pH 5 with phosphoric acid (Buffer was 1.5 mM sodium phosphate containing 0.75 mM tetrabutylammonium phosphate (low-UV PIC A).); C 28 mM Phosphate buffer containing 0.6 mM sodium azide (Caution! Sodium azide is toxic! Do not discharge to plumbing system!)
Column temperature: 40 (B and C only, A is ambient)
Flow rate: A 2; B 0.15; C 0.4
Injection volume: 2400
Detector: F ex 308 em 365

CHROMATOGRAM
Retention time: 26 (6S), 30 (6R)
Limit of detection: 5 ng/mL

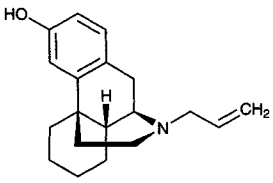
Levallorphan



Molecular formula: $C_{19}H_{25}NO$
Molecular weight: 283.41
CAS Registry No.: 152-02-3, 71-82-9 (tartrate)
Merck Index: 5485

SAMPLE

Matrix: blood, CSF, urine
Sample preparation: Dilute urine 3:1 or more with water. Mix 1 mL CSF, plasma, or diluted urine with 500 μL saturated sodium carbonate, add 5 mL hexane containing 0.1% n-octylamine. Vortex for 60 s, centrifuge at 2000 g for 10 min. Re-extract aqueous phase with 5 mL hexane containing 0.1% n-octylamine, evaporate the combined hexane extracts to dryness under a stream of nitrogen in a 50° water bath. Reconstitute residue with 150 μL 100 mM hydrochloric acid, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 4.6 5 μm CN
Column: 220 × 4.6 5 μm Brownlee Spheri-5CN (Applied Biosystems, USA)
Mobile phase: MeCN:n-octylamine:water 19:0.05:80.95 adjusted to pH 2.8 with phosphoric acid
Column temperature: 40
Flow rate: 1
Injection volume: 100
Detector: F ex 230 em 330

SAMPLE

Matrix: tissue
Sample preparation: Condition a 3 mL Bakerbond Cyano SPE cartridge with 5 mL ethyl acetate:hexane 50:50, do not allow to dry out. Pulverize frozen tissue samples to a fine powder. 3 g Powdered tissue + 2 g anhydrous sodium sulfate + 9 mL ethyl acetate + 500 μL 50% KOH (w/v), homogenize (Silverson) for 1 min, centrifuge at 2000 rpm for 10 min. Remove 6 mL of the ethyl acetate extract and add it to 6 mL hexane, mix, add to the SPE cartridge, wash with 5 mL chloroform:hexane 50:50, dry under vacuum for 10 min, elute with two 2 mL portions of MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 70°, reconstitute the residue in 200 μL, sonicate for 5 min, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 5 μm LiChrospher 60 RP-select B guard column
Column: 125 × 4 5 μm LiChrospher 60 RP-select B
Mobile phase: MeCN:THF:triethylamine:water 35:5:0.2:59.8 containing 100 mM ammonium acetate
Flow rate: 1
Injection volume: 50

Detector: MS, Hewlett-Packard 5989A, thermospray, vaporizer 15° below take-off temperature, ion source 250°, quadrupole 100°, electron multiplier +200 V with respect to autotune voltage, SIM, m/z 205

CHROMATOGRAM
Retention time: 3.5
Limit of detection: <3 ng/g

KEY WORDS
sheep; liver; kidney; muscle; SPE; LC-MS; thermospray

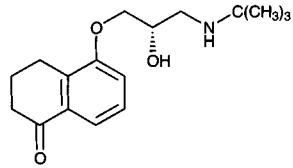
Levobunolol



Molecular formula: $C_{17}H_{25}NO_3$
Molecular weight: 291.39
CAS Registry No.: 47141-42-4, 27912-14-7 (HCl)
Merck Index: 5488
Lednicer No.: 2 110, 215, 280

SAMPLE
Matrix: blood, urine
Sample preparation: Blood. Add MeCN to blood so that the ratio is 1:5. Remove a 1 mL aliquot and add 10 μL 2 μg/mL metoprolol in water, add 1 mL water, adjust pH to 9.8-10.2 with 7-10 drops 100 mM NaOH, add 2 mL benzene (CAUTION! Benzene is a carcinogen!), shake on an automatic shaker for 30 min, centrifuge, remove the organic phase and extract the aqueous layer again with 2 mL benzene for 20 min. Combine the organic layers and evaporate them under reduced pressure at 30°, dissolve the residue in 50 μL mobile phase, inject a 10-50 μL aliquot and determine amount of dihydrolevobunolol present (DHL-A). Add MeCN to blood so that the ratio was 1:5. Remove a 1 mL aliquot and add 10 μL 2 μg/mL metoprolol in water, add 1 mL water, adjust pH to 9.8-10.2 with 7-10 drops 100 mM NaOH, add 2 mL benzene, shake on an automatic shaker for 30 min, centrifuge, remove the organic phase and extract the aqueous layer again with 2 mL benzene for 20 min. Combine the organic layers and evaporate them under reduced pressure at 30°, dissolve the residue in 200 μL MeOH, add 5 mg sodium borohydride, let stand at room temperature in a closed tube for 30 min, add 1 mL water, add 300 mg NaCl, extract with 3 mL benzene for 20 min, centrifuge. Remove the organic layer and evaporate it under reduced pressure, dissolve the residue in 50 μL mobile phase, inject a 10-50 μL aliquot and determine the amount of dihydrolevobunolol (DHL-B) that is now present which represents the total amount of levobunolol and dihydrolevobunolol originally present. Determine amount of levobunolol originally present by subtracting DHL-A from DHL-B. Urine. 20-1000 μL Urine + 200 ng metoprolol + 1 mL 200 mM pH 10.2 sodium borate buffer (Sörensen), adjust pH to 9.8-10.2 with 100 mM NaOH (if necessary), add 500 mg NaCl, extract with 4 mL benzene for 30 min, proceed as described above for blood samples. (Levobunolol itself is not fluorescent so it must be reduced to the fluorescent derivative dihydrolevobunolol. Addition of MeCN to freshly drawn blood stopped enzymatic conversion of levobunolol to dihydrolevobunolol.)

HPLC VARIABLES
Column: 250 × 4.6 10 μm μBondapak C18
Mobile phase: MeOH:water 48:52 containing 0.4% phosphoric acid and 0.2% heptanesulfonic acid
Flow rate: 2
Injection volume: 10-50
Detector: F ex 225 em 295

CHROMATOGRAM
Retention time: 3.8 (dihydrolevobunolol)
Internal standard: metoprolol (4.6)
Limit of detection: 0.5-1 ng/mL

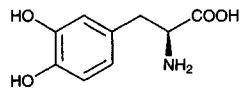
Levodopa



Molecular formula: $C_9H_{11}NO_4$
Molecular weight: 197.19
CAS Registry No.: 59-92-7
Merck Index: 5490

SAMPLE
Matrix: amniotic fluid, blood, CSF, urine
Sample preparation: Plasma. Condition a 100 mg Bond Elut SCX (propylbenzenesulfonic acid, H^+ form) SPE cartridge with 1 mL 50 mM HCl, 1 mL MeOH, 2 mL water, and 1 mL 50 mM HCl. 100 μL Plasma + 100 μL 250 μM norleucine in 100 mM HCl + 10 mg solid sulfosalicylic acid + 800 μL acetone or MeOH, mix, centrifuge, add a 50 μL aliquot to the SPE cartridge, wash with 2 mL water, elute with two 500 μL portions of MeOH:water:triethylamine 40:40:20, dry the eluate under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 100 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Dried blood. Add 25 μL 250 μM norleucine in 100 mM HCl to a 6 mm filter paper disc containing dried blood, add 100 μL MeCN, let stand for 30 min, centrifuge, remove a 75 μL aliquot of the supernatant, evaporate to dryness under reduced pressure, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 2 min, evaporate to dryness under vacuum, reconstitute with 50 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Amniotic fluid, CSF. Mix amniotic fluid or CSF with an equal volume of 250 μM norleucine in 100 mM HCl, filter (Centrifree 10000 MW cutoff) while centrifuging at 2200 g. Evaporate a 50 μL aliquot of the

ultrafiltrate to dryness under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 50 (CSF) or 100 (amniotic fluid) μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Urine. Dilute urine with water to a creatinine concentration of 1 mM, mix an aliquot with an equal volume of 250 μM norleucine in 100 mM HCl, filter (Centrifree 10000 MW cutoff) while centrifuging at 2200 g. Evaporate a 50 μL aliquot of the ultrafiltrate to dryness under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 100 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 Pico-Tag amino acid column (Waters)
Mobile phase: Gradient. A was MeCN:70 mM pH 6.55 sodium acetate 2.5:97.5. B was MeCN:MeOH:water 45:15:40
Column temperature: 46
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 34.14
Internal standard: norleucine (55.07)

OTHER SUBSTANCES

Extracted: β-alanine, alanine, alloisoleucine, α-aminoadipic acid, 4-aminobenzoic acid, gamma-aminobutyric acid, β-amino-n-butyric acid, gamma-amino-n-butyric acid, 4-aminohippuric acid, β-aminoisobutyric acid, 4-aminophenylacetic acid, α-aminophenylacetic acid, 3-amino-3-phenylpropionic acid, δ-amino-n-valeric acid, ammonia, anserine, arginine, asparagine, aspartic acid, aspartylglucosamine, carnosine, citrulline, cystathionine, cysteic acid, cysteine, cysteine-homocysteine (mixed disulfide), cystine, ethanolamine, ethionine, ethylamine, galactosamine, glucosamine, glutamic acid, glutamine, glutathionine (oxidized), glycine, glycylglycine, glycylhistidine, glycylleucine, glycylphenylalanine, glycyltyrosine, histidine, homoarginine, homocitrulline, homoserine, homocystine, 3-hydroxyanthranilic acid, 3-hydroxykynurenine, hydroxyproline, isoleucine, kynurenine, leucine, lysine, methionine sulfone, methionine, 3-methylhistidine, 1-methylhistidine, ornithine, phenylalanine, phosphoethanolamine, phosphoserine, proline, sarcosine, serine, serotonin, taurine, threonine, tromethamine, tryptophan, tyrosine, valine
Noninterfering: cadaverine, 2-phenylethylamine

SAMPLE

Matrix: blood
Sample preparation: Mix 450 μL plasma with 50 μL 310 μ g/L iso-homovanilic acid in antioxidant solution. Dialyze this solution using a Carnegie Medicin (Stockholm) microdialysis system. Perfuse 10 mm microdialysis probes with Ringer solution at 2 μ L/min. Collect dialysate for each plasma sample over 20 min in a vial containing 80 μL antioxidant solution, inject a 100 μL aliquot. (Antioxidant solution was 10 mM HCl containing 1 g/L sodium metabisulfite and 0.1 g/L Na_2EDTA.)

HPLC VARIABLES

Guard column: 30 × 4 Bondapak C18/Corasil 37-50 μ m
Column: 250 × 4.8 5 μm ODS (Beckman, CA)

Mobile phase: MeOH:buffer 20:80 (Buffer was 70 mM pH 2.55 NaH_2PO_4 containing 2.08 mM sodium octanesulfonate and 80 μ M EDTA.)
Flow rate: 1
Injection volume: 100
Detector: E , Waters 460 containing an electrochemical cell fitted with a glassy carbon working electrode and an Ag/AgCl reference electrode; the detector potential is + 0.8 V vs the reference electrode

CHROMATOGRAM
Retention time: 3.5
Internal standard: iso-homovanilic acid (10)
Limit of detection: 1.1 nM/L

OTHER SUBSTANCES
Extracted: dihydroxyphenylacetic acid, dopamine, homovanilic acid

KEY WORDS
plasma; pharmacokinetics; dialysate

SAMPLE
Matrix: blood, tissue
Sample preparation: Plasma. 20 μL Plasma + 180 μL isoproterenol in 100 mM perchloric acid containing 10 μM disodium EDTA, centrifuge at 4° at 4000 rpm for 10 min. Filter (0.45 μm cellulose acetate) the supernatant and inject a 10 μL aliquot of the supernatant. Tissue. Homogenize (Polytron PT 10-35) 50 mg brain tissue + 500 μL isoproterenol in 100 mM perchloric acid containing 10 μM disodium EDTA at 15000 rpm for 10 s, centrifuge at 4° at 4000 rpm for 10 min. Filter (0.45 μm cellulose acetate) the supernatant and inject a 10 μL aliquot of the supernatant.

HPLC VARIABLES
Guard column: Supelcosil LC-18-DB
Column: Supelcosil LC-18-DB
Mobile phase: MeOH:10 mM pH 4.4 citrate buffer 10:90 containing 10 μM disodium EDTA and 0.5 mM sodium 1-octanesulfonate
Flow rate: 1
Injection volume: 10
Detector: E, EICOM Co. ECD-100, +0.7 V, Ag/AgCl reference electrode

CHROMATOGRAM
Retention time: 4
Internal standard: isoproterenol (45)

KEY WORDS
plasma; rat; brain; pharmacokinetics

SAMPLE

Matrix: blood, urine

Sample preparation: Condition a 150 μL Toyopak IC-SP S (sulfopropyl resin, H^+ form) SPE cartridge (Tosoh) with 10 mL water. Plasma. 700 μL Plasma + 50 μL 700 nM 3,4-dihydroxybenzylamine + 350 μL 2 M perchloric acid, mix, centrifuge at 4° at 1000 g for 15 min. Remove a 700 μL aliquot of the supernatant and add it to 30 μL 2 M potassium carbonate, centrifuge at 4° at 1000 g for 5 min. Add a 500 μL aliquot of the supernatant to the SPE cartridge, wash with 1 mL water, wash with 500 μL EtOH:water 50:50, wash with 5 mL water, elute with 500 μL 2 M sodium perchlorate, filter (0.2 μm), inject a 50 μL aliquot of the filtrate. Urine. Acidify urine collected over 24 h with 10 mL 6 M HCl. 500 μL Urine + 25 μL 10 μM 3,4-dihydroxybenzylamine + 25 μL 40 μM ferulic acid + 500 μL 1 M perchloric acid, mix, centrifuge at 4° at 1000 g for 15 min. Remove a 700 μL aliquot of the supernatant and add it to 30 μL 2 M potassium carbonate, centrifuge at 4° at 1000 g for 5 min, add a 500 μL aliquot of the supernatant to the SPE cartridge, wash with 1.5 mL water, wash with 500 μL EtOH:water 50:50, wash with 5 mL water, elute with 500 μL 2 M sodium perchlorate, filter (0.2 μm), inject a 50 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 150 × 4.6 5 μm TSK-gel ODS-80TM (Tosoh)

Mobile phase: Gradient. A was buffer. B was MeCN:MeOH:buffer 8:12:80, pH 3.1. A:B 100:0 for 4 min, to 60:40 over 8 min, to 0:100 over 2 min, maintain at 0:100 for 16 min, return to initial conditions (step gradient), re-equilibrate for 20 min. Buffer was 60 mM pH 3.1 citric acid containing 32 mM Na_2HPO_4, 1.7 mM sodium hexanesulfonate, and 0.1 mM disodium EDTA (J. Chromatogr. 1989, 467, 237).

Flow rate: 1

Injection volume: 50

Detector: F ex 345 em 480 following post-column reaction. The column effluent passed through a Hitachi 655A electrochemical detector with carbon cloth electrodes; working electrode at +0.68 V versus reference electrode (200 mM equimolar mixture of potassium hexacyanoferrate(II) and potassium hexacyanoferrate(III) containing 200 mM potassium nitrate and 200 mM KOH). The effluent from the electrochemical detector mixed with 20 mM meso-1,2-diphenylethylenediamine in 50 mM HCl pumped at 0.4 mL/min and with 1 M glycine containing 490 mM KOH and 3 mM potassium hexacyanoferrate(III) pumped at 0.4 mL/min. This mixture flowed through a 10 m × 0.47 mm ID coil at 80° to the detector (J. Chromatogr. 1989, 467, 237).

CHROMATOGRAM

Retention time: 9.5

Internal standard: 3,4-dihydroxybenzylamine (12.5)

Limit of detection: 12 nM (urine), 10 nM (plasma)

OTHER SUBSTANCES

Extracted: dopamine, epinephrine, metanephrine, 3-methoxytyramine, norepinephrine

KEY WORDS

post-column reaction; plasma; SPE

REFERENCE

SAMPLE

Matrix: blood, urine

Sample preparation: Condition a Toyopak IC-SP S sulfopropyl resin, H^+ form, SPE cartridge (Tosoh) with 10 mL water and 2 mL 200 mM pH 5.0 sodium phosphate buffer. Plasma. 700 μL Plasma + 30 μL 700 nM isoproterenol + 50 μL 7 μM 3,4-dihydroxyphenylpropanoic acid + 350 μL 2 M perchloric acid, mix, centrifuge at 4° at 1000 g for 15 min. Remove a 700 μL aliquot

of the supernatant and adjust the pH to 1.5-2.0 with about 150 μL 2 M potassium carbonate, centrifuge at 4° at 1000 g for 5 min, add the supernatant to the SPE cartridge, wash with 10 mL water, elute with 300 μL MeOH:2 M sodium perchlorate 7:93, filter (cellulose acetate membrane), inject a 100 μL aliquot of the filtrate. Urine. Collect human urine for 24 h in the presence of 10 mL 6 M HCl. 500 μL Urine + 10 μL 15 μM isoproterenol + 25 μL 800 μM 3,4-dihydroxyphenylpropanoic acid + 500 μL 1 M perchloric acid, mix, centrifuge at 4° at 1000 g for 15 min. Remove a 700 μL aliquot of the supernatant and adjust the pH to 1.5-2.0 with about 130 μL 2 M potassium carbonate, centrifuge at 4° at 1000 g for 5 min, add the supernatant to the SPE cartridge, wash with 1.5 mL water, wash with 500 μL EtOH:water 50:50, wash with 5 mL water, elute with 500 μL 1.5 M KCl in MeOH:100 mM HCl 7:93, filter (cellulose acetate membrane), inject a 100 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 250 × 4.6 5 μm TSK-gel ODS-80TM (Tosoh)

Mobile phase: MeOH:buffer 7:93 (Buffer was 30 mM pH 2.5 citrate buffer containing 0.4 mM sodium octanesulfonate.)

Flow rate: 0.8

Injection volume: 100

Detector: F ex 350 em 480 following post-column reaction. The column effluent mixed with reagent A pumped at 0.3 mL/min and the mixture flowed through a 3 m × 0.5 mm ID stainless steel coil at 90°. The effluent from this coil mixed with reagent B pumped at 0.3 mL/min and the mixture flowed through a 10 m × 0.5 mm ID stainless steel coil at 90° and through a 1 m × 0.5 mm ID stainless steel cooling coil to the detector (Anal. Sci. 1991, 7, 257). (Reagent A was 10 mM sodium periodate containing 3 mM potassium ferricyanide. Reagent B was 30 mM meso-1,2-diphenylethylenediamine in EtOH:water 70:30 containing 130 mM sodium methylate.)

CHROMATOGRAM

Retention time: 23

Internal standard: isoproterenol (60)

Limit of detection: 7-9 nM

OTHER SUBSTANCES

Extracted: dopamine, epinephrine, metanephrine, 3-methoxytyramine, norepinephrine, normetanephrine

SAMPLE

Matrix: blood, urine

Sample preparation: 2 mL Plasma or 1 mL urine + dihydroxybenzylamine + 20 mg Sigma WA4 alumina + 200 μL 1 M pH 8.6 Tris-EDTA buffer, mix for 10 min, discard plasma. Wash the alumina three times with 3 mL water and dry it. Add 125 μL 500 mM phosphoric acid, after 1 min inject a 100 μL aliquot. (Ann. Clin. Biochem. 1985, 22, 194-203)

HPLC VARIABLES

Column: 250 × 4.5 5 μm Ultratechsphere

Mobile phase: Per liter 75 mmol citric acid, 58.5 mmol NaH_2PO_4, 0.2 mmol disodium EDTA, and 4.4 mmol heptanesulfonic acid, pH adjusted to 3.4, made up to a final volume of 2 L, add 200 mL MeOH

Flow rate: 1

Injection volume: 100

Detector: E, ESA Coulochem conditioning cell +0.35 V, first electrode +0.05 V, second electrode -0.35 V

CHROMATOGRAM
Retention time: 5.37
Internal standard: dihydroxybenzylamine (10.53)
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Simultaneous: norepinephrine, metanephrine, epinephrine, 3-methoxytyrosine, normetanephrine, dihydroxyphenylacetic acid, dopamine

KEY WORDS
plasma

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 3.575

Urine. 500 μL Urine + 50 μL 50 μg/mL pholcodine in water + 500 μL saturated sodium carbonate, mix, add 4 mL diethyl ether:chloroform:isopropanol 20:9:1, mix on a rotary mixer for 10 min, centrifuge at 2000 g for 10 min. Remove the organic layer and add it to 100 μL 100 mM HCl, mix on a rotary mixer for 10

min, centrifuge at 2000 g for 5 min, inject a 10-50 μL aliquot of the aqueous layer. (If desired, hydrolyse 500 μL plasma or urine with 500 μL 8000 U/mL β-glucuronidase (Helix pomatia, type H-1, Sigma) in 200 mM pH 5 acetate buffer at 37° for 16 h, proceed as above.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Spherisorb cyano
Mobile phase: MeCN:water:triethylamine 17:82.94:0.06, adjusted to pH 3.0 with orthophosphoric acid
Flow rate: 1
Injection volume: 10-50
Detector: F ex 230 em 330

CHROMATOGRAM
Retention time: 5.1
Internal standard: pholcodine (6.3)
Limit of detection: 1 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, dextromethorphan
Noninterfering: acetaminophen, clofibrate, codeine, cyclophosphamide, diclofenac, digoxin, doxepin, doxorubicin, estrogens, flucloxacillin, folic acid, furosemide, metformin, metoclopramide, miconazole, minoxidil, morphine, nifedipine, nitroglycerin, norcodeine, norethisterone, oxazepam, oxethazaine, prednisolone, pseudoephedrine, quinine, spironolactone, temazepam, tolbutamide, warfarin

Richheimer,S.L.; Amer,T.M. Stability-indicating assay, dissolution, and content uniformity of sodium levothyroxine in tablets, *J.Pharm.Sci.*, **1983**, *72*, 1349–1351.

SAMPLE
Matrix: formulations
Sample preparation: Grind tablets containing about 1 mg levothyroxine, add 4.5 mL 0.5 mg/mL hydroxyprogesterone caproate in MeOH, add 20.5 mL 10 mM NaOH in MeOH:water 75:25, shake intermittently for 5 min, filter, discard first 5 mL filtrate, inject a 25 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 μBondapak CN
Mobile phase: MeCN:0.1% phosphoric acid in water 35:65
Flow rate: 3
Injection volume: 25
Detector: UV 225

CHROMATOGRAM
Retention time: 5
Internal standard: hydroxyprogesterone caproate (8)

KEY WORDS
tablets

REFERENCE

SAMPLE
Matrix: formulations

Sample preparation: Condition a 13 mm Empore C18 SPE disk (Baker) with 2.5 mL MeOH and 2.5 mL water at 1.5 mL/min. Dissolve tablet in dissolution medium (?). Pass 40 mL through the SPE disk, wash with 2.5 mL water, dry, add 1 mL MeOH and let it soak in for 3 min, elute at 0.5 mL/min, dilute the eluate to 2 mL with 50 mM pH 2.5 phosphate buffer, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm LiChrospher cyano
Mobile phase: MeCN:water:phosphoric acid 45:55:0.05
Column temperature: 25
Flow rate: 1.6
Injection volume: 20
Detector: UV 225

KEY WORDS
tablets; SPE; comparison with capillary electrophoresis

SAMPLE
Matrix: solutions
Sample preparation: Take up 1.5 mg levothyroxine in 200 μL 100 mM sodium bicarbonate and 400 μL reagent, stir in an ice bath for 30 min, evaporate to dryness below 30°, add 100 μL trifluoroacetic acid to the dry residue, let stand for 30 min at room temperature, add 2 mL 1 M sodium bicarbonate, centrifuge. Remove the precipitate and dissolve it in 600 μL MeOH:20 mM NaOH 50:50, inject a 15 μL aliquot. Reagent was 7 mg/mL BOC-L-Leu-SU (tert-butyloxy-L-leucine-N-hydroxysuccinimide ester) in MeOH, prepared immediately before use.)

HPLC VARIABLES
Column: 150 × 3.2 7 μm LiChrosorb RP-18
Mobile phase: MeOH:water 60:40 containing 0.05% methanesulfonic acid
Flow rate: 1
Injection volume: 15
Detector: UV 230

CHROMATOGRAM
Retention time: 9
Limit of detection: 0.05% of the D form

OTHER SUBSTANCES
Simultaneous: dextrothyroxine, impurities

SAMPLE
Matrix: blood

Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 μL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 μL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES

Guard column: LC-8-DB (Supelco)
Column: 150 × 4.6 LC-8-DB (Supelco)
Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 2
Injection volume: 100
Detector: UV 228

CHROMATOGRAM

Retention time: 1.8
Internal standard: protriptyline (4)

OTHER SUBSTANCES

Extracted: acetazolamide, amitriptyline, chlordiazepoxide, chlorimipramine, chlorpromazine, desipramine, dextromethorphan, diazepam, diphenhydramine, doxepin, fentanyl, flecainide, fluoxetine, flurazepam, haloperidol, hydroxyethylflurazepam, ibuprofen, imipramine, maprotiline, methadone, methaqualone, midazolam, norchlorimipramine, nordiazepam, nordoxepin, norfluoxetine, nortriptyline, norverapamil, promazine, propafenone, propoxyphene, protriptyline, temazepam, trazodone, trimipramine, verapamil
Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin
Interfering: encainide, mexiletine, pentazocine, propranolol, quinidine

KEY WORDS

plasma; SPE

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 10 μg/mL bupivacaine in 25 mM sulfuric acid + 1 mL 1 M NaOH + 5 mL diethyl ether, shake or rotate for 15 min, centrifuge at 1000 rpm for 5 min, freeze at -20°. Remove the organic layer and add it to 250 μL 25 mM sulfuric acid, shake for 15 min, centrifuge at 1000 rpm for 5 min, freeze, discard the organic layer. Thaw the aqueous layer, pass air over the aqueous phase at room temperature to remove traces of ether, adjust pH to 5.0-6.5 by adding 10 μL 1 M NaOH, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 4 μm LiChroCART Superspher 60 RP Select B (Merck)
Column: 125 × 4 4 μm LiChroCART Superspher 60 RP Select B (Merck)
Mobile phase: MeCN:buffer 30:70 (Buffer was 7.0 g/L K_2HPO_4 in water adjusted to pH 5.8 with 1 M NaOH.)

Column temperature: 40
Flow rate: 1
Injection volume: 50
Detector: UV 202

CHROMATOGRAM

Retention time: 5
Internal standard: bupivacaine (10)
Limit of quantitation: 100 ng/mL

KEY WORDS

plasma

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 264

CHROMATOGRAM

Retention time: 4.45
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, CSF, gastric contents, urine

Sample preparation: 200 μL Serum, urine, CSF, or gastric fluid + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine HCl and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 40 μm preparative grade C18 (Analytichem); B 75 × 2.1 pellicular C18 (Whatman) + 250 × 4.6 5 μm C8 end-capped (Whatman)

Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 20 min.

Column temperature: 50

Flow rate: 1.5
Detector: UV 220

CHROMATOGRAM
Retention time: 8.0
Internal standard: heptanophenone (19)

OTHER SUBSTANCES
Extracted: acetaminophen, allobarbital, azinphos, barbital, brallobarbitone, bromazepam, butethal, caffeine, carbamazepine, carbaryl, cephaloridine, chloramphenicol, chlordiazepoxide, chlorothiazide, chlorvinphos, clothiapine, cocaine, coomassie blue, desipramine, diazepam, diphenhydramine, dipipanone, ethylbromphos, flufenamic acid, formothion, griseofulvin, indomethacin, lorazepam, malathion, medazepam, midazolam, oxazepam, paraoxon, penicillin G, pentobarbital, prazepam, propoxyphene, prothiophos, quinine, salicylic acid, secobarbital, strychnine, sulfamethoxazole, theophylline, thiopental, thioridazine, trimethoprim

SAMPLE
Matrix: blood, tissue
Sample preparation: 10 g Whole blood or tissue + 10 mL 100 mM HCl + 100 μL 200 μg/mL procaine in ethyl acetate, homogenize, shake for 10 min, centrifuge at 6000 g for 10 min, add the supernatant to an Extrelut-20 SPE cartridge, let stand for 15 min, pass ammonia gas through the column, elute with 40 mL chloroform. Evaporate the eluate to dryness, reconstitute the residue in 1 mL mobile phase, dilute 10 times with mobile phase, inject a 50 μL aliquot. (Ammonia gas was generated by placing concentrated ammonia under reduced pressure and pulling the evolved ammonia through the column.)

HPLC VARIABLES
Column: 250 × 4.6 6 μm normal phase silica (BST)
Mobile phase: MeCN:100 mM pH 2 KH_2PO_4:water:THF:concentrated phosphoric acid 5.4:90:4.6:1:1
Flow rate: 2
Injection volume: 50
Detector: UV 230

CHROMATOGRAM
Retention time: 5.28
Internal standard: procaine (4.13)
Limit of detection: 250 ng/mL

OTHER SUBSTANCES
Simultaneous: benzocaine, bupivacaine, cocaine, tetracaine

KEY WORDS

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

SAMPLE
Matrix: solutions
Sample preparation: Dissolve in MeOH:water 1:1 at a concentration of 50 μg/mL, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:acetic acid:triethylamine:water 50:1.5:0.5:48
Flow rate: 1.5
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 6

OTHER SUBSTANCES
Simultaneous: butacaine, bupivacaine, benzocaine, tetracaine

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES
Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, lorazepam, lormetazepam, lox-

apine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

SAMPLE
Matrix: solutions
Sample preparation: Inject a 20 μL aliquot of a 100-500 μg/mL solution in mobile phase.

HPLC VARIABLES
Column: 100 × 4.6 5 μm Hypersil C8 MOS 100A coated with phosphatidylcholine (95% pure soybean lecithin, Epikuron, Lucas Meyer & Co.) (Coat column by recycling a 1 mM solution of phosphatidylcholine in MeOH:water 80:20 for 24 h.)
Mobile phase: MeCN:35 mM pH 7.4 sodium phosphate buffer 40:60
Flow rate: 0.5–2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: k' 5.37

OTHER SUBSTANCES
Also analyzed: amoxicillin, antipyrine, carbamazepine, chlorpheniramine, chlorpromazine, clonidine, codeine, desipramine, diphenhydramine, dipyridamole, ephedrine, flufenamic acid, haloperidol, hydroxyzine, imipramine, indomethacin, megestrol acetate, metoprolol, nabumetone, nadolol, phenobarbital, phenol, promazine, propranolol, pyrilamine, quinidine, ropinirole, testosterone, thioridazine, tolfenamic acid, verapamil
Noninterfering: acetaminophen, aspirin, azathioprine, caffeine, carprofen, chlorambucil, cimetidine, fenoterol, flurbiprofen, ibuprofen, ketoprofen, ranitidine, salicylic acid, sulfamethoxazole, theophylline, thioguanine, tiaprofenic acid, trimethoprim, valproic acid

SAMPLE
Matrix: urine
Sample preparation: 500 μL Urine + N-ethylnordiazepam + chlorpheniramine + 100 μL buffer, centrifuge at 11000 g for 30 s, inject a 500 μL aliquot onto column A with mobile phase A, after 0.6 min backflush column A with mobile phase A to waste for 1.6 min, elute column A with 250 μL mobile phase B, with 200 μL mobile phase C, and with 1.15 mL mobile phase D. Elute column A to waste until drugs start to emerge then elute onto column B. Elute column B to waste until drugs started to emerge, then elute onto column C. When all the drugs have emerged from column B remove it from the circuit, elute column C with mobile phase D,

monitor the effluent from column C. Flush column A with 7 mL mobile phase E, with mobile phase D, and mobile phase A. Flush column B with 5 mL mobile phase E then with mobile phase D. (Buffer was 6 M ammonium acetate adjusted to pH 8.0 with 2 M KOH.)

HPLC VARIABLES

Column: A 10 × 2.1 12-20 μm PRP-1 spherical poly(styrene-divinylbenzene) (Hamilton); B 10 × 3.2 11 μm Aminex A-28 (Bio-Rad); C 25 × 3.2 5 μm C8 (Phenomenex) + 150 × 4.6 5 μm silica (Macherey-Nagel)
Mobile phase: A 0.1% pH 8.0 potassium borate buffer; B 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid; C MeCN:buffer 40:60 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); D MeCN:buffer 33:67 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); E MeCN:buffer 70:30 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.)
Column temperature: ambient (column A), 40 (columns B and C)
Flow rate: A 5; B-E 1
Injection volume: 500
Detector: UV 210, UV 235

CHROMATOGRAM

Retention time: k' 2.7
Internal standard: N-ethylnordiazepam (k' 2.1), chlorpheniramine (k' 5.9)
Limit of detection: 300 ng/mL

OTHER SUBSTANCES

Extracted: methamphetamine, desipramine, nortriptyline, diphenhydramine, methadone, imipramine, flurazepam, amitriptyline, morphine, codeine, hydromorphone, hydrocodone, caffeine, cotinine, benzoylecgonine, secobarbital, oxazepam, phenobarbital, nordiazepam, diazepam, phenylpropanolamine
Interfering: phentermine, amphetamine, phenmetrazine, ephedrine, pentazocine

KEY WORDS

column-switching

SAMPLE
Matrix: tissue

Sample preparation: Condition a 3 mL 500 mg Sep-Pak Vac C18 SPE cartridge with 15 mL MeOH and 5 mL water. Homogenize 5 g blended fish tissue with 20 mL 10 mM pH 4.5 KH_2PO_4buffer at 8000 rpm for 2 min. Centrifuge the homogenized sample at 4000 g for 10 min. Decant and collect the supernatant, extract the residue with 20 mL buffer. Filter the combined extracts through glass wool. Add 1 mL 10% sodium tungstate solution and 1 mL 34 mM sulfuric acid, mix. Centrifuge at 4000 rpm for 15 min, filter the supernatant and discard the precipitated protein. Add 1mL 3% 1-pentanesulfonic acid and mix well. Add the fish extract to the SPE cartridge. Wash with 4 mL MeOH:water 10:90 and 2 mL water at 1 mL/min. Elute with 2 mL MeCN:water 50:50. Add 200 μL 1 M KOH and 500 mg NaCl to the eluate. Extract with three 3 mL portions of ethyl acetate by agitating on a Vortex mixer and centrifuging at 800 g for 3-5 min. Combine the extracts and filter through 3 g anhydrous sodium sulfate. Wash sodium sulfate with 2 mL ethyl acetate. Evaporate the filtrate to dryness under vacuum at 35°. Reconstitute the residue in 1 mL mobile phase, filter (0.45 μm). Inject a 50 μL aliquot.

HPLC VARIABLES

SAMPLE

Matrix: tissue
Sample preparation: Condition a C18 Sep-Pak SPE cartridge with 20 mL MeOH and 40 mL distilled water. Homogenize 5 g chopped kidney with 50 mL MeOH, 5 g sodium sulfate, and 2 mL 1 M NaOH. Centrifuge at 1200 rcf for 10 min, decant the supernatant, repeat the extraction with another 50 mL portion of MeOH. Adjust the MeOH phases to pH 4 with 1 M HCl, filter (Whatman No.4 filter paper), transfer filtrate to a separatory funnel, add 50 mL hexane, shake. Remove the lower MeOH phase and reduce its volume to approximately 5 mL on a rotary evaporator. Transfer concentrated extract to a centrifuge tube with four 2 mL portions of water, add 50 mg sodium tungstate, centrifuge at 1200 rcf for 10 min. Add the supernatant to the SPE cartridge, wash with 4 mL water, elute with 5 mL MeOH, evaporate the eluate to dryness under nitrogen, redissolve the residue in 200 μL mobile phase inject an aliquot.

HPLC VARIABLES

Guard column: 50 × 5 30-35 μm Co Pell ODS
Column: 250 × 5 5 μm Spherisorb ODS
Mobile phase: MeOH:pH 7.0 phosphate buffer 65:35
Flow rate: 1
Injection volume: 200
Detector: UV 214

Linoleic acid

Molecular formula: $C_{18}H_{32}O_2$
Molecular weight: 280.45
CAS Registry No.: 60-33-3
Merck Index: 5529

SAMPLE
Matrix: beverages
Sample preparation: Heat 240 mL beer at 60°, cool. Remove a 200 mL aliquot and add it to 10 mL 3 M sulfuric acid, add 100 µL 100 µg/mL n-heptadecanoic acid in MeOH, add 200 mL ether:pentane 50:50, add 60 g NaCl, shake for 30 min, centrifuge at 5000 rpm for 5 min. Remove a 150 mL aliquot of the organic layer and wash it with 150 mL 5% sodium bicarbonate, evaporate to dryness under reduced pressure, reconstitute the residue in 1 mL 6 mM tetramethylammonium hydroxide in DMF, add 1 mL 7.5 mM 9-(chloromethyl)anthracene in DMF, heat at 75° for 20 min, inject a 50 µL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Kaseisorb LC ODS-60-5S C18 (Tokyo Kasei)
Mobile phase: Gradient. MeCN:water 90:10 for 5 min, to 95:5 over 40 min, maintain at 95:5 for 20 min, to 100:0 over 5 min, maintain at 100:0 for 15 min.
Column temperature: 40
Flow rate: 1.1
Injection volume: 50
Detector: F ex 365 em 412

CHROMATOGRAM
Retention time: 54

Limit of detection: 0.2 ng/mL
Limit of quantitation: 0.4 ng/mL

OTHER SUBSTANCES

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 20 mL chloroform:MeOH 2:1, vortex for 30 s, add 4 mL water, shake for 5 min, centrifuge at 2500 rpm for 5 min, extract the aqueous layer twice more with 10 mL portions of chloroform:MeOH 2:1. Combine the organic layers and dry them over anhydrous sodium sulfate, evaporate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 1 mL dry dichloromethane, add 1 mg p-aminophenol, add 150 μL triethylamine, add at least a 3-fold molar excess of 2-bromo-1-methylpyridinium iodide, heat at 60° for 30 min, cool, concentrate under a stream of nitrogen, add 1 mL 100 mM HCl, add 1 mL ethyl acetate, shake vigorously, centrifuge at 2500 rpm for 5 min, inject an aliquot of the supernatant. (Prepare 2-bromo-1-methylpyridinium iodide by analogy with the preparation of 2-chloro-1-methylpyridinium iodide. Add 15 g methyl iodide to 13.9 g 2-bromopyridine in 3 mL acetone at 0°, stir at room temperature for 3 days. Filter the precipitate and wash it with 50 mL dry ether, dry under reduced pressure to give 2-bromo-1-methylpyridinium iodide (Bull. Chem. Soc. Japan 1977, 50, 1863).)

HPLC VARIABLES
Column: 250 × 4.6 10 μm Nucleosil C-18
Mobile phase: MeOH:water:perchloric acid 88:12:0.1 containing 50 mM sodium perchlorate
Column temperature: 25 ± 0.1
Flow rate: 1.2
Detector: E, 0.75 V, Ag/AgCl reference electrode

SAMPLE
Matrix: blood
Sample preparation: 10 μL Plasma + 200 μL 500 mM pH 6.5 phosphate buffer + 50 μL 20 μM IS in MeOH + 2 mL n-heptane:chloroform 50:50, vortex for 2 min, centrifuge at 1000 g for 10 min. Remove the lower organic layer and evaporate it to dryness, reconstitute the residue in two 100 μL aliquots of acetone. Evaporate the acetone solution to dryness, add 2-3 mg finely powdered potassium bicarbonate:sodium sulfate 50:50, add 50 μL 800 μM dibenzo-18-crown-6 in acetone, add 50 μL 2 mM 4-bromomethyl-7-acetoxycoumarin in acetone, heat at 50° in the dark for 30 min, inject a 50 μL aliquot. (Prepare 4-bromomethyl-7-acetoxycoumarin as follows. Reflux 50 g 7-hydroxy-4-methylcoumarin (β-methylumbelliferone) and 100 mL acetic anhydride for 1 h, cool, pour into 500 mL cold water, filter, dry the solid, recrystallize from EtOH to give 4-methyl-7-acetoxycoumarin. Reflux 10 g 4-methyl-7-acetoxycoumarin, 9 g N-bromosuccinimide, a little 2,2'-(azobis(2-methylpropionitrile) (α,α'-azobisisobutyronitrile, Eastman), and 100 mL carbon tetrachloride for 20 h, cool, evaporate under reduced pressure to remove the solvent, wash the residue with water, filter, dry, recrystallize from ethyl acetate/cyclohexane to give 4-bromomethyl-7-acetoxycoumarin (mp 184-185°). (J. Chromatogr. 1982, 234, 121).)

HPLC VARIABLES
Column: 250 × 4 5 μm LiChrosorb RP-18
Mobile phase: Gradient. MeCN:MeOH:water from 35:35:30 to 0:90:10 over 70 min (convex gradient).
Column temperature: 40
Flow rate: 1.2
Injection volume: 50
Detector: F ex 365 em 460 following post-column reaction. The column effluent mixed with 200 mM NaOH in MeOH:water 80:20 pumped at 0.4 mL/min and the mixture flowed through a 3.5 m × 0.5 mm ID stainless steel coil at 50° to the detector.

CHROMATOGRAM
Retention time: 42
Internal standard: margaric acid (57)
Limit of quantitation: 5 pmole

OTHER SUBSTANCES
Extracted: arachidonic acid, capric acid, caproic acid, caprylic acid, heptanoic acid, lauric acid, linoleic acid, linolenic acid, myristic acid, myristoleic acid, nonanoic acid, oleic acid, palmitic acid, palmitoleic acid, stearic acid, tridecanoic acid, undecanoic acid

SAMPLE
Matrix: blood
Sample preparation: Condition a Sep-Pak silica SPE cartridge with chloroform. 500 μL Serum + 1 mL 20 μM tridecanoic acid in chloroform containing 9.53 μM 2-heptenoic acid + 100 μL 500 mM sulfuric acid + 5 mL chloroform + 20 mL MeCN, shake slowly, add 1.5 g anhydrous calcium chloride, invert slowly, let stand for 30 min, filter (No 5A paper) the upper layer. Add 500 μL 45 mM dansyl semipiperazide in chloroform and 150 mg dicyclohexylcarbodiimide to the filtrate, let stand for 30 min, remove the solvent by evaporation under reduced pressure, dissolve the residue in the minimum amount of chloroform, add to the SPE cartridge, elute with two 1 mL portions of chloroform. Evaporate the eluate to dryness under reduced pressure, reconstitute with the minimum amount of MeOH, inject an aliquot. (Prepare dansyl semipiperazide as follows. Add 8 g dansyl chloride to 50 g piperazine dissolved in 500 mL acetone with stirring at room temperature over 30 min, stir overnight, evaporate to dryness under reduced pressure. Dissolve the residue in 300 mL chloroform, filter (5A paper), wash the filtrate three times with 5% sodium bicarbonate, wash with water. Extract the organic layer three times with 100 mL portions of 1 M HCl, combine the extracts and wash them repeatedly with chloroform, make alkaline with a slight excess of powdered sodium carbonate, extract with benzene (Caution! Benzene is a carcinogen!). Wash the benzene layer twice with 5% sodium bicarbonate, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure. Dissolve the residue in the minimum amount of chloroform, chromatograph on a 200 × 50 column of Wako Gel C-200 silica gel with chloroform. When the first eluting yellow band reaches the bottom change the eluent to MeOH, continue eluting until all the yellow band is collected. Evaporate the eluate to dryness to obtain dansyl semipiperazide, store in the dark at 5°. Determine the concentration of dansyl semipiperazide by spectrophotometry, extinction coefficient at 340 nm in MeOH or EtOH is 4300 $M^{-1}cm^{-1}$.)

HPLC VARIABLES
Column: 250 × 4.6 Hitachi C18 3056
Mobile phase: Gradient. MeCN:water 45:55 for 43 min, 60:40 for 32 min, 75:25 for 28 min, 85:15 for 100 min, 100:0 for rest of run (step gradient).
Flow rate: 0.8
Detector: F ex 350 em 530

SAMPLE

Matrix: blood
Sample preparation: 50 μL Plasma + 10 μL IS solution + 450 μL micelle solution, vortex for 10 s, add 25 μL 28 mg/mL 9-bromomethylacridine in acetone, mix. Remove a 50 μL aliquot and heat it to 60° for 6 min, inject the whole amount through a 2 μm stainless steel filter of 8 sq mm area onto column A, wash to waste with 400 μL mobile phase A, back flush the contents of column A onto column B with the mobile phase B, monitor the effluent from column B. After each injection backflush the stainless steel filter with 1 mL buffer. (Micelle solution was 25 mM Arkopal N-130 (a polyoxyethylene(13)nonylphenol, Hoechst Holland, Amsterdam) in 10 mM pH 7.0 phosphate buffer containing 6 mM tetrakis(decyl)ammonium bromide. Synthesize 9-bromomethylacridine as follows. Heat 10 g diphenylamine, 10 mL glacial acetic acid, and 40 g anhydrous zinc chloride to 220°, evaporate excess acetic acid with stirring, heat at 220-230° for 6 h, digest with hot 10% sulfuric acid, make strongly alkaline with 25% ammonia to dissolve the zinc chloride. Extract the insoluble residue with toluene. Extract the organic layer with 10% sulfuric acid, make the aqueous layer alkaline with aqueous ammonia. Collect the yellow precipitate that separates and recrystallize it twice from petroleum ether to give 9-methyl acridine as pale yellow needles (Chromatographia 1989, 28, 267). Reflux 560 mg 9-methylacridine, 445 mg N-bromosuccinimide, and 10 mg benzoyl peroxide in 30 mL carbon tetrachloride for more than 2 h, cool, chromatograph on silica gel with benzene:ethyl acetate 30:1 (Caution! Benzene is a carcinogen!) to obtain 9-bromomethylacridine as yellow crystals (mp 147-151°) (Anal. Lett. 1987, 20, 1581).)

HPLC VARIABLES

Column: A 10 × 2.1 40 μm Chromsep C18 (Chrompack); B 100 × 3 5 μm Chromspher C18 (Chrompack)

SAMPLE
Matrix: blood
Sample preparation: 50 μL Serum + 10 μL 100 μM margaric acid in DMF + 200 μL 500 mM pH 6.5 phosphate buffer, mix, add 2 mL chloroform:n-heptane 50:50, vortex for 1 min, centrifuge at 1500 g for 5 min. Remove a 1.5 mL aliquot of the organic layer and evaporate it to dryness, reconstitute the residue in 200 μL DMF. Remove a 100 μL aliquot and add it to 50 μL 1 M 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide in water, 50 μL 10% pyridine in water, and 100 μL 30 mM reagent in DMF, mix well, let stand at room temperature for 45 min, inject a 20 μL aliquot. (Synthesis of the reagent, 2-(4-hydrazinocarbonylphenyl)-4,5-diphenylimidazole, is as follows. Add 3.15 g benzil and 2.46 g methyl 4-formylbenzoate (terephthalaldehydic acid methyl ester) to 10 g ammonium acetate in 30 mL acetic acid, stir at 80° for 9 h, cool to room temperature, pour into cold water, filter. Wash the precipitate with water and recrystallize it from EtOH to give 4-(4,5-diphenyl-1H-imidazol-2-yl)benzoic acid methyl ester as pale yellow crystals (mp 245-248°). Reflux 1.47 g 4-(4,5-diphenyl-1H-imidazol-2-yl)benzoic acid methyl ester and 15 mL 80% hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) in 100 mL EtOH for 4 h, cool, to room temperature, pour into cold water, filter. Wash the precipitate with water and recrystallize it from EtOH:benzene 50:50 (Caution! Benzene is a carcinogen!) to give 2-(4-hydrazinocarbonylphenyl)-4,5-diphenylimidazole as a colorless powder (mp >300°).)

SAMPLE

Matrix: blood

Sample preparation: 10 μL Serum + 44 μL MeOH + 1 μL pyridine, sonicate for 5 min, add 25 μL 100 mM reagent in DMF, add 20 μL 400 mM 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide in MeOH, let stand at 25° for 2 h, centrifuge, inject an aliquot. (Reagent was 2-(5-hydrazinocarbonyl-2-furyl)-5,6-dimethoxybenzothiazole which was synthesized as follows. Pass dry hydrogen chloride into a mixture of 12.6 g methyl 2-furoate, 4.5 g paraformaldehyde, and 3.4 g anhydrous zinc chloride in 50 mL dry chloroform for 3 h while holding the reaction temperature at 30°. After cooling pour the contents of the flask into 100 mL cold water, remove the chloroform layer, extract the aqueous layer with chloroform (cf Coll. Czech. Chem. Commun. 1960, 25, 1058). Combine the chloroform layers, neutralize, dry over anhydrous calcium chloride, evaporate, distil to give 5-chloromethyl furyl-2-carboxylic acid methyl ester (bp 108°/4 mm Hg). Reflux 10 g 5-chloromethyl furyl-2-carboxylic acid methyl ester and 25 g silver carbonate in 100 mL THF:water 70:30 for 5 h, filter through Celite, concentrate the filtrate under reduced pressure, chromatograph the product on silica gel with chloroform to give 5-hydroxymethyl furyl-2-carboxylic acid methyl ester as a light yellow oil. Add a solution of 2.9 g 5-hydroxymethyl furyl-2-carboxylic acid methyl ester in 30 mL dichloromethane to 12 g pyridinium chlorochromate in 100 mL, dichloromethane, stir at room temperature for 4 h, evaporate to dryness under reduced pressure, chromatograph on silica with dichloromethane to give 5-formyl furyl-2-carboxylic acid methyl ester as a light yellow powder. Add 10 mL concentrated nitric acid dropwise to 20 g 4-bromoveratrole in 60 mL acetic acid while keeping the temperature at 10-30° with occasional cooling, when the addition is complete pour the reaction mixture into ice-water. Collect the precipitate and dissolve it in 500 mL hot EtOH, add activated charcoal, filter, add 40 mL water to the filtrate to give 4,5-dimethoxy-2-nitrobromobenzene as a light yellow crystalline solid (mp 121-122°). Prepare sodium sulfide by melting together 5 g sodium sulfide nonahydrate and 700 mg sulfur, add this mixture to 5 g 4,5-dimethoxy-2-nitrobromobenzene in 50 mL EtOH:water 95:5, reflux for 30 min, pour into ice-water, collect the

solid, recrystallize from dichloromethane to give di(4,5-dimethoxy-2- nitrophenyl)sulfide as yellow needles (mp 231-232°). Add 15 mL concentrated HCl dropwise to 1.5 g di(4,5-dimethoxy-2-nitrophenyl)sulfide and 4.5 g tin powder stirred at 40-50° in 150 mL EtOH, reflux for 1 h, cool to room temperature, filter, add 1.17 g 5-formyl furyl-2-carboxylic acid methyl ester to the filtrate, reflux for 1 h, cool, filter, chromatograph the solid on silica gel with dichloromethane, recrystallize from EtOH to give 5-(5',6'-dimethoxybenzothiazolyl)-N-furan-2-carboxylic acid methyl ester as a yellow powder (mp 192-202°). Add 2 mL hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) to 800 mg 5-(5',6'-dimethoxybenzothiazolyl)-N-furan-2-carboxylic acid methyl ester in 20 mL EtOH, reflux for 30 min, collect the solid, wash with MeOH, dry under vacuum over phosphorus pentoxide to give 2-(5-hydrazinocarbonyl-2-furyl)-5,6-dimethoxybenzothiazole as a light yellow solid (mp 226-228°).)

SAMPLE

Matrix: blood
Sample preparation: 50 μL Serum + 100 μL isopropanol:heptane:0.5 M sulfuric acid 80:20:2, extract. Remove 50 μL of the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 50 μL 15 mM reagent in DMSO, 50 μL 100 mM 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide in MeOH, 50 μL 1% pyridine in MeOH, and 50 μL 100 μM nonadecanoic acid, heat at 37° for 1 h, inject a 10 μL aliquot. (Reagent was 2-(5-hydrazinocarbonyl-2-oxazolyl)-5,6-dimethoxybenzothiazole which was synthesized as follows. Add 10 mL concentrated nitric acid dropwise to 20 g 4-bromoveratrole in 60 mL acetic acid while keeping the temperature at 10-30° with occasional cooling, when the addition is complete pour the reaction mixture into ice-water. Collect the precipitate and dissolve it in 500 mL hot EtOH, add activated charcoal, filter, add 40 mL water to the filtrate to give 4,5-dimethoxy-2-nitrobromobenzene as a light yellow crystalline solid (mp 121-122°). Prepare sodium sulfide by melting together 5 g sodium sulfide nonahydrate and 700 mg sulfur, add this mixture to 5 g 4,5-dimethoxy-2-nitrobromobenzene in 50 mL EtOH:water 95:5, reflux for 30 min, pour into ice-water, collect the solid, recrystallize from dichloromethane to give di(4,5-dimethoxy-2-nitrophenyl)sulfide as yellow needles (mp 231-232°) (Anal. Sci. 1995, 11, 103). Add ethyl oxalyl chloride in ether to a solution of diazomethane in ether at 0° to give ethyl diazopyruvate (Caution! Diazo compounds are explosive and toxic!) (cf. Buehler,C.A.; Pearson,D.E. Survey of Organic Syntheses, Wiley, New York, 1970, p. 179). Heat 100 mg ethyl diazopyruvate, a few mg copper(II) acetylacetonate, and 400 μL chloroacetonitrile in benzene at 60° overnight (Caution! Benzene is a carcinogen!), cool, add to sodium bicarbonate solution, extract with ether, dry the organic layer, evaporate, chromatograph on silica with petroleum ether:ethyl acetate 90:10, distil the product at 90°/12 mm Hg to give ethyl 2-chloromethyl-5-oxazolecarboxylate as

an oil in 18% yield (US Patent 4 603 209 (July 29, 1986)). Reflux 5.0 g ethyl 2-chloromethyl-5-oxazolecarboxylate and 11.7 g NaI in 80 mL acetone for 1 h, partition the reaction mixture between ethyl acetate and water. Wash the organic layer with water and dry it over anhydrous sodium sulfate, evaporate to give ethyl 2-iodomethyl-5-oxazolecarboxylate as a reddish-brown oil. Reflux 7.4 g ethyl 2-iodomethyl-5-oxazolecarboxylate and 21.5 g silver carbonate in 100 mL THF:water 70:30 for 4 h, filter through Celite, evaporate under reduced pressure, chromatograph on silica gel using benzene:ethyl acetate 95:5 to give ethyl 2-hydroxymethyl-5-oxazolecarboxylate (mp 60.5-62°). Stir 2.04 g oxalyl chloride in 15 mL dichloromethane at -50° under nitrogen, add 1.54 g DMSO in 3 mL dichloromethane, after 5 min add 1.4 g ethyl 2-hydroxymethyl-5-oxazolecarboxylate in 6 mL dichloromethane, stir for 15 min at -50°, add 5.7 mL triethylamine, allow to warm to room temperature, dilute with dichloromethane, wash with water, dry over anhydrous sodium sulfate, concentrate under reduced pressure, chromatograph on silica gel using benzene:ethyl acetate 95:5 to give ethyl 2-carboxaldehyde-5-oxazolecarboxylate (mp 71.5-73°). Add 11.3 mL concentrated HCl to 750 mg di(4,5-dimethoxy-2-nitrophenyl)sulfide stirred in 100 mL EtOH, add 3.3 g tin powder at 40-45°, stir for 1 h at 40-45°, dilute with 100 mL water, pass hydrogen sulfide gas through this solution (Caution! Hydrogen sulfide is highly toxic!), filter, concentrate the filtrate under reduced pressure to give 4,5-dimethoxy-2-aminothiophenol. Take up this compound in 30 mL EtOH:acetic acid 2:1 and add 750 mg ethyl 2-carboxaldehyde-5-oxazolecarboxylate, reflux for 1 h, collect the precipitate and recrystallize it from EtOH to give 2-(5-ethoxycarbonyl-2-oxazolyl)-5,6-dimethoxybenzothiazole as yellow needles (mp 200-201°). Add 381 mg 2-(5-ethoxycarbonyl-2-oxazolyl)-5,6-dimethoxybenzothiazole to 20 mL EtOH containing 3 mL DMF and 5 mL hydrazine hydrate, reflux for 1 h, collect the precipitate and wash it with EtOH, dry under vacuum to give 2-(5-hydrazinocarbonyl-2-oxazolyl)-5,6-dimethoxybenzothiazole as a yellow powder (mp 255.5-280° (d)).)

SAMPLE

Matrix: blood
Sample preparation: 10 μL Serum or plasma + 10 μL 100 μM pentadecanoic acid in DMF + 200 μL 500 mM pH 6.5 phosphate buffer, mix, add 2 mL n-heptane:chloroform 50:50, vortex thoroughly, centrifuge at 1500 g for 10 min. Remove 750 μL of the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 375 μL DMF, add 25 μL 4 M 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride in pyridine:water 40:60, add 100 μL 5 mM DBD-ProCZ in DMF, let stand at room temperature in the dark for 1.5 h, inject an aliquot. (Synthesis of DBD-ProCZ is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three

times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ tlc plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Add 100 mg DBD-F in 10 mL MeCN to 47 mg proline in 20 mL 250 mM pH 11.5 sodium carbonate solution, stir at room temperature for 30 min, wash with ethyl acetate, adjust the pH of the aqueous layer to 1-2 with 2 M HCl, extract three times with 30 mL ethyl acetate. Combine the extracts and evaporate them under reduced pressure, recrystallize from benzene/ethyl acetate to give 4-(N,N-dimethylaminosulfonyl)-7-(2- carboxypyrrolidin-1-yl)-2,1,3-benzoxadiazole (DBD-Pro) as yellow needles (mp 187-9° d) (Analyst 1989, 114, 1233). Suspend 55 mg (S)-(-)-DBD-Pro in 55 mL anhydrous diethyl ether at 0°, add 110 mg phosphorus pentachloride, stir at 5° for 1 h, filter quickly, evaporate to dryness under reduced pressure, dry under vacuum over phosphorus pentoxide for 12 h to give 4-(N,N-dimethylaminosulfonyl)-7-(2-chloroformylpyrrolidin-1-yl)-2,1,3-benzoxadiazole (DBD-Pro-Cl) as yellow crystals (mp 116-17°) (Analyst 1993, 118, 759). DBD-Pro-Cl is also available from Tokyo Kasei (TCI America, Portland OR). Add 130 mg DBD-Pro-Cl dissolved in 25 mL anhydrous benzene dropwise to 100 mL MeOH containing 70 mg hydrazine hydrate, stir for 30 min at room temperature, evaporate under reduced pressure, recrystallize from ethyl acetate:MeOH 90:10 to give 4-(2-carbazolyl-pyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole (DBD-ProCZ) as orange crystals (mp 107-109°) (Anal.Proc. 1994, 31, 265).)

SAMPLE

Matrix: blood

Sample preparation: Dilute serum 20 times with water. 100 μL Diluted serum + 100 μL 1 M 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide in MeOH + 100 μL pyridine:MeOH 20:80 + 100 μL 15 mM reagent in DMF, heat at 37° for 20 min, inject a 20 μL aliquot. (Prepare reagent as follows. Stir 20 g 4-bromoveratrole in 60 mL acetic acid and add 10 mL concentrated nitric acid dropwise, keep at 10-30° with occasional cooling, pour in to ice-water, filter. Take up the precipitate in 500 mL hot EtOH and add activated charcoal, filter, add 40 mL water to the filtrate, collect 4-bromo-5-nitroveratrole as light yellow crystals (mp 121-2°). Melt 5 g sodium sulfide nonahydrate and 0.7 g sulfur together, add this mixture to 5 g 4-bromo-5-nitroveratrole in 50 mL 95% EtOH, reflux for 30 min, pour into ice-water, filter, recrystallize the product from dichloromethane to give the nitro disulfide as yellow needles (mp 231-2°). Add 8 g tin powder to 2 g of the nitro disulfide in 300 mL EtOH, add 30 mL concentrated HCl dropwise, basify with 4 M NaOH, filter, dilute the filtrate with 200 mL water. Extract the diluted filtrate twice with 100 mL portions of benzene (Caution! Benzene is a carcinogen!). Combine the extracts and evaporate them under reduced pressure, take up the residue in 10 mL benzene and add 2 mL 10% hydrogen peroxide, stir for 30 min, recrystallize the precipitate from EtOH to give 2,2'-dithiobis(1-amino-4,5-dimethoxybenzene) (mp 155-6°) (Anal.Chim.Acta 1994, 291, 189). Add a mixture of 3.7 g 2,2'-dithiobis(1-amino-4,5-dimethoxybenzene) and 1.2 g tri-n-butylphosphine in 40 mL 800 mM disodium hydrogen phosphite in MeOH to 1.2 g 4-carboxybenzaldehyde in 20 mL MeOH, stir at 37° for 2 h, filter the precipitate. Wash the precipitate with MeOH:water 70:30 and dry it under reduced pressure. Dissolve in 50 mL MeOH and treat with ethereal diazomethane (e.g., prepared as Anal. Chem. 1960, 32, 1412), evaporate to dryness under reduced pressure, chromatograph the residue on a 250 × 35 column of 130 g 70-230 mesh silica gel 60 (Merck) with n-hexane:ethyl acetate:chloroform 50:25:25, collect the main fraction and evaporate to obtain the product, 5,6-dimethoxy-2-(4-carbomethoxyphenyl)benzothiazole, as pale yellow needles (mp 223-224°). Add 100 mL aqueous 45% hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen and may explode on distillation!) to 500 mg of the product in 50 mL EtOH, reflux for 1 h, collect the precipitate and recrystallize it from EtOH to give the reagent, 5,6-dimethoxy-2-(4-hydrazinocarbonylphenyl)benzothiazole, as colorless needles (mp 252-254°).)

Yamaguchi,M.; Hara,S.; Obata,K. 5,6-Dimethoxy-2-(4'-hydrazinocarbonylphenyl)benzothiazole as a highly sensitive and stable fluorescence derivatization reagent for carboxylic acids in high performance liquid chromatography, *J.Liq.Chromatogr.*, **1995**, *18*, 2991–3006.

SAMPLE
Matrix: blood
Sample preparation: 50 μL Serum + 200 μL ethyl acetate + 100 μL dilute HCl (pH 3.0), vortex for 5 min. Remove the supernatant and add it to 50 μL 4 mM 4-aminomethyl-6,7-dimethoxycoumarin in DMF containing 25 mM 1-hydroxybenzotriazole, add 40 μL 500 mM pH 7.0 phosphate buffer, add 100 μL 2 M 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide in water, add 10 μL 1 mM nonadecanoic acid in MeOH, vortex at 25° for 5 min, inject a 10 μL aliquot of the organic layer. (Preparation of 4-aminomethyl-6,7-dimethoxycoumarin is as follows. Heat 1 g 4-bromomethyl-6,7-dimethoxycoumarin and 1.3 g potassium phthalimide in 40 mL DMF at 80° for 1 h, cool, add 100 mL chloroform, wash with 50 mL 100 mM NaOH, wash with 100 mL water. Dry the organic layer over anhydrous sodium sulfate, concentrate to a small volume, add ether, collect 4-phthalimidylmethyl-6,7-dimethoxycoumarin as a crystalline solid (mp 240.5-242°). Reflux 950 mg 4-phthalimidylmethyl-6,7-dimethoxycoumarin and 520 mg hydrazine hydrate in 40 mL THF:MeOH 50:50 for 1.5 h (Caution! Hydrazine hydrate is a carcinogen and explodes on distillation in air!), filter, evaporate the filtrate to dryness, add 20 mL dilute HCl, evaporate to dryness, recrystallize from EtOH:ether 50:50 to give 4-aminomethyl-6,7-dimethoxycoumarin hydrochloride as slightly yellow crystals (mp 240-242.5°). Dissolve 370 mg 4-aminomethyl-6,7-dimethoxycoumarin hydrochloride in 20 mL 5% NaOH, extract 5 times with 20 mL portions of ethyl acetate, evaporate to dryness under reduced pressure, chromatograph on silica with chloroform:MeOH 98:2 to give 4-aminomethyl-6,7-dimethoxycoumarin as a slightly yellow powder (mp 137-147°).)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Wakosil-II 5C18
Mobile phase: Gradient. MeCN:water from 40:60 to 100:0 over 35 min, maintain at 100:0.
Column temperature: 40
Flow rate: 1
Injection volume: 10
Detector: F ex 348 em 429

CHROMATOGRAM
Retention time: 27
Internal standard: nonadecanoic acid (42)
Limit of detection: 20-50 fmole

OTHER SUBSTANCES
Extracted: arachidonic acid, lauric acid, linolenic acid, margaric acid, myristic acid, myristoleic acid, oleic acid, palmitic acid, palmitoleic acid, stearic acid

KEY WORDS
derivatization; serum

SAMPLE
Matrix: butter, oil, margarine, solutions
Sample preparation: Butter, oil, margarine. Dissolve 20-40 mg in 5 mL chloroform. Remove a 100 μL aliquot and add it to 1.5 mL 25 mM tetraethylammonium carbonate in MeOH, heat in a capped tube at 70° for 5 min, remove the cap, heat at 70° for 30 min, evaporate to dryness under a stream of nitrogen, reconstitute with 1 mL DMF. Remove a 100 μL aliquot and add it to 200 μL 5 mM 9-bromomethylacridine in DMF, let stand at room temperature for at least 10 min, inject an aliquot. Solutions. Mix 100 μL of a solution in DMF with 100 μL 5 mM 9-bromomethylacridine in DMF in 100 μL 2.5 mM tetraethylammonium carbonate in DMF, let stand at room temperature for 10 min, inject a 10 μL aliquot. (Prepare tetraethylammonium carbonate by adding dry ice to an aqueous solution of tetraethylammonium hydroxide, evaporate to dryness under reduced pressure at 56° over phosphorus pentoxide to give tetraethylammonium carbonate as a white hygroscopic powder (mp 294-288° d). Prepare 9-bromomethylacridine as follows. Reflux 560 mg 9-methylacridine, 445 mg N-bromosuccinimide, and 10 mg benzoyl peroxide in 30 mL carbon tetrachloride for more than 2 h, cool, chromatograph on a column of silica gel with benzene:ethyl acetate 30:1 to obtain 9-bromomethylacridine as yellow crystals (mp 147-151°).)

HPLC VARIABLES
Column: 150 × 4.6 TSK-gel ODS 120A (Toyo Soda)
Mobile phase: Gradient. MeOH:water from 90:10 to 97:3 over 32 min (JASCO concave curve 2), maintain at 97:3 for 30 min.
Flow rate: 0.8
Injection volume: 10
Detector: F ex 365 em 425, UV 252

CHROMATOGRAM
Retention time: 36

OTHER SUBSTANCES
Extracted: arachidonic acid, capric acid, caprylic acid, docosahexaenoic acid, eicosapentaenoic acid, eicosatrienoic acid, lauric acid, linolenic acid, margaric acid, myristic acid, oleic acid, palmitic acid, palmitoleic acid, stearic acid

SAMPLE
Matrix: enzyme incubations
Sample preparation: 50 μL Enzyme incubation + 200 μL n-heptane:isopropanol:1 M sulfuric acid 20:80:2, add 120 μL heptane, add 70 μL water, add 5 nmoles margaric acid, vortex for 20 s. Remove a 30-50 μL aliquot of the heptane layer and evaporate it to dryness under reduced pressure, add 50 μL 500 μg/mL 9-anthryldiazomethane in MeOH:ethyl acetate 90:10 (prepare immediately before use), let stand at room temperature for 15 min, inject a 3-10 μL aliquot. (9-Anthryldiazomethane is available from Funakoshi Co., Tokyo or it may be synthesized as follows. Stir 8.8 g 9-anthraldehyde and 8.5 g 80% hydrazine hydrate in 150 mL EtOH at room temperature for 3 h, filter off the solid 9-anthraldehyde hydrazone and dry under vacuum (mp 124-6°) (Bull. Chem. Soc. Jpn. 1967, 40, 691). Dissolve 220 mg 9-anthraldehyde hydrazone in 100 mL anhydrous ether, add 800 mg activated manganese dioxide, follow the reaction by reverse-phase HPLC using MeCN at 0.4 mL/min and UV 254. At the end of the reaction filter off the manganese and wash it with 20 mL ether, evaporate the filtrate to obtain 9-anthryldiazomethane (mp 64-6°) (Anal.Biochem. 1980, 107, 116 and 1983, 132 456). Prepare activated manganese dioxide as follows. Stir a solution of 20 g potassium permanganate in 250 mL water at room temperature, add 10 g activated carbon (Nuchar C-190 or C-190N), stir for 16 h, filter (Buchner funnel), wash 4 times with 50 mL portions of water, dry in air, dry in an oven at 105-110° for 8-24 h (J.Org.Chem. 1970, 35, 3971).)

SAMPLE
Matrix: food
Sample preparation: Dissolve 20-40 mg oil, butter, or margarine in 5 mL chloroform. Remove a 100 μL aliquot and add it to 1.5 mL 25 mM tetraethylammonium carbonate in MeOH, heat in a capped tube at 70° for 5 min, heat at 70° for 30 min in an open tube, evaporate to dryness under a stream of nitrogen, reconstitute with 1 mL DMF. Remove a 100 μL aliquot and add it to 200 μL 5 mM 9-bromomethylacridine in DMF, let stand at room temperature for at least 10 min, inject a 10 μL aliquot. (Synthesize 9-bromomethylacridine as follows. Heat 10 g diphenylamine, 10 mL glacial acetic acid, and 40 g anhydrous zinc chloride to 220°, evaporate excess acetic acid with stirring, heat at 220-230° for 6 h, digest with hot 10% sulfuric acid, make strongly alkaline with 25% ammonia to dissolve the zinc chloride. Extract the insoluble residue with toluene. Extract the organic layer with 10% sulfuric acid, make the aqueous layer alkaline with aqueous ammonia. Collect the yellow precipitate that separates and recrystallize it twice from petroleum ether to give 9-methyl acridine as pale yellow needles (Chromatographia 1989, 28, 267). Reflux 560 mg 9-methylacridine, 445 mg N-bromosuccinimide, and 10 mg benzoyl peroxide in 30 mL carbon tetrachloride for more than 2 h, cool, chromatograph on silica gel with benzene:ethyl acetate 30:1 (Caution! Benzene is a carcinogen!) to obtain 9-bromomethyl-

acridine as yellow crystals (mp 147-151°). Prepare tetraethylammonium carbonate by adding dry ice to an aqueous solution of tetraethylammonium hydroxide, evaporate to dryness under reduced pressure over phosphorus pentoxide at 56° to obtain tetraethylammonium carbonate as a white hygroscopic powder (decomposes 284-288°).)

SAMPLE

Matrix: food
Sample preparation: Orange juice. 10 mL Orange juice + 70 mL water + 8 g NaCl, mix until homogeneous, add 50 mL dichloromethane, shake for 1 min, centrifuge at 400 g for 5 min, repeat extraction twice more. Combine the organic layers and evaporate them to dryness under reduced pressure at 40°, dissolve the residue in five 3 mL portions of MeCN. Combine the MeCN extracts and evaporate them to 1 mL under a stream of nitrogen at 40°, filter (0.45 μm), inject an aliquot. Butter, margarine. Warm 1 g butter of margarine at 40° until it melts, add 10 mL MeCN, vortex for 5 min, filter (0.45 μm), inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Spherisorb ODS-2
Mobile phase: Gradient. MeCN:buffer from 79:21 to 87:13 over 10 min, to 99:1 over 5 min, maintain at 99:1 for 5 min, return to initial conditions over 2 min, re-equilibrate for 6 min. (Buffer was water adjusted to pH 4.0 with 5% orthophosphoric acid.)
Flow rate: 0.8
Injection volume: 10
Detector: UV 651 following post-column extraction. The column effluent mixed with 2 μg/mL methylene blue in 20 mM Na_2HPO_4 pumped at 2 mL/min and the mixture flowed through a 45 cm × 0.5 mm ID stainless steel coil. The effluent from this coil mixed with chloroform pumped at 1 mL/min and the mixture flowed through a 50 cm × 1 mm ID stainless steel coil to a CTFE polymer phase separator fitted with a polyethylene filter disc from a SPE cartridge (construction details in paper). The organic phase flowed downwards to the detector at 0.5 mL/min and the aqueous phase flowed to waste. Every 2-3 injections rinse detector cell with 2-3 mL MeCN.

CHROMATOGRAM

Retention time: 9.7
Limit of detection: 39 ng

SAMPLE
Matrix: milk, milk products
Sample preparation: Free fatty acids. Measure out 100 μL milk, 20 mg butter, 20 mg cheese, 50 mg condensed milk, 50 mg ice cream, or 50 mg yogurt, add 100 μL water, add 200 μL 100 μM 2-ethylbutyric acid in EtOH containing 100 μM margaric acid, add 200 μL 20 mM 2-nitrophenylhydrazine hydrochloride in EtOH:100 mM HCl 50:50, add 200 μL 250 mM 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride in EtOH:pyridine 97:3, heat at 80° for 5 min, add 200 μL 10% KOH in MeOH:water 50:50, heat at 80° for 5 min, cool, add 4 mL 33 mM pH 6.4 phosphate buffer:500 mM HCl 7:1, extract with 5 mL n-hexane. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 200 μL MeOH, filter (0.45 μm), inject a 10-20 μL aliquot of the filtrate. Total fatty acids. Measure out 10 μL milk, 1 mg butter, 1 mg cheese, 2 mg condensed milk, 2 mg ice cream, or 10 mg yogurt, add 200 μL 2 mM 2-ethylbutyric acid in EtOH containing 1 mM margaric acid, add 100 μL EtOH:400 mM KOH 50:50, heat at 80° for 20 min, add 200 μL 20 mM 2-nitrophenylhydrazine hydrochloride in EtOH:300 mM HCl 50:50, add 200 μL 250 mM 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride in EtOH:pyridine 97:3, heat at 80° for 5 min, add 200 μL 10% KOH in MeOH:water 50:50, heat at 80° for 5 min, cool, add 4 mL 33 mM pH 6.4 phosphate buffer:500 mM HCl 7:1, extract with 5 mL n-hexane. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 200 μL MeOH, filter (0.45 μm), inject a 2-10 μL aliquot of the filtrate.

HPLC VARIABLES
Guard column: 10 × 4 5 μm BBC-4-C8 (Yamamura Chemical Labs)
Column: 250 × 6 5 μm YMC-FA C8 (Yamamura Chemical Labs)
Mobile phase: MeCN:MeOH:water 75:11:14, adjusted to pH 4.5 with 100 mM HCl
Column temperature: 35
Flow rate: 1.2
Injection volume: 2-10
Detector: UV 400

CHROMATOGRAM
Retention time: 13.5
Internal standard: 2-ethylbutyric acid (17.5 (A)), margaric acid (19.5 (B))
Limit of detection: 0.5-2 pmole

OTHER SUBSTANCES
Extracted: arachidic acid, arachidonic acid, capric acid, caprylic acid, docosadienoic acid, docosahexaenoic acid, docosatetraenoic acid, docosatrienoic acid, eicoatrienoic acid, eicosadienoic acid, eicosaenoic acid, eicosapentaenoic acid, elaidic acid, erucic acid, lauric acid, linoelaidic acid, linolenic acid, myristic acid, myristoleic acid, oleic acid, palmitic acid, palmitoleic acid, stearic acid

KEY WORDS
derivatization; milk; butter; cheese; condensed milk; ice cream; yogurt

SAMPLE
Matrix: solutions

Sample preparation: Add 500 μL of a solution in MeCN to 100 mg finely powdered potassium carbonate, add 250 μL 3.8 mM 18-crown-6 in MeCN, add 250 μL 0.8 mM reagent in MeCN, heat at 80° in the dark for 20 min, cool, inject a 5 μL aliquot. (Synthesize the reagent, 3-bromomethyl-6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone, as follows. Stir 483 g veratrole in 1.45 L acetic acid at 15° for 1 h, add 683 g concentrated nitric acid (d 1.05) over 1 h (maintain the temperature below 40° by cooling and regulating the rate of addition of the nitric acid). Continue stirring and add 2.127 L fuming nitric acid (d 1.50) over 1 h while maintaining the temperature below 30°, let stand for 2 h, pour into a large volume of cold water, filter, wash the solid with water until the washings are neutral, recrystallize from EtOH to give 4,5-dinitroveratrole (mp 129.5-130.5°) (J. Am. Chem. Soc. 1946, 68, 1536). Reflux 5 g 4,5-dinitroveratrole in 200 mL benzene (Caution! Benzene is a carcinogen!), add 100 g 60 mesh iron powder and 20 mL concentrated HCl in small portions over 1 h, reflux for 4 h, add 10 mL water, reflux for 2 h, cool, make alkaline with 2.5 M NaOH, extract several times with 200 mL portions of benzene. Combine the organic layers and evaporate them to dryness, add 10 mL concentrated HCl, recrystallize from EtOH to give 1,2-diamino-4,5-dimethoxybenzene monohydrochloride as very slightly pink needles (mp 240°) (Anal. Chim. Acta 1982, 134, 39). Heat 2.5 mmoles 1,2-diamino-4,5-dimethoxybenzene hydrochloride and 2.4 mmoles pyruvic acid in 30 mL 500 mM HCl on a boiling water bath for 2 h, cool with ice-water, filter. Wash the precipitate with water and dry it under vacuum, recrystallize from MeOH:water 90:10 to give 6,7-dimethoxy-3-methyl-2(1H)-quinoxalinone as yellow needles (mp 255°) (Chem. Pharm. Bull. 1985, 33, 3493). Treat 1 g 6,7-dimethoxy-3-methyl-2(1H)-quinoxalinone dissolved in 50 mL anhydrous MeOH with a solution of diazomethane in ether, evaporate to dryness under reduced pressure, dissolve the residue in 5 mL ethyl acetate, chromatograph on a 250 × 35 column filled with 130 g 70-230 mesh silica gel 60 (Merck) using n-hexane:ethyl acetate 25:75 to give 6,7-dimethoxy-1,3-dimethyl-2(1H)-quinoxalinone as yellow needles (mp 170-171°). Dissolve 350 mg 6,7-dimethoxy-1,3-dimethyl-2(1H)-quinoxalinone in 3 mL acetic acid, add 350 mg anhydrous sodium acetate, add 2 mL 1.5 M bromine in acetic acid, heat at 100° for 15 min, cool, add 10 mL ether, filter, wash the solid 2 or 3 times with small portions of ether. Combine the filtrate and washings and evaporate them to dryness, dissolve the residue in 5 mL ethyl acetate, chromatograph on a 250 × 35 column filled with 130 g 70-230 mesh silica gel 60 (Merck) using ether, evaporate the main fraction to dryness, recrystallize the residue from n-hexane:ethyl acetate 50:50 to give 3-bromomethyl-6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone as yellow needles (mp 161-163°).)

HPLC VARIABLES

Column: 100 × 4 10 μm Radial-Pak C18 (Waters)

SAMPLE

Matrix: solutions

Sample preparation: Mix 100 μL of a 0.01-10 μg/mL solution in MeOH with 100 μL 1 mg/mL 1-pyrenyldiazomethane in ethyl acetate, let stand at room temperature for 1.5 h, inject a 5 μL aliquot. (Synthesis of 1-pyrenyldiazomethane is as follows. Suspend 5 g 1-pyrenecarboxaldehyde in 80 mL EtOH, add 3.4 g hydrazine monohydrate (Caution! Hydrazine monohydrate is a carcinogen!), stir at room temperature for 3 h, filter off the product and wash it with 50 mL cold EtOH, recrystallize from EtOH to obtain 1-pyrenecarboxaldehyde hydrazone as yellow crystals (mp 186-194° d). Add 6.55 g activated manganese dioxide to 2 g 1-pyrenecarboxaldehyde hydrazone in 300 mL diethyl ether, sonicate at room temperature for about 80 min (monitor by HPLC), filter, wash the solid with a little ether, evaporate the filtrate to obtain 1-pyrenyldiazomethane as red crystals. Prepare activated manganese dioxide as follows. Stir a solution of 20 g potassium permanganate in 250 mL water at room temperature, add 10 g activated carbon (Nuchar C-190 or C-190N), stir for 16 h, filter (Buchner funnel), wash 4 times with 50 mL portions of water, dry in air, dry in an oven at 105-110° for 8-24 h (J.Org.Chem. 1970, 35, 3971). 1-Pyrenyldiazomethane is also available from Molecular Probes, Eugene OR.)

HPLC VARIABLES

SAMPLE

Matrix: solutions

Sample preparation: Mix 100 μL of a 0.3 μM solution in MeCN with 50 μL 100 μM tetraethylammonium carbonate in MeCN, add 50 μL freshly-prepared 200 μM reagent in MeCN, vortex for 10 s, let stand at room temperature for 10 min, inject a 1 μL aliquot. (Prepare tetraethylammonium carbonate by adding dry ice to an aqueous solution of tetraethylammonium hydroxide, evaporate to dryness under reduced pressure at 56° over phosphorus pentoxide to give tetraethylammonium carbonate as a white hygroscopic powder (mp 294-288° d) (Anal. Lett. 1987, 20, 1581). The reagent was 2,3-(anthracenedicarboximido)ethyl trifluoromethanesulfonate, prepared as follows. Add 11.7 g benzoyl chloride dropwise over 30 min to 10 g 1,2,4-trimethylbenzene and 11.7 g aluminum trichloride in 10 mL dichloromethane stirred at 0°, stir at room temperature for 6 h, pour into a mixture of 25 mL concentrated HCl and 50 g ice, remove the organic layer, extract the aqueous layer with dichloromethane. Combine the organic layers and wash them with 5% sodium bicarbonate, dry over anhydrous magnesium sulfate, evaporate to dryness under reduced pressure, distil through a Vigreux column to give 2,4,5-trimethylbenzophenone (bp 130°/0.15 mm Hg). Reflux 12.5 g 2,4,5-trimethylbenzophenone in 75 mL 20% nitric acid for 5 days, cool, decant the aqueous layer, wash the solid with 75 mL water. Dissolve the solid in 125 mL 10% NaOH, reflux this solution while stirring it mechanically, add 35 g potassium permanganate in portions (Caution! Frothing may occur!) over 40 min, reflux for 3 h, allow to cool somewhat, filter. Add the solid that is collected to water, reflux for 6 h, filter while hot. Combine the filtrates and evaporate them to half volume under reduced pressure, cool, acidify slowly with concentrated HCl, filter, dry the solid in air to give benzophenone-2,4,5-tricarboxylic acid as white crystals (mp 281-283°). Stir 2.1 g benzophenone-2,4,5-tricarboxylic acid in 21 g concentrated sulfuric acid at 120° for 3 h, pour onto 30 g of ice, filter, wash the solid with water, dry in air to give anthraquinone-2,3-dicarboxylic acid as a pale yellow solid (mp 342°). Add 1 g anthraquinone-2,3-dicarboxylic acid to 50 mL 20% ammonium hydroxide then add 3.75 g activated zinc dust, reflux, as soon as the blood-red color disappears filter while hot. Add the solid that is collected it to 50 mL 20% ammonium hydroxide, reflux for 2 h, filter while hot. Combine the filtrates and cool them to 0°, acidify to pH 1 with 6 M HCl, let stand at room temperature for 1 day, filter to give 2,3-anthracenedicarboxylic acid as a bright yellow solid (mp 345°) (J. Org. Chem. 1991, 56, 6243). Reflux 2,3-anthracenedicarboxylic acid in acetic anhydride for 2 h to give 2,3-anthracenedicarboxylic anhydride. Vigorously reflux 200 mg 2,3-anthracenedicarboxylic anhydride, 200 mg 2-aminoethanol, 60 mL dry toluene, and 30 mL butanol under a Dean-Stark trap for 1.5 h, evaporate the solvent under reduced pressure until crystallization starts, dissolve these crystals by warming, cool to obtain crystals, recrystallize from toluene/butanol to give N-(hydroxyethyl)-2,3- anthracenedicarboximide as orange crystals (mp 292-294°). Suspend 200 mg N-(hydroxyethyl)-2,3-anthracenedicarboximide in 50 mL dichloromethane and 1 mL pyridine, add this mixture to a solution of 400 mg trifluoromethanesulfonic anhydride in 30 mL dichloromethane at such a rate as to keep the temperature below -5°, stir for 3 h below -5°, add 200 mL cold water. Remove the organic layer and dry it over anhydrous magnesium sulfate, evaporate to dryness under reduced pressure, recrystallize from dichloromethane at -20° to give 2,3-(anthracenedicarboximido)ethyl trifluoromethanesulfonate as pale yellow crystals (mp >300°).)

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 0.17-1.7 mg/mL solution in MeOH, inject a 30 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: Gradient. A was MeOH containing 0.05% acetic acid. B was water containing 0.05% acetic acid. A:B 85:15 to 100:0 over 40 min, maintain at 100:0.
Flow rate: 1
Injection volume: 30
Detector: evaporative light scattering (ELSD, MK VIII, Varex), drift tube 75°, nitrogen flow 1 L/min, nitrogen pressure 22 psi or UV 205

CHROMATOGRAM
Retention time: 22.36

OTHER SUBSTANCES
Simultaneous: ricinoleic acid, fatty acids

SAMPLE
Matrix: tissue
Sample preparation: 50 mg Fat + 1 mL 25% KOH in 96% EtOH, heat in a boiling water bath for 1 h, cool, adjust pH to 2 with 3 M HCl, extract three times with 2 mL portions of n-hexane: diethyl ether 50:50. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue with 25 μL 10 mg/mL α-bromoacetophenone in acetone and 25 μL 10 mg/mL triethylamine in acetone, heat in a boiling water bath for 5 min, add 40 μL 2 mg/mL acetic acid in acetone, heat for 5 min, evaporate to dryness under a stream of nitrogen at 40°, reconstitute with 100 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES
Guard column: 50 × 4 7 μm Separon SGX C18 (Tessek, Prague)
Column: 250 × 4 5 μm Separon SGX C18 (Tessek, Prague)
Mobile phase: Gradient. MeCN:MeOH:water from 40.5:40:19.5 to 0:81.5:18.5 over 25 min, to 0:90:10 over 45 min, to 0:100:0 over 20 min.
Column temperature: 40
Flow rate: 1
Injection volume: 10
Detector: UV 242

CHROMATOGRAM
Retention time: 31
Limit of detection: 0.8-1.2 ng

OTHER SUBSTANCES
Extracted: arachidonic acid, capric acid, caproic acid, caprylic acid, docosahexaenoic acid, eicosadienoic acid, eicosatrienoic acid, eicosenoic acid, elaidic acid, erucic acid, heptadecanoic acid, lauric acid, linoelaidic acid, linoleic acid, linolenic acid, myristic acid, myristoleic acid, oleic acid, palmitic acid, palmitoleic acid, pentadecanoic acid, stearic acid

KEY WORDS
derivatization; rat; fat

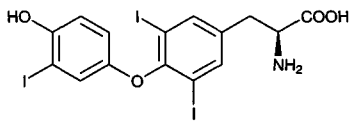
Liothyronine



Molecular formula: $C_{15}H_{12}I_3NO_4$
Molecular weight: 650.98
CAS Registry No.: 6893-02-3, 66-06-1 (Na salt)
Merck Index: 5535
Lednicer No.: 1 97

SAMPLE
Matrix: bulk
Sample preparation: Dissolve 1 mg compound in 1 mL EtOH and 10 μL 1 M KOH in EtOH: water 50:50 (freshly prepared). Remove a 10 μL aliquot and evaporate it to dryness under <0.05 Torr at 45° for 30 min, add 50 μL 80 mM 4-dimethylaminopyridine in dry MeCN, add 5 μL EtOH, vortex thoroughly, add 50 μL trimethylacetic anhydride, vortex for 10 s, heat at 65-70° for 50 min, add 100 μL EtOH, heat at 65-70° for 10 min, evaporate to dryness, add 100 μL toluene, add 100 μL 100 mM pH 6 phosphate buffer, vortex, centrifuge. Remove the organic layer and evaporate it to dryness, add 100 μL MeCN, sonicate for 2 min, add 100 μL pH 2.1 phosphate buffer, mix, inject an aliquot. (Pass MeCN through an aluminum oxide column before use.)

HPLC VARIABLES
Column: 150 × 4.6 Supelcosil LC-8
Mobile phase: Gradient. MeCN:10 mM KH_2PO_4 adjusted to pH 2.1 with phosphoric acid from 30:70 to 87:13 over 10 min.
Flow rate: 2
Detector: UV 214

CHROMATOGRAM
Retention time: 10.7

OTHER SUBSTANCES
Simultaneous: 3,5-diiodothyronine, thyroxine

KEY WORDS
derivatization

SAMPLE
Matrix: bulk, formulations
Sample preparation: Weigh out powder equivalent to about 65 mg thyroid, add 5 mL enzyme solution, mix well, incubate at 37° for 28 h, agitate after 4-8 h and after 20-24 h, add 2 mL deactivating solution, mix well, centrifuge at 2000 rpm for 5-10 min, if necessary filter (0.45 μm). (The enzyme solution was about 150 protease units/mL of bacterial protease from Streptomyces griseus in 110 mM NaCL + 40 mM Tris buffer + 50 mM methimazole (pH adjusted to 8.4 ± 0.05 with 6 M HCl) reducing buffer. Deactivating solution was 1:100 phosphoric acid: MeCN.)

HPLC VARIABLES
Column: 300 × 4 μBondapak C18
Mobile phase: MeCN:0.5% phosphoric acid in water 28:72
Column temperature: 34
Flow rate: 1.5
Injection volume: 200
Detector: UV 225

CHROMATOGRAM
Retention time: 13

OTHER SUBSTANCES

CAS Registry No.: 63329-53-3, 64808-48-6 (Na salt)
Merck Index: 5581
Lednicer No.: 4 43

SAMPLE
Matrix: blood
Sample preparation: Add 50 μL 35 μ g/mL IS in MeOH to 200 μL plasma, shake, add 300 μL MeCN, shake. Vortex for 2 min, centrifuge at 25° at 460 g for 10 min, inject a 20 μL aliquot of supernatant.

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChroCART
Column: 125 × 4 5 μm Lichrospher100 RP-18
Mobile phase: MeCN:water:glacial acetic acid 50:50:0.2
Flow rate: 1.0
Injection volume: 20 RT 4.48
Detector: UV 308

CHROMATOGRAM
Internal standard: diphenylamine (9.20)
Limit of quantitation: 2 μ g/L

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 200 μL Plasma + 50 μL 200 mM HCl + 50 μL water, mix, add 50 μL 100 μg/mL diphenylamine in MeCN, add 550 μL MeCN, centrifuge at 4° at 1400 g for 10 min, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax phenyl
Mobile phase: MeCN:water:glacial acetic acid 50:50:0.2
Flow rate: 1
Injection volume: 50
Detector: UV 308

CHROMATOGRAM
Retention time: 10
Internal standard: diphenylamine (18.8)
Limit of quantitation: 500 ng/mL

OTHER SUBSTANCES
Simultaneous: acetaminophen, aspirin, flufenamic acid, hydrochlorothiazide, indomethacin, ketoprofen, meclofenamic acid, mefenamic acid, naproxen, phenylbutazone, piroxicam, sulindac, tolmetin
Noninterfering: fenoprofen, ibuprofen

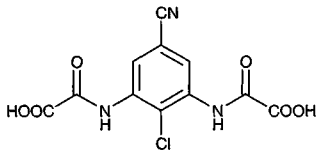
Lodoxamide



Molecular formula: $C_{11}H_6ClN_3O_6$
Molecular weight: 311.64
CAS Registry No.: 53882-12-5, 63610-09-3 (tromethamine salt)
Merck Index: 5585
Lednicer No.: 3 57

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 10 μL 115 μg/mL p-nitrocinnamic acid in MeOH:water 50:50 + 100 μL concentrated HCl, vortex for 30 s, heat on a steam bath for 1 min, cool to room temperature, add 5 mL ethyl acetate, vortex for 45 s, centrifuge at 860 g for 10 min. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH:water 50:50 containing 50 mM tris(hydroxymethyl)aminomethane adjusted to pH 6, if necessary centrifuge at 1239 g for 5 min, inject a 25 μL aliquot.

HPLC VARIABLES
Column: 300 × 4 10 μm μBondapak C18
Mobile phase: MeOH:50 mM tris(hydroxymethyl)aminomethane 10:90 adjusted to pH 6 with concentrated phosphoric acid
Flow rate: 1
Injection volume: 25
Detector: UV 254

CHROMATOGRAM
Retention time: 10
Internal standard: p-nitrocinnamic acid (19)
Limit of detection: 20 ng/mL

KEY WORDS
plasma

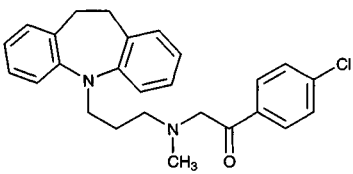
Lofepramine



Molecular formula: $C_{26}H_{27}ClN_2O$
Molecular weight: 418.97
CAS Registry No.: 23047-25-8, 26786-32-3 (HCl)
Merck Index: 5587
Lednicer No.: 4 201

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM
Retention time: 1.4

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, loxapine, maprotiline, mecamylamine, meclo-

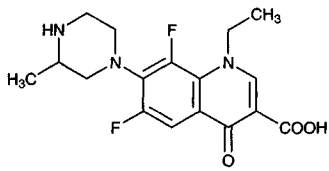
Lomefloxacin



Molecular formula: $C_{17}H_{19}F_2N_3O_3$
Molecular weight: 351.35
CAS Registry No.: 98079-51-7, 98079-52-8 (HCl)
Merck Index: 5592
Lednicer No.: 5 125

SAMPLE

Matrix: blood
Sample preparation: Mix 1 mL serum with 20 µL 20 µg/mL IS in MeOH and 100 µL 20 mM NaOH. Vortex for 1 min with 4 mL dichloromethane:diethylether 80:20, centrifuge at 2000 g for 10 min, remove 3 mL organic phase. Repeat the same extraction procedure twice. Combine organic layers, evaporate to dryness under a stream of nitrogen. Add 100 µL 20 mM NaOH to the residue, shake for 5 min, inject a 20 µL aliquot.

HPLC VARIABLES

Guard column: 20 × 4.6 10 µm Vydac AXGU
Column: 250 × 4.6 5 µm Supelcosil LC-SAX
Mobile phase: MeCN:100 mM pH 7.0 phosphate buffer 10:90
Flow rate: 1.2
Injection volume: 20
Detector: UV 280

CHROMATOGRAM

Retention time: 4.3
Internal standard: 2-[4-(2'-furoyl)phenyl]propionic acid (3.5)
Limit of detection: 50 ng/mL
Limit of quantitation: 200 ng/mL

OTHER SUBSTANCES

Extracted: felbinac, fenbufen

KEY WORDS
plasma

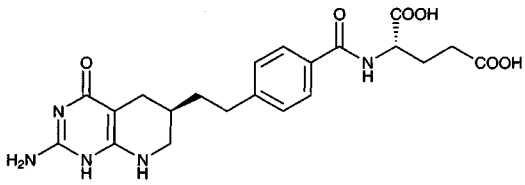
Lometrexol



Molecular formula: $C_{21}H_{23}N_5O_6$
Molecular weight: 441.44
CAS Registry No.: 106400-81-8, 120408-07-3 (disodium salt)
Lednicer No.: 5 151

SAMPLE
Matrix: blood
Sample preparation: Condition a 10 mm Bond-Elut C8 SPE cartridge with 5 mL MeOH and 5 mL buffer. Dilute plasma with an equal volume of 100 ng/mL IS in buffer, vortex, centrifuge at 4° at 1000 g for 20 min, add a 2 mL aliquot of the supernatant to the SPE cartridge, wash with 5 mL buffer, elute with 1.5 mL MeCN:buffer 20:80. Centrifuge the eluate at 4° at 1000 g for 5 min, evaporate the supernatant to dryness under reduced pressure, reconstitute with 20 μL 13% formic acid in water, add 100 μL of a freshly prepared 200 μg/mL suspension of activated manganese dioxide (Sigma) in water, vortex, heat at 37° for 1.5 h, cool to 4°, add 30 μL 5 M NaOH:1% pH 5 ammonium carbonate 50:50, cool on ice, centrifuge at room temperature at 13000 g for 10 min, inject a 100 μL aliquot of the supernatant. (Buffer was 1% aqueous formic acid adjusted to pH 3.7 with 5 M NaOH.)

HPLC VARIABLES
Column: 150 × 4.6 3 μm Apex II C18 (Jones Chromatography)
Mobile phase: MeCN:buffer 12:88 containing 171 μg/mL tetramethylammonium hydrogen sulfate (Buffer was 1% aqueous acetic acid adjusted to pH 5 with strong ammonia. Wash column with MeOH for 10 min between experiments.)
Flow rate: 1
Injection volume: 100
Detector: F ex 325 em 450

CHROMATOGRAM
Retention time: 4.2
Internal standard: C10-desmethylene lometrexol (5.3)
Limit of quantitation: 10 ng/mL

SAMPLE
Matrix: blood, urine
Sample preparation: 1 mL Plasma or urine + 50 μL 100 μg/mL IS in MeOH + 400 μL 1 M HCl, vortex for 15 s, add 5 mL anhydrous diethyl ether, shake on a reciprocal shaker for 10 min, centrifuge at 800 g for 10 min, repeat extraction with 3 mL anhydrous diethyl ether. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 45°, reconstitute the residue in 200 μL MeCN, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Spherisorb ODS
Mobile phase: MeCN:100 mM pH 3.50 acetate buffer 50:50
Flow rate: 2
Injection volume: 20
Detector: UV 300

CHROMATOGRAM
Retention time: 5.5
Internal standard: 1-(4-chlorobenzyl)-1H-indazole-3-carboxylic acid (AF 1312/TS) (4)
Limit of detection: 200 ng/mL

KEY WORDS
plasma; pharmacokinetics

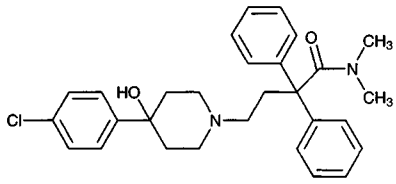
Loperamide



Molecular formula: $C_{29}H_{33}ClN_2O_2$
Molecular weight: 477.05
CAS Registry No.: 53179-11-6, 34552-83-5 (HCl)
Merck Index: 5601
Lednicer No.: 2 334

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 260

CHROMATOGRAM

Retention time: 8.50
Limit of detection: <120 ng/mL

KEY WORDS

SAMPLE

Matrix: blood, cell incubations, cell lysates, feces, urine

Sample preparation: Urine, plasma. Inject an aliquot directly. Feces. Extract with MeOH, evaporate extract to dryness under a stream of nitrogen, reconstitute in DMSO, inject an aliquot. Cell incubates. Centrifuge, inject an aliquot of the supernatant. Cell lysates. Dilute with an equal volume of DMSO, centrifuge, inject an aliquot of the supernatant.

HPLC VARIABLES

Column: 300 × 4.6 5 μm Hypersil C18

Mobile phase: Gradient. A was 100 mM ammonium acetate containing 0.2% diethylamine, pH 7.88. B was MeCN:MeOH:1 M ammonium acetate containing 2% diethylamine (pH 7.88) 65: 25:10 (?). A:B from 100:0 to 65:35 over 2 min, to 35:65 over 30 min.

Flow rate: 1

Detector: UV 230 or radioactivity

CHROMATOGRAM

Retention time: 41

OTHER SUBSTANCES

Extracted: loperamide oxide (prodrug)

KEY WORDS

plasma; prodrug; pharmacokinetics

REFERENCE

SAMPLE

Matrix: formulations

Sample preparation: Capsules, tablets. Remove contents of capsules and powder tablets. Weigh out an amount equivalent to about 10 mg loperamide hydrochloride, add 80 mL chloroform, shake for 15 min, make up to 100 mL with chloroform, filter and discard first 10-20 mL of filtrate. 5 mL Filtrate + 1 mL 400 μg/mL cyclizine hydrochloride in chloroform, make up to 25 mL with chloroform, inject an aliquot. Syrups. Add a quantity of syrup corresponding to about 10 mg loperamide hydrochloride to 30 mL water, extract four times with 20 mL portions of chloroform and filter each extract through glass wool, combine the extracts and make up to 100 mL with chloroform. Remove a 5 mL aliquot and add it to 1 mL 400 μg/mL cyclizine hydrochloride in chloroform, make up to 25 mL with chloroform, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 10 μm Perkin-Elmer Analytical silica

Mobile phase: Chloroform:MeOH:ammonia 95.5:4.5:0.05

Flow rate: 2

Injection volume: 50

Detector: UV 254

CHROMATOGRAM

Retention time: 6

Internal standard: cyclizine (4)

OTHER SUBSTANCES
Noninterfering: propylene glycol

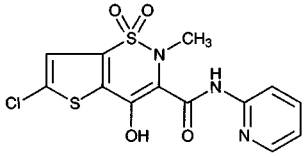
Lornoxicam



Molecular formula: $C_{13}H_{10}ClN_3O_4S_2$
Molecular weight: 371.83
CAS Registry No.: 70374-39-9
Merck Index: 5612

SAMPLE

Matrix: blood
Sample preparation: Mix plasma with 800 μL 5 mM pH 4 phosphate buffer and 400 μL 1 μg/mL tenoxicam in water. Centrifuge at 2500 rpm for 5 min. Add the supernatant to Extrelut-1 cartridge (Merck, Darmstadt, Germany). Elute with 10 mL dichloromethane, dry eluate under a stream of nitrogen at 35°, dissolve the residue in 300 μL mobile phase, centrifuge and inject 100 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: MeOH:50 mM pH 6 phosphate buffer 50:50
Column temperature: 35
Flow rate: 1.3
Injection volume: 100
Detector: UV 371

CHROMATOGRAM

Retention time: 4.4
Internal standard: tenoxicam (2.2)
Limit of detection: 10 ng/mL
Limit of quantitation: 20 ng/mL

KEY WORDS

pharmacokinetics; plasma

SAMPLE

Matrix: blood, synovial fluid
Sample preparation: Plasma. 500 μL Plasma + 100 μL 4 μg/mL IS in 200 mM NaOH + 500 μL 500 mM pH 4 phosphate buffer, mix, homogenize, centrifuge at 900 g. Add 1 mL of the mixture to an Extrelut-1 SPE cartridge. Elute with two 5 mL portions of dichloromethane. Evaporate the eluate under a stream of nitrogen at 35°. Dissolve the residue in 120 μL mobile phase by vortexing, inject an aliquot. Plasma, synovial fluid. Condition a 100 mg C18 SPE cartridge (Phenomenex) with 1 mL MeOH, 1 mL water, and 500 μL 500 mM pH 2 phosphate buffer. 500 μL Plasma or synovial fluid + 100 μL 2 μg/mL IS in 200 mM NaOH + 500 μL 500 mM pH 2 phosphate buffer. Mix, homogenize, centrifuge at 2500 rpm. Add 1 mL of the clean supernatant to the SPE cartridge, wash with 1 mL water, dry with 2 mL air, elute with 1.25 mL MeCN:25% ammonia 90:10. Evaporate the eluate under reduced pressure at 35°. Reconstitute the residue in 100 μL MeOH:100 mM pH 8 phosphate buffer 50:50, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: MeOH:100 mM pH 6 sodium dihydrogen phosphate buffer 50:50
Flow rate: 1.5
Injection volume: 50-100
Detector: UV 372

CHROMATOGRAM
Retention time: 5.8-6.1 (Extrelut), 6.7 (C18 SPE)
Internal standard: tenoxicam (2.6-2.8)
Limit of detection: 800 pg
Limit of quantitation: 10 ng/mL

SAMPLE
Matrix: bile, blood, tissue, urine
Sample preparation: Plasma, urine. Condition a Varian Bond Elut non-endcapped CN SPE cartridge with two 1 mL portions of MeOH and two 1 mL portions of water. Vortex 500 μL plasma + 300 ng IS + 500 μL 200 mM HCl or 500 μL urine + 300 ng IS + 500 μL water + 200 μL 1.0 M HCl and add to the SPE cartridge. Wash with 500 μL water, with 500 μL MeOH: water 10:90, and with 50 μL MeOH, elute with five 200 μL portions of pH 8 MeOH:ammonia 99:1. Evaporate the combined eluates to dryness. Reconstitute the residue in 100 μL mobile phase adjusted to pH 1.9 with 85% phosphoric acid, inject an 80 μL aliquot. Elute with mobile phase A. Whole blood. Freeze at -30°, centrifuge at 2000 g for 10 min at -10°, dilute 500 μL supernatant with 500 μL water, add 300 ng IS and 200 μL 1 M HCl, vortex, extract with 7 mL MTBE by shaking at low speed for 30 min, centrifuge at 2000 g at -10° for 15 min. Freeze the aqueous layer in a dry ice-acetone bath and discard it, evaporate the organic layer to dryness. Reconstitute the residue in 120 μL mobile phase adjusted to pH 3.1 with 85% phosphoric acid (if necessary centrifuge at 0° at 2000 g for 5 min), inject a 90 μL aliquot. Elute with mobile phase B. Bile. Mix 100 parts bile with 20 parts 1.0 M HCl, centrifuge at 5000 g for 15 min at 15°, dilute 120 μL of the supernatant (=100 μL bile) with 500 μL water, add IS and 100 μL 1 M HCl, vortex, extract with 7 mL MTBE by shaking for 30 min, centrifuge at 2000 g for 15 min at -10°. Freeze the aqueous layer in a dry ice-acetone bath and discard it, evaporate the organic layer to dryness. Reconstitute the residue in 120 μL mobile phase adjusted to pH 3.1 by 85% phosphoric acid, inject a 90 μL aliquot. Elute with mobile phase B. Liver, kidney, heart, lung, small intestine. Homogenize (Ultra Turrax T25) tissue in 2 volumes of pH 7.4 phosphate buffer at highest speed and filter through cotton gauze with a Potter S with 10-20 hubs at 450 g. (All steps were carried out on ice.) 1 mL Homogenate (for li ver 300 μL) + IS + 400 μL 500 mM HCL (for liver 600 μL 100 mM HCl), vortex, extract with 7 mL MTBE by shaking at low speed for 30 min, centrifuge at 2000 g for 15 min at 4°, freeze in dry ice/acetone. Remove the organic layer and evaporate it to dryness. Reconstitute the residue in

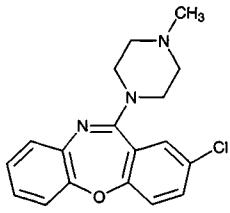
Loxapine



Molecular formula: $C_{18}H_{18}ClN_3O$
Molecular weight: 327.81
CAS Registry No.: 1977-10-2, 27833-64-3 (succinate)
Merck Index: 5617
Lednicer No.: 2 427

SAMPLE

Matrix: blood
Sample preparation: 500 μL Plasma or 1 mL diluted red blood cells (red blood cells:water 50:50), add 6 mL ethyl acetate, vortex for 2 min, centrifuge at 2000 g for 5 min. Remove the organic layer, add 250 μL 100 mM HCl, vortex for 2 min, centrifuge at 2000 g for 5 min. Remove a 200 μL volume of the acid layer, evaporate to dryness at 40°. Reconstitute the residue in 200 μL mobile phase and inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μm Hypersil ODS
Column: 250 × 4.6 5 μm Kromasil Ultrabase C 18
Mobile phase: MeCN:buffer 48:52 (Buffer was 716 mg disodium hydrogen phosphate and 2 g cetrimide in 1 L water, adjusted to pH 7.0 with phosphoric acid.)
Column temperature: 50
Flow rate: 1.5
Injection volume: 100
Detector: UV 254

CHROMATOGRAM

Retention time: 20.0
Internal standard: loxapine

OTHER SUBSTANCES

Extracted: amitriptyline, clonazepam, clorazepate, clozapine, droperidol
Noninterfering: clomipramine, diazepam, hydroxyzine

KEY WORDS

SAMPLE
Matrix: blood
Sample preparation: 2 mL Serum + 75 μL MeCN containing 4 mg/mL amoxapine + 2 mL 250 mM NaOH + 400 μL isoamyl alcohol, vortex vigorously, let stand for 5 min, add 10 mL heptane, shake vigorously for 1 h, centrifuge at >2000 g for 30 min. Remove the upper heptane layer and add it to 1 mL 100 mM pH 3 glycylglycine buffer, shake vigorously for 1 h, centrifuge at >2000 g for 30 min. Discard the heptane layer, add 1 mL 250 mM NaOH to the aqueous layer, add 5 mL n-pentane, shake for 1 h, centrifuge at 2000 g for 30 min. Remove the organic layer and evaporate it to dryness under educed pressure, reconstitute the residue in 70 μL mobile phase, vortex vigorously, centrifuge at 2000 g for 2-3 min, inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 40 μm pellicular silica (CEL Associates, Houston)
Column: 100 × 6 3 μm silica 80 Å (CEL Associates, Houston)
Mobile phase: MeCN:buffer 20:80 containing 21 mM n-nonylamine, pH 7.4-7.8 (Buffer was 25 mM Na_2HPO_4 adjusted to pH 3 with concentrated phosphoric acid.)
Flow rate: 1.6
Injection volume: 50
Detector: UV (wavelength not specified)

CHROMATOGRAM
Retention time: 22.68
Internal standard: amoxapine (9.63)

OTHER SUBSTANCES
Extracted: doxepin
Simultaneous: amitriptyline, chlorpromazine, clomipramine, desipramine, fluoxetine, imipramine, mianserin, nortriptyline, thioridazine, trimipramine
Noninterfering: diazepam

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 209.9

CHROMATOGRAM
Retention time: 14.553

Molecular weight: 246.31
CAS Registry No.: 68767-14-6
Merck Index: 5619

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 1 M HCl, extract with 5 mL hexane:ethyl acetate 75:25, wash the organic layer with 1 mL 100 mM HCl. Remove a 4 mL aliquot of the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 100 μL 1 mg/mL (1S)-1-(4-dimethylaminonaphthalen-1-yl)ethylamine in dichloromethane:pyridine 10:1, add 20 μL 10 mg/mL 1-hydroxybenzotriazole in dichloromethane:pyridine 10:1, add 100 μL 2 mg/mL N,N'-dicyclohexylcarbodiimide, mix, let stand at room temperature for 1 h, evaporate to dryness, add 500 μL hexane:ethyl acetate 75:25, add 500 μL 100 mM HCl, vortex for 1 min. Remove the organic layer and dry it over anhydrous sodium sulfate, inject a 20 μL aliquot. (Synthesis of (1S)-1-(4-dimethylaminonaphthalen-1-yl)ethylamine is as follows. Mix 9.6 g (S)-(-)-1-(1-naphthyl)ethylamine ((1S)-1-(naphthalen-1-yl)ethylamine) with 37 mL acetic anhydride, let stand at room temperature for 30 min, cool to 12°, add 7.1 mL concentrated nitric acid dropwise, stir at room temperature for 1 h, adjust pH to 9 with 1 M NaOH, extract with ethyl acetate. Dry the organic layer over anhydrous sodium sulfate and evaporate to dryness under reduced pressure, chromatograph on a column of silica gel with ethyl acetate:benzene 10:1 (Caution! Benzene is a carcinogen!). Evaporate the eluate to dryness under reduced pressure to give (1S)-1-(4-nitronaphthalen-1-yl)-N-acetylethylamine as colorless needles. Stir 100 mg 10% PdC and 2.5 g (1S)-1-(4-nitronaphthalen-1-yl)-N-acetylethylamine in 15 mL EtOH, add 1.5 mL hydrazine hydrate in portions (Caution! Hydrazine hydrate is a carcinogen and explodes on distillation in air!), add 100 mg 10% PdC, reflux for 1 h, cool, filter. Evaporate the filtrate to dryness under reduced pressure and chromatograph the residue on a column of silica gel with ethyl acetate, evaporate the eluate to dryness under reduced pressure to give (1S)-1-(4-aminonaphthalen-1-yl)-N-acetylethylamine as a colorless powder. Stir 1.5 g (1S)-1-(4-aminonaphthalen-1-yl)-N-acetylethylamine and 1.7 g sodium bicarbonate in 5 mL water at 0°, add 2 mL dimethyl sulfate (Caution! Dimethyl sulfate is highly toxic!), stir at room temperature for 3 h, distil to remove excess reagent. Concentrate the aqueous layer under reduced pressure, purify the residue by TLC using ethyl acetate (R_f 0.30) to obtain (1S)-1-(4-dimethylaminonaphthalen-1-yl)-N-acetylethylamine as a colorless powder. Reflux 1.2 g (1S)-1-(4-dimethylaminonaphthalen-1-yl)-N-acetylethylamine in 15 mL concentrated HCl for 35 h, adjust the pH to 9 with 2 M NaOH (Caution! Exothermic!), cool, extract with ethyl acetate. Dry the organic layer over anhydrous sodium sulfate and evaporate it to dryness under reduced pressure, purify by TLC using ethyl acetate to obtain (1S)-1-(4-dimethylaminonaphthalen-1-yl)ethylamine as a slightly yellow oil ($[\alpha]_D$ +19.75° (c = 2.0, EtOH).)

SAMPLE
Matrix: blood, urine
Sample preparation: Dilute urine nine-fold with water. 500 μL Plasma or diluted urine + 200 μL 2 M HCl + 500 μL 2 μg/mL 1-naphthoic acid, extract with 6 mL benzene (Caution! Benzene is a carcinogen!), centrifuge at 900 g for 10 min, repeat extraction. Combine the upper organic layers and evaporate them to dryness under reduced pressure, reconstitute the residue in 500 μL freshly prepared 250 μg/mL 4-bromomethyl-6,7-methylenedioxycoumarin in MeCN and 500 μL freshly prepared 1.5 mg/mL 18-crown-6 in MeCN (saturated with finely powdered potassium carbonate), sonicate briefly, heat at 40° for 30 min, add 100 μL MeCN:acetic acid 90:10, inject a 5 μL aliquot. (To hydrolyze glucuronides add 500 μL 500 mM NaOH to 500 μL diluted urine, let stand for 30 min, neutralize with 500 mM HCl. Prepare 4-bromomethyl-6,7-methylenedioxycoumarin as follows. Add 250 mmole finely powdered crystalline citric acid stepwise to 67.5 mL concentrated sulfuric acid at 70° (Caution! Carbon monoxide is evolved!), cool in ice, add 250 mmoles finely ground sesamol (3,4-methylenedioxyphenol) keeping the temperature below 5°, add 29 mL concentrated sulfuric acid, stir gently overnight, dilute with 50 mL chilled water, filter. Wash the brown solid with 10 mM sulfuric acid, with 2 M NaOH, and with 2 M HCl. Recrystallize from MeCN to give white prisms, mp 170°. Suspend 10 mL of this solid in 7.5 mL acetic acid, slowly add 7.5 mL acetic acid containing 10 mmoles bromine, reflux for 1 h, cool, chromatograph the solid on a silica gel column, elute with acetone, recrystallize 4-bromomethyl-6,7-methylenedioxycoumarin from MeOH to give yellow prisms, mp 241° (J.Chromatogr. 1989, 478, 149).)

SAMPLE

Matrix: solutions

Sample preparation: Prepare a 10 μM solution of the compound in MeCN containing 2 mM L-DBD-APy, 3 mM 2,2'-dipyridyl disulfide, and 3 mM triphenylphosphine, let stand at room temperature for 2 h, inject a 5 μL aliquot. (Synthesis of L-DBD-APy, (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole, is as follows. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane: acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-

fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 60F_{254} TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7- fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°).)

SAMPLE
Matrix: urine
Sample preparation: 1 mL Urine + 1 mL 1 M NaOH, mix, let stand at room temperature for 1 h, add 1.5 mL M HCl, add 10 mL mobile phase, shake for 5 min, centrifuge at 1000 g for 5 min. Remove a 1 mL aliquot of the organic layer and evaporate it to dryness under reduced pressure at 40°, reconstitute the residue in 100 µL 2 mg/mL (1S)-1-(4-dimethylaminonaphthalen-1-yl)ethylamine in dichloromethane:pyridine 10:1, add 20 µL 10 mg/mL 1-hydroxybenzotriazole in dichloromethane:pyridine 10:1, add 100 µL 2 mg/mL N,N'-dicyclohexylcarbodiimide, mix, let stand at room temperature for 1 h, evaporate to dryness, add 500 µL mobile phase, add 500 µL 100 mM HCl, vortex for 1 min. Remove the organic layer and dry it over anhydrous sodium sulfate, inject a 20 µL aliquot. (Synthesis of (1S)-1-(4- dimethylaminonaphthalen-1-yl)ethylamine is as follows. Mix 9.6 g (S)-(-)-1-(1-naphthyl)ethylamine ((1S)-1-(naphthalen-1-yl)ethylamine) with 37 mL acetic anhydride, let stand at room temperature for 30 min, cool to 12°, add 7.1 mL concentrated nitric acid dropwise, stir at room temperature for 1 h, adjust pH to 9 with 1 M NaOH, extract with ethyl acetate. Dry the organic layer over anhydrous sodium sulfate and evaporate to dryness under reduced pressure, chromatograph on a column of silica gel with ethyl acetate:benzene 10:1 (Caution! Benzene is a carcinogen!). Evaporate the eluate to dryness under reduced pressure to give (1S)-1-(4-nitro-naphthalen-1-yl)-N-acetylethylamine as colorless needles. Stir 100 mg 10% PdC and 2.5 g (1S)-1-(4-nitro-naphthalen-1-yl)-N-acetylethylamine in 15 mL EtOH, add 1.5 mL hydrazine hydrate in portions (Caution! Hydrazine hydrate is a carcinogen and explodes on distillation in air!), add 100 mg 10% PdC, reflux for 1 h, cool, filter. Evaporate the filtrate to dryness under reduced pressure and chromatograph the residue on a column of silica gel with ethyl acetate, evaporate the eluate to dryness under reduced pressure to give (1S)-1-(4-aminonaphthalen-1-yl)-N-acetylethylamine as a colorless powder. Stir 1.5 g (1S)-1-(4-aminonaphthalen-1-yl)-N-acetylethylamine and 1.7 g sodium bicarbonate in 5 mL water at 0°, add 2 mL dimethyl sulfate (Caution! Dimethyl sulfate is highly toxic!), stir at room temperature for 3 h, distil to remove excess reagent. Concentrate the aqueous layer under reduced pressure, purify the residue by TLC using ethyl acetate (R_f 0.30) to obtain (1S)-1-(4-dimethylaminonaphthalen-1-yl)-N-acetylethylamine as a colorless powder. Reflux 1.2 g (1S)-1-(4-dimethylaminonaphthalen-1-yl)-N-acetylethylamine in 15 mL concentrated HCl for 35 h, adjust the pH to 9 with 2 M NaOH (Caution! Exothermic!), cool, extract with ethyl acetate. Dry the organic layer over anhydrous sodium sulfate and evaporate it to dryness under reduced pressure, purify by TLC using ethyl acetate to obtain (1S)-1-(4-dimethylaminonaphthalen-1-yl)ethylamine as a slightly yellow oil ($[\alpha]_D$ +19.75° (c = 2.0, EtOH) (Chem. Pharm. Bull. 1984, 32, 251).)

HPLC VARIABLES
Column: 300 × 3.9 10 µm µPorasil
Mobile phase: n-Hexane:ethyl acetate 68:32
Flow rate: 1.7
Injection volume: 20
Detector: F ex 313 em 420

CHROMATOGRAM
Retention time: 6 (S), 7 (R)
Limit of quantitation: 5 ng

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
derivatization; normal phase; chiral

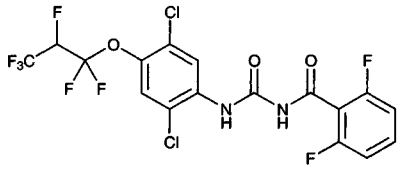
Lufenuron



Molecular formula: $C_{17}H_8Cl2F_8N_2O_3$
Molecular weight: 511.15
CAS Registry No.: 103055-07-8
Merck Index: 6524

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 209.9

CHROMATOGRAM
Retention time: 27.658

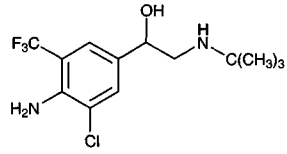
Mabuterol



Molecular formula: $C_{13}H_{18}ClF_3N_2O$
Molecular weight: 310.75
CAS Registry No.: 56341-08-3
Merck Index: 5674

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 1 mL 250 mM NaOH + 100 µL 50 ng/mL IS in water + 5 mL diethyl ether:2-butanol 90:10, shake for 10 min, centrifuge at 1500 g for 10 min. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 100 µL mobile phase, vortex for 2 min, store at 4° overnight, warm tyo room temperature, inject a 50 µL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 7 µm LiChrosorb (select B) C18
Column: 125 × 4 7 µm LiChrosorb (select B) C18
Mobile phase: MeCN:buffer 23:77 containing 0.2 mM sodium 1-heptanesulfonate (Buffer was pH 4.0-4.1 phosphate buffer, ionic strength 0.1.)
Injection volume: 50
Detector: E, ESA Coulochem Model 5100A, Model 5011 detector, +0.75 V

CHROMATOGRAM

Retention time: 13.5
Internal standard: 4-amino-3,5-dichloro-α-[[(1,1-dimethylpropyl)amino]methyl]benzenemethanol (NAB 760) (10)
Limit of detection: 2 ng/mL

OTHER SUBSTANCES

Extracted: clenbuterol

KEY WORDS

horse; plasma

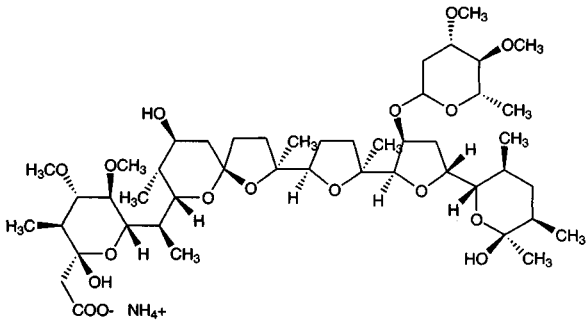
Maduramicin



Molecular formula: $C_{47}H_{83}NO_{17}$
Molecular weight: 934.17
CAS Registry No.: 84878-61-5
Merck Index: 5682

SAMPLE

Matrix: bulk, feed, premix
Sample preparation: Bulk, premix. Dissolve in MeCN to give a maduramicin concentration of 3 μg/mL (sonicate premix). Remove a 1 mL aliquot and mix it with 30 ± 3 mg calcium carbonate, 100 μL 7.5 mg/mL dansyl hydrazine in MeCN, and 100 μL 150 mg/mL trichloroacetic acid in MeCN, shake vigorously by hand for 1 min, centrifuge for 1 min, immediately inject an aliquot. Feed. Add 50 g feed to 250 mL MeCN, shake for 30 min, clarify. Remove a 2 mL aliquot and add it to 600 μL 7.5 mg/mL dansyl hydrazine in MeCN and 600 μL 150 mg/mL trichloroacetic acid in MeCN, shake by hand for 10 s, add to a Florisil Sep-Pak at 1 drop/s, wash with three 5 mL aliquots of MeCN at 1 drop/s, purge with air, elute with MeCN:water 90:10, collect 5 mL eluate, mix eluate, inject an aliquot.

HPLC VARIABLES

Column: 50 × 4.6 5 μm C18 (IBM)
Mobile phase: MeCN:water 75:25 containing 250 mg/L tetrabutylammonium hydrogen sulfate, pH 3.5
Flow rate: 2
Injection volume: 60
Detector: F ex 210 em 320 (cutoff filter)

CHROMATOGRAM

Retention time: 5.8, 7.7 (two possible derivatives are formed)
Limit of quantitation: 3 ppm

KEY WORDS

derivatization; SPE

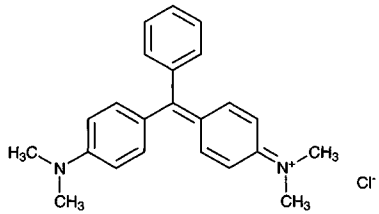
Malachite green

Molecular formula: $C_{23}H_{25}ClN_2$
Molecular weight: 364.92
CAS Registry No.: 569-64-2 (chloride)
Merck Index: 5739



SAMPLE
Matrix: blood, tissue
Sample preparation: Plasma. 200 μL Plasma + 1 mL MeCN, vortex for 20 s, centrifuge for 5 min. Add the supernatant to 2 mL MeOH, evaporate to dryness, reconstitute with 500 μL diluting solvent with sonication, centrifuge for 5 min, filter (0.2 μm), inject a 50 μL aliquot of the filtrate. Muscle. Condition a 6 mL Bakerbond neutral alumina SPE cartridge with 1 column volume MeCN and a 3 mL Bond Elut LRC propylsulfonic acid (PRS) SPE cartridge with 1 column volume MeCN, place the alumina cartridge on top of the PRS cartridge. 5 g Muscle + 1.5 mL 250 mg/mL hydroxylamine hydrochloride in water + 2.5 mL 1 M p-toluenesulfonic acid in water + 5 mL buffer, mix, homogenize (Tekmar SDT Tissuemizer) at medium speed for 30 s, remove contents of container, add 45 mL MeCN to container and shake vigorously for 30 s, add 10 g alumina (activated 80-200 mesh, Alcoa type F-20) to the container and shake vigorously for 30 s. Combine all these mixtures and centrifuge at 4° at 2700 g for 10 min, remove the supernatant, add 45 mL MeCN to the pellet, shake vigorously for 30 s. Combine the supernatants and add them to 100 mL water and 2 mL diethylene glycol, add 50 mL dichloromethane, shake vigorously for 30 s, allow to separate for 15 min, repeat extraction. Combine the organic layers and evaporate to about 10 mL under reduced pressure at 40°, add 15 mL dichloromethane and evaporate to about 10 mL, add 10 mL MeCN and evaporate to about 1 mL, add 2 mL dichloromethane, mix, add 5 mL MeCN, mix, add to the SPE cartridges, rinse container 3 times with MeCN and add the rinses to the SPE cartridges, discard the alumina cartridge. Elute the PRS cartridge with two 1 mL portions of mobile phase then 1 mL 2.5 mg/mL hydroxylamine hydrochloride in MeOH, make up the eluate to 3 mL with mobile phase (if necessary), mix, inject a 50 μL aliquot. (Diluting solvent was MeCN:buffer 60:40 containing 700 μL/L 250 mg/mL hydroxylamine hydrochloride in water. Prepare buffer by dissolving 8.2 g sodium acetate trihydrate and 0.95 g p-toluenesulfonic acid monohydrate in 900 mL water, adjust pH to 4.5 with glacial acetic acid, make up to 1 L with water.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultremex 5 CN

Mobile phase: MeCN:buffer 50:50 (Prepare buffer by dissolving 8.2 g sodium acetate trihydrate and 0.95 g p-toluenesulfonic acid monohydrate in 900 mL water, adjust pH to 4.5 with glacial acetic acid, make up to 1 L with water.)
Flow rate: 1
Injection volume: 50
Detector: UV 618 following post-column reaction. The column effluent passed through a column (Alltech direct-connect rfefillable guard column) packed with lead(IV) oxide:Celite 545-AW (25:75) to the detector.

CHROMATOGRAM
Retention time: 16.2 (malachite green), 6.3 (leucomalachite green)
Limit of detection: 2 ppb (muscle), 10 ppb (plasma)

OTHER SUBSTANCES
Extracted: metabolites, leucomalachite green

KEY WORDS
plasma; muscle; fish; catfish; SPE; post-column reaction

REFERENCE
Plakas,S.M.; El Said,K.R.; Stehly,G.R.; Roybal,J.E. Optimization of a liquid chromatographic method for determination of malachite green and its metabolites in fish tissues, *J.AOAC Int.*, **1995**, *78*, 1388–1393.

SAMPLE
Matrix: tissue
Sample preparation: Condition a 6 mL neutral alumina SPE cartridge (J.T. Baker) and a 2.8 mL 500 mg Bond Elut PRS SPE cartridge with 5 mL MeCN. Place the alumina SPE cartridge on the top of the PRS SPE cartridge using a Bond Elut adapter. Mix 3 mL 250 mg/mL hydroxylamine hydrochloride in water with 5 mL 50 mM p-toluene sulfonic acid, 20 mL 100 mM ammonium acetate adjusted to pH 4.5 with glacial acetic acid, and 20 g fish tissue. Homogenize at 20000 rpm for 1 min (Ultra-Turrax T25 Tissuemizer, Tekmar, USA). Add 90 mL MeCN to the sample and homogenize for 10 s. Shake vigorously by hand for 1 min. Add 20 g basic alumina (Brockman activity I), shake for 1 min. Centrifuge, decant the supernatant. Add 30 mL MeCN to the residue, extract, combine the supernatants. Add 100 mL water, 50 mL dichloromethane, and 20 mL diethylene glycol to the supernatants, shake vigorously, separate the bottom layer. Again add 50 mL dichloromethane, shake for 1 min, combine the separated dichloromethane layers. Concentrate to 2-3 mL under reduced pressure at 65°. Add 2 mL dichloromethane and 5 mL MeCN then add the mixtures to the SPE cartridges. Rinse the flask twice with 5 mL portions of MeCN and add the rinses to the SPE cartridges. Wash with 5 mL MeCN to waste. Remove the alumina cartridge. Wash the PRS cartridge with 2 mL water and with 1 mL MeCN:100 mM ammonium acetate buffer 50:50 adjusted to pH 4.5 with glacial acetic acid. Elute with 2 mL MeCN:100 mM ammonium acetate buffer 50:50 adjusted to pH 4.5 with glacial acetic acid and collect in a tube containing 500 μL 2.5 mg/mL hydroxylamine hydrochloride in water. Inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 2.0 pellicular C18
Column: 150 × 4.6 5 μm SynChropak SCD-100 (SynChrom, USA)
Mobile phase: MeCN:buffer 55:45 (Buffer was 400 mg ammonium acetate and 1 mL triethylamine in 400 mL water, adjusted to pH 3.0 with glacial acetic acid, and made up to 450 mL with water)
Flow rate: 2.0
Injection volume: 100
Detector: E, ESA Coulochem Model, oxidative electrochemical cell (EC) +900 mV; UV 588; F ex 265 em 360

CHROMATOGRAM
Retention time: 5.2
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, gentian violet

KEY WORDS
SPE; catfish; trout,

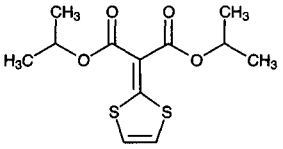
Malotilate



Molecular formula: $C_{12}H_{16}O_4S_2$
Molecular weight: 288.39
CAS Registry No.: 59937-28-9
Merck Index: 5751
Lednicer No.: 5 75

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 1 mL 1 M pH 5.0 acetate buffer + 1 mL water + 5 mL 200 ng/mL IS in chloroform; shake horizontally for 10 min, centrifuge. Remove 4 mL of the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 150 × 4 Nucleosil 5C18
Mobile phase: MeCN:water:acetic acid 60:39:1
Flow rate: 1
Injection volume: 10
Detector: UV 360

CHROMATOGRAM
Retention time: 8
Internal standard: di-sec-butyl 1,3-dithiol-2-ylidenemalonate (15)
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; dog

REFERENCE

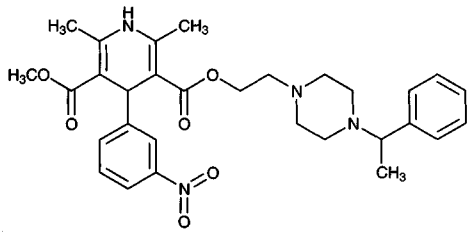
Manidipine



Molecular formula: $C_{35}H_{38}N_4O_6$
Molecular weight: 610.71
CAS Registry No.: 120092-68-4
Merck Index: 5786

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 1 mL 20 mM pH 10 Na_2HPO_4, extract twice with 5 mL n-hexane:diethyl ether 2:1. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 200 µL mobile phase A, inject a 150 µL aliquot into column A and elute to waste with mobile phase A. Divert the eluate from column A containing manidipine onto column B. When all the manidipine has passed onto column B elute column B with mobile phase B and monitor the effluent from column B. (Elute column A with mobile phase A to waste.)

HPLC VARIABLES

Column: A 100 × 2.1 3 µm Develosil ODS-3K; B 100 × 2.1 5 µm Develosil ODS-5K
Mobile phase: A MeCN:20 mM KH_2PO_4 46:54 containing 5 mM sodium nonanesulfonate, adjusted to pH 3.0 with 85% orthophosphoric acid; B MeCN:20 mM KH_2PO_4 46:54 adjusted to pH 3.0 with 85% orthophosphoric acid
Column temperature: 40
Flow rate: 0.3
Injection volume: 150
Detector: UV 230

CHROMATOGRAM

Retention time: 20
Limit of detection: 0.1 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

serum; protect from light; column-switching; heart-cut; pharmacokinetics

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 1 mL 20 mM pH 10 Na_2HPO_4, extract twice with 5 mL n-hexane:diethyl ether 2:1. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 200 µL EtOH, inject a 150 µL aliquot. Collect the eluate for each enantiomer, evaporate to dryness under a stream of nitrogen, reconstitute in 200 µL mobile phase A, inject a 150 µL aliquot, and analyze further as in J.Chromatogr. 1989, 494, 209. This resolves the enantiomers from interfering endogenous serum peaks.

HPLC VARIABLES

Column: 250 × 4.6 10 µm Chiralcel OJ
Mobile phase: n-Hexane:EtOH:MeOH 80:15:5
Column temperature: 50
Flow rate: 1
Injection volume: 150
Detector: UV 230

CHROMATOGRAM
Retention time: 10 (R-(-)), 14 (S-(+))

KEY WORDS
serum; protect from light; chiral

REFERENCE

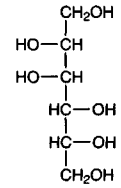
Mannitol



Molecular formula: $C_6H_{14}O_6$
Molecular weight: 182.17
CAS Registry No.: 69-65-8
Merck Index: 5788

SAMPLE
Matrix: beverages, juice, milk
Sample preparation: Orange juice. Dilute orange juice 100-fold with water, filter (Millipore HV, 0.45 μm), dilute filtrate 10-fold, inject an aliquot. Beverages. Dilute soft drinks 1000-fold with water, inject an aliquot. Milk. Dilute 5 mL milk to 100 mL with mobile phase, filter (Millipore HV, 0.45 μm), dilute filtrate 50-fold, inject an aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 Cation H (Bio-Rad)
Column: 300 × 3.8 9 μm HPX 87-H Aminex (Bio-Rad)
Mobile phase: 10 mM Sulfuric acid
Column temperature: 50
Flow rate: 0.5
Injection volume: 40
Detector: E following post-column reaction, Hewlett-Packard 1049A programmable electrochemical detector, Metrohm detector cell, cuprous oxide working electrode +550 mV, glassy carbon auxiliary electrode, Ag/AgCl (3 M KCl) reference electrode. The column effluent mixed with 200 mM NaOH pumped at 0.4 mL/min, the mixture flowed through a 220 × 0.8 single-bead string reactor packed with 0.6 mm glass beads to the detector. (Prepare cuprous oxide electrode as follows. Stir 300 mg conductive carbon cement (Gerhard Neubauer, Münster), 60 mg cuprous oxide (Fluka), and 300 μL acetone until a thick paste forms as the acetone evaporates. Pack conductive carbon cement into the base of a 3 mm diameter cavity carbon paste electrode base (Metrohm), allow to dry, polish with dry emery paper (grade 2/0, Oakey), remove surface layer with an acetone-soaked tissue, pack the paste into the cavity, allow to dry overnight, polish with dry emery paper (grade 2/0), 3 μm imperial micro finishing film sheet (3M), 0.3 μm imperial micro finishing film sheet (3M), and 0.05 μm alumina particles on a Buehler pad, sonicate for 2 min in water (Anal. Chim. Acta 1995, 300, 5).)

CHROMATOGRAM
Retention time: 11.65
Limit of detection: 0.8 μM

OTHER SUBSTANCES
Also analyzed: arabinose, cellobiose, dextrose, fructose, fucose, galactitol, galactose, galacturonic acid, lactose, lactulose, lyxose, maltose, mannose, myo-inositol, raffinose, rhamnose, ribose, sorbose, sucrose, xylose

KEY WORDS
orange juice; soft drinks; post-column reaction; fruit

SAMPLE
Matrix: blood
Sample preparation: 500 μL Serum + 25 μg adonitol + 1 mL EtOH, centrifuge at 1000 g for 10 min. Remove the organic layer and evaporate it to 500 μL under a stream of nitrogen. Apply the residue to a Bond Elut SCX SPE cartridge (100 mg/mL), elute with 2 mL water. Apply the eluate to a Bond Elut SAX SPE cartridge (100 mg/mL), elute with 2 mL water. Freeze-dry the eluate, reconstitute in 100 μL MeOH:water 50:50, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 6 10 μm Gelpack GL-C64Z sulfonated styrene-divinylbenzene copolymer with zinc ions (Hitachi-Kasei)
Mobile phase: MeCN:water 80:20
Column temperature: 80
Flow rate: 1
Injection volume: 20
Detector: MS, Hitachi M-1000S quadrupole, negative-ion APCI, drift voltage -25 V, vaporizer 250°, desolvator 399°, m/z 217, $[M + Cl]^-$, SIM The column effluent was mixed with MeOH: chloroform 99:1 pumped at 0.5 mL/min, the combined effluent then flowed to the MS detector.

CHROMATOGRAM
Retention time: 12.5
Internal standard: adonitol (m/z 187) (9)

OTHER SUBSTANCES
Extracted: 1,5-anhydroglucitol, arabinose, arabitol, dextrose, erythritol, fructose, galactose,-myoinositol, sorbitol, xylitol

KEY WORDS
serum; SPE

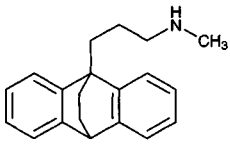
Maprotiline



Molecular formula: $C_{20}H_{23}N$
Molecular weight: 277.41
CAS Registry No.: 10262-69-8, 10347-81-6 (HCl)
Merck Index: 5792
Lednicer No.: 2 220

SAMPLE

Matrix: blood
Sample preparation: Add 250 μL 2 M sodium carbonate to 500 μL plasma. Add 100 μL 1 μg/mL IS in MeOH, extract with 10 mL n-hexane. Shake for 30 min and centrifuge at 3000 g for 10 min. Cool in a dry ice-acetone bath. Add 200 μL 0.3% phosphoric acid to upper organic layer. Shake for 10 min and centrifuge at 3000 g for 10 min. Separate the organic layer. Inject a 100 μL aliquot of the acidic aqueous layer.

HPLC VARIABLES

Column: 250 × 4.6 5 μm C18 Symmetry (Waters Millipore, USA)
Mobile phase: MeCN:67 mM potassium phosphate buffer adjusted to pH 3.0 with phosphoric acid 35:65 (After each chromatographic session wash the column with 200 mL MeCN:water 50:50.)
Flow rate: 1.2
Injection volume: 100
Detector: UV 226, UV 254, UV 400

CHROMATOGRAM

Retention time: 10.92
Internal standard: clovoxamine (6.5)
Limit of quantitation: 5 ng/mL (UV 226, UV 400 nm); 7 ng/mL (UV 254)

OTHER SUBSTANCES

Extracted: metabolites, amitriptyline clomipramine desipramine fluoxetine, imipramine, nortriptyline

Simultaneous: amineptine, carbamazepine, chlordiazepoxide, chlorpromazine, clonazepam, clorazepate, clozapine, cyamemazine, desmethylmaproptiline, desmethylvenlafaxine, doxepin, flunitrazepam, fluvoxamine, haloperidol, levomepromazine, lorazepam, loxapine, mianserine, sulpiride, trimipramine, venlafaxine, viloxazine, zolpidem, zopiclone
Noninterfering: diazepam, valproic acid

SAMPLE
Matrix: blood
Sample preparation: Mix 1 mL plasma with 400 μL 700 mM pH 9.7 bicarbonate buffer, vortex for 1 min, add 1.5 mL isoamyl alcohol:hexane 7.5:92.5, shake at 300 rpm for 30 min. Centrifuge at 1500 g for 15 min, freeze at -20° overnight, decant the organic layer into a tube containing 200 μL 0.05% orthophosphoric acid. Shake vigorously at 300 rpm for 45 min, centrifuge at 1500 g for 15 min, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES
Guard column: 13 × 4.3 5 μm C4/E butyl-bonded reversed-phase (MetaChem Technologies)
Column: 150 × 4.6 5 μm C4/E butyl-bonded reversed-phase(MetaChem Technologies)
Mobile phase: MeCN:40 mM pH 6.8 sodium phosphate buffer 50:50
Flow rate: 1.5
Injection volume: 100
Detector: F ex 276 em 598

CHROMATOGRAM
Retention time: 10
Internal standard: maprotiline

OTHER SUBSTANCES
Extracted: venlafaxine

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 500 μL 10% potassium carbonate + 3 mL freshly-distilled n-hexane, shake for 30 min, centrifuge. Remove 2 mL of the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 500 μL 1 mg/mL benoxaprofen chloride in dry dichloromethane, heat at 50° for 30 min, inject a 10 μL aliquot. (Prepare benoxaprofen chloride as follows. Dissolve 600 mg benoxaprofen in 50 mL dry toluene, slowly add 5 mL thionyl chloride (freshly distilled from linseed oil), reflux for 30 min, evaporate to dryness, recrystallize from dichloromethane (if necessary) to give benoxaprofen chloride (mp 91.5°).)

HPLC VARIABLES
Column: 250 × 4.6 7 μm Zorbax-sil
Mobile phase: Cyclohexane:dichloromethane:THF 5:1:1
Flow rate: 1
Injection volume: 10
Detector: F ex 312 em 365

CHROMATOGRAM
Retention time: 8.6

OTHER SUBSTANCES
Simultaneous: amphetamine, benzylamine, methamphetamine, α-methylbenzylamine, phenylbutylamine, β-phenylethylamine, tolylethylamine, tranylcypromine
Interfering: procaine

SAMPLE

Matrix: blood

Sample preparation: 1 mL Plasma + 1 mL 0.6 M pH 9.8 carbonate buffer + 40 μL 5 μg/mL maprotiline in 10 mM HCl + 5 mL 200 g/L ethyl acetate in n-heptane, mix by rocking for 10 min, centrifuge at 1500 g for 10 min. Remove organic layer and add it to 150 μL 100 mM HCl, mix 10 min, centrifuge at 1500 g for 10 min. Discard organic layer and evaporate aqueous layer at 45° in a vacuum centrifuge for 1 h. Take up residue in 50 μL 1 M pH 10.3 carbonate buffer and 25 μL 10 mg/mL dansyl chloride in MeCN, vortex, allow to react at room temperature for 45 min, evaporate at 45° in a vacuum centrifuge for 20 min, reconstitute in 125 μL MeCN:water 75:25, vortex, centrifuge for 3-5 min, inject a 25-40 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-18

Mobile phase: MeCN:25 mM KH_2PO_4 75:25 + 500 μL/L orthophosphoric acid + 600 μL/L n-butylamine

Flow rate: 2

Injection volume: 25-40

Detector: F ex 235 em 470 (cut-off)

CHROMATOGRAM

Retention time: 12.8

Internal standard: maprotiline

OTHER SUBSTANCES

Simultaneous: fluoxetine, propranolol, clovoxamine, fluvoxamine, fenfluramine, amoxapine, protriptyline, nortriptyline, norfluoxetine, desipramine, sertraline

Noninterfering: amitriptyline, imipramine, clomipramine, trimipramine, mianserin, chlordiazepoxide, trazodone, cyclobenzaprine, nomifensine, bupropion, metoprolol, atenolol, pindolol, tranylcypromine, moclobemide, thioridazine, citalopram, clozapine, carbamazepine, doxepin, loxapine

SAMPLE
Matrix: blood
Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 µL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 µL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 µL aliquot of the aqueous phase.

HPLC VARIABLES
Guard column: LC-8-DB (Supelco)
Column: 150 × 4.6 LC-8-DB (Supelco)
Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 2
Injection volume: 100
Detector: UV 228

CHROMATOGRAM
Retention time: 5.0
Internal standard: protriptyline (4)

OTHER SUBSTANCES
Extracted: acetazolamide, amitriptyline, chlordiazepoxide, chlorimipramine, chlorpromazine, desipramine, dextromethorphan, diazepam, diphenhydramine, doxepin, encainide, fentanyl, flecainide, fluoxetine, flurazepam, haloperidol, hydroxyethylflurazepam, ibuprofen, lidocaine, methadone, methaqualone, mexiletine, midazolam, norchlorimipramine, nordoxepin, norfluoxetine, norverapamil, pentazocine, promazine, propafenone, propranolol, protriptyline, quinidine, trazodone, trimipramine
Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin
Interfering: nordiazepam, propoxyphene, temazepam, imipramine, nortriptyline, verapamil

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood
Sample preparation: 100 μL Plasma + 100 μL 100 ng/mL desipramine in 2-methoxyethanol containing 75 mM triethylamine + 500 μL 6 M NaOH + 3 mL n-hexane:isoamyl alcohol 95:5, vortex for 5 min, centrifuge at 1000 g for 5 min. Remove a 2 mL aliquot of the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 100 μL 75 mM triethylamine in 2-methoxyethanol, add 100 μL 1 mM 6-isothiocyanatobenzo[g]phthalazine-1,4(2H,3H)-dione in DMSO, add 10 μL 75 mM triethylamine in 2-methoxyethanol, heat at 80° for 10 min, inject a 20 μL aliquot. (Prepare 6-isothiocyanatobenzo[g]phthalazine-1,4(2H,3H)-dione as follows. Dissolve 2.2 g 2,3-naphthalenedicarboxylic acid in 6.6 mL MeOH:concentrated sulfuric acid 10:1, reflux for 3 h, pour into ice-water, filter. Dissolve the precipitate in 20 mL ethyl acetate and purify on a 250 × 35 column containing 120 g 70-230 mesh silica gel 60 (Merck) using n-hexane:ethyl acetate 50:50 to give dimethyl 2,3-naphthalenedicarboxylate as a brownish crystalline solid (mp 46-49°). Stir 8 mL concentrated nitric acid:concentrated sulfuric acid 3:5 at 4°, add 2.5 g dimethyl 2,3-naphthalenedicarboxylate, stir at 4° for 4-6 h until the reaction is complete. (Check by TLC using Merck Kieselgel 60 F254 with n-hexane:ethyl acetate 50:50.) Pour the reaction mixture into ice-water and extract with 350 mL dichloromethane. Wash the organic layer with water, with 5% sodium bicarbonate, and with water. Evaporate to dryness under reduced pressure, recrystallize from EtOH to give dimethyl 5-nitro-2,3- naphthalenedicarboxylate as yellow needles (mp 146-148°). Dissolve 1.25 g dimethyl 5-nitro-2,3-naphthalenedicarboxylate in 60 mL MeOH, add 500 mg 5% platinum on activated carbon, hydrogenate, filter, evaporate to dryness under reduced pressure, recrystallize from n-hexane/ethyl acetate to give dimethyl 5-amino-2,3-naphthalenedicarboxylate as pale yellow-green crystals (mp 129-131°). Add 2.7 mL triethylamine and 2.7 mL hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) to 1.2 g dimethyl 5-amino-2,3-naphthalenedicarboxylate dissolved in 18 mL MeOH, reflux for 3 h, evaporate to remove the solvent, rinse the residue with EtOH, dry to give 6-aminobenzo[g]phthalazine-1,4(2H,3H)-dione as a yellow powder (mp 280° d). Add 1 mL thiophosgene dropwise to a solution of 1 g 6-aminobenzo[g]phthalazine-1,4(2H,3H)-dione in 20 mL water stirred at room temperature, stir for 1 h, filter, wash the precipitate with MeCN, dry to give 6-isothiocyanatobenzo[g]-phthalazine-1,4(2H,3H)-dione as a pale brownish-yellow powder (mp 360° d) (Anal. Chim. Acta 1995, 302, 61).)

HPLC VARIABLES
Column: 150 × 4.6 5 μm TSKgel ODS-80 (Tosoh)
Mobile phase: MeCN:100 mM pH 3.2 acetate buffer 40:60
Flow rate: 1
Injection volume: 20
Detector: Chemiluminescence following post-column reaction. The column effluent mixed with 20 mM hydrogen peroxide in water pumped at 1 mL/min and with 40 mM potassium ferricyanide in 1.5 M NaOH pumped at 2 mL/min and the mixture flowed to the detector.

SAMPLE
Matrix: blood, CSF, urine
Sample preparation: Dilute urine ten-fold. 1 mL Plasma, serum, CSF, or diluted urine + 250 μL 100 mM diethylamine in 4 M HCl + 1 mL 1 μM desmethyldoxepin hydrochloride in water, mix briefly, add 8 mL n-hexane, shake horizontally at 150 rpm for 30 min, centrifuge, discard the hexane layer. Add 250 μL 6 M NaOH to the aqueous layer, add 8 mL hexane, shake for 30 min, centrifuge. Remove the organic layer and evaporate it to 0.5 mL under a stream of nitrogen at 45°, add 100 μL 100 mM HCl to the residue , vortex for 2 min, inject an aliquot of the aqueous layer.

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeCN:100 mM pH 2.5 potassium phosphate buffer 30:70
Flow rate: 2
Injection volume: 50
Detector: UV 205

CHROMATOGRAM
Retention time: k' 9.45
Internal standard: desmethyldoxepin (k' 4.56)
Limit of detection: 11 nM

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: amitriptyline, chlordiazepoxide, chlorpromazine, desmethyldiazepam, desmethylimipramine, desmethylmaprotiline, diazepam, doxepin, fluphenazine, haloperidol, imipramine, lorazepam, mianserin, nomifensine, oxazepam, perphenazine, trifluoperazine
Noninterfering: sulpiride, thioridazine
Interfering: nortriptyline

KEY WORDS
plasma; serum

SAMPLE
Matrix: blood, tissue
Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM
Retention time: 6.00
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES
Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, meperidine, mesoridazine, methadone, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, tranylcypromine, trazodone, trihexyphenidyl, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine
Interfering: desipramine

KEY WORDS
serum; whole blood; liver

SAMPLE
Matrix: blood, tissue, urine
Sample preparation: Serum, urine. 500 μL Serum or urine + 100 μL 2 μg/mL diazepam + 200 μL 20% sodium carbonate + 500 μL water + 3 mL n-hexane:isoamyl alcohol 98.5:1.5, mix for 2 min, centrifuge at 1200 g for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 μL mobile phase, inject a 10 μL aliquot. Tissue. Homogenize 1 g sample with 9 mL 100 mM HCl and 100 μL 20 μg/mL diazepam, centrifuge at 15000 g for 10 min. Add 500 μL 20% sodium carbonate and 4 mL n-hexane:isoamyl alcohol 98.5:1.5 to 1 mL of the supernatant, mix for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 μL mobile phase, filter by microconcentrator (Microcon-30, Grace). Inject a 10 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 2 μm TSK gel Super-Octyl (A) or 100 × 4.6 5 μm Hypersil MOS-C8 (B), (Yokogawa, Japan)
Mobile phase: MeOH:20 mM pH 7 KH_2PO_4 60:40
Flow rate: 0.6
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 5.6 (A), 7.8 (B)
Internal standard: diazepam (4.4, A)
Limit of quantitation: 50 ng/mL (serum, urine) (A), 500 ng/mL (tissue) (A)

OTHER SUBSTANCES
Extracted: amitriptyline, clomipramine, dothiepin, doxepin, imipramine, melitracen, mianserin, nortriptyline
Noninterfering: barbital, carbamazepine, ethosuximide, hexobarbital, lofepramine, pentobarbital, phenobarbital, phenytoin, primidone, sulpiride, trimethadione, trimipramine
Interfering: amoxapine, desipramine

KEY WORDS
serum; brain; liver

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 0.5-2 mL Plasma + 2 mL pH 10 phosphate buffer + 6 mL diethyl ether:hexane 50:50, shake for 15 min, centrifuge at 3750 g for 5 min. Remove the organic phase and add it to 2 mL 250 mM sulfuric acid, shake for 10 min, centrifuge for 5 min, discard the organic layer. Adjust the pH of the aqueous phase to 9.5-10.5 with 500 mM NaOH containing 1 M K_2HPO_4, add 6 mL diethyl ether:hexane 50:50, shake for 10 min, centrifuge for 10 min. Remove the organic layer and evaporate it to dryness under vacuum and a stream of nitrogen at 45°, reconstitute the residue in 100 μL 100 mM sodium carbonate, add 10 μL 1% dansyl chloride in acetone, vortex for 20-30 s, heat at 45° for 30 min. Evaporate the solvent, reconstitute in 100 μL mobile phase, inject a 10-50 μL aliquot. Urine. 0.5-2 mL Urine + 2 mL pH 10 phosphate buffer + 6 mL diethyl ether:hexane 50:50, shake for 15 min, centrifuge at 3750 g for 5 min. Remove the organic phase and evaporate it to dryness under vacuum and a stream of nitrogen at 45°, reconstitute the residue in 100 μL 100 mM sodium carbonate, add 10 μL 1% dansyl chloride in acetone, vortex for 20-30 s, heat at 45° for 30 min. Evaporate the solvent, reconstitute in 100 μL mobile phase, inject a 10-50 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm LiChrosorb RP-18
Mobile phase: MeCN:water 65:35
Flow rate: 2
Injection volume: 10-50
Detector: F ex 248 em 470

CHROMATOGRAM
Retention time: 18.5
Internal standard: maprotiline

OTHER SUBSTANCES
Extracted: metapramine

KEY WORDS
plasma; derivatization; maprotiline is IS

REFERENCE

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 15.508

KEY WORDS
whole blood

SAMPLE

Matrix: tissue

Sample preparation: Activate amino propyl SPE cartridge (containing 1 g 40 μm Bakerbond Amino aminopropylsilane (J.T. Baker) for flash chromatography) with 5 mL MeOH. Condition SPE cartridge with 2 mL ethyl acetate and 2 mL ethyl acetate:hexane 4:5. Add 1 mL ethyl acetate:hexane 4:5 to SPE cartridge. Attach SPE reservoir to SPE cartridge. 5 g tissue + 3 mL buffer, vortex for 10 s. Add 10 mL ethyl acetate, vortex for 10 s, shake mechanically at 500 rpm for 10 min, centrifuge at 3800 g for 10 min. Decant the supernatant, add 10 mL ethyl acetate to pellet, vortex for 10 s, shake mechanically at 500 rpm for 10 min, centrifuge at 3800 g for 10 min. Combine the supernatants, add 25 mL hexane and mix well. Centrifuge at 3800 g for 5 min. Add combined centrifuged supernatants into SPE reservoir and aspirate through SPE cartridge at flow rate of ca 2 mL/min. Add 5 mL ethyl acetate:hexane 4:5 to remaining pellet, vortex for 10 s, centrifuge at 3800 g for 5 min. Add centrifuged liquid into SPE reservoir and aspirate through SPE cartridge at ca. 2 mL/min. Remove SPE reservoir, wash SPE cartridge twice with 2 mL isooctane, let dry, dry under a stream of nitrogen for 20 min. Elute twice with 2 mL portions of MeOH. Evaporate eluate to dryness under a stream of nitrogen at 37°. Reconstitute the residue in 1.0 mL mobile phase, vortex for 10 s, centrifuge at 3800 g for 5 min. Inject a 50 μL aliquot of the supernatant. (Prepare buffer as follows. Dissolve 44.5 g Na_2HPO_4. $2H_2O$ in 450 mL water, adjust to pH 7.8 with 5 M NaOH and make up to 500 mL with water.)

HPLC VARIABLES

Guard column: 10 × 2.1 20 μm nonporous nonspherical C18 (Chrompack)
Column: 100 × 3.0 5 μm ChromSpher B porous spherical C18 (Chrompack)
Mobile phase: MeCN:buffer 30:70 (Buffer was 10 mM NaH_2PO_4 adjusted to pH 6.2 with 500 mM NaOH.)
Flow rate: 0.5
Injection volume: 50
Detector: UV 289

CHROMATOGRAM

Retention time: 6
Limit of detection: 1.4 μg/kg
Limit of quantitation: 2.3 μg/kg

SAMPLE

Matrix: tissue
Sample preparation: Wash 22 g bulk 40 μm 18% load end-capped C18 material (Analytichem) in a syringe barrel with 100 mL hexane, with 100 mL dichloromethane, and with 100 mL MeOH and dry under vacuum aspiration. Gently blend 2 g C18 material and 0.5 g liver in a glass pestle for 1 min until homogeneous in appearance. Place in a 10 mL syringe barrel plugged with filter paper (Whatman No. 1), cover with filter paper, compress to 4.5 mL, place a 100 μL pipette tip on the barrel to restrict flow, wash with 8 mL hexane, elute with 8 mL MeCN. Pass the eluate through 0.5 g activated alumina (EM Science Type F-20 80-200 mesh) between filter paper in a 10 mL syringe barrel (wash column with 4 mL MeCN just before use). Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH and 400 μL 17 mM phosphoric acid, sonicate for 5-10 min, centrifuge at 17000 g for 5 min, filter the supernatant (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 4 10 μm Micro Pak ODS (Varian)
Mobile phase: MeCN:17 mM phosphoric acid 40:60
Column temperature: 45
Flow rate: 1
Injection volume: 20
Detector: UV 290

CHROMATOGRAM

Retention time: 9
Internal standard: mebendazole

OTHER SUBSTANCES

Extracted: albendazole, thiafendazole, oxfendazole, fenbendazole

Long,A.R.; Malbrough,M.S.; Hsieh,L.C.; Short,C.R.; Barker,S.A. Matrix solid phase dispersion isolation and liquid chromatographic determination of five benzimidazole anthelmintics in fortified beef liver, *J.Assoc.Off.Anal.Chem.*, **1990**, *73*, 860–863.

SAMPLE

Matrix: tissue

Sample preparation: Condition a 2.8 mL 500 mg 40 μm 60 Å Bond Elut silica SPE cartridge with 2 mL dichloromethane. 10 g Minced tissue + 5 mL 1 M sodium carbonate + 150 mL ethyl acetate + 1 mL 10 mg/mL BHT in ethyl acetate, blend (Waring) at high speed for 5 min, add 80 g anhydrous sodium sulfate, blend at low speed for 1 min. Decant the organic layer and filter it (No. 41 paper), add 150 mL acetone to material remaining in blender, blend at low speed for 2-3 min, filter, wash solid with 10 mL EtOH. Combine all the filtrates and evaporate them to dryness under vacuum at 30-35° (beware of bumping). Rinse out flask with two 10 mL portions of hexane and two 10 mL portions of 1 M phosphoric acid, combine rinses, shake vigorously for 2 min, allow to separate for 10 min, extract the hexane layer twice more with 10 mL portions of 1 M phosphoric acid. Combine all the aqueous layers and wash them with 10 mL hexane, adjust the pH of the aqueous layer to 8.5 ± 1.0 by slowly adding about 9 mL 10 M KOH while using an ice bath. Extract twice with 50 mL ethyl acetate (2 min shaking), pass ethyl acetate layers through 40 g anhydrous sodium sulfate, wash the sodium sulfate with 25 mL ethyl acetate. Combine the ethyl acetate layers, add 200 μL 10 mg/mL BHT in ethyl acetate, evaporate to dryness under vacuum at 30-35° (beware of bumping). Rinse out flask with three 3 mL portions of dichloromethane, add rinses to the SPE cartridge, wash with 5 mL dichloromethane, elute with 5 mL dichloromethane:MeOH 75:25. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 1 mL mobile phase, vortex, filter (0.2 μm), inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 30 × 4.6 Brownlee RP-18 Spheri-10 MPLC

Column: 250 × 4.6 5 μm C18 (Alltech)

Mobile phase: MeOH:buffer 53:47 (Buffer was 1.15 g $(NH_4)H_2PO_4$ in 950 mL water, adjust pH to 7.0 with dilute ammonia, make up to 1 L with water.)

Flow rate: 1

Injection volume: 50

Detector: UV 298

CHROMATOGRAM

Retention time: 20

Limit of detection: 100 ppb

OTHER SUBSTANCES

Extracted: oxfendazole, thiabendazole

Simultaneous: chloramphenicol

Noninterfering: amprolium, chlortetracycline, erythromycin, levamisole, morantel, oxytetracycline, phenothiazine, sulfadimethoxine, sulfamethazine, sulfaquinoxaline

SAMPLE

Matrix: tissue

Sample preparation: Condition a J.T.Baker 3 mL 500 mg silica SPE cartridge with 6 mL n-hexane:ethyl acetate 2.5:1. 5 g Ground eel muscle tissue + 5 g sodium sulfate + 500 μL 4 M potassium carbonate solution + 10 mL ethyl acetate, vortex for 10 s, shake mechanically at 500 rpm for 10 min, centrifuge at 1300 g for 5 min, decant the supernatant, repeat the extraction with 10 mL ethyl acetate. Combine the extracts, add 50 mL hexane (ratio of n-hexane to ethyl acetate should be 2.5:1), add 5 g anhydrous sodium sulfate, shake, allow to stand until solution becomes transparent, filter (S & S 589.1 paper), add the filtrate to the SPE cartridge, rinse flask with 5 mL n-hexane:ethyl acetate 2.5:1, add the rinse to the SPE cartridge. Dry the SPE cartridge in a stream of nitrogen for 10 min, elute with 3 mL MeOH:acetic acid 97:3. Evaporate the eluate to dryness under a stream of nitrogen at 37°, reconstitute the residue in 1 mL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 10 × 2.1 40 μm ChromSep pellicular reversed-phase (stainless steel)
Column: 100 × 3 5 μm LiChrosorb RP-8 glass column
Mobile phase: MeCN:buffer 30:70, apparent pH 6.7 (Buffer was 50 mM $(NH_4)H_2PO_4$ adjusted to pH 6.2 with 10 M NaOH.)
Flow rate: 0.5

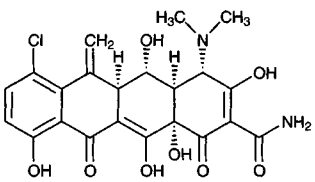
Meclocycline



Molecular formula: $C_{22}H_{21}ClN_2O_8$
Molecular weight: 476.87
CAS Registry No.: 2013-58-3, 73816-42-9 (sulfosalicylate)
Merck Index: 5818

SAMPLE

Matrix: formulations
Sample preparation: Weigh out cream containing 5 mg meclocycline, add 20 mL MeOH, add 20 mL 12.5 mM sulfuric acid, sonicate for 1 h, vortex for 2 min until cream is thoroughly dispersed, make up to 50 mL with MeOH, centrifuge at 2000 g for 10 min. Remove a 5 mL aliquot of the supernatant and make it up to 50 mL with mobile phase, filter (0.5 μm, Millipore Fluorophore FHL P04700), inject a 10 μL aliquot.

HPLC VARIABLES

Column: 250 × 3.2 10 μm 201 TP reverse phase (Vydac)
Mobile phase: THF:buffer 15:85 (Prepare buffer by dissolving 0.6 g EDTA in 2 mL MeOH in 15 mL concentrated ammonium hydroxide, add 1.8 L water, adjust pH to 6.6 with glacial acetic acid, make up to 2 L with water. Periodically purge column with 95% EtOH.)
Flow rate: 0.8
Injection volume: 10
Detector: UV 340

CHROMATOGRAM

Retention time: 7
Limit of detection: 0.4 ppm

OTHER SUBSTANCES
Simultaneous: methacycline, C-4-epimeclocycline

KEY WORDS
cream

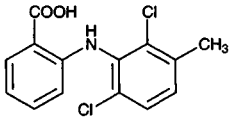
Meclofenamic acid



Molecular formula: $C_{14}H_{11}Cl_2NO_2$
Molecular weight: 296.15
CAS Registry No.: 644-62-2, 6385-02-0 (Na salt)
Merck Index: 5819
Lednicer No.: 1 110

SAMPLE
Matrix: aqueous humor
Sample preparation: 100 μL Aqueous humor + 500 μL MeCN + 30 μL 400 ng/mL (+)-naproxen in MeOH, mix mechanically for 90 s, centrifuge at 3000 g for 20 min. Remove the supernatant and dry it under nitrogen at room temperature, dissolve the residue in 50 μL mobile phase by swirl-mixing for 1 min, centrifuge at 3000 g for 20 s, reduce volume to 20-30 μL, inject an aliquot.

HPLC VARIABLES
Column: 150 × 4.5 5 μm Ultrasphere octyl
Mobile phase: MeCN:triethylamine:1.65% glacial acetic acid 505:0.65:495, pH 4.35
Column temperature: 30
Flow rate: 1
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 11.2
Internal standard: naproxen (3.89)

OTHER SUBSTANCES
Extracted: diclofenac, flurbiprofen, indomethacin
Simultaneous: bacitracin, cortisone acetate, diazepam, fluorometholone, hydrocortisone acetate, imipramine, ketoprofen, ketorolac tromethamine, levobunolol, metipranolol, neomycin, prednisolone acetate, proparacaine, propranolol, salicylic acid, sulfacetamide, suprofen
Noninterfering: acebutolol, acetaminophen, acetazolamide, alprenolol, apraclonidine, atenolol, atropine, betamethasone, betaxolol, bupivacaine, caffeine, cyclopentolate, dexamethasone, diphenhydramine, erythromycin, haloperidol, lidocaine, phenylephrine, polymyxin B, procaine, scopolamine, timolol, tropicamide

KEY WORDS
human; rabbit

SAMPLE
Matrix: blood
Sample preparation: 1.5 mL Plasma + 2 mL 150 ng/mL diclofenac sodium in 100 mM pH 4.6 sodium citrate buffer, mix, add 5 mL dichloromethane, rotate for 30 min, centrifuge. Remove 3 mL of the organic layer and evaporate it to dryness, reconstitute the residue in 200 μL eluent, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 100 × 3 10 μm Spherisorb ODS
Mobile phase: MeOH:100 mM pH 6.1 sodium phosphate buffer 40:60
Flow rate: 0.8
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 10
Internal standard: diclofenac sodium (5.5)
Limit of detection: 107 ng/mL

OTHER SUBSTANCES
Simultaneous: flunixin, mefenamic acid

KEY WORDS
plasma; horse; pharmacokinetics

SAMPLE
Matrix: blood, urine
Sample preparation: Dilute urine with an equal volume of water. 1 mL Plasma or diluted urine + 500 μL 6 M HCl + 10 mL toluene:EtOH 80:20, shake horizontally at slow speed for 15 min,

centrifuge at 2000 rpm for 10 min. Remove 8 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 200 (plasma) or 500 (urine) μL MeOH:water:acetic acid 70:30:0.5, inject a 20 (plasma) or 30 (urine) μL aliquot. (To assay total concentration add 1 mL 2 M pH 5.2 acetate buffer and 25 μL β-glucuronidase (Helix pomatia, Type H-1, 500000 units, Sigma) to 1 mL plasma or diluted urine, heat at 37° for 24 h, add 6 M HCl and proceed as above.)

HPLC VARIABLES

Column: 250 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:water 70:30 (plasma) or 64:36 (urine) containing 5 mM tetrabutylammonium phosphate
Flow rate: 0.6
Injection volume: 20-30
Detector: UV 340

CHROMATOGRAM

Retention time: 25 (plasma)
Internal standard: 3,5-dichloroanthranilic acid (11.3)
Limit of detection: 200 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

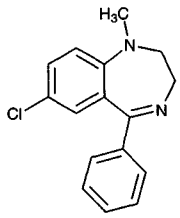
Medazepam



Molecular formula: $C_{16}H_{15}ClN_2$
Molecular weight: 270.76
CAS Registry No.: 2898-12-6, 2898-11-5 (HCl)
Merck Index: 5829
Lednicer No.: 1 368

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 255

CHROMATOGRAM

Retention time: 6.62
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

CHROMATOGRAM

Retention time: 15.83

KEY WORDS

whole blood

SAMPLE
Matrix: urine
Sample preparation: 1 mL Urine + 1 mL pH 10 borate-NaOH buffer + 50 μL 1 μg/L (sic) 5,6-benzoquinoline in water + 6 mL ethyl acetate:diethyl ether, shake gently for 10 min, centrifuge at 350 g for 5 min. Remove the organic layer and evaporate it to dryness at 70°, reconstitute the residue in 120 μL mobile phase, inject an aliquot. Hydrolyze conjugates as follows. 1 mL Urine + 1 mL buffer + 100 μL 1000 U/mL β-glucuronidase (from Helix pomatia, Sigma) in 0.2% NaCl, shake gently, heat at 37° for 24 h. (Buffer was 681 mg sodium acetate trihydrate in 40 mL water, equilibrate at 37°, adjust pH to 5 with 1 M HCl, make up to 50 mL with water.)

HPLC VARIABLES
Column: 150 × 5 5 μm Hypersil silica 5 ODS
Mobile phase: MeOH:buffer 56:40 (Buffer was 2.375 g Na_2HPO_4 and 0.135 g KH_2PO_4 in 400 mL water, pH 8.)
Flow rate: 2
Detector: UV 266

CHROMATOGRAM
Retention time: 15.6
Internal standard: 5,6-benzoquinoline (5.7)

OTHER SUBSTANCES
Extracted: metabolites

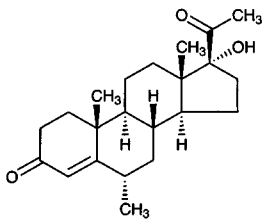
Medroxyprogesterone



Molecular formula: $C_{22}H_{32}O_3$
Molecular weight: 344.49
CAS Registry No.: 520-85-4, 71-58-9 (acetate)
Merck Index: 5838
Lednicer No.: 1 180, 2 165

SAMPLE
Matrix: blood
Sample preparation: 2 mL Plasma + 1 mL 0.5 μg/mL 16β-methylprogesterone in 200 mM pH 7.0 phosphate buffer, vortex for 3 s, add 7 mL hexane, mix on a rolling mixer for 30 min. Remove the hexane layer and evaporate it to dryness at 30° under nitrogen. Dissolve residue in 200 μL mobile phase, inject a 150 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Spherisorb 5-ODS2
Mobile phase: MeOH: 20 mM pH 4 acetate buffer 79:21
Flow rate: 1.5
Injection volume: 150
Detector: UV 240

CHROMATOGRAM
Retention time: 5.3 (medroxyprogesterone acetate)
Internal standard: 16β-methylprogesterone (9.0)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Extracted: progesterone, 17α-hydroxyprogesterone, cortisone, corticosterone, aldosterone, testosterone, androstenedione, estradiol
Noninterfering: cholesterol
Interfering: lignocaine

KEY WORDS
plasma

REFERENCE
Read,J.; Mould,G.; Stevenson,D. Simple high-performance liquid chromatographic method for the determination of medroxyprogesterone acetate in human plasma, *J.Chromatogr.*, **1985**, *341*, 437–444.

SAMPLE
Matrix: blood
Sample preparation: Extract 0.1-1 mL plasma twice with 40 volumes of diethyl ether, evaporate the organic solvent, dissolve the residue in 100 μL MeOH:water 80:20, inject a 30 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Beckman RP-ODS
Mobile phase: Gradient. MeCN:water from 40:60 to 70:30 over 20 min, then at 70:30 for 5 min
Injection volume: 30
Detector: UV 238

CHROMATOGRAM
Retention time: 20.5 (medroxyprogesterone acetate)

OTHER SUBSTANCES
Simultaneous: metabolites

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18

HPLC VARIABLES

Column: 75 × 4.6 3 μm Supelcosil LC-8
Mobile phase: MeCN:50 mM phosphoric acid 45:55

Flow rate: 1
Injection volume: 20
Detector: UV 235

CHROMATOGRAM
Retention time: 8
Internal standard: indomethacin (5)
Limit of detection: 50-250 ng/mL

OTHER SUBSTANCES
Simultaneous: naproxen, flunixin, thiosalicylic acid, ethacrynic acid, phenylbutazone

KEY WORDS
plasma

REFERENCE
Singh,A.K.; Jang,Y.; Mishra,U.; Granley,K. Simultaneous analysis of flunixin, naproxen, ethacrynic acid, indomethacin, phenylbutazone, mefenamic acid and thiosalicyclic acid in plasma and urine by high-performance liquid chromatography and gas chromatography-mass spectrometry, *J.Chromatogr.*, **1991**, *568*, 351–361.

SAMPLE
Matrix: microsomal incubations
Sample preparation: Add 150 μL MeCN to 250 μL microsomal incubation, vortex vigorously, filter (0.45 μm), inject an aliquot

HPLC VARIABLES
Column: 250 × 5 Spherisorb C8
Mobile phase: Gradient. A was MeCN. B was 50 mM pH 4.5 ammonium acetate buffer. A:B from 20:80 to 60:40 over 20 (?) min.
Detector: UV 280

CHROMATOGRAM
Retention time: 18

OTHER SUBSTANCES
Extracted: metabolites, mefenamic acid 1-O-acyl glucuronide

REFERENCE
McGurk,K.A.; Remmel,R.P.; Hosagrahara,V.P.; Tosh,D.; Burchell,B. Reactivity of mefenamic acid 1-O-acyl glucuronide with proteins in vitro and ex vivo, *Drug Metab.Dispos.*, **1996**, *24*, 842–849.

SAMPLE
Matrix: solutions
Sample preparation: Inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Spherisorb S10-ODS2
Mobile phase: MeCN:water:acetic acid 60:35:0.5
Flow rate: 1
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Internal standard: flurbiprofen

REFERENCE
Galia,E.; Nicolaides,E.; Hörter,D.; Löbenberg,R.; Reppas,C.; Dressman,J.B. Evaluation of various dissolution media for predicting in vivo performance of class I and II drugs, *Pharm.Res.*, **1998**, *15*, 698–705.

SAMPLE
Matrix: solutions
Sample preparation: Dissolve compounds in MeOH, inject a 1 μL aliquot.

HPLC VARIABLES
Column: 150 × 1 3 μm Hitachi-Gel 3011 porous polymer (Hitachi)
Mobile phase: MeOH:ammonia 99:1
Flow rate: 0.03
Injection volume: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 3.16

OTHER SUBSTANCES
Also analyzed: acetaminophen, caffeine, bucetin (3-hydroxy-p-butyrophenetidine), phenacetin, dipyrone (sulpyrin), aspirin, salicylamide, salicylic acid, ethenzamide (o-ethoxybenzamide), theobromine, theophylline

KEY WORDS
semi-micro; porous polymer

REFERENCE
Matsushima,Y.; Nagata,Y.; Niyomura,M.; Takakusagi,K.; Takai,N. Analysis of antipyretics by semimicro liquid chromatography, *J.Chromatogr.*, **1985**, *332*, 269–273.

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 500 μg/mL solution in MeOH:water 50:50, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Zorbax C8
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L MeCN:water 20:80. A:B from 100:0 to 0:100 over 30 min. (Purify triethylamine as follows. Wash neutral alumina (Merck) 3 times with 2 bed volumes of pentane, 3 times with 2 bed volumes of dichloromethane, and 3 times with 2 bed volumes of MeOH, allow solvent to evaporate in a fume hood overnight, heat alumina at 130° for 2 h. Prepare a 14 cm column of the washed alumina in a 290 × 22 tube, pass through a head volume of MeOH, pass through triethylamine. When triethylamine starts to elute discard the first 20 mL, use the next 20 mL, discard the column.)
Flow rate: 2
Injection volume: 5
Detector: UV 210

CHROMATOGRAM
Retention time: 27

OTHER SUBSTANCES
Simultaneous: acetophenone, amphetamine, desipramine, ethylmorphine, imipramine, methamphetamine, morphine, phenylbutazone, salicylic acid

KEY WORDS
also details of isocratic elution

REFERENCE
Hill,D.W. Evaluation of alkyl bonded silica and solvent phase modifiers for the efficient elution of basic drugs on HPLC, *J.Liq.Chromatogr.*, **1990**, *13*, 3147–3175.

SAMPLE
Matrix: solutions

Sample preparation: Inject a 50 μL aliquot of a solution in mobile phase.

HPLC VARIABLES
Column: 100 × 4.6 5 μm Spheri-5 RP-8
Mobile phase: MeOH:buffer 30:70 (Prepare buffer by mixing 4 mM Na_2HPO_4 and 7 mM KH_2PO_4 to achieve pH 7.)
Flow rate: 1
Injection volume: 50
Detector: F ex 355 em 460 (408 nm cutoff filter) following post-column extraction. The column effluent mixed with 50 μg/mL reagent in mobile phase pumped at 0.5 mL/min and then with chloroform pumped at 1 mL/min and the mixture flowed through a 1.8 m × 0.3 mm ID knitted PTFE coil to a 50 μL membrane phase separator using a polyethylene-backed 0.5 μm Fluoropore membrane filter (design in paper). The organic phase flowed to the detector. (Synthesize the reagent, α-(3,4-dimethoxyphenyl)-4'-trimethylammoniummethylcinnamonitrile methosulfate, as follows. Stir 20 mmoles 3,4-dimethoxyphenylacetonitrile and 20 mmoles p-toluamide in 50 mL EtOH at 50°, add 5 mL 50% aqueous KOH slowly, stir at 50° for 5 min, cool to room temperature, filter, dry the precipitate of α-(3,4-dimethoxyphenyl)-4'- methylcinnamonitrile. Dissolve 20 mmoles α-(3,4-dimethoxyphenyl)-4'-methylcinnamonitrile, 20 mmoles N-bromosuccinimide, and 20 mg benzoyl peroxide in 100 mL carbon tetrachloride (Caution! Carbon tetrachloride is a carcinogen!), reflux with stirring for 1.5 h , cool, filter, evaporate to dryness under reduced pressure, recrystallize from MeOH to give α-(3,4-dimethoxyphenyl)-4'-bromomethylcinnamonitrile. Vigorously stir 30 mmoles anhydrous dimethylamine in 100 mL dry benzene (Caution! Benzene is a carcinogen!) at 0°, very slowly add 10 mmoles α-(3,4-dimethoxyphenyl)-4'-bromomethylcinnamonitrile while stirring at 0°, stir at room temperature overnight, add 150 mL water, remove the organic phase, extract the aqueous phase twice with 100 mL portions of diethyl ether, wash the organic layers with saturated NaCl solution, dry over anhydrous magnesium sulfate, evaporate under reduced pressure to give α-(3,4-dimethoxyphenyl)-4'-dimethylaminomethylcinnamonitrile (J.Chem.Eng.Data 1987, 32, 387). Reflux 10 mmoles α-(3,4-dimethoxyphenyl)-4'-dimethylaminomethylcinnamonitrile, 20 mmoles dimethyl sulfate (Caution! Dimethyl sulfate is a carcinogen and acutely toxic!), and 5 g potassium carbonate in 50 mL acetone for 1 h, cool to room temperature, filter, dry the precipitate under vacuum at room temperature overnight, recrystallize from chloroform containing 2-3 drops of 95% EtOH to give α-(3,4-dimethoxyphenyl)-4'-trimethylammoniummethylcinnamonitrile methosulfate (mp 212-215°). Protect solutions from light.)

CHROMATOGRAM
Retention time: k' 7.5039
Limit of detection: 2 μg/mL

OTHER SUBSTANCES
Simultaneous: ibuprofen, ketoprofen, naproxen, probenecid, salicylic acid, valproic acid

KEY WORDS
post-column extraction; post-column reaction

Bergqvist,Y.; Al Kabbani,J.; Krysén,B.; Palme,I.B.; Rombo,L. High-performance liquid chromatographic method for the simultaneous determination of mefloquine and its carboxylic metabolite in 100-μl blood samples dried on paper, *J.Chromatogr.*, **1993**, *615*, 297–302.

SAMPLE

Matrix: blood
Sample preparation: 500 μL Plasma + 500 μL 20% Na_3PO_4 + 2 mL MTBE, vortex for 30 s, centrifuge at 2000 g for 10 min, freeze in dry ice/acetone. Remove the organic phase, repeat the extraction with 2 mL MTBE. Combine the organic phases and evaporate them under a stream of nitrogen, reconstitute the residue in 70 μL mobile phase, inject a 50 μL aliquot onto column A with mobile phase A. Three min after mefloquine had left column A and entered column B (use a detector between column A and column B to ascertain this) backflush contents of column B onto column C with mobile phase B, elute column C with mobile phase B and monitor the effluent for the enantiomers.

HPLC VARIABLES

Column: A 250 × 4.6 5 μm Nucleosil cyanopropyl; B 60 × 4 5 μm Kromasil (Informatiques & Technologies); C 250 × 4.6 5 μm chiral (S)-naphthylurea (S.F.C.C./Shandon)
Mobile phase: A Hexane:isopropanol:MeOH 82:4:14 modified with 125 μL triethylamine in MeOH (1:40); B Hexane:isopropanol:MeOH 50:5:45 modified with 125 μL triethylamine in MeOH (1:40)
Flow rate: A 2; B 1.5
Injection volume: 50
Detector: UV 285

CHROMATOGRAM

Retention time: 36 (+), 38 (-)

KEY WORDS

plasma; chiral; column-switching

SAMPLE
Matrix: blood
Sample preparation: Whole blood. 100 μL Whole blood was allowed to dry on Whatman 31 ET Chroma chromatographic paper. Cut paper into small pieces and add to 150 μL 5 μM IS in water, add 2 mL ammonia:water 90:10, incubate at room temperature for 30-60 min, sonicate at 37° for 30 min, add 4 mL 10 mM pH 10.0 borate buffer and 5 mL MTBE, shake for 20 min, centrifuge at 3000 g for 5 min. Remove the organic layer and evaporate it to dryness at 65°, add 125 μL 0.4 mM (-)-1-(9-fluorenyl)ethyl chloroformate in water-free MeCN, add 50 μL 15 mM pH 8.5 borate buffer, vortex, leave at room temperature for 40 min, centrifuge at 3000 g for 10 min, inject a 100 μL aliquot. Plasma. 100 μL Plasma + 25 μL 100 mM zinc sulfate, vortex for 15 s, add 750 μL 1 μM IS in MeCN, vortex for 15 s, let stand for 15 min, centrifuge at 10000 g for 10 min. Remove the supernatant and add it to 4 mL 10 mM pH 10.0 borate buffer and 5 mL MTBE, shake for 20 min, centrifuge at 3000 g for 5 min. Remove the organic layer and evaporate it to dryness at 65°, add 125 μL 0.4 mM (-)-1-(9-fluorenyl)ethyl chloroformate in water-free MeCN, add 50 μL 15 mM pH 8.5 borate buffer, vortex, leave at room temperature for 40 min, centrifuge at 3000 g for 10 min, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere octadecylsilica
Mobile phase: MeCN:water:acetic acid 82:18:0.07
Flow rate: 1
Injection volume: 100
Detector: F ex 263 em 475

CHROMATOGRAM
Retention time: 13 (RS), 15 (SR)
Internal standard: D,L-erythro-α-(2-piperidyl)-2-trifluoromethyl-6,8-dichloro-4-quinolinemethanol (18 and 22)
Limit of detection: 50 nM (SR), 10 nM (RS)

OTHER SUBSTANCES
Noninterfering: chloroquine, quinine, pyrimethamine, sulfadoxine

KEY WORDS
whole blood; plasma; chiral; derivatization

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 222

CHROMATOGRAM
Retention time: 9.58
Limit of detection: <120 ng/mL

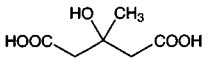
Meglutol



Molecular formula: $C_6H_{10}O_5$
Molecular weight: 162.14
CAS Registry No.: 503-49-1
Merck Index: 5852

SAMPLE
Matrix: formulations
Sample preparation: Powder tablets, weigh out amount equivalent to 100 mg meglutol, suspend in 10 mL water, make up to 100 mL with MeOH, stir for 10 min, dilute an aliquot 1:10 with water. 200 μL Sample + 150 μL 20 mM tetrahexylammonium bromide in 100 mM pH 7.0 phosphate buffer + 100 μL 4.2 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, stir at 65° for 43 min, add 150 μL 7.5 μg/mL IS in MeCN, sonicate for 1 min, inject a 50 μL aliquot. (Synthesis of 2-bromoacetyl-6-methoxynaphthalene is as follows. Stir equimolar amounts of 2-acetyl-6-methoxynaphthalene (6'-methoxy-2'-acetonaphthone, Aldrich) and methyltriphenylphosphonium tribromide in anhydrous THF under nitrogen at room temperature for 1 h, dilute the reaction mixture with ether, wash with sodium bisulfite solution, wash with water (Phosphorus and Sulfur 1985, 25, 357). [Bromination can also be achieved with phenyltrimethylammonium tribromide over 3 h but the reaction is less selective.] Purify the crude product by column chromatography on silica gel using chloroform:petroleum ether 50:50 to give 2-bromoacetyl-6-methoxynaphthalene (mp 109-112°) (Chromatographia 1992, 33, 13).)

HPLC VARIABLES
Column: 250 × 4.6 Hypersil 5 ODS
Mobile phase: MeCN:MeOH:THF:water 35.75:26:3.25:35
Column temperature: 35
Flow rate: 1.2
Injection volume: 50
Detector: F ex 300 em 460

CHROMATOGRAM
Retention time: 12
Internal standard: n-hexanoic acid 6-methoxynaphthacylester (15) [Prepare by dissolving 2 mmoles n-hexanoic acid and 1 mmole 2-bromoacetyl-6-methoxynaphthalene in 10 mL anhydrous MeCN, add 0.5 mL triethylamine, heat at 60° for 30 min, cool, dilute with 30 mL water, extract three times with 10 mL portions of diethyl ether. Combine the extracts, wash with 5% sodium bicarbonate, wash three times with 10 mL portions of water, dry over anhydrous sodium sulfate, evaporate under reduced pressure, recrystallize from MeOH/water.]

KEY WORDS
tablets; derivatization

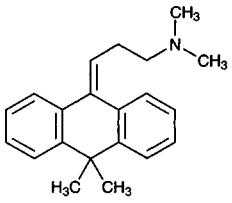
Melitracen



Molecular formula: $C_{21}H_{25}N$
Molecular weight: 291.44
CAS Registry No.: 5118-29-6, 10563-70-9 (HCl)
Merck Index: 5866

SAMPLE

Matrix: blood, tissue, urine

Sample preparation: Serum, urine. 500 µL Serum or urine + 100 µL 2 µg/mL diazepam + 200 µL 20% sodium carbonate + 500 µL water + 3 mL n-hexane:isoamyl alcohol 98.5:1.5, mix for 2 min, centrifuge at 1200 g for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 µL mobile phase, inject a 10 µL aliquot. Tissue. Homogenize 1 g sample with 9 mL 100 mM HCl and 100 µL 20 µg/mL diazepam, centrifuge at 15000 g for 10 min. Add 500 µL 20% sodium carbonate and 4 mL n-hexane:isoamyl alcohol 98.5:1.5 to 1 mL of the supernatant, mix for 5 min. Remove the organic phase and evaporate it under a gentle stream of nitrogen at about 40°. Dissolve the residue in 100 µL mobile phase, filter by microconcentrator (Microcon-30, Grace). Inject a 10 µL aliquot.

HPLC VARIABLES

Column: 100 × 4.6 2 µm TSK gel Super-Octyl (A) or 100 × 4.6 5 µm Hypersil MOS-C8 (B), (Yokogawa, Japan)
Mobile phase: MeOH:20 mM pH 7 KH_2PO_4 60:40
Flow rate: 0.6
Injection volume: 10
Detector: UV 254

CHROMATOGRAM

Retention time: 19.1 (A), 33.8 (B)
Internal standard: diazepam (4.4, A)
Limit of quantitation: 50 ng/mL (serum, urine) (A), 500 ng/mL (tissue) (A)

OTHER SUBSTANCES

Extracted: amitriptyline, amoxapine, clomipramine, desipramine, dothiepin, doxepin, imipramine, maprotiline, mianserin, nortriptyline
Noninterfering: barbital, carbamazepine, ethosuximide, hexobarbital, lofepramine, pentobarbital, phenobarbital, phenytoin, primidone, sulpiride, trimethadione, trimipramine

SAMPLE
Matrix: solutions
Sample preparation: Inject a 500 μL aliquot of a solution in 10 mM pH 7.57 potassium phosphate buffer.

HPLC VARIABLES
Column: 100 × 10 15 μm Pharmacia PepRPC C18
Mobile phase: Gradient. A was 0.1% trifluoroacetic acid in water. B was 0.1% trifluoroacetic acid in MeCN. A:B 100:0 for 4 min, to 80:20 over 32 min, to 0:100 (step gradient).
Flow rate: 5
Injection volume: 500
Detector: UV 260

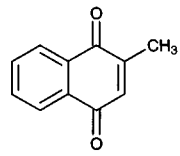
Menadione



Molecular formula: $C_{11}H_8O_2$
Molecular weight: 172.18
CAS Registry No.: 58-27-5
Merck Index: 5874

SAMPLE
Matrix: blood
Sample preparation: 800 μL Plasma + 100 μL 35 μg/mL carbazole in mobile phase + 6 mL n-hexane, rotate for 45 min, centrifuge at 1080 g for 15 min, freeze at -76° for 30 min. Remove the organic layer and add it to 200 μL MeOH:water 70:30, evaporate under a stream of nitrogen, inject an aliquot.

HPLC VARIABLES
Guard column: 10 μm Bondapak C18

Column: 250 × 4.6 μm Ultrasphere ODS
Mobile phase: MeOH:water 70:30
Flow rate: 0.8
Detector: UV 265

CHROMATOGRAM
Retention time: 8.7
Internal standard: carbazole (12.5)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES
Extracted: menadiol, metabolites

KEY WORDS
plasma; protect from light; rabbit; pharmacokinetics

REFERENCE

SAMPLE
Matrix: feed
Sample preparation: Grind feed to pass 20 mesh sieve. Feed + 100 mL chloroform, shake for 3 min, add 5 mL 25% ammonium hydroxide, shake for 3 min, add 10 g Celite:anhydrous sodium sulfate 3:10 w/w, shake for 20 min, neutralize with acetic acid, shake mechanically for 20 min, centrifuge at 2500 rpm for 10 min. Either dilute chloroform layer with chloroform and inject a 40-100 μL aliquot or evaporate chloroform layer to dryness under reduced pressure at 40°, reconstitute in 1,2-dichloroethane, inject a 40 -100 μL aliquot.

HPLC VARIABLES
Guard column: Guard-Pak Resolve Si (waters)
Column: 250 × 4 5 μm Lichrosorb Si 60
Mobile phase: 1,2-Dichloroethane
Column temperature: 45
Flow rate: 1.8
Injection volume: 40-100
Detector: UV 251

CHROMATOGRAM
Retention time: 3.08
Limit of detection: 2.5 ppm

KEY WORDS
normal phase; protect from light

REFERENCE
Laffi,R.; Marchetti,S.; Marchetti,M. Normal-phase liquid chromatographic determination of menadione in animal feeds, *J.Assoc.Off.Anal.Chem.*, **1988**, *71*, 826–828.

SAMPLE
Matrix: feed
Sample preparation: Extract 500 mg feed in a 152 × 19 stainless steel tube with supercritical carbon dioxide at 65° at 8000 psi for 20 min, the effluent is passed through a 152 × 6.35 column of silica gel. Elute the silica gel with 10 mL dichloromethane and evaporate the eluate to dryness under reduced pressure, reconstitute in 1 mL MeCN, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:25 mM sodium perchlorate 90:10
Flow rate: 2
Injection volume: 20

Detector: E, polished silver working electrode -0.75 V, calomel reference electrode

CHROMATOGRAM
Retention time: 2.5
Limit of detection: 125 pg

KEY WORDS
SFE

SAMPLE
Matrix: feed
Sample preparation: 1 g Ground feed + 10 mL MeOH:water 40:60, shake for 30 min on a mechanical shaker, centrifuge at 1000 g for 10 min. Remove 5 mL of the supernatant and add it to 10 mL 5% sodium carbonate and 10 mL n-pentane, shake for 1 min, centrifuge at 1000 g for 1 min, repeat extraction twice. Combine the n-pentane layers and evaporate to dryness under reduced pressure at room temperature, reconstitute the residue in 10 mL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelcosil LC-18
Mobile phase: MeOH:water 75:25
Flow rate: 0.9
Injection volume: 10
Detector: F ex 325 em 425 following post-column reduction. The effluent from the column flowed through a 20 × 2 column packed with powdered zinc (≤ 38 μm) and a 0.5 μm filter and then to the detector.

CHROMATOGRAM
Retention time: 6
Limit of quantitation: 1 ng

KEY WORDS
post-column reaction; also for menadione sodium bisulfite

Billedeau,S.M. Fluorimetric determination of vitamin K3 (menadione sodium bisulfite) in synthetic animal feed by high-performance liquid chromatography using a post-column zinc reducer, *J.Chromatogr.*, **1989**, *472*, 371–379.

SAMPLE
Matrix: feed, premix
Sample preparation: 1-10 g Ground feed or premix + 96 mL EtOH:water 40:60, shake for 10 min, add 4 mL 10% tannin solution, shake for 1 min, centrifuge at 2000 g for 5 min, filter through a fine-pore glass filter. Add a 40 mL portion of the filtrate to 50 mL n-hexane and 20 mL 10% sodium carbonate, shake for 1 min, discard the lower layer. Wash the n-hexane layer twice with 100 mL portions of water and dry it with strips of blue-ribbon filter paper. Evaporate an aliquot to dryness under nitrogen with a rotary evaporator, reconstitute in mobile phase, sonicate for 1 min, filter (0.2 μm) (if necessary), inject a 100 μL aliquot. (Use a brown glass separatory funnel.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm ODS-Hypersil
Mobile phase: EtOH:water 60:40
Flow rate: 0.6
Injection volume: 100
Detector: F ex 325 em 425 following post-column reduction. The reagent passed through a debubbler was mixed with the effluent at 0.27 mL/min, the combined solution flowed through a

1.4 m long stainless steel reaction coil to the detector. (Reagent was 0.8 g/L sodium borohydride in EtOH, sonicate for 5 min, stable for 2 h.)

CHROMATOGRAM
Retention time: 12
Limit of quantitation: 20 ng/g

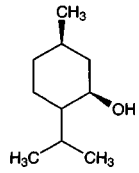
Menthol



Molecular formula: $C_{10}H_{20}O$
Molecular weight: 156.27
CAS Registry No.: 1490-04-6, 89-78-1
Merck Index: 5882

SAMPLE
Matrix: formulations
Sample preparation: Powder, granules. Dissolve the powder or granules in a small volume of MeCN, sonicate for 30 min, centrifuge at 2500 rpm for 5 min, dilute 2-fold with water, pass through a Sep-pak C18 SPE cartridge, filter(0.45 μm), inject a 100 μL aliquot. Lotion. Dilute lotion 2-fold with water, filter(0.45 μm), inject a 100 μL aliquot. Plaster. Extract plasters by sonication with MeCN for 30 min., filter (0.45 μm), inject a 100 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 J'sphere ODS-H80 (YMC)
Mobile phase: MeCN:water 60:40
Column temperature: 40
Flow rate: 1
Injection volume: 100
Detector: UV 210; Polarized photometric detector, SPD-10 AV UV-VIS detector with HN32 polarizers (Polaroid, MA), 530 nm, angle+1.0 rad

CHROMATOGRAM
Retention time: 7.5
Limit of detection: 500 ng

KEY WORDS
chiral; comparison with GC; SPE; polarized photometric detection; powders; granules; lotion; plasters

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 259

CHROMATOGRAM
Retention time: 4.55
Limit of detection: <120 ng/mL

KEY WORDS

SAMPLE
Matrix: blood tissue
Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30

Detector: UV 220

CHROMATOGRAM
Retention time: 4.89
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES
Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, imipramine, loxapine, maprotiline, mesoridazine, methadone, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, tranylcypromine, trazodone, trihexyphenidyl, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine
Interfering: haloperidol, norpropoxyphene, northiaden

KEY WORDS
serum; whole blood; liver

REFERENCE

SAMPLE
Matrix: blood, urine
Sample preparation: Serum. 1 mL Serum + 100 μL 1 μg/mL diphenhydramine and 1 μg/mL nordiphenhydramine in 1 mM orthophosphoric acid + 100 μL 1 M NaOH + 5 mL hexane, rotate at 60 rpm for 15 min, centrifuge. Remove 4 mL of the organic layer and add it to 80 μL 1 mM orthophosphoric acid, vortex vigorously for 30 s, inject a 50 μL aliquot of the aqueous phase. Urine. Dilute 1:10 with drug-free urine. 1 mL Diluted urine + 100 μL 1 μg/mL diphenhydramine and 1 μg/mL nordiphenhydramine in 1 mM orthophosphoric acid + 1 mL saturated sodium borate (pH 10.2) + 5 mL hexane, rotate at 60 rpm for 15 min, centrifuge. Remove 4 mL of the organic layer and add it to 80 μL 1 mM orthophosphoric acid, vortex vigorously for 30 s, inject a 50 μL aliquot of the aqueous phase.

HPLC VARIABLES
Guard column: 20 × 4.6 5 μm Supelguard LC-CN cyanopropyl (Supelcosil)
Column: 150 × 4.6 5 μm Supelcosil LC-PCN cyanopropyl
Mobile phase: MeCN:MeOH:buffer 55:20:25 (Buffer was 2.6 g K_2HPO_4 in 1 L water, pH adjusted to 7.0 with 900 mM orthophosphoric acid.) (Optimize the separation by adjusting the pH of the mobile phase with a few drops of 1 M NaOH or 900 mM orthophosphoric acid.)
Flow rate: 2.5
Injection volume: 50
Detector: UV 205

CHROMATOGRAM
Retention time: 1.5
Internal standard: diphenhydramine (1.9), nordiphenhydramine (2.9)
Limit of detection: 2 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, normeperidine

KEY WORDS
serum; pharmacokinetics

REFERENCE
Meatherall,R.C.; Guay,D.R.P.; Chalmers,J.L. Analysis of meperidine and normeperidine in serum and urine by high-performance liquid chromatography, *J.Chromatogr.*, **1985**, *338*, 141–149.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 11.77

Molecular formula: $C_{10}H_{14}O_3$
Molecular weight: 182.22
CAS Registry No.: 59-47-2, 533-06-2 (carbamate)
Merck Index: 5895
Lednicer No.: 1 118

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 272

CHROMATOGRAM
Retention time: 3.53
Limit of detection: <120 ng/mL

KEY WORDS
whole blood; plasma; interferences may occur–compounds (all of which are extracted) elute in this order tenoxicam; iproniazid; methocarbamol; methotrexate; caffeine; nialamide; colchicine; cytarabine; benzoylecgonine; acetaminophen; diazoxide; dacarbazine; sulfinpyrazole; flumazenil; sulpride; morphine; atenolol; toloxatone; terbutaline; albuterol; phenobarbital; ranitidine; tiapride; phenol; chlormezanone; aspirin; metformin; ritodrine; codeine; sultopride; amisulpride; naltrexone; lisinopril; benzocaine; nizatidine; nalorphine; mephenesin; naloxone; sotalol; carteolol; procainamide; carbamazepine; bromazepam; nalbuphine; nadolol; procarbazine; dihydralazine; omeprazole; strychnine; acebutolol; glutethimide; chlorpropamide; glipizide; triazolam; prazosin; flunitrazepam; clonazepam; metoclopramide; melphalan; estazolam; tolbutamide; ephedrine; clonidine; pindolol; clobazam; minoxidil; disopyramide; nitrazepam; dextromethorphan; tofisopam; zopiclone; debrisoquine; sulindac; alprazolam; cycloguanil; lorazepam; methaqualone; ketamine; piroxicam; metoprolol; nifedipine; quinine; mephentermine; prilocaine; pentazocine; oxazepam; tiaprofenic acid; quinidine; celiprolol; ajmaline; yohimbine; lidocaine; secobarbital; viloxazine; mepivacaine; meperidine; doxylamine; labetalol; temazepam; amodiaquine; benperidol; droperidol; hydroxychloroquine; zolpidem; ketoprofen; alminoprofen; cicletanine; moclobemide; chloroquine; cocaine; timolol; nomifensine; ticlopidine; acenocoumarol; vindesine; mexiletine; dipyridamole; trazodone; pipamperone; pyrimethamine; benazepril; vincristine; metapramine; chlordiazepoxide; oxprenolol; warfarin; clorazepate; flecainide; phencyclidine; thiopental; fenfluramine; metipranolol; triprolidine; naproxen; buprenorphine; verapamil; buspirone; tianeptine; midazolam; bupivacaine; carbinoxamine; loprazolam; cetirizine; chlorpheniramine; moperone; cibenzoline; medifoxamine; astemizole; vinblastine; nicardipine; bisoprolol; diltiazem; glibornuride; reserpine; aconitine; nitrendipine; diazepam; mianserin; ramipril; haloperidol; tetracaine; alprenolol; aceprometazine; glibenclam-

SAMPLE

Matrix: blood, urine

Sample preparation: Serum. 2 mL Serum, adjust pH to 14 with 2 M NaOH, extract twice with 6 mL diethyl ether. Combine the organic layers, dry under nitrogen, dissolve the residue in 200 μL MeOH. Inject a 20 μL aliquot. Urine. 5 mL Urine, adjust pH to 5 with 1 mL 2 M pH 5 sodium acetate buffer. Add 100 μL β-glucuronidase (Helix pomatia 98400 U/mL), incubate at 37° overnight, cool, wash with 8 mL diethyl ether, discard the organic layer. Adjust to pH 14 with 25% NaOH, extract twice with 8 mL diethyl ether. Combine the organic layers, dry under nitrogen, reconstitute the residue in 200 μL MeOH. Inject a 20 μL aliquot.

SAMPLE

Matrix: blood, milk
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL water and MeOH:water 20:80. Add 5 mL 0.5% pH 6.0 KH_2PO_4 to 1 mL human breast milk or plasma, mix briefly, add the sample to the SPE cartridge, elute with 5 mL MeOH, evaporate the eluate to dryness, dissolve the residue in 200 μL mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.6 Develosil C8-5 (Nomura Chemicals)
Mobile phase: MeCN:0.5% KH_2PO_4 buffer 30:70 (The pH of mobile phase was adjusted to 4.5 with 50% H_3PO_4.)
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 13
Internal standard: mephenytoin

OTHER SUBSTANCES
Extracted: phenytoin

KEY WORDS
cord blood plasma; human breast milk; maternal plasma; mephenytoin is IS; human; plasma; SPE

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 150 × 4.6 Supelcosil LC-ABZ
Mobile phase: MeCN:25 mM pH 6.9 potassium phosphate buffer 35:65
Flow rate: 1.5
Injection volume: 25
Detector: UV 254

CHROMATOGRAM
Retention time: 4.128

OTHER SUBSTANCES
Also analyzed: 6-acetylmorphine, amiloride, amphetamine, benzocaine, benzoylecgonine, caffeine, cocaine, codeine, doxylamine, fluoxetine, glutethimide, hexobarbital, hypoxanthine, levorphanol, LSD, meperidine, methadone, methylphenidate, methyprylon, N-norcodeine, oxazepam, oxycodone, phenylpropanolamine, prilocaine, procaine, terfenadine

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeCN:10 mm KH_2PO_4 + 5 mM 1-decanesulfonic acid 30:70, adjusted to pH 3.2 with 85% phosphoric acid
Flow rate: 1
Injection volume: 10
Detector: UV 214

CHROMATOGRAM
Retention time: 11.5
Internal standard: methyl paraben (7.0)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Simultaneous: allobarbital, barbital, butalbital, aprobarbital, pentobarbital, phenobarbital, secobarbital, talbutal, vinbarbital

KEY WORDS
stability-indicating

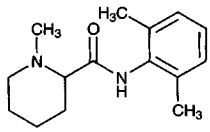
Mepivacaine



Molecular formula: $C_{15}H_{22}N_2O$
Molecular weight: 246.35
CAS Registry No.: 96-88-8, 1722-62-9 (HCl)
Merck Index: 5905
Lednicer No.: 1 17

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 25 µL EtOH + 25 µL 17.6 µg/mL ropivacaine in EtOH, mix. Add 5 mL diethyl ether, vortex for 3 min, centrifuge at 2000 g for 10 min at 4°. Add 500 µL 100 mM hydrochloric acid to organic phase, back extract for 3 min. Discard organic phase, add 5 mL n-pentane containing 100 µL isoamyl alcohol, wash for 3 min, discard organic phase again. Add 50 µL 2 M NaOH, extract aqueous phase with 5 mL n-pentane containing 100 µL isoamyl alcohol, centrifuge at 2000 g for 10 min at 4°. Evaporate organic phase to dryness under a gentle stream of nitrogen at 40°. Reconstitute the residue in 100 µL mobile phase, inject a 30 µL aliquot.

HPLC VARIABLES

Guard column: 10 × 4.0 40 µm α1-AGP (J.T.Baker)
Column: 100 × 4.0 5 µm α1-AGP (J.T.Baker)
Mobile phase: 2-Propanol:buffer 6.8:93.2 (Buffer was 3.6 g/L $Na_2HPO_4.12$ H2O adjusted to pH 6.8 with phosphoric acid.)
Column temperature: 30
Flow rate: 1.1
Injection volume: 30
Detector: UV 210

CHROMATOGRAM

Retention time: 4.6 (R-(-)), 5.8 (S-(+))
Internal standard: S-(-)-ropivacaine (10.5)
Limit of detection: 3 ng/mL
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES

Noninterfering: bupivacaine
Interfering: lidocaine, prilocaine

KEY WORDS

plasma; chiral; pharmacokinetics

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL Bond-Elut C18 SPE cartridge with 1 mL 100 mM HCl, 1 mL MeOH and 1 mL water. Add 350 µL 100 mM pH 4.5 phosphate buffer and 40 µL 200 µg/mL S-bupivacaine in MeOH to 1 mL serum, vortex. Add the mixture to the SPE cartridge and pass it through the cartridge attached to a vacuum manifold, wash 4 times with 250 µL water, then wash with 500 µL MeCN and allow to air dry for 1 min between each wash. Elute with four 250 µL aliquots of MeOH containing 2% HCl, evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 1 mL mobile phase and inject a 100 µL aliquot.

HPLC VARIABLES

Column: 250 × 4 5 µm Sumichiral OA-4700 (YMC, Wilmington, NC, USA)

Mobile phase: Hexane:dichloroethane:absolute MeOH 85:10:5
Flow rate: 0.8
Injection volume: 100
Detector: UV 220

CHROMATOGRAM
Retention time: 9.3 (R-(+)), 11.4 (S-(-))
Internal standard: S-bupivacaine (7.7)
Limit of detection: 100 ng/mL
Limit of quantitation: 150 ng/mL

KEY WORDS
chiral; SPE; serum

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 50 μL 40 μg/mL etidocaine hydrochloride in water + 100 μL 1 M NaOH, vortex for 15 s, add 5 mL diethyl ether, shake on a reciprocating shaker for 10 min, centrifuge. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 100 μL mobile phase, inject a 80 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.2 10 μm μBondapak C18
Mobile phase: MeCN:50 mM pH 5.80 Na_2HPO_4 25:75
Flow rate: 0.9
Injection volume: 80
Detector: UV 210

CHROMATOGRAM
Retention time: 3.7
Internal standard: etidocaine (12.0)

OTHER SUBSTANCES
Extracted: 2,6-pipecolylxylidine, bupivacaine, lidocaine
Noninterfering: metabolites, 2,3-chloroprocaine, theophylline, mexiletine, quinidine, disopyramide, verapamil, phenobarbital, phenytoin, carbamazepine, ethosuximide, digoxin, theobromine, caffeine, furosemide, phenprocoumon, aldactone

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL BondElut C18 SPE cartridge once with 1 M HCl, twice with MeOH, and once with water, remove the liquid completely with suction each time. Add 250 μL bupivacaine in 100 mM NaH_2PO_4 and 250 μL serum to the column at 1 mL/min, wash twice with water and once with MeCN draining the column completely after each wash, elute with 250 μL eluting solution, centrifuge for 20 s to remove last of eluate, inject a 5 μL aliquot of the eluate. (Eluting solution was 2.5 mL 35% perchloric acid in 100 mL MeOH.)

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm RP-8 (Applied Biosystems)
Column: 150 × 4.6 5 μm Ultrasphere octyl
Mobile phase: MeCN:10 mM KH_2PO_4 25:80, pH 5.2
Flow rate: 1.5
Injection volume: 5
Detector: UV 205

CHROMATOGRAM
Retention time: 2.6
Internal standard: bupivacaine (7.2)

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

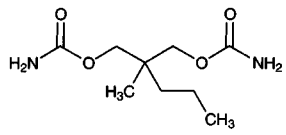
Meprobamate



Molecular formula: $C_9H_{18}N_2O_4$
Molecular weight: 218.25
CAS Registry No.: 57-53-4
Merck Index: 5908
Lednicer No.: 1 218

SAMPLE
Matrix: blood
Sample preparation: 500 µL Serum + 100 µL 200 mM HCl + 200 µL 100 µg/mL carisoprodol + 1 mL chloroform, shake for 2 min, sonicate for 1 min, centrifuge for 1 min. Remove the organic layer and add it to 200 mM NaOH, shake for 1 min, sonicate for 1 min, centrifuge for 1 min. Remove 750 µL of the organic layer and evaporate it to dryness, dissolve the residue in 50 µL mobile phase, inject a 20 µL aliquot.

HPLC VARIABLES
Column: 100 × 3 octyl CP-tm-Spher C8 glass column (Chrompack)
Mobile phase: MeCN:50 mM NaH_2PO_4 35:65 adjusted to pH 2.2 with phosphoric acid
Flow rate: 0.8
Injection volume: 20
Detector: UV 190

CHROMATOGRAM
Retention time: 1.8
Internal standard: carisoprodol (5.5)
Limit of detection: 2000 ng/mL

KEY WORDS
serum

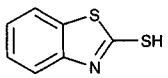
Mercaptobenzothiazole



Molecular formula: $C_7H_5NS_2$
Molecular weight: 167.26
CAS Registry No.: 149-30-4
Merck Index: 5916

SAMPLE

Matrix: blood, tissue, urine

Sample preparation: Urine. 1 mL Urine + 4 mL EtOH, centrifuge at 3000 rpm for 10 min. Dilute the supernatant with EtOH, filter (0.2 μm, Acro LC13), inject a 20 μL aliquot. (Hydrolyze conjugates by mixing 100 μL urine with 900 μL 100 mM pH 5 acetate buffer and 33 units sulfatase or 5000 units β-glucuronidase, heat at 37° for 30 min, proceed as above.) Tissue. Homogenize liver or kidney in 3 volumes of cold 100 mM pH 5 acetate buffer containing 2 mM aminooxyacetic acid, add 4 volumes of EtOH, centrifuge at 3000 rpm for 20 min. Filter (0.2 μm, Acro LC13) the supernatant and inject a 20 μL aliquot. Plasma. Add 4 volumes of EtOH to plasma, centrifuge at 3000 rpm for 20 min. Filter (0.2 μm, Acro LC13) the supernatant and inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 30 mm long C18
Column: 250 × 4.6 Partisil 10 ODS 3
Mobile phase: MeCN:water 50:50 adjusted to pH 4.5 with trifluoroacetic acid
Flow rate: 1
Injection volume: 20
Detector: UV 321

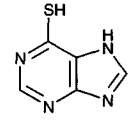
Mercaptopurine



Molecular formula: $C_5H_4N_4S$
Molecular weight: 152.18
CAS Registry No.: 50-44-2, 6112-76-1 (monohydrate)
Merck Index: 5919

SAMPLE
Matrix: blood
Sample preparation: Condition a 500 mg Bakerbond SPE cartridge packed with LiChrosorb RP-18 with 2 mL MeOH, 2 mL water and 1 mL MeOH. Make up 500 μL plasma to 3 mL with MeOH. Centrifuge at 1100 g for 15 min, add 1.5 mL supernatant to the SPE cartridge, elute at 50 μL/min flow-rate, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 200 × 4 7 μm Lichrosorb RP-18
Mobile phase: MeOH: pH 4.15 phosphate buffer 20:80
Flow rate: 1
Injection volume: 20
Detector: UV 262

CHROMATOGRAM
Retention time: 3.30
Internal standard: mercaptopurine

KEY WORDS
plasma; SPE; mercaptopurine is IS

SAMPLE
Matrix: blood
Sample preparation: 2 mL Blood + 120 μg dithiothreitol (to prevent oxidation of 6-mercaptopurine), centrifuge at 2000 g for 5 min. Cool plasma in ice, add a volume of ice-cold 50% trichloroacetic acid equal to 10% of the plasma volume, mix vigorously, keep on ice for 10 min, centrifuge at 2000 g for 10 min. Remove the supernatant and adjust the pH to 6-7 with 4 M KOH, inject a 460 μL aliquot.

HPLC VARIABLES
Column: Two 250 × 4.6 10 μm Spherisorb 10-ODS columns in series
Mobile phase: 50 mM pH 6.35 potassium phosphate buffer
Flow rate: 1.5
Injection volume: 460
Detector: UV 312

CHROMATOGRAM
Retention time: 9
Limit of detection: 3 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 25 μL 4 μg/mL 6-thioguanine in water + 100 μL 400 mM NaOH + 1 mL 0.3% phenylmercuric acetate in ethyl acetate + 3 mL diethyl ether, shake on a tumble mixer for 10 min, centrifuge for 5 min. Remove the organic layer and add it to 500 μL 100 mM HCl, whirlmix for 2 min, centrifuge for 5 min, discard the organic layer, evaporate traces of organic solvent under a stream of nitrogen at room temperature for 15 min, add 10 μL 3 mg/mL dithioerythritol in water, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 LiChrosorb 10 RP-18
Mobile phase: Isopropanol:water 3:97 containing 13.80 g/L $NaH_2PO_4.H_2O$, 200 μL/L 85% phosphoric acid, 60 mg/L dithioerythritol, and 500 mg/L sodium octanesulfonate, pH 3.6-3.7
Flow rate: 1.5
Detector: F ex 295 em 380 following post-column reaction. The column effluent mixed with 8 mM potassium chromate in 500 mM HCl pumped at 0.16 mL/min and with air flowing at 0.32 mL/min and the mixture flowed through a single mixing coil. The effluent from this coil mixed with 1.6% sodium metabisulfite pumped at 0.16 mL/min and this mixture flowed through a single mixing coil. The effluent from this coil mixed with 4 M ammonium hydroxide pumped

at 0.23 mL/min and this mixture flowed through a double mixing coil to a debubbler. The liquid effluent from the debubbler flowed to the detector.

CHROMATOGRAM
Retention time: 6
Internal standard: 6-thioguanine (8)
Limit of detection: <2 ng/mL

SAMPLE

Matrix: enzyme incubations

Sample preparation: To 237 μL enzyme incubation add 850 μL ice-cold 3.5 mM DL-dithiothreitol immediately followed by 500 μL 1.5 M sulfuric acid, place tubes on ice. Equilibrate tubes to room temperature, heat at 100° for 2 h. Cool, add 500 μL 3.4 M NaOH immediately followed by 8 mL toluene:amyl alcohol:phenyl mercury acetate mixture. Shake gently for 10 min, centrifuge at 10° at 900 g for 5 min. Transfer 6 mL toluene to another tube and add 200 μL 100 mM HCl. Vortex for four 20 s periods, centrifuge at 10° at 900 g for 5 min, inject a 50 μL aliquot of the aqueous layer. (Prepare toluene:amyl alcohol:phenyl mercury acetate mixture by adding enough phenyl mercury acetate to toluene containing 170 mM amyl alcohol so as to form a solution containing 1.3 mM phenyl mercury acetate, mix gently for 1 h, store in the dark (J.Chromatogr. 1992, 583, 83).)

HPLC VARIABLES

Guard column: 5 × 4 5 μm Resolve C18

Column: 100 × 8 5μm Resolve C18 radial compression

Mobile phase: MeOH:water 20:80 containing 100 mM triethylamine and 0.5 mM dithiothreitol, pH adjusted to 3.2 with orthophosphoric acid (Add dithiothreitol immediately prior to use.)

Flow rate: 1.5

SAMPLE
Matrix: blood
Sample preparation: Dilute plasma with water, prepare using a 1 mL C18 SPE cartridge.

HPLC VARIABLES
Column: 100 × 4.6 3 μm Hypersil C18
Mobile phase: MeOH:5 mM tetrabutylammonium dihydrogen phosphate 15:85
Detector: UV 296

CHROMATOGRAM
Limit of quantitation: 500 ng/mL

KEY WORDS
plasma; SPE; pharmacokinetics

SAMPLE
Matrix: blood, formulations, urine
Sample preparation: Dilute plasma 1:4, urine 1:10, and injections 1:100 with water, filter (0.6 μm), inject a 5-50 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 200 × 4 5 μm Nucleosil C18
Mobile phase: MeOH:10 mM pH 7.4 potassium phosphate buffer 18:82 (plasma, injections) or 25:75 (urine)
Flow rate: 1
Injection volume: 5-50
Detector: UV 296

CHROMATOGRAM
Limit of detection: 5 μg/mL (urine), 500 ng/mL (plasma)

KEY WORDS
plasma; injections; saline; pharmacokinetics

REFERENCE

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. Condition a Bond Elut C18 SPE cartridge. Add 100 μL plasma to the SPE cartridge, wash with 50 mM KH_2PO_4, elute with 800 μL eluent, inject an aliquot of the eluate. Urine. Dilute urine 1:10 with water, inject an aliquot directly. (Eluent was MeOH: 5 mM tetrabutylammonium dihydrogen phosphate 12:88.)

HPLC VARIABLES
Column: 100 × 4 3 μm Hypersil ODS
Mobile phase: MeOH:5 mM tetrabutylammonium dihydrogen phosphate 12:88 (plasma) or MeCN:10 mM pH 7.4 phosphate buffer 6:100 (urine)
Detector: UV 296

CHROMATOGRAM
Limit of detection: 60 ng/mL (plasma), 10 μg/mL (urine)

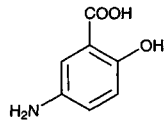
Mesalamine



Molecular formula: $C_7H_7NO_3$
Molecular weight: 153.14
CAS Registry No.: 89-57-6
Merck Index: 5964

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 4 mL MeOH, let stand for 15 min at 4°, centrifuge at 3000 g for 15 min. Remove 1 mL of the supernatant and add it to 1 mL water, mix, inject an aliquot.

HPLC VARIABLES
Column: 40 × 4.6 3 μm Hypersil
Mobile phase: MeOH:water:200 mM pH 6.5 potassium phosphate buffer 40:40:20 containing 4 mM hexadecyltrimethylammonium bromide
Column temperature: 34
Flow rate: 1.7
Injection volume: 20
Detector: F ex 315 em 470

CHROMATOGRAM
Retention time: 2.5

KEY WORDS
plasma

SAMPLE
Matrix: blood, feces, urine
Sample preparation: Plasma. 1 mL Plasma + 2 mL MeOH, vortex for 20 s, let stand for 15 min at -20° and 10 min at room temperature, mix, centrifuge at 2000 g for 15 min. Remove the supernatant and add it to 5 mL 1,1,1-trichloroethane, shake for 2 min, centrifuge at 2000 g for 15 min, inject a 20 μL aliquot of the supernatant. Urine. 1 mL Urine + 4 mL MeOH, mix, let stand at -20° for 15 min, centrifuge at 2000 g for 15 min. Dilute an aliquot of the supernatant with an equal volume of water, inject a 20 μL aliquot. Feces. Extract with 500-1000 mL MeOH, centrifuge at 10000 g for 4 min. Dilute an aliquot of the supernatant with an equal volume of water, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 40 × 4.6 3 μm Hypersil
Mobile phase: MeOH:water:200 mM pH 6.5 potassium phosphate buffer 40:40:20 containing 4 mM hexadecyltrimethylammonium bromide
Column temperature: 34
Flow rate: 1.7
Injection volume: 20

Detector: F ex 315 em 470

SAMPLE
Matrix: blood, urine
Sample preparation: Serum. Add disodium-3,5'-azo-bis-(6-hydroxybenzoate) to serum, treat with proteinase K (0.5 mg/mL protein) for 10 min, add tetrabutylammonium hydrogen sulfate buffered to pH 6.5, add dichloromethane, agitate for 30 min, centrifuge. Remove the organic layer and evaporate it to dryness, reconstitute the residue in mobile phase, inject an aliquot. Urine. Add 2,4-dihydroxybenzoic acid to urine, react with propionic anhydride for 5 min, add perchloric acid, add diethyl ether, shake for 10 min, freeze. Remove the organic layer and add it to pH 7.4 phosphate buffer, extract, inject an aliquot of the aqueous phase.

HPLC VARIABLES
Guard column: 30 × 4 30-40 μm Perisorb RP-18
Column: 250 × 4 10 μm Nucleosil C18
Mobile phase: MeOH:buffer 30:70 (Buffer was pH 7.4 phosphate buffer containing 20 mM tetrabutylammonium hydrogen sulfate.)
Detector: F ex 312 em 469

CHROMATOGRAM
Retention time: k' 2.4 (propionyl derivative)
Internal standard: disodium-3,5'-azo-bis-(6-hydroxybenzoate), 2,4-dihydroxybenzoic acid
Limit of quantitation: 6.1 μM urine, 0.4 μM (serum)

OTHER SUBSTANCES
Extracted: acetylaminosalicylic acid

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 205.2

James,C.A.; Rogers,H.J. Estimation of mesna and dimesna in plasma and urine by high-performance liquid chromatography with electrochemical detection, *J.Chromatogr.*, **1986**, *382*, 394–398.

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 100 μL Plasma + 25 μL 330 mM sulfuric acid + 25 μL 5% sodium hexametaphosphate + 10 μL 40 μg/mL p-aminobenzoic acid, make up to 200 μL, vortex for 2 s, centrifuge at 3400 g for 6 min, inject a 50-100 μL aliquot of the supernatant. Urine. Dilute 1:50 with water. 100 μL Diluted urine + 100 μL 150 μg/mL p-aminobenzoic acid in 1.25% sodium hexametaphosphate, vortex for 2 s, inject a 50 μL aliquot. (Reduce dimesna to mesna as follows. 100 μL Plasma or diluted urine + 100 μL 1% EDTA in buffer + 100 μL 1.06 M sodium borohydride in water, mix thoroughly, heat at 50° for 30 min, cool to room temperature, add 200 μL 1.74 M acetic acid, vortex for 20 s, centrifuge for 10 min, inject a 50-100 μL aliquot of the supernatant. Buffer was 50 mL 500 mM Na_2HPO_4 + 22 mL NaOH.)

HPLC VARIABLES

Guard column: Guard PAK C18 (Waters)
Column: 100 × 8 10 μm Resolve C18 (Waters)
Mobile phase: 100 mM Sodium citrate containing 1 mM tetrabutylammonium phosphate and 0.71 mM triethylamine, pH adjusted to 5 with 85% phosphoric acid
Flow rate: 2
Injection volume: 50-100
Detector: E, ESA Coulochem II model 5100, model 5011 analytical cell +450 mV, model 5021 conditioning cell +500 mV

CHROMATOGRAM

Retention time: 6.73
Internal standard: p-aminobenzoic acid (8.87)
Limit of quantitation: 1 μg/mL

OTHER SUBSTANCES

Simultaneous: acetaminophen, 5-fluorouracil, procarbazine, prochlorperazine
Noninterfering: aspirin, bleomycin, carboplatin, carmustine, chlorambucil, cyclophosphamide, cyclosporine A, cytarabine, doxorubicin, etoposide, hydrocortisone, ifosfamide, lomustine, methotrexate, mitomycin, mitoxantrone, teniposide, thiotepa, vincristine

KEY WORDS
plasma; pharmacokinetics

REFERENCE
el-Yazigi,A.; Yusuf,A.; Al-Rawithi,S. Liquid chromatographic analysis of mesna and dimesna in plasma and urine of patients treated with mesna, *Ther.Drug Monit.*, **1995**, *17*, 153–158.

SAMPLE
Matrix: formulations
Sample preparation: Dilute formulation with 15 μg/mL disodium EDTA solution to a mesna concentration of 3.2 μg/mL. Remove a 1 mL aliquot and add it to 300 μL reagent solution, let stand at room temperature for 20 min, add 500 μL 300 mM phosphoric acid solution, add 3 mL 4 μg/mL IS solution, make up to 10 mL with water, inject a 50 μL aliquot. (Prepare the reagent solution by dissolving 3.5 mg methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate in 10 mL THF, make up to 25 mL with pH 7.5 borate buffer. Prepare methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate as follows. Dissolve 5 g 6'-methoxy-2'-acetonaphthone in warm glacial acetic acid and add 2.5 g glyoxylic acid, reflux for 24 h, evaporate to dryness under reduced pressure. Take up the residue in chloroform and extract it three times with 5% sodium carbonate solution. Combine the aqueous layers and acidify them with concentrated HCl, collect the product by filtration, recrystallize from MeOH/water or acetic acid to give 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoic acid (mp 167-9°) (Farmaco, Ed. Sci. 1982, 37, 171). Reflux 0.5 g 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoic acid, 2.5 mL MeOH, and 2-3 drops sulfuric acid in 25 mL anhydrous benzene (Caution! Benzene is a carcinogen!) for 1 h, add 20 mL water, wash the organic layer with 10 mL 5% sodium bicarbonate solution, wash the organic layer with 20 mL water. Dry the organic layer over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, purify by flash chromatography on silica gel using ethyl acetate:light petroleum (bp 40-70°) 40:60 to give methyl 4-(6-methoxynaphthalen-2-yl)-4-oxo-2-butenoate as a pale yellow compound (mp 116-120°).)

HPLC VARIABLES
Column: 150 × 4 5 μm Spherisorb RP-8
Mobile phase: MeOH:50 mM pH 3.0 triethylammonium phosphate 53:47
Flow rate: 1
Injection volume: 50
Detector: F ex 310 em 450

CHROMATOGRAM
Retention time: 6
Internal standard: 4-(6-methoxynaphthalen-2-yl)-4-oxobutanoic acid (8)

OTHER SUBSTANCES
Simultaneous: acetylcysteine, cysteamine, cysteine, glutathione, homocysteine
Noninterfering: bacitracin, biotin, calcium pantothenate, cystine, glycine, magnesium oxide, neomycin, starch, threonine, vitamin E, pyridoxine, riboflavin phosphate

KEY WORDS
solutions; derivatization

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 0.5-2 mL Plasma + 10-1000 ng maprotiline in water + 2 mL pH 10 phosphate buffer + 6 mL diethyl ether:hexane 50:50, shake for 15 min, centrifuge at 3750 g for 5 min. Remove the organic phase and add it to 2 mL 250 mM sulfuric acid, shake for 10 min, centrifuge for 5 min, discard the organic layer. Adjust the pH of the aqueous phase to 9.5-10.5 with 500 mM NaOH containing 1 M K_2HPO_4, add 6 mL diethyl ether:hexane 50:50, shake for 10 min, centrifuge for 10 min. Remove the organic layer and evaporate it to dryness under vacuum and a stream of nitrogen at 45°, reconstitute the residue in 100 μL 100 mM sodium carbonate, add 10 μL 1% dansyl chloride in acetone, vortex for 20-30 s, heat at 45° for 30 min. Evaporate the solvent, reconstitute in 100 μL mobile phase, inject a 10-50 μL aliquot. Urine. 0.5-2 mL Urine + 10-1000 ng maprotiline in water + 2 mL pH 10 phosphate buffer + 6 mL diethyl ether:hexane 50:50, shake for 15 min, centrifuge at 3750 g for 5 min. Remove the organic phase and evaporate it to dryness under vacuum and a stream of nitrogen at 45°, reconstitute the residue in 100 μL 100 mM sodium carbonate, add 10 μL 1% dansyl chloride in acetone, vortex for 20-30 s, heat at 45° for 30 min. Evaporate the solvent, reconstitute in 100 μL mobile phase, inject a 10-50 μL aliquot.

HPLC VARIABLES

Column: 125 × 4 5 μm LiChrosorb RP-18
Mobile phase: MeCN:water 65:35
Flow rate: 2
Injection volume: 10-50

Detector: F ex 248 em 470

CHROMATOGRAM
Retention time: 16.2
Internal standard: maprotiline (18.5)
Limit of detection: 1 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; derivatization; pharmacokinetics

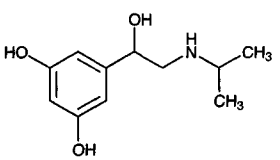
Metaproterenol



Molecular formula: $C_{11}H_{17}NO_3$
Molecular weight: 211.26
CAS Registry No.: 586-06-1, 5874-97-5 (sulfate)
Merck Index: 5992
Lednicer No.: 1 64

SAMPLE
Matrix: blood

Sample preparation: Condition a Bond-Elut C18 SPE cartridge with MeCN and water. 1 mL Plasma + 100 μL 2 μg/mL terbutaline sulfate + 1 mL 20 mM pH 9.0 Na_2HPO_4, mix, add to the SPE cartridge, wash with 5 column volumes of water, dry the SPE cartridge for 5 min, wash with 3 mL dichloromethane:n-butanol 97:3, elute with two 1 mL portions of 0.09% HCl in MeCN, evaporate the eluate to dryness under a stream of nitrogen at 37°, dissolve the residue in 300 μL mobile phase, inject a 200 μL aliquot. (To hydrolyze 3-O-metaproterenol sulfate mix 1 mL plasma and 200 μL 2 μg/mL terbutaline sulfate, add 1 mL 6% trichloroacetic acid, vortex, centrifuge at 1000 g for 15 min. Remove the supernatant and add it to 200 μL 2 M HCl, heat at 65° for 90 min, cool, adjust pH to 10 with 400 μL 2 M carbonate buffer, proceed as above.)

HPLC VARIABLES

Column: 250 × 4.9 5 μm Spherisorb C8
Mobile phase: MeCN:buffer:water 4:1.5:94.5
Flow rate: 1.8
Injection volume: 200
Detector: F ex 200 em 300 (cut-off filter)

CHROMATOGRAM

Retention time: 6.9
Internal standard: terbutaline (14.8)
Limit of quantitation: 0.5 ng/mL

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 4.15

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of

the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 231

CHROMATOGRAM

Retention time: 3.41
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 500 μL Plasma + 200 μL 30 μg/mL 1-propylbiguanide sulfate in 1.2 mM trichloroacetic acid, vortex for 5 s, let stand for 10 min, centrifuge at 5000 g for 5 min, inject a 100 μL aliquot of the supernatant. Urine. Dilute urine with water, if necessary. 500

μL Urine + 200 μL 30 μg/mL 1-propylbiguanide sulfate in water, vortex for 5 s, let stand for 10 min, centrifuge at 5000 g for 5 min, inject a 100 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 250 × 4.6 Partisil-10 SCX
Mobile phase: 30 mM $(NH_4)H_2PO_4$ adjusted to pH 2.4 with orthophosphoric acid
Column temperature: 50
Flow rate: 3
Injection volume: 100
Detector: UV 230

CHROMATOGRAM

Retention time: 8
Internal standard: 1-propylbiguanide sulfate (Synthesis of 1-propylbiguanide is as follows. Heat 9 g propylamine, 7.5 g cyanoguanidine, 11.6 g copper sulfate pentahydrate, 75 mL water in a sealed tube at 100° for 12 h, cool, dilute with 350 mL water, heat to 80°, pass a stream, of hydrogen sulfide (Caution! Highly toxic!) through the solution to precipitate copper salts, filter. Evaporate the filtrate under reduced pressure at 100°. Recrystallize the product from hot EtOH and dry it at 100°, mp 194-6°.) (10)
Limit of detection: 50-100 ng/mL

OTHER SUBSTANCES

Noninterfering: acetaminophen, albuterol, allopurinol, amiloride, amitriptyline, ampicillin, amobarbital, aspirin, caffeine, carbamazepine, chlorpropamide, chlorothiazide, clonidine, danthron, dextropropoxyphene, diazepam, digoxin, dioctyl sodium sulfosuccinate, doxepin, ephedrine, ethylestranol, furosemide, glyburide (glibenclamide), hydrochlorothiazide, insulin, isosorbide dinitrate, methyclothiazide, methyldopa, metoprolol, nitrazepam, nitroglycerin, nortriptyline, oxazepam, phenylbutazone, phenytoin, pindolol, prazosin, prochlorperazine, propoxyphene, propranolol, quinine, sodium chromoglycate, sulfamethoxazole, theophylline, thyroxine, tolbutamide, trimethoprim, verapamil, vitamin B, warfarin

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 250 μL water + 1 mL bromothymol blue solution + 50 μL 2 μg/mL propyl biguanide in water, vortex briefly, adjust pH to 7.6-7.8 with a few drops of 0.1% orthophosphoric acid, add 5 mL diethyl ether:dichloromethane 2:1, vortex for 1 min, centrifuge at 2000 g for 5 min. Remove 4 mL of the upper organic phase and add it to 100 μL 0.1% tetrabutylammonium hydroxide adjusted to pH 7 with 0.1% orthophosphoric acid, vortex for 1 min, centrifuge at 2000 g for 5 min. Discard the organic phase, heat the aqueous phase at 70-90° for 10 min, inject a 25 μL aliquot of the aqueous phase. Urine. 20 μL Urine + 2 mL bromothymol blue solution + 100 μL 20 μg/mL propyl biguanide in water, vortex briefly, adjust pH to 7.6-7.8 with a few drops of 0.1% orthophosphoric acid, add 5 mL diethyl ether: dichloromethane 2:1, vortex for 1 min, centrifuge at 2000 g for 5 min. Remove 4 mL of the upper organic phase and add it to 100 μL 1% tetrabutylammonium hydroxide adjusted to pH 7 with 0.1% orthophosphoric acid, vortex for 1 min, centrifuge at 2000 g for 5 min. Discard the organic phase, heat the aqueous phase at 70-90° for 10 min, inject a 25 μL aliquot of the aqueous phase. (Bromothymol blue solution was 1.48 g bromothymol blue in 20 mL 200 mM NaOH, make up to 200 mL with water, let stand at room temperature with occasional mixing for 2 days before use.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Spherisorb ODS 2
Mobile phase: MeCN:buffer 8:92 adjusted to pH 4.0 with orthophosphoric acid (Buffer was 50 mM K_2HPO_4 containing 3 mM heptanesulfonic acid.)
Flow rate: 1
Injection volume: 25

Detector: UV 234

CHROMATOGRAM

Retention time: 3.3

Internal standard: propyl biguanide (Synthesis of 1-propylbiguanide is as follows. Heat 9 g propylamine, 7.5 g cyanoguanidine, 11.6 g copper sulfate pentahydrate, 75 mL water in a sealed tube at 100° for 12 h, cool, dilute with 350 mL water, heat to 80°, pass a stream, of hydrogen sulfide (Caution! Highly toxic!) through the solution to precipitate copper salts, filter. Evaporate the filtrate under reduced pressure at 100°. SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 233.4

SAMPLE

Matrix: blood
Sample preparation: 900 μL Plasma + 100 μL 10 μg/mL difenoxin in mobile phase, add to a C18 Sep Pak SPE cartridge at 1 mL/min, wash with 4 mL MeCN:buffer 10:90 at 1 mL/min, elute with 4 mL MeCN:buffer 40:60 at 5 mL/min, inject a 100 μL aliquot of the eluate. (Buffer was 0.08% diethylamine in water adjusted to pH 2.3 with orthophosphoric acid.)

HPLC VARIABLES

Guard column: C18
Column: 150 × 4.6 30 μm Ultracarb ODS (Phenomenex)
Mobile phase: MeCN:buffer 25:75 (Buffer was 0.08% diethylamine in water adjusted to pH 2.3 with orthophosphoric acid.)
Column temperature: 28
Flow rate: 1.5
Injection volume: 100
Detector: UV 210

CHROMATOGRAM

Retention time: 18
Internal standard: difenoxin (32)
Limit of detection: 0.25 ng

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma; SPE; rat

REFERENCE

Pierce,T.L.; Murray,A.G.W.; Hope,W. Determination of methadone and its metabolites by high performance liquid chromatography following solid-phase extraction in rat plasma, *J.Chromatogr.Sci.*, **1992**, *30*, 443–447.

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 1 mL 160 nM dextropropoxyphene in 1 M sodium carbonate + 6 mL n-hexane, shake horizontally for 15 min, centrifuge at 1300 g for 5 min, freeze in dry ice/acetone for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 100 μL mobile phase, inject a 10-80 μL aliquot.

HPLC VARIABLES

Guard column: reversed-phase (Chrompack)
Column: 100 × 3 5 μm Spherisorb CN + 100 × 4 Chiralcel-AGP (in series)
Mobile phase: MeCN:10 mM pH 5.0 sodium phosphate buffer:dimethyloctylamine 10:90:0.05
Flow rate: 0.9
Injection volume: 10-80
Detector: UV 200

CHROMATOGRAM

Retention time: 18.5 (R-(-)), 21.1 (S-(+))
Internal standard: dextropropoxyphene (15.2)
Limit of quantitation: 1.7 ng/mL

OTHER SUBSTANCES

Noninterfering: benzodiazepines, carbamazepine, ketobemidone, morphine, piroxicam, tenoxicam, valproic acid

KEY WORDS
serum; chiral; pharmacokinetics

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 μL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 μL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES
Guard column: LC-8-DB (Supelco)
Column: 150 × 4.6 LC-8-DB (Supelco)
Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 2
Injection volume: 100
Detector: UV 228

CHROMATOGRAM
Retention time: 5.4
Internal standard: protriptyline (4)

OTHER SUBSTANCES
Extracted: acetazolamide, chlordiazepoxide, chlorimipramine, chlorpromazine, desipramine, dextromethorphan, diazepam, diphenhydramine, doxepin, encainide, fentanyl, flecainide, fluoxetine, flurazepam, haloperidol, hydroxyethylflurazepam, ibuprofen, imipramine, lidocaine, maprotiline, methaqualone, mexiletine, midazolam, norchlorimipramine, nordoxepin, nortriptyline, norverapamil, pentazocine, promazine, propafenone, propranolol, protriptyline, quinidine, trazodone, trimipramine, verapamil
Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin
Interfering: amitriptyline, nordiazepam, norfluoxetine, propoxyphene, temazepam

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 261

CHROMATOGRAM

Retention time: 7.53
Limit of detection: <120 ng/mL

KEY WORDS

whole blood; plasma; interferences may occur–compounds (all of which are extracted) elute in this order tenoxicam; iproniazid; methocarbamol; methotrexate; caffeine; nialamide; colchicine; cytarabine; benzoylecgonine; acetaminophen; diazoxide; dacarbazine; sulfinpyrazole; flumazenil; sulpride; morphine; atenolol; toloxatone; terbutaline; albuterol; phenobarbital; ranitidine; tiapride; phenol; chlormezanone; aspirin; metformin; ritodrine; codeine; sultopride; amisulpride; naltrexone; lisinopril; benzocaine; nizatidine; nalorphine; mephenesin; naloxone; sotalol; carteolol; procainamide; carbamazepine; bromazepam; nalbuphine; nadolol; procarbazine; dihydralazine; omeprazole; strychnine; acebutolol; glutethimide; chlorpropamide; glipizide; triazolam; prazosin; flunitrazepam; clonazepam; metoclopramide; melphalan; estazolam; tolbutamide; ephedrine; clonidine; pindolol; clobazam; minoxidil; disopyramide; nitrazepam; dextromethorphan; tofisopam; zopiclone; debrisoquine; sulindac; alprazolam; cycloguanil; lorazepam; methaqualone; ketamine; piroxicam; metoprolol; nifedipine; quinine; mephentermine; prilocaine; pentazocine; oxazepam; tiaprofenic acid; quinidine; celiprolol; ajmaline; yohimbine; lidocaine; secobarbital; viloxazine; mepivacaine; meperidine; doxylamine; labetalol; temazepam; amodiaquine; benperidol; droperidol; hydroxychloroquine; zolpidem; ketoprofen; alminoprofen; cicletanine; moclobemide; chloroquine; cocaine; timolol; nomifensine; ticlopidine; acenocoumarol; vindesine; mexiletine; dipyridamole; trazodone; pipamperone; pyrimethamine; benazepril; vincristine; metapramine; chlordiazepoxide; oxprenolol; warfarin; clorazepate; flecainide; phencyclidine; thiopental; fenfluramine; metipranolol; triprolidine; naproxen; buprenorphine; verapamil; buspirone; tianeptine; midazolam; bupivacaine; carbinoxamine; loprazolam; cetirizine; chlorpheniramine; moperone; cibenzoline; medifoxamine; astemizole; vinblastine; nicardipine; bisoprolol; diltiazem; glibornuride; reserpine; aconitine; nitrendipine; diazepam; mianserin; ramipril; haloperidol; tetracaine; alprenolol; acepromethazine; glibenclamide; chlorophenacinone; doxepin; nimodipine; diphenhydramine; cyclizine; histapyrrodine; phenylbutazone; demexiptiline; clozapine; proguanil; trifluperidol; medazepam; cyamemazine; bumadizone; suriclone; propranolol; acepromazine; dothiepin; dextromoramide; fenoprofen; dextropropoxyphene; loxapine; betaxolol; propafenone; promethazine; thioproperazine; methadone; amoxapine; quinupramine; opipramol; cyproheptadine; brompheniramine; mefenidramine; protriptyline; flurbiprofen; tetrazepam; zorubicin; prazepam; alimemazine; loperamide; imipramine; desipramine; levomepromazine; hydroxyzine; niflumic acid; penbutolol; fluvoxamine; pimozide; daunorubicin; indomethacin; maprotiline; tropatenine; etodolac; fluoxetine; amitriptyline; nortriptyline; tioclomarol; diclofenac; mefloquine; trimipramine; chlorambucil; lidoflazine; ibuprofen; floctafenine; alpidem; loratadine; chlorpromazine; clomipramine; carpipramine; thioridazine; fentiazac; clemastine; mefenamic acid; fluphenazine; prochlorperazine; penfluridol; bepridil; terfenadine; trifluoperazine

SAMPLE

Matrix: blood

Sample preparation: Condition a 3 mL Bond Elut Certify SPE cartridge with 2 mL MeOH and 2 mL 100 mM pH 6.0 phosphate buffer, do not allow to dry. 1 mL Blood + 6 mL 100 mM pH 6.0 phosphate buffer, vortex, sonicate, centrifuge, add the supernatant to the SPE cartridge, wash with water, wash with 1 mM pH 3.3 acetic acid, dry by suction, wash with 2 mL acetone: chloroform 50:50, elute with 3 mL ethyl acetate:ammonia 98:2. Evaporate the eluate under a stream of nitrogen at 40°, reconstitute the residue in 50 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 150 × 3.9 4 μm Nova-Pack C18
Mobile phase: MeOH:50 mM ammonium acetate 75:25 (Mix column effluent with 50 mM ammonium acetate pumped at 0.5 mL/min.)
Flow rate: 0.6
Injection volume: 10
Detector: MS, Finnigan MAT TSQ 700 tandem quadrupole, MAT TSP-2 interface, thermospray, selective reaction monitoring m/z 310-265, collision offset -10 V, repeller 100 V, vaporizer 130°, source 200°, filament on 200 μA, argon 2.5 mTorr, multiplier 1500 V, dynode 15 kV, scan time 1.20 s, MSMSC factor 10

CHROMATOGRAM

Retention time: 7.45
Limit of detection: 50 pg

OTHER SUBSTANCES

Extracted: benperidol, dextromoramide, droperidol, haloperidol, penfluridol, pimozide, pipamperidone, propoxyphene (dextropropoxyphene)

KEY WORDS

SPE; LC/MS

SAMPLE

Matrix: blood, CSF
Sample preparation: 200 μL Serum, plasma, or CSF + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, elute the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine hydrochloride and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 30 × 2.1 40 μm preparative grade C18 (Analytichem); B 250 × 4.6 10 μm Partisil C8
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 15 min, maintain at 30:70 for 4 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 280 for 5 min then UV 254

CHROMATOGRAM

Retention time: 8.10
Internal standard: heptanophenone (19.2)

OTHER SUBSTANCES

Extracted: acetazolamide, ampicillin, bromazepam, caffeine, carbamazepine, chloramphenicol, chlorothiazide, diazepam, droperidol, ethionamide, furosemide, isoniazid, penicillin G, phenobarbital, phenytoin, prazepam, propoxyphene, pyrazinamide, rifampin, trimeprazine, trimethoprim

KEY WORDS
plasma; serum; column-switching

SAMPLE
Matrix: blood, tissue
Sample preparation: 2 mL Blood or 250 mg liver (homogenized with 3 parts water) or 500 mg brain (homogenized with 3 parts water) + 2 μg SKF-525-A + 1.5 mL pH 9.5 ammonium carbonate/ammonium hydroxide buffer + 10 mL hexane:isopropanol 99:1, rotate at 10 rpm for 10 min, centrifuge at 3500 rpm for 10 min. Remove the organic layer and add it to 2.5 mL 0.25 M sulfuric acid, rotate for 5 min, centrifuge at 1500 rpm for 5 min. Remove the aqueous layer and add concentrated ammonium hydroxide to make the pH 9.5, add 1.5 mL chloroform, vortex for 15 s, centrifuge at 1500 rpm for 5 min. Remove the organic layer and add 1 drop of 1% HCl in MeOH, evaporate to dryness at 50° under vacuum, reconstitute with 200 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: 30 × 2.1 Whatman C18 pellicular
Column: 250 × 4.6 Spherisorb S-5-ODS
Mobile phase: MeCN:MeOH:buffer 48:4:48 (Buffer was 1980 mL water + 20 mL 85% phosphoric acid + 3.7 mL methanesulfonic acid adjusted to pH 3.0 with 5 M NaOH.)
Column temperature: 60
Flow rate: 2
Injection volume: 100
Detector: UV 220

CHROMATOGRAM
Retention time: 9.8
Internal standard: SKF-525-A (11.2)
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES
Simultaneous: norpropoxyphene, propoxyphene, diazepam, N-desmethyldiazepam

KEY WORDS
liver; brain

REFERENCE

SAMPLE
Matrix: blood, tissue
Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18

Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM
Retention time: 11.16
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES
Simultaneous: amitriptyline, amoxapine, benztropine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, tranylcypromine, trazodone, trihexyphenidyl, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine
Interfering: brompheniramine

KEY WORDS
serum; whole blood; liver

SAMPLE
Matrix: blood, urine
Sample preparation: Serum. Mix 100 μL serum with 100 μL. 10 μg/mL estazolam in EtOH. Add 300μL 10% anhydrous sodium carbonate in water, 4 mL hexane, and 500 μL 2-propanol. Vortex for 2 min. Centrifuge at 1500 g for 10 min and evaporate the upper organic layer to dryness under a stream of nitrogen at room temperature. Add 100 μL mobile phase, vortex for 30 s, centrifuge at 3000 g or filter (0.22 μm). Inject a 50 μL aliquot. Urine. Mix 100 μL urine with 50 μL. 10 μg/mL estazolam in EtOH. Add 300μL 10% anhydrous sodium carbonate in water and 4 mL hexane. Vortex for 2 min. Centrifuge at 1500 g for 10 min and evaporate the upper organic layer to dryness under a stream of nitrogen at room temperature. Add 100 μL mobile phase, vortex for 30 s. Inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 10 × 3.2 5 μm Cyclobond I-200 RSP
Column: 250 × 4.6 5 μm Cyclobond I-200 RSP
Mobile phase: MeCN:buffer:water 19:8:73 (Prepare buffer by adding 1 mL triethylamine to 70 mL water, adjusting the pH to 4.5 with glacial acetic acid, and making up to 100 mL with water.)
Flow rate: 0.4
Injection volume: 50
Detector: UV 210

CHROMATOGRAM
Retention time: 15.5 (R-(-)), 17 (S-(+))
Internal standard: estazolam (22)
Limit of detection: 1 ng/mL
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: amphetamine, benzoylecgonine, caffeine, clonazepam, cocaine, codeine, dextropropoxyphene, diamorphine, diazepam, dionine, lorazepam, morphine, monoacetylmorphine, nalorphine, narcotine, nitrazepam, oxazepam, theophylline

Noninterfering: aspirin, barbiturates, clomipramine, imipramine, phenytoin, salicylic acid, valproic acid

KEY WORDS
serum; chiral

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 15.753

KEY WORDS
whole blood

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica

Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM
Retention time: 2.9

OTHER SUBSTANCES
Simultaneous: metabolites
Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

SAMPLE
Matrix: solutions
Sample preparation: Prepare a solution in mobile phase, inject a 40 μL aliquot.

HPLC VARIABLES
Guard column: Pelliguard LC-CN (Supelco)
Column: 150 × 4.6 5 μm Supelcosil LC-PCN
Mobile phase: MeCN:MeOH:10 mM pH 7.0 phosphate buffer 58:14:28
Flow rate: 1.2
Injection volume: 40

Detector: UV 254

CHROMATOGRAM
Retention time: 11.0
Internal standard: N-propionylprocainamide (6)

OTHER SUBSTANCES
Simultaneous: amitriptyline, atropine, butalbital, chlorpromazine, desipramine, desmethylmaprotiline, doxepin, imipramine, maprotiline, norpropoxyphene, nortriptyline, phenylpropanolamine, procainamide, prochlorperazine, promethazine, propranolol, protriptyline, quinidine, trifluoperazine, trimeprazine, trimipramine
Noninterfering: acetaminophen, allopurinol, amikacin, amoxapine, amytal, bretylium, caffeine, carbamazepine, carisoprodol, chloramphenicol, chlordiazepoxide, chlorpropamide, clonazepam, codeine, diazepam, disopyramide, droperidol, ethinamate, ethinamate, ethosuximide, fluphenazine, flurazepam, furosemide, gentamicin, haloperidol, hydrochlorothiazide, hydroxyzine, ibuprofen, kanamycin, lidocaine, loxapine, meperidine, mephobarbital, meprobamate, methaqualone, methotrexate, morphine, nafcillin, naloxone, neomycin, perphenazine, phenacetin, phenobarbital, phenytoin, prazepam, primidone, procaine, propoxyphene, reserpine, salicylamide, salicylic acid, secobarbital, spironolactone, theophylline, thiopental, thioridazine, tobramycin, valproic acid, verapamil

SAMPLE
Matrix: urine
Sample preparation: 500 μL Urine + N-ethylnordiazepam + chlorpheniramine + 100 μL buffer, centrifuge at 11000 g for 30 s, inject a 500 μL aliquot onto column A with mobile phase A, after

0.6 min backflush column A with mobile phase A to waste for 1.6 min, elute column A with 250 μL mobile phase B, with 200 μL mobile phase C, and with 1.15 mL mobile phase D. Elute column A to waste until drugs start to emerge then elute onto column B. Elute column B to waste until drugs started to emerge, then elute onto column C. When all the drugs have emerged from column B remove it from the circuit, elute column C with mobile phase D, monitor the effluent from column C. Flush column A with 7 mL mobile phase E, with mobile phase D, and mobile phase A. Flush column B with 5 mL mobile phase E then with mobile phase D. (Buffer was 6 M ammonium acetate adjusted to pH 8.0 with 2 M KOH.)

HPLC VARIABLES

Column: A 10 × 2.1 12-20 μm PRP-1 spherical poly(styrene-divinylbenzene) (Hamilton); B 10 × 3.2 11 μm Aminex A-28 (Bio-Rad); C 25 × 3.2 5 μm C8 (Phenomenex) + 150 × 4.6 5 μm silica (Macherey-Nagel)

Mobile phase: A 0.1% pH 8.0 potassium borate buffer; B 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid; C MeCN:buffer 40:60 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); D MeCN:buffer 33:67 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); E MeCN:buffer 70:30 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.)

Column temperature: ambient (column A), 40 (columns B and C)

Flow rate: A 5; B-E 1

Injection volume: 500

Detector: UV 210, UV 235

CHROMATOGRAM

Retention time: k' 3.8

Internal standard: N-ethylnordiazepam (k' 2.1), chlorpheniramine (k' 5.9)

Limit of detection: 300 ng/mL

OTHER SUBSTANCES

Extracted: caffeine, cotinine, benzoylecgonine, secobarbital, oxazepam, phenobarbital, nordiazepam, diazepam, phenylpropanolamine, phentermine, amphetamine, phenmetrazine, lidocaine, ephedrine, pentazocine, methamphetamine, desipramine, nortriptyline, diphenhydramine, imipramine, flurazepam, amitriptyline, morphine, codeine, hydromorphone, hydrocodone

Sample preparation: 100 μL Serum + 50 μL 100 ng/mL aniline sulfate in water + 200 μL 20 mM pH 10.6 carbonate buffer + 2 mL ethyl acetate, shake for 15 min, centrifuge at 1200 g for 5 min. Remove the organic layer and add it to 200 μL 50 mM HCl, shake for 15 min, centrifuge at 1200 g for 5 min. Remove the aqueous layer and add it to 40 μL 250 mM NaOH, add 50 μL 330 mM pH 7.8 phosphate buffer, add 250 μL MeCN, add 25 μL 1 mM (-)-1-(9-fluorenyl)ethyl chloroformate in acetone, let stand overnight at room temperature, add 30 μL 100 mM glycine in water, add 750 μL n-pentane, vortex for 2 min, centrifuge at 1200 g for 5 min. Remove the organic layer and evaporate it to dryness under vacuum, reconstitute the residue in MeCN: water 50:50, inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: Direct-Connect column prefilter (Alltech)

Column: 150 × 4.6 3 μm Adsorbosphere HS C18 (Alltech)
Mobile phase: MeCN:THF:20 mM pH 3.6 acetate buffer 39:15:46
Flow rate: 1
Injection volume: 100
Detector: F ex 265 em 330

CHROMATOGRAM
Retention time: 27.7 (R), 29.0 (S)
Internal standard: aniline (21.0)
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES
Extracted: amphetamine

SAMPLE
Matrix: bulk

Sample preparation: Dissolve 10 μmole compound (as free base or hydrochloride) in 500 μL MeCN, add 250 μL 5% sodium carbonate (for hydrochlorides only), add 500 μL 100 mM reagent in MeCN, vortex for 1 min, heat at 60° for 2 h, add 100 μmole L-proline, heat at 60° for 30 min. Remove a 100 μL aliquot and dilute it with mobile phase, neutralize with acetic acid, inject a 10 μL aliquot. Prepare the reagent ((R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate) as follows. Add 0.7 mL carbon disulfide to 6 mL (1R,2R)-(-)-1,2-diaminocyclohexane, 12 mL water, and 12 mL EtOH, heat the oil bath to 80°, add 2.8 mL carbon disulfide dropwise (making sure that the product does not start to precipitate), when addition is complete reflux for 1 h, acidify with 500 μL 5 M HCl, reflux for 12 h, cool, filter, wash the solid with a little cold EtOH to give trans-4,5-tetramethyleneimidazolidine-2-thione as a white fluffy solid (mp 148-150°) (Tetrahedron 1993, 49, 4419). Stir 7.97 g 3,5-dinitrobenzoyl chloride in 30 mL dichloroethane at 50°, add a solution of 6 g trans-4,5-tetramethyleneimidazolidine-2-thione in 120 mL dichloroethane containing a catalytic amount of 4-(dimethylamino)pyridine over 15 min, reflux for 2 h, remove the crystals of (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate by filtration, evaporate the filtrate to dryness and dissolve the residue in 60 mL dichloroethane, reflux for 16 h to obtain more (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate (mp >250°, $[\alpha]_{546}$ = -133° (c = 1) in MeCN).

HPLC VARIABLES

SAMPLE

Matrix: solutions
Sample preparation: 2 mL THF + 1 mL 33.5 mM reagent in THF (freshly prepared) + 1 mL 1 mg/mL amphetamine in water + 700 μL 10% sodium bicarbonate in water, heat at 65° for 1 h, cool, extract three times with 10 mL aliquots of chloroform. Combine the extracts and wash them with 10 mL water, dry over anhydrous magnesium sulfate, evaporate to dryness, reconstitute with 2.5 mL mobile phase, inject a 5 μL aliquot. (Prepare reagent (1-[(4-nitrophenyl)sulfonyl]prolyl chloride) as follows. Mix 40-45 mmoles L-(-)-proline, 40 mL THF, and 200 mL 10% potassium carbonate, add 37-43 mmoles 4-nitrobenzenesulfonyl chloride in 40 mL THF dropwise, heat at 50° and maintain at pH 8 or above for 3 h, cool, acidify to pH 2, extract with chloroform. Extract the organic layers with potassium carbonate in water. Acidify the aqueous layer and extract it with chloroform. Dry the chloroform layer and evaporate it to dryness, recrystallize the resulting 1-[(4-nitrophenyl)sulfonyl]proline from petroleum ether and benzene (Caution! Benzene is a carcinogen!). Stir 15 mmoles 1-[(4-nitrophenyl)sulfonyl]proline in 100 mL benzene and add 75 mmoles thionyl chloride in 50 mL benzene dropwise, heat at 35-40° until the reaction is complete (about 48 h; monitor by IR), evaporate to dryness, recrystallize from n-heptane to give 1-[(4-nitrophenyl)sulfonyl]prolyl chloride (Anal.Chem. 1984, 56, 958) (mp 110-110.5°).)

SAMPLE

Matrix: solutions

Sample preparation: Prepare a 500 μg/mL solution in MeOH:water 50:50, inject a 5 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Zorbax C8

Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L MeCN:water 20:80. A:B from 100:0 to 0:100 over 30 min. (Purify triethylamine as follows. Wash neutral alumina (Merck) 3 times with 2 bed volumes of pentane, 3 times with 2 bed volumes of dichloromethane, and 3 times with 2 bed volumes of MeOH, allow solvent to evaporate in a fume hood overnight, heat alumina at 130° for 2 h. Prepare a 14 cm column of the washed alumina in a 290 × 22 tube, pass through a head volume of MeOH, pass through triethylamine. When triethylamine starts to elute discard the first 20 mL, use the next 20 mL, discard the column.)

Flow rate: 2

Injection volume: 5

Detector: UV 210

CHROMATOGRAM

Retention time: 10

OTHER SUBSTANCES
Simultaneous: acetophenone, amphetamine, desipramine, ethylmorphine, imipramine, mefenamic acid, morphine, phenylbutazone, salicylic acid

KEY WORDS
also details of isocratic elution

REFERENCE

SAMPLE
Matrix: solutions
Sample preparation: Mix 50 μL of a 200 ppm solution in MeCN:500 mM pH 9.0 borate buffer 50:50 with 25 mg reagent, after 1 min elute with 1 mL hexane:THF 75:25, inject a 5 μL aliquot. (Reagent was dinitrophenyl carbamate benzotriazole polymeric reagent, synthesized as follows. (Caution! Chloroform, dichloromethane, dioxane, and hydrazine are carcinogenic in experimental animals! DMF may be carcinogenic! 3,5-dinitrobenzoyl chloride and aluminum chloride are corrosive! Nitrobenzene is toxic!) 10 g Dried macroporous polystyrene (Xe-305, Rohm and Haas) + 10 g 3-nitro-4-chlorobenzyl alcohol + 10 g anhydrous aluminum chloride + 50 mL nitrobenzene, heat at 65-70° for 3 days, cool, filter, wash polymer with three 50 mL portions of 1 M HCl in dioxane, with three 50 mL portions of DMF,with three 50 mL portions of MeOH, and with three 50 mL portions of dichloromethane, dry under vacuum at 100°. Reflux 19 g of this polymer in 60 mL hydrazine hydrate:ethylene glycol monoethyl ether 40:60 for 20 h, cool to room temperature, filter off the polymer and wash it thoroughly with water. Suspend the polymer in 100 mL concentrated HCl:dioxane 50:50, reflux for 20 h, filter the polymer and wash it with five 100 mL portions of water, with three 100 mL portions of MeOH, and with three 50 mL portions of ether, dry under vacuum at 80°. Functionalization was 1.17 mmoles/g (Eur.J.Biochem. 1975, 59, 55). Dissolve 3,5-dinitrobenzoyl chloride in the minimum amount of glacial acetic acid, add an equimolar amount of sodium azide, stir for 30 min, dilute with water, filter to obtain 3,5-dinitrobenzoyl azide (Caution! Azides are toxic and potentially explosive!) (J. Liq. Chromatogr. 1986,9, 443). Heat 71 mg 3,5-dinitrobenzoyl azide in 15 mL toluene (dried over calcium hydride) at ??? for 30 min, cool using an ice bath, add 200 mg polymer, allow to warm to room temperature with stirring for 1 h, filter, wash the polymer with four 10 mL portions of warm (40°) dichloromethane, dry under high vacuum for 1 h.)

SAMPLE

Matrix: urine
Sample preparation: 5 mL Urine + 4.5 mL MeCN + 500 μL 1 M KOH, centrifuge at 2500 rpm for 10 min, filter (45 μm) the supernatant. Inject on to column A at 180 μL/min 25 μL 50 mM KOH in MeCN:water 20:80, 50 μL filtrate, 25 μL 50 mM KOH in MeCN:water 20:80, and 200 μL MeCN:water 20:80, backflush the contents of column A on to column B with mobile phase, after 18 s remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Wash column A with 400 μL MeCN.

HPLC VARIABLES

Column: A 20 × 2 polymeric reagent; B 250 × 4.6 5 μm Supelcosil LC-18-DB (with a guard column) (Prepare polymeric reagent as follows. Prepare a porous rigid resin using a divinylbenzene:ethylstyrene:styrene 24:6:70 mixture with trimethylsilyl modified silica (102 Å average pore size, 1.08 mL/g pore volume, 366 m^2/g surface area, 16-20 μm irregular particle shape, IMPAQ RG 1020 Si silica, PQ Co., Valley Forge PA). Further preparation details are not given but a typical procedure given in the cited reference is as follows. Aerate a mixture of 10 g modified silica in 100 mL water with nitrogen for 15 min, add 10 mL styrene:80% divinylbenzene:t-butyl peroxybenzoate 49:49:2 (remove preservative by passing through a butylcatechol remover (Scientific Polymer, Ontario NY), shake vigorously at room temperature for 4 h, add 150 mL 0.75% polyvinyl alcohol, shake for 4 h, heat at 120° for 24 h while shaking on a Parr instrument, cool to room temperature, filter, wash with 100 mL water, wash with 50 mL MeOH. Add the solid to 500 mL 3 M NaOH in MeOH:water 40:60, shake at room temperature for 14 h (to dissolve the silica), filter, wash with water until the washings are neutral, wash with 100 mL MeOH, dry at 60°. The polymer has similar properties to the template silica (US Pat. 4 933 372 (1990)). Soxhlet extract the resin with dioxane for 8 h (Caution! Dioxane is a carcinogen!). Add 25 g aluminum trichloride in 300 mL dry nitrobenzene to 50 g resin and 100 g 4-chloro-3-nitrobenzoyl chloride, stir mechanically at 60° for 5 h, pour into a mixture of 150 mL DMF, 100 mL concentrated HCl, and 150 g ice, filter. Wash the solid with 300 mL portions of DMF:water 75:25 until the washings are colorless, wash with warm (60°) DMF, wash with six 300 mL portions of dichloromethane:MeOH 2:1. Stir the product in 130 mL 40% benzyltrimethylammonium hydroxide in water, 130 mL water, and 260 mL dioxane at 90° for 8 h, filter, repeat the process. Wash the product with four portions of warm (60°) dioxane. Stir the solid

with 30 mL acetic acid for 15 min, filter. Wash the solid with dioxane until the washings are neutral, wash with six 300 mL portions of dichloromethane:MeOH 2:1 to give a nitrobenzophenol-substituted polymer (J. Org. Chem. 1984, 49, 924). Heat 4 g 9-fluoreneacetic acid, 3.9 mL oxalyl chloride, 30 mL benzene (dried over anhydrous sodium sulfate, Caution! Benzene is a carcinogen!), and 3 drops of triethylamine at 55° for 1 h, evaporate under reduced pressure to remove oxalyl chloride, dissolve the product in 35 mL dichloromethane to give a 120 mg/mL solution of 9-fluoreneacetyl chloride, dilute to obtain a 2 mM solution. Stir 1.3 g nitrobenzophenol-substituted polymer, 4.2 mL 2 mM 9-fluoreneacetyl chloride solution, 300 μL triethylamine, and 20 mL dichloromethane at room temperature for 1 h, filter, wash with three 20 mL portions of MeCN to obtain the reagent, polymer-bound nitrobenzophenol 9-fluoreneacetate (J. Chromatogr. 1992, 609, 103).)

Mobile phase: Gradient. MeCN:water 50:50 for 3.5 min, to 70:30 over 12 min, maintain at 70:30 for 2.5 min, return to initial conditions over 1 min. (Place a 100 × 4.6 30-40 μm silica column before the injector.)

Column temperature: 60 (column A only)

SAMPLE

Matrix: urine

Sample preparation: Condition a 100 mg Bond-Elut C18 SPE cartridge with 500 μL MeOH and 500 μL water. Adjust pH of urine to 10, centrifuge at 1500 g. 2 mL Supernatant + 100 μL 75 μg/mL β-phenylethylamine hydrochloride in water, add to the SPE cartridge, wash with 2.5 mL water, elute with 2 mL MeOH, evaporate the eluate to dryness. Reconstitute in water, add 500 μL 8% sodium bicarbonate, add 500 μL 0.5% 1,2-naphthoquinone-4-sulfonic acid sodium salt, make up to 1.5 mL with water, heat at 70° for 20 min, cool, add an equal volume of chloroform, shake for 2 min, centrifuge at 1500 g for 5 min. Remove the organic layer and dry it over anhydrous sodium sulfate, filter (0.45 μm), inject a 25 μL aliquot of the filtrate.

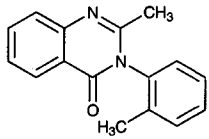
Methaqualone



Molecular formula: $C_{16}H_{14}N_2O$
Molecular weight: 250.30
CAS Registry No.: 72-44-6, 340-56-7 (HCl)
Merck Index: 6028
Lednicer No.: 1 353

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 226

CHROMATOGRAM

Retention time: 4.19
Limit of detection: <120 ng/mL

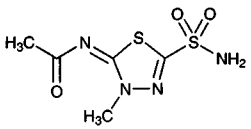
Methazolamide



Molecular formula: $C_5H_6N_4O_3S_2$
Molecular weight: 236.28
CAS Registry No.: 554-57-4
Merck Index: 6031
Lednicer No.: 1 250

SAMPLE

Matrix: blood, urine
Sample preparation: To 500 μL whole blood, plasma, or urine add 20 μL 1 mg/mL acetazolamide solution and 2.5 mL 50% ammonium sulfamate, vortex for 30 s. (Place the tube containing whole blood in boiling water for 30 s and then quickly in cold water.) Add 5 mL ethyl acetate, vortex, centrifuge at 3000 g for 10 min, transfer the organic layer to 5 mL pH 8.0 phosphate buffer, vortex, centrifuge at 3000 g for 10 min, transfer the organic layer to 500 μL pH 10.0 glycine buffer, vortex for 30 s, centrifuge at 3000 g for 5 min. Aspirate and discard the organic layer, add 500 μL ether to the remaining glycine buffer layer, vortex for 1 min, discard the ether phase. Vent the aqueous layer for about 30 min and inject a 20 μL aliquot.

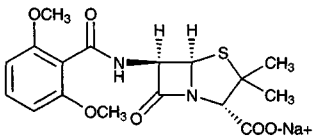
Methicillin sodium



Molecular formula: $C_{17}H_{19}N_2NaO_6S$
Molecular weight: 402.40
CAS Registry No.: 132-92-3, 7246-14-2 (monohydrate), 61-32-5 (free acid)
Merck Index: 6047
Lednicer No.: 1 412

SAMPLE
Matrix: blood
Sample preparation: 400 μL Serum + 400 μL MeCN, vortex for 10 s, shake slowly for 15 min, centrifuge at 3000 g for 10 min. Remove the supernatant and add it to 4 mL dichloromethane, vortex for 10 s, shake for 15 min, centrifuge at 3000 g for 10 min, inject a 50 μL aliquot of the upper aqueous layer.

HPLC VARIABLES
Column: μBondapak C18
Mobile phase: MeCN:water:200 mM ammonium acetate 28:62:10, pH 5.6
Flow rate: 1
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 4.0
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Extracted: cloxacillin, dicloxacillin, nafcillin, oxacillin
Noninterfering: amdinocillin (mecillinam), amikacin, amoxicillin, ampicillin, carbenicillin, cefamandole, cefazolin, ceforanide, cefatoxamine, cefoxitin, cephalexin, cephaloridine, cephalothin, cephradine, cepharin, chloramphenicol, clindamycin, co-trimoxazole, fluorocytosine, gentamicin, metronidazole, moxalactam, penicillin, piperacillin, sulfamethoxazole, theophylline, ticarcillin, tobramycin, trimethoprim, vancomycin

SAMPLE

Matrix: fermentation solutions

Sample preparation: Adjust pH of fermentation broth to 7, centrifuge at 8000 g for 10 min, add MeCN, centrifuge, add dichloromethane to the supernatant, vortex for 10 s, shake for 15 min, centrifuge at 8000 g for 15 min. Add 1 mL of the aqueous layer to 100 μL reagent, heat at 50° for 50 min, cool in an ice bath, inject a 20 μL aliquot. (Prepare reagent by dissolving 4.125 g imidazole in 2.5 mL water, add 1 mL HCl, add 500 μL 110 mM mercury(II) chloride, add 1.5 mL HCl. Recrystallize imidazole twice from isopropanol.)

HPLC VARIABLES

Guard column: 10 × 4 5 μm Spherisorb C18

Column: 20 × 4.6 5 μm Spherisorb C18 S5ODS2

Mobile phase: Gradient. MeCN:buffer from 16.5:83.5 to 31.5:68.5 over 17 min (Buffer was 10 mM NaH_2PO_4 containing 10 mM EDTA, adjusted to pH 6.5 with 2 M NaOH.)

Flow rate: 2

Injection volume: 20

Detector: UV 325

CHROMATOGRAM

Retention time: 12

Limit of detection: 1 μg/mL

OTHER SUBSTANCES

Extracted: penicillin G, penicillin V, penicillin X

KEY WORDS

derivatization

SAMPLE

Matrix: milk

Sample preparation: 50 g Milk + 2 drops penicillinase (Difco Laboratories), let stand 1 h at 37°, add 50 MeCN, shake vigorously for 1 min, centrifuge at 9000 g for 10 min, decant, add 5 g NaCl, swirl to dissolve, add 100 mL dichloromethane, shake for 1 min, centrifuge at 1000 g for 10 min. Remove top aqueous layer and extract organic layer with 25 mL 10% NaCl by shaking and centrifuging as before. Combine aqueous layers, add 1 mL 0.3% mercuric chloride in water, let stand 30 min, add 1 mL 2 M HCl, extract with three 50 mL portions of dichloromethane by shaking each portion for 1 min and centrifuging at 1000 g for 10 min, filter dichloromethane extracts through 30 g anhydrous sodium sulfate, evaporate to dryness under reduced pressure at 35°, if water remains add 5-10 mL MeOH to flask and complete evaporation. Dissolve residue in 1 mL 10% acetic acid, add 0.5 mL 0.08% dansyl hydrazine in 10% acetic acid, let stand 90 min to overnight in the dark, transfer reaction mixture to a separatory funnel with three 25 mL portions of dichloromethane, add 5 mL 2 M HCl, shake for 1 min, wash organic layer with 5 mL 5% $NaHCO_3$ solution, filter through 10-20 g anhydrous sodium sulfate. Extract acid aqueous layer again with 25 mL dichloromethane. Combine dichloromethane layers and evaporate to dryness at 35° under reduced pressure. Dissolve residue in 2 mL IS solution, inject a 20 μL aliquot. (Prepare IS solution by dissolving 10 μL benzaldehyde in 100 mL dichloromethane, evaporate 1 mL to dryness under reduced pressure, dissolve residue in 1 mL 10% acetic acid, add 0.5 mL 0.08% dansyl hydrazine in 10% acetic acid, let stand 90 min to overnight in the dark, transfer reaction mixture to a separatory funnel with three 25 mL portions of dichloromethane, add 5 mL 2 M HCl, shake for 1 min, wash organic layer with 5 mL 5% $NaHCO_3$ solution, filter through 10-20 g anhydrous sodium sulfate. Extract acid aqueous layer again with 25 mL dichloromethane. Combine dichloromethane layers and evaporate to dryness at 35° under reduced pressure. Dissolve residue in 100 mL MeCN then dilute an aliquot 1:4 with MeCN.)

HPLC VARIABLES

Column: 250 × 4 10 μm Lichrosorb RP-18
Mobile phase: MeCN:water 58:42
Flow rate: 1
Injection volume: 20
Detector: F ex 254 em 500 filter

CHROMATOGRAM

Retention time: 5.23
Internal standard: benzaldehyde (derivatized) (12.18)
Limit of detection: 5 ng/g

OTHER SUBSTANCES

Extracted: penicillin V, phenethicillin, oxacillin, cloxacillin, dicloxacillin, nafcillin
Interfering: penicillin G

KEY WORDS

derivatization

Simultaneous: dicloxacillin, penicillin G, penicillin V, cloxacillin, nafcillin, carbenicillin

REFERENCE
Moats,W.A. Effect of the silica support of bonded reversed-phase columns on chromatography of some antibiotic compounds, *J.Chromatogr.*, **1986**, *366*, 69–78.

SAMPLE
Matrix: solutions
Sample preparation: React the antibiotic, triethylamine, and 1-(2,5-dihydroxyphenyl)-2-bromoethanone in a 1:2:4 molar ratio in DMF at 45° for 2 h (use dibenzo-18-crown-6 to make the sodium salt soluble), inject a 10 μL aliquot. (Preparation of 1-(2,5-dihydroxyphenyl)-2-bromoethanone is as follows. Stir 27.6 g 1,4-dimethoxybenzene and 28 mL bromoacetyl bromide at 0°, add 53.4 g aluminum bromide over 10 min (an exothermic reactions ensues), let stand at room temperature for 12 h, add 100 mL 48% HBr, add 100 g ice, stir for 1 h, extract twice with 200 mL portions of diethyl ether. Combine the extracts and wash them 3 times with 200 mL portions of water, dry over 40 g anhydrous magnesium sulfate, evaporate to dryness, recrystallize the product 3 times from EtOH to yield 1-(2,5-dihydroxyphenyl)-2- bromoethanone monobromoacetate (mp 105-107°). Dissolve 11 g 1-(2,5-dihydroxyphenyl)-2-bromoethanone monobromoacetate in 200 mL warm dry MeOH saturated with HBr, stir for 18 h, add 200 mL water, cool to -10°. Collect the yellow solid and dry it under vacuum at 50° for 48 h, recrystallize from toluene:heptane 50:50 then toluene to obtain 1-(2,5-dihydroxyphenyl)-2-bromoethanone as yellow needles (mp 117-119°).)

HPLC VARIABLES
Column: 250 × 4 7 μm RP-18 LiChrocart (Merck)
Mobile phase: MeOH:100 mM pH 6.5 sodium acetate 58:42

SAMPLE
Matrix: blood
Sample preparation: 500 µL Plasma + 100 mg disodium EDTA + 3 mL ethyl acetate, vortex for 3 min, centrifuge at 5000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 200 µL MeOH, inject a 10 µL aliquot.

HPLC VARIABLES
Guard column: 25 × 3 LiChroprep RP-18 (Merck)
Column: 250 × 4 10 µm LiChrosorb RP-18
Mobile phase: Gradient. MeOH:25 mM pH 3 phosphate buffer from 10:90 to 70:30 over 30 min
Flow rate: 1
Injection volume: 10
Detector: UV 258

CHROMATOGRAM
Retention time: 6.95
Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Extracted: methylthiouracil (UV 276), propylthiouracil (UV 276), phenylthiouracil (UV 276), thiouracil (UV 276)

KEY WORDS
cow; plasma

REFERENCE

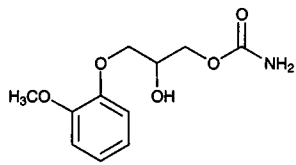
Methocarbamol



Molecular formula: $C_{11}H_{15}NO_5$
Molecular weight: 241.24
CAS Registry No.: 532-03-6
Merck Index: 6060
Lednicer No.: 1 118

SAMPLE
Matrix: blood
Sample preparation: 200 µL Plasma + 100 µL 200 µg/mL mephenesin in water, mix, add 5 mL ethyl acetate, shake for 15 min. Remove 3 mL of the organic layer and evaporate it to dryness under a stream of nitrogen. Reconstitute in 500 µL of water, inject a 50 µL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 3 μm Microsorb C18
Mobile phase: MeOH:100 mM KH_2PO_4:water 35:10:55
Column temperature: 40
Flow rate: 0.8
Injection volume: 50
Detector: UV 272

CHROMATOGRAM
Retention time: 5.2
Internal standard: mephenesin (10.5)

OTHER SUBSTANCES
Simultaneous: guaifenesin
Noninterfering: acetaminophen, ibuprofen

KEY WORDS
plasma

REFERENCE
Weng,N.; Lee,J.W.; Hulse,J.D. Development and validation of a high-performance liquid chromatographic method for the determination of methocarbamol in human plasma, *J.Chromatogr.B*, **1994**, *654*, 287–292.

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 223

CHROMATOGRAM
Retention time: 3.01
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Serum. 2 mL Serum + 20 μg IS, adjust pH to 14 with 2 M NaOH, extract twice with 6 mL diethyl ether. Combine the organic layers, dry under nitrogen, dissolve the residue in 200 μL MeOH. Inject a 20 μL aliquot. Urine. 5 mL Urine + 75-1000 μg IS, adjust pH to 5 with 1 mL 2 M pH 5 sodium acetate buffer. Add 100 μL β-glucuronidase (Helix pomatia 98400 U/mL), incubate at 37° overnight, cool, wash with 8 mL diethyl ether, discard the organic layer. Adjust the aqueous layer to pH 14 with 25% NaOH, extract twice with 8 mL diethyl ether. Combine the organic layers, dry under nitrogen, reconstitute the residue in 200 μL MeOH. Inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 7 μm LiChrospher 100 RP-18
Column: 250 × 4 7 μm LiChrospher 100 RP-18
Mobile phase: MeCN:1% acetic acid 20:80
Flow rate: 1
Injection volume: 20
Detector: UV 280; MS, API III LC-MS-MS (PE Sciex, Canada), triple quadrupole, nebulizer 400° and 75 psi, auxiliary nitrogen gas, nitrogen-curtain gas, positive mode ionization, CID technique, collision gas argon, m/z 242

CHROMATOGRAM

Retention time: 11.8
Internal standard: mephenesin (19)
Limit of detection: 700 ng/mL (urine), 200 ng/mL (serum)
Limit of quantitation: 1.09 μg/mL (urine), 550 ng/mL (serum)

OTHER SUBSTANCES

Extracted: degradation products

KEY WORDS

horse; serum; pharmacokinetics

SAMPLE
Matrix: blood, urine
Sample preparation: Dilute urine 1:100. Plasma or diluted urine + 10 μg/mL (R)-(-)-flecainide acetate in water + 1 mL 1 M NaOH + 5 mL ethyl acetate, shake mechanically for 20 min, centrifuge at 1000 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 1 mL distilled ethyl acetate, add 80 μL 0.2% (S)-(+)-1-(1-naphthyl)ethyl isocyanate in ethyl acetate, vortex for 5 s, heat at 85° for 12 h, evaporate, reconstitute in 200 μL ethyl acetate, inject a 30-150 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Partisil 5 silica
Mobile phase: Hexane:isopropanol 95:5
Flow rate: 1.6
Injection volume: 30-150
Detector: UV 280

CHROMATOGRAM
Retention time: 33 (S), 41 (R)
Internal standard: (R)-(-)-flecainide (12)
Limit of detection: 10 ng/mL
Limit of quantitation: 500 ng/mL

OTHER SUBSTANCES
Simultaneous: guaifenesin

KEY WORDS

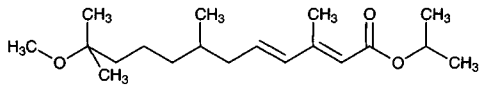
Methoprene



Molecular formula: $C_{19}H_{34}O_3$
Molecular weight: 310.48
CAS Registry No.: 40596-69-8
Merck Index: 6063

SAMPLE
Matrix: solutions
Sample preparation: 5 mL Water + 100 µL 22.7 µg/mL dipentyl phthalate in MeCN + 3 mL MTBE, vortex for 1 min, centrifuge at 2500 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 45°, reconstitute the residue in 100 µL mobile phase, vortex for 30 s, inject a 20 µL aliquot.

HPLC VARIABLES
Column: 70 × 4.6 3 µm Ultrasphere XL-ODS
Mobile phase: MeCN:water 90:10
Flow rate: 1
Injection volume: 20
Detector: UV 255

CHROMATOGRAM
Retention time: 6.5
Internal standard: dipentyl phthalate (4)
Limit of detection: 2.5 ng/mL
Limit of quantitation: 5 ng/mL

KEY WORDS
water; groundwater

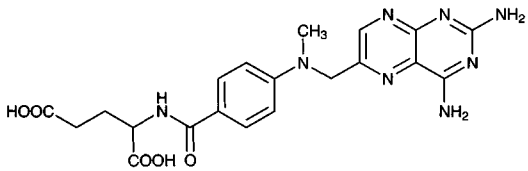
Methotrexate



Molecular formula: $C_{20}H_{27}N_8O_5$
Molecular weight: 454.45
CAS Registry No.: 59-05-2
Merck Index: 6065

SAMPLE
Matrix: blood
Sample preparation: Mix 20 µL serum with 20 µL 2 M perchloric acid, vortex for a few seconds, centrifuge at 10000 g for 2 min. Inject a 20 µL aliquot of the supernatant.

HPLC VARIABLES
Column: 150 × 4.6 5 µm Inertsil ODS-2 (GL Sciences, Japan)
Mobile phase: MeCN:25 mM pH 7.0 sodium phosphate buffer 8:92 containing 25 mM hydrogen peroxide
Flow rate: 1
Injection volume: 20
Detector: F ex 379 em 457 following post-column reaction. The column effluent flowed through a 5 m × 0.5 mm i.d. stainless-steel reaction coil at 160° and a 3 m × 0.5 mm i.d. stainless-steel coil at 15° to the detector.

CHROMATOGRAM
Retention time: 10
Limit of detection: 20 nM

OTHER SUBSTANCES
Extracted: metabolites, leucovorin

KEY WORDS
serum; post-column reaction; comparison with immunoassay

SAMPLE
Matrix: blood
Sample preparation: Condition a C18 Sep-Pak Classic SPE cartridge with 20 mL MeOH and 3 mL 200 mM pH 6 phosphate buffer. Gently vortex a 200-500 μL aliquot of serum with 1 ml 4 μg/mL IS in 200 mM pH 6 phosphate buffer. Add to the SPE cartridge, wash with 1 mL water, dry under vacuum for 5 min, elute with 2 mL MeOH. Dry the eluate under nitrogen at 60°. Reconstitute the residue in 200-300 μL 5 mM HCl, inject a 100μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Beckmann Ultrasphere ODS
Mobile phase: MeCN:buffer 10:90 (Buffer was 10 mM pH 2.5 KH_2PO_4 containing 20 mM tetramethylammonium chloride.)
Flow rate: 1
Injection volume: 100
Detector: UV 313

CHROMATOGRAM
Retention time: 12.71
Internal standard: 8-chlorotheophylline (8.42)
Limit of detection: 20 nM
Limit of quantitation: 30 nM

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
serum; SPE

SAMPLE

Matrix: blood

Sample preparation: 500 μL Plasma + 500 μL acetone, vortex vigorously for 1 min, centrifuge at 3000 rpm for 4 min. Remove a 600 μL aliquot of the supernatant and add it to 600 μL butanol and 800 μL diethyl ether, mix vigorously, centrifuge at 2000 rpm for 2 min. Remove a 300 μL aliquot of the lower aqueous layer and evaporate it to dryness under reduced pressure, reconstitute the residue with 150 μL 0.9% NaCl in water, filter (0.45 μm), inject a 50 μL aliquot onto column A and column B in series and elute with mobile phase A, after 5 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. (Methotrexate is oxidized on column A to the fluorescent compounds 2,4-diaminopteridine-6-carboxylic acid and 2,4-diaminopteridine-6-carboxaldehyde.)

HPLC VARIABLES

Column: A 70 × 4.5 cerium(IV) trihydroxyperoxide; B 250 × 4.6 5 μm ODS/TM silica (Preparation of cerium(IV) trihydroxyperoxide is as follows. Add 15 mL 35% ammonia solution with stirring to a cooled solution of 11.18 g cerium(III) chloride heptahydrate in 100 mL water, add 20 mL 30% hydrogen peroxide with stirring over 15 min, collect the orange-red precipitate by filtration, wash the solid several times with water, wash with acetone, dry under vacuum at

room temperature overnight to obtain cerium(IV) trihydroxyperoxide, discard after 6 months. Suspend 1 g cerium(IV) trihydroxyperoxide in chloroform, degas under vacuum with stirring for 10 min, add the suspension to a 100 × 7 reservoir on top of the column, pump the slurry into the column using acetone as a purge solvent at 5 mL/min for 20 min, wash the column with acetone:pH 3.5 phosphate buffer 50:50 at 1 mL/min for 20 min, equilibrate with mobile phase A at 0.5 mL/min for 1 h (Analyst 1996, 121, 183).)

Mobile phase: A 40 mM pH 3.5 phosphate buffer; B MeCN:50 mM pH 6.6 phosphate buffer 10:90

Flow rate: A 0.2; B 1

Injection volume: 50

Detector: F ex 367 em 463

CHROMATOGRAM

Retention time: 5 (2,4-diaminopteridine-6-carboxylic acid), 6 (2,4-diaminopteridine-6-carboxaldehyde)

Limit of detection: 2.78 ng/mL

SAMPLE
Matrix: formulations
Sample preparation: Dilute with mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 300 × 4.6 5 μm C18
Mobile phase: MeCN:100 mM NaH_2PO_4 20:80 adjusted to pH 4.2 with phosphoric acid
Flow rate: 1.2
Injection volume: 20
Detector: UV 300

CHROMATOGRAM
Retention time: 2.73

OTHER SUBSTANCES
Simultaneous: granisetron

KEY WORDS
stability-indicating; injections; saline

REFERENCE
Mayron,D.; Gennaro,A.R. Stability and compatibility of granisetron hydrochloride in i.v. solutions and oral liquids and during simulated Y-site injection with selected drugs, *Am.J.Health-Syst.Pharm.*, **1996**, *53*, 294–304.

SAMPLE
Matrix: solutions
Sample preparation: Inject a 10 μL aliquot of an aqueous solution.

HPLC VARIABLES
Guard column: 5 μm Lichrospher 60 RP-select B
Column: 125 × 3 3 μm Hypersil BDS
Mobile phase: Gradient. A was MeCN. B was 5 mM monobasic potassium phosphate adjusted to pH 2.3 with phosphoric acid. A:B 7:93 for 5 min, to 13:87 over 15 min, to 21:79 over 6 min, maintain at 21:79 for 1 min, back to 7:93 over 2 min, re-equilibrate at initial conditions for 5 min.
Flow rate: 0.5
Injection volume: 10
Detector: UV 310

CHROMATOGRAM
Retention time: 21

OTHER SUBSTANCES
Simultaneous: leucovorin

REFERENCE
Mandl,A.; Lindner,W. Improved detection of leucovorin in mixed folates and antifolates by reversed-phase liquid chromatography and on-line post-column UV irradiation, *Chromatographia*, **1996**, *43*, 327–330.

SAMPLE
Matrix: solutions
Sample preparation: Inject an aliquot of a saline solution.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeOH:buffer 35:65, pH 3.0 (Buffer was 4.88 mM KH_2PO_4 containing 1.623 mM phosphoric acid.)
Flow rate: 1
Detector: UV 303

CHROMATOGRAM
Retention time: 5
Limit of detection: 5 pmole

KEY WORDS
saline

REFERENCE
Chatelut,E.; Suh,P.; Kim,S. Sustained-release methotrexate for intracavitary chemotherapy, *J.Pharm.Sci.*, **1994**, *83*, 429–432.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)
Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25
Detector: UV 229

CHROMATOGRAM
Retention time: 4.72 (A), 2.93 (B)

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, acetophenazine, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, antipyrine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butabarbital, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clonidine, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene, desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloperidol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen,

ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, metformin, methadone, methdilazine, methocarbamol, methotrimeprazine, methoxamine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen, nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone, phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, salicylic acid, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terbutaline, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, xylometazoline, yohimbine, zopiclone

SAMPLE
Matrix: urine
Sample preparation: Add 250 μL 1 M pH 5.0 acetate buffer to a 1.0 mL urine, vortex and add a 250 μL aliquot of the mixture to a Sep-Pak silica cartridge and dry by aspiration of air. Wash the cartridge with 5 mL ethyl acetate and 5 mL EtOH:MeOH 60:40 and dry by aspiration of air. Elute with 3 mL of 1% ammonia in MeOH, dry eluate under a stream of nitrogen in a water bath at 37°. Reconstitute dried residue with 100 μL mobile phase and inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Inertsil ODS-2 (GL Science, Tokyo, Japan)
Mobile phase: MeCN:50 mM pH 5.3 phosphate buffer 9.5:90.5
Flow rate: 1.1
Injection volume: 20
Detector: UV 303

CHROMATOGRAM
Retention time: 6.5
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

Noninterfering: diclofenac, felbinac, fenbufen, indomethacin, loxoprofen, naproxen, piroxicam, sulindac

KEY WORDS
SPE

REFERENCE
Hirai,T.; Matsumoto,S.; Kishi,I. Determination of methotrexate and its main metabolite 7-hydroxymethotrexate in human urine by high-performance liquid chromatography with normal solid-phase extraction, *J.Chromatogr.B*, **1997**, *690*, 267–273.

SAMPLE
Matrix: urine
Sample preparation: Condition a 100 mg Bond Elut phenyl SPE cartridge with 1 mL MeOH and 1 mL water. Centrifuge urine at 1000 g. Adjust pH of 1 mL supernatant to 5.0 ± 0.1 with 2 M trichloroacetic acid then with 0.6 M trichloroacetic acid, add to the SPE cartridge, wash with 2 mL water, wash with 1 mL ethyl acetate, elute with 2 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 37°, reconstitute the residue in 100 μL water, inject a 10-50 μL aliquot onto column A and elute to waste with mobile phase A, after 9.5 min divert the effluent from column B onto column A, after another 5 min remove column A from the circuit and start the gradient, elute column B with mobile phase B and monitor the effluent from column B. Re-equilibrate both columns with mobile phase A for 15 min. Wash both columns separately with MeCN at the end of the day.

HPLC VARIABLES
Column: A 250 × 4 10 μm Nucleosil 100 SB strong anion-exchange (maintained at 25 ± 1°); B 250 × 4 10 μm LiChrospher 100 RP-18e
Mobile phase: A MeCN:buffer 1:99; B Gradient. MeCN:buffer from 1:99 to 25:75 over 24 min. (Buffer was 314 mM formic acid adjusted to pH 2.7 with 25% ammonia.)
Flow rate: 1
Injection volume: 10-50
Detector: UV 310

CHROMATOGRAM
Retention time: 34
Limit of quantitation: 4 ng/mL

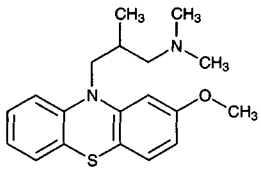
Methotrimeprazine



Molecular formula: $C_{19}H_{24}N_2OS$
Molecular weight: 328.48
CAS Registry No.: 60-91-1
Merck Index: 6066

SAMPLE

Matrix: blood
Sample preparation: 2-5 mL Plasma + 1 mL 1 M NaOH + 8 mL diethyl ether:chloroform 4:1, shake for 10 min, centrifuge. Remove the upper organic layer and evaporate it to dryness at 50° under a stream of nitrogen. Dissolve the residue in 50 µL mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 µm Spherisorb nitrile-bonded silica
Mobile phase: MeCN:MeOH:100 mM K_2HPO_4 adjusted to pH 6.5 with orthophosphoric acid 6:4:7
Detector: E, Model LCA 15-EDT Research, glassy carbon electrode +0.85 V

CHROMATOGRAM

Retention time: 4
Internal standard: methotrimeprazine
Limit of detection: 0.2 ng/mL

OTHER SUBSTANCES

Simultaneous: prochlorperazine
Noninterfering: chlorpromazine

KEY WORDS

plasma; methotrimeprazine is IS

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Work under yellow light. 1 mL Serum + 2 mL water + 2 mL 2 M NaOH, vortex for 10 s, add 5 mL water-saturated n-heptane:isoamyl alcohol 99:1, shake gently for 20 min, centrifuge at 4° at 2800 g, remove organic layer and repeat the extraction. Combine the organic layers and evaporate them to dryness under reduced pressure. Dissolve the residue in 500 µL MeCN, inject a 30 µL aliquot (store at 5°).

HPLC VARIABLES

Column: 250 × 4.6 5 µm Nucleosil 100 CN
Mobile phase: MeCN:pyridine:140 mM sodium acetate pH 3.1 698:2:300
Flow rate: 0.9
Injection volume: 100
Detector: E, Environmental Sciences Assoc. Coulochem II, Model 5011 detector cell, oxidative screen mode, screen electrode +0.35 V, sample electrode +0.65 V

CHROMATOGRAM

Retention time: 9
Limit of detection: 0.2 ng/mL

OTHER SUBSTANCES

Simultaneous: chlorprothixene
Interfering: promethazine

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 252

CHROMATOGRAM
Retention time: 8.59
Limit of detection: <120 ng/mL

SAMPLE
Matrix: solutions

HPLC VARIABLES
Guard column: 30 × 3.2 7 μm SI 100 ODS (not commercially available)
Column: 150 × 3.2 7 μm SI 100 ODS (not commercially available)
Mobile phase: MeCN:buffer 31.2:68.8 (Buffer was 6.66 g KH_2PO_4 and 4.8 g 85% phosphoric acid in 1 L water, pH 2.3.)
Flow rate: 0.5-1
Detector: UV 202, 247

CHROMATOGRAM
Retention time: 4.5
Internal standard: 5-(4-methylphenyl)-5-phenylhydantoin (7.3)

OTHER SUBSTANCES
Also analyzed: aspirin, caffeine, carbamazepine, chlordiazepoxide, chlorprothixene, clonazepam, diazepam, doxylamine, ethosuximide, furosemide, haloperidol, hydrochlorothiazide, methocarbamol, nicotine, oxazepam, procaine, promazine, propafenone, propranolol, salicylamide, temazepam, tetracaine, thiopental, triamterene, verapamil, zolpidem, zopiclone

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 1 mg/mL solution in MeOH, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Lichrosphere cyanopropyl
Mobile phase: Carbon dioxide:MeOH:isopropylamine 94:6:0.03
Column temperature: 50

Flow rate: 3
Injection volume: 5
Detector: UV 254

CHROMATOGRAM
Retention time: 3.4

OTHER SUBSTANCES
Simultaneous: triflupromazine, carphenazine, promazine, perphenazine, chlorprothixene, deserpidine, thiothixene, reserpine
Also analyzed: acetophenazine, ethopropazine, promethazine, propiomazine

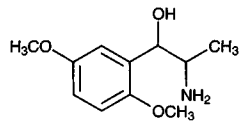
Methoxamine



Molecular formula: $C_{11}H_{17}NO_3$
Molecular weight: 211.26
CAS Registry No.: 390-28-3, 61-16-5 (HCl)
Merck Index: 6067

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 50 μL water + 100 μL 1 M NaOH + 4 mL ethyl acetate, vortex for 30 s, centrifuge at 3000 rpm for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 200 μL saturated sodium carbonate and 200 μL 187 mM (-)-menthyl chloroformate in MeCN, vortex for 30 s, add 1 mL water, add 2 mL chloroform, vortex for 30 s, centrifuge for 3 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 200 μL mobile phase, vortex for 5 s, centrifuge for 5 min, inject a 20-60 μL aliquot of the supernatant. Urine. Dilute urine 10 times with water. 100 μL Diluted urine + 50 μL water + 100 μL saturated sodium carbonate + 200 μL 187 mM (-)-menthyl chloroformate in MeCN, vortex for 30 s, add 1 mL water, add 2 mL chloroform, vortex for 30 s, centrifuge for 3 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 200 μL mobile phase, vortex for 5 s, centrifuge for 5 min, inject a 20-60 μL aliquot of the supernatant.

HPLC VARIABLES
Guard column: 50 mm long pellicular ODS (Whatman)

Column: 100 × 4.6 5 μm Partisil 5 ODS3
Mobile phase: MeCN:MeOH:water 35:22:43
Flow rate: 1.2
Injection volume: 20-60
Detector: F ex 195 em no emission filter

CHROMATOGRAM
Retention time: 18 (-), 20 (+)
Internal standard: methoxamine

OTHER SUBSTANCES
Extracted: atenolol

SAMPLE
Matrix: perfusate
Sample preparation: 30 μL Perfusate (artificial CSF) + 10 μL 200 mM perchloric acid. Mix a 25 μL aliquot with 12.5 μL reagent, let stand for 2 min, inject an aliquot. (Prepare a stock solution by dissolving 27 mg o-phthalaldehyde in 1 mL MeOH, add 5 μL β-mercaptoethanol, add 9 mL 100 mM pH 9.3 sodium tetraborate containing 10 μM EDTA. This solution is good for 5 days in a sealed amber bottle at room temperature. Prepare the working reagent by diluting 1 mL of the stock solution with 3 mL 100 mM pH 9.3 sodium tetraborate containing 10 μM EDTA, allow to stand for 24 h before use.)

HPLC VARIABLES
Column: two columns 150 × 4.6 5 μm M.S. Gel C18 (ESA)
Mobile phase: MeOH:buffer 8:92 adjusted to pH 3.0 with phosphoric acid (Buffer was 54 mM NaH_2PO_4 containing 1.24 mM sodium heptanesulfonate.)
Column temperature: 33
Flow rate: 1.2
Detector: E, ESA Coulochem Electrode Array System Model 5500, detector temp 33°, oxidation potential 900 mV

CHROMATOGRAM
Retention time: 5.00
Limit of quantitation: 0.5 ng/mL

OTHER SUBSTANCES
Extracted: apomorphine, dopamine, hydralazine, isoproterenol, morphine, norepinephrine, phenylephrine

KEY WORDS
rat

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)
Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25
Detector: UV 229

CHROMATOGRAM

Retention time: 6.41 (A), 3.62 (B)

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, acetophenazine, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, antipyrine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butabarbital, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clonidine, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene, desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloper-

idol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen, ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, metformin, methadone, methdilazine, methocarbamol, methotrexate, methotrimeprazine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen, nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone, phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, salicylic acid, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terbutaline, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, xylometazoline, yohimbine, zopiclone

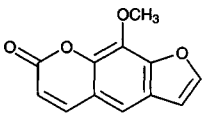
Methoxsalen



Molecular formula: $C_{12}H_8O_4$
Molecular weight: 216.19
CAS Registry No.: 298-81-7
Merck Index: 6068
Lednicer No.: 1 333

SAMPLE
Matrix: blood
Sample preparation: 1 mL Whole blood + 2.5 mL 1 M pH 9 borate buffer, mix well, add 8 mL n-hexane:isopropanol 95:5, shake at 80-100 strokes/min for 10 min, centrifuge at 5° at 1500 g. Remove 7.0 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL mobile phase, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 10 μm Partisil silica
Mobile phase: Dichloromethane:MeCN 95:5
Flow rate: 2.2
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 3.8
Limit of detection: 10-15 ng/mL

KEY WORDS
normal phase; whole blood; dog; human; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Condition a 3 mL Bond Elut C18 SPE cartridge with 9 mL MeOH and 9 mL water. Add 500 μL plasma to the SPE cartridge, wash with 9 mL water, elute with 500 μL 500 ng/mL 5-methoxypsoralen in MeOH, vortex the eluate, inject a 20 μL aliquot of the eluate.

HPLC VARIABLES
Column: 100 mm long Spheri-5 RP-18
Mobile phase: MeCN:MeOH:water 10:25:65
Flow rate: 0.7
Injection volume: 20
Detector: UV 300

CHROMATOGRAM
Retention time: 5.0
Internal standard: 5-methoxypsoralen (bergapten) (8.5)
Limit of detection: 1.5 ng/mL

OTHER SUBSTANCES
Noninterfering: acetaminophen, alprazolam, amikacin, amobarbital, caffeine, carbamazepine, chloramphenicol, diazepam, disopyramide, gentamicin, lidocaine, lithium, lorazepam, meprobamate, mexiletine, phenobarbital, phenytoin, procainamide, propranolol, quinidine, salicylic acid, theophylline, tobramycin, valproic acid, vancomycin

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL 60 μm Silicacart C18 SPE cartridge (Tessek) with 5 mL MeOH and 5 mL water. 2 mL Plasma + 2 mL MeCN + 1 mL 6.25 μg/mL griseofulvin in MeOH, shake by hand for 1-2 s, centrifuge at 500 g for 10 min, add 4 mL of the supernatant to the SPE cartridge, wash with 5 mL water, elute with 2 mL MeOH. Evaporate the eluate to dryness under vacuum at 38°, reconstitute in 1 mL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 5 μm Spherisorb 5 ODS
Mobile phase: MeCN:10 mM phosphoric acid 34:66, pH 2.82
Column temperature: 40
Flow rate: 1
Injection volume: 50
Detector: UV 248

CHROMATOGRAM
Retention time: 7.59
Internal standard: griseofulvin (12.13)
Limit of detection: 15 ng/mL

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood

Sample preparation: Inject 25 μL plasma onto column A with mobile phase A, elute column A with mobile phase A to waste, after 8 min backflush the contents of column A onto column B with mobile phase B, monitor the effluent from column B. (Re-equilibrate column A with mobile phase A for 2 min before next injection.)

HPLC VARIABLES

Column: A 250 × 4 25 μm C8-Alkyl-Diol Silica (some preparation details given); B 125 × 4 5 μm LiChrospher RP-18
Mobile phase: A water; B MeOH:water 60:40
Flow rate: A 1; B 0.8
Injection volume: 25
Detector: F ex 312 em 540

CHROMATOGRAM

Retention time: 4
Limit of detection: 0.39 ng/mL
Limit of quantitation: 0.79 ng/mL

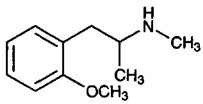
Methoxyphenamine



Molecular formula: $C_{11}H_{17}NO$
Molecular weight: 179.26
CAS Registry No.: 93-30-1, 5588-10-3 (HCl)
Merck Index: 6077

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 2.3

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene,

dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

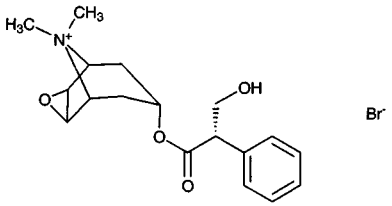
Methscopolamine bromide

Molecular formula: $C_{18}H_{24}BrNO_4$
Molecular weight: 398.30
CAS Registry No.: 155-41-9
Merck Index: 6084



SAMPLE

Matrix: formulations
Sample preparation: Crush 10 tablets, add 250 mL 50 mM HCl in EtOH:water 50:50, heat for 15 min on a steam bath, shake mechanically for 2 h, filter (glass fiber GF/A, Whatman), inject a 30 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 250 × 4.6 10 μm Partisil-10-ODS
Mobile phase: MeCN:buffer 50:50 (Buffer was 2.85 mM ethylenediamine sulfate adjusted to pH 7.44 ± 0.02 with 1 M ammonium hydroxide.)

Flow rate: 3.8
Injection volume: 30
Detector: UV 216.5

CHROMATOGRAM
Retention time: 9

OTHER SUBSTANCES
Simultaneous: aposcopolamine, pheniramine, phenylpropanolamine, pyrilamine, tropic acid

KEY WORDS
tablets

REFERENCE
Heidemann,D.R. High-pressure liquid chromatographic determination of methscopolamine nitrate, phenylpropanolamine hydrochloride, pyrilamine maleate, and pheniramine maleate in tablets, *J.Pharm.Sci.*, **1981**, *70*, 820–822.

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 1.5 mg/mL solution, inject a 10 μL aliquot.

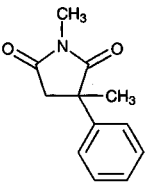
HPLC VARIABLES
Guard column: Supelguard LC-8-DB (Supelco)
Column: 50 × 4.6 Supelcosil LC-8-DB
Mobile phase: MeCN:buffer 10:90 containing 0.02% triethylamine (Buffer was KH_2PO_4 adjusted to pH 2.0 with phosphoric acid.)
Column temperature: 35
Flow rate: 2
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 2

OTHER SUBSTANCES
Simultaneous: chlorpheniramine, phenylpropanolamine, pseudoephedrine, triprolidine

REFERENCE
Supelco Catalog, **1992**, p. 179.

Methsuximide



Molecular formula: $C_{12}H_{13}NO_2$
Molecular weight: 203.24
CAS Registry No.: 77-41-8
Merck Index: 6085
Lednicer No.: 1 228

SAMPLE
Matrix: blood
Sample preparation: 100 μL Serum + 100 μL buffer + 1.5 mL IS in 5% isopropanol in chloroform, vortex for 30 s, centrifuge. Remove the organic layer and evaporate it to dryness under a stream of air at room temperature, reconstitute the residue in 100 μL mobile phase, inject a 6-10 μL aliquot. (Buffer was 13.6 g KH_2PO_4 in 90 mL water, pH adjusted to 6.8 with about 3 mL 10 M NaOH, made up to 100 mL.)

HPLC VARIABLES

Guard column: 20 × 4.6 Supelguard LC-1 (Supelco)
Column: 250 × 4.6 5 μm Supelcosil LC-1 (Supelco)
Mobile phase: MeOH:MeCN:buffer 17.5:17.5:65 (Buffer was 2.72 g KH_2PO_4 in 1.9 L water, pH adjusted to 6.3 with about 2 mL 1 M NaOH, made up to 2 L.)
Flow rate: 2
Injection volume: 6-10
Detector: UV 204

CHROMATOGRAM

Retention time: 5.30
Internal standard: 3-isobutyl-1-methylxanthine (3.15)

OTHER SUBSTANCES

Extracted: acetaminophen, amobarbital, barbital, caffeine, carbamazepine, chloramphenicol, ethosuximide, mephobarbital, pentobarbital, phenobarbital, phenytoin, primidone, secobarbital, theophylline, thiopental
Also analyzed: acetanilide, acetylcysteine, acetylprocainamide, ampicillin, aspirin, butabarbital, butalbital, chlorpropamide, cimetidine, codeine, cyheptamide, diazoxide, diflunisal, diphylline, disopyramide, ethchlorvynol, gentisic acid, glutethimide, heptabarbital, hexobarbital, ibuprofen, indomethacin, ketoprofen, mefenamic acid, mephenytoin, methaqualone, methsuximide, methyl salicylate, methyprylon, morphine, naproxen, nirvanol, oxphenylbutazone, phenacetin, phensuximide, phenylbutazone, procainamide, salicylamide, salicylic acid, sulfamethoxazole, sulindac, tolmetin, trimethoprim, vancomycin
Noninterfering: amikacin, gentamicin, meprobamate, netilmicin, quinidine, tetracycline, tobramycin, valproic acid

KEY WORDS

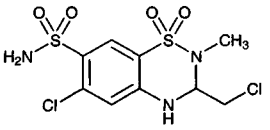
Methyclothiazide



Molecular formula: $C_9H_{11}Cl_2N_3O_4S_2$
Molecular weight: 360.24
CAS Registry No.: 135-07-9
Merck Index: 6086
Lednicer No.: 1 360

SAMPLE
Matrix: blood
Sample preparation: 2 mL Plasma + 2 mL 100 mM NaOH + 8 mL ethyl acetate, vortex vigorously for 30 s, centrifuge at 10° at 2000 g for 10 min. Remove the organic layer and pass it through a 35 × 6 column of anhydrous magnesium sulfate, rinse column with 2 mL ethyl acetate. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 100 μL 8 μg/mL phenacetin in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 10 μm μBondapak C18
Mobile phase: MeOH:water 35:65
Column temperature: 35
Flow rate: 1.5
Injection volume: 20
Detector: UV 225

CHROMATOGRAM
Retention time: 7.5
Internal standard: phenacetin (11)
Limit of detection: 1.5 ng/mL

OTHER SUBSTANCES
Noninterfering: clonidine, methyldopa, prazosin, propranolol

KEY WORDS
plasma

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 226.3

CHROMATOGRAM
Retention time: 15.36

KEY WORDS
whole blood

SAMPLE
Matrix: urine
Sample preparation: 2 mL Urine + 2 mL 1 M pH 4.1 NaH_2PO_4 + 4 mL ethyl acetate, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic phase and add it to 5 mL 100 mM pH 7.5 Na_2HPO_4, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL MeCN:10 mM pH 3.0 phosphate buffer, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm LiCHrosorb RP-18
Mobile phase: Gradient. MeCN:10 mM pH 3.0 phosphate buffer 10:90 for 1.5 min then to 35:65 over 2 min
Column temperature: 50
Flow rate: 1.5
Injection volume: 5
Detector: UV 271

CHROMATOGRAM
Retention time: 4.7
Limit of quantitation: 500 ng/mL

OTHER SUBSTANCES
Extracted: chlorothiazide, hydrochlorothiazide, quinethazone, chlorthalidone, furosemide, metolazone, mefruside, bendroflumethiazide, cyclopenthiazide, bumetanide
Simultaneous: indapamide, clorexolone, ethacrynic acid
Noninterfering: aspirin, albuterol, allopurinol, alprenolol, atenolol, captopril, carbimazole, clonidine, coloxyl, danthron, diazepam, digoxin, doxepin, glibenclamide, hydralazine, indomethacin, labetalol, metformin, methyldopa, metoprolol, mianserin, minoxidil, nifedipine, nitrazepam, oxazepam, oxprenolol, pindolol, prazosin, propranolol, senokot, theophylline, trifluoperazine
Interfering: clopamide

SAMPLE
Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)
Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)
Flow rate: 1
Injection volume: 5
Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 11.7 (A), 12.6 (B)
Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))
Limit of detection: 500 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, benzthiazide, cyclothiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone, flumethiazide
Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

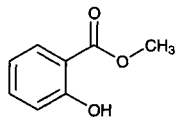
Methyl salicylate



Molecular formula: $C_8H_8O_3$
Molecular weight: 152.15
CAS Registry No.: 119-36-8
Merck Index: 6200

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood + 100 μL 2 M NaOH + 10 mL dichloromethane, rotate for 10 min, centrifuge for 5 min. Remove 6 mL of the organic layer and evaporate it to dryness, reconstitute the residue in 1 mL 100 mM NaOH, heat at 60° for 2 h, cool, add 200 μL 1 M HCl, add 200 μL 1 mg/mL β-hydroxyethyltheophylline in MeOH, add 5 mL dichloromethane, rotate for 10 min, centrifuge for 5 min. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 200 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm ODS (Altex)
Mobile phase: MeOH:water:glacial acetic acid 40:66:1
Flow rate: 1.5
Injection volume: 20
Detector: UV 250

CHROMATOGRAM
Retention time: 6.4 (salicylic acid), 13 (unhydrolyzed methyl salicylate)
Internal standard: β-hydroxyethyltheophylline (2)
Limit of quantitation: 10 μg/mL

OTHER SUBSTANCES
Simultaneous: theophylline
Noninterfering: acetaminophen, amobarbital, butalbital, caffeine, carbamazepine, glutethimide, ibuprofen, indomethacin, meprobamate, methaqualone, pentobarbital, phenobarbital, phenylbutazone, phenytoin, primidone, secobarbital

KEY WORDS
whole blood; methyl salicylate is hydrolyzed to salicylic acid

REFERENCE

SAMPLE
Matrix: solutions
Sample preparation: Inject a 6-10 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 Supelguard LC-1 (Supelco)
Column: 250 × 4.6 5 μm Supelcosil LC-1 (Supelco)
Mobile phase: MeOH:MeCN:buffer 17.5:17.5:65 (Buffer was 2.72 g KH_2PO_4 in 1.9 L water, pH adjusted to 6.3 with about 2 mL 1 M NaOH, made up to 2 L.)
Flow rate: 2
Injection volume: 6-10
Detector: UV 204

CHROMATOGRAM
Retention time: 7.17 (tails)
Internal standard: 5-ethyl-5-p-tolybarbituric acid (tolybarb) (4.80)

OTHER SUBSTANCES
Simultaneous: acetaminophen, acetanilide, N-acetylcysteine, N-acetylprocainamide, amobarbital, ampicillin, aspirin, barbital, butabarbital, butalbital, caffeine, carbamazepine, chloramphenicol, chlorpropamide, codeine, cyheptamide, diazoxide, diflunisal, diphylline, disopyramide, ethchlorvynol, gentisic acid, glutethimide, heptabarbital, hexobarbital, ibuprofen, indomethacin, ketoprofen, mefenamic acid, mephenytoin, mephobarbital, methaqualone, methsuximide, methyprylon, morphine, naproxen, nirvanol, oxphenylbutazone, pentobarbital, phenacetin, phenobarbital, phensuximide, phenytoin, procainamide, salicylamide, salicylic acid, secobarbital, sulfamethoxazole, sulindac, theophylline, thiopental, tolmetin, trimethoprim, vancomycin
Noninterfering: amikacin, gentamicin, meprobamate, netilmicin, quinidine, tetracycline, tobramycin, valproic acid
Interfering: ethosuximide, cimetidine, primidone, phenylbutazone

SAMPLE
Matrix: formulations
Sample preparation: Powder tablets or contents of capsules, weigh out an amount equivalent to about 100 mg levodopa, add 30 mL 0.1 M HCl, sonicate, make up to 50 mL with 0.1 M HCl, mix, filter (0.45 μm), discard first 5 mL filtrate. 5 mL Filtrate + 10 mL 2 mg/mL methyldopa in 0.1 M HCl, make up to 100 mL with mobile phase, mix, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: 3% aqueous acetic acid
Flow rate: 1.5
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 4.5
Internal standard: methyldopa

OTHER SUBSTANCES
Simultaneous: levodopa

KEY WORDS
capsules; tablets; methyldopa is IS

REFERENCE
Ting,S. Liquid chromatographic determination of levodopa and levodopa-carbidopa in solid dosage forms: collaborative study, *J.Assoc.Off.Anal.Chem.*, **1987**, *70*, 987–990.

SAMPLE
Matrix: formulations
Sample preparation: Grind beads from sustained-release microcapsules containing 500 mg methyldopa to a fine powder, add 50 mL 50 mM sulfuric acid, sonicate for 15 min, make up to 100 mL with 50 mM sulfuric acid. Filter, reject the first 10 mL of the filtrate, make up a 10 mL aliquot to 100 mL with 50 mL sulfuric acid, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm CN (Phenomenex)

Mobile phase: MeOH:water:acetic acid 20:80:2 containing 5 mM sodium 1-heptanesulfonate, pH adjusted to 2.60
Flow rate: 1.6
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 4.5

OTHER SUBSTANCES
Simultaneous: degradation products, 3-O-methylmethyldopa

KEY WORDS
microcapsules; stability-indicating

SAMPLE
Matrix: formulations
Sample preparation: Dissolve in mobile phase, filter, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 10 μm μBondapak C18
Mobile phase: MeOH:50 mM ammonium acetate adjusted to pH 4.1 with 0.6 M acetic acid 1:99
Flow rate: 0.9
Detector: E, Coulochem model 5100A, screen electrode +0.3 V, sample electrode +0.6 V and UV 280

CHROMATOGRAM
Retention time: 8.59
Limit of detection: 1400 ng/mL (UV), 20 ng/mL (E)

OTHER SUBSTANCES
Simultaneous: hydroxydopa, carbidopa, levodopa, methoxytyrosine, methylcarbidopa, impurities

KEY WORDS
stability-indicating; tablets

SAMPLE
Matrix: formulations
Sample preparation: Tablets. Grind tablets, weigh out a portion, dissolve in 50 mL mobile phase, sonicate, filter (No. 4 sintered glass plate), dilute, inject an aliquot. Capsules. Dissolve 10 capsules (without opening) in 100 mL mobile phase, sonicate, inject an aliquot. Injections, ampules, sprays. Dilute, inject an aliquot.

HPLC VARIABLES
Column: 120 × 4.6 Spherisorb C18 ODS-2
Mobile phase: Isopropanol:buffer 5:95 (Buffer was 100 mM sodium dodecyl sulfate containing 25 mM Na_2HPO_4, pH adjusted to 3.0 with HCl.)
Flow rate: 1
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 4.5
Limit of detection: 4 ng/mL

OTHER SUBSTANCES
Simultaneous: carbidopa, dopamine, epinephrine, hydrochlorothiazide, isoproterenol, levodopa, norepinephrine, phenylephrine

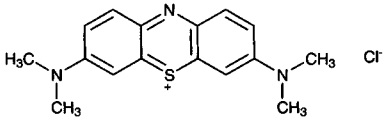
Methylene blue



Molecular formula: $C_{16}H_{18}ClN_3S$
Molecular weight: 319.86
CAS Registry No.: 61-73-4, 7220-79-3 (trihydrate)
Merck Index: 6137

SAMPLE
Matrix: blood
Sample preparation: Condition a 40 μm Sepralyte non-bonded silica SPE cartridge (Analytichem) with 1 mL 1 M HCl, with 3 mL water, and with 500 μL 2 M $(NH_4)H_2PO_4$. Centrifuge 1 mL plasma at 4° at 12000 g for 1 min, add the supernatant to the SPE cartridge at 1 mL/min, vortex the precipitate in the centrifuge tube with 500 μL 0.3% ascorbic acid in 12 mM pH 3.0 citrate buffer, add the mixture to the SPE cartridge, wash with 500 μL water, wash with 500 μL MeCN saturated with tetramethylammonium chloride, apply suction for 5 min, elute with 300 μL elution solvent by centrifuging at 4° at 2000 g for 5 min, inject an aliquot of the eluate. (The elution solvent was MeOH:1 M tetramethylammonium chloride:1 M citric acid:water 32:10:20:38.)

HPLC VARIABLES
Column: 75 × 3.9 4 μm Nova-pak ODS
Mobile phase: MeOH:THF:triethylamine phosphate solution: 1 M tetramethylammonium chloride:water 30:1:10:2:57 (Triethylamine phosphate was 67.8 mL orthophosphoric acid in 800 mL water, adjust pH to 3.0 with triethylamine, make up to 1 L with water.) (Filter mobile phase but do not degas.)
Flow rate: 1
Injection volume: 50
Detector: UV 658

CHROMATOGRAM
Retention time: 7
Internal standard: methylene blue

OTHER SUBSTANCES
Extracted: mitoxantrone

KEY WORDS
plasma; SPE; use polypropylene containers; methylene blue is IS

SAMPLE
Matrix: formulations
Sample preparation: Injections. 1 mL Injection (200 μg/mL) + 300 mg NaCl + 200 μL 10% ammonia + 5 mL dichloromethane, shake vigorously for 10 min, let stand for a few min. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 4 mL water, mix an aliquot with an equal volume of 30 μg/mL 17α-hydroxyprogesterone in MeOH, inject a 20 μL aliquot. Tablets. Weigh out amount of powdered tablets equivalent to about 200 μg compound, add 1 mL water, sonicate for 2 min, add 300 mg NaCl, add 200 μL 10% ammonia, add 5 mL dichloromethane, shake vigorously for 10 min, let stand for a few min. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 4 mL water, mix an aliquot with an equal volume of 30 μg/mL 17α-hydroxyprogesterone in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4 5 μm LiChrosorb RP-18
Mobile phase: MeCN:50 mM pH 3.5 acetate buffer 40:60 containing 1.5 mM triethylamine
Column temperature: 30
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 9
Internal standard: 17α-hydroxyprogesterone (12)

OTHER SUBSTANCES
Simultaneous: benzyl alcohol, ergonovine
Noninterfering: ascorbic acid

KEY WORDS
injections; tablets

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 125 × 4.9 Spherisorb S5W silica

Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 1.2

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

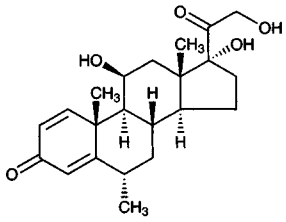
Methylprednisolone



Molecular formula: $C_{22}H_{30}O_5$
Molecular weight: 374.48
CAS Registry No.: 83-43-2, 53-36-1 (acetate), 5015-36-1 (sodium phosphate), 2375-03-3 (sodium succinate), 2921-57-5 (hemisuccinate), 90350-40-6 (suleptanate)
Merck Index: 6189
Lednicer No.: 1 193, 196

SAMPLE

Matrix: blood, urine
Sample preparation: Condition a 3 mL 500 mg Sep-Pak Vac C18 SPE cartridge with 3 mL MeOH and 3 mL water. 1 mL Serum or urine + 500 µL 200 mM pH 3.85 acetate buffer (serum only) + 400 µL 2.5 µM IS in mobile phase, mix, centrifuge. Add the supernatant to the SPE cartridge, wash with 3 mL acetone:water 20:80, 3 mL water, and 3 mL hexane. Elute with 3 mL diethyl ether into tubes containing 1 mL 200 mM NaOH, vortex, centrifuge. Dry the organic layer under a stream of nitrogen. Reconstitute the residue in 250 µL mobile phase, mix for 5 min. Inject a 60 µL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 µm Spherex C18 (Phenomenex USA)
Mobile phase: MeOH:THF:water 3:25:72
Flow rate: 1.0
Injection volume: 60
Detector: UV 254

CHROMATOGRAM

Retention time: 21.0
Internal standard: fludrocortisone (15.9)
Limit of detection: 5 nM

OTHER SUBSTANCES

Extracted: 11-deoxycortisol, dexamethasone, hydrocortisone, prednisolone

KEY WORDS

serum; SPE

REFERENCE

McWhinney,B.C.; Ward,G.; Hickman,P.E. Improved HPLC method for simultaneous analysis of cortisol, 11-deoxycortisol, prednisolone, methylprednisolone, and dexamethasone in serum and urine, *Clin.Chem.*, **1996**, *42*, 979–981.

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 245.2

CHROMATOGRAM
Retention time: 18.887

SAMPLE
Matrix: urine
Sample preparation: Activate 3-mL 500 mg Bakerbond C18 cartridge with 2 mL MeOH and 2 mL water. Filter sample. Add 2 mL urine to the SPE cartridge, wash with two 2 mL portions of 25 mM borate buffer and with 200 mL/L acetone in water. Add 1 mL hexane and air-dry under reduced pressure for 4 min. Elute with two 1 mL portions of ethyl acetate. Dry the eluate under a stream of nitrogen and dissolve in 75 μL 400 mL/L MeOH, inject a 25 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm LiChrospher 100 C18
Mobile phase: MeCN:MeOH:water 3:43:54
Column temperature: 40
Flow rate: 1
Injection volume: 25
Detector: UV 242

CHROMATOGRAM
Retention time: 39.3-40.1
Internal standard: 6α-methylprednisolone

OTHER SUBSTANCES
Extracted: hydrocortisone

Simultaneous: metabolites, alprazolam, amlodipine, aspirin, carbamazepine, citalopram, cortisone, dexamethasone, digoxin, enalapril, ferrous sulfate, fluoxetine, furosemide, gabapentin, 5-hydroxyindoleacetic acid, lamotrigine, metyrapone, naproxen, oxazepam, oxcarbazepine, oxybutynin, phenobarbital, phenytoin, prednisone, prednisolone, spironolactone, valproic acid, vigabatrin, zopiclone
Noninterfering: octreotide
Interfering: corticosterone

SAMPLE
Matrix: formulations
Sample preparation: Oils. 1 mL Sample + 25 mL MeOH:water 90:10, shake vigorously for 5 min, centrifuge, inject a 10 μL aliquot of the supernatant. Tablets. Grind a tablet to a fine powder, add 25 mL MeOH, sonicate for 5-10 min, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate. Suspensions (aqueous). Make up 5 mL to 50

mL with MeOH, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax ODS
Mobile phase: MeOH:water 75:25
Flow rate: 1.5
Injection volume: 10
Detector: UV 240

CHROMATOGRAM
Retention time: 8.0
Limit of detection: 5 μg/mL

OTHER SUBSTANCES
Simultaneous: calusterone, mesterolone (UV 210), norethandrolone, trenbolone acetate, benzyl benzoate, nandrolone acetate, testosterone acetate, stanozolol, oxymetholone, nandrolone propionate, methenolone acetate, testosterone propionate, aspirin, caffeine, formebolone, benzyl alcohol, testolactone, cortisone, fluoxymesterone, norethindrone, oxandrolone (UV 210), boldenone, ethisterone, methandrostenolone, nandrolone, norgestrel, testosterone, dehydroepiandrosterone (UV 210), mibolerone
Interfering: methandriol (UV 210), norethindrone acetate

KEY WORDS
oils; tablets; suspensions

CHROMATOGRAM
Retention time: 6.15
Limit of quantitation: 1000 ng/g

OTHER SUBSTANCES
Simultaneous: testosterone

KEY WORDS
fish; muscle; tilapia aurea; SPE

REFERENCE
Goudie,C.A. Extraction of a synthetic androgen from fish muscle and quantitation by high performance liquid chromatography, *Steroids*, **1984**, *44*, 241–252.

SAMPLE
Matrix: tissue
Sample preparation: Homogenize 1-5 g tissue in 10-50 mL chloroform:MeOH 2:1, add 0.2 volume water, centrifuge at 1800 g for 10 min, extract aqueous phase again with 2 volumes of chloroform, evaporate organic phases under vacuum, dissolve residues in MeCN, pass through a Lipidex 5000 column and a Sep Pak silica cartridge, inject an aliquot.

HPLC VARIABLES
Guard column: 25 × 3.8 5 μm ODS 2
Column: 150 × 4.6 5 μm Hypersil C8 plus 150 × 4.6 5 μm Nucleosil C18
Mobile phase: MeOH:water 75:25
Flow rate: 0.8
Injection volume: 50
Detector: F ex 340 em 470 following post-column reaction. The eluate from the column mixed with freshly prepared 0.6 mM nicotinamide-adenine dinucleotide (NAD) in 20 mM pH 9 pyrophosphate buffer pumped at 1.2 mL/min and flowed into a 950 μL static mixing chamber then through an immobilized enzyme reactor into the fluorescence detector. The Chrom Sep immobilized enzyme reactor was prepared by pumping 10 mM pH 7.8 KH_2PO_4 through it at 0.8 mL/min. Ten 100 μL samples of a solution of 25 U/mL 3α-hydroxysteroid dehydrogenase in 10 mM pH 7.8 KH_2PO_4 were injected onto the reactor which was then equilibrated with 10 mM pH 7.8 KH_2PO_4 for 20 min. The reactor was then attached to the chromatographic system.

CHROMATOGRAM
Retention time: 21.2 (5β-17-methyltestosterone), 22.6 (5α-17-methyltestosterone)
Limit of detection: 1 ng/g

KEY WORDS
immobilized enzyme reactor; fish; muscle; SPE

REFERENCE
Cravedi,J.P.; Delous,G. Use of an immobilized enzyme reactor for the analysis of residues of 17α-methyltestosterone in trout by high-performance liquid chromatography, *J.Chromatogr.*, **1991**, *564*, 461–467.

SAMPLE
Matrix: urine
Sample preparation: 10 mL Urine + glucuronidase/sulfatase (Helix pomatia), incubate at 37° for 1 h, extract twice with 5 mL diethyl ether, add 225 μL water and evaporate ether under nitrogen, add 400 μL MeOH, inject a 250 μL aliquot of this mixture.

HPLC VARIABLES
Guard column: 75 × 2.1 Corasil C18
Column: 150 × 4.6 5 μm Hypersil ODS
Mobile phase: MeOH:water 60:40
Flow rate: 2
Injection volume: 250
Detector: UV 240

CHROMATOGRAM
Retention time: 9
Limit of detection: about 6 ng/mL

OTHER SUBSTANCES
Simultaneous: 17 β-trenbolone, zeranol, trans-diethylstilbestrol, medroxyprogesterone, nandrolone

KEY WORDS
cow

REFERENCE
Jansen,E.H.; Both-Miedema,R.; van Blitterswijk,H.; Stephany,R.W. Separation and purification of several anabolics present in bovine urine by isocratic high-performance liquid chromatography, *J.Chromatogr.*, **1984**, *299*, 450–455.

SAMPLE
Matrix: urine
Sample preparation: Add 10 mL urine to a Supelclean LC-18 SPE tube at a flow rate of 2 mL/min, wash with 4 mL 25 mM sodium borate buffer, wash with 4 mL 40% MeOH, wash with 4 mL 20% acetone, elute with two 500 μL aliquots of 73% MeOH, evaporate under nitrogen at 40°, reconstitute with 1 mL mobile phase, inject a 200 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Microsorb silica
Mobile phase: Cyclohexane:ethyl acetate 40:60
Injection volume: 200
Detector: F ex 247 em 547, after post-column reaction with 30 mM $Tb(NO_3)_3$ in ethyl acetate using a 50 cm tightly coiled capillary tube to ensure mixing

CHROMATOGRAM
Retention time: 16
Limit of detection: 100 pg/mL

OTHER SUBSTANCES
Extracted: testosterone acetate, progesterone, bolasterone, testosterone

KEY WORDS
SPE; normal phase; post-column reaction

REFERENCE
Amin,M.; Harrington,K.; von Wandruszka,R. Determination of steroids in urine by micellar HPLC with detection by senstized terbium fluorescence, *Anal.Chem.*, **1993**, *65*, 2346–2351.

SAMPLE
Matrix: urine
Sample preparation: 5 mL Urine + 1 mL 200 mM pH 7.0 sodium phosphate buffer + 50 μL β-glucuronidase (E. coli K12, Boehringer Mannheim), heat at 55° for 1 h, cool to room temperature, add 1 g sodium bicarbonate:potassium carbonate 1:2, add 1 g sodium sulfate, add 5 mL n-pentane, shake for 20 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 50 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm Hypersil BDS-C18
Mobile phase: Gradient. MeCN:1 mM phosphoric acid from 25:75 to 30:70 over 10 min, to 35:65 over 6.5 min, maintain at 35:65 for 11.5 min.
Column temperature: 40
Flow rate: 1.2
Injection volume: 20
Detector: UV 240

CHROMATOGRAM
Retention time: 25
Internal standard: methyltestosterone

OTHER SUBSTANCES
Extracted: epitestosterone, testosterone

KEY WORDS
methyltestosterone is IS

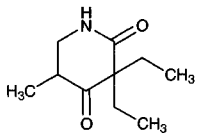
Methyprylon



Molecular formula: $C_{10}H_{17}NO_2$
Molecular weight: 183.25
CAS Registry No.: 125-64-4
Merck Index: 6216

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tol-

metin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

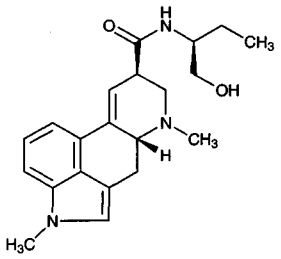
Methysergide



Molecular formula: $C_{21}H_{27}N_3O_2$
Molecular weight: 353.46
CAS Registry No.: 361-37-5, 129-49-7 (maleate)
Merck Index: 6217
Lednicer No.: 2 477

SAMPLE
Matrix: blood
Sample preparation: 2 mL Plasma + 1 mL 500 mM potassium carbonate, mix for 5 s, add 10 mL ethyl acetate, shake horizontally for 15 min, centrifuge at 700-1000 g for 5 min. Remove 8 mL of the upper organic phase and add it to 700 μL 50 mM phosphoric acid, shake horizontally for 15 min, centrifuge at 750 g for 2 min, discard the organic phase. Heat the aqueous phase at 50° in a vortex evaporator to remove residual organic solvent, inject a 400 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelcosil LC-8
Mobile phase: MeCN:10 mM pH 7 potassium phosphate buffer 30:70
Column temperature: 60
Flow rate: 1
Injection volume: 400
Detector: F ex 315 em 440

CHROMATOGRAM
Retention time: 9
Limit of detection: 0.005 ng/mL
Limit of quantitation: 0.02 ng/mL

OTHER SUBSTANCES
Extracted: methylergonovine

KEY WORDS
plasma; protect from sunlight; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: 0.1-0.7 mL Plasma or whole blood + 2.5 mL HCl/ammonia solution + 200 μL 100 nM ergometrine in water, mix, add to an Extrelut silica SPE cartridge, let stand for 20 min, elute with two 5 mL portions of ethyl acetate. Evaporate the eluate to dryness under a stream of nitrogen below 40°, reconstitute the residue in mobile phase, inject a 25-150 μL aliquot. (HCl/ammonia solution was 2 M HCl and 1 M ammonia mixed to a pH of 9.0.)

HPLC VARIABLES
Column: 250 mm long 5 μm Hypersil C18 ODS
Mobile phase: MeCN:10 mM ammonium carbonate 30:70
Flow rate: 2
Injection volume: 25-150
Detector: F ex 328 em 415

CHROMATOGRAM
Retention time: 7.0
Internal standard: ergonovine (ergometrine) (2.4)
Limit of detection: 0.6 nM

OTHER SUBSTANCES
Extracted: methylergonovine (methylergometrine)

KEY WORDS
rat; plasma; whole blood; SPE; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Add 10 μL 20 μg/mL oxaprotiline in MeOH to 990 μL plasma or serum. Inject 100 μL plasma or serum onto column A with mobile phase A and elute to waste, after 15 min elute column A onto column B with mobile phase B for 2 min. Remove column A from circuit and re-equilibrate it with mobile phase A for 5 min. Chromatograph on column B with mobile phase B.

HPLC VARIABLES
Column: A 20 × 4.6 10 μm Hypersil MOS C8; B 20 × 4.6 5 μm Hypersil CPS CN + 250 × 4.6 5 μm Nucleosil 100 CN

Mobile phase: A MeOH:water 5:95; B MeOH:MeCN:10 mM pH 6.8 potassium phosphate buffer 188:578:235
Flow rate: 1.5
Injection volume: 100
Detector: UV 214

CHROMATOGRAM
Retention time: 5.7
Internal standard: oxaprotiline (9.5)
Limit of detection: 20 ng/mL

OTHER SUBSTANCES
Simultaneous: clozapine, fluvoxamine, doxepin, amitriptyline, clomipramine, fluoxetine, imipramine, norfluoxetine, nortriptyline, desipramine, maprotiline
Noninterfering: haloperidol, spiroperidol, pimozide, fluspirilene, trifluperidol, perazine, chlordiazepoxide, clobazam, diazepam, nordiazepam, flurazepam, lorazepam, nitrazepam, oxazepam, carbamazepine

KEY WORDS
plasma; serum; column-switching

REFERENCE
Härtter,S.; Wetzel,H.; Hiemke,C. Automated determination of fluvoxamine in plasma by column-switching high-performance liquid chromatography, *Clin.Chem.*, **1992**, *38*, 2082–2086.

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 275

CHROMATOGRAM
Retention time: 3.92
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, tissue

Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM

Retention time: 1.38
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES

Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, mianserin, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, trazodone, trihexyphenidyl, trimipramine, triprolidine

Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine

Interfering: moclobemide, tranylcypromine, pentobarbital

KEY WORDS
serum; whole blood; liver

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. Condition a 3 mL C8 Analytichem SPE cartridge with 1 volume (2.7 mL) MeOH and 1 volume buffer A, do not allow to dry. Mix 1 mL plasma + 100 μL 10 μg/mL amisulpride and 10 μg/mL alpiropride in 10 mM HCl + 1 mL buffer A, add to SPE cartridge, rinse the sample container with 1 mL buffer A and add the rinse to the SPE cartridge, wash with 1 volume water, wash with 2 mL buffer B, dry the column for 1 min, wash with 200 μL acetone, dry for 30 s, elute with 1 mL buffer C, add 50 μL buffer D, evaporate to dryness under a stream of air, reconstitute in 200 μL mobile phase, sonicate for 1 min, inject an aliquot. Urine. Connect a Baker 3 mL ion exchange quaternary aminesilicane-bonded silica gel SPE cartridge on top of a 3 mL Baker carboxylic acid-bonded silica gel SPE cartridge, condition with 1 volume (2.7 mL) buffer D, 1 volume of water, 1 volume of MeOH, and 1 volume of water. Mix 1 mL urine + 100 μL 10 μg/mL amisulpride and 10 μg/mL alpiropride in 10 mM HCl + 1 mL water, add to SPE cartridges, rinse the sample container with 2 mL water and add the rinse to the SPE cartridges, wash with 1 mL water, remove the top column, wash the bottom column with 1 volume of water and 2 volumes of MeOH, dry the column for 1 min, elute with 1 mL buffer D, evaporate the eluate to dryness under a stream of air at 45°, reconstitute in 200 μL mobile phase, sonicate for 1 min, inject an aliquot. (Buffer A was 10 mL triethylamine in 1 L water, pH adjusted to 7.00 with acetic acid. Buffer B was MeOH:water 20:80. Buffer C was 10 mL triethylamine + 7 mL acetic acid in 1 L MeOH. Buffer D was 2.10 mL concentrated HCl in 250 mL MeOH (100 mM).)

HPLC VARIABLES
Guard column: 10 cm long Chrompack reverse-phase pellicular material
Column: 250 × 4.6 10 μm LiChrosorb RP-8
Mobile phase: MeCN:MeOH:buffer 160:80:760 (Buffer was 10 mL triethylamine + 760 mL water adjusted to pH 6.8 with acetic acid (about 4.2 mL).)
Flow rate: 2
Injection volume: 175
Detector: UV 230

CHROMATOGRAM
Retention time: 7.1
Internal standard: amisulpride (4.9), alpiropride (6.0)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Simultaneous: alizapride, aspirin, theophylline, acetaminophen, caffeine, isosorbide-5-mononitrate, nitrofurantoin, codeine, acenocoumarol, carbamazepine, nitrazepam, clonazepam
Noninterfering: indomethacin, orphenadrine, furosemide, cisplatin, amitriptyline, isosorbide dinitrate, propranolol

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 250 μL Plasma + 300 μL 2 M NaOH, vortex for 30 s, add 5 mL dichloromethane, mix for 2 min, centrifuge at 10000 rpm for 15 min. Remove the organic layer

and evaporate to dryness under nitrogen. Reconstitute the residue in 150 μL mobile phase, inject a 50 μL aliquot. Urine. Dilute 100 μL urine + 75 μL 2 mg/mL metoclopramide to 10 mL with water, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Spherisorb S 5 ODS II
Mobile phase: MeCN:MeOH:buffer 60:30:5 pH adjusted to 3.8 with glacial acetic acid (Buffer was 50 mM ammonium acetate containing 10 mM sodium octane sulfonate.)
Flow rate: 1.2
Injection volume: 50
Detector: UV 330

CHROMATOGRAM
Retention time: 8
Internal standard: metoclopramide

OTHER SUBSTANCES
Simultaneous: oxazepam, desmethyldiazepam, chlorodiazepam, diazepam, theophylline, theobromine, acetaminophen, chlorpromazine, ranitidine

KEY WORDS
plasma; metoclopramide is IS

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a 100 mg Isolute MF C18 (International Sorbent Technology) SPE cartridge with 2 mL MeCN, 2 mL water, and 500 μL buffer. Mix 1 mL urine and 25 mL water. Mix 1 mL diluted urine or plasma with 1 mL buffer, vortex, add to the SPE cartridge, wash with 1 mL buffer, wash with 1 mL MeCN:water 30:70, wash with 80 μL MeOH, air dry for 30 s, elute with 500 μL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 250 μL mobile phase, inject a 100 μL aliquot. (Prepare buffer by dissolving 6.18 g boric acid and 7.46 g KCl in 1 L water. Mix 500 mL of this solution with 185 mL 100 mM NaOH, pH 9.)

HPLC VARIABLES
Guard column: 20 × 4.6 40 μm Pelliguard Si
Column: 250 × 4.6 Chiralpak AS amylose carbamate (J.T. Baker)
Mobile phase: n-Heptane:EtOH:diethylamine 70:29.8:0.2
Column temperature: 28
Flow rate: 0.5
Injection volume: 100
Detector: F ex 280 em 370

CHROMATOGRAM
Retention time: 11.5
Internal standard: metoclopramide

OTHER SUBSTANCES
Extracted: amisulpride

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 213.4

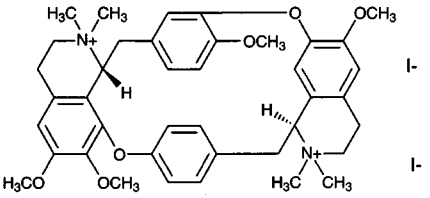
Metocurine iodide



Molecular formula: $C_{40}H_{48}I_2N_2O_6$
Molecular weight: 906.64
CAS Registry No.: 7601-55-0
Merck Index: 6227

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg Bond Elut C18 SPE cartridge with 2 column volumes of THF, 2 volumes of MeOH, and 2 volumes of water. 1 mL Plasma + 100 μL 5 μg/mL D-tubocurarine chloride in 10 mM HCl, add to the SPE cartridge, wash with 2 volumes of water, elute with 250 μL mobile phase. Evaporate the eluate and reconstitute with 100 μL mobile phase, vortex, centrifuge at 12800 g for 5 min, inject an aliquot.

HPLC VARIABLES
Guard column: 10 μm CN Guard-Pak (Waters)
Column: 10 μm Radial-Pak CN (Waters)
Mobile phase: MeCN:MeOH:water:1 M pH 2.5 dibutylamine phosphate 40:10:10:1
Flow rate: 2.4
Detector: UV 204

CHROMATOGRAM
Retention time: 13.2
Internal standard: D-tubocurarine chloride (5.9)
Limit of quantitation: 25 ng/mL

KEY WORDS
SPE; plasma; pharmacokinetics

REFERENCE
Avram,M.J.; Shanks,C.A. Determination of D-tubocurarine chloride or metocurine iodide in human plasma by high-performance liquid chromatography with ultraviolet detection, *J.Chromatogr.*, **1984**, *306*, 398–404.

SAMPLE
Matrix: blood
Sample preparation: 250 μL Plasma + 250 μL picric acid (1:50 dilution of saturated picric acid solution) + 250 μL tubocurarine solution + 250 μL water + 2.5 mL dichloromethane:isopropanol 85:15, vortex for 15 s, centrifuge at 1500 g for 10 min. Remove the organic phase and evaporate it to dryness at 40° under a stream of nitrogen, reconstitute the residue in 150-250 μL MeCN: water 40:60, centrifuge at 1500 g for 4 min, inject a 20-100 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 μPorasil
Mobile phase: MeCN:2 mM sulfuric acid 50:50
Flow rate: 2
Injection volume: 20-100
Detector: UV 210

CHROMATOGRAM
Retention time: 5.3
Internal standard: tubocurarine (3.7)
Limit of detection: 25 ng/mL

OTHER SUBSTANCES
Also analyzed: atracurium, alcuronium

KEY WORDS
plasma

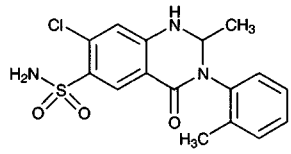
Metolazone



Molecular formula: $C_{16}H_{16}ClN_3O_3S$
Molecular weight: 365.84
CAS Registry No.: 17560-51-9
Merck Index: 6231
Lednicer No.: 2 384

SAMPLE
Matrix: blood
Sample preparation: Clean an Amalytichem C2 ethyl sorbent cartridge with 1 mL MeCN and 1 mL buffer. 25 μL Plasma + 1 mL buffer, add to cartridge, wash with 1 mL buffer, blow dry with nitrogen for 1 min, elute cartridge directly on to column (Varian AASP system). (Buffer was 10 mM KH_2PO_4 adjusted to pH 3.0 with concentrated phosphoric acid.)

HPLC VARIABLES
Guard column: 3 × 4.6 30 μm C18 Alltech pellicular packing
Column: 150 × 4.6 5 μm Nucleosil C18
Mobile phase: MeCN:10 mM KH_2PO_4 adjusted to pH 3.0 with concentrated phosphoric acid 30:70
Flow rate: 1.5
Detector: F ex 272 em 410

CHROMATOGRAM
Retention time: 8.3
Internal standard: metolazone

OTHER SUBSTANCES
Noninterfering: bumetanide, chlorothiazide, hydrochlorothiazide, chlorthalidone, ibuprofen, acetaminophen, salicylic acid

KEY WORDS
plasma; SPE; metolazone is IS

SAMPLE

Matrix: blood

Sample preparation: Condition a C2 ethyl SPE cartridge (Analytichem) with 1.5 mL MeCN:MeOH 50:50 and 1.5 mL buffer. 500 μL Whole blood + 1.5 mL water, vortex for 15 s, centrifuge at 13000 g for 5 min. 250 μL Plasma or diluted whole blood + 25 μL 1 μg/mL IS in water + 250 μL buffer, add to the SPE cartridge, wash with 1 mL MeOH:buffer 10:90, wash with 1 mL hexane, purge with nitrogen for 1 min, elute the contents of the SPE cartridge onto the column with mobile phase. (Buffer was 25 mM (?) K_2HPO_4 adjusted to pH 7.0 with concentrated phosphoric acid.)

HPLC VARIABLES

Guard column: 30 mm long 40-50 μm pellicular C18
Column: 100 × 4.6 3 μm Spherisorb ODS C18
Mobile phase: MeCN:KH_2PO_4 30:70 adjusted to pH 3.0 with concentrated phosphoric acid
Flow rate: 1
Detector: F ex 235 em 410

CHROMATOGRAM

Retention time: 5.83
Internal standard: 7-chloro-1,2,3,4-tetrahydro-2-methyl-3-(3-methylphenyl)-4-oxo-6-quinazolinesulfonamide (7.40)
Limit of detection: 0.02 ng/mL
Limit of quantitation: 1 ng/mL

OTHER SUBSTANCES

Noninterfering: bumetanide, furosemide, hydrochlorothiazide, ibuprofen, indomethacin

KEY WORDS

plasma; whole blood; protect from light; SPE

SAMPLE

Matrix: urine
Sample preparation: 2 mL Urine + 2 mL 1 M pH 4.1 NaH_2PO_4 + 4 mL ethyl acetate, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic phase and add it to 5 mL 100

mM pH 7.5 Na_2HPO_4, vortex for 2 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL MeCN:10 mM pH 3.0 phosphate buffer, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm LiCHrosorb RP-18
Mobile phase: Gradient. MeCN:10 mM pH 3.0 phosphate buffer 10:90 for 1.5 min then to 35:65 over 2 min
Column temperature: 50
Flow rate: 1.5
Injection volume: 5
Detector: UV 271

CHROMATOGRAM
Retention time: 5.3
Limit of quantitation: 1000 ng/mL

OTHER SUBSTANCES
Extracted: chlorothiazide, hydrochlorothiazide, quinethazone, chlorthalidone, clopamide, methyclothiazide, furosemide, mefruside, bendroflumethiazide, cyclopenthiazide, bumetanide
Simultaneous: indapamide, clorexolone, ethacrynic acid
Noninterfering: aspirin, albuterol, allopurinol, alprenolol, atenolol, captopril, carbimazole, clonidine, coloxyl, danthron, diazepam, digoxin, doxepin, glibenclamide, hydralazine, indomethacin, labetalol, metformin, methyldopa, metoprolol, mianserin, minoxidil, nifedipine, nitrazepam, oxazepam, oxprenolol, pindolol, prazosin, propranolol, senokot, theophylline, trifluoperazine

SAMPLE
Matrix: urine
Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)
Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)
Flow rate: 1
Injection volume: 5
Detector: UV 230, UV 275

CHROMATOGRAM
Retention time: 12.16 (A), 12.3 (B)
Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))
Limit of detection: 1000 ng/mL

OTHER SUBSTANCES
Extracted: amiloride, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, flumethiazide, hydroflumethiazide, chlorthalidone, dichlorphenamide, trichloromethiazide, methyclothiazide, benzthiazide, cyclothiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone

Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil
Interfering: furosemide

SAMPLE
Matrix: blood
Sample preparation: Add 1.5 mL MeCN to 500 μL serum, centrifuge, evaporate the supernatant to dryness, redissolve the residue in 200 μL water. Inject onto column A, wash with MeCN:

water 10:90 or MeOH:water 20:80 for 20 min, backflush the contents of column A onto column B with mobile phase, elute with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 25 × 4 25 μm pore diameter 6 nm LiChrospher RP-18 ADS (Merck); B 125 × 4 5 μm endcapped LiChroCART HPLC-cartridge RP-18 (Merck)
Mobile phase: MeCN:50 mM pH 4 K_3PO_4 buffer 27:73
Column temperature: 40
Flow rate: 1
Injection volume: 200
Detector: UV 242, UV 230

CHROMATOGRAM

Retention time: 3.0

OTHER SUBSTANCES

Extracted: celiprolol, tiracizine, talinolol, oxprenolol, metabolites

KEY WORDS

serum; column-switching

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 50 μL 200 μg/mL (R)-(-)-flecainide in water + 1 mL pH 11 borate buffer, mix, add 5 mL diisopropyl ether (Caution! Diisopropyl ether readily forms explosive peroxides!), shake on a reciprocal shaker for 15 min, centrifuge at -10° at 4000 rpm, freeze in dry ice/acetone. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 100 μL 10 mM HCl, adjust pH to 11 with 200 μL borate buffer, add 50 μL 100 μg/mL (+)-4-(6-methoxy-2-naphthyl)-2-butyl chloroformate in MeCN, mix, let stand at room temperature for 1 h, add 3 mL dichloromethane, swirl mix for 30 s. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 100 μL n-hexane:MeOH 100:6, inject a 20 μL aliquot. (Synthesis of (+)-4-(6-methoxy-2-naphthyl)-2-butyl chloroformate is as follows. Slowly add 2 mmoles 4-(6-methoxy-2-naphthyl)-2-butanone (nabumetone) in 20 mL anhydrous diethyl ether to 0.55 mmoles lithium aluminum hydride in anhydrous diethyl ether, when the reaction is complete (monitor by TLC) cautiously add water, add 6 M HCl, remove the organic layer. Extract the aqueous layer 3 times with 10 mL portions of diethyl ether. Combine the organic layers and dry them over anhydrous sodium sulfate, evaporate to dryness to obtain racemic 4-(6-methoxy-2-naphthyl)-2-butanol. Dissolve 0.5 mmole 4-(6-methoxy-2-naphthyl)-2-butanol in 20 mL dry dichloromethane, add 0.55 mmole dry pyridine, stir, add 1 mmole (1S)-(-)-camphanoyl chloride ((1S)-(-)-camphanic chloride) in small portions, stir at room temperature overnight, wash 3 times with 1 M HCl, wash with water, wash with saturated sodium bicarbonate solution, wash with water until neutral. Dry the organic layer over anhydrous magnesium sulfate, evaporate to dryness to obtain the camphanoyl ester. Purify by preparative HPLC (250 × 50 (R)-DNBPG (J.T. Baker), n-hexane:isopropanol 70:30, 65 mL/min, UV 220) to obtain diastereomerically pure camphanoyl esters. Add 5 mmole diastereomerically pure camphanoyl ester dissolved in 30 mL dry diethyl ether dropwise under argon to 2.5 mmoles lithium aluminum hydride stirred in diethyl ether at 0°, stir at room temperature for 1 h, stir in an ice bath, cautiously add 10% aqueous ammonium chloride, remove the organic layer, extract the aqueous layer three times with diethyl ether. Combine the organic layers and dry them over anhydrous magnesium sulfate, evaporate to dryness. Dissolve 1 g in 10 mL dichloromethane, purify by flash chromatography on a 500 × 40 column filled with 200 g 40-63 μm silica gel 60 using dichloromethane:MeOH 99.5:0.5 at 45 mL/min to obtain enantiomerically pure 4-(6-methoxy-2-naphthyl)-2-butanol. Dissolve 0.5 mmole (+)-4-(6-methoxy-2-naphthyl)-2-butanol and 0.5 mmole triethylamine in 10 mL dry toluene, cool to 0°, stir, add 1 mL 20% phosgene in dry toluene, stir for 4 h, filter, evaporate under reduced pressure to obtain (+)-4-(6-methoxy-2-naphthyl)-2-butyl chloroformate as an oil.)

HPLC VARIABLES

Guard column: 20 × 4 6 μm Ultrasep ES 100 (Bischoff, Germany)

Column: 125 × 3 3 μm Nucleosil 120
Mobile phase: n-Hexane:MeOH 100:0.4
Flow rate: 1
Injection volume: 20
Detector: UV 230, F ex 270 em 350

CHROMATOGRAM
Retention time: 24.5 ((S)-(-)), 26.5 ((R)-(+))

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

SAMPLE
Matrix: bulk

Sample preparation: Dissolve 10 μmole compound (as free base or hydrochloride) in 500 μL MeCN, add 250 μL 5% sodium carbonate (for hydrochlorides only), add 500 μL 100 mM reagent in MeCN, vortex for 1 min, heat at 60° for 2 h, add 100 μmole L-proline, heat at 60° for 30 min. Remove a 100 μL aliquot and dilute it with mobile phase, neutralize with acetic acid, inject a 10 μL aliquot. Prepare the reagent ((R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate) as follows. Add 0.7 mL carbon disulfide to 6 mL (1R,2R)-(-)-1,2-diaminocyclohexane, 12 mL water, and 12 mL EtOH, heat the oil bath to 80°, add 2.8 mL carbon disulfide dropwise (making sure that the product does not start to precipitate), when addition is complete reflux for 1 h, acidify with 500 μL 5 M HCl, reflux for 12 h, cool, filter, wash the solid with a little cold EtOH to give trans-4,5-tetramethyleneimidazolidine-2-thione as a white fluffy solid (mp 148-150°) (Tetrahedron 1993, 49, 4419). Stir 7.97 g 3,5-dinitrobenzoyl chloride in 30 mL dichloroethane at 50°, add a solution of 6 g trans-4,5-tetramethyleneimidazolidine-2-thione in 120 mL dichloroethane containing a catalytic amount of 4-(dimethylamino)pyridine over 15 min, reflux for 2 h, remove the crystals of (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate by filtration, evaporate the filtrate to dryness and dissolve the residue in 60 mL dichloroethane, reflux for 16 h to obtain more (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate (mp >250°, $[\alpha]_{546}$ = -133° (c = 1) in MeCN).

SAMPLE
Matrix: blood, urine
Sample preparation: 100 μL Urine or 1 mL plasma + 100 ng IS + 1 mL MeCN, centrifuge. Remove supernatant and add it to 1 mL buffer, add 6 mL dichloromethane:petroleum ether: isopropanol 45:45:10, rotate for 10 min. Remove the upper organic layer and evaporate it under nitrogen at 60°. Dissolve residue in 100 μL mobile phase, inject. (Buffer contained 80 g $NaHCO_3$ and 30 g K_2CO_3 per liter, pH 9.5.)

HPLC VARIABLES
Column: 466 × 5 5 μm Spherisorb ODS
Mobile phase: MeCN:MeOH:45 mM pH 4.5 KH_2PO_4 40:3:57, containing 40 g/L $NaClO_4$ and 40 g/L trimethylammonium chloride
Flow rate: 1
Injection volume: 100
Detector: UV 338

CHROMATOGRAM
Retention time: 3.8
Internal standard: 4-(3-dimethylaminopropyl)-4-chloroquinoline (5)
Limit of quantitation: < 10 ng/mL

OTHER SUBSTANCES
Simultaneous: chloroquine

KEY WORDS
plasma

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the

residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 320

CHROMATOGRAM
Retention time: 6.778

KEY WORDS
whole blood

SAMPLE
Matrix: formulations
Sample preparation: Grind tablets to a fine powder and weigh out powder equivalent to about 80 mg metronidazole, add 90 mL water, heat to 60° with stirring, cool to room temperature, make up to 100 mL with water, filter, reject first 20 mL of filtrate. Mix 12.5 mL filtrate with 7 mL 10 mg/mL phenylpropanolamine hydrochloride in water, make up to 50 mL with water, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 4 10 μm μBondapak phenyl
Mobile phase: 20 mM KH_2PO_4, pH 4.2
Flow rate: 2.5
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 7
Internal standard: phenylpropanolamine hydrochloride (3.5)

OTHER SUBSTANCES
Noninterfering: mannitol, excipients

SAMPLE

Matrix: tissue
Sample preparation: Condition a 1 mL Accubond C18 SPE cartridge (J&W Scientific) with three 1 mL portions of MeOH and three 1 mL portions of water. Homogenize (Tekmar tissuemiser) 250 ng vaginal tissue, 1 mL water, and 1 mL 400 ng/mL tinidazole in water in ice for 30 s, rinse homogenizer. Combine homogenate and rinse and add 100 μL 5% trichloroacetic acid, mix, centrifuge at 1500 g for 30 min, remove the supernatant, wash the precipitate with 1 mL water. Add the supernatant and the wash to the SPE cartridge, wash with two 1 mL portions of water, dry under vacuum for 10 min, elute with four 250 μL aliquots of MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 1 mL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Zorbax SB-phenyl
Mobile phase: MeOH:buffer 15:85 (Buffer was 10 mM KH_2PO_4 adjusted to pH 4.0 with 10% phosphoric acid
Flow rate: 1
Injection volume: 100
Detector: UV 313

CHROMATOGRAM

Retention time: 9.2
Internal standard: tinidazole (23.2)
Limit of detection: 100 ng/g

OTHER SUBSTANCES

Simultaneous: cefazolin, cefmetazole, cephalexin

SAMPLE
Matrix: blood
Sample preparation: 1 mL serum + 250 μL triethylamine + 100 μL 1 M NaOH + 100 μL 2 μg/mL IS in 10 mM HCl + 1.75 mL dichloromethane, rotate slowly for 20 min, centrifuge at 3600 g for 10 min. Remove 1 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 500 μL 10 mM HCl, inject a 200 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Hypersil CPS (CN)
Mobile phase: MeCN:buffer 5:95 (Buffer was 973.5 mL water, 25 mL PIC B-8 low-UV reagent + 1 mL butylamine + 0.5 mL PIC D-4 reagent.)
Flow rate: 2
Injection volume: 200
Detector: UV 215

CHROMATOGRAM
Retention time: 21
Internal standard: 1-(2,4-dimethylphenoxy)-2-aminopropane hydrochloride (KOE 768-CL) (29)
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Noninterfering: acebutolol, acenocoumarol, amiodarone, aspirin, atenolol, betaxolol, digoxin, dipyridamole, flecainide, furosemide, hydrochlorothiazide, metoprolol, nifedipine, phenprocoumon, pindolol, propafenone, quinidine, sotalol, spironolactone, sulfinpyrazone, triamterene, verapamil

KEY WORDS
serum

Krämer,B.K.; Ress,K.M.; Mayer,F.; Kühlkamp,V.; Liebich,H.M.; Risler,T.; Seipel,L. Rapid high-performance liquid chromatographic method for the quantification of mexiletine and its metabolites in serum, *J.Chromatogr.*, **1989**, *493*, 414–420.

SAMPLE
Matrix: blood
Sample preparation: 500 μL Serum or plasma + 100 μL 500 mM sodium carbonate + 100 μL 5 μg/mL N-propionylprocainamide in water, mix gently, add 5 mL dichloromethane, shake gently for 5 min, centrifuge. Remove the lower organic layer and add it to 200 μL 10 mM HCl, vortex for 15 s, centrifuge, inject a 20 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 100 × 5 NovaPak cyano HP radial compression
Mobile phase: MeCN:buffer 10:90, final pH adjusted to 6.0 (Buffer was 5 mM acetate buffer containing 0.05% triethylamine.)
Flow rate: 1.5
Injection volume: 20
Detector: UV 210

CHROMATOGRAM
Retention time: 6.8
Internal standard: N-propionylprocainamide (5.9)
Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Simultaneous: N-acetylprocainamide, disopyramide, lidocaine, procainamide, quinidine, tocainide
Noninterfering: carbamazepine, desmethyldoxepin, digoxin, doxepin, ethosuximide, lithium, phenobarbital, phenytoin, primidone, propranolol, theophylline, valproic acid

KEY WORDS
serum; plasma

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 0.4 μg/mL methylmexiletine hydrochloride in water + 1 mL 150 mM barium hydroxide + 1 mL 170 mM zinc sulfate, vortex, add 500 μL 2 M NaOH, extract twice with 5 mL portions of diethyl ether. Combine the organic layers and evaporate them to dryness at 45°, reconstitute the residue in 20 μL 30 mM HCl, add 60 μL 100 mM sodium borate, add 60-80 μL reagent, keep at 4°, inject an aliquot. (Reagent was 40 mg o-phthalaldehyde and 50 mg N-acetyl-L-cysteine in 5 mL MeOH, prepare daily.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Apex C18 (Jones Chromatography)
Mobile phase: MeOH:50 mM sodium acetate 65:35, pH 7.3
Flow rate: 1
Injection volume: 100
Detector: F ex 350 em 445

CHROMATOGRAM
Retention time: 14 (S-(+)), 15 (R-(-))
Internal standard: methylmexiletine (23, 24 (enantiomers))
Limit of detection: 1.5 ng/mL

OTHER SUBSTANCES
Noninterfering: metabolites

KEY WORDS
chiral; plasma; pharmacokinetics; derivatization

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 200 μL Serum + 30 μL 1 μg/mL IS in water + 200 μL 300 mM barium hydroxide, vortex, add 200 μL 300 mM zinc sulfate, add 200 μL 2 M NaOH, add 5 mL diethyl ether, vortex, centrifuge at 2000 g for 5 min, repeat extraction. Combine the organic layers and evaporate them to 1 mL under a stream of nitrogen at 37°, add 300 μL 100 mM HCl, vortex, discard the ether layer. Wash the aqueous layer with 2 mL diethyl ether, add 300 μL 2 M NaOH to the aqueous layer, add 10 μL 1 mg/mL 2-anthroyl chloride in dry dichloromethane, vortex for 3 min, extract with 1 mL dichloromethane. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 200 μL mobile phase, inject an aliquot. (Prepare 2-anthroyl chloride as follows. Reflux 500 mg anthra-

quinone-2-carboxylic acid with 30 mL 14% aqueous ammonia, add 2 g zinc dust in small portions over 30 min, reflux with stirring for 1 h, filter, acidify the filtrate to pH 3 with dilute HCl, filter, recrystallize from hot EtOH to give 2-anthracenecarboxylic acid (mp 278-279°, yield 230%). Add 100 mg 2-anthracenecarboxylic acid in 100 mL dry benzene (Caution! Benzene is a carcinogen!) to 500 μL oxalyl chloride with stirring, heat slowly on a water bath for 30 min, add 500 μL oxalyl chloride, heat for 30 min, cool, filter. Evaporate the filtrate to obtain 40 mg pale yellow 2-anthroyl chloride. Purify by dissolving in dichloromethane and precipitating with hexane. Purify further by HPLC by injecting 100 μL aliquots of a 50 mg/mL solution in MeCN onto a 250 × 9.4 10 μm ODS-2 Magnum-9 (Whatman) column and eluting with MeCN at 0.7 mL/min. Using a UV 230 detector collect the appropriate fraction (about 11 min) and evaporate to dryness to obtain pure compound.)

HPLC VARIABLES

Guard column: 150 × 4.6 5 μm silica (Alltech)
Column: 250 × 4.6 5 μm Pirkle 1-A phenylglycine (Regis)
Mobile phase: Hexane:isopropanol:chloroform 78:7:15
Flow rate: 0.8
Injection volume: 20
Detector: F ex 270 em 420

CHROMATOGRAM

Retention time: 11.5 (R-(-)), 12.5 (S-(+))
Internal standard: 1-(2',6'-dimethylphenoxy)-2-ethanamine hydrochloride (Boehringer Ingelheim KPE-2963) (14.5)
Limit of detection: 0.5 ng/mL
Limit of quantitation: 2.5 ng/mL

KEY WORDS

derivatization; serum; chiral; pharmacokinetics

SAMPLE

Matrix: blood
Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 μL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 μL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES

Guard column: LC-8-DB (Supelco)
Column: 150 × 4.6 LC-8-DB (Supelco)
Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 2
Injection volume: 100
Detector: UV 228

CHROMATOGRAM

Retention time: 1.4
Internal standard: protriptyline (4)

OTHER SUBSTANCES

Extracted: acetazolamide, amitriptyline, chlordiazepoxide, chlorimipramine, chlorpromazine, desipramine, dextromethorphan, diazepam, diphenhydramine, doxepin, fentanyl, flecainide, fluoxetine, flurazepam, haloperidol, hydroxyethylflurazepam, ibuprofen, imipramine, maprotiline, methadone, methaqualone, midazolam, norchlorimipramine, nordiazepam, nordoxepin, norfluoxetine, nortriptyline, norverapamil, pentazocine, promazine, propafenone, propoxyphene, propranolol, protriptyline, temazepam, trazodone, trimipramine, verapamil

Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin

Interfering: encainide, lidocaine, quinidine

KEY WORDS

plasma; SPE

SAMPLE
Matrix: bulk
Sample preparation: Reflux a 10% excess of reagent in toluene for 10 min, add the drug, let stand at room temperature for 10 min, cool, dilute, inject an aliquot. (The reagent was N-(p-toluenesulfonyl)prolyl azide and was prepared as follows. Mix 40-45 mmoles L-(-)-proline, 40 mL THF, and 200 mL 10% potassium carbonate, add 37-43 mmoles p-toluenesulfonyl chloride in 40 mL THF dropwise, heat at 50° and maintain at pH 8 or above for 3 h, cool, acidify to pH 2, extract with chloroform. Extract the organic layers with potassium carbonate in water. Acidify the aqueous layer and extract it with chloroform. Dry the chloroform layer and evaporate it to dryness, recrystallize the resulting 1-[(p-toluene)sulfonyl]proline from petroleum ether and benzene (Caution! Benzene is a carcinogen!) (Anal.Chem. 1984, 56, 958). Suspend 86 mmoles 1-[(p-toluene)sulfonyl]proline in 15 mL water and add sufficient acetone to give a clear solution, cool to 0°, add 10.2 g triethylamine in 175 mL acetone, slowly add 12.5 g ethyl chloroformate in 45 mL acetone while maintaining the temperature at 0°, stir at 0° for 30 min, add dropwise 8.6 g sodium azide in 30 mL water, stir at 0° for 1 h, pour into ice water, extract with ether, dry over anhydrous magnesium sulfate, evaporate under reduced pressure at room temperature to give N-(p-toluenesulfonyl)prolyl azide (cf J.Org.Chem. 1961, 26, 3511).)

SAMPLE
Matrix: microbial broth
Sample preparation: Dilute microbial broth 1:20. 250 μL Diluted microbial broth + 5 μg IS + 100 μL 200 mM sodium carbonate, add 2 mL diethyl ether, vortex for 15 s, centrifuge at 1800

g for 4 min, remove 1.5 mL of the ether layer, repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 300 μL chloroform, add 75 μL 0.1% S-(+)-1-(1-naphthyl)ethyl isocyanate in chloroform, vortex for 10 s, evaporate to dryness under a stream of nitrogen. Reconstitute the residue in 220 μL chloroform, add 30 μL 0.33% n-butylamine in chloroform, inject a 10-65 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 Partisil 5
Mobile phase: Hexane:chloroform:MeOH 65:34:1
Flow rate: 0.8 for 12 min then 2.5 for 23 min
Injection volume: 10-65
Detector: F ex 280 em 340

CHROMATOGRAM
Retention time: 7.0 (S-(+)), 7.6 (R-(-))
Internal standard: prenalterol ((±)-1-(4-hydroxyphenoxy)-3-isopropylaminopropan-2-ol) (27.7, 32.4 (enantiomers))
Limit of quantitation: 400 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
chiral; derivatization; normal phase

REFERENCE
Freitag,D.G.; Foster,R.T.; Coutts,R.T.; Pasutto,F.M. High-performance liquid chromatographic method for resolving the enantiomers of mexiletine and two major metabolites isolated from microbial fermentation media, *J.Chromatogr.*, **1993**, *616*, 253–259.

SAMPLE
Matrix: solutions
Sample preparation: Mix a 50 μL aliquot of a solution in MeOH:triethylamine 99:1 with 20 μL 0.1% FLOPIC in dry toluene, vortex briefly, let stand at room temperature in the dark for 30 min, add 50 μL 1% ethanolamine in MeOH, let stand at room temperature for 15 min, evaporate to dryness under reduced pressure, reconstitute with 100 μL mobile phase, sonicate for 30 s, inject a 20 μL aliquot. (FLOPIC is (-)-(S)-flunoxaprofen isocyanate; synthesis is as follows. Dissolve 1 g (+)-(S)-flunoxaprofen in 30 mL acetone, cool to 0°, add a solution of 500 μL triethylamine in 2 mL acetone dropwise, add a solution of 370 μL ethyl chloroformate in 2 mL acetone dropwise, stir at 0° for 15 min, add a solution of 250 mg sodium azide in 1 mL water dropwise (Caution! Sodium azide is highly toxic!), stir for 1 h, pour into 60 mL ice water, stir for 10 min, filter, wash the solid with two 50 mL aliquots of ice-water, dry under reduced pressure to obtain flunoxaprofen azide. Dissolve 100 mg flunoxaprofen azide in 3 mL dry toluene, reflux for 10-15 min, cool to room temperature, filter. Evaporate the filtrate to dryness under reduced pressure and dry under reduced pressure to obtain FLOPIC as a crystalline solid (mp 93-94°), store in a desiccator under reduced pressure.)

HPLC VARIABLES
Column: 150 × 3.9 4 μm Nova Pak C18
Mobile phase: MeOH:water:THF 62:35:3
Flow rate: 1
Injection volume: 20
Detector: F ex 296 em 356

CHROMATOGRAM
Retention time: 20.9 (S), 22.7 (R)

OTHER SUBSTANCES
Simultaneous: flecainide

KEY WORDS
derivatization; chiral

Enantiomeric separation and spectrofluorometric detection of the racemic drugs, (±)-1-(2,5-dimethylphenoxy)-2-propamine (mexiletine) and (3RS)-4-amino-3-hydroxybutanoic acid (GABOB), derivatized with 4-fluoro-7-nitro-2,1,3-benzoxadiazole on a phenylcarbamylated cyclodextrin bonded stationary phase, *Analyst*, **1995**, *120*, 381–383.

SAMPLE
Matrix: solutions

Sample preparation: Mix 20 µL of a 1 mM solution in MeOH or water with 50 µL pH 8 borate buffer and 50 µL 18 mM 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate in acetone, vortex, let stand at room temperature for 30 min, add 100 µL 10 mM trans-4-hydroxy-L-proline in water, mix, let stand for 2 min, add 2 mL dichloromethane, vortex for 30 s. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 100 µL mobile phase, inject an aliquot. Prepare 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate as follows. Stir 1.5 mmoles lithium aluminum hydride in THF, slowly add 2 mmoles (S)-naproxen in 20 mL anhydrous THF, reflux for 1 h, evaporate most of the solvent, cautiously add water with stirring, acidify with 6 N HCl, extract three times with diethyl ether. Combine the organic layers and dry them over anhydrous sodium sulfate, evaporate to dryness, chromatograph on silica gel with dichloromethane:MeOH 100:2 (flash chromatography), evaporate eluate to dryness, dry under vacuum over KOH to give 2-(6-methoxy-2-naphthyl)propanol as a white solid (mp 92-3°). Stir 0.5 mmoles 2-(6-methoxy-2-naphthyl)propanol and 0.5 mmoles triethylamine in 10 mL dry toluene at 0°, add 1 mL 20% phosgene in toluene (Caution! Phosgene is highly toxic, perform reaction in a chemical fume hood!) (Fluka), stir for 4 h, filter, evaporate to dryness under reduced pressure, dry under vacuum to give 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate (mp 60°). Store under vacuum over phosphorus pentoxide at room temperature.)

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

CHROMATOGRAM

Retention time: 13.787

KEY WORDS

whole blood

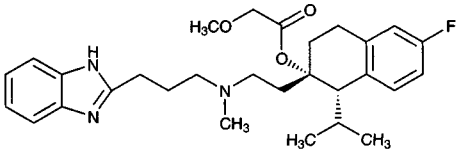
Mibefradil



Molecular formula: $C_{29}H_{38}FN_3O_3$
Molecular weight: 495.64
CAS Registry No.: 116644-53-2, 116666-63-8 (2.HCl)
Merck Index: 6261

SAMPLE
Matrix: blood
Sample preparation: Add 100-30 ng/mL IS, extract either using dichloromethane or using a Bond-Elut C2 SPE cartridge.

HPLC VARIABLES
Column: 3μm C6 (Gromsil or Spherisorb)
Mobile phase: MeCN:9.5 mM pH 3.9 phosphate buffer 55:45 to 70:30
Flow rate: 1
Detector: F ex 270 em 300

CHROMATOGRAM
Internal standard: Ro 40-6792

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
rat; marmoset; cynomolgus monkey; human; plasma; pharmacokinetics; SPE

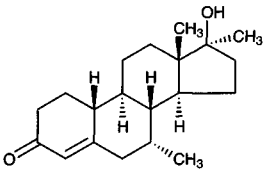
Mibolerone



Molecular formula: $C_{20}H_{30}O_2$
Molecular weight: 302.46
CAS Registry No.: 3704-09-4
Merck Index: 6262
Lednicer No.: 2 144

SAMPLE
Matrix: formulations
Sample preparation: Oils. 1 mL Sample + 25 mL MeOH:water 90:10, shake vigorously for 5 min, centrifuge, inject a 10 μL aliquot of the supernatant. Tablets. Grind a tablet to a fine powder, add 25 mL MeOH, sonicate for 5-10 min, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate. Suspensions (aqueous). Make up 5 mL to 50

mL with MeOH, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Zorbax ODS
Mobile phase: MeOH:water 75:25
Flow rate: 1.5
Injection volume: 10
Detector: UV 240

CHROMATOGRAM

Retention time: 7.3
Limit of detection: 5 μg/mL

OTHER SUBSTANCES

Simultaneous: methyltestosterone, methandriol (UV 210), norethindrone acetate, calusterone, mesterolone (UV 210), norethandrolone, trenbolone acetate, benzyl benzoate, nandrolone acetate, testosterone acetate, stanozolol, oxymetholone, nandrolone propionate, methenolone acetate, testosterone propionate, aspirin, caffeine, formebolone, benzyl alcohol, testolactone, cortisone, fluoxymesterone, norethindrone, oxandrolone (UV 210), boldenone, ethisterone, methandrostenolone, nandrolone, norgestrel, testosterone
Interfering: dehydroepiandrosterone (UV 210)

SAMPLE
Matrix: blood
Sample preparation: 100 μL Plasma + 100 μL 1 M NaOH + 2 mL 10% (v/v) isopropanol in dichloromethane containing 25 ng/mL IS, vortex for 60 s, centrifuge at 2000 g for 45 s. Evaporate organic phase under a gentle stream of air at 60° for 10 min. Dissolve residue in 1 mL hexane:MTBE 2:1, add 200 μL 20 mM orthophosphoric acid, vortex for 30 s, centrifuge at 3200 g for 45 s. Carefully aspirate upper organic layer, add 7 μL 1 M NaOH to acidic aqueous phase to adjust pH to 6.6-6.9, inject an 80 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 5 μm C8 Symmetry (Waters)
Mobile phase: MeCN:THF:10 mM pH 6.7 phosphate buffer 35:5:60
Flow rate: 1
Injection volume: 80
Detector: UV 220

CHROMATOGRAM
Retention time: 7.4
Internal standard: climazolam (8.4)
Limit of detection: 10 ng/mL
Limit of quantitation: 12.5 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Noninterfering: amoxicillin, caffeine, carbamazepine, cisapride, dexamethasone, dopamine, furosemide, gentamicin, indomethacin, morphine, phenobarbital, ranitidine, theophylline

KEY WORDS
plasma; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Add 25 μL 40 μg/mL diazepam in MeOH, 40 μL 2% NaOH, and 3.5 mL cyclohexane:diethyl ether 31:69 to 1 mL plasma. Extract on a rotary mixer at 4° for 10 min, centrifuge at 4° at 2000 g for 10 min. Remove a 3.3 mL aliquot of the organic layer and evaporate it to dryness under a stream of nitrogen at 40°. Dissolve the residue in 300 μL MeCN: water 5:95, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 5 × 0.8 μ-Precolumn cartridge C18 (LC Packings)
Column: 150 × 0.8 3 μm Hypersil C18 BDS
Mobile phase: Gradient. MeCN:10 mM pH 7.0 sodium phosphate buffer 35:65 for 16 min, to 60: 40 over 1 min, maintain at 60:40.
Flow rate: 0.016
Injection volume: 20
Detector: UV 240 for 17.6 min then UV 300

CHROMATOGRAM
Retention time: 15.4
Internal standard: diazepam (19.5)
Limit of quantitation: 1 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, 1'-hydroxymidazolam

SAMPLE
Matrix: milk
Sample preparation: Fill a disposable polypropylene column (Bio-Rad Econo-Pac column) with Chelating Sepharose Fast Flow (Pharmacia) and condition it with 10 mL water, 1.5 mL 100 mM copper sulfate, and 100 mL water. Condition a 6 mL SupelClean ENVI-Chrom P SPE cartridge with 2 mL MeOH and 5 mL water. Homogenize 10 g tissue with 20-30 mL 100 mM pH 4 succinic acid buffer. Centrifuge the homogenate at 2000 g at 10° for 15-20 min. Add the supernatant to the metal chelate affinity column, wash sequentially with 5 mL 500 mM NaCl, 10 mL water, 10 mL MeOH, 10 mL water, and 3 mL McIlvaine buffer, discard the clear effluent. Elute with 8 mL McIlvaine-EDTA-NaCl buffer. Add the eluate to the SPE cartridge under gravity, rinse the column with 2.5 mL water, add the rinse to the SPE cartridge. Wash the SPE cartridge with 2.5 mL water. Dry the SPE cartridge by drawing air through it for 2-3 min. Elute with 5 mL MeOH. Evaporate the eluate to dryness under nitrogen at 40-50°, dissolve the residue in 1 mL water. Inject a 100 μL aliquot. (McIlvaine buffer was 500 mM NaCl and 100 mM EDTA (Carson, M.C. J. AOAC Int. 1993, 76, 329).)

HPLC VARIABLES
Column: 150 × 3.9 5 μm PLRP-S (Polymer Labs, USA)
Mobile phase: MeOH:5 mM oxalic acid 58:42
Flow rate: 0.5
Injection volume: 100
Detector: MS, HP 5989, NICI, high energy dynode, HP 59980B particle beam interface 60°, helium sheath 40-45 p.s.i., source 250°, quadrupole 100°, source pressure 1 Torr with methane reagent gas, m/z 378-483

CHROMATOGRAM
Retention time: 6.75

OTHER SUBSTANCES
Extracted: chlortetracycline, demeclocycline, doxycycline, oxytetracycline, tetracycline

SAMPLE
Matrix: milk
Sample preparation: Prepare a column as follows. Swirl Chelating Sepharose Fast Flow resin (Pharmacia) in its bottle, add it to a polypropylene column to give a bed volume of 1.0-1.2 mL, wash 3 times with 2 mL portions of water, wash with 2 mL 10 mM copper sulfate, wash with two 2 mL portions of water. Centrifuge 5 mL milk at 10° at 1500 g for 15 min, remove the

lower layer and add it to 10 mL succinate buffer, mix, centrifuge at 1500 g for 30 min, add the supernatant to the column. Wash with 2 mL succinate buffer, wash with 2 mL water, wash with 2 mL MeOH, wash with 2 mL water, wash with 700 μL citrate/phosphate buffer (be careful not to disturb bed), elute with 2.5 mL citrate/phosphate buffer (column is white and eluate is blue). Filter (Amicon Centricon 30, MW 30000 cut-off; pre-washed by centrifuging with 2 mL water) while centrifuging at 5000 g for 30-90 min, inject a 600 μL aliquot of the ultrafiltrate. (Prepare succinate buffer by dissolving 11.8 g succinic acid in 980 mL water, adjust pH to 4.0 with 10 M NaOH, make up to 1 L. Prepare the citrate/phosphate buffer by dissolving 12.9 g citric acid monohydrate, 10.9 g Na_2HPO_4, 37.2 g disodium EDTA dihydrate, and 29.2 g NaCl in 1 L water.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm PLRP-S (Polymer Labs)
Mobile phase: Gradient. MeCN:MeOH:10 mM oxalic acid 0:0:100 for 1 min, to 22:8:70 over 5 min, maintain at 22:8:70 for 11 min, return to initial conditions.
Flow rate: 1
Injection volume: 600
Detector: UV 355

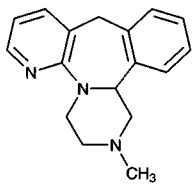
Mirtazepine



Molecular formula: $C_{17}H_{19}N_3$
Molecular weight: 265.36
CAS Registry No.: 61337-67-5
Merck Index: 6295
Lednicer No.: 5 177

SAMPLE
Matrix: formulations
Sample preparation: Extract 300 mg powdered tablet with 100 mL MeCN:water 50:50, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: MeCN:MeOH:THF:buffer 14.875:12.67:7.455:65 (Buffer was 18 g/L tetramethylammonium hydroxide pentahydrate in water adjusted to pH 7.4 with 85% phosphoric acid.)
Column temperature: 40
Flow rate: 1.5
Injection volume: 10
Detector: UV 210

CHROMATOGRAM
Limit of detection: 0.01-0.04%
Limit of quantitation: 0.02-0.12%

OTHER SUBSTANCES
Simultaneous: impurities

KEY WORDS
tablets; comparison with capillary electrophoresis

REFERENCE

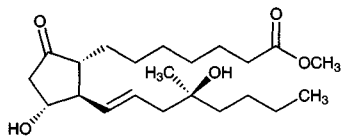
Misoprostol



Molecular formula: $C_{22}H_{38}O_5$
Molecular weight: 382.54
CAS Registry No.: 59122-46-2
Merck Index: 6297

SAMPLE

Matrix: formulations
Sample preparation: Extract polymeric controlled-release formulations under supercritical fluid conditions using carbon dioxide:formic acid 95:5 at 330 atmospheres at 75° in a 500 μL cell, restrictor temperature 100°, collection solvent 15 mL hexane:EtOH 2:1, collection solvent temperature 0°, extraction time 1 h. Evaporate the collection solvent to dryness, reconstitute with 1 mL mobile phase, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Supelco ODS
Mobile phase: MeCN:MeOH:water 45:20:35
Flow rate: 1.5
Injection volume: 10
Detector: UV 280 following post-column reaction. The column effluent mixed with 4 M KOH pumped at 0.5 mL/min and the mixture flowed at 80° to the detector.

CHROMATOGRAM

Retention time: 7.5
Limit of detection: <0.1 ppt

OTHER SUBSTANCES

Simultaneous: degradation products

KEY WORDS

polymeric controlled-release formulations; SFE; post-column reaction

REFERENCE

Roston,D.A.; Sun,J.J.; Collins,P.W.; Perkins,W.E.; Tremont,S.J. Supercritical fluid extraction-liquid chromatography method development for a polymeric controlled-release drug formulation, *J.Pharm.Biomed.Anal.*, **1995**, *13*, 1513–1520.

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 1 mg/mL solution in MeOH:water 60:40, inject a 20 μL aliquot onto column A with mobile phase A. When the 11R,16S and 11S,16R enantiomers elute (as one peak) switch effluent into the 250 μL sample loop of an injection valve. When the whole peak has been collected inject the contents of the sample loop onto column B with mobile phase B.

HPLC VARIABLES

Column: A 150 × 4.6 3 μm Supelcosil ODS; B 100 × 4.6 LKB EnantioPac
Mobile phase: A MeOH:water 60:40; B Isopropanol:20 mM pH 5.7 phosphate buffer 4:96
Column temperature: 28
Flow rate: A 0.7; B 0.4
Injection volume: 20
Detector: A UV 205; B UV 205

CHROMATOGRAM

Retention time: 43 (11R,16S and 11S,16R from column A), 37 (11S,16R from column B), 55 (11R,16S from column B)

KEY WORDS

chiral; column-switching

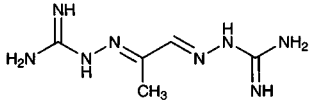
Mitoguazone



Molecular formula: $C_5H_{12}N_8$
Molecular weight: 184.20
CAS Registry No.: 459-86-9
Merck Index: 6299

SAMPLE
Matrix: solutions
Sample preparation: Inject a 20 μL aliquot of a 10 μg/mL solution in mobile phase.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Hypersil BDS C8
Mobile phase: MeCN:buffer 11:89 (Buffer was 50 mM KH_2PO_4 containing 1 g/L sodium heptanesulfonate, adjusted to pH 3.0 with concentrated phosphoric acid.)
Column temperature: 40
Flow rate: 2
Injection volume: 20
Detector: UV 283

CHROMATOGRAM
Retention time: 18

OTHER SUBSTANCES
Simultaneous: degradation products

KEY WORDS
comparison with capillary electrophoresis and TLC

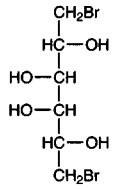
Mitolactol



Molecular formula: $C_6H_{12}Br_2O_4$
Molecular weight: 307.97
CAS Registry No.: 10318-26-0
Merck Index: 6300

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 1 mL ice-cold MeOH, let stand at -20° for 20 min, centrifuge at 1500 g for 5 min. Remove a 1 mL aliquot of the supernatant and add it to 1 mL 5% diethyldithiocarbamate and 2 mL 50 mM pH 7.4 potassium phosphate buffer, heat at 50° for 1 h, extract with 5 mL chloroform. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Alltech CN
Mobile phase: Heptane:isopropanol:acetic acid 74.4:21.6:4
Flow rate: 1.3
Detector: UV 254

CHROMATOGRAM
Retention time: 9.9
Limit of detection: 500 nM

KEY WORDS
derivatization; plasma; human; mouse; pharmacokinetics

REFERENCE

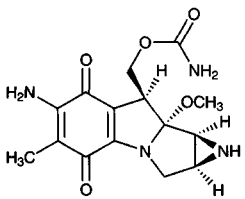
Mitomycin



Molecular formula: $C_{15}H_{18}N_4O_5$
Molecular weight: 334.33
CAS Registry No.: 50-07-7
Merck Index: 6301

SAMPLE
Matrix: aqueous humor
Sample preparation: 100 μL Aqueous humor + 25 μL 5 μg/mL 4-aminoacetophenone in water, vortex, inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: Microsorb C18
Column: 50 × 4.6 3 μm Microsorb C18 (Short-One)
Mobile phase: MeOH:water 28:72 containing $(NH_4)H_4PO_4$ adjusted to pH 7.0 with dilute ammonium hydroxide
Flow rate: 1.5
Injection volume: 100
Detector: UV 365

CHROMATOGRAM
Retention time: 2.3
Internal standard: 4-aminoacetophenone (2.7)
Limit of detection: 6.25 ng/mL

REFERENCE

Andersen,A.; Warren,D.J.; Nome,O.; Vesterhus,L.; Slordal,L. A high-pressure liquid chromatographic method for measuring mitotane [1,1-(*o,p'*-dichlorodiphenyl)-2,2-dichloroethane] and its metabolite 1,1-(*o,p'*-dichlorodiphenyl)-2,2-dichloroethene in plasma, *Ther.Drug Monit.*, **1995**, *17*, 526[94]531.

SAMPLE
Matrix: formulations
Sample preparation: Tablets. Powder tablet, add 10 mg DDE, extract four times with 10 mL isooctane. Combine extracts, filter, make up to 50 mL with isooctane. Dilute an aliquot 1:10, inject an aliquot. Emulsions. 5 mL Emulsion + 10 mg IS, extract with 40 mL isooctane:EtOH 98:2 for 15 min. Make up isooctane layer to 50 mL with isooctane. Remove a 1 mL aliquot and make up to 10 mL with isooctane, inject an aliquot.

HPLC VARIABLES
Guard column: 100 × 4.6 30-38 μm HC Pellosil (Whatman)
Column: 250 × 4.6 Partisil PxS 5/25
Mobile phase: Isooctane:cyclohexane 80:20 (Flush column with isooctane:EtOH 98:2 at 2 mL/min for 15 min to remove corn oil from emulsions, re-equilibrate with 120 mL mobile phase.)
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 9
Internal standard: 1,1-bis-(p-chlorophenyl)-2,2-dichloroethylene (p,p'-DDE) (4.5)

KEY WORDS
tablets; emulsions; normal phase

REFERENCE
Musial,S.P.; Freeman,C.J.; Sinsheimer,J.E. Mitotane (*o,p'*-DDD) emulsion and tablet analysis by high-performance liquid chromatography, *J.Chromatogr.*, **1985**, *319*, 467–470.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Guard column: 30 × 4.6 10 μm spherical C-18 MCP (Brownlee)

Column: 100 × 5 Nova-Pak C-18
Mobile phase: Gradient. MeOH:water:acetic acid 50:50:0.2 for 40 min then to MeCN:water:acetic acid 55:45:0.2 over 10 min

CHROMATOGRAM
Retention time: 40-50

OTHER SUBSTANCES
Simultaneous: metabolites

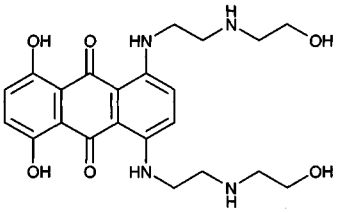
Mitoxantrone



Molecular formula: $C_{22}H_{28}N_4O_6$
Molecular weight: 444.49
CAS Registry No.: 65271-80-9, 70476-82-3 (di HCl)
Merck Index: 6303
Lednicer No.: 3 75

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL Bond-Elut C18 SPE cartridge with 10 mL MeOH and 5 mL water. Add 1-2 mL plasma to the SPE cartridge, wash with 5 mL water, elute with 300 µL 500 mM methanolic HCl, inject an aliquot.

HPLC VARIABLES
Guard column: 70 × 2.1 Co:Pell ODS (Whatman)
Column: 300 × 3.9 10 µm µBondapak C18
Mobile phase: MeCN:200 mM pH 4.0 ammonium acetate 25:75
Flow rate: 1.5
Detector: UV 658

CHROMATOGRAM
Retention time: 4
Limit of detection: 1 ng/mL

KEY WORDS
plasma; SPE

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 50 µL 100 µg/mL bisantrene, adjust to pH 11 with 50 µL 1 M NaOH, add 5 mL dichloromethane, extract. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 250 µL mobile phase, centrifuge at 15600 g for 1 min, inject a 150 µL aliquot of the supernatant.

HPLC VARIABLES
Guard column: 37-50 µm C18/Corasil
Column: 300 × 3.9 10 µm µBondapak C18

Mobile phase: MeCN:80 mM pH 3.0 sodium formate 28:72
Flow rate: 1
Injection volume: 150
Detector: E, BAS LC-4B detector, TL-5 glassy carbon electrode at +0.75 V, Ag/AgCl reference electrode or UV 660

CHROMATOGRAM
Retention time: 5.5
Internal standard: bisantrene (8)
Limit of detection: 0.1 ng/mL (electrochemical)

KEY WORDS
plasma; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Condition a 40 μm Sepralyte non-bonded silica SPE cartridge (Analytichem) with 1 mL 1 M HCl, with 3 mL water, and with 500 μL 2 M $(NH_4)H_2PO_4$. 1 mL Plasma + 5 μL 5 μg/mL methylene blue, centrifuge at 4° at 12000 g for 1 min, add the supernatant to the SPE cartridge at 1 mL/min, vortex the precipitate in the centrifuge tube with 500 μL 0.3% ascorbic acid in 12 mM pH 3.0 citrate buffer, add the mixture to the SPE cartridge, wash with 500 μL water, wash with 500 μL MeCN saturated with tetramethylammonium chloride, apply suction for 5 min, elute with 300 μL elution solvent by centrifuging at 4° at 2000 g for 5 min, inject an aliquot of the eluate. (The elution solvent was MeOH:1 M tetramethylammonium chloride:1 M citric acid:water 32:10:20:38.)

HPLC VARIABLES
Column: 75 × 3.9 4 μm Nova-pak ODS
Mobile phase: MeOH:THF:triethylamine phosphate solution: 1 M tetramethylammonium chloride:water 30:1:10:2:57 (Triethylamine phosphate was 67.8 mL orthophosphoric acid in 800 mL water, adjust pH to 3.0 with triethylamine, make up to 1 L with water.) (Filter mobile phase but do not degas.)
Flow rate: 1
Injection volume: 50
Detector: UV 658

CHROMATOGRAM
Retention time: 3.5
Internal standard: methylene blue (7)
Limit of quantitation: 1 ng/mL

KEY WORDS
plasma; SPE; use polypropylene containers

SAMPLE
Matrix: blood, tissue
Sample preparation: Add 1 mL solution containing 10 μg/mL hexanesulfonic acid, 500 μg/mL ascorbic acid and 8 μg/mL ametantrone to 1 mL whole blood or tissue homogenate, vortex for 30 s. Add 1 mL 100 mM pH 9.5 borate buffer, 300 μL 1 M NaOH, vortex for 30 s. Extract using a horizontal linear shaker (Infors HT, Infors, Switzerland) with 5 mL dichloromethane at 150 rpm for 60 min. Centrifuge at 2800 g for 15 min, evaporate organic layer to dryness under

reduced pressure, dissolve the residue in 150 μL mobile phase. Inject a 92 μL aliquot. (Silanize all glassware.)

HPLC VARIABLES
Guard column: 11 × 4 5 μm Nucleosil C18
Column: 250 × 4 5 μm Nucleosil C18
Mobile phase: MeCN:160 mM pH 2.7 ammonium formate buffer 33:67 containing 250 mM (sic) hexanesulfonic acid
Flow rate: 1
Injection volume: 92
Detector: UV 658

CHROMATOGRAM
Retention time: 5.4-6.7
Internal standard: ametantrone (6.9-8.3)
Limit of detection: 2 ng/mL
Limit of quantitation: 5 ng/mL

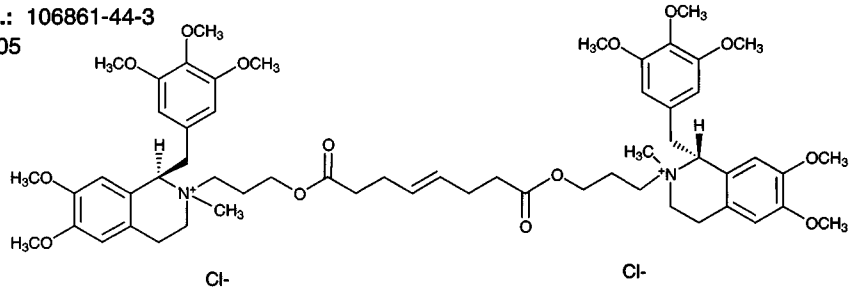
Mivacurium chloride

Molecular formula: $C_{58}H_{80}Cl_2N_2O_{14}$
Molecular weight: 1100.18
CAS Registry No.: 106861-44-3
Merck Index: 6305



SAMPLE
Matrix: bile, blood, urine
Sample preparation: Condition a Bond Elut C1 SPE cartridge with 3 mL MeOH and 3 mL water, do not allow to dry. Dilute bile 1:3 with water. Add 50 μL 70 mg/mL phenylmethanesulfonyl fluoride (an enzyme inhibitor) in DMF to 5 mL blood before centrifuging at 3000 g for 10 min to prepare plasma. 1 mL Plasma, urine, or diluted bile, add to the SPE cartridge, wash with 3 mL water, wash with 3 mL MeCN, wash with 3 mL MeOH, wash with 3 mL water, elute with 1 mL eluant, mix eluate thoroughly, inject a 20-100 μL aliquot. (Eluant was MeOH: 50 mM pH 3 KH_2PO_4 80:20.)

HPLC VARIABLES
Guard column: 5 μm Spherisorb S5C1 methylsilyl
Column: 150 × 4.6 5 μm Spherisorb S5C1 methylsilyl
Mobile phase: MeCN:MeOH:50 mM pH 3 KH_2PO_4 70:0.35:30
Flow rate: 1
Injection volume: 20-100
Detector: UV 210

CHROMATOGRAM
Retention time: 5.7
Internal standard: mivacurium chloride
Limit of quantitation: 30 ng/mL (bile), 10 ng/mL (plasma, urine)

OTHER SUBSTANCES
Extracted: doxacurium
Simultaneous: pancuronium, atracurium, tubocurarine succinylcholine, metocurine

KEY WORDS
plasma; dog; human; SPE; mivacurium is IS

SAMPLE
Matrix: blood
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH and 8 mL water. Condition a QMA anion-exchange SPE cartridge with 5 mL MeOH and 8 mL water. 1 mL Plasma containing 330 μg phospholine iodide (esterase inhibitor) + 1 mL 100 ng/mL IS in saline, add to the C18 SPE cartridge, wash with 4 mL water, wash with 4 mL MeOH, wash with 4 mL MeCN, elute with 2.8 mL MeCN:6 M HCl 99.67:0.33. Add the eluate to the anion-exchange SPE cartridge, elute with 900 μL MeCN:6 M HCl 99.67:0.33. Evaporate the eluate to dryness under vacuum at 55°, reconstitute the residue in 200 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 5 μm LiChrosphere 60 RP Select B
Column: 125 × 4.6 5 μm LiChrosphere 60 RP Select B
Mobile phase: MeCN:water 40 60 containing 5 mM octanesulfonic acid (PIC B-8, low UV)
Column temperature: 35
Flow rate: 1
Injection volume: 50
Detector: F ex 202 em 320

CHROMATOGRAM
Retention time: 8.4 (trans-trans), 9.3 (cis-trans), 10.2 (cis-cis)
Internal standard: bis-[3-[trans-1,2,3,4-tetrahydro-6,7-dimethoxy-N-methyl-1-(3,4,5-trimethoxybenzyl)isoquinolinium]propyl]-1,3-phenylenedipropionate dihydrochloride (BW 785U77) (13.1)
Limit of quantitation: 5 ng/mL

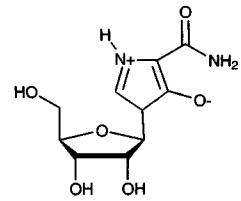
Mizoribine



Molecular formula: $C_9H_{13}N_3O_6$
Molecular weight: 259.22
CAS Registry No.: 50924-49-7
Merck Index: 6306

SAMPLE
Matrix: blood
Sample preparation: 500 µL Plasma + 50 µL 65 µg/mL 3-methylxanthine in water + 50 µL 70% perchloric acid, mix, add 50µL saturated potassium chloride, mix well, centrifuge. Remove a 350 µL aliquot of the supernatant and add it to 35 µL 10 M NaOH, wash with 1.5 mL dichloromethane. Remove a 250 µL aliquot of the aqueous phase and neutralize it with 20 µL 2 M HCl, inject an aliquot.

HPLC VARIABLES
Column: 200 × 4.6 5 µm Hypersil ODS
Mobile phase: Gradient. MeOH:20 mM Na_2HPO_4 2:98, pH 3, containing 0.04% octanesulfonic acid, after 1.1 min MeOH:20 mM Na_2HPO_4 6:94, pH 3, containing 0.04% octanesulfonic acid (step gradient).
Column temperature: 40
Flow rate: 1.3
Injection volume: 2
Detector: UV 275

CHROMATOGRAM
Retention time: 2.5
Internal standard: 3-methylxanthine (5)
Limit of detection: 100 ng/mL
Limit of quantitation: 250 ng/mL

KEY WORDS
dog; plasma; human

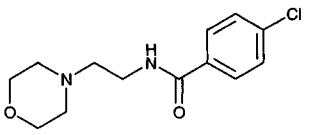
Moclobemide



Molecular formula: $C_{13}H_{17}ClN_2O_2$
Molecular weight: 268.74
CAS Registry No.: 71320-77-9
Merck Index: 6309
Lednicer No.: 4 39

SAMPLE

Matrix: bile, blood, tissue, vitreous humor
Sample preparation: Bile, blood, vitreous humor. Mix 1 mL sample with 2 μg IS, 1 mL deionized water, and 1 mL 200 mM sodium carbonate. Add 6 mL hexane:butanol 95:5, extract for 30 min, centrifuge. Remove the organic layer and add it to 100 μL 0.2% orthophosphoric acid, extract for 30 min, centrifuge. Inject a 30 μL aliquot of the aqueous layer. Tissue. Mix 500 μL liver homogenate with 2 μg IS, 1 mL deionized water, and 1 mL 200 mM sodium carbonate. Add 6 mL hexane:butanol 95:5, extract for 30 min, centrifuge. Remove the organic layer and add it to 400 μL 0.2% orthophosphoric acid, extract again for 30 min, centrifuge. Inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 100 × 4.6 Spheri-5RP-18 (Applied Biosystems)
Mobile phase: MeCN:100 mM $NaH_2PO_4.2H_2O$ containing 1% diethylamine 15:85, adjusted to pH 5.8
Flow rate: 0.9
Injection volume: 30
Detector: UV 220, UV 254

CHROMATOGRAM

Internal standard: R011-9900 (Roche Australia)

KEY WORDS

liver; use silanized glassware

Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM
Retention time: 1.30
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES
Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, mianserin, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, trazodone, trihexyphenidyl, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine
Interfering: metoclopramide, tranylcypromine, pentobarbital

KEY WORDS
serum; whole blood; liver

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 500 μL Plasma + 400 μL saturated sodium phosphate solution (pH 11) + 100 μL 8 μg/mL IS in water, vortex for a few s, add to a glass Extrelut 1 SPE cartridge, let stand for 10 min, elute with two 6 mL portions of freshly distilled dichloromethane. Evaporate the eluate to dryness under a stream of nitrogen at 37°, reconstitute the residue in 250 μL mobile phase, vortex for 30 s, inject a 75 μL aliquot. Urine. 200 μL Urine + 700 μL saturated sodium phosphate solution (pH 11) + 100 μL 20 μg/mL IS in water, vortex for a few s, add to a glass Extrelut 1 SPE cartridge, let stand for 10 min, elute with two 6 mL portions of freshly distilled dichloromethane. Evaporate the eluate to dryness under a stream of nitrogen at 37°, reconstitute the residue in 750 μL mobile phase, vortex for 30 s, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 125 × 4 Spherisorb S5 C6
Mobile phase: MeCN:67 mM KH_2PO_4 30:320 adjusted to pH 3.9 with dilute HCl
Flow rate: 1.3
Injection volume: 50-75
Detector: UV 240

CHROMATOGRAM
Retention time: 7.2
Internal standard: p-iodo-N-(2-morpholinoethyl)benzamide (Ro 11-9900) (12.7)
Limit of quantitation: 75 ng/mL (urine), 20 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; SPE; pharmacokinetics

REFERENCE
Geschke,R.; Körner,J.; Eggers,H. Determination of the new monoamine oxidase inhibitor moclobemide and three of its metabolites in biological fluids by high-performance liquid chromatography, *J.Chromatogr.*, **1987**, *420*, 111–120.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 10.218

KEY WORDS
whole blood

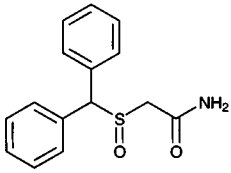
Modafinil



Molecular formula: $C_{15}H_{15}NO_2S$
Molecular weight: 273.36
CAS Registry No.: 68693-11-8
Merck Index: 6311

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 1 mL 100 mM HCl + 100 µL MeOH + 100 µL 40 µg/mL IS in MeOH + 10 mL diethyl ether, shake for 10 min, centrifuge at 0-4° at 4000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 200 µL mobile phase, vortex for 30 s, inject a 25 µL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 µm µBondapak C18
Mobile phase: MeCN:water:acetic acid 15:42:1.2
Flow rate: 1.4
Injection volume: 25
Detector: UV 236

CHROMATOGRAM
Retention time: 11.0
Internal standard: [bis-(4-fluorophenyl)methylsulfinyl]acetic acid (24.0)
Limit of detection: 40 ng/mL
Limit of quantitation: 130 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

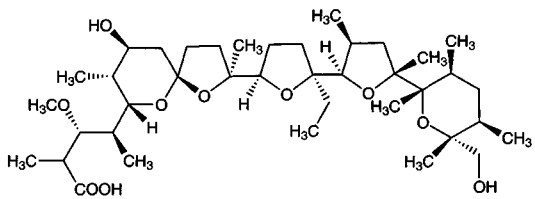
Monensin

Molecular formula: $C_{36}H_{62}O_{11}$
Molecular weight: 670.88
CAS Registry No.: 17090-79-8
Merck Index: 6329



SAMPLE
Matrix: eggs, tissue
Sample preparation: 5 g Pulverized frozen tissue or 5 g homogenized whole eggs + 2 mL water + 13 mL MeOH, homogenize for 30 s. Sonicate for 10 min and centrifuge at 2000 g for 10 min. Add 4 mL 100 mM NaOH to a 2 mL aliquot of the supernatant, extract with 2 mL and 1 mL hexane:toluene 50:50 (v/v) for 30 s by inversion, centrifuge at 1500 g for 10 min. Evaporate the combined extracts to dryness under a stream of nitrogen at 60°. Dissolve the residue in 200 µL MeCN:water 75:25. Inject a 20 µL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 µm Inertsil ODS-2 (GL Sciences, Japan)
Mobile phase: MeCN:MeOH:THF:water:trifluoroacetic acid 67:10:10:13:0.1
Flow rate: 1
Injection volume: 20
Detector: MS, VG Platform, Megaflow electrospray probe, positive ion mode, source at 125°, cone voltage 25 V, m/z 693

CHROMATOGRAM
Retention time: 7
Limit of detection: 0.5-1 ng/g
Limit of quantitation: 2 ng/g

OTHER SUBSTANCES
Extracted: narasin, salinomycin

KEY WORDS
domestic fowl; muscle; liver

SAMPLE
Matrix: feed
Sample preparation: 20 g Ground feed + 50 mL MeOH, shake on a reciprocating shaker for 1 h, allow to settle, centrifuge an aliquot of the supernatant at 2500 rpm for 5 min, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 250 × 4.6 Partisil 5ODS-3
Mobile phase: MeOH:water:glacial acetic acid 94:5.9:0.1
Flow rate: 0.7
Injection volume: 50
Detector: UV 520 following post-column reaction with the reagent pumped at 0.7 mL/min. The mixture passed through a 7.6 m × 0.05 mm i.d. coil of stainless steel tubing maintained at 70° to the detector. (Prepare reagent by stirring 900 mL MeOH and slowly and cautiously adding 20 mL concentrated sulfuric acid (Caution! Corrosive! Exothermic reaction!), cool in an ice bath, add 100 g vanillin, mix to dissolve, make up to 1 L with MeOH. Degas under vacuum with sonication for 2 min.)

CHROMATOGRAM
Retention time: 11.5
Limit of detection: 250 ng/g

OTHER SUBSTANCES
Simultaneous: narasin, salinomycin

KEY WORDS
post-column reaction

REFERENCE

SAMPLE
Matrix: feed
Sample preparation: 20 g Ground Feed + 200 mL hexane:ethyl acetate 90:10, stir at high speed for 2 h, let stand. Remove an aliquot equivalent to 1 g feed and evaporate it to dryness under reduced pressure at 40°, reconstitute with 2 mL MeOH, filter (0.45 μm), inject an aliquot of the filtrate.

HPLC VARIABLES
Column: 60 × 4.6 3 μm C18 (Hewlett-Packard)
Mobile phase: MeOH:5% acetic acid 90:10
Flow rate: 0.5
Injection volume: 20-25
Detector: UV 520 following post-column reaction. The column effluent mixed with the reagent pumped at 1 mL/min and the mixture flowed through a 1.5 mL reaction coil (Kratos Model 510) at 95° to the detector. (Reagent was 40 g/L vanillin in MeOH:sulfuric acid 100:2. Keep in an ice bath and prepare fresh daily.)

CHROMATOGRAM
Retention time: 5.5
Limit of detection: 0.5 ppm

SAMPLE

Matrix: feed, premix

Sample preparation: Feed. Shake 5 g feed with 15 mL MeOH for 2 h, filter, evaporate the filtrate to 3 mL and make up to 10 mL with MeOH, inject a 3 μL aliquot. Premix. Shake 0.5 g premix with 15 mL MeOH for 2 h, filter, make up the filtrate to 50 mL with MeOH, inject a 3 μL aliquot.

HPLC VARIABLES

Column: 150 × 1 5 μm Separon SGX C18 glass column (Tessek Prague)

Mobile phase: MeOH:water:glacial acetic acid 94:5.9:0.1

Flow rate: 0.02

Injection volume: 3

Detector: UV 592 following post-column derivatization. The column effluent mixed with the reagent pumped at 0.015 mL/min and the mixture flowed through a 150 × 1 reactor containing 40-70 μm acid-washed glass beads at 75° to the detector. (The reagent was 500 mM 4-dimethylaminobenzaldehyde in 1.2 M sulfuric acid in MeOH.)

CHROMATOGRAM

Retention time: 11 (monensin B), 14 (monensin A)

Limit of detection: 1.7 μg/mL (monensin A)

SAMPLE
Matrix: milk, tissue
Sample preparation: Tissue. Condition a Sep-Pak silica gel SPE cartridge (No. 51900) with 3 mL dichloromethane, do not allow it to go dry. Sonicate or blend 10 g ground or minced tissue and 75 mL MeOH:water 85:15, centrifuge at 2000 rpm for 10 min. Remove the supernatant and add it to 50 (muscle, liver), 40 (kidney) or 60 (fat) mL 100 mg/mL NaCl, extract twice with 35 mL portions of dichloromethane. Combine the organic layers and evaporate them to dryness under vacuum at 45°, reconstitute the residue in 7 mL dichloromethane, add it to the SPE cartridge at no more than 5 mL/min, rinse out the flask with 3 mL dichloromethane, add the rinse to the SPE cartridge, wash with 10 mL dichloromethane, elute with 5 mL dichloromethane:MeOH 95:5. Evaporate the eluate to dryness under a stream of nitrogen or air at 45°, reconstitute the residue in 1 mL MeOH:water 90:10, filter (Gelman Acrodisc CR PTFE 0.45 μm), inject a 100 μL aliquot. Milk. Condition a Sep-Pak silica gel SPE cartridge (No. 51900) with 3 mL dichloromethane, do not allow it to go dry. Sonicate (ultrasonic cell disrupter) or blend 40 mL milk and 160 mL MeOH for 30 s, let stand for 10-15 min, centrifuge at 2000 rpm for 10 min. Decant the supernatant and add it to 60 mL 100 mg/mL NaCl, extract twice with 70 mL portions of dichloromethane. Combine the organic layers and evaporate them to dryness under vacuum at 45°, reconstitute the residue in 7 mL dichloromethane, add it to the SPE cartridge at no more than 5 mL/min, rinse out the flask with 3 mL dichloromethane, add the rinse to the SPE cartridge, wash with 10 mL dichloromethane, elute with 5 mL dichloromethane:MeOH 95:5. Evaporate the eluate to dryness under a stream of nitrogen or air at 45°, reconstitute the residue in 1 mL MeOH:water 90:10, filter (Gelman Acrodisc CR PTFE 0.45 μm), inject a 100 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Partisil 5 ODS-3 25 LC
Mobile phase: MeOH:water:acetic acid 94:6:0.1
Flow rate: 0.7
Injection volume: 100
Detector: UV 520 following post-column reaction. The column effluent mixed with the reagent pumped at 0.7 mL/min and flowed through a 0.5 mm i.d. × 6 m stainless steel tube held at 98° to the detector. (The reagent was prepared by slowly adding 20 mL concentrated sulfuric acid to 950 mL MeOH (Caution! Exothermic!), allow to cool to room temperature, add 30 g vanillin while stirring.)

CHROMATOGRAM
Retention time: 8
Limit of quantitation: 25 ppb (tissue), 5 ppb (milk)

SAMPLE
Matrix: solutions
Sample preparation: Condition a Mega Bond Elut silica gel SPE cartridge with benzene (Caution! Benzene is a carcinogen!). Evaporate a solution in MeOH to dryness, add 5 mL 5.28 mg/mL 1-bromoacetylpyrene in MeCN, add 5 mL 1.28 mg/mL Kryptofix 222 in MeCN, heat at 50° for 1.5 h, cool. Either inject this solution directly or evaporate it to dryness, dissolve the residue in 5 mL benzene:chloroform 50:50, rinse out the flask with two 5 mL portions of benzene:chloroform 50:50, filter, add the filtrate to the SPE cartridge, elute with two 5 mL portions of benzene:acetone 70:30. Evaporate the eluate to dryness, reconstitute the residue in 10 mL MeCN, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Develosil 5C18
Mobile phase: MeOH:water 97:3
Flow rate: 1
Detector: F ex 360 em 420

CHROMATOGRAM
Retention time: 13.5
Internal standard: 18,19-dihydrosalinomycin (25), 18,19-dihydro-20-ketosalinomycin (16.5)

Limit of quantitation: 200 ng/mL

OTHER SUBSTANCES

Simultaneous: lasalocid, narasin, salinomycin

KEY WORDS

derivatization; SPE

REFERENCE

SAMPLE

Matrix: tissue

Sample preparation: Homogenize (Tissuemizer) 10 g tissue and 25 mL solvent for 1 min, wash blades with 3-4 mL solvent, combine with homogenate, shake for 30 min, centrifuge at 800 g for 15 min, decant. Add 25 mL solvent to residue, mix thoroughly, shake vigorously for 1 min, centrifuge at 800 g for 15 min, add supernatants to a 75 × 20 column of 80-200 mesh alumina (Fisher), rinse container onto column with 25 mL solvent, add 100 mL solvent to the column. Combine all the eluates and add 100 mL 5% NaCl, shake vigorously, let stand 2-3 min, add 30 mL dichloromethane, shake vigorously for 30 s, repeat extraction twice. Combine the dichloromethane layers and evaporate them to dryness under reduced pressure at 48-50°, reconstitute the residue in 1 mL solvent, add to a 75 × 20 column of 25-100 μm Sephadex LH-20, rinse flask with two 3.5 mL portions of solvent and add the rinses to the column, add 10 mL solvent to the column, discard the first 18 mL of eluate, add 10 mL solvent to the column, collect this fraction, evaporate to dryness under a stream of nitrogen at 48-50°, reconstitute the residue in 1 mL dichloromethane, evaporate to dryness under a stream of nitrogen at 48-50°, repeat twice, reconstitute in MeOH, evaporate to dryness under a stream of nitrogen at 48-50°, reconstitute in 100 μL pyridine and 100 μL acetic anhydride, let stand overnight at room temperature, add to 35 mL water, rinse vial with 5 mL water. Combine the aqueous layers and add 40 mL petroleum ether, shake vigorously for 1 min, separate and preserve the organic layer. Add 40 mL anhydrous ethyl ether to the aqueous phase, shake for 1 min. Combine the organic phases and wash with 20 mL 10% HCl, twice with 20 mL water, and with 40 mL saturated NaCl (shake for 1 min each time). Filter the organic layer through a glass fiber filter containing 20-30 g anhydrous sodium sulfate, wash the sodium sulfate with 10-15 mL petroleum ether, evaporate the filtrate to dryness under a stream of nitrogen at 48-50°. Take up the residue in 1 mL solvent and put it in another tube, wash flask into tube with three 2 mL portions of solvent, evaporate almost to dryness under a stream of nitrogen at 48-50°, make up to 1 mL with solvent, mix, add 500 μL 9-anthryldiazomethane solution, let stand in the dark for 30 min, evaporate to dryness under a stream of nitrogen at 48-50°, reconstitute in 1 mL hexane. Condition a Baker-10 silica SPE cartridge with 5-10 mL hexane, do not allow to dry. Add the hexane solution to the SPE cartridge, rinse tube with 9 mL hexane, add rinse to the SPE cartridge. Wash SPE cartridge with 10 mL hexane:dichloromethane 50:50, with 10 mL hexane:dichloromethane 20:80, with 10 mL dichloromethane, and with 1 mL MeOH. Elute with 1 mL MeOH, inject a 20 μL aliquot of the eluate. (Solvent was MeOH:water 80:20. Prepare 9-anthryldiazomethane solution as follows. Add 1100 g manganous sulfate tetrahydrate in 1.5 L water and 1170 mL 40% NaOH over 1 h to a hot stirred solution of 960 g potassium permanganate in 6 L water, stir for 1 h, centrifuge, wash solid with water until washings are colorless, dry solid at 100-120°, grind the activated manganese dioxide to a fine powder. Add 8.5 g 85% hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!) to 8.8 g 9-anthraldehyde dissolved in 150 mL EtOH, stir at room temperature for 3 h, filter off solid, dry under vacuum, recrystallize from EtOH to give 9-anthraldehyde hydrazone as red-yellow crystals, mp 124-6°. Dissolve 220 mg 9-anthraldehyde hydrazone in 100 mL anhydrous ethyl ether, add 800 mg activated manganese dioxide, add 600 μL EtOH saturated with KOH, stir vigorously for 30 min, filter (glass fiber), wash solid with 20 mL anhydrous ethyl ether, evaporate to reduce volume, make up to 100 mL with anhydrous ethyl ether, store in a dark flask in the dark in a refrigerator. Discard after 30 days (J.Assoc.Off.Anal.Chem. 1985, 68, 1149).)

HPLC VARIABLES

Guard column: pellicular C18 (Alltech)

Column: 200 × 4.6 5 μm RP-C8 (Hewlett-Packard)

Mobile phase: Gradient. A was MeCN. B was MeCN:water 10:90. A:B 20:80 for 9 min, 10:90 for 7 min, 20:80 for 1 min.

Column temperature: 40
Flow rate: 1
Injection volume: 20
Detector: F ex 365 em 418 (filter)

CHROMATOGRAM
Retention time: 11.5
Limit of detection: 0.15 ppm

OTHER SUBSTANCES
Extracted: salinomycin, narasin

KEY WORDS
cow; liver; SPE; derivatization

REFERENCE

SAMPLE
Matrix: tissue
Sample preparation: Blend 20 g ground or minced tissue with 150 mL MeOH:water 85:15 for 30 s or until homogeneous, centrifuge at 2500 rpm for 15 min. Remove the supernatant and mix it with 40 mL 10% NaCl in water, extract three times with 25 mL portions of carbon tetrachloride (Caution! Carbon tetrachloride is a carcinogen!), evaporate the extracts to dryness under reduced pressure at ≤40°, reconstitute with 5 mL chloroform, add to a SepPak silica SPE cartridge at 2 mL/min, rinse flask with 3 mL chloroform, add the rinse to the SPE cartridge, wash with 10 mL hexane:chloroform 10:90, elute with 10 mL chloroform:MeOH 95:5, evaporate the eluate to dryness under reduced pressure or a stream of air at ≤40°, reconstitute with 2 mL MeOH:water 90:10, filter (0.45 μm), inject a 200 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Partisil 5 ODS-3 25 LC
Mobile phase: MeOH:water:acetic acid 94:6:0.1
Flow rate: 0.7
Injection volume: 200
Detector: UV 520 following post-column reaction. The column effluent mixed with the reagent pumped at 0.7 mL/min and the mixture flowed through a 6.1 m × 0.5 mm ID stainless steel coil at 98° to the detector. (Prepare reagent by cautiously adding 20 mL concentrated sulfuric acid to 950 mL MeOH, allow to cool to room temperature, allow 30 g vanillin while stirring.)

CHROMATOGRAM
Retention time: 11
Limit of detection: 5 ng/g
Limit of quantitation: 25 ng/g

OTHER SUBSTANCES
Simultaneous: narasin, salinomycin
Noninterfering: bacitracin, bambermycin, lasalocid, lincomycin, nicarbazin, tylosin

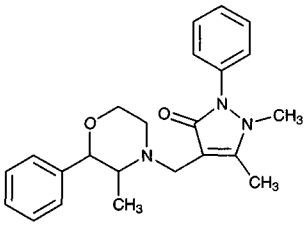
Morazone



Molecular formula: $C_{23}H_{27}N_3O_2$
Molecular weight: 377.49
CAS Registry No.: 6536-18-1, 50321-35-2 (HCl)
Merck Index: 6349
Lednicer No.: 2 261

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 1.5

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

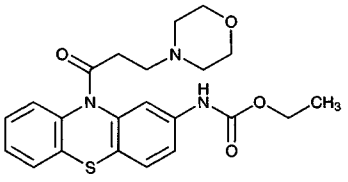
Moricizine



Molecular formula: $C_{22}H_{25}N_3O_4S$
Molecular weight: 427.52
CAS Registry No.: 31883-05-3, 29560-58-8 (HCl)
Merck Index: 6351
Lednicer No.: 4 200

SAMPLE
Matrix: bile, blood, urine
Sample preparation: 1 mL Bile, plasma, or urine + 20 μL 40 μg/mL clozapine in EtOH + 200 μL 2.5 mM pH 6.0 sodium pentanesulfonate, mix for 3 s, add 6 mL diethyl ether, shake vigorously for 2 min, centrifuge at 2500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 100 μl mobile phase, vortex for 30 s, inject a 25 μL aliquot.

HPLC VARIABLES
Guard column: 25 × 4.6 30 μm C18 (Merck)
Column: 100 × 8 10 μm μBondapak C18
Mobile phase: MeOH:water:triethylamine 65:35:0.5, adjust pH to 6-7 with glacial acetic acid
Flow rate: 2
Injection volume: 25
Detector: UV 254

CHROMATOGRAM
Retention time: 6.2
Internal standard: clozapine (9.7)
Limit of detection: 20 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; rat

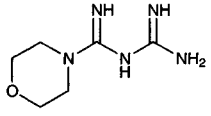
Moroxydine



Molecular formula: $C_6H_{13}N_5O$
Molecular weight: 171.20
CAS Registry No.: 3731-59-7, 3160-91-6 (HCl)
Merck Index: 6354

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 236.9

CHROMATOGRAM
Retention time: 2.873

KEY WORDS
whole blood

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond Elut SPE cartridge with 1 mL MeOH, 1 mL water, and 1 mL 100 mM pH 9.0 sodium bicarbonate buffer, do not allow to go dry. 100 μL Plasma + 20 μL 1 μg/mL nalorphine in MeOH:water 30:70 + 750 μL 100 mM pH 9.0 sodium bicarbonate buffer, vortex for 10 s, add to the SPE cartridge, wash with 1 mL 100 mM pH 9.0 sodium bicarbonate buffer, wash with 1 mL water, wash with 100 μL MeOH:water 50:50, dry under vacuum for 10 min, elute with three 250 μL aliquots of MeOH. Evaporate the eluate to dryness at 45° in a vacuum centrifuge for 1 h, reconstitute with 25 μL 100 mM pH 11.4 sodium carbonate or 25 μL pH 9.5 sodium bicarbonate, add 25 μL 1 mg/mL dansyl chloride in acetone, vortex, let stand in the dark at 45° for 20 min, add 250 μL toluene, vortex for 2 min, centrifuge at 12500 g for 1 min, inject a 100-200 μL aliquot of the upper organic layer.

HPLC VARIABLES
Guard column: 10 × 4.6 3 μm silica
Column: 150 × 4.6 3 μm Spherisorb 3CN
Mobile phase: n-Hexane:isopropanol:ammonia 95:5:0.25 (Place a silica column between the pump and the injector.)
Flow rate: 1.5
Injection volume: 100-200
Detector: F ex 340 em 500

CHROMATOGRAM
Retention time: 5.7
Internal standard: nalorphine (2.8)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES
Extracted: 6-acetylmorphine

KEY WORDS
plasma; derivatization; pharmacokinetics; SPE; normal phase

SAMPLE
Matrix: blood
Sample preparation: Condition a 3 mL 500 mg Bond Elut C8 SPE cartridge with 5 mL MeOH, 3 mL MeCN:10 mM NaH_2PO_4 10:90, and 5 mL water. 1 mL Plasma + 0.5 μg nalorphine in water + 1 mL 500 mM ammonium sulfate, add to the SPE cartridge, wash with 6 mL 5 mM ammonium sulfate, elute with 1 mL MeCN:10 mM NaH_2PO_4 10:90, inject a 100 μL aliquot of the eluate.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:buffer 26:74 (Buffer was 10 mM NaH_2PO_4 containing 1 mM sodium dodecyl sulfate, pH adjusted to 2.1 with orthophosphoric acid.)
Flow rate: 1
Injection volume: 100
Detector: F ex 210 em 340

CHROMATOGRAM
Retention time: 13.5
Internal standard: nalorphine (22)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, glucuronides, normorphine

KEY WORDS
plasma; SPE; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL Baxter C18 SPE cartridge with 3 mL MeOH and 3 mL water. 1 mL Plasma + 2 mL 500 mM pH 9.3 ammonium sulfate + 30 μL 1 μg/mL naltrexone, add to the SPE cartridge, wash with 3 mL 5 mM pH 9.3 ammonium sulfate, wash with 3 mL water, dry under vacuum, elute with 1 mL MeOH:triethylamine 99.5:0.5. Evaporate the eluate to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: C18 (Upchurch)
Column: 100 × 3.2 5 μm Spherisorb C8
Mobile phase: MeOH:50 mM Na_2HPO_4 15:85 containing 3 mM 1-heptanesulfonic acid, pH adjusted to 3.5 with orthophosphoric acid
Flow rate: 0.8
Injection volume: 20
Detector: E, ESA Coulochem, guard cell + 650 mV, analytical cell +250 mV and +600 mV (monitored)

CHROMATOGRAM
Retention time: 5.2
Internal standard: naltrexone (16.4)
Limit of quantitation: 1.2 ng/mL

OTHER SUBSTANCES
Extracted: hydromorphone

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood
Sample preparation: Condition a 3 mL 40 μm bonded silica Clean Screen SPE cartridge (Worldwide monitoring) with 3 mL MeOH, 3 mL water, and 1 mL pH 3 phosphate buffer. 1 mL Plasma + 2 mL 10 mM phosphoric acid, mix, add to the SPE cartridge, air dry for 30 s, wash with 1 mL pH 3 phosphate buffer, wash with 1 mL MeOH, air dry for 30 s, elute with 3 mL 2% ammoniacal MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue in 50 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 200 × 4.5 5 μm LiChrosphere diol
Mobile phase: MeCN:50 mM NaH_2PO_4 80:20 pH adjusted to 3 with orthophosphoric acid
Flow rate: 1
Injection volume: 20
Detector: UV 230

CHROMATOGRAM
Retention time: 7

Limit of detection: 1 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, glucuronides, normorphine, codeine

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood
Sample preparation: Rock 5 mL whole blood + 10 mL water + 8.5 mL Na_2WO_4 in a 50 mL stoppered tube for 1 min, add 6 mL $NiCl_2$, rock for 5 min, add 15 mL dichloromethane:isobutyl alcohol:THF 30:45:25, centrifuge at 2500 g for 15 min. Remove organic phase and repeat the process. Filter all organic phases through a 40-90 μm filter and evaporate to dryness in a 100 mL porcelain dish at a moderate temperature in a sand bath. Take up residue in 500 μL MeCN: water 80:20, inject a 20 μL aliquot. (Na_2WO_4 prepared by mixing 10 g $Na_2WO_4.2H_2O$ in 38 mL of 2 M NaOH and 2.5 g of $NaHCO_3$ and making up to 100 mL. $NiCl_2$ was 17% w/v $NiCl_2$ in water.)

HPLC VARIABLES
Column: 200 × 4.6 5 μm Hypersil C8
Mobile phase: A = MeCN; B = 20 mM n-propylamine adjusted to pH 5 with 85% phosphoric acid. A:B from 15:85 to 20:80 over 5 min to 45:55 over another 15 min to 65:35 over another 5 min
Injection volume: 20
Detector: UV 230

CHROMATOGRAM
Retention time: 8
Limit of detection: 0.20 ppm

OTHER SUBSTANCES
Extracted: buprenorphine, caffeine, cocaine, codeine, diamorphine, ethylmorphine, lidocaine, methaqualone, naloxone, noscapine, papaverine, pentazocine, procaine
Also analyzed: bromazepam, clonazepam, diazepam, flunitrazepam, flurazepam, medazepam, nitrazepam, oxazepam

KEY WORDS
whole blood

SAMPLE
Matrix: blood
Sample preparation: 100 μL Plasma + 200 μL ethyl p-hydroxybenzoate in MeOH, stir thoroughly, centrifuge at 15000 rpm for 10 min, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 250 × 4 5 μm LiChrospher 100RP-8(e)
Mobile phase: MeCN:buffer 23:77 (Buffer was 50 mM NaH_2PO_4 containing 5 mM sodium dodecylsulfonate, pH adjusted to 2.1 with phosphoric acid.)
Column temperature: 33
Flow rate: 1
Injection volume: 20

Detector: E, Shimadzu L-ECD-6A, +0.80 V

CHROMATOGRAM
Internal standard: ethyl p-hydroxybenzoate (F ex 280 em 330)
Limit of detection: 30 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, glucuronides (F ex 280 em 330)

KEY WORDS
pharmacokinetics; plasma

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL 50 mg Bond Elut C8 SPE cartridge with 1 mL MeOH and 1 mL water. Add 200 μL buffer to the SPE cartridge, add 200 μL serum, add 200 μL buffer, wash with 1 mL buffer, elute with two 150 μL portions of MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 50 μL mobile phase or water, inject a 20 μL aliquot. (Buffer was 1 mM pH 9 ammonium bicarbonate.)

HPLC VARIABLES
Column: 250 × 8.4 Nucleosil 5C18
Mobile phase: Gradient. MeCN:25 mM tetraethylammonium phosphate buffer 1:99 for 8 min, 3:97 for 15 min (step gradient).
Flow rate: 1
Injection volume: 20
Detector: F ex 245 em 345

CHROMATOGRAM
Retention time: 6.97
Limit of detection: 5 ng/mL

SAMPLE

Matrix: blood, CSF

Sample preparation: Prepare 500 mg 3 mL Bond Elut C2 cartridges by rinsing with 2 mL MeOH then 2 mL 50 mM pH 7.5 Tris-HCl buffer. Apply 1 mL serum or CSF + 1 mL 50 mM pH 7.5 Tris-HCl buffer to the column and wash column with 10 mL 50 mM pH 7.5 Tris-HCl buffer. Elute with 2 mL 50% MeCN containing 0.1% trifluoroacetic acid. Freeze dry eluent or dry an aliquot at 40° under a stream of nitrogen, dissolve residue in 2560 μL mobile phase, inject 20-200 μL aliquot.

HPLC VARIABLES

Guard column: Hexyl

Column: 150 × 4.6 Spherisorb S5 C6

Mobile phase: Gradient. A 0.1% trifluoroacetic acid in water; B 0.1% trifluoroacetic acid in 40% MeCN. 16% B for 2 min then to 50% B over 10 min then to 100% B over 2 min, after 7 min return to original conditions over 2 min.

Flow rate: 1

Injection volume: 20-200

Detector: F ex 280 em 335

CHROMATOGRAM

Retention time: 8

Limit of detection: 0.87 ng/mL

OTHER SUBSTANCES

Extracted: codeine, normorphine, metabolites

Simultaneous: diamorphine, dihydrocodeine

KEY WORDS

serum; SPE

SAMPLE
Matrix: blood, CSF, urine, vitreous humor
Sample preparation: Condition a 200 mg Bond Elut SPE cartridge with 1 mL MeOH, 1 mL water, and 2 mL buffer. Centrifuge 1.5 mL serum, CSF, urine, or vitreous humor at 14000 g for 5 min, vortex 1 mL supernatant with 2 mL buffer and 100 ng internal standard. Centrifuge at 5000 g for 10 min, slowly add 2 mL supernatant to the SPE cartidge, wash with 2 mL buffer, dry under vacuum for 5 min. Elute with 500 μL MeOH:500 mM acetic acid 90:10 under gravity. Dry the eluate under a stream of nitrogen, reconstitute in 100 μL mobile phase, centrifuge at 14000 g for 4 min, inject a 10-20 μL aliquot. (Prepare buffer by adjusting pH of 900 mL 960 mg/L ammonium carbonate to 9.3 with concentrated ammonium hydroxide and 1 M ammonium hydroxide, make up to 1 L.)

HPLC VARIABLES
Column: 125 × 3 4 μm Superspher RP 18
Mobile phase: MeCN:50 mM pH 3 ammonium formate buffer 5:95
Flow rate: 0.6 for 4 min, to 1.1 over 3 min, maintain at 1.1 for 10 min
Injection volume: 10-20
Detector: MS, Finnigan MAT SSQ 7000 single quadrupole, 100-500u, 10 V, positive ion, sheath gas nitrogen pressure 70 p.s.i., auxiliary gas nitrogen 20 mL/min; heated vaporizer temperature 400°, heated capillary temperature 170°, corona current, 5 μ A, m/z 286

CHROMATOGRAM
Retention time: 4.1
Internal standard: morphine-d3
Limit of detection: 500 pg/mL
Limit of quantitation: 1 ng/mL

SAMPLE
Matrix: blood, urine
Sample preparation: 10 mL Serum, plasma, whole blood, or urine + 10 mL nalorphine in water + 25 mL saturated ammonium sulfate solution + 500 μL concentrated HCl, heat at 120° for 30 min, filter (Whatman No. 1 paper), adjust the pH of the filtrate to 9.0 with 25% NaOH, extract with 125 mL chloroform:isopropanol 80:20, repeat extraction with 50 mL chloroform:isopropanol 80:20. Combine the organic phases and wash them twice with 15 mL portions of 50 mM sodium borate solution, extract the organic phase twice with 10 mL portions of 1 M sulfuric acid. Combine the aqueous extracts and add 4 mL saturated ammonium sulfate, adjust pH to 9.0 with 25% NaOH, extract twice with 5 mL portions of chloroform:isopropanol 80:20. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 50 μL water, add 100 μL 0.1% dansyl chloride in acetone, add 50 μL 200 mM sodium carbonate, let stand at room temperature in the dark for 3 h, add 1 mL toluene, vortex for 2 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.5 3 μm Spherisorb S3W silica
Mobile phase: n-Hexane:isopropanol:ammonia 97:2.7:0.3
Flow rate: 1.5
Injection volume: 20
Detector: F ex 330-380 (filters) em 410-500 (filters)

CHROMATOGRAM
Retention time: 9.5
Internal standard: nalorphine (5)
Limit of detection: 0.2 pmole

OTHER SUBSTANCES
Noninterfering: acetaminophen, amitriptyline, amphetamine, atropine, benzoylecgonine, caffeine, carbamazepine, carisoprodol, chlorpromazine, chlorprothixene, cimetidine, cocaine, codeine, cyclizine, dextromethorphan, diazepam, dihydrocodeine, diphenoxilate, disopyramide, doxepin, doxylamine, emetine, erythromycin, ethylmorphine, flurazepam, glutethimide, hydrocodone, hydrocortisone, hydromorphone, hydroxyzine, imipramine, lidocaine, loxapine, meperidine, metapyrilene, methadone, methamphetamine, methocarbamol, methylphenidate, naloxone, nicotine, nordiazepam, nortriptyline, orphenadrine, oxycodone, papaverine, pentazocine, phenacetin, phencyclidine, phenmetrazine, phenolphthalein, phentermine, phenytoin, prazepam, procainamide, propoxyphene, propranolol, protriptyline, pyrilamine, quinine, spironolactone, strychnine, terpin hydrate, thioridazine, thiothixene, triamterene, trifluoperazine, triflupromazine, trihexyphenidyl, trimethoprim, trimetobenzamide, tripelennamine

KEY WORDS
derivatization; serum; plasma; whole blood; normal phase

Tagliaro,F.; Frigerio,A.; Dorizzi,R.; Lubli,G.; Marigo,M. Liquid chromatography with pre-column dansyl derivatisation and fluorimetric detection applied to the assay of morphine in biological samples, *J.Chromatogr.*, **1985**, *330*, 323–331.

SAMPLE
Matrix: blood, urine
Sample preparation: Condition two 130 mg Sep-Pak Light C18 SPE cartridges with 1 mL MeOH and 1 mL water. Dilute urine, if necessary, 20-fold with water. 1 mL Plasma, urine, or diluted urine + 1 mL 500 mM pH 9.3 ammonium sulfate buffer, mix, add 1.9 mL of this mixture to a SPE cartridge at 0.75 mL/min, wash with 4 mL 5 mM pH 9.1 ammonium sulfate buffer at 1.5 mL/min, wash with 200 μL MeCN:30 mM pH 2.1 potassium phosphate buffer 15:85 at 0.75 mL/min, elute with 600 μL MeCN:30 mM pH 2.1 potassium phosphate buffer 15:85 at 0.75 mL/min. Mix the eluate with 1 mL 500 mM pH 9.3 ammonium sulfate buffer, add to a second SPE cartridge at 0.75 mL/min, wash with 4 mL 5 mM pH 9.1 ammonium sulfate buffer at 1.5 mL/min, wash with 200 μL MeCN:30 mM pH 2.1 potassium phosphate buffer 15:85 at 0.75 mL/min, elute with 600 μL MeCN:30 mM pH 2.1 potassium phosphate buffer 15:85 at 0.75 mL/min, inject a 400 μL aliquot of the eluate.

HPLC VARIABLES
Column: 100 × 4 3 μm Spherisorb S3 ODS2
Mobile phase: MeCN:buffer 22:78 (Buffer was 30 mM KH_2PO_4 containing 3 mM dodecyl sulfate, adjusted to pH 2.1 with phosphoric acid.)
Flow rate: 1.5
Injection volume: 400
Detector: E, ESA Model 5100 A Coulochem, Model 5010 detector cell, first electrode 0.25 V, second electrode 0.35 V

CHROMATOGRAM
Retention time: 8
Limit of detection: 0.5 nM

OTHER SUBSTANCES
Extracted: metabolites, codeine (UV 214), norcodeine (UV 214), normorphine

KEY WORDS
plasma; SPE

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. Condition a Toxiclean SPE cartridge (Alltech) with 3 mL MeOH, two 3 mL portions of water, and 2 mL buffer. 100 μL Plasma or serum + 100 μL MeOH + 200 μL MeCN + 100 μL buffer, vortex for 1 min, centrifuge at 4000 rpm for 15 min, add the supernatant to the SPE cartridge, wash with two 3 mL portions of water, dry under vacuum for 10 min, elute with 2 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue in 100 μL 2.5 μg/mL flufenamic acid in MeOH (?), inject an aliquot. Urine. Condition a Bond Elut C8 SPE cartridge with 3 mL MeOH, two 3 mL portions of water, and 2 mL buffer. 100 μL Urine + 100 μL MeOH + 200 μL MeCN + 500 μL buffer, vortex for 1 min, centrifuge at 2000 rpm for 5 min, add the supernatant to the SPE cartridge, wash with two 3 mL portions of water, dry under vacuum for 10 min, elute with 2 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue in 100 μL 2.5 μg/mL flufenamic acid in MeOH (?), inject an aliquot. (Buffer was 250 mL 25 mM sodium borate and 18 mL 100 mM NaOH, pH 9.2.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Adsorbosphere HS C18
Mobile phase: MeCN:MeOH:1.2% ammonium acetate 15:40:45
Flow rate: 0.8
Detector: UV 239

CHROMATOGRAM

Retention time: 5.6
Internal standard: flufenamic acid (24.39)
Limit of quantitation: 300 ng/mL (urine), 100 ng/mL (plasma, serum)

OTHER SUBSTANCES

Extracted: codeine, monoacetylmorphine, papaverine

KEY WORDS

SPE; plasma; serum

Theodoridis,G.; Papadoyannis,I.; Tsoukali-Papadopoulou,H.; Vasilikiotis,G. A comparative study of different solid phase extraction procedures for the analysis of alkaloids of forensic interest in biological fluids by RP-HPLC/Diode array, *J.Liq.Chromatogr.*, **1995**, *18*, 1973–1975.

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 211.1

CHROMATOGRAM
Retention time: 3.315

KEY WORDS
whole blood

SAMPLE
Matrix: bulk
Sample preparation: Prepare a 750 μg/mL solution in 10 mM pH 2.5 orthophosphoric acid, sonicate for 10 min, filter (0.2 μm), inject a 15 μL aliquot.

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChrospher 100
Column: 125 × 4 3 μm Spherisorb ODS-1
Mobile phase: Gradient. A was water containing 5 mL/L 85% orthophosphoric acid and 0.56 mL/L hexylamine. B was MeCN:water 90:10 containing 5 mL/L 85% orthophosphoric acid and 0.56 mL/L hexylamine. A:B from 91:9 to 86:14 over 4 min, maintain at 86:14 for 13 min, to 55:45 over 11 min, maintain at 55:45 for 8 min, re-equilibrate at initial conditions for 20 min.
Flow rate: 0.7
Injection volume: 15
Detector: UV 210

CHROMATOGRAM
Retention time: 2.9

OTHER SUBSTANCES
