# Dictionary of Computer and Internet Terms

JOHN C. RIGDON

Dictionary of Computer and Internet Terms
(Vol. 1)

John C. Rigdon,
Editor

Dictionary of Computer and Internet Terms

1st Edition – AUG 2016 0/0/0/CS

This dictionary is adapted from Microsoft Language Portal with additions and edits by John C. Rigdon.

Overview

This dictionary contains over 32,000 terms that are specific to Computers and the Internet. Each term includes a definition / description.   With more than 750 pages, this dictionary is one of the most comprehensive resources available.

Terms relate to applications, commands, functions, operating systems, image processing and networking.

No other dictionary of computing terms even comes close to the breadth of this one. It is designed to be used by everyone from the novice seeking the most basic information … to the mainframe systems programmer and MIS professional looking for sophisticated and hard-to-find information that's not available in most reference books. It's all here in one indispensable reference source.

- artificial intelligence.
- computer-integrated manufacturing
- data communication
- databases
- distributed data processing
- fiber optics
- fundamental terms
- local area networks
- multimedia
- office automation
- open systems interconnection
- peripheral equipment
- personal computing
- processing units
- programming

- system development
- text processing

This dictionary is ideal not only for students of computing but for those studying the related fields of Information Technology, mathematics, physics, media communications, electronic engineering, and natural sciences.

We also publish a companion volume (Vol.2) of Computer Acronyms and Abbreviations with an additional 4,500 terms. Volume 2 also includes a section on file name extensions showing the most commonly used extensions and their association with various software systems.

This dictionary is available in more than 100 languages. See our website for pricing and availability.

http://www.wordsrus.info/catalog/computer_dictionary.html

Abbreviations used:

(n) – noun

(pn) – Proper Name

(v) – verb

(adj) – adjective

(oth) – other

Miscellaneous Terms

8.3 (oth)~ The standard format for file names in MS-DOS and Windows 3.1. A file name with eight or fewer characters, followed by a period (dot), followed by a three-character file name extension.

OEM (n)~ The name of a folder that includes additional files for the Windows installation.

%SYSTEMROOT% (n)~ The path and folder name where the Windows system files are located. Typically, this is C:\Windows, although you can designate a different drive or folder when you install Windows. You can use the value %systemroot% to replace the actual location of the folder that contains the Windows system files. To identify your systemroot folder, click Start, click Run, type %systemroot%, and then click OK.

%WINDIR% (n)~ The system environment variable that points to the directory where Windows is installed, most commonly C:\Windows.

0 or 1 Matches (n)~ A menu item that allows the user to search for a pattern A to be represented in pattern B 0 or 1 times. Patterns could be strings, characters, etc. For example, if you want to find any strings that meet the criteria AB 0 or 1 matches in string'

0 or More Matches (n)~ A menu item that allows the user to search for a pattern A to be represented in pattern B 0 or more times. Patterns could be strings, characters, etc.

1 on 1 (n)~ ?A curated time when Cortana brings high-priority or high-impact information to the user and takes the time to learn more about the user based on inferences she's working on.

1 or More Matches (oth)~ A menu item that allows the user to search for a pattern A to be represented in pattern B 1 or more times. Patterns could be strings, characters, etc.

100% stacked bar chart (n)~ A bar chart subtype that compares the percentage that each value contributes to a total across categories.

100% stacked column chart (n)~ A column chart subtype that compares the percentage that each value contributes to a total across categories.

100baseT (n)~ The Ethernet standard for local area networks using twisted-pair cable carrying data at 100 megabits per second (Mbps).

1099 report (n)~ A report to the U.S. Internal Revenue Service (IRS) on a 1099 form. A 1099 form is used to report non-employee income and is filed on a calendar year basis. The IRS produces various types of 1099 forms, including Dividend (1099-DIV), Interest (1099-INT), Miscellaneous (1099-MISC), and Retirement (1099-R).

10base2 (oth)~ The Ethernet and IEEE 802.3 standard for baseband LANs (local area networks) using a thin coaxial cable (3/16 inch) up to 200 meters long and carrying 10 Mbps (megabits per second) in a bus topology. A network node is connected to the cable by a BNC connector on the adapter card.

12+ (oth)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

12+ (oth)~ A game rating symbol developed by Unterhaltungssoftware Selbstkontrolle (USK).

128-bit encryption (n)~ A high level of encryption that uses a 128-bit key to scramble the contents of a file or data packet to make the data unreadable without the decryption key.

128-bit SSL encryption (n)~ An encryption level used for SSL. The number refers to the length of the key, so the higher the number, the more difficult the encryption is to break.

12-Month Plan (n)~ A monthly commitment to Microsoft Azure for 12 months. There are two subscription options: Pay Monthly and Pre-Pay.

15+ (oth)~ A game rating symbol developed by the British Board of Film Classification (BBFC).

16+ (oth)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

16+ (oth)~ A game rating symbol developed by Unterhaltungssoftware Selbstkontrolle (USK).

18+ (oth)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

1-byte unsigned Integer (n)~ An integer data type that has a positive value ranging from 0 to 255.

1-D shape (n)~ Either a straight line you draw or a shape that has a beginning point and ending point and can be glued between two shapes to connect them.

1M Events (n)~ A unit of measure of the 'Premium Overage Events' and 'Standard Overage Events' resources of the 'Application Insights' service type of the 'Visual Studio' service for 'Pay-As-You-Go' billing based on the number of events produced using 1M as baseline.

1M Queries (n)~ A unit of measure for DNS Queries (1M) resource of the DNS service type of the Networking service.

2007 Microsoft-® Office system (PN)~ A version of the integrated system of Microsoft core desktop productivity tools, programs, servers, and services designed for information work.

21 CFR Part 11 (PN)~ A Food and Drug Administration (FDA) regulation, Title 21 of the Congressional Federal Record, Part 11. This regulation specifies the conditions and criteria for determining the validity and trustworthiness of electronic signatures and processes.

2-byte signed Integer (n)~ An automation integer data type that can be either positive or negative. The most significant bit is the sign bit, which is 1 for negative values and 0 for positive values. The storage size of the integer is 2 bytes. A 2-byte signed integer can have a range from -32,768 to 32,767.

2-D (oth)~ Existing in reference to two measures, such as height and width—for example, a two-dimensional model drawn with reference to an x-axis and a y-axis, or a two-dimensional array of numbers placed in rows and columns.

2-D chart (n)~ A chart that represents data on two axes, x and y, and displays chart objects in flat graphical formatting.

2-D shape (n)~ A shape that has four selection handles that you can use to resize the shape proportionally.

2-element constraint (n)~ A constraint that applies to two elements, such as two classes or two associations. The constraint is shown as a dashed arrow from one element to the other, labeled by the constraint string in braces ({ }).

2-in-1 (n)~ A computer that has properties both of a tablet and a laptop.

2PC (n)~ A protocol that ensures that transactions that apply to more than one server are completed on all servers or none at all. Two-phase commit is coordinated by the transaction manager and supported by resource managers.

2-way paging (n)~ A system that allows users to send and receive messages when they are out of range.

3+ (oth)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

32 bit machine (n)~ A computer that works with data in groups of 32 bits at a time. The Apple Macintosh II and higher models are 32-bit machines, in terms of both the word size of their microprocessors and the size of the data buses, as are computers based on the Intel 80386 and higher-level microprocessors.

3270 emulator (n)~ Software that enables a microcomputer to act as a 3270 terminal. Emulator software can also enable a desktop computer to send print jobs from a host system to a printer connected to the microcomputer.

3270 terminal emulation (n)~ The use of software that enables a microcomputer to act as a 3270 terminal. Emulation software can also enable a microcomputer to send print jobs from a host system to a printer connected to the microcomputer.

3D (adj)~ Of, pertaining to, or being an object or image having or appearing to have all three spatial dimensions (length, width, and depth).

3-D (adj)~ Of, pertaining to, or being an object or image having or appearing to have all three spatial dimensions (length, width, and depth).

3D Builder (PN)~ An app to create, print, and scan in 3D.

3-D column chart (n)~ A column chart subtype that compares data points along two axes.

3D display controller (n)~ A display controller that supports 3D operations.

3-D effect (n)~ A diagramming capability that shows charts in three dimensions.

3D Human Body (PN)~ A feature that allows a user to explore human anatomy with 3D imaging.

3D model (n)~ A computer simulation of a physical object in which length, width, and depth are real attributes: a model, with x-, y-, and z-axes, that can be rotated for viewing from different angles.

3D object (n)~ A digital representation of a three-dimensional object that can be rendered on a computer screen using specialized software. The most common file format is the .obj file format.

3-D reference (n)~ A reference to a range that spans two or more worksheets in a workbook.

3-D walls and floor (n)~ The areas surrounding many 3-D chart types that give dimension and boundaries to the chart. Two walls and one floor are displayed within the plot area.

3DES (n)~ An encryption algorithm based on the Data Encryption Standard (DES).

3G (PN)~ The third generation of digital wireless technology, as defined by the International Telecommunications Union (ITU). Third generation technology is expected to deliver data transmission speeds between 144 Kbps (kilobits per second) and 2 Mbps (megabits per second), compared to the 9.6 Kbps to 19.2 Kbps offered by second generation technology. Western Europe and Japan lead the world in adoption of 3G technology and services.

3G connection (n)~ A connection that enables the transfer of information using the 3G technology.

3-leg configuration (n)~ A perimeter network where the server acting as a firewall has three network cards: one for the internal network, one for the intranet, and one for a protected perimeter network server.

3PL (n)~ A party that provides logistics services to customers.

404 error ~ An error message received when you try to access a web page that either doesn't exist or is unavailable at the address you gave.

40-bit encryption (n)~ A low level of encryption that uses a 40-bit key to scramble the contents of a file or data packet to make the data unreadable without the decryption key.

4-byte signed Integer (n)~ An Automation integer data type that can be either positive or negative. The most significant bit is the sign bit, which is 1 for negative values and 0 for positive values. The storage size of the integer is 4 bytes. A 4-byte signed integer can have a range from -2,147,483,648 to 2,147,483,647.

52-week high (PN)~ The highest price that a stock has traded at during the previous 52 weeks.

52-week low (PN)~ The lowest price that a stock has traded at during the previous 52 weeks.

6 - Month Plan (n)~ A monthly commitment to Microsoft Azure for 6 months. There are two subscription options: Pay Monthly and Pre-Pay.

6/12-Month Plan (PN)~ A monetary monthly pre-pay commitment to Windows Azure. This offer is no longer available to new subscribers.

6+ (oth)~ A game rating symbol developed by Unterhaltungssoftware Selbstkontrolle (USK).

64 bit machine (n)~ A computer that works with data in groups of 64 bits at a time. A computer may be considered a 64-bit machine either because its CPU operates internally on 64-bit words or because its data bus can transfer 64 bits at a time. A 64-bit CPU thus has a word size of 64 bits, or 8 bytes; a 64-bit data bus has 64 data lines, so it ferries information through the system in sets of 64 bits at a time. Examples of 64-bit architecture include the Alpha AXP from Digital Equipment Corporation, the Ultra workstation from Sun Microsystems, Inc., and the PowerPC 620 from Motorola and IBM.

64-bit (adj)~ Of, pertaining to, or descriptive of the amount of data -64 bits, or 8 bytes- that certain computer systems or programs can process at one time.

7+ (oth)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

802.1X (n)~ An Institute of Electrical and Electronics Engineers (IEEE) standard that defines port-based network access control which either allows or denies connection requests to IEEE 802.3 wired Ethernet networks or IEEE 802.11 wireless networks.

802.1X-capable switch (n)~ A network access server that adheres to both the Institute of Electrical and Electronics Engineers (IEEE) 802.1X and the Remote Authentication Dial-in User Service (RADIUS) standards, and that is deployed in networks to enforce 802.1X authenticated IEEE 802.3 wired Ethernet access.

802.1X-capable wireless access point (n)~ A network access server that adheres to both the Institute of Electrical and Electronics Engineers (IEEE) 802.1X and the Remote

Authentication Dial-in User Service (RADIUS) standards, and that is deployed in networks to enforce 802.1X authenticated IEEE 802.3 wired Ethernet access.

80211a, 80211b, 80211g, 80211i, 80211n ~ Different standards for operating wireless networks (Wi-Fi). Loosely the higher the letter, the faster the speed.

80286, 80386, 80486 (or 286, 386, 486) ~ Three generations of PC- processor, now pretty much obsolete, the ancestors of Intel's- Pentium. The 286 was the earliest processor able to run (just about) a version of- Windows, although the 386 was really the minimum to run it properly. The 486 was the earliest processor able to run- Windows 95- - just about. Machines of this vintage cannot run modern versions of Windows at all, but many are still in use as basic word-processors or where a dedicated machine is required which doesn't need to be powerful.

8-bit color (n)~ A display setting that holds up to 256 specific color entries. Any color palette attached to a picture is by definition an 8-bit palette.

9+ participants (PN)~ An indicator that is displayed in the meeting roster when there are more than nine participants in the meeting.

90 Day Free Trial (n)~ The offer that provides a free trial for 90 days for any new customer. It is now no longer available to new subscribers.

A ~

 A (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

A cappella (Adverb) ~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 123.

A record (n)~ A type of resource record in the Domain Name System that associates a specific IP address with a domain name. This is the record that contains the information that connects your domain name to your actual Web site content when people type your domain name into a browser.

A/P (n)~ A group of posting accounts that show the amounts owed to suppliers or creditors for goods, supplies, or services purchased on credit.

A/R (n)~ A group of posting accounts that show the amounts customers owe for services or sales made on credit.

A/V Conferencing Edge Server (n)~ An Office Communications Server that resides in the perimeter network and provides a single trusted point through which media traffic can traverse NATs and firewalls.

A/V Conferencing Edge service (n)~ An Office Communications Server that resides in the perimeter network and provides a single trusted point through which media traffic can traverse NATs and firewalls.

A/V Edge server (n)~ Enables internal users to share audio and video data with external users (that is, users who are not logged on to your internal network).

A1 notation (n)~ An alphanumeric convention for referencing the location of cells in a worksheet. The column is represented by a letter (A through IV, for a total of 256 columns) and the row is represented by a number (1 through 65536).

A2 HDInsight (n)~ The size and options for Microsoft's Windows version of Hadoop on Azure implementation.

A2 HDInsight (Non-Windows) (n)~ The size and options for Microsoft's non-Windows version of Hadoop on Azure implementation.

A2A integration (n)~ The process of coordinating the operation of the various programs, databases, and existing technologies of a business or enterprise so that they function as an efficient, business-wide system.

A3270 (n)~ The server transaction program for the APPC 3270 Terminal Emulator facility.

AA (n)~ A software technique for smoothing the jagged appearance of curved or diagonal lines caused by poor resolution on a display screen. Methods of anti-aliasing include surrounding pixels with intermediate shades and manipulating the size and horizontal alignment of the pixels.

AAD Sync (PN)~ A software tool for connecting to data sources, synchronizing data between data sources, as well as the provisioning and deprovisioning of identities.

AADRM (PN)~ The Microsoft technology that allows customers to protect their data by

encrypting and managing access rights in document authoring, email, and publishing.

AADSync (PN)~ A software tool for connecting to data sources, synchronizing data between data sources, as well as the provisioning and deprovisioning of identities.

AAL (n)~ The layer of the asynchronous transfer mode (ATM) protocol stack that parses data into the payload portion of the ATM cell for transport across an ATM network.

AAM (n)~ A security feature of Windows that allows administrators to perform normal day-to-day tasks while running with a standard user token. If administrator privileges are needed for an operation, the administrator will be notified and asked to provide either consent or credentials, depending on system policy settings.

abandon (v)~ To terminate the current action before it is complete.

ABAP (PN)~ A programming language for developing applications for the SAP mySAP ERP 2004 system.

ABC classification (n)~ A system for ranking discrete categories of items according to Pareto's 80/20 principle that states that a small percentage of items account for the largest fraction of significance.

ABC code (n)~ A classifier that names categories in an ABC classification.

ABC code for carrying cost classification (n)~ A classifier that names categories in an ABC classification that ranks discrete categories of items according to their carrying cost.

ABC code for contribution margin (n)~ A classifier that names categories in an ABC classification that ranks discrete categories of items according to their contribution margin.

ABC code for revenue (n)~ A classifier that names categories in an ABC classification that ranks discrete categories of items according to their revenue.

ABC code value (n)~ The categorization of an inventory item based on its value compared to the total inventory on hand.

abend (n)~ The premature ending of a program because of a program error or system failure.

ABEND (n)~ The premature ending of a program because of a program error or system failure.

ABN (PN)~ An 11-digit number issued by the Australian Taxation Office Australian Business Register to any entities registered to carry on an enterprise in Australia.

abort (v)~ To terminate abruptly, often used in reference to a program or procedure in progress.

About (PN)~ An item on the Help menu that opens the About dialog box, which includes the copyright, licensing, and license terms for the product.

About (PN)~ The link group that includes links to the About Hotmail webpage, the What's New webpage, and so on.

about (PN)~ A Settings screen containing information relating to the phone, such as phone manufacturer, available storage, OS version, etc.

About Microsoft Office Communicator (n)~ An item on the Help menu that opens the About dialog box, which includes the copyright, licensing, and license terms for Communicator.

ABR (n)~ A router that is attached to multiple areas. Area border routers maintain separate topological databases for each area.

absolute address (n)~ An absolute (machine) address specifying a physical location in

memory.

absolute categorization rating (n)~ A method of evaluating transmitted voice quality where subjects rate (from 1 to 5) short groups of unrelated sentences under controlled conditions.

absolute category rating (n)~ A method of evaluating transmitted voice quality where subjects rate (from 1 to 5) short groups of unrelated sentences under controlled conditions.

absolute cell reference (n)~ In a formula, the exact address of a cell, regardless of the position of the cell that contains the formula.

absolute link (n)~ A hyperlink to the exact location of a file on a file server, the World Wide Web, or a company intranet. Absolute links use an exact path; if anyone moves the file containing the hyperlink or a hyperlink destination, the link breaks.

absolute path (n)~ A path to a file that begins with the drive identifier and root directory or with a network share and ends with the complete file name (for example, C:\docs\work\contract.txt or \netshare\docs\work\contract.txt).

absolute pointing device (n)~ A mechanical or physical pointing device whose location is associated with the position of the on-screen cursor. For example, if the user of a graphics tablet places the pen on the upper right corner of the tablet, the cursor moves to the upper right corner of the screen or on-screen window associated with the pen.

absolute positioning (n)~ Placement of an element relative to either the element's parent or, if there isn't one, the body. Values for the element's Left and Top properties are relative to the upper-left corner of the element's parent.

absolute reference (n)~ In a formula, the exact address of a cell, regardless of the position of the cell that contains the formula.

absolute security descriptor (n)~ A security descriptor structure that contains pointers to the security information associated with an object.

absolute URL (n)~ The full Internet address of a page or other World Wide Web resource. The absolute URL includes a protocol, such as http

abstract (n)~ A short summary of the contents of a document that gives the reader a quick overview of its topic and purpose.

abstract application definition (n)~ The abstract type of an application, which defines common characteristics of a class of applications.

abstract class (n)~ A generic class that is used only as a template for derived classes, and that cannot be instantiated.

abstract class (n)~ In object-oriented programming, a class in which no objects can be created. It is, however, used to defined subclasses, and objects are created from the subclasses.

abstract definition (n)~ The definition of a class of (concrete) definitions, which describes characteristics common to all instances of the abstract definition.

abstract endpoint definition (n)~ The abstract type of an endpoint, which defines common characteristics of a class of endpoints. Examples include, Web Site Endpoint, Http Client Endpoint, Http Server Endpoint.

abstract server definition (n)~ The abstract type of an application server, which defines common characteristics of a class of logical application servers including the set of supported abstract endpoint definitions.

abuse alias (n)~ An e-mail alias for Exchange Hosted Services designed to receive spam submissions from customers.

AC (n)~ Electric current that reverses its direction of flow (polarity) periodically according to a frequency measured in hertz, or cycles per second. The rapid change from positive to negative electricity of 60 or more times each second.

AC power connector (n)~ A connector that is used to connect an AC power cord to a piece of equipment, such as a device, a computer, or Surface unit.

AC/Main switch (n)~ The overall power control for a piece of equipment, such as a device, a computer, or Surface unit.

Academic Library (n)~ A site template that offers a protected document library for educational institutions where students can discover, acquire, and consume selected content that is subject to digital rights management.

ACCDE file (n)~ An Access 2007 database (.accdb) file with all modules compiled and all editable source code removed.

Accelerated Cost Recovery System (n)~ A system of depreciation that assigns depreciation methods to different classes of assets. Created by the Economic Recovery Tax Act of 1981 for U.S. tax purposes and modified by the Tax Reform Act of 1986.

accelerated graphics port (n)~ A technology that provides a dedicated, high-speed port through which large blocks of 3-D texture data can be moved between the computer's graphics controller and system memory.

Accelerator (PN)~ A type of browser extension that gives users quick access to their Web and client applications from any Web page. An Accelerator can run on user-selected data, links, and the current document. This browser extension can provide -€œlookup-€? service like in-place definition or -€œsend-€? service like sending selected text to a Web e-mail provider.

accelerator editor (n)~ A resource editor that allows you to add, delete, change, or browse the shortcut key assignments for your project.

accent color (n)~ A color that affects the background and system controls throughout the new Windows user interface.

Accent Process (PN)~ A SmartArt graphic layout used to show a progression, a timeline, or sequential steps in a task, process, or workflow. Works well for illustrating both Level 1 and Level 2 text.

Accents (PN)~ The title of a screen displaying the list of accent colors.

accept (v)~ A UI element the user presses to agree to an incoming file transfer, invitation, audio/video call, or application sharing.

acceptable use policy (n)~ A statement issued by an online service that indicates what activities users may or may not engage in while logged into the service. For example, some providers prohibit users from engaging in commercial activity on the network.

acceptance criteria (n)~ The criteria that a product or product component must satisfy to be accepted by a user, customer, or other authorized entity.

acceptance testing (n)~ Formal testing conducted to enable a user, customer, or other authorized entity to determine whether to accept a product or product component.

accepted domain (n)~ Any SMTP namespace for which an Exchange organization sends and receives e-mail. Accepted domains include those domains for which the Exchange

organization is authoritative. An Exchange organization is authoritative when it handles mail delivery for recipients in the accepted domain. Accepted domains also include domains for which the Exchange organization receives mail and then relays to an e-mail server that is outside the Active Directory forest for delivery to the recipient.

access (n)~ In respect to privacy, an individual's ability to view, modify, and contest the accuracy and completeness of PII collected about him or her. Access is an element of the Fair Information Practices.

access (v)~ To gain entry to memory in order to read or write data.

access (n)~ The act of reading data from or writing data to memory.

access (n)~ The ability to view data or navigate to or within a physical or virtual computer environment.

Access 2016 (PN)~ The year 2016 edition of the Microsoft relational database management system.

access account (n)~ An account used to crawl Web sites, servers and network resources included in a content index.

Access app (n)~ An app for SharePoint that is built by using Access and has its data stored in SQL Server or SQL Azure.

Access app for SharePoint (PN)~ An app for SharePoint that is built by using Access and has its data stored in SQL Server or SQL Azure.

access bar (n)~ A toolbar that docks to the desktop, similar to the taskbar.

access code (n)~ A string of characters entered by a user to verify his or her identity to a network or to a local computer, device, or client, or to sign in to an account, app, and so on.

Access Connectivity Engine (PN)~ Part of the Access database system that retrieves and stores data in user and system databases. The engine can be thought of as a data manager on which database systems are built.

access control (n)~ A security mechanism that determines which operations a user, group, service, or computer is authorized to perform on a computer or on a particular object, such as a file, printer, registry subkey, or directory service object.

Access Control (PN)~ The Microsoft Azure service that provides federated authentication and rules-driven, claims-based authorization for REST Web services.

access control entry (n)~ An entry in either a securable object's discretionary access control list (DACL) or an object's system access control list (SACL). In a DACL, the entry grants or denies permissions to a user or group. In a SACL, the entry specifies which security events to audit for a particular user or group or controls the Windows Integrity Level for the object.

Access Control Entry Management View (n)~ A feature that allows the user to set access levels for a group of contacts.

access control list (n)~ In Windows-based systems, a list of access control entries (ACE) that apply to an entire object, a set of the object's properties, or an individual property of an object, and that define the access granted to one or more security principals.

Access Control Service (PN)~ The Microsoft Azure service that provides federated authentication and rules-driven, claims-based authorization for REST Web services.

Access Control Transactions (in 100,000s) (PN)~ The pricing unit associated with the

offer Microsoft Azure Pay-As-You-Go (Partners).

Access database engine (PN)~ Part of the Access database system that retrieves and stores data in user and system databases. The engine can be thought of as a data manager on which database systems are built.

Access Edge Server (n)~ A service that runs on Lync Server that resides in the perimeter network and routes instant messaging (IM) and presence information from external users to internal users.

Access Edge service (n)~ A service that runs on Lync Server that resides in the perimeter network and routes instant messaging (IM) and presence information from external users to internal users.

access key (n)~ Any combination of keys that must be pressed sequentially.

access level (n)~ A setting that determines how much information a contact can view about you.

access level (n)~ A security role setting that determines for a given object type at which levels within the organization hierarchy a user can act on that object type.

Access Levels Management (PN)~ A UI element that displays a user's contacts and access level entries (ACEs) organized by access level.

access mask (n)~ In Windows-based computers, a 32-bit value (a bitmask) that specifies the permissions that are assigned in an access control entry (ACE). An access mask is also part of the access request when an object is opened. The access mask in the request is compared to the access mask in each ACE to determine whether or not to grant the request.

Access number (n)~ A product that is used like a calling card, that allows a user to enter a number manually and dial any phone number. An Access number is a type of Skype To Go number.

access permissions (n)~ Authorization to perform operations associated with a specific shared resource, such as a file, directory, or printer. Permissions must be granted by the system administrator to individual user accounts or administrative groups.

access point (n)~ A device used to connect wireless computers and other wireless devices to a wired network.

access point (n)~ One of the four corner buttons on the screen of a Surface unit. In attract applications or a running standard application, you can touch an access point to open Launcher. In Launcher, you can touch an access point to close Launcher and reopen a running application.

Access Point Name (n)~ A field in the Properties dialog box for GPRS installation items in the Mobile Deployment Manager MMC snap-in that enables the user to specify the wireless access point for the device.

access policy (n)~ A policy which defines the permissions and duration of access to an asset.

access privileges (n)~ The type of operations permitted for a given user of a certain system resource on a network or a file server.

access provider (n)~ A business that supplies Internet connectivity services to individuals, businesses, and other organizations. An ISP provides a telephone number, a user name, a password, and other connection information so that users can access the Internet through

the ISP's computers.

Access Services (PN)~ A scalable Web platform that enables users to publish an Access database application to a SharePoint site. Data in these databases can then be viewed and edited in a Web browser. This enables browser-based viewing and interaction with the databases on machines that do not have a database application installed.

Access Services Administration (PN)~ A feature that allows administration of Access services through an administration interface and powershell scripts.

Access to Azure Active Directory (PN)~ The offer that gives customers access to Azure Active Directory Premium as part of their volume license agreement.

access token (n)~ A data structure that contains authentication and authorization information for a user. Windows creates the access token when the user logs on and the user's identity is confirmed. The access token contains the user's security ID (SID), the list of groups that the user is a member of, the list of privileges held by that user. Each process or thread started for the user inherits a copy of the access token. In some cases a user may have more than one access token, with different levels of authority.

access token (n)~ A data structure that contains authentication and authorization information for a user or a page.

access URL (n)~ The internal URL that is used by a crawler to identify and access an item.

access violation (n)~ An attempt to run a memory operation that the underlying page protection does not allow. An access violation applies to memory operations, but does not apply when the security manager checks user-mode access rights to objects.

Access Web Datasheet (PN)~ An ActiveX component that is used to implement Datasheet view in SharePoint.

Access Web Services API (PN)~ An API that provides programmatic access to the capabilities on SharePoint.

access-based enumeration (n)~ A feature that displays only the files and folders that a user has permissions to access.

access-denied assistance (n)~ Assistance provided to users who receive an access denied' error while attempting to access a file or folder on a file server for which access-denied assistance has been enabled by the administrator of the server.'

accessibility (n)~ The quality of a system incorporating hardware or software to engage a flexible, customizable user interface, alternative input and output methods, and greater exposure of screen elements to make the computer usable by people with cognitive, hearing, physical, or visual disabilities.

Accessibility Advocate (PN)~ A collection of Office.com content about the people and tools that make work and life easier for people living with disability.

accessibility aid (n)~ A utility that makes a computer easier to use for people with disabilities. Examples of accessibility aids include screen readers, speech recognition programs, and on-screen keyboards.

Accessibility API (PN)~ An API that contains controls and features that facilitate accessibility.

Accessibility Checker (PN)~ A feature that helps users of some Office applications to improve the accessibility of documents they create.

accessibility feature (n)~ A set of techniques that you can use to make your Microsoft Silverlight-based applications more accessible.

Accessibility Scope Viewer (PN)~ The tool that helps designers and developers visualize the accessibility information of UI elements, as seen by a screen reader.

Accessibility Wizard (n)~ An interactive tool that makes it easier to set up commonly used accessibility features by specifying options by type of disability, rather than by numeric value changes.

accessor (n)~ A data structure or group of structures created by the consumer that describes how row or parameter data from the data store is to be laid out in the consumer's data buffer, enabling providers to optimize access. An accessor is a collection of bindings.

accessory (n)~ A device, such as a disk drive, printer, modem, or joystick, that is connected to a computer and is controlled by the computer's microprocessor.

accessory app (n)~ A companion app for a third-party hardware accessory. This app communicates with both the phone and a hardware accessory to transfer notification data from the phone to the accessory.

Accidental Deletion Protection (n)~ A feature to prevent the directory from unwanted deletions.

account (n)~ A record-keeping arrangement used by the vendor of an online service to identify a subscriber and to maintain a record of customer usage for billing purposes.

account (n)~ The record-keeping mechanism used by networks and multiuser operating systems for keeping track of authorized users.

account (n)~ The person or business to which the salesperson tries to sell a product or service.

account (n)~ The type of record - asset, liability, revenue, expense, or owner's equity - traditionally used for recording individual transactions in an accounting system.

Account (n)~ A UI element that links to Account Services or other, account-related site.

account (n)~ An organization's authorization to access the Live Meeting service.

account (n)~ Private information that a customer provides to establish their Windows Live ID. This information is separate from the customer's (outward-facing) profile and is never shared without explicit consent.

account (n)~ A set of attributes that define a user's access to a given service or application.

account (n)~ A chronological record that describes the changes in value classified as assets, liabilities, expenses, and revenue.

Account (PN)~ A tab in the Backstage view where users can manage their identities and services, view licensing details, and link to account management features.

account (n)~ A feature that enables the user to see Skype activity, change settings, and purchase Skype Credit.

Account (n)~ A group of customers who share data related to tickets, chats, emails, calls, and owned products and assets.

Account (PN)~ The section of the Store where account holders can manage their account.

account administrator (n)~ The only person who is authorized to access to the Azure Account Center and create subscriptions, cancel subscriptions, change billing for a subscription, change Service Administrator, and more.

account alias (n)~ A 20-character 'short name' for a posting account in the chart of accounts. If the account format has an unusually large number of segments, entering aliases rather than accounts will speed up data entry.

account balance (n)~ The difference between the sum of debit entries and the sum of credit entries entered into an account during a financial period.

account certification (n)~ The process that associates user accounts with key pairs.

account certification service (n)~ A Windows RMS Web service that creates and distributes RM account certificates.

account code (n)~ The unique identifier for a record that holds the balance relating to any single asset, liability, owner's equity, revenue, or expense of the business.

account code segment (n)~ A section of an account code that represents a type of entity for which you are accounting.

account domain (n)~ A Windows NT domain that holds user account data.

account entry (n)~ A record of the increase or decrease in economic value classified by a ledger account.

account expiration (n)~ A time limit that is applied to the life of an account, so that it can be used only for a predetermined period of time.

account federation server (n)~ The federation server that is located in the corporate network of the account partner organization. The account federation server issues security tokens to users based on user authentication. The server authenticates a user, pulls the relevant attributes and group membership information out of the account store, and generates and signs a security token to return to the user-€"either to be used in its own organization or to be sent to a partner organization.

account federation server proxy (n)~ The federation server proxy that is located in the perimeter network of the account partner organization. The account federation server proxy collects authentication credentials from a client that logs on over the Internet (or from the perimeter network) and passes those credentials to the account federation server.

account for organizations (PN)~ The Microsoft Commerce Platform portal that gives organizations the ability to view, manage, and purchase Microsoft organizational services, licenses, and subscriptions, like O365, Windows Intune, and GSM, from a single location.

account ID (n)~ A record-keeping number used to identify a subscriber/customer and to maintain a record of customer usage for billing purposes.

account information (n)~ The required information provided in order to authorize access to the enterprise application.

account linking (n)~ The process of linking Windows user accounts to Windows Live IDs or other online accounts, allowing seamless interaction between the two authentication models. As a result, users can be automatically logged into their online services when logging into Windows. They can also share with other users based on their Windows Live IDs (or other), granting them specific permissions to files and folders (read only, read-write, etc.).

account lockout (n)~ A Windows security feature that locks a user account if a number of failed logon attempts occur within a specified amount of time, based on security policy lockout settings. Locked accounts cannot log on.

account manager (n)~ A Microsoft employee who is the primary contact for the business

relationship between the OEM and Microsoft.

account manager (n)~ The person who sets up and maintains the systems and records related to authorized users of multi-user computer networks or operating systems.

account mapping (n)~ Specifies maps between text in payment descriptions and the debit or credit account that you want the payment to be matched with when you use the Match Automatically function in the General Journal window.

account name (n)~ The part of an e-mail address that identifies a user or an account on an e-mail system.

Account Number (PN)~ A field label on the Details tab of an account that lists the number assigned to the account. The account number is included as a part of the company profile.

account number (n)~ The identifying alphanumeric characters that have been assigned to an account.

account owner (n)~ A person who signs up for an account. Some features, such as billing, purchasing account add-ons, and creating e-mail accounts, are available to the account owner only.

account partner (n)~ A federation partner that is trusted by the Federation Service to provide security tokens to its users (that is, users in the account partner organization) so that they can access Web-based applications in the resource partner.

Account partner discovery form (n)~ The title of the Web form used to determine the client's account partner membership.

account picture (n)~ A graphical representation that's associated with a user account for Windows and Windows Live.

account policy (n)~ On local area networks and multiuser operating systems, a set of rules governing whether a new user is allowed access to the system and whether an existing user's rights are expanded to include additional system resources. An account policy also generally states the rules with which the user must comply while using the system in order to maintain access privileges.

account reconciliation (n)~ The practice of reconciling accounts.

account record (n)~ The location for storing account information, including information that is entered on the Account form, linked records, and history items.

account rule (n)~ A rule in an accounting system that controls the valid financial dimension value combinations when the requirements of the financial dimension structure condition are met.

account set (n)~ A named group of ledger accounts.

Account Setup Assistant (PN)~ The assistant that helps users configure some of the most widely used e-mail accounts, such as POP, IMAP, Windows Live Hotmail, and Microsoft Exchange accounts.

account statement (n)~ A detailed report of the transactions and balance of an account.

account structure (n)~ A configuration of the main account financial dimension and other financial dimensions.

account updater (n)~ A feature of Windows 8 mobile broadband networking that is used to bind an account that a user has with a mobile broadband service provider both to a unique identifier that we use in Windows to identify that user, and to the user's SIM card.

accounting (n)~ The practice of recording, classifying, summarizing, and reporting the financial consequences of accounting events.

accounting (n)~ The process of tracking and/or analyzing user activities on a network by logging key data (e.g. amount of time in the network, services accessed, amount of data transferred).

Accounting & finance (PN)~ The Business subcategory containing apps to help businesses with accounting, bookkeeping, and financial tasks.

accounting application (n)~ A program that helps a user perform tasks related to accounting.

accounting category (n)~ A classifier used to group journal account entries according to their economic characteristics.

accounting currency (n)~ The customary monetary unit of measure that is used to record the monetary value of economic resources in ledger accounts.

accounting currency unit (n)~ A currency unit used to quantify the financial consequences of accounting events.

accounting customer (n)~ A customer in the accounting application that is linked to a Business Contact Manager account.

accounting cycle (n)~ A recurring set of documenting, journalizing, balancing, and statement preparation activities performed by parties that report on and analyze the financial position and performance of accounting entities.

accounting data (n)~ Information from the accounting system.

accounting distribution (n)~ A distribution of the financial consequence of an economic transaction to ledger accounts.

accounting distribution line (n)~ The subline of a source document line documenting the financial consequence of an economic transaction that documents the distribution of an aliquot portion of the financial consequence to a ledger account.

accounting entity (n)~ A real or conceptual economic unit that uses ledger accounts to record and report on its financial and management performance.

accounting event (n)~ The occurrence of an accounting action in an accounting system.

accounting event liquidity classification (n)~ The liquidity classification of an accounting event.

Accounting Integration (n)~ A feature that enables the user to access information from an accounting system from within Business Contact Manager for Outlook.

accounting journal (n)~ A journal that is used to record the financial consequences of accounting events in an accounting system.

accounting journal entry (n)~ A record of original entry in an accounting system that records a date, one or more accounts, and the monetary value to be debited or credited to each account.

Accounting Loader (n)~ Software required to connect to the accounting system.

accounting period (n)~ A division of a fiscal year that is reflected on financial statements.

accounting policy (n)~ A policy that prescribes the general principles and procedures that an organization follows to prepare statements that report on its performance.

accounting provider (n)~ A provider that records client activity for analysis or accounting purposes.

accounting rule (n)~ A rule in an accounting system that controls the principles, methods, and procedures for classifying, recording, and reporting the financial consequences of accounting events.

accounting system (n)~ The accounting program.

accounts database (n)~ A database which stores user accounts and their network access properties.

Accounts page (n)~ The page for creating and administering individual user accounts, and adding new administrators.

accounts payable (n)~ A group of posting accounts that show the amounts owed to suppliers or creditors for goods, supplies, or services purchased on credit.

accounts payable (n)~ A subclassification of a liability account classification that describes the changes in value owed to vendors or creditors.

accounts payable three-way invoice matching (n)~ A practice of matching vendor invoice prices and product quantities to purchase orders and product receipts.

accounts receivable (n)~ A group of posting accounts that show the amounts customers owe for services or sales made on credit.

accounts receivable (n)~ A subclassification of an asset account classification that describes the changes in value owed by customers.

accrual accounting (n)~ An accounting method that recognizes revenues when they are earned and expenses when they are incurred, regardless of when they are received or paid.

accrual basis accounting (n)~ An accounting method that recognizes revenues when they are earned and expenses when they are incurred, regardless of when they are received or paid.

accrual method (n)~ An accounting method that recognizes revenues when they are earned and expenses when they are incurred, regardless of when they are received or paid.

accrued cost (n)~ A transaction that is recorded in a profit and loss account by an expense transaction.

accrued cost (n)~ The accumulated value of costs recognized from invoicing a job. The accrued cost is posted to an accrued expense liability account in the balance sheet.

accrued revenue (n)~ Revenue earned in one accounting period but received in a subsequent accounting period.

AccScope (PN)~ The tool that helps designers and developers visualize the accessibility information of UI elements, as seen by a screen reader.

accumulated cost (n)~ The costs of inventory, overhead, materials, labor, and services that aggregate into one total cost.

accumulated depreciation (n)~ The sum of posted depreciations for all the periods in which a fixed asset has been in service.

accumulation (n)~ Profits that are added to the capital of an organization instead of paid to investors as dividends.

accumulator (n)~ An accumulation of numeric data that can be used for reporting purposes, such as yearly taxable earnings for the T4 or W 2 statement, or used in a calculation. For example, Canada Pension Plan, Social Security, Medicare, and withholding taxes are based on accumulators. The contents of an accumulator can be manually adjusted, preset, and deleted.

ACD (n)~ A system that automatically routes and queues incoming phone calls and generates reports to an agent or a set of agents, e.g., in a call center such as for customer service.

ACE (n)~ An entry in either a securable object's discretionary access control list (DACL) or an object's system access control list (SACL). In a DACL, the entry grants or denies permissions to a user or group. In a SACL, the entry specifies which security events to audit for a particular user or group or controls the Windows Integrity Level for the object.

ACE (PN)~ Part of the Access database system that retrieves and stores data in user and system databases. The engine can be thought of as a data manager on which database systems are built.

ACE Management View (n)~ A feature that allows the user to set access levels for a group of contacts.

ACH (oth)~ An electronic funds transfer system available in the United States that facilitates the transfer of funds between receiving party and originating party bank accounts.

achievement (n)~ An accomplishment as defined by a game.

ACID (n)~ The four essential properties of an electronic transaction. Atomicity requires that a transaction be fully completed or else fully canceled. Consistency requires that resources used are transformed from one consistent state to another. Isolation requires all transactions to be independent of each other. Durability requires that the completed transaction be permanent, including survival through system failure.

Acid (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 34.

Acid Jazz (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 74.

Acid Punk (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 73.

ACK (n)~ A message transmitted to indicate that data has been received correctly. The Transmission Control Protocol (TCP) requires that the recipient acknowledge successful receipt of data. Such acknowledgments (ACKs) generate additional network traffic, decreasing the rate at which data passes but increasing reliability. To reduce the impact on performance, most hosts send an acknowledgment for every other segment or when a specified time interval has passed.

acknowledgement (n)~ A message transmitted to indicate that data has been received correctly. The Transmission Control Protocol (TCP) requires that the recipient acknowledge successful receipt of data. Such acknowledgments (ACKs) generate additional network traffic, decreasing the rate at which data passes but increasing reliability. To reduce the impact on performance, most hosts send an acknowledgment for every other segment or when a specified time interval has passed.

ACL (n)~ In Windows-based systems, a list of access control entries (ACE) that apply to an entire object, a set of the object's properties, or an individual property of an object, and

that define the access granted to one or more security principals.

Acoustic (adj)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 99.

ACP (n)~ A third-party organization that provides audio conferencing services over public switched telephone network (PSTN).

ACPI (n)~ An open industry specification that defines power management on a wide range of mobile, desktop, and server computers and peripherals. ACPI is the foundation for the OnNow industry initiative that allows system manufacturers to deliver computers that start at the touch of a keyboard. ACPI design is essential to take full advantage of power management and Plug and Play.

acquisition date (n)~ The date that an asset is acquired.

ACR (n)~ A method of evaluating transmitted voice quality where subjects rate (from 1 to 5) short groups of unrelated sentences under controlled conditions.

acronym casing guideline (n)~ A rule that clarifies whether an acronym is to be spelt with upper- or lowercase letter or a mix.

ACRS (oth)~ A system of depreciation that assigns depreciation methods to different classes of assets. Created by the Economic Recovery Tax Act of 1981 for U.S. tax purposes and modified by the Tax Reform Act of 1986.

acrylic end panel (n)~ The end panel of a Surface commercial unit that is covered with a colored acrylic finish. In contrast, developer units have metal end panels.

acrylic side panel (n)~ The side panel of a Surface commercial unit that is covered with a colored acrylic finish. In contrast, developer units have metal side panels.

ACS (PN)~ A service that collects and forwards all security events from monitored computers to a central database.

ACS claim rule (n)~ The logic used by ACS to transform input claims into output claims; claim rules are contained within rule groups and are thereby associated with relying party applications.

ACS database (oth)~ The database in which Audit Collection Services stores all the security events that it collects from monitored computers.

ACS management portal (n)~ A Web-based user interface that ACS administrators can use to manage the configuration settings of a specific ACS namespace

ACS management service (n)~ A Representational State Transfer (REST) Web service that enables programmatic management of an ACS namespace, using the Open Data (OData) protocol.

ACS rule group (n)~ A named set of rules that define which claims are passed to a relying-party application.

ACS rules engine (n)~ The component in ACS that processes the input claims that are present in the security tokens that ACS receives from clients and which generates the output claims that are present in the security tokens that ACS issues to relying-party applications.

ACS service identity (n)~ A credential that is registered with an ACS namespace and intended for use by autonomous applications or clients.

ACT (PN)~ A suite of tools that enables software developers, independent software

vendors (ISVs), and enterprise IT professionals to determine whether their applications are compatible with a new version of Windows before rolling it out to the company. ACT also enables such individuals to determine how Windows security updates may impact their applications.

ACT Community (PN)~ An online environment that enables Application Compatibility Toolkit (ACT) users to anonymously share issue and solution data with other registered ACT users.

ACT Data Collector (PN)~ A component of the Application Compatibility Toolkit that installs the compatibility evaluators, maintains the compatibility evaluator scheduling, collects your data through the compatibility evaluators, and uploads the issue data to both the Microsoft Compatibility Exchange and your ACT database.

ACT Log Processing Service (PN)~ The service that processes the log files uploaded from your client computers, adding the information to your ACT database.

ACT-DC (PN)~ A component of the Application Compatibility Toolkit that installs the compatibility evaluators, maintains the compatibility evaluator scheduling, collects your data through the compatibility evaluators, and uploads the issue data to both the Microsoft Compatibility Exchange and your ACT database.

action (n)~ The basic building block of a macro; a self-contained instruction that can be combined with other actions to automate tasks. This is sometimes called a command in other macro languages.

action (n)~ A unit of work that is represented to users in the form of buttons, links, and menu items.

action (n)~ A named entity made up of an XML document and an operation on that document. Web services can be generated from actions.

action (n)~ An end-user-initiated operation on a selected cube or portion of a cube.

action (n)~ A workflow that is used to process any further activities after the original request has been completed successfully.

action (n)~ An object that does something when it is invoked by a trigger.

action (n)~ A function that corresponds to the Then' part of a rule (If-Then) and is used to specify what is to be done when a condition evaluates as true.'

action (n)~ An option presented to the user through a right-click menu that simplifies common Office tasks and provides more control over automatic features.

action (n)~ An act that has an effect in a system.

action (n)~ A way to categorize events based on entry points, such as page calls, button clicks, web service calls, or some other atomic action representing a particular business process. This grouping is valuable for determining under what circumstances a failure occurs.

action (n)~ A data service operation that is bound to a URI that, when called, has a side-effect on data exposed by the data service.

action (n)~ An entity in a graph edge that is the operation the actor performs on the object.

Action (n)~ Operations that are performed on a ticket by a customer or customer service representative (CSR) to provide information, change ticket status, and notify CSRs or customers of changes to the ticket.

action + adventure (PN)~ A game category that emphasizes action or exploration

elements.

action account (n)~ The Windows account that is used by the MonitoringHost.exe processes to gather data from providers and to run actions, such as scripts and command-line batch files, on monitored devices.

action argument (n)~ Additional information required by some macro actions - for example, the object affected by the action or special conditions under which the action is carried out.

Action Bar (PN)~ A horizontal pane found along the bottom of the application window that both displays and lets you change the transformations applied to one or more objects (the location, rotation, scaling, skewing, and so on).

action button (n)~ A ready-made button that the user can insert into his/her presentation and define hyperlinks for.

Action Center (PN)~ A comprehensive PC maintenance center that provides the user with a single point of entry for tasks and notifications associated with PC Health, i.e. security, diagnostics, problem reports and solutions, how to update the system (Windows Updates), performance, reliability, backup and restore, and complete PC backup (recovery and Rescue my PC).

action center (PN)~ A feature that provides quick access to settings and notifications specified by the user.

action gesture (n)~ In Tablet PC Input Panel, a gesture (pen stroke) used to perform a basic action, such as inserting a space or deleting something.

Action Items (n)~ A feature that identifies a possible question or requested action in an email message and enables the user to take action on it from within the message.

action list (n)~ The list that appears when you click the arrow in the Action column of the Macro object tab.

action log (n)~ A record of the actions that have been taken during the lifetime of an incident to resolve the incident. Examples include comments by the analyst, communications from the user, attachments, and task outputs.

Action Pack (PN)~ An annual subscription that provides Microsoft partners with access to the latest Microsoft software, technical support and training, world-class developer tools, and customizable sales and marketing campaigns.

action page (n)~ A single ASP file that provides a particular aspect of the functionality associated with a module in Commerce Server Business Desk. For example, defining the properties of a particular product. Action pages are typically displayed as a result of clicking a module name in the navigation pane, or as a result of clicking a task button presented by a (probably) different action page in the same module.

action pane (n)~ A pane that provides easy access to features available in the Add-in for Excel. It includes the Assignments tab and the Authoring tab.

Action Pane (PN)~ A control directly beneath the menu bar that contains commands that are particularly important for the user in a given context and are therefore promoted commands. These promoted commands are a subset of the commands available in the Actions menu on the menu bar.

action query (n)~ A query that copies or changes data.

action recording (n)~ A file in which the user's input and actions in one or many

applications for each step in a test are recorded. You can then play back this action recording to automatically run specific test steps.

action recording section (n)~ A part of an action recording that is based on the steps that you mark as passed or failed in a test. Each time you mark the outcome of a test step, a new section of the action recording is created.

action row (n)~ A row in the upper part of the Macro window in which you enter macro names, actions, conditions, and comments associated with a particular macro or macro group.

action shot (n)~ A photo that illustrates action by blending multiple frames of a short video to create a strobe effect in the resulting still image.

action state (n)~ In an activity diagram, a type of state that has an internal action and at least one outgoing transition that involves the explicit events of completing the internal action.

action statement (n)~ The smallest executable entity within a programming language.

action table (n)~ A set of rules, stored as an ADO Recordset, that define how workflow items can change state. Each row in an action table represents a possible state transition in the workflow.

action type (n)~ A classification that describes what an action does.

Actions (n)~ The name of a menu from which the customer can choose to create new Accounts, Business Contacts, and Opportunity records, as well as history items that can be attached to selected records.

Actions (PN)~ The name of a menu from which the user can call someone, send an instant message or e-mail, schedule or join a conference, start a video conversation, set options, start a Live Meeting, or run the Audio and Video Tuning Wizard.

Actions (PN)~ A menu item that enables users to initiate operations, such as sending an instant message or playing a game.

actions group (n)~ A set of commands on the actions pane that are grouped together logically with a label that characterizes the type of command. For example, the commands with the label -€œNew-€? in the example below constitute an actions group.

actions pane (n)~ A pane listing tasks or action that can be performed.

activate (v)~ To make a chart sheet or worksheet the active, or selected, sheet. The sheet that you activate determines which menu bar and toolbars are displayed.

activate (v)~ To verify that your software product is a legal copy and is installed in compliance with the Microsoft Software License Terms.

activate (v)~ To make a record, file, or other data available in the system.

activate-as-activator server (n)~ A server or running object table object that is not a service or running under a specific user account.

activation (n)~ The chain of events that results in the creation of a COM object and returning a valid pointer to an interface on that object.

activation (n)~ The process of starting a service program in response to a Service Broker message.

activation (n)~ The process of validating software with the manufacturer. Activation confirms the genuine status of a product and that the product key has not been compromised. It establishes a relationship between the software's product key and a

particular installation of that software on a device.

activation (n)~ In a sequence diagram, the time period during which an object or actor is performing an action. Activation is represented by a thin rectangle.

activation (n)~ The process of assigning an identity on Microsoft Online Services to a user account that has been migrated from a local Active Directory.

activation (n)~ The act when, an assigned user successfully receives the access rights of a privileged role.

Activation Assistant (PN)~ A Microsoft HTML application that enables users to retrieve a trial key to activate available Office 2007 release programs for a limited time period. Trial keys are retrieved by using the owner's Internet connection to communicate with a dedicated service.

Activation Assistant (PN)~ A toolbar application that allows users to use a combination of a computer ID and an activation code to activate Windows, without using a product key.

activation block (n)~ A grouping of steps or actions within an activity model.

activation clock (n)~ A type of countdown timer that is initially set to 30 days during which you must activate an installation of Windows. If you do not activate Windows within the 30- day period and do not reset the activation clock, Windows will enter Reduced Functionality Mode.

activation code (n)~ A unique 12-character code that is used in combination with a computer ID to activate Windows in licensing models where a product key is not used for activation.

activation confirmation message (n)~ An e-mail message sent from Microsoft Online Services telling a user that the user's account has been activated and supplying a user name and password for initial log-on.

activation exploit (n)~ An exploit that attempts to work around product activation.

activation gate (n)~ An authentication or authorization gate that the an assigned user has to complete in order to activate a role.

Activation Key (n)~ The unique, 25-character number that activates prepaid computing with Windows.

activation object (n)~ An object used by one or more client computers to activate a volume license for an application such as Windows or Office. The activation object contains the ID of the root domain and the end user license data from the activation and validation service.

activation password (n)~ A password that is specific to the BlackBerry(R) device user account. The BlackBerry Enterprise Server activates a BlackBerry device over the wireless network using the wireless activation authentication protocol. Typical activation passwords are four to eight characters long.

activation service (n)~ The Microsoft service responsible for placing a secure repository on an end user's computer.

activation token (n)~ A unique identifier that activates a Microsoft Azure Connect endpoint and is linked to the customer's Microsoft Azure subscription.

active (adj)~ Pertaining to the device, program, file, record or portion of the screen that is currently operational or subject to command operations.

Active Accessibility (PN)~ A technology that improves the way programs and the

operating system work with accessibility aids, such as screen readers.

active area (n)~ A conversation area where active conversations and associated information are displayed.

active attract application (n)~ The attract application that is configured to show when users start new user sessions on a Surface unit. You can add many attract applications to a Surface unit, but only one can be the active attract application.

Active Cache (n)~ A client-side cache and caching service that enables Project Pro to interact directly with the local cache on the machine rather than with the server, for opens and saves, and then handles moving any changes to the project plan between the client and Project Server.

active cell (n)~ The selected cell in which data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

Active Channel (n)~ A Web site that has been enabled for Webcasting to information-receiving applications.

active client (n)~ The client-side set of technologies in Microsoft's Active Platform for Web-oriented, cross-platform distributed computing. The chief features of the Active Client include support for HTML and dynamic HTML, language-independent scripting, Java applets, and ActiveX objects. Active Client is operating system independent, so it runs on multiple platforms, including Microsoft Windows, UNIX, and Apple Macintosh.

active cluster member (n)~ A node that is running and participating in cluster operations.

active color (n)~ The color displayed in the central square of the color box that appears in most workpanes. The active color is used when you create a new object and when you add fills and patterns to a selected object.

active color palette (n)~ A subset of up to 256 of the colors in the True Color spectrum.

active content (n)~ Interactive or animated content used on the Internet. Active content includes ActiveX controls and web browser add-ons.

active control (n)~ In an environment capable of displaying multiple on-screen controls, the control that will be affected by current cursor movements, commands, and text entry.

active conversation area (n)~ A conversation area where active conversations and associated information are displayed.

active date (n)~ The date at which something goes into effect or becomes applicable.

Active Desktop (PN)~ One of the two components installed with Windows Desktop Update. Active Desktop allows users to add active content, such as a stock ticker, to their desktop, taskbar, or folders. Users can also single-click files to run and open them. Active Desktop can be disabled in the Internet Explorer Administration Kit, even if Windows Desktop Update is installed.

Active Directory account (n)~ The identity of a user, which can be used to grant access to resources or authority to perform certain tasks.

Active Directory Administrative Center (PN)~ A role service and feature that provides users and network administrators with an enhanced Active Directory data management experience and a rich graphical user interface (GUI) to perform common Active Directory object management tasks. Built on top of Windows PowerShell technology, Active Directory Administrative Center makes it possible for users and network administrators to administer directory service objects through both data-driven and task-oriented navigation.

Active Directory B2C (PN)~ An Azure service type of the Identity service, for single sign on to all cloud-based applications for transactions and related activity between a business and customers.

Active Directory Certificate Services (n)~ A software service that issues certificates for a particular certification authority (CA). It provides customizable services for issuing and managing certificates for the enterprise. Certificates can be used to provide authentication support, including secure e-mail, Web-based authentication, and smart-card authentication.

Active Directory Connector (n)~ An Active Directory synchronization agent that provides an automated way of keeping directory information consistent between directories.

Active Directory contact (n)~ An Active Directory object that contains information about an individual such as name, address, and job title. It can include a foreign e-mail address.

Active Directory container (n)~ The identity that Active Directory gives to a collection of objects, such as a group of users or a domain of computers.

Active Directory credentials (n)~ A set of sign-in credentials (username and password) for an Active Directory account.

Active Directory data model (n)~ A model derived from the LDAP data model. The directory holds objects that represent entities of various sorts, described by attributes. The objects and classes of objects that can be stored in the directory are defined in the schema. For each class of objects, the schema defines the attributes an instance of the class must have, the additional attributes it can have, and the class that can be its parent.

Active Directory Delta Discovery (n)~ A discovery option that allows Configuration Manager to discover only new or changed resources in Active Directory independently of a full discovery cycle.

Active Directory Domain (PN)~ A collection of objects (a single user, a group, or a hardware component) within a Microsoft Active Directory network.

Active Directory Domain Services (n)~ The Microsoft Windows based directory service. Active Directory Domain Services stores information about objects on a network and makes this information available to users and network administrators.

Active Directory Domain Services Installation Wizard (PN)~ The tool that is used to install and remove Active Directory Domain Services (AD DS).

Active Directory Federation Services (PN)~ A component that provides Web single-sign-on (SSO) technologies. AD- FS provides SSO by securely sharing digital identity and entitlement rights across security and enterprise boundaries. AD- FS supports the WS-Federation Passive Requestor Profile (WS-F PRP).

Active Directory Forest Discovery method (n)~ A Configuration Manager discovery method that searches for Active Directory sites and subnets in Active Directory forests.

Active Directory Group Discovery method (n)~ A Configuration Manager discovery method that searches for the group memberships of- computers and users by polling Active Directory Domain Services.

Active Directory group validation (n)~ A procedure that ensures the uniqueness of the account name of a group within a domain stored in Active Directory.

Active Directory Lightweight Directory Services (n)~ A Lightweight Directory Access Protocol (LDAP) directory service that provides flexible support for directory-enabled

applications, without the restrictions of Active Directory Domain Services (AD DS).

Active Directory Lightweight Directory Services instance (n)~ A single copy of the Active Directory Lightweight Directory Services (AD LDS) directory service that includes its associated directory store and its application event log.

Active Directory Lookup (PN)~ A feature that enables Client for NFS and Server for NFS to obtain user identifier (UID) and group identifier (GID) information directly from Active Directory.

Active Directory Management Agent (PN)~ The Identity Lifecycle Manager management agent provided by Microsoft to connect to Active Directory Domain Services (AD DS) or Active Directory directory service.

Active Directory Metadirectory Services (n)~ A Microsoft technology that creates joined views of data contained in multiple directory services.

Active Directory object (n)~ An entity that can hold an identity in a Windows environment, such as computers, printers, mobile devices, users, groups, and so on.

Active Directory Premium (PN)~ The advanced offering of the Microsoft Azure Active Directory service that includes additional capabilities beyond the free offering of Microsoft Azure AD.

Active Directory provider (n)~ A mechanism for mapping objects to Windows Media Instrumentation.

Active Directory Rights Management (PN)~ The Microsoft technology that allows customers to protect their data by encrypting and managing access rights in document authoring, email, and publishing.

Active Directory Rights Management Services (n)~ A Microsoft technology designed to help enterprise customers control and protect critical digital information by offering easy-to-use, flexible, and persistent policy expression and enforcement.

Active Directory schema (n)~ The set of definitions of every object class that can be created in Active Directory, as well as the definitions of every attribute that can be assigned to that object class.

Active Directory Security Group Discovery method (n)~ A Configuration Manager discovery method that searches for security group resources by polling Active Directory Domain Services.

Active Directory Service Interfaces (n)~ A directory service model and a set of Component Object Model (COM) interfaces. ADSI enables Windows applications and Active Directory clients to access several network directory services, including Active Directory.

Active Directory site (n)~ A collection of Internet Protocol subnets, usually used to connect a group of computers that are physically close to each other.

Active Directory synchronization (n)~ The process of matching user accounts and mail-enabled contacts and groups from the local Active- Directory directory service.

Active Directory System Discovery method (n)~ A Configuration Manager discovery method that searches for system resources by polling Active Directory Domain Services.

Active Directory System Group Discovery method (n)~ A Configuration Manager discovery method that searches for system group resources by polling Active Directory Domain Services.

Active Directory User Discovery method (n)~ A Configuration Manager discovery method that searches for computer user resources by polling Active Directory Domain Services.

Active Directory Users and Computers (n)~ An administrative tool used by an administrator to perform day-to-day Active Directory administration tasks. The tasks that can be performed with this tool include creating, deleting, modifying, moving, and setting permissions on objects stored in the directory. Examples of objects in Active Directory are organizational units, users, contacts, groups, computers, printers, and shared file objects.

Active Directory-based activation (n)~ The activation of systems in an enterprise environment by using an established Active Directory implementation and the same key types.

Active Directory-integrated primary zone (n)~ A DNS zone for which the zone information is stored in the Active Directory object structure.

active document (n)~ The document in which you are working.

active document (n)~ A document that contains ActiveX controls, Java applets, HTML pages, or document objects for display in Internet Explorer.

active document window (n)~ In an environment capable of displaying multiple on-screen windows, the window containing the document that will be affected by current cursor movements, commands, and text entry.

active element (n)~ The layout container element that is currently subject to special operations, such as adding child elements or defining columns and rows. The active element is identified by a yellow bounding box.

active end (n)~ The ending point for a selected range of objects. It is usually established at the object logically nearest the hot spot of the pointer when a user releases the primary mouse button.

active field (n)~ The field on a form in which the cursor or pointer is positioned.

active file (n)~ The file affected by a current command—typically a data file.

active geo-replication (n)~ The process of continuously copying changes from a primary database to one or more active secondary databases in the same or different geographic regions.

active hyperlink (n)~ A hyperlink that is currently selected in a Web browser. Some Web browsers indicate the active hyperlink by changing its color.

active identity (n)~ The identity the user has logged on with.

active ingredient (n)~ An ingredient in a formula that has a specified concentration and potency.

active mailbox (n)~ A mailbox that has been accessed at least once in the last 30 days.

active mailbox migration (n)~ The stage during the e-mail migration when the migration service is actively provisioning new cloud-based mailboxes.

Active Management Technology (n)~ An Intel networking management technology that is supported by Configuration Manager out of band management, which enables a Configuration Manager administrator to manage desktop computers independently from the Configuration Manager client or the computer operating system.

Active Manager (PN)~ An Exchange 2010 component that manages switchovers and failover and runs on every server in a DAG. Active Manager provides functionality that

replaces the resource model and failover management features previously provided by integration with the Cluster service.

Active Messaging Protection (n)~ A process by which antivirus and anti-spam agents and filters are applied to e-mail messages for the purpose of stopping unsolicited or malicious e-mails from entering the organization.

active monitoring (n)~ Gives Lync system administrators the ability to monitor pools, servers, and networks across data centers through the public Internet.

active object (n)~ The object with which the user is currently interacting or that has the input focus.

active object (n)~ In a collaboration diagram, an object role that can initiate control. Typical active objects include processes and tasks. In contrast, a passive object holds data and may send messages, but it does not initiate control.

Active On (PN)~ A set of improved availability capabilities introduced in Windows Server 8.

active page (n)~ The page that is currently available for editing in a document.

active partition (n)~ A partition from which a computer starts up. The active partition must be a primary partition on a basic disk. If you use Windows exclusively, the active partition can be the same as the system volume.

active pattern (n)~ A pattern that enables you to define named partitions that subdivide input data, so that you can use these names in a pattern matching expression.

active power plan (n)~ The power plan that is currently selected in Power Options in Control Panel.

active presenter (n)~ The presenter whose name (and optional photo) is displayed in the Now Presenting pane during a meeting.

active program (n)~ The program currently in control of a microprocessor.

active requisition (n)~ A requisition for which a business process has been initiated, but not completed.

active screening (n)~ A screening method that prevents users from saving files that are members of blocked file groups, and generates notifications when users try to save blocked files.

active scripting (PN)~ A Microsoft technology that uses COM to run third-party scripts in Microsoft Internet Explorer without regard to language and other elements of implementation.

active secondary database (n)~ A continuously updated copy of the primary database created […] for the purposes of data redundancy. The active secondary database is readable but cannot be updated until the continuous copy relationship with its primary is terminated.

active selection (n)~ The current selection of cells, rows, or columns that includes the active cell in a datasheet.

Active Server (n)~ The server-based component of Microsoft's Active Platform. Comprised of a set of technologies that includes DCOM (distributed component object model), Active Server Pages, Microsoft Transaction Server, and message queues, Active Server provides support for developing component-based, scalable, high-performance Web applications on Microsoft Windows NT servers. Active Server is designed to allow

developers to concentrate on creating Internet and intranet software in a variety of languages without having to focus on the intricacy of the network itself.

Active Server component (n)~ An OLE Automation component designed to run on the server side as part of a Web application. These components are activated through Active Server Pages (ASP) technology but don't require a Windows interface.

Active Server Page Extension (n)~ The standard file format used for ASP pages written with ASP.NET.

Active Server Pages (n)~ A Web-oriented technology developed by Microsoft that is designed to enable server-side scripting.

Active Server Pages buffering (n)~ A functionality of Active Server Pages (ASP) that temporarily stores all output that is generated by a script until script execution is complete and then sends the output to a client.

Active Setup (n)~ An application that collects information about the user's computer before download of Internet Explorer begins, and then uses this information to manage the download intelligently.

active sheet (n)~ The sheet that you're working on in a workbook. The name on the tab of the active sheet is bold.

active software update point (n)~ The software update point for a site that interacts with Windows Server Update Services (WSUS) to configure software updates settings and manage software updates synchronization. The active software update point can accept connections from the intranet and the Internet.

Active State Power Management (n)~ A power-saving mode which reserves power by ensuring efficient execution of computing tasks and by reducing the number of components running unnecessarily when not actually in use.

active statement (n)~ A SQL statement that has been run but whose result set has not yet been canceled or fully processed.

Active Template Library (n)~ A set of compact, template-based C++ classes that simplify the programming of Component Object Model objects. ATL provides the mechanism to use and create COM objects.

Active Template Library server (n)~ A server that houses an Active Template Library.

active time (n)~ The entire duration of a timeline, including forward and backward iterations. For example, a timeline programmed to play forward and then backward, once, is active for twice the specified duration—once for the forward iteration and once again for the backward iteration.

active upgrade (n)~ An upgrade that is performed on a sequenced application package without shutting down the server that streams it.

active vendor (n)~ A vendor with whom business is being conducted on a regular basis.

Active View (n)~ A feature in Hotmail that's designed to help people get more done on the web without having to leave their inbox. Active View displays directly in the body of the e-mail message, showing either previews to other web content or interactive elements created by the sender that let the recipient complete core tasks. A preview message example might include a reference to a file on a photo-sharing or video-sharing website that the recipient can view in the message, or package-tracking information that's extracted from a shipping website. Interactive scenarios might include rating movies and

updating wish lists on movie-rental websites or responding to invitations or comments on social networking websites.

active volume (n)~ The volume from which the computer starts up. The active volume must be a simple volume on a dynamic disk. You cannot mark an existing dynamic volume as the active volume, but you can upgrade a basic disk containing the active partition to a dynamic disk. After the disk is upgraded to dynamic, the partition becomes a simple volume that is active.

active window (n)~ The window in which a user is currently working or directing input. An active window is typically at the top of the Z order and is distinguished by the color of its title bar.

active/active mode (n)~ The mode in which Application Request Routing is deployed on two or more servers to achieve both high availability and scalability.

active/passive mode (n)~ The mode in which Application Request Routing is deployed on two ARR servers that process requests and that together act as a failover server. This configuration can achieve high availability, but is still limited by the maximum capacity of one ARR server.

active-state power management (n)~ A power-saving mode which reserves power by ensuring efficient execution of computing tasks and by reducing the number of components running unnecessarily when not actually in use.

ActiveX (PN)~ A set of technologies that allows software components to interact with one another in a networked environment, regardless of the language in which the components were created.

ActiveX ~ A Windows technology which allows programmers to do various things on your computer. The early versions had security issues which hackers could exploit.

ActiveX Animation (n)~ An animation that utilizes ActiveX technology.

ActiveX component (n)~ A reusable software component that can be used to incorporate ActiveX technology.

ActiveX control (n)~ A software control that incorporates ActiveX technology.

ActiveX Data Objects (n)~ A data access interface that communicates with OLE DB-compliant data sources to connect to, retrieve, manipulate, and update data.

ActiveX Data Objects (Multidimensional) (n)~ A high-level, language-independent set of object-based data access interfaces optimized for multidimensional data applications.

ActiveX Data Objects MultiDimensional.NET (PN)~ A .NET managed data provider that provides access to multidimensional data sources, such as Microsoft SQL Server Analysis Services.

ActiveX kill bit (n)~ A registry value that contains the CLSID of all controls that are vunerable to security flaws.

ActiveX object (n)~ An object supplied by a component that supports Automation.

activity (n)~ A pattern of work performed together for a single purpose. An activity may use or produce work products and may be tracked by a work item.

activity (n)~ In a statechart diagram, the response an object in a particular state makes to an event without changing its state. Unlike actions, activities have non-negligible execution times and can be interrupted. The keyword do indicates an activity.

activity (n)~ A collaborative action, such as sharing, calendar sharing, or using a

whiteboard.

activity (n)~ A unit of program behavior in Windows Workflow Foundation. Single activities can be composed together into more complex activities.

activity (n)~ A user action, such as a change to status, social tags, or profiles. Notification of these changes can be sent to other users through an activity feed.

activity (n)~ In Windows Live (primarily through profile), online actions, such as updating a status message, publishing photos, or updating profile info. These actions can take place on Windows Live or on other services someone has connected to their profile, such as Facebook or Twitter. These actions can show up as updates in feeds within Windows Live or on connected services.

activity (n)~ A functional work structure in which one or more persons and pieces of equipment participate and in which resources are consumed, produced, and used. An activity can be decomposed into subactivities.

activity (n)~ A single task in a runbook that performs a specific function.

activity (n)~ The posts and comments that are occurring on a social network page, for example a Facebook Page.

activity assembly (n)~ A .DLL or an .EXE file containing a .NET assembly that implements the logic for a workflow activity.

activity button (n)~ A button at the bottom of the navigation pane used for grouping list places in which are common to a task or a work process relevant to the users role. When the activity button is activated, the navigation pane displays the links to the list places which have been assigned to that activity button and the content area displays one of the list places assigned to the activity button.

activity company (n)~ Any company from which transaction data is included on a centralized customer statement.

activity data (n)~ Data generated as part of a business transaction by executing an activity within an application. It is characterized by an exclusive write access pattern.

activity diagram (n)~ A special case of a statechart diagram in which all of the states are action states and the transitions are triggered by the completion of actions in the source state.

activity feed (n)~ A feed that provides information, notifications and updates based on people, documents, and tags you are following.

Activity Feeds (PN)~ A solution in Microsoft Dynamics CRM that displays posts about records.

activity implementer (n)~ A user who has been assigned the Activity Implementer role and who implements an assigned manual activity.

activity log (n)~ A historic record of the state of a source document.

Activity Map (PN)~ Real-time visualization of a steady stream of posts on a map. Fresh posts show up as they come in and older posts fade out of the map after a user-defined amount of time.

activity model (n)~ A predefined sequence of actions.

activity model step (n)~ A synonym for an action from the viewpoint of an activity model. When an action is contained within an activity model, it is referred to as an activity model step.

activity occurrence (n)~ An instance of an activity.

activity plan (n)~ A schedule for planning the activities that often follow the completion of a project.

Activity Propagation (PN)~ A system job that distributes activities to records.

activity report (n)~ A report that an administrator, parent, or guardian can view showing children's or family members' online activity.

Activity Reporting (n)~ An option on Windows Parental Control that, if selected, creates logs of all the actions performed by a user on the computer.

activity status (n)~ The condition, at a particular time, of an activity.

activity stream (PN)~ The set of automatic Yammer posts in a record.

Activity Tracker (PN)~ A feature that allows a user to track physical activity.

actor (n)~ A person or process that either starts or participates in an activity. Actors can be either initiators or targets.

actor (n)~ A representation of a role played by an outside object. One physical object, therefore, may be represented by several actors.

actor (n)~ An entity in a graph edge that performs the action.

actor class (n)~ The basic component of a ROOM structure diagram. The space inside the actor can contain actor references, behavior end ports, reference ports, bindings, and layer connections. The border can contain class relay ports and class end ports.

actor reference (n)~ The actors that define components of your structure diagram. Actor references can appear only inside an actor class. An actor reference can have reference ports on its outside border.

actual (adj)~ Pertaining to information that shows what has actually occurred. For example, the actual start date for a task is the day that the task actually started.

Actual Capacity (n)~ The amount of time a resource has available to work at any given point in time. Actual Capacity is equal to Capacity minus resource calendar exceptions (e.g. offsite training, morale events, jury duty) and previously scheduled committed work (Project task assignments with type = committed). This is the most valuable measure for scheduling a resource.

actual cost (n)~ The definite cost incurred in the performance of an activity.

actual cost (n)~ The cost of an item as recorded on the purchase receipt.

actual cost of work performed (n)~ The actual costs incurred for work already performed by a resource on a task, up to the project status date or today's date.

actual demand (n)~ The total quantity of an item requested on all orders.

actual demand (n)~ The demand for products driven by customer orders.

actual duration (n)~ The amount of time a task has been in progress.

actual quantity (n)~ The measured quantity that is input into or output from an activity.

actual value (n)~ A value for a KPI that is compared to a predefined target value.

actual work (n)~ The amount of work that has been performed on a task or assignment.

actuals (n)~ The amount of work that has been performed on a task or assignment.

acute accent (n)~ The -´ character.

ACWP (n)~ The actual costs incurred for work already performed by a resource on a task, up to the project status date or today's date.

ad (n)~ A piece of content to be delivered by Commerce Server based on a specific

formula for delivery referred to as Need of Delivery (NOD).

AD (n)~ One of the Distributed System Designers that comprise Team Architect. The Application Designer is used to design individual applications that comprise an application system.

AD (n)~ A boundary that the common language runtime establishes around objects created within the same application scope (that is, anywhere along the sequence of object activations beginning with the application entry point). Application domains help isolate objects created in one application from those created in other applications so that run-time behavior is predictable. Multiple application domains can exist in a single process.

ad click (n)~ A measurement of the user-initiated action of responding to an ad by clicking on an element, causing a redirect to another Web location, frame, or page within the advertisement.

ad click rate (n)~ The ratio of ad clicks to ad requests, used to quantify audience response to an advertisement.

AD CS (n)~ A software service that issues certificates for a particular certification authority (CA). It provides customizable services for issuing and managing certificates for the enterprise. Certificates can be used to provide authentication support, including secure e-mail, Web-based authentication, and smart-card authentication.

AD DS (n)~ The Microsoft Windows based directory service. Active Directory Domain Services stores information about objects on a network and makes this information available to users and network administrators.

AD FS (n)~ A component that provides Web single-sign-on (SSO) technologies. AD- FS provides SSO by securely sharing digital identity and entitlement rights across security and enterprise boundaries. AD- FS supports the WS-Federation Passive Requestor Profile (WS-F PRP).

ad hoc network (n)~ A temporary network used for sharing files or an Internet connection. In an ad hoc network, computers and devices are connected directly to each other instead of to a hub or router.

ad hoc report (n)~ A type of report that requires users to select the data that they want to display on the report and to design the layout of the report.

ad hoc reporting (n)~ A reporting system that enables end users to run queries and create custom reports without having to know the technicalities of the underlying database schema and query syntax.

ad ID (n)~ An identification number that is generated for an ad that you create.

AD LDS (n)~ A Lightweight Directory Access Protocol (LDAP) directory service that provides flexible support for directory-enabled applications, without the restrictions of Active Directory Domain Services (AD DS).

AD LDS instance (n)~ A single copy of the Active Directory Lightweight Directory Services (AD LDS) directory service that includes its associated directory store and its application event log.

ad mediation (n)~ A technology that enables app publishers to send ad requests to multiple ad networks to ensure that publishers can match the right ad networks to the right inventory and maximize the ad revenue.

AD MS (n)~ A Microsoft technology that creates joined views of data contained in

multiple directory services.

ad network (n)~ An aggregator or broker of advertising inventory for a group of Web sites. Ad networks act as sales representatives for member sites.

ad request (n)~ An opportunity to deliver an advertising element to a Web site visitor. Requests are generated by events on the site, such as a request for a particular page or the purchase of a specific item. The ad used to fulfill the request is determined by the Need of Delivery.

AD RMS (n)~ A Microsoft technology designed to help enterprise customers control and protect critical digital information by offering easy-to-use, flexible, and persistent policy expression and enforcement.

ad scheduler (n)~ A program of events or appointments to schedule large number of advertisements.

AD Sync (PN)~ A software tool for connecting to data sources, synchronizing data between data sources, as well as the provisioning and deprovisioning of identities.

AD- FS Web Agent (PN)~ An installable role service of AD- FS that is used to create an AD- FS-enabled Web server. An AD- FS Web Agent consumes incoming security tokens and authentication cookies that are signed by a valid federation server-€"to either allow or deny a user access to the protected application-€"while taking into consideration application-specific access control settings.

AD- FS-enabled Web server (n)~ A Web server that is configured with the appropriate AD- FS Web Agent software-€"either the claims-aware agent or the Windows token-€"based agent-€"which is necessary for authenticating and authorizing federated access to locally hosted, Web-based applications.

Adamsync (n)~ A command-line tool that synchronizes data from an Active Directory forest to an Active Directory Application Mode (ADAM) instance.

adapted member (n)~ An apparent member of an MshObject that is surfaced by an adapted view of the base object.

adapter (n)~ A printed circuit board that enables a personal computer to use a peripheral device, such as a CD-ROM drive, modem, or joystick, for which it does not already have the necessary connections, ports, or circuit boards. Commonly, a single adapter card can have more than one adapter on it.

adapter (n)~ A software component that enables message exchange through a specific transport.

adapter framework (n)~ The specifications for building BizTalk adapters using open standards based on Web Services.

adapter host (n)~ The root abstract class Adapter, which defines the handshake between the adapter and the StreamInsight server in the ENQUEUE interaction point. It provides all the required adapter services such as memory management, and exception handling.

adapter object (n)~ A kernel-mode object type that represents a direct memory access (DMA) channel.

adaptive brightness (n)~ Automatic display adjustment that changes the brightness of your PC screen (laptop and desktop) using light environment information provided by the ambient light sensor.

adaptive compression (n)~ Data compression software that continually analyzes and

compensates its algorithm, depending on the type and content of the data and the storage medium.

adaptive format (n)~ A type of format that uses Extensible Application Markup Language (XAML') to optimize the layout of a page. By declaring a document adaptive

adaptive layout (n)~ A layout system that enables the visual elements in an application to adapt to changes in the size of the overall application window.

adaptive layout (n)~ A layout that has been pre-defined for different orientation or size thresholds.

Adaptive SQM (PN)~ An extension to SQM that allows Microsoft to cause clients sending reports matching a pattern to perform some predefined action.

adaptive streaming (n)~ A method of streaming video that enables audio and video, played back from the Web, to dynamically adjust its playback quality according to the bandwidth capabilities of the user who is playing back the video.

adaptive update (n)~ An update process that uses an analysis of historical information accumulated over all previous updates to determine which documents are likely to have changed. Only this content is accessed during the crawl.

ADC (n)~ An Active Directory synchronization agent that provides an automated way of keeping directory information consistent between directories.

adCenter Desktop (PN)~ Bing Ads Editor is a desktop application that enables users to manage their Bing Ads paid search campaigns offline.

Add (v)~ A button on the 'Add a Person to the Call' dialog box. Once a call is connected, clicking Add adds the call to the current conversation.

add (v)~ To join or combine thereby increasing the quantity or size of something.

Add a Contact… (PN)~ An item on the Contacts menu that opens a wizard to guide the user through the steps to add one or more persons from the corporate address book to the user's personal contact list.

Add a Person to the Call (oth)~ A button in a conversation window that opens the Add a Person to the Call' dialog box. The user can call a number for the selected participant to add them to the current call.'

add call (PN)~ A button that appears during an active phone call, allowing a user to add another person to his/her conference call.

Add content (PN)~ The button in Sway that allows for the addition of Headers, Text and Media from the Web or local device, and Layout options at the indicated location.

Add Domains area (n)~ The area of the Organizations page where hosted customers can set up additional domains.

Add Service Reference (v)~ Dialog box enables the user to add references to Windows Communication Foundation (WCF) services and WCF Data Services.

Add SourceSafe Database Wizard (n)~ A wizard that locates and configures a Visual SourceSafe database. If you cannot find an existing database to use, the wizard allows you to create a new one.

Add Time Stamp (v)~ A button in the Comments section that the user can click to add a date or time stamp.

Add to Contacts List (PN)~ An item on the shortcut menu that adds a selected person to the user's Contacts list.

Add to dictionary (PN)~ A menu item that enables the user to add a word marked as a misspelling to the dictionary used by the spelling checker.

Add to OneNote (v)~ A UI option that enables the user to add content from an application to OneNote.

addendum (n)~ The part of an agreement that defines the business process that is used, your role, your partner's role, and the policies or parameters that are used in that relationship along with documentation, such as a list of business and legal terms.

add-in (n)~ A supplemental program that can extend the capabilities of an application program.

add-in function (n)~ A worksheet function that is provided by an add-in, instead of being built-in.

add-in view (n)~ In the .NET Framework add-in programming model, an assembly that contains interfaces or abstract base classes, and represents the add-in's view of the methods and types used to communicate with a host.

add-in-side adapter (n)~ In the .NET Framework add-in programming model, an assembly that contains one or more classes, and converts data to and from the add-in view and the contract. Depending on the direction of the call, the adapter is either converting from a view to a contract or from a contract to a view.

addition operator (n)~ The + character, used to indicate addition or a positive number.

Additional Actions (PN)~ A context-menu command that can launch an operation with a selected item as a parameter or retrieve information about the selected item. Actions are enabled by cube administrators and are defined in SQL Server Analysis Services.

additional display (n)~ A computer monitor that supplements the main monitor.

additional requirement (n)~ A list of requirements and peripherals in the Windows Store that help the app have optimal functionality.

add-on (n)~ A device that is added to the base computer system to increase functionality, such as audio, networking, graphics, or SCSI controller.

add-on device (n)~ A device that is added to the base computer system to increase functionality, such as audio, networking, graphics, or SCSI controller.

add-on package (n)~ An XML file in the addons folder of the Datastore. Add-on packages are used to deploy files or an application to a device or emulator.

address (n)~ A string that identifies a user so that the user can receive Internet email. An email address on the Internet typically consists of an account name, followed by the @ (at) symbol, a host name, and a domain name.

address (n)~ A unique identifier that identifies a network node to other nodes on the network.

address (n)~ A number specifying a location in memory where data is stored.

address (v)~ To reference a particular storage location.

address (n)~ The path to an object, document, file, page, or other destination. An address can be a URL (Web address) or a UNC path (network address), and can include a specific location within a file, such as a bookmark within a document or a cell range within a spreadsheet.

Address Bar Top Result (PN)~ The feature that allows users to navigate directly to the webpage of the top-ranked search result when a search is performed in the address bar.

address book (n)~ A collection of contact information for particular individuals, groups or organizations.

Address Book (PN)~ A directory that you can use to store names, e-mail addresses, fax numbers, and distribution lists.

address book (n)~ A list of party records.

Address Book Service (n)~ A service that runs on an Office Communications Server Front End Server and daily synchronizes SIP user data on the client with refreshes from Active Directory.

address class (n)~ A predefined grouping of Internet addresses with each class defining networks of a certain size. The range of numbers that can be assigned for the first octet in the IP address is based on the address class. Class A networks (values 1 to 127) are the largest, with more than 16 million hosts per network. Class B networks (128 to 191) have up to 65,534 hosts per network, and Class C (192 to 223) can have up to 254 hosts per network.

address list (n)~ A collection of recipient and other Active Directory objects. Each address list can contain one or more types of objects (for example, users, contacts, groups, public folders, conferencing, and other resources).

address mask (n)~ A number that, when compared by the computer with a network address number, will block out all but the necessary information. For example, in a network that uses XXX.XXX.XXX.YYY and where all computers within the network use the same first address numbers, the mask will block out XXX.XXX.XXX and use only the significant numbers in the address, YYY.

Address Name (PN)~ An attribute of the Address entity used to identify an address. It is a required field on the Address form.

address pool (n)~ The addresses within a DHCP scope range of addresses that are available for leased distribution to clients.

address range (n)~ A contiguous range of IP addresses.

address record (n)~ A type of resource record in the Domain Name System that associates a specific IP address with a domain name. This is the record that contains the information that connects your domain name to your actual Web site content when people type your domain name into a browser.

address reservation (n)~ Process of configuring DHCP so that a certain client always receives the same IP address lease at startup.

address resolution (n)~ The identification of a computer's IP address by finding the corresponding match in an address mapping table.

Address Resolution Protocol (n)~ In TCP/IP, a protocol that uses broadcast traffic on the local network to resolve a logically assigned Internet Protocol version 4 (IPv4) address to its physical hardware or media access control (MAC layer address. In asynchronous transfer mode (ATM), ARP is used two different ways. For classical IPv4 over ATM (CLIP), ARP is used to resolve addresses to ATM hardware addresses. For ATM LAN emulation (LANE), ARP is used to resolve Ethernet/802.3 or Token Ring addresses to ATM hardware addresses.

address rewriting (n)~ Functionality available on Receive connectors and Send connectors on the Exchange Server 2007 Edge Transport server that lets e-mail

administrators modify the SMTP addresses of senders and recipients on messages that enter and leave an Exchange organization. Address rewriting lets an organization present a consistent appearance to external recipients of messages from the organization.

Address Rewriting agent (n)~ An agent on the Receive connector and Send connector on a computer that has the Edge Transport server role installed, which lets e-mail administrators modify the addresses of senders and recipients on messages that enter and leave an Exchange Server 2007 organization.

Address Rewriting Inbound agent (n)~ Address Rewriting agent for messages that enter an Exchange Server 2007 organization.

Address Rewriting Outbound agent (n)~ Address Rewriting agent for messages that leave an Exchange Server 2007 organization.

address verification service (n)~ The service that is provided by a credit card processor that validates that the billing address provided by a card holder matches the information on file with the issuing bank.

addressing (n)~ The process of assigning or referring to an address. In programming, the address is typically a value specifying a memory location.

ADE file (n)~ A Microsoft Access project (.adp) file with all modules compiled and all editable source code removed.

adequate stack (n)~ A critical check for services and other system processes which run after the operating system has booted - examples include winlogon, csrss, smss, and services in general. It ensures that an application has sufficient stack space, as this test disables stack growth after the test starts.

ADF (n)~ An attachment available on some scanners that allows automatic scanning of multiple pages.

ADF (n)~ An XML file that fully describes a single Notification Services application. The ADF file contains the schemas for the events, subscriptions, and notifications; the rules for matching events with subscriptions; and may provide the name of the XSLT file used to format generated notifications.

AdHoc License Administrator (n)~ The role entitled to allow access and manage licenses granted for specific problems or tasks, not intended to be apt to other purposes.

adhoc network (n)~ A temporary network used for sharing files or an Internet connection. In an ad hoc network, computers and devices are connected directly to each other instead of to a hub or router.

ad-hoc network (n)~ A temporary network used for sharing files or an Internet connection. In an ad hoc network, computers and devices are connected directly to each other instead of to a hub or router.

adjacent cell (n)~ A cell that is in the same row as and adjoins the current cell in a worksheet.

Adjust Time Stamp (v)~ A control that allows users to adjust the time an image or a set of images was taken. Particularly useful when a camera was not set to the appropriate time zone.

adjustable cell (n)~ A cell that can be modified to meet the size specifications.

adjusted cost (n)~ The cost of goods that have been updated with changes in the original purchase prices of the goods.

adjusted percentage (n)~ The amount to be taken off the price of each unit of the product or service.

adjusted price (n)~ The unit or sale price of the product, multiplied by the adjusted percentage. This is displayed in the local currency (that is, the currency of your installed locale).

adjusted price value (n)~ Similar to adjusted price, except it is not displayed in the local currency (that is, there is no currency associated with the price).

adjusted profit (n)~ A profit taken on the sold item, taking into consideration changes in the original purchase prices of the goods.

adjusted unit price (n)~ The calculated unit price based on the attribute-based pricing and the actual potency received.

adjustment (n)~ A change to an account to correct or update the balance.

adjustment handle (n)~ A diamond-shaped handle used to adjust the appearance but not the size of most AutoShapes. For example, you can adjust a rounded rectangle to be more or less rounded.

ADM (PN)~ A service that allows sending push notifications from the cloud to Amazon devices to help engage with customers and create new opportunities for monetization with apps or games.

ADMA (PN)~ The Identity Lifecycle Manager management agent provided by Microsoft to connect to Active Directory Domain Services (AD DS) or Active Directory directory service.

admin (n)~ A person who manages accounts and determines safety settings.

Admin Approval Mode (n)~ A security feature of Windows that allows administrators to perform normal day-to-day tasks while running with a standard user token. If administrator privileges are needed for an operation, the administrator will be notified and asked to provide either consent or credentials, depending on system policy settings.

Administration (n)~ A feature of Microsoft Office Live Web sites and Shared Sites that allows users to restore their Web site or Shared Sites from backups maintained on Microsoft servers. This feature also allows users to switch to Microsoft FrontPage for creating their Web pages and to select a time zone for their Shared Sites.

Administration Center mode (n)~ A mode for uploading an address list file to Directory Services via the Administration Center user interface. This is one of the three upload modes in EHS. This mode does not permit specifying multiple domains per file.

Administration Console (PN)~ A thin client that allows members of the global administrator role to make configurations to any computer that is running PerformancePoint Planning Server. Configurations include creating and editing applications, creating and editing model sites, adding users to PerformancePoint Planning Server applications, and adding users to or removing users from the global administrator role, the Modeler role, or the user administrator role.

Administration database (n)~ The SQL Server database that stores the configuration data for the resources for all computers being run as part of the same (logical) installation of Commerce Server. Commerce Server Setup creates this database.

Administration Pack for IIS 7 (PN)~ The Administration Pack for IIS 7 contains additional management features for IIS 7, including: Administration UI support for

ASP.NET authorization, custom errors, FastCGI configuration, and Request Filtering.

Administration page (n)~ The main Administration Center page, from which all other monitoring and managing functions are accessible via columns, tabs, and pop-up windows.

administration port (n)~ The Internet Information Services (IIS) virtual server and port used for SharePoint Central Administration.

Administration view (n)~ The view in the Virtual Machine Manager Administrator Console in which the administrator manages Virtual Machine Manager agents deployed on virtual machine hosts and library servers, configures systemwide settings for Virtual Machine Manager, and manages Web servers used in virtual machine self-service.

administrative closure (n)~ The process of documenting and archiving a project in a timely manner, as well as formally accepting the project's product and lessons learned.

administrative credentials (n)~ Logon information that is used to identify a member of an administrative group. Groups that use administrative credentials include Administrators, Domain Admins, and DNS Admins. Most system-wide or domain-wide tasks require administrative credentials.

administrative privilege (n)~ The privilege of an administrator of a computer system to control which users have the right to perform various administrative functions.

administrative report (n)~ A report run by a System Administrator.

administrative role (n)~ An access privilege in PerformancePoint Server that consists of predefined roles for design and maintenance of system infrastructure.

administrative setup (n)~ A mode of setup that allows network administrators to silently deploy to client computers.

administrative task (n)~ An operation that can only be performed by an administrator, not a standard user.

Administrative Templates (PN)~ A feature that gives access to a collection of files that provide policy setting information for the items that appear under the Administrative Templates folder in the console tree of the Local Group Policy Editor and when editing a Group Policy object using the Group Policy Management Console. The individual files are in the ADMX and ADML file format.

Administrative Time (n)~ All of a resource's time not devoted to a formal project' (includes Working and Non-Working Time).'

administrative users (oth)~ The users and security groups that are granted administrative rights within Configuration Manager. These users and groups are associated with collections, security roles, and security scopes to grant administrative permissions.

administrator (n)~ The person in charge of managing a computer. The administrator is responsible for installing software, assigning passwords, and managing files.

administrator (n)~ The person responsible for setting up and managing local computers, stand-alone servers, member servers, or domain controllers. An administrator performs such duties as assigning user accounts and passwords, establishing security access levels, watching for unauthorized access, allocating storage space, and helping users with networking problems.

administrator (PN)~ On Windows-based computers, a user account that is a member of the computer's local Administrators group or a member of a group that is a member of the

local Administrators group, such as the Domain Admins group in a Windows domain. This is the first account that is created when you install an operating system on a new workstation, stand-alone server, or member server. By default, this account has the highest level of administrative access to the local computer.

Administrator (n)~ An option on a user account setup dialog that creates an administrator account.

administrator (n)~ A person who manages accounts and determines safety settings.

administrator (n)~ A Windows Live account that manages a subscription.

administrator (n)~ An employee of hosted customers who can access the Administration Center to administer their organization's EHS service.

Administrator (PN)~ Highest level of user role. Administrators can change instance/application settings and manage users.

administrator account (n)~ On Windows-based computers, a user account that is a member of the computer's local Administrators group or a member of a group that is a member of the local Administrators group, such as the Domain Admins group in a Windows domain. This is the first account that is created when you install an operating system on a new workstation, stand-alone server, or member server. By default, this account has the highest level of administrative access to the local computer.

administrator account (n)~ A type of user account that allows complete access to the computer. Administrators can make any desired changes. This account type is not recommended for daily use, and should only be used when necessary.

administrator audit log (n)~ An auditing record that records any action, based on a Windows PowerShell cmdlet, performed by an administrator. This can help the administrator troubleshoot configuration issues or identify the cause of security- or compliance-related problems.

Administrator Console (PN)~ The console that provides access to the administrative functions of Virtual Machine Manager.

administrator mode (n)~ The mode of a Surface unit when the Windows operating system is available. In administrator mode, administrators can administer the Windows operating system and developers can develop and test applications while running the Surface Input application.

Administrator Recovery report (n)~ A DPS report that provides statistics on administrator-initiated recoveries.

administrator role (n)~ A collection of rights that allows a user to modify all web site content and manage site settings and accounts.

administrator role (n)~ A predefined security group that provides specific permissions to allow role members to manage Exchange configuration data. Exchange 2007 provides the following four administrator roles: Exchange Recipient Administrators, Exchange Organization Administrators, Exchange Server Administrators, and Exchange View-Only Administrators.

administrator role group (n)~ A universal security group with administrative rights assigned to it. These administrative rights are specified by built-in management roles, which are part of the role-based access control (RBAC) permissions model in Exchange Server 2010.

administrator role separation (n)~ The ability to delegate local administrative permissions for a read-only domain controller (RODC) to any domain user without granting that user any user rights for the domain or other domain controllers.

administrator setup (n)~ A mode of setup that allows network administrators to silently deploy to client computers.

Administrator user role (PN)~ A role that is used to limit the host groups and library servers on which an administrator can perform Virtual Machine Manager administrative tasks.

administrator-approved form template (n)~ A browser-compatible form template that has been uploaded by an administrator to a server running InfoPath Forms Services. An administrator-approved form template can include code.

Administrators group (n)~ On a local computer, a group whose members have the highest level of administrative access to the local computer.

Admins group (n)~ The system administrator's group account that retains full permissions on all databases used by a workgroup. The Setup program automatically adds the default Admin user account to the Admins group.

admission control (n)~ The service used to administratively control network resources on shared network segments.

ADMX files (n)~ One .admx and .adml file, joined by a common name, that are used to describe Group Policy settings in Group Policy management tools.

ADN (PN)~ A resource of the Content Delivery Network service as a suite of technologies deployed together to provide application availability, security, visibility, and acceleration.

ADN Data Transfer (GB) (n)~ The unit of measure for ADN.

ADO (n)~ A data access interface that communicates with OLE DB-compliant data sources to connect to, retrieve, manipulate, and update data.

ADO connection (n)~ A connection that uses the ActiveX Data Objects (ADO) data access interface.

ADO data source (n)~ Data and the information that is needed to access that data from applications and databases that support the ActiveX Data Objects (ADO) data access interface.

ADO MD (n)~ A high-level, language-independent set of object-based data access interfaces optimized for multidimensional data applications.

ADO.NET (n)~ The suite of data access technologies included in the .NET Framework class libraries that provide access to relational data and XML. ADO.NET consists of classes that make up the DataSet (such as tables, rows, columns, relations, and so on), .NET Framework data providers, and custom type definitions (such as SqlTypes for SQL Server).

ADO.NET Entity Framework Tools (PN)~ The toolset available as part of Entity Framework.

ADOMD.NET (n)~ A .NET managed data provider that provides access to multidimensional data sources, such as Microsoft SQL Server Analysis Services.

Adorner (PN)~ A control that can add functional handles to a visual element that enable a user to manipulate the element in some way (resize, rotate, reposition, etc.).

adorner (n)~ A special glyph on the design surface. Adorners are usually attached to a

target control, and they give the user a graphical means of adjusting the control's properties.

adornment (n)~ A control or status area that is attached to the edge of a pane or window, such as a toolbar or ruler.

ADSI (n)~ A directory service model and a set of Component Object Model (COM) interfaces. ADSI enables Windows applications and Active Directory clients to access several network directory services, including Active Directory.

ADSL (n)~ A high-bandwidth digital transmission technology that uses existing phone lines and also allows voice transmissions over the same lines. Most of the traffic is transmitted downstream to the user, generally at rates of 512 Kbps to about 6 Mbps.

ADSync (PN)~ A software tool for connecting to data sources, synchronizing data between data sources, as well as the provisioning and deprovisioning of identities.

ADT (n)~ A table of attribute names, numbers and descriptions.

adult content (n)~ Content for mature audiences.

adult content (n)~ The preferred term for mature content. Don't use explicit' or -€œsexually explicit.-€?'

Adults Only (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

advance ship notice (n)~ A business document that documents the notification of the shipment of product.

Advanced Author role (n)~ A collection of rights that allows the user to view, add, and change pages, documents in libraries, discussion boards, themes, and borders, as well as manage tasks and recalculate links. A default role.

Advanced Client (n)~ An SMS 2003 client type, supported on Windows 2000 or later operating systems, that can be assigned to a Configuration Manager mixed mode site.

Advanced Configuration and Power Interface (PN)~ An open industry specification that defines power management on a wide range of mobile, desktop, and server computers and peripherals. ACPI is the foundation for the OnNow industry initiative that allows system manufacturers to deliver computers that start at the touch of a keyboard. ACPI design is essential to take full advantage of power management and Plug and Play.

Advanced Connection Settings (PN)~ The name of the dialog box in Lync and Office Communicator where a user can configure their connection settings to a server.

Advanced Encryption Standard (n)~ A cryptographic algorithm specified by the National Institute of Standards and Technology (NIST) to protect sensitive information.

Advanced Filter tab (n)~ A tab, located on the Action menu in the Filter Report group, that enables the user to further refine the records for a report.

Advanced Find (n)~ A tool used to search for specific records and activities. With Advanced Find, users can specify fields, conditions, and values to search on, in order to receive a detailed result list of records and activities.

Advanced Group Policy Management (PN)~ An extension to the Group Policy Management Console (GPMC) that provides change control and enhanced management for Group Policy objects (GPOs).

advanced list (n)~ A type of list task page where the primary action is selecting an entity from the list. Users access the advanced list through the Advanced link on the dropdown

list. If the user cannot find the information they need on the simple drop-down list, they may choose to view the more complete advanced list where they can view all the fields for a particular entity.

advanced mapping (n)~ The link that is established when an administrator maps users with different Windows and UNIX names or multiple Windows user names to the same UNIX user name.

advanced membership (n)~ The membership status that configures the anti-malware application to send information to Microsoft about malicious software, spyware, and potentially unwanted software. This status allows more information to be sent than the basic membership allows.

Advanced Peer-to-Peer Networking (n)~ An upgrade to IBM Systems Network Architecture that supports distributed session control services and dynamic routing, avoiding dependencies on centralized mainframe network services.

Advanced Power Management (n)~ An older power management technology used in mobile PCs before the implementation of Advanced Configuration and Power Interface (ACPI). Advanced Power Management is a software interface that functions between the BIOS power-management software that is specific to the hardware and a power-management policy driver that is run by the operating system.

advanced pricing (n)~ Logic used to calculate the purchase price of a potency item.

advanced programmable interrupt controller (oth)~ A programmable interrupt controller (PIC) that provides multiprocessor interrupt management. An APIC incorporates both static and dynamic symmetric interrupt distribution across all processors. It usually has more available interrupt lines than a typical PIC.

Advanced Program-to-Program Communication (oth)~ An IBM Systems Network Architecture communications method that uses the LU 6.2 protocol to establish, manage, and terminate network communication between programs in a distributed computing environment.

Advanced Program-to-Program Communication File Transfer Protocol (n)~ A file transfer protocol used in IBM host systems, the IBM Advanced Program-to-Program Communications equivalent to the TCP/IP File Transfer Protocol.

Advanced Query Syntax (PN)~ A search query syntax that helps produce more precise search results by using targeted queries that search specific properties in a message type. AQS defines certain keywords which can be used to refine the search query, such as specifying boolean operations on searched terms (AND, OR, NOT) as well as to specify further filters based on file metadata or file type. It can also be used to limit results from specific information stores like regular files, offline files cache, or e-mail stores.

advanced search (n)~ A feature that enables users to build robust, targeted queries that include search operators. The least complex of which are the Boolean operators many users are familiar with. In addition, customers can use advanced operators such as contains:' or 'inanchor:' or 'site:' Customers can add operator upon operator and watch their query change in the search box.'

advanced search (n)~ A search feature that allows users to build robust, targeted queries that include search operators.

Advanced Stream Redirector (PN)~ A format that is commonly used to deliver digital

media to clients (Windows Media Player and Silverlight).

Advanced Sync settings (n)~ Settings for managing bandwidth and storage parameters for directory synchronization.

Advanced Systems Format (n)~ A low-overhead data format for multimedia streams. It encapsulates images, audio, AVI, and so forth, as well as URLs, and allows for the synchronization of these objects within the stream. Windows Media Technologies can stream ASF formatted content and can store ASF streams as .asf files.

Advanced user (n)~ A unit of measure for users of the Visual Studio Online Advanced service offering.

adversary (n)~ A disfavored persona or persona with the objective of gaining access to an asset. Examples of adversaries include hackers.

adverse event (n)~ Any problematic medical occurrence that may happen during a medical treatment involving drugs. The adverse event may not necessarily be caused by the drug treatment.

advertise (v)~ To make a program, software update deployment, or task sequence available to clients via a collection.

advertised program (n)~ A program that has been advertised to a collection.

advertisement (n)~ A Configuration Manager object that the site server sends as a notification to the management points, specifying that a program, software update deployment, or task sequence is available for clients.

advertisement (n)~ A message placed in a mass medium (and usually paid for by the advertiser) to persuade targeted customers or prospects.

advertiser (n)~ The company placing, and often paying for, a promotional message, or advertisement.

advertising asset (n)~ A piece of content provided by an advertiser that is used in one or more advertisements that run on your site, for example, text, a photograph, or a company logo. The content is owned and controlled by the originating advertiser.

advertising campaign goaling (n)~ Determining the number of ads to deliver in a specified amount of time. You can goal by any event, such as clicks or amount sold.

advertising ID (n)~ An identifier used by app developers and advertising networks to provide more relevant advertising to users by understanding which apps they use and how they use them.

advisory hour (n)~ The currency used to access certain key services offered to Microsoft Partner Network members to help them build their skill set with training powered by Microsoft Services, and get customized guidance for competing, developing, and deploying solutions for customers.

advisory mode (n)~ An option for Active Directory replication that specifies that lingering objects should be displayed, but not deleted.

adware (n)~ Advertising that is integrated into software. Adware is often combined with a host application that is provided at no charge as long as the user agrees to accept the adware.

AE (n)~ A method of encryption that uses a pair of mathematically related keys: a public key and a corresponding private key. Either key can be used to encrypt data, but the corresponding key must be used to decrypt it.

AEM (PN)~ A software product that can be used to perform centralized installation, reporting, and administration of Antigen on all servers in an environment.

AEM (n)~ A feature in Operations Manager that allows the collection of client application crash data to a single location on a management server, resulting in data that can then be analyzed by your company for patterns.

aerial view (n)~ A map view created from aerial photos that shows buildings, roads, and geographical features.

Aero (n)~ The visual experience of the premium Windows Vista editions. Windows Aero builds on the Basic and Standard user experiences to offer customers our best-designed, highest-performing desktop environment. A noticeable element of the new Windows Aero experience is the professional-looking, transparent glass design, which creates an open, lightweight environment but more importantly enables users to focus on their content rather than the interface.

Aero Glass (n)~ A graphic mode that is available with Aero UI that supports 3D graphics, visual effects, and animation as well as the regular features of Aero UI.

Aero Wizard (n)~ A wizard that allows third-party developers to achieve the same look in their dialog boxes as Aero.

AES (n)~ A cryptographic algorithm specified by the National Institute of Standards and Technology (NIST) to protect sensitive information.

AES Secure Delivery (PN)~ The service type of the Media Service based on Advanced Encryption Standard.

AF (PN)~ A class for the delivery of video media streams.

affiliate (n)~ An organization or person that promotes Skype on its website or (re)sells its regular products.

affiliate application (n)~ A logical entity in Enterprise Single Sign-On (SSO), defined by the administrator, that represents a system or subsystem such as a host, back-end system, or line-of-business application to which you are connecting using SSO. An affiliate application can represent a non-Windows system such as a mainframe or UNIX computer. It can also represent an application such as SAP, or a subdivision of the system, such as the Benefits' or 'Pay stub' sub-systems.'

Affiliate Program (n)~ A collaboration process for Skype affiliates that allows website owners to earn money by directing internet traffic to the Skype website.

Affiliation Changed (n)~ A reason for revocation of a certificate.

affinity (n)~ For Network Load Balancing, the method used to associate client requests to cluster hosts. When no affinity is specified, all network requests are load balanced across the cluster without respect to their source. Affinity is implemented by directing all client requests from the same IP address to the same cluster host.

affinity (n)~ The mechanism for associating threads of a process with a processor.

affinity group (n)~ A geographical grouping of a customer's hosted service deployments and storage accounts within Microsoft Azure. An affinity group can improve service performance by locating computer workloads in the same datacenter or near the target user audience.

affinity group (n)~ A group of resources with the same level of affinity helping the underlying platform with the placement of related resources together and the allocation of

instances across fault domains and upgrade domains.

affinity marketing (n)~ Selling products or services to customers with similar interests on the basis of their established buying patterns or preferences. Additionally, several noncompeting advertisers may join together to develop a single targeted campaign.

affinity mask (n)~ A value that contains bits for each processor on the system, defining which processors a process or thread can use.

affinity set (n)~ A group of resources with the same level of affinity helping the underlying platform with the placement of related resources together and the allocation of instances across fault domains and upgrade domains.

affordance (n)~ A UI element or control that offers the user the opportunity to take or initiate an action.

AFNOR (oth)~ The French subsidiary of the International Standards Organization (ISO).

AFNOR certification (n)~ A certification that accounting software is legally compliant with French legislation for electronic accounting.

after event (n)~ An asynchronous event whose handler runs only after the action that raised the event is complete.

AFTP (n)~ A file transfer protocol used in IBM host systems, the IBM Advanced Program-to-Program Communications equivalent to the TCP/IP File Transfer Protocol.

age (v)~ To become mature or past due, as in a mature account or a past due account.

age (n)~ To calculate the number of days that customer and supplier accounts have been outstanding.

Age (n)~ A content descriptor developed by the Pan European Game Information (PEGI).

age (n)~ The amount of time that has elapsed since an alert was triggered through MOM.

age (n)~ A time period of existence or a time period after the occurrence of an event.

age of onset (n)~ The age at which an individual first experiences an illness or symptoms of a sickness or disorder.

age rating (n)~ The age appropriateness of an app or game published in the Windows Store.

agenda (n)~ An ordered list of rule actions to be executed by the Rule Engine.

agenda (n)~ A list or outline of things to be done or considered.

Agenda view (n)~ A calendar view that displays all scheduled items.

agent (n)~ An application that runs on a Simple Network Management Protocol (SNMP) managed device. The agent application is the object of management activities. A computer running SNMP agent software is also sometimes referred to as an agent.

agent (n)~ In client/server applications, a process that mediates between the client and the server.

agent (n)~ A program that performs a background task for a user and reports to the user when the task is done or some expected event has taken place.

agent (n)~ The part of the rig that is used to run tests and generate simulated load.

agent (n)~ A monitoring option in real-time spyware protection that monitors various types and areas of software activity on your computer.

agent (n)~ A managed software component that monitors events and performance pertaining to a specific application component, and transmits observations to a host application for display, action, or reporting.

agent (n)~ The feature that is installed on a Windows-based computer that performs management. The agent collects data, compares sampled data to predefined values, creates alerts, and runs responses.

Agent (PN)~ The MOM/SCE component installed on computers to perform management tasks on those computers. The agent communicates with the SCE Management Server, sending data from the managed computers to the Management Server and downloading data from the Management Server to the managed computer.

agent (n)~ A person who works for a call center and signs in to an ACD system or who responds to calls routed to him or her by an IVR system. Formal agents may be signed in into UC throughout the day, and they may sign in and out of the ACD system during the day. They are fully aware of their role as an agent and want to be able to see the numbers of calls in the queues they are serving, and so on. Informal agents may not consider themselves as agents, and they don't sign in and out of the ACD system as agents. They do not monitor queue fill levels or other metrics.

agent (n)~ A helper bot for Windows Live Messenger that was developed on the Windows Live Agents platform.

agent (n)~ A user who works for a company that is a valid partner tenant who has been assigned either limited or full administration agent role.

agent character (n)~ An interactive animated character who guides users through Windows Welcome. The character interacts with the user in ways similar to the natural aspects of human social communication. Characters can respond by using synthesized speech, recorded audio, or text in a cartoon word balloon.

agent coordinator (n)~ The service that manages installation and uninstallation of the DPM protection agent.

Agent Desktop (PN)~ The compiled version of the Unified Service Desk that represents the agent's workspace from which they perform their job functions.

agent heartbeat (n)~ The process when the MOM agent contacts the MOM server every 10 seconds to indicate that it is alive.

Agent Manager (PN)~ A MOM 2000 feature that was part of the MOM Server components, which tracked computer groups, installed and uninstalled agents, etc.

agent participation policy (n)~ The administrator-defined policy which defines whether an agent needs to sign-in and out of response group groups in order to receive calls from the response group service.

agent proxying (n)~ The process during which an agent forwards data on behalf of another computer or network device.

agent state (n)~ An attribute of a user that specifies whether the user is signed in as an agent or not.

Agent tab (n)~ A custom tab, displayed in Office Communicator, that formal agents can use to sign in to or out of the ACD. The Agent tab shows the groups that the user is a member of, the number of callers that are waiting, the wait times, and the number of agents who are signed in.

agent update (n)~ The update of the Data Protection Server File Agent with a more recent version of the File Agent.

Agentless Exception Monitoring (n)~ A feature in Operations Manager that allows the

collection of client application crash data to a single location on a management server, resulting in data that can then be analyzed by your company for patterns.

agentless exception monitoring (n)~ The process by which managed computers send error reports to a specified location on the System Center Essentials Management Server when an application error such as a program crash occurs on the managed computer.

agentless managed (adj)~ Pertaining to a computer or device that is managed by MOM and does not have the MOM agent installed.

agentless managed computer (n)~ A computer without an agent that is monitored by a management server or a proxy agent.

agent-managed (adj)~ Pertaining to a computer or device that is managed by MOM and has the MOM agent installed on it.

agent-managed computer (n)~ A computer that has an agent installed on it and that reports to a management group.

Agents 2013 (PN)~ Short form for Agents for Microsoft Visual Studio 2013, which contains agents and controllers that you can use to build and test applications across the desktop, the server, and the cloud.

Agents for Microsoft Visual Studio 2013 Update 2 (n)~ Update to Microsoft Visual Studio 2013 developer tooling containing agents and controllers to build and test applications across the desktop, the server, and the cloud.

aggregate (n)~ A single value that is composed of multiple values.

aggregate (v)~ To combine multiple values.

aggregate (adj)~ Pertaining to a combination of multiple values.

Aggregate Diagnostic Provider (PN)~ A set of private, internal to Microsoft, APIs that provide a uniform interface to discover diagnostic content that is local to the customer's computer as well as diagnostic content stored -€œin the cloud-€?.

aggregate event (n)~ A type of event that is generated after a series of events of another type have occurred. An aggregate event is used to represent a series of events to avoid flooding the event consumer.

aggregate function (n)~ A function that performs a calculation on multiple values and returns a single value.

aggregate query (n)~ A query (SQL statement) that summarizes information from multiple rows by including an aggregate function such as Sum or Avg.

aggregated catalog (n)~ A catalog assembled from different sources.

aggregation (n)~ A table or structure containing pre-calculated data for an online analytical processing (OLAP) cube. Aggregations support the rapid and efficient querying of a multidimensional database.

aggregation (n)~ A collection of objects that makes a whole. An aggregation can be a concrete or conceptual set of whole-part relationships among objects.

aggregation (n)~ A collection of shared objects.

aggregation prefix (n)~ A string that is combined with a system-defined ID to create a unique name for a partition's aggregation table.

Aggregation view (n)~ A view in the Health and Activity Tracking tool that displays the near real-time business processes defined as well as the health monitoring cubes that are shipped with BizTalk Server 2004.

aggregation wrapper (n)~ A wrapper that encapsulates a COM object within another COM object.

aggressive address acquisition retry (n)~ A registry setting that allows the DHCP client to transmit more messages to the server to obtain an IP address when the PC is in connected standby mode. This setting can increase power consumption but can also help resolve IP address (IPv4 or IPv6) problems more quickly.

Agile method (n)~ Any of a family of processes that software developers use to minimize risk by developing applications incrementally, over a series of short iterations. In this model, real-time communications, such as in person conversations and telephone calls, are preferred over written documentation; the primary measure of progress is working software, instead of hours spent, tasks completed, documents reviewed, or phases signed-off; stakeholders are expected to collaborate, instead of negotiating; and planning happens continuously in order to respond to change.

agile software development (n)~ A conceptual framework for undertaking software engineering projects in a lighter, faster, more people-centric way. Many of the characteristics for agile software development originate in the Agile Manifesto established by the Agile Alliance, group of software professionals.

aging (n)~ The process of categorizing, by time period, amounts that are due to a company after a given invoice date or bill date, or the number of days the account has been outstanding.

aging (adj)~ The process of classifying time periods by age.

aging bucket (n)~ A time category to distinguish between items with different aging criteria.

aging period (n)~ The number of days in a time period used to report an overdue customer payment balance.

aging period (n)~ A period within which you analyze the payment balance of a customer's account.

aging run (n)~ The execution of a process that looks at old objects'

aging snapshot (n)~ An aging snapshot contains the calculated aged balances for a customer at a point in time.

AGP (n)~ A technology that provides a dedicated, high-speed port through which large blocks of 3-D texture data can be moved between the computer's graphics controller and system memory.

AGP slot (n)~ A slot that is designed for fast, high-quality display of 3-D and video images.

AGPM (n)~ An extension to the Group Policy Management Console (GPMC) that provides change control and enhanced management for Group Policy objects (GPOs).

AGPM Service (PN)~ A Windows service that enables Advanced Group Policy Management (AGPM) clients to manage deployed and archived Group Policy objects (GPOs) and enforces delegation in AGPM.

AGPM Service Account (PN)~ The account under which the AGPM Service runs.

agreement (n)~ A commitment between two or more parties based on a mutual understanding about their respective rights and obligations.

agreement (PN)~ A definitive and binding agreement between two trading partners for

transacting messages over a specific business-to-business protocol. A trading partner agreement brings together common bi-directional message processing properties from specific business profiles of both partners. It is a comprehensive collection of all aspects governing the business transaction between the two trading partners. The trading partner agreement is typically derived from the profiles of each partner, with the ability to customize and override the required settings.

Agreement Administrator (PN)~ The first customer to sign the agreement, unless changed as provided in section- 1 of the agreement.

agreement number pair (n)~ A pair of numbers that is obtained from the Microsoft Volume Licensing Service Center when a customer purchases a Microsoft Volume Licensing agreement. Each agreement number pair contains an agreement or authorization number and a license or enrollment number.

AIA (n)~ A certificate extension that contains information useful for verifying the trust status of a certificate, as defined by the 2008 Memo of the Network Working Group. This information potentially includes Uniform Resource Locations (URLs) where the issuing CA's certificate can be retrieved, as well as a location of an Online Certificate Status Protocol (OCSP) responder configured to provide status for the certificate in question.

AIF (PN)~ The framework that provides a collection of features, tools, and infrastructure that uses a services programming model to support application integration.

AIK (n)~ The cryptographic representation of the hardware or software state and other integrity metrics, and which can be used to perform anonymous or pseudo-anonymous attestations to remote parties in multiparty transactions.

airplane mode (n)~ A setting that allows a user to turn off cellular, Wi-Fi, and Bluetooth on the phone simultaneously. Often required during takeoff and landing in an aircraft.

AIS (n)~ A system service that facilitates starting applications that require one or more elevated privileges to run, such as Administrative Tasks. When user requires elevated privileges to run an application and gives consent, AIS creates a new process for the application with the user's full access token.

AIT (n)~ A sub-feature of Application Telemetry whose goal is to gather information on how applications use features exposed by the operating system (COM objects, registry, DLLs, DLL exports, etc.). This data is used to better understand how a change to or removal of a Windows feature may impact applications and overall application compatibility goals. It also helps understand how features are used, and allows Microsoft to use that information in planning new features, allocating testing resources, etc.

AIT Agent (PN)~ The scheduled task part of Application Impact Telemetry (AIT) that runs nightly to consume the events logged to Event Tracing for Windows (ETW) by the AIT Runtime system and send them back to Microsoft using SQM.

AJAX (PN)~ A set of technologies consisting of a client-side script framework, server controls, and more.

AKI (n)~ A certificate extension used by the certificate chaining engine to determine what certificate was used to sign a presented certificate. The AKI can contain the issuer name, serial number, public key information, or no information at all. By matching the information in a certificate's AKI extension to a CA certificate's Subject Key Identifier (SKI) extension, a certificate chain can be built.

alarm (n)~ A visual or auditory signal from a computer alerting the user to an error or a hazardous situation.

alarm (n)~ An alert that is set by the user to be activated at a particular time.

Alarms (PN)~ The app that enables users to set alarms.

Alarms & Clock (PN)~ An app that enables user to use clock, check world clocks, set alarms, set timers and run a stopwatch.

album (n)~ A collection of compositions or memorabilia of a specific type or for a particular purpose, such as audio recordings, photographs, or documents.

album (n)~ A predefined collection of audio files (for example, songs) from a CD or digital download.

album art (n)~ The image that appears on the front of an album or custom collection.

album list (n)~ A page that has a comprehensive list of all the albums in a community.

Alcohol (n)~ A content descriptor developed by Microsoft.

Alcohol and/or Tobacco (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

Alcohol Reference (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

ALE (n)~ An operation of Windows Filtering Platform (WFP) which provides enforcement for security policies by, in each case, trapping the event, determine what application initiated it, and query the filter engine to determine whether the socket should be allowed to proceed.

Alef Hamza (n)~ A single Arabic character that represents the two-character combination Alef plus Hamza.

Alef Lam (n)~ Analogous to the English word the.' Can be ignored when sorting text in tables in several Microsoft Office programs when enabled for right-to-left features.'

alef maqsoora (n)~ A contextual variant of the Arabic letter alef.

alert (n)~ An event that is shown to the administrator within a DPS application user interface as a result of DPS monitoring. Three types of alerts are possible: critical, information, and warning.

alert (n)~ An audible or visual warning signal, generated by a computer, indicating that a threshold has been or is about to be breached.

alert (n)~ A feature that notifies a user when there is a change to posted content, workflow status, or when other user-defined criteria are met.

alert (v)~ To notify by means of an alert that a particular event has occurred.

alert (n)~ A notification that is displayed to a user when user-defined criteria are met.

alert (n)~ A feature available in Business Applications that notifies a user by e-mail when there is a change to an item, document, list, or library.

alert (n)~ A class of notification of significance to a user. An alert message is a notification that is generated by a user-defined rule designed to notify a user of an event, condition, or status.

alert (n)~ A notification on the app bar that is displayed to the user to perform a system-based action. For example, password expiration.

alert box (n)~ An on-screen box, in a graphical user interface, that is used to deliver a message or warning.

alert criteria (n)~ The criteria that, if met, trigger an alert.

alert forwarding (n)~ A process which forwards alerts from zone configuration group to master configuration group.

alert history (n)~ A list of the alerts that a Windows Live Messenger customer has received.

alert latency (n)~ The delay between when an alert is raised and when an alert is displayed on the MOM console.

alert name (n)~ The name of a MOM alert.

alert owner (n)~ The person who is assigned the alert and who is working on it.

alert rule (n)~ A specification of the set of conditions that, when met, will trigger a notification.

alert severity (n)~ The property of an alert indicating its seriousness. Examples include Service Unavailable, Security Issue, Critical Error, Error, Warning, Information, and Success.

Alert Source (n)~ The control that specifies the user-defined alert source name. If no name is defined, the default is the event source name.

Alert view (n)~ A view in the Operations console that displays the alerts that the console user has the rights to see about a specific object.

Alerter service (n)~ A service used by the server and other services to notify selected users and computers of administrative alerts that occur on a computer.

alerting threshold (n)~ A threshold, measured in milliseconds, that Application Performance Monitoring (APM) uses to determine if an event must be reported. APM measures the processing time of an entry point (a top-level function) and reports an event if the alerting threshold is exceeded.

alerts manager (n)~ A feature that allows someone to manage their Windows Live alerts.

algorithm (n)~ A rule or procedure for solving a problem.

alias (n)~ The portion of the e-mail address that appears to the left of the @ symbol.

alias (n)~ An alternative label for some object, such as a file or data collection.

alias (n)~ An additional name that can be used to access a specific port.

alias (n)~ An attribute of the schema element in CSDL and SSDL schemas that can be substituted for the full namespace to shorten element references in the schema.

alias (n)~ A link to any item accessible on your computer or on a network, such as a program or application, file, folder, disk drive, printer, or another computer. You can put shortcuts in various areas, such as on the desktop, on the Start menu, or in specific folders.

alias type (n)~ A user-defined data type based on one of the SQL Server system data types that can specify a certain data type, length, and nullability.

align (v)~ To adjust some device to position it within specified tolerances, such as the read/write head relative to a track on a disk.

align (v)~ To position objects or text relative to some point, such as the page margin.

align (v)~ In data handling, to store multiple-byte data units so that the respective bytes fall in corresponding locations of memory.

alignment (n)~ The consistent positioning of text, graphics, and other objects.

alignment (n)~ A condition whereby an index is built on the same partition scheme as that of its corresponding table.

alignment box (n)~ The rectangle that appears around shapes and objects from other applications as you move them.

alignment guide (n)~ A line that is used to help line up figures with common locations on the page, such as the top of paragraphs or page margins.

alignment tab (n)~ A tab character that can be inserted in headers and footers for aligning data relative to the margin or indent. If you change the margin/indent, the text is realigned automatically.

Alipay (PN)~ An online escrow payment service in China that allows customers to complete financial transactions after verifying goods purchased are delivered as promised.

All Activity Associated View (n)~ A view in CRM that displays all activities associated with an entity.

All Contacts (n)~ The default contact group that Communicator displays when the user has not created any contact groups.

All rights reserved. (oth)~ A statement indicating that the copyright holder reserves, or holds for their own use, all the rights provided by copyright law, such as distribution, performance, and creation of derivative works; that is, they have not waived any such right.

All services (PN)~ The link to the overview page of all Windows Live, MSN, and Microsoft products on offer.

AllBits (PN)~ A Windows delivery technology that provides an edition upgrade -€œpath-€? where customers and OEMs can move from a lower to a higher edition within an edition family on an active installed OS. An example would be a Retail edition family that includes Home Basic, Home Premium, Professional, and Ultimate, and which allows for easier moves between editions.

all-in-one card reader (n)~ A flash card reader with slots that support the majority of card formats without the need of either a camera adaptor or external power.

allocate (v)~ To assign a portion of a resource for a particular use or purpose.

allocate (v)~ To assign Skype features (such as Skype Credit, a Skype Number, or subscriptions) to the members of Skype Manager.

allocation (n)~ In operating systems, the process of reserving memory for use by a program.

allocation (n)~ The process of distributing amounts (monetary or statistical) to one or more accounts, fields, or records.

allocation (n)~ The percentage of a resource's capacity that is designated for a specific assignment.

allocation (n)~ An assignment of a portion of a resource for a particular use or purpose.

allocation rule (n)~ A rule for the source, destination, and calculation of allocation amounts.

Allocation Type (PN)~ A drop-down list that lets you select whether the customer is entitled to service based on the number of cases that are generated for the customer, or the number of hours that are spent on the customer's cases.

allocation unit (n)~ The smallest amount of disk space that can be allocated to hold a file.

allocation unit (n)~ A set of pages that can be operated on as a whole. Pages belonging to an allocation unit are tracked by Index Allocation Map (IAM) pages. An allocation unit

consists of the IAM page chain and all pages marked allocated in that IAM page chain. An allocation unit can contain at most a single IAM chain, and an IAM chain must belong to one, and only one, allocation unit.

allotment (n)~ A portion or unit of something that has been reserved for a particular use.

allotment remaining (n)~ The number of units of allotted service that remain in the service contract.

allotment type (n)~ A unit of service, such as a case or a range of coverage dates, specified in a service contract that indicates how much access a customer has to customer service.

allotment used (n)~ The number of units of allotted service that have been used.

Allotments Remaining (n)~ A field in the contract line dialog where the user enters the number of allotments remaining.

Allotments Used (n)~ A field in the contract line dialog where the user enters the number of allotments used.

Allow (v)~ A permission setting that permits a person or domain to add the user to contact lists, see the user's status, or send instant messages to the user.

allow (v)~ To permit someone else to perform an action. For example, to let someone else see your online status, send you messages, or see your public Messenger information.

Allow list (n)~ A list of users, accounts, Web sites, etc. that are permitted to perform certain actions on a network.

allow list (n)~ A list of users, accounts, Web sites, etc. that are permitted to perform certain actions on a network.

Allow Partially Trusted Callers Attribute (n)~ An attribute that tells the CLR to remove the implicit LinkDemands. By default, strongly named, fully trusted assemblies are given an implicit LinkDemand for FullTrust on every public and protected method of every publicly visible class. Essentially, any code that someone outside of your assembly could use as an entry point into your code is protected with this demand.

Allow phrase (n)~ A custom word or phrase that the administrator sets for the Content Filter agent to enable the processing of e-mail messages to Exchange Server 2007 mailbox users that contain specific words or phrases.

Allow Unknown Sender (PN)~ A Boolean field for the Convert Rule entity that shows whether items from an unknown sender need to be converted to a case.

Allow User Opt-Out option (n)~ The option on the Spam Filter page for turning off spam and virus filtering at the individual user level.

Allow Users to Log in to Spam Quarantine option (n)~ The option on the Spam Quarantine page that controls access to the Spam Quarantine Web site for a specific user.

allowed domains (n)~ Domains or parts of domains that are added to an allow list by the user, allowing communication between an application and certain domains while blocking connections from other domains.

Allowed Values Collection Editor (PN)~ A custom collection editor dialog box in Visual Studio .NET that developers use to define the set of allowed values for a custom property of the type selection.' This dialog box opens when you click the ellipsis [] button in the value field of the AllowedValues property in the Custom Property Definition Collection Editor dialog box.'

alpha (n)~ A very early release of a product to get preliminary feedback about the feature set and usability.

alpha (adj)~ Pertaining to a pixel's opacity. A pixel with the maximum alpha value is opaque, one with a value of zero is transparent, and one with an intermediate value is translucent.

alpha blending (n)~ In computer graphics, a technique that causes a foreground image to appear partially transparent over a background image. The technique blends the background image with partially transparent pixels in the foreground image by performing a weighted average of the color components of the two images.

alpha channel (n)~ The opacity of an image defined by an alpha value per pixel interleaved with the color components (for example ARGB) an alpha value per pixel stored in a separate alpha surface or a constant alpha value for the entire surface.

alpha mask (n)~ A path or shape that is applied to another object. The transparent portions of the path represent areas where the underlying image is hidden, whereas the opaque portions of the mask indicate where the masked object is allowed

alpha premultiplied (adj)~ Pertaining to the technique of scaling the three color components of a sample by alpha before storing their values. This saves many mathematical steps when alpha blending two images. For the PMARGB32 pixel format, all color values are alpha premultiplied.

alpha test (n)~ A type of post-pixel blending operation which allows applications to control when pixels are written to the render target.

alpha version (n)~ A very early release of a product to get preliminary feedback about the feature set and usability.

alphabetical (adj)~ Arranged in order according to the letters of the alphabet.

alphanumeric (adj)~ Consisting of letters or digits, or both, and sometimes including control characters, space characters, and other special characters.

alphanumeric mode (n)~ A display mode in which the monitor can display letters, numbers, and other text characters but no graphical images or WYSIWYG (what-you-see-is-what-you-get') character formatting (italics

ALT key (n)~ A keyboard key that is used in conjunction with another key to produce some special feature or function and is typically marked with the letters Alt.

alt text (n)~ The text string that appears in place of an image when a Web page is loading, when graphics are not being displayed, or when users pause on the image itself with their mouse.

Alt. Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 40.

alternate (n)~ A potential word match for a segment of ink.

alternate access mapping (n)~ An alternate URL mapping that Windows SharePoint Services preserves in the mapping table. It is the URL a user would see, but is not a URL that IIS would give to WSS.

alternate account (n)~ An additional user account that is in a different domain, but within the same forest as the primary account.

alternate currency (n)~ The currency unit used on a site to convert and format a second

currency for dual display.

alternate e-mail address (n)~ An e-mail address to which password reset information can be sent if a customer forgets the password portion of their Windows Live ID.

alternate key (n)~ A candidate key that is not designated as the primary key and is used to uniquely identify records in a database table.

alternate list (n)~ A list of alternate words that you can use to correct recognition errors on the writing pad.

Alternate Question (n)~ A key word or phrase that customers may use instead of the article question (title) when searching the Support Portal for the same or similar content.

alternate recipient (n)~ An e-mail account to which e-mail messages are forwarded. A user can bundle e-mail messages addressed to different accounts by using a single alternate recipient for all the accounts.

alternating current (n)~ Electric current that reverses its direction of flow (polarity) periodically according to a frequency measured in hertz, or cycles per second. The rapid change from positive to negative electricity of 60 or more times each second.

Alternating Flow (PN)~ A SmartArt graphic layout used to show groups of information or sequential steps in a task, process, or workflow. Emphasizes the interaction or relationships among the groups of information.

Alternative (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 20.

alternative text (n)~ Text displayed by Web browsers during image downloads for users who have graphics turned off, and for users who rely on screen-reading software to convert graphics on the screen to spoken words.

alternative text (n)~ The text string that appears in place of an image when a Web page is loading, when graphics are not being displayed, or when users pause on the image itself with their mouse.

Altstoff Recycling Austria AG notification (n)~ A report of packaging materials used for manufactured products, as required by Austrian regulation. Altstoff Recycling Austria AG is an Austrian waste management organization that collects and recycles packaging material.

ALU (n)~ A component of a microprocessor chip used for arithmetic, comparative, and logical functions.

Always Move gallery (PN)~ A gallery that allows users to create a quick rule to move mail to a selected folder based on the sender, recipients, or conversation of the currently selected e-mail message without opening the full Create Rule dialog.

Always on Top (PN)~ A user interface element that causes the application window to always be displayed over other open windows on the computer, even when it does not have focus.

always-on ~ An internet connection which remains on 24/7 such as- ADSL- orcable, rather than only connecting on demand like a dialup.

AlwaysOn Availability Groups (PN)~ A high-availability and disaster-recovery solution that provides protection for a set of user databases across multiple machines and data centers using SQL Server to replicate the data.

Amazon Device Messaging (PN)~ A service that allows sending push notifications from the cloud to Amazon devices to help engage with customers and create new opportunities for monetization with apps or games.

Amazon Web Services (PN)~ A collection of remote computing services that make up a cloud computing platform offered by Amazon.com.

Ambient (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 26.

ambient context (n)~ A pattern that provides a place to store scope or context related information or functionality that automatically follows the flow of execution between execution scopes or domains.

ambient light (n)~ A type of light that appears as if it is coming from all directions. Use this when you want to light all objects evenly.

Ambient Light Indicator (PN)~ An administration application to help you find lighting issues that affect a smaller area of the Surface screen. This tool can help you adjust the lighting or the unit position. You should use this tool every time that the Surface unit is moved to a new location or lighting is modified significantly.

ambient light sensor (n)~ A type of light sensor that tracks ambient light in the surroundings and therefore the amount of backlight needed for the LCD screen to be adjusted accordingly.

American National Standards Institute (PN)~ A voluntary, nonprofit organization of U.S. business and industry groups formed in 1918 for the development of trade and communication standards. ANSI is the American representative of the International Standards Organization and has developed recommendations for the use of programming languages including FORTRAN, C, and COBOL.

American Standard Code for Information Interchange (n)~ A standard single-byte character encoding scheme used for text-based data. ASCII uses designated 7-bit or 8-bit number combinations to represent either 128 or 256 possible characters. Standard ASCII uses 7 bits to represent all uppercase and lowercase letters, the numbers 0 through 9, punctuation marks, and special control characters used in U.S. English. Most current x86-based systems support the use of extended (or high') ASCII. Extended ASCII allows the eighth bit of each character to identify an additional 128 special symbol characters

AMO (n)~ A collection of .NET namespaces included with Analysis Services, used to provide administrative functionality for client applications.

amortize (v)~ To gradually write off the regular portion of the cost of an asset over the projected life of the asset.

amount (n)~ A definite magnitude of currency, a quantity of currency, or an indefinite magnitude of an uncountable substance or quality.

ampersand (n)~ The & character.

AMPERSAND (n)~ The & character.

AMS (PN)~ The Microsoft Azure service that allows you to create workflows for the creation, management, and distribution of digital media.

AMT (n)~ An Intel networking management technology that is supported by Configuration Manager out of band management, which enables a Configuration Manager

administrator to manage desktop computers independently from the Configuration Manager client or the computer operating system.

analog (adj)~ Pertaining to the traditional format in which audio and video are transmitted by using a wave or analog signal. An analog signal may not work with digital speakers; computers use digital signals.

analogous colors (n)~ Colors that are directly next to each other on the color wheel. Each color has two analogous colors (one on each side of it).

analogue copy protection (n)~ A form of rights management based on technology developed by Macrovision, which prevents analogue output to be played back from VHS tape.

analysis (n)~ In conceptual design, the breaking down and examination of business and user information into use cases and scenarios documenting work processes. In logical design, the identification of services, objects, attributes, and relationships from scenarios. In physical design, the examination of physical constraints of the infrastructure and the physical requirements of the application to select candidate implementation technologies and to draft a preliminary deployment model.

Analysis Management Objects (n)~ A collection of .NET namespaces included with Analysis Services, used to provide administrative functionality for client applications.

Analysis Server (PN)~ The server component of Analysis Services that is specifically designed to create and maintain multidimensional data structures and provide multidimensional data in response to client queries.

Analysis Services (n)~ A feature of Microsoft SQL Server that supports online analytical processing (OLAP) and data mining for business intelligence applications. Analysis Services organizes data from a data warehouse into cubes with precalculated aggregation data to provide rapid answers to complex analytical queries.

Analysis Services Connector (PN)~ A client agent that enables Power BI to connect to on-premises SQL Server Analysis Services instances.

Analyst (PN)~ Lowest level of user roles. Analysts can see the solution content and review sentiments.

analytic chart (n)~ A report type that displays cube data in a visual, interactive chart format.

analytic grid (n)~ A report type that displays cube data in a visual, interactive tabular format.

analytical data (n)~ Data that provides the values that are associated with spatial data. For example, spatial data defines the locations of cities in an area whereas analytical data provides the population for each city.

analytics dashboard (n)~ A dashboard that monitors and tracks the trend of users' Yammer participation and activities so that organizations can see how their Yammer network is being used.

Analytics Service (PN)~ The service that performs analytics processing for search in SharePoint.

Analytics Unit Hours (n)~ The unit of measure for Business Analytics in Azure.

ancestor (n)~ In a tree structure, the element of which a given element is a child. Equivalent to a parent element.

ancestor category (n)~ A category that is closer to the root category through one or more parent-child relationships. A parent category is an ancestor category, as is the parent of the parent, and so forth

ancestor element (n)~ In a tree structure, the element of which a given element is a child. Equivalent to a parent element.

anchor (n)~ A location or selection of text in a file that you name for reference purposes. Bookmarks identify a location within your file that you can later refer or link to.

anchor (n)~ A format code in a desktop publishing or word processing document that keeps an element in the document, such as a figure or a caption or a label associated with the figure, in a certain position in the document. The anchored object is generally attached to another element in the document.

anchor (v)~ To manipulate an interface element, such as a toolbar, so that it maintains the relative position to the anchored edges, when the display orientation or size changes.

anchor cap (n)~ A line cap where the width of the cap is bigger than the width of the line.

anchor member (n)~ The first invocation of a recursive CTE consists of one or more CTE_query_definition joined by UNION ALL, UNION, EXCEPT or INTERSECT operators. Because these query definitions form the base result set of the CTE structure, they are referred to as anchor members.

anchor plugin (n)~ A gatherer plug-in that is responsible for indexing the anchor text. Anchor text is an important feature in the ranking of the search results in v3.

anchor point (n)~ The starting point for a selected range of objects. An anchor point is usually established at the object logically nearest the hot spot of a mouse pointer when a user presses a mouse button or touches the tip of a pen to the screen.

anchor point (n)~ A point in space that is used to align other objects, or used to determine the fixed points or edges in other objects when they are resized.

Anchor Volume Descriptor Pointer (n)~ A part of the UDF file system necessary to identify the required blocks in order to interpret the file system.

anchor window (n)~ A small window that can appear in the lower-right corner of the screen when Windows Media Player is in skin mode. You can use the window to return to full mode and access other commands.

AND (n)~ A logical operation combining the values of two bits (0, 1) or two Boolean values (false, true) that returns a value of 1 (true) if both input values are 1 (true) and returns a 0 (false) otherwise.

Android (PN)~ A mobile operating system (OS) based on the Linux kernel and currently developed by Google.

Android ~ A popular operating system for- smartphones- and- tablets, owned by Google.

Android China (PN)~ An operating system for mobile devices based on Google's Android as an independent development by Baidu, the dominant search engine operator in China.

angle brackets (n)~ The <> characters.

angle of rotation (n)~ The angle of the orientation of a shape's local coordinate system with respect to its parent coordinate system. The angle of rotation is specified in the Angle cell of the Shape Transform section in a ShapeSheet spreadsheet.

angular unit (n)~ The unit in which angles are expressed in ShapeSheet cells.

ANI (n)~ A program that identifies the phone number where a call originates.

animate (v)~ To add a special visual or sound effect to text or an object. For example, you can have your text bullet points fly in from the left, one word at a time, or hear the sound of applause when a picture is uncovered.

animated background (n)~ A background that changes appearance through the display of a sequential set of images contained in a single file.

Animated Blood (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

animated GIF (n)~ A series of graphic images in GIF format, displayed sequentially in a single location to give the appearance of a moving picture.

animation (n)~ A record of synthetic, successive still images that produce an illusion of movement when played back.

animation effect (n)~ A special visual or sound effect added to text or an object. For instance, a user can have the text bullet points fly in from the left, one word at a time, or hear the sounds of applause when a picture is uncovered.

animation interpolation (n)~ A kind of interpolation that animates the property values between successive key times.

Animation Library (PN)~ A library that developers can use in their applications throughout the new Windows user interface.

animation manager (n)~ A core component of an animation application and the central programmatic interface for managing (creating, scheduling, and controlling) animations.-

Animation Painter (v)~ A feature that replicates the animation associated with a source object to one or more target objects.

animation resource (n)~ An animation storyboard that is encapsulated in such a way that it can be reused elsewhere in your application.

animation scheme (n)~ Adds preset visual effects to text on slides. Ranging from subtle to exciting, each scheme usually includes an effect for the slide title and an effect that is applied to bullets or paragraphs on a slide.

animation style (n)~ An abstract grouping of similar animation effects.

animation timer (n)~ A component to provide timing services used in conjunction with the animation manager. It dynamically throttles the frame rate based on application and system load or in low-power mode.

animation trigger (n)~ An animation option that can be set so that the animation plays when a specified item is clicked.

animation workspace (n)~ A user interface area where animations are composed.

anniversary date (n)~ The calendar date which signifies the date on which an event occurred in some previous year.

annotation (n)~ A note or comment attached to some part of a document to provide related information. Some applications support voice annotations or annotations accessible by icons.

annotation file (n)~ A file that contains annotations.

annotational property (n)~ A property that is maintained by Metadata Services as string data that can be attached to any repository object that exposes the IAnnotationalProps interface.

announced transfer (n)~ The act of sending the current phone call to a third person and speaking to the third person first before disconnecting from the call.

Announcement (PN)~ A Microsoft Dynamics CRM component that is used to communicate text information in a bulletin-board fashion to an organization.

Announcements (n)~ The Settings sub-area where you can configure the publication settings for internal business news and notices.

Annual Report Preparation (n)~ A template that addresses, from a Finance & Accounting view, the general activities that define a typical effort to prepare an Annual Financial Report.- Includes activities focused on obtaining the necessary information from multiple departments, to working with other departments (e.g., Legal and Public Relations) to ensure all required information is presented accurately, and up through the printing and distribution process.

annual revenue (n)~ The income that an account generates in one year as the result of buying or selling goods and services.

annunciator (n)~ An effect that is applied to an existing element on the taskbar to indicate that a user notification is active.

anonymity (n)~ A condition in which an individual's true identity is unknown.

anonymizer (n)~ Software or web service that provides an anonymous proxy designed to make user identity untraceable.

anonymous (adj)~ On the Internet, the standard login name used to obtain access to a public FTP file archive.

anonymous (adj)~ Pertaining to a process or content that is not associated with an identifiable user or originator.

anonymous allowed meeting (n)~ A meeting in which users without Active Directory credentials are allowed to attend so long as they have a valid conference key and pass Digest authentication.

anonymous binding (n)~ A way of binding to a directory where users can access only a limited area of the directory.

anonymous FTP (n)~ A type of internet file transfer that allows user to access a remote computer without having to establish an account.

anonymous FTP authentication (n)~ A protocol that makes it possible for a user to retrieve documents, files, programs, and other archived data from anywhere on the Internet without having to establish a logon name and password.

anonymous logon (n)~ A user who has connected to the computer without supplying a user name and password.

anonymous method (n)~ A practical language construct that allows programmers to create code blocks that can be encapsulated in a delegate and executed at a later time. They are based on a language concept called a lambda function and are similar to those found in Lisp and Python.

anonymous replica (n)~ A special type of replica in which you don't keep track of individual users.

anonymous subscription (n)~ A type of pull subscription for which detailed information about the subscription and the Subscriber is not stored.

anonymous type (n)~ A class type whose name is generated by the compiler and that

inherits directly from Object. Members of an anonymous type are properties that are inferred from the object initializer that creates instances of the type.

anonymous user (n)~ A non-validated user who is not recognized by the server, and who can only access published folders and address lists.

anonymous user (n)~ A user who accesses content on a Web site without providing a user login name and password.

anonymous user (n)~ An external user who does not have credentials in the Active Directory Domain Services. Unlike a federated user, an anonymous user is not authenticated.

anonymous user access (n)~ The ability to gain access to a Web server on which one does not have an account.

ANSI character set (n)~ An 8-bit character set used by Microsoft Windows that allows you to represent up to 256 characters (0 through 255) by using your keyboard. The ASCII character set is a subset of the ANSI set.

ANSI SQL query mode (n)~ One of two types of SQL syntax: ANSI-89 SQL (also called Microsoft Jet SQL and ANSI SQL), which is the traditional Jet SQL syntax; and ANSI-92 SQL, which has new and different reserved words, syntax rules, and wildcard characters.

ANSI X.12 (n)~ A message format developed by the American National Standards Institute for electronic data interchange (EDI). X.12 is used primarily in the United States.

answer (PN)~ A User Interface (UI) element that initiates the process of accepting an incoming telephone call.

answer (v)~ To accept an incoming telephone call.

Answer Desk (PN)~ The primary one-to-one support offering for Microsoft consumer products and software.

answer file (n)~ A file that automates Windows Setup. This file enables the configuration of Windows settings, the addition and removal of components, and many Windows Setup tasks, such as disk configuration.

answer file (n)~ A text file that stores the information that a user provides through the Setup wizard, along with the command-line arguments for the actions performed by Setup. This file- can be used later to run unattended installations with the same settings.

Answer Tech (PN)~ A Microsoft technical expert who provides one-to-one support through Answer Desk.

answering router (n)~ The router that answers the demand-dial connection attempt (the VPN server).

antialiasing (n)~ A software technique for smoothing the jagged appearance of curved or diagonal lines caused by poor resolution on a display screen. Methods of anti-aliasing include surrounding pixels with intermediate shades and manipulating the size and horizontal alignment of the pixels.

anti-aliasing (n)~ A software technique for smoothing the jagged appearance of curved or diagonal lines caused by poor resolution on a display screen. Methods of anti-aliasing include surrounding pixels with intermediate shades and manipulating the size and horizontal alignment of the pixels.

anti-bullying supervision policy (n)~ E-mail policy settings that administrators use to prevent a bully from sending e-mail messages to specific people by adding the bully's e-

mail address as an entry on the victim's' supervision list. This functionality supports anti-harassment policies in schools and other organizations.'

Antigen Administrator (n)~ The program used by an administrator to configure and run Antigen, either locally or remotely.

Antigen Service (n)~ The configuration and monitoring agent on the server to which the Antigen Administrator connects.

Antigen Spam Manager (PN)~ An add-on module for Antigen, used to minimize the number of spam e-mail messages that enter the Exchange environments.

anti-hammering (adj)~ A type of software or hardware method that increases the difficulty and cost of a key search attack on a PIN or password.

antimalware policy (n)~ A collection of protection settings that are applied to collections of client computers to specify how Endpoint Protection protects them from malware and other threats, including information about the scan schedule, the types of files and folders to scan, and the actions to take when malware is detected.

antimalware program (n)~ A computer program designed to detect and respond to malicious software, such as viruses and worms. Responses may include blocking user access to infected files, cleaning infected files or systems, or informing the user that an infected program was detected.

antimalware software (n)~ A computer program designed to detect and respond to malicious software, such as viruses and worms. Responses may include blocking user access to infected files, cleaning infected files or systems, or informing the user that an infected program was detected.

anti-phishing (adj)~ Pertaining to methods employed to protect users from phishing.

anti-shake (n)~ An image stabilization technique that's used to reduce the appearance of camera shake in a video image.

anti-shake feature (n)~ An image stabilization technique that's used to reduce the appearance of camera shake in a video image.

antispam ~ An antispam program is used to filter out email- spam.

anti-spam stamping (n)~ Functionality in Exchange Server 2007 that helps the messaging administrator diagnose spam-related problems by applying diagnostic metadata, or stamps

antispyware (n)~ A general class of software used to detect spyware and sometimes remove it.

antispyware program (n)~ A program used to detect spyware and sometimes remove it.

antispyware software (n)~ A general class of software used to detect spyware and sometimes remove it.

antivirus ~ Software which protects computers from viruses and suchlike. Has to be updated frequently to keep up with the latest threats, so is usually sold with a subscription which enables you to download updates from the internet.

antivirus engine (n)~ A computer program that identifies viruses.

antivirus program (n)~ A computer program designed to detect and respond to malicious software, such as viruses and worms. Responses may include blocking user access to infected files, cleaning infected files or systems, or informing the user that an infected program was detected.

antivirus software (n)~ A computer program designed to detect and respond to malicious software, such as viruses and worms. Responses may include blocking user access to infected files, cleaning infected files or systems, or informing the user that an infected program was detected.

antivirus stamping (n)~ A mechanism that helps reduce the volume of antivirus scanning that is required across an organization by stamping messages that have been scanned for viruses with metadata that indicates the version of the antivirus software that performed the scan and the result of that scan. This metadata, or stamp

antivirus update (n)~ Periodic update from software manufacturers to their antivirus software.

Any Character (oth)~ A menu item that allows the user to search a string based on a wildcard for a character, when the number of letters is known. Example: The search for D*O** will return all five-letter words that begin with a D and where O is the third letter.

Any Character, 0 or More Matches (oth)~ A menu item that allows the user to search a string based on a wildcard for a character. Example: The search for D*O** will return all words that begin with a D and where O is the third letter.

Any Digit (oth)~ A menu item that allows the user to search a string based on a wildcard that substitutes a digit.

Anywhere Access (PN)~ A collection of product and platform remote access technologies that enable users anywhere on the Internet to access information located behind the corporate firewall.

AO (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

AOL exploit (n)~ A type of trojan that attacks users of the AOL Internet service, often by retrieving passwords or modifying settings.

AOT (n)~ A navigable view of the element objects in an application model.

AP East (PN)~ The Asia Pacific East region within the Azure region taxonomy.

AP Southeast (PN)~ The Asia Pacific Southeast region within the Azure region taxonomy.

Apache Cordova (PN)~ A set of device APIs that allow a mobile app developer to access native device function for building native mobile applications using HTML, CSS, and JavaScript.

Apache Storm (PN)~ A distributed, fault-tolerant, open source computation system that allows you to process data in real time.

apartment (n)~ A group of one or more COM objects in a process. A COM object lives in exactly one apartment, in the sense that its methods can legally be directly called only by a thread that belongs to that apartment. Any other thread that wants to call the object must go through a proxy.

apartment threading (n)~ A COM threading model where all calls to an object occur on one thread. In apartment threading, COM synchronizes and marshals calls.

apartment threading model (n)~ A COM threading model where all calls to an object occur on one thread. In apartment threading, COM synchronizes and marshals calls.

apartment-threaded component (n)~ A COM component that resides on a single thread of execution. Apartment-threaded components rely on COM to synchronize calls to them.

All COM objects created with Visual Basic are apartment threaded.

APC (n)~ A function call that executes separately from an executing program when a set of enabling conditions exist. After the conditions have been met, the operating system's kernel issues a software interrupt and directs the executing program to execute the call.

aperture (n)~ A small, circular opening inside the lens that can change in diameter to control the amount of light reaching the camera's sensor as a picture is taken. The aperture diameter is expressed in f-stops; the lower the number, the larger the aperture.

aperture (n)~ In photography, the diameter of the aperture expressed in terms of the focal length of the camera lens. The greater the f-number, the less light reaches the film and the more in focus the objects in the foreground and the background will be. For example, with an f-number = 16 the objects in the far background will be in focus. Whereas, with an f-number = 2 the background will be blurry (while foreground objects are in focus).

aperture priority (n)~ A mode in many digital cameras that allows users to adjust the aperture value to their own liking.

aperture value (n)~ In photography, the diameter of the aperture expressed in terms of the focal length of the camera lens. The greater the f-number, the less light reaches the film and the more in focus the objects in the foreground and the background will be. For example, with an f-number = 16 the objects in the far background will be in focus. Whereas, with an f-number = 2 the background will be blurry (while foreground objects are in focus).

API (n)~ A set of routines that an application uses to request and carry out lower-level services performed by a computer's or device's operating system. These routines usually carry out maintenance tasks such as managing files and displaying information.

API call (n)~ A transition from user to kernel mode.

API contract (n)~ An atomic set of APIs (regardless of Windows app model) that provides a specific Windows platform capability.?

API function (n)~ An application programming interface (API) routine.

API Management (PN)~ The service type of the App Services service that enables organizations to control access, control and reporting of public and private APIs.

API server cursor (n)~ A server cursor that is built to support the cursor functions of an API, such as ODBC, OLE DB, ADO, and DB-Library.

APIC (oth)~ A programmable interrupt controller (PIC) that provides multiprocessor interrupt management. An APIC incorporates both static and dynamic symmetric interrupt distribution across all processors. It usually has more available interrupt lines than a typical PIC.

APIPA (n)~ A TCP/IP feature in WindowsXP and Windows Server2003 that automatically configures a unique IP address from the range 169.254.0.1 through 169.254.255.254 with a subnet mask of 255.255.0.0 when the TCP/IP protocol is configured for dynamic addressing and a DHCP server is not available. The APIPA range of IP addresses is reserved by the Internet Assigned Numbers Authority (IANA) for use on a single subnet, and IP addresses within this range are not used on the Internet.

APM (n)~ An older power management technology used in mobile PCs before the implementation of Advanced Configuration and Power Interface (ACPI). Advanced Power Management is a software interface that functions between the BIOS power-

management software that is specific to the hardware and a power-management policy driver that is run by the operating system.

APM (n)~ The process of collecting information about software performance.

APM agent (n)~ An agent that resides on a monitored system and gathers exception and performance information from a monitored application and reports it to the APM service.

APN (n)~ The name of the access point used to establish wireless connectivity.

APNs (PN)~ An Apple service that lets you send push notifications to iOS apps.

apostrophe (n)~ The ' character (user-typed text).

apostrophe (n)~ The ' character (publishing character).

APOSTROPHE (n)~ The ' character (user-typed text).

app (n)~ A set of instructions that a computer or device uses to perform a specific task, such as word processing, accounting, or data management.

app bar (n)~ A UI element that appears along the top or bottom edge of the screen and may include app commands or navigation.

app bundle (n)~ A collection of app packages and shared app package resources for a single app.

App Catalog (PN)~ A SharePoint document library that administrators can use to distribute apps for Office and SharePoint to their end users.

app command (n)~ A function relevant to an app in use that is displayed on the app bar.

app compat (n)~ The concept of ensuring that older applications still run correctly under newer operating systems.

App Connect (PN)~ A feature that highlights relevant apps for the user, depending on what they are doing on the phone or looking for in search.

App connector (PN)~ A hidden utility or app that works in the background to connect Windows features to a 3rd party service.

app container (n)~ A runtime environment for Windows Store apps that's designed to minimize app impact on the computer by placing runtime restrictions on what apps can do.

app Context Menu (n)~ The system user interface provided for cut, copy, and paste.

app contract (n)~ A contract between apps. App contracts include App to app picking, Play to, Print, Search, Send, Setting, Sharing (Share source and Share target).

App Controller Library (n)~ A single logical representation of all library objects from registered clouds from VMM and Microsoft Azure.

app custom action (n)~ A type of custom action that is added to a host site by an app for SharePoint and that links to more functionality that is contained by the app.

app data storage (n)~ An isolated data store specific to a particular application and user.

App Default Config resource (n)~ A Commerce Server resource with site-level properties, managed through Commerce Server Manager. Use App Default Config to set properties that determine site functionality in areas such as currency options, billing options, and BizTalk Server integration.

app description (n)~ A Product Description Page that provides a composite view of all the details that a consumer needs to determine if they want to buy a particular app. This page typically includes the title, publisher name, language support, device support, price point, screen shots, ratings, and reviews.

app for Windows 8 (PN)~ An app that targets Windows 8. It could be a Windows Store

app or a desktop app.

app host (n)~ The hosting environment for Windows Store apps that use JavaScript/HTML; it plays a role in activation, deactivation, event/SQM logging, configuration, security, and other functions.

app ID (n)~ An identification number for a software application.

app installer (n)~ A developer tool that installs Windows Store apps.

app launcher (n)~ The icon on the upper-left corner of the Office 365 suite. The icon is the entry point to all Office 365 services for which the user has a valid subscription, and to the Admin center (only if the user is an admin).

App list (PN)~ An alphabetical list of apps on the phone, accessed from the Start menu; not labeled in the UI.

app listing (n)~ The description data of a single app that is rendered for display in the consumer side of the store. It consists of several pages of info that provide a composite view of all the details a consumer needs to determine if they want to buy the app. An app listing typically includes the app's name, the publisher's name, language support, device support, price tier, screen shots, age rating and customer reviews. The web-based version of this is called an app listing page.

app localizer (n)~ A developer tool that is used to create localizable resources for an app.

app manifest (n)~ An XML file that specifies the characteristics of an application. This includes metadata for the application, dependencies on other packages, and capabilities required by the app.

App Model (PN)~ A model that defines characteristics of Windows Store apps.

App Monitor (n)~ A dashboard where admins can track the overall health of the apps in a site collection or tenancy.

app name (n)~ The name of a product in the store that appears to customers. To the end user, this is the name of the product.

app package (n)~ A file that contains the app manifest, executable files, text and image resource files, and other files that make up the app for a single platform.

App Package Deployment Client DLL (PN)~ A DLL that deploys .appx packages.

app package signing (n)~ The process of adding a secure digital Authenticode signature to an app package before it is available in the Windows Store. The digital signature shows who signed the package, that the signer is recognized by the client as a trusted source, and that the content of the package was not changed after it was signed.

App Package Sysprep (PN)~ A utility that prepares the operating system for an installation of an app package.

app packager (n)~ A developer tool to build appx packages.

app part (n)~ A component of an app for SharePoint that can be embedded on a site page to expose the functionality of the app.

app preview (n)~ A placeholder on the Start screen that represents an app not yet installed on the PC.

app proceeds (n)~ Receipts after the Windows Store fee has been subtracted.

app proceeds since last payment (n)~ Receipts after the Windows Store fee has been subtracted.

app proceeds to date (n)~ Receipts after the Windows Store fee has been subtracted.

App Service Logic Apps (n)~ A feature of App Service that automates the access and use of data across clouds without writing code.

App Service Mobile Apps (n)~ A feature of App Service that allows developers to create mobile apps that engage employees, partners, and customers on any device at any time.

App Service Web Apps (n)~ A feature of App Service that allows developers to create and deploy business-scalable mission-critical web apps.

App Services (PN)~ The family of application services in Microsoft Azure to allow users to brand and distribute their applications.

app step (n)~ A workflow step whose actions can read from and write to all items in a site.

App Summary (PN)~ Collected data about an app, such as analytics of download, usage, in-application transaction, customer ratings provided by the Windows Store developer portal. This type of information helps developers clearly understand how their applications are doing in the Windows market.

app switch (n)~ A feature of Internet Explorer 10 that allows users to easily switch between websites and their corresponding apps.

App Switcher (PN)~ A feature that displays the recently used apps that can be accessed by pressing and holding the Back hardware button.

app switching (n)~ The functionality that allows users to switch back to recently used apps.

app tile (n)~ A tile on the Start screen, as defined in its manifest. An app can only have one app tile, but it can have multiple secondary tiles.

app title (n)~ The name a developer provides for their application.

App Update (PN)~ A Windows Store service that enables end users to update apps one at a time or all at the same time for all apps purchased through the Windows Store.

app web (n)~ A subweb site to which the SharePoint components of an app are deployed when the app is installed on a host web.

APPC (oth)~ An IBM Systems Network Architecture communications method that uses the LU 6.2 protocol to establish, manage, and terminate network communication between programs in a distributed computing environment.

AppCompat database (n)~ A database that contains a list of applications that may have potential compatibility problems and remedies. When an application starts, Windows checks this database to configure system options to minimize compatibility problems.

AppDomain (n)~ A boundary that the common language runtime establishes around objects created within the same application scope (that is, anywhere along the sequence of object activations beginning with the application entry point). Application domains help isolate objects created in one application from those created in other applications so that run-time behavior is predictable. Multiple application domains can exist in a single process.

appealing (adj)~ Compelling and/or attractive in appearance.

Appear Away (PN)~ An item on the user's My Status menu that can be selected while signed in to make it appear to other users that he or she is currently away.

Appear Offline (PN)~ The item on the user's My Status menu that the user can select while signed in to make it appear to other users that he or she is currently offline.

Appear offline (PN)~ The status menu item that makes it appear to the user's contacts that he or she is currently offline.

append (v)~ To place or insert as an attachment by adding data to the end of a file or database or extending a character string.

Append (n)~ An access right available in Microsoft Dynamics CRM that enables users to attach an entity instance to the selected entity instance.

append query (n)~ An action query that adds the records in a query's result set to the end of an existing table.

appender (n)~ In the logging framework, the part of logger configuration files containing parameters that control the logging of each logger to trace logs sent automatically to Application Insights and explore and search on them.

AppFabric 1.1 for Windows Server (PN)~ The 1.1 version of Windows Server AppFabric which contains: read-through and write-behind provider support, graceful shutdown, domain account support, new ASP.NET session state and output caching providers, compression, and multiple cache client application configuration sections.

Apple ~ The Apple Corporation makes the only successful mass-market personal computer which doesn't use Microsoft Windows, theMac, and the phenomenally successful- iPhone- (smartphone),iPod- (music player) and- iPad- (tablet).

Apple QuickTime (n)~ Software components developed by Apple for creating, editing, publishing, and viewing multimedia content. QuickTime, which supports video, animation, graphics, 3-D, VR (virtual reality), MIDI, music, sound, and text, has been part of the Mac OS since version 7 of the operating system and is used in many Macintosh applications. Windows applications can also run QuickTime files but require the installation of special player software. QuickTime is often used on the Web to provide Web pages with video and animation. Most Web browsers support plug-ins for running these types of files. QuickTime is also part of the new MPEG-4 specification.

AppleShare File Server (n)~ A remote filing system protocol that provides a standard means for a workstation on an AppleTalk network to access and manipulate files on an AFP-implemented server.

applet (n)~ A small piece of code that can be transported over the Internet and executed on the recipient's machine. The term is especially used to refer to such programs as they are embedded in line as objects in HTML documents on the World Wide Web.

Applet ~ A small program used to carry out a particular task, usually on a web page.

AppleTalk (n)~ The Apple Computer network architecture and network protocols. A network that has Macintosh clients and a computer running Windows 2000 Server or Windows NT Server with Services for Macintosh functions as an AppleTalk network.

AppleTalk Protocol suite (n)~ The set of network protocols on which AppleTalk network architecture is based. The AppleTalk Protocol is installed with Services for Macintosh to help users access resources on a network.

applicability rule (n)~ A rule used by an update agent to determine whether the update is needed by a given computer.

Applicable to (PN)~ A field on the cross-campaign rules page where a person can specify what the rule applies to. The choices are Contacts' and 'Email address."

applicant (n)~ A person who makes a formal written or electronic request to work for or

fill an open position in an organization.

application (n)~ A set of instructions that a computer or device uses to perform a specific task, such as word processing, accounting, or data management.

application (n)~ A Commerce Server application is a logical representation of an application in Microsoft Internet Information Services (IIS); it appears in both Commerce Server Manager and the IIS console trees. In the IIS console tree an application is either at the root directory level of the Web site or at a subdirectory level of the Web site.

application (n)~ The container for your company's PerformancePoint Planning business model definitions, predefined and user-defined dimensions, the mappings that connect these business model definitions with your company's data source, and other PerformancePoint Planning metadata like views, permissions, and process scheduling information.

application (n)~ A collection of Web-based lists, libraries, calendars, and other pages you use to share information and manage an area of your business, such as your projects, documents, and company information.

application (n)~ A Web application that consists of a group of tightly related components such as ASP.NET Web pages, WCF Web services, and workflows that run in a .NET application domain. An application is a unit of deployment, configuration, and management.

application (n)~ A document that records the profile of the applicant.

application adapter (n)~ An adapter created to work with a specific application or protocol.

Application Administrator (n)~ A security role that grants permissions to administrative users so that they can perform both the Application Deployment Manager role and the Application Author role.

Application Advisor (n)~ A web console that is used to provide environment-wide and application-specific reports.

Application Agent (n)~ An agent that monitors checkpoints for potential threats making changes to your installed applications, such as modifying Internet Explorer or downloading ActiveX applications from the Internet.

application approval (n)~ An additional action that is required after an end user requests an application and before the application becomes available for deployment.

Application Assemblies Gallery (PN)~ The site collection level gallery containing the binary assemblies that are used by code method business data actions, or External Data Parts.

Application Author (n)~ A security role that grants permissions to administrative users so that they can create, modify, and retire applications.

application base (n)~ The directory where the .exe file that loads into the initial or default application domain is located. If you create your own application domain, the application base is the location you specify in the AppDomainSetup class.

application basket (n)~ A list of applications reviewed by human resource personnel.

application calendar (n)~ A time period concept that matches the practices that are used in your company.

Application Catalog web service point (n)~ A Configuration Manager site system role

that provides application information from the Software Library to the Application Catalog website.

Application Catalog website point (n)~ A Configuration Manager site system role that provides users with a list of available software from the Application Catalog

Application Center (PN)~ A Microsoft deployment and management tool for high availability Web applications built on the Microsoft Windows operating system.

application compatibility (n)~ The concept of ensuring that older applications still run correctly under newer operating systems.

application compatibility database (n)~ A database that contains a list of applications that may have potential compatibility problems and remedies. When an application starts, Windows checks this database to configure system options to minimize compatibility problems.

Application Compatibility Manager (PN)~ The user interface that enables you to view reports based on the Update Compatibility Evaluator (UCE) and security information generated from the ACT database. This is also where you create the data collection packages used to deploy UCE.

Application Compatibility Toolkit (n)~ A suite of tools that enables software developers, independent software vendors (ISVs), and enterprise IT professionals to determine whether their applications are compatible with a new version of Windows before rolling it out to the company. ACT also enables such individuals to determine how Windows security updates may impact their applications.

Application Compatibility Toolkit Data Collector (PN)~ A component of the Application Compatibility Toolkit that installs the compatibility evaluators, maintains the compatibility evaluator scheduling, collects your data through the compatibility evaluators, and uploads the issue data to both the Microsoft Compatibility Exchange and your ACT database.

Application Configuration Attach mode (n)~ A mode that restores configuration data stored in the administration database.

application configuration file (n)~ An XML-based file in a Microsoft .NET
- application- that - is used for storing application configuration settings. This file is named app.config in a Microsoft C# project.

application data (n)~ The settings and data used by a particular application.

application database (n)~ The database that stores user and system data for one application. The application database contains the events, subscriptions, and notifications for the application. It also contains system metadata, including the schemas for the events, subscriptions, and notifications for the application; and the match rules for the application.

application definition (n)~ A design-time description of an 'atomic' deployable application layer system that offers and/or consumes services.

application definition (n)~ A file that describes a database or Web service and includes connection settings, authentication mode, definitions of available entities, and other information.

application definition file (n)~ An XML file that fully describes a single Notification Services application. The ADF file contains the schemas for the events, subscriptions, and notifications; the rules for matching events with subscriptions; and may provide the name

of the XSLT file used to format generated notifications.

Application Delivery Network (PN)~ A resource of the Content Delivery Network service as a suite of technologies deployed together to provide application availability, security, visibility, and acceleration.

Application Deployment Manager (PN)~ A security role that grants permissions to administrative users so that they can deploy and monitor applications.

Application Designer (n)~ One of the Distributed System Designers that comprise Team Architect. The Application Designer is used to design individual applications that comprise an application system.

application development language (n)~ A computer language designed for creating applications. The term is usually restricted to refer to languages with specific high-level constructs geared toward record design, form layout, database retrieval and update, and similar tasks.

Application Diagnostics (n)~ A feature for monitoring the performance of code and providing the monitoring information back to a user in a consumable format.

Application Diagnostics navigation pane (n)~ The resizable navigation pane on which you can access the filtering and reporting capabilities of Application Diagnostics.

Application Diagnostics preview pane (n)~ The pane that displays the Event Properties tab of the Event dialog box.

Application Diagnostics toolbar area (n)~ The area where the toolbar options provide all of the tools that you require to control the quantity and type of information to display in Application Diagnostics.

Application Diagnostics view pane (n)~ The view pane that provides a list of selected events.

application diagram (n)~ The diagram used to visualize, define, connect, and configure applications in the solution. The application diagram (.ad) file contains information based on the System Definition Model (SDM).

application directory (n)~ The directory on an index server or a query server where all files are stored for the purpose of creating a full-text index catalog or performing queries on a full-text index catalog.

application display (n)~ The screen (the Surface screen or an attached external monitor) where user mode will appear when you are calibrating the unit.

application domain (n)~ A boundary that the common language runtime establishes around objects created within the same application scope (that is, anywhere along the sequence of object activations beginning with the application entry point). Application domains help isolate objects created in one application from those created in other applications so that run-time behavior is predictable. Multiple application domains can exist in a single process.

application domain host (n)~ A host on which the application domain is located.

application endpoint (n)~ An endpoint at which an application provides or uses a service and is of provider or consumer type, respectively.

Application Error Monitoring (PN)~ A System Center Essentials that provides agentless monitoring of application exceptions on clients. Managed computers can generate and send an error report upon detection of applications errors.

Application Error Reporting (n)~ A tool that compiles a detailed report in the event that an Office program crashes and either directs the user to a potential solution (for known problems) or transmits the report to Microsoft for investigation (with user permission).

Application Event Log (n)~ A record of activities with an application.

application exclusion (n)~ A feature that enables the license issuer to specify the application ID of those players on which to disallow the use of the packaged files.

application exclusive time (n)~ The time spent in function to kernel mode and Performance Tools probes, excluding time spent in items it calls and excluding time spent in transitions.

application extension services (n)~ In Silverlight, classes that extend the application model by providing services that can participate in the application life cycle.

application file (n)~ A disk file that contains the executable portions of a computer program. Depending on its size and program generator programming complexity, an application or other program, such as an operating system, can be stored in several different files, each containing the instructions necessary for some part of the program's overall functioning.

application flow (n)~ A map or diagram that outlines the flow of an application from one screen or piece of UI to the next.

Application Flow panel (n)~ A panel that displays the application flow of a prototype project.

application framework (n)~ A group of C++ classes in the Microsoft Foundation Class Library that provides the essential components of an application for Windows. The application framework defines the skeleton, or framework, of an application and supplies standard user-interface implementations that can be placed onto the skeleton.

Application Frameworks resources (n)~ A set of programs, Windows PowerShell cmdlets, and scripts that enable users to install virtual applications and Web applications during the deployment of a service.

Application Gateway Hours (n)~ A unit of measure for the time used of the Basic Application Gateway service type of the Networking service in Azure.

application icon (n)~ A small static image or graphic that represents an application.

application identity (n)~ The account that is used to run the application.

Application Impact Telemetry (PN)~ A sub-feature of Application Telemetry whose goal is to gather information on how applications use features exposed by the operating system (COM objects, registry, DLLs, DLL exports, etc.). This data is used to better understand how a change to or removal of a Windows feature may impact applications and overall application compatibility goals. It also helps understand how features are used, and allows Microsoft to use that information in planning new features, allocating testing resources, etc.

Application Impact Telemetry Agent (PN)~ The scheduled task part of Application Impact Telemetry (AIT) that runs nightly to consume the events logged to Event Tracing for Windows (ETW) by the AIT Runtime system and send them back to Microsoft using SQM.

application inclusive time (n)~ The time spent in function and items it calls, excluding time spent in transitions to kernel mode and Performance Tools probes.

Application Information Service (n)~ A system service that facilitates starting applications that require one or more elevated privileges to run, such as Administrative Tasks. When user requires elevated privileges to run an application and gives consent, AIS creates a new process for the application with the user's full access token.

Application Initialization (PN)~ An IIS feature that enables web administrators to configure IIS to initialize web applications, so the application is ready for the first request.

Application Insights (PN)~ A Visual Studio Add-in and a Microsoft Azure service of telemetry collection for monitoring the availability, performance, and usage of deployed live applications, not necessarily Microsoft Azure applications, and diagnosing issues or exceptions in web services through log traces, without code redeploying.

Application Insights Status Monitor (PN)~ A runtime instrumentation agent to monitor a web application that is already installed and running without updating the code or redeploying it and get performance telemetry right away, or insert trace code, or usage analytics.

Application Insights Telemetry (PN)~ A tool to get insights into the KPIs of on-premises and Windows Azure applications.

Application Insights Tools for Visual Studio (n)~ A Visual Studio Add-in and a Microsoft Azure service of telemetry collection for monitoring the availability, performance, and usage of deployed live applications, not necessarily Microsoft Azure applications, and diagnosing issues or exceptions in web services through log traces, without code redeploying.

application installation package (n)~ The package that includes the installer, Application Compatibility Toolkit Data Collector (ACT-DC), the compatibility evaluators, and the configuration files to be deployed to client computers.

Application Integration Framework (PN)~ The framework that provides a collection of features, tools, and infrastructure that uses a services programming model to support application integration.

application isolation (n)~ The separation of applications by process boundaries that prevent the applications from affecting one another.

application layer (n)~ Layer seven of the OSI model, the layer at which applications access network services. This layer represents the services that directly support applications, such as software for file transfer, database access, and e-mail.

application layer (n)~ A set of application models that take precedence over application models that are in lower application layers. The lowest layer is named SYS.

Application Layer Enforcement (n)~ An operation of Windows Filtering Platform (WFP) which provides enforcement for security policies by, in each case, trapping the event, determine what application initiated it, and query the filter engine to determine whether the socket should be allowed to proceed.

application library caching (n)~ In Silverlight, a feature that enables applications to use external library assemblies retrieved from the server or from the local browser cache.

application license (n)~ A license that authorizes protection of file and application resources on a single server.

application log (n)~ A record of events that are generated by the applications running on a system.

application manifest (n)~ An XML document that describes requirements for an application. The application manifest can be a separate file or embedded in the application's .exe file.

application map (n)~ A mapping between file name extensions and HTTP request handlers that enables Web hosting applications to determine which handler responds to requests for specific types of files.

application media pool (n)~ A media pool created by applications. Application media pools determine which media can be accessed by which applications and set the policies for that media. There can be any number of application media pools in a Media Service system.

application migration (n)~ The movement of the structure and metadata of an application from one system to another.

application mode (n)~ The mode of a Surface unit when an application is running. Only one application appears on a Surface screen at a time. The application displays on the entire screen.

application model (n)~ Within a single application layer, a model that includes a specific set of developer elements such as classes, tables, and forms.

application name (n)~ The unique and friendly name that refers to an application.

application notification (n)~ A notification that starts an application at a specified time or when a system event occurs. When an application starts as the result of a notification, the system specifies a command-line parameter that identifies the event that has occurred.

Application Object Tree (n)~ A navigable view of the element objects in an application model.

application offlining (adj)~ The act of downloading BCS Solutions from a SharePoint site to Outlook.

application package (n)~ A package file, containing the application files and the service model files, used to run the application as a cloud service.

Application Page Request (PN)~ The option that specifies events triggered by the service application when locating a server- for loading a PowerPivot data source and communicating with other servers in the farm.

application pane (n)~ A discrete area of a split or single window in which an application user interface is rendered.

Application Performance Monitoring agent (n)~ An agent that resides on a monitored system and gathers exception and performance information from a monitored application and reports it to the APM service.

Application Planning and Design Guide (PN)~ A supplemental document to the core application questionnaire that is intended to provide a broad overview of PerformancePoint Server.

application pool (n)~ A grouping of one or more URLs served by a worker process.

application pool identity (n)~ The user account that the worker processes servicing the application pool use as their process identity. Process identity is the term that is used to denote the account that a process runs under.

Application Preload (PN)~ An IIS extension that enables the process of automatically starting an application without a request so that initial warm-up time for the application is

minimized.

application preview (n)~ The image, video or slide show for an application that appears in Launcher when the application is selected and appears at the center of the Launcher menu. When the application is not selected in Launcher, the application icon is displayed.

application profile (n)~ A Virtual Machine Manager library resource that contains instructions for installing Microsoft Server App-V, the Web Deploy tool, and Microsoft SQL Server data-tier applications and for running scripts when you deploy a virtual machine as part of a service.

application programming interface (n)~ A set of routines that an application uses to request and carry out lower-level services performed by a computer's or device's operating system. These routines usually carry out maintenance tasks such as managing files and displaying information.

application prototype (n)~ A template of an application definition that can be placed on the toolbox. May be pre-supplied or can be created from any application on the Application Connection Diagram and distributed for use by other users.

application provider agreement (n)~ An agreement that describes the terms and conditions of the relationship between the application provider and the organization offering a particular service with regards to the application.

application provisioning (n)~ The process of synchronizing a secondary server with Web Deploy providers that are installed on the primary server by using the Application Provisioning feature. The Application Provisioning feature uses the Microsoft Web Deploy agent service to perform synchronization.

Application Registry Service (PN)~ A shared service in SharePoint Server that duplicates the Office SharePoint Server Business Data Catalog service. The Application Registry Service supports running solutions that are based on the SharePoint Server Business Data Catalog service.

Application Request Routing (n)~ A proxy-based routing and load-balancing module for IIS 7. This module uses information gathered from HTTP headers and server variables and then leverages the URL Rewrite module to make routing decisions at the application layer.

application revocation (n)~ A process by which applications that are known to be damaged or corrupted are prevented from playing any packaged files.

application role (n)~ A SQL Server role created to support the security needs of an application.

application root (n)~ The root directory for an application; all directories and files contained within the application root are considered part of the application. Also called an application starting point directory.

application scope (n)~ A way of making data available to all users of an application from all pages of a Web application. A variable or an object is given application scope by storing it in the Active Server Pages (ASP) application object. Application scope is useful for global data, such as a global counter.

Application server (PN)~ A component of Front End Server that provides a platform by which to deploy, host, and manage unified communications applications.

Application Server role (n)~ A role that consists of the services that provide users access to data and content. To run Microsoft Dynamics CRM, you must have at least one

computer that is running the Application Server role.

application service (n)~ In ASP.NET, built-in functionality for common application tasks. ASP.NET includes application services for authentication (ASP.NET membership), persistent per-user information (profile properties), and more.

application service provider (n)~ An organization that delivers a contractual service to deploy, host, manage, and provide access to an application from a facility other than the customer's site.

application session (n)~ The period of time when an application is running. When an application starts, the session starts. When an application quits, the session ends.

application setting (n)~ A simple key/value pair that lets you create application-wide values in a central location that can be accessed from anywhere within the Web application.

application sharing (n)~ A feature that allows a user to share documents or applications with others. The user can also choose to give another person control of an application or the user's computer.

application single-threaded apartment (n)~ A single-threaded apartment the thread of which is the core UI thread for an application window.

application source data integration (n)~ The process of taking data from a data warehouse or data mart into PerformancePoint Planning Server staging and application databases.

Application Source Root (n)~ A registry key that allows an override of the OSD CODEBASE for the HREF element (for example, the source location) for an application to enable an administrator or ESD system to ensure application loading is performed according to their topology management scheme.

application state (n)~ In ASP.NET, a variable store that is created on the server for the current application and is shared by all users. Application state is typically used to store information that is used for all users, such as application-wide settings.

application suite (n)~ A set of application programs sold as a package, usually at a lower price than that of the individual applications sold separately. A suite for office work, for example, might contain a word processing program, a spreadsheet, a database management program, and a communications program.

Application Suite (PN)~ The set of applications from Microsoft that includes Concierge, Music, and Photos. You installed these applications by using the Application Suite Setup wizard.

application system (n)~ A system that defines a specific and reusable configuration of applications and other systems as members. You can configure these members and describe the communication pathways between them.

Application Telemetry (PN)~ A system that is used to gather a wide variety of information about applications. It includes, but is not limited to, what shims are applied, what compatibility switching context is used, if PCA applies a layer, and it includes Application Impact Telemetry.

application time (n)~ The total time after estimated kernel time has been subtracted from elapsed time.

application time (n)~ The clock time supplied by applications which must communicate

their application time to the StreamInsight server so that all temporal operators refer to the timestamp of the events and never to the system clock of the host machine.

Application Verifier (n)~ A graphical user interface (GUI) tool that aids IT managers and developers in testing applications on Microsoft-® Windows-® and the Windows Server family. It helps developers identify potential application compatibility, stability, and security issues.

application virtualization (n)~ The process of creating a virtual application.

Application Virtualization Client (PN)~ An application that resides on a Terminal Server and which communicates and authenticates with the Microsoft System Center Virtual Application Server to receive the application code and allow a sequenced application to be run locally.

Application Virtualization drive (n)~ The default virtual application client drive (Q:\) from which sequenced applications are run.

Application Virtualization Management Console (PN)~ Centralized snap-in to the Microsoft Management Console and which you use to administer the System Center Application Virtualization system.

Application Virtualization Management Server (PN)~ One of two Application Virtualization server types from which a sequenced application package can be streamed. In addition to streaming virtual application packages, the Application Virtualization Management Server offers other services such as publishing, management, reporting, and so on.

Application Virtualization Management Service (PN)~ A service that acts as an intermediary between the Management Console and the Data Store. First it authenticates its users, and then it allows authorized administrators to manipulate data in the data store.

Application Virtualization reporting (n)~ Virtual application information gathered for data analysis. Data is collected for assembly of custom views and interpretation.

Application Virtualization Streaming Server (PN)~ One of two Application Virtualization server types from which a sequenced application package can be streamed. The Streaming Server streams applications to the client machines only and does not offer other services such as publishing, management, reporting, and so on.

application window (n)~ A window that serves as an interface between the user and the application.

Application Wizard (n)~ The Wizard that helps you determine how the application is presented to users. This step lets you specify an icon, modify shortcut settings, create file type associations, and run the applications so the Sequencer can collect information about the applications.

Application XML (PN)~ An XML-based serialization format used by SharePoint-based servers to represent Access Services database applications. It includes database properties, queries, forms, reports, and macros.

application-level add-in (n)~ A supplemental program that modifies or adds functionality to an existing program or application. The modifications are available to the application at all times.

applied decrease (n)~ An inventory decrease that has been applied to a specific inventory increase, for the purpose of exact cost reversing. This might be the case, for example, with

a purchase return that is applied to a specific purchase receipt.

AppLocker (PN)~ A Windows feature that allows IT professionals to create rules and policies governing which applications can be run by individual users on the PCs in an enterprise.

apply (v)~ To link one or more transactions to another transaction to either to reduce the outstanding balance of a transaction or to show a valid connection between the transactions.

apply (v)~ To put into operation or to use.

apply branch (n)~ The set of operations applied to an event group.

APPN (oth)~ An upgrade to IBM Systems Network Architecture that supports distributed session control services and dynamic routing, avoiding dependencies on centralized mainframe network services.

appointment (n)~ An activity represented by a time interval that has a start time, an end time, and a duration.

appointment (n)~ A calendar item in the Exchange store. Appointments do not include other people or resources.

Appointment Book (n)~ A view of service activities and schedules. New activities can be created or existing activities can be viewed and updated.

Appointment details (n)~ The notes field in an appointment, where the user can add extra information.

appointment scheduling (n)~ The process of reserving dates and times for the pickup and delivery of truckloads of goods at specific warehouse locations.

apportionment engine (n)~ An engine that determines and processes the apportionment of freight charges, either by weight or by volume.

Apprentice Baker (n)~ A skill level in the Comfy Cakes game. Once you have completed a Comfy Cakes game, a player gets a skill level rank assigned automatically by the game (based on the score you hit during the game).

appropriation (n)~ A distribution of net income to various accounts or entities.

approval (n)~ A workflow decision point that can be used to obtain authorization from a person before continuing in the workflow.

approval activity (n)~ A workflow decision point that can be used to obtain authorization from a person before continuing in the workflow.

Approval Assistant (PN)~ A report, accessible from the Web Author, that generates a list of all pages waiting for the approval of the user who is logged on.

Approval Center (PN)~ A feature that provides a centralized location for managers of all types to approve work and control progress on all of their projects plans. It gives managers the ability to preview the impact of accepting updates from resources as well as view their past history of accepted updates.

approval e-mail (n)~ An e-mail that is sent to identified approvers when a request requires an approval before being committed.

approval history (n)~ The log of approved changes made to an object.

approval limit (n)~ Any amount or other limits set for an approver.

approval request (n)~ A request that is sent to an approver in the ILM Service as part of the processing of an approval activity.

approval response (n)~ An e-mail message sent from the ILM 2' Outlook add-in in reply to an approval request.'

approval status (n)~ The approval status for an entry.

approval template (n)~ A table with a list of templates that the user can select to set up which documents he wants to be included in an approval process.

approval threshold (n)~ The number of positive approval response messages needed to permit a request to continue processing.

Approval Type (PN)~ The UI field that specifies the role of a document approver.

approvals search folder (n)~ The search folder that is created by the ILM Add-in for Outlook 2007 and that provides the user with a way to see pending and completed approvals, and approval request updates.

approve (v)~ To manually or automatically authorize the occurrence of future events in a system.

approved vendor (n)~ A vendor that is authorized to supply products to one or more legal entities.

approver (n)~ A user who has permission to approve or reject submitted documents or data.

approximate taxes (n)~ The estimated taxes from production and supply chain that apply to an item or service.

Apps (n)~ A unit of measure of the 'Premium Apps' and 'Standard Apps' resources of the 'Application Insights' service type of the 'Visual Studio' service for 'Pay-As-You-Go' billing based on the number of apps delivered.

Apps Corner (PN)~ A feature that allows small business and consumers to lock down the phone or tablet running Windows Phone to only allow the use of specific apps.

Apps for Office and SharePoint Developer Center (PN)~ A website that provides tools and resources to help developers create apps for Office and SharePoint.

Apps Marketplace (PN)~ The service on the phone where you can purchase and download apps.

AppVerifier (n)~ A graphical user interface (GUI) tool that aids IT managers and developers in testing applications on Microsoft-® Windows-® and the Windows Server family. It helps developers identify potential application compatibility, stability, and security issues.

AQS (n)~ A search query syntax that helps produce more precise search results by using targeted queries that search specific properties in a message type. AQS defines certain keywords which can be used to refine the search query, such as specifying boolean operations on searched terms (AND, OR, NOT) as well as to specify further filters based on file metadata or file type. It can also be used to limit results from specific information stores like regular files, offline files cache, or e-mail stores.

ARA notification (n)~ A report of packaging materials used for manufactured products, as required by Austrian regulation. Altstoff Recycling Austria AG is an Austrian waste management organization that collects and recycles packaging material.

arbitration port (n)~ A TCP/IP port used by the cache hosts to determine whether a cache host in the cluster has become unavailable. The port number that is used for arbitration can be different on each cache host.

architecture (n)~ The design of application software incorporating protocols and the means for expansion and interfacing with other programs.

architecture (n)~ The physical construction or design of a computer system and its components.

architecture (n)~ The data-handling capacity of a microprocessor.

Architecture ~ The basic design of a computer's hardware. Computers with different architecture, such as the PC and the Mac, cannot run each others' programs.

archive (n)~ A compressed file.

archive (n)~ Information that has been moved to another location for storage and occasional future access.

archive (v)~ To compress a file.

archive (v)~ To move selected items to another location for long term storage.

archive (v)~ To create a copy of a live smooth stream in the Smooth Streaming presentation format for later on-demand viewing.

Archive (PN)~ The Outlook folder where archived items are stored.

archive mailbox (n)~ An alternate storage location in which to store historical messaging data, accessible online through Outlook 2010 or Outlook Web App.

archive mailbox (n)~ An additional mailbox enabled for a mailbox user.

archive member header (n)~ In the portable executable (PE) (image) file format for executables and object file under the Windows family of operating systems, one or more lines printed at the beginning of the file that identify the file as a PE format image file.

Archived (PN)~ A Knowledgebase Article Status. Articles in this status cannot be viewed on the Support Portal.

Archiving and CDR Server (n)~ A server that provides the ability to archive instant messages for specified users for two-party IM sessions as well as IM conferences with more than two parties, and adds the ability to archive call detail records for specified users for peer-to-peer sessions, conferences and Enterprise Voice calls.

area (n)~ A group of networks within an OSPF autonomous system. OSPF areas reduce the size of the link state database and provide the ability to summarize routes.

area (n)~ A part of the user interface dedicated to a particular purpose, such as instant message area."

area (n)~ A node on the Common Structure Service hierarchy that represents a feature area.

area (n)~ A tile in a pane or on a page.

area border router (n)~ A router that is attached to multiple areas. Area border routers maintain separate topological databases for each area.

area chart (n)~ A type of chart that displays the trend of values over time or categories. By displaying the sum of the plotted values, an area chart also shows the relationship of parts to a whole.

area code (n)~ A number that identifies each telephone service area in a country/region and is used as a dialing prefix.

ARGB32 (PN)~ One of the two common pixel formats supported by DirectX. ARGB32 consists of uncompressed alpha, red, green, and blue.

argument (n)~ A value that a function or a method uses to perform operations or

calculations. The type of argument is specific to the function or method. Common arguments include numbers, text, cell references, and names.

argument mode (n)~ A mode in the Monad parser in which everything is treated as an expandable string unless it starts with $, @, -€˜, -€œ, or (.

ARIMA (n)~ A method for determining dependencies in observations taken sequentially in time, that also supports multiplicative seasonality.

arithmetic expression (n)~ A series of elements, including data labels and constants as well as numbers, that are joined by arithmetic operators, such as + and -, and can be calculated to produce a value.

arithmetic logic unit (n)~ A component of a microprocessor chip used for arithmetic, comparative, and logical functions.

arithmetic operator (n)~ An operator that performs an arithmetic operation: +, -, x, or /. An arithmetic operator usually takes one or two arguments.

arithmetic overflow (n)~ A condition that results from calculating a column value that exceeds the column's specified size.

ARM (PN)~ A group of processors commonly used for low-powered hardware, such as tablets and other mobile devices. These small, high-performance 32-bit RISC-based microprocessors are licensed to various semiconductor manufacturers by designer ARM Limited.

ARM architecture (n)~ A family of instruction set architectures for computer processors based on a reduced instruction set computing (RISC) architecture developed by British company ARM Holdings.

ARM Cross Tools (n)~ A set of programs to develop applications that can be run or operated on ARM devices.

ARM kits policy (n)~ A set of rules that enables developers to use various Microsoft tools and kits on ARM devices, and at the same time, preserves the integrity of ARM devices that ship with a production policy.

armored (adj)~ Pertaining to a defense mechanism used in some malicious software code, intended to complicate or prevent analysis of the code with reverse engineering or code disassembly methods.

ARP (n)~ In TCP/IP, a protocol that uses broadcast traffic on the local network to resolve a logically assigned Internet Protocol version 4 (IPv4) address to its physical hardware or media access control (MAC layer address. In asynchronous transfer mode (ATM), ARP is used two different ways. For classical IPv4 over ATM (CLIP), ARP is used to resolve addresses to ATM hardware addreses. For ATM LAN emulation (LANE), ARP is used to resolve Ethernet/802.3 or Token Ring addresses to ATM hardware addresses.

ARP cache (n)~ A table of Internet Protocol version 4 (IPv4) addresses and their corresponding media access control (MAC) address. There is a separate ARP cache for each interface.

ARR (n)~ A proxy-based routing and load-balancing module for IIS 7. This module uses information gathered from HTTP headers and server variables and then leverages the URL Rewrite module to make routing decisions at the application layer.

arrangement (n)~ A predefined combination of grouped and sorted messages in table view.

arrangement (n)~ A custom-created layout of photos in an album.

Arrangement view (n)~ A Windows view that provides easy results organization by date, type, author, tag or folder (Arrange by Folder'

array (n)~ In programming, a list of data values, all of the same type, any element of which can be referenced by an expression consisting of the array name followed by an indexing expression. Arrays are part of the fundamentals of data structures, which, in turn, are a major fundamental of computer programming.

array bounds (n)~ Specifications of the maximum and minimum size of an array.

array constant (n)~ A set of constants that is a component of an array formula.

array formula (n)~ A formula that performs multiple calculations on one or more sets of values, and then returns either a single result or multiple results.

array initializer (n)~ A sequence of variable initializers that are assigned to the array elements in the same statement in which the array is declared.

array network (n)~ A server network defined at the array level.

array server (n)~ A server computer that's a member of a server array.

array variable (n)~ A variable that can contain a series of values.

Arrived (adj)~ A scheduled' service activity status that denotes the customer has arrived at the location of the service activity

arrow key (n)~ Any of four keys labeled with arrows pointing up, down, left, and right, used to move the cursor vertically or horizontally on the display screen or, in some programs, to extend the highlight.

Arrow Ribbon (PN)~ A SmartArt graphic layout used to show either related or contrasting concepts with some connection, such as opposing forces. The first two lines of Level 1 text are used for text in the arrows. Unused text does not appear, but remains available if you switch layouts.

artboard (n)~ The design surface used to layout the visual elements of your document.

Artemis TiP (n)~ A type of subscription purchased by customers meant to be used as a production test offer by Microsoft's partners.

article (n)~ A message that appears in a newsgroup, public folder, or other forum, such as Facebook or Twitter, accessible by a number of individuals.

article (n)~ A component in a publication. For example, a table, a column, or a row.

article (n)~ A text-based piece of content in the knowledge base.

Article (n)~ A single instance of content that is displayed in the Knowledgebase section of your Support Portal.

articulation (n)~ A series of adjustments applied by a synthesizer to the pitch, volume, and other parameters of an instrument sound to make it more realistic.

artifact (n)~ A component of a BizTalk application or project. Examples are orchestrations, pipelines, message schemas, security certificates, business rule policies, and bindings.

artifact (n)~ A software construct that is available in common to Azure services and resources

artifact type (n)~ A type of data that a tool exposes publicly so that other tools can refer to it. Each artifact must have an artifact type. Each artifact must be identified by a unique and immutable artifact identifier.

artist (n)~ A performer of a song or other audio recording.

artistic effect (n)~ An effect that a user can apply to an image to achieve a specific artistic look.

AS (n)~ A group of routers or networks controlled by a single administrative authority using a common Interior Gateway Protocol (IGP) for routing packets. Each autonomous system is assigned a globally unique number called an autonomous-system number (ASN).

AS boundary router (n)~ A router that exchanges routing information with routers that belong to other autonomous systems. The ASBR then advertises external routes throughout the autonomous system. ASBRs can be internal or area border routers, and they might or might not be connected to the backbone.

ASBR (oth)~ A router that exchanges routing information with routers that belong to other autonomous systems. The ASBR then advertises external routes throughout the autonomous system. ASBRs can be internal or area border routers, and they might or might not be connected to the backbone.

as-built software (n)~ A deliverable, consisting of software components, that is the result of compiling (building) the raw code files from a discrete set of source versions.

ascending order (n)~ The arrangement of a sequence of items from lowest to highest, such as from 1 to 10 or from A to Z. The rules for determining ascending order in a particular application can be very complicated: capital letters before lowercase letters, extended ASCII characters in ASCII order, and so on.

ASCII (n)~ A standard single-byte character encoding scheme used for text-based data. ASCII uses designated 7-bit or 8-bit number combinations to represent either 128 or 256 possible characters. Standard ASCII uses 7 bits to represent all uppercase and lowercase letters, the numbers 0 through 9, punctuation marks, and special control characters used in U.S. English. Most current x86-based systems support the use of extended (or high') ASCII. Extended ASCII allows the eighth bit of each character to identify an additional 128 special symbol characters

ASCII apostrophe (n)~ The ' character (user-typed text).

ASCII character set (n)~ A standard 7-bit code for representing ASCII characters using binary values; code values range from 0 to 127. Most PC-based systems use an 8-bit extended ASCII code, with an extra 128 characters used to represent special symbols, foreign-language characters, and graphic symbols.

ASCII file (n)~ A document file in ASCII format, containing characters, spaces, punctuation, carriage returns, and sometimes tabs and an end-of-file marker, but no formatting information.

ASF (n)~ A low-overhead data format for multimedia streams. It encapsulates images, audio, AVI, and so forth, as well as URLs, and allows for the synchronization of these objects within the stream. Windows Media Technologies can stream ASF formatted content and can store ASF streams as .asf files.

Asia Pacific (PN)~ The Asia Pacific geo within the Azure region taxonomy.

Ask Cortana (PN)~ ?A feature that lets customers learn about unfamiliar terms on the web by asking Cortana.

Ask for Remote Assistance… (oth)~ An item on the Actions menu that invites someone

to help the user. Using an Internet connection, the user can give permission to anyone running Windows XP to chat, view the user's screen, and work on the user's computer.

ASM (PN)~ An add-on module for Antigen, used to minimize the number of spam e-mail messages that enter the Exchange environments.

ASMX file (n)~ A file that represents the addressable entry point for XML Web services created with managed code. Web service consumers utilize the functionality of a Web service by accessing its ASMX file.

ASN (n)~ A business document that documents the notification of the shipment of product.

ASP (n)~ An organization that delivers a contractual service to deploy, host, manage, and provide access to an application from a facility other than the customer's site.

ASP (n)~ A Web-oriented technology developed by Microsoft that is designed to enable server-side scripting.

ASP buffering (n)~ A functionality of Active Server Pages (ASP) that temporarily stores all output that is generated by a script until script execution is complete and then sends the output to a client.

ASP.NET (PN)~ A set of technologies in the Microsoft .NET Framework for building Web applications and XML Web services. ASP.NET pages execute on the server and generate markup (such as HTML, WML, or XML) that is sent to a desktop or mobile browser. ASP.NET pages use a compiled, event-driven programming model that improves performance and enables the separation of application logic and user interface. ASP.NET pages and XML Web services files created using ASP.NET contain server-side (rather than client-side) logic written in Visual Basic .NET, C# .NET, or any .NET-compatible language. Web applications and XML Web services take advantage of the features of the common language runtime, such as type safety, inheritance, language interoperability, versioning, and integrated security.

ASP.NET application services database (n)~ In ASP.NET, a database that stores the data for several ASP.NET application services, including membership, Web Parts personalization, roles, and profiles. The database can be a local database in the Web site's App_Data folder or a SQL Server or other database, depending on how the site is configured.

ASP.NET controls (n)~ Components that run on an ASP.NET-compatible server and encapsulate user-interface and other related functionality. They are used in ASP.NET pages and in ASP.NET code classes.

ASP.NET Development Server (PN)~ The web server that ships with Visual Studio.

ASP.NET Master Page (n)~ An ASP.NET-based templating feature available in ASP.NET 2.0 and later.

ASP.NET mobile control (n)~ One of a set of ASP.NET controls designed for mobile Web applications. ASP.NET mobile controls extend their ASP.NET server control counterparts.

ASP.NET mobile Web Forms (n)~ An extension to the ASP.NET Web Forms framework that targets mobile devices from cell phones to Pocket PCs.

ASP.NET page (n)~ A component of an ASP.NET application.

ASP.NET server control (n)~ A server-side component that encapsulates user-interface

and related functionality. An ASP.NET server control derives directly or indirectly from the System.Web.UI.Control class. The superset of ASP.NET server controls includes Web server controls, HTML server controls, and ASP.NET mobile controls. The page syntax for an ASP.NET server control includes a runat=server' attribute on the control's tag.'

ASP.NET Universal Providers (PN)~ A package of unified data-provider classes that support session, membership, roles, and profile properties in all versions of SQL Server 2005 and later, including SQL Server Compact Edition and SQL Azure.

ASP.NET Web API (PN)~ A framework that lets developers use the .NET Framework to build HTTP services (for example, RESTful applications) that reach a broad range of clients, including browsers and mobile devices.

ASP.NET Web application (n)~ An application that processes HTTP requests (Web requests) and executes on top ASP.NET. An ASP.NET Web application can include ASP.NET pages, XML Web services, HTTP handlers, and HTTP modules.

ASP.NET Web Pages (PN)~ A framework for developing dynamic Web pages that is based on Microsoft ASP.NET technology, in which code that runs on the server dynamically generates Web page output to the browser or client device.

aspect (n)~ A way to group events into incident groups. Aspects include: application failures, connectivity, performance, and security failures.

aspect (n)~ The width-to-height ratio of a video or still image, or of the screen on which an image is displayed.

aspect ratio (n)~ The width-to-height ratio of a video or still image, or of the screen on which an image is displayed.

aspect value (n)~ The x-height of a font divided by the font size. The aspect value indicates the relative legibility of a font for a given font size. A higher aspect ratio indicates that a font is more legible.

ASPM (n)~ A power-saving mode which reserves power by ensuring efficient execution of computing tasks and by reducing the number of components running unnecessarily when not actually in use.

ASPX (n)~ The standard file format used for ASP pages written with ASP.NET.

ASR (n)~ Technology that allows machines to recognize and respond to human voice commands.

ASR (n)~ A feature that helps you recover a system that will not start.

assemble (v)~ To put together for sale or use an item composed of component parts.

assembler (n)~ A pipeline component that combines individual documents into a batch. Assembler pipeline components provided in BizTalk Server are Flat file assembler, BizTalk Framework Assembler, and XML Assembler pipeline components.

assembler (n)~ A program that converts assembly language programs, which are understandable by humans, into executable machine language.

assembly (n)~ A collection of one or more files that are versioned and deployed as a unit.

assembly (n)~ The act of putting an item together.

assembly (n)~ A managed application module containing class metadata and managed code as an object in SQL Server, against which CLR functions, stored procedures, triggers, user-defined aggregates, and user-defined types can be created in SQL Server.

assembly cache (n)~ A machine-wide code cache used for side-by-side storage of

assemblies. There are two parts to the cache: the global assembly cache contains assemblies that are explicitly installed to be shared among many applications on the computer; the download cache stores code downloaded from Internet or intranet sites, isolated to the application that triggered the download so that code downloaded on behalf of one application/page does not impact other applications.

assembly file (n)~ A file that is part on an assembly.

assembly item (n)~ A group of inventoriable items to be sold as a new item.

assembly list (n)~ A content of a kit item that may consist of one or more components (that are raw materials, regular sellable items, or kit items), resources, and text comments.

assembly management (n)~ A feature to manage the creation of sellable items from other sellable items using nonproduction resources.

assembly manifest (n)~ An integral part of every assembly that renders the assembly self-describing. The assembly manifest contains the assembly's metadata. The manifest establishes the assembly identity, specifies the files that make up the assembly implementation, specifies the types and resources that make up the assembly, itemizes the compile-time dependencies on other assemblies, and specifies the set of permissions required for the assembly to run properly. This information is used at run time to resolve references, enforce version binding policy, and validate the integrity of loaded assemblies. The self-describing nature of assemblies also helps makes zero-impact install and XCOPY deployment feasible.

assembly metadata (n)~ Metadata that is part of the assembly manifest.

assembly order (n)~ A supply order that represents a request to fulfill demand for an assembly item by picking items on the assembly BOM or modified on the order and assembling them.

assembly-qualified name (n)~ The name of a type that includes the name of the assembly from which the type was loaded.

assembly-qualified type name (n)~ The name of a type that includes the name of the assembly from which the type was loaded.

assert statement (n)~ A Boolean statement used in a program to test a condition that, if the program is operating correctly, should always evaluate as true; otherwise the program will typically terminate with an appropriate error message. Assertions are used for debugging programs and for documenting how a program should operate.

assertion failure (n)~ The inability of a condition to hold true at some particular point in a program. When a condition does not hold true, execution of the program is interrupted, and a dialog box or message may appear.

assertion statement (n)~ A Boolean statement used in a program to test a condition that, if the program is operating correctly, should always evaluate as true; otherwise the program will typically terminate with an appropriate error message. Assertions are used for debugging programs and for documenting how a program should operate.

assess (v)~ To evaluate a Windows computer by using the Windows Assessment Toolkit that is included in the Windows Assessment and Deployment Kit (ADK).

assessment (n)~ Collection of binaries, scripts, configuration parameters, and manifest files used to perform measurements on a computer or Windows image and to report results.

assessment manifest (n)~ The XML file that describes the content and function of an assessment for use with the Assessment Platform.

Assessment Platform (PN)~ A platform that developers can use to write and manage system and component tests. Assessment Platform provides a unified testing experience and standardized infrastructure to discover, manage, configure, and execute targeted tests; view, analyze, and remediate results; and develop additional tests.

assessment setting (n)~ A setting that the user can edit in a job, but that the assessment manifest does not retain in its parameters.

Assessment Toolkit (PN)~ A toolkit that helps you determine the quality of a running operating system or a set of components with regard to performance, reliability and functionality. The toolkit includes several assessments and provides the tools needed to run assessments on a local computer or on multiple computers, and review the results of the assessments to diagnose problems and determine how to make improvements.

asset (n)~ Anything owned or controlled by a business, tangible or intangible, that has monetary value and was acquired at a measurable cost.

asset (n)~ The abstract or concrete resources that a system must protect from misuse by an adversary.

asset (n)~ An entity that can be added to your project, such as an image file, sound file, movie file, markup file, code file, font file, 3D object, control, style resource, template resource, brush resource, and so on.

asset (n)~ An accounting classifier used to classify the value of economic resources that are owned by a party.

asset (n)~ A unit of media programming, such as a television program, a movie, or a digital music track, that are delivered to a subscriber in exchange for on-demand fees or subscription fees. Assets are usually files that are stored on a media server.

Asset (n)~ A specific instance of a Product that is tracked by a unique identification number (Serial Number).

asset (n)~ An entity contains digital files (including video, audio, images, thumbnail collections, text tracks and closed caption files) and the metadata about these files.

asset book (n)~ Accounting records (ledgers or journals) for a specific reporting purpose, such as financial or taxes.

asset group (n)~ A collection of assets that share one or more specific characteristics.

Asset Intelligence (PN)~ A Configuration Manager feature that allows administrators to inventory and manage software license usage throughout their enterprise.

Asset Intelligence catalog (n)~ A Configuration Manager catalog that contains categorization and identification information for software titles and versions, which is used to classify inventoried software.

Asset Intelligence Knowledge Base (PN)~ A part of the Asset Intelligence feature that is used to produce new reports that identify and categorize deployed hardware and software assets.

Asset Intelligence synchronization point (n)~ A Configuration Manager site system role that connects to System Center Online to download Asset Intelligence catalog information and upload uncategorized titles so that they can be considered for future inclusion in the catalog.

Asset Inventory Service (PN)~ A Web-based service that collects and displays information about an enterprise's desktop software environment. AIS collects information about programs installed on computers in the enterprise that have the AIS client software installed. AIS is part of the Microsoft Desktop Optimization Pack (MDOP) for Software Assurance.

Asset Library (PN)~ A library that provide content types with common properties, and enhanced views to find and preview rich media, also called digital assets.

asset library (n)~ A library that provide content types with common properties, and enhanced views to find and preview rich media, also called digital assets.

Asset Manager (n)~ A security role that grants permissions to administrative users so that they can manage the Asset Intelligence synchronization point, Asset Intelligence reporting classes, software inventory, hardware inventory, and metering rules.

assign (v)~ To fix or specify in correspondence or relationship.

assign (v)~ To specify the owner of a record, such as an account or case, or an activity, such as an e-mail message or phone call. Users can assign cases and activities to either a user or a queue.

assign (v)~ To tie a configuration object to a resource; for example, one would assign custom setting to a collection, assign a configuration baseline to a collection, or assign a client to a site.

assign (v)~ To designate an object for a particular use or purpose.

Assigned (adj)~ An assignment type meaning that the user or group has been granted access at the node in the resource hierarchy that the user is looking at (such as at a particular website or resource group).

assigned access (PN)~ A feature that allows a system administrator to manage the user's experience by limiting application entry points exposed to the user of the device.

Assigned At (adj)~ The node in the resource hierarchy where access was granted.

assigned configuration (n)~ The resources contained in the device node that are allocated for the device. For Plug and Play cards, the assigned resources for a device can change dynamically or from one system start-up to the next.

assigned management point (n)~ The default management point at the assigned primary site for the Configuration Manager client.

assigned program (n)~ A program that has been advertised to a collection and is mandatory to run.

assigned site (n)~ A site to which a Configuration Manager client is currently assigned.

assigned task (n)~ A task that has been sent to someone as a task request in an e-mail message. When you assign a task, you give up ownership of it (unless the assignee declines it). The assigner can receive status reports for the task.

Assigned To (adj)~ The principal (user or group) to whom access has been assigned.

assigned user (n)~ A user, who can inherit the access permissions of a certain role, after performing all necessarily authNZ activities.

assignment (n)~ A process-related task that is delegated to a particular user.

assignment (n)~ A unit of work that a student is expected to complete.

assignment (n)~ A designation that forms an association among objects.

assignment action (n)~ An action that a user can perform on an assignment in the Add-in

for Excel, such as Submit Draft, Submit Final, or Approve.

assignment delay (n)~ The amount of time between the scheduled start of a task and the time that the assigned resource is to start working on the task.

assignment owner (n)~ An enterprise resource who is responsible for entering progress information in Project Web Access. This person can be different than the person initially assigned to the task.

assignment pane (n)~ In PerformancePoint Add-in for Excel, the pane that is used to open assignments, view assignment details, and access process scheduling actions such as save and submit.

assignment statement (n)~ A programming language statement used to assign a value to a variable. It usually consists of three elements: an expression to be assigned, an assignment operator (typically a symbol such as = or :=), and a destination variable. On execution of the assignment statement, the expression is evaluated and the resulting value is stored in the specified destination.

assignment units (n)~ The percentage of a work resource's time, or units, that the resource is assigned to a task.

assignment view (n)~ A view that shows the resources assigned to each task as well as the total and timephased work and cost information for each assignment. The two assignment views are the Task Usage and Resource Usage views.

Assignments (PN)~ A Web Part that displays a list of relevant assignments. For educators, the list includes active assignments for which grades have not yet been posted. For students, the list includes upcoming assignments and their due dates.

Assistant object (n)~ The Assistant is the shared Microsoft Office Assistant object. It is a fully programmable object.

assistant shape (n)~ In an organization chart, a shape that is placed below and connected to any other shape with an elbow connector. This shape is placed above any additional subordinate shapes for the particular superior shape it is attached to.

assisted service (n)~ A service for which an employee requires assistance from another person, such as a call center.

assistive technology (n)~ Technology that provides enhancements to other technology so that people with disabilities can use it.

Assistive Technology Program (n)~ A service that provides recommendations for technology that can help people with disabilities.

associate (v)~ To link a document, file, task, or link with a To Do.

associate (v)~ To connect peer objects.

Associate a different document (v)~ An option that allows the user to replace the document currently attached to the To Do with another document that has already been saved.

Associate a different Web site link (v)~ An option that allows the user to replace the Web link attached to the To Do with a different web link.

Associate a different Works task (v)~ An option that allows the user to change the document associated with the active To Do by selecting a different Works template to serve as the basis for a new associated item.

Associate a document (v)~ An option that allows the user to associate an existing

document with a Project To Do.

Associate a Web link (oth)~ An option that allows the user to associate a Web site link with a Project To Do.

Associate a Works task (v)~ An option that allows the user to associate a Works task with a Project To Do.

Associate Child Cases (PN)~ An option on the command bar where you can select cases, and then specify which case will be the parent case to the other cases you selected.

associate enterprise (n)~ An enterprise that is directly or indirectly involved in the management or control of another enterprise.

Associate to Contact (oth)~ In a conference, this command associates a participant or phone number with a contact on the user's contact list.

associated item (n)~ A document, file, task, or link that has been associated with a To Do.

associated PivotTable report (n)~ The PivotTable report that supplies the source data to the PivotChart report. It is created automatically when you create a new PivotChart report. When you change the layout of either report, the other also changes.

associated view (n)~ The view of an entity that is displayed in the forms of other entities.

association (n)~ The mapping of a file extension (for example, .mp3) or protocol (for example, http) to a programmatic identifier (ProgID). This mapping is stored in the registry as a per-user setting with a per-computer fallback. Applications that participate in the Default Programs system set the association mapping for the file extension or protocol to point to the ProgID keys that they own.

association (n)~ In PerformancePoint Planning Business Modeler, the relationship between a source model and a destination model for the purpose of manipulating the arrangement of interpretive data and aggregating the corresponding numerical measurements.

association (n)~ The definition of a relationship between entity types.

association (n)~ The link between a collection and a deployment.

association (n)~ A relationship between peer objects.

association array (n)~ An ordered list of registry locations used to store information about an item type, including handlers, verbs, and other attributes like the icon and display name of the type.

association class (n)~ A class that describes a relationship between two classes or between instances of two classes. The properties of an association class include pointers, or references, to the two classes or instances.

association end (n)~ The end of a binary or other association where it connects to a class. By associating properties with an association end, you can indicate the role or direction.

Association Française de Normalisation (n)~ The French subsidiary of the International Standards Organization (ISO).

Association Française de Normalisation certification (n)~ A certification that accounting software is legally compliant with French legislation for electronic accounting.

association line (n)~ A line leading from a field or property to a shape that represents that field or property's type.

association set (n)~ A logical container for instances of associations of the same type.

AssociationRole (n)~ A type of collaboration role that describes the relationship between

two ClassifierRoles. It is represented by a path between two class role elements and can include the underlined name of the corresponding association.

associative array (n)~ A data structure that carries out a mathematical calculation on a field identifier to determine where a data element in a large table or index is located.

associative array (n)~ An array composed of a collection of keys and a collection of values, where each key is associated with one value. The keys and values can be of any type.

assumption (n)~ Baseline data that apply throughout a business or to a financial model.

Assured Forwarding (PN)~ A class for the delivery of video media streams.

ASTA (n)~ A single-threaded apartment the thread of which is the core UI thread for an application window.

asterisk (n)~ The * character. Indicates multiplication in programming languages and also serves as a wildcard character representing one or more characters.

ASTERISK (n)~ The * character. Indicates multiplication in programming languages and also serves as a wildcard character representing one or more characters.

ASX (n)~ A format that is commonly used to deliver digital media to clients (Windows Media Player and Silverlight).

asymmetric algorithm (n)~ An asymmetric cipher that uses two keys, one for encryption, the public key, and the other for decryption, the private key. As implied by the key names, the public key used to encode plaintext can be made available to anyone. However, the private key must remain secret. Only the private key can decrypt the ciphertext. The public key algorithm used in this process is slow (on the order of 1,000 times slower than symmetric algorithms), and is typically used to encrypt session keys or digitally sign a message.

asymmetric encryption (n)~ A method of encryption that uses a pair of mathematically related keys: a public key and a corresponding private key. Either key can be used to encrypt data, but the corresponding key must be used to decrypt it.

asymmetric key algorithm (n)~ A method of encryption that uses a pair of mathematically related keys: a public key and a corresponding private key. Either key can be used to encrypt data, but the corresponding key must be used to decrypt it.

asynchronous (adj)~ Pertaining to, being, or characteristic of something that is not dependent on timing. Each application or command runs in the specified order, but the specified item does not wait for any previously started processes to finish before an application or command runs.

asynchronous agent (n)~ A task that follows the actor pattern and uses an asynchronous message queue to communicate with other similar tasks. Agents let you take advantage of coarse-grained task parallelism in your applications.

asynchronous call (n)~ A method call that returns to the caller immediately regardless of whether processing has completed. The results of processing are returned through another call on another thread. Asynchronous methods free the caller from having to wait until processing has finished.

asynchronous communication (n)~ A form of data transmission in which information is sent and received at irregular intervals, one character at a time. Because data is received at irregular intervals, the receiving modem must be signaled to let it know when the data bits

of a character begin and end. This is done by means of start and stop bits.

asynchronous communication layer (n)~ The layer of AJAX functionality that takes care of communication between the browser and the server.

asynchronous data exchange (n)~ A style of processing where an application posts a request for an event to occur and then continues without waiting for the event. A separate service will recognize the request and take responsibility for ensuring that the event occurs.

asynchronous device (n)~ A device whose internal operations are not synchronized with the timing of any other part of the system.

asynchronous event (n)~ An event whose handler runs in a different processing thread from the action that raised the event. The event handler and the action are processed simultaneously.

Asynchronous JavaScript And XML (PN)~ A set of technologies consisting of a client-side script framework, server controls, and more.

asynchronous method call (n)~ A method call that returns to the caller immediately regardless of whether processing has completed. The results of processing are returned through another call on another thread. Asynchronous methods free the caller from having to wait until processing has finished.

asynchronous operation (n)~ A process whose execution can proceed independently or in the background. Other processes may be started before the asynchronous process has finished.

asynchronous pattern (n)~ A core technology in the .NET Framework which provides an efficient model to manage asynchronous operations and a consistent programming model.

asynchronous postback (n)~ In ASP.NET, the process of sending Web page data (plus viewstate and other necessary metadata) from the browser to the server without a complete postback and without blocking the user from continuing to work in the page. Asynchronous postbacks are an important feature of AJAX technology.

asynchronous procedure call (n)~ A function call that executes separately from an executing program when a set of enabling conditions exist. After the conditions have been met, the operating system's kernel issues a software interrupt and directs the executing program to execute the call.

asynchronous transfer mode (n)~ A high-speed, connection-oriented, virtual circuit-based packet switching protocol used to transport many different types of network traffic. ATM packages data in 53-byte, fixed-length cells that can be switched quickly between logical connections on a network.

At Least N Matches (oth)~ A menu item that allows the user to search for any pattern A that is represent in pattern B at least n times. Patterns could be strings, characters, etc.

At Most N Matches (oth)~ A menu item that allows the user to search for any pattern A that is represent in pattern B at most n times. Patterns could be strings, characters, etc.

at sign (n)~ The separator between account names and domain names in Internet e-mail addresses.

Athlon (PN)~ Family of x86-compatible processors introduced by Advanced Micro Devices, Inc. (AMD) in 1999. Athlon, which was code-named AMD-K7, is a successor to the AMD-K6 family. Comparable to upper-end Intel Pentium III processors in

performance, Athlon is distinguished by over 22 million transistors; a fully pipelined, superscalar floating-point engine, which enhances performance of graphics and multimedia programs, Internet streaming applications, and games; a 200-MHz system bus; and a 128-KB L1 cache. Although the L2 cache is 512 KB in size, the Athlon can support L2 cache sizes up to 8 MB. The first Athlon releases featured clock speeds of 500 to 650 MHz; 800-MHz and faster versions are now available. Athlon, which runs 32-bit programs, is compatible with most PC operating systems, including Microsoft Windows, Linux, OS/2 Warp, and NetWare.

ATL (n)~ A set of compact, template-based C++ classes that simplify the programming of Component Object Model objects. ATL provides the mechanism to use and create COM objects.

ATL Pipeline Component Wizard (n)~ A Visual C++ wizard that uses ATL and additional templates to facilitate the development of pipeline components.

ATL server (n)~ A server that houses an Active Template Library.

ATM (n)~ A high-speed, connection-oriented, virtual circuit-based packet switching protocol used to transport many different types of network traffic. ATM packages data in 53-byte, fixed-length cells that can be switched quickly between logical connections on a network.

ATM (n)~ A special-purpose terminal that bank customers can use to make deposits, obtain cash, and perform other transactions.

ATM adaptation layer (n)~ The layer of the asynchronous transfer mode (ATM) protocol stack that parses data into the payload portion of the ATM cell for transport across an ATM network.

Atom (PN)~ A Web content and metadata syndication format based on XML that describes feeds.

atom (n)~ A 16-bit integer that provides access to a string that has been placed in an atom table by an application.

atom feed (n)~ An XML structure that contains metadata about content, such as the language version and the date when the content was last modified, and is sent to subscribers by using the Atom Publishing Protocol (AtomPub).

atom name (n)~ A string that has been placed in an atom table.

atom table (n)~ A system-defined table that stores strings and corresponding identifiers.

atomic (adj)~ Pertaining to an operation where all the transaction data modifications must be performed; either all of the transaction data modifications are performed or none are performed.

atomic (adj)~ Pertaining to a threading or multiprocessing operation that is performed in a single, uninterruptable step. Operations that are atomic do not require a threading synchronization device such as a critical section, mutex, or semaphore.

atomic orchestration (n)~ A short-lived transaction that enforces the commit and rollback semantics of an ACID (Atomicity, Consistency, Isolation and Durability) transaction similar to a COM+ application that uses the DTC service.

atomicity (n)~ A feature of a transaction that indicates that either all actions of the transaction happen or none happens.

atomicity, consistency, isolation, durability (n)~ The four essential properties of an

electronic transaction. Atomicity requires that a transaction be fully completed or else fully canceled. Consistency requires that resources used are transformed from one consistent state to another. Isolation requires all transactions to be independent of each other. Durability requires that the completed transaction be permanent, including survival through system failure.

ATP (adj)~ The portion of inventory that is not allocated and which can be used to fulfill new orders and requirements.

ATR string (n)~ A sequence of bytes returned from a smart card when it is turned on. These bytes are used to identify the card to the system.

attach (v)~ To include an external document, a file, or an executable program with an e-mail message.

attach (v)~ To expose a virtual disk to the user, backed by a file.

attached (adj)~ Pertaining to being physically connected to a system. A device can be installed without being attached.

attached document (n)~ An ASCII text file or a binary file, such as a document created in a word processing system, that is included with an e-mail message as an attachment.

attached event (n)~ A routed event that can be attached to any ContentElement or UIElement type and that is not limited to the type which defines it.

attached property (n)~ A property that is defined by XAML. An attached property can be set on any object, not just on the type that defines the property or its accessors. The attached property provider must provide static Get(PropertyName) and Set(PropertyName) methods as accessors for these attached properties.

attachment (n)~ An external file included with an e-mail message.

Attachment (n)~ A data type that will provide support for storing binary files within an Access database. More similar to the SharePoint concept of attachments than the current OLE object fields in Access. The data will be stored as a raw blob within the database.

Attachment ~ A file sent by- email- is 'attached' to the email. An attachment can be a picture, a document, a program or any other type of file. You should never open an attachment if you are not sure what it is, because some- viruses- propagate as email attachments; but they can't infect your machine if you don't open the attachment.

attachment link (n)~ A Team Foundation link between a work item and a file attachment.

Attachment Previewer (n)~ An application that is used to open an attachment for Attachment Previewing.

Attachment Previewing (n)~ A feature that allows users to see and interact with E-mail messages and their attachments side by side in the reading pane.

Attachment Reminder (n)~ A feature that alerts the user before an email message is sent if it detects that an attachment may have been omitted from the message.

attachment table (n)~ A Table object whose rows represent the Attachment objects that are attached to a Message object.

attendant console (n)~ A console for call handling.

attendee (n)~ A meeting participant who cannot initiate desktop or application sharing or presenting. Attendee permissions are controlled by the organizer and presenters.

attendee key (n)~ A meeting key that is used by attendees to join a meeting.

attendee permissions (n)~ Permissions that control how attendees can participate in the

meeting and that only presenters can change.

Attendee/Recipient List (PN)~ A special control that shows pictures, names and titles of people who are attending a meeting, or who are the recipients of an e-mail message.

Attendees pane (n)~ A client element that displays the list of participants for a Live Meeting session.

attention (n)~ Text that alerts a user to a note or a warning.

attenuation (n)~ The weakening of a transmitted signal, such as the distortion of a digital signal or the reduction in amplitude of an electrical signal. Attenuation is usually measured in decibels and is sometimes desirable, as when signal strength is reduced electronically, for example, by a radio volume control, to prevent overloading.

attenuation (n)~ The weakening of a transmitted signal, such as the reduction in the brightness of light, as it travels farther from its source.

attestation (n)~ The process of verifying that a computer is really the computer it claims to be, and is running the software it claims to be running.

attestation identity key (n)~ The cryptographic representation of the hardware or software state and other integrity metrics, and which can be used to perform anonymous or pseudo-anonymous attestations to remote parties in multiparty transactions.

attorney-client privilege (n)~ A legal doctrine that is intended to protect the confidentiality of communications between an attorney and his or her client. The underlying rationale is that by assuring confidential communications, lawyers and their clients will feel free to discuss sensitive legal matters thoroughly.

attract application (n)~ An application that appears when a Surface unit enters Attract Mode. An attract application is similar to a screen saver that is touch-sensitive. By default, Surface units include the Water attract application.

Attract Mode (PN)~ The mode that a Surface unit enters when the unit is not being used. Attract Mode is designed to attract users to the unit, entice them to interact with the unit, and then access Launcher through the access points.

attribute (n)~ In screen displays, an element of additional information stored with each character in the video buffer of a video adapter running in character mode. Such attributes control the background and foreground colors of the character, underlining, and blinking.

attribute (n)~ A characteristic of an object.

attribute (n)~ The name or structure of a field in a database entity. For example, the LASTNAME, FIRSTNAME, and PHONE are attributes of each record in a PhoneList entity. The size of a field and the type of information it contains are also attributes of a database record.

attribute (n)~ For files, information that indicates whether a file is read-only, hidden, ready for archiving (backing up), compressed, or encrypted, and whether the file contents should be indexed for fast file searching.

attribute (n)~ A single characteristic or additional piece of information (financial or non-financial) that exists in a database.

attribute (n)~ In markup languages such as SGML, HTML, and XML, a name-value pair within a tagged element that describes data or the formatting or properties of data associated with that element.

attribute (n)~ A descriptive declaration that can be applied to programming elements such

as types, fields, methods, and properties.

attribute (n)~ In a computing system, an inherent characteristic of the hardware and software of a Windows computer. Such characteristics can be enumerated, but do not need to be measured. Examples are memory (RAM) and storage size.

attribute category (n)~ A classification of dimension values that is used to summarize transaction data.

attribute class (n)~ A container object that groups related attributes within an object type.

attribute collection (n)~ The sum of attributes gathered during the attribute discovery process.

attribute definition table (n)~ A table of attribute names, numbers and descriptions.

attribute discovery (n)~ A process through which the attributes, such as the operating system, of a computer are gathered.

Attribute Dropper (PN)~ A tool that lets you copy the fill, stroke, and effect attributes from one object on the page to another.

attribute field (n)~ A field in the data source that can contain data and that is an attribute, instead of an element. Attribute fields cannot contain other fields.

attribute filter (n)~ In a column definition, the list of attributes that limit the data that is available for a report.

attribute flow (n)~ An authoritative source for an attribute value that can flow its value to other destination directories and systems.

Attribute flows (n)~ A mapping of an attribute in one directory to an attribute in another directory so that values of the attribute in the first directory can flow to values of the attribute in the other.

attribute hierarchy (n)~ A flat hierarchy (typically having an All level and a member level) containing a single attribute. It is created from one column in a dimension table, if supported by the cube.

attribute instance (n)~ An occurrence of an attribute that is defined in the schema.

attribute relationship (n)~ The hierarchy associated with an attribute containing a single level based on the corresponding column in a dimension table.

attribute type (n)~ The type of information contained by an attribute, such as quarters or months in a time dimension, which may enable specific treatment by the server and client applications.

attribute value (n)~ The value of an object or text feature a user can manipulate by using drawing tools and menu commands.

AU East (PN)~ The Australia East region within the Azure region taxonomy.

AUD (n)~ The official currency of Australia.

audience (n)~ A custom group used to target content to people based on membership within the group.

audience (n)~ Facebook users other than the Facebook page account. These are users that interact with a Facebook page by commenting on posts that are made by the Facebook page account, by commenting on another other user's post on a Facebook page, and posting on a Facebook page.

Audience Activity (PN)~ The number of comments and posts made by Facebook users on Facebook pages.

audience compilation (n)~ The process of evaluating a set of user profile entities with an audience rule to determine which user profile entities are members of the audience.

audience identifier (n)~ A GUID or string that is used to uniquely identify an audience.

audience rule (n)~ A set of logical conditions that determine whether a user profile can be a member of an audience.

audio (adj)~ Relating to frequencies within the range of perception by the human ear - from about 15 to 20,000 hertz (cycles per second).

audio (n)~ Sound within the range of perception by the human ear — from about 15 to 20,000 hertz (cycles per second).

audio (n)~ A file containing digitized audio, such as voice or music.

Audio and Video Tuning Wizard… (n)~ An item on the Tools menu (in a Conversation window) or Actions menu (in the main Communicator window) that runs a wizard that helps the user verify that the camera, speakers, and microphone are working properly on the user's computer.

audio board (n)~ A type of expansion board on PC-compatible computers that allows the playback and recording of sound, such as from a WAV or MIDI file or a music CD-ROM. Most PCs sold at retail include a sound card.

audio book (n)~ A book that has been read and recorded on cassette tape, CD or digital format.

audio call (n)~ A call for transmitting audio data, including but not limited to speech.

audio call (n)~ A Skype call where only audio is used (without video).

audio card (n)~ A type of expansion board on PC-compatible computers that allows the playback and recording of sound, such as from a WAV or MIDI file or a music CD-ROM. Most PCs sold at retail include a sound card.

audio CD (n)~ A compact disc containing audio information (as opposed to a CD-ROM containing data and files).

audio challenge (n)~ A type of Human Interaction Proof challenge, which plays an audio file decipherable only by a person. The audio file might seem faint or mixed with background voices and noise. This is intentional to ensure a person, not an automated program, completes the HIP challenge.

audio codec (n)~ The digital encoding used to represent audio data.

audio conference (n)~ The audio portion of a meeting. The audio can be provided through a telephone conferencing service or by using Voice over Internet Protocol (VoIP) technology.

audio conference line (n)~ The bridge line that participants call to hear the audio portion of a Live Meeting session.

audio conferencing partner (n)~ An audio conference service that is chosen by an organizations's conference center to integrate client functions with its Live Meeting service.

audio conferencing profile (n)~ Audio settings for a user that are associated with a telephone conferencing provider or with an audio-video conferencing server.

audio conferencing provider (n)~ A third-party organization that provides audio conferencing services over public switched telephone network (PSTN).

Audio Controls (n)~ An item on the View menu that displays the toolbar of controls for

audio calls. Audio Controls include a Call menu for the currently selected person, microphone and speaker controls, Mute, Hang Up, and Transfer buttons.

Audio Controls (n)~ A button in a conversation window that displays Audio Controls in the current conversation window. Audio Controls contain Call, Hang Up, Hold, Transfer, Dial Pad, Mute Microphone, Mute Speakers, and microphone and speaker volume control buttons.

audio device (n)~ A hardware device capable of reproducing sound.

audio file (n)~ A file containing digitized audio, such as voice or music.

audio frame (n)~ One of the smaller parts (with their own headers and audio information) that make up an audio file.

audio input device (n)~ An audio input device records music and voice input into your computer. Examples of audio input devices are CD-ROM players and microphones.

audio mixing (n)~ The process of combining multiple streams of audio data into a single stream.

audio output (n)~ Any sound produced by a computer; specifically, spoken output produced by a computer in response to some specific type of input. Such output may be generated using a combination of words from a digitized vocabulary or through the synthesis of words from tables of phonemes.

audio prompt (n)~ An audio cue to the user to begin recording audio data.

audio provider (n)~ A third-party organization that provides audio conferencing services over public switched telephone network (PSTN).

Audio Repackager (PN)~ A component responsible for breaking audio source samples into small buffer chunks ready to be consumed by the audio queue.

audio response (n)~ Any sound produced by a computer; specifically, spoken output produced by a computer in response to some specific type of input. Such output may be generated using a combination of words from a digitized vocabulary or through the synthesis of words from tables of phonemes.

audio stream (n)~ Audio data that is delivered in a continuous flow across a network.

audio style (n)~ A combination of audio playback options that are identified by a style name. This allows you to configure playback with a single click.

Audio Test service (n)~ A built-in tool whereby a test call can be made before the actual call is. This ensures that there aren't any severe network or other issues that could affect call quality.

Audio toolbar (n)~ A Live Meeting client toolbar for performing audio tasks during a Live Meeting session.

audio track (n)~ An individual song or other discrete piece of audio content.

audio type (n)~ One of the encoding formats for audio files, for instance Advanced Audio Coding (MP4), AIFF and WAV.

Audio Video Interleaved (n)~ A Microsoft Windows multimedia file format for sound and videos that uses the Microsoft Resource Interchange File Format (RIFF) specification.

audio waveform (n)~ A visual representation of an audio signal over time.

Audio/Video Conferencing Server (n)~ A server running Lync Server or Office Communications Server that mixes and manages audio and video inputs from multiple sources for multiparty audio and video conferences.

audit (n)~ In CMMI process-improvement work, an independent examination of a work product or set of work products to determine whether requirements are being met.

audit (n)~ To track changes in entities and fields as required.

Audit and Control Management Server (PN)~ A Microsoft Office product that provides non-intrusive auditing of changes made to Excel spreadsheets and Access databases, and supports alerts, notifications and automatic workflows based on user activities such as macro or formula changes.

Audit Collection Services (PN)~ A service that collects and forwards all security events from monitored computers to a central database.

Audit Collection Services database (oth)~ The database in which Audit Collection Services stores all the security events that it collects from monitored computers.

audit diagram (n)~ A type of diagram used to document and analyze processes such as financial transactions and inventory management.

audit history (n)~ Information maintained about the history of an item, including all reading and editing sessions.

audit log (n)~ The SQL Server database in which Microsoft Provisioning Framework (MPF) stores data about successful and failed transactions for which auditing is enabled.

audit logging (n)~ The process of recording specific actions performed by targeted users.

audit mode (n)~ The stage of the preinstallation process used to test a manufactured computer before it is delivered to the end user.

audit policy (n)~ A policy that determines the security events to be reported to the network administrator.

audit trail (n)~ A time-stamped record of all the changes that users make to a record. An audit trail also contains the name and identification of the user who made the change, and typically includes the reason for the change.

auditing (n)~ The process an operating system uses to detect and record security-related events, such as an attempt to create, to access, or to delete objects such as files and directories. The records of such events are stored in a file known as a security log, whose contents are available only to those with the proper clearance.

auditor (n)~ A third-party independent organization or individual who conducts formal examinations and verifies measurements through a process of reviews.

Auditorium Place (n)~ A Live Meeting session type that is designed for large, structured meetings.

AUP (n)~ A statement issued by an online service that indicates what activities users may or may not engage in while logged into the service. For example, some providers prohibit users from engaging in commercial activity on the network.

auth method (n)~ The authentication protocol (such as CHAP, PAP, EAP etc.) used when authenticating access to resources on a network.

Authentic, Energetic, Reflective, and Open (oth)~ The visual experience of the premium Windows Vista editions. Windows Aero builds on the Basic and Standard user experiences to offer customers our best-designed, highest-performing desktop environment. A noticeable element of the new Windows Aero experience is the professional-looking, transparent glass design, which creates an open, lightweight environment but more importantly enables users to focus on their content rather than the

interface.

authenticated access (n)~ A user access option that you specify at the default Web site level or Application level in IIS. Authenticated access requires a user to have a valid account and password to access the site.

authenticated denial of existence (n)~ The authentication of a DNS query for a record that does not exist.

Authenticated Internet Protocol (PN)~ A protocol extension to Internet Key Exchange (IKE) that supports additional authentication mechanisms and the combination of user and computer authentication requirements.

Authenticated IP (PN)~ A protocol extension to Internet Key Exchange (IKE) that supports additional authentication mechanisms and the combination of user and computer authentication requirements.

authenticated users only meeting (n)~ A meeting in which all participants have Active Directory credentials and connect from either inside or outside the corporate firewall.

authentication (n)~ The process of verifying the identity of a user, computer, device, process, or other entity by validating the credentials provided by the entity. Common forms of credentials are digital signatures, smart cards, biometric data, and a combination of user names and passwords.

authentication (n)~ A workflow that is used to perform additional user identity validation before continuing with the request.

authentication assurance (n)~ A Windows Server feature that provides the ability to determine which logon method was used by a user from his Kerberos token.

authentication challenge (n)~ A dialog that requires the user to provide a response in order to authenticate to ILM -€œ2-€?.

authentication challenge activity (n)~ A Windows Workflow Foundation activity that is used to configure a challenge that will be issued to a user in order to authenticate to ILM -€œ2-€?.

authentication data (n)~ A scheme-specific block of data that is exchanged between the server and client during authentication. To prove its identity, the client encrypts some or all of this data with a user name and password. The client sends the encrypted data to the server, which decrypts the data and compares it to the original. If the decrypted data matches the original data, the client is authenticated.

authentication database (n)~ A database on a server that matches user names to passwords.

authentication delegation (n)~ A method used to authenticate a session that has been opened with the published Web site.

authentication method (n)~ The authentication protocol (such as CHAP, PAP, EAP etc.) used when authenticating access to resources on a network.

authentication method (n)~ For BitLocker Drive Encryption, a combination of one or more of the following elements, identified by a globally unique identifier (GUID): personal identification number (PIN), recovery password, recovery key, startup key, and Trusted Platform Module (TPM).

authentication option (n)~ One of multiple authentication mechanisms or settings that a user can set.

authentication package (n)~ A DLL that encapsulates the authentication logic used to determine whether to permit a user to log on. LSA authenticates a user logon by sending the request to an authentication package. The authentication package then examines the logon information and either authenticates or rejects the user logon attempt.

authentication page (n)~ A Web page presented to unauthenticated users logging on to a site requiring authentication with a Web browser.

authentication provider (n)~ The software component that provides services for authenticating security principals. For example, the implementation of RADIUS is an authentication provider.

authentication service (n)~ A service provided by an operating system or underlying subsystem (like Microsoft Internet Information Services) that provides a means to authenticate users, typically using a user name and password. Part of the general security system, authentication services can also be offered at the application layer.

authentication set (n)~ In IPsec, a collection of authentication methods that the client proposes during negotiation with the remote host.

authentication ticket (n)~ A ticket that Commerce Server creates for registered users.

Authentications (n)~ A unit of measure of the 'Basic Authentications' resource of the 'Active Directory B2C' service type of the 'Identity' service for 'Pay-As-You-Go' billing based on the number of authentications submitted.

Authentications (10s) (PN)~ The unit of measure for authentications performed in blocks of 10.

authenticator (n)~ A data structure used by one party to prove that another party knows a secret key. In the Kerberos authentication protocol, authenticators include timestamps, to prevent replay attacks, and are encrypted with the session key issued by the Key Distribution Center (KDC).

Authenticator (PN)~ The app that generates security codes that change frequently as part of two-step verification.

authenticity (n)~ The validity or correctness of a document.

Authenticode (n)~ A security feature of Microsoft Internet Explorer. Authenticode allows vendors of downloadable executable code (plug-ins or ActiveX controls, for example) to attach digital certificates to their products to assure end users that the code is from the original developer and has not been altered. Authenticode lets end users decide for themselves whether to accept or reject software components posted on the Internet before downloading begins.

AuthIP (PN)~ A protocol extension to Internet Key Exchange (IKE) that supports additional authentication mechanisms and the combination of user and computer authentication requirements.

author (n)~ The entity primarily responsible for creating the content resource (that is, the author).

author (n)~ Individual, account, or website that published a post that was stored to the application's database.

Author Lists right (n)~ A right that allows a user to add, modify, or remove items in a list, document library, discussion board, or survey.

Author Marks (PN)~ A feature that identifies the author of unread new or changed

content in a shared notebook.

Author role (n)~ A collection of rights that enables a user to view, add, and modify pages, and items in a list, document library, discussion board or survey.

authoring (n)~ The process of creating and designing content by using specialized authoring tools.

Authoring Connector (PN)~ A Microsoft Content Management Server (MCMS) feature that enables users to author, edit, and submit content from a Microsoft Word document to an MCMS Web site.

authoring pane (n)~ In PerformancePoint Add-in for Excel, the pane that is used to author forms.

authoring tool (n)~ A tool that allows an author to create, edit, manage and/or publish a content deliverable in a consistently organized fashion.

authoritative name server (n)~ A DNS server that is responsible for the DNS records that are associated with a domain.

authoritative page (n)~ A Web page that a site collection administrator has designated as more relevant than other Web pages. This is typically the URL of the home page for the intranet of an organization. The higher the authority level assigned to a page, the higher the page appears in search results. Also referred to as authoritative page.

authoritative recovery (n)~ In Backup, a type of restore operation performed on an Active Directory domain controller in which the objects in the restored directory are treated as authoritative, replacing (through replication) all existing copies of those objects.

authoritative restore (n)~ In Backup, a type of restore operation performed on an Active Directory domain controller in which the objects in the restored directory are treated as authoritative, replacing (through replication) all existing copies of those objects.

authoritative server (n)~ Pertaining to, or characteristic of, a DNS server that hosts a primary or secondary copy of a DNS zone. When a DNS server is configured to host a zone, it is said to be authoritative for names within that zone.

authoritative source (n)~ A user that has thoroughly tested and certified the software. Typically, these sources include Microsoft Corporation and independent software vendors (ISVs).

authority information access (n)~ A certificate extension that contains information useful for verifying the trust status of a certificate, as defined by the 2008 Memo of the Network Working Group. This information potentially includes Uniform Resource Locations (URLs) where the issuing CA's certificate can be retrieved, as well as a location of an Online Certificate Status Protocol (OCSP) responder configured to provide status for the certificate in question.

Authority Key Identifier (n)~ A certificate extension used by the certificate chaining engine to determine what certificate was used to sign a presented certificate. The AKI can contain the issuer name, serial number, public key information, or no information at all. By matching the information in a certificate's AKI extension to a CA certificate's Subject Key Identifier (SKI) extension, a certificate chain can be built.

authorization (n)~ The process of granting a person, computer process, or device access to certain information, services or functionality. Authorization is derived from the identity of the person, computer process, or device requesting access, which is verified through

authentication.

authorization (n)~ A workflow with activities that must be completed before the approval or validation request is committed to the database.

authorization code (n)~ A code that grants rights to an individual, for example to use a system or access stored data.

authorization header (n)~ In the context of an HTTP transaction, a string containing the credentials that the user agent sends to server containing the authentication information.

Authorization Manager (n)~ A role-based security architecture for Microsoft Windows Server 2003 or Microsoft Windows 2000 Server (Service Pack 4) that can be used in any application requiring role-based authorization, such as ASP.NET Web applications or Web services. It consists of a run-time environment and a Microsoft Management Console (MMC) snap-in tool that enables network administrators to define roles, assign users and groups to application roles, and create application groups based on an employees job role or an organizations structure.

Authorization Policies Wizard (PN)~ A wizard that is available through Remote Desktop Gateway Manager that enables you to quickly configure a Remote Desktop connection authorization policy (RD CAP), a Remote Desktop resource authorization policy (RD RAP), and a computer group that is associated with an RD RAP.

authorization rule (n)~ A script, written in VBScript or JScript, that can be included in role definitions and task definitions. An authorization rule determines whether the role or task is allowed.

authorization store (n)~ A file containing user and group information used by the Authorization Manager.

authorize (v)~ To grant a person, computer process, or device access to certain information, services or functionality.

authorize (v)~ To sanction the future occurrence of an event in a system.

authorized distributor (n)~ An independent company licensed by Microsoft Licensing, GP or Microsoft Ireland Operations, Ltd. to manage the production and distribution of multipacks of Windows OEM products to system builders.

authorized replicator (n)~ An independent company licensed by Microsoft Licensing, Inc., to manage the production and distribution of Microsoft OEM products for royalty OEMs. Microsoft Licensing, Inc., supplies the authorized replicator with the master components, manufacturing and assembly specifications, and other pertinent instructions. The authorized replicator manufactures and assembles genuine Microsoft products to exact specifications. The benefits of using an authorized replicator include protection against piracy, consistent high-quality software, and competitive prices.

authorized user (n)~ A user who has been authenticated and who has access to objects and tasks in the system.

Auto Answer (PN)~ A feature of some Windows Mobile devices that uses the hands-free system to automatically answer incoming calls (without a person touching the device) after a user-specified period of time, such as 2 seconds, 5 seconds, 10 seconds, and so on.

auto apply quota (n)~ A quota that allows the user to assign a quota template on a folder and have quotas based on the template be automatically created for the existing subfolders and any subfolders created in the future.

Auto Approval (n)~ An update management configuration in which newly synchronized updates are automatically approved, and deployed to managed computers.

Auto Attendant (n)~ The feature that supplies a caller with information and performs an action without the intervention of a human operator. It automatically routes calls based on selections made by the caller.

Auto Collage (PN)~ A feature that assembles a composite photo collage from multiple source photos.

auto correction (n)~ A feature that automatically corrects errors and makes other substitutions as soon as a user types text.

auto discover (n)~ To automatically find newly-added servers and newly-added shares or volumes, or to detect changes, such as deletion or remapping, to protected data.

auto discovery (n)~ The daily process by which DPM automatically detects new or removed servers on the network and discovers changes to protected servers, such as the addition, removal, or renaming of databases, shares, and volumes.

Auto Fill (PN)~ A feature that allows the user to fill cells with data that follows a pattern or that is based on data in other cells.

Auto Hide (PN)~ A feature that minimizes tool windows along the edges of the IDE when these windows are not in use.

Auto PC (n)~ An information and entertainment system for use in automobiles. Developed by Microsoft and powered by Microsoft-® Windows-® CE (a Windows-compatible operating system designed for embedded applications), Auto PC implements speech-recognition technology to enable individuals to rely on hands-free, spoken commands for tasks such as accessing a contact database (names, addresses, numbers), calling up e-mail or traffic reports, controlling an audio system, or obtaining destination directions. The Auto PC fits into the dashboard, in the space normally occupied by a radio.

auto size (v)~ For an object, to resize automatically if the containing object or the overall window is resized.

auto style application mode (n)~ A mode in which the default style settings defined in Page Options > CSS tab will be used on a page level as well as on an inline style level. The style application mode can also be set to manual.

auto thumbnail (n)~ A tool that creates a thumbnail (a miniature version) of a picture or photograph and a hyperlink to the original picture.

auto top-up (n)~ A Skype feature that enables automatic payments so that the user doesn't run out of Skype Credit.

AutoArchive (n)~ A feature which automatically and periodically removes items to another folder, or deletes them, based on the amount of time they have been in the folder.

AutoArchive (v)~ To automatically remove items to another folder periodically or delete them, based on the amount of time that they have been in the folder.

autochanger (n)~ A robotic device that automatically loads storage media into a computer drive.

autocommit mode (n)~ The default transaction management mode for the Database Engine. The Database Engine automatically starts a transaction for each individual Transact-SQL statement. When the statement completes, the transaction is committed or rolled back based on the success or failure of the statement.

AutoComplete (PN)~ The feature in Internet Explorer that remembers the information you have typed into the Address bar, web forms, or password fields, and which automatically fills in that information if you start to type the same thing again later.

AutoConnect (n)~ A technology that allows Outlook and mobile devices to automatically discover and connect to the correct Exchange server without requiring the user to know the Exchange server name or other details, even if the mailbox has been moved or a server has failed.

AutoConnect (PN)~ A feature that automatically connects, aligns, and evenly distributes flowchart shapes in a drawing.

auto-consistency check (n)~ A feature that automatically runs a consistency check on protected data sources when it detects an inconsistent replica.

auto-correct (PN)~ A feature that automatically corrects errors and makes other substitutions as soon as a user types text.

Auto-detect server (oth)~ The label for a check-box that when selected establishes automatic detection of the server upon signing in.

Autodiscover (n)~ A feature available in Outlook 2007 and some mobile devices that automatically configures the clients for access to Exchange Server 2007. The client sends the user name and password information to the Exchange 2007 server. The Autodiscover Web service that is running on the Exchange Client Access server returns an XML file that contains configuration information, which is interpreted by the client. If the user is moved to a different server later, the client will automatically query the Autodiscover Web service again to update the client configuration.

Autodiscover service (n)~ A service that returns server configuration information for a mobile device or other client using only the user's SMTP e-mail address and password.

auto-exit (n)~ A text box in which the focus automatically moves to the next control as soon as a user types the last character.

Auto-Extend (PN)~ A feature that facilitates the use of Presenter View by automatically applying the Extend setting for Windows projection and identifying the correct display for Slide Show versus Presenter view.

AutoFilter (n)~ A software feature that allows users to filter records in a spreadsheet or database by selecting filter criteria right in the working window rather than going through complex views and features.

autoflow (n)~ The automatic flowing of text from one frame to another.

AutoHide (PN)~ A feature that minimizes tool windows along the edges of the IDE when these windows are not in use.

auto-hide button (n)~ A button that appears on the edge of a frame when a window is in auto-hide mode. The hidden window pane appears when the mouse cursor hovers over the button.

autohost (v)~ To deploy the components of an app on appropriate hosts and establish app isolation automatically.

auto-implemented property (n)~ A Visual Basic and C# property that can be declared in a single line of code.

auto-insert delay (n)~ Time elapsed after the last stroke and before the handwriting recognizer result is inserted.

auto-joining (n)~ The movement of text to fill a gap that remains after a user deletes other text.

auto-labelling (n)~ A procedure in which adding a shape to the drawing canvas automatically also adds the shape's name as a text label.

AutoLayout (n)~ A feature that automatically adjusts the layout if you insert items that don't fit the original layout. You can undo it using the Automatic Layout Options button.

autoloader (n)~ A robotic device that automatically loads storage media into a computer drive.

autologger (n)~ A data-capturing tool used in remote usability studies to automatically record application information (active windows, titles and locations) and user actions such as mouse clicks and keystrokes.

autologon (n)~ The process of automatically logging on to the computer when the computer restarts.

automated activity (n)~ An activity that is automatically completed by Service Manager.

Automated Clearing House (n)~ An electronic funds transfer system available in the United States that facilitates the transfer of funds between receiving party and originating party bank accounts.

Automated System Recovery (n)~ A feature that helps you recover a system that will not start.

Automated System Recovery Preparation Wizard (n)~ A wizard that backs up the partition used by the operating system, but it does not back up other partitions, such as program or data partitions. Those partitions must be backed up using Backup or other standard routines.

automated task (n)~ A workflow task that is completed by an automatic operation.

automated test (n)~ A set of steps that a computer may run programmatically to test the functionality of the system.

automatic (adj)~ Pertaining to something that functions without external control.

Automatic Answering (PN)~ A feature of some Windows Mobile devices that uses the hands-free system to automatically answer incoming calls (without a person touching the device) after a user-specified period of time, such as 2 seconds, 5 seconds, 10 seconds, and so on.

automatic approval (n)~ An update management configuration in which newly synchronized updates are automatically approved, and deployed to managed computers.

automatic approval rule (n)~ A type of rule that allows updates to be automatically approved based on product and update classifications.

automatic call distributor (n)~ A system that automatically routes and queues incoming phone calls and generates reports to an agent or a set of agents, e.g., in a call center such as for customer service.

Automatic configuration (PN)~ An option in the Options dialog box, on the Accounts tab. When the phone is integrated with Communicator, this option uses the automatic configuration settings for the phone.

automatic document feeder (n)~ An attachment available on some scanners that allows automatic scanning of multiple pages.

automatic failover (n)~ A failover that occurs automatically on the loss of the primary

replica.

automatic failover set (n)~ Within a given availability group, a pair of availability replicas (including the current primary replica) that are configured for synchronous-commit mode with automatic failover, if any.

automatic file restore (n)~ A feature that replaces malware-infected system files with uninfected files from the cloud.

Automatic Layout (n)~ A feature that recognises some repetitive, highly-used steps and automatically helps in the layout of the text.

automatic learning (n)~ A handwriting personalization feature that collects data about the words you use and how you write them. If you turn on automatic learning, it enables the handwriting recognizer to learn your handwriting style and vocabulary.

Automatic Maintenance (PN)~ A feature of Windows that includes a set of maintenance tasks that run automatically when the user's PC is idle.

Automatic mapping (n)~ Field in the Import Data Wizard that indicates that the wizard can determine which of the fields being imported match up with Microsoft Dynamics CRM fields.

automatic number identification (n)~ A program that identifies the phone number where a call originates.

automatic outlining (n)~ The process that makes it possible to collapse a sequence of text lines into a single line. For example, in C++ all methods can be collapsed to a single line, showing only the method signature.

automatic partnering (n)~ A setting for APPC LUs and modes that enables LU-LU pairs (with assigned modes) to be generated automatically by Host Integration Server 2004. Each time a new APPC LU or mode is created with automatic partnering enabled, Host Integration Server 2004 searches for existing LUs and modes that also have automatic partnering enabled. Host Integration Server 2004 then uses all available automatic partners to create as many unique LU-LU pairs as possible, each pair containing a remote LU, local LU, and assigned mode. Disabling an automatic partner setting after an LU or mode has been created does not remove that LU or mode from LU-LU pairs already generated.

Automatic Private IP Addressing (n)~ A TCP/IP feature in WindowsXP and Windows Server2003 that automatically configures a unique IP address from the range 169.254.0.1 through 169.254.255.254 with a subnet mask of 255.255.0.0 when the TCP/IP protocol is configured for dynamic addressing and a DHCP server is not available. The APIPA range of IP addresses is reserved by the Internet Assigned Numbers Authority (IANA) for use on a single subnet, and IP addresses within this range are not used on the Internet.

Automatic Provisioning (n)~ The automation of user provisioning

automatic recovery (n)~ Recovery that occurs every time SQL Server is restarted.

Automatic Replies (PN)~ A tool that allows the user to configure auto-replies.

automatic reply (n)~ The auto-reply text specified using Outlook's Automatic Replies or Out of Office Assistant.

automatic scrolling (n)~ A technique whereby a display area automatically scrolls without direct interaction with a scroll bar.

Automatic Speech Recognition (n)~ Technology that allows machines to recognize and respond to human voice commands.

automatic synchronization (n)~ The automatic exchange and update of information between a device and a desktop computer or server according to a preset schedule or criteria, so that the information is the same in both places.

automatic transaction (n)~ A transaction that is created by the COM+ run-time environment for an object based on the transaction attribute of a component.

automatic update (n)~ A method that allows a computer to be scanned and recommends software updates that fix problems, add functionality, or provide the latest drivers.

Automatic Updates (n)~ A feature that works with the Windows Update website to deliver updates (patches and fixes) for Windows as they become available according to settings that users can choose.

automatic variable (n)~ A shell variable that is always available as part of a Monad session ($?, $true, etc.).

automatic virtual machine activation (n)~ Activation of a guest operating system or application based on properties of a host system or parent partition, including but not limited to the license state of the host.

Automatically retrieve Out Of Office settings from Outlook (oth)~ An option in the Options dialog box, on the Rules tab. When this option is selected, Communicator obtains the user's Out Of Office information from Outlook and displays it as part of the user's status.

automatically save (v)~ To save the user's work on a continuous basis, so that it is not necessary to save manually.

Automation (PN)~ A technology that is based on the Component Object Model (COM) that enables interoperability among ActiveX components, including OLE components. Formerly referred to as OLE Automation.

Automation (PN)~ A Microsoft Azure service that automates the manual, long-running, error-prone, and frequently repeated tasks that are commonly performed in a cloud environment.

Automation client (n)~ An application that uses Automation to manipulates the objects, methods, and properties of another application. Also called an Automation controller.

Automation object (n)~ An object supplied by a component that supports Automation.

Automation server (n)~ An application that enables its objects, methods, and properties to be controlled by other applications through Automation.

Automotive (PN)~ The Lifestyle subcategory containing apps for car enthusiasts.

AutoMovie (n)~ A Movie Maker tool that helps users quickly create a movie by analyzing the video, pictures, and music that a user selects, and then combining those to create a movie.

autonomous system (n)~ A group of routers or networks controlled by a single administrative authority using a common Interior Gateway Protocol (IGP) for routing packets. Each autonomous system is assigned a globally unique number called an autonomous-system number (ASN).

autonomous system boundary router (oth)~ A router that exchanges routing information with routers that belong to other autonomous systems. The ASBR then advertises external routes throughout the autonomous system. ASBRs can be internal or area border routers, and they might or might not be connected to the backbone.

AutoNumber (PN)~ A field data type that automatically stores a unique number for each record as it's added to a table.

AutoPlay (n)~ A feature that allows you to set up your computer so that when you insert a CD or DVD, it will play automatically and you won't have to select your preferences every time.

autopostback (n)~ A process in which the control submits the page when the user interacts with the control. (By default, only button controls cause a postback.) For example, if a DropDownList control is set to perform autopostback, the page is submitted as soon as a user selects an item from the list.

auto-protection (n)~ In DPM, a feature that automatically identifies and adds new data sources for protection.

auto-recharge (n)~ A Skype feature that enables automatic payments so that the user doesn't run out of Skype Credit.

Auto-recover (n)~ A feature that allows the user to rescue work if the computer crashes for any reason.

auto-redial (n)~ A feature that repeatedly redials the desired number until the user gets through.

auto-reduce statement completion (n)~ The IntelliSense feature that filters the list of values that IntelliSense displays to only the relevant ones based on what the user types. It also filters on title casing (e.g., if the user types dl'

autoregressive integrated moving average (n)~ A method for determining dependencies in observations taken sequentially in time, that also supports multiplicative seasonality.

auto-repeat (n)~ An event or interaction that is automatically repeated. Auto-repeat events usually occur when a user holds down a keyboard key or presses and holds a special control (for example, scroll bar buttons).

AutoReply (PN)~ A feature in Outlook Mobile that allows the user to set up an automatic response to incoming e-mail messages.

auto-report (n)~ A type of report that is automatically generated from the data that is displayed on a form.

autorestart (n)~ A process or system feature that can automatically restart the system after the occurrence of certain type of errors or a power system failure.

Autos (PN)~ An MSN site that provides information and expert advice on automobiles, including safety ratings, market values, and listings for new and used cars.

autosave (n)~ A program feature that automatically saves an open file to a disk or other medium at defined intervals or after a certain number of keystrokes to ensure that changes to a document are periodically saved.

autoscroll (n)~ A technique whereby a display area automatically scrolls without direct interaction with a scroll bar.

AutoShape (n)~ A predefined or free-form figure -€" such as a line, oval, cube, flowchart symbol, banner, or free-form scribble -€" that the user can insert into a document and then customize.

AutoShapes (n)~ A menu for a group of ready-made shapes that includes basic shapes, such as rectangles and circles, plus a variety of lines and connectors, block arrows, flowchart symbols, stars and banners, and callouts.

autosnap (n)~ A feature in which dropping a shape onto a connector automatically glues the shape to the connector.

auto-start (n)~ A feature of Windows Server AppFabric that allows a WCF or WF service to automatically start when it is created, or when IIS is started.

autostatic update (n)~ The process of adding to the routing table automatically. When you configure an interface to use auto-static update mode, the router sends a request to other routers and inherits routes. The routes are saved in the routing table as and are kept even if the router is restarted or the interface goes down. Auto-static updates are supported in (RIP) for (IP) and in RIP for Internetwork Packet Exchange (), but they are not available for use with Open Shortest Path First (OSPF).

Autostretch (adj)~ An option for setting all or part of a layout table to a fixed width. After setting part of a layout table to a fixed width, the other part of the layout table automatically stretches to adjust to the size of the Web browser window.

AutoSum (n)~ An Excel feature that automatically creates a sum formula based on user selection.

AutoText (n)~ A gallery for text and graphics, such as a standard contract clause, that can be used multiple times in one or more documents. Each selection of text or graphics is recorded as an AutoText entry and assigned a unique name. It is visible in Quick Parts and the Building Blocks Organizer.

Autotext code (PN)~ A text-based variable in a column definition that is automatically updated each time that a report is generated.

Autounattend.xml (n)~ The unattended answer file that is automatically detected by Windows Setup during operating system installation.

auxiliary AppCompat database (n)~ An additional database that is associated with the AppCompat database. The Auxiliary AppCompat database can be modified on the system and is used primarily in large enterprises where the IT environment is heavily managed. The main AppCompat database is read-only.

auxiliary class (n)~ A class that extends the definition of a class that inherits from it but cannot form a class by itself.

auxiliary display (n)~ A feature of Windows Vista that gives the user quick access to useful information on their computer, such as calendar appointments and the latest e-mail message even when the computer is in standby mode or hibernating, media playback control when the computer is off, and other application notifications.

AV (n)~ A computer program designed to detect and respond to malicious software, such as viruses and worms. Responses may include blocking user access to infected files, cleaning infected files or systems, or informing the user that an infected program was detected.

availability (n)~ A level of service provided by applications, services, or systems.

availability (n)~ The periods of time when a resource can be scheduled to participate in a service activity.

availability (n)~ The condition of a user that can be displayed to the user's contacts to communicate whether the user is currently online and available, offline and unavailable, and so on.

availability database (n)~ A database that belongs to an availability group.

availability group (n)~ A set of user databases that fail over together.

availability group listener (n)~ A server to which clients can connect in order to access a database in a primary or secondary replica of an availability group.

availability indicator (n)~ Appears to the left of a meeting or appointment (or all the way around the item when selected), indicating time status as free, tentative, busy, out of office, or no information available. Visible only in Day and Work Week view.

availability replica (n)~ An instantiation of an availability group that is hosted by a specific instance of SQL Server and that maintains a local copy of the set of availability databases that belong to the availability group.

Availability service (n)~ A service that improves information workers' free/busy data by providing secure, consistent, and up-to-date free/busy information to computers that are running Microsoft Office Outlook 2007. By default, this service is installed with Exchange 2007.

availability set (n)~ A group of virtual machines that are set up so that its members are guaranteed to be highly available. An availability set combines the operations of fault domains and update domains to help guard against hardware failures and host operating system updates, both of which cause virtual machine outages.

availability warning (n)~ An icon or a warning message that appears when an item quantity, lot number, or serial number is already reserved or otherwise specified for other documents.

available (adj)~ Referring to anything that is ready for immediate use by a user or application.

available (PN)~ A presence status the user can select, while signed in, to make it appear to other users that he or she is currently willing to be contacted.

available disk space (n)~ Memory that is not allocated to any program.

available disks (n)~ A storage pool that exposes physical disks that are currently available for inclusion in a storage pool on a particular storage subsystem.

available hard disk space (n)~ Memory that is not allocated to any program.

available language (n)~ A language pack that is present in the langpacks folder, but is not yet installed to the Windows image. To install an available language, you must run Windows Setup. Optionally, you can use the Lpksetup.exe tool to install a language pack after Windows is installed.

available memory (n)~ Memory that is not allocated to any program.

available to promise (adj)~ The portion of inventory that is not allocated and which can be used to fulfill new orders and requirements.

Avantgarde (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 90.

Avatar ~ A picture or figure representing a person in an online environment.

AVDP (n)~ A part of the UDF file system necessary to identify the required blocks in order to interpret the file system.

average cost period (n)~ An interval of time that the program uses to calculate average costs of items that use the Average costing method. The program calculates an average cost for the ending date of each average cost period in which an inventory decrease takes

place. This average cost is then applied to all inventory decreases with valuation dates in the average cost period.

average duration (oth)~ The average event- time for all performance events in the group.

AVI (n)~ A Microsoft Windows multimedia file format for sound and videos that uses the Microsoft Resource Interchange File Format (RIFF) specification.

AVIcode .NET Enterprise agent (PN)~ A feature that is installed on a Windows-based computer by the AVIcode .NET application monitoring product.

AVS (n)~ The service that is provided by a credit card processor that validates that the billing address provided by a card holder matches the information on file with the issuing bank.

award certificate (n)~ A document presented to an individual or team in formal recognition of their effort or achievement.

Away (n)~ A tab on the Power Options Properties dialog box which allows the user to select away mode.

Away (n)~ An item on the user's My Status menu that can be selected while signed in to make it appear to other users that he or she is currently away.

Away (PN)~ An item on the user's Status menu. A user can select this status to indicate that they are not actively using their computer.

Away (PN)~ The status that appears when a user is elsewhere than at their computer. The Away status can be selected manually when the user plans to be away, or automatically when the user has been away.

away greeting (n)~ A voice message that's played to callers to let them know that the person they called is away for an extended period of time and unavailable to answer the phone. It can be customized by the user. It's different from the voice mail greeting that's played when the recipient is away for a short period of time.

away mode (n)~ A power mode in which a Media Center PC appears off, but can still perform functions such as recording a TV program. In away mode, the monitor appears blank, the audio is muted, the input devices are locked, the power LED changes from green to amber, and the system fans turn down.

AWS (PN)~ A collection of remote computing services that make up a cloud computing platform offered by Amazon.com.

AWT (PN)~ A library of Java GUIs (graphical user interfaces) that provides the connections between a Java application and the native GUI of the computer on which the application runs.

AxBC class (n)~ A business component class that encapsulates business logic, including the provision of default values, validation of data, value mapping, and access to display fields.

Axd (oth)~ The prefix used for document classes for the application programmer interfaces (APIs).

axis (n)~ A line bordering the chart plot area used as a frame of reference for measurement.

axis (n)~ A set of tuples. Each tuple is a vector of members. A set of axes defines the coordinates of a multidimensional data set.

axis (n)~ A directional vector that can be used to specify a position in space. The

horizontal axis x-axis, the vertical y-axis, and near-to-far z-axis are used for three-dimensional graphing.

AXL (PN)~ An XML-based serialization format used by SharePoint-based servers to represent Access Services database applications. It includes database properties, queries, forms, reports, and macros.

AzMan (n)~ A role-based security architecture for Microsoft Windows Server 2003 or Microsoft Windows 2000 Server (Service Pack 4) that can be used in any application requiring role-based authorization, such as ASP.NET Web applications or Web services. It consists of a run-time environment and a Microsoft Management Console (MMC) snap-in tool that enables network administrators to define roles, assign users and groups to application roles, and create application groups based on an employees job role or an organizations structure.

Azure Active Directory (PN)~ The identity service in Microsoft Azure that provides identity management and access control capabilities through a REST-based API.

Azure Active Directory Connect Health (PN)~ An Microsoft Azure preview portal extension with a server and client component to monitor service's health, performance and usage of an on-premises identity infrastructure (ADFS), providing alerts, summaries and reports.

Azure Active Directory Connect Health Agent (PN)~ A program installed and running as a background task on the targeted servers to accomplish Azure AD Connect Health functions.

Azure Active Directory identity synchronization tools (n)~ The services providing for automatical synchronization of user and group accounts on-premise and to the accounts stored in Azure Active Directory via pass-back through federation and password hash synchronization.

Azure AD App (PN)~ An Internet application that runs on smartphones and other portable devices and uses Microsoft Azure Mobile Services to provide authorized users with sign-on capability to access secured resources via the identity service in Microsoft Azure that provides identity management and access control capabilities.

Azure AD Connect Health (PN)~ An Microsoft Azure preview portal extension with a server and client component to monitor service's health, performance and usage of an on-premises identity infrastructure (ADFS), providing alerts, summaries and reports.

Azure AD Connect Health Alerts (PN)~ The section of the Azure AD Connect Health providing the list of active alerts. includes relevant information, resolution steps, and links to related documentation. By selecting an alert you will see additional information, as well as steps you can take to resolve the alert, and links to additional documentation. You can also view historical data on alerts that were resolved in the past.

Azure AD Connect Health Usage Analytics (PN)~ A feature of Azure AD Connect Health that analyzes user actions and usage events on tne monitored service.

Azure AD Sync (PN)~ A software tool for connecting to data sources, synchronizing data between data sources, as well as the provisioning and deprovisioning of identities.

Azure App (PN)~ An Internet application that runs on smartphones and other portable devices and uses Microsoft Azure Mobile Services to provide authorized users with sign-on capability to access secured resources via the identity service in Microsoft Azure that

provides identity management and access control capabilities.

Azure App Service (PN)~ The Microsoft Azure hosting offer that is streamlined for fast and easy website deployments either running custom application code or popular open source web apps.

Azure App Service Environment (PN)~ A Premium service plan option of Azure App Service that provides a fully isolated and dedicated environment for securely running all apps.

Azure Application (PN)~ An Internet application that runs on smartphones and other portable devices and uses Microsoft Azure Mobile Services to provide authorized users with sign-on capability to access secured resources via the identity service in Microsoft Azure that provides identity management and access control capabilities.

Azure Authenticator (PN)~ A dual-component app that can be installed on a user's mobile device for secure access to work and school accounts through account sign-in verification.

Azure Automation (PN)~ A Microsoft Azure service that automates the manual, long-running, error-prone, and frequently repeated tasks that are commonly performed in a cloud environment.

Azure Automation Intelligence Pack (PN)~ An Azure Automation component transforming the newborn agent into a useful member of society, otherwise known as a Hybrid Runbook Worker.

Azure Batch forum (n)~ An MSDN forum to discuss the Azure Batch service. The topics include management, development, performance, roadmap, feature request, etc.

Azure Classic Portal (PN)~ The service principal first-released web-based user interface to Azure services.

Azure credit (n)~ The amount of money that an Azure user is entitled to use for Azure services.

Azure Data Catalog (PN)~ A shared Azure service that provides a means for storing and administering definitions of models, content types, and data sources.

Azure Data Lake (PN)~ A hyper scale repository for big data analytic workloads.

Azure for BizSpark Plus (n)~ The offer of a monthly credit on Microsoft Azure for startups who are members of a local Accelerator or Incubator and who are BizSpark Plus partners.

Azure Gaming Services (PN)~ The Microsoft Azure service for 3 limited-availability Xbox (gaming) service types, including Compute and two Data Transfers.

Azure in Open (PN)~ A monetary commitment offer based on the open licensing program and targeted for small- to medium-sized businesses.

Azure in Open (PN)~ A monetary commitment that makes Microsoft Azure available for partners to resell through Open licensing for 12 months, and that a customer can use against any consumption-based Azure service.

Azure Pass (PN)~ An offer that provides a certain amount in monetary credit to anyone who would like to try out Microsoft Azure services.

Azure Portal (n)~ The web-based user interface that hosts all Azure services.

Azure PowerShell (PN)~ A module that provides cmdlets to manage Azure through Windows PowerShell. You can use the cmdlets to create, test, deploy, and manage

solutions and services delivered through the Azure platform.

Azure Preview Portal (n)~ The next-generation web-based user interface to which Azure services are migrating. It provides a customizable end-to-end DevOps experience along with Azure Resource Manager for composing and managing all resources in an application together.

Azure Redis Cache (PN)~ The Microsoft Azure Cache offering that provides access to a secure, dedicated Redis cache, managed by Microsoft.

Azure region (n)~ An area within a geo Azure region taxonomy. Does not imply any hierarchy or nesting within a geo. Regions can be assigned to other geos in the future if needed.

Azure Resource Manager (PN)~ The service to grant access to a service principal and authenticate it so that it can perform the permitted management actions on resources that exist in the subscription or as a tenant.

Azure Rights Management (Government Pricing) (PN)~ The offer of the Azure Rights Management capability for government organizations where data is hosted in the commercial cloud environment.

Azure Rights Management for Government (PN)~ The offer of the Azure Rights Management capability for government organizations where data is hosted in the government cloud environment.

Azure Search (PN)~ The service that allows developers to incorporate search capabilities into their applications without having to worry about the complexities of full-text search and without having to deploy, maintain or manage any infrastructure.

Azure Site Recovery (n)~ The Microsoft Azure service that allows users to automate protection and replication and orchestrate recovery for virtual machines and applications that run on Hyper-V hosts located in System Center Virtual Machine Manager (VMM) clouds and also in Microsoft Azure for simplified disaster recovery.

Azure Stack (PN)~ A cloud infrastructure that brings Azure IaaS and PaaS capabilities to customers' datacenters for blending enterprise applications such as SQL Server, SharePoint, and Exchange with modern distributed applications and services while maintaining centralized oversight.

Azure Sync Portal (PN)~ The web UI that you use to interact with the Azure Sync Service.

Azure Sync Service (PN)~ The synchronization service running behind the Azure Sync Portal.

Azure Tenant (n)~ An instance of Azure Active Directory that is automatically created for use by an organization when signing up for any Microsoft cloud service to create and manage users and groups, add the organization's registered Internet domains and set up integration with the on-premises directory service to process user authentications.

Azure Trust Center (PN)~ A website that describes the compliance, security, and privacy features of Microsoft Azure.

B (n)~ A game rating symbol developed by the Computer Entertainment Rating Organization (CERO).

B+ tree (n)~ A B-tree in which data are stored in the leaves. B+ trees (B plus trees) make it possible to easily search, insert, delete and access data.

B2B (n)~ Relating to the sales category pertaining to transactions and related activity between a business and buyers who are not consumers, such as government bodies, companies, and resellers.

B2B integration (n)~ The exchange of electronic documents between two companies, for example, for the purpose of trading.

B2B site (n)~ A Web site designed for the creation and transmission of purchase orders between businesses that have an established relationship.

B2C site (n)~ A Web site that provides retail shopping directly to the public.

BAC (n)~ The original project, resource, and assignment cost as shown in the baseline plan. The baseline cost is a snapshot of the cost at the time when the baseline plan was saved.

bacillus Calmette-Guérin vaccine (n)~ A serum against tuberculosis that is prepared from a strain of the weakened live bovine tuberculosis bacillus and used for vaccination against tuberculosis and also in cancer chemotherapy.

Back (PN)~ A navigation button used to return to recently visited Web pages in Internet Explorer and other internet browsers.

back buffer (n)~ A nonvisible surface to which bitmaps and other images can be drawn while the primary surface displays the currently visible image.

Back button (PN)~ The button that takes the user to the previous item or page.

back clipping plane (n)~ The far boundary of a viewing frustum or camera beyond which objects are not rendered.

back door (n)~ A hardware or software-based hidden entrance to a computer system that can be used to bypass the system's security policies.

back end (n)~ The part of a compiler that transforms source code (human-readable program statements) into object code (machine-readable code).

back end ~ the part of a computer system not directly interacting with the user.

back order (n)~ An unfilled customer order or commitment. A back order is an immediate (or past due) demand against an item whose inventory is insufficient to satisfy the demand.

back payment (n)~ A payment made by a customer for a past due obligation.

back reference (n)~ In regular expressions, an element of the form \dd'

back up (v)~ To make a duplicate copy of a program, a disk, or data.

backbone ~ Backbone network is the main communication path in a WAN; the set of cables or connections that carries most of the traffic

backbone router (n)~ In Open Shortest Path First (OSPF), a router that is connected to the backbone area. This includes routers that are connected to more than one area (area border routers (ABRs)). However, backbone routers do not have to be ABRs. Routers that

have all networks connected to the backbone are internal routers.

backdoor (n)~ Pertaining to a type of trojan used to bypass a computer's security policies.

backdoor (n)~ An entryway into a computer that is neither authorized nor intentionally deliberate.

backend (adj)~ In a client/server application, the part of the program that runs on the server.

back-end application (adj)~ In a client/server application, the part of the program that runs on the server.

back-end database (n)~ In a two-database approach, the server-side database that contains the tables that hold your solution's data, and that is accessed by your solution through links in the front-end database.

back-end database server (n)~ A server that hosts data, configuration settings, and stored procedures that are associated with one or more applications.

backend server (n)~ A server that is used to handle data processing and typically is not accessed by the clients and is not exposed to the Web.

back-end server (n)~ A server that is used to handle data processing and typically is not accessed by the clients and is not exposed to the Web.

backfill (v)~ To retrieve missing updates from another store when a public folder store determines that it has not received all of the updates for a replicated folder (or for the hierarchy).

backflush costing (n)~ An accounting method that flows product and production costs to cost of goods sold accounts during an accounting period and that backflushes those costs to raw material and finished goods accounts for products not sold at the close of the accounting period.

background (n)~ In a graphical user interface such as Windows, a pattern or picture in the screen background that can be chosen by the user.

background (adj)~ In the context of processes or tasks that are part of an operating system or program, operating without interaction with the user while the user is working on another task.

background (n)~ The color or image that appears behind the content of a visual element, for example, behind the text that is displayed in a TextBox control or on your graphical user interface.

background (n)~ A page that you can assign to another page to create multiple layers in a drawing.

background (n)~ The image that appears in the conversation window.

background (n)~ The area that appears behind the tiles on the Start screen.

background (n)~ The picture that appears in the Photos Hub.

Background (PN)~ The area on a card that allows a user to make the card's image a background when clicked on.

background agent (n)~ A multitasking feature that allows for running code periodically in the background.

background color (n)~ The color against which characters and graphics are displayed.

background compilation (n)~ Compilation that occurs while the developer is writing code, before an explicit build command is made through the IDE. Background

compilation enables error reporting while the developer is writing code.

background graphics (n)~ Any graphics on a slide, including drawing objects, patterns in a background fill, and pictures.

background graphics mode (n)~ A mode that defines how background colors are mixed with window or screen colors for text and bitmap operations.

background handles (n)~ The handles used to resize the background. By default, background handles are hidden.

background image (n)~ The background that appears under an application.

Background Intelligent Transfer Service (PN)~ A component of Windows XP and later operating systems that facilitates prioritized, throttled, and asynchronous transfer of files between computers using idle network bandwidth.

background page (n)~ A page that you can assign to another page to create multiple layers in a drawing.

background pattern (n)~ The pattern against which characters and graphics are displayed.

background printing (n)~ The process of sending a document to a printer at the same time that the computer is performing one or more other tasks.

background processing (n)~ The execution of certain operations by the operating system or a program during momentary lulls in the primary (foreground) task. An example of a background process is a word processor program printing a document during the time that occurs between the user's keystrokes.

background program (n)~ A program that can run or is running in the background.

Background Removal (PN)~ An image editing feature that allows a user to isolate the foreground portion of an image and make the background transparent.

background shading (n)~ The application of color behind selected text or paragraph.

background sound (n)~ An audio file associated with a Web page. When a site visitor opens the page in a Web browser, the audio file plays either continuously or the number of times that the code in the Web page specifies.

background streaming (n)~ A client runtime policy configuration parameter that enables the secondary feature block of a virtualized application to be streamed to the client automatically in the background.

Background Sync (PN)~ A feature that synchronizes offline files in the background, ensuring that the server is frequently updated with the latest changes.

background task (n)~ A task that is part of an operating system or program, and is operating without interaction with the user while the user is working on another task.

background texture (n)~ The texture (illusion of physical substance) against which characters and graphics are displayed.

backhaul ~ The terrestrial link between an earth station and a switching or data center.

backing field (n)~ A private variable that holds the value of a property. The property's Get and Set procedures access the backing field.

backing store (n)~ A mass-storage device that serves as backup memory for paging when physical memory is full.

backing stream (n)~ The existing stream, that the new stream will be based on.

backing type (n)~ A type in a given type system that defines the object that is created

when parsing a XAML object element or instantiating a XAML type. In XAML for WPF, a backing type is a CLR type.

backing variable (n)~ A private variable that holds the value of a property. The property's Get and Set procedures access the backing field.

backlight (n)~ The light behind the screen on mobile devices used to illuminate the screen in the dark, or just to make it brighter under normal conditions.

Backlight time out (n)~ A menu item that sets the amount of time for the device to be idle before the backlight turns off.

backlog (n)~ The set of work items not yet closed, representing work under consideration or still to be completed.

backlog priority (n)~ Sort order assigned to a backlog item, which is used to manage the sequence of items on the backlog

backoff (n)~ A mechanism that is used to deliver messages at an interim hop, along the least-cost routing path. A backoff occur when direct relay fails for any reason, such as network issues or servers going offline. The routing component tries to deliver messages as close to the destination as possible by backing off, hop by hop, along the least-cost routing path until a connection is made.

Back-Order Limit (n)~ The value below zero beyond which it is not prudent to take back orders. Back ordering cannot occur beyond this value. This is to restrict overselling and thereby preventing failure to fulfill an order.

backplane (n)~ A tool integration framework that enables the enactment of end user scenarios that require collaboration among tools developed independently by groups inside and outside of Microsoft.

backplane (n)~ A circuit board or framework that supports other circuit boards, devices, and the interconnections among devices, and provides power and data signals to supported devices.

backslash (n)~ A character used to separate directory names in MS-DOS and UNIX path specifications. When used as a leading character, it means that the path specification begins from the topmost level for that disk drive.

backspace gesture (n)~ In Tablet PC Input Panel, an action gesture that performs the same action as pressing the BACKSPACE key on the keyboard.

BACKSPACE key (n)~ A keyboard key that moves the cursor to the left, one character at a time, usually erasing each character as it moves.

Backstage view (PN)~ A full-page UI view that exposes file-level functionality in Office applications. This is a companion feature to the Office Ribbon and helps users discover and use the features that fall outside of the authoring features on the Ribbon.

backup (n)~ A duplicate of a program, a disk, or data, made either for archiving purposes or for safeguarding files.

Backup (PN)~ The Microsoft Azure service that lets you manage cloud backups by using standard backup tools in Windows Server 2012, Windows Server 2012 Essentials, or System Center 2012 Data Protection Manager.

Backup & manage (PN)~ The Utilities & tools subcategory containing apps to backup your personal data and manage it.

backup and restore (n)~ The process of maintaining backup files and putting them back

onto the source medium if necessary.

backup battery (n)~ An additional battery source available in Windows Mobile powered devices. It avoids data loss if the primary battery loses power.

backup browse server (n)~ A computer on a Microsoft network that maintains a list of computers and services available on the network. The master browser supplies the list. The backup browser distributes the Browsing service load to a workgroup or domain.

backup browser (n)~ A computer on a Microsoft network that maintains a list of computers and services available on the network. The master browser supplies the list. The backup browser distributes the Browsing service load to a workgroup or domain.

backup copy (n)~ A duplicate of a program, a disk, or data, made either for archiving purposes or for safeguarding files.

backup designated router (n)~ An OSPF router that forms adjacencies with all other routers on a multiple access network and becomes the designated router when the designated router becomes unavailable.

backup device (n)~ A tape or disk drive containing a backup medium.

backup file (n)~ A duplicate of a program, a disk, or data, made either for archiving purposes or for safeguarding files.

backup media pool (n)~ A logical collection of data-storage media that has been reserved for use by Microsoft Windows Backup. Backup uses Removable Storage to control access to specific media within a library.

backup medium (n)~ Disk file or tape used to hold one or more backups.

Backup Operators group (n)~ A type of local or global group that contains the user rights you need to back up and restore files and folders. Members of the Backup Operators group can back up and restore files and folders regardless of ownership, permissions, encryption, or auditing settings.

backup privilege (n)~ A user's right to perform backups.

backup set (n)~ A collection of files, folders, and other data that have been backed up and stored in a file or on one or more tapes.

backup shadow copy (n)~ A shadow copy of a replica created by the DpmBackup command-line tool. In DPM, backup shadow copies are used to archive replicas to tape.

backup snapshot (n)~ A snapshot of a site's data, created by the Backup Configuration Manager Site Server task or by another backup utility. The backup snapshot is used during a site recovery process to restore the site's data.

Backup Storage for Windows Server (n)~ The offer that provides qualified Windows Server customers up to 800 GB of Azure Backup per month at no charge for two months.

backup withholding (n)~ An IRS tax rule in the United States that requires notified payers to withhold a set percentage from payments made to payees who cannot be identified due to missing or incorrect taxpayer identification numbers on tax forms.

Backup, back up ~ A backup is an extra copy of your work, eg documents, pictures etc, saved onto a removable storage medium such as CD, DVD or magnetic tape, so that if your computer is stolen or breaks down you don't lose everything. Backup is a noun, back up is a verb.

Backus-Naur form (n)~ A metalanguage used for defining the syntax of formal languages, both for the developer of the language and for the user. A language is defined

by a set of statements, in each of which a language element known as a metavariable, written in angle brackets, is defined in terms of actual symbols (called terminals) and other metavariables (including itself if necessary).

backward compatibility (n)~ The capability of source code or programs developed on a more advanced system or compiler version to be executed or compiled by a less advanced (older) version.

backward compatible (Adverb) ~ Pertaining to a product or version that is able to interact with previous versions.

backward extension (n)~ An range that is extended downward, using smaller numbers.

backward pass (n)~ Calculation of late finish and late start dates for project activities, determined by working backward from the project's finish date.

backward planning (n)~ A method for determining a production schedule by beginning with the date the order is required to be ready and working backward to the date work must begin in order to meet the required due date.

backward scheduling (n)~ A method for determining a production schedule by beginning with the date the order is required to be ready and working backward to the date work must begin in order to meet the required due date.

backward slash (n)~ A character used to separate directory names in MS-DOS and UNIX path specifications. When used as a leading character, it means that the path specification begins from the topmost level for that disk drive.

backward-compatible (Adverb) ~ Pertaining to a product or version that is able to interact with previous versions.

Backwards-compatible ~ A program (or system) designed to work with data generated by earlier versions of itself, even though the format may since have changed completely.

BACS (n)~ An automated clearinghouse system for electronic financial transactions.

bad block (n)~ A disk sector that cannot be used for data storage, usually because of media damage or imperfections. Finding, marking, and avoiding bad sectors on a disk is one of the many tasks performed by a computer's operating system. A disk-formatting utility can also find and mark the bad sectors on a disk.

bad debt (n)~ An accounts receivable that will likely remain uncollectable and will be written off.

Bad Language (n)~ A content descriptor developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

bad sector (n)~ A disk sector that cannot be used for data storage, usually because of media damage or imperfections. Finding, marking, and avoiding bad sectors on a disk is one of the many tasks performed by a computer's operating system. A disk-formatting utility can also find and mark the bad sectors on a disk.

bad syntax (n)~ Violation of one or more of the rules governing formation of an expression, resulting in unacceptability or illegality.

bad word (n)~ A specific word or phrase that is specified on the basis of an organization's messsaging policy and used in keyword filtering (content filtering) to identify and prevent unwanted e-mail messages from being delivered to users in the organization.

bad word supervision policy (n)~ E-mail policy settings that prevent sending and receiving e-mail that has specifically banned content. Administrators can use this policy to

reject e-mail that contains profanity or other objectionable words, also known as bad words'.'

badge (n)~ A small icon, image or title that is associated with a user's name and that provides a visual indication of their role, contribution level, or other achievement or affiliation.

badge (n)~ An indication that appears on the lock screen or a tile to inform the user of recent activity or updates, such as number of email messages received, since the PC was locked or the app was last viewed.

badwill (n)~ The difference between the fair market value and purchase price of an asset, when the fair market value is higher than the price paid.

bag semantics (n)~ A form of semantics in which duplicates are allowed.

BAIDU (PN)~ An operating system for mobile devices based on Google's Android as an independent development by Baidu, the dominant search engine operator in China.

bailor (n)~ A person or an organization that transfers personal property or items, but not proprietary rights, to another person or organization for storage purposes.

Baker Supreme (n)~ A skill level in the Comfy Cakes game. Once you have completed a Comfy Cakes game, a player gets a skill level rank assigned automatically by the game (based on the score you hit during the game).

balance (n)~ The difference between the sum of debit entries and the sum of credit entries entered into an account during a financial period.

Balance (PN)~ A SmartArt graphic layout used to compare or show the relationship between two ideas. Each of the first two lines of Level 1 text corresponds to text at the top of one side of the center point. Emphasizes Level 2 text, which is limited to four shapes on each side of the center point. The balance tips towards the side with the most shapes containing Level 2 text. Unused text does not appear, but remains available if you switch layouts.

balance (n)~ The amount of economic resource required to bring opposite economic resource flows to a state of equilibrium.

balance account (n)~ An account that records transactions about assets and liabilities and that is used in the preparation of the balance sheet.

balance due (n)~ The unpaid amount that a customer owes a creditor.

balance sheet (n)~ A statement of the financial position of an organization that reports the state of assets, liabilities, and equity on a specified date.

balance sheet account (n)~ An account that describes the changes in value reported on a balance sheet.

balance sheet transaction (n)~ A posted ledger transaction that is associated with a balance account, asset account, or liability account.

balanced hierarchy (n)~ A dimension hierarchy in which all leaf nodes are the same distance from the root node.

balanced scorecard (n)~ A business-oriented scorecard that conveys key metrics related to the service and business of providing service. A balanced scorecard contains a balance of operational, financial and quality driven metrics.

balanced scorecard (n)~ A strategic performance management report that aligns, tracks, and measures key organization activity against objectives.

balanced scorecard methodology (n)~ A scorecard system that adheres to the framework and components established by the Balanced Scorecard Collaborative.

Ball Mode (n)~ A type of thumbnail view that allows the user to navigate through the thumbnails as if they were displayed around a sphere; user can use the direction keys or mouse to rotate' the thumbnails. This is an option on the View/Thumbnails menu of the XPS Viewer.'

Ballad (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 116.

balloon (n)~ An outlined container that displays a markup element, such as a comment or revision, in the margin of a document.

balloon (n)~ A small pop-up window that informs users of a non-critical problem or special condition in a control.

balloon tip (n)~ A ToolTip style design to provide message information about a control or object.

BAM (PN)~ A service that allows a customer to view and manage account and billing information for Microsoft services online.

BAM (n)~ A BizTalk Server feature that gives business users a real-time view of their heterogeneous business processes, enabling them to make important business decisions.

BAM Definition (n)~ An XML document that describes business activities and business views.

BAM Event Bus MMC (n)~ The MMC snap-in for the BAM Event Bus.

BAM Framework (n)~ A set of managed APIs that support dynamically created infrastructure and event concentration.

BAML (n)~ A binary representation of the objects and properties declared in an Extensible Application Markup Language (XAML) file.

banana clip (n)~ One of the two pipe (|) characters that appear on each side of a pattern to indicate that it is an active pattern.

Banco do Brasil (PN)~ A commercial bank in Brazil.

band (n)~ The interval between status thresholds that define a specific level of performance. All input values between the upper and lower thresholds or boundaries of a band have the same indicator status and performance level.

band (n)~ A container for label and control pairs and for complex controls such as grids.

banded (adj)~ Characterized by row or column-specific formatting. Often describes rows or columns of data that use alternating colors or shading to enhance readability.

banding (n)~ The use of bands to represent ranges of performance based on thresholds.

banding setting (n)~ A setting that defines thresholds, or boundaries between changes in indicator status.

bandwidth (n)~ In analog communications, the difference between the highest and lowest frequencies in a specific range. For example, an analog telephone line accommodates a bandwidth of 3,000 hertz (Hz), the difference between the lowest (300 Hz) and highest (3,300 Hz)

bandwidth (n)~ The data transfer capacity, or speed of transmission, of a digital communications system as measured in bits per second (bps).

bandwidth ~ A measure of total amount of data transferred over a period of time, often used to measure how busy a website is. A- webhostwill usually base its charges on the bandwidth a website uses, ie how much data per month is requested- from it.

bandwidth allocation protocol (n)~ A Point-to-Point Protocol (PPP) control protocol that is used on a multiprocessing connection to dynamically add and remove links.

bandwidth shaping ~ The process of manipulating, managing or controlling (shaping) portions of a network connection to the outside world and determining an allowed bandwidth consumption based on types of activities.

bandwidth throttling (n)~ The process of setting the maximum portion of total network capacity that a service is allowed to use. An administrator can deliberately limit a servers Internet workload by not allowing it to receive requests at full capacity, thus saving resources for other programs, such as e-mail.

bank (n)~ A business that keeps money for individual people or companies, exchanges currencies, makes loans, and offers other financial services.

bank ~ A slot or group of slots, usually on a systemboard (motherboard), that are populated by memory modules of the same capacity.

bank ~ A slang term for general memory in a computer; the memory bank.

bank advice (n)~ An official notice of a bank transaction.

bank balance (n)~ The amount of funds in a bank account after adding all the deposits and subtracting all the withdrawals and charges.

bank code (n)~ A unique bank registration number that a bank uses to identify itself.

bank fee (n)~ A charge made by a bank based on account status or activity such as minimum balance, overdrafts, or nonsufficient funds.

bank giro number (n)~ An address that points to a bank account.

bank payment (n)~ A payment for goods or services that a bank customer authorizes the bank to make on his behalf.

bank payment order (n)~ A source document that documents a request for a bank to perform an electronic funds transfer service.

bank reconciliation (n)~ The process of making the cash balance shown on a bank statement and the cash balance recorded for a bank account match as of a certain date.

bank reconciliation (n)~ A practice of reconciling a ledger account that represents a bank account by matching ledger account entries to bank statement entries.

bank remittance (n)~ An amount of money sent to or from an account in a bank.

bank sorting code (n)~ A 6-digit code used by the British and Irish banking industries to identify banks and route money transfers between banks.

bank statement (n)~ A statement that itemizes economic activity recorded in one or more accounts over a specified period of time.

bank transit number (n)~ A unique bank registration number that a bank uses to identify itself.

banker's rounding (n)~ The process of rounding a fraction to its nearest even integer.

Bankgiro Receivables (n)~ A complete deposit service product from BankGiroCentrolen, which provides accounts receivable and deposit handling support for organizations that use it.

BankGiroCentralen (n)~ The leading payment company in Sweden, which processes

payment transactions in a system called BankGirot and is owned by the majority of the banks that operate in Sweden.

BankGirot (n)~ An open system for exchanging payments between senders and recipients of payments in Sweden.

Banking & investments (PN)~ The Personal Finance subcategory containing apps to help people with their finances.

Banks Automated Clearing System (n)~ An automated clearinghouse system for electronic financial transactions.

banner (n)~ A graphic ad that spans the full width of the page and is normally 120 pixels high.

banner (n)~ A large-format publication, typically with one dimension much larger than the other, that is printed with a symbol, logo, slogan or other message.

banner (n)~ A transient message that contains relevant, time-sensitive information and that provides quick access to the subject of that content in an app.

banner page (n)~ The title page that may be added to printouts by most print spoolers. Such a page typically incorporates account ID information, job length, and print spooler information, and is used primarily to separate one print job from another.

BAP (n)~ A Point-to-Point Protocol (PPP) control protocol that is used on a multiprocessing connection to dynamically add and remove links.

BAPI (oth)~ The technology that is used to interface with the tax office server for submitting electronic tax declarations in the Netherlands.

BAR (n)~ A list of addresses that serves as a reference point for other addresses.

bar chart (n)~ A graph that uses horizontal bars to illustrate comparisons among individual data items.

bar chart (n)~ A chart with rectangular bars with lengths proportional to the values that they represent.

bar code (n)~ The special identification code printed as a set of vertical bars of differing widths on books, grocery products, and other merchandise. Used for rapid, error-free input in such facilities as libraries, hospitals, and grocery stores, bar codes represent binary information that can be read by an optical scanner. The coding can include numbers, letters, or a combination of the two; some codes include built-in error checking and can be read in either direction.

bar code reader (n)~ An optical device that uses a laser beam to read and interpret bar codes, such as the Universal Product Codes, found on grocery products and other retail items.

bar code scanner (n)~ An optical device that uses a laser beam to read and interpret bar codes, such as the Universal Product Codes, found on grocery products and other retail items.

bar graph (n)~ A graph that uses horizontal bars to illustrate comparisons among individual data items.

bar of pie chart (n)~ A pie chart with user-defined values extracted and combined into a stacked bar.

bar pointer (n)~ A pointer that is displayed as a bar, that is to which the bar type has been applied.

barcode (n)~ The special identification code printed as a set of vertical bars of differing widths on books, grocery products, and other merchandise. Used for rapid, error-free input in such facilities as libraries, hospitals, and grocery stores, bar codes represent binary information that can be read by an optical scanner. The coding can include numbers, letters, or a combination of the two; some codes include built-in error checking and can be read in either direction.

bare bones (adj)~ An application that provides only the most basic functions necessary to perform a given task.

bare-metal backup (n)~ A backup that includes all critical volumes so that the recovered system is bootable. It can optionally include all the data volumes so that, if a recovery is performed to a new hard disk, the data volumes also get restored. You can rebuild a machine from scratch and it works on alternate hardware too.

bare-metal computer (n)~ A computer that does not have an operating system installed.

bare-metal recovery (n)~ A recovery of a system using a backup that contains critical volumes and, optionally, data files that you can use to rebuild a system from scratch or rebuild a system using alternate hardware.

Bargain Stocks (PN)~ Fast-growing small-cap stocks with high dividends that are good buys.

barrel button (n)~ A button on some tablet pens. You can use it to perform certain actions, including a mouse right-click equivalent.

barter (n)~ The exchange of goods and services for advertising without the exchange of cash. The barter value equals the dollar value of the goods and services. This is a recognized form of revenue under GAAP (Generally Accepted Accounting Principles).

BAS (n)~ A BizTalk Server feature that enables business users to configure business processes and interact with trading partners.

BAS (n)~ A form that Australian businesses file to report and pay taxes.

basal metabolic rate (n)~ The amount of energy that is needed to support the body's most basic functions when at rest. The Basal metabolic rate (or BMR) is the number of calories a person needs per day to stay alive.

base (n)~ A mathematical object that is the basis for a derivation, system, or formulation.

base 2 (n)~ Having two components, alternatives, or outcomes. The binary number system has 2 as its base, so values are expressed as combinations of two digits, 0 and 1. These two digits can represent the logical values true and false as well as numerals, and they can be represented in an electronic device by the two states on and off, recognized as two voltage levels. Therefore, the binary number system is at the heart of digital computing.

Base 64 encoding (n)~ A binary-to-text encoding scheme whereby an arbitrary sequence of bytes is converted to a sequence of printable ASCII characters.

base address (n)~ The part of a two-part memory address that remains constant and provides a reference point from which the location of a byte of data can be calculated.

base address register (n)~ A list of addresses that serves as a reference point for other addresses.

base amount (n)~ The amount of a transaction before taxes. Taxes are calculated on the base amount.

base backup (n)~ A data backup of a database or files upon which a differential backup is

fully or partially based. The base backup is the most recent full or file backup of the database or files.

base calendar (n)~ A template that can be used as a project and task calendar to specify default working and nonworking time for a set of resources.

Base Capacity (n)~ The amount of available time a resource has to work based on their resource base calendar. This is equivalent to the capacity of the position to which the resource is assigned. For example, a resource in a 70% part-time position has a Base Capacity of .7FTE. Not very useful for scheduling but of more value in determining the maximum capacity or cost of an organization.

base catalog (n)~ A catalog containing product data that is referenced by a virtual catalog. Base catalogs are stored in the catalog database.

base character (n)~ A character that has meaning independent of other characters, or any graphical character that is not a diacritical mark.

base class (n)~ A class from which other classes are derived by inheritance.

base class (n)~ A class that assumes a parent role when it participates in an inheritance relationship with another class.

base class library (n)~ A library that contains base classes.

base content type (n)~ A type of data contained in a PKCS #7 message. Base content types only contain data, no cryptographic enhancements such as hashes or signatures. Currently, the only base content type is the Data content type.

base currency (n)~ The currency a business uses to record all transactions in their ledgers, or the primary currency in which they transact with their bank. The base currency is also commonly referred to as the billing currency, functional currency, or booking currency of a business. The Order Processing pipeline always processes orders using the base currency of the Web site. The base currency can be different than the buyer currency and the supplier currency. The base currency is stored in the billing_currency field in the orderform header.

base currency unit (n)~ The computed currency unit in an exchange rate calculation.

base data type (n)~ Any system-supplied data type, for example, char , varchar , binary , and varbinary . User-defined data types are derived from base data types.

base entity (n)~ A generic entity that all other entities in the system inherit base functionality from.

base file name (n)~ In a log definition, the part of the log file name that is the same for all of the log files that are created. The base file name and a timestamp form the complete log file name, for example, Basefilename_timestamp.log. The timestamp value varies, depending on the selected log file rollover option.

Base Filtering Engine (n)~ A service that coordinates the filtering platform components.

base forecast (n)~ The estimate of sales volume based on the sales volume from previous time periods.

base language (n)~ The language used for the installation of software.

base location (n)~ A URL that you can specify for a Web page in order to convert all relative URLs on that page to absolute URLs.

base object (n)~ The object that a synonym references.

base period (n)~ The reporting period specified in the report definition. The column

definition can refer to the base period in order to specify report columns for relative time periods. For example, if the column definition specifies BASE in the Period cell, then the actual period is defined at the time the report is generated.

base row (n)~ The row of a report that is used for percentage calculations in a column definition.

Base Smart Card Cryptographic Service Provider (n)~ The basic software module for by smart cards that performs cryptography and includes algorithms for authentication, encoding, and encryption.

Base Smart Card CSP (n)~ The basic software module for by smart cards that performs cryptography and includes algorithms for authentication, encoding, and encryption.

base style (n)~ The underlying or original style on which other styles in a document are dependent. When you change a formatting element of the base style in a document, all other styles that originate from the base style will also reflect the change.

base table (n)~ A table stored permanently in a database. Base tables are referenced by views, cursors, SQL statements, and stored procedures.

base table (n)~ A table that assumes a parent role when it participates in an inheritance relationship with another table.

base type (n)~ A parent type or super-type in the Entity Data Model from which derived types inherit some of their properties.

base unit (n)~ A fundamental unit of measure in a system of measurement from which other units are derived.

base unit (n)~ A Surface developer unit that has metal panels, with the I/O connections exposed on one end of the unit. In contrast, a finished unit has acrylic side and end panels.

base URL (n)~ A URL that you can specify for a Web page in order to convert all relative URLs on that page to absolute URLs.

base year (n)~ The reporting period that is specified in the report definition, displayed as years. The column definition can refer to the base year to specify report columns for relative time periods.

baseband (n)~ Of or relating to communications systems in which the medium of transmission (such as a wire or fiber-optic cable) carries a single message at a time in digital form. Baseband communication is found in local area networks such as Ethernet and Token Ring.

baseboard management controller (n)~ A specialized service processor that monitors the physical state of a computer, network server or other hardware device using sensors and communicating with the system administrator through an independent connection. The BMC is part of the Intelligent Platform Management Interface (IPMI) and is usually contained in the motherboard or main circuit board of the device to be monitored.

Based on Location… (Adverb) ~ An item on the Call Forwarding On menu, which is opened from the user's My Status menu. This item automatically forwards incoming calls based on the user's current location.

baseline (n)~ The original plan for a project, a work package, or an activity.

baseline (n)~ A range of measurements derived from performance monitoring that represents acceptable performance under typical operating conditions.

baseline cost (n)~ The original project, resource, and assignment cost as shown in the

baseline plan. The baseline cost is a snapshot of the cost at the time when the baseline plan was saved.

baseline DC (n)~ A domain controller used as the control for Group Policy Object (GPO) replication within that domain to which all GPO content is compared.

baseline domain controller (n)~ A domain controller used as the control for Group Policy Object (GPO) replication within that domain to which all GPO content is compared.

baseline guide (n)~ A layout guide to which lines of text can be aligned to provide a uniform appearance between columns of text.

baseline plan (n)~ The original project plans [up to 11 per project] used to track progress on a project. The baseline plan is a snapshot of your schedule at the time that you save the baseline and includes information about tasks, resources, and assignments.

Basic (adj)~ An Azure Web site hosting tier, used for pricing calculation.

Basic Application Gateway (Large) (n)~ A billing meter for the Basic Application Gateway service in Azure based on long usage time.

Basic Application Gateway (Medium) (n)~ A billing meter for the Basic Application Gateway service in Azure based on mid-sized usage time.

Basic Application Gateway (Small) (n)~ A billing meter for the Basic Application Gateway service in Azure based on short usage time.

Basic authentication (n)~ An authentication mechanism that is supported by most browsers, including Internet Explorer, and encodes (but does not encrypt) user name and password data before transmitting it over the network.

Basic Batch (n)~ The Basic tier for the Microsoft Azure service that enables large amounts of discrete, compute-intensive batches of tasks to be easily executed in Azure. Typical workloads include media transcoding, rendering, test suite execution, simulations, image analysis, and file processing.

Basic Bending Process (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow. Maximizes both horizontal and vertical display space for shapes.

Basic BizTalk unit (n)~ A unit of measure for the compute capacity and memory used by the Basic tier of Microsoft Azure BizTalk Services.

Basic Block List (PN)~ A SmartArt graphic layout used to show non-sequential or grouped blocks of information. Maximizes both horizontal and vertical display space for shapes.

basic calibration (n)~ The calibration process to capture the blank reference image and white reference image for a Surface unit.

Basic Chevron Process (PN)~ A SmartArt graphic layout used to show a progression; a timeline; sequential steps in a task, process, or workflow; or to emphasize movement or direction. Level 1 text appears inside an arrow shape while Level 2 text appears below the arrow shapes.

Basic Columns (n)~ A grouping of column headings on a report.

basic constraint (n)~ A constraint used to ensure that a certificate is only used in certain applications.

Basic Cycle (PN)~ A SmartArt graphic layout used to represent a continuing sequence of stages, tasks, or events in a circular flow. Emphasizes the stages or steps rather than the

connecting arrows or flow. Works best with Level 1 text only.

basic disk (n)~ A physical disk that can be accessed by MS-DOS and all Windows-based operating systems. Basic disks can contain up to four primary partitions, or three primary partitions and an extended partition with multiple logical drives.

Basic Event Hubs (n)~ The Basic tier of the feature in Service Bus that provides large-scale ingestion, persistence and processing of data events from high-throughput data sources and/or millions of devices. The ingested events are stored durably until the required retention period expires.

Basic Firewall (n)~ A component of the Routing and Remote Access service that combines dynamic packet filtering of network traffic with a set of static packet filters.

basic hunt group (n)~ The simplest workflow which hunts one or more agents using any administrator-defined agent selection algorithm and supports overflowing based on time in queue or call volume.

basic input/output system (n)~ The set of essential software routines that test computer hardware at startup, start the operating system, and support the transfer of information between hardware devices. The BIOS is stored in read-only memory (ROM) so that it can be run when the computer is turned on. Although critical to performance, the BIOS is usually invisible to computer users.

Basic Large App Service Hours (n)~ A new name for Large Basic Websites Hours, a billing meter for the Microsoft Azure Web Sites service based on long usage time.

basic logging (n)~ A type of logging available to capture information about mailbox searches that includes information about the search and who performed it.

basic marker map (n)~ A map that displays a marker at each location (for example, cities) and varies marker color, size, and type.

Basic Matrix (PN)~ A SmartArt graphic layout used to show the relationship of components to a whole in quadrants. The first four lines of Level 1 text appear in the quadrants. Unused text does not appear, but remains available if you switch layouts.

Basic Medium App Service Hours (n)~ A new name for Medium Basic Websites Hours, a billing meter for the Microsoft Azure Web Sites service based on mid-sized usage time.

basic membership (n)~ The membership status that configures the anti-malware application to send basic information to Microsoft about software that Windows Intune Endpoint Protection detects.

Basic Mobile Services unit (n)~ A unit of measure for the Basic tier of the Microsoft Azure Mobile Services service.

Basic Notification Hub unit (n)~ A unit of measure for the Basic tier of the Microsoft Azure Notification Hubs service.

Basic Notification Hubs (n)~ he Basic tier of the highly scalable, cross-platform push notification infrastructure that enables users to either broadcast push notifications to millions of users at once or tailor notifications to individual users.

basic page (n)~ A Web Parts page that contains only one Web Part zone and, by default, a Content Editor Web Part.

Basic Pie (PN)~ A SmartArt graphic layout used to show how individual parts form a whole. The first seven lines of Level 1 text correspond to the evenly distributed wedge or pie shapes. The top Level 1 text shape appears outside of the rest of the pie for emphasis.

Unused text does not appear, but remains available if you switch layouts.

Basic Process (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow.

Basic Pyramid (PN)~ A SmartArt graphic layout used to show proportional, interconnected, or hierarchical relationships with the largest component on the bottom and narrowing up. Level 1 text appears in the pyramid segments and Level 2 text appears in shapes alongside each segment.

Basic Radial (PN)~ A SmartArt graphic layout used to show the relationship to a central idea in a cycle. The first line of Level 1 text corresponds to the central shape, and its Level 2 text corresponds to the surrounding circular shapes. Unused text does not appear, but remains available if you switch layouts.

Basic Small App Service Hours (n)~ A new name for Small Basic Websites Hours, a billing meter for the Microsoft Azure Web Sites service based on short usage time.

basic storage (n)~ A storage method in MS-DOS and Windows for primary partitions, extended partitions, and logical drives.

Basic Target (PN)~ A SmartArt graphic layout used to show containment, gradations, or hierarchical relationships. The first five lines of Level 1 text are associated with a circle. Unused text does not appear, but remains available if you switch layouts.

Basic Timeline (PN)~ A SmartArt graphic layout used to show sequential steps in a task, process, or workflow, or to show timeline information. Works well with both Level 1 and Level 2 text.

Basic Title (n)~ A title animation in Windows Movie Maker.

Basic user (n)~ A unit of measure for users of the Visual Studio Online Basic service offering.

Basic Venn (PN)~ A SmartArt graphic layout used to show overlapping or interconnected relationships. The first seven lines of Level 1 text correspond with a circle. If there are four or fewer lines of Level 1 text, the text is inside the circles. If there are more than four lines of Level 1 text, the text is outside of the circles. Unused text does not appear, but remains available if you switch layouts.

Basic VM Support hour (n)~ A unit of measure of time for the Basic level of support for a virtual machine.

basic volume (n)~ A primary partition or logical drive that resides on a basic disk.

Basics (PN)~ The part of a Yammer profile that shows a user's first and last name, email address, and photograph.

basket (n)~ A list of items that a customer has selected to purchase from a commerce Web site. It is usually compiled into a file and sometimes visually represented by a shopping basket, shopping cart, or other container used when shopping.

batch (n)~ A set of requests or transactions that have been grouped together.

batch (n)~ A quantity of one or more items produced in one operation.

Batch (PN)~ A Microsoft Azure service that enables large amounts of discrete, compute-intensive batches of tasks to be easily executed in Azure. Typical workloads include media transcoding, rendering, test suite execution, simulations, image analysis, and file processing.

Batch account (n)~ A uniquely identified entity within the Batch service.

batch attribute (n)~ A product attribute of a process batch or a transfer batch.

batch balancing (n)~ A process that adjusts the required quantities of ingredients that are used in the production of a formula based on the level of potency of active ingredient of a specific inventory batch.

batch file (n)~ An ASCII (unformatted text) file that contains one or more operating system commands. A batch program's file name has a .cmd or .bat extension. When you type the file name at the command prompt, or when the batch program is run from another program, its commands are processed sequentially.

batch group (n)~ A group of batch jobs. An administrator can determine which application object server (AOS) runs the jobs, and how many jobs an AOS runs.

batch job (n)~ A set of computer processes that can be run without user interaction.

batch process (n)~ A production process for producing items in batches.

batch processing (n)~ The execution of a batch file.

batch program (n)~ An ASCII (unformatted text) file that contains one or more operating system commands. A batch program's file name has a .cmd or .bat extension. When you type the file name at the command prompt, or when the batch program is run from another program, its commands are processed sequentially.

batch rename (n)~ A feature that enables the user to rename many files at once.

batch script (n)~ A script that consists of the commands contained in a batch file.

batch task (n)~ One of a set of tasks that make up a batch job. The tasks within a batch job may have complex dependencies between them.

batch update (n)~ An update that processes multiple database records in a single operation.

batching (n)~ The process of sending changes in small groups instead of in a one-shot transfer of the data in its entirety.

battery (n)~ A power source for a portable device.

battery charge (n)~ The amount of battery power left on the system.

battery level (n)~ The amount of battery power left on the system.

battery life (n)~ The time for which a dry or alkaline cell is able to produce an electric current before it needs to be replaced.

battery life (n)~ The time for which the cell(s) in a rechargeable battery can produce an electric current before the battery needs to be recharged.

Battery Saver (PN)~ A feature to help monitor and save on battery usage.

battery saver (PN)~ A feature to help monitor and save on battery usage.

battery-friendly maintenance (n)~ A feature that enables IT professionals to wake mobile systems for servicing by using a timer that activates only when the computer is plugged in. Using this feature, Windows runs maintenance only if the computer is using AC power.

baud (n)~ The speed at which a modem transmits data.

baud rate (n)~ The speed at which a modem can transmit data, measured by the number of events, or signal changes, that occur in one second.

Baud Rate ~ The speed at which a modem sends and receives data, e.g., 2400 bps, 9600 bps. One baud is roughly equivalent to one bit per second.

Bayesian Graphical Model (n)~ A probabilistic method of modeling for risk analysis to

measure and reduce uncertainty.

BBBOnLine (n)~ A privacy seal program established by the Better Business Bureau which certifies that certain Web sites conform to baseline privacy standards. Microsoft is a sponsor of BBBOnLine.

BBFC 12+ (n)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

BBFC 15+ (n)~ A game rating symbol developed by the British Board of Film Classification (BBFC).

BBFC 18+ (n)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

BBFC R18+ (n)~ A game rating symbol developed by the British Board of Film Classification (BBFC).

BBS (n)~ An application or computer that makes it possible to join an online community and exchange messages, share files, and participate in Usenet and chat rooms, often at not cost. The BBS found its inspiration in traditional bulletin boards that held participants' posted communication.

Bcc line (n)~ Text box located on the Compose page. Provides space for users to type the e-mail address(es) of those who will be the blind' recipient(s) of an e-mail message. Derives from the term blind carbon copy. Note! Primary recipients (those on the To line) and secondary recipients (those on the Cc line) will not see the names and e-mail addresses of those on the Bcc line.'

BCD (n)~ A data store that contains boot configuration parameters and controls how the operating system is started beginning with Windows Vista or Windows Server 2008.

BCD object (n)~ A collection of elements that describes the settings for the object that are used during the boot process. There are three main types of objects: application, device, and inherited.

BCG (n)~ A serum against tuberculosis that is prepared from a strain of the weakened live bovine tuberculosis bacillus and used for vaccination against tuberculosis and also in cancer chemotherapy.

BCP (n)~ A command prompt bulk copy utility that copies SQL Server data to or from an operating system file in a user-specified format.

BCS solution deployment (n)~ BCS server to client solution deployment that is based on ClickOnce technology.

BCWP (n)~ The earned value field that indicates how much of the task's budget should have been spent, given the actual duration of the task.

BCWS (n)~ The earned value field that shows how much of the budget should have been spent, in view of the baseline cost of the task, assignment, or resource. BCWS is calculated as the cumulative timephased baseline costs up to the status date or today's date.

BDC Administration object model (n)~ An object model that lets you- create, read, update, and delete metadata objects in the BDC Metadata Store.

BDC Client Runtime (PN)~ A set of services and functions that uses Business Connectivity Services on the client computer to connect to and execute operations on external data sources for rich client access.

BDC Metadata Store (PN)~ The collection of XML files, stored in the Business Data Connectivity Service, that contain definitions of models, external content types, and external data sources.

BDC model (n)~ An XML file that contains sets of descriptions of one or more external content types, their related external data sources, and information that is specific to the environment, such as authentication properties.

BDC publishing (n)~ The process of simultanously importing all Duet BDC models.

BDC Runtime object model (n)~ An object model designed for use by BDC clients and applications that provides an intuitive, object-oriented interface that abstracts the underlying data sources.

BDC Service Application (n)~ A deployed instance of the Business Data Connectivity Shared Service.

BDC Service Application Proxy (PN)~ An application proxy that allows Web applications to connect to a Business Data Connectivity Shared Service Application and contains features for using the shared service.

Be Right Back (PN)~ An item on the user's My Status menu that can be selected to indicate that the user is away from the computer but will return shortly.

beacon (n)~ A snippet of software placed in an advertisement or e-mail message, or on a Web page to help measure delivery of the item to a Web browser and to track a user's actions in general.

beacon (n)~ A signal that tells your Xbox Live and Facebook friends that you want to play a particular game, and notifies you when friends are playing or want to play that game.

beam (v)~ To transfer information between mobile devices or a device and desktop computer using infrared (IR) or Bluetooth.

bearer channel (n)~ One of the 64Kbps communications channels that carry data on an ISDN circuit. A BRI (Basic Rate Interface) ISDN line has two B channels and one D (data) channel. A PRI (Primary Rate Interface) ISDN line has 23 B channels (in North America) or 30 B channels (in Europe) and one D channel.

Beat (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 135.

beat-'em-up ~ A computer game in which you control one or more characters fighting onscreen using karate, kung-fu and so forth. Derives from- shoot-'em-up.

beats per minute (n)~ The number of heartbeats per minute.

Bebob (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 85.

before event (n)~ A synchronous event whose handler runs completely before the action that raised the event starts.

begin date (n)~ The date when a project or task is scheduled to begin.

begin point (n)~ The selection handle at the beginning of a one-dimensional (1-D) shape. The begin point is marked by an X.

begin time (n)~ The time at which an animation timeline should begin, relative to its

parent's BeginTime. If this timeline is a root timeline, the time is relative to its interactive begin time (the moment at which the timeline was triggered).

beginpoint (n)~ A provider in a Web Part connection that sends data to consumers, used in connections for PerformancePoint Web Parts.

behavior (n)~ A component that controls various run-time aspects of a service, an endpoint, a particular operation, or a client. Behaviors are grouped according to scope: common behaviors affect all endpoints globally, service behaviors affect only service-related aspects, endpoint behaviors affect only endpoint-related properties, and operation-level behaviors affect particular operations.

behavior extension element (v)~ An XML element in a configuration file that allows you to configure a service behavior.

behavioral analysis (n)~ Functions that enable users to track the online activity of prospects, customers, and all types of Internet users.

behaviors (n)~ Reusable components that encapsulate interactive behavior and can be applied to objects in an application. A behavior may contain some state, and may expose one or more commands.

Belastingdienst (n)~ The Dutch Tax Office.

Belastingdienst application programming interface (n)~ The technology that is used to interface with the tax office server for submitting electronic tax declarations in the Netherlands.

bell contour (n)~ A contour that follows the general shape of a bell curve.

benchmark (n)~ A quantitative measure of performance that is used to compare the company's products, services, or processes to an external standard. Competitive benchmarks are based on industry best, and process benchmarks are based on best in class.

benchmark / benchmarking ~ a computer program used to test the performance of a computer or a piece of software.

benchmark / benchmarking ~ Measuring performance qualities (such as efficiency or spending) of enterprise organizations or processes (such IS) against comparative benchmarks.

Bending Picture Accent List (PN)~ A SmartArt graphic layout used to show non-sequential or grouped blocks of information. The small circular shapes are designed to contain pictures. Works well for illustrating both Level 1 and Level 2 text. Maximizes both horizontal and vertical display space for shapes.

beneficiary (n)~ A person who is a member of an organization that provides benefits, or a party who is designated as the recipient a benefit.

beneficiary correspondent account (n)~ A 20-digit number used to identify a Central Bank of Russian Federation account needed to facilitate international transactions.

beneficiary INN (n)~ A 10-12 digit number used to identify individual and organizational taxpayers in the Russian Federation receiving funds through an international transaction.

beneficiary KPP (n)~ A numerical code used in combination with a beneficiary INN to identify and categorize a taxpayer identity in the Russian Federation.

beneficiary RUT (n)~ An 8 or 9-digit number issued to all individuals and organizations in Chile for identification and taxation purposes during an international financial transaction.

benefit (n)~ Indirect compensation or reward offered by an organization.

Benefit/deductions (PN)~ A UI element that allows a user to specify the type of charge or service that is paid for by the employee, by the employer, or by both the employee and employer. Benefit/deductions paid by an employer are calculated during the payment process and then captured for reporting and remittance purposes.

Berkeley Internet Name Domain (n)~ An implementation of Domain Name System (DNS) written and ported to most available versions of the UNIX operating system. The Internet Software Consortium maintains the BIND software.

Berkeley Software Distribution (n)~ A UNIX version developed at the University of California at Berkeley, providing additional capabilities such as networking, extra peripheral support, and use of extended filenames. BSD UNIX was instrumental in gaining widespread acceptance of UNIX and in getting academic institutions connected to the Internet. BSD UNIX is now being developed by Berkeley Software Design, Inc.

Bessel function (n)~ A worksheet function that can be used to perform engineering calculations in Excel.

best before date (n)~ A recommended date for obtaining the optimum quality or characteristic of a product.

best before period (n)~ The time period in which to obtain the optimum quality or characteristic of a product.

Best Bet (PN)~ Content or links that an administrator associates with specific keywords, and that are displayed prominently in search results when a query contains one of those keywords.

Best Bet Suggestions report (n)~ A Web analytics report that identifies terms that should become Best Bets.

Best Bet Usage report (n)~ A Web analytics report that identifies the Best Bet terms and how they are utilized by the system.

best practice (n)~ A practice recognized and advocated as an effective or efficient means of achieving desired objectives.

best practice ~ A group of tasks that optimizes the efficiency or effectiveness of the business discipline or process to which it contributes. Best practices are generally adaptable and replicable across similar organizations or enterprises.

best practice rule (n)~ A rule that is optionally enforced after compilation in X++. The rules represent safe or consistent code design.

Best Practices Analyzer (PN)~ A tool which examines a system configuration and the settings against a set of pre-defined rules to generate a list of issues outlining any best practice violations it finds.

Best rated (PN)~ The category that lists the highest rated items (apps or games) at a given point in time.

Best Rated Apps (PN)~ The category that lists the highest rated items (apps or games) at a given point in time.

Best rated apps (PN)~ The category that lists the highest rated items (apps or games) at a given point in time.

Best Rated Games (PN)~ The category that lists the highest rated items (apps or games) at a given point in time.

Best rated games (PN)~ The category that lists the highest rated items (apps or games) at a given point in time.

best-effort ~ Describes a network system that does not use a sophisticated acknowledgment system to guarantee reliable delivery of information.

beta (adj)~ Of or relating to software or hardware that is a beta.

beta ~ Software that's still in the testing stage not quite ready for wide release. During a beta test users report bugs back to the developers.

bevel (n)~ A three-dimensional edge effect that is applied to the border of an object.

bevel join (n)~ The join style where two lines join at an angle creating a straight edge cutting off the corner.

Bezier curve (n)~ A curve that is calculated mathematically to connect separate points into smooth, free-form curves and surfaces of the type needed for illustration programs and CAD models. Bezier curves need only a few control points to define a large number of shapes—hence their usefulness over other mathematical methods for approximating a given shape.

Bezier path (n)~ A vector path defined by anchor points and path segments between those points.

Bezier spline (n)~ A spline defined by four points: a start point, two control points that influence the curves, and an endpoint.

BFE (n)~ A service that coordinates the filtering platform components.

b-frame (n)~ In MPEG and WMV encoding, a frame that contains only the differences from the frame preceding it and the frame following it.

BG Max (n)~ The payment import file format used by the Bankgiro Receivables product.

BGC (oth)~ The leading payment company in Sweden, which processes payment transactions in a system called BankGirot and is owned by the majority of the banks that operate in Sweden.

BGM (n)~ A probabilistic method of modeling for risk analysis to measure and reduce uncertainty.

BGP peer (n)~ A peer connected to other peers on the Border Gateway Protocol level.

BGP peering (n)~ The process of route exchange between peers via the Border Gateway Protocol.

BHO (n)~ An in-process Component Object Model (COM) component that Internet Explorer will load each time it starts; it runs in the same memory context as the browser and can perform actions on the available windows and modules.

bias (n)~ In mathematics, an indication of the amount by which the average of a group of values deviates from a reference value.

bicubic (adj)~ A rendering method used to map a source image to a target image. This method uses the weighted average of the sixteen nearest source pixels to define a target pixel.

bicubic filtering (adj)~ A rendering method used to map a source image to a target image. This method uses the weighted average of the sixteen nearest source pixels to define a target pixel.

bid (n)~ The price at which a buyer has offered to purchase an item.

bid ~ An attempt to gain control over a line in order to transmit data.Usually associated

with contention style of sharing a single line among several terminals.

bidded keyword (n)~ In search advertising, the search term that you bid on to make your ad appear on the corresponding search results page.

bidi (adj)~ Pertaining to a mixture of characters that are read from left to right and characters that are read from right to left.

bidirectional (adj)~ Pertaining to a mixture of characters that are read from left to right and characters that are read from right to left.

bidirectional prediction (n)~ A compression technique in which some images are predicted from the picture immediately preceding and following the image.

bidirectional predictive frame (n)~ In MPEG and WMV encoding, a frame that contains only the differences from the frame preceding it and the frame following it.

bidirectional support (n)~ The ability for a printer to support bidirectional printing.

bifurcation (n)~ The act of splitting a single copy of a message to multiple copies of the message.

Big Band (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 96.

Big Blue ~ A slang name for IBM. Blue is IBM's corporate color.

big endian (adj)~ Pertaining to a processor memory architecture that stores numbers so that the most significant byte is placed first.

bigint (n)~ An integer data type with a value from -2^63 (-9223372036854775808) through 2^63-1 (9223372036854775807).

BIK (n)~ A series of 9 digits used to identify Russian Federation banks for routing transactions.

Bilevel ~ A type of image containing only black and white pixels.

bilinear (n)~ A rendering method used to map a source image to a target image. This method uses the weighted average of the four nearest source pixels to define a target pixel.

bilinear filtering (n)~ A rendering method used to map a source image to a target image. This method uses the weighted average of the four nearest source pixels to define a target pixel.

bilingual glossary (n)~ An alphabetical list of technical terms in some specialized field of knowledge that includes terms in two languages.

bill (n)~ A request for payment for products and/or services sold.

bill of exchange (n)~ A source document that documents an unconditional request for a third-party to pay a second party on demand.

bill of lading (n)~ A business document issued by a carrier to a shipper that serves as the document of title.

bill of material version (n)~ A specific configuration of a bill of material (BOM) to include an item. An item can be associated with a number of BOM versions.

bill of materials (n)~ A list of the components and subassemblies needed to build one unit of a product. A bill of materials also shows quantities for each component.

bill of materials (n)~ A list of products and their quantities that are required to produce one product.

bill of materials explosion (n)~ The process of identifying the components, and their

quantities, that are required to produce an item.

bill of materials item (n)~ An itemized product defined by a bill of materials.

billable time (n)~ An amount of time in which work or a task is performed. A client/customer can be charged for the time spent performing the task.

billfold (n)~ A paper size of 95.25mm x 171.45 mm.

Billing (n)~ A button or other UI element that links to billing-related information.

Billing (PN)~ A navigation bar item that links to billing-related information.

billing (n)~ Pertaining to a request for payment.

billing account (n)~ An account where customers manage their payments, dues, invoicing, and contact information for paid Microsoft services. These accounts are managed on the Billing and Account Management website.

billing address (n)~ The address to which the invoice for products ordered should be sent.

billing address information (n)~ The complete set of bill-to address information that makes up the full postal address.

billing administrator (n)~ A Microsoft Online Services administrator who can make purchases, manage subscriptions, manage support tickets, and monitor services health.

billing classification (n)~ A payment request classifier documented on customer invoices that govern payment terms and conditions and the processing of the invoices.

billing frequency (n)~ The frequency that a billing cycle will be used to create billing invoices for a customer.

billing information (n)~ Information, such as name, billing address, and payment method, related to paying for account services.

Billing Manager (n)~ A button or other UI element that links to billing-related information.

billion (n)~ In American usage (as is usual with microcomputers), a thousand million, or 109. Computer terminology uses the prefixes giga-for 1 billion and nano-for 1 billionth.

bill-to address (n)~ The address to which the invoice for products ordered should be sent.

bin (n)~ A handling unit for storing and transferring items.

BIN2 (PN)~ The suffix for collation names that implement the code-point collation semantics.

binary (adj)~ Having two components, alternatives, or outcomes. The binary number system has 2 as its base, so values are expressed as combinations of two digits, 0 and 1. These two digits can represent the logical values true and false as well as numerals, and they can be represented in an electronic device by the two states on and off, recognized as two voltage levels. Therefore, the binary number system is at the heart of digital computing.

binary (n)~ A fixed-length data type with a maximum length of 8,000 bytes of binary data.

Binary ~ A numbering system with only two values: 0 (zero) and 1 (one).

Binary Application Markup Language (n)~ A binary representation of the objects and properties declared in an Extensible Application Markup Language (XAML) file.

binary association (n)~ In a static structure diagram, a relationship between exactly two classes. You can add name and stereotype properties to a binary association. The point where a binary association connects to a class is an association end or role.

binary behavior (n)~ A component attached to HTML elements which encapsulate specific functionality.

binary collation (n)~ A collation where data is sorted based on the sequence of coded values defined by the locale and data type.

binary delta replication (n)~ A Configuration Manager process that copies- only the changed portions of a package or content- file rather than the entire file when an update has been made.

binary digit (n)~ The smallest unit of information handled by a computer or device. One bit expresses a 1 or a 0 in a binary numeral, or a true or false logical condition. A group of 8 bits makes up a byte, which can represent many types of information, such as a letter of the alphabet, a decimal digit, or other character.

binary file (n)~ A file that contains encoded information that is interpreted according to the application that created it. In general, a binary file can be edited only by the application in which it was created.

binary large object (n)~ A discrete packet of binary data that has an exceptionally large size, such as pictures or audio tracks stored as digital data, or any variable or table column large enough to hold such values. The designation binary large object' typically refers to a packet of data that is stored in a database and is treated as a sequence of uninterpreted bytes.'

binary notation (n)~ Representation of numbers using the binary digits, 0 and 1.

binary number (n)~ A number expressed in binary form, or base.

binary planting (n)~ An attack that tricks an application into loading a malicious library when it thinks it's loading a trusted library.

binary search (n)~ A type of search algorithm that seeks an item, with a known name, in an ordered list by first comparing the sought item to the item at the middle of the list's order. The search then divides the list in two, determines in which half of the order the item should be, and repeats this process until the sought item is found.

binary transfer (n)~ The preferred mode of electronic exchange for executable files, application data files, and encrypted files.

binary tree (n)~ In programming, a specific type of tree data structure in which each node has at most two sub-trees, one left and one right. Binary trees are often used for sorting information; each node of the binary search tree contains a key, with values less than that key added to one subtree and values greater than that key added to the other.

bind (v)~ To connect a control to a field or group in the data source so that data entered into the control is saved to the corresponding field or group. When a control is unbound, it is not connected to a field or group, and data entered into the control is not saved.

BIND (n)~ An implementation of Domain Name System (DNS) written and ported to most available versions of the UNIX operating system. The Internet Software Consortium maintains the BIND software.

bind redirection (n)~ An Active Directory Lightweight Directory Services (AD LDS) mechanism that enables AD LDS to accept bind requests from applications that want to use AD LDS as the application data store. Through AD LDS bind redirection, AD LDS redirects bind requests to AD DS based on the contents of a proxy object that represents an Active Directory security principal. This proxy object can be augmented to store

additional data related to the security principal that is specific to the application.

bind token (n)~ A bind token is a character string that uniquely identifies each bound transaction.

binder (n)~ Any construct that associates a variable to a value (or type, etc.).

binder class (n)~ A class that selects a member from a list of candidates, and performs type conversion from actual argument type to formal argument type.

binder constructor (n)~ A constructor that initializes a new instance of the Binder class.

binder divider (n)~ A page size type. A small paper piece that is inserted into a transparent plastic tab which divides binder sections or paper files.

binder method (n)~ A method that executes binding operations.

binding (n)~ A process by which software components and layers are linked together. When a network component is installed, the binding relationships and dependencies for the components are established. Binding allows components to communicate with each other.

binding (n)~ The process of creating a link between a property and a source. The source can be local or external.

binding (n)~ A relationship created between a property and a source. The source can be local or external.

binding (n)~ In Analysis Services, a defined relationship between an attribute or a measure and one or more underlying columns in a dimension or fact table.

binding (n)~ A representation of the communication path between actors.

binding (n)~ A request in a search query for a column in a returned rowset.

binding dependency (n)~ A kind of dependency that indicates a binding of parameterized class, or template, parameters to actual values to create a bound, or nonparameterized, element.

binding entry (n)~ A mapping between a field in a table and a variable. In the ADO Visual C++ extensions, Recordset fields are mapped to C/C++ variables.

binding file (n)~ A file that contains a snapshot of the binding as seen at that instant. It does not contain details about the completeness of the binding with respect to the orchestration.

binding pattern (n)~ A rule for binding matched values in a logical structure to variable or constant names.

binding policy (n)~ A policy that establishes which version of an assembly is loaded by the common language runtime.

binding source (n)~ In data binding, the object from which the value is obtained.

binding target (n)~ In data binding, the object that consumes the value of the binding.

binding time (n)~ The point in a program's use at which binding of information occurs, usually in reference to program elements being bound to their storage locations and values. The most common binding times are during compilation (compile-time binding), during linking (link-time binding), and during program execution (run-time binding).

Bing (PN)~ The link to bing.com in some regions but to a dropdown list of more Bing options in other regions.

Bing (PN)~ The Microsoft service that facilitates web searches.

Bing Bar (PN)~ A toolbar including the Bing search box installed for the variety of

common-used browsers, like Internet Explorer, Firefox, etc.

Bing Bar Translator (PN)~ A service available on Bing Bar allowing translation of web-page text in place using the Microsoft statistical machine translation system.

Bing Dictionary (PN)~ The Bing service that provides dictionary search.

Bing Finance (PN)~ A part of the Bing search engine dedicated to finance.

Bing Games (PN)~ A part of the Bing search engine dedicated to online games.

Bing Maps (PN)~ The Bing service that allows search and view of maps and satellite images.

Bing Mobile (PN)~ The Microsoft service that facilitates Web searches on Web-enabled mobile devices.

Bing Movies (PN)~ A part of the Bing search engine dedicated to movies.

Bing Music (PN)~ A part of the Bing search engine dedicated to music.

Bing News (PN)~ A part of the Bing search engine dedicated to news.

Bing Rewards (PN)~ A program that gives customers the opportunity to earn credits redeemable for rewards. Rewards credits are earned by searching on Bing, setting their Home page to Bing, or trying out new Bing features.

Bing Shopping (PN)~ A part of the Bing search engine dedicated to online shopping.

Bing Smart Search (PN)~ The search feature for Windows 8.1 and beyond that enables a central search from the Start screen across the device used, the cloud, apps, and the web.

Bing Translator (PN)~ The service that allows users to translate text and web pages into different languages using the Microsoft statistical machine translation system.

Bing TV (PN)~ A part of the Bing search engine dedicated to TV.

Bing Video Games (PN)~ A part of the Bing search engine dedicated to video games.

Bing Videos (PN)~ A part of the Bing search engine dedicated to videos.

Bing Vision (PN)~ A feature that lets a user search by pointing their phone at barcodes, text, QR codes, Microsoft Tags, CDs, DVDs, or books.

Bing Weather (PN)~ A part of the Bing search engine dedicated to weather.

Bing Webmaster Center (PN)~ The hub where site managers can find tools to help with site optimization, blogs from the Bing team, and forums for peer support.

BINLSVC (n)~ A service that runs on a Remote Installation Services (RIS) server that acts on client boot requests. The display name of BINLSVC is Remote Installation.

bio (n)~ A biography of an artist whose music is in Xbox Music or on the phone.

biometric ~ A system that examines biological things like fingerprints or retinas, usually for security purposes.

Biometric Authentication ~ use biometric traits to verify users' claimed identities when accessing devices, networks, networked applications or Web applications

biometric factor (n)~ A particular characteristic of a person that can be measured and used for identification purposes, such as fingerprints, hand geometry, and iris patterns.

biometric sample (n)~ A set of data resulting from the measurement of one specific characteristic of a single individual. Examples of a biometric sample would be the image of one fingerprint or one iris scan.

biometric sensor (n)~ A category of sensor that collects biometric data for a variety of applications.

biometric unit (n)~ A software object that consists of three software plug-in components:

a sensor adapter, engine adapter and storage adapter. These adapters are plug-ins for the Windows Biometric Service and are used to capture and process biometric samples, as well as create, store, and match biometric templates.

biometrics (n)~ Technologies that measure and analyze physical and behavioral human characteristics, such as fingerprints, eye retinas and irises, voice patterns, facial patterns, hand measurements, typing patterns and signatures, to recognize or authenticate identity.

BIOS (n)~ The set of essential software routines that test computer hardware at startup, start the operating system, and support the transfer of information between hardware devices. The BIOS is stored in read-only memory (ROM) so that it can be run when the computer is turned on. Although critical to performance, the BIOS is usually invisible to computer users.

BIOS boot order (n)~ A list of all potential bootable devices listed in booting order. If the boot on the first device on the list does not yield a valid boot sector, the BIOS proceeds with the next device in the list.

Bird's eye (PN)~ An option in Microsoft Virtual Earth that allows the user to view an object in a 45-degree angle from above in bird's eye view.

Bird's eye (adj)~ A feature in Bing Maps that provides high-resolution aerial imagery of locations photographed from north, south, east, and west, providing four actual views of a point.

birthday calendar (n)~ A calendar that displays all of the birthdays stored in someone's contact list.

birthday reminder (n)~ A feature that notifies the user about upcoming birthdays of contacts in the contact list.

B-ISDN (n)~ An International Telecommunication Union - Telecommunication [Standardization Sector] (ITU-T) communication standard for high-speed networking that provides new services, including voice, video, and data on the same network.

bit (n)~ The smallest unit of information handled by a computer or device. One bit expresses a 1 or a 0 in a binary numeral, or a true or false logical condition. A group of 8 bits makes up a byte, which can represent many types of information, such as a letter of the alphabet, a decimal digit, or other character.

bit (n)~ A data type that stores either a 1 or 0 value. Integer values other than 1 or 0 are accepted, but they are always interpreted as 1.

Bit ~ The smallest unit of information in a computer, can either equal 0 or 1. Eight bits equal one- byte.

bit count (n)~ The number of bits of data in a color plane that represent a single pixel.

bit depth (n)~ The number of color values that can be assigned to a single pixel in an image. Color depth can range from 1 bit (black and white) to 32 bits (over 16.7 million colors).

bit image (n)~ A sequential collection of bits that represents in memory an image to be displayed on the screen, particularly in systems having a graphical user interface. Each bit in a bit image corresponds to one pixel (dot) on the screen. The screen itself, for example, represents a single bit image; similarly, the dot patterns for all the characters in a font represent a bit image of the font. In a black-andwhite display each pixel is either white or black, so it can be represented by a single bit. The pattern' of 0s and 1s in the bit image

then determines the pattern of white and black dots forming an image on the screen. In a color display the corresponding description of on-screen bits is called a pixel image because more than one bit is needed to represent each pixel. '

bit manipulation (n)~ An action intended to change only one or more individual bits within a byte or word. Manipulation of the entire byte or word is much more common and generally simpler.

bit mask (n)~ A numeric value intended for a bit-by-bit value comparison with other numeric values, typically to flag options in parameter or return values. Usually this comparison is done with bitwise logical operators, such as And and Or in Visual Basic, && and || in C++.

bit rate (n)~ The speed at which binary digits are transmitted.

bit toggling keypad (n)~ A keypad that is available in Programmer mode, which allows the user to look at numbers represented as various combinations of- 1s and 0s, and to toggle between 1 and 0 for each binary- bit- to form a new number.

Bitcoin (PN)~ A decentralized peer-to-peer online payment system with completely digital currency, called bitcoins. From a user perspective, Bitcoin is a mobile app or computer program that provides a personal Bitcoin wallet that allows them to send and receive bitcoins for purchases and payments.

bitcoin (n)~ A digital currency that uses Bitcoin.

Bitcoin ~ digital currency that serves the same functions and purposes as money

BitLocker (PN)~ A hardware-based security feature that prevents unauthorized access to a computer by providing full-volume encryption and integrity checking of boot components.

BitLocker disabled mode (n)~ A mode in which the disk volume is still encrypted by BitLocker Drive Encryption, but security is effectively disabled because the full-volume encryption key that is used to encrypt the operating system volume is accessible by using a clear key to access the volume master key.

BitLocker Drive Encryption (n)~ A hardware-based security feature that prevents unauthorized access to a computer by providing full-volume encryption and integrity checking of boot components.

BitLocker enabled mode (n)~ A mode in which BitLocker Drive Encryption is turned on and the data on the volume is transparently encrypted by BitLocker as it is written and decrypted as it is read.

BitLocker encrypted installation (PN)~ A feature of BitLocker that enables IT pros to encrypt a disk before a user begins to use it.

BitLocker Enterprise (PN)~ A BitLocker extension that adds management capabilities to BitLocker.

BitLocker network unlock (PN)~ A feature of BitLocker that allows unlocking of an OS volume using a key received over the network.

BitLocker off mode (n)~ A mode in which BitLocker Drive Encryption protection is turned off on a disk volume and the disk volume is not encrypted. This leaves the disk volume with a standard clear text file format.

BitLocker on-write encryption (PN)~ A BitLocker feature that incrementally encrypts the hard drive as free space is used.

BitLocker recovery key (n)~ A special key that you can create when you turn on Bitlocker Drive Encryption for the first time on each drive that you encrypt.

BitLocker To Go (PN)~ An extension of the BitLocker drive encryption feature that enables the encryption of portable (e.g. USB) drives.

BitLocker To Go Reader (PN)~ A user interface tool that is used to unlock external drives locked by BitLocker To Go and view/copy files in the drive.

bitmap (n)~ A picture made from a series of small dots, much like a piece of graph paper with certain squares filled in to form shapes and lines.

bitmap (n)~ A data structure in memory that represents information in the form of a collection of individual bits. A bit map is used to represent a bit image. Another use of a bit map in some systems is the representation of the blocks of storage on a disk, indicating whether each block is free (0) or in use (1).

Bitmap ~ See- bmp.

bitmap effect (n)~ An effect that can be rendered on content. Such bitmap effects include: Blur, drop shadow, bevel, outer glow, and emboss.

bitmapped font (n)~ A font that is stored as a bitmap. Raster fonts are designed with a specific size and resolution for a specific printer and cannot be scaled or rotated. If a printer does not support raster fonts, it will not print them. The five raster fonts are Courier, MS Sans Serif, MS Serif, Small, and Symbol.

bitmask (n)~ A numeric value intended for a bit-by-bit value comparison with other numeric values, typically to flag options in parameter or return values. Usually this comparison is done with bitwise logical operators, such as And and Or in Visual Basic, && and || in C++.

bitmask identifier (n)~ A name assigned to a bitmask to help identify its purpose.

bitness (n)~ A characteristic of a microprocessor's data stream (the distinction between 16-bit, 32-bit and 64-bit address spaces) and the potential differences in instantiation of components that this entails.

bitrate (n)~ The speed at which binary digits are transmitted.

bit-rate throttling (n)~ The ability to slow down the rate at which files can be downloaded.

BITS (PN)~ A component of Windows XP and later operating systems that facilitates prioritized, throttled, and asynchronous transfer of files between computers using idle network bandwidth.

bits per pixel (n)~ The number of bits (e.g. 8, 16, 24, or 32) used to store and display the color data for a single pixel. This is the standard unit of measure for bit or color depth.

bits per second (n)~ The number of bits transmitted every second, used as a measure of the speed at which a device, such as a modem, can transfer data.

bitwise comparison (n)~ A bit-by-bit comparison of identically positioned bits in two numeric expressions.

bit-wise comparison (n)~ A bit-by-bit comparison of identically positioned bits in two numeric expressions.

bitwise operation (n)~ An operation that manipulates a single bit, or tests whether a bit is on or off.

BizSpark (PN)~ A program that makes software, support, and visibility available to

startups for free.

BizSpark 1111 (PN)~ The offer that provides certain qualified BizSpark members heavily discounted access to Microsoft Azure. It is now no longer available for new customers.

BizTalk Administration console (n)~ A Microsoft Management Console (MMC) used to administer a BizTalk Server group.

BizTalk application (n)~ A group of related artifacts, resources, and settings that are exposed together for management from within the BizTalk Administration console. Any artifact within an application may refer to any other artifact within that application, as well as any artifact in any referenced application.

BizTalk Application Users Group (n)~ The group of users who can access MessageBoxes for a particular BizTalk Group

BizTalk Application view (n)~ One of two views (along with BizTalk Deployment View) that appears when the System Center Operations Manager console for BizTalk Server is opened. A BizTalk administrator uses this view to monitor the health of BizTalk artifacts and applications such as orchestrations, send ports, and receive locations.

BizTalk BAS Administrators (n)~ A security role for accessing the Business Activity Services (BAS) portal. Members of the Business Administrator role can perform all of the tasks that Business Managers can. Additionally, Business Administrators can connect and disconnect the BAS Web site to a BizTalk Server. Business Administrators can refresh the BAS Web site with data from the Trading Partners Management (TPM) database, and refresh the TPM database with data from the BAS Web site. Business Administrators can install and configure the BAS Web site.

BizTalk BAS Users (n)~ A security role for accessing the Business Activity Services (BAS) portal. Members of the Business User role have the least amount of site privileges. Business Users can create and manage profiles and profile groups, create and manage agreements, and manage documents.

BizTalk Deployment view (n)~ One of two views (along with BizTalk Application view) that appears when the System Center Operations Manager console for BizTalk Server is opened. An enterprise IT administrator uses this view to monitor the overall health of the -€œphysical deployment-€? of a BizTalk Server setup.

BizTalk Deployment Wizard (n)~ A UI-based tool to deploy BizTalk Server assemblies to the Configuration database.

BizTalk Editor (n)~ A visual tool, hosted within Visual Studio, for constructing BizTalk Server schemas that can define the structure of both XML- and native-formatted instance messages.

BizTalk Explorer (n)~ A Microsoft Visual Studio-© .NET tool window that displays the contents of a BizTalk Configuration database. It displays items such as assemblies, ports, and parties in a hierarchical tree. You can use BizTalk Explorer to configure and manage BizTalk projects, parties, and orchestrations.

BizTalk Explorer Object Model (n)~ The APIs used to create tools and scripts to automate the post-deployment tasks that you perform in BizTalk Explorer. You can use the BizTalk Explorer Object Model for such post-deployment tasks as creating ports, binding orchestrations, managing party properties, or any other task where you would use BizTalk Explorer. The BizTalk Explorer Object Model APIs are in the

Microsoft.BizTalk.ExplorerOM namespace.

BizTalk Framework (n)~ A platform-neutral e-commerce framework that is based on Extensible Markup Language (XML) schemas and industry standards. The framework enables integration across industries and between business systems, regardless of platform, operating system, or underlying technology.

BizTalk group (n)~ A group that contains MessageBoxes, hosts, receive locations, send ports, send port groups, orchestrations, servers, and adapters.

BizTalk Management Pack alert (n)~ A notification that administrators can subscribe to in the BizTalk Server 2010 Management Pack. After subscribing to a given alert, administrators receive a notification whenever certain conditions are met. For instance, if a certain number of host instances are throttling, an alert could be raised.

BizTalk Management Pack diagnostics (n)~ A feature that administrators can use to see the cause and troubleshooting information for a given problem. For example, if the health of a send port appears as red, the State Change Event tab in the Operations Manager console displays the reason why it went from green to red.

BizTalk Mapper (n)~ A feature that visually enables users to build transformations between two schemas in a BizTalk application. It also has usability enhancements to help with complex maps.

BizTalk Message Queuing adapter (n)~ An adapter that enables exchange of messages between BizTalk Server and Microsoft Message Queue (MSMQ).

BizTalk message store (n)~ A Microsoft SQL Server table that holds all messages and their parts. Consuming orchestrations use the message references contained in the store to dequeue a copy of the message and its properties from the message store.

BizTalk project (n)~ A type of Visual Studio project used to create applications that run on BizTalk Server.

BizTalk project system (n)~ A system used to create part or all of a BizTalk Server application or business solution. It is used to add, edit, or remove BizTalk Server items (orchestrations, maps, schemas, and pipelines). It contains commands such as compile and deploy.

BizTalk Server (PN)~ The family of Microsoft server products that support large scale implementation management of enterprise application integration processes.

BizTalk Server 2010 Management Pack (PN)~ A BizTalk enhancement that helps ensure full monitoring capabilities of BizTalk applications and infrastructure. It includes features like diagnostics and alerts to help monitor the health of a BizTalk deployment.

BizTalk Server Enterprise (n)~ The BizTalk Server edition for customers with enterprise-level requirements for high volume, reliability, and availability.

BizTalk Server map (n)~ An Extensible Stylesheet Language Transformations (XSLT)-based transformation used to convert instance messages that conform to one BizTalk Server schema into instance messages that conform to another BizTalk Server schema.

BizTalk Server map file (n)~ The persisted form of a BizTalk map, created by BizTalk Mapper and compiled to generate run-time transformation directives specified using Extensible Stylesheet Language Transformations (XSLT).

BizTalk Server pipeline file (n)~ A file that describes the configuration of the pipeline and the components within it. This file type can be compiled as part of a BizTalk project.

BizTalk Server schema (n)~ An XML Schema Definition language (XSD)-based description of the structure of one or more BizTalk Server instance messages.

BizTalk Server schema file (n)~ A file containing the persisted form of a BizTalk schema.

BizTalk Server Standard (n)~ The BizTalk Server edition for organizations with moderate volume and deployment scale requirements.

BizTalk Services (PN)~ The Microsoft Azure service that provides Business-to-Business (B2B) and Enterprise Application Integration (EAI) capabilities for delivering cloud and hybrid integration solutions within a secure, dedicated, per-tenant environment.

BizTalk Settings Dashboard (PN)~ A BizTalk feature that BizTalk administrators can use to centrally manage and modify BizTalk Engine settings. Administrators can export and import settings from one environment to another, such as from staging to production.

BLA (n)~ A telephony feature that makes two or more phones behave as if they are linked; that is, that a call to one number causes all phones to ring.

black (adj)~ Having a font weight that corresponds to a weight class value of 900 according to the OpenType specification.

black and white effect (n)~ One of a group of photo modifications someone can make to a color photo that mimic different effects that would be achieved by taking the same photo using black and white film stock. One effect uses strict conversion to monochrome by throwing away all of the color information. Others mimic the result when a black and white photo is taken through a colored filter-€"orange, red, or yellow-€"to enhance or suppress certain color information. Two effects perform strict conversions to monochrome and then apply a color tint-€"sepia or cyan-€"in one step.

Black and White Effects (n)~ A control that initiates a task to create and fine tune black and white images.

Black and white effects (PN)~ The panel item that opens the image editing tool that enables the user to apply a black and white effect.

black box (n)~ Based on a component's actual behavior, without regard to its implementation.

black box ~ A generic term used to identify functional equipment segments, as opposed to circuitry, that make up each segment of a telecommunications system.-

black box test (n)~ A test that is based on a component's actual behavior, without regard to its implementation.

Black metal (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 138.

Black thumbpads (n)~ A DialKeys style that shows black keys appearing in two semicircles in the corners of the screen.

BlackBerry Business Cloud Services (n)~ A smartphone service for BlackBerry devices using Office 365. The service is hosted by Research In Motion.

BlackBerry device (n)~ One in a line of smartphones developed by the Canadian company Research In Motion (RIM) that supports e-mail, mobile telephone, text messaging, Internet faxing, and other wireless information services.

BlackBerry Enterprise Server for Microsoft Exchange (n)~ The software package that

is part of the BlackBerry(R) wireless platform from Research In Motion. The software and service connects to messaging and collaboration software (such as Microsoft Exchange) on enterprise networks and redirects e-mails and synchronizes contacts and calendaring information between servers, desktop workstations, and mobile devices.

BlackBerry Internet Service (n)~ A subscription service that enables e-mail synchronization for BlackBerry(R) devices.

blackout time (n)~ The time that a server is identified as being unavailable, measured in seconds.

Black-Scholes (n)~ A technical algorithm used to determine the present value of a future stock price (for determining the value of newly awarded stock options).

blade (n)~ The surface on which service functions or navigation elements appear when selected. Equivalent to a new window that is opened in Windows.

blade server ~ A server architecture that houses multiple server modules ('blades') in a single chassis. It is widely used in datacenters to save space and improve system management.

blank (n)~ The character entered by pressing the spacebar.

blank line (n)~ A line where there is no information displayed.

blank page (n)~ A page where there is no information displayed

blank reference image (n)~ A snapshot of what the Surface screen looks like in your lighting environment with nothing on the screen. This snapshot is taking during calibration.

blank space (n)~ A space where there is no information displayed

blanket order (n)~ A purchase order with a specific supplier that covers a period of time rather than specific line items. A blanket order can be used to obtain recurring, short-term releases of goods or materials.

blawg ~ Slang term used to describe an online blog that is written by lawyers, or one that is focused on providing legal-oriented content.

bleed (n)~ The extent to which a picture runs off the printed page.

bleed setting (n)~ A setting that determines how much of an object can print beyond the edges of a label, sticker, or page.

Blend + SketchFlow for Visual Studio 2013 (PN)~ Sketchflow is a feature included in Blend for Visual Studio 2013 to rapidly create and prototype new ideas and effectively present them to clients before evolving and delivering them as completed projects. It enables to map and experiment with the flow of an application UI, the layout of the individual screens and how the application will transition from one state of the application to another.

Blend for Microsoft Visual Studio 2013 (PN)~ Blend for Visual Studio 2013 allows to visually build engaging and sophisticated user interfaces for Windows applications by using the accurate design surface and tools. It is installed with the Visual Studio installation.

Blend for Visual Studio (PN)~ Blend for Visual Studio helps to design and build engaging and sophisticated user interfaces by providing with an accurate design surface and tools that let the user to visually create and edit Microsoft Windows applications. With Blend, Windows Phone applications and Windows store apps can be designed and build.

Blend for Visual Studio 2013 SDK (PN)~ The Blend for Visual Studio Software Development Kit (SDK) provides conceptual topics for behaviors, which are reusable pieces of packaged code that can be dragged onto any object and then fine-tuned by changing their properties. The SDK also includes a programming reference for other extensibility features in Blend, such as controls, drawing features, and effects.

blend mode (n)~ A method of determining how an object should appear when placed over another object.

blending (n)~ The process of combining two or more objects by adding them on a pixel-by-pixel basis.

blind carbon copy (n)~ A feature of e-mail programs that allows a user to send a copy of an e-mail message to a recipient without notifying other recipients that this was done.

blind via (n)~ A copper-plated hole in a printed circuit board that does not extend all the way thru a PCB. This prevents probing a component's signal pin by removing access to the via on the opposite side of the board.

blindness (n)~ A visual impairment that results in complete loss of vision in both eyes.

blinds (n)~ A type of transition that simulates the opening and closing of window blinds as one clip transitions to another.

blink (v)~ To flash on and off. Cursors, insertion points, menu choices, warning messages, and other displays on a computer screen that are intended to catch the eye are often made to blink. The rate of blinking in a graphical user interface can sometimes be controlled by the user.

blink speed (n)~ The rate at which the cursor indicating the active insertion point in a text window, or other display element, flashes on and off.

blink time (n)~ The elapsed time, in milliseconds, required to invert the caret display. This value is half of the flash time.

blit (n)~ A graphics function that moves many continuous bits from one memory location to another in the most efficient manner supported by the hardware.

blittable (adj)~ Capable of being copied by BLT (block transfer).

blittable type (n)~ A data type that has a unique characteristic and an identical presentation in memory for both managed and unmanaged environments. It can be directly shared.

BLOB (n)~ A discrete packet of binary data that has an exceptionally large size, such as pictures or audio tracks stored as digital data, or any variable or table column large enough to hold such values. The designation binary large object' typically refers to a packet of data that is stored in a database and is treated as a sequence of uninterpreted bytes.'

BLOb (n)~ A discrete packet of binary data that has an exceptionally large size, such as pictures or audio tracks stored as digital data, or any variable or table column large enough to hold such values. The designation binary large object' typically refers to a packet of data that is stored in a database and is treated as a sequence of uninterpreted bytes.'

blob (n)~ A discrete packet of binary data that has an exceptionally large size, such as pictures or audio tracks stored as digital data, or any variable or table column large enough to hold such values. The designation binary large object' typically refers to a packet of data that is stored in a database and is treated as a sequence of uninterpreted bytes.'

blob (n)~ An object that does not have an identifiable shape, i.e. that cannot be identified

as a finger or as a tagged object.

blob input (n)~ A contact on the Surface screen that is categorized as a blob (i.e., that does not have an identifiable shape).

Blob service (PN)~ The data management service in Microsoft Azure Storage for storing large amounts of unstructured data that can be accessed from anywhere via HTTP or HTTPS.

block (n)~ A segment of text that can be selected and acted upon as a whole in an application.

block (n)~ A group of statements in a program that are treated as a unit. For example, if a stated condition is true, all of the statements in the block are executed, but none are executed if the condition is false.

Block (v)~ A permission setting that prevents a person or domain from adding the user to contact lists, seeing the user's status, or sending instant messages to the user.

block (v)~ To prevent another user from initiating a conversation and from viewing your presence or other information, such as your personal information.

block (n)~ A Transact-SQL statement enclosed by BEGIN and END.

block (n)~ An HTML element that, in general, begins a new line. A block-level element may include other block-level elements or inline elements.

Block and Filter (PN)~ An app (shipped in China only) that filters out certain calls and messages from the user's phone as well as messaging services, with optional blocking of withheld and unknown numbers. It also provides caller ID info for incoming calls from bare numbers that are not on local contact list.

Block and Filter (global) (PN)~ An app that filters out certain calls and messages from the user's phone, as well as messaging services, with optional blocking of withheld and unknown numbers.

block blob (n)~ A blob comprised of blocks, each of which is identified by a block ID.

Block button (n)~ Button located in the Inbox and other folders. Allows users to prevent unwanted e-mail messages from arriving.

block cipher (n)~ A cipher algorithm that encrypts data in discrete units (called blocks), rather than as a continuous stream of bits. The most common block size is 64 bits. For example, DES is a block cipher.

Block Cycle (PN)~ A SmartArt graphic layout used to represent a continuing sequence of stages, tasks, or events in a circular flow. Emphasizes the stages or steps rather than the connecting arrows or flow.

block diagram (n)~ A type of diagram with block and raised block shapes used to brainstorm, plan, and communicate.

block diagram with perspective (n)~ A type of block diagram that contains 3-D geometric shapes, directional lines, and a vanishing point for changing depth and perspective. Use for functional decomposition, hierarchical, and data structure diagrams.

Block Facebook Pages (PN)~ A setting that allows users to block posts and comments from Facebook Pages to not show up in analysis any more.

block level backup (n)~ A type of backup operation that can be performed on a file system. The backup and restore operations can either be full, incremental or differential, and a physical (block-level) restore is performed at the volume level.

Block list (n)~ A list of users, accounts, Web sites etc. that are prevented from performing certain actions on a network.

block list (n)~ A list of users, accounts, Web sites etc. that are prevented from performing certain actions on a network.

block map (n)~ An XML file that maps logical files and ranges to block ranges in the AppX package. A block map is required for any AppX package. BlockMap XML markup, stored in a BlockMap.xml part, is used to define indexes and cryptographic hashes for blocks of executable code and data that are stored in the files of an Appx package. The deployment engine uses the Block Map to download individual blocks in random order as needed for streaming execution.

block of text (n)~ A segment of text that can be selected and acted upon as a whole in an application.

Block phrase (n)~ A custom word or phrase that the administrator sets for the Content Filter agent to prevent e-mail messages that contain specific words or phrases from being delivered to Exchange Server 2007 mailbox users.

Block Programs List (n)~ Tab on the User Settings tool used to block a given user from accessing listed programs.

Block Quote (PN)~ The Sway card that provides a quote-like treatment with breaks before and after selected content.

Block Recognizer (PN)~ A version of the character recognizer feature that uses handwriting recognition to convert written shorthand symbols to typed text, and then inserts the text in a location that you can specify.

block scope (n)~ The restriction of the range in which a variable can be referenced to a section of code that is grouped together, consisting of one or more declarations and statements.

Blocked (adj)~ A privacy relationship setting that prevents a person or domain from adding the user to contact lists, seeing the user's status, or sending instant messages to the user.

Blocked (PN)~ The status label that indicates that a user has assigned this contact to the Blocked Contacts privacy relationship.

Blocked Contacts (PN)~ A privacy relationship setting that prevents a person or domain from adding the user to contact lists, seeing the user's status, or sending instant messages to the user.

Blocked Content (PN)~ A view in settings where users can add terms to a list that globally exclude posts that contain one of the added terms from analysis.

Blocked Encodings List (n)~ A list that allows you to block a language encoding or character set in order to filter out unwanted international e-mail messages that display in a language you don't understand.

blocked sender (n)~ A domain or a person that an end user doesn't want to receive e-mail messages from. Messages received from any e-mail address or domain listed in the users' Blocked Senders list are sent directly to the user's Junk E-Mail folder.

Blocked Senders List (n)~ A list of domain names and e-mail addresses that are treated as junk e-mail and are blocked unless the sender is on the Safe Senders List or the recipient is on the Safe Recipients List.

Blocked Sources (PN)~ A view in settings where users can add URLs and partial URLs to a blocked sources list that will be excluded from data acquisition and analysis.

Blocked Top-Level Domain List (n)~ A list that allows you to block top-level domain names. Blocking country/region top-level domains allows you to filter unwanted e-mail messages you receive from specific countries or regions.

blocking (n)~ A method of operation in which a program that issues a call does not regain control until the call completes.

blocking (n)~ The action of placing a document or product on hold.

blocking transaction (n)~ A transaction that causes another transaction to fail.

block-level element (n)~ An HTML element that, in general, begins a new line. A block-level element may include other block-level elements or inline elements.

blog (n)~ A frequently updated online journal or column.

blog (v)~ To publish or write entries for a blog.

blog ~ (weBLOG)- A website documenting someone's life and/or thoughts.

blogger (adj)~ A person who creates or maintains a weblog.

Blogging Windows (PN)~ ?The official consumer-facing Windows blog.

Blood (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Blood and Gore (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

blood glucose measurement (n)~ The amount of a person's blood glucose levels at a certain point in time.

blood glucose meter (n)~ An electronic device used to measure a person's blood glucose level.

blood glucose monitor (n)~ An electronic device used to measure a person's blood glucose level.

blood pressure (n)~ A measurement of the pressure that the body's blood is putting on the blood vessel walls.

blood pressure measurement (n)~ A measurement of the pressure that the body's blood is putting on the blood vessel walls. The measurement is displayed with the systolic pressure number over the diastolic pressure number (in millimeters of mercury).

blood pressure monitor (n)~ A health device used to measure a person's blood pressure.

Blue chips (PN)~ Very specific set of stocks of large, well-established and financially sound companies that have operated for many years, typically with a market capitalization in the billions and considered to be very sound investments.

Blue Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of blue colors.

Bluegrass (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 89.

Blues (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 0.

Bluetooth (PN)~ A wireless communication technology that conforms to the Bluetooth

computing and telecommunications industry specification. This specification describes how mobile phone, landline phones, computers, and mobile devices can easily exchange information by using a short-range wireless connection.

Bluetooth ~ A short range wireless data communication system for smartphones and other computing devices. However Bluetooth devices from different manufacturers wouldn't always communicate with each other reliably, so it hasn't really taken off as the industry had hoped, and it is now under threat from faster wireless technologies (see- Wi-Fi).

Bluetooth device (n)~ A device such as a cellular phone, printer, keyboard, mouse, or computer that has a Bluetooth radio transmitter installed in it.

Bluetooth stack (n)~ The core portion of the Bluetooth protocol stack implementation that enables devices to locate each other and establish a connection. Through this connection, devices can exchange data and interact with one another through various applications.

blur (n)~ An effect applied to a graphical object that typically reduces the difference between the outline of the object and the graphical area next to it.

Blu-ray Disc (n)~ A high definition optical disc format which uses a smaller focus blue-violet 405 nm laser allowing higher precision and storage density. A competitor to HD DVD.

BMC (n)~ A specialized service processor that monitors the physical state of a computer, network server or other hardware device using sensors and communicating with the system administrator through an independent connection. The BMC is part of the Intelligent Platform Management Interface (IPMI) and is usually contained in the motherboard or main circuit board of the device to be monitored.

BMD (n)~ A measurement that shows the amount of minerals in one square centimeter of bones. A bone density measurement can be used as a possible marker of osteoporosis and fracture risk.

BMI (n)~ An index for human body fat based on a person's weight and height.

BMO (n)~ The set of objects that a modeler uses to create a custom application. The set includes the following primary object categories: system, application, model, and modeling site. Primary object categories can contain other object categories. For example, system-level security objects and application-level security objects.

bmp ~ (BitMaP)- A standard type of graphics file. An uncompressed format, so the files tend to be fairly big.

BMR (n)~ A recovery of a system using a backup that contains critical volumes and, optionally, data files that you can use to rebuild a system from scratch or rebuild a system using alternate hardware.

BMR (n)~ The amount of energy that is needed to support the body's most basic functions when at rest. The Basal metabolic rate (or BMR) is the number of calories a person needs per day to stay alive.

BNC connector (n)~ A connector for coaxial cables that locks when one connector is inserted into another and rotated 90 degrees.

b-node (n)~ A NetBIOS implementation that uses broadcast NetBIOS name queries for name registration and resolution.

Board (PN)~ The agile task board in Visual Studio 2012's Team Web Access that enables

the user to track team's progress in real-time.

boarding pass (n)~ A ticket for transit, such as on an airplane or a train.

body (n)~ In e-mail and Internet newsgroups, the content of a message. The body of a message follows the header, which contains information about the sender, origin, and destination of the message.

body mass index (n)~ An index for human body fat based on a person's weight and height.

body text (n)~ The text that forms the major content of a publication. Does not include titles, headlines, pull quotes, and captions, for example.

BOF (n)~ The starting location of a file on a disk relative to the first storage location on the disk. A data directory or catalog contains this location.

BOF (PN)~ The model-view-controller framework that synchronously or asynchronously controls the execution of immediate or batched business operation implementations.

bogie ~ also spelled bogey, refers to a false blip on a radar display. The term is also used to describe radar echoes that occur for unknown reasons, especially in the military, where such a signal might indicate hostile aircraft.

boilerplate text (n)~ Recyclable text; a piece of writing or code, such as an organization's mission statement or the graphics code that prints a software company's logo, which can be used over and over in many different documents.

bold (adj)~ Pertaining to characters that are formatted to appear darker and heavier than the surrounding text.

bold (adj)~ Having a font weight that corresponds to a weight class value of 700 according to the OpenType specification.

Boleto Bancário (PN)~ A payment method used in Brazil that is issued in the form of a paper ticket from ATMs or various agencies or businesses.

Bollinger Bands (n)~ A formula that calculates the standard deviation above and below a simple moving average of the data. Since standard deviation is a measure of volatility, a large standard deviation indicates a volatile market, and a smaller standard deviation indicates a calmer market.

Bollinger Bands formula (n)~ A formula that calculates the standard deviation above and below a simple moving average of the data. Since standard deviation is a measure of volatility, a large standard deviation indicates a volatile market, and a smaller standard deviation indicates a calmer market.

BOM (n)~ A list of the components and subassemblies needed to build one unit of a product. A bill of materials also shows quantities for each component.

BOM (n)~ A Unicode character used to indicate that text is encoded in UTF-8, UTF-16 or UTF-32.

BOM explosion (n)~ The process of identifying the components, and their quantities, that are required to produce an item.

BOM version (n)~ A specific configuration of a bill of material (BOM) to include an item. An item can be associated with a number of BOM versions.

Bomb Making (n)~ A content descriptor developed by Microsoft.

bond (n)~ Lightweight paper commonly used for letterhead and other business publications.

bonded device (n)~ A Bluetooth device that has been paired to another one.

bone mineral density (n)~ A measurement that shows the amount of minerals in one square centimeter of bones. A bone density measurement can be used as a possible marker of osteoporosis and fracture risk.

bonus depreciation (n)~ Extra depreciation amounts that can be taken in the first year that an asset is placed in service and depreciated. Bonus depreciation is taken before any other depreciation is calculated and is available only for depreciation books.

bonus indicator (n)~ In Purble Place, a symbol which looks like a golden stamp and allows players to earn a Sneak Peek token if they can match a tile while the indicator is on it.

book code (n)~ A predefined dimension that is used to differentiate between different modeling scenarios. For example, you can use this dimension to track values for budget, actual, and forecasted scenarios for any given period of time. It is automatically included with every model.

book fold (n)~ A style of publication that is printed with two pages on one side of each sheet of paper. When you fold the paper, it opens like a book.

book value (n)~ The value of an asset as calculated by the acquisition price plus or minus any adjustments (acquisition or value) minus any depreciation previously taken.

book value (n)~ The net value of an asset reported on a statement of financial position.

Booking Attendant (PN)~ A calendaring feature that automatically manages resources. Resource requests are automatically accepted or denied depending on availability and policies.

booking.com ~ Booking.com is the world's leading online hotel reservations agency by room nights sold, attracting over 30 million unique visitors each month via the Internet from both leisure and business markets worldwide. Priceline is the parent company.http://www.booking.com/

booklet (n)~ A small publication made of printed pages that are folded and bound together to open like a book.

bookmark (n)~ A location or selection of text in a file that you name for reference purposes. Bookmarks identify a location within your file that you can later refer or link to.

bookmark (n)~ A unique identifier of a row within a rowset.

bookmarklet (n)~ A script-based applet that is stored as a favorite or bookmark in a web browser, or is accessed through a hyperlink on a webpage.

Books & Reference (PN)~ An app category that facilitates reading or provides access to e-book or reference content.

books + reference (PN)~ An app category that facilitates reading or provides access to e-book or reference content.

Boolean (adj)~ Of, pertaining to, or characteristic of logical (true, false) values.

Boolean ~ A term that originated in the in the realm of mathematics, and that is now commonly known for its application to search engine logic. A Boolean search allows for the inclusion or exclusion of documents containing certain keywords

Boolean data type (n)~ A data type with only two passable values, True (-1) or False (0). Boolean variables are stored as 16-bit (2-byte) numbers.

Boolean expression (n)~ An expression that yields a Boolean value (true or false). Such

expressions can involve comparisons (testing values for equality or, for non—Boolean values, the < [less than] or > [greater than] relation) and logical combination (using Boolean operators such as AND, OR, and XOR) of Boolean expressions.

Boolean operator (n)~ An operator designed to work with Boolean values. The four most common Boolean operators in programming use are AND (logical conjunction), OR (logical inclusion), XOR (exclusive OR), and NOT (logical negation).

Boolean search (n)~ A method of searching for data that uses logical operators (e.g. AND, OR, NOT).

Boot Configuration Data (n)~ A data store that contains boot configuration parameters and controls how the operating system is started beginning with Windows Vista or Windows Server 2008.

Boot Configuration Data object (n)~ A collection of elements that describes the settings for the object that are used during the boot process. There are three main types of objects: application, device, and inherited.

boot critical driver (n)~ A driver that must be available in order for the operating system to successfully complete the boot process. Boot critical drivers include all boot start drivers.

boot disk (n)~ A floppy disk that contains key system files from a PC-compatible operating system that can boot, or start, the PC. A boot disk must be inserted in the primary floppy disk drive (usually drive A:) and is used when there is some problem with starting the PC from the hard disk, from which the computer generally boots.

Boot disk ~ A CD pr DVD which holds a copy of the operating system, or enough of it to start the computer, useful if the computer won't start up properly from the hard disk.

boot drive (n)~ In a PC-compatible computer, the disk drive that the BIOS uses to automatically load the operating system when the computer is turned on.

boot file (n)~ A system file needed to start Windows. The boot files include Ntldr and Ntdetect.com.

boot image (n)~ The Microsoft Windows Preinstallation Environment image that you boot a client into before you install the install image.

Boot Information Negotiation Layer Service (n)~ A service that runs on a Remote Installation Services (RIS) server that acts on client boot requests. The display name of BINLSVC is Remote Installation.

Boot Logging (n)~ A process in which a computer that is starting (booting) creates a log file that records the loading of each device and service. The log file is called Ntbtlog.txt, and it is saved in the systemroot directory.

boot partition (n)~ The partition that contains the Windows operating system and its support files. The boot partition can be, but does not have to be, the same as the system partition.

boot record (n)~ The section of a disk that contains the operating system.

boot sector (n)~ A critical disk structure for starting your computer, located at sector 1 of each volume or floppy disk. It contains executable code and data that is required by the code, including information used by the file system to access the volume. The boot sector is created when your format the volume.

boot sector (n)~ The first 512 bytes of sector 0 of a partitioned data storage device.

boot sector virus (n)~ A virus that infects computer systems by copying code either to the boot sector on a floppy disk or the partition table on a hard disk. During startup, the virus is loaded into memory. Once in memory, the virus will infect any non-infected disks accessed by the system.

boot volume (n)~ The volume that contains the Windows operating system and its support files. The boot volume can be, but does not have to be, the same as the system volume.

Boot, boot up ~ Usually used to mean 'start up the computer'. Literally, the process of loading up the operating system and getting the computer ready for use. See- Reboot. A 'boot password' is a password you have to give to start up the computer.

bootable (adj)~ Containing the system files necessary for booting a PC and running it.

bootable CD (n)~ A CD-ROM that can be used to start a computer. An automated installation uses a bootable CD to start a computer.

BOOTP (n)~ A protocol used primarily on TCP/IP networks to configure diskless workstations. RFCs 951 and 1542 define this protocol. DHCP is a later boot configuration protocol that uses this protocol. The Microsoft DHCP service provides limited support for BOOTP service.

bootstrap (n)~ The process of starting or resetting a computer or a device. When first turned on (cold boot) or reset (warm boot), the computer runs the software that loads and starts the computer's operating system, which prepares it for use.

bootstrap installation service (n)~ A service that invokes the bootstrap installation process.

border (n)~ In programs and working environments that feature on-screen windows, the edge surrounding the user's workspace. Window borders provide a visible frame around a document or graphic. Depending on the program and its requirements, they can also represent an area in which the cursor or a mouse pointer takes on special characteristics. For example, clicking the mouse on a window border can enable the user to resize the window or split the window in two.

border (n)~ The visible line around the edge of an object. For example, the four lines of a rectangle that comprise its border.

Border Painter (PN)~ A tool that is used to apply formatting to borders in a table.

Border Sampler (PN)~ A tool used to collect the formatting of an existing table border so that it can be applied to another border.

Border Styles gallery (PN)~ A gallery of predefined and recently used formatting styles that the user can apply to borders.

borrowed time (n)~ A limited amount of usage time provided after all purchased time has been expended. If the user does not add or download more usage time within this remaining amount of time, they will lose access to the computer.

borrowed usage time (n)~ A limited amount of usage time provided after all purchased time has been expended. If the user does not add or download more usage time within this remaining amount of time, they will lose access to the computer.

bot (n)~ A program that performs a task on a network, especially a task that is repetitive or time-consuming.

Bot ~ (roBOT)- An automated program, usually performing a function on the internet such as indexing webpages or sorting email.

both-threaded (adj)~ Pertaining to a threading model in which the object has the characteristics of an apartment-threaded object as well as a free-threaded object.

Bottleneck ~ A point at which the performance or capacity of an entire system or network can be significantly influenced. Formally, a bottleneck lies on a network or system's critical path and provides the lowest throughput.

bottom app bar (n)~ An app bar that appears along the bottom edge of the screen and may include app commands or navigation.

bottom-up estimating (n)~ A principle of good scheduling. It means having those who do the work estimate the effort, rolling up task-level estimates, and recognizing that experience is the best estimating technique.

bottom-up estimating (n)~ An estimating method in which the base costs of individual work items or resources are calculated into task, resource, and project cost totals.

bounce (v)~ To return an undeliverable email message to the sender's mail server.

bounce ~ The return of a piece of mail because of an error in its delivery.

bounce message (n)~ A non-delivery notification that is sent to an e-mail sender when a message cannot be delivered to the intended recipient either temporarily or permanently.

BounceKeys (n)~ A feature in Windows that instructs the processor to ignore double strokes of the same key and other unintentional keystrokes.

bound (n)~ The upper or lower limit in a permitted range of values.

bound (n)~ The size and location of an object.

bound (adj)~ Of, pertaining to, or characteristic of a file that can be managed using the source control features in tools such as Visual Studio and Expression Blend.

bound application (n)~ An application from within the bound system that is bound to a specific server within the target logical datacenter.

bound column (n)~ The column in a list box, combo box, or drop-down list box that's bound to the field specified by the control's ControlSource property.

bound control (n)~ A control used on a form, report, or data access page to display or modify data from a table, query, or SQL statement.

bound data (n)~ Data linked to a Web page.

bound element (n)~ In a static structure diagram, a use of a parameterized class, or template, in which the parameters from the parameterized class are bound to actual values.

bound hyperlink control (n)~ A control used on a data access page to bind a link, intranet address, or Internet address to a Text field in an underlying table. Use when you want a different hyperlink address for each record in a table—for example, as you move from record to record in a Suppliers table, you can click on the hyperlink and go to a different Web page for each supplier.

bound item (n)~ An item that has been extended with system attributes and line-of-business (LOB) data for the purpose of associating it with an LOB entity.

bound object frame (n)~ A control on a form or report used to display and manipulate OLE objects that are stored in tables.

bound stream (n)~ An event stream that contains all the information needed to produce events. Either the information is an already instantiated data source, or the information is sufficient for the StreamInsight server to start the data source.

bound system (n)~ The application system whose applications are bound to logical

servers as described on a deployment diagram.

bound trap (n)~ In programming, a problem in which a set of conditions exceeds a permitted range of values that causes the microprocessor to stop what it is doing and handle the situation in a separate routine.

boundary (n)~ An IP subnet, IP address range, IPv6 prefix, or Active Directory site that identifies the network location of clients in the Configuration Manager hierarchy.

boundary delimiter (n)~ One or more characters that identify the start or end of a boundary.

boundary feedback (n)~ A visual indication to the user that the end of the pan-able area is reached. This feedback is provided when sliding the parent window in the direction of pan and seeing it snap back to the initial position once the finger is released. This feedback is also provided when the page is moving with some momentum, and reaches the end of the scrollable region.

boundary network (n)~ A logical portion of a network that can be accessed by computers that are in the restricted network or the secure network.

boundary scan (n)~ A technology that allows engineers to perform extensive debugging and diagnostics on a system through a small number of dedicated test pins. Signals are scanned into and out of the I/O cells of a device serially to control its inputs and test the outputs under various conditions.

Boundary Scan Description Language file (n)~ An external file that defines the capabilities of any single device's boundary scan logic.

bounding box (n)~ The smallest rectangle that can enclose the text in a text frame.

bounding box (n)~ The smallest rectangular area that will surround a path, shape, or group of objects.

bounding rectangle (n)~ The smallest rectangular area that will surround a path, shape, or group of objects.

Bourne shell (n)~ A UNIX command processor developed by Steven Bourne.

bow (n)~ The distance from the midpoint of a circular arc to the midpoint of the arc's chord.

box model (n)~ A cascading style sheet (CSS) model where rectangular boxes are generated for elements in the document tree and laid out according to the visual formatting model.

box plot chart (PN)~ A statistical type of chart that uses boxes to indicate statistical distribution and easily identify outlier points. There are five values: upper quartile, lower quartile, High Box, Low Box, and Median.

boxed mode (n)~ A Tablet PC input mode that provides a restrictive writing surface with a boxed guide that shows users where they can write each character. In boxed mode, user's ink is recognized and converted to text when the user starts writing the next character.

boxing (n)~ The conversion of a value type instance to an object, which implies that the instance will carry full type information at run time and will be allocated in the heap. The Microsoft intermediate language (MSIL) instruction set's box instruction converts a value type to an object by making a copy of the value type and embedding it in a newly allocated object.

boxplot (PN)~ A statistical type of chart that uses boxes to indicate statistical distribution

and easily identify outlier points. There are five values: upper quartile, lower quartile, High Box, Low Box, and Median.

BPA (PN)~ A tool which examines a system configuration and the settings against a set of pre-defined rules to generate a list of issues outlining any best practice violations it finds.

BPA engine (n)~ The engine that captures and processes the results of the Best Practice Analyzer (BPA).

BPA scan (n)~ A scan that is run by the Best Practice Analyzer (BPA) to identify any issues that violate a pre-defined set of best practices.

BPL (n)~ A type of high-speed Internet connection using existing electrical wiring. With BPL, you plug a modem directly into a power outlet. BPL connection speeds are comparable to those of other broadband technologies, such as digital subscriber line (DSL) or cable.

BPM (n)~ The number of heartbeats per minute.

BPMN (PN)~ A standard notation for process management developed by the Business Process Management Initiative.

bpp (n)~ The number of bits (e.g. 8, 16, 24, or 32) used to store and display the color data for a single pixel. This is the standard unit of measure for bit or color depth.

bps (n)~ The number of bits transmitted every second, used as a measure of the speed at which a device, such as a modem, can transfer data.

bps ~ (Bits Per Second)- A measure of how quickly information is being transferred, usually via a modem or network. Divide by ten to get an approximation of the number of characters per second (cps). See also- Kbps,- Mbps.

BR South (PN)~ The South Brazilian region within the Azure region taxonomy.

brace matching (n)~ An editor feature that, when the insertion point is moved to a brace, highlights the matching brace.

bracket (n)~ A chained set of Request/Response units (RUs) and their responses, which together make up a transaction between two Logical units (LUs). One bracket must be finished before another can be started.

bracket expression (n)~ In regular expressions, an expression of the form [expr]'

bracketed exposures (n)~ A series of photos that all depict the same scene using different exposure settings for each photo. Each photo in the series is, thereby, either lighter or darker than another in the series.

Bradesco (PN)~ A banking and financial services company in Brazil.

brainstorming diagram (n)~ A type of diagram that shows the interrelationships among topics in a hierarchy. You can think of it as a graphical illustration of a text outline.

branch (n)~ A segment of a logical tree structure, representing a folder and any folders that it contains.

branch (v)~ To allow a collection of files to evolve in two or more divergent paths.

branch (n)~ An element of workflow logic that defines an alternative condition and action or additional steps, in cases when the criteria in a condition element are not met. A logical 'else-if-then' statement in a workflow.

branch (v)~ In reference to a package, to upgrade an existing sequenced application package and run it side-by-side with the original sequenced application package.

branch (n)~ A fork within a conversation, where more than one reply was made to a

single e-mail and caused a split in the conversation.

branch code (n)~ A numeric code used in combination with a bank code to identify a specific bank branch.

branch distribution point (n)~ A Configuration Manager site system that has the role of storing package source files and is designed to be located in a distributed location with limited network bandwidth or a limited number of clients.

Branch Edition (n)~ A version of BizTalk Server that can be used as a local office implementation within a distributed (multi-site) business organization. Each site instance can be connected to a BizTalk Server implementation located in a central office or headquarters. The Branch Edition can be used at a very high scale but it is only a part of the entire enterprise solution, rather than being the whole enterprise solution itself.

branch office (n)~ A site that is geographically separated from the central management site.

branch office deployment scenario (n)~ A deployment scenario in which connectivity between the central site and the branch office is over a wide-area-network (WAN) and is assumed to be unreliable with low bandwidth.

branch office proxy (n)~ An Office Communications Server used to enable users in branch offices to connect to the home office SIP network.

branch plaque (n)~ An award (plaque) signifiying a particular office, or branch, that is a member of the Partner Program (certified level).

BranchCache (PN)~ A Windows component that helps speed data transfer within remote (branch) offices by caching the data on a local server or individual PCs.

brand colors (n)~ The colors that are specific to a particular company or product.

brand element (n)~ A distinctive component that is unique to a company and that adds to its recognition with consumers.

brand identity (n)~ A company's or partner's logo, fonts, and colour themes or schemes intended to visually signify who and what the company is.

brand image (n)~ A company's or partner's logo, fonts, and colour themes or schemes intended to visually signify who and what the company is.

brand name (n)~ Text, entered by a meeting organizer, that identifies the company or organization using Live Meeting and that replaces the image file (if unavailable) in the Live Meeting user interface.

brand personality attribute (n)~ A characteristic typically associated with a person, but inferable from exposure to and/or experience with a commercial brand.

branded experience (n)~ A designed experience that is intentionally differentiated from other brands with consistent delivery across all customer channels in a way that adds value to the core customer proposition.

branding (n)~ The process of incorporating a company name, logo, support information, and Help files into the Microsoft Windows installation.

Branding pane (n)~ A client element that displays optional branding for your conference center.

BRB ~ (Be Right Back)- Internet slang.

breadcrumb bar (n)~ A navigational element, usually appearing at the top of a window, that displays, and allows users to change, their current location.

breadcrumb navigation (n)~ A form of navigation that shows the path to the current Web page.

break (n)~ Interruption of a program caused by the user pressing the Break key or its equivalent.

break (v)~ To interrupt execution at a given spot, usually for the purpose of debugging.

break (v)~ To cause a routine, module, or program that had previously worked to cease working correctly.

break (n)~ Interruption of a communications transmission that occurs when the receiving station interrupts and takes over control of the line or when the transmitting station prematurely halts transmission.

break (n)~ A short period of time in a resource's schedule where the resource is not available for work.

break line (n)~ The actual line that is shown in a document to indicate a line break.

break mode (n)~ A temporary suspension of program execution while in the development environment. In break mode, you can examine, debug, reset, step through, or continue program execution.

Breakdown (n)~ A shape in a PivotDiagram, positioned along the connector between a parent PivotDiagram node and the children of that node.

break-fix (adj)~ Pertaining to a service agreement which provides for the repair or replacement of multiple types of in-warranty or out-of-warranty broken IT equipment or services.

breakout room (n)~ A shared space where smaller groups of attendees can meet separately.

breakpoint (n)~ A location in a program at which execution is halted so that a programmer can examine the program's status, the contents of variables, and so on.

breakthrough list (n)~ The list of contacts who may break through in quiet hours.

Bricks and clicks ~ business that existed pre-Internet that now uses e-commerce technology to sell on the internet

bridge (n)~ Software or hardware that connects two or more networks so that they can communicate, and that operates at the data-link layer (layer 2) of the OSI model.

bridge ~ Device that connects and passes packets between two network segments that use the same communications protocol. Bridges operate at the data link layer (Layer 2) of the OSI reference model.

bridge line appearance (n)~ A telephony feature that makes two or more phones behave as if they are linked; that is, that a call to one number causes all phones to ring.

bridge mode (n)~ A router configuration in which data passes directly through the router without the protection of network address translation.

bridge router (n)~ A router that supports the functions of both a bridge and router. A bridge router links two segments of a local or wide area network, passing packets of data between the segments as necessary, and uses Level 2 addresses for routing.

bridged line appearance (n)~ A telephony feature that makes two or more phones behave as if they are linked; that is, that a call to one number causes all phones to ring.

bridged transaction (n)~ A journal transaction that is posted to a bridging account.

bridgehead server (n)~ A computer that connects servers using the same communications

protocols so information can be passed from one server to another.

bridging account (n)~ A ledger account into which transactions are entered as they await manual approval by the person who is specified in the journal line.

bridging posting (n)~ A type of posting in which a transaction is first posted to a bridging account and later posted to a different ledger account.

brightness (n)~ The amount of light that is emitted by a computer monitor or picture displayed on the monitor.

Brightness, Decrease (n)~ A filter effect in Windows Movie Maker.

Brightness, Increase (n)~ A filter effect in Windows Movie Maker.

Brilliant Black for Windows Media Player (n)~ A Windows Media Player skin created specifically for touch-screen computers.

Bring Your Own Device (PN)~ The set of features that let employees use personal devices to access corporate information and services and let IT admins manage such devices.

bring-your-own-license (adj)~ Pertaining to features that allow use of existing product licenses for a product that is used in connection with another product.

BritPop (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 132.

BRL (n)~ The official currency of Brazil.

broad band (n)~ A structure of compensation levels that includes broad ranges of pay per level and is generally defined by grouping jobs with similar aggregate levels of responsibility. Pay for individual jobs is often linked to the external market. Bands are also typically differentiated by the variable compensation awards available at each band. Broad banding eliminates the hierarchy and narrow ranges of graded structures and allows ranges to overlap (for example, the 90th percentile of Band B equals the 10th percentile of Band C). Broad bands do not contain midpoints and generally do not have fixed minimums or maximums (for example, allowing pay that is either below a minimum or above a maximum rate within a band because the external market determines a specific job rate). Companies can store additional reference points for a band, such as a 50th percentile (or Control Point), 25th and 75th percentile, and base variable compensation on one of those points.

broadband (adj)~ Of or relating to communications systems in which the medium of transmission (such as a wire or fiber-optic cable) carries multiple messages at a time, each message modulated on its own carrier frequency by a modem.

broadband (n)~ A transmission medium designed for high-speed data transfers over long distances. Cable modem services and Digital Subscriber Line (DSL) are examples of broadband networks.

Broadband ~ Internet access over a connection much faster than an ordinary modem, such as- ADSL- or cable.

broadband ~ Broadband is another word for high-speed Internet. Because it transfers information quickly, broadband is ideal for downloading music and watching streaming videos.

broadband connection (n)~ A high-speed Internet connection. Broadband connections

are typically 256 kilobytes per second (KBps) or faster. Broadband includes DSL and cable modem service.

Broadband Integrated Services Digital Network (n)~ An International Telecommunication Union - Telecommunication [Standardization Sector] (ITU-T) communication standard for high-speed networking that provides new services, including voice, video, and data on the same network.

broadband network (n)~ A transmission medium designed for high-speed data transfers over long distances. Cable modem services and Digital Subscriber Line (DSL) are examples of broadband networks.

broadband over power lines (n)~ A type of high-speed Internet connection using existing electrical wiring. With BPL, you plug a modem directly into a power outlet. BPL connection speeds are comparable to those of other broadband technologies, such as digital subscriber line (DSL) or cable.

broadcast (adj)~ Sent to more than one recipient. In communications and on networks, a broadcast message is one distributed to all stations.

broadcast (n)~ A method by which a client receives a stream. During a broadcast connection, clients cannot control the stream. This is the opposite of an on-demand presentation.

broadcast (v)~ In wireless networking, for a wireless router or access point to transmit its service set identifier (SSID) every few seconds so that computers and devices can detect and connect to the network.

broadcast ~ Data packet that are sent to all nodes on a network. Broadcasts are identified by a broadcast address.

broadcast address (n)~ An Internet Protocol version 4 (IPv4) address that is destined for all hosts on a particular network segment.

broadcast bit (n)~ A one-bit field value in the flags field of the DHCP packet sent by the client to provide a hint to the DHCP server and to the relay agents to broadcast any messages sent to the client.

broadcast message (n)~ A network message sent from a single computer that is distributed to all other devices on the same segment of the network as the sending computer.

broadcast network (n)~ A network that supports more than two attached routers and has the ability to address a single physical message to all of the attached routers (broadcast). Ethernet is an example of a broadcast network.

broadcast publishing point (n)~ A type of publishing point that streams content to multiple users at once, similar to a television broadcast. Content streamed from a broadcast publishing point can be delivered as a multicast or unicast stream.

Broadcast Slide Show (PN)~ A feature that enables presenters in the rich client to broadcast a slide show to remote viewers watching in a Web browser. Throughout the presentation, the remote attendees will see the current slide being shown by the presenter.

broadcast verification (n)~ By using a technology called video encoded invisible light (VEIL), a method whereby MarketingPilot users can verify that the TV ads that have been ordered actually ran as ordered.

brochure (n)~ A three or four-panel publication style typically used to present information

about products, services or special offers.

broken hyperlink (n)~ A hyperlink that points to an incorrect URL or a missing page or file.

broken link (n)~ A hyperlink that points to an incorrect URL or a missing page or file.

brokered messaging (n)~ An asynchronous messaging service: Producers (senders) and consumers (receivers) do not have to be online at the same time. The messaging infrastructure stores messages until the consuming party is ready to receive them. This allows the components of the distributed application to be disconnected.

brokered service (n)~ A service provided through the interaction of two or more applications being integrated where an intermediary lies between the service requestor and the service provider performing some functions for security, reliability and overall monitoring of the performance of interactions.

Bronze (adj)~ The mimimum service level that can be allocated to a case. The service contract a customer purchases determines the service level for its associated cases.

brouter (n)~ A router that supports the functions of both a bridge and router. A bridge router links two segments of a local or wide area network, passing packets of data between the segments as necessary, and uses Level 2 addresses for routing.

browse (v)~ To scan a database, a list of files, or the Internet, either for a particular item or for anything that seems to be of interest.

browse button (n)~ A button that displays a dialog box to help users select a valid value.

browse for (v)~ To scan a database, a list of files, or the Internet, either for a particular item or for anything that seems to be of interest.

browse mode (n)~ A function that lets you scan database rows and update their values one row at a time.

browse server (n)~ A computer on a Microsoft network that maintains a list of computers and services available on the network.

browser (n)~ A computer on a Microsoft network that maintains a list of computers and services available on the network.

browser (n)~ A software program used to display webpages and to navigate the Internet.

Browser ~ A program used for viewing World Wide Web pages on the Internet. Usually available free for download. Popular browsers include Internet Explorer (IE), which is built in to Windows, Mozilla Firefox, and Google Chrome. The most popular browser on Apple devices is Safari.

browser extension (n)~ A program that extends the capabilities of Internet Explorer.

browser helper object (n)~ An in-process Component Object Model (COM) component that Internet Explorer will load each time it starts; it runs in the same memory context as the browser and can perform actions on the available windows and modules.

Browser Link (n)~ A channel between Visual Studio IDE and any open browser to allow dynamic data exchange between a web application and Visual Studio.

browser mix (n)~ A mix of browsers selected for the test scenario and their percentage distributions within the test scenario. The percentage distribution determines the probability that a virtual user is running a specific browser profile.

browser modifier (n)~ Software that changes browser settings, such as the home page, without adequate consent.

browser plug-in (n)~ A kind of software that lets a standard web browser display and run specific types of content, such as media files, animations, and interactive forms.

browser profile (n)~ A collection of HTTP headers to simulate a particular browser, such as Internet Explorer 6 or Netscape 6.

browser window (n)~ A window that serves as an interface between the user and the browser.

browser-compatible form template (n)~ A form template that is designed in InfoPath by using a specific compatibility mode. A browser-compatible form template can be browser-enabled when it is published to a server running InfoPath Forms Services.

browser-compatible mode (n)~ A mode that displays the necessary ribbons, tools and filitered functionality so that the resulting application is Web-compatible.

browser-enabled form template (n)~ A browser-compatible form template that has been published to a server running InfoPath Forms Services, and that has been browser-enabled so that users can both display and fill out the form in a Web browser.

browser-safe palette (n)~ A palette of colors designed to display pictures on the Web, regardless of the browser or operating system used. A browser-safe color palette protects against color-flashing or inaccurate color mapping.

browsing history (n)~ A user's private information such as temporary files, history, passwords, web form entries, and cookies that captures Internet surfing and other online activities.

brush (n)~ A graphical object used in paint programs to sketch or fill in areas of a drawing with the color, pattern, or image currently in use.

brush resource (n)~ A brush that is encapsulated in such a way that it can be reused elsewhere in your application.

brush stroke (n)~ A line style resembling natural media paint strokes or photorealistic images that you can apply to an object.

Brush Transform (PN)~ A tool used to modify the appearance of a brush set on an object. The applied brush can be rotated, scaled, skewed, etc. The effect is not noticed on a solid color brush.

brute force attack (n)~ An attack by a malicious user or malicious software on a computer or operating system to find a secret password or a symmetric encryption key by guessing passwords or keys until the correct password or key is discovered.

BSB (n)~ A series of 6 digits used in Australia and New Zealand to identify banks and their branches and for routing transactions.

BSD (n)~ A UNIX version developed at the University of California at Berkeley, providing additional capabilities such as networking, extra peripheral support, and use of extended filenames. BSD UNIX was instrumental in gaining widespread acceptance of UNIX and in getting academic institutions connected to the Internet. BSD UNIX is now being developed by Berkeley Software Design, Inc.

BSDL file (n)~ An external file that defines the capabilities of any single device's boundary scan logic.

B-spline (PN)~ A tool that allows a user to draw a vector path defined by a series of points that indicate the direction the path should follow.

b-spline path (n)~ A vector path defined by a series of points that indicate the direction

the path should follow. Each node on a B-spline path can be a curve or corner control node. B-Spline paths are similar to Bezier paths, but curves are described by anchor points placed off the path itself.

BTC (n)~ A digital currency that uses Bitcoin.

B-tree (n)~ A tree structure for storing database indexes.

BTS (oth)~ The family of Microsoft server products that support large scale implementation management of enterprise application integration processes.

BTW ~ (By The Way)- Internet slang.

bubble chart (n)~ A variation on a scatter chart in which the data points are replaced with bubbles, and three values are compared instead of two. The third value determines the size of the bubble marker.

bubble map (n)~ A geographical map that displays a circle over specific locations, where the radius of the circle is proportional to a numeric value.

bubble packet (n)~ A data packet that is typically sent to create or maintain a NAT mapping and consists of an IPv6 header with no IPv6 payload.

bubble-jet printer (n)~ A form of nonimpact printer that uses a mechanism similar to that used by an ink-jet printer to shoot ink from nozzles to form characters on paper. A bubble-jet printer uses special heating elements to prepare the ink, whereas an ink-jet printer uses piezoelectric crystals.

bubbling (n)~ In Windows Presentation Foundation, an event routing strategy where the event instance moves up the element tree (starting with the source and ending at the root of the visual tree).

bucket (n)~ A virtual container that holds a particular category of items or data.

bucket count (n)~ The number of buckets in the hash index.

Bucket tool (n)~ A tool that allows the user to change the color of a group of pixels at once.

Bucketizer (PN)~ A post-processor that processes the raw XML data collected by the Update Compatibility Evaluator (UCE) and sends it to a centralized location.

budget (n)~ A statement that estimates projected income and expenses for a period of time.

budget (n)~ A financial plan that control expenditures for planned activities.

budget allocated (n)~ The amount of money designated for an activity or task.

Budget Allocated (n)~ In the Microsoft Dynamics CRM user interface, a field in which users type the amount of money designated for a campaign activity.

budget allocation term (n)~ The financial dimension values and the percentages that are used to generate budget allocations.

budget at completion (n)~ The original project, resource, and assignment cost as shown in the baseline plan. The baseline cost is a snapshot of the cost at the time when the baseline plan was saved.

budget control (n)~ A practice of authorizing expenditure only when budget funds can be reserved to meet future payment commitments.

budget control dimension (n)~ A combination of active financial dimensions values used to allocate budget funds to pay for planned activities.

budget control rule (n)~ The encoding of a business decision to check committed and

actual expenditure against available budget funds allocated for detailed or aggregate activities defined by valid budget control dimension value combinations.

budget cycle time span (n)~ A time period specified as a number of fiscal calendar periods. The budget period can be different from the accounting period.

budget group (n)~ A set of financial dimension values in a budget dimension hierarchy that is used to calculate aggregate budget funds allocated to superordinate financial dimension values by summing budget funds allocated to subordinate financial dimension values.

budget model (n)~ A planning structure used to schedule budget fund allocations and expenditures.

Budget Monitoring (PN)~ The Duet end-user application that enables Microsoft Office Outlook users to receive budget reports, alerts, and notifications that are generated in SAP systems in the form of e-mails delivered to Outlook Inbox. Users can then work on these reports from within Outlook.

budget plan (n)~ A document that is used to develop estimates for amounts and units in budget plan scenarios.

budget plan scenario (n)~ A classification of budget plan lines, such as Prior year or Department request, that describes the budget that you are working with or planning for.

budget planning process (n)~ A process that identifies the budget cycle and ledger for the budget planning period and defines how the budget plans will be routed, reviewed, and approved in an organization hierarchy.

budget resource (n)~ A resource that captures the maximum capacity for a project to consume money, work, or material units for a project. Budgets can only be applied at the project level by assigning a budget resource to the project summary task.

budget revision (n)~ A change to a budget that affects the current and remaining available budget funds.

budget schedule (n)~ A schedule for the planned expenditure of allocated financial resources.

budget source (n)~ The source of the original budget amounts for the project.

budget threshold (n)~ A budget threshold is the level of budget usage at which you can prevent posting or display warnings.

budgeted cost of work performed (n)~ The earned value field that indicates how much of the task's budget should have been spent, given the actual duration of the task.

budgeted cost of work scheduled (n)~ The earned value field that shows how much of the budget should have been spent, in view of the baseline cost of the task, assignment, or resource. BCWS is calculated as the cumulative timephased baseline costs up to the status date or today's date.

Budgeting & taxes (PN)~ The Personal Finance subcategory containing apps to help people create budgets and prepare tax returns.

buffer (n)~ An area of memory reserved for temporarily holding data before that data is used by a receiving device or application. Buffering protects against the interruption of data flow.

buffer (v)~ To use a region of memory to hold data that is waiting to be transferred, especially to or from input/output (I/O) devices such as disk drives and serial ports.

buffer (n)~ A quantity of time or materials maintained in the work flow as a cushion against fluctuations in throughput.

Buffer ~ A temporary storage area for data, often used to 'smooth out' incoming audio or video streams. Several seconds worth of material is stored in the buffer and it is then played back from there, so that if there is a brief interruption in the stream your music or video doesn't stop.

buffer ~ A storage area used for handling data in transit. Buffers are used in internetworking to compensate for differences in processing speed between network devices. Bursts of data can be stored in buffers until they can be handled by slower processing devices. Sometimes referred to as a- packet buffer.

buffer cache (n)~ A block of memory reserved for index and table data pages.

buffer overflow (n)~ A condition that results from adding more information to a buffer than it was designed to hold. An attacker may exploit this vulnerability to take over a system.

buffer overrun (n)~ A condition that results from adding more information to a buffer than it was designed to hold. An attacker may exploit this vulnerability to take over a system.

buffer pool (n)~ A block of memory reserved for index and table data pages.

buffer size (n)~ The size of the area of memory reserved for temporary storage of data.

buffer space (n)~ The amount of memory, in bytes, available for temporary storage of data.

buffer storage (n)~ An area of storage that is used to hold data to be passed between devices that are not synchronized or have different bit transfer rates.

buffering (n)~ As the client renders the stream, the interruption of flow while the client temporarily stores streaming content before playing it, in order to protect against playback interruption. The streaming content is downloaded into a buffer, and then played after an amount sufficient to prevent playback interruption has been stored. Buffering will always occur if the encoded bit rate of the stream exceeds the available network bandwidth. Because a Smooth Streaming presentation contains multiple copies of the video, each encoded at different bit rates, the client can use Smooth Streaming heuristics to switch to a bit rate that avoids buffering.

bug (n)~ An error in coding or logic that causes a program to malfunction or to produce incorrect results.

bug (n)~ A type of work item that records a potential source of dissatisfaction with the product. The common name of a work item type for tracking code defects.

Bug ~ Error, especially in a program, that has been missed in testing. The story goes that the original bug was an insect that got itself cremated inside an electrical circuit in an early computer, causing it to fail (and I don't suppose the insect enjoyed it much, either).- It took them ages to figure out what was causing the problem, and when they eventually found the bug the story passed into legend.

bug ~ An error in a piece of software that stops it from working the way that it should do.

bug allotment (n)~ A chunk of development time allocated to fix bugs. An allotment is created by leaving slack in the iteration plan.

bug convergence (n)~ The point at which the rate of fixed bugs exceeds the rate of found

bugs. Bug convergence is a visible indication that the team is making progress against the active bug count. It is a sign that the project end is within reach.

build (n)~ A named set of deliverables (software components) produced, usually by compiling, from a discrete set of source versions.

build (v)~ To translate all the source code of a program from a high-level language into object code prior to execution of the program.

build (n)~ The version from the main assembly of the application, which is automatically incremented when the assembly is built, and which is stored in Assemblyinfo.cs.

build acceptance test (n)~ A group of tests used to determine the health of a build at a high level. Typically, these tests exercise the core functionality to help team members determine whether further testing is worthwhile. They are run after the daily build to verify that compilation of source code has been built successfully and is ready for further testing.

build activity (n)~ A Windows Workflow Foundation activity that is part of the Team Foundation Server build process. It incorporates the logic that is executed before, during, or after the building of a software application.

build agent (n)~ A background process that receives, runs, and reports on Team Foundation Server builds and other property settings on a single computer. The build agent communicates with the build controller, usually located on another computer.

build configuration (n)~ The configuration of a particular build.

build controller (n)~ A background process that manages a set of build agents.

Build controller name (n)~ The name of a build controller. To use Team Foundation Build, your team must have at least one build controller to perform lightweight tasks and distribute the processor-intensive work of your build process to its pool of build agents.

build cycle (n)~ A part of the internal release cycle. It is the process of adding features, creating test cases for each, stabilizing each feature before building new features, and then releasing for evaluation.

build definition (n)~ A set of a) build activities and b) the conditions under which the workflow is activated, that together build a single solution or a set of solutions in a team project.

Build Dependencies (n)~ When building a solution that contains multiple projects, it can be necessary to build certain projects first, to generate code used by other projects. Build dependencies allow you to specify which projects depend on which other projects.

build directory (n)~ A folder location on the development system in which the run-time image is placed during the build process.

build engineer (n)~ An engineer who is responsible for the compilation of a named set of deliverables from a discrete set of source versions.

build error (n)~ A message that notifies you of an issue that breaks the build.

build event (n)~ The definition of the build process. A build event lets you specify an action to occur at a specific time in the build process. For example, you could use a build event to register a file with regsvr32.exe after the project finishes building.

build health (n)~ The quality of the as-built software.

build log (n)~ The recorded text output of a Visual Studio build, often indicating command lines issued and status of each step in the build process. For a C++ build, this

file is called BuildLog.htm.

build minute (n)~ A unit of measure for the amount of computing time it takes to build a project.

Build Notifications (n)~ Microsoft Visual Studio application that can be accessed through Team Foundation Server Tools to receive alerts from the system tray when a build is completed.

build number (n)~ A version of a program.

build policy (n)~ A set of rules that enables developers to run, monitor, and manage builds.

build rule (n)~ A set of guidelines that determine how a Visual Studio project is built.

Build Service Accounts group (n)~ A build server can build and test code in a team project collection only if the build service account is a member of the Project Collection Build Service Accounts- group of that collection.

build type (n)~ A template used to manage the conditions under which a single solution or a set of solutions will be built.

build verification test (n)~ A group of tests used to determine the health of a build at a high level. Typically, these tests exercise the core functionality to help team members determine whether further testing is worthwhile. They are run after the daily build to verify that compilation of source code has been built successfully and is ready for further testing.

builder (n)~ A tool that simplifies a task.

building block (n)~ A reusable piece of content, formatting information or other document parts that are stored in galleries.

building block (n)~ One of three primary elements (row worksheet, column worksheet, and reporting tree) used to construct a report in Management Reporter.

Building Blocks Organizer (n)~ A feature that allows users to preview, edit or delete building blocks in a variety of galleries, and insert them into the current document.

building plan (n)~ A general category that could represent a floor plan, home plan, or other layout.

build-to-order (n)~ Pertaining to the process of manufacturing a computer according to a customer`s specification.

build-to-plan (n)~ Pertaining to the process of manufacturing computers according to a general specification.

built-in (v)~ Pertaining to a source category of logging fields that is included by default in IIS Advanced Logging and which cannot be edited.

built-in administrator (n)~ On Windows-based computers, a user account that is a member of the computer's local Administrators group or a member of a group that is a member of the local Administrators group, such as the Domain Admins group in a Windows domain. This is the first account that is created when you install an operating system on a new workstation, stand-alone server, or member server. By default, this account has the highest level of administrative access to the local computer.

built-in administrator account (n)~ On Windows-based computers, a user account that is a member of the computer's local Administrators group or a member of a group that is a member of the local Administrators group, such as the Domain Admins group in a

Windows domain. This is the first account that is created when you install an operating system on a new workstation, stand-alone server, or member server. By default, this account has the highest level of administrative access to the local computer.

built-in app (n)~ An app that is included in the product when a user first starts using it.

built-in experience (n)~ An experience that ships natively in Win8 and- that vendors can extend - e.g. print, mobile broadband.

built-in functions (n)~ A group of predefined functions provided as part of the Transact-SQL and Multidimensional Expressions languages.

built-in group (n)~ A default security group installed with the operating system. Built-in groups have been granted useful collections of rights and built-in abilities.

built-in menu (n)~ A menu that is available by default in an application; it is not created by the user.

built-in microphone (n)~ A microphone that is part of a device.

built-in role group (n)~ A role group that ships by default as opposed to a customized role group that a admin would customize specifically for the needs of their organization

built-in style (n)~ The formatting attributes that are available by default in an application's style list.

built-in toolbar (n)~ A toolbar that is part of an application when it's installed on your computer.

BUILTIN\Administrators (n)~ User account (local administrators)

bulk add (n)~ A procedure by which an administrator can add a group of users (or properties for users) to an account.

bulk copy (n)~ An action of copying a large set of data.

Bulk Copy Program (n)~ A command prompt bulk copy utility that copies SQL Server data to or from an operating system file in a user-specified format.

Bulk Deletion (PN)~ A system job that deletes selected records from one entity.

Bulk Duplicate Detection (PN)~ A system job that detects duplicate records for one entity.

bulk edit (n)~ A procedure by which a user can simultaneously change specified properties for a group of selected items.

Bulk E-mail (PN)~ A system job that sends e-mail messages to recipients specified by the user.

bulk encryption (n)~ A process in which large amounts of data, such as files, e-mail messages, or online communications sessions, are encrypted for confidentiality. It is usually done with a symmetric key algorithm.

bulk export (n)~ To copy a large set of data rows out of a SQL Server table into a data file.

bulk import (v)~ To load a large amount of data, usually in batches, from a data file or repository to another data repository.

Bulk Import Wizard (n)~ A tool used to add multiple rows of data into a database in one operation.

bulk ingestion (n)~ The intake of multiple pieces of content by a service in a single operation.

bulk item (n)~ A formula item input into a product delivery activity.

bulk load (n)~ An action of inserting a large set of rows into a table.

bulk log backup (n)~ A backup that includes log and data pages changed by bulk operations. Point-in-time recovery is not allowed.

bulk mail (n)~ Large-volume mail.

bulk mail protection (n)~ A feature that enables the blocking of newsletter-type email that users may have opted into.

bulk order (n)~ An order for a large quantity of products or services. The minimum quantity that qualifies as a bulk order is set by individual companies.

bulk rowset provider (n)~ A provider used for the OPENROWSET instruction to read data from a file. In SQL Server 2005, OPENROWSET can read from a data file without loading the data into a target table. This enables you to use OPENROWSET with a simple SELECT statement.

Bulk Smart Card Issuance Tool (PN)~ A software program running on a client computer that a certificate manager can use to simultaneously issue multiple certificates.

bulk storage (n)~ Any medium capable of containing large quantities of information, such as tape, fixed disk, or optical disc.

bulk-logged recovery model (n)~ A database recovery mode that minimally logs bulk operations, such as index creation and bulk imports, while fully logging other transactions. Bulk-logged recovery increases performance for bulk operations, and is intended to be used an adjunct to the full recovery model.

bulleted (adj)~ Marked with a bullet (a typographical symbol such as a filled or empty circle, diamond, box, or asterisk.)

bulleted list (n)~ A list in which each item or block of text is preceded by a bullet.

Bulleted list (PN)~ The Sway button that allows users to create a bulleted list out of their text.

Bulletin Board ~ A semi-public area which computer users can connect to using a modem, to read and post messages and/or exchange files. Now largely replaced by websites.

Bulletin Board System (n)~ An application or computer that makes it possible to join an online community and exchange messages, share files, and participate in Usenet and chat rooms, often at not cost. The BBS found its inspiration in traditional bulletin boards that held participants' posted communication.

bump map (n)~ A set of per-pixel color and luminance data used to simulate relief, detail, or texture (bumps) on the surface of a graphic object without modifying the geometry of the object model.

bump mapping (n)~ A technique for simulating the appearance of rough surfaces in 3-D scenes. Variations in depth are stored in a texture and applied to geometry, using standard texture-blending techniques.

bumper advertisements (n)~ Advertising content that is played before and after the primary content.

bundle (n)~ To combine products for sale as a lot. Frequently, operating system software and some widely used applications are bundled with a computer system for sale.

bundle (n)~ The grouping of jobs in shop floor control so that multiple jobs can be started at one time.

bundle (n)~ The combination of a number of products for sale as one unit.

bundle (v)~ To group jobs in shop floor control so that multiple jobs can be started at one time.

bundled trial (n)~ A trial subscription for a service that includes different options.

bundling (n)~ The combing of files (typically JavaScript, CSS) into one file to reduce the number of HTTP requests for resources.

burden hour (n)~ An hour that is included in a calculation as nonbillable or inefficient, e.g., hours that cannot be charged to a customer.

buried via (n)~ A copper plated hole that interconnects one or more internal layers, but does not connect to an external layer, hence the hole is completely internal or buried within the board.

burn (v)~ To copy files to a recordable CD.

Burn ~ Create a CD or DVD.

burn ~ Create a CD or DVD.

Burn a Sharing Disc (v)~ A control that initiates burning a disc with selected pictures for sharing.

burn destination (n)~ The drive that is used to burn the disc.

Burn Pictures and Videos Wizard (n)~ The wizard used to burn pictures and videos on a disk.

burn rate (n)~ A calculation of the completed and required rate of work based on a specified time period.

burndown (n)~ The trend of completed and remaining work over a specified time period.

burndown chart (n)~ A graphical representation of the amount of work left and the period of time available.

Burnt Glaze Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a burnt glaze finish for their cake.

burst (n)~ Transfer of a block of data all at one time without a break. Certain microprocessors and certain buses have features that support various types of burst transfers.

burst (n)~ The multiple photos taken on shutter press to capture moving subjects. The user can pick the best one or just accept the photo recommended by the software.

burst ~ Temporary increased network loading due to a data surge or alarm avalanche

burst density (n)~ The fraction of RTP (Real-Time Transport Protocol) data packets within burst periods since the beginning of reception that were either lost or discarded. A burst period is a period in which a high proportion of packets are either lost or discarded due to late arrival.

burst duration (n)~ The mean duration, expressed in milliseconds, of the burst periods that have occurred since the beginning of reception.

burst length (n)~ The mean duration, expressed in milliseconds, of the burst periods that have occurred since the beginning of reception.

burst mode (n)~ A method of data transfer in which information is collected and sent as a unit in one high-speed transmission. In burst mode, an input/output device takes control of a multiplexer channel for the time required to send its data. In effect, the multiplexer, which normally merges input from several sources into a single high-speed data stream,

becomes a channel dedicated to the needs of one device until the entire transmission has been sent. Burst mode is used both in communications and between devices in a computer system.

burst mode (n)~ A camera option that enables users to capture moving subjects by snapping multiple photos on shutter press and allowing the user to pick the best one or just accept the photo recommended by the software.

bus (n)~ A communication line used for data transfer among the components of a computer system.

bus ~ A communication pathway between the components in your computer.

bus ~ Bus topology has computers connected to a strand of network cabling that is connected to network repeaters at one end and terminated at the other.

bus enumerator (n)~ In a Plug and Play (PnP) operating system, a bus driver that detects devices that are located on a specific bus. The driver then loads information about the devices into the hardware tree.

business (n)~ An entity that provides goods and/or services to others.

Business (adj)~ A field that contains a contact's business phone number.

business (PN)~ An app category that facilitates business operations or career advancement.

Business (PN)~ An app category that facilitates business operations or career advancement.

business account (n)~ The person or business to which the salesperson tries to sell a product or service.

Business Activity Monitoring (n)~ A BizTalk Server feature that gives business users a real-time view of their heterogeneous business processes, enabling them to make important business decisions.

Business Activity Services (n)~ A BizTalk Server feature that enables business users to configure business processes and interact with trading partners.

business activity statement (n)~ A form that Australian businesses file to report and pay taxes.

business analyst (n)~ A person who identifies the business needs of their clients to help determine solutions to business problems. This person has a strong knowledge of business activity monitoring and enterprise process management. This person analyzes multidimensional business information based on key performance indicators and is a liaison between senior management and the IT staff.

business analytics (n)~ The category of services in Microsoft Azure that includes SQL StreamInsight, SQL Reporting, and Hadoop.

business analytics service (n)~ The category of services in Microsoft Azure that includes SQL StreamInsight, SQL Reporting, and Hadoop.

business application (n)~ A collection of Web-based lists, libraries, calendars, and other pages you use to share information and manage an area of your business, such as your projects, documents, and company information.

Business Applications (n)~ A feature that provides Web-based applications in a central location to help businesses manage sales, customer relationships, projects, employees, and company functions.

Business Card (n)~ A card-like layout on an Outlook Contact that provides the user with the look of a real world business card.

business classification (n)~ A classifier that classifies organizations in an industry classification system.

business closure (n)~ A period of time that an entire business is not available for service activities.

Business Connectivity Services (PN)~ A feature that enables users to interact with back-end (LOB) data from within the Office Suite and SharePoint.

business contact (n)~ An individual who is interested in doing business or who currently does business with your organization. A contact may or may not be part of a larger organization (account).

Business Contact Manager (PN)~ A feature or add-in for Outlook that enables small business owners to list business contacts, accounts, and opportunities, and to perform several tasks related to managing and tracking information about the business.

Business Contact Manager database (n)~ The database that stores information about accounts, business contacts, opportunities, business projects, and other items.

Business Contact Manager for Microsoft Outlook 2010 Database Tool (PN)~ A downloadable tool that provides users with administration capabilities such as creating, sharing, backing up or restoring a database.

Business Contact Manager for Microsoft-® Office Outlook-® 2007 (n)~ Microsoft supplemental software shipped on a separate disc that adds small-business contact management capabilities to Office Outlook 2007. It enables users to organize customer and prospect information, and manage sales and marketing activities in one location.

Business Contact Manager for Outlook (PN)~ A feature or add-in for Outlook that enables small business owners to list business contacts, accounts, and opportunities, and to perform several tasks related to managing and tracking information about the business.

Business Contact Manager Home Page (n)~ A document that serves as a starting point for exploring Business Contact Manager for Outlook. The home page is displayed by default and can be customized.

Business Contact Manager Learning Center (n)~ A Web page that contains hyperlinks to the Quick Start Guide, the Microsoft Office Online Web site, and selected Help topics about the newest features.

Business Contact Manager toolbar (n)~ The toolbar at the top of an item where you can view existing links or create new links to Account, Business Contact, Opportunity, or Business Project records.

Business Contact Record (n)~ The location for storing business contact information, including information that is entered on the Business Contact form, linked records, and communication history items.

Business Continuity (n)~ Strategies and processes for keeping an organization's internal and external applications, workloads, and services up and running during planned downtime and unplanned outages.

business data action (n)~ A link that appears alongside business objects from the Application Registry. These links can open web pages, display the user interfaces of line-of-business applications, launch InfoPath forms, or, through custom actions, invoke any

logic in a .NET assembly.

Business Data Actions Gallery (PN)~ The site collection level gallery of XML metadata files that defines business data actions.

Business Data Collaboration Workspace (PN)~ The Collaborate On site that is bound to a BCS external content type.

Business Data Connectivity Model Template (PN)~ A Visual Studio project template that enables you to create your own .NET Connectivity Assemblies.

Business Data Connectivity service (PN)~ A shared service in Windows SharePoint Services and SharePoint Server that provides a means for storing, securing, and administering external content types and related objects.

Business Data Connectivity Service Application (n)~ A deployed instance of the Business Data Connectivity Shared Service.

Business Data Connectivity Service Application Proxy (PN)~ An application proxy that allows Web applications to connect to a Business Data Connectivity Shared Service Application and contains features for using the shared service.

Business Data Connectivity Shared Service (PN)~ A shared service in Windows SharePoint Services and SharePoint Server that provides a means for storing, securing, and administering external content types and related objects.

Business Data Schema (n)~ A framework for the business data an object carries with it.

Business Data Task Panes Gallery (PN)~ The site collection level gallery containing the XML metadata files that define task pane layouts displaying business data in external data parts.

business database (n)~ The repository for all Business Contact Manager for Outlook data.

business document (n)~ A view of a source document that is issued by one party and received by one or more other parties.

business driver (n)~ A condition or phenomenon that has the potential to impact a business either positively or negatively.

business driver (n)~ A brief statement that defines clearly and specifically the desired business outcomes of the organization along with the necessary activities to reach them.

Business Edition (PN)~ The edition of Microsoft Azure SQL Database that offers relational databases run (up to 150 GB) on shared resources, with built-in replicas within a datacenter, and dynamic scale-out of thousands of distributed databases.

business event (n)~ The abstraction of an economic event and an accounting event.

Business History Folder (n)~ A folder that contains all history items and the records they are linked to.

business hours (n)~ The days of the week and the hours of each day that a hunt group is available to take phone calls.

Business Information (PN)~ A UI element that links to a page where the account owner can enter information, such as address and phone number, for his or her company or organization.

Business Insights (PN)~ The answers Cortana provides that are based on corporate data inside a Power BI data set.

business intelligence (n)~ The aggregation, storage, analysis, and reporting of data for the

purpose of informing business decision makers.

Business Intelligence Center (PN)~ A SharePoint site template that provides an entry point for users to access the business intelligence ecosystem.

Business Intelligence Development Studio (n)~ A project development and management tool for business intelligence solution developers. It can be used to design end-to-end business intelligence solutions that integrate projects from Microsoft SQL Server Analysis Services (SSAS), Microsoft SQL Server Integration Services (SSIS), and Microsoft SQL Server Reporting Services (SSRS).

Business Intelligence Resource Center (n)~ A web site that provides information about business intelligence in Microsoft SharePoint Server 2010.

business logic (n)~ The part of an application program that performs the required data processing of the business. It refers to the routines that perform the data entry, update, query and report processing, and more specifically to the processing that takes place behind the scenes rather than the presentation logic required to display the data on the screen.

business logic handler (n)~ A merge replication feature that allows you to run custom code during the synchronization process.

business logic handler framework (n)~ The business logic handler framework allows you to write a managed code assembly that is called during the merge synchronization process.

Business Logic Module (n)~ A module that contains Business Logic software and is called to enforce data constraints and/or perform tasks that are loaded and executed in a host-specific run-time environment.

business manager (n)~ A person who is responsible for managing information and interacting with business processes, structured as well as ad hoc. This person manages business users or information workers who also create information and consume business process. This person acts as a liaison between information workers and the IT department where business analysts, developers, and IT staff work. This person is also responsible for automating, building, and deploying business processes.

Business Modeler (n)~ A component of PerformancePoint Planning Server that is the primary interface for designing and managing business applications that perform complex planning, budgeting, forecasting, and consolidation.

business modeling objects (n)~ The set of objects that a modeler uses to create a custom application. The set includes the following primary object categories: system, application, model, and modeling site. Primary object categories can contain other object categories. For example, system-level security objects and application-level security objects.

Business Network profile (n)~ An entity that represents a person in the Business Network, to which person-type entities in CRM can be linked.

Business Network relationship (n)~ An explicit (for example, -€œcolleague-€?) or implicit (for example, -€œsent 100 emails in the last 30 days-€?) relationship, with inherent strength, between people in the Business Network.

business note (n)~ An Outlook item that can be attached to a record's history log. Typically a note contains information regarding a conversation with a customer or other people in the company they work for.

business operation (n)~ A logical business action controlled by the business operation framework and implemented by a class that communicates with the framework using data contracts.

Business Operation Framework (PN)~ The model-view-controller framework that synchronously or asynchronously controls the execution of immediate or batched business operation implementations.

Business Phone (PN)~ The field where the telephone number for a business can be entered.

business presentation (n)~ A presentation created for business purposes.

business process (n)~ A specified sequence of steps required to complete a complex task, such as creating a contract. A business process can be performed manually or through the use of a workflow rule.

business process flow (n)~ An operational process that guides a user to achieve a certain goal.

Business Process Modeling Notation (PN)~ A standard notation for process management developed by the Business Process Management Initiative.

Business Process Workspace (n)~ An interface that enables business managers to track and manage all the business processes from STS.

Business Project (n)~ A project that is created in Business Contact Manager for Outlook. A business project is made up of one or several project tasks.

business relation (n)~ Any organization, person, or other legal entity with whom a company has significant interaction, such as sales or services.

business role (n)~ An access privilege that enables user-defined roles for viewing and analyzing business data.

business rule (n)~ A prescribed action that performs one or multiple operations on the multidimensional data in a model.

Business Rule (n)~ A criteria-based rule that can route Tickets to the appropriate CSR or Queue as well as perform specific Actions on Tickets.

Business Rule Composer (PN)~ A graphical user interface (GUI) tool that is used to create and deploy specific versions of business policies.

Business Rule Engine (n)~ A run-time inference engine that evaluates rules against facts and initiates actions based on the results of that evaluation.

business rules (n)~ The logical rules that are used to run a business

Business Rules (PN)~ A node in the solution explorer that will display all the rules that are created on attributes on the current entity and that apply to other entities.

Business Rules workspace (n)~ In PerformancePoint Planning Business Modeler, a user interface area that allows you to create and manage business rule sets, business rules, and model properties.

Business Scorecard Builder (n)~ A client application that is used to create and manage business performance scorecards and to create views of these scorecards.

Business Scorecard Manager Server (n)~ The set of three server components for Microsoft Office Business Scorecard Manager; the components are a Web service, a metadata database, and Web Parts for a Microsoft SharePoint Products and Technologies Web site.

Business Scorecard Manager Server database (n)~ A database that stores metadata for scorecards, including user permissions and the settings for scorecard elements.

Business Scorecard Manager Server Web Parts (n)~ A feature of Business Scorecard Manager that provides views of scorecard elements and data on a Microsoft SharePoint Products and Technologies Web site.

Business Scorecard Manager Server Web service (n)~ An application programming interface (API) that provides the core functionality of Microsoft Office Business Scorecard Manager.

business service (n)~ A collection of features and functions that enable a business process, including configuration items, metadata, and the people associated with the process.

business services (n)~ For-fee services that are available on the Microsoft Small Business Center Web site.

Business Store for Windows 10 (PN)~ ?A portal where a business or IT manager can purchase Windows Store apps, and also manage the assignment of app ownership to employees.

business task (n)~ A work-related action item that can be tracked through completion. A business task may occur once or repeatedly.

business technology ~ Pervasive technology use that boosts business results.

business to business (adj)~ Relating to the sales category pertaining to transactions and related activity between a business and buyers who are not consumers, such as government bodies, companies, and resellers.

business tool (n)~ An item that is frequently accessed (such as reports and the product and service items list) when using Business Contact Manager for Outlook. Many of these are listed on the Business Tools Menu.

Business Tools menu (n)~ The menu on the Outlook menu bar that provides access to Business Contact Manager functions.

business type (n)~ The kind of business organization or sector (such as a public company, a partnership, a private corporation, and so on).

business unit (n)~ A semi-autonomous operating unit that is created to meet strategic business objectives.

Business Unit Settings (n)~ A sub-area of the Settings module where business units, users, security roles, teams, facilities and equipment, resource groups, and queues are managed.

business user (n)~ An information user, such as a business manager, marketing manager, or business analyst that uses information to make critical decisions.

business view (n)~ A business data perspective. Designated fields and records are arranged in a designated sequence.

business-to-business (adj)~ Relating to the sales category pertaining to transactions and related activity between a business and buyers who are not consumers, such as government bodies, companies, and resellers.

business-to-business integration (n)~ The exchange of electronic documents between two companies, for example, for the purpose of trading.

business-to-business site (n)~ A Web site designed for the creation and transmission of

purchase orders between businesses that have an established relationship.

business-to-consumer site (n)~ A Web site that provides retail shopping directly to the public.

busy (adj)~ Pertaining to time when a person is already scheduled for another task and is not available.

busy (adj)~ Pertaining to the state of a phone line when it is in use.

Busy (PN)~ An item on the user's My Status menu. This is a status the user can select to indicate that they are currently busy.

Busy Inactive (PN)~ A presence status that indicates a person is in a meeting or is scheduled to be in a meeting, but their computer has been inactive for the idle time period setting.

busy signal (n)~ The indication that the phone is busy.

button (n)~ A graphic element that appears similar to a physical button or keyboard key in the UI. A button is pressed' by clicking on it with a mouse

button (n)~ A movable piece on a device that is pressed to activate some function.

button control (n)~ A graphical control that enables a user to provide input to an application.

button face (n)~ The surface of a button where text or an image (typically indicating the button's function) may be displayed.

button grid (n)~ A rectangular group of buttons with similar functions on a point-of-sale screen.

Buy (v)~ The level in the Media Console account hierarchy that represents the media buys that support an advertising campaign. The Buy level is subordinate to the Media Plan level.

Buy Now (v)~ A content template used in Commerce Server to facilitate impulse shopping: a user can purchase goods from any Web page on the Internet. When a user clicks a product image, a dialog box appears prompting the user for a shipping address and credit card information.

Buy Skype Credit (PN)~ A call to action on the skype.com homepage. Users can purchase Skype Credit to pay for using Skype products.

buyer currency (n)~ The currency unit used on a site to convert and format a second currency for dual display.

buyer ID (oth)~ A code that identifies the person who purchases the item from a supplier.

buyer's push (n)~ The process where products are purchased by a centralized purchasing department and then distributed to stores.

buzz (n)~ A feature that shows suggestions for things that are trending or popular based on social networking amalgamation.

Buzz (PN)~ The total number (the volume) of posts in a set of filters/dataset.

BV (oth)~ By using a technology called video encoded invisible light (VEIL), a method whereby MarketingPilot users can verify that the TV ads that have been ordered actually ran as ordered.

BVT (n)~ A group of tests used to determine the health of a build at a high level. Typically, these tests exercise the core functionality to help team members determine whether further testing is worthwhile. They are run after the daily build to verify that

compilation of source code has been built successfully and is ready for further testing.

by default (Adverb) ~ How a program's action is determined if the user does not make a choice or supply a required value.

BYOC/CAL discount (n)~ A discounted rate for software or services available to customers who already own client access licenses (CALs).

BYOD (PN)~ The set of features that let employees use personal devices to access corporate information and services and let IT admins manage such devices.

BYOL (adj)~ Pertaining to features that allow use of existing product licenses for a product that is used in connection with another product.

BYOS (n)~ The policy of permitting existing customers to utilize their own subscriptions within the public cloud and easily move new and existing workloads between their data centers and the cloud.

BYOS Red Hat Enterprise Linux (PN)~ A service type of the 'Virtual Machines' service based on the Red Hat Linux distribution, allowing customers to use their own subscription to run the server. The number preceding 'core' refers to the size of the server.

bypass call (n)~ A call that bypasses the Mediation Server.

bypass mode ~ Operating mode on FDDI and token ring networks where an interface has de-inserted from the ring.

by-product (n)~ A item produced as a consequence of producing another item.

byte (n)~ A unit of data that typically holds a single character, such as a letter, a digit, or a punctuation mark. Some single characters can take up more than one byte.

byte (n)~ A field size or data type that can hold positive integer numbers ranging from 0 to 255.

Byte ~ A basic unit of measurement for pieces of information; the space required to store one character. See also- Bit,- Kilobyte,Megabyte,- Gigabyte,- Terabyte.

byte order (n)~ The processor memory architecture in which bytes of data (typically, integer values) are stored. The two most common orders are: little endian (least significant byte is placed first) and big endian (most significant byte is placed first).

byte order mark (n)~ A Unicode character used to indicate that text is encoded in UTF-8, UTF-16 or UTF-32.

byte tag (n)~ A tag on a physical object that defines 8 bits (or 1 byte).

bytecode caching (n)~ A technique for preprocessing JavaScript files so they can be loaded faster.

C (oth)~ The label for the text box where the user types the postal code for outgoing correspondence.

C (n)~ A game rating symbol developed by the Computer Entertainment Rating Organization (CERO).

C ~ programming language developed at Bell Laboratories in the 1970s, based on the two earlier languages B (1970) and BCPL (1967).

C corporation (n)~ An United States tax law designation given to any corporation that is a unique entity apart from and taxed separately from its owners.

C# (n)~ A programming language designed for building enterprise applications that run on the .NET Framework. C#, which is an evolution of C and C++, is type safe and object oriented. Because it is compiled as managed code, it benefits from the services of the common language runtime, such as language interoperability, security, and garbage collection.

C# ~ pronounced -€œC sharp-€?, a programming language developed by Anders Hejlsberg (the developer of Turbo Pascal and Delphi) for Windows programming under Microsoft's .NET Framework.

C++ Accelerated Massive Parallelism (PN)~ An object model that accelerates execution of C++ code by taking advantage of the data-parallel hardware that is generally present as a GPU on a discrete graphics card.

C++ AMP (PN)~ An object model that accelerates execution of C++ code by taking advantage of the data-parallel hardware that is generally present as a GPU on a discrete graphics card.

C++ template (n)~ A template that enables you to define a family of functions or classes that can operate on different types of information.

CA (n)~ An entity entrusted to issue certificates that assert that the recipient individual, computer, or organization requesting the certificate fulfills the conditions of an established policy.

CA certificate (n)~ A certificate that identifies the certification authority (CA) that issues server and client authentication certificates to the servers and clients that request these certificates.

CA compromise (n)~ A situation in which it is known or suspected that the CA's private key or other aspects of the CA validated in the certificate have been revealed.

CA hierarchy (n)~ A hierarchy in which the roles of the certification authority are separated into one root CA and one or more subordinate CAs.

CA name (n)~ The name of the certifying authority.

CAB (n)~ A formally constituted group of people representing service delivery and support functions that is responsible for assessing, planning, and authorizing changes to the IT environment.

Cabaret (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 65.

cabinet (n)~ The box in which the main components of a computer (CPU, the hard drive, floppy and CD-ROM drives, and expansion slots for peripheral devices, such as monitors) are located.

cabinet file (n)~ A single file that stores multiple compressed files. These files are commonly used in software installation and to reduce the file size and the associated

download time for Web content.

cable (n)~ A collection of wires shielded within a protective tube, used to connect peripheral devices to a computer. A mouse, a keyboard, and a printer might all be connected to a computer with cables. Printer cables typically implement a serial or a parallel path for data to travel along.

Cable ~ 1) Any insulated wiring used to connect computer equipment together. 2) An always-on high speed internet connection similar to- ADSL- but using cable TV technology instead of a phoneline.

cable connection (n)~ A communications method by which you use a cable to connect your mobile device to another device.

cable modem (n)~ A device that enables a broadband connection to the Internet by using cable television infrastructure. Access speeds vary greatly, with a maximum throughput of 10 megabits per second (Mbps).

cable range (n)~ In the Macintosh environment, the routing address or range of addresses assigned to the physical network that AppleTalk Phase 2 routers use to direct information to the appropriate network.

cache (n)~ A special memory subsystem in which frequently used data values are duplicated for quick access.

cache (v)~ To store frequently used data values in a special memory subsystem for quick access.

cache (n)~ Generally, a file used to store information temporarily. Windows Disk Protection utilizes a cache file to store changes made to system and profile files during user sessions. This cache file is emptied of contents at intervals, depending on how Windows Disk Protection is configured.

Cache ~ A temporary storage area for frequently or recently used data, either in memory, on your hard disk or the internet. For example, if you go back to a webpage you have recently visited, your PC will usually be able to display it from the internet cache on your hard disk, so it won't need to download it from the internet again.

Cache ~ Pronounced 'Cash'. A temporary storage area for frequently accessed information. The cache shortens the time it takes to access this information, relieves the burden from the main memory, and increases the overall speed of applications.

cache aging (n)~ The mechanism of caching that determines when a cache row is outdated and must be refreshed.

cache client (n)~ A .NET application that uses the Windows Server AppFabric client APIs to communicate with and store data to a Windows Server AppFabric distributed cache system.

cache cluster (n)~ The instantiation of the distributed cache service, made up of one or more instances of the cache host service working together to store and distribute data. Data is stored in memory to minimize response times for data requests. This clustering technology differs from Windows Clustering.

cache file (n)~ A file used by DNS servers and clients to store responses to DNS queries. For Windows DNS servers, the cache file is named Cache.dns by default.

cache hierarchy (n)~ A network of cache proxies that have sibling and parent relationships.

cache hit (n)~ The condition that exists when a client requests content and the cache server determines that the content is both stored in the cache and up to date. When there is a cache hit, the content is streamed from the cache to the client.

cache interval (n)~ The length of time that a stored copy of the views that are shown in a dashboard can exist on the server.

cache invalidation (n)~ The process of flagging an object in the cache so that it will no longer be used by any cache clients. This occurs when an object remains in cache longer than the cache time-out value (when it expires).

cache item (n)~ An object that is stored in the cache and additional information associated with that object, such as tags and version. It can be extracted from the cache cluster using the GetCacheItem client API.

cache line (n)~ The smallest unit of memory than can be transferred between the main memory and the cache.

Cache Loader (n)~ A component used by the CacheManager object to load data into a cache Dictionary object. Although this component is implemented as a pipeline component, it is not run in the context of a pipeline.

Cache Memory (MB/month) (PN)~ The unit of measure for the Cache Memory resource that is equal to 1,024 Cache Memory (MB/month) units.

cache notification (n)~ An asynchronous notification that can be triggered by a variety of cache operations on the cache cluster. Cache notifications can be used to invoke application methods or automatically invalidate locally cached objects.

cache operation (n)~ An event that occurs on regions or cached items that can trigger a cache notification.

cache plug-in (n)~ A type of plug-in that enables a Windows Media server to provide cache and proxy support for another Windows Media server.

cache port (n)~ A TCP/IP port used by cache hosts to transmit data to and from the cache clients. The port number used for the cache port can be different on each cache host. These settings are maintained in the cluster configuration settings.

cache proxy (n)~ A proxy that is capable of caching responses so that when there is a cache hit, the proxy can serve the requested content without forwarding the request to the destination server.

cache region (n)~ A container of data, within a cache, that co-locates all cached objects on a single cache host. Cache Regions enable the ability to search all cached objects in the region by using descriptive strings, called tags.

cache server (n)~ A server that stores previously requested Web content. When the same content is requested later, the server either sends the cached content or acquires newer content, depending on the freshness of the cached content that is defined by cache directives. A cache server is frequently used to reduce the network traffic and the response time by serving the cached content, when appropriate.

Cache Service (PN)~ The managed service in Microsoft Azure that creates a secure, dedicated cache in the Microsoft Azure region of the user's choice, guaranteeing isolation of the user's business critical data.

cache tag (n)~ One or more optional string-based identifiers that can be associated with each cached object stored in a region. Regions allow you to retrieve cached objects based

on one or more tags.

Cache Writer (n)~ A component used by the CacheManager object to write activity data from a cache Dictionary object. Although this component is implemented as a pipeline component, it is not run in the context of a pipeline.

cache/proxy server (n)~ A server running Windows Media Services for which a cache/proxy plug-in has been enabled, allowing the server to provide cache and proxy support to another Windows Media server.

cacheable (adj)~ Pertaining to, or characteristic of, the Smooth Streaming fragments that can be cached on servers on the edge of an HTTP network for reuse by clients. The fragments can be cached because of the stateless nature of the HTTP protocol, which treats each HTTP request as an independent transaction that is unrelated to any previous request.

cache-aside programming pattern (n)~ A programming pattern in which if the data is not present in the cache, the application, not the distributed cache system, must reload data into the cache from the original data source.

cache-coherent NUMA (n)~ A NUMA architecture that provides cache coherency across nodes.

cached copy (n)~ A copy of data stored in a cache in order to shorten the time required to retrieve the data if it is large or accessed frequently.

cached data (n)~ Data stored in a cache.

Cached Exchange Mode (n)~ A feature that lets a Microsoft Outlook user who has a Microsoft Exchange e-mail account work offline, either by choice or due to a connection problem. A copy of the user's mailbox is stored on their computer and is frequently updated from the mail server. Any changes that are made while a connection to the server is not available are synchronized automatically when a connection becomes available.

Cached File Updater contract (PN)~ A contract that enables an app to provide real-time updates and saving capabilities for specific files on the system.

cached locally (n)~ Pertaining to a file that resides on the remote storage media, but the contents of which are still available on the local media. If this file is accessed, access will be quicker because the data are still on the local media.

cached page (n)~ A stored version of a document or web page.

cache-enabled application (n)~ An application that uses the Windows Server AppFabric cache client to store data in cache on the cache cluster.

caching (n)~ The process of temporarily storing recently accessed information in a special memory subsystem for quicker access.

caching resolver (n)~ A program that extracts information from DNS servers in response to client requests.

caching service (n)~ The category of services in Microsoft Azure that includes Content Delivery Network (CDN), InMem Cache, and Caching.

caching-only server (n)~ A DNS sever that does not host any DNS zones but that performs name resolution and stores the results in its cache.

CAD (n)~ The official currency of Canada.

CAD ~ (Computer Aided Design)- Software- used to produce complex technical drawings by designers and engineers.

Cake pan button (n)~ The button to choose which shape cake you're going to make.

cake paper (n)~ In the Comfy Cakes game, a piece of parchment paper on the conveyor belt for a new cake that the player will try to bake'. Each paper represents an order for a new cake

CAL pack (n)~ A digital or paper format pack that usually consists of a proof of purchase, the description of the licensing terms and policies, and number of client access licenses (CALs) purchased in this pack.

calculated column (n)~ A type of column that displays the results of mathematical or logical operations or expressions instead of stored data.

calculated control (n)~ A control used on a form, report, or data access page to display the result of an expression. The result is recalculated each time there is a change in any of the values that the expression is based on.

calculated expression (n)~ An expression that is not constant, but whose value depends upon other values. To be evaluated, a calculated expression must obtain and compute values from other sources, typically in other fields or rows.

calculated field (n)~ A field defined in a query that displays the result of an expression rather than displaying stored data. The value is recalculated each time a value in the expression changes.

calculated measure (n)~ A measure whose value is calculated at run time by using an expression.

calculated member (n)~ A member of a dimension whose value is calculated at run time by using an expression. Calculated member values can be derived from the values of other members.

calculated metric (n)~ A metric that is based on the result of an expression, rather than originating from a data source.

Calculated Metrics (PN)~ A feature that enables users to create simple calculations using one or more KPI values. This reduces the amount of MDX that is required to create complex scorecards.

calculated value (n)~ A read-only value that is the result of a lookup or calculation against the data using an XPath expression.

calculation code (n)~ A code that represents a specific numerical calculation that returns a numeric amount.

calculation condition (n)~ A Multidimensional Expressions (MDX) logical expression that is used to determine whether a calculation formula will be applied against a cell in a calculation subcube.

calculation formula (n)~ A Multidimensional Expressions (MDX) expression used to supply a value for cells in a calculation subcube, subject to the application of a calculation condition.

calculation pass (n)~ A stage of calculation in a multidimensional cube in which applicable calculations are evaluated.

calculation pass number (n)~ An ordinal position used to refer to a calculation pass.

calculation subcube (n)~ The set of multidimensional cube cells that is used to create a calculated cells definition. The set of cells is defined by a combination of MDX set expressions.

calculator (n)~ Broadly, any device that performs arithmetic operations on numbers. Sophisticated calculators can be programmed for certain functions and can store values in memory, but they differ from computers in several ways: they have a fixed set of commands, they do not recognize text, they cannot retrieve values stored in a data file, and they cannot find and use values generated by a program such as a spreadsheet.

Calculator (PN)~ The app that calculates (standard and scientific) and converts.

Calculator (PN)~ A tool that allows the user to create calculations, build formulas etc. in Microsoft Excel for Mac.

calendar (n)~ An application or tool in the form of an electronic calendar, commonly used for scheduling.

Calendar (PN)~ The link to the online calendar on Windows Live Calendar.

Calendar (PN)~ The Microsoft app to facilitate the management of events.

Calendar (PN)~ A Web Part for students and educators that displays upcoming events along with links to event content and actions.

Calendar (PN)~ The area of Outlook.com that lets people and groups add, manage, and share event information.

Calendar (PN)~ The Outlook app that facilitates the management of events.

Calendar Attendant (n)~ An Exchange Server feature that automatically places meetings marked Tentative on the recipient's calendar without requiring the intervention of any client software such as Outlook.

Calendar Concierge (n)~ A set of calendar enhancements that enable users to schedule people and resources quickly, efficiently, and reliably. The enhancements include the Calendar Attendant, the Resource Booking Attendant, and the Scheduling Assistant.

calendar data (n)~ Free or busy information for internal or federated contacts obtained by Lync or Office Communicator from Microsoft Outlook via a web service.

Calendar Event Search (PN)~ A feature that enables a user to search for events in the Calendar using keywords, and use filters to refine the search.

calendar information (n)~ Information about schedules and appointments that is stored in an Exchange Server 2007 user's mailbox and retrievable for display through a client interface or voice mail.

calendar item (n)~ An item in the Exchange store that represents an appointment, a meeting, a meeting request, or an event. It can identify the place, resources, recurrence, and attendees involved at a discrete time.

calendar item peek (n)~ A contextual summary of appointment or meeting information, which is displayed in a callout without opening the item.

Calendar live tile (n)~ A tile that updates dynamically to show upcoming calendar items directly from the Calendar.

Calendar peek (PN)~ A contextual summary of the user's daily schedule, which is displayed in a callout without switching to the Calendar module.

Calendar Preview (PN)~ A feature that allows users to see conflicting appointments directly from Mail view without having to switch to Calendar view. Makes it much easier for users to decide to accept or decline a meeting invite that conflicts with an existing meeting.

Calendar Printing Assistant for Microsoft-® Office Outlook-® 2007 (n)~ A Microsoft

Office Outlook 2007 feature that allows users to select from and print a variety of customizable calendar templates.

calendar program (n)~ An application or tool in the form of an electronic calendar, commonly used for scheduling.

Calendar Settings (n)~ A tab that allows the user to set options that apply to the whole Calendar application.

Calendar Snapshot (n)~ A feature that allows you to send a snapshot of your calendar to someone outside your Exchange organization and allow them to see the data on your calendar and schedule against it.

Calendar Tasks (n)~ A list of tasks that the user can perform in the Calendar.

calendar user agent (n)~ A client program such as Microsoft Outlook. Calendar information can be sent between calendar user agents that comply with the iCalendar specification.

calendar view (n)~ A Project view that displays a project's tasks in a calendar format.

Calendar World Readiness (PN)~ The Calendar settings that allow the users to define their calendar for their country and time zone requirements.

calendar year (n)~ An accounting period running from January 1 to December 31.

calibrate (v)~ To adjust precisely for a particular function.

calibration (n)~ The process of establishing predictable behavior in a device.

calibration board (n)~ A rectangular board that you use to calibrate the cameras and vision system of a Surface unit. The calibration board has two sides. The white side of the calibration board enables the cameras to take a snapshot that helps the Surface vision system build a contrast to your environment's lighting. (You use this side of the calibration board in basic calibration and full calibration.) The black-and-white checkered side of the calibration board enables all the cameras to align themselves properly. You use this side of the calibration board only during full calibration. (You use this side of the calibration board only during full calibration.)

call (v)~ To attempt to establish a voice conversation with another person or other people from a phone, computer, or mobile device.

Call (PN)~ A Lync menu that opens a list of options for the selected person. In Office Communicator, a menu item that opens a list of numbers for the selected person. When the user selects a phone number, Lync or Office Communicator places the call.

call (n)~ A voice session that can be conducted between two or more telephones, two or more devices (such as computers or smartphones), or between two or more such devices and telephones.

Call (PN)~ An app for making video calls.

call admission control (n)~ A service that manages media quality over a wide area network (WAN) connection by either rerouting traffic or by denying connection requests when bandwidth is approaching saturation.

call answering (n)~ A voice mail application that answers a call so that a message can be left.

call barring (n)~ A feature that can block incoming and/or outgoing calls.

call barring password (n)~ A password that enables access to the Call Barring feature settings.

Call Browser (PN)~ A window that enables you to search for function calls, and then browse the search results and navigate to the function references in your source code files.

call center (n)~ A facility in which an organization's telephone calls are answered and made, including helpdesk and service lines. Call centers usually use some amount of computer automation.

call context (n)~ Information about the options that a caller selects that is collected and provided to the agent who receives the call.

call detail recording (n)~ A function of the Monitoring Server for collecting information such as when a user signs in or out; starts, joins, leaves, or ends a conference or IM session; transfers a file; or places or answers a VoIP call. CDR captures only usage data; it does not archive the content of any communication activity.

call detail records (n)~ An Office Communications Server Archiving Service feature for capturing and reporting on events associated with users logging on and off, IM conversations, and conferences.

call forwarding (n)~ A feature that allows for automatic forwarding of incoming calls.

Call forwarding (n)~ A group of options in the Options dialog box, on the Phone tabs, that controls the automatic forwarding of incoming phone calls.

call forwarding (n)~ A feature that enables Skype calls to be diverted to a mobile phone or landline.

Call Forwarding Off (PN)~ The menu item that turns off the automatic forwarding of incoming calls.

Call Forwarding On (PN)~ The menu item that displays a menu of options that the user can select to turn on the automatic forwarding of incoming calls.

call graph (n)~ The graph of method calls and the points in the program that call them.

Call History (n)~ A User Interface (UI) element in various communications apps and in contact cards that provides access to a list of previous communication via that app or with a particular contact.

call history (n)~ A record of the date, time, caller, subject, and so forth, of a call or IM.

call icon (n)~ An icon tapped to initiate a voice conversation between two people.

Call Level Interface (n)~ The interface supported by ODBC for use by an application.

call logs (n)~ A list of incoming calls and outgoing calls, showing information such as the name of the caller or call recipient, the date and the time of the call.

Call Manager (n)~ A software component that establishes, maintains and terminates a connection between two computers.

Call Me (PN)~ A feature of Communicator Web Access in which a user can join a conference by requesting that Office Communications Server call a specified phone number instead of the user placing a call to a conferencing service.

call note (n)~ A note with general information about the call, such as subject, that is generated by the ACD to potentially be forwarded or transferred along with the call.

Call Park (PN)~ An application that lets an Enterprise Voice user put a call on hold from one telephone, and then later, retrieve the call from any telephone. It also manages Call Park orbits.

Call Park orbit (PN)~ A number assigned to a parked call by the Call Park application.

call phones (n)~ A Skype feature that allows users to call directly from Skype to landlines

and mobile phones.

call recipient (n)~ The person whom, or place that, a caller is calling.

call script (n)~ A dialog scenario to be used in a telephone interaction situation.

call sign (n)~ The identifying code letters or numbers of a radio or television transmitting station, assigned by a regulatory body.

Call Someone… (oth)~ An item on the Actions menu that calls the person the user selects from the corporate address book.

call stack (n)~ The series of method calls leading from the beginning of the program to the statement currently being executed at run time.

Call Status (PN)~ A softkey option available when a call is in progress that switches from the Home Screen back to the phone user interface screen.

Call Timers (n)~ A menu item that provides access to various call timers and call durations.

call tree (n)~ All modules that might be called by any procedure in the module in which code is currently running.

Call Via Conferencing Service (oth)~ An item on the right-click menu for a conference participant. In a conference, this command requests that the conferencing service call the selected participant.

Call via Work (PN)~ A callback option whereby an outgoing call can be made by using the work number. The person who is receiving the call will see the work number of the caller, in their caller ID.

call waiting (n)~ A service that notifies a user that a call is coming in while the user is in a call.

Callable (adj)~ A field-level setting on the Display tab that designates a phone number field as one that can be called.

callable (adj)~ Capable of being called.

callback (n)~ The process used to authenticate users calling in to a network. During callback, the network validates the caller's username and password, hangs up, and then returns the call, usually to a preauthorized number. This process prevents unauthorized access to an account even if an individual's logon ID and password have been stolen.

callback (n)~ Code within a managed application that helps an unmanaged DLL function complete a task.

callback (n)~ In telecommunications, a callback occurs when the originator of a call is immediately called back in a second call as a response.

Callback Control Protocol (n)~ The Network Control Protocol that negotiates the use of callback over PPP links.

callback function (n)~ A function provided by (IIS) that allows an Internet Server API (ISAPI) extension or filter to access IIS services.

callback function (n)~ Code within a managed application that helps an unmanaged DLL function complete a task.

callback number (n)~ The phone number at which the sender of an SMS can be reached that is displayed to the recipient in the SMS itself; it can be a different number than the cell phone number used to send the SMS.

callback security (n)~ A form of network security in which a remote access server calls a

user back at a preset number after the user has made an initial connection and has been authenticated.

callee (n)~ A computer that is called by another.

callee (n)~ The person whom, or place that, a caller is calling.

callee (n)~ The endpoint to which a call is initiated by a caller.

callee (n)~ A child function that is called by the current function.

caller (n)~ The person who is calling another person or place.

caller (n)~ The endpoint that initiates a call to establish a media session.

caller (n)~ A parent function that calls the current function.

caller ID (n)~ A feature that displays the identity of the originator of an incoming call on the device screen.

Caller ID (n)~ The identity of the originator of an incoming call.

caller ID (n)~ A feature that enables the display of the caller's number on the callee's phone when calling a phone from Skype.

caller identification (n)~ A feature that enables the display of the caller's number on the callee's phone when calling a phone from Skype.

CallEvent (n)~ In a statechart or activity diagram, an indication that an object has received a call for an operation. A CallEvent is defined using the following format: event-name (comma-separated-parameter-list)

callgraph (n)~ The graph of method calls and the points in the program that call them.

callgraph analysis (n)~ The graph of method calls and the points in the program that call them. A node would be a method and the link would be the relationship of the other methods that it calls.

call-handling rules (n)~ A set of features used for call answering and forwarding.

call-home Trojan (n)~ A type of trojan malware that connects to a remote server through a stealth connection and that notifies the server that the malware has been installed.

calling (n)~ The phone capability that lets you place or receive calls.

calling channel (n)~ A path enabling one inbound or outbound call. Calling channels are a means of having concurrent calls on PBX.

calling convention (n)~ Any standard that is used more or less universally for one function (caller) to make calls into another internal and external function (callee)

calling device (n)~ Equipment, telephone or computer, used to place a call.

calling sequence (n)~ In a program when a subroutine call occurs, an agreement between the calling routine and the called routine on how arguments will be passed and in what order, how values will be returned, and which routine will handle any necessary housekeeping (such as cleaning up the stack). The calling sequence becomes important when the calling and called routines were created with different compilers or if either was written in assembly language. Two common calling sequences are the C calling sequence and the Pascal calling sequence. In the C calling sequence, the calling routine pushes any arguments included in the call on the stack in reverse order (right to left) and performs any stack cleanup; this permits a varying number of arguments to be passed to a given routine. In the Pascal calling sequence, the calling routine pushes any included arguments on the stack in the order in which they appear (left to right), and the called routine is expected to clean up the stack.

call-level interface (n)~ The interface supported by ODBC for use by an application.

callout (n)~ A contextual UI element that displays additional content and controls in a container.

Calorie Counter (PN)~ A feature that counts/tracks daily calorie intake.

calorie intake (n)~ The total amount of calories in a daily diet.

camera (n)~ A digital video device that is used for recording moving images and audio in a digital format.

camera (n)~ An imaginary viewing position that represents objects in 3-D coordinate space and projects them onto a 2-D visual.

camera (PN)~ A Windows Phone application that is both a digital still camera and a digital video camera.

Camera (PN)~ An app to facilitate the capture of photos and videos by using the PC.

camera capture (n)~ A Windows 8 feature that allows developers to use the webcam for communication and still image capture without calling complex APIs. The camera capture API allows for devices to expose capture controls, a preview window, and the ability to specify resolution and codecs for audio/video capture.

Camera Capture API (PN)~ The API that allows for devices to expose capture controls, a preview window, and the ability to specify resolution and codecs for audio/video capture.

Camera for Lumia (PN)~ The Camera app- that- comes pre-installed- on high-end Lumia devices.

camera look point (n)~ An invisible, distant point on an axis perpendicular to the view plane that the camera is -€œlooking at-€?. When we move it, the camera follows it.

Camera Orbit (PN)~ A tool used to move the camera around 3D content within a XAML document.

camera pan (n)~ The movement of the camera, left and right, across a scene.

camera roll (n)~ An album that contains a continuous roll of live viewfinder and captured photos and videos that have not been archived or moved to other folders.

campaign (n)~ A marketing program designed to accomplish a specific result, such as introducing a new product or increasing market share. The main way to accomplish this result is through communicating the benefits of a product or service to people and businesses. Campaigns often include more than one communication method, such as print advertisements, promotional discounts, and direct mail.

campaign (n)~ A planned set of activities developed by an organization to meet the objective of increasing market shared over a distinct time period.

campaign activity (n)~ An activity performed, or to be performed, by a user for planning or running a campaign. A campaign activity includes additional, campaign-specific information, such as budgets and vendor names.

campaign automation flowchart (n)~ A graphical flowchart that displays all of the operations, for example, defining landing pages, creating social media, and creating tasks, that are included in an automated campaign.

Campaign Builder (PN)~ A tool which allows partners to assemble their own marketing campaigns using a series of pre-created marketing materials.

campaign code (n)~ An identifier, usually made up of numbers or letters, such as 1234 or

Early Spring, for a marketing campaign. The campaign code is another way to identify a marketing campaign distinct from the name of the marketing campaign.

campaign conversion (n)~ The completion of an online transaction by a visitor redirected to the site by an advertisement.

campaign goaling (n)~ Determining the number of ads to deliver in a specified amount of time. You can goal by any event, such as clicks or amount sold.

campaign item (n)~ A communication vehicle that contributes to the specified result of a campaign. You can create three types of campaign items in Commerce Server: ads, direct mail, or discounts. You can use third-party products to create additional types of campaign items.

campaign item ID (n)~ The computer-generated identification number for a campaign item.

campaign name (n)~ The name by which a marketing progam is identified.

campaign response (n)~ A reply by a recipient of a campaign activity. Campaign responses can result from many channels, including e-mail, telephone, and fax.

Campaign Type (n)~ The field in a Campaign form in which you can select the type of campaign that is being run. Possible types are Advertisement, Direct Marketing, Event, and Other.

Campaigns (n)~ A business application in Microsoft Office Live that allows users to create and manage marketing and sales campaigns.

Campfire (PN)~ A web-based service to set up password-protected chat rooms designed exclusively for groups. In can be integrated with Visual Studio.

Canadian Payment Association (n)~ An organization that specifies payment formats for Canada.

Canadian Payments Association Standard 005 (PN)~ A standard for the exchange of financial data on automatic funds transfer (AFT) records that is maintained by the Canadian Payments Association (CPA).

canary (n)~ A predetermined value that must be present in a client-server request for the request to be considered valid.

canary value (n)~ A predetermined value that must be present in a client-server request for the request to be considered valid.

cancel (v)~ To revoke an action. To quit an action without saving any changes that the action would result in.

Cancel (v)~ A button that stops the task in progress and returns to the previous state.

cancel (v)~ To end the processing of a workflow instance by transitioning the instance to a completed state. The workflow executes cancellation handlers that enable you to perform additional actions such as error handling and compensation.

cancel (v)~ To terminate an event prior to processing.

candidate key (n)~ A column or set of columns that have a unique value for each row in a table.

candidate vector (n)~ A series of files that has been generated by the ported implementation for comparison testing with the Conformance Test Tool.

Canonical (PN)~ The UK-based privately held computer software company that markets commercial support and related services for Ubuntu and related projects.

canonical command tree (n)~ A common, programmatic representation of any Entity Framework query composed of one or more expressions.

canonical form (n)~ In mathematics and programming, the standard or prototypical form of an expression or a statement.

canonical name (n)~ An object's distinguished name presented with the root first and without the (LDAP) attribute tags (such as CN=, DC=). The segments of the name are delimited with forward slashes (/). For example, CN=MyDocuments,OU=MyOU,DC=Microsoft,DC=Com is presented as microsoft.com/MyOU/MyDocuments in canonical form.

canonical name (n)~ A name of a Control Panel item that can be used to programmatically launch that item.

canonical name record (n)~ A type of resource record in the Domain Name System that associates a computer's true (canonical) name with any alias names also used by the computer. Some domain registrars use CNAME records to redirect or redelegate domain names.

canonical path (n)~ The definitive path for navigating to a category or product that is a member of more than one category. The primary parent category determines the canonical path to a category or product.

canonical verb (n)~ A system-recognized standard verb, such as print

canvas (n)~ A basic layout panel that supports absolute positioning and does not apply any layout policy (for example, auto sizing) to its child elements -€" it is literally a blank canvas.

Canvas (n)~ An HTML5 element that is part of the World Wide Web Consortium (W3C) HTML5 specification. This element allows dynamic scriptable rendering of pixels, bitmaps, and 2D shapes such as rectangles, polygons, and ellipses.

canvas (n)~ A surface on which to draw or paint.

canvas panel (n)~ A basic layout panel that supports absolute positioning and does not apply any layout policy (for example, auto sizing) to its child elements -€" it is literally a blank canvas.

CAP (n)~ In SMS 2003 and earlier releases, an SMS site system that provides a communication point between the SMS site server and Legacy Client computers. Legacy Clients deliver their collected files, inventory information, discovery data records, software metering data, and status information to CAPs.

cap (n)~ For paths that contain unconnected ends, such as lines, the end of a stroke. You can change the way the stroke looks at each end by applying one of four end cap styles: flat cap, round cap, square cap, and triangle cap.

capability (n)~ A value that developers specify in the app manifest for their Windows Store apps. Windows Store apps use capabilities to declare that the app requires programmatic access to protected user resources, such as the Pictures library, or connected devices, such as a webcam.

capability (n)~ The ability to perform a function, for example, the ability of a cloud to host highly available virtual machines is a capability, and the ability of a cloud to connect virtual machines to a certain logical network is a capability.

capability profile (n)~ A Virtual Machine Manager library resource that defines which

resources (for example, number of processors or maximum memory) are available to a virtual machine that is created in a private cloud.

capable to promise (n)~ The portion of product output from available operations resources and available input product required to fulfill a specific customer requirement.

capacity (n)~ The ability of a resource to produce an amount of output in a specified amount of time.

Capacity (n)~ A resource's time based on their resource base calendar minus certain standard exceptions. Capacity is equal to Base Capacity minus an allowance for planned vacations, holidays, sick time, etc. For example, a part-time resource with a Base Capacity of .7FTE might have a Capacity of .65FTE after accouting for partial benefits.

capacity (n)~ The actual or potential ability of a resource to perform an activity or to produce output in a specified time period.

capacity (n)~ A consumable resource which is pooled and reported as an aggregate value via a cloud.- CPU count, memory, and storage are examples of capacity dimensions.

capacity load (n)~ The maximum amount of scheduled work that a work center can perform at a required capacity level.

capacity planning (n)~ The process of identifying and preparing for the application, hardware, and network requirements to support expected site traffic and achieve site performance goals.

capacity planning (n)~ A procedure for determining the resource capacity requirements that meet the demand of future output during specific time periods.

capacity reservation (n)~ Reservation of a resource capacity for a related work center or planned production order.

CAPI (n)~ An (API) that is provided as part of Microsoft Windows. CryptoAPI provides a set of functions that allow applications to encrypt or digitally sign data in a flexible manner while providing protection for the user's sensitive private key data. Actual cryptographic operations are performed by independent modules known as (CSPs).

CAPI2 (n)~ The API that supports PKI and X.509 certificates, such as certificate chain validation, certificate stores, and signature verification.

CAPICOM (PN)~ A Microsoft ActiveX control that provides a Component Object Model (COM) interface to Microsoft CryptoAPI, which exposes a select set of CryptoAPI functions to application developers.

capital (n)~ The amount of owners' investment in a business plus retained earnings.

capital letter (n)~ In some languages, a distinct, and usually larger, form of a letter. May be used in word-initial position in certain cases, or for emphasis.

capitalization (n)~ The use of a capital letter in writing or printing.

capitalization (n)~ The conversion of funds into capital or treating them as capital rather than expenses.

capitalization of cost (n)~ The temporary treatment of the costs of hours, items, and expenses as capital until the revenue is posted.

capitalize (v)~ To write or print with an initial capital or in capitals.

capitalized (adj)~ Written or printed with an initial capital or in capitals.

capitalized letter (n)~ In some languages, a distinct, and usually larger, form of a letter. May be used in word-initial position in certain cases, or for emphasis.

CAPS LOCK (n)~ A toggle key that, when on, shifts the alphabetic characters on the keyboard to uppercase.

CAPS LOCK key (n)~ A toggle key that, when on, shifts the alphabetic characters on the keyboard to uppercase.

CAPTCHA (n)~ A challenge meant to be easily solved by humans, while remaining too hard to be economically solved by computers.

caption (n)~ Descriptive text that is associated with a piece of content, such as an image.

caption (n)~ The horizontal bar at the top of a window that displays the name of the window. Title bars can contain different buttons, such the Minimize, Maximize, and Close buttons, so that you can control how you want to view the window.

caption (n)~ Descriptive text that represents the audio content of a television or video program as text on the screen. Captions are usually visible only if decoded or activated.

caption bar (n)~ The horizontal bar at the top of a window that displays the name of the window. Title bars can contain different buttons, such the Minimize, Maximize, and Close buttons, so that you can control how you want to view the window.

caption button (n)~ A button that is displayed on the caption bar of a dockable pane or mini-frame window.

caption section (n)~ The section on a grouped data access page that displays captions for columns of data. It appears immediately before the group header.

caption text (n)~ Descriptive text that is associated with a piece of content, such as an image.

captive portal (n)~ A Web page that a user of a public-access network has to view and interact with for authentication, accepting terms of use, or security updates.

capture (v)~ To assign a port to a printer. Documents that you print are sent to the printer through the captured port.

capture (n)~ An area of the screen that has been circled during a capture session and is available for annotation or other operations.

capture buffer (n)~ The maximum size of the capture file. When the capture file reaches the maximum size, the oldest frames are removed to make room for newer frames (FIFO queue).

capture date (n)~ The date when a digital photograph was taken.

capture device (n)~ Hardware that transfers audio and video from an external source, such as a VCR or camcorder, to a computer.

capture drift (n)~ The degree to which the two data streams are out of synchronization when capturing multimedia with separate audio and video cards.

capture group (n)~ In regular expressions, an expression of the form (subexpressionaafe202a-1d96-4b36-a270-d676dfd3c51c)' or '\(subexpressionaafe202a-1d96-4b36-a270-d676dfd3c51c \)' which matches the sequence of characters in the target sequence that is matched by the pattern between the delimiters.'

capture trigger (n)~ A set of conditions that, when met, stop the capture or execute a program or command file to perform another type of action related to the capture.

captured traffic (n)~ The network traffic that is saved to be later examined and analyzed.

Car (PN)~ The name of device profile that is activated when a car kit is plugged into the device.

carbon copy (n)~ A directive to an e-mail program to send a complete copy of a given piece of mail to another individual. The use of cc mail addressing, as opposed to directly addressing the mail to a person, generally implies that the recipient is not required to take any action; the message is for informational purposes only. In a cc directive, the fact that this recipient received the mail is printed in the mail header and is thus known to all other recipients.

carbon neutral ~ also called- carbon neutrality, used to describe the action of organizations, businesses and individuals taking action to remove as much carbon dioxide from the atmosphere as each put in to it.

card (n)~ A Web page in WML. WML devices can either display the contents of a card on a single screen or, when necessary, provide scroll bars so that the entire contents of the card can be viewed. Developers need not worry about manipulating cards or decks because ASP.NET mobile controls handle formatting, including pagination, for targeted devices.

card (n)~ A virtual object that is similar in shape to playing cards.

card (n)~ A group of different visualization patterns and interactions for content shown in Sway.

card (n)~ An item in Cortana home showing an answer, suggestion, or question.

Card & board (PN)~ A game category that replicates a physical card or board game experience.

card + board (PN)~ A game category that replicates a physical card or board game experience.

Card gallery (PN)~ The Sway menu that displays all of the available cards in a single panel.

card reader (n)~ An input device used chiefly for identification purposes that reads information that has been magnetically encoded, usually in two tracks, on a plastic card, such as a credit card or an employee badge.

card screen (n)~ The first screen in Concierge where users can open a map or choose points of interest from recommended selections or categories (such as Restaurants).

card validation code (n)~ A code that credit card companies use to authorize credit card charges. For example, American Express uses a four-digit number on the front of the credit card, and Visa, MasterCard, and Discover use a three-digit number on the back.

Card Verification Value (n)~ A code that credit card companies use to authorize credit card charges. For example, American Express uses a four-digit number on the front of the credit card, and Visa, MasterCard, and Discover use a three-digit number on the back.

cardholder (n)~ A person or company who has the authority to purchase goods and services using a payment card.

cardinality (n)~ The number of entities that can exist on each side of a relationship.

Cardio Tracker (PN)~ A feature that allows the user to track eating patterns to track cardio exercise activities.

caret (n)~ A symbol used to represent the Control key on the keyboard. For example, ^Z means hold the Control key down and press the Z key."

caret (n)~ A flashing line, block, or bitmap in the client area of a window or in a control that accepts keyboard input.

caret blink time (n)~ The elapsed time, in milliseconds, required to invert the caret display. This value is half of the flash time.

Caret Browsing (PN)~ Browsing or navigating through a page using the arrow keys, PAGE UP, PAGE DOWN, HOME and END keys.

Carnivore ~ an Internet surveillance system developed for the U.S. FBI so that they could monitor the electronic transmissions of criminal suspects. Critics, however, charged that Carnivore did not include appropriate safeguards to prevent misuse and might violate the constitutional rights of the individual. The- EPIC- reported in early 2005 that the FBI had replaced Carnivore with other, unspecified surveillance software from commercial sources.

carousel view (n)~ In PowerPivot Gallery, a specialized view where the preview area is centered and the thumbnails that immediately precede and follow the current thumbnail are adjacent to the preview area.

carriage (n)~ The assembly that holds the platen of a typewriter or a typewriterlike printer. On a standard typewriter, the platen and carriage move past a fixed position within the typewriter housing, where the keys strike the paper; the platen rotates to advance the paper held in the carriage. On most impact printers for computers, however, the print head moves back and forth across a platen, which rotates but does not move horizontally; in such machines, the assembly that carries the print head is often called the print-head carriage assembly.

carrier (n)~ A company that provides telephone and other communications services to consumers.

carrier (n)~ A signal in serial communications that is sent from a modem to its computer to indicate that the modem is ready for transmitting.

carrier ~ A network operator may market any number of communication services for voice and data. Carriers offer their services to both end-customers (private or business) and other carriers. In the latter case, the service simply consists of transport capacity for long-distance traffic.

carrier detected (oth)~ A signal in serial communications that is sent from a modem to its computer to indicate that the modem is ready for transmitting.

carry forward (v)~ To transfer closing account balances from one accounting period to opening account balances in the subsequent accounting period.

carry-forward budget (n)~ The budget that is transferred from one fiscal year to the next and that is reserved for open purchase orders in the new fiscal year.

carrying cost (n)~ The cost of retaining inventory, whether raw materials, components, or finished goods. Carrying cost typically is expressed as a percentage of inventory value per year or other time period.

Cartesian product (n)~ An operator in the relational algebra used in database management that, when applied to two existing relations (tables), results in the creation of a new table containing all possible ordered concatenations (combinations) of tuples (rows) from the first relation with tuples from the second. The number of rows in the resulting relation is the product of the number of rows in the two source relations.

Cartoon Violence (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

CAS policy (n)~ A set of rules that defines security permissions for a collection of assemblies by associating attributes of those assemblies, such as location and signature, with a set of code access security permissions.

cascade (v)~ To propagate an action from one data entry to referencing tables or entries in order to enforce referential integrity in a relational database. Examples of actions that can be cascaded are deletions and updates.

Cascade ~ A method of connecting circuits together in series to make the output of one, the input of the next. This kind of end-to-end connectivity is useful in extending the distance of a network.

Cascade ~ A method of displaying several windows of information on a monitor.

cascade delete (n)~ For relationships that enforce referential integrity between tables, the deletion of all related records in the related table or tables when a record in the primary table is deleted.

cascading delete (n)~ For relationships that enforce referential integrity between tables, the deletion of all related records in the related table or tables when a record in the primary table is deleted.

cascading event (n)~ A sequence of events caused by an event procedure directly or indirectly calling itself.

cascading menu (n)~ A type of drop-down menu that appears when a user points to a command on a higher-level menu.

cascading style sheet (n)~ A style sheet (a .css file) attached to an HTML document that controls the formatting of tags on Web pages. The browser follows rules (a cascading order') to determine precedence and resolve conflicts.'

Cascading Style Sheets (n)~ A Hypertext Markup Language (HTML) specification developed by The World Wide Web Consortium (W3C) that allows authors of HTML documents and users to attach style sheets to HTML documents. The style sheets include typographical information on how the page should appear, such as the font of the text in the page. This specification also directs the way in which the style sheets of the HTML document and the user's style will blend.

cascading update (n)~ For relationships that enforce referential integrity between tables, the updating of all related records in the related table or tables when a record in the primary table is changed.

case (n)~ In text processing, an indication of whether one or more alphabetic characters are capitalized (uppercase) or not (lowercase). A case-sensitive program or routine distinguishes between uppercase and lowercase letters and treats the word cat as totally distinct from either Cat or CAT. A case-sensitive program that also separates capitalized and lowercased words would list Arkansas before aardvark or antimony, even though its alphabetic position follows both lowercased words.

case (n)~ A customer service issue or problem reported by a customer and the activities that customer service representatives use to resolve it.

case (n)~ A receptacle for holding goods to be stored or transported.

case (n)~ An abstract view of data characterized by attributes and relations to other cases.

case key (n)~ The element of a case by which the case is referenced within a case set.

Case No. (n)~ The number given to a specific case for identification purposes.

case resolution (n)~ An activity that includes such information as the description of the resolution and the billable time of the case.

case sensitivity (n)~ Discrimination between lowercase and uppercase characters in a program or a programming language.

Case Type (n)~ A sub-category of customer service issues that indicates whether an issue is a question, problem, or request.

cash (n)~ A currency limited to money.

cash discount (n)~ A discount that is offered to a purchaser for paying early or paying with cash.

cash discount (n)~ A discount that depends on prompt payment.

cash float (n)~ An amount of cash provided for the purpose of giving change or exchanging cash.

cash flow (n)~ The amount of money coming into and going out of a company and the timing of these flows.

cash flow forecast (n)~ An estimate of future cash flow on particular dates, based on current data and/or budget data.

cash on delivery (oth)~ A payment policy that requires payment in full for product upon delivery.

cash on delivery outstanding (oth)~ Undelivered and unpaid cash-on-delivery transaction.

cash receipt (n)~ A document used to record payments and deposits received from customers.

cash receipt (n)~ A source document that documents the receipt of cash or cash equivalents.

cash register (n)~ An electronic or mechanical device with a till that records sales, calculates totals, calculates change, and generates product receipts.

Cashback (PN)~ The menu item on the Bing menu that links to http://www.bing.com/cashback/.

cash-generating unit (n)~ The smallest group of classifiable assets that generates cash independently of other assets within an organization. These groups of assets are used to measure impairment losses that will be incurred.

Casino (PN)~ The Games subcategory containing games of chance, like poker, roulette, or dice.

cast (v)~ To convert one data type to another, such as converting from integer to floating point.

catalog (n)~ A directory of information about data sets, files, or a database. It usually describes where a data set, file or database entity is located and may also include other information, such as the type of device on which each data set or file is stored.

catalog (n)~ A collection of data, for example, a set of images and audio files, that is grouped into a single directory.

catalog (n)~ A collection of categories and products. Each catalog has a unique name.

catalog (n)~ A list of Web Parts controls (or other Web server, custom server, or user controls), created by a System.Web.UI.WebControls.CatalogPart control, that users can add to a Web Parts page.

catalog (n)~ A binary file that contains the state of all of the settings and packages in a Windows image. When a catalog is created, it queries the Windows image for a listing of all of the settings in that image. Because the contents of a Windows image can change over time, it is important that you recreate the catalog file whenever you update a Windows image.

catalog (n)~ The highest-level unit of organization in Windows Search.

catalog (n)~ A list or library that is shared between site collections.

Catalog and Inventory Schema Manager (n)~ A user interface in Commerce Server that allows users to edit, add, or remove catalog properties and property definitions.

catalog data (n)~ The content of the catalog, including data about the individual product items and their organized categories.

catalog definition (n)~ A description of the characteristics of a catalog. The catalog definition consists of properties that define the catalog. Several catalogs can share one definition.

Catalog Designer module (n)~ The Commerce Server Business Desk module used to create and manage catalog schema. Catalog schema consists of category definitions, product definitions, and property definitions. These components are the foundation of the categories, products, and properties in catalogs.

Catalog Editor module (n)~ The Commerce Server Business Desk module used to edit and manage catalogs. The Catalog Editor module supports adding, editing, and deleting products and categories, as well as, importing and exporting catalogs and refreshing full-text indexing.

catalog expression (n)~ An expression that specifies which catalog products must be in the basket before a discount is applied.

catalog file (n)~ A file that contains links to all data stored in a catalog and the thumbnail images that correspond to those images.

Catalog Finder (PN)~ A feature that lets the user search for a particular catalog file.

Catalog Importers (PN)~ A feature that lets the user choose which file types will be recognized for import into a catalog.

Catalog Maintenance Request file (PN)~ A data file of products, their descriptions and prices, and action codes that add, update, or delete product data in a vendor catalog.

Catalog Manager (n)~ The Commerce Server Business Management user interface used to import, create, and manage base and virtual catalogs.

catalog merge (n)~ The process of combining information from a data source with a template to create pages that display multiple records per page.

catalog merge area (n)~ The area in a catalog merge template into which merge fields are inserted. When a merge is completed, data from a data source populates each field, and the catalog merge area will repeat and display multiple records on each page.

catalog property (n)~ One of the basic properties that describes a catalog, such as name, start date, end date, currency, unit of weight measure, and product unique ID.

catalog schema (n)~ A description of a catalog that specifies its category definitions, product definitions, and property definitions. Several catalogs can share one schema.

catalog set (n)~ A group of one or more catalogs.

catalog set (n)~ A free-form, hierarchical method of organizing media files. You can use

catalog sets to organize play lists, photo albums, and work assignments, or to create a complex system of categorization.

Catalog Sets module (n)~ The Commerce Server Business Desk module used to create and manage catalog sets.

catalog views (n)~ Built-in views that form the system catalog for SQL Server.

catastrophic error (n)~ An error that causes the system or a program to fail abruptly with no hope of recovery. An example of a fatal error is an uncaught exception that cannot be handled.

catch weight (n)~ The actual or nominal weight of a sales item or inventory item.

catch-up scan (n)~ A scan that is initiated because regularly scheduled quick scans or full scans were missed.

Categories (PN)~ A feature that allows the user to apply custom or default markers to items (e.g. Outlook messages or OneNote content) in order to categorize information for easy retrieval and sorting.

categories (PN)~ A list of categories that developers select from to make their app more discoverable.

categories (PN)~ A list of different types of Xbox Music application contents, such as games, music+video, lifestyle.

Categories (PN)~ The section of the Store that shows subgroups of apps and games, grouped by intended use or function.

categorize (v)~ To custom group applications, computers, devices, Web sites, and updates into sets that you can use to organize your data and to create custom reports.

categorizer (n)~ A component of Exchange transport that processes all incoming messages and determines what to do with the messages based on information about the intended recipients. In Exchange Server 2007, the Edge Transport server uses the categorizer to route the message to the appropriate destination. The Hub Transport server uses the categorizer to expand distribution lists and identify alternate recipients and forwarding addresses. After the categorizer retrieves full information about recipients, it uses that information to apply policies, route the message, and perform content conversion.

category (n)~ A container for products or sub-categories. Each category is an individual instance of a category definition.

Category (n)~ A UI element that a user can click on to associate categories with an appointment.

category (n)~ A keyword or description used to identify groups of related items.

category (n)~ A tab-like navigation link that provides access between different sections of information within the Options dialog box.

category (n)~ A classification for grouping content by user-defined criteria such as page contents, file types, or a similar distinction.

category (n)~ A custom grouping used to organize your data and to create customized reports.

category (n)~ A keyword or phrase with an associated color that helps you keep track of items, such as messages, contacts, and appointments. You can use color categories to easily find, sort, filter, or group items.

category (n)~ A classifier used to group parties, locations, products, and activities.

category (n)~ A classifier, designation, or division of objects that share a common property.

category (n)~ In the Alerts workspace, an item in the navigation pane.

category axis (n)~ A chart axis that represents the category for each data point. It displays arbitrary text values like Qtr1, Qtr2, and Qtr3; it cannot display scaled numerical values.

category catalog (n)~ A collection of category items that are used only for purchase requisitions.

category definition (n)~ The properties that are available in a particular type of category. One category definition may be used for many categories.

Category Explorer (n)~ A window that displays a list of all the elements in the space plan, grouped by category. It provides a way to view the resources in the drawing by category.

category field (n)~ A field that is displayed in the category area of PivotChart view. Items in a category field appear as labels on the category axis.

category hierarchy (n)~ A structure that orders categories using a superordinate-subordinate relationship.

category item (n)~ A general, nonspecific item that is registered in the system but typically not stocked and often consumed immediately. A category item is used in purchase requisitions when users cannot find a suitable item in a product catalog or by searching all items. A category item must be associated with a product category.

category property (n)~ One of the properties that form a category definition.

category relationship (n)~ The association of one product with another product or category. Category relationships have names, a description, and a target.

Category Value (PN)~ A field that allows the user to specify a basic category of business activity that is involved in one type of business.

CAU (PN)~ A feature that automates the process of applying software updates to the nodes in a failover cluster. With Cluster-Aware Updating, a server administrator can preview and apply updates to a cluster, create a profile that standardizes the way updates are applied, and view reports of past updating runs. Cluster-Aware Updating includes a graphical interface, Windows PowerShell cmdlets, and for extensibility, a custom plug-in API.

causality chain (n)~ A series of method calls, events, and asynchronous operations leading from the beginning of a program to the statement currently being executed at run time.

cause and effect diagram (n)~ A type of diagram that documents all the factors that contribute to or affect a given situation (all the causes that lead to a certain effect).

CBCP (n)~ The Network Control Protocol that negotiates the use of callback over PPP links.

CBR (n)~ A characteristic of a data stream in which the bit rate remains nearly uniform for the duration of the stream.

CBR (n)~ A report generated by OEMs for each OA 3.0 manufactured computer which is then sent to Microsoft for processing. This report includes the hardware hash value and Product Key ID.

CBS (n)~ A servicing model used in Windows in which components are identified by an XML manifest containing the full contents of the component. Multiple components can be included in a package, the contents of which are also identified in an XML manifest.

CBS (oth)~ The government agency that is responsible for collecting statistical information (such as Intrastat data or manufacturing statistics) from companies in the Netherlands.

CBS (PN)~ A service that manages the OLAP cubes for Project Server reporting.

CBT (n)~ The use of computers and specially developed tutorial programs for teaching. CBT uses color, graphics, and other attention-getting aids to help maintain interest, and it has both simple and sophisticated applications.

cc (n)~ A directive to an e-mail program to send a complete copy of a given piece of mail to another individual. The use of cc mail addressing, as opposed to directly addressing the mail to a person, generally implies that the recipient is not required to take any action; the message is for informational purposes only. In a cc directive, the fact that this recipient received the mail is printed in the mail header and is thus known to all other recipients.

Cc line (n)~ Text box located on the Compose page. Provides space for users to type the e-mail address(es) of those who will be the secondary recipient(s) of an e-mail message. Derives from the term carbon copy.

cc:Mail (PN)~ An e-mail program originally introduced by cc:mail, Inc., and currently produced by the Lotus Development Corporation. Lotus cc:Mail runs on multiple networking platforms and the Internet and is closely integrated with Lotus Notes collaborative software.

CCB (n)~ A specifically formatted information set used in the IBM Token Ring environment that is transmitted from the application program to the adapter support software to request an operation.

CCB (n)~ An internal file system structure in which a file system maintains the per-file object state for an open instance of a file.

CCCP (n)~ A custom protocol for communicating conference creation and control commands from clients to Communications Server.

CCD (n)~ A device in which individual semiconductor components are connected so that the electrical charge at the output of one device provides the input to the next.

CCD (n)~ A standard format used to transfer patient health information between systems.

CCD (PN)~ Corporate Cash Disbursement - A unique Standard Entry Code (SEC) that is primarily used for business-to-business transactions.

CCD ~ (Charge Coupled Device)- The component of a- scanner- or digital camera which actually takes the pictures. The quality of image it is capable of is usually measured in- Megapixels- - the higher the number, the more detailed the image.

CCM (n)~ A numeric code that identifies taxpayers who perform self-employed work in Brazil.

CCR (n)~ A replication that combines the asynchronous log shipping and replay features built into Exchange 2007 with the failover and management features provided by a failover cluster that is created with the Microsoft Windows Cluster service.

CCR (n)~ A standard format used to transfer patient health information between systems.

CCW (n)~ A proxy object generated by the common language runtime so that existing

COM applications can use managed classes, including .NET Framework classes, transparently.

CD (n)~ An optical storage medium for digital data.

CD boot (n)~ The process of starting a computer from the retail product CD-ROM and then installing Windows on the hard disk using the Setup program on the CD.

CD burner (n)~ A device used to write CD-ROMs. Because a disc can be written only once on these machines, they are used most commonly to create CD-ROMs for data archives or to produce CD-ROM masters that can be duplicated for mass distribution.

CD Burner ~ A CD drive that can create ('burn') CDs.

CD burner speed (n)~ The speed at which the CD drive will record the data.

CD drive (n)~ An electromechancial device that reads data on CD-ROMs. Most CD-ROM drives have a SCSI interface, although some are connected to a PC via a controller for a disk drive. Data is read through a small laser that is focused on the surface of the CD-ROM through optical mirrors in the read/write head. A spindle and drive motor revolve the CD-ROM, so all data, which is stored in spirals from the center, can be read.

CD jewel case (n)~ The plastic case housing a CD.

CD player (n)~ A device that reads the information stored on a compact disc. A compact disc player contains the optical equipment necessary for reading a disc's contents and the electronic circuitry for interpreting the data as it is read.

CD recorder (n)~ A device used to write CD-ROMs. Because a disc can be written only once on these machines, they are used most commonly to create CD-ROMs for data archives or to produce CD-ROM masters that can be duplicated for mass distribution.

CD sleeve (n)~ A case for holding CDs.

CD/DVD-ROM subscription (n)~ The act of subscribing to product media in CD/DVD format.

CDA (oth)~ An abbreviation for -€˜Clinical Document Architecture' which is the standard format used to define how patient health information is transferred between systems.

CDATA (n)~ A section in an Extensible Markup Language (XML) document, bracketed by [!CDATA[[and]]] characters. All data in this section, including markup tags, is treated as normal characters by the XML parser.

CDFS (n)~ A 32-bit protected-mode file system that controls access to the contents of CD-ROM drives.

CDMA network (n)~ A Code Division Multiple Access (CDMA) network, used by phones that do not have SIM cards.

CDN (n)~ A distributed system of servers deployed in multiple data centers that cache content from origin servers and then serve it to customers. This action reduces the load on the origin servers and provides high- availability and performance to customers.

CDN (PN)~ The Microsoft Azure caching service that stores blobs at strategically placed locations to provide maximum bandwidth for delivering content to users.

CDN Data Transfer (GB) (PN)~ The unit of measure for the CDN Data Transfer resource.

CDN SSL Transactions (in 10,000s) (PN)~ The unit of measure for the CDN transactions transferred via the Secure Socket Layer.

CDN Transactions (in 10,000s) (PN)~ The unit of measure for the CDN Transactions

resource.

CDO (n)~ A device object that represents the filter driver to the system and to user-mode application and which allows applications to communicate with the filter driver directly, even before the filter is attached to a file system or volume device object.

CDO (n)~ An application programming interface (API) that allows users and applications high-level access to data objects in Exchange. CDO defines the concept of different object classes, including messages, posts, appointments, and tasks.

CDP (n)~ A certificate extension that indicates where the certificate revocation list for a CA can be retrieved. It can contain none, one, or many HTTP, file, or LDAP URLs.

CDR (n)~ A function of the Monitoring Server for collecting information such as when a user signs in or out; starts, joins, leaves, or ends a conference or IM session; transfers a file; or places or answers a VoIP call. CDR captures only usage data; it does not archive the content of any communication activity.

CD-R (n)~ A type of CD-ROM that can be written (only once) on a CD recorder and read on a CD-ROM drive.

CD-ROM (n)~ A form of storage characterized by high capacity (roughly 650 MB) and the use of laser optics instead of magnetic means for reading data.

CD-ROM drive (n)~ An electromechancial device that reads data on CD-ROMs. Most CD-ROM drives have a SCSI interface, although some are connected to a PC via a controller for a disk drive. Data is read through a small laser that is focused on the surface of the CD-ROM through optical mirrors in the read/write head. A spindle and drive motor revolve the CD-ROM, so all data, which is stored in spirals from the center, can be read.

CD-ROM, CD-R ~ (Compact Disk-Read Only Memory)- A misnomer, as strictly speaking it is not memory but storage. Identical to standard music CDs. A popular medium for releasing programs. Now being replaced by- DVD, which has a much higher capacity.

CDRs (n)~ An Office Communications Server Archiving Service feature for capturing and reporting on events associated with users logging on and off, IM conversations, and conferences.

CD-RW (n)~ A type of CD on which files can be copied, erased, and replaced.

CD-RW ~ (Compact Disk-ReWriter)- A CD drive which can create CDs, either audio or data, using special rewriteable CDs which are also often called CD-RWs. A CD-RW drive can also create ordinary CDs, though not rewrite them.

CDS (PN)~ A service that enables DCE clients to locate compatible servers.

CE ~ CE-marking is a European Union regulatory community sign. It symbolizes the compliance of the product with all essential requirements relating to safety, public health, consumer protection.- http://www.eurunion.org/

cedilla (n)~ The diacritical mark '-¸' placed under a letter to indicate an alteration or modification of its usual phonetic value (as in the French word 'faÃ§ade').

CEIP (PN)~ A Microsoft program that invites customers to provide Microsoft with more detailed information about how the software is used including the type and frequency of errors, software and hardware performance, and feature usage. This information is anonymous and voluntary, and is used strictly for the purposes of software development.

cell (n)~ A box formed by the intersection of a row and a column in a worksheet or a

table, in which you enter information.

cell (n)~ In a cube, the set of properties, including a value, specified by the intersection when one member is selected from each dimension.

Cell Directory Service (PN)~ A service that enables DCE clients to locate compatible servers.

cell phone (n)~ A handheld portable telephone that operates through a radio network.

cell range (n)~ A block of two or more cells in a spreadsheet.

cell reference (n)~ The set of coordinates that a cell occupies on a worksheet. For example, the reference of the cell that appears at the intersection of column B and row 3 is B3.

cell spacing (n)~ The distance between the cells of a table or workbook.

cellset (n)~ In ADO MD, an object that contains a collection of cells selected from cubes or other cellsets by a multidimensional query.

cellular (n)~ A radio network that provides coverage for cellular telephone communications.

Cellular & SIM (PN)~ A feature in Settings where the user can change the settings for the cellular connection and for the SIM card.

cellular data (n)~ Non-voice data that a phone exchanges over the air, using the mobile operator's cellular network.

Cellular Line (PN)~ A modem option used to connect to an Internet service provider (ISP) or network.

cellular network (n)~ A radio network that provides coverage for cellular telephone communications.

cellular phone (n)~ A handheld portable telephone that operates through a radio network.

cellular signal (n)~ The signal between a cellular phone and the mobile operator's network that allows the user to access the Internet and make phone calls using a cellular phone. A telecommunications standard that lets users send and receive messages that include rich text, images, audio, and video.

Celtic (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 88.

cent sign (n)~ The -¢ character.

CENT SIGN (n)~ The -¢ character.

center (v)~ To align objects or text around a point located in the middle of a line, page, or other defined area; in effect, to position items an equal distance from each margin or border.

center of rotation (n)~ The point around which a shape or text block rotates.

center point (n)~ The point on an object around which the object can be rotated, scaled, or skewed. (When scaling or skewing, the ALT key must be pressed to use the center point as the anchor instead of the opposite edge.) The center point starts out in the center of the object, but can be moved anywhere.

centered mode (n)~ A keyboard layout in which the onscreen keyboard is centered.

centerline trap (n)~ The small overlap created where two differently colored objects that are close in luminance abut on a printed page.

center-spot (n)~ In photography, pertaining to a spot metering mode which uses a tiny point at the very center of the scene in calculating exposure.

Centraal Bureau voor de Statistiek (n)~ The government agency that is responsible for collecting statistical information (such as Intrastat data or manufacturing statistics) from companies in the Netherlands.

central access policy (n)~ An access policy that allows organizations to centrally deploy and manage authorization policies that include conditional expressions using user groups, user claims, device claims, and resource properties.

Central Administration site (PN)~ A special SharePoint site where an administrator can manage all sites and servers in a farm that is running Microsoft-® SharePoint-® Products and Technologies.

central administration site (n)~ A site that coordinates intersite data replication across the hierarchy by using Configuration Manager database replication, and enables the administration of hierarchy-wide configurations for client agents, discovery, and other operations.

Central Bank MFO Code (n)~ A 9-digit code used to identify banks for routing transactions in the Russian Federation.

central bank transaction code (n)~ A statistical code defined by the Central Bank of Russia used to describe the subjects of payments denominated in Russian roubles for cross-border transactions.

Central Bureau for Statistics (n)~ The government agency that is responsible for collecting statistical information (such as Intrastat data or manufacturing statistics) from companies in the Netherlands.

Central Management Server (n)~ The server role (one per organization) on one Front End pool in the deployment that manages and deploys basic configuration data to all servers that are running Lync Server. Also provides Lync Server Management Shell and file transfer capabilities.

Central Management store (PN)~ The central database (one per organization) that contains the data to define, set up, maintain, and administer a deployment, including the deployment topology and user policies.

central processing unit (n)~ The computational and control unit of a computer. The CPU is the device that interprets and executes instructions. Mainframes and early minicomputers contained circuit boards full of integrated circuits that implemented the CPU. Single-chip central processing units, called microprocessors, made possible personal computers and workstations.

Central Publishing service (PN)~ A service within Remote Desktop Services responsible for aggregating RemoteApp programs and desktops that are published to end users from across the entire deployment. It ensure only users with appropriate rights can access published resources. The resources are used to display error messages that, for example, might say that the publishing service is unavailable. This can help the admin debug their deployment.

central site (n)~ The primary site at the top of the Configuration Manager hierarchy, to which all other sites in the system report their inventory, site configurations, software metering data, and status.

Centralized Certificates (PN)~ An IIS feature that provides a single SSL certificate store for a server farm (web farm) and simplifies the management of SSL bindings.

Centralized Conference Control Protocol (n)~ A custom protocol for communicating conference creation and control commands from clients to Communications Server.

centralized payment system (n)~ A payment processing system in which one company in an organization manages the incoming and outgoing payments between other companies in the same organization. The other companies still own the invoices. During the settlement process, applicable 'due to' and 'due from' transactions are generated.

centralized processing (n)~ A shared service that pools resources for leveraging or cost reduction purposes.

centralized registration model (n)~ A registration model that removes all certificate subscriber participation from the management policy. For the workflow, a user designated as the originator will initiate the request and an enrollment agent will execute the request.

centralized statement (n)~ A consolidated customer statement that includes transaction data for all companies in the same organization that a customer does business with.

Centrex ~ A service provided from a reserved section of the main public exchange that has been reprogrammed to act as if it were the exclusive PBX of an individual user, in other words a 'virtual' PBX.

Centronics (PN)~ A standard 36-pin parallel interface for connecting printers and other devices to a computer. It defines the plu, socket and signals used and transfers data asynchronously up to 2000 Kbytes/sec. This de facto standard was developed by the printer manufacturers Centronics Corp.

CEP (n)~ The continuous and incremental processing of event streams from multiple sources based on declarative query and pattern specifications with near-zero latency.

CEP (PN)~ A role service within the AD CS server role that enables users and computers to obtain certificate enrollment policy information even when the computer is not a member of a domain or if a domain-joined computer is temporarily outside the security boundary of the corporate network.

CEP engine (n)~ The core engine and adapter framework components of Microsoft StreamInsight. The StreamInsight server can be used to process and analyze the event streams associated with a complex event processing application.

CERN (PN)~ A physics research center located in Geneva, Switzerland, where the original development of the World Wide Web took place under the leadership of Tim Berners-Lee in 1989 as a method to facilitate communication among members of the scientific community.

CERO (n)~ A non-profit, self-regulatory organization which applies and enforces interactive game ratings in Japan.

Cert Manager (PN)~ A feature used to import and export digital IDs and to view all digital IDs stored on the user's computer.

certificate (n)~ A digital document that is commonly used for authentication and to help secure information on a network. A certificate binds a public key to an entity that holds the corresponding private key. Certificates are digitally signed by the certification authority that issues them, and they can be issued for a user, a computer, or a service.

certificate ~ Digital representation of user or device attributes, including a public key, that

is signed with an authoritative private key.

certificate authentication (n)~ A form of IIS authentication in which IIS accepts client-certificates used to prove the client's identity. Using this form of authentication, IIS can optionally map a client certificate to a Windows user account by using an internal mapping table or Active Directory.

certificate chain (n)~ A sequence of certificates, where each certificate in the sequence is signed by the subsequent certificate. The last certificate in the chain is normally a self-signed certificate.

certificate chaining (n)~ A process that builds one or more certificate paths. The certificate paths may or may not trace up to a self-signed or root certificate.

certificate enrollment (n)~ The process of requesting, receiving, and installing a certificate.

certificate enrollment policy (n)~ A set of rules governing certificate enrollment.

Certificate Enrollment Policy Web Service (PN)~ A role service within the AD CS server role that enables users and computers to obtain certificate enrollment policy information even when the computer is not a member of a domain or if a domain-joined computer is temporarily outside the security boundary of the corporate network.

certificate enrollment request (n)~ The initial phase of the certificate enrollment process, in which the client submits his request for a certificate to the certification authority (CA) in a special format that includes the identity of the user requesting the certificate and all the necessary information needed by the CA to approve or reject the request.

Certificate Enrollment Web Service (PN)~ A role service within the AD CS server role that enables users and computers to enroll for and renew certificates even when the computer is not a member of a domain or if a domain-joined computer is temporarily outside the security boundary of the computer network.

certificate issuance (n)~ The process of generating, issuing and publishing certificates, typically in accordance with the applicable certificate issuance policy.

certificate issuance policy (n)~ A set of rules that defines all the security-relevant requirements (such as key management and authentication levels) that must be met when certificates are issued to users.

certificate issuer (n)~ The certification authority which issued the certificate to the subject.

Certificate Lifecycle Manager Client (PN)~ A suite of Certificate Lifecycle Manager (CLM) client tools that assist end users with managing their smart cards. The tools include the Smart Card Self Service Control, the Smart Card Personalization Control, and the Certificate Profile Update Control. See Smart Card Self-Service Control, Smart Card Personalization Control, Certificate Profile Update Control.

certificate manager (n)~ A Certificate Lifecycle Manager (CLM) user that has the appropriate CLM permissions to either administer other CLM users or to administer the CLM application itself.

certificate manager Web portal (n)~ A Web application running on the Certificate Lifecycle Manager (CLM) server. This portal allows certificate administrators to administer other users' certificates and smart cards. The certificate subscriber and certificate manager Web portals are both accessed through the same universal resource

locator (URL); however, the content displayed is based on a user's roles and permissions.

certificate of authenticity (n)~ A label with sophisticated anti-counterfeiting features that helps the end user identify that the computer uses a validly licensed copy of Microsoft Windows. The product name and a unique product key appear in the center of the label. The OEM must physically attach the COA label to the computer chassis, and it should never be removed from the computer.

certificate policy (n)~ A named set of rules that indicate the applicability of certificates for a specific class of applications with common security requirements. Such a policy might, for example, limit certain certificates to electronic data interchange transactions within given price limits.

Certificate Profile Update Control (PN)~ An ActiveX control that automates the update of Certificate Lifecycle Manager (CLM) profiles on client computers.

certificate registration point (n)~ A site system role that communicates with the server that runs the Network Device Enrollment Service of Active Directory Certificate Services to manage device certificate requests that use the Simple Certificate Enrollment Protocol.

certificate request (n)~ A specially formatted electronic message (sent to a CA) used to request a certificate. The request must contain the information required by the CA to authenticate the request, plus the public key of the entity requesting the certificate. All the information necessary to create the request is mapped to a CERT_REQUEST_INFO structure.

certificate revocation (n)~ The process of revoking a digital certificate.

certificate revocation checking (n)~ A way to see if a certificate used to sign a message is valid. Outlook can check the status of the certificate from the issuing certification authority's database.

certificate revocation list (n)~ A document maintained and published by a certification authority that lists certificates that have been revoked.

certificate revocation list distribution point (n)~ A certificate extension that indicates where the certificate revocation list for a CA can be retrieved. It can contain none, one, or many HTTP, file, or LDAP URLs.

Certificate Services (PN)~ A software service that issues certificates for a particular certification authority. It provides customizable services for issuing and managing certificates for the enterprise. Certificates can be used to provide authentication support, including secure e-mail, Web-based authentication, and smart-card authentication.

certificate store (n)~ A permanent storage where certificates, certificate revocation lists, and certificate trust lists are stored. A certificate store can also be temporary when working with session-based certificates.

certificate subscriber (n)~ A user that needs certificates with our without smart cards. Certificate subscribers can access a small number of functions that can only be performed for the user's own certificates.

certificate subscriber Web portal (n)~ A Web application running on the Certificate Lifecycle Manager (CLM) server. This component of the CLM server interacts directly with users in a self-service mode. The specific functionality is based upon Active Directory group memberships and permissions. The certificate subscriber and certificate manager Web portals are both accessed through the same universal resource locator

(URL); however, the content displayed is based on a user's roles and permissions.

certificate template (n)~ A Windows construct that specifies the format and content of certificates based on their intended usage. When requesting a certificate from a Windows enterprise certification authority (CA), certificate requestors can select from a variety of certificate types that are based on certificate templates.

certificate trust list (n)~ A signed list of root certification authority certificates that an administrator considers reputable for designated purposes, such as client authentication or secure e-mail.

certificate trust validation (n)~ The validation process that determines if a certificate chains to a root CA certificate that is trusted by the actual security context.

Certificates (PN)~ A feature that initiates the process of sending a certificate when a message is digitally signed. The certificate proves the sender's identity and supplies the recipient with a public key with which to decrypt the sender's encrypted message.

certificates snap-in (n)~ A Microsoft Management Console (MMC) snap-in that is used to manage certificate stores for users, computers, and services.

certification authority (n)~ An entity entrusted to issue certificates that assert that the recipient individual, computer, or organization requesting the certificate fulfills the conditions of an established policy.

certification authority hierarchy (n)~ A hierarchy in which the roles of the certification authority are separated into one root CA and one or more subordinate CAs.

certification authority snap-in (n)~ A Microsoft Management Console (MMC) snap-in that is used to configure and manage certification authorities.

Certification Authority Web Enrollment (PN)~ The role service that provides a set of web pages that allow interaction with the Certification Authority role service.

certification hierarchy (n)~ A model of trust for certificates in which certification paths are created by means of the establishment of parent-child relationships between certification authorities.

certification path (n)~ A sequence of certificates, where each certificate in the sequence is signed by the subsequent certificate. The last certificate in the chain is normally a self-signed certificate.

certification status (n)~ The stage of an app in the certification process.

CertUtil (PN)~ A command-line program that is installed as part of Certificate Services and can be used to dump and display certification authority (CA) configuration information, configure Certificate Services, backup and restore CA components, and verify certificates, key pairs, and certificate chains.

CES (PN)~ A role service within the AD CS server role that enables users and computers to enroll for and renew certificates even when the computer is not a member of a domain or if a domain-joined computer is temporarily outside the security boundary of the computer network.

CF card (n)~ A memory card that is supported by many types of devices. It is larger than a secure digital card.

CGI (n)~ A server-side interface for initiating software services. For example, a set of interfaces that describe how a Web server communicates with software on the same computer. Any software can be a CGI program if it handles input and output according to

the CGI standard.

cgi-bin (n)~ A file directory that holds external applications to be executed by HTTP servers via CGI.

CGMS-A (n)~ A method for controlling the copying of broadcast media content that allows only one generation of copying.

CGU (n)~ The smallest group of classifiable assets that generates cash independently of other assets within an organization. These groups of assets are used to measure impairment losses that will be incurred.

CGU group (n)~ A group of cash-generating units (CGUs) that is used to allocate the net book value of an asset to a cash-generating unit and to allocate the impairment losses- to fixed assets.

chain (n)~ The relationship between applications and related web service calls associated with a business transaction. Chains are not client-side or server-side specific.

chain of trust (n)~ A sequence of certificates, where each certificate in the sequence is signed by the subsequent certificate. The last certificate in the chain is normally a self-signed certificate.

challenge (n)~ A security task that a user must complete to verify they are a human and not a machine.

challenge group (n)~ The group that consists of requests/connections awaiting authentication.

Challenge Handshake Authentication Protocol (n)~ A challenge-response authentication protocol for Point-to-Point Protocol (PPP) connections described in RFC 1994. It uses the industry-standard MD5 hashing algorithm to hash the combination of a challenge string issued by the authenticating server and the user's password in the response.

challenge password (n)~ A password used for certificate revokation as well as authentication challenge.

challenge/response authentication (n)~ A security mechanism in which a client computer uses its established user logon information to identify itself to the server computer. The user is not prompted to enter these user credentials. Instead, the information is available after the user first logs on to a Microsoft-® Windows NT-®-based computer.

Chamber music (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 104.

Champion of Logic (n)~ Skill level in the Purble Place game. Once a Purble Place game is completed, a player gets a skill level rank assigned automatically by the game (based on number of guesses and hints during the game).

change (v)~ To modify the value of a property or attribute.

change advisory board (n)~ A formally constituted group of people representing service delivery and support functions that is responsible for assessing, planning, and authorizing changes to the IT environment.

change applier (n)~ An object that performs conflict detection, conflict handling, and change application for a batch of changes.

change control (n)~ Principles and processes that facilitate the management of change without compromising the quality or integrity of an IT project or solution, through structured procedures for submitting, approving, implementing, and reviewing change requests.

change creator (n)~ The user who creates a new change request.

Change Font (PN)~ A button that opens the Change Font dialog box, where the user can select a new font, style, size, and effects for instant messages.

change hint (n)~ A vertical bar in the margin of a document that shows where changes have been tracked and displays those changes when clicked.

change history (n)~ In a shared file, information that is maintained about changes made in past editing sessions. The information includes the name of the person who made each change, when the change was made, and what data was changed.

change journal (n)~ A feature that tracks changes to NTFS volumes, including additions, deletions, and modifications. The change journal exists on the volume as a sparse file.

Change Level of Access (PN)~ Contact context menu item that allows the user to assign an access level to the selected contact(s).

change log (n)~ The log where the quorum resource stores data. This data is maintained by the clustering software.

change management (n)~ The practice of administering changes with the help of tested methods and techniques in order to avoid new errors and minimize the impact of changes.

change manager (n)~ A user who coordinates change requests. Some of the tasks include adding or removing activities, voting on behalf of the change advisory board, overriding votes, or putting change requests on hold.

change marker (n)~ An icon that designates a change made by a reviewer to a presentation.

Change Message Font (oth)~ A button in the Options dialog box, Instant Messages tab, where the user can change the font of the text of instant message conversations.

change propagation (n)~ The process of applying changes from one replica to another.

change request (n)~ A means of proposing a change to any component of an IT infrastructure or any aspect of an IT Service. It may be a document or record in which the nature and details of and the justification and authorization for the proposed change are entered.

change script (n)~ A text file that contains SQL statements for all changes made to a database, in the order in which they were made, during an editing session.

Change Sign-In Account… (PN)~ An item on the Connect menu that opens the Accounts tab of the Options dialog box, where the user can change sign-in name and Communicator server information.

Change the task status to Completed and close the form (oth)~ Check box that indicates if the user wants to have the task marked as completed after it has been converted to an opportunity.

change type attribute (n)~ An attribute applicable to text file and database management agents that denotes the type of change (that is, add, modify, or delete) to be made to a connector space object.

change unit (n)~ The minimal unit of change tracking in a store. In change propagation,

only the units that are changed must be sent; whereas, in conflict detection, independent changes to the same unit are considered a conflict.

changed lines (n)~ Vertical lines appearing next to text that has been added, deleted, or changed by using tracked changes. You can specify that changed lines appear to the left or right of text. You can also hide changed lines.

ChangeEvent (n)~ In a statechart or activity diagram, an event in which a designated condition becomes true. A ChangeEvent is indicated by the keyword when followed by a Boolean expression in parentheses, for example: when (balance < 0)

changeset (n)~ A logical grouping of changes. The purpose of changesets is to group all of the file and work item updates that get delivered with a single check-in action.

changeset ID (n)~ A numerical ID that is assigned to a specific changeset.

changing dimension (n)~ A dimension that has a flexible member structure, and is designed to support frequent changes to structure and data.

channel (n)~ A path through which information passes between two computers or devices. It can refer to the physical medium (such as wires) or to a set of properties that distinguishes one channel from another.

Channel (PN)~ A drop-down list from which users can select the method of distribution (for a campaign activity), or the method of how a customer's case will be handled (for an entitlement).

channel (n)~ The distribution method used for a campaign activity in a marketing campaign.

channel (n)~ A medium for transferring information. Depending on its type, a communications channel can carry information (data, sound, and/or video) in either analog or digital form. A communications channel can be a physical link, such as the cable connecting two stations in a network, or it can consist of some electromagnetic transmission on one or more frequencies within a bandwidth in the electromagnetic spectrum, as in radio and television, or in optical, microwave, or voice-grade communication.

channel (n)~ A path enabling one inbound or outbound call. Calling channels are a means of having concurrent calls on PBX.

channel agility (n)~ The switching of frequencies within a given bandwidth during a point-to-point transmission.

Channel Bank ~ Channel terminal equipment used for combining (multiplexing) channels on a frequency-division or time-division basis.

Chanson (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 102.

CHAP (n)~ A challenge-response authentication protocol for Point-to-Point Protocol (PPP) connections described in RFC 1994. It uses the industry-standard MD5 hashing algorithm to hash the combination of a challenge string issued by the authenticating server and the user's password in the response.

chapter (n)~ In a DVD or a video, a portion of a title, such as a scene or sequence. A title can contain one or more chapters.

chapter (n)~ An identifier of a group of details within a rowset.

Chapter 11 (n)~ A U.S. bankrupcy statute that allows a debtor to continue to own a business and control its operations while reorganizing the business to achieve solvency.

chapter point (n)~ An internal marker used to mark the beginning and the end of a chapter to help navigate DVDs or videos.

char (PN)~ The data type that holds a maximum of 8,000 characters.

char data type (n)~ A character data type that holds a maximum of 8,000 characters.

character (n)~ A letter, number, punctuation mark, or other symbol.

Character ~ A letter of the alphabet, number, space or punctuation mark is a character.

character code (n)~ A numeric value that corresponds to a particular character in a set.

character data (n)~ All the textual content of an element or attribute that is not markup. XML differentiates this plain text from binary data. In the XML OM, character data is stored in text nodes, which are implemented as DOM text objects.

character encoding (n)~ A one-to-one mapping between a set of characters and a set of numbers.

character entity (n)~ A code that's used in HTML to describe symbols, international letters, and other special characters. Character entities are maintained by the International Standards Organization (ISO).

character formatting (n)~ Formatting you can apply to selected text characters.

character map (n)~ In text-based computer graphics, a block of memory addresses that correspond to character spaces on a display screen. The memory allocated to each character space is used to hold the description of the character to be displayed in that space.

Character Map (n)~ A feature in Windows that makes it possible to use characters that are not displayed on the keyboard.

character mode (n)~ A display mode in which the monitor can display letters, numbers, and other text characters but no graphical images or WYSIWYG (what-you-see-is-what-you-get') character formatting (italics

character pad (n)~ The pad in Tablet PC Input Panel that you can use to write one character (such as a letter, number, or symbol) at a time. Each character is converted into typed text.

character set (n)~ A grouping of alphabetic, numeric, and other characters that have some relationship in common. For example, the standard ASCII character set includes letters, numbers, symbols, and control codes that make up the ASCII coding scheme.

character spacing (n)~ The distance between characters in a line of text. Tracking, kerning, and scaling can be used to adjust the space between characters.

character string (n)~ A set of characters treated as a unit and interpreted by a computer as text rather than numbers. A character string can contain any sequence of elements from a given character set, such as letters, numbers, control characters, and extended ASCII characters.

character style (n)~ A combination of any of the character formatting options identified by a style name.

characteristic diagram (n)~ A type of diagram that documents all the factors that contribute to or affect a given situation (all the causes that lead to a certain effect).

characters per second (n)~ A measure of the rate at which a device, such as a disk drive,

can transfer data. In serial communications, the speed of a modem in bits per second can generally be divided by 10 for a rough determination of the number of characters per second transmitted.

charge (n)~ The incidental cost of product acquisition or product delivery.

charge card (n)~ A credit card issued by banks. A charge card authorizes the holder to buy goods or services on credit. Payments received from charge cards are treated as accounts receivable amounts because they must be submited to card companies for reimbursement.

charge variance (n)~ The difference between an expected charge and an actual charge.

chargeable transaction (n)~ A transaction that can be included on an invoice and charged to a customer.

chargeback (n)~ The return to a customer's account of funds that were used to purchase an item. This may occur as a result of a customer's contacting a bank to dispute a credit-card transaction.

charge-coupled device (n)~ A device in which individual semiconductor components are connected so that the electrical charge at the output of one device provides the input to the next.

charger (n)~ A device, connected to a USB charging cable, for charging the phone battery.

charm (n)~ An icon that is attached to an event and that is viewable in someone's calendar. Depending on the calendar view, a charm may appear next to an event title, or may be the only visual representation of an event on a calendar day.

charm (n)~ A user interface element similar to a button that provides access to key Windows features, such as Start, search, sharing, devices, and settings. Charms differ from buttons in that they have extended functionality, such as flyout menus that provide access to individual or grouped commands.

chart (n)~ A graphic or diagram that displays data or the relationships between sets of data in pictorial rather than numeric form.

chart (v)~ To make a map or chart of.

chart (n)~ A catalog of information for apps, games, movies and TV shows based on dynamic information such as new or fastest rising, top free, best rated, and top paid.

chart area (n)~ The entire chart and all its elements.

chart data region (n)~ A report item on a report layout that displays data in a graphical format.

chart effect option (n)~ An animation enhancement that lets you apply effects to a chart by series, category, or element in a series or category.

chart element (n)~ One of the distinct pieces that make up a chart, such as a title, axis, legend, trendline, or error bar.

chart of accounts (n)~ An account structure whose valid value combinations are constrained by integrity constraints and account rules.

chart of accounts (n)~ A list of main accounts.

chart sheet (n)~ A sheet in a workbook that contains only a chart.

chart style (n)~ A predefined style that users can apply to their chart and that is optimized for the chart type.

Chart Web Part (PN)~ A Web Part that implements Web chart controls to visually display information in a variety of chart types in SharePoint.

Charts (n)~ A customizable Web part that displays charts.

chat (n)~ A real-time conversation via computer using short instant messages between two or more participants. When a participant types a line of text and then presses the Enter key, that participant's words appear on the screens of the other participants, who can then respond in kind.

chat (v)~ To carry on a real-time conversation with other users by computer or device.

Chat Link (n)~ A web address that Customers can click to initiate a Chat Request.

Chat Queue (n)~ A customized list of Chat Requests based on custom criteria (see Chat Routing Rules) in order to organize Chat Requests based on issue type, Product, or the skill base of your Support teams.

Chat Request (n)~ A request made by a Customer to initiate a Chat Session with a CSR through a Chat Link on the Support Portal or external websites, or using a Personal Chat Link from a CSR.

chat room (n)~ A data communication channel that links computers and allows users to send messages to each other in real time. Chat rooms are available through online services and some electronic bulletin board systems.

Chat Routing Rule (n)~ A criteria-based rule that can route Chat Requests to the appropriate CSR or Queue, as well as take deflective action on Chat Requests that are initiated when your CSRs are unavailable or busy.

Chat Session (n)~ A text-based support interaction using the Live Chat system between a Customer and a CSR.

Chat Shortcut (n)~ A macro that substitutes a set key phrase with a string specified by the CSR.

Chat tool (n)~ A tool that participants can use to communicate one-on-one during a Live Meeting session.

Chatroom ~ A website where you can meet and chat live (via the keyboard) with other internet users. Most such websites have multiple 'rooms', each dedicated to a particular topic or theme.

Chats (PN)~ A label for a tab that has a list of conversations for all methods (modalities) of communication, such as voice call or instant message, for past and present.

check (n)~ Part of a group of tests that are run against an application.

check (n)~ A written order on a bank to pay a sum of money from funds in an account. Checks show the name of the company or individual receiving payment, the signature and account number of the person issuing the check, the payment amount and the current date. Checks usually are numbered in sequence.

check (n)~ A bill of exchange drawn on a bank.

Check Active SLA (PN)~ A Boolean field for the Convert Rule entity that shows whether a case needs to be created for a customer with an active service level agreement (SLA).

check box (n)~ A control that indicates whether or not an option is selected. A check mark or x' appears in the box when the option is selected.'

check card (n)~ A type of bank card where the amount of purchase is immediately withdrawn from the user's bank account.

check clause (n)~ Code that enforces constraints on a table or column.

CHECK constraint (n)~ A constraint that allows for business rules that span multiple tables. For example, the Order table could have a CHECK constraint that would prevent orders for a customer from exceeding a credit limit defined for the customer in the Customer table.

check date (n)~ The date on the check.

check digit calculator engine (n)~ An engine that calculates apportionment based on check digits.

Check If Resolved (PN)~ A Boolean field for the Convert Rule entity that shows whether an item related to a resolved case needs to be converted to a case.

check in (v)~ To place a file or project back in a source repository. This releases the lock for editing and enables other users to view the updated file or check out the file.

check in (v)~ To indicate that a user is in a certain place or location. Users check in' to a physical place to share their location with their friends.'

check in (v)~ To save the changes in a runbook to the database.

check letter (n)~ A payment letter that accompanies a check and which lists the documents that are paid by the check. Used for French check format.

check list (n)~ A set of standards that a deliverable or task should meet or a list of possible errors.

check mark (n)~ A small x or other sign that appears in the check box if the option represented by the box is selected.

Check Names (v)~ A button on the message toolbar that compares the names in the To, Cc, and Bcc boxes against the names in the Address Book and against those contact folders that you've specified as Outlook Address Books.

check number (n)~ A unique identification number that is assigned to a check.

check out (v)~ To retrieve a writable copy of a file or project from a source repository. This locks the file for editing to prevent others from overwriting or editing it inadvertently.

check out (v)~ To finalize a purchase on a Web site. For example, when customers shop on your Web site, they may select several items and save them in their shopping basket. When they have finished shopping, they click on a checkout link or graphical button that takes them to an online form where they enter their name, billing address, payment type, and shipping information.

check out (v)~ To allow edits to a runbook.

check register (n)~ A list of all transactions for a specific checkbook.

checked build (n)~ A version of the operating system that has been compiled with debug symbols and built with special support for debugging components that are under development.

checkerboard test (n)~ A memory test employed to detect catastrophic failures and wiring problems within the memory chip and on the data bus by writing an alternating pattern of 0's and 1's to the memory chip.

check-in (v)~ In a source control system, the action of putting the modified source back to the source repository.

check-in note (n)~ A comment associated with a changeset that is added during the check-in process by prompting the user for specific data.

check-in policy (n)~ A policy that provides the ability to validate compliance with organizational rules for a team project.

check-in test (n)~ A test run by a developer to determine whether his code has affected the general stability of the product.

checklist (n)~ A set of standards that a deliverable or task should meet or a list of possible errors.

checkmate (n)~ In chess, a move that wins the game whereby the opponent's king cannot escape.

checkout (n)~ The process of finalizing a purchase on a website. For example, when customers shop on your website, they may select several items and save them in their shopping basket. When they have finished shopping, they click on a checkout link or graphical button that takes them to an online form where they enter their name, billing address, payment type, and shipping information.

Checkout (PN)~ The button that allows customers to finalize their purchase on a website.

check-out (v)~ In a source control system, the action of copying the source file from the repository to one's own machine (drive), possibly for editing.

checkout folder (n)~ Folder that Visual SourceSafe Explorer reports in the Check Out Folder column of the file pane. This folder is not the user's actual working folder, which is displayed under the Toolbar.

checkpoint (n)~ In a server cluster node`s registry, a snapshot of the Cluster subkey or of an application subkey. The checkpoint is written to the quorum disk when certain events take place, such as a node failure.

checkpoint (n)~ A common point of entry for spyware guarded by an agent. Examples of checkpoints include Startup Folder, dial up connections, Wi-Fi connections, Internet Safe Sites, Winsock Layered Service Providers, Windows Messenger Service, and SPAM Zombie prevention.

checkpoint (n)~ A point-in-time snapshot of a virtual machine that enables an administrator to roll the virtual machine back to its state at the moment when the checkpoint was created.

checkpoint (n)~ An event in which the Database Engine writes dirty buffer pages to disk. Each checkpoint writes to disk all the pages that were dirty at the last checkpoint and still have not been written to disk.

checksum (n)~ A calculated value that is used to test data for the presence of errors that can occur when data is transmitted or when it is written to disk. The checksum is calculated for a given chunk of data by sequentially combining all the bytes of data with a series of arithmetic or logical operations. After the data is transmitted or stored, a new checksum is calculated in the same way using the (possibly faulty) transmitted or stored data. If the two checksums do not match, an error has occurred, and the data should be transmitted or stored again. Checksums cannot detect all errors, and they cannot be used to correct erroneous data.

cheque (n)~ A written order on a bank to pay a sum of money from funds in an account. Checks show the name of the company or individual receiving payment, the signature and account number of the person issuing the check, the payment amount and the current date. Checks usually are numbered in sequence.

Chess Titans (n)~ A 3-D chess game that is part of Windows Vista operating system.

chevron (n)~ The double angle bracket denoting an overflow button control.

Chevron List (PN)~ A SmartArt graphic layout used to show a progression through several processes that make up an overall workflow. Also works for illustrating contrasting processes. The Level 1 text corresponds to the first arrow shape on the left, while the Level 2 text corresponds to horizontal sub-steps for each shape that contains Level 1 text.

CHF (n)~ The official currency of Switzerland.

child (n)~ In a tree structure, the relationship of a node to its immediate predecessor.

child (n)~ In a tree structure, an element that is contained by a parent element. A subordinate element.

child (n)~ An account holder who is a family member, but not a parent, and who has limited use of the Internet. Children can view their own settings, but they can't change them.

child account (n)~ An account optimized for children that parents can control and customize.

child app container (n)~ An app container that places additional restrictions on what an app can do based on its parent app container.

child breakpoint (n)~ A breakpoint created by the debugger based on a breakpoint set by a user.

child business unit (n)~ A business unit that is immediately under another business unit in the business hierarchy of an organization.

child category (n)~ An entity used in catalogs to group a set of products together in a hierarchy. A child category is a subordinate of a parent category. For example, Music is a parent category, and Rock, Country, and Classical are child categories. You create parent and child categories to organize the products displayed on your site.

child domain (n)~ A DNS domain located directly beneath another domain name (the parent domain) in the namespace tree. For example, example.microsoft.com' would be a subdomain of the domain 'microsoft.com'.'

child element (n)~ In a tree structure, an element that is contained by a parent element. A subordinate element.

child host group (n)~ A host group contained within another host group, which can inherit host reserve settings and virtual machine permissions from its parent host group. All host groups are child host groups of the root host group, which is named All Hosts by default.

child menu (n)~ A type of drop-down menu that appears when a user points to a command on a higher-level menu.

child model site (n)~ A model site that is subordinate to a root model site and is used to organize data in an application.

child node (n)~ A subordinate node.

child object (n)~ An object that resides in another object. A child object implies relation. For example, a file is a child object that resides in a folder, which is the parent object.

child process (n)~ A process initiated by another process (the parent). This initiating action is frequently called a fork. The parent process often sleeps (is suspended) until the

child process stops executing.

child record (n)~ A work item that is subordinate to a parent.

child site (n)~ A site that is the subordinate of another site in a hierarchy. Any site, except the central site, is a child site of another site. A site can be both a child site and a parent site.

child table (n)~ A table that assumes a child role when it participates in an integrity relationship with another table and whose foreign key attribute values are migrated from the table assuming the parent role in the relationship.

Child Ticket (n)~ A Ticket that is linked to a related (Parent) Ticket. Child Tickets are associated to a Parent Ticket that deals with the issue(s) that cause the issues of the Child Tickets. Multiple Child Tickets can have the same Parent Ticket, but a Child Ticket cannot have multiple Parent Tickets.

child window (n)~ A document window used within an MDI window.

child window (n)~ A window that has a parent. It has the WS_CHILD style and is confined to the client area of its parent window.

child workflow (n)~ A workflow instance that is generated by a parent workflow instance.

child-friendly site (n)~ A website whose content is understandable and usable by kids and that is appropriate for them. The language is typically aimed at a grade-school reading level, and the concepts presented are accessible to younger minds.

child-friendly website (n)~ A website whose content is understandable and usable by kids and that is appropriate for them. The language is typically aimed at a grade-school reading level, and the concepts presented are accessible to younger minds.

chimney (n)~ A collection of offloaded protocol state objects and the semantics associated with them.

Chinese Conversion add-in (PN)~ A COM add-in that enables conversion between Chinese (Traditional) and Chinese (Simplified).

chip (n)~ A device consisting of a number of connected circuit elements, such as transistors and resistors, fabricated on a small rectangle (a die') cut from a silicon (or

Chip ~ A silicon wafer with millions of tiny circuits engraved on it - what computers are made of..

chip ~ a miniaturized electronic circuit that has been manufactured in the surface of a thin substrate of semiconductor material

chip set (n)~ A collection of chips designed to function as a unit in the performance of some common task. The term is most commonly used to refer to the set of integrated circuits, such as the programmable interrupt controller, that support a CPU together with the CPU itself. Often a chip set will fit on one chip.

chip-on-board (n)~ A manufacturing technology that mounts an integrated circuit die directly to a circuit board. The die is electrically connected to the circuit board using wire bonding, and is then covered with a protective epoxy cover.

chit chat (n)~ ?A category of responses to conversational or fun questions.

Chocolate Batter Button (n)~ A button on the Comfy Cakes game interface that allows the player to select chocolate batter for their cake.

Chocolate Icing Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a chocolate icing for their cake.

choice group (n)~ A control that is used to present a set of mutually exclusive choices. By default, a choice group contains two choice sections, one of which appears to the user as the default choice in the form.

choicepoint (n)~ The point at which transitions split into multiple, mutually exclusive branches, each terminating at a different destination state. One of the branches must be a default branch.

choke (n)~ A small overlap that decreases the knockout of the lower of two differently colored, abutting objects.

cholesterol profile (n)~ A pattern of lipids in the blood. It usually includes the levels of total cholesterol, high-density lipoprotein (HDL) cholesterol, triglycerides, and the calculated low-density lipoprotein (LDL) 'cholesterol.

choose (v)~ To pick a command or an option from within a graphical user interface, as by clicking a button in a dialog box or pulling down a menu and then releasing the mouse button on one of its options.

Chooser (n)~ The Macintosh desk accessory with which users select the network server and printers they want to use.

chord (n)~ To press more than one mouse or keyboard button at the same time.

Chorus (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 97.

Christian gangsta rap (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 136.

Christian Rap (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 61.

Christian Religious Holidays (PN)~ The list item in Outlook that allows users to add standard Christian holidays to their calendar.

Christian Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 141.

chrome (n)~ The common user interface elements rendered around each Web Parts part control within a given zone. The chrome for a part control includes a border, a title bar, and the icons, title text, and verbs menu that appear within the title bar. The appearance of the chrome is set at the zone level and applies to all part controls in a zone. The rendering of chrome and of individual System.Web.UI.WebControls.WebParts.WebPart controls is handled by the System.Web.UI.WebControls.WebParts.WebPartChrome class.

Chrome ~ A popular internet- browser, free from the Google Corporation.

Chrome ~ a powerful Google browser that loads Web pages quickly and accurately.www.google.com/chrome

chrome control (n)~ An HTML and JavaScript based control that renders the top chrome, which is available to use in apps for SharePoint.

chronic condition (n)~ A disease that is persistent in its effects.

chronicle (n)~ A table that stores state information for a single application. An example is

an event chronicle, which can store event data for use with scheduled subscriptions.

cHTML (n)~ A markup language used on some cell phones. cHTML is a subset of HTML with additional tags to enhance mobile functionality.

chunk (n)~ A specified amount of data.

chunk (n)~ A concrete sequence of media samples of a track that correspond to a particular interval in an IIS Smooth Streaming presentation.

chunk container (n)~ A container in which chunks of data are stored and which is then compressed for further space optimization during deduplication.

chunk store container (n)~ A container in which chunks of data are stored and which is then compressed for further space optimization during deduplication.

chunked file (n)~ The process of outputting a stream as a number of discrete file chunks rather than a single contiguous file.-

CIDR (n)~ An IP address and routing management method that allocates IP addresses in a way that reduces the number of routes stored on any individual router, while also increasing the number of available IP addresses. CIDR replaces class-based IP address allocation.

CIF (n)~ A video format that has 352 pixels by 288 lines and 30 fps.

CIL (n)~ A language used as the output of a number of compilers and as the input to a just-in-time (JIT) compiler. The common language runtime includes a JIT compiler for converting the language to native code.

CIM (n)~ The model that describes how to represent real-world managed objects. CIM uses an object-oriented paradigm, where managed objects are modeled using the concepts of classes and instances. The CIM is divided into the metamodel and the standard schema. The metamodel describes what types of entities make up the schema. It also defines how these entities can be combined into objects that represent real-world devices.

CIM Object Manager (PN)~ A component in the Windows Management Instrumentation (WMI) infrastructure that handles the interaction between management applications and providers. The CIM Object Manager supports services such as event notification, remote access, and query processing. The CIM Object Manager also grants access to the WMI repository.

CIM Object Manager repository (n)~ A central storage area, managed by the CIM Object Manager, where defined objects, such as static class definitions and instances that are used to access and manipulate system management information, are stored.

CIM repository (n)~ A central storage area, managed by the CIM Object Manager, where defined objects, such as static class definitions and instances that are used to access and manipulate system management information, are stored.

CIM schema (n)~ A collection of class definitions used to represent managed objects that occur in every management environment.

cipher (n)~ The particular algorithm used to transform a readable message (called plaintext or cleartext) into an unreadable, scrambled, or hidden message (called ciphertext).

cipher ~ A cryptographic- algorithm- used to encrypt data that is unreadable until converted into plain data with a predefined key.

cipher mode (n)~ The method used to encrypt data. The stream cipher mode encodes data

one bit at a time. The block cipher mode encodes data one block at a time. Although it tends to execute more slowly than stream cipher, block cipher is more secure.

ciphertext (n)~ Data that has been encrypted.

Circular (adj)~ A node placement style that specifies that the nodes are circular in relation to the MOM Management Server.

Circular Bending Process (PN)~ A SmartArt graphic layout used to show a long or non-linear sequence or steps in a task, process, or workflow. Works best with Level 1 text only. Maximizes both horizontal and vertical display space for shapes.

circular dependency (n)~ The state when items depend upon each other in such a way that the set of all dependencies forms a circle.

circular reference (n)~ A situation in which one object refers back to itself, either directly or indirectly.

circulating card (n)~ A reusable card that signals process and transfer activities as it- circulates- between the material's point of origin and- point of consumption.

circulation (n)~ An item that is communicated to team members on a Group Work Site, and that supports confirmation and tracking of which team members have viewed it.

CISC (n)~ The implementation of complex instructions in a microprocessor design so that they can be invoked at the assembly language level. The instructions can be very powerful, allowing for complicated and flexible ways of calculating such elements as memory addresses. All this complexity, however, usually requires many clock cycles to execute each instruction.

citation (n)~ A reference to a specific legal case, statute, or other legal document.

City guides (PN)~ The Travel subcategory containing apps providing current information about a city, including sightseeing, museums, dining, etc.

CJK Strokes (n)~ A set of individual strokes in the Unicode Standard used to compose Chinese/Japanese/Korean (CJK) ideographs.

CLABE (PN)~ A series of 18 digits used to identify bank accounts and their holders in Mexico and used to route electronic funds transfers.

claim (n)~ A statement that a server makes (for example, name, identity, key, group, privilege, or capability) about a client.

claim mapping (n)~ The act of mapping, removing or filtering, or passing claims between various claim sets.

claims identity (n)~ A unique identifier that represents a specific user, application, computer, or other entity, enabling it to gain access to multiple resources, such as applications and network resources, without entering credentials multiple times. It also enables resources to validate requests from an entity.

claims provider (n)~ A software component or service that can be used to issue a claim during sign-in operations and to display, resolve, and provide search capabilities for claims in a card selector.

claims-based application (n)~ A Microsoft ASP .NET application that performs authorization based on the claims that are present in an Active Directory Federation Services (ADFS) security token.

claims-based authentication (n)~ The process of authenticating a user based on a set of claims about the user's identity contained in a trusted token. This token is often issued and

signed by an entity that is able to authenticate the user by other means, and that is trusted by the entity doing the claims-based authentication.

claims-based identity (n)~ A unique identifier that represents a specific user, application, computer, or other entity, enabling it to gain access to multiple resources, such as applications and network resources, without entering credentials multiple times. It also enables resources to validate requests from an entity.

class (n)~ An individual training session on a subject.

class (n)~ A named descriptor for a set of objects that share the same attributes, operations, methods, relationships, and behaviors.

class (n)~ A category of objects that share a common set of characteristics.

class (n)~ A set of objects that share a common definitional property, that share common operations and behavior, or both.

Class A IP address (n)~ A unicast IP address that ranges from 1.0.0.1 through 127.255.255.254. The first octet indicates the network, and the last three octets indicate the host on the network. Class-based IP addressing has been superceded by Classless Interdomain Routing (CIDR).

Class B IP address (n)~ A unicast IP address that ranges from 128.0.0.1 through 191.255.255.254. The first two octets indicate the network, and the last two octets indicate the host on the network. Class-based IP addressing has been superceded by Classless Interdomain Routing (CIDR).

Class C IP address (n)~ A unicast IP address that ranges from 192.0.0.1 to 223.255.255.254. The first three octets indicate the network, and the last octet indicates the host on the network. Network Load Balancing provides optional session support for Class C IP addresses (in addition to support for single IP addresses) to accommodate clients that make use of multiple proxy servers at the client site. Class-based IP addressing has been superceded by Classless Interdomain Routing (CIDR).

class coupling (n)~ The degree of coupling to unique classes through parameters, local variables, return types, method calls, generic or template instantiations, base classes, interface implementations, fields defined on external types, and attribute decoration.

Class Designer (n)~ A fully-functional, visual design environment for the Common Language Runtime.

Class Details Window (n)~ A window in Visual Studio Class Designer that you can use to configure the members of a type. By default, the Class Details Window appears automatically when you open a new class diagram.

class diagram (n)~ A visual and static representation of classes and the relationships between them.

class driver (n)~ An intermediate driver that provides a simple interface between a minidriver and the operating system.

class factory (n)~ An object that implements the IClassFactory interface, which enables it to create objects of a specific class.

Class Finder (PN)~ A tool that allows partners find online and in-person educational opportunities to continue their skill development.

class ID (n)~ A universally unique identifier (UUID) that identifies a COM component. Each COM component has its CLSID in the Windows registry so that it can be loaded by

other applications.

Class ID extension (n)~ An extended HTML element that is used to describe the class of a viewable or downloadable document. It can be misused to pass dangerous attachments; EHS allows users to block this tag.

class identifier (n)~ A universally unique identifier (UUID) that identifies a COM component. Each COM component has its CLSID in the Windows registry so that it can be loaded by other applications.

class key (n)~ The subset of data members of a class whose values uniquely identify an instance of the class.

class key member (n)~ One of the members of a multi-valued class key.

class library (n)~ A library of classes, interfaces, and value types that are included in .NET Framework. This library provides access to system functionality and is designed to be the foundation on which .NET Framework applications, components, and controls are built.

class materials (n)~ Content and resources that are made available as part of a class and that can be associated with individual lessons or assignments.

class member relation (n)~ An association between specific data members of the two classes in a class relation.

class meta-data (n)~ A conceptual model that describes the attributes that must be specified to create a class in the Data Warehouse logical schema.

class module (n)~ A module that can contain the definition for a new object. Each instance of a class creates a new object. Procedures defined in the module become properties and methods of the object.

class name (n)~ The name used to refer to a class module. If the class module is a form or report module, the class name is prefaced with the type of module. For example, the class name for a module associated with a form called OrderForm would be Form_OrderForm, while one associated with a report called OrderReport would be Report_OrderReport.

class name (n)~ A predefined name used to refer to an OLE object in Visual Basic. A class name consists of the name of the application used to create the OLE object, the object's type, and, optionally, the version number of the application.

class provider (n)~ A COM server that supplies class definitions. Class providers can support data retrieval, modification, deletion, enumeration, and query processing.

class relation (n)~ A connection between two classes in a parent-child relationship. The relation defines the number of instances of each class.

Class Schedule (PN)~ A view in which you can organize class materials into assignments and lessons.

class selector (n)~ In cascading style sheets, a name identifying a user-defined style. Depending on how it's defined, a class selector can be used with a single type of tag or with any HTML tag inside the BODY element.

Class View (n)~ A window that displays the symbols defined, referenced, or called in the application you are developing.

Classic mode (n)~ A compatibility mode for managed content. When an application pool is configured to use classic mode, IIS processes requests for managed resources by using separate IIS and ASP.NET request-processing pipelines.

classic mode (n)~ A view or appearance of a form that was used in CRM 2011 and earlier versions.

Classic Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 1.

classic version (n)~ The version that uses checkboxes and does not include a reading pane. It is recommneded for users with a slow internet connection.

Classic view (n)~ A display option of the Windows Control Panel that makes it look and work like it did in previous versions.

classic view (n)~ A SharePoint view that renders in HTML format, or a similar markup language such as CHTML or WML, and provides backward compatibility for mobile browsers that cannot support the contemporary view.

Classic Windows application (n)~ ?An application that is built using the traditional Win32 app model, typically makes use of the COM or .NET runtime, and runs only on the desktop of Windows.

Classic Windows Platform (PN)~ ?The traditional Windows platform that includes Win32, .NET, and COM.

Classic Workspace (PN)~ An enhanced version of the original peer-to-peer workspace in Groove. It offers users a more familiar alternative to the newer SharePoint Workspace.

Classical (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 32.

classics (PN)~ A game category that draws inspiration from classic arcade experiences.

classification (n)~ The type of updates that SCE downloads from Microsoft Update during synchronization.

classification (n)~ The placement of an incident into a hierarchy of descriptors that indicate what the incident is generally about. For example, an incident could be classified as being related to software, and then to Microsoft, and then to Word 2003.

classification (n)~ A systematic organization of classes.

classification matrix (n)~ A chart that shows the accuracy of a data mining model or other statistical analysis by separately counting cases that were correctly and incorrectly classified.

classifier (n)~ A superclass that includes class, data type, and interface subclasses. Because all classifier subclasses share the same syntax, they are all represented by the same rectangle model element.

ClassifierRole (n)~ A type of collaboration role that is a slot for an object in a collaboration. It is represented by the class rectangle symbol with only the name compartment showing.

Classless Interdomain Routing (n)~ An IP address and routing management method that allocates IP addresses in a way that reduces the number of routes stored on any individual router, while also increasing the number of available IP addresses. CIDR replaces class-based IP address allocation.

class-like interface (n)~ In a UML Static Structure or UML Component diagram, one of two types of interfaces that can be connected to class or component shapes and has a box

shape.

clause (n)~ In Transact-SQL, a subunit of an SQL statement. A clause begins with a keyword.

clean installation (n)~ The process of installing Windows onto a bare-metal system or overwriting an existing operating system installation. Clean installations do not migrate data from previous installations.

clean shutdown (n)~ A system shutdown that occurs without errors.

clean system (n)~ An installation of Windows that has not been modified and has not had any additional software installed on it.

Clean Up (PN)~ An action that removes redundant messages from an e-mail conversation to reduce information overload and improve readability.

cleaning tape (n)~ A tape used to clean heads on a tape drive.

clear (v)~ To turn a setting off or to remove a value.

clear (v)~ To collect the funds for a check and pay them to the check holder. When a check clears, the money has been withdrawn from the bank account and paid to the recipient.

clear (v)~ When Windows Disk Protection is enabled, to erase or empty the cache file on the hard disk when a user logs off or the computer is restarted.

Clear Annotations (v)~ A UI element that allows a presenter to remove all annotations in a presentation or on a specific slide.

clear channel ~ A channel that uses out-of-band signaling (as opposed to in-band signaling), so the channel's entire bit rate is available.

Clear Group (v)~ An item on the group context menu in the contact list that removes all members of the Recent Contacts group.

clear key (n)~ The key that is stored unencrypted on the disk volume. This key is used to freely access the volume master key, and in turn, the full volume encryption key when BitLocker Drive Encryption protection is disabled but the disk volume remains encrypted.

Clear Note (oth)~ An item on the user's My Status menu that deletes the user's current status note.

Clear Recordings (v)~ An option that removes narrations and laser pointer gestures or timings from a presentation or from a specific slide.

clear registration attribute (n)~ An attribute that clears the registration that is associated with a particular authentication workflow. For example, in a Question and Answer Challenge, answers are stored in ILM -€œ2-€? in the form of registration data. When the clear registration box is checked and a workflow is saved, the registration data is deleted, requiring users to re-register.

Clear To Send (n)~ A control packet that a destination station sends to indicate its readiness to receive data. A destination station responds to a request to send (RTS) by transmitting a CTS.

clearing house (n)~ An Office Communications Server deployment that is configured to relay traffic between different customer domains.

cleartext (n)~ Data in its unencrypted or decrypted form.

clear-text password (n)~ A password that is not scrambled, thus making it more susceptible to network sniffers.

ClearType (PN)~ A font display technology that dramatically improves font display resolution so that letters on the computer screen appear smooth, not jagged. ClearType dramatically improves the readability of text on color LCD monitors with a digital interface, such as those found in laptops and high-quality flat-panel desktop displays.

ClearType Text Tuner (PN)~ A program that helps make the text on your screen easier to read for long periods of time.

CLFS (PN)~ A general-purpose logging service that can be used by software clients running in user-mode or kernel-mode.

CLI (n)~ The interface supported by ODBC for use by an application.

CLI (n)~ A form of interface between the operating system and the user in which the user types commands, using a special command language. Although systems with command-line interfaces are usually considered more difficult to learn and use than those with graphical interfaces, command-based systems are usually programmable; this gives them flexibility unavailable in graphics-based systems that do not have a programming interface.

CLI (PN)~ A specification describing how applications written in multiple high-level languages may be executed in different system environments without the need to rewrite the applications to take into consideration the unique characteristics of those environments.

click (v)~ To press and release a mouse button once without moving the mouse. Clicking is usually performed to select or deselect an item or to activate a program or program feature.

Click and Type pointer shape (n)~ A visual cue to indicate which formatting will be applied when you double-click: a left-aligned, centered, or right-aligned tab stop; a left indent; or left or right text wrapping.

click distance (n)~ The number of links between a content item and an authoritative page linking to the content item.

click frequency (n)~ The number of clicks divided by the reach of clicks.

click to call (n)~ The feature with which a mobile phone user can place a voice call by clicking a contact's single phone number or Session Initiation Protocol (SIP) URI.

clickable map (n)~ An image that contains more than one hyperlink on a Web page. Clicking different parts of the image links the user to other resources on another part of the Web page or a different Web page or in a file.

click-distance (n)~ The number of links between a content item and an authoritative page linking to the content item.

Clicker (PN)~ A PowerPoint add-in that allows your mobile device to be used to navigate through a PowerPoint presentation on your computer.

ClickOnce (PN)~ A Microsoft-developed technology that reduces the complexity of multiple applications' deployment, launching, and updating processes.

clicks conversion (n)~ The completion of an online transaction by a visitor who was not redirected to the site from an advertisement. The visitor may have typed the URL directly, or searched and clicked on a result.

clickstream analysis (n)~ Clickstream data are information that users generate as they move from page to page and click on items within a Web site, usually stored in log files.

Web site designers can use clickstream data to improve users' experiences with a site.

clickthrough (n)~ A type of ad click that follows a hyperlink to another Web site, or a page or frame within the initial Web site.

clickthrough report (n)~ A report that displays related report model data when you click data within a rendered Report Builder report.

Click-to-Run (n)~ A streaming technology that quickly installis Office over the Internet, internal networks, local file systems, or from offline media.

client (n)~ A computer, device or program that connects to or requests the services of another computer, device or program.

client (n)~ In object-oriented programming, a member of a class (group) that uses the services of another class to which it is not related.

client (n)~ A process, such as a program or task, that requests a service provided by another program—for example, a word processor that calls on a sort routine built into another program. The client process uses the requested service without having to know' any working details about the other program or the service itself.'

client (n)~ A computer running SMS client components. A client can be further categorized as either a Legacy Client or an Advanced Client.

client (n)~ A service, application, or device that wants to integrate into the Microsoft Sync Framework architecture.

client access (n)~ The ability of client computers to connect to a server or resource, for example, a file on a server or a cluster resource.

client access point (n)~ In SMS 2003 and earlier releases, an SMS site system that provides a communication point between the SMS site server and Legacy Client computers. Legacy Clients deliver their collected files, inventory information, discovery data records, software metering data, and status information to CAPs.

Client Access Rule (PN)~ Logical rules composed of predicates and actions that enable administrators to perform actions, such as allow, block, or redirect client access traffic on the Exchange Server.

Client Access server (n)~ A set of components and services that enable users to access their Exchange mailboxes through the Outlook Web Access application.

Client Access server redirection (n)~ A process by which Outlook Web Access users who access an Internet-facing Client Access server that is in a different Active Directory site than the site that contains their mailbox can be redirected to the Client Access server that is in the same site as their Mailbox server if that Client Access server is Internet-facing.

Client Access server role (n)~ A set of components and services that enable users to access their Exchange mailboxes through the application Outlook Web Access and the protocols Exchange ActiveSync, Post Office Protocol version 3 (POP3), and Internet Message Access Protocol 4rev1 (IMAP4). The Client Access server role also includes Web services that are used by other Exchange 2007 server roles.

client account partner discovery Web page (n)~ The Web page that is used to interact with a user to determine which account partner the user belongs to when Active Directory Federation Services (ADFS) cannot automatically determine which of the account partners should authenticate the user.

client agent (n)~ Software that runs on SMS/Configuration Manager clients and performs client-side functions associated with a specific SMS/Configuration Manager feature, such as software metering.

client application (n)~ Application software that gathers data from the user, prepares it for the server, and issues a request to the server. The client presents data received from the server to the user through its own user interface.

client application service (n)~ In Windows-based applications, built-in functionality to access ASP.NET application services for common application tasks, including remote login, roles, and application settings.

client area (n)~ The portion of a Windows-based application excluding toolbars, menus, and status bars.

client authentication (n)~ A method of authentication by which the client in a client-server communication proves its identity to the server.

client authentication certificate (n)~ In AD FS, a certificate that federation server proxies use to authenticate a client to the Federation Service.

client bank (n)~ A program that is used to make electronic payments to banks and to receive information from banks. This information includes acknowledgements of payments that were made, information about incoming payments, and bank account balances.

client certificate (n)~ A digital certificate that functions in a manner that is similar to a driver's license or passport. Client certificates can contain detailed identification information about the user and organization that issued the certificate.

client code generation (n)~ The action of generating code for the client project based on operations and entities exposed in the middle tier. A RIA Services link must exist between the client and server projects.

client computer (n)~ A computer, device or program that connects to or requests the services of another computer, device or program.

client context (n)~ The object that is used to initiate any actions with the client-side object model. It is the primary entry point for the client object model, and the primary object for coordinating requests against corresponding objects in a site collection.

client coordinate (n)~ A coordinate that specifies the X or Y screen position relative to the upper-left corner of the application, which is regarded as the origin (0,0). In right-to-left (RTL) applications, the upper-right corner is the origin.

client cursor (n)~ A cursor that is implemented on the client. The entire result set is first transferred to the client, and the client API software implements the cursor functionality from this cached result set.

client database (n)~ A relational database that is created on a client computer during the installation of client components.

client enrollment (n)~ The process of creating the client licensor certificate, which enables the user's computer or device to create publishing licenses that will be honored by a licensing server.

client extension (n)~ A category of customizations that enable configuration of client extension controls.

client extension control (n)~ A user interface control that can be added to Microsoft

Dynamics CRM entity forms and within the application toolbar or navigation area of an entity form. These controls are configured in XML within ISV.Config and are designed to allow the inclusion of functionality from another web application within Microsoft Dynamics CRM. There are three types of client extension controls: Menu Items, Buttons, Entity Form Navigation areas.

client failback (n)~ The process in which a DFS client, after being redirected (failed over) to a non-optimal folder target, reverts to a preferred folder target when it comes back online.

client failover (n)~ The process in which a namespace client attempts to access subsequent targets in a referral if the first target is (or becomes) unavailable.

Client Hyper-V (PN)~ The Hyper-V technology that runs on the Windows Client operating system, rather than Windows Server.

client in-band provisioning (n)~ A mechanism whereby the server (and/or admin) can configure a client in accordance with infrastructure and policy requirements.

client layer (n)~ The layer that resides closest to your application, and that your application uses to communicate directly with SQL Azure. The client layer can reside on-premises in your data center, or it can be hosted in Microsoft Azure.

Client log off form (PN)~ The title of the Web form used to delete the client's cached cookies from the servers.

client logoff Web page (n)~ When Active Directory Federation Services (ADFS) performs a logoff operation, a Web page that is executed to provide visual feedback to the user that the logoff has occurred.

client logon Web page (n)~ When AD- FS collects client credentials, a Web page that is executed to perform the user interaction.

Client manifest (n)~ A file with an .ismc file name extension that describes the available bit rates to Silverlight clients. It uses XML-formatting.

client object model (n)~ A set of APIs for SharePoint products. These APIs are based on the server object model, and can be called from clients such as desktop PCs and mobile devices.

client script (n)~ A script consisting of statements that appear on the HTML page. The script is executed by the browser either when the document is loaded, or in response to an event such as a button click.

client secret (n)~ Part of the code that allows Open Authorization (OAuth). Client secrets are linked to client IDs. You can have multiple client secrets linked to a single Client ID.

client software (n)~ A program that is run on a client computer rather than on a server computer.

Client Statistics pane (n)~ One of the tabs that hosts the output of the client statistics information.

client status (n)~ A feature that monitors the health and activity of the Configuration Manager client and that can take remedial action if it is required.

client subscription (n)~ A subscription to a merge publication that uses the priority value of the Publisher for conflict detection and resolution.

Client Sync Agent (PN)~ The synchronization agent between the SQL Server database and the SQL Azure hub database.

client tier (n)~ In the three-tier Web application model, the application or process that requests services from the middle tier, which typically includes a Web server and business processes.

client type (n)~ Information that determines how a cache client functions and impacts the performance of your application. There are two client types: a simple client type and a routing client type.

client version filter (n)~

client version policy (n)~ A set of client version rules that defines the actions to be taken when users try to log on with specific clients and client versions.

Client Virtualization Handler (PN)~ A Click-to-Run component that is installed on a user's PC in order to enable the technology.

client/server architecture (n)~ A model of computing whereby client applications running on a desktop or personal computer access information on remote servers or host computers. The client portion of the application is typically optimized for user interaction, whereas the server portion provides centralized, multiuser functionality.

client/server computing (n)~ A model of computing whereby client applications running on a desktop or personal computer access information on remote servers or host computers. The client portion of the application is typically optimized for user interaction, whereas the server portion provides centralized, multiuser functionality.

client-side image map (n)~ An image map that directly encodes in a Web page the destination URL of each hot spot in that image map. Client-side image maps do not require processing from a server when a site visitor follows the hyperlinks in the image map.

client-side monitoring (n)~ The monitoring perspective that receives events and statistics from end user browser sessions.

client-side program (n)~ A program that is run on a client computer rather than on a server computer.

client-side rendering (n)~ Technology that enables rendering operations to be handled by the client.

client-side session (n)~ The Windows PowerShell session on a user's local computer, which has the basic Windows PowerShell commands available to it.

Clinical Document Architecture (n)~ The standard format used to define how patient health information is transferred between systems

clip (v)~ To cut a photograph, drawing, or other illustration from a clip art collection—either in a book or on a disk.

clip (v)~ To cut off the portion of a displayed image that lies beyond a certain boundary, such as the edge of a window or a bounding box.

clip (n)~ A single media file, including art, sound, animation, or movies.

clip art (n)~ Ready-made art, often appearing as a bitmap or a combination of drawn shapes.

clip collection (n)~ A hierarchical organization of media clips. You can create your own clip collections, import clip collections, or add, move, or copy clips from one collection to another.

clip creation (n)~ The process of detecting and splitting video content into separate clips.

Clips are created by Windows Movie Maker when there is a significant change from one frame to another.

Clip Gallery (PN)~ A feature that contains a collection of clip art.

clipboard (n)~ The area of storage for objects, data, or their references after a user carries out a Cut or Copy command.

Clipboard ~ A temporary storage area in Windows. When you cut (Ctrl-X) or copy (Ctrl-C) highlighted text, documents or whatever in Windows they are sent to the clipboard; when you paste (Ctrl-V) they are copied from the clipboard to the cursor position. Sending something to the clipboard automatically overwrites its previous contents.

Clipboard clipping (n)~ A piece of text or other clipping that has been added to the Clipboard.

clipboard format (n)~ A data format that a memory object is instantiated on the clipboard.

clipbook (n)~ Clipboard data that is stored separately from the system clipboard.

ClipBook Server (n)~ A system service that supports ClipBook Viewer, which allows pages to be seen by remote ClipBooks.

clip-on microphone (n)~ A microphone that can be attached by a clip.

clipping mask (n)~ A mask that is applied to another object, hiding the portions of the masked object which fall outside of the clipping path.

clipping path (n)~ A path that is applied to another object, hiding the portions of the masked object which fall outside of the clipping path.

CLM Audit (n)~ A Certificate Lifecycle Manager (CLM) extended permission in Active Directory that allows the generation and display of CLM policy templates, defining management policies within a profile template, and generating CLM reports.

CLM credentials (n)~ User account information that can be used to authenticate a user to Certificate Lifecycle Manager (CLM). These credentials can be in the form of domain credentials or one-time passwords.

CLM Enroll (n)~ A Certificate Lifecycle Manager (CLM) extended permission in Active Directory that allows the user to specify the workflow and the data to be collected while issuing certificates using a template. This extended permission only applies to profile templates.

CLM Enrollment Agent (n)~ A Certificate Lifecycle Manager (CLM) extended permission in Active Directory that allows a user or group to perform certificate requests on behalf of another user. The issued certificate's subject will contain the target user's name, rather than the requestor's name.

CLM reports (n)~ Audit information pertaining to credential management activities within Certificate Lifecycle Manager (CLM).

CLM Request Unblock Smart Card (n)~ A Certificate Lifecycle Manager (CLM) extended permission in Active Directory that enables a smart card's User Personal Identification Number (PIN) to be reset, allowing access to the key material on a smart card and for that material to be re-established.

cloak (v)~ Protect a project from being affected by certain commands, for example, Check Out, Check In, and Undo Check Out.

clock (n)~ The electronic circuit in a computer that generates a steady stream of timing

pulses—the digital signals that synchronize every operation. The system clock signal is precisely set by a quartz crystal, typically at a specific frequency between 1 and 50 megahertz. The clock rate of a computer is one of the prime determinants of its overall processing speed, and it can go as high as the other components of the computer allow.

clock rate (n)~ The speed at which the internal clock in an electronic device oscillates. In computers, each tick (oscillation) of the clock is called a cycle, and the clock rate is measured in megahertz, or millions of cycles per second. The clock rate determines how quickly the CPU can execute basic instructions, such as adding two numbers, and it is used to synchronize the activities of various components in the system.

clock setting (n)~ The time to which a clock is set.

clock speed (n)~ A measure of processing power, given in megahertz (MHz).

clock speed (n)~ The speed at which the internal clock in an electronic device oscillates. In computers, each tick (oscillation) of the clock is called a cycle, and the clock rate is measured in megahertz, or millions of cycles per second. The clock rate determines how quickly the CPU can execute basic instructions, such as adding two numbers, and it is used to synchronize the activities of various components in the system.

clock tick (n)~ The time required for the CPU to perform the simplest instruction, such as fetching the contents of a register or performing a no-operation instruction (NOP).

clock vector (n)~ A collection of clock vector elements that represents updates to a replica. Any change that occurs between 0 and the tick count is contained in the vector.

clock vector element (n)~ A pair of values, consisting of a replica key and a tick count, that represents a change to a replica.

clone (n)~ A duplicate of any vector path or shape, but which can have different fill, stroke, or effect formatting.

clone (v)~ To copy or replicate the entire contents of a hard disk drive, including the operating system, configuration settings, and programs, by creating an image of the hard disk drive.

cloned configuration (n)~ The practice of deploying new Edge Transport servers based on the configuration information of a previously configured source server. The configuration information of the previously configured source server is copied and exported to an XML file, which is then imported to the target server.

cloning (n)~ The process by which a new virtual machine is created from an existing virtual machine. The new virtual machine has the same identity as the source machine.

close (v)~ To end an application's relationship with an open file so that the application will no longer be able to access the file without opening it again.

Close (v)~ An item on the Connect menu that closes the current window without signing the user out of Communicator.

Close (PN)~ The tooltip for the Close button.

close (v)~ To make unavailable for use.

close box (n)~ In the Macintosh graphical user interface, a small box in the left corner of a window's title bar. Clicking on the box closes the window.

Close button (n)~ In Windows-based programs, the box that has an Ã— at the upper-right corner of the screen that, when clicked, closes the window.

close date (n)~ The date on which an opportunity is closed, either because it resulted in a

sale or was unsuccessful.

closed (adj)~ The state in a period in which an activity cannot occur, the state of an operational process, or the status of a source document.

closed authenticated meeting (n)~ An authenticated-users-only meeting that is open only to users on the organizer's invite list.

closed campus supervision policy (n)~ E-mail policy settings that apply inbound and outbound e-mail restrictions so students can send e-mail to or receive e-mail from addresses inside the organization only. Administrators can set up organization-wide exceptions so e-mail can be sent to or from specific domains and public groups. Administrators can also configure per-user exceptions so students can send e-mail to and receive e-mail from specific addresses outside the organization.

closed caption (n)~ Descriptive text that represents the audio content of a television or video program as text on the screen. Captions are usually visible only if decoded or activated.

closed captioning (n)~ A service or feature that renders the audio content of a television or video program as text on the screen. These captions are usually visible only if decoded or activated.

Closed Chevron Process (PN)~ A SmartArt graphic layout used to show a progression, a timeline, or sequential steps in a task, process, or workflow, or to emphasize movement or direction. Can be used to emphasize information in the starting shape. Works best with Level 1 text only.

closed content model (n)~ XML document rules that state that an element in an XML document cannot include any information that does not follow the referenced schema.

closed fiscal period (n)~ The state of a fiscal period that cannot be reopened and that prevents its use as a time period classifier for account entries.

closed generic type (n)~ A constructed generic type that has no unspecified generic type parameters, either of its own or of any enclosing types or methods. Closed generic types can be instantiated.

closed path (n)~ A vector path that is closed, meaning that beginning and ending points are the same point.

closed shape (n)~ A shape that is surrounded by a continuous outline, such as a rectangle or circle.

closed visit (n)~ A visit completed before a log file stops collecting data.

closing (n)~ An accounting procedure that transfers the balances of the temporary owners' equity accounts to the permanent owners' equity account, which leaves the temporary accounts with zero balances.

closing chevron (n)~ The -» character.

closing curly quotation mark (n)~ The -€? character.

closing parenthesis (n)~ The) character.

closing quotation mark (n)~ The -€? character.

cloud (n)~ The worldwide collection of networks and gateways that use the TCP/IP suite of protocols to communicate with one another.

cloud (n)~ A pool of resources which exposes a set of capacity and capabilities without revealing the actual physical backing of the resources.

cloud (n)~ The collection of hardware and software that enables the five essential characteristics (on-demand self-service, broad network access, resource pooling, rapid elasticity, and measured service) of cloud computing. The cloud infrastructure can be viewed as containing both a physical layer and an abstraction layer. The physical layer consists of the hardware resources that are necessary to support the cloud services being provided, and typically includes server, storage and network components. The abstraction layer consists of the software deployed across the physical layer, which manifests the essential cloud characteristics. Conceptually the abstraction layer sits above the physical layer.

Cloud Accelerate Program (PN)~ A component of the Cloud Partner program designed for partners that are already committed to a cloud business.

Cloud App Model (PN)~ An application-hosting architecture that relies on cloud-based services. Application logic and data are typically hosted on a distributed set of services on the Internet, connected through web APIs, and authenticated with server-to-server authentication technologies such as OAuth.

Cloud Business App (n)~ Cloud-based business application for SharePoint 2013 or SharePoint on Office 365, which is optimized for adding and managing data.

cloud collection (n)~ A description for music or videos stored in the cloud that users may access from their phone. Used for Xbox Music and any other potential cloud-based media services.

cloud computing (n)~ A type of computing that uses groups of servers and scalable resources, generally a platform as a service and software as a service, over the Internet.

cloud computing ~ Cloud computing is a general term for anything that involves delivering hosted services over the Internet. These services are broadly divided into three categories: Infrastructure-as-a-Service (IaaS), Platform-as-a-Service (PaaS) and Software-as-a-Service (SaaS).

Cloud Deployment Program (PN)~ A component of the Cloud Partner program designed to meet the needs of partners that are deploying Office 365 to enterprise customers.

Cloud Essentials Pack (PN)~ A training package of the Cloud Partner program designed for partners starting to build a Microsoft Online Services business who want to try the latest cloud software, online technical support, training and other resources from Microsoft at no charge.

cloud library (n)~ A grouping of read-only library shares that are assigned to a private cloud and a location where self-service users of a private cloud can store virtual machines or services.

Cloud Migration (n)~ A type of subscription purchased by customers targeted to customers considering migration to the cloud.

Cloud OS (PN)~ An operating system that manages applications and hardware at the scope and scale of cloud computing. The foundations of the Cloud OS are Windows Server and Microsoft Azure, complemented by the full breadth of technology solutions, such as SQL Server, System Center and Visual Studio. Together, these technologies provide one consistent platform for infrastructure, apps and data that can span the client's datacenter, service provider datacenters, and the Microsoft public cloud.

cloud resource mapping (n)~ A mapping created by an App Controller administrator

with all the cloud resources.

cloud search service (n)~ A service that enables adding content to the search index in Office 365.

cloud service (n)~ An instance of the Cloud Services offer that consists of packaged software programming and configuration settings and is hosted on virtual machines based on web and worker roles.

Cloud Services (PN)~ The Platform-as-a-Service (PaaS) offer in Microsoft Azure that allows customers to build powerful, scalable web applications without having to worry about managing the underlying platform issues.

Cloud Services Low Priority (n)~ A service type of the Cloud Services' service suitable for workloads with low priority

Cloud Solution Provider (PN)~ The Microsoft program that allows external partners to sell, set up, and manage Office 365 accounts for small businesses, as well as set their own terms.

Cloud, the ~ Remote storage via the internet, or sometimes just the internet in general. Called 'the cloud' because you don't know where your data is physically located, it's just out there somewhere.

cloud-based (adj)~ Pertaining to operations that take place within the cloud.

CLP (n)~ The official currency of the Republic of Chile.

CLR (n)~ The engine at the core of managed code execution. The runtime supplies managed code with services such as cross-language integration, code access security, object lifetime management, and debugging and profiling support.

CLR function (n)~ A function created against a SQL Server assembly whose implementation is defined in an assembly created in the .NET Framework common language runtime (CLR).

CLR metadata (n)~ Information that describes every element managed by the common language runtime: an assembly, loadable file, type, method, and so on. This can include information required for debugging and garbage collection, as well as security attributes, marshaling data, extended class and member definitions, version binding, and other information required by the runtime.

CLR stored procedure (n)~ A stored procedure created against a SQL Server assembly whose implementation is defined in an assembly created in the .NET Framework common language runtime (CLR).

CLR trigger (n)~ A trigger created against a SQL Server assembly whose implementation is defined in an assembly created in the .NET Framework common language runtime (CLR).

CLR user-defined type (n)~ A user-defined data type created against a SQL Server assembly whose implementation is defined in an assembly created in the .NET Framework common language runtime (CLR).

CLS (n)~ A subset of language features supported by the common language runtime, including features common to several object-oriented programming languages. CLS-compliant components and tools are guaranteed to interoperate with other CLS-compliant components and tools.

CLS-compliant (adj)~ Pertaining to code that publicly exposes only language features

that are in the Common Language Specification. CLS compliance can apply to classes, interfaces, components, and tools.

CLSID (n)~ A universally unique identifier (UUID) that identifies a COM component. Each COM component has its CLSID in the Windows registry so that it can be loaded by other applications.

CLSID tag (n)~ An extended HTML element that is used to describe the class of a viewable or downloadable document. It can be misused to pass dangerous attachments; EHS allows users to block this tag.

Club (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 112.

Club-House (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 128.

cluster (n)~ The smallest amount of disk space that can be allocated to hold a file.

cluster (n)~ A group of independent computers that work together to provide a common set of services and present a single-system image to clients. The use of a cluster enhances the availability of the services and the scalability and manageability of the operating system that provides the services.

cluster (n)~ A group of warehouse-related work items of the same type, based on user-defined criteria (such as location and inventory number).

Cluster ~ Data stored on a disk is spread across a number of clusters, small physical areas on the disk. How big they are depends on the way the disk is formatted.

cluster ~ process of connecting multiple servers together in order to provide greater overall system availability, performance, and capacity for your server platforms.

cluster adapter (n)~ The adapter that, when using multiple network adapters in each host of a Network Load Balancing cluster, handles the network traffic for cluster operations (the traffic for all hosts in the cluster). This adapter is programmed with the host's cluster IP address.

cluster configuration storage location (n)~ The shared location (or shared storage location) where cluster configuration information is persisted. It can be a shared file or a database.

cluster continuous replication (n)~ A replication that combines the asynchronous log shipping and replay features built into Exchange 2007 with the failover and management features provided by a failover cluster that is created with the Microsoft Windows Cluster service.

cluster disk resource (n)~ A disk on a cluster storage device.

cluster log (n)~ A trace log of Cluster service events and activities on a node.

cluster manifest (n)~ A schematized xml document that describes the nodes forming a Windows Fabric cluster.

cluster network (n)~ A group of independent computers that work together to provide a common set of services and present a single-system image to clients. The use of a cluster enhances the availability of the services and the scalability and manageability of the operating system that provides the services.

cluster network address (n)~ The network (media access control) address for the network adapter that is to be used for handling client-to-cluster traffic in a Network Load Balancing cluster.

cluster node (n)~ An individual computer in a server cluster.

cluster ordered dither (n)~ In photography, a method of digital halftoning used to create the illusion of smooth gradation between colours.

cluster package (n)~ The cluster manifest and/or Windows Fabric MSI that form an atomic unit of deployment for a Windows Fabric cluster.

cluster port (n)~ A TCP/IP port used by the cache hosts to manage the cache cluster. The port number used for the cluster ports can be different on each cache host. These settings are maintained in the cluster configuration settings.

cluster quorum (n)~ A disk which contains the database which contains metadata about the cluster's members.

cluster repair (n)~ A repair operation in which all missing or corrupt files are replaced, all missing or corrupt registry keys are replaced and all missing or invalid configuration values are set to default values.

cluster resource (n)~ A internal entity that can be owned by a Windows Server Failover Clustering (WSFC) node, brought online and taken offline, moved between nodes, and managed as a cluster object. A cluster resource can be owned by only a single node at any point in time.

cluster resource group (n)~ An internal collection of cluster resources managed as a single cluster object in the WSFC cluster.

Cluster service (n)~ The essential software component that controls all aspects of server cluster or failover cluster operation and manages the cluster configuration database.

Cluster Shared Volume (PN)~ A feature that simplifies the configuration and management of Hyper-V virtual machines in failover clusters. With CSV, on a failover cluster that runs Hyper-V, multiple virtual machines can use the same disk yet fail over independently of one another. CSV provides increased flexibility for volumes in clustered storage-€"for example, it allows you to keep system files separate from data to optimize disk performance, even if the system files and the data are contained within virtual hard disk files.

cluster storage (n)~ Storage where one or more attached disks hold data used either by server applications running on the cluster or by applications for managing the cluster. Each disk on the cluster storage is owned by only one node of the cluster. The ownership of disks moves from one node to another when the disk group fails over or moves to the other node.

Cluster.exe (n)~ A command-line utility that is used as an alternative to Failover Cluster Management to administer clusters from the command prompt. You can also call Cluster.exe from command scripts to automate many cluster administration tasks.

cluster-aware application (n)~ An application that can run on a cluster node and that can be managed as a cluster resource. Cluster-aware applications use the Cluster API to receive status and notification information from the server cluster.

Cluster-Aware Updating (PN)~ A feature that automates the process of applying software updates to the nodes in a failover cluster. With Cluster-Aware Updating, a server

administrator can preview and apply updates to a cluster, create a profile that standardizes the way updates are applied, and view reports of past updating runs. Cluster-Aware Updating includes a graphical interface, Windows PowerShell cmdlets, and for extensibility, a custom plug-in API.

clustered bar chart (n)~ A bar chart subtype that compares values across categories.

clustered column chart (n)~ A column chart subtype that compares values across categories. The categories are organized horizontally, and values vertically, to emphasize variation over time.

clustered index (n)~ A B-tree-based index in which the logical order of the key values determines the physical order of the corresponding rows in a table.

clustered instance (n)~ A group of resources in a failover cluster that are handled as a unit of failover. When the resources fail over, they fail over together in a predefined way to another node in the cluster.

clustered mailbox server (n)~ A mailbox server that is installed in a Windows failover cluster. A clustered mailbox server is used in both cluster continuous replication (CCR) and single copy cluster (SCC) configurations. A clustered mailbox server was called an Exchange Virtual Server in previous versions of Exchange Server.

clustered role (n)~ A role configured within a cluster.

clustered server (n)~ A server that belongs to a server cluster.

clustering (n)~ The grouping of multiple servers in a way that allows them to appear to be a single unit to client computers on a network. Clustering is a means of increasing network capacity, providing live backup in case one of the servers fails, and improving data security.

clustering (n)~ A data mining technique that analyzes data to group records together according to their location within the multidimensional attribute space.

cluster-unaware application (n)~ An application that can run on a cluster node and be managed as a cluster resource but that does not support the Cluster API.

CLUT (n)~ When a graphic is created or edited, the user may specify a CLUT that corresponds with the needs of print, Web, or other destination media. In Web design, a specific CLUT of browser-safe colors is used to be certain graphics and designs will display consistently across different platforms and with different browsers.

Clutter (PN)~ The Outlook email filter that moves low priority messages out of the Inbox to the Clutter folder based on individual user preferences.

CM Client (n)~ A software program running on a client computer to assists in client-side, smart card management activities such as changing the personal identification number (PIN) on a smart card.

CMAK (n)~ A tool for creating, editing, and managing Connection Manager profiles. The Connection Manager is a client dialer.

cmdlet (n)~ A small, basic command, named in the form 'verb-noun' and implemented as a .Net class that derives from a base cmdlet class.

Cmdlet Logging Viewer (PN)~ A feature in Exchange Admin Center (EAC) that generates a dynamic log of commands made to a server at that given point of time. Administrators can view the log to check the UI behavior, analyze or troubleshoot commands, or even run custom scripts on a server.

CMOS (n)~ A semiconductor technology in which pairs of metal-oxide semiconductor field-effect transistors (MOFSETs), one N-type and one P-type, are integrated on a single silicon chip.

CMOS ~ (Complementary Metal Oxide Semiconductor; pr. 'see-moss') A special type of memory which retains its data when the PC is switched off, used to store settings for things like what type of hard disk you have, and how much memory. The settings are accessed via the- BIOS.

CMR file (PN)~ A data file of products, their descriptions and prices, and action codes that add, update, or delete product data in a vendor catalog.

CMYK (n)~ A color model for commercial printing that produces a wide range of colors by mixing varying percentages of cyan, magenta, yellow, and black inks.

CMYK ~ (Cyan, Magenta, Yellow, Keystone black)- The standard four colours used by most printers - almost any colour can be created out of these. See also- RGB.

CN (n)~ A naming attribute from which an object's distinguished name is formed. For most object classes, the naming attribute is the Common-Name. For example, a user object with its CN set to Jeff Smith' might have a distinguished name of 'CN=Jeff Smith

CNAME record (n)~ A type of resource record in the Domain Name System that associates a computer's true (canonical) name with any alias names also used by the computer. Some domain registrars use CNAME records to redirect or redelegate domain names.

CNG (n)~ A replacement of the CryptoAPI that enables support for Suite B cryptographic algorithms such as elliptic curve cryptography (ECC).

CNG provider (n)~ The cryptographic service provider that is used for Cryptography Next Generation (CNG).

CNPJ (n)~ A 14-digit identification number issued to Brazilian companies by the Brazilian Ministry of Revenue for tax purposes.

CNY (n)~ An official currency of the People's Republic of China.

COA (n)~ A label with sophisticated anti-counterfeiting features that helps the end user identify that the computer uses a validly licensed copy of Microsoft Windows. The product name and a unique product key appear in the center of the label. The OEM must physically attach the COA label to the computer chassis, and it should never be removed from the computer.

co-admin (n)~ A person added from within the Developer Portal by the Account Administrator or the Service Administrator who can login to the Azure Portal and manage accounts and determines security settings.

coalesce (v)~ To unite or merge into one.

COALESCE (PN)~ A function that returns the first non-null expression from a list of arguments.

coarse-grained lock (n)~ A lock that applies to a large amount of code or data.

coated paper (n)~ Paper that has clay or other coating applied to one or both sides.

co-authoring (n)~ A process by which multiple authors edit a shared document simultaneously, or collaborate effectively even when they are not online at the same time.

coaxial cable (n)~ A round, flexible, two-conductor cable consisting of - from the center outwards - a copper wire, a layer of protective insulation, a braided metal mesh sleeve,

and an outer shield, or jacket of PVC or fire-resistant material. The shield prevents signals transmitted on the center wire from affecting nearby components and prevents external interference from affecting the signal carried on the center wire. Coaxial cable is widely used in networks. It is the same type of wiring as that used for cable television.

COB (n)~ A manufacturing technology that mounts an integrated circuit die directly to a circuit board. The die is electrically connected to the circuit board using wire bonding, and is then covered with a protective epoxy cover.

Co-Branding (PN)~ The option in the Campaign Types list that indicates that the marketing effort or promotion will be shared with another company.

co-branding (n)~ The process of customizing the look and feel of a product to support marketing or promotion of another company.

cockpit (n)~ A tool used to view and manage certain types of computer jobs, such as data upgrade jobs during an upgrade to a new version of the program.

coclass (n)~ A keyword that is used to describe a class.

coclass wrapper class (n)~ A flattening of all of the methods of all of the interfaces (including eventing interfaces) implemented by a given COM object.

COD (oth)~ A payment policy that requires payment in full for product upon delivery.

COD (n)~ A method of payment by which a customer pays the freight carrier for goods when they are delivered. The freight carrier then remits the payment to the shipper.

COD outstanding (oth)~ Undelivered and unpaid cash-on-delivery transaction.

CODA (PN)~ A format for reports from the electronic banking system that is used in Belgium.

code (v)~ To write program instructions in a programming language.

code (n)~ Program instructions.

Code (PN)~ A free code editor and cross-platform development tool in the Visual Studio family supporting OSX, Linux, and Windows, redefined and optimized for building and debugging modern web and cloud applications.

Code 39 (PN)~ A barcode symbology standard maintained by American National Standards Institute (ANSI).

code access security (n)~ A mechanism provided by the common language runtime whereby managed code is granted permissions by security policy and these permissions are enforced, helping to limit the operations that the code will be allowed to perform.

code access security (CAS) policy (n)~ A set of rules that defines security permissions for a collection of assemblies by associating attributes of those assemblies, such as location and signature, with a set of code access security permissions.

code analysis (n)~ The process of checking code for conformance to design guidelines. Code analysis goes beyond compilation to look for common coding and design errors determined by a set of guidelines.

code comment Web report (n)~ Web pages that enable you to browse the code structure within files in your current project or solution, such as objects and interfaces defined in a project.

code complete (n)~ A development milestone marking the point at which all features for the release are implemented and functionality has been verified against the functional specification.

code coverage (n)~ A technology that includes adding instructions to an existing assembly or artifact and that enables Visual Studio to monitor the code paths that are touched by a test.

code coverage (n)~ A metric used to describe the degree to which the source code of a program has been tested. Code coverage is expressed as a percentage of the blocks of code tested over the total blocks of code.

Code Definition window (n)~ A read-only editor view that displays the definition of a symbol in a code file stored in, or referenced by, the active project.

Code Document Object Model (PN)~ A mechanism that enables developers of programs that emit source code to generate source code in multiple programming languages at run time, based on a single model that represents the code to render.

code element (n)~ The minimum bit combination that can represent a unit of encoded text for processing or exchange.

code example (n)~ A block of sample code in documentation that is used to demonstrate a concept or process.

Code First (PN)~ A set of features in the Entity Framework that enables you to define a model by first creating an object model in code.

Code First Migrations (PN)~ A feature that allows a database created by Code First to be incrementally changed as a developer's Code First model evolves.

code freeze (n)~ A point at which a technical project document (requirements specification, functional specification, etc.) or developed component of the solution cannot change without significant justification and approval by key project stakeholders.

code group (n)~ A logical grouping of code that has a specified condition for membership.

code library (n)~ In programming, a collection of routines stored in a file. Each set of instructions in a library has a name, and each performs a different task.

code list (n)~ A set of abbreviation/explanation pairs that are used as a design-time aid to providing sets of XML Schema Definition language (XSD) enumeration values.

code mask (n)~ The format that you define for a work breakdown structure [WBS] code or a custom outline code. The mask specifies the sequence and number of letters or numbers required for each level and the symbol separating the levels.

code metric (n)~ A software measure that provides developers better insight into the code they are developing. By taking advantage of code metrics, developers can understand which types and/or methods should be reworked or more thoroughly tested. Development teams can identify potential risks, understand the current state of a project, and track progress during software development.

Code Metrics Powertool for Visual Studio 2013 (n)~ Command line utility for Visual Studio 2013, which calculates code metrics for your managed code and saves them to an XML file. This tool enables teams to collect and report code metrics as part of their build process.

code of conduct (n)~ Rules that explain how someone should behave while using a service or product.

Code of Conduct (PN)~ The link to the code of conduct, which contains rules that explain how someone should behave while using a service or product.

code package (n)~ The collection of service packages and the configuration file combined as an atomic unit of deployment for an application.

code page (n)~ A table that relates the character codes (code point values) used by a program to keys on the keyboard or to characters on the display. This provides support for character sets and keyboard layouts for different countries or regions.

code pane (n)~ In Visual Basic for Applications, the window that is used to display, edit, and write module-level and procedure code.

code point (n)~ The minimum bit combination that can represent a unit of encoded text for processing or exchange.

code point (n)~ A numeric value that corresponds to a particular character in a set.

code profiler (n)~ A software tool, implemented as a DLL, which is called by the runtime system during the execution of an image.

code review (n)~ The process of assessing code to improve its quality and the capabilities of the development team. Types of code review include formal review, peer-based review, and third-party review.

code sample (n)~ A set of program instructions that are provided as an example, typically for learning and re-use.

code signing (n)~ The process of adding a digital signature to additions and updates made to source code and applications published on the Internet. Code signing is intended to provide a level of security and trust to Internet software distribution.

code snippet (n)~ In a graphical user interface, programming instructions embedded in a menu option or button defined by the user. The snippet—consisting of one or more lines of source code—determines what the option or button does when chosen or clicked.

code snippet (n)~ A small piece of programming code that is part of a larger program. Usually the code snippet performs a specific function or task.

code snippet (n)~ One or more lines of HTML or other code that you can save and reuse.

code stub (n)~ A segment of Visual Basic code that defines the beginning and end of a procedure.

code value (n)~ An abbreviation used to represent textual information for properties such as country/region, state/province, and order status.

Code view (n)~ A window that shows the code that comprises a web page.

code-behind (n)~ For ASP.NET pages and XAML-based applications, code that is contained within a separate file, allowing for the separation of markup (for example, markup contained in an HTML or XAML file) from behavior that is implemented in code.

code-behind class (n)~ A class that is accessed by an .aspx file, but resides in a separate file (such as a .dll or .cs file). For example, you can write a code-behind class that creates an ASP.NET custom server control, contains code that is called from an .aspx file, but does not reside within the .aspx file.

code-behind file (n)~ A code file containing the page class that implements the program logic of a Web Forms or ASP.NET mobile Web Forms application.

code-behind page (n)~ A code file containing the page class that implements the program logic of a Web Forms or ASP.NET mobile Web Forms application.

codec (n)~ Software that is used to compress or decompress a digital media file.

codec ~ (COmpressor/DECompressor)- A small piece of computer code that tells the

computer how to decode particular types of information, usually video files. If your video player won't play a particular format, you can usually download and install a codec which will tell it how from the internet.

coded UI test (n)~ An automated test of the user interface of an application. A coded UI test exercises user actions and validates the expected results.

coded Web test (n)~ A type of test that is typically created by converting an existing recorded Web test into C# or Visual Basic code.

CodeDOM (PN)~ A mechanism that enables developers of programs that emit source code to generate source code in multiple programming languages at run time, based on a single model that represents the code to render.

CodeLens (PN)~ A feature of Visual Studio 2013 previously known as Code Information Indicators to show information about the code such as method references, tests associated with a method, the last time a line of code was changed or how many times the code has been changeddirectly in the code editor.

coefficient of determination (n)~ A number from 0 to 1 that reveals how closely the estimated values for the trendline correspond to your actual data. A trendline is most reliable when its R-squared value is at or near 1.

coercion (n)~ A programmer-specified data conversion from one type to another, such as a conversion from integer to floating point.

COFF (n)~ A format in 32-bit programming for executable (image) and object files that is portable across platforms. The Microsoft implementation is called portable executable (PE) file format.

cofunctional mode set (n)~ The set of modes that are available for a particular source or target, given the constraints (for example, topology, modes pinned on other sources and targets) of a VidPN.

cofunctional VidPN modality (n)~ The collection of cofunctional mode sets for all the sources and targets in the topology of a VidPN.

COGS (n)~ An accounting category used to sum the financial consequences of manufacturing products and carrying inventory.

Cold (adj)~ An option on the Ratings drop-down list on the General tab that indicates that the interest of a lead or opportunity is weak.

cold (adj)~ Pertaining to the lowest rating of perceived interest that an account, opportunity, or lead has in a product or service.

cold boot (n)~ A startup process that begins with turning on the computer's power. Typically, a cold boot involves some basic hardware checking by the system, after which the operating system is loaded from disk into memory.

cold latency (n)~ The time that elapses when the workflow is being used for the first time and the XOML or XAML needs to be compiled.

cold link (n)~ A link established upon a request for data. Once the request is filled, the link is broken. The next time data is required, a link from the client to the server must be reestablished. In a client/server architecture, cold links are useful when the linked item consists of a large amount of data. Dynamic Data Exchange (DDE), used in applications such as Microsoft Excel, uses cold links for data exchange.

cold standby (n)~ A second data center that can provide availability within hours or days.

cold start (n)~ A startup process that begins with turning on the computer's power. Typically, a cold boot involves some basic hardware checking by the system, after which the operating system is loaded from disk into memory.

collaborate (v)~ To work with other people to update or interact with content.

Collaborate On (PN)~ The framework that automatically provisions SharePoint sites that are associated with business data entities. The site template used for a particular business entity type can be configured on the BDC model using business data actions.

collaboration (n)~ A collection of modeling elements that interact within a given context to perform an operation or a use case. The objects in a collaboration are roles describing types of objects rather than representations of the objects themselves.

Collaboration (PN)~ The Business subcategory containing apps to help people to collaborate on work via the Internet.

Collaboration Data Objects (n)~ An application programming interface (API) that allows users and applications high-level access to data objects in Exchange. CDO defines the concept of different object classes, including messages, posts, appointments, and tasks.

collaboration diagram (n)~ An interaction diagram that shows, for one system event described by one use case, how a group of objects collaborate with one another.

collaboration service provider (n)~ A company which provides online collaboration services (sharepoint sites, message boards, etc.) to businesses or organizations.

collaborative slide (n)~ A slide on which all meeting participants can make freehand notes and drawings, type text, conduct polls, show screen shots, or display Web pages.

collapse (v)~ To reduce the amount of information displayed by hiding from view the subentries within a folder, section or conversation, or a portion of text or other content within a control.

collapsed backbone (n)~ The wires that carry major communications traffic within a network. In a local area network, a backbone may be a bus.

collation (n)~ A set of rules that determines how data is compared, ordered, and presented.

collation sequence (n)~ The ordering relationship (sequence) among objects that is to be established by a collating sort.

Colleagues (PN)~ A privacy relationship setting that allows a medium amount of information to be viewed, typically for people in your company and for people outside your company who work with you.

Collect Data Through E-mail (oth)~ A feature that allows an end-user to collect data via E-mail using Access, Outlook, and InfoPath.

Collect On Delivery (n)~ A method of payment by which a customer pays the freight carrier for goods when they are delivered. The freight carrier then remits the payment to the shipper.

collected file (n)~ Any file that is copied from SMS/Configuration Manager clients during software inventory. After the files are collected from clients, they are stored on the site server.

collectible assembly (n)~ A transient dynamic assembly that you generate at run time by using the classes in the System.Reflection.Emit namespace, subject to certain restrictions. When you have released all references to all instances of the types in the collectible

assembly and to all objects that were used to create the assembly, the common language runtime unloads the assembly from memory without unloading the application domain. This is the only circumstance in which an assembly can be unloaded without unloading the application domain.

collection (n)~ An object that contains a set of related objects. An object's position in the collection can change whenever a change occurs in the collection; therefore, the position of any specific object in a collection may vary.

collection (n)~ A container for organizing clips.

collection (n)~ A set of resources in the Configuration Manager hierarchy.

collection (n)~ A type of specialized class in the .NET Framework for data storage and retrieval. These classes provide support for stacks, queues, lists, and hash tables. Most collection classes implement the same interfaces, and these interfaces may be inherited to create new collection classes that fit more specialized data storage needs.

collection (n)~ An export format that maintains a group of images that is generated at export.

collection (n)~ A customer's assemblage of digital media, including music, videos, pictures, games, and apps.

collection (n)~ Automatic grouping of user's photos and videos based on time and place.

Collection (n)~ A set of thematically related apps, games, music tracks, videos, or other items available for purchase or download in the Store. A thematic group of editorially chosen apps and games for merchandising or marketing purposes.

collection editor (n)~ A nested dialog box that enables you to modify properties that are set on items in a collection.

Collection Evaluator (PN)~ A component that, after receiving a file change notification from SQL Monitor, assigns resources to collections according to the most recent data about the resources.

collection expenses fee (n)~ A fee that is charged to a customer for the collection of a bill of exchange remittance.

collection initializer (n)~ A sequence of object initializers that are assigned to the collection elements in the same statement in which the collection is constructed.

collection interface (n)~ The interface of a collection object.

collection item (n)~ An instance of a collector type that is created with a specific set of input properties and collection frequency, and that is used to gather specific types of data.

collection item (n)~ An item in a collection.

collection letter (n)~ Correspondence sent to a debtor requesting payment for a past due account.

collection letter fee (n)~ A fee that is attached to a collection letter and charged to the delinquent debtor.

collection limiting (n)~ Restricting the scope of a query. A query that is collection limited can return only resources that are in a specified collection, even if other resources in the SMS/Configuration Manager site database match the query criteria.

collection mode (n)~ The frequency at which data is collected and uploaded to the management data warehouse.

collection probe (n)~ A function that collects timing and other performance data in an

instrumented module.

collection set (n)~ A group of collection items with which a user can interact through the user interface.

collection-limited query (n)~ A query that is scoped to include only resources that are in a specified collection.

Collections (PN)~ The section of the Store that contains a selection of products presented to the customer in a group. The products may be purchased individually.

collections agent (n)~ A person who works with customers to ensure that payments are collected in a timely manner.

collector type (n)~ A logical wrapper around the SQL Server Integration Services packages that provide the actual mechanism for collecting data and uploading it to the management data warehouse.

collocate (v)~ To select a partitioned table that contains related data and join with this table on the partitioning column.

collocation (n)~ A condition whereby partitioned tables and indexes are partitioned according to equivalent partition functions.

Color average tool (n)~ Tool that is used by dragging the eyedropper tool across a selection of graphics or various solid colors on a web page and thereby determining the average color spectrum.

color balance (n)~ A feature that lets the user change the overall color and tonal values of an image or object through three parameters: source lighting, saturation, and color balance.

color boost (n)~ A feature that allows the user to select a color and increase or decrease the vibrancy of that color in an image.

color box (n)~ A set of color choices located in a workpane.

color burn (PN)~ A blending mode where the background colors are darkened based on the foreground colors. A black foreground color will result in black, while a white foreground color will have no effect.

color cast (n)~ A predominance of a color in a picture that causes the rest of the colors to look inaccurate.

Color Cast (PN)~ A filter that removes the color cast from a photo.

color category (n)~ A keyword or phrase with an associated color that helps you keep track of items, such as messages, contacts, and appointments. You can use color categories to easily find, sort, filter, or group items.

color channel (n)~ An image of the same size as a color image (such as a pixel) in a primary color (typically red, green, blue).

color context (n)~ An abstraction for a color profile.

color depth (n)~ The number of color values that can be assigned to a single pixel in an image. Color depth can range from 1 bit (black and white) to 32 bits (over 16.7 million colors).

color dodge (PN)~ A blending mode in which the color channels of the background color are brightened based on the color channels in the foreground color. If the foreground color is black, then it has no effect. Anything brighter than black dodges' or 'lightens' the background.'

Color Dropper (PN)~ A tool that lets you copy the screen color from one object to another.

color editor (n)~ An interface control for setting the color of a brush or the color of a property on an object (such as Background).

color gamut (n)~ The particular range of colors that a device or color model is able to produce.

color index (n)~ An index mode that specifies colors as indexes into a palette instead of as levels of red, green, and blue.

color interpolation (n)~ The specification of gradations between pairs of colors.

color key (n)~ A color used for transparent or translucent effects. An overlay surface is displayed in the region of the primary surface that contains the color key. In video production, color keys are used to combine two video signals.

color key transparency (n)~ A method for blending texture maps so that parts appear transparent. Color key transparency accomplishes this by defining a single color as transparent.

color level (n)~ The intensity value of a color in an image.

color look-up table (n)~ When a graphic is created or edited, the user may specify a CLUT that corresponds with the needs of print, Web, or other destination media. In Web design, a specific CLUT of browser-safe colors is used to be certain graphics and designs will display consistently across different platforms and with different browsers.

color map (n)~ When a graphic is created or edited, the user may specify a CLUT that corresponds with the needs of print, Web, or other destination media. In Web design, a specific CLUT of browser-safe colors is used to be certain graphics and designs will display consistently across different platforms and with different browsers.

color menu button (n)~ A button that drops down to expose a color palette when a user clicks it.

color monitor (n)~ A monitor designed to work with a video card or adapter to produce text or graphics images in color.

color palette (n)~ An array that contains color values identifying the colors that can currently be displayed or drawn on the output device.

color picker (n)~ An interface control for setting the color of a brush or the color of a property on an object (such as Background).

color printer (n)~ A computer printer that can print full-color output. Most color printers can also produce black-and-white output.

color profile (n)~ A profile that contains the data needed for translating the values of a color gamut. This data includes information about color, hue, saturation, and brightness.

color ramp (n)~ A range of colors in which each color gradually blends into the next one. For example, a blue ramp gradually blends hues of blue from pure black to pure blue.

color range (n)~ The range of colors available to a display device.

color rule (n)~ A rule that applies to fill colors for polygons, lines, and markers that represent points or polygon center points.

color scale (n)~ A scale that displays the results of color rules only.

color scheme (n)~ A predefined set of harmonized colors that you can apply to text and objects. Text and objects with an applied scheme color will change automatically when

you switch to a new color scheme or modify the current color scheme.

color separation (n)~ A decomposed layer of a full-color image used in printing. Typical printing processes use four color separations (cyan, magenta, yellow, and black) which combine together to produce the final image.

color separation (n)~ The process of printing the colors in a document as separate output files, each of which is to be printed using a different-colored ink. There are two types of color separation: spot color separation and process color separation.

color space (n)~ The three-dimensional space that is defined by a set of coordinates for representing color on devices such as monitors, scanners, and printers. For example, in the LAB color space, the colors are defined in terms of their luminance or whiteness (L), redness-greenness (A), and yellowness-blueness (B); the HVC system uses hue (H), value (V), and chroma (C). The two most common color space models are RGB and YUV.

color space conversion (n)~ A technique for converting a color in one color space to another color space. Typically, this conversion is from YUV colors from a video source to RGB for display.

color space model (n)~ The three-dimensional space that is defined by a set of coordinates for representing color on devices such as monitors, scanners, and printers. For example, in the LAB color space, the colors are defined in terms of their luminance or whiteness (L), redness-greenness (A), and yellowness-blueness (B); the HVC system uses hue (H), value (V), and chroma (C). The two most common color space models are RGB and YUV.

color spectrum (n)~ Colors, as people see them, range from violet at the high-frequency end of the visible-light band to red at the low-frequency end. In PhotoDraw, the True Color spectrum is represented as a color matrix.

color table (n)~ When a graphic is created or edited, the user may specify a CLUT that corresponds with the needs of print, Web, or other destination media. In Web design, a specific CLUT of browser-safe colors is used to be certain graphics and designs will display consistently across different platforms and with different browsers.

color transform (n)~ A resource that changes a color space by representing the color as a five-dimensional vector, where the first four values are the red, green, blue, and alpha channels of the color and the last value is 1, and multiplying it by a 5x5 matrix that represents the color transformation. The resulting five-dimensional vector contains the representation of the new color.

color wheel (n)~ A feature that allows the user to select a group of colors that compliment each other well, by making one click on the wheel.

color-coded (adj)~ Classified or identified according to color.

color-space conversion (n)~ A technique for converting a color in one color space to another color space. Typically, this conversion is from YUV colors from a video source to RGB for display.

column (n)~ A series of items arranged vertically within some type of framework—for example, a continuous series of cells running from top to bottom in a spreadsheet, a set of lines of specified width on a printed page, a vertical line of pixels on a video screen, or a set of values aligned vertically in a table or matrix.

column (n)~ The area in each row of a database table that stores the data value for some

attribute of the object modeled by the table.

column area (n)~ The part of PivotTable view that contains column fields.

column binding (n)~ The binding of an Analysis Services object to a column in a data source view.

column break (n)~ A special symbol that breaks a column when inserted into a document. It ends the current column and starts the next column.

column building block (n)~ A worksheet template that contains headings for report columns as well as codes to define the type of information in a column, such as reporting periods and calculations. One of the three Management Reporter building blocks.

column chart (n)~ A graph that uses vertical bars to show data changes over a period of time or illustrate comparisons among items.

column definition (n)~ A worksheet template that contains headings for report columns as well as codes to define the type of information in a column, such as reporting periods and calculations. One of the three Management Reporter building blocks.

column delimiter (n)~ A character which separates columns from each other in the CSV file being imported/exported.

column field (n)~ A field that's assigned a column orientation in a PivotTable report. Items associated with a column field are displayed as column labels.

column filter (n)~ A filter that restricts columns that are to be included as part of a snapshot, transactional, or merge publication.

column graph (n)~ A graph that uses vertical bars to show data changes over a period of time or illustrate comparisons among items.

column guide (n)~ A vertical layout guide that is used to divide a publication page into two or more columns.

column heading (n)~ A standard Windows control that can be used to provide interactive column titles for a list.

Column Labels (PN)~ An area in the layout section of a PivotTable field list to which fields can be added in order to display fields as columns at the top of the report.

Column Options (n)~ A dialog for specifying columns and sort order to display in a result list.

column ordinal (n)~ A number that represents the position of the column in a set of columns. So, if a table has 3 columns, named Name, Address, and Zip, in that order, their ordinals are 0, 1, and 2.

Column Pattern Profile (PN)~ A report containing a set of regular expressions that cover the specified percentage of values in a string column.

column restriction (n)~ A code in a column definition that restricts or suppresses the data in a column, such as row formatting, details, and amounts.

column selector (n)~ The horizontal bar at the top of a column. You can click a column selector to select an entire column in the query design grid or the filter design grid.

column set (n)~ An untyped XML representation that combines all the sparse columns of a table into a structured output.

column type (n)~ A value in a column definition that identifies the type of information that is displayed in that column, such as descriptive text, a calculation, financial dimensions, or an accounting attribute.

column worksheet (n)~ A worksheet template that contains headings for report columns as well as codes to define the type of information in a column, such as reporting periods and calculations. One of the three Management Reporter building blocks.

column-level collation (n)~ Supporting multiple collations in a single instance.

column-level constraint (n)~ A constraint definition that is specified within a column definition when a table is created or altered.

Columns Grid (PN)~ An editable grid structure in the Table Designer that lists the columns of a table and additional information about each column.

columnstore index (n)~ Stores each column in a separate set of disk pages rather than storing multiple rows per page.

COM (n)~ An object-based programming model designed to promote software interoperability; it allows two or more applications or components to easily cooperate with one another, even if they were written by different vendors, at different times, in different programming languages, or if they are running on different computers running different operating systems.

COM add-in (n)~ A supplemental program with the filename extension .dll or .exe that extends the capabilities of a program by adding custom commands and specialized features.

COM callable wrapper (n)~ A proxy object generated by the common language runtime so that existing COM applications can use managed classes, including .NET Framework classes, transparently.

COM class (n)~ A concrete implementation of one or more COM interfaces. COM objects are instances of COM classes.

COM interop (n)~ A service that enables .NET Framework objects to communicate with COM objects.

COM object (n)~ An instance of a COM class.

COM port (n)~ A serial communications port used to connect a device, such as a modem, printer, or mobile device, to a computer.

COM+ (n)~ An extension of the COM (Component Object Model) programming architecture that includes a run-time or execution environment and extensible services, including transaction services, security, load balancing, and automatic memory management.

combination chart (n)~ A chart that uses two or more chart types to emphasize that the chart contains different kinds of information, often with different y axes.

combination class (n)~ A feature in Service Manager that is used mostly in reports and in views to display information from multiple classes that are defined in Service Manager.

combination view (n)~ A view containing two views. The bottom pane view shows detailed information about the tasks or resources in the top pane view. For example, the Gantt Chart view could be in the top pane and the Task Form view in the bottom pane.

combinator (n)~ A method used to map a source image to a target image. This method uses the weighted average of the four nearest source pixels to define a target pixel.

combine (v)~ To join two or more paths in various ways depending on the combine option chosen.

combine (v)~ To group together multiple windows of the same application under a single

button on the taskbar's taskband.

combined worksheet link (n)~ A worksheet link that combines references to cells in an external worksheet file into the same link column that is used in a report to link to accounts or dimensions.

combining character (n)~ A character, such as diacritic, that has no meaning by itself, but overlaps a base character to modify it.

combo box (n)~ A standard Windows control that combines text box and list box functions.

combo box control (n)~ A standard Windows control that combines text box and list box functions.

combo chart (n)~ A chart that uses two or more chart types to emphasize that the chart contains different kinds of information, often with different y axes.

Comedy (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 57.

Comfy Cakes (n)~ A game that is part of the Purble Place game that allows the player to make a cake.

Comic Mischief (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Coming soon (PN)~ The collection title for items that will be in the store shortly.

comma (n)~ The , character.

comma delimited file (n)~ A data file consisting of fields and records, stored as text, in which the fields are separated from each other by commas.

comma-delimited file (n)~ A data file consisting of fields and records, stored as text, in which the fields are separated from each other by commas.

command (n)~ An instruction to a computer program that, when issued by the user, causes an action to be carried out. Commands are usually either typed at the keyboard or chosen from a menu.

command (n)~ An instruction sent via mobile phone to perform a certain action on Windows Live, such as updating a status message, or to retrieve information, such as a list of the day's events).

command bar control (n)~ A built-in or custom control on a menu bar, toolbar, menu, submenu, or shortcut menu. Custom controls you can add to command bars include buttons, edit boxes, drop-down list boxes, and pop-up controls, which display a menu or submenu.

command buffer (n)~ An area in memory in which commands entered by the user are kept. A command buffer can enable the user to repeat commands without retyping them completely, edit past commands to change some argument or correct a mistake, undo commands, or obtain a list of past commands.

command button (n)~ A standard system control that initiates a command.

command holder (n)~ A logical container for registered Visual Studio commands on toolbars and in context menus.

command language (n)~ The set of keywords and expressions that are accepted as valid by the command interpreter.

command line (n)~ A string of text written in the command language and passed to the command interpreter for execution.

command line deployment tool (n)~ A tool used to add, remove, import and export assemblies, import and export bindings, and install or uninstall assemblies from the global assembly cache (GAC).

command line interface (n)~ A form of interface between the operating system and the user in which the user types commands, using a special command language. Although systems with command-line interfaces are usually considered more difficult to learn and use than those with graphical interfaces, command-based systems are usually programmable; this gives them flexibility unavailable in graphics-based systems that do not have a programming interface.

command notification (n)~ A notification channel that allows the user or administrator to run an executable program automatically in response to an alert.

command prompt (n)~ An interface between the operating system and the user in which the user types command language strings of text that are passed to the command interpreter for execution.

command prompt window (n)~ A window that mimics an old MS-DOS display for typing command-line instructions.

command relationship (n)~ Provides instructions to hardware based on natural-language questions or commands.

command timeout (n)~ The amount of time allotted for executing a command against the database, which when reached causes an error message to be generated and displayed in the Web browser.

Command window (n)~ A window that is used to execute commands or aliases directly in the Visual Studio integrated development environment (IDE). You can execute both menu commands and commands that do not appear on any menu.

command-line interface (n)~ A form of interface between the operating system and the user in which the user types commands, using a special command language. Although systems with command-line interfaces are usually considered more difficult to learn and use than those with graphical interfaces, command-based systems are usually programmable; this gives them flexibility unavailable in graphics-based systems that do not have a programming interface.

command-line program (n)~ A program that runs from the command line.

command-line tool (n)~ A program that runs from the command line.

comma-separated file (n)~ A data file consisting of fields and records, stored as text, in which the fields are separated from each other by commas.

comma-separated value file (n)~ A data file consisting of fields and records, stored as text, in which the fields are separated from each other by commas.

comma-separated values file (n)~ A data file consisting of fields and records, stored as text, in which the fields are separated from each other by commas.

comment (n)~ Text embedded in a program for documentation purposes. Most programming languages have a syntax for creating comments so that they can be recognized and ignored by the compiler or assembler.

comment (n)~ A note or annotation that an author or reviewer adds to a document.

comment (n)~ A contribution or feedback left by someone viewing content on a site. Someone who views a space, photos, or files can leave a comment, if permissions allow it.

comment block (n)~ A specifically formatted chunk of textual information on a piece of code.

comment hint (n)~ A visual indicator that denotes the presence of a comment and opens the comment when clicked.

comment mark (n)~ A mark inserted in a document to show where a comment has been added.

Comments (PN)~ A field in a Business Contact Manager for Outlook record that enables the user to write notes about the Account, Business Contact, Opportunity, or Business Project.

Comments pane (PN)~ A pane beside the document that displays all comments made in the document.

Commerce application (n)~ A Commerce Server application is a logical representation of an application in Microsoft Internet Information Services (IIS); it appears in both Commerce Server Manager and the IIS console trees. In the IIS console tree an application is either at the root directory level of the Web site or at a subdirectory level of the Web site.

Commerce Module (n)~ An extension to the ASP.NET HTTP module framework. Commerce Modules are responsible for initializing run-time services specific to .NET-based Commerce Server applications. Commerce Modules are derived from the Microsoft.CommerceServer.Runtime.CommerceModule base class. A Commerce Module is an HTTP module.

Commerce Server application (n)~ A Commerce Server application is a logical representation of an application in Microsoft Internet Information Services (IIS); it appears in both Commerce Server Manager and the IIS console trees. In the IIS console tree an application is either at the root directory level of the Web site or at a subdirectory level of the Web site.

Commerce Server Class Library (n)~ A collection of classes, interfaces, and value types that are included in the Commerce Server .NET Application Framework. This library provides access to run-time Commerce Server functionality and is designed to be the foundation on which .NET-based Commerce Server applications, components, and controls are built.

Commerce Server Configuration Wizard (n)~ The Commerce Server wizard used to configure Commerce Server security, such as assigning domain user accounts and their corresponding passwords for Commerce Server services, and for configuring the Administration and Direct Mailer databases.

Commerce Server Direct Mailer (n)~ A Commerce Server global resource that sends personalized e-mail messages from a Web page, or non-personalized mailings from a flat text file, to large groups of recipients. It processes lists of recipients, constructs personalized message bodies from either Web pages or static files, and sends the mail message to the recipients. Use Commerce Server Manager to configure and manage Direct Mailer, and to specify the database connection string to the Direct Mailer database.

Commerce Server Manager (n)~ A system administration tool that you use to manage

and configure Commerce Server resources, sites, applications, and Web servers. Commerce Server Setup installs it automatically when you perform a Web Server or Complete installation, or when you select the Administration Tools feature during a Custom installation. The Microsoft Management Console (MMC) hosts Commerce Server Manager.

Commerce Server site (n)~ A collection of site resources and ASP or ASP.NET-based applications that use these resources through the Commerce Server object model. With a Commerce Server site, you can administer the applications in the site as a group.

Commerce Server Starter Site (n)~ A set of Commerce Server features that are pre-configured and bundled into a package file. The package file is designed to be unpacked and then customized to meet the needs of your organization

commercial @ (n)~ The separator between account names and domain names in Internet e-mail addresses.

COMMERCIAL AT (n)~ The separator between account names and domain names in Internet e-mail addresses.

commercial press (n)~ A high volume printing machine capable of creating full-colour publications or other printed pieces.

commercial printing (n)~ The process of producing copies of documents, publications, or images in high volume.

commercial unit (n)~ A Surface unit that is optimized to use in a user environment (or venue). A commercial unit does not include the software that is required to develop applications by using the Surface SDK, such as Microsoft Visual C# 2008 Express Edition.

commission (n)~ The amount, usually a percentage of the sales amount, paid to the salesperson making the sale.

commission offset (n)~ An interim method of recording commission until payment for the sale is actually collected and paid to the salesperson.

commit (n)~ An operation that saves all changes to databases, cubes, or dimensions made since the start of a transaction.

Commit Preview (PN)~ The title of a window that displays actions to be taken during the commit operation.

commitment (n)~ The memory manager's current systemwide total of memory pages that have been committed to either physical memory or a page file.

commitment (n)~ A promise or obligation to perform an activity in the future.

commitment accounting (n)~ A practice of recording the financial consequences of budget fund reservation accounting events in pre-encumbrance and encumbrance journal accounts for financial and management reporting and analysis.

committed budget (n)~ The amount of money allocated for a certain project or resource.

committed cost (n)~ A commitment made by a legal entity to incur a cost when a future obligation comes due.

committed memory (n)~ The number of bytes that have been allocated by processes, and to which the operating system has committed a RAM page frame or a page slot in the page file (or both).

committed resource (n)~ A resource that is formally allocated to any task assignments

they have within a project.

commodity (n)~ Interchangeable products with no physical differentiation that are supplied by multiple vendors.

commodity channel index formula (n)~ A formula that calculates the mean deviation of the daily average price of a commodity from the moving average. A value above 100 indicates that the commodity is overbought, and a value below -100 indicates that the commodity is oversold.

commodity code hierarchy (n)~ A category hierarchy that orders categories that are created from commodity codes.

commodity pricing (n)~ A pricing strategy for updating the price of sales items produced from commodities subject to frequent price changes.

common gateway interface (n)~ A server-side interface for initiating software services. For example, a set of interfaces that describe how a Web server communicates with software on the same computer. Any software can be a CGI program if it handles input and output according to the CGI standard.

common groups (n)~ Groups that appear in the program list on the Start menu for all users who log on to the computer. Only administrators can create or change common groups.

Common Information Model (n)~ The model that describes how to represent real-world managed objects. CIM uses an object-oriented paradigm, where managed objects are modeled using the concepts of classes and instances. The CIM is divided into the metamodel and the standard schema. The metamodel describes what types of entities make up the schema. It also defines how these entities can be combined into objects that represent real-world devices.

Common Intermediate Format (n)~ A video format that has 352 pixels by 288 lines and 30 fps.

Common Intermediate Language (n)~ A language used as the output of a number of compilers and as the input to a just-in-time (JIT) compiler. The common language runtime includes a JIT compiler for converting the language to native code.

Common Labels (n)~ A label for the frequently-used labels that users assign to their photos. This appears in the Library Preview Pane when multiple photos are selected.

Common Language Infrastructure (n)~ A specification describing how applications written in multiple high-level languages may be executed in different system environments without the need to rewrite the applications to take into consideration the unique characteristics of those environments.

common language runtime (n)~ The engine at the core of managed code execution. The runtime supplies managed code with services such as cross-language integration, code access security, object lifetime management, and debugging and profiling support.

common language runtime host (n)~ An unmanaged application that uses a set of APIs, called the hosting interfaces, to integrate managed code into the application. Common language runtime hosts often require a high degree of customization over the runtime that is loaded into the process.

Common Language Runtime support (n)~ The engine at the core of managed code execution. The runtime supplies managed code with services such as cross-language

integration, code access security, object lifetime management, and debugging and profiling support.

Common Language Specification (n)~ A subset of language features supported by the common language runtime, including features common to several object-oriented programming languages. CLS-compliant components and tools are guaranteed to interoperate with other CLS-compliant components and tools.

Common Log File System (PN)~ A general-purpose logging service that can be used by software clients running in user-mode or kernel-mode.

common model (n)~ The second layer of the CIM schema, which includes a series of domain-specific but platform-independent classes. The domains are systems, networks, applications, and other management-related data. The common model is derived from the core model.

common name (n)~ A naming attribute from which an object's distinguished name is formed. For most object classes, the naming attribute is the Common-Name. For example, a user object with its CN set to Jeff Smith' might have a distinguished name of 'CN=Jeff Smith

common object file format (n)~ A format in 32-bit programming for executable (image) and object files that is portable across platforms. The Microsoft implementation is called portable executable (PE) file format.

common parameter (n)~ A parameter that is added to all cmdlets and advanced functions by the Windows PowerShell engine.

Common RSS Data Store (n)~ A common data store which provides a single location where applications can access content that has been downloaded to the PC via RSS, including text, pictures, audio, calendar events, documents and just about anything else. All applications will have access to this content for creating rich user experiences.

Common RSS Feed List (n)~ A feature of Windows which maintains a common list of the user's subscriptions across all applications. This allows the user to subscribe to a feed once and have all RSS-enabled applications able to access the common list to view the subscriptions.

common script (n)~ In database unit testing, one of the following scripts: TestInitialize or TestCleanup.

Common Structure Services (PN)~ The mechanism in Team Foundation for describing a feature hierarchy.

Common Table Expression (PN)~ A temporary result set that is defined within the execution scope of a single SELECT, INSERT, UPDATE, DELETE, or CREATE VIEW statement, similar to a derived table in that it is not stored as an object and lasts only for the duration of the query but different from a derived table, as possibly being self-referencing and referenced multiple times in the same query.

common type system (n)~ The specification that determines how the common language runtime defines, uses, and manages types.

communicates relationship (n)~ In a use case diagram, a relationship that defines how an actor participates in a use case. You can add an arrow to the relationship to indicate the direction the information flows.

communication channel (n)~ A medium for transferring information. Depending on its

type, a communications channel can carry information (data, sound, and/or video) in either analog or digital form. A communications channel can be a physical link, such as the cable connecting two stations in a network, or it can consist of some electromagnetic transmission on one or more frequencies within a bandwidth in the electromagnetic spectrum, as in radio and television, or in optical, microwave, or voice-grade communication.

Communication History (n)~ The section, located on the Business Contact Manager menu, that tracks interactions with customers by linking items to records.

Communication History folder (n)~ A folder, accessible from the Business Contact Manager menu, that contains all communication history items and the records they are linked to.

communication history item (n)~ An item such as an appointment, business note, e-mail message, file, or task that is linked to an Account, Business Contact, Opportunity, or Business Project.

communication pathway (n)~ An established connection between two endpoints, each on separate servers or zones. The connection may additionally be configured with appropriate communication protocols.

communication pattern (n)~ A property that determines whether the communication on the port is one-way or two-way (request-response).

communication preferences (n)~ A product's settings that enable customers to determine how people who also use the product may interact with them.

communication settings (n)~ Operating parameters, such as bits per second (bps) and modem type, that apply to serial ports on a computer.

communications channel (n)~ A medium for transferring information. Depending on its type, a communications channel can carry information (data, sound, and/or video) in either analog or digital form. A communications channel can be a physical link, such as the cable connecting two stations in a network, or it can consist of some electromagnetic transmission on one or more frequencies within a bandwidth in the electromagnetic spectrum, as in radio and television, or in optical, microwave, or voice-grade communication.

communications language (n)~ The language chosen by a company in which they want to receive e-mail messages and other business communications from Microsoft.

communications link (n)~ The connection between computers that enables data transfer.

communications port (n)~ A serial communications port used to connect a device, such as a modem, printer, or mobile device, to a computer.

communications protocol (n)~ A set of rules or standards designed to enable computers to connect with one another and to exchange information with as little error as possible. The protocol generally accepted for standardizing overall computer communications is a seven-layer set of hardware and software guidelines known as the OSI (Open Systems Interconnection) model. A somewhat different standard, widely used before the OSI model was developed, is IBM's SNA (Systems Network Architecture). The word protocol is often used, sometimes confusingly, in reference to a multitude of standards affecting different aspects of communication, such as file transfer (for example, XMODEM and ZMODEM), handshaking (for example, XON/XOFF), and network transmissions (for

example, CSMA/CD).

communications server (n)~ The server through which Communicator connects with other users.

communications service (n)~ The program that runs the server through which Communicator connects with other users.

Communicator (n)~ A enterprise instant messaging (IM) client that integrates IM, presence awareness, and telephony. Communicator users can simultaneously control multiple modes of communication, including IM, video conferencing, telephony, application sharing, and file transfer.

Communicator 2005 (n)~ The short product name, including version, for second and subsequent use.

Communicator call (n)~ A Voice over Internet Protocol (VoIP) call that is routed to all of a contact's devices that are running Office Communicator 2007. A contact can receive a Communicator call on his or her computer or on a telephony device that is configured for Office Communicator 2007.

Communicator Tour (n)~ Initial experience tour that describes Communicator concepts, features, and usage.

Communicator Web Access Manager (n)~ A product that allows you to manage a Communicator Web Access services from a computer on which the MMC has been installed.

community (n)~ The collective of people who interact through or use online resources.

Community (PN)~ A site template that is designed to create an online community where people come together to share ideas or get answers to their questions.

Community Basic (PN)~ One of five support levels for SharePoint solutions provided by the third party development community. It is the second in order from lowest to highest level of support.

Community Limited (PN)~ One of five support levels for SharePoint solutions provided by the third party development community. It is the first in order from lowest to highest level of support.

community name (n)~ A name that identifies groups of Simple Network Management Protocol (SNMP) hosts. This name is placed in SNMP messages that are sent between SNMP-managed devices such as servers running Windows Server 2003 and SNMP management stations. Typically, all hosts belong to Public, which is the standard name for a common community of all SNMP hosts.

Community Platinum (PN)~ One of five support levels for SharePoint solutions provided by the third party development community. It is the fifth in order from lowest to highest level of support.

Community Premium (PN)~ One of five support levels for SharePoint solutions provided by the third party development community. It is the fourth in order from lowest to highest level of support.

community representative (n)~ A role that is similar to the customer service role, with the addition of being able to manage public conversations enabled and with the following permissions: organization read, BU append, BU append to, and user delete.

Community Standard (PN)~ One of five support levels for SharePoint solutions

provided by the third party development community. It is the third in order from lowest to highest level of support.

community technology preview (n)~ Unsupported, prerelease software intended to make the latest working build of a particular product available to developers.

COMP-1 (n)~ A 4-byte, single precision, floating-point Real data type that specifies internal floating-point items. The sign is contained in the first bit of the leftmost byte, and the exponent is contained in the remaining seven bits of that byte. The remaining three bytes hold the mantissa.

COMP-2 (n)~ An 8-byte, double precision, floating-point Real data type that specifies internal floating-point items. The sign is contained in the first bit of the leftmost byte, and the exponent is contained in the remaining seven bits of the first byte. The remaining seven bytes hold the mantissa.

COMP-3 (n)~ A packed decimal data type that specifies internal decimal items stored in packed decimal format. In the packed decimal format, each byte in a field represents two numeric digits except for the rightmost byte. The rightmost byte holds one digit and the sign.

compact (v)~ To reduce the size of a dynamically expanding virtual hard disk by removing unused space from the .vhd file.

compact disc (n)~ An optical storage medium for digital data.

Compact Disc File System (n)~ A 32-bit protected-mode file system that controls access to the contents of CD-ROM drives.

compact disc player (n)~ A device that reads the information stored on a compact disc. A compact disc player contains the optical equipment necessary for reading a disc's contents and the electronic circuitry for interpreting the data as it is read.

compact disc read-only memory (n)~ A form of storage characterized by high capacity (roughly 650 MB) and the use of laser optics instead of magnetic means for reading data.

compact disc-recordable (n)~ A type of CD-ROM that can be written (only once) on a CD recorder and read on a CD-ROM drive.

compact disc-rewritable (n)~ A type of CD on which files can be copied, erased, and replaced.

compact row axis (n)~ A feature that enables the user to compact or collapse rows when viewing several levels of data.

CompactFlash card (n)~ A memory card that is supported by many types of devices. It is larger than a secure digital card.

compaction (n)~ The process of gathering and packing the currently allocated regions of memory or auxiliary storage into as small a space as possible, so as to create as much continuous free space as possible.

company (n)~ The parent business unit of a reporting entity within an organization. Company business units define company groups within an enterprise organization structure.

Company (n)~ In the Add a Contact Wizard, this is one of the fields by which you can search for a contact.

company (n)~ A commercial organization or a small business.

Company (n)~ A privacy relationship setting that allows a medium amount of information

to be viewed, typically for people in your company and for people outside your company who work with you.

company app (n)~ The apps or hubs provided by a company that users can install on their phones once they have enrolled in a company account.

company chain (n)~ A group of companies that are under the same ownership and management.

company definition (n)~ Information about a company that is used to create a report.

company hub (n)~ A line of business (LOB) app hub where enterprise customers can feature and distribute developed, packaged, and privately signed apps to their employees.

company information (n)~ Information specified by an external account or contact.

company knowledge (n)~ An editable field of a rule or monitor in which you can capture any relevant information about the required steps to resolve an alert that was raised by the rule or monitor.

Company Knowledge Base (n)~ A field which specifies the company-provided knowledge base information associated with the rule group. This field is available only if there is company-provided knowledge base information associated with the rule group.

company network (n)~ A network of computers, printers, and other devices located within a relatively limited area (for example, a building). A LAN enables any connected device to interact with any other on the network.

company phone (PN)~ The main telephone number of a company. Not the same as an individual's work phone.

company reference (n)~ Someone within a company who can verify the status of the company or the status of someone else as an employee of the company.

compa-ratio (n)~ The ratio of fixed pay rate to the grade midpoint (or control point) in graded compensation plans. The ratio is used as a measure of how well an employee is paid relative to the grade structure. The ratio is calculated by dividing the fixed pay rate by the midpoint; for example, an employee with a compa-ratio of less than 1.0 is paid less than the range midpoint. Compensation plans are typically designed so that the average fixed pay rate of all employees at a given grade equals the midpoint of the range.

comparator (n)~ A device for comparing two items to determine whether they are equal. In electronics, for example, a comparator is a circuit that compares two input voltages and indicates which is higher.

compare (v)~ To check two items, such as words, files, or numeric values, so as to determine whether they are the same or different. In a program, the outcome of a compare operation often determines which of two or more actions is taken next.

Compare (PN)~ A feature in the Clock app that allows the user to input any time and see it converted to the equivalent time in another time zone.

Compare times (PN)~ A feature in the Clock app that allows the user to input any time and see it converted to the equivalent time in another time zone.

comparer (n)~ A function used for controlling the comparison in search.

comparison criteria (n)~ A set of search conditions that is used to find data. Comparison criteria can be a series of characters that you want to match, such as Northwind Traders

comparison evaluator (n)~ A filter that compares a device capability name to a value.

compartment (n)~ An abstraction (not a specific storage location) that consists of one or

more isolated storage files, called stores, which contain the actual directory locations where data is stored. Any kind of data can be saved in the store.

compatibility (n)~ The degree to which a computer, an attached device, a data file, or a program can work with or understand the same commands, formats, or language as another. True compatibility means that any operational differences are invisible to people and programs alike.

compatibility (n)~ In reference to software, harmony on a task-oriented level among computers and computer programs.

compatibility (n)~ The extent to which a web site or web page displays as the designer expects from one browser to the next.

Compatibility Administrator (PN)~ A tool that enables you to create and deploy compatibility fixes, compatibility modes, and AppHelp messages, to resolve your compatibility issues.

compatibility checker (n)~ A function that verifies the technology is compatible with the target browser.

Compatibility Checker (PN)~ A feature that identifies elements in your file that aren't supported or will behave differently in a different format or previous version of the product.

compatibility evaluator (n)~ A command-line program launched by ACT Data Collector and configured by the user through the data collection package (DCP) settings to collect and process your application information. Each evaluator performs a set of functions, providing a specific type of information to ACT. A compatibility evaluator may run immediately and exit or it may continue to monitor system activity throughout the duration of time configured by the user.

compatibility fix (n)~ A small piece of code that intercepts API calls from applications, transforming them so that Windows Vista will provide the same product support for the application as previous versions of the operating system.

compatibility mode (n)~ A feature of a computer or operating system that allows it to run programs written for a different system.

compatibility mode (n)~ A group of compatibility fixes found to resolve many common app compatibility issues.

Compatibility Report (PN)~ A tool that checks for issues that might prevent a document from displaying or printing properly in current and previous versions of Microsoft Office for Windows and Mac.

compatibility solution (n)~ The solution to a known compatibility issue, as entered by the user, Microsoft, or a vendor.

compatibility switching (n)~ The process of reverting to legacy code when Windows detects that an application needs it to run seamlessly for the end user.

Compatibility View (PN)~ A view mode in Internet Explorer that determines whether content is rendered as if users were viewing it in a previous version of Internet Explorer.

compatible (adj)~ Pertaining to a product that can work with or is equivalent to another product.

Compatible ~ Compatible pieces of equipment can work together; incompatible ones can't.

compelling (adj)~ Persuasive, convincing, or attractive.

compensating ingredient (n)~ A type of ingredient in a formula whose quantities can be adjusted. This adjustment is based on the difference between the quantities of active ingredient that are estimated and the quantities of active ingredient inventory batches that are reserved based on the potency of active ingredient.

compensation (n)~ A group of actions designed to undo or mitigate the effect of a committed transaction.

compensation (n)~ Direct or indirect monetary and nonmonentary rewards in exchange for services rendered, or an award for damages sustained by an injury or by the violation of a contract.

compensation level (n)~ An internal ordered classification that differentiates levels of pay within a compensation structure.

competency (n)~ A recognized level of expertise within a given technical and/or business area.

competency toolkit (n)~ A set of the tools relevant to a Microsoft Competency.

competition (n)~ Businesses that sell similar products or services and compete for the same customer segment.

Competition Tracker (PN)~ A business application that tracks details and news about competitors and compares one's key products with those of competitors.

competitor (n)~ An entity that sells similar products or services and competes for the same customer segment.

Competitor Win Loss (PN)~ A report in the Microsoft Dynamics CRM user interface that provides a table showing each competitor, the number of open opportunities and closed opportunities against each competitor, and the percentage and ratio of won and lost opportunities.

compiland (n)~ The basic unit of compilation or translation. A project usually consists of several compilands (for example, .c and .cpp files) that are compiled to produce a corresponding object file. See also function.

compilation error (n)~ An error which occurs while compiling an application. These compilation errors typically occur because syntax was entered incorrectly.

compile (v)~ To translate all the source code of a program from a high-level language into object code prior to execution of the program.

compile time (n)~ The amount of time required to perform a compilation of a program. Compile time can range from a fraction of a second to many hours, depending on the size and complexity of the program, the speed of the compiler, and the performance of the hardware.

compile time (n)~ The point at which a program is being compiled (i.e., most languages evaluate constant expressions at compile time but evaluate variable expressions at run time).

compiled binary file (n)~ An Access 2007 database (.accdb) file with all modules compiled and all editable source code removed.

compiled query (n)~ A query that has been pre-compiled and cached for the future reuse.

compiler ~ A software-development tool that translates high-level language programs into the machine-language instructions that a particular processor can understand and execute.

compiler option (n)~ An option that is set in the development environment before a file is compiled.

compiler warning (n)~ A warning that is issued due to a compiler problem.

compile-time error (n)~ An error in a script that occurs if you mistype a keyword, forget to close a multi-line command (such as DO … LOOP), or introduce a similar mistake. If a script includes a compile-time error, the script will not execute and an error message is displayed as soon as the browser or server processes the page. Also called a syntax error.

complementary colors (n)~ Colors that are opposite each other on the color wheel, such as yellow and blue.

complete database restore (n)~ A restore of a full database backup, the most recent differential database backup (if any), and the log backups (if any) taken since the full database backup.

Complete PC Backup (n)~ A tool in Windows Vista that backs up the entire computer (OS, settings, and files).

Complete PC Restore (n)~ A tool in Windows Vista that restores the entire computer (OS, settings, and files).

Complete the merge (oth)~ The heading for the last Mail Merge step, which allows the user to select how the merged publication or letters are produced.

completed (adj)~ The state of having reached the normal or expected end to a program or process.

completed contract (n)~ A type of assessment principle that specifies that revenue and costs are recognized when contract activity is completed.

completed percentage (n)~ A type of assessment principle that specifies that revenue and costs are recognized while work progresses.

completed state (n)~ The state of a workflow instance that has finished processing and accepts no future input, such as messages. A user, when terminating or canceling an instance, completes the workflow.

complex event processing (n)~ The continuous and incremental processing of event streams from multiple sources based on declarative query and pattern specifications with near-zero latency.

complex network (n)~ A type of operations network in which simultaneous operations take place or in which operations overlap, are contingent on each other, or have other complex relationships.

complex number (n)~ A number in the form a + bi, where a and b are real numbers and i = sqrt(-1) , so that bi is imaginary unless b = 0.

complex object (n)~ An instance of a complex type that exists within an object context.

complex script (n)~ A language whose characters require ligation or shaping, such as a right-to-left language (Arabic, Persian, Hebrew, and Urdu) or certain South Asian languages.

complex transition (n)~ In a statechart or activity diagram, a relationship between multiple source and/or target states or action states.

complex type (n)~ A composite type that represents a non-scalar property of an entity type, which enables scalar properties to be organized within entities.

complex type (n)~ An element that can contain other elements or attributes and appears as

<complexType> in an XML document.

compliance (n)~ The adherence to stated standards.

compliance (n)~ Meeting an organization's various obligations, which may arise from laws, regulations, rules, and many other legal instruments, such as court judgments, litigation, and even contracts. Specific and important examples of these obligations include the Sarbanes-Oxley Act (SOX) and the California Law on Notice of Security Breach, formerly known as SB-1386. These regulatory obligations may be created by many sources, such as national and local governments and from industry-specific oversight groups, such as the Payment Card Industry Data Security Standards.

Compliance Administrator (n)~ The role responsible for setting up and maintaining product compliance.

compliance officer (n)~ Person responsible for ensuring that an organization complies with the various regulations and standards that are imposed by government and other regulatory bodies.

Compliance Settings (n)~ A Configuration Manager feature that allows administrators to define, monitor, and remediate noncompliance.

Compliance Settings Manager (n)~ A security role that grants permissions to administrative users so that they can define and monitor Compliance Settings.

Compliance Settings Manager role (n)~ A security role that grants permissions to define and monitor compliance by using the Desired Configuration Compliance feature. Administrative users who are associated with this role can create, modify, and delete configuration items and baselines. They can also deploy configuration baselines to collections, initiate compliance evaluation, and initiate remediation for noncompliant computers.

Compliance Technologies International (PN)~ A company that provides reporting compliance services.

compliant (n)~ Meeting or falling within a set of standards or guidelines in the creation and production of a product.

compliant card (n)~ A card that meets the requirements for use in a Windows Phone.

component (n)~ An object that is reusable and can interact with other objects. Note: Every control is a component, but not every component is a control.

component (n)~ Any raw material, ingredient, part or item used to assemble a subassembly, finished good, or used as part of a kit.

component (n)~ In general, a modular unit of code that acts as part of a larger system or structure. For COM, a unit of code built to deliver a well-specified set of services through well-specified interfaces. A component provides an object that a client requests at runtime.

component (n)~ A hardware or software element that is part of a larger system or structure.

component (n)~ An advertising or media item that you create, such as a brochure, business card, letter, ad, webpage, poster, TV commercial, radio spot, poster, tent cards promotional item, point of purchase display, or shelf talker.

component connection (n)~ The connection between two component nodes in the Application Flow panel in SketchFlow.

component database (n)~ A central database that holds the metadata necessary to define

one or more componentized OSs. Includes platforms, components, repositories, resource types and groups, but not configurations.

component diagram (n)~ An implementation diagram that shows the structure of the code itself.

Component Explorer (n)~ A window that shows a hierarchical view of the process engineering components grouped by category, such as valves or pipelines.

Component Gallery (n)~ A container for catalogs of software objects such as class libraries, forms, buttons, etc.

component node (n)~ A node in the Application Flow panel of a SketchFlow prototype that represents a screen.

Component Object Model (n)~ An object-based programming model designed to promote software interoperability; it allows two or more applications or components to easily cooperate with one another, even if they were written by different vendors, at different times, in different programming languages, or if they are running on different computers running different operating systems.

component registrar (n)~ An object that can register and unregister individual components in a DLL.

component server (n)~ A server that runs Configuration Manager services. When you install all the site system roles except for the distribution point role, Configuration Manager automatically installs the component server.

Component Services (n)~ An extension of the COM (Component Object Model) programming architecture that includes a run-time or execution environment and extensible services, including transaction services, security, load balancing, and automatic memory management.

component settings database (n)~ A database that stores service information for each portal site in a deployment.

component tray (n)~ A rectangular region that appears at the bottom of the Windows Forms Designer when it is in Design view. The component tray is a container for components, which are controls that are not visible. It appears only after a component is added to the current form and provides a way for users to access and set the properties of those components.

Component-Based Servicing (n)~ A servicing model used in Windows in which components are identified by an XML manifest containing the full contents of the component. Multiple components can be included in a package, the contents of which are also identified in an XML manifest.

composable (adj)~ Pertaining to the ability to form complex queries by using query components (objects or operators) as reusable building blocks. This is done by linking query components together or encapsulating query components within each other.

compose (v)~ To create an object, such as an email message.

composed environment (n)~ A virtual environment that was created from virtual machines. Those virtual machines were created outside of Microsoft Test Manager and are already deployed on a host group.

composite (n)~ An aggregated set or group of objects that is recognized as an object itself (for example, characters in a paragraph, a named range of cells in a spreadsheet, or a

grouped set of drawing objects).

composite application (n)~ An application that consists of both client-side and Web-based components.

composite bus enumerator (n)~ A bus enumerator for composite devices.

composite character (n)~ A text element consisting of a base character and a diacritic or accent mark. Although most common in the Latin script, other scripts (including Greek, Devanagari, and Tamil) also have composite characters.

composite control (n)~ A custom server control that consists of a custom collection of other server controls as child controls.

composite data type (n)~ A data type where the sum of the members is larger than all individual members taken together, such as a structure or an array.

composite device (n)~ A child device of the composite bus enumerator that aggregates multiple transport devices for a single point of access.

composite index (n)~ An index that uses more than one column in a table to index data.

composite key (n)~ A key whose definition consists of two or more fields in a file, columns in a table, or attributes in a relation.

composite object (n)~ A high-level object made of tightly bound parts. A composite object is an instance of a composite class, which implies the composition aggregation between the class and its parts.

composite plan (n)~ A plan that is calculated by summing discrete components and which is usually associated with a span of time. This is often an annual cash bonus plan or other plan that depends on measurable past performance.

composite state (n)~ In a statechart diagram, a state that has been decomposed into concurrent (representing and relationships) or mutually exclusive (representing or relationships) substates.

Composites Runtime object model (n)~ An object model that that can be used to incorporate and/or modify the behavior of a composite at runtime.

compositing (n)~ The process of combining two images to form a new image. The most common compositing operation is an over operation, in which one image is placed over another, taking into account the alpha information of both images.

composition (n)~ An activity flow created from multiple actions. Composition is core to the Human Workflow Services system.

composition (n)~ One or more images that are positioned, arranged, ordered, and proportionally resized according to a user's specifications within a Deep Zoom Composer project.

composition (n)~ An export format that flattens a group of images defined in a Deep Zoom Composer project into a single high-resolution image that is generated at export.

composition (n)~ A whole-part relationship in which the life cycle of the part object is dependent on the life cycle of the whole object.

compositional hierarchy (n)~ A set of entities that are conceptually part of a hierarchy, such as a parent entity and a child entity. Data operations require that the entities be treated as a single unit.

compound control (n)~ A control and an attached label, such as a text box with an attached label.

compound file (n)~ A number of individual files bound together in one physical file where each individual file can be accessed as if it were a single physical file.

compound file directory (n)~ A structure used to contain per-stream information about the streams in a compound file.

compound keyframe (n)~ In an animation timeline, a type of keyframe that indicates that the property has child properties that have simple keyframes set on them. You can work with compound keyframes in order to modify large groups of properties at once with a single selection, for example when moving keyframes along the timeline.

compound path (n)~ A path that is made up of two or more sub-paths.

compress (v)~ To reduce the size of a set of data, such as a file or a communications message, so that it can be stored in less space or transmitted with less bandwidth.

compress (v)~ To reduce the time available for a scheduled storyboard to reach its final state.

compressed drive (n)~ A hard disk whose apparent capacity has been increased through the use of a compression utility, such as Stacker or Double Space.

Compressed Serial Line Internet Protocol (n)~ A version of SLIP using compressed Internet address information, thereby making the protocol faster than SLIP.

compression (n)~ A process for removing redundant data from a digital media file or stream to reduce its size or the bandwidth used.

compression (n)~ A reduction of the time available for a scheduled storyboard to reach its final state.

Compression ~ A way of making files smaller, either to fit into restricted storage space or to speed up transmission over the Internet. Popular compression standards include- JPEG- and- GIF- for pictures,- MP3for music files,- MPEG, MP4, AVI- and- MOV- for movie footage, and- zip- for just about everything else.

compression exclusion list (n)~ A list of files that are not compressed when capturing an image using ImageX. Some files do not shrink in size when compressed. When capturing an image, you can identify these files to ImageX to save time. These files will still be captured, but ImageX will not attempt to compress them.

compression level (n)~ The amount by which an image's file size is reduced. Higher compression levels yield smaller file sizes and shorter download times.

compression ratio (n)~ The ratio of the uncompressed size to the compressed size of a stored unit of data.

compression utility (n)~ A software program that reduces a file's size for storage on a disk. If a compressed file is too large to fit onto a single disk, the compression utility copies it onto multiple disks.

computation-bound (oth)~ Of, pertaining to, or characteristic of a situation in which the performance of a computer is limited by the number of arithmetic operations the microprocessor must perform. When a system is computation-bound, the microprocessor is overloaded with calculations.

Compute (PN)~ The family of compute services in Microsoft Azure.

compute cluster (n)~ A large array of processors (-€œnodes-€?), with an infrastructure to submit computation jobs to the cluster nodes and collect results.

compute emulator (n)~ The software emulation of the Microsoft Azure Compute service

that runs in the developer's local environment for application testing and debugging.

compute hour (n)~ A unit of measure of time for a subscription to a hosted service deployed and running in the Microsoft Azure compute environment. A customer is charged different rates for different sized compute instances.

Compute Intensive Batch Instances (PN)~ The service type of the Batch service for batches that require a large compute power.

compute node (n)~ A server that is added to a cluster to run jobs.

Compute Services (PN)~ The family of compute services in Microsoft Azure.

computed column (n)~ A virtual column in a table whose value is computed at run time.

computed field (n)~ A value in a formatted notification that has been computed by using a Transact-SQL expression.

computed group (n)~ A group whose membership is automatically determined and kept up to date by ILM by ensuring that the group contains all the resources (such as people, groups, computers) that fall within the conditions that are expressed using XPath.

computed group member (n)~ A member of a group whose membership is dynamically calculated by a defined filter.

computed radiography (n)~ Digital radiography that records images which are converted to electronic signals and digitized so they can be stored and manipulated by a computer.

computed tomography (n)~ A technique that produces a computer-processed X-ray image of a cross section of an internal organ or tissue.

computer (n)~ Any device capable of processing information to produce a desired result. No matter how large or small they are, computers typically perform their work in three well-defined steps: (1) accepting input, (2) processing the input according to predefined rules (programs), and (3) producing output. There are several ways to categorize computers, including class (ranging from microcomputers to supercomputers), generation (first through fifth generation), and mode of processing (analog versus digital).

Computer (n)~ An item the user can select in the Options dialog box, Phones tab, from the Select the default device for calling phone numbers' drop-down list. When the user selects Computer as the default device for calling phone numbers

computer account (n)~ An account that is on a local system or domain.

computer administrator (n)~ The person in charge of managing a computer. The administrator is responsible for installing software, assigning passwords, and managing files.

computer audio (n)~ The use of the Internet Protocol (IP) for transmitting voice communications. VoIP delivers digitized audio in packet form and can be used to transmit over intranets, extranets, and the Internet. It is essentially an inexpensive alternative to traditional telephone communication over the circuit-switched Public Switched Telephone Network (PSTN). VoIP covers computer-to-computer, computer-to-telephone, and telephone-based communications. For the sake of compatibility and interoperability, a group called the VoIP Forum promotes product development based on the ITU-T H.323 standard to transmit multimedia over the Internet.

Computer Browser service (n)~ A service that maintains an up-to-date list of computers that share resources on your network and that supplies the list to programs that request it. The Computer Browser service is used to view a list of available network resources.

computer build report (n)~ A report generated by OEMs for each OA 3.0 manufactured computer which is then sent to Microsoft for processing. This report includes the hardware hash value and Product Key ID.

computer call (n)~ A function that allows a user to call a computer.

computer details (n)~ A list of computer properties that are configured to display and provide information about a specific computer.

computer discovery (n)~ A process to discover computers on the network.

Computer Entertainment Rating Organization (n)~ A non-profit, self-regulatory organization which applies and enforces interactive game ratings in Japan.

computer group (n)~ A collection of computers with some attribute in common. Computer groups are defined by computer grouping rules for similar event management.

computer grouping rule (n)~ A rule that combines computers with common attributes into a group to be similarly managed and monitored.

computer ID (n)~ A number that uniquely identifies a particular computer.

computer language (n)~ An artificial language that specifies instructions to be executed on a computer. The term covers a wide spectrum, from binary-coded machine language to high-level languages.

computer name (n)~ A unique name with as many as 15 characters that identifies a computer to the network.

computer name (n)~ A unique name for a subscription computer that is specified by the solution provider. This is the name that the solution provider submits to the Provisioning Server when configuring a subscription computer or querying information about that computer. The computer name is an alphanumeric string of up to fifty characters.

computer program (n)~ A set of instructions in some computer language intended to be executed on a computer so as to perform some task. The term usually implies a self-contained entity, as opposed to a routine or a library.

computer restrictions (n)~ Settings that limit operating system functionality; including, privacy and security.

Computer Supported Telecommunications Applications (PN)~ An international standard established by the European Computer Manufacturers Association (ECMA) that specifies an application's interface and protocols for monitoring and controlling calls and devices in a communications network.

computer telephony integration (n)~ The practice of using a computer to control one or more telephone and communications functions.

computer usage time (n)~ An amount of time that is used toward computer or software access.

Computer-Brain Interface ~ interpret distinct brain patterns, shifts and signals as commands that can be used to guide a computer or other device.

computerized tomography (n)~ A technique that produces a computer-processed X-ray image of a cross section of an internal organ or tissue.

computer-to-computer network (n)~ A temporary network used for sharing files or an Internet connection. In an ad hoc network, computers and devices are connected directly to each other instead of to a hub or router.

computing device (n)~ A piece of equipment that is used for running programs.

COM-structured storage file (n)~ A component object model (COM) compound file used by Data Transformation Services (DTS) to store the version history of a saved DTS package.

concatenate (v)~ To join sequentially (for example, to combine the two strings hello' and 'there' into the single string 'hello there').'

concatenation (n)~ The process of combining two or more character strings or expressions into a single character string or expression, or combining two or more binary strings or expressions into a single binary string or expression.

concept (n)~ A unit of thought that consists of characteristics attributed to an object, a relation, or an entity and that can be expressed in a symbol (e.g., a word or phrase).

conceptual design (n)~ A major stage in the design process, through which the project team translates the business requirements into a common language to be shared by users and developers, and describes the feature set and/or usage scenarios that the solution must encompass. Conceptual design is analogous to the rough sketches and scenarios created when designing a house. These are easily understood models jointly created by the customer and the architect.

conceptual model (n)~ A tool used in the analysis phase of software development to help decompose a problem into individual concepts or objects and clarify the vocabulary of the domain.

conceptual model (n)~ An abstract specification for the entity types, associations, entity containers, entity sets, and association sets in the domain of an application built on an Entity Data Model.

conceptual schema definition language (n)~ An XML-based language that is used to define the entity types, associations, entity containers, entity sets, and association sets of a conceptual model.

Concierge (PN)~ A Surface application from Microsoft where you can create maps and menus for users to navigate, and you can highlight specific locations, such as your venue locations and locations in the surrounding area. Users can browse locations by categories, view the locations on a map, browse the map, and find driving directions to the locations.

Concierge Administration wizard (n)~ The wizard that you use to configure Concierge initially and later on.

concordance file (n)~ An index file with two columns: the first column lists the text in the document that you want to index, and the second column lists the index entries to generate from the text in the first column.

concrete class (n)~ In Windows Management Instrumentation (WMI), a class from which you can create an instance because it has a full implementation.

concrete pool (n)~ A storage pool created from disks in a primordial pool.

concurrency (n)~ A process that allows multiple users to access and change shared data at the same time. The Entity Framework implements an optimistic concurrency model.

concurrency model (n)~ A way in which an application can be designed to account for concurrent operations that use the same cached data. Windows Server AppFabric supports optimistic and pessimistic concurrency models.

Concurrency Runtime (n)~ A concurrent programming framework for C++ that simplifies parallel programming and helps developers write robust, scalable, and

responsive parallel applications.

Concurrency Visualizer Collection Tools for Visual Studio 2013 (n)~ A collection of tools designed for Visual Studio 2013, which significantly reduces the burden of parallel performance analysis and can help developers analyze their sequential applications to discover opportunities for parallelism.

concurrent ~ A way to measure the usage of software licenses. Rather than limiting usage based on the number of people who are entitled to use the software, a concurrent-use license places a limit on the number of people who may do so simultaneously.

concurrent execution (n)~ The apparently simultaneous execution of two or more routines or programs. Concurrent execution can be accomplished on a single process or by using time-sharing techniques, such as dividing programs into different tasks or threads of execution, or by using multiple processors.

condition (n)~ The state of an expression or a variable (for example, when a result can be either true or false, or equal or not equal).

condition (n)~ An illness or other defective state of health.

condition code (n)~ One of a set of bits that are set on (1, or true) or off (0, or false) as the result of previous machine instructions. The term is used primarily in assembly or machine language situations. Condition codes are hardware-specific but usually include carry, overflow, zero result, and negative result codes.

conditional (adj)~ Of, pertaining to, or characteristic of an action or operation that takes place based on whether or not a certain condition is true.

conditional branch (n)~ An element of workflow logic that defines an alternative condition and action or additional steps, in cases when the criteria in a condition element are not met. A logical 'else-if-then' statement in a workflow.

conditional expression (n)~ An expression that yields a Boolean value (true or false). Such expressions can involve comparisons (testing values for equality or, for non—-Boolean values, the < [less than] or > [greater than] relation) and logical combination (using Boolean operators such as AND, OR, and XOR) of Boolean expressions.

conditional filter (n)~ A filter that allows Operations Manager to evaluate further rules but does not insert events into the database unless another rule match occurs.

conditional filtering (n)~ Filtering a field to show the top or bottom n items based on a total. For example, you could filter for the three cities that generated the most sales or the five products that are least profitable.

conditional format (n)~ A format, such as cell shading or font color, that Excel automatically applies to cells if a specified condition is true.

conditional formatting (n)~ Formatting that is applied to cell contents, form controls, Outlook items or other data based on one or more logical conditions.

conditional primitive preprocessing (n)~ Altering of strings based on the requirements of individual script engines.

conditional print control code (n)~ A code in a column definition that displays or does not display a specified column, depending on certain variables or values in the column definition. If the values or variables in the specified report column do not meet the conditions of the code, the column is not displayed or printed in the report.

conditional report (n)~ A report that displays or suppresses portions of the data according

to whether specified conditions are met.

conditional sales tax (n)~ A sales tax that is reported to the tax authority when the invoice is paid, in contrast to normal sales tax, which is reported when the invoice is created.

conditional spanning header (n)~ A header in a report that is automatically updated each time the report is generated, according to the base period that is defined in the column definition.

conditional split (n)~ A restore of a full database backup, the most recent differential database backup (if any), and the log backups (if any) taken since the full database backup.-

conditional sum formula (n)~ A formula that will sum a set of values that meet specified conditions.

conditional visibility (n)~ A type of conditional formatting that allows you to specify when a control is visible on the form.

conditions (n)~ A set of specified constraints and parameters that are part of the rights group bundled into a rights label. These are enforced at the time of consumption.

cone angle (n)~ The angle between the edges of the spot light's beam. If you shine a flashlight on the ground, you will notice that it does not light the ground evenly, but that the light gets dimmer the farther from the center it gets. The cone angle determines how quickly this falloff happens.

cone chart (n)~ A variation on a column chart that uses cone shapes instead of rectangular columns.

Conference (n)~ A toolbar button that provides the user with the service that allows three or more persons to converse together in a phone call.

Conference (PN)~ A screen showing an active conference call.

conference (n)~ A conversation between three or more people, where the communications technology is unknown or not specified.

conference (n)~ A telephone conversation between three or more people.

Conference (PN)~ An association of sports teams that play each other.

Conference Announcement Service (PN)~ The service that implements in-conference services for multiple PSTN users at the same time. For example, it can be used to play an entry or exit tone to multiple PSTN users at the same time.

conference call (n)~ A telephone conversation between three or more people.

conference center (n)~ The server location, specified by a URL, for all Live Meeting sessions conducted within an organization.

Conference ID (PN)~ A field label for the identifier of a conference that is conducted through a conferencing service provider.

conference mode (n)~ A Groove talk tool option that allows all members who select it to do audio-chat at once instead of one at a time.

conference resource (n)~ A Microsoft Exchange mailbox that allocates a specific number of connections. The resource serves as a virtual room for your online meeting. You invite the resource to an online meeting just as you would reserve a room for a meeting.

Conferencing Add-in for Microsoft Office Outlook (PN)~ A Microsoft Outlook add-in that allows you to schedule a Live Meeting or Lync or Office Communicator conference call from Outlook.

Conferencing Add-in for Microsoft Outlook (PN)~ A Microsoft Outlook add-in that allows you to schedule a Live Meeting or Lync or Office Communicator conference call from Outlook.

Conferencing Announcement service (n)~ A unified communications application that plays tones and prompts on certain actions, such as when conference participants enter or leave a conference, and when participants are muted or unmuted. This service is automatically installed and activated by default when you deploy a Conferencing workload and select the dial-in conferencing option.

Conferencing Attendant (PN)~ The server application that makes it possible for an enterprise user without access to a unified communications client to use a PSTN phone to dial in to a scheduled conference. Conferencing Attendant also provides such a user with basic conference controls.

conferencing information (n)~ The identifier, password, and any other information that a user needs to participate in a conference that is conducted through a conferencing service provider.

Conferencing Server Factory (n)~ A server component that allocates conferencing servers to a meeting and returns their URLs to the meeting Focus.

conferencing service (n)~ An internally or externally hosted service for users to host multiparty conferences from their computers.

conferencing service provider (n)~ An organization that provides computer audio conference services, which allow more than two people to participate in a conference over their computer's Internet connection.

confidentiality (n)~ A basic security function of cryptography that ensures that only authorized users can read or use confidential or secret information. Without confidentiality, anyone with network access can use readily available tools to eavesdrop on network traffic and intercept valuable proprietary information. For example, an Internet Protocol security service ensures that a message is disclosed only to intended recipients by encrypting the data.

config file (n)~ A file that contains machine-readable operating specifications for a piece of hardware or software or that contains information on another file or on a specific user, such as the user's logon ID.

config set (n)~ A file and folder structure that contains the necessary files and/or configuration settings that control the preinstallation process and define the manufacturers' custom information.

configuration (n)~ The entire interconnected set of hardware, or the way in which a network is laid out—the manner in which elements are connected.

configuration (n)~ In reference to a single microcomputer, the sum of a system's internal and external components, including memory, disk drives, keyboard, video, and generally less critical add-on hardware, such as a mouse, modem, or printer. Software (the operating system and various device drivers), the user's choices established through configuration files such as the AUTOEXEC.BAT and CONFIG.SYS files on IBM PCs and compatibles, and sometimes hardware (switches and jumpers) are needed to configure the configuration' to work correctly. Although system configuration can be changed

configuration (n)~ The arrangement of parts, options, or features to produce a product

that meets a specification, such as a customer order.

Configuration (n)~ Administrative options that control the interface and functionality of the Service Desk and Support Portal.

configuration control (n)~ The process of ensuring that the product sent to the customer is designed and arranged as the customer specified.

configuration database (n)~ The Microsoft SQL Server, MSDE, or Windows Internal database that contains the configuration information that applies across all servers in a deployment of SharePoint Products and Technologies, such as Web application information.

Configuration database server name (n)~ A UI element. The name of the server on which the Configuration database is housed.

configuration event (n)~ An event during which important changes are made to the configuration state which appreciably help or degrade the ability of end users to diagnose software or hardware problems.

Configuration Export (PN)~ A feature that allows administrators the ability to backup and replicate their configuration.

configuration file (n)~ A file that contains machine-readable operating specifications for a piece of hardware or software or that contains information on another file or on a specific user, such as the user's logon ID.

configuration file (n)~ An XML file with the .config file name extension that contains settings for an application, Web site, or server. Common configuration files include Machine.config and Web.config.

Configuration Framework (n)~ A generic method for providing changes to configuration at setup. In conjunction with the Microsoft Windows Installer (MSI), the Configuration Framework determines the state of your computer and the configuration tasks requiring action.

configuration group (n)~ The list of components in a bill of materials (BOM) that are to be used together to produce a parent item.

configuration inheritance (n)~ The adoption of configuration settings by an object in a hierarchy from an object that is higher in that hierarchy. For example, a service can inherit its configuration settings from the application, Web site, or server with which it is associated.

configuration item (n)~ Any component that needs to be managed to deliver a service. In Service Manager, configuration items might include services, hardware, software, buildings, people, and formal documentation, such as process documentation and service level agreements (SLA).

configuration item class (n)~ A collection of configuration items. Groups can contain members of different configuration items classes (for example, a computer and a user).

configuration management (n)~ The process of identifying and defining configuration items in a system, recording and reporting the status of configuration items and requests for change, and verifying the completeness and correctness of configuration items.

Configuration Manager (n)~ The Windows Plug and Play system component that drives the process of locating devices, setting up their nodes in the hardware tree, and running the resources allocation process. Each of the three phases of configuration management—boot

time, real mode, and protected mode—have their own configuration managers.

Configuration Manager (n)~ An administrative tool included in Duet Settings Manager. Users with Administrator privileges on the Duet client computer can use this tool to set and modify the configuration settings for the Duet client components.

Configuration Manager Administrator console (n)~ The primary interface that you use to administer Configuration Manager.

Configuration Manager Application Catalog (n)~ The web-based view of the applications that are available for a user to search, browse, request, and install.

Configuration Manager client (n)~ A computer running Configuration Manager client components. A client can be further categorized as either a Legacy Client or an Advanced Client.

Configuration Manager client policy (n)~ Configuration details for the Configuration Manager Client that are provided after client installation.

Configuration Manager collection (n)~ A set of resources in a Configuration Manager site. Collections are used to distribute software, view hardware and software inventories of clients, and access clients for remote control sessions.

Configuration Manager hardware inventory (n)~ A Configuration Manager feature that automatically gathers information about hardware on Legacy Client computers in a Configuration Manager site.

Configuration Manager health state reference (n)~ A reference that is published to Active Directory to refer to Configuration Manager NAP policy and stored for the System Health Validator(SHV) to use in determining policy compliance.

Configuration Manager hierarchy (n)~ A collection of one or, typically, more Configuration Manager sites bound together via child-parent relationships.

Configuration Manager inventory (n)~ A Configuration Manager feature that automatically gathers information about hardware and software on Advanced Client computers in a Configuration Manager site.

Configuration Manager object (n)~ A component used in Configuration Manager software distribution and software updates — for example, collections, advertisements, programs, packages, deployments, and so on.

Configuration Manager resource (n)~ An object (such as a computer, a router, or a user group) that can be discovered and potentially become a Configuration Manager client and be managed by Configuration Manager. Resources and clients can be organized into collections.

Configuration Manager site (n)~ A collection of clients and Configuration Manager site systems that are bounded by a group of subnets, such as IP subnets or an Active Directory site, and that are specified by a Configuration Manager administrator as a site.

Configuration Manager site database (n)~ A Microsoft SQL Server database that stores Configuration Manager site data, such as discovery data, configuration data, and status messages and inventory data. Every primary site has a Configuration Manager site database. The server supporting the Configuration Manager site database is automatically assigned the site database server role.

Configuration Manager Software Center (n)~ The end-user program that allows the user to set preferences for how their software is installed. End users can also use

Configuration Manager Software Center to request, install, remove, and monitor the software that is deployed by using System Center 2012 Configuration Manager.

Configuration Manager software distribution (n)~ A Configuration Manager feature that automatically distributes software programs to client computers in a Configuration Manager hierarchy.

Configuration Manager software inventory (n)~

configuration object (n)~ A generic user-defined instance of any of the different kinds of configurations in ILM 2'

Configuration Role (PN)~ A type of role within Social Engagement that defines the permissions a user has when setting up searches and analyzing the resulting data.

configuration route (n)~ The sequence in which configuration groups are selected during the production process.

configuration rule (n)~ A rule that limits the items that can be combined to produce a manufactured product. A configuration rule applies to a configuration group.

configuration section handler (n)~ A class that implements the IConfigurationSectionHandler interface. Configuration section handlers contain information that Commerce Server .NET-based applications read at run time to configure application settings.

configuration set (n)~ A file and folder structure that contains the necessary files and/or configuration settings that control the preinstallation process and define the manufacturers' custom information.

configuration set (n)~ A set of Active Directory Lightweight Directory Services (AD LDS) instances that share and replicate their configuration and schema partitions and that can also be configured to share and replicate application directory partitions.

configuration variable (n)~ A variable that specifies a testing requirement, such as a hardware or software requirement. Each configuration variable has a set of allowable values associated with it.-

Configuration Wizard (PN)~ The semi-automated tool for planning and executing directory synchronization.

configure (v)~ To set up hardware and software.

Configure DataSource Wizard (n)~ A graphical interface where programmers can define the appropriate details to configure the data source in a few easy steps.

configure-to-order (n)~ Pertaining to the process of manufacturing a computer according to a customer`s specification by customizing a pre-existing image of a master installation.

confirm (v)~ To acknowledge an action or the value of some data (e.g. password) by definite assurance.

confirm (v)~ To affirm the past occurrence of an event in a system.

confirmation dialog box (n)~ A dialog box in which a user confirms that he or she wants a specified action to occur, usually by clicking OK.

confirmation message (n)~ An alert that is shown to prompt the user to agree to the action being taken.

confirmation of receipt policy (n)~ A policy that prescribes the functional location where the physical acceptance of items takes place.

confirmation page (n)~ A page that is displayed in a Web browser, confirming that data

entered into a form has been successfully submitted.

Confirmation time out (PN)~ A menu item that allows the user to set the delay before an unconfirmed action times out.

confirmed receipt date (n)~ The date the selling company confirms that a customer or vendor will receive the goods.

confirmed ship date (n)~ The date that the selling party confirms that the items will ship to a customer or vendor.

conflict (n)~ An item that has been changed on both the mobile device and desktop computer.

conflict (n)~ The inability to perform two or more activities because they have been scheduled to occur during the same time period and with the same resource or resources.

conflict detection (n)~ The process of determining which operations were made by one replica without knowledge of the other, such as when two replicas make local updates to the same item.

conflict resolution method (n)~ The method that is used to determine which change is written to the store in the event of a conflict. Typical conflict resolution methods are as follows: last writer wins, source wins, destination wins, custom, or deferred. For custom resolution, the resolving application reads the conflict from the conflict log and selects a resolution. For deferred resolution, the conflict is logged together with the conflicting change data and the made-with knowledge of the change.

conflict resolver (n)~ A special mechanism which handles resolving of conflict situations.

conform (adj)~ To be in accordance with requirements, specifications, or explicit expectations.

conforming (Adverb) ~ In accordance with requirements, specifications, or explicit expectations.

Congestion Controller (PN)~ A Media Center plug-in that is used for advanced network flow management, and in particular to avoid or limit network congestion.

connect (v)~ To assign a drive letter, port, or computer name to a shared resource so that you can use it.

Connect (v)~ The name of a menu from which the user can sign in, sign out, change sign-in information, and view and modify status settings.

connect (v)~ To join or link.

connect (PN)~ One of the pivots for a contact pinned to your Start screen, where you can find all your apps through which you can connect with that contact.

connect time (n)~ The amount of time during which a user is actively connected to a remote computer. On commercial systems, the connect time is one means of calculating how much money the user must pay for using the system.

Connect to a Projector (n)~ A wizard that is part of the Network Presentation feature of Windows Vista. This wizard finds and connects to available network-attached projectors on the local network.

Connected Accounts (PN)~ A feature that lets users receive and send mail from other e-mail accounts in Outlook Web App. They can add and delete those accounts, check their account synchronization status, and manage e-mail from those accounts in their Inbox using Inbox rules.

connected data source (n)~ A directory, database, file, or other data repository that is typically offsite and that needs to be accessed remotely.

Connected Frames (n)~ A Windows feature that enables developers and designers to build paginated content. They can take a single stream of HTML content containing text and images, and segment that stream into multiple containers defined in an HTML template across multiple pages. Connected Frames provides a declarative mechanism to link and flow HTML content across a finite set of frames with variable position and sizing that have been defined either statically or dynamically. Connected Frames also provides a set of programmatic interfaces which allow developers to detect when content overflow has occurred on a Connected Frame, determine when no more content is available for fragmentation, exposes the entire document associated with a set of Connected Frames, and exposes fragment content associated with a specific Connected Frame.

connected graph (n)~ A graph where for any two nodes in the graph, there is a path between them by following edges.

connected network (n)~ In MSMQ, a network that contains computers that are all interconnected.

connected object scope (n)~ A filter that identifies object types from a source directory based on a particular condition, for example Users, Computers, Printers.

connected object type (n)~ The object type in the connected system to which the ILM objects are connected.

connected standby (n)~ The state that enables a PC to turn on instantly and have tiles and other services update even when the screen is off.

connected system object creation flag (n)~ A parameter of a synchronization rule to indicate whether an object should be created in the connector space if the relationship criteria are not met.

connected system scope (n)~ A filter that defines what objects on the connected system to include in the target system.

connected TV (n)~ A TV that is connected to your Windows Media Center with a Media Center Extender, such as the Xbox 360, to enable you to share entertainment throughout your home.

connected user (n)~ A user who has access to a computer or a resource across the network.

connection (n)~ A link via wire, radio, fiber-optic cable, or other medium between two or more communications devices.

connection (n)~ Someone with whom a user has established a mutual social relationship on a third-party service that refers to such a relationship as a connection.

connection account (n)~ An account that provides access to a resource such as a Web site or a database.

connection agreement (n)~ A configurable section in the ADC user interface that holds information such as the server names to contact for synchronization, object classes to synchronize, target containers, and the synchronization schedule.

Connection Director (PN)~ A connectivity technology where applications based on different data access technologies (.NET or native Win32) can share the same connection information. Connection information can be centrally managed for such client

applications.

Connection Filter agent (n)~ An anti-spam agent that is enabled on computers that have the Microsoft Exchange Server 2007 Edge Transport server role installed.

Connection Manager (PN)~ An area that shows available network connections and helps users quickly connect to the most appropriate one.

connection manager (n)~ A logical representation of a run-time connection to a data source.

Connection Manager Administration Kit (PN)~ A tool for creating, editing, and managing Connection Manager profiles. The Connection Manager is a client dialer.

connection object (n)~ An Active Directory object that represents a replication connection from one domain controller to another. The connection object is a child of the replication destinations NTDS Settings object and identifies the replication source server, contains a replication schedule, and specifies a replication transport. Connection objects are created automatically by the Knowledge Consistency Checker (KCC), but they can also be created manually. Automatically generated connections must not be modified by the user unless they are first converted into manual connections.

connection point (n)~ A handle on a shape to which you can glue the endpoints of a 1-D shape such as a connector shape.

connection point (n)~ A System.Web.UI.WebControls.WebParts.ConnectionPoint object associated with the provider and consumer controls that participate in Web Parts connections. A connection point manages the exchange of data between the controls. Providers and consumers each have their own connection points.

connection speed (n)~ The maximum rate, in bits per second, at which data can be transferred between a network and a computer or device.

connection string (n)~ A series of arguments that define the location of a resource and how to connect to it.

connection string (n)~ A string that contains the parameters necessary to access a Microsoft Azure storage account.

connection timeout (n)~ The amount of time allotted for a connection to the database to take place, which when reached causes an error message to be generated and displayed in the Web browser.

connection type (n)~ The type of Web Part connection. For example, the Provide Row To connection type passes a row of data from one Web Part to another Web Part.

connectionless (adj)~ In communications, of, pertaining to, or characteristic of a method of data transmission that does not require a direct connection between two nodes on one or more networks. Connectionless communication is achieved by passing, or routing, data packets, each of which contains a source and destination address, through the nodes until the destination is reached.

connectivity (n)~ The ability of hardware devices or software packages to transmit data between other devices or packages.

connectivity (n)~ The ability of hardware devices, software packages, or a computer itself to work with network devices or with other hardware devices, software packages, or a computer over a network connection.

Connectivity Explorer (n)~ A window that shows pipeline components and all

components to which the pipeline is connected.

connector (n)~ A software component designed to support connections between products.

connector (n)~ In programming, a circular symbol used in a flowchart to indicate a break, as to another page.

connector (n)~ In hardware, a coupler used to join cables or to join a cable to a device (for example, an RS-232-C connector used to join a modem cable to a computer). Most connector types are available in one of two genders—male or female. A male connector is characterized by one or more exposed pins; a female connector is characterized by one or more receptacles—sockets or jacks— designed to accept the pins on the male connector.

Connector (n)~ A communications service used to exchange documents with your trading partners or your internal systems.

connector (n)~ Any one-dimensional (1-D) shape that can be glued between two shapes in a drawing to connect the shapes.

connector application (n)~ For Message Queuing, an application that enables Message Queuing computers to communicate with computers that use other messaging systems.

connector framework (n)~ A software component that can be used to connect to a data source, and index and include data from that source in search results.

connector point (n)~ An element in the Orchestration Designer that enables users to connect a Send/Receive shape with the operation of a port.

connector queue (n)~ For Message Queuing, a queue created on servers running a connector application. You can use the connector application to exchange messages with computers that are running other message-queuing products.

connector space (n)~ A staging area that contains representations of selected objects and attributes in a connected data source.

connector space object (n)~ An object in the connector space that is either created by a data import from the connected data source or by provisioning. These objects hold attribute values that can be imported or exported from corresponding objects in the connected data source or the metaverse.

consent prompt (n)~ A dialog box that appears when a user is requested to confirm whether an administrative process should be permitted to start. The user can approve the process by clicking Continue or cancel the process by clicking Cancel.

consistency (n)~ The ability of a transaction to change a system from one consistent state to another consistent state.

consistency check (n)~ The process by which DPM checks for and corrects inconsistencies between a protected volume and its replica. A consistency check is performed only when normal mechanisms for recording changes to protected volumes and for applying those changes to replicas have been interrupted.

consistency unit (n)~ The minimal unit of data synchronization. Because all changes that have the same consistency unit are sent together, synchronization can never be interrupted with part of a consistency unit applied.

consistency unit (n)~ The boundary of data that is kept consistent for a given service and can be moved around in the cluster due to failovers and load balancing.

console (n)~ A framework for hosting administrative tools, such as Microsoft Management Console (MMC). A console is defined by the items in its console tree, which

might include folders or other containers, World Wide Web pages, and other administrative items. A console has windows that can provide views of the console tree and the administrative properties, services, and events that are acted on by the items in the console tree.

Console ~ Nowadays usually refers to a dedicated gaming computer such as the Playstation or X-Box. Originally meant a terminal connected to a mainframe computer.

console root (n)~ The top node in an MMC saved view (.msc file).

console scope (n)~ In the Operations Manager Operations Console, a definition of the set of computer groups for individual Operations Manager users. A console scope limits the user to seeing only those computers that are in the computer groups associated with the console scope.

console tree (n)~ The left pane in Microsoft Management Console (MMC) that displays the items contained in the console. The items in the console tree and their hierarchical organization determine the capabilities of a console.

consolidate (v)~ In logging, to merge the information written to different log files in a single log file or, more typically, to a database (such as a SQL Server database) that can be processed by log analysis tools.

consolidated invoice (n)~ A vendor invoice that documents a sum of product quantities and monetary amounts from more than one referenced vendor invoice.

consolidated order (n)~ A source document that documents more than one referenced order.

consolidated project (n)~ A project containing one or more inserted projects. These can retain links to their source projects and may be linked to one another.

consolidated source document (n)~ A source document that documents a sum of product quantities and monetary amounts from more than one referenced source document of the same class.

consolidation (n)~ The process of producing an accounting of the earnings of a parent company and its subsidiaries, post acquisition, where the parent is the company with controlling interest.

consolidation account (n)~ The main account in the parent legal entity that is used for ledger consolidation.

consolidation opportunity (n)~ A potential cost-savings event obtained by grouping approved requisition line items in order to negotiate a more favorable price with vendors.

Consolidator (PN)~ In MOM 2000, a feature that collects and sends collected information from agents through the DAS to the database.

constant (n)~ A numeric or string value that is not calculated and, therefore, does not change.

constant attenuation (n)~ The intensity of a beam of light that does not diminish as it gets further from the light source.

constant bit rate (n)~ A characteristic of a data stream in which the bit rate remains nearly uniform for the duration of the stream.

constant buffer (n)~ A single-element vertex buffer that allows developers to efficiently supply shader constants data to the pipeline and store the results of the stream-output stage.

constant consumption (n)~ Specification that the volume or quantity of a component used in a finished item is fixed, regardless of the number of items produced or reported as finished.

constant expression (n)~ An expression that is composed only of constants and, hence, whose value does not change during program execution.

constant scrap (n)~ The quantity of a particular component that is expected to be scrapped during production regardless of the number of items produced.

constituent (n)~ A person who is associated with, or who is a member of, a non-profit organization.

constrained call (n)~ A method for invocation of interface methods on value types.

constrained delegation (n)~ The ability to specify that a service or computer account can perform Kerberos delegation to a limited set of services.

constrained field (n)~ A field that has certain restrictions, such as no images allowed.

constraint (n)~ A limitation or a restriction.

Constraint Service (n)~ A service responsible for answering HWS constraints-related querying by evaluating constraint clauses that are based on facts provided by the fact store manager and the relevant fact retrievers.

constraint violation (n)~ A violation that occurs when the restriction criteria are not satisfied.

Constraint-based configuration (n)~ A configuration technology that uses constraints to develop product masters and to configure distinct products.

construct (n)~ A structured piece of code formed from various syntax elements. Examples are expressions (try … with, if…then…else, etc.), function definitions (let … = …), and type declarations (type … = …).

constructed generic type (n)~ A generic type whose generic type parameters have been specified. A constructed type or method can be an open generic type if some of its type arguments are type parameters of enclosing types or methods, or a closed generic type if all of its type arguments are real types.

constructor (n)~ A special initialization function that is called automatically whenever an instance of a class is declared. This function prevents errors that result from the use of uninitialized objects. The constructor must have the same name as the class itself and must not return a value.

constructor string (n)~ An initialization string that is administratively specified for a component. It is possible to specify a constructor string when a component has been written specifically to recognize the string.

consult (v)~ To confer with the call recipient before transferring a call or adding the call recipient to a conference call.

consume (PN)~ A posting which registers which items were used, how much time was spent and what costs were incurred for a service. This type of posting does not increase the amount for which the customer will be invoiced.

consumed (adj)~ Pertaining to the items used, time spent and costs incurred during servicing that are not included in the invoice to the customer.

consume-first mode (n)~ One of the two statement completion modes that are provided by IntelliSense. Consume-first mode is used when classes and members are used before

they are defined.

consumer (n)~ In a Web Parts connection, a server control that receives data from a provider control and processes or displays it. A consumer can be any type of server control, but must be designed to function as a consumer. A consumer must have a special callback method marked with a ConnectionConsumerAttribute attribute in the source code. This method receives data from the provider in the form of an interface instance.

consumer endpoint (n)~ An endpoint where an application or system uses a service.

consumer good (n)~ A good that is created for consumer user rather than business use.

consumption (n)~ The items used, time spent and costs incurred during servicing that are not included in the invoice to the customer.

consumption depreciation method (n)~ A method of depreciation based on the usage of the asset.

consumption factor (n)~ A factor, specified as a quantity or percentage, that is used to calculate depreciation proposals for value models associated with depreciable fixed assets.

consumption statement (n)~ A report of the consumed cost for a project.

consumption unit (n)~ A unit that is used to enter unit price and calculate depreciation proposals for value models associated with depreciable fixed assets.

contact (n)~ A person, inside or outside your organization, for whom you have created an entry where you can save several types of information, such as street and e-mail addresses, telephone and fax numbers, and Web page URLs.

contact (n)~ An individual who is interested in doing business or who currently does business with your organization. A contact may or may not be part of a larger organization (account).

contact (n)~ A person whose information, such as ID or email address, has been added by the user to their contact list or to an address book.

contact (n)~ Any input on the Surface screen by a valid input type (finger, blob, or tagged object).

contact card (n)~ A presentation of information about a contact, including presence status and activity.

Contact Center Desktop (PN)~ An implementation of User Interface Integration (UII) intended to focus on Microsoft Dynamics CRM as the primary hosted control.

contact flyout (n)~ A flyout that provides information about a contact and allows the user to connect with the contact directly from an app.

contact form (n)~ A view of an individual contact that contains all the information stored in the contact.

contact group (n)~ A collection of e-mail addresses that is treated as a single recipient for e-mail distribution purposes, and that is created by and available to an individual Outlook user.

contact group (n)~ A user-specified collection of contacts.

Contact index (n)~ A set of buttons used to move through contact items displayed in Address Cards or Detailed Address Cards view. The Contact index moves the focus to the first contact whose name begins with the selected character.

Contact info (PN)~ The link to the page where users enter information for the methods by which they can be contacted, such as Messenger, home phone, mobile phone, and e-mail.

contact information (n)~ Information, such as name, phone number, email address, or address, that is used to contact someone.

contact item (n)~ An item that represents a contact in the Exchange store.

contact linking (n)~ The process of linking contacts that represent the same person. This enables you to view information from multiple contacts in a single contact card.

contact list (n)~ A list of people, groups, or organizations with whom you communicate.

contact management (n)~ The process of managing business and/or social contacts in order to follow up, track conversations, etc.

Contact Manager (PN)~ A feature that helps small businesses build, track, and grow relationships with customers. It enables users to organize customer relations and to set up a centralized location that coworkers can access for contact and sales information about customers and organizations.

contact note (n)~ An annotation in a conversation window that contains contact-specific information that may be important for call handling.

contact object (n)~ An object, similar to a user in Active Directory, that holds Office Communications Server configuration information, such as its routing and storage settings.

contact person (n)~ A person who acts as a connection to another organization or group, or who provides special information.

contact person (n)~ An individual or a person in another organization who works for the company that you interact with.

contact picker (n)~ A contact list designed for use within a form for selecting contacts. Users can click a contact to select it and may make multiple selections by using CTRL+click.

Contact Quick Form (n)~ UI button that allows a user to open a form to easily enter contact information without opening a record form.

contact request (n)~ A message asking to add or adding a Skype user to another user's contact list.

Contact requests (PN)~ The tab on the Family Safety website that displays requests a child has made via e-mail to have new contacts added.

Contact Support (PN)~ ?The app experience built into Windows that gives customers a way to contact Microsoft and third-party support for help with their PC.

Contacts (n)~ Entries in the Administration Center for main personnel, technical personnel, and billing personnel within the specified organization.

Contacts (PN)~ The UI label in Messenger for the results list of a contacts search.

Contacts list (n)~ A list of people, groups, or organizations with whom you communicate.

contained database (n)~ A SQL Server database that includes all of the user authentication, database settings, and metadata required to define and access the database, and has no configuration dependencies on the instance of the SQL Server Database Engine where the database is installed.

contained subgroup (n)~ A group of computers that is also part of another group.

container (n)~ An abstraction for associating one or more entities to a relational database or other store.

container (n)~ A directory object that can contain other directory objects. In Active

Directory, the schema definition of each object class determines the types of objects that can be containers of instances of the class.

container (n)~ A control flow element that provides package structure.

container (n)~ A handling unit for shipping and receiving items.

container (n)~ An application that contains a linked or embedded OLE object from another application.

container (n)~ A logical grouping of entity and association sets.

container (n)~ An object that can contain one or more child objects.

container (n)~ In HTML or XHTML, a tag pair that contains content (such as a <p> tag) as opposed to one consisting solely of the tag name and attributes (standalone tags).

container (n)~ A Shell item that can contain other items.

container (n)~ A user-defined set of blobs within a storage account. A container resource has no associated content, only properties and metadata.

container application (n)~ An application that contains a linked or embedded OLE object from another application.

container control (n)~ A type of ASP.NET mobile control that contains other controls and provides visual groupings of controls and content.

container element (n)~ An object that can contain one or more child objects.

container file (n)~ Files that can hold other kinds of files (such as *.ZIP, *.RAR, and *.JAR). Also, Microsoft Office files that use structured storage and the OLE embedded data format (for example, *.DOC, *.XLS, *.PPT, *.SHS) are considered container files.

container format (n)~ A metafile format that identifies and interleaves different data types, such as audio and video streams, subtitles, chapter-information, and metadata (tags) -€" along with the synchronization information needed to play the various streams together.

Container Name (PN)~ In mail forwarding, the name of the object that bundles e-mail accounts for forwarding.

container object (n)~ An object that can logically contain other objects. For example, a folder is a container object.

containment relationship (n)~ In a model, the inclusion of one object in a set of objects that all have something in common, to indicate some type of administrative grouping.

Contemporary Christian (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 140.

contemporary view (n)~ A SharePoint view that provides an optimized mobile browser experience for users and renders in HTML5.

content (n)~ The data that appears between the starting and ending tags of an element in an SGML, XML, or HTML document. The content of an element may consist of plain text or other elements.

content (n)~ Audio, video, images, text, or any other information that is contained in a digital media file or stream.

content (n)~ The information in a campaign that is intended to be communicated to marketing list members about the campaign. For example this content could be the dialog for a phone call or the body text of an e-mail message.

content (n)~ Audio, video, images, text, or any other information that presenters share with participants during a meeting, including resources, collaborative slides, and sharing slides.

Content (PN)~ An option on the Views menu in Windows Explorer that shows the most appropriate details for the file type in a flexible layout rather than only showing the details associated with the column headers in the view.

content access account (n)~ An account used to crawl Web sites, servers and network resources included in a content index.

Content Advisor (n)~ A tool in Microsoft Internet Explorer that lets you control which sites users on your computer can visit. This is particularly helpful for parents who want to control the content their children view on the Web.

content app (n)~ An app for Office that is embedded in the body of a client application window, inline with content.

content app for Office (n)~ An app for Office that is embedded in the body of a client application window, inline with content.

content application (n)~ An application that is used to create content, such as a graphic design application, a computer-aided design application, or an industry-specific content generating application.

Content by Query (PN)~ A Web Part that queries data from multiple sources within a site collection and presents that data in a custom view.

content class (n)~ A Web Storage System content class defines the intent or purpose of an item along with the names of properties that are intended for items in this class.

content control (n)~ A control designed to contain content such as placeholder or sample text or images that is updated by the user, or pre-defined lists of items from which users can select.

content conversion (n)~ The process of transforming e-mail messages from one format to another for the purpose of mail flow or storage, such as MAPI to MIME, or uuencode to Base64 encoded, or for appropriate rendering that is specific to an e-mail client, such as HTML to RTF to plain text.

content database (n)~ The Microsoft SQL Server or WMSDE database that contains the content for one or more SharePoint sites.

content delivery network (n)~ A distributed system of servers deployed in multiple data centers that cache content from origin servers and then serve it to customers. This action reduces the load on the origin servers and provides high- availability and performance to customers.

Content Delivery Network (n)~ The Microsoft Azure caching service that stores blobs at strategically placed locations to provide maximum bandwidth for delivering content to users.

content deployment (n)~ The act of exporting objects such as resources, templates, and galleries from a source system and importing them to a destination system. A common application is moving data from a development server to a production server.

Content Expiration (n)~ A UI element that allows a user to set the period of time that content remains on a Live Meeting server and is available to participants, after which it is deleted.

content formatter (n)~ The part of the distributor that turns raw notification data into readable messages.

content header (n)~ Part of the file structure of a Windows Media file that contains information necessary for a client computer to decompress and render the content data. In a packaged file, an additional content header exists and contains the key ID, content ID, and license acquisition URL. This content header can also include a required individualization version number and attributes defined by the content provider.

content index (n)~ The full-text index, pointer to the property store, and other data that describes content across content sources, scopes, and servers.

content index server (n)~ A server that is dedicated to creating and updating context indexes.

content indexing (n)~ The process of creating an index of the content.

content key (n)~ The cryptographic key used to both encrypt and decrypt protected content during publishing and consumption.

content library (n)~ A data repository, in which items such as text, text boxes, pictures, tables, shapes, etc. can be stored and re-used within the same document and across multiple documents.

content management (n)~ The collection, storing, and sharing of information in a single system where many users can access it.

content master (n)~ A slide template that defines default formatting or the position of placeholders for one or more slides in a presentation.

Content Organizer (PN)~ A feature of the Records Center that can automatically route incoming records (whether submitted automatically or manually) to their proper location, based on their record type.

content owner (n)~ The person or organization that controls access to protected content.

content page (n)~ A page that contains the content to be merged with a master page in order to render as complete web page.

content pane (n)~ In Commerce Server Business Desk, the window in which action pages are rendered.

content presenter (n)~ A slot in the template of a control (e.g. a button) into which you can place content without adding it directly to the template.

Content Protection (PN)~ The Azure Media Services solution for token-based authorization for both AES Clear-key and Microsoft PlayReady license delivery.

content provider (n)~ Broadly, an individual, group, or business that provides information for viewing or distribution on the Internet or on private or semiprivate intranets or extranets. Content in this sense includes not only information but also video, audio, software, listings of Web sites, and product-specific materials such as online catalogs.

content provider (n)~ An organization that prepares content for posting on the Web.

Content Query (PN)~ A Web Part that queries data from multiple sources within a site collection and presents that data in a custom view.

content rating (n)~ A value assigned to an item of media content that indicates its suitability for a particular audience.

content region (n)~ The area inside content placeholders.

content replication (n)~ A method of copying Web site content from one server node to another. You can copy files manually, or use replication software to copy content automatically. Replication is a necessary function of clustering to ensure fault tolerance.

content revocation (n)~ A process by which content owners or content packagers can disable licenses for their own packaged files.

content revocation string (n)~ A string that is generated by the content owner or content packager and is based on their public and private signing keys. This string is shared with the license issuer, who includes it in all licenses. Computers that receive a license with this string are no longer able to play files packaged with that particular signing key pair.

content scoping (n)~ The ability to control (on a folder basis) which file contents are downloaded to document tools on user devices.

Content Search (PN)~ A Web Part that performs a search using a customizable query and presents the results in a custom view.

Content Selection Framework (n)~ A development framework for the targeted delivery of content. The Content Selection Framework (CSF) provides the components you use to build a business-specific messaging system. CSF provides a platform for making high-speed decisions to target content to users.

Content Selection Pipeline (n)~ The infrastructure that links together the stages and pipeline components necessary to gather, filter, score, and select content.

content size (n)~ Height and width values (by pixel) for your content.

content slide show (n)~ A process that automatically displays each slide or page in a Live Meeting resource, one at a time, for a specified time interval.

content source (n)~ A set of options that you can use to specify what type of content is crawled, what URLs to crawl, and how deep and when to crawl.

content steward (n)~ A user role for an individual who owns or maintains a document repository, and who is responsible for configuring, customizing, and creating site features.

content template (n)~ A design template that also contains text suggestions on each slide. You replace the text suggestions with the text that you want. A content template contains a slide master and an optional title master.

content toolbar (n)~ The RTE (Rich Text Editor) toolbar used to create and format text and images.

content type (n)~ A group of reusable settings that describes the shared attributes and behaviors of a list item, a document, or a folder.

Content view (n)~ The view in Windows Explorer (offered in Windows 7 and later) that displays the most relevant content for each item based on its file name extension or Kind association.

content zone (n)~ The areas on the Page Editor where users can add content to the body of their Web page.

content-based routing (n)~ The routing of a document based on the information extracted from the payload of the document.

contention (n)~ On a network, competition among stations for the opportunity to use a communications line or network resource.

Contents (n)~ The listing of contents at the beginning of a document or file.

Contents (PN)~ A button that opens the current document's table of contents in a pane.

Users can pin the pane to the document, and when they scroll through the document, the table of contents dynamically highlights the section they are in.

context (n)~ An ordered sequence of properties that define an environment for the objects resident inside it. Contexts are created during the activation process for objects that are configured to require certain automatic services such as synchronization, transactions, just-in-time activation, security, and so on. Multiple objects can live inside a context.

context (n)~ In the Concurrency Runtime, an abstraction of an operating system thread.

context (n)~ A structure in the Entity Framework that represents the entity container that contains a connection to the underlying data source and provides services such as change tracking and identity resolution. A context is represented by an instance of the DbContext or ObjectContext class.

context control block (n)~ An internal file system structure in which a file system maintains the per-file object state for an open instance of a file.

context field (n)~ One of four fields of an SCODE. This field is reserved in the SCODE on 16-bit platforms and does not exist in the version for 32-bit platforms.

context ID (n)~ A unique number or string that corresponds to a specific object in an application. Context IDs are used to create links between the application and corresponding Help topics.

context menu (n)~ A menu that is related to the active window or item, accessible by right-clicking the mouse.

context menu item (n)~ A command displayed in the shortcut (context) menu. Examples include open and print.

context object (n)~ A pattern that provides a place to store scope or context related information or functionality that automatically follows the flow of execution between execution scopes or domains.

Context pane (n)~ A tree view included in the Table Designer that lists objects related to a table.

context property (n)~ The implicit state, and code to manage that state, held on behalf of an object instance. For example, the transaction context property holds the transaction identifier of the transaction that the object is participating in.

context switch (n)~ The changing of the identity against which permissions to execute statements or perform actions are checked.

context-sensitive Help (n)~ A form of assistance in which a program that provides on-screen help shows information to the user concerning the current command or operation being attempted.

contextual (adj)~ Specific to the conditions in which something exists or occurs.

contextual menu (n)~ A menu that is related to the active window or item, accessible by right-clicking the mouse.

Contextual Spelling (oth)~ An enhanced spell-check feature that looks at words before or after the word in question to assess proper usage. This allows the software to flag correctly-spelled words as 'wrong' if the usage appears to be incorrect.

contextual tab (n)~ A tab that is available only when an object in a page is selected.

contiguous (adj)~ Having a shared boundary; being immediately adjacent. For example, contiguous sectors on a disk are data-storage segments physically located next to one

another.

contiguous selection (n)~ A selection that consists of a set of objects that are logically sequential or adjacent to each other.

contiguous subtree (n)~ Any unbroken path in the tree, including all members of any container in that path.

contingency plan (n)~ A plan for addressing recognized risks that may arise during the course of a project. The plan identifies alternative strategies to be used to ensure project success if specified risk events occur.

continuable error (n)~ A non-access violation. An error that does not prevent an application from continuing.

continuation media (n)~ The series of removable backup media used after the initial medium becomes full, allowing continuation of the backup operation.

continuation tape (n)~ A tape that is used after the initial tape in a media family fills, allowing continuation of a media family.

Continued notice (n)~ A note at the beginning or end of a text box indicating that the text is continued from or continues on a different page.

continuity of care document (n)~ A standard format used to transfer patient health information between systems.

continuity of care record (n)~ A standard format used to transfer patient health information between systems.

Continuous Arrow Process (PN)~ A SmartArt graphic layout used to show a timeline or sequential steps in a task, process, or workflow. Works best with Level 1 text because each line of Level 1 text appears inside the arrow shape. Level 2 text appears outside the arrow shape.

Continuous Block Process (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow. Works best with minimal Level 1 and Level 2 text.

continuous copy relationship (n)~ The link between a primary database and an active secondary database with automatic data synchronization between them.

continuous crawl (n)~ A crawl that operates on a continuous basis to scan and index new and modified content from a source.

Continuous Cycle (PN)~ A SmartArt graphic layout used to represent a continuing sequence of stages, tasks, or events in a circular flow. Emphasizes the connection between all components. Works best with Level 1 text only.

continuous export (n)~ An export option for Application Insights Telemetry to put all the telemetry data of an Azure account into a blob storage for subsequent processing.

continuous form (n)~ A form that displays more than one record on the screen in Form view.

continuous loop (n)~ A loop that is repeated until a terminating event occurs.

Continuous Picture List (PN)~ A SmartArt graphic layout used to show groups of interconnected information. The circular shapes are designed to contain pictures.

Continuum (PN)~ A set of features that seamlessly adapt and optimize the user interface for different devices, modes of working, hardware, or platforms.

contour (n)~ The shape of how scheduled work for an assignment is distributed across

time. Use a contour to control how Project schedules the work of a resource.

contour chart (n)~ A surface chart subtype that provides a view of the surface chart from above, with colors representing specific ranges of values.

contra account (n)~ An account used to reduce an asset or a liability to its current value.

contra asset (n)~ An account that is used to reduce the gross cost of an asset to then arrive at the net cost.

contra liability (n)~ An account that is used to reduce a liability to arrive at its carrying value.

contract (n)~ A Service Broker object that defines the message types that can be exchanged within a given conversation.

contract (n)~ An agreement to provide customer service support during specified coverage dates or for a specified number of cases or length of time. When customers contact customer service, the level of support they receive is determined by their contract.

contract (n)~ A customer service issue or problem reported by a customer and the activities that customer service representatives use to resolve it.

contract (n)~ A formal or legally binding agreement between two or more parties.

contract (n)~ The behavior and state that a class provides, which is matched with what a client of that class can expect to hold. A contract is expressed partly by the signatures for all public fields, methods, properties, and events of that class. This is augmented by a description (usually in simple descriptive text) of what each field or property represents, together with what each method does. In the .NET Framework add-in programming model, a non-versioning interface that defines the methods and specifies the data types for transferring data over the communication pipeline between the host and the add-in. The contract is in the middle of the communication pipeline between the add-in and the host. The contract assembly is loaded into the application domains of both the add-in and the host.

contract (n)~ A legally binding agreement between two or more parties.

contract address (n)~ The postal location that correspondence should be mailed to about a contract.

contract closeout (n)~ The completion of the contract [such as fixed price or lump sum, cost reimbursable, unit price contracts]. Closeout includes resolving all outstanding issues and items, such as inspections or invoices.

contract line (n)~ The specific description in a contract of the service support to be provided, including pricing and how support is to be allotted.

contract template (n)~ A template that contains the standard attribute of a contract such as billing frequency and allotment type.

contract value (n)~ The price to be paid for a fixed-price project.

contractor (n)~ A role assumed by a person who participates in a contractor-employer relationship with a legal entity.

contrast (n)~ The degree of difference between light and dark extremes of color on a monitor, device screen, or printed output, or between the darkest and lightest areas in a photo. The greater the difference, the higher the contrast.

contravariance (n)~ In programming languages, the ability to use a less derived type than that originally specified. Contravariance in generic interfaces and delegates allows for

implicit conversion of generic type parameters. Contravariance is also supported for non-generic delegates for matching method signatures with delegate types.

contributor (n)~ A person who is involved in the creation of content. For example editors, technical reviewers and subject matter experts are contributors.

Contributor mode (PN)~ A feature that gives the user controlled access to features based on a given group role.

Contributor role (n)~ A collection of rights that enable the user to view pages and documents in a library, and contribute to discussions. This is a default role.

control (n)~ An object that enables user interaction or input, often to initiate an action, display information, or set values.

control (n)~ Management of a computer and its processing abilities so as to maintain order as tasks and activities are carried out. Control applies to measures designed to ensure error-free actions carried out at the right time and in the right order relative to other data-handling or hardware-based activities.

control bar (n)~ A control implemented by MMC to display and manage its own toolbars and menu buttons, as well as those added by snap-ins.

Control call forwarding from Communicator (oth)~ An item the user can select in the Options dialog box, Phones tab. When the user selects this option, Communicator controls automatic forwarding of incoming calls using the call-forwarding settings the user selects.

control character (n)~ A character that is inserted in right-to-left and mixed text to specify the formatting of text when the inherent directionality of the text is insufficient to display expected results.

Control chart (n)~ A chart that displays additional information about a graph in terms of the following control lines: Average, Upper limit (calculated based on natural process deviation and six sigma technique), and Lower limit (calculated based on natural process deviation and six sigma technique).

control code (n)~ One or more nonprinting characters used by a computer program to control the actions of a device, used in printing, communications, and management of display screens. Control codes are mainly employed by programmers or by users to control a printer when an application program does not support the printer or one of its specialized features. In video, control codes are sent from a computer to a display unit to manipulate the appearance of text or a cursor on the screen. Popular video control code sets are ANSI and VT-100.

control code (n)~ A unique code that is used to identify cash register receipts.

control device object (n)~ A device object that represents the filter driver to the system and to user-mode application and which allows applications to communicate with the filter driver directly, even before the filter is attached to a file system or volume device object.

control escape sequence (n)~ In regular expressions, a backslash followed by the letter 'c' followed by one of the letters 'a' through 'z' or 'A' through 'Z'. It matches the ASCII control character that is named by that letter.

control flow (n)~ A group of connected control flow elements that perform tasks.

control flow (n)~ A transition in an activity diagram. A control flow represents a relationship between two states or action states and indicates that an object in the first state will enter the second state and perform specified actions.

control flow guard (n)~ A security feature that makes it more difficult to corrupt memory by implementing restrictions on where an application can execute code from.

Control Gallery (n)~ A library of controls that support user interface development. Some of these controls function as containers for other controls or content, such as images and media.

control group (n)~ A set of controls that are conceptually or logically related. Controls that are conceptually related are usually viewed together but do not necessarily affect each other. Controls that are logically related affect each other.

control handle (n)~ A handle that specifies unique behavior for certain shapes.

control interface (n)~ The virtual objects and mechanisms that control an application.

Control key (n)~ A key that, when pressed in combination with another key, gives the other key an alternative meaning.

control menu (n)~ A menu that contains commands you can use to manipulate a window or close a program. You click the program icon at the left of the title bar to open this menu. The context menu of a window replaces this menu.

control message (n)~ An application-readable message requesting the execution of a specific operation on the client side.

Control Node (PN)~ An- appliance- node that is the central point of control for processing queries on the- SQL Server PDW appliance, receiving the user query, creating a distributed query plan, communicating relevant plan operations and data to- Compute nodes, receiving Compute node results, performing any necessary aggregation of results, and then returning the query results to the user.

Control Panel (PN)~ A Windows program that collects and displays for users the system-level features of the computer, including hardware and software setup and configuration. From Control Panel, users can click individual items to configure system-level features and perform related tasks.

Control Panel Home (n)~ The main Control Panel window.

control part (n)~ An element in a control template that has special, possibly mandatory, significance and semantics in the functioning of the control. For example, a template for a ScrollBar control should supply a Thumb part for the ScrollBar to function correctly, but it need not provide a small decrease or a small increase button.

control pattern (n)~ A design implementation that describes a discrete piece of functionality for a control. This functionality can include the visual appearance of a control and the actions it can perform.

control point (n)~ A handle that can be dragged to change the curve or symmetry of a segment.

control point (n)~ The reference point in a compensation range that represents the intended average pay for all employees at that compensation level. For grade structures, control points are typically, but not always, the range midpoint. Broad band structures can use control points but rarely do.

control protocol plug-in (n)~ A type of plug-in that enables a Windows Media server to communicate with clients and other servers through different network protocols.

control skin (n)~ A skin that is characterized by the properties for controls, such as buttons, labels, calendars, etc.

control state (n)~ A field in an ASP.NET Web page that stores the current property settings for server controls on the page. Control state is used to recreate the page and reestablish previous settings on each postback.

control template (n)~ A tree of elements that is expanded into the scene whenever a control of a particular type is found. The elements typically have properties bound to properties of the control instance.

control tip (n)~ A brief phrase that describes a control, a page, or a tab. The control tip appears when the user briefly holds the mouse pointer over a control.

Control Tools (n)~

control unit (n)~ A device that processes data from receipts that are generated by a cash register.

control-break (n)~ A key or combination of keys used to tell a computer to halt, or break out of, whatever it is doing. On IBM PCs and compatibles under DOS, pressing the Pause/Break or Scroll Lock/Break key while holding down the Ctrl key issues the break command (as does Ctrl-C). On Macintosh computers, the key combination that sends a break code is Command-period.

controller (n)~ The part of a test rig that distributes tests to agent computers and collects test results.

controller server (n)~ The server computer on which the Microsoft Web Farm Framework software is installed. This server is used to specify the administrator account for the Web farm, to manage primary and secondary servers, and to synchronize Web platform components, configuration, applications, and content between servers.

control-of-flow language (n)~ Transact-SQL keywords that control the flow of execution of SQL statements and statement blocks in triggers, stored procedures, and batches.

convention (n)~ Any standard that is used more or less universally in a given situation. Many conventions are applied to microcomputers. In programming, for example, a language such as C relies on formally accepted symbols and abbreviations that must be used in programs. Less formally, programmers usually adopt the convention of indenting subordinate instructions in a routine so that the structure of the program is more easily visualized. National and international committees often discuss and arbitrate conventions for programming languages, data structures, communication standards, and device characteristics.

convention (n)~ A rule that describes how to model a class with the Entity Framework.

Convergence ~ The consolidation of all communications - voice, data and video - onto a single network infrastructure.

Converging Arrows (PN)~ A SmartArt graphic layout used to show ideas or concepts that converge to a central point. Works best with Level 1 text only.

Converging Radial (PN)~ A SmartArt graphic layout used to show relationships of concepts or components to a central idea in a cycle. The first line of Level 1 text corresponds to the central circular shape and the lines of Level 2 text correspond to the surrounding rectangular shapes. Unused text does not appear, but remains available if you switch layouts.

conversation (n)~ A discussion with a customer or colleague.

conversation (n)~ A real-time communication session between two or more users. A

session can involve IM, video, or audio.

conversation (n)~ A collection of communications (e-mail, IM, text messaging, voice mail, and so on) between two or more participants.

conversation area (n)~ The pane where conversations, including phone calls, conference calls, and instant messages, are displayed for the user.

conversation endpoint (n)~ The object which represents a party participating in the conversation.

conversation group (n)~ A group of related Service Broker conversations. Messages in the same conversation group can only be processed by one service program at a time.

conversation handle (n)~ An handle which uniquely defines a conversation.

Conversation History (PN)~ The folder in Outlook where instant messages and phone conversations are stored.

conversation invitation (n)~ A request for a conversation.

conversation note (n)~ A note you type on the Notes tab of a conversation window to potentially be forwarded along with the call and saved in the call history.

conversation subject (n)~ Text indicating the topic of a conversation. It is entered by the user or generated by the computer based on conversation information. It is displayed in the conversation title bar or in an alert.

conversation tracking (n)~ Keeping a record of chat conversations in CRM, which occur through Lync.

Conversation window (n)~ The window that is displayed when the user is in any type of conversation. This window displays the list of conversation window participants, the conversation content for instant messaging and video conversations, and commands and controls for managing the conversation.

Conversational MOS (n)~ A prediction of the narrowband conversational quality MOS (MOS-CQ) of the audio stream that is played to the user. This value takes into account the listening quality of the audio played and sent across the network, the speech and noise levels for both audio streams, and echoes.

conversational quality MOS (n)~ A class of MOS values that takes into account listening quality in each direction, as well as bidirectional effects, such as delay and echo.

conversion (n)~ The process of changing from one form or format to another; where information is concerned, a changeover that affects form but not substance. Types of conversion include data (changing the way information is represented), file (changing a file from one format to another), hardware (changing all or part of a computer system), media (transferring data from one storage media to another), software (changing a program designed for one platform so that it runs on another), and system (changing from one operating system to another).

conversion (n)~ An action taken by a visitor to your public Web site that results in a desired customer response, such as requesting more information or signing up for a newsletter.

conversion (n)~ An action by which a subscription (the source subscription) is replaced by a new subscription, both owned by the same billing account, along a preconfigured conversion path. The source subscription is canceled and the destination subscription is the new subscription.

conversion cycle (n)~ A recurring set of production and logistics activities performed by parties that manufacture or distribute items.

conversion function (n)~ A function that converts one data type or format to another data type or format.

Conversion Manager (PN)~ A report administration page that allows users to view, create or change conversion points.

conversion page (n)~ A Web site page that a visitor reaches after having completed an action.

conversion point (n)~ A measurement of the number of visitors who reach a conversion page.

conversion rate (n)~ The number of clickthroughs your site receives divided by the number of conversions.

conversion rate sales (n)~ The total revenue from all conversions for a specified time period.

conversion referrer (n)~ An ad, search result, or any other link that sends a user to the site where that user completes a transaction.

conversion table (n)~ A table listing a set of characters or numbers and their equivalents in another coding scheme. Common examples of conversion tables include ASCII tables, which list characters and their ASCII values, and decimal-to-hexadecimal tables.

conversion time (n)~ The time at which the conversion rate is applied to a transaction. If the conversion type is a fixed rate, the conversion time should always be the time at which the order was accepted for fulfillment. If the conversion type is a spot rate, the conversion time is when the bank performs the conversion.

conversion tool (n)~ A tool that is used to perform conversions.

conversion tracking (n)~ The process of collecting data about which visitors to your site perform the actions you desire (such as signing up for a newsletter or making a purchase).

conversion type (n)~ The type of currency conversion used to convert the buyer currency to the base currency for the Web site, or to convert the supplier currency to the base currency in a multicurrency transaction. The conversion type can be either a fixed (static) rate, or a spot (dynamic) rate.

conversion type (n)~ The kind of conversion based on the action desired from the user (e.g. purchase, subscription).

convert (v)~ To change from one form or function to another.

convert (v)~ To change one type of record, for example, a campaign response to an opportunity, or an activity to a case.

Convert to Motion Path (v)~ A tool that allows the user to convert a shape or path into a path along which another object will move, automatically generating a storyboard for the animation.

Convert to Path (v)~ A tool that is used to convert a shape to a path object, whose vertices you can then modify individually.

Convert to Shape (PN)~ A feature that enables Tablet PC users to convert an ink drawing to a standard OfficeArt shape, which can be formatted with colors and effects exactly as if it were inserted using -€œInsert Shape.-€?

converter (n)~ Any device that changes electrical signals or computer data from one form

to another. For example, an analog-to-digital converter translates analog signals to digital signals.

convex hull (n)~ The smallest convex set that contains X in the Euclidean plane or Euclidean space.

co-occurrence matrix (n)~ A matrix or distribution that is defined over an image to be the distribution of co-occurring values at a given offset.

cookie (n)~ On the World Wide Web, a block of data that a Web server stores on a client system. When a user returns to the same Web site, the browser sends a copy of the cookie back to the server. Cookies are used to identify users, to instruct the server to send a customized version of the requested Web page, to submit account information for the user, and for other administrative purposes.

Cookie ~ A small data file stored on your computer by a website, in theory to allow it to 'remember' your preferences, but in practise mostly used to track which adverts you have seen. You can set most browsers to reject all cookies, or to ask your permission before storing them, but this will generate multiple error messages on a lot of websites and is generally more hassle than it's worth - they are pretty harmless. UK websites are required to display a warning message about them because no-one could make Prime Minister David Cameron understand what they do.

Cookie ~ a piece of information sent by a Web- Server- to a Web- Browser- that the Browser software is expected to save and to send back to the Server whenever the browser makes additional requests from the Server.

Cookie replay attack (n)~ An attack that captures the user's authentication cookie using monitoring software and replays it to the application to gain access under a false identity.

cooldown time (n)~ The minimum length of time that the user needs to wait after using the system before using it again.

cooperative blocking (n)~ In multithreading, the act of one task yielding processing resources to other tasks.

coordinate (n)~ Each of a set of references that together describe the exact position of something with respect to a set of axes (or a row and column).

coordinate pair (n)~ A pair of values representing the x- and y-coordinates of a point that are stored in a two-dimensional array that can contain coordinates for many points.

Coordinated Universal Time (n)~ The standard time common to every place in the world, coordinated by the International Bureau of Weights and Measures. Coordinated Universal Time is used for the synchronization of computers on the Internet.

co-owner (n)~ The person who, together with the owner, controls how permissions are set on objects and can grant permissions to others.

COP (n)~ The official currency of Colombia.

copay (n)~ A fee that must be payed for the use of specific medical services covered by a medical plan.

coprocessor (n)~ A processor, distinct from the main microprocessor, that performs additional functions or assists the main microprocessor.

co-product (n)~ An item produced jointly with another item.

copy (v)~ To duplicate information and reproduce it in another part of a document, in a different file or memory location, or in a different medium. A copy operation can affect

data ranging from a single character to large segments of text, a graphics image, or from one to many data files.

copy area (n)~ The cells that you copy when you want to paste data into another location. After you copy cells, a moving border appears around them to indicate that they've been copied.

copy backup (n)~ A backup that copies all selected files but does not mark each file as having been backed up (in other words, the archive attribute is not cleared). Copying is useful if you want to back up files between normal and incremental backups because copying does not affect these other backup operations.

Copy General Management System Analog (n)~ A method for controlling the copying of broadcast media content that allows only one generation of copying.

Copy Number (PN)~ The button that enables the user to copy the retrieval number of a parked call.

copy on write (n)~ Page protection that allows multiple applications to map their virtual address spaces to share the same physical pages until an application needs to modify the page and have its own instance copy, which allows the virtual memory manager to save memory and execution time.

copy set (n)~ A duplicate of the media master that Remote Storage copies to a different tape or disk. Copy sets are typically used for backup purposes.

copyfitting (n)~ The resizing of text to fit into an allotted amount of space.

copy-on-write page protection (n)~ A concept that allows multiple applications to map their virtual address spaces to share the same physical pages, until an application needs to modify the page and have its own instance copy.

copyright (n)~ A method of protecting the rights of an originator of a creative work, such as a text, a piece of music, a painting, or a computer program, through law.

copyright symbol (n)~ The -© character. Normally included at the beginning of a copyright notice.

Coral Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of coral colors.

CORBA (n)~ A specification developed by the Object Management Group in 1992 in which pieces of programs (objects) communicate with other objects in other programs, even if the two programs are written in different programming languages and are running on different platforms. A program makes its request for objects through an object request broker, or ORB, and thus does not need to know the structure of the program from which the object comes. CORBA is designed to work in object-oriented environments.

core (n)~ One of the types of memory built into computers before random access memory (RAM) was available or affordable. Some people still use the term to refer to the main memory of any computer system, as in the phrase core dump—a listing of the raw contents of main memory at the moment of a system crash.

core application questionnaire (n)~ A questionnaire used to gather key information about your organization to be used as a roadmap for building your PerformancePoint Server application.

core cmdlet (n)~ One of a core set of commands for manipulating the system and that corresponds to commands found in other shell environments.

core installation (n)~ An option that can be used for installing Windows Server 2008 or Windows Server 2008 R2. It provides a minimal environment for running specific server roles, which reduces the maintenance and management requirements and the attack surface for those server roles.

Core layer (n)~ A layer in the Surface SDK that exposes a set of APIs for developers to use to create Surface applications.

core model (n)~ The first layer of the CIM schema, which includes the top-level classes and their properties and associations. The core model is both domain- and platform-independent.

Core Parking (PN)~ A feature that dynamically selects a set of processors that should stay idle and not run any threads based on the current power policy and their recent utilization.

core program (n)~ A program or program segment that is resident in random access memory (RAM).

Core Web Server (PN)~ The Windows services that make up the core of IIS 7. The Core Web server provides the foundation for the modular architecture of IIS.

core-based licensing (n)~ A licensing option where cores are licensed rather than users or devices.

corner join (n)~ Two lines that are joined at an angle. For objects that have sharp corners, such as rectangles, you can change the way the stroke looks at each corner point by applying one of three corner join styles: miter join, round join, and bevel join.

corner point (n)~ An anchor point where the two handles are fully retracted, so they're sitting inside' the node itself and cannot be selected.'

corner radius (n)~ The radius that determines how much, if any, the corner of a rectangular object is actually curved or rounded-off'.'

correction area (n)~ An area that appears in the writing pad when you tap the recognized text that you want to correct. You can use it to rewrite an incorrectly recognized character or to replace a word with a suggested alternative.

correction comb (n)~ An area that appears in the writing pad when you tap the recognized text that you want to correct. You can use it to rewrite an incorrectly recognized character or to replace a word with a suggested alternative.

Corrections (PN)~ A set of features that enables users to improve the quality of their images with just one or two clicks. Galleries help the user optimize characteristics such as brightness, contrast, color, and sharpness.

correlate (v)~ In logging, to show which logged client-side events caused corresponding server-side events. Log data is ofen correlated as it is being consolidated to a database or log file.

correlated subquery (n)~ A subquery that references a column in the outer statement. The inner query is run for each candidate row in the outer statement.

correlation (n)~ Creating relationships between an email activity and other records by using the information from email headers.

correlation ID (n)~ A randomly generated ID that is associated with a message and passed along for the lifetime of a given message.

correlation set (n)~ An instance of a correlation type; that is, the listed properties for a

message that are used to determine whether it belongs to a given instance of an orchestration.

correlation type (n)~ A set of message properties that uniquely identifies a business process and which is used to correlate messages with orchestration instances.

correspondent account (n)~ An account established by a banking institution to make transactions on behalf of another financial institution, usually for international transactions.

corrupt (v)~ To damage, in regard to files or data.

corrupted (adj)~ Damaged. Mostly used in regard to files or data.

corrupted heap pointer (n)~ An access violation that occurs most typically when a block is allocated in one heap and freed in another.

corrupted infix pattern (n)~ An access violation that occurs when a set of freed blocks that have been marked non-accessible are touched by a program.

corrupted prefix pattern (n)~ An access violation that occurs with buffer underruns.

corrupted suffix pattern (n)~ An access violation that happens most typically with buffer overruns.

Cortana (PN)~ The personal assistant feature on Windows Phone and Windows.

Cortana Home (PN)~ ?The place where Cortana shows cards to the user that include suggestions, questions, feedback, etc.

Cortana's Notebook (PN)~ ?The space where Cortana stores all of the information she knows about you.

co-sign (v)~ To digitally sign data along with one or more additional signatories. A cosignature does not imply that other signatures are valid.

cost (n)~ The amount of money spent in producing or acquiring.

cost (n)~ The value of an economic resource that is quantified in monetary units and that is measured using an accounting valuation principle.

cost accounting (n)~ The branch of accounting concerned with identifying and evaluating the cost of producing a product.

cost accumulation method (n)~ The method used to classify and allocate transformation costs.

cost adjustment amount (n)~ The sum of the differences between the original purchase price of the goods and the final price, which includes any additional item charges, revaluation, or rounding amounts.

cost basis (n)~ The purchase price of an asset, including freight, tax, and other expenses, less any adjustments, such as Section 179 Expense Deduction and salvage value.

cost center (n)~ An operating unit whose managers are accountable for budgeted and actual expenditures.

Cost Increase (PN)~ A calculated field that subtracts the total budgeted cost from the total actual cost and then divides that value by the total budgeted cost. This value is then multiplied by 100.

cost line (n)~ The part of a cost template that specifies one or more categories that form the basis of a cost estimate.

cost of goods sold (n)~ An accounting category used to sum the financial consequences of manufacturing products and carrying inventory.

cost per click (n)~ The amount an advertiser's account is charged each time the advertiser's ad is clicked by a search user or site visitor.

cost performance index (n)~ The ratio of budgeted costs of work performed to actual costs of work performed [BCWP/ACWP]. The cumulative CPI [sum of the BCWP for all tasks divided by the sum of the ACWP for all tasks] can be used to predict whether a project will go over budget.

cost project (n)~ An internal project for which costs of hours, expenses, and items can be registered, but not capitalized.

cost rate table (n)~ A collection of information about a resource's rates, including the standard rate, overtime rate, any per-use cost, and the date when the pay rate takes effect. You can establish up to five different cost rate tables for each resource.

cost resource (n)~ A resource that doesn't depend on the amount of work on a task or the duration of a task, such as airfare or lodging.

cost template (n)~ A method for applying estimates on fixed-price projects and investment projects.

cost variance (n)~ The difference between an expected cost and an actual cost.

costed (adj)~ Pertaining to something for which an estimate or cost has been provided.

costed (v)~ To calculate, assign, and allocate the cost of economic resources acquired, produced, or delivered by an organization.

costing (n)~ The process of calculating, assigning, and allocating the cost of economic resources acquired, produced, or delivered by an organization.

count window (n)~ A window with a variable window size that moves along a timeline with each distinct event start time.

count XPath (n)~ An XPath expression that returns a numeric value to be rendered within parentheses after the display name of the object.

countdown timer (n)~ A mechanism that measures the remaining time from a preset amount of time and sounds an alarm when this time has elapsed.

counter (n)~ In programming, a variable used to keep count of something.

counter (n)~ A global integer variable that is used in a runbook.

counter set (n)~ A set of system performance counters that are useful to monitor during a load test. Counter sets are organized by technology, for example, ASP.NET or SQL counter sets.

counter set map (n)~ An association between a counter set and a computer used during a load test. For example, a Web server might have ASP.NET, IIS, and .NET application counter set mappings.

counter threshold (n)~ The threshold at which alerts are triggered. There are two types of thresholds: warning and critical. Counter set definitions contain predefined thresholds for many key performance indicators.

Counterbalance Arrows (PN)~ A SmartArt graphic layout used to show two opposing ideas or concepts. Each of the first two lines of Level 1 text corresponds to an arrow and works well with Level 2 text. Unused text does not appear, but remains available if you switch layouts.

counterfeit software (n)~ Software that a system builder does not obtain from an authorized distributor, or that a royalty OEM does not obtain from an authorized

replicator. Counterfeit software usually has many of the following problems: missing drivers, missing documentation, viruses, bugs, and other defects. Installing legitimate Microsoft products helps ensure the quality of your products, prevents customer problems, and reduces requests for customer support.

countersign (v)~ To sign a document already signed by the other party.

countersignature (n)~ A signature of an existing signature and message or a signature of an existing signature. A countersignature is used to sign the encrypted hash of an existing signature or to time stamp a message.

counter-signature (n)~ A signature of an existing signature and message or a signature of an existing signature. A countersignature is used to sign the encrypted hash of an existing signature or to time stamp a message.

counting loop (n)~ In a program, a group of statements that are repeated, thereby incrementing a variable used as a counter (for example, a program might repeat a counting loop that adds 1 to its counter until the counter equals 10).

Country (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 2.

country/region-specific (adj)~ Of, pertaining to, or characteristic of hardware or software that uses characters or conventions unique to a particular country/region or group of countries/regions. Country/region-specific does not necessarily refer to spoken languages, although it does allow for special characters (such as accent marks) that are language-specific. Generally, the features considered country/region-specific include keyboard layout (including special-character keys), time and date conventions, financial and monetary symbols, decimal notation (decimal point or comma), and alphabetic sorting order. Such features are handled either by a computer's operating system or by application programs that offer options for tailoring documents to a particular set of national/regional or international conventions.

Courier Sender (n)~ A Configuration Manager communication mechanism that enables you to create and send package information to another Configuration Manager site through non-network channels.

course (n)~ A series of classes that cover aspects of a subject area.

course code (n)~ A number or code that an educational institution uses to identify a particular class.

Coursera (PN)~ An education platform that partners with top universities and organizations worldwide, to offer courses online for anyone to take, for free.

courtesy copy (n)~ A directive to an e-mail program to send a complete copy of a given piece of mail to another individual. The use of cc mail addressing, as opposed to directly addressing the mail to a person, generally implies that the recipient is not required to take any action; the message is for informational purposes only. In a cc directive, the fact that this recipient received the mail is printed in the mail header and is thus known to all other recipients.

covariance (n)~ A statistical measure of the tendency of two variables to change in conjunction with each other. It is equal to the product of their standard deviations and correlation coefficients.

covariance (n)~ In programming languages, the ability to use a more derived type than that originally specified. Covariance in generic interfaces and delegates allows for implicit conversion of generic type parameters. Covariance is also supported for non-generic delegates for matching method signatures with delegate types.

cover (n)~ The photo displayed at the top of an album, and used to represent the whole album when albums are shown in list view. It is also used to describe the representative photo in a stack (of near duplicate photos).

cover inserter (n)~ An additional (usually optional) unit on high-end copy machines that allows users to insert pre-printed covers, tabs and chapter separators into documents.

cover letter (n)~ A letter that serves to introduce accompanying documents to the recipient. Often refers to a letter sent with a resume when applying for a job.

cover photo (n)~ The photo displayed at the top of an album, and used to represent the whole album when albums are shown in list view. It is also used to describe the representative photo in a stack (of near duplicate photos).

coverage collection (n)~ Information collected at run time about which blocks or lines of an application are executed at least once.

coverage map (n)~ A digital map indicating the area in which one can expect good cell-phone reception from a specific mobile operator.

COW (n)~ Page protection that allows multiple applications to map their virtual address spaces to share the same physical pages until an application needs to modify the page and have its own instance copy, which allows the virtual memory manager to save memory and execution time.

coworker shape (n)~ In an organization chart, a shape next to another shape that is connected to the same superior (or manager) shape.

CPA (oth)~ An organization that specifies payment formats for Canada.

CPF (n)~ An 11-digit identification number issued to Brazilians and resident aliens by the Brazilian Ministry of Revenue for identification and tax purposes.

CPI (n)~ A programming interface used to build and maintain unattended installation answer files and configuration sets by adding security fixes, changing drivers, and so forth.

CPI (n)~ The ratio of budgeted costs of work performed to actual costs of work performed [BCWP/ACWP]. The cumulative CPI [sum of the BCWP for all tasks divided by the sum of the ACWP for all tasks] can be used to predict whether a project will go over budget.

CPM (n)~ A project management method of calculating the total duration of a project based on individual task durations and their dependencies.

cps ~ (Characters Per Second)- A measure of how quickly information, particularly text, is being transferred over a modem link or network. See also- bps.

CPU (n)~ The computational and control unit of a computer. The CPU is the device that interprets and executes instructions. Mainframes and early minicomputers contained circuit boards full of integrated circuits that implemented the CPU. Single-chip central processing units, called microprocessors, made possible personal computers and workstations.

CPU ~ (Central Processing Unit)- The nerve centre of the computer : everything flows through it. Often just called 'the processor'. The best known PC processors are

Intel's- Pentium- and AMD'sAthlon.

CPU busy (n)~ A SQL Server statistic that reports the time, in milliseconds, that the central processing unit (CPU) spent on SQL Server work.

CPU cap (n)~ The maximum amount of CPU time that can be consumed by each processor to ensure that no application nor virtual machine blocks the system. This is mostly used in virtualization.

CPU capping (n)~ The use of CPU caps.

CPU speed (n)~ A relative measure of the data-processing capacity of a particular central processing unit (CPU), usually measured in megahertz.

CPU time (n)~ In multiprocessing, the amount of time during which a particular process has active control of the CPU (central processing unit).

CPU-bound (oth)~ Of, pertaining to, or characteristic of a situation in which the performance of a computer is limited by the number of arithmetic operations the microprocessor must perform. When a system is computation-bound, the microprocessor is overloaded with calculations.

Crack, cracked ~ A crack is a small program intended to defeat software's copy protection, thus allowing unlicensed copies to be made - stealing it, in effect. Software that is distributed with its copy protection disabled or bypassed has been 'cracked'.

cradle (v)~ To place a mobile device in a cradle to connect to a desktop computer.

Craigslist ~ Craigslist is a centralized network of online communities featuring free online classified advertisements, with sections devoted to jobs, housing, personals, for sale, services, community, gigs, résumés, and discussion forums.- http://www.craigslist.org/

Craquelure (PN)~ A live effect that simulates fine cracks in paint or enamel on the surface of an object.

crash (v)~ For a system or program, to fail to function correctly, resulting in the suspension of operation.

crash (n)~ The failure of either a program or a disk drive. A program crash results in the loss of all unsaved data and can leave the operating system unstable enough to require restarting the computer. A disk drive crash, sometimes called a disk crash, leaves the drive inoperable and can cause loss of data.

Crash ~ When a computer program or operating system stops working completely or almost completely it (or the computer) is said to have 'crashed'. When a computer crashes it usually needs to berebooted- before it can be used again. See also- lockup.

crash dump (n)~ A binary file that a programmer can load into a debugger to analyze the cause of the crash. It contains the contents of the memory when the crash occurred.

Crash Dump Type (n)~ Specifies the file format Dr. Watson will use to store the information. The Full format contains the entire memory space of the program, as well as the program image itself, the handle table, and other information that will be useful to the debugger. The Mini format may include the full memory and handle table, or it may simply contain information about a single thread. The Windows NT 4.0-compatible Full format provides you with the opportunity to use older tools to analyze the dump file. Crash Dump Type is only available when you have selected the Create Crash Dump File check box.

crash recovery (n)~ The ability of a computer to resume operation after a disastrous failure, such as the failure of a hard drive. Ideally, recovery can occur without any loss of data, although usually some, if not all, data is lost.

Crate (PN)~ A compression container format (.cr8) in Windows that largely replaces the CAB format in all servicing scenarios. This format extends beyond servicing and is a compression solution for file sharing in general.

crawl (v)~ To compile and organize entries for a search engine or content index by reading Web pages or other content.

crawl (n)~ The process of scanning content to compile and maintain an index.

crawl log (n)~ A set of properties that provides information about the results of crawling a display URL. The information includes whether the crawl was successful, the content source to which the display URL belongs, and the level, message, time, and identifier for any errors that occur.

crawl rule (n)~ A set of preferences that applies to a specific URL or range of URLs that you can use to include or exclude items you want to crawl and specify the content access account to use when crawling that URL or range.

crawl scope (n)~ A collection of data stores (identifiable by URL) that represents content that the indexer crawls and indexes.

Crawl Scope Manager (PN)~ The set of interfaces that provides methods to inform the Windows Search engine about containers to crawl and items under those containers to include in or exclude from the catalog.

Crawler ~ A program that indexes pages on the World Wide Web for search engines.

crawler impact rule (n)~ A rule that applies to a specific URL or range of URLs on which you can configure crawling to reduce the resources that are used on the server that is being crawled.

crawling account (n)~ An account used to crawl Web sites, servers and network resources included in a content index.

CRC (n)~ A procedure used in checking for errors in data transmission. CRC error checking uses a complex calculation to generate a number based on the data transmitted. The sending device performs the calculation before transmission and includes it in the packet that it sends to the receiving device. The receiving device repeats the same calculation after transmission. If both devices obtain the same result, it is assumed that the transmission was error free. The procedure is known as a redundancy check because each transmission includes not only data but extra (redundant) error-checking values. Communications protocols such as XMODEM and Kermit use cyclical redundancy checking.

create (v)~ To bring an object into existence by allocating the necessary storage space and giving values to its attributes.

Create Console Scope Wizard (n)~ A wizard that allows the user to define a console scope, the computer groups associated with the console scope, and the users associated with the console scope.

Create Deployment Package Wizard (n)~ A wizard you use in Mobile Deployment Manager to create a deployment package.

Create Installation Item Wizard (n)~ A wizard you use in Mobile Deployment Manager

to create an installation item.

create mode (n)~ The mode in which certain information is not available for edit on the page until the page is saved after creation. An example of this would be the opportunity record pages, where the opportunity has to be saved before products can be added.

Create New Group (PN)~ A menu item that creates a new group for the user's Contacts list.

Create Task Wizard (n)~ A wizard that allows the user to create new tasks that can be run in different locations, for example, in the Operator console or on an agent-managed computer.

Creative Asset Manager (PN)~ A Microsoft Advertising program that advertisers use to upload, organize, preview, and validate creatives.

creative content (n)~ The content that is to be placed on an advertising schedule. In the advertising industry, creative denotes ownership of the content. You cannot change any aspect of the ad without approval from the company that owns the ad you are running.

creator (n)~ On the Apple Macintosh, the program that creates a file. Files are linked to their creators by creator codes; this link enables the operating system to open the creator application when a document file is opened.

creator (n)~ The entity primarily responsible for creating the content resource (that is, the author).

Credential Locker (PN)~ A feature of Windows where a user's credentials are securely stored.

Credential Manager (PN)~ A common credential store and interface that is used to save and manage user credentials, such as user names and passwords, so you can easily log on to Web sites and connect to other resources, such as computers.

credential prompt (n)~ A dialog box that appears when a user is requested to confirm whether an administrative process should be permitted to start. The user can approve the process by providing a user name and password for an administrator account, or the user can cancel the process by clicking Cancel.

Credential Provider (n)~ A tool that provides information, which includes identification and proof of identification, that is used to gain access to local and network resources.

Credential Vault Service (PN)~ A behind-the-scene service that is part of Credential Manager and that actually does the work of creating and managing user credentials to allow users to log on across machines and sites.

credentials (n)~ Information that includes identification and proof of identification that is used to gain access to local and network resources. Examples of credentials are user names and passwords, smart cards, and certificates.

credentials lock (n)~ A type of device lock in Windows Mobile that requires the user to enter credentials to gain access to phone resources.

credit (v)~ To enter an amount that decreases the balance of an asset or expense account or increases a liability, owners equity or revenue account.

credit (n)~ An account entry that typically increases liabilities, owners' equity, or income, and decreases assets or expenses.

credit advice (n)~ An official notice of a bank credit transaction.

credit balance transaction (n)~ A transaction with an unapplied balance that decreases

the customer's or supplier's balance. Examples include credit memos, returns, payments, and receipts.

credit card (n)~ A type of payment card where the supplier is paid by the card issuer. The card holder then pays the card issuer.

credit card authorization (n)~ The process of verifying the credit card holder's identification and credit worthiness before a sales order is processed and fulfilled.

credit card capture (n)~ The process of verifying the credit card holder's identification and credit worthiness when a sales order is fulfilled.

credit card preauthorization (n)~ The process of verifying the credit card holder's identification and credit worthiness before a sales order is processed and fulfilled. The merchant asks the credit card company to reduce the customer's credit line by the invoice amount without charging the account. The preauthorization usually expires after a fixed period of time defined by the credit card processor.

credit hold (n)~ A restriction placed by the vendor that prevents a business or customer from charging for work or goods.

Credit hold (n)~ A field name on the account form. The user can set this field to Yes or No depending on whether there is a hold on the account.

credit limit (n)~ A limit placed by a vendor on the monetary amount that a business or customer can charge.

Credit limit (n)~ A field name on the account form. The user enters the amount in dollars that represents the maximum limit of the account.

credit limit check (n)~ A calculation to determine whether a customer's outstanding balance is within the maximum credit allowed for that customer.

credit note (n)~ An invoice with a negative amount.

Crime (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

criteria (n)~ Conditions you specify to limit which records are included in the result set of a query or filter.

Criteria pane (n)~ The area of the window that displays the criteria used to limit the records included in the result set of your query.

critical alert (n)~ An alert that indicates that a protection group requires immediate attention. Critical problems are caused by significant abnormal (unexpected) behavior that affects data protected by DPS.

critical exception (oth)~ An exception that leads to a monitored component's failure. For ASP.NET applications, a critical exception results in the user seeing either the standard or a custom error page. For web services, critical exceptions are those that ASP.NET serializes into valid SOAP messages on the server-side, and deserializes to SOAP exceptions on the ASP.NET client.

critical file (n)~ A file that is crucial for the system to perform.

critical path (n)~ The series of activities that determines the duration of the project. In a deterministic model, the critical path is usually defined as those activities with float less than or equal to a specified value, often zero. It is the longest path through the project.

critical path (n)~ The series of tasks that must be completed on schedule for a project to finish on schedule. Each task on the critical path is a critical task.

critical path method (n)~ A project management method of calculating the total duration of a project based on individual task durations and their dependencies.

critical section (n)~ A segment of code which is not reentrant; that is, it does not support concurrent access by multiple threads. Often, a critical section is used to protect shared resources.

critical task (n)~ A task that must be completed on schedule for the project to finish on time. If a critical task is delayed, the project completion date might also be delayed. A series of critical tasks makes up a project's critical path.

critical update (n)~ A broadly released fix for a specific problem addressing a critical, non-security related bug.

CRL (n)~ A document maintained and published by a certification authority that lists certificates that have been revoked.

CRL issuer (n)~ The organization (CA) which issued the CRL.

CRM (n)~ The process of building profitable customer relationships through the delivery of highly targeted interactions at all customer touch points by aligning marketing, sales and service functions and systems.

CRM (PN)~ The Business subcategory containing apps to help companies manage customer relations and retention.

CRM Back End Server (PN)~ A back-end server in CRM that runs the server roles, incl. Asynchronous Processing Service, Sandbox Service, and SharePoint Integration Service.

CRM Front End Server (PN)~ A front-end server in CRM that runs a number of server roles, incl. the Web Application Server, Organization Web Service, Discovery Web Service and Help Server.

CRM Mobile Customization (n)~ A tool used to create views that are available to all mobile users. Each view defines a subset of data that is designed to fit on the screen of the mobile device, and can include data from any Microsoft CRM attributes in supported record types. CRM Mobile Customization is also used to customize forms used by the CRM Mobile application on the device.

CRM Mobile perimeter network components (n)~ The Microsoft CRM Mobile components that are installed on a perimeter network IIS server in either the standard or traditional perimeter network configuration to provide secure registration and synchronization when Microsoft CRM Mobile is available over the Internet.

CRM Mobile server components (n)~ Components that you use to register devices, perform the initial provisioning, and perform synchronization of data between the mobile device and the Microsoft CRM server for a variety of network configurations. Includes two tools for system administrators: CRM Mobile Customization and Mobile Deployment Manager

CRM-Exchange E-mail Router (PN)~ A software component that provides an interface between the Microsoft CRM system and Exchange 2000 or Exchange 2003.

crop (v)~ To trim the vertical or horizontal edges of an object. Pictures are often cropped to focus attention on a particular area.

crop mark (n)~ A mark that shows where a publication page will be trimmed.

cross hair (n)~ Intersecting lines used by some computer input devices to locate a particular x-y-coordinate.

cross hatch (n)~ Shading made up of regularly spaced, intersecting lines.

cross join (n)~ A logical operator which joins each row from the first (top) input with each row from the second (bottom) input. It can also be called a Cartesian join, since it returns the Cartesian product of the two tables.

cross reference object (n)~ An object in which Active Directory stores information about directory partitions and external directory services.

cross sell (n)~ A specific type of related sell that suggests to users a product related to the product(s) they already have in their baskets.

cross-database ownership chaining (n)~ An ownership chain that spans more than one database.

cross-docking (n)~ A distribution practice in which items flow from receiving to shipping, with limited or no storage required.

cross-domain barrier (n)~ An Internet Explorer security feature that stops scripts and Document Object Model (DOM) objects from executing across domains.

cross-domain library (n)~ A JavaScript library available in apps for SharePoint to allow cross-domain client-level communication.

crossfade (n)~ A method of smoothly moving from one video clip or photo to another. With a crossfade transition, the frames in the playing clip fade out as the frames in the new clip fade in. In the film industry, the same process is called a dissolve.

cross-foot (v)~ To add amounts across a row (horizontally). The resulting total can be checked against a total obtained by footing (adding amounts vertically).

cross-forest authentication (n)~ An authentication feature that enables secure access to resources when the user account is in one forest and the computer account is in another forest. This feature allows users to securely access resources in other forests, using either Kerberos or NTLM, without sacrificing the single sign-on and administrative benefits of having only one user ID and password maintained in the user's home forest.

cross-forest member (n)~ A member of a security group whose user account is in a different forest from the group account.

cross-functional flowchart (n)~ A type of flowchart that shows the relationship between a business process and the functional units (such as departments) responsible for that process.

cross-hatching (n)~ Shading made up of regularly spaced, intersecting lines. Cross-hatching is one of several methods for filling in areas of a graphic.

crossing extent (n)~ The extent of a crossing file occupying space on the volume of the owning file.

cross-model association (n)~ A relationship that allows users to define links between reference data elements to enable fact data movement.

cross-model mapping (n)~ A one-to-one correspondence that a business rule can establish between members or dimensions of two separate models.

Crossover (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 139.

crossover cable (n)~ A type of cable that facilitates network communications. A crossover cable interconnects two computers by reversing their respective pin contacts.

cross-page posting (n)~ In ASP.NET Web pages, the process of submitting a page to a specified target page in contrast to submitting the page to itself.

cross-platform (adj)~ Of, pertaining to, or characteristic of a software application or hardware device that can be run or operated on more than one system platform.

cross-premises deployment (n)~ A deployment model in which part of a tenant organization's mailboxes, files, or other services, are hosted and part of them are not hosted but instead exist in the organization's own on-premises deployment.

cross-project link (n)~ A relationship in which the start or finish date of a task depends on a task in another project.

cross-site publishing (n)~ A content publishing model in which multiple sites select and republish content that is authored and managed in a single source location.

cross-site request forgery (n)~ An attack where a malicious website makes an HTTP request to a target website in such a way that the website thinks that the request is part of a legitimate user's session.

cross-slide (n)~ A touch-optimized technique for selecting or moving an item within a content area that is pannable in one direction only.

crosstab query (n)~ A query that calculates a sum, average, count, or other type of total on records, and then groups the result by two types of information: one down the left side of the datasheet and the other across the top.

crosstab report (n)~ Printed information about tasks and resources over a specified time period. There are five predefined crosstab reports in Project: Cash Flow, Crosstab, Resource Usage, Task Usage, and Who Does What When.

cross-validation (n)~ A method for evaluating the accuracy of a data mining model.

cross-varying dimension (n)~ In OLAP terminology, a listing of all valid tuples by rule.

Crow's Foot (n)~ A specification language for describing data structures. You can use the Crow's Foot entity and relationship shapes to diagram the structure of databases.

CRT (n)~ The basis of the television screen and the standard microcomputer display screen. A CRT display is built around a vacuum tube containing one or more electron guns whose electron beams rapidly sweep horizontally across the inside of the front surface of the tube, which is coated with a material that glows when irradiated. Each electron beam moves from left to right, top to bottom, one horizontal scan line at a time. To keep the screen image from flickering, the electron beam refreshes the screen 30 times or more per second. The clarity of the image is determined by the number of pixels on the screen.

CRT ~ (Cathode Ray Tube)- The imaging technology used in older desktop monitors. Provides an excellent colour display, but is extremely bulky and is widely being replaced by flatscreens.

Crude Humor (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

crushed microdots (n)~ Microdots that are distorted or damaged between the diffuser layers of the Surface display.

crypto agility (n)~ The ability of software to support customer-preferred algorithms for encryption, hashing, entropy and digital signatures.

Crypto API Diagnostics (PN)~ A utility that can only be enabled by an administrator and which logs events associated with an applications use of certificates.

crypto escrow key (n)~ A secondary encryption key that provides the ability for an authorized IT Helpdesk administrator to open an encrypted document when the password is lost.

crypto key (n)~ A piece of data that is required to initialize a cryptographic algorithm.

crypto set (n)~ A specific group of cryptography settings.

crypto-accelerator board (n)~ A hardware device that speeds up cryptographic operations by offloading operations to a special processor on the board.

CryptoAPI (n)~ An (API) that is provided as part of Microsoft Windows. CryptoAPI provides a set of functions that allow applications to encrypt or digitally sign data in a flexible manner while providing protection for the user's sensitive private key data. Actual cryptographic operations are performed by independent modules known as (CSPs).

CryptoAPI 2.0 (n)~ The API that supports PKI and X.509 certificates, such as certificate chain validation, certificate stores, and signature verification.

CryptoAPI Component Object Model (PN)~ A Microsoft ActiveX control that provides a Component Object Model (COM) interface to Microsoft CryptoAPI, which exposes a select set of CryptoAPI functions to application developers.

cryptographic agility (n)~ The ability of software to support customer-preferred algorithms for encryption, hashing, entropy and digital signatures.

cryptographic algorithm (n)~ A mathematical function used for encryption and decryption. Most cryptographic algorithms are based on a substitution cipher, a transposition cipher, or a combination of both.

cryptographic digest (n)~ The result of a one-way hash function that takes a variable-length input string and converts it to a fixed-length output string. This fixed-length output string is probabilistically unique for every different input string and thus can act as a fingerprint of a file. It can be used to determine whether a file was tampered with.

cryptographic key (n)~ A piece of data that is required to initialize a cryptographic algorithm.

cryptographic service provider (n)~ An independent software module that performs cryptography algorithms for authentication, encoding, and encryption.

cryptographic set (n)~ A specific group of cryptography settings.

cryptography (n)~ The study or analysis of codes and encoding methods used to secure information. Cryptography is used to provide confidentiality, data integrity, authentication (entity and data origin), and nonrepudiation.

Cryptography Application Programming Interface (n)~ An (API) that is provided as part of Microsoft Windows. CryptoAPI provides a set of functions that allow applications to encrypt or digitally sign data in a flexible manner while providing protection for the user's sensitive private key data. Actual cryptographic operations are performed by independent modules known as (CSPs).

Cryptography Next Generation (PN)~ A replacement of the CryptoAPI that enables support for Suite B cryptographic algorithms such as elliptic curve cryptography (ECC).

CS Authentication resource (n)~ A Commerce Server resource with global-level properties, managed through Commerce Server Manager. Use CS Authentication to configure authentication options for a site.

CSAT Index (n)~ A survey solution to allow users to understand and act on customer

feedback.

CSDL (n)~ An XML-based language that is used to define the entity types, associations, entity containers, entity sets, and association sets of a conceptual model.

CSF (n)~ A development framework for the targeted delivery of content. The Content Selection Framework (CSF) provides the components you use to build a business-specific messaging system. CSF provides a platform for making high-speed decisions to target content to users.

CSFM option (n)~ An area on the Spam Filter page that gives IT administrators the ability to select various content attributes of a message that either increase the potential for the message to be quarantined as spam (the spam score') or absolutely quarantine messages that contain specific attributes.'

CSLIP (n)~ A version of SLIP using compressed Internet address information, thereby making the protocol faster than SLIP.

C-SLIP (n)~ A version of SLIP using compressed Internet address information, thereby making the protocol faster than SLIP.

CSM (n)~ See client-side monitoring. CSM is a common tag used when client-side monitoring is turned on for an application. For example, CSM Collector.

CSM (PN)~ The set of interfaces that provides methods to inform the Windows Search engine about containers to crawl and items under those containers to include in or exclude from the catalog.

CSM Collector (oth)~ A part of the Application Performance Monitoring (APM) feature that receives client events and statistics from end users.

CSO (PN)~ An Internet directory service that matches users' own names with e-mail addresses, generally at colleges and universities. The CSO service, which can be reached through Gopher, was originally developed at the Computing Services Office at the University of Illinois.

CSOM (n)~ A set of APIs for SharePoint products. These APIs are based on the server object model, and can be called from clients such as desktop PCs and mobile devices.

CSP (n)~ An independent software module that performs cryptography algorithms for authentication, encoding, and encryption.

CSP (PN)~ The Microsoft program that allows external partners to sell, set up, and manage Office 365 accounts for small businesses, as well as set their own terms.

CSR (oth)~ An employee who provides service to the customers of the organization or business unit through the opening and resolution of cases, among other activities.

CSR (n)~ Technology that enables rendering operations to be handled by the client.

CSRF (n)~ An attack where a malicious website makes an HTTP request to a target website in such a way that the website thinks that the request is part of a legitimate user's session.

CSS (n)~ A Hypertext Markup Language (HTML) specification developed by The World Wide Web Consortium (W3C) that allows authors of HTML documents and users to attach style sheets to HTML documents. The style sheets include typographical information on how the page should appear, such as the font of the text in the page. This specification also directs the way in which the style sheets of the HTML document and the user's style will blend.

CSS (n)~ A feature in Commerce Server 2006 that updates Web site changes from one environment to another, for example, from a testing environment to a production environment. These changes can include Web site pages, configuration settings, and database resources.

CSS ~ (Cascading Style Sheets)- A set of- HTML- commands used to control the style of web pages, much more complex than the tag-set it is intended to replace, but also more powerful and particularly useful for retaining a uniform style across a large website. Generally only used by professional web designers.

CSS selector (n)~ The name of the element type to which the display information applies.

CSTA (n)~ An international standard established by the European Computer Manufacturers Association (ECMA) that specifies an application's interface and protocols for monitoring and controlling calls and devices in a communications network.

CSV (n)~ A data file consisting of fields and records, stored as text, in which the fields are separated from each other by commas.

CSV (PN)~ A feature that simplifies the configuration and management of Hyper-V virtual machines in failover clusters. With CSV, on a failover cluster that runs Hyper-V, multiple virtual machines can use the same disk yet fail over independently of one another. CSV provides increased flexibility for volumes in clustered storage-€"for example, it allows you to keep system files separate from data to optimize disk performance, even if the system files and the data are contained within virtual hard disk files.

CSV import file (n)~ A comma separated value (CSV) file used to provision many new users at one time.

CSVLK (PN)~ A unique volume license key used to activate a key management service (KMS) host or to enable volume software licenses to be issued and managed from Active Directory.

CT (n)~ A technique that produces a computer-processed X-ray image of a cross section of an internal organ or tissue.

CTAS (PN)~ A T-SQL feature (parallelized operation) that creates a new table based on the output of a SELECT statement used when table was not created earlier and needs to be created when data from one table needs to be inserted into a newly created table from another table, with same data types as that of the selected columns.

CTE (PN)~ A temporary result set that is defined within the execution scope of a single SELECT, INSERT, UPDATE, DELETE, or CREATE VIEW statement, similar to a derived table in that it is not stored as an object and lasts only for the duration of the query but different from a derived table, as possibly being self-referencing and referenced multiple times in the same query.

CTI (n)~ The practice of using a computer to control one or more telephone and communications functions.

CTI (PN)~ A company that provides reporting compliance services.

CTI event (n)~ A special punctuation event that indicates the completeness of the existing events.

CTL (n)~ A signed list of root certification authority certificates that an administrator considers reputable for designated purposes, such as client authentication or secure e-mail.

CTO (n)~ Pertaining to the process of manufacturing a computer according to a

customer`s specification by customizing a pre-existing image of a master installation.

CTP (n)~ The portion of product output from available operations resources and available input product required to fulfill a specific customer requirement.

CTRL (n)~ A key that, when pressed in combination with another key, gives the other key an alternative meaning.

CTRL key (n)~ A key that, when pressed in combination with another key, gives the other key an alternative meaning.

Ctrl+Break (oth)~ A key or combination of keys used to tell a computer to halt, or break out of, whatever it is doing. On IBM PCs and compatibles under DOS, pressing the Pause/Break or Scroll Lock/Break key while holding down the Ctrl key issues the break command (as does Ctrl-C). On Macintosh computers, the key combination that sends a break code is Command-period.

CTS (n)~ A control packet that a destination station sends to indicate its readiness to receive data. A destination station responds to a request to send (RTS) by transmitting a CTS.

CTS (n)~ The specification that determines how the common language runtime defines, uses, and manages types.

CUA (n)~ A client program such as Microsoft Outlook. Calendar information can be sent between calendar user agents that comply with the iCalendar specification.

cube (n)~ A set of data that is organized and summarized into a multidimensional structure that is defined by a set of dimensions and measures.

Cube Build Service (PN)~ A service that manages the OLAP cubes for Project Server reporting.

cube definition (n)~ Information, stored by the OLAP Cube Wizard in an .oqy file, that defines how to construct an OLAP cube in memory using data retrieved from a relational database.

cube role (n)~ A collection of users and groups with the same access to a cube. A cube role is created when you assign a database role to a cube, and it applies only to that cube.

cubic Bezier curve (n)~ A curve described by two endpoints and two control points.

cue (n)~ An icon depicting a stack of papers that represent filtered lists. The cue appears in the Activities home part on the Role Center. The height of each cue roughly represents the number of entities in the underlying list; as the number of entities increases, the height of the cue increases.

Cult (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 58.

culture (n)~ In managed code, a class of information about a particular nation or people including their collective name, writing system, calendar used, and conventions for formatting dates and sorting strings.

cumulative threshold (n)~ The maximum limit of a cumulative transaction value, up to which a tax on the transaction value is not calculated.

cumulative update (n)~ A roll-up update that contains all previous critical on-demand hotfixes to date.

curate (v)~ Edit or confirm a sentiment value for a post.

curfew (n)~ The time or times during the day that a child is restricted from using the computer.

currency (n)~ Any form of money, including bills and coins, used as a medium of exchange.

Currency (n)~ An 8-byte, fixed-point data type that is useful for calculations involving money or for fixed-point calculations in which accuracy is extremely important. The Currency data type is used to store numbers with up to 15 digits to the left of the decimal point and 4 digits to the right. The type-declaration character in Microsoft-© Visual Basic-© is an at sign (@). Currency can range from -922,337,203,685,477.5808 to 922,337,203,685,477.5807.

currency (n)~ A medium of exchange in circulation that is not limited to money.

currency code (n)~ An alphanumeric identifier that represents a currency unit.

currency conversion (n)~ The process of restating foreign currency accounts of subsidiaries into equivalent currency (usually the reporting currency of the parent company), in order to prepare consolidated financial statements in the native currency of the parent company.

currency conversion rate (n)~ The multiplier used for converting the base currency of the Web site to the buyer currency or supplier currency.

Currency Converter (PN)~ A calculator tool that converts the value or quantity of one currency into the relative values or quantities of other currencies.

currency exchange (n)~ The process of restating foreign currency accounts of subsidiaries into equivalent currency (usually the reporting currency of the parent company), in order to prepare consolidated financial statements in the native currency of the parent company.

currency LCID (n)~ A value that identifies the locale for currency handling. The default value is zero, which uses the default locale ID of the server.

currency locale identifier (n)~ A value that identifies the locale for currency handling. The default value is zero, which uses the default locale ID of the server.

currency symbol (n)~ A symbol selected to designate a specific currency.

currency translation (n)~ The process of restating foreign currency accounts of subsidiaries into equivalent currency (usually the reporting currency of the parent company), in order to prepare consolidated financial statements in the native currency of the parent company.

currency unit (n)~ A discrete division of currency value.

current (Adverb) ~ Pertaining to an account status indicating that payments are up-to-date.

current cell (n)~ The selected cell in which data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

Current Conversations group (n)~ A group, at the top of the Contact List, used to show any ongoing or open instant messaging conversations.

current cost (n)~ The most recent price of a product or service.

current directory (n)~ The first directory in which the operating system looks for programs and data files and stores files for output.

current liability (n)~ An obligation that is due within a short period of time, usually one

year or less, and which will be paid out of current assets.

current period (n)~ A dynamic cycle property that you set to define either the start or end of the data period for the cycle.

current record (n)~ The record in a recordset that you can modify or retrieve data from. There is only one current record in a recordset, but a recordset may have no current record, for example, after a record has been deleted from a dynaset-type recordset.

current region (n)~ The block of filled-in cells that includes the currently selected cell or cells. The region extends in all directions to the first empty row or column.

current time increment event (n)~ A special punctuation event that indicates the completeness of the existing events.

current user (n)~ The authenticated user during processing operations in a front-end Web server and a back-end database server.

current version (n)~ Version of a file most recently stored in a Visual SourceSafe database. The current version of the file has the highest version number.

curriculum vitae (n)~ A detailed summary of one's academic and work history and experience, including information about research, publications, and/or academic or personal interests and achievements.

curriculum vitae (n)~ A summary of one's academic and work history, usually submitted with a job application.

curried delegate (n)~ A delegate that is handled through curried functions.

cursor (n)~ A representation on the screen of the mouse pointer location. In a document or file, it usually appears as a blinking vertical line to indicate where you can insert text or graphics. In other applications, it can appear as a cross or as an arrow.

cursor (n)~ An entity that maps over a result set and establishes a position on a single row within the result set.

Cursor ~ The representation of the mouse on the screen. It may take many different shapes. Example: I-beam, arrow pointer, and hand.

cursor blink rate (n)~ The rate at which the cursor indicating the active insertion point in a text window, or other display element, flashes on and off.

cursor controller (n)~ The button and arrows on a mobile keyboard that enable customers to move the text cursor within text.

cursor data type (n)~ A special data type used to reference a cursor.

cursor degradation (n)~ The return of a different type of cursor than the user had declared.

cursor key (n)~ Any of four keys labeled with arrows pointing up, down, left, and right, used to move the cursor vertically or horizontally on the display screen or, in some programs, to extend the highlight.

cursor library (n)~ A part of the ODBC and DB-Library application programming interfaces (APIs) that implements client cursors

curve (n)~ In DirectMusic, a continuous series of events with a start and end value, such as volume fade.

curve (n)~ A rounded line.

curve (n)~ A shape representing a single path in a coordinate system. This is an abstract type; its implementations define how to interpolate between control points.

cusp (n)~ A peak, angle, radical change of direction or endpoint of a stroke.

custodian (n)~ Someone who has full access to all the information in a record, with the ability to see, change, share, and delete any of that information.

custodian access (n)~ The highest level of access.

custom action (n)~ A dropdown menu item or ribbon component that is added to a site page.

custom adapter (n)~ A custom piece of code that a developer writes and places before a receive pipeline or after a send pipeline to interface with adapters and/or applications.

Custom Animation list (n)~ The list of animation sequences for a slide. Items are listed in the order in which they are added, and include icons that indicate timing in relation to other animation events.

custom attribute (n)~ A class used to represent custom metadata.

custom build rule (n)~ A build rule defined by the user, typically to call a tool that is not part of the normal Visual Studio build process.

custom calculation (n)~ A method of summarizing values in the data area of a PivotTable report by using the values in other cells in the data area. Use the Show data as list on the PivotTable Field dialog for a data field to create custom calculations.

custom client control (n)~ A custom control authored by a user or a third-party software vendor in Windows Forms applications.

custom collection (n)~ A collection of audio files (for example, songs) that is represented by an interactive object in Music and that you set up in Windows Media Player. In contrast, albums are predefined collections of songs from a CD or digital download.

custom color (n)~ A color in the Visio application that is stored with a shape as an RGB or HSL value rather than as an index to the document's color palette. A custom color is saved only with the shape to which it is applied.

custom color palette (n)~ A set of colors on a palette with up to 256 specific color entries.

Custom Columns (n)~ A grouping of column headings on a report.

Custom Connector (PN)~ A .NET assembly created using Visual Studio that provides custom connection logic.

custom control (n)~ A form component, such as a template part or ActiveX control, that isn't included with InfoPath by default. Form designers can add or remove custom controls by using the Controls task pane.

custom control (n)~ A control authored by a user or a third-party software vendor.

custom device (n)~ A microphone and speaker combination configured by the user in Lync and Office Communicator.

custom dialog box (n)~ A modal pop-up form you create to ask the user for additional information or to display a message.

custom dialog control (n)~ A control that developers use to create a custom dialog.

custom dictionary (n)~ A user dictionary that contains a list of words not in the application dictionary that an author wants the spelling checker to accept as correct.

custom domain (n)~ A domain name whose purpose is to express the individuality of the person on whose behalf it is registered. Custom domains are often subdomains, and contrast with domain names which resolve to an organization (e.g. a company) or a service that organization offers.

custom driver access (n)~ Device IO Control to 3rd party driver, a form of restricted device interface access for privileged apps

custom editor (n)~ An editor that allows you to view, edit, compare, or merge content inside a SourceSafe database.

custom expression (n)~ A property value that is hand-edited.

Custom expression (n)~ An expression in some scripting language describing how a value is to be transformed in flowing from an attribute of an entry in one directory to an attribute of an entry in another.

custom extraction dictionary (n)~ A user defined dictionary that lists single words or phrases that the system matches to words in the content in either a case-sensitive way or a case-insensitive way, depending on the type of dictionary that is used.

custom field (n)~ A field you can create. A custom field can be a blank, combination, or formula field.

custom form (n)~ A form that you customize to better fit your needs.

custom group (n)~ An item of a custom group field. A custom group contains two or more items from a row or column field.

custom group field (n)~ A field in the row or column area that contains custom groups as its items.

custom install (n)~ A type of installation that allows the user to specify certain installation settings and options, such as which components will be installed.

custom installation (n)~ A type of installation that allows the user to specify certain installation settings and options, such as which components will be installed.

custom locale (n)~ A locale that supports international properties, providing a more culturally appropriate user experience than those furnished with the standard locales shipped by Microsoft with the operating system. The use of custom locales enables administrators to extend the set of locales provided by Microsoft or to replace the data in a locale that ships with Windows; for example, currency symbols or names of the months of the year.

custom logo (n)~ An organization's logo that an administrator can upload to replace the Office 365 logo in the upper-left corner of the website.

custom map (n)~ A map that you add to your application, as opposed to a map that is available by default (in the application).

custom order (n)~ User-defined sort order. For example, you could define a custom sort order to display values in the EmployeeTitle column on the basis of the title's seniority.

custom OS image (n)~ The user-customized virtual hard disks (VHDs) that define the operating environment hosted by the VM role.

custom palette (n)~ A set of colors on a palette with up to 256 specific color entries.

Custom Panel pane (n)~ A client element that displays optional streaming media feeds to presenters and attendees.

custom path expression (n)~ When data binding to a CLR data source or another object, a data path or binding expression that is hand-edited.

custom phrase (n)~ A word or phrase that the administrator sets for the Content Filter agent to evaluate the content of an e-mail message and apply appropriate filter processing.

custom plug-in (n)~ A type of plug-in created by a third-party vendor that is tightly

integrated with the Windows Media Services platform architecture.

custom price (n)~ The price calculated according to specific pricing rules that apply to products in a virtual catalog. There are three types of custom prices: percentage off, fixed amount off, and explicit price.

custom profile (n)~ A group of settings, defined by an end user, for configuring the encoder output.

custom properties dialog box (n)~ A custom property sheet that allows users to set properties for an ActiveX control.

custom property (n)~ A characteristic or parameter of an object or device that can be defined by the user.

custom property (n)~ A metabase property that is not predefined in the metabase schema (MBSchema.xml) and is created programmatically to meet a specific need.

custom recipient (n)~ In Exchange 5.5 and earlier, a custom recipient is a user who is not hosted by Exchange. In Exchange 2003, such users can be added to Active Directory as contacts, Windows users, or users whose Windows accounts are disabled. In any case, they are mail-enabled, but not mailbox-enabled, because their mailboxes are hosted on another messaging system.

custom repeat (n)~ A recurring meeting that does not have a standard pattern of daily, weekly, monthly, etc.

Custom Report (n)~ A representation of statistics and data that is organized and created by a CSR.

custom rollup (n)~ An aggregation calculation that is customized for a dimension level or member, and that overrides the aggregate functions of a cube's measures.

custom rule (n)~ In a role, a specification that limits the dimension members or cube cells that users in the role are permitted to access.

custom server control (n)~ A custom control authored by a user or a third-party software vendor in Web Forms (ASP.NET pages)

custom show (n)~ A presentation within a presentation in which you group slides in an existing presentation so that you can show that section of the presentation to a particular audience.

custom solution (n)~ A collection of components that have been packaged together to provide a cohesive solution to a customer problem.

Custom Spam Filter Management option (n)~ An area on the Spam Filter page that gives IT administrators the ability to select various content attributes of a message that either increase the potential for the message to be quarantined as spam (the spam score') or absolutely quarantine messages that contain specific attributes.'

custom subnet mask (n)~ A subnet mask that is not based on the Internet address classes. Custom subnet masks are commonly used when subnetting.

custom table (n)~ A type of filter that enables users to choose from a list and then drive dashboard content from multiple data sources.

custom task pane (n)~ An .html file whose content is displayed in a window next to a form. Custom task panes can provide form-specific commands and Help content.

Custom Task Wizard (n)~ A wizard that will help users to define a custom task for their workflow. Custom Task can be used to collect information from workflow participants.

That information will be stored in the Tasks list for the site and can be used later in the workflow via workflow lookup.

custom theming (n)~ The process of customizing the look and feel of the site to reflect the company's style. An administrator can customize the logo, change the background image and theme colors, and change the home page's URL

custom toolbar (n)~ A toolbar that you create for your application.

custom update (n)~ An update, patch, or upgrade to software other than those available through Microsoft Update.

custom variable (n)~ A variable provided by package developers.

custom volume (n)~ A volume that is not in the DPM storage pool and is specified to store the replica and recovery points for a protection group member.

customer (n)~ A person or company to whom your company sells products or services.

customer (n)~ The account or contact with which a business unit conducts a business transaction.

Customer (n)~ A person or organization that uses any of the products or services that your organization provides and who takes advantage of the support resources you provide through Parature.

customer account statement (n)~ A form that can be sent to customers that includes the customer's balance and amount due for the statement period.

customer advance (n)~ A payment received from a customer in anticipation of the delivery of items or of the performance of a service.

Customer and Orders Manager (n)~ The Commerce Server Business Management user interface that you use to view customer and order status information and display all the associated details.

customer data (n)~ All data, including all text, sound, image files, or software, given to Microsoft by, or on behalf of, Customer or its Affiliates through use of an Online Service or in connection with Professional Services.

customer discount (n)~ A price reduction for a particular customer.

Customer Experience Improvement Program (PN)~ A Microsoft program that invites customers to provide Microsoft with more detailed information about how the software is used including the type and frequency of errors, software and hardware performance, and feature usage. This information is anonymous and voluntary, and is used strictly for the purposes of software development.

Customer Feedback (n)~ A tab in the Array Managment feature that enables the user join the Customer Experience Improvement Program.

customer group (n)~ A classification of customers that share key characteristics.

customer invoice (n)~ A source document that documents a customer payment request. When a payment is received, it can be matched to the invoice.

customer lead (n)~ A potential customer who must be contacted by a salesperson and either qualified or disqualified as a sales opportunity. Leads will be converted into accounts, contacts, or opportunities if they are qualified. Otherwise they are deleted or archived.

customer loyalty program (n)~ A structured program that rewards customers with incentives or other benefits for loyal buying behavior.

customer pool (n)~ A query that defines a group of customers that can be displayed and managed for collections or aging processes.

customer relations management (n)~ The business area related to managing a company's interactions with its customers, including sales, service, and delivery of product. Software solutions are designed and implemented specifically to manage this business area.

customer relationship (n)~ An association between a customer (account or contact) and a partner (account or contact).

customer relationship management (n)~ The process of building profitable customer relationships through the delivery of highly targeted interactions at all customer touch points by aligning marketing, sales and service functions and systems.

customer retention (n)~ The ability to maintain customer loyalty.

Customer Satisfaction Index (n)~ A survey solution to allow users to understand and act on customer feedback.

customer service (n)~ A wide variety of activities intended to ensure that customers receive the goods and services they require to satisfy their needs or wants in the most effective and efficient manner possible.

customer service (n)~ A business department that deals with routine inquiries and complaints from customers.

customer service center (n)~ A business department that deals with routine inquiries and complaints from customers.

customer service representative (n)~ An employee who provides service to the customers of the organization or business unit through the opening and resolution of cases, among other activities.

Customer Service Representative (CSR) (n)~ A Parature Service Desk user and support agent.

customer statement (n)~ A form that can be sent to customers that includes the customer's balance and amount due for the statement period.

customer support (n)~ A business department that deals with routine inquiries and complaints from customers.

customer trade agreement (n)~ A fixed-price agreement that a company enters into with one or more customers in relation to sales prices or discounts for costs associated with the completion of a project (labor, expenses, and fees).

customer verification (PN)~ The validation that a customer's credentials meet the criteria to access and use a resource.

customer verification program (n)~ An application or tool to validate a customer's credentials.

customer-specific volume license key (n)~ A unique volume license key used to activate a key management service (KMS) host or to enable volume software licenses to be issued and managed from Active Directory.

customizable component (n)~ A solution component that, once protected and installed, can be modified, but not deleted, by a solution.

customization (n)~ The modification of, or additions to, hardware or software to fit the needs of a specific business or customer.

customize (v)~ To modify or assemble hardware or software to suit the needs or preferences of the user.

Customize (PN)~ The Sway button that provides users with a menu of different style modifications that can be applied to their sway.

customized scorecard (n)~ A scorecard that is created without using a template.

cut (v)~ To remove part of a document, usually placing it temporarily in memory so that the cut portion can be inserted (pasted) elsewhere.

cut and paste (n)~ A procedure in which the computer acts as an electronic combination of scissors and glue for reorganizing a document or for compiling a document from different sources. In cut and paste, the portion of a document to be moved is selected, removed to storage in memory or on disk, and then reinserted into the same or a different document.

cutover migration (n)~ An e-mail migration process that provisions new cloud-based mailboxes and then migrates mailbox data to the cloud from a non-premises Exchange server. Cutover' refers to the fact that all on-premises mailboxes are migrated in preparation for moving the entire e-mail organization to the cloud

Cut-through ~ Technique for examining incoming packets where Ethernet switch looks only at first few bytes of packet before forwarding or filtering it. Faster than looking at whole packet but allows some bad packets to be forwarded.

CV (n)~ A detailed summary of one's academic and work history and experience, including information about research, publications, and/or academic or personal interests and achievements.

CV (n)~ A summary of one's academic and work history, usually submitted with a job application.

CVV (n)~ A code that credit card companies use to authorize credit card charges. For example, American Express uses a four-digit number on the front of the credit card, and Visa, MasterCard, and Discover use a three-digit number on the back.

cxn (n)~ A linkage between a group of on-premises (local) endpoints and the role instances for a Microsoft Azure deployment. A connection enables the endpoints in the group to connect to instances in the Microsoft Azure deployment, and vice versa.

cyan (n)~ A color that is essential to the CMY color model and the CMYK color-mxing method.

cyan-magenta-yellow-black (n)~ A color model for commercial printing that produces a wide range of colors by mixing varying percentages of cyan, magenta, yellow, and black inks.

CyberSource Corp (PN)~ An eCommerce services company that provides electronic payment and fraud prevention services.

Cyberspace ~ Loosely speaking, the internet, and virtual places thereon. Cyber is used as a prefix meaning related to computers or the internet.

Cybersquatter ~ Someone who buys up internet domain names in order to sell them on at a profit.

cycle (n)~ A user-defined period of time during which you can schedule form data entry, review, or approval, or report review or approval through assignments, or schedule server actions, also known as jobs. Cycle also defines the time period for which data can be

submitted.

Cycle (PN)~ A SmartArt graphic layout type that includes layouts designed to show a continual process.

cycle chart (n)~ A chart that surfaces cyclical patterns in data by comparing the performance for certain time periods, such as days of the week or months, over time.

cycle counting (n)~ An inventory counting method where items that are stored in different warehouse locations are counted to verify the on-hand inventory levels and to facilitate inventory-level corrections.

cycle definition (n)~ Essentially, a template used to create cycle instances. Any edits to the cycle definition are applied to every subsequently-created cycle instance that is based on that cycle definition.

cycle diagram (n)~ A diagram that is used to show a process that has a continuous cycle.

cycle end date (n)~ The defined end of a period of time during which cycle items are active and can be acted upon.

cycle end date (n)~ The final date of the active period on which the variable compensation award is based.

cycle instance (n)~ A specific occurrence of a cycle definition.

Cycle Matrix (PN)~ A SmartArt graphic layout used to show the relationship to a central idea in a cyclical progression. Each of the first four lines of Level 1 text corresponds to a wedge or pie shape, and Level 2 text appears in a rectangular shape to the side of the wedge or pie shape. Unused text does not appear, but remains available if you switch layouts.

cycle start date (n)~ The defined beginning of a period of time during which cycle items are active and can be acted upon.

cycle start date (n)~ The beginning date of the active period on which the variable compensation award is based.

cycle time (n)~ The time taken to complete an activity.

cyclic protection (n)~ A type of protection between two DPM servers where each server protects the data on the other.

cyclic redundancy check (n)~ A procedure used in checking for errors in data transmission. CRC error checking uses a complex calculation to generate a number based on the data transmitted. The sending device performs the calculation before transmission and includes it in the packet that it sends to the receiving device. The receiving device repeats the same calculation after transmission. If both devices obtain the same result, it is assumed that the transmission was error free. The procedure is known as a redundancy check because each transmission includes not only data but extra (redundant) error-checking values. Communications protocols such as XMODEM and Kermit use cyclical redundancy checking.

cyclical redundancy check (n)~ A procedure used in checking for errors in data transmission. CRC error checking uses a complex calculation to generate a number based on the data transmitted. The sending device performs the calculation before transmission and includes it in the packet that it sends to the receiving device. The receiving device repeats the same calculation after transmission. If both devices obtain the same result, it is assumed that the transmission was error free. The procedure is known as a redundancy

check because each transmission includes not only data but extra (redundant) error-checking values. Communications protocols such as XMODEM and Kermit use cyclical redundancy checking.

cylinder chart (n)~ A variation on a column chart that uses cylinder shapes instead of rectangular columns.

cylindrical projection (n)~ The result of projecting an image onto a cylinder.

D ~

D3D (PN)~ A virtualized representation of dedicated graphics hardware resources. Direct3D provides a standardized implementation of the common graphics processing pipeline.

D-4 ~ A digital multiplexer used to convert 24 voice grade analog or data channels into DS1.

DAC (n)~ A application that captures the SQL Server database and instance objects used by a client-server or 3-tier application.

DAC instance (n)~ A copy of a DAC deployed on an instance of the Database Engine. There can be multiple DAC instances on the same instance of the Database Engine.

DAC package (n)~ An XML manifest that contains all of the objects defined for the DAC; the package gets created when a developer builds a DAC project.

DAC package file (n)~ The XML file that is the container of a DAC package.

DAC placement policy (n)~ A PBM policy that comprises a set of conditions, which serve as prerequisites on the target instance of SQL Server where the DAC can be deployed.

DAC project (n)~ A Visual Studio project used by database developers to create and develop a DAC. DAC projects get full support from Visual Studio and VSTS source code control, versioning, and development project management.

DACL (n)~ An access control list that is controlled by the owner of an object and that specifies the access particular users or groups can have to the object.

daemon (n)~ A program, usually associated with UNIX systems, that runs in the background and performs housekeeping or maintenance functions without user intervention or awareness.

DaFont ~ DaFont is an archive of freely downloadable fonts. Fonts are categorized by theme, and can also be sorted by name, date, and popularity.http://www.dafont.com/

DAG (n)~ A group of up to 16 Mailbox servers that host a set of databases and provide automatic database-level recovery from failures that affect individual servers or databases.

dagger (n)~ The -€ character.

DAGGER (n)~ The -€ character.

daily backup (n)~ A backup that copies all selected files that have been modified the day the daily backup is performed. The backed-up files are not marked as having been backed up (in other words, the archive attribute is not cleared).

Daily Report (PN)~ A report that is automatically generated by Windows Midmarket Server and sent to subscribed administrators via e-mail.

Daily Task List (n)~ The name of a pane at the bottom of the Calendar module where tasks are displayed. Tasks that are completed on a particular day stick' to the day and are shown as a record of what work was performed on that day. Tasks not completed roll over to the next day and accumulate until completed.'

Damage potential Reproducibility Exploitability Affected users Discoverability (oth)~ A ranking of the risk that is associated with a vulnerability or a security requirement.

Dance (n)~ One of the music genres that appears under Genre classification in Windows

Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 3.

Dance hall (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 125.

DAO (n)~ A programming interface to access and manipulate database objects.

DAR (n)~ A device that receives digital audio wirelessly from your computer and broadcasts it to TV sets or stereos around your home.

dark (n)~ A theme setting that consists of a black background.

dark fiber ~ Fiber-optic cable deployments that are not yet being used to carry network traffic. (The word 'dark' refers to the fact that no light is passing through the optical fibers.)

Darkwave (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 50.

DAS (n)~ A component that receives events from the MOM Servers and inserts them into the database. Requests for data from the database and requests to insert data into the database typically go through the DAS.

DAS registry (n)~ The registry keys used by DAS.

dash (n)~ A short horizontal line used as a punctuation mark.

dashboard (n)~ A set of reports or other data that is arranged in a panel format on a single page, or series of pages, in a web browser or SharePoint site.

dashboard (n)~ A customizable landing page for a business application or workspace that uses Web Parts to display selected information. It can provide a comprehensive look at the information inside the application or workspace by consolidating lists, libraries, text, images and other data into a dynamic, customizable information portal.

dashboard (n)~ The all-up view in the Microsoft Azure Portal that provides the state of all of your services, deployments, storage accounts, and databases. The dashboard also provides access to usage reports, billing information, and management operations.

dashboard (n)~ A part of the user interface that organizes and presents information for easy readability. Dashboards display simulated gauges, dials, etc. that resemble an automobile dashboard.

dashboard (n)~ A place in the Store, Hardware, Desktop app, Windows Store app, and Internet Explorer development sections of the Windows Dev Center where respective users can get reports and information that's specific to them.

dashboard (n)~ The service run by the Windows Store team that supports the end-to-end process for registering Windows Store developers and onboarding apps into the Windows Store catalog.

dashboard (n)~ The area within the Protection tab in the Exchange Administration Center (EAC) where stand-alone customers land.

dashboard (n)~ A subscreen within an entity that displays filtered information associated with that entity.

dashboard ~ A summary view of the status of multiple service level agreements (SLAs). Or a Web page that can contain one or more viewers that graphically represent business

data.

Dashboard Designer (PN)~ A client application that you use to create and manage dashboards, scorecards, reports, and other PerformancePoint items prior to deploying them within a dashboard to a SharePoint site.

Dashboard Designer Installation Site (PN)~ A Monitoring Server component that facilitates the download of Dashboard Designer into each users computer.

dashboard pack (n)~ A kind of management pack that allows new dashboards to be installed and used in Operations Manager to display monitoring data.

Dashboard Viewer for SharePoint Services (PN)~ Functionality in PerformancePoint Monitoring Server that makes it possible to display dashboard views that are defined in Dashboard Designer to users of a SharePoint site.

Dashboard Web Preview (PN)~ A Monitoring Server component that deploys a dashboard to a pre-configured preview Web site so that dashboard designers can see the completed dashboard prior to deploying it to a production SharePoint site.

dashboard widget (n)~ A user interface element in a dashboard view that is a combination of a UI control, such as a pie chart or dial, and a data provider.

DAT (n)~ A magnetic-tape storage medium for recording digitally encoded audio information. In addition to the tape cassette, DAT indentifies a type of digital tape recorder and player.

data (n)~ A representation of facts, concepts or instructions in a formalized manner, suitable for communication, interpretation or processing.

Data ~ Any information created by a user, such as documents, pictures or sound recordings.

Data & analytics (PN)~ The Business subcategory containing apps to help businesses gather and analyze data.

Data Access Objects (n)~ A programming interface to access and manipulate database objects.

data access page (n)~ A Web page, published from Access, that has a connection to a database. In a data access page, you can view, add to, edit, and manipulate the data stored in the database.

data acquisition (n)~ The process of obtaining data from another source, usually one outside a specific system.

data adapter (n)~ An object used to submit data to and retrieve data from databases, Web services, and Extensible Markup Language (XML) files.

data administrator role (n)~ One of the PerformancePoint Server administrative roles. In addition to being able to perform all operations that a member of the modeler role can perform, a member of the data administrator role can perform all data integration operations in Planning Business Modeler. This includes synchronizing and loading dimensions, models, and associations, as well as exporting outgoing data and executing associations.

Data Analysis (PN)~ The group of Excel add-ins that support data analysis.

Data Analyzer Light (PN)~ A component that performs some of the simpler data processing tasks for the Web Analytics Web Part.

data annotation (n)~ An attribute that is added to a class or property to add information

about its use or behavior.

Data API (PN)~ An API that contains controls and features for accessing, working with, and storing data and documents.

data at rest (n)~ A resource of the Data Lake service type of the Business Analytics service in Azure referring to inactive data which is stored physically in a repository.

data backup (n)~ Any backup that includes the full image of one or more data files.

data bar (n)~ A graphical bar (think bar charts) displayed in each cell. The length of the bar is related to the cell's value.

data bind (v)~ To connect items in a data source to user interface components (controls). This means that whenever the data changes, the interface components will optionally reflect those changes, and vice versa.

data binding (n)~ The process of creating a link between a property and a source. The source can be local or external.

data block (n)~ In text, ntext, and image data, a data block is the unit of data transferred at one time between an application and an instance of SQL Server. The term is also applied to the units of storage for these data types.

data bound control (n)~ An ASP.NET control that can be bound to a data source control to make it easy to display and modify data in your Web application.

data buffer (n)~ An area in memory where data is temporarily stored while being moved from one location to another.

data bus (n)~ A mechanism in Orchestrator that passes information from one activity in a runbook to another activity.

data call (n)~ A phone connection to a service provider or a corporate server, for the purpose of viewing the Web, or transmitting data.

data capture (n)~ The process of saving on a storage medium a record of interchanges between a user and a remote information utility.

data card (n)~ A small card that provides mobile broadband Internet access. Removable data cards can be in the format of PC cards, USB cards, ExpressCards; data cards can also be embedded laptop modules.

data center (n)~ A facility used to house mission critical computer systems and associated components. It generally includes environmental controls (air conditioning, fire suppression, etc.), redundant/backup power supplies, redundant data communications connections and high security.

Data Center TCP (PN)~ A TCP-like protocol for data center networks which leverages Explicit Congestion Notification (ECN) in the network to provide multi-bit feedback to the end hosts.

Data Center Transmission Control Protocol (PN)~ A TCP-like protocol for data center networks which leverages Explicit Congestion Notification (ECN) in the network to provide multi-bit feedback to the end hosts.

data channel (n)~ A separate channel of an Integrated Services Digital Network (ISDN) line that is used for ISDN signaling. For ISDN Basic Rate Interface (BRI), the D-channel is 16 kilobits per second (Kbps). For ISDN Primary Rate Interface (PRI), the D-channel is 64 Kbps.

data cleaning (n)~ A part of the process of analyzing data, especially when data comes

from multiple sources. The process must address errors such as incorrect spellings, different ways of labeling the same information, inconsistent field length, missing values, and conflicting data, such as having two part numbers for the same part.

data cleansing (n)~ The process of standardizing data, which includes conformance, detection, and removal of duplicate data. Data cleansing facilitates data integrity and accuracy.

data collection (n)~ The process of gathering information by sending and receiving HTML forms or InfoPath forms from Access.

data collection control function (n)~ An API function that provides sophisticated control over the data collection logger.

data collection logger (n)~ Software that logs profiling data to a performance data file.

data collection package (n)~ A self-extracting executable (.exe) created by the Application Compatibility Manager (ACM) for deploying to each of your client computers. Each data collection package can include one or more compatibility evaluators, depending on what you are trying to evaluate.

data collector (n)~ An object that defines what data will be collected from a provider (such as a counter provider or event provider).

data collector (n)~ A set of compatibility evaluator modules that produce or gather data and then store the data locally in a raw or nearly raw form. All compatibility evaluators act as data collectors and are installed and deployed by ACT-DC.

Data Collector Set (n)~ A computer management tool used to group data collectors into sets that run on the same schedule.

data collector set (n)~ A group of data collectors stored as a single object.

data co-location (n)~ In DPM, a feature that enables protection of multiple data sources on a single volume or on the same tape. This allows you to store more data on each volume or tape.

Data Communications Equipment (n)~ One of two types of hardware that are connected by an RS-232-C serial connection, the other being a Data Terminal Equipment (DTE) device.

data compartment (n)~ An abstraction (not a specific storage location) that consists of one or more isolated storage files, called stores, which contain the actual directory locations where data is stored. Any kind of data can be saved in the store.

data conferencing (n)~ A method of real-time communication wherein participants share and collaborate on several data and document types. The session can be hosted on an in-house server, an Internet-based service, or both.

data connection (n)~ A connection that specifies the name, type, location, and, optionally, other information about a database file or server.

data connection (n)~ A connection that enables the transmission of data.

data connection file (n)~ A file that stores information about a connection to a data source, such as an Access database, spreadsheet, or text file, and that facilitates data source administration.

Data Connection Library (n)~ A document library, located on a site running Microsoft Office SharePoint Server 2007, that contains a collection of universal data connection (.udcx) and Office data connection (.odc) files.

data context (n)~ A convenient way to share data between multiple controls by establishing a scope within which all data-bound properties inherit a common source of data.

Data Control Language (n)~ The subset of SQL statements used to control permissions on database objects.

data convergence (n)~ Data at the Publisher and the Subscriber that matches.

data corruption (n)~ A process wherein data in memory or on disk is unintentionally changed, with its meaning thereby altered or obliterated.

data coverage (n)~ The geographical area of a mobile communications network or system.

Data Deduplication (PN)~ A feature that searches data on a selected volume to find and remove duplicate records without compromising data fidelity or integrity.

data definition (n)~ The attributes, properties, and objects in a database.

data definition language (n)~ A language that defines all attributes and properties of a database, especially record layouts, field definitions, key fields, file locations, and storage strategy.

data description language (n)~ A language that defines all attributes and properties of a database, especially record layouts, field definitions, key fields, file locations, and storage strategy.

data diagram (n)~ A report type that maps shapes in a Visio diagram to data stored in lists, workbooks, or databases.

data dictionary (n)~ A database containing data about all the databases in a database system. Data dictionaries store all the various schema and file specifications and their locations. They also contain information about which programs use which data and which users are interested in which reports.

data dimension (n)~ A specific node created in the hierarchical view of the Tracking Profile Editor as an immediate child of the specific tracking profile in order to describe a logical grouping or dimension of data. Each data dimension is uniquely named and is made up of one or many data fields.

data discovery record (n)~ The file format (.ddr) and the actual file that is used by Configuration Manager to report discovery data to a Configuration Manager site database.

data encryption (n)~ The process of converting readable data (plaintext) into a coded form (ciphertext) to prevent it from being read by an unauthorized party.

Data Encryption Standard (n)~ An encryption algorithm that uses a 56-bit key and maps a 64-bit input block to a 64-bit output block. The key appears to be a 64-bit key, but one bit in each of the eight bytes is used for odd parity, resulting in 56 bits of usable key.

data enrichment (n)~ A feature that allows the user to choose an external data provider, and update the records in the CRM system based on the information from that data provider.

data entity (n)~ An information structure that represents the data characteristic of an entity.

data entry (n)~ The process of writing new data to computer memory.

data event (n)~ The X++ event that is raised when a data value in a table changes.

Data Execution Prevention (n)~ A security feature that monitors programs on a computer

to determine if they use system memory safely. To do this, DEP software works alone or with compatible microprocessors to mark some memory locations as non-executable.' If a program tries to run code that is malicious or is not from a protected location

data explosion (n)~ The exponential growth in size of a multidimensional structure, such as a cube, due to the storage of aggregated data.

data export job (n)~ The movement of data that is generated in Planning Business Modeler to a specified external database.

data feed (n)~ An XML data stream in Atom 1.0 format.

data field (n)~ A field that contains the result of a query to an external data source.

data file (n)~ A file consisting of data in the form of text, numbers, or graphics, as distinct from a program file of commands and instructions.

data file (n)~ A collection of rows that have been inserted into durable memory-optimized table.

data flow (n)~ The movement of data through a group of connected elements that extract, transform, and load data.

data flow component (n)~ A component of SQL Server 2005 Integration Services that manipulates data.

data flow engine (n)~ An engine that executes the data flow in a package.

data flow task (n)~ The task that encapsulates the data flow engine that moves data between sources and destinations, providing the facility to transform, clean, and modify data as it is moved.

data form (n)~ A dialog box that displays one complete record at a time. You can use data forms to add, change, locate, and delete records.

data format (n)~ The structure or appearance of a unit of data, such as a field, or text in a message body.

data generation plan (n)~ A file that contains information about a particular database schema and how Data Generator will generate data for it.

data graphic (n)~ A graphic element on a drawing that is associated with data.

Data Grid (PN)~ An instance of Excel that has minimal UI and that enables a user to insert or edit chart data within the context of a non-Excel Office document.

data group (n)~ A defined set of data that is synchronized.

data integration (n)~ The process of cleaning and moving data from one system to another system.

data integrity (n)~ The accuracy of data and its conformity to its expected value, especially after being transmitted or processed.

data item (n)~ A single unit of data.

data label (n)~ A label that provides additional information about a data marker, which represents a single data point or value that originates from a datasheet cell.

Data Lake (PN)~ A hyper scale repository for big data analytic workloads.

data layout (n)~ The arrangement and structure of data in a chart.

data limit (n)~ The amount of data the user can download/upload through the carrier's network each month without being billed additional charges.

Data Link Control (n)~ An error-correction protocol in the Systems Network Architecture (SNA) responsible for transmission of data between two nodes over a

physical link. Supported by Microsoft Windows NT and Windows 2000, DLC is designed to provide access to IBM mainframe computers and to Hewlett-Packard printers connected to the network.

data loss prevention (PN)~ A collection of features that provides content-aware classification and applies a policy for sensitive data within email that is specific to an organization.

data loss tolerance (n)~ The maximum amount of data loss, measured in time, that is acceptable to business requirements.

Data Macros (PN)~ A feature that allows users to build business logic in a new and easy-to-use authoring environment. The declarative, macro-style logic will run on client and server and includes both UI-level and data-level actions.

data management (n)~ The category of services in Microsoft Azure that includes SQL Database, Blob, Table, and Queue services.

Data Management Gateway (PN)~ The gateway that allows IT to build connections to internal data sources so reports that are published to BI Sites in Office 365 will refresh either on-demand or on a scheduled basis, ensuring that customers are always looking at the latest view of their data.

data management service (n)~ The category of services in Microsoft Azure that includes SQL Database, Blob, Table, and Queue services.

data manipulation language (n)~ The subset of SQL statements that is used to retrieve and manipulate data. DML statements typically start with SELECT INSERT UPDATE or DELETE.

data map (n)~ A mapping between source files and Microsoft Dynamics CRM that can be used with either the Import Wizard or the Data Migration Wizard and take either the form of an import map or a data migration map.

data marker (n)~ A bar, area, dot, slice, or other symbol in a chart that represents a single data point or value.

data mart (n)~ A subset of the contents of a data warehouse that tends to contain data focused at the department level, or on a specific business area.

data medium (n)~ The physical material on which computer data is stored.

data member (n)~ A child member associated with a parent member in a parent-child hierarchy. A data member contains the data value for its parent member, rather than the aggregated value for the parent's children.

data merge (n)~ The process of collating data from multiple sources to create a one final output.

Data Merge Manager (PN)~ A feature that guides the user through organizing address data, merging it into a generic document, and printing the resulting personalized documents. It can be used to create form letters, mailing labels, envelopes or catalogs.

data mining (n)~ The process of identifying commercially useful patterns or relationships in databases or other computer repositories through the use of advanced statistical tools.

data mining extension (n)~ In Analysis Services, a statement that performs mining tasks programmatically.

data model (n)~ A collection of related object types, operators, and integrity rules that form the abstract entity supported by a database management system (DBMS). Thus, one

speaks of a relational DBMS, a network DBMS, and so on, depending on the type of data model a DBMS supports. In general, a DBMS supports only one data model as a practical rather than a theoretical restriction.

Data Movement Cloud (PN)~ A resource type of the Data Factory' service type of the 'Business Analytics' service to transpose

Data Movement On Premises (PN)~ A resource type of the Data Factory' service type of the 'Business Analytics' service to transpose

Data Outline (n)~ A window that you can display when a data access page is open in Design view.

data packet (n)~ A unit of information transmitted as a whole from one device to another on a network.

data pane (n)~ The area of the window that displays the result set of your query.

data plan (n)~ A standardized service agreement between a cell phone user and a mobile operator that establishes data service details such as pricing, types of services, and bandwidth.

data point (n)~ An individual value plotted in a chart and represented together with other data points by bars, columns, lines, pie or doughnut slices, dots, and various other shapes called data markers. Data markers of the same color constitute a data series.

data point (n)~ In the Charts And Graphs template, a control handle on the Line Graph shape that you can drag to change the values in the graph.

data policy (n)~ A policy that determines which XML elements in a document are valid for a particular action associated with an endpoint.

data processing (n)~ The manipulation of data to transform it into some desired result.

data processing extension (n)~ A plug-in that processes data for a specific kind of data source (similar to a database driver).

Data Processor component (n)~ A component of the report server engine that processes data.

data protection (n)~ The process of protecting data from loss or corruption by centrally creating and maintaining replicas and shadow copies of the data. DPM is designed to provide short-term disk-based backup, to support rapid and reliable recovery of data.

Data Protection API (n)~ A set of routines, protocols, and tools that provides information confidentiality to user and system processes by applying password-based cryptographic protection at the local operating system level.

Data Protection Manager (n)~ Microsoft server software that supports continuous disk-based backup and recovery on Windows Server-based networks.

data provider (n)~ A known data source specific to a target type that provides data to a collector type.

Data Provider (PN)~ An OLE DB provider that allows the user to create distributed applications targeting IBM DB2 databases.

data pump (n)~ A component used in SQL Server 2000 Transformation Services (DTS) to import, export, and transform data between heterogeneous data stores.

data record (n)~ A data structure that is a collection of fields (elements), each with its own name and type. Unlike an array, whose elements all represent the same type of information and are accessed using an index, the elements of a record represent different

types of information and are accessed by name. A record can be accessed as a collective unit of elements, or the elements can be accessed individually.

data region (n)~ A range of cells that contains data and that is bounded by empty cells or worksheet borders.

data region (n)~ A report item that provides data manipulation and display functionality for iterative data from an underlying dataset.

data retrieval service connection (n)~ A Web Service installed on Windows SharePoint Services for connecting to and retrieving data.

data roaming (n)~ The use of data connection in a roaming area. Generally making phone calls or using your data connection when the phone is roaming is more expensive, and the user will be charged additional fees for voice roaming calls.

data segment (n)~ The portion of memory or auxiliary storage that contains the data used by a program.

Data Selector (n)~ A wizard that lets users select, configure, and import data from a data source into a Visio diagram.

Data Selector Wizard (n)~ A wizard that lets users select, configure, and import data from a data source into a Visio diagram.

data series (n)~ Related data points that are plotted in a chart. Each data series in a chart has a unique color or pattern and is represented in the chart legend. You can plot one or more data series in a chart. Pie charts have only one data series.

data service provider (n)~ A business entity, typically a company, that provides up to date data to a Microsoft Dynamics CRM user.

Data Services (PN)~ The family of data services in Microsoft Azure.

data set (n)~ A collection of related information made up of separate elements that can be treated as a unit in data handling.

data source (n)~ In communications, the portion of a Data Terminal Equipment (DTE) device that sends data.

data source (n)~ A share, volume, database, storage group, or system state that is a member of a protection group.

data source (n)~ A disk, file, document, or other collection of information from which data is taken or moved.

data source control (n)~ An object that can be added to an ASP.NET Web page that encapsulates the logic required to connect to a data source, such as a database or XML file, and that can execute queries or other data-access commands. A data source control can in turn provide data to other controls on that page.

data source driver (n)~ A program file used to connect to a specific database. Each database program or management system requires a different driver.

data source formatting (n)~ A type of conditional formatting that is configured within Microsoft SQL Server Analysis Services.

data source name (n)~ The collection of information used to connect an application to a particular ODBC database.

data source plug-in (n)~ A type of plug-in that enables a Windows Media server to use different storage systems.

data source view (n)~ A named selection of database objects—such as tables, views,

relationships, and stored procedures, based on one or more data sources—that defines the schema referenced by OLAP and data mining objects in an Analysis Services databases. It can also be used to define sources, destinations, and lookup tables for DTS tasks, transformations, and data adapters.

data space (n)~ A series of transforms that operate on data in a specific order.

data store (n)~ A repository of data that can be exposed to the Shell programming model as a container using a Shell data source.

data stream (n)~ The flow of data from a source to a single receiver that flows through a channel, as opposed to packets, which may be addressed and routed independently, possibly to multiple recipients.

data structure (n)~ An organizational scheme, such as a record or array, that can be applied to data to facilitate interpreting the data or performing operations on it.

data synchronization (n)~ The process of reconciling the differences between data stored in one location and a copy of the same data stored in another location.

data table (n)~ A range of cells that shows how changing certain values in your formulas affects the results of the formulas.

data template (n)~ A tree of elements that is expanded into the scene whenever data of a particular type is found. The elements typically have properties bound to properties of the data object.

Data Terminal Equipment (n)~ In the RS-232-C hardware standard, any device, such as a remote access server or client, that has the ability to transmit information in digital form over a cable or a communications line.

data terminal ready (n)~ A signal used in serial communications sent, for example, by a computer to its modem to indicate that the computer is ready to accept an incoming transmission.

data theft (n)~ The collection and distribution or sharing of confidential information that is stored on a computer.

data tier (n)~ A layer that is part of a three-tier server software architecture that stores and persists data. Each logical server machine group contains an interface tier (a perimeter network), an application tier, and a data tier. This architecture provides high levels of scalability.

data transfer (n)~ The movement of information from one location to another, either within a computer (as from a disk drive to memory), between a computer and an external device (as between a file server and a computer on a network), or between separate computers.

data transfer bandwidth (n)~ Data transmissions to and from a Microsoft Azure datacenter as measured in GB. Data transfers are charged based on the total amount of data going in and out of the Azure services via the Internet in a specified 30-day period. Data transfers within a sub-region are free.

Data Transfer In at 200 Mbps (GB) (PN)~ The resource of the Networking service that enables data transfer at 200 Mbps (GB).

Data Transmission Unit (n)~ The average number of bits, characters or symbols, or blocks per unit time passing between equipment in a data transmission system.

data type (n)~ A property of a field that defines the kinds of data the field can store.

Data usage (PN)~ A pre-loaded app that allows users to better monitor and manage their data usage on their phone or PC. It can notify users when they are close to their cellular data limit and delay some data-intensive tasks until the phone or PC is connected to Wi-Fi.

data validation (n)~ The process of ensuring that data meets specified criteria.

Data view (n)~ A databindable, customized view of a data for sorting, filtering, searching, editing, and navigation.

data viewer (n)~ A graphical tool that displays data as it moves between two data flow components at run time.

data visualization (n)~ A feature that enables the use of color, icons, or bars to help illustrate trends or show different values in a data range.

data warehouse (n)~ The database that stores operations data for long periods of time. This data is then used by the Operations Manager reporting server to build reports. By default, this database is named OperationsManagerDW.

Data Warehouse (n)~ The database that stores operations data for long periods of time. This data is then used by the Operations Manager reporting server to build reports. By default, this database is named OperationsManagerDW.

Data Warehouse Configuration Wizard (n)~ A configuration wizard, available from Commerce Server Setup that you use to configure a distributed installation of the Data Warehouse and your non-Commerce applications and Web servers.

data warehouse database (n)~ The database that stores operations data for long periods of time. This data is then used by the Operations Manager reporting server to build reports. By default, this database is named OperationsManagerDW.

Data Warehouse resource (n)~ A global-level Commerce Server resource that is managed through Commerce Server Manager. Use the Data Warehouse resource to specify the database connection string to the Data Warehouse database.

data warehouse server (n)~ The server that hosts the OperationsManagerDW database.

Data Warehouse Unit (n)~ A billing meter for the usage of the SQL Data Warehouse service in Azure.

database (n)~ A collection of data formatted/arranged to allow for easy search and retrieval.

Database (PN)~ The Developer tools subcategory containing apps to help developers with database aspects of building an app.

Database ~ A- program- used for organising any kind of information on a computer into a searchable form, anything from a list of contacts to a complex stock control and accounts system.

database administrator (n)~ The person who manages a database. The administrator determines the content, internal structure, and access strategy for a database, defines security and integrity, and monitors performance.

database application (n)~ A set of objects that can include tables, queries, forms, reports, macros, and code modules that are designed to work together to make a database easier to use.

database attach upgrade (n)~ An upgrade that takes enables you to move to new hardware or a new farm.

database availability group (n)~ A group of up to 16 Mailbox servers that host a set of

databases and provide automatic database-level recovery from failures that affect individual servers or databases.

database catalog (n)~ The part of a database that contains the definition of all the objects in the database, as well as the definition of the database.

database column value (n)~ The placeholder for a database field displayed inside a database results region.

Database Compare (PN)~ A Microsoft Office product that detects and categorizes changes between two databases to facilitate review and approval processes.

database connection (n)~ A connection that specifies the name, type, location, and, optionally, other information about a database file or server.

database connection endpoint (n)~ An endpoint representing the connection to a database.

Database Connector (PN)~ An out-of-the-box BDC connector that ships with WSS. It provides connectivity between BCS and a database endpoint.

Database Console Command (PN)~ A set of instructions in the Transact-SQL (T-SQL) programming language to perform tasks on input parameters and return values.

Database Days (n)~ The number of days back in time to with data from any transaction can be recovered.

database development life cycle (n)~ A structured process that is imposed upon the development of the database portion of an application. It is essentially a subset of the software development life cycle that is specific to one or more databases in an application.

database diagram (n)~ A graphical representation of any portion of a database schema. It can be either a whole or partial picture of the structure of the database. It includes tables, the columns they contain, and the relationships between the tables.

Database Documenter (PN)~ A tool that builds a report that contains detailed information about the objects in a database.

database engine (n)~ The program module or modules that provide access to a database management system (DBMS).

Database Engine Tuning Advisor (n)~ A tool for tuning the physical database design that helps users to select and create an optimal set of indexes, indexed views, and partitioning.

Database Explorer (PN)~ A simple database administration tool that lets the user perform database operations such as creating new tables, querying and modifying existing data, and other database development functions.

database file (n)~ One of the physical files that make up a database.

database filter (n)~ A filter that allows Operations Manager to evaluate further rules but does not insert matching events into the database.

Database First (PN)~ A set of features in the Entity Framework for defining a model by first creating a database.

database grooming (n)~ The process of deleting old data to reduce the total database size.

Database Hours (PN)~ The unit of measure for hours used of the SQL Database Premium edition.

database instance (n)~ An instance of a database environment, including the RDBMS software, table structure, stored procedures and other functionality.

database language (n)~ The language used for accessing, querying, updating, and

managing data in relational database systems.

database maintenance tool (n)~ One of a number of utilities that allow users to back up, restore, and check for errors in the Business Contact Manager for Outlook database.

database management system (n)~ A layer of software between the physical database and the user. The DBMS manages all access to the database.

database manager (n)~ A layer of software between the physical database and the user. The DBMS manages all access to the database.

database migration (n)~ The movement of an existing database from one computer running SQL Server to another one within the same system.

database mirroring (n)~ Immediately reproducing every update to a read-write database (the principal database) onto a read-only mirror of that database (the mirror database) residing on a separate instance of the database engine (the mirror server). In production environments, the mirror server is on another machine. The mirror database is created by restoring a full backup of the principal database (without recovery).

Database Mirroring Monitor (PN)~ A tool used to monitor any subset of the mirrored databases on a server instance.

database mirroring partner (n)~ One in a pair of server instances that act as role-switching partners for a mirrored database.

database mirroring partners (n)~ A pair of server instances that act as role-switching partners for a mirrored database.

database object (n)~ A database component (for example, a table, index, trigger, view, key, constraint, default, rule, user-defined data type, or stored procedure in a database).

database owner (n)~ The person who created the database, and has full control, including granting access permissions or deleting records. When a database has been restored, then the person who restored it becomes the owner.

database project (n)~ An offline representation of a database. Each database project contains the scripts that are required to deploy a new database or to update an existing database to a database server. A database project does not contain the data that resides in that database. Database projects are saved as .dbproj files.

database project (n)~ A collection of one or more data connections (a database and the information needed to access that database).

database refactoring (n)~ The process by which you can modify the names of database objects in such a way that all instances of those names within the database project are modified at the same time.

database reference (n)~ A path, expression or filename that resolves to a database.

database replication (n)~ The process of creating two or more special copies (replicas) of an Access database. Replicas can be synchronized, changes made to data in one replica, or design changes made in the Design Master, are sent to other replicas.

database replication (n)~ A type of data replication in System Center 2012 Configuration Manager that uses SQL Server replication.

Database restore (v)~ A dialog box that enables the user to select the data file to use when restoring a database.

database role (n)~ A collection of users and groups with the same access to an Analysis Services database.

database schema (n)~ The names of tables, fields, data types, and primary and foreign keys of a database.

database script (n)~ A collection of statements used to create database objects.

database server (n)~ A computer that is running Microsoft SQL Server and is used by an SMS/Configuration Manager site to store the site data.

database server (n)~ A DBMS (database management system) designed to be run in a client/server environment. These DBMS provide a stand-alone database engine that provides rich support for SQL and transactions. They are accessed through DBMS-based drivers. For example, Oracle, Informix, DB/2, or Microsoft SQL Server.

database shard (n)~ A database partition generated as a product of splitting a large database into chunks in a distributed scalable database system.

database snapshot (n)~ A read-only, static view of a database at the moment of snapshot creation.

database structure (n)~ The names of tables, fields, data types, and primary and foreign keys of a database.

database unit (n)~ A unit of measure for the SQL Database resource.

database unit test (n)~ A unit test that validates whether a certain aspect of your database is working as you expect.

Database view (n)~ A read-only, static snapshot of a source database at the moment of the view's creation.

data-centered design (n)~ A design in which users interact with their data directly without having to first start an appropriate editor or application.

data-definition query (n)~ An SQL-specific query that contains data definition language (DDL) statements. These statements allow you to create or alter objects in the database.

data-driven subscription (n)~ A subscription that takes generated output for subscription values (for example, a list of employee e-mail addresses).

dataflow (n)~ In a DFD model, an exchange of information between processes. Data flows represent discrete packets of data that flow into and out of processes.

dataflow diagram (n)~ A tool for functional analysis that shows the general flow of information through a system or program.

datagram (n)~ One packet, or unit, of information that includes relevant delivery information, such as the destination address, that is sent through a packet-switching network.

datagram socket (n)~ A socket using the Windows Sockets API that provides a connectionless, unreliable flow of data.

data-link layer (n)~ Layer two of the OSI model. A layer that packages raw bits from the physical layer into frames (logical, structured packets for data). This layer is responsible for transferring frames from one computer to another, without errors. After sending a frame, the data-link layer waits for an acknowledgment from the receiving computer.

data-overrun error (n)~ A state in which the sending computer is transmitting characters faster than the receiving computer can accommodate them. If this problem persists, reduce the bits-per-second (bps) rate.

datareader (n)~ A stream of data that is returned by an ADO.NET query.

dataset (n)~ A collection of related information made up of separate elements that can be

treated as a unit in data handling.

Dataset Designer (PN)~ A designer which provides a set of visual tools for working with ADO.NET Datasets, and XML Schemas.

dataset parameter (n)~ A type of parameter that is created by the reporting framework when a dataset is created based on the Query property and the Dynamic Filters property of the dataset.

data-sharing session (n)~ A conversation that is used to share data between conversation members using a non-Communicator application or plug-in.

datasheet (n)~ Data from a table, form, query, view, or stored procedure, displayed in a row-and-column format.

Datasheet view (n)~ A window that displays data from a table, form, query, view, or stored procedure in a row-and-column format.

data-tier application (n)~ A application that captures the SQL Server database and instance objects used by a client-server or 3-tier application.

data-tier application instance (n)~ A copy of a DAC deployed on an instance of the Database Engine. There can be multiple DAC instances on the same instance of the Database Engine.

data-tier application package (n)~ An XML manifest that contains all of the objects defined for the DAC; the package gets created when a developer builds a DAC project.

date (n)~ A SQL Server system data type that stores a date value from January 1, 1 A.D., through December 31, 9999

Date (n)~ An 8-byte, real data type used to store dates and times as a real number. Variables are stored as 64-bit numbers. The value to the left of the decimal represents a date, and the value to the right of the decimal represents a time. The Date data type can range from January 1, 1000 to December 31, 9999.

date expression (n)~ Any expression that can be interpreted as a date. This includes any combination of date literals, numbers that look like dates, strings that look like dates, and dates returned from functions.

date literal (n)~ Any sequence of characters with a valid format that is surrounded by number signs (#). Valid formats include the date format specified by the locale settings for your code or the universal date format.

Date Navigator (n)~ The small calendar that displays the current month in Calendar. It provides a quick and easy way to move appointments and to view other dates.

Date Only (PN)~ The behavior property of a Date and Time attribute where the date portion of the value is as specified in the UI and SDK and the time portion of the value is always 12:00 A.M.

date period code (n)~ A code that represents a period of time measured by starting and ending dates.

date picker (n)~ A control that developers use to allow a user to select a date.

date picker control (n)~ A control that developers use to allow a user to select a date.

date range (n)~ The time span between the start and end dates.

date separator (n)~ A character that is used to separate the day, month, and year when date values are formatted. The characters are determined by system settings or by the Format function.

date stamping (n)~ A software feature that automatically inserts the current date into a document.

Date/Time (n)~ A data type used to hold date and time information.

datetime (n)~ A data type used to hold date and time information.

Daughter Board ~ A circuit board that plugs into a larger circuit board, or motherboard.

day pane (n)~ A section of the calendar window that displays information for a single date.

Day view (n)~ A calendar view that displays information for a single day.

daypart (n)~ The practice of dividing the day into several parts, during each of which a different type of radio programming or television programming appropriate for that time is aired.

Days Neglected (PN)~ A field in the Neglected Cases, Neglected Leads, and Neglected Accounts reports in the Microsoft Dynamics CRM user interface. The Days Neglected field is calculated from the number of days that the case, lead, or account has not received any type of activity.

dB (n)~ One tenth of a bel (named after Alexander Graham Bell), a unit used in electronics and other fields to measure the strength of a sound or signal. Decibel measurements fall on a logarithmic scale and compare the measured quantity against a known reference.

DB unit (n)~ A unit of measure for the SQL Database resource.

DBA name (n)~ The registration of an assumed, fictitious, or trade name under which a business operates, which must be included on U.S. tax reports. In the U.S., any business that operates under a name other than a personal or corporate legal name must register a DBA name with the appropriate government agency.

DBCC (PN)~ A set of instructions in the Transact-SQL (T-SQL) programming language to perform tasks on input parameters and return values.

DBCS (n)~ A character set that can use more than one byte to represent a single character. A DBCS includes some characters that consist of 1 byte and some characters that consist of 2 bytes. Languages such as Chinese, Japanese, and Korean use DBCS.

dBi ~ A unit that is used to represent the gain of an antenna compared to the gain of an isotropic radiator.

DBMS (n)~ A layer of software between the physical database and the user. The DBMS manages all access to the database.

DC (n)~ In an Active Directory forest, a server that contains a writable copy of the Active Directory database, participates in Active Directory replication, and controls access to network resources.

DC (n)~ A data structure that defines the graphic objects, their associated attributes, and the graphic modes that affect output on a device.

DCB (n)~ An internal NT file system (NTFS) structure in which the file system maintains the state for an open instance of a directory file.

DCE (n)~ One of two types of hardware that are connected by an RS-232-C serial connection, the other being a Data Terminal Equipment (DTE) device.

D-channel (n)~ A separate channel of an Integrated Services Digital Network (ISDN) line that is used for ISDN signaling. For ISDN Basic Rate Interface (BRI), the D-channel is 16

kilobits per second (Kbps). For ISDN Primary Rate Interface (PRI), the D-channel is 64 Kbps.

DCM digest (n)~ A predefined XML schema that is used with the desired configuration management feature to create and validate configuration baselines and configuration items.

DCOM (n)~ The version of Microsoft's Component Object Model (COM) specification that stipulates how components communicate over Windows-based networks. It permits the distribution of different components for a single application across two or more networked computers, running an application distributed across a network so that the distribution of components is not apparent to the user, and remotely displaying an application. Because DCOM is language-neutral, any language that uses COM components can also produce DCOM applications.

DCP (n)~ A self-extracting executable (.exe) created by the Application Compatibility Manager (ACM) for deploying to each of your client computers. Each data collection package can include one or more compatibility evaluators, depending on what you are trying to evaluate.

DCR (n)~ Of, pertaining to, or characteristic of a High Definition Television (HDTV) that conforms to the plug-and-play digital cable TV standard; thus, removing the need for a separate set-top box.

DCTCP (PN)~ A TCP-like protocol for data center networks which leverages Explicit Congestion Notification (ECN) in the network to provide multi-bit feedback to the end hosts.

DDE (n)~ An interprocess communication method that allows two or more applications running simultaneously to exchange data and commands.

DDE channel (n)~ An active link between Microsoft Windows programs over which data can be exchanged.

DDE conversation (n)~ The interaction between two applications that are communicating and exchanging data through special functions and code known as dynamic data exchange (DDE).

DDI (n)~ A set of functions that are implemented by the operating system for use by drivers.

DDL (n)~ A language that defines all attributes and properties of a database, especially record layouts, field definitions, key fields, file locations, and storage strategy.

DDL trigger (n)~ A special kind of trigger that executes in response to Data Definition Language (DDL) statements.

DDR ~ (Double Data Rate)- A fast type of- RAM- for a PC. DDR2 is a yet faster version.

DDR SDRAM (n)~ A type of SDRAM that supports data transfers on both edges of each clock cycle (the rising and falling edges), effectively doubling the memory chip's data throughput.

deactivate (v)~ To remove the ability of a network object, such as a user account or a network-joined computer to access the resources that the server provides. Deactivating a network object does not delete the object from the active directory, nor does it delete any data that is associated with the object.

deactivate (v)~ A process, when an assigned user who is already activated in a role,

decides to withdraw from the role access rights, and return back to the normal state of no access rights of this role.

dead code (n)~ Code that is not called during profiling.

dead gateway detection (n)~ The practice of the TCP/IP protocol in Windows 2000 and the Windows Server 2003 family to change the default gateway to the next default gateway in the list of configured default gateways when a specific number of connections retransmit segments.

dead key (n)~ A key that is used to modify the character that follows it, for example, by adding an accent mark or other diacritic.

dead-letter queue (n)~ For Message Queuing, a queue that stores nontransactional messages that are undeliverable or expired. These queues store failed messages on the computer on which the message expired. Messages in these queues are written to disk and are therefore recoverable.

deadline (n)~ A date within each assignment by which submission, review and approval should be completed.

deadline (n)~ A target date that indicates when you want a task to be completed and allows you to track the status of the task against that target without imposing a constraint on the schedule.

deadline date (n)~ A target date that indicates when you want a task to be completed and allows you to track the status of the task against that target without imposing a constraint on the schedule.

deadlock (n)~ In operating systems and database applications, a situation in which two or more processes cannot continue because each process is waiting for resources to be freed by the continuation of the other process.

deadlock (n)~ A situation when two users, each having a lock on one piece of data, attempt to acquire a lock on the other's piece.

deadlock (n)~ A situation in which a thread will not relinquish its exclusive access to a critical section.

deadlock ~ A condition under which a transaction cannot proceed

deadlock ~ Unresolved contention for the use of resources.

deadlock ~ A condition in which two independent threads of control are blocked, each waiting for the other to take some action.

deadlock-prone (adj)~ likely to produce a situation in which one of several threads is waiting for the other thread(s) to do something

deafness (n)~ Hearing impairment that results in complete loss of hearing.

deal (n)~ A discount, coupon, or other sorts of promotions.

deallocate (v)~ To free previously allocated memory.

Deals Hub (PN)~ ?A feature in the Windows Store for merchandising apps and collections.

Death metal (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 22.

debit (v)~ To enter an amount that increases an asset or expense account, or decreases the balance of a liability, owners' equity or income account; the left side of any T account.

debit (n)~ An entry on the left side of a T account or double-entry balance sheet that typically increases asset or expense accounts and decreases liabilities, owners' equity, or income accounts.

debit advice (n)~ An official notice of a bank debit transaction.

debit card (n)~ A type of bank card where the amount of purchase is immediately withdrawn from the user's bank account.

debriefing (n)~ An official or formal questioning session after event or an interview in which somebody is asked about or reports on a task, mission, or event after it has ended.

debug (v)~ To detect, locate, and correct logical or syntactical errors in a program or malfunctions in hardware. In hardware contexts, the term troubleshoot is the term more often used, especially when the problem is a major one.

debug ~ To detect, diagnose, and eliminate errors in programs. Checking the logic of a program to isolate and eliminate the mistakes from a computer program or other software.

debug engine (n)~ A component that allows finding and reducing the number of defects in a computer program in a run-time architecture, by working in conjunction with the interpreter or operating system and providing execution control, breakpoints, and expression evaluation.

Debug Interface Access SDK (n)~ An SDK that provides access to debug information stored in program database (.pdb) files generated by Microsoft post-compiler tools.

debug session (n)~ The set of all processes, related or unrelated, that have been launched or attached to from a single instance of the IDE.

debug symbol (n)~ Information that expresses which programming-language constructs generated a specific piece of machine code in a given executable module.

debug target (n)~ A debuggable execution context.

debug type (n)~ Debugging information generated by the compiler about every function or variable that will tell the debugger whether it is an integer, or a string, or a user defined type, etc. or it is the number of parameters, calling convention, and the type of the function's return value.

debug value (n)~ A specific value written to memory during allocation or deallocation, so that it will later be possible to tell whether or not it has become corrupted.

debug zone mask (n)~ A named bit mask in application source code that is used to turn a debug zone on or off.

debuggee (n)~ A process or application upon which a debugger acts. The process that is being debugged.

debugger (n)~ A program designed to aid in detecting, locating, and correcting errors in another program by allowing the programmer to step through the program, examine the data, and monitor conditions such as the values of variables.

debugger display (n)~ The screen on an external monitor when you are calibrating a Surface unit.

debugger event (n)~ A diagnostic event in IntelliTrace that occurs within the Visual Studio Debugger when it is running your application.

debugging (n)~ The process of finding and fixing errors in a Visual Basic procedure or a macro. Debugging usually involves executing specific portions of the procedure or macro and analyzing them at various points.

debugging mode (n)~ The operational state of the tool during which problems within the selected application are detected and transferred to a debugger.

deceptive trade practices (n)~ Practices that involve misleading or misrepresenting products or services to consumers and customers. In the U.S., these practices are regulated by the Federal Trade Commission at the federal level and typically by the Attorney General's Office of Consumer Protection at the state level.

decimal (n)~ A number in a counting system that is based on units of 10. Most commonly used to refer to a real number expressed in decimal notation (i.e. containing a .' between the integer part and the fraction part of the number).'

Decimal (adj)~ A data type that stores a signed, exact numeric value described as the number of digits appearing before and after the decimal point, with a maximum of 29 total digits. All possible digits cannot be represented if you are using the maximum number of digits.

decision (n)~ In an activity diagram, a guard condition that indicates different possible transitions from an action state. If one of these transitions leads to another decision, that decision is represented with the traditional diamond shape.

decision engine (n)~ Software or service able to process a large amount of data and provide reports that help users make more informed decisions.

decision maker (n)~ A person who is responsible for the administration of a business.

decision support (n)~ Systems designed to support the complex analytic analysis required to discover business trends.

decision support system (n)~ A set of programs and related data designed to help with analysis and decision making. A decision support system provides more help in formulating decisions than a management information system (MIS) or an executive information system (EIS). It includes a database, a body of knowledge about the subject area, a language' used to formulate problems and questions

decision tree (n)~ A treelike model of data produced by certain data mining methods. Decision trees can be used for prediction.

deck (n)~ A group of one or more cards.

deck (n)~ A storage device, such as a tape deck, or a group of such devices.

declaration (n)~ A binding of an identifier to the information that relates to it. For example, to make a declaration of a constant means to bind the name of the constant with its value. Declaration usually occurs in a program's source code; the actual binding can take place at compile time or run time.

declaration (n)~ A statement in which information is provided to government authorities for an official purpose, such as Intrastat reporting or tax reporting.

declaration (n)~ A list of contracts and capabilities declared in the app manifest.

Declarations section (n)~ The section of a module containing declarations that apply to every procedure in the module. It can include declarations for variables, constants, user-defined data types, and external procedures in a dynamic-link library.

Declarative Management Framework (PN)~ A policy based system of SQL Server management.

Declarative Management Framework Facet (PN)~ A set of logical pre-defined properties that model the behavior or characteristics for certain types of managed targets

(such as a database, table, login, view,etc) in policy-based management.

declarative programming (n)~ Rule-based programming in which each rule is independent and the order in which rules are declared or executed is not significant.

declarative referential integrity (n)~ FOREIGN KEY constraints defined as part of a table definition that enforce proper relationships between tables.

declarative security check (n)~ Declarative security information in metadata. Developers can use such declarations, which are usually written as custom attributes, to invoke several kinds of security functionality - require permissions to bind reference to the code, require permissions to derive a type, demand that callers have certain permissions, and so on.

declarative test (n)~ An ordinary Web test that is generated by using the Web Test Recorder that is launched when a new Web test is created.

declarative workflow (n)~ A workflow that is defined by using workflow markup language contained in XAML-formatted files. The XAML files are deployed and stored in the database.

declare (v)~ To specify the name and type of a variable that will be used in a program. In most high-level programming languages, variables are declared at the beginning of sections of code.

Decline (v)~ The administrator's act of removing an update from the main view of updates so that the respective update is no longer displayed or available for deployment.

Decline (PN)~ The button in Yammer that allows a user to refuse a network invitation.

decloak (v)~ Remove the cloaked attribute from a project.

decoder (n)~ A device or program routine that converts coded data back to its original form.

decommission CA (v)~ To stop using CA

Decomposition Tree (PN)~ A data visualization tool that helps users analyze complex information using a hierarchical scheme.

decompress (v)~ To restore the contents of a compressed file to its original form.

decompression (n)~ The process of reversing the procedure that is run by compression software. During decompression, the compressed data returns to its original file size and format so it can be accessed or played.

decompressor (n)~ A module or algorithm that decompresses data.

decorator (n)~ A type of control that is used in a style to apply effects to another element. Decorators can include a single child element, usually the element whose appearance they affect.

decoupled provider (n)~ A provider hosted in a separate process from WMI. Decoupled providers are the recommended way to instrument an application because the provider can control its own lifetime instead of being launched every time a user accesses the provider through WMI.

decrease (n)~ A transaction where items go out of inventory.

decrement operator (n)~ An operator that subtracts 1 from its operand depending on the position of the operator.

decrypt (v)~ To convert encrypted content back into its original form.

decryption (n)~ The process of converting encrypted content back into its original form to make it readable again. This is also called converting ciphertext back to plaintext.

Decryption ~ The act of restoring an encrypted file to its original state.

dedicated adapter (n)~ The network adapter that, when using multiple network adapters in each host of a Network Load Balancing cluster, handles network traffic not related to cluster operations (the traffic for individual hosts on the network). This adapter is programmed with the host's dedicated IP address.

dedicated administrator connection (n)~ A dedicated connection that allows an administrator to connect to a server when the Database Engine will not respond to regular connections.

dedicated connection (n)~ A communications channel that permanently connects two or more locations. Dedicated lines are private or leased lines, rather than public ones. T1 lines, which are used by many organizations for Internet connectivity, are examples of dedicated lines.

dedicated line (n)~ A communications channel that permanently connects two or more locations. Dedicated lines are private or leased lines, rather than public ones. T1 lines, which are used by many organizations for Internet connectivity, are examples of dedicated lines.

dedicated resource (n)~ A resource that is committed to or reserved for a specific purpose.

deduplication (n)~ The process of saving only one copy of duplicate items in the search results

deep copy (n)~ A copy of the contents of a data structure, including all its substructures.

deep link (n)~ A link that takes you to a precise location, such as a slide within a presentation, a section of a document, or a specific page within a site, instead of to the main page of the web site.

deep linking (n)~ The process of creating a hyperlink to a specific page within a Web site or Web-based application instead of to the site's home page.

deep refiner (n)~ A refiner that is based on the aggregation of managed property statistics for all of the results of a search query.

Deep Zoom (PN)~ In Silverlight, a technology that enables users to interactively view high-resolution images. With Deep Zoom, users can zoom in, zoom out, and pan images rapidly.

Deeper Sleep ~ an Intel power management technology. It helps to deliver longer battery life by minimizing the power consumption of the processor during brief periods of inactivity by the user including microseconds between keystrokes.

default (oth)~ A value that is automatically used by a program when the user does not specify an alternative. Defaults are built into a program when a value or option must be assumed for the program to function.

Default ~ A default setting is one you haven't changed - what a program will do (or use) if you don't tell it any different. 'Accept the defaults' means leave any settings as they are.

default button (n)~ In some dialog boxes, the command button that is selected or highlighted when the dialog box is initially displayed. The default button has a bold border, indicating that it will be chosen automatically if you press ENTER. You can override a default button by clicking Cancel or another command button.

default capture mode (n)~ The capture mode that specifies whether capture variables that

were not explicitly specified by the user are captured by value or by reference.

default company service level agreement (n)~ A service level agreement that a company uses as a default.

default control style (n)~ The default property setting of a control type. You customize a control type before you create two or more similar controls to avoid customizing each control individually.

default data file (n)~ The .pst data file used as the main delivery location for your e-mail messages.

default database (n)~ The database the user is connected to immediately after logging in to SQL Server.

Default delimiter (n)~ Field that specifies which character will be the default character used to separate data items when the data is being imported into Microsoft Dynamics CRM.

default device (PN)~ The device that Lync and Communicator uses by default when the user places a call (either PBX telephone phone or computer through a VOIP connection).

default document (n)~ The file that is sent by a Web server when it receives a request for a Uniform Resource Locator (URL) that does not specify a file name. This document can be generated automatically by the server, or it can be a custom file that is placed in that directory by the administrator.

default folder (n)~ A folder that exists by default in all users' mailboxes. The Inbox, Outbox, Sent Items, Deleted Items, Calendar, and Contacts folders are default folders.

default font (n)~ The font that a program uses by default to display text.

default form (n)~ A form that is provided out of the box' for any entity

default gateway (n)~ A configuration item for the TCP/IP protocol that is the IP address of a directly reachable IP router. Configuring a default gateway creates a default route in the IP routing table.

default home page (n)~ The file that is sent by a Web server when it receives a request for a Uniform Resource Locator (URL) that does not specify a file name. This document can be generated automatically by the server, or it can be a custom file that is placed in that directory by the administrator.

default host (n)~ Administration objects that facilitate deployment and orchestration enlistment. These objects are identified in the BizTalk Server Administration console with a checkmark symbol. During the orchestration enlistment process, the default host is automatically used to host the orchestration, unless the user explicitly selects a different host.

default hyperlink (n)~ In an image map, the hyperlink that site visitors follow when they click an area of the picture where there are no hot spots.

default instance (n)~ The instance of SQL Server that uses the same name as the computer name on which it is installed.

default language (n)~ The human language that SQL Server uses for errors and messages if a user does not specify a language.

Default Location (PN)~ An area within the Windows Control Panel that allows the user to designate his home coordinates or address for location-aware functionalities.

default location (n)~ Information that describes the current location of a computer. The

location is entered manually in Default Location, and can be used by programs to determine the location of a computer when a location sensor is unavailable.

default management point (n)~ The active management point for a site. This could also be an IP address of a Network Load Balancing (NLB) cluster that combines several management points. While additional management points can be configured, a management point must be designated as a default management point or part of the designated default NLB management point cluster, or it will not respond to client requests.

default member (n)~ The dimension member used in a query when no member is specified for the dimension.

default name (n)~ The name automatically assigned to an object by a program or process when the user does not specify an alternative.

default network (n)~ In the Macintosh environment, the physical network on which the processes of a server reside as nodes and on which the server appears to users. The default network of the server must be one to which that server is attached. Only servers on AppleTalk Phase 2 internets have default networks.

default printer (n)~ The printer to which a computer sends documents if you select the Print command without first specifying which printer you want to use with a program. You can have only one default printer; it should be the printer you use most often.

default property (n)~ A property that you can set for a control so that each time a new control of that type is created, this property will have the same value.

default report (n)~ A type of report that does not allow a user to modify the layout but that does allow a user to filter and sort the data in the report.

default result set (n)~ The default mode that SQL Server uses to return a result set back to a client.

default role (n)~ A setting associated with a particular user role. Users who are not assigned to an existing role are automatically assigned to the role that is specified as the default.

Default Route ~ Entry in a routing table that can redirect any frames for which the table has no definitive listing for the next hop.

default shape (n)~ A virtual shape that contains default formatting properties for new shapes. Each presentation contains one default shape.

default skin (n)~ A control skin that automatically applies to all controls of the same type when a theme is applied to a page.

default solution (n)~ A catch-all' solution that contains a reference to all unprotected components.'

default subnet mask (n)~ A subnet mask that is used on an Internet Protocol version 4 (IPv4) class-based network. The subnet mask for Class A is 255.0.0.0. The subnet mask for Class B is 255.255.0.0. The subnet mask for Class C is 255.255.255.0.

default template (n)~ The boilerplate document used whenever you start a new document.

default tile (n)~ The tile that a developer defines in the manifest. It's the app tile before it receives its first update notification. It consists of just a logo as an image, plus an optional short name.

default unit (n)~ The unit of measure used to display a value if no units of measure are

explicitly specified.

default user (n)~ The profile that serves as a basis for all user profiles. Every user profile begins as a copy of the default user profile.

default value (n)~ A value that is automatically entered in a field or control when you add a new record. You can either accept the default value or override it by typing a value.

default verb (n)~ The verb that represents the action that is executed when a user double-clicks a file in Windows Explorer.

default workbook template (n)~ The Book.xlt template that you create to change the default format of new workbooks. Excel uses the template to create a blank workbook when you start Excel or create a new workbook without specifying a template.

default worksheet template (n)~ The Sheet.xlt template that you create to change the default format of new worksheets. Excel uses the template to create a blank worksheet when you add a new worksheet to a workbook.

default zone (n)~ The zone to which all Macintosh clients on the network are assigned by default.

defection (n)~ The removal of a server from multiserver operations.

Defense Advanced Research Projects Agency (n)~ The U.S. government agency that provided the original support for the development of the interconnected networks that later grew into the Internet.

defer (v)~ To postpone a payment or delivery.

deferred enforcement mode (n)~ The enforcement mode in which client computers immediately receive NAP notifications if they are not in compliance with network health requirements, but do not have their access restricted until the specified time and date.

deferred event (n)~ In a statechart or activity diagram, an event that must be postponed for later use while another activity is under way. You can show a deferred event for a state by including the event among the state's internal transitions.

deferred input VAT (n)~ The calculated value-added tax (VAT) amount that is not due until the invoice is paid. This amount is posted to an unrealized purchase VAT account and can be claimed only after the receipt of a receipt/tax invoice or a tax invoice.

deferred loading (n)~ A pattern of data loading where related objects are not loaded until a navigation property is accessed.

deferred output VAT (n)~ The calculated value-added tax (VAT) amount that is not due until the invoice is paid. This amount is posted to an unrealized sales VAT account and can be claimed only after a receipt or tax invoice is printed.

deferred query (n)~ A LINQ query that is not evaluated until it is iterated over, either with a foreach statement (C#) or a For Each statement (Visual Basic), or by manually using the underlying GetEnumerator and MoveNext methods.

deferred transaction (n)~ A transaction that is not committed when the roll forward phase of recovery completes and that cannot be rolled back during database startup because data needed by roll back is offline. This data can reside in either a page or a file.

Define (v)~ A menu option that becomes available when a user right-clicks a word. It opens the chosen definitions provider and displays information for the word selected.

defined name (n)~ A word or string of characters in a formula that represents a cell, range of cells, formula, or constant value.

definition (n)~ A verbal representation of a concept which serves to differentiate it from related concepts and allows humans to recognize and agree on the concept.

definition update (n)~ A broadly-released and frequent software update containing additions to a product's definition database. Definition databases are often used to detect objects with specific attributes, such as malicious code, phishing Web sites, or junk e-mail.

definitions (n)~ Files that are used to help detect harmful or unwanted software and to prevent it from installing or running on your computer.

definitions callout (n)~ A callout that is invoked through contextual UI to display reference data, such as definitions and synonyms, for the word selected.

defragmentation (n)~ The process of rewriting parts of a file to contiguous sectors on a hard disk to increase the speed of access and retrieval.

degradation (n)~ In computer systems, a reduction in level of performance or service. Degradation in microcomputer performance is indicated by slow response times or frequent pauses for disk access because memory is insufficient to hold an entire program plus the data the program is using.

DEGREE SIGN (n)~ The -° character

degree symbol (n)~ The -° character

dehydrate (v)~ To save the state of a running orchestration to persistent storage and remove it from memory when the orchestration has been idle for a certain length of time.

deinterlace (v)~ To combine two interlaced fields into a single frame that is not interlaced.

delamination (n)~ A problem with the Surface display when the diffuser (or one of its layers) detaches from the top of the Surface unit along one edge.

delay (n)~ The amount of time between the scheduled start of a task and the time when work should actually begin on the task; it is often used to resolve resource overallocations. There are two types of delay: assignment delay and leveling delay.

delayed group call (n)~ A group call that first rings the group owner, and then after a specified number of seconds rings the call group in addition to the group owner.

delegate (n)~ A type that references a method. Once a delegate is assigned a method, it behaves exactly like that method. Delegates are roughly similar to function pointers in C++; however, they are type-safe and secure.

delegate (n)~ Someone granted permission to access items or perform functions on another user's behalf.

delegate (n)~ A security impersonation level used to allow remote access involving more than one network hop.

delegate (n)~ Someone who has been specified by a manager (or other person) to make or receive calls on their behalf. Delegates can change call forwarding settings and add other delegates. Delegates are automatically given -€œTeam Access,-€? which allows them to contact the -€œmanager-€? even when his or her presence is set to Do not Disturb.

delegate control (n)~ A control on a page or master page that can be replaced with another control or content.

delegated administrator (n)~ A partner (authorized by the Microsoft Partner Network) who has been granted administrative permissions by a Microsoft Online Services customer. The delegated administrator can access the customer's account in the Microsoft

Online Services Administration Center and perform all the administrative tasks (add or delete users, reset passwords, etc.) on behalf of the customer.

delegated administrator (n)~ A Microsoft partner who is associated with one or more companies and authorized to provide certain administrative tasks for said companies. A delegated administrator may be the same or different than a customer's subscription advisor. Referred to within Microsoft as a -€œdelegated administrator partner (DAP).-€?

Delegated Administrator user role (PN)~ A user role that allows the user to create new Delegated Administrator and Self-Service user roles and add or remove members to the Administrator user role, but not modify VMM settings.

delegated authentication (n)~ A method of authentication by which a trusted server (or service) is enabled to act as the client when it connects to third-tier application resources.

delegated evaluator (n)~ A filter that uses a custom method to evaluate the specified data.

delegated registration model (n)~ A registration model in which a person other than the certificate subscriber initiates the certificate transaction. The certificate subscriber then completes the transaction by providing a supplied one-time password.

delegation (n)~ An assignment of administrative responsibility to a user, computer, group, or organization.

delegation (n)~ The process of passing on the approval of a document to a substitute approver within the context of a NAV document approval process.

delegation setting (n)~ A configuration element that specifies which features of a Web site or Web application to delegate to Web site and Web application administrators in IIS Manager. You can delegate features as read only, read/write, not delegated, and so on.

delegation state (n)~ The condition, at any particular time, of the delegation setting. Delegation state examples include read only, read/write, not delegated, and so on.

delegation wizard (n)~ A wizard used to distribute precise elements of the administrator's workload to others.

delete (v)~ To eliminate text, a file, or part of a document with the intention of removing the information permanently.

Delete (v)~ A button, option, or other UI element that permanently removes the selected text or objects.

Delete a Contact… (oth)~ A UI element that opens a list of contacts so the user can select one to remove from the user's contact list.

Delete a Group (oth)~ A menu item that removes a group and its contacts from the user's Contacts list.

DELETE clause (n)~ A part of a DML Statement that contains the DELETE keyword and associated parameters.

delete gesture (n)~ In Tablet PC Input Panel, an action gesture or a revision gesture that performs the same action as pressing the DELETE key on the keyboard.

Delete Group (PN)~ A menu item that removes a group and its contacts from the user's Contacts list.

Delete Group and Contacts (oth)~ An item on the right-click menu for a group that removes the selected group and its contacts from the user's contact list.

DELETE key (n)~ On IBM and PC-compatible computers, a key whose function changes depending on the application program. Usually it erases the character under the cursor,

although in some applications it can erase selected text or graphics.

delete level (n)~ In Data Transformation Services, the amount and kind of data to remove from a data warehouse.

delete query (n)~ A query (SQL statement) that removes rows matching the criteria you specify from one or more tables.

Deleted Items folder (n)~ A folder that stores items deleted by the user.

delimited flat file (n)~ A data file that contains one or more records separated by a record delimiter. Each delimited record contains one or more fields separated by a common field delimiter.

delimited identifier (n)~ An object in a database that requires the use of special characters (delimiters) because the object name does not comply with the formatting rules of regular identifiers.

delimited text file (n)~ A file containing data where individual field values are separated by a character, such as a comma or a tab.

delimiter (n)~ One or more special characters used to separate peers in a delimited structure, at any level (fields, records, and so on).

deliver (v)~ To provide or give.

deliverable (n)~ Any measurable, tangible, verifiable outcome, result, or item that must be produced to complete a project or part of a project.

delivery (n)~ A product sent to a customer.

delivery address (n)~ The location to which goods are to be sent.

delivery channel (n)~ A pipeline between a distributor and a delivery service.

delivery channel type (n)~ The protocol for a delivery channel, such as Simple Mail Transfer Protocol (SMTP) or File.

delivery extension (n)~ A plug-in that delivers reports to a specific target (for example, e-mail delivery).

delivery note (n)~ A business document that documents the delivery of products between two parties.

delivery protocol (n)~ The set of communication rules used to route notification messages to external delivery systems.

delivery queue (n)~ A queue that is used to hold messages that being delivered to a Mailbox server or remote location. A delivery queue is created for each unique message destination.

delivery schedule (n)~ A schedule for the planned delivery of products.

delivery status notification (n)~ A notification made up of a DSN code and a DSN message, that reports the result of an attempt to deliver an e-mail message.

delta file (n)~ A file which contains references to those rows in the data file that have been deleted.

delta inventory (n)~ A hardware or software inventory cycle that creates a delta inventory file containing all the information that was added, removed, or changed since the previous inventory. The delta inventory file is smaller than the complete inventory file.

delta inventory file (n)~ A file generated during inventory cycles that occur after the initial complete inventory, containing only hardware or software properties that were added, removed, or changed since the previous inventory cycle.

delta replication (n)~ The copying of only the changed files in a Configuration Manager package when an update has been made to the package.

demand during lead time (n)~ The average daily demand for a product multiplied by the average lead time.

demand forecast (n)~ A prediction of future product demand.

demand forecasting (n)~ A business process that estimates future demand and creates demand forecasts based on historical transaction data.

Demand Management (PN)~ A feature that captures and manages work proposals in a single location. Proposals move through a customizable, multi-stage governance process that may include review, selection of proposals for approval, and tracking the execution of approved proposals through to completion.

demand plan (n)~ The estimated future demand for a product family. A demand plan is similar to a sales forecast, but if the demand cannot be met, the sales will be less than the demand.

demand planner (n)~ The employee who is responsible for creating a demand plan.

demand-dial interface (n)~ A logical interface that represents a demand-dial connection (a PPP link) that is configured on the calling router. The demand-dial interface contains configuration information such as the port to use, the addressing used to create the connection (such as a phone number), authentication and encryption methods, and authentication credentials.

demi-bold (adj)~ Having a font weight that corresponds to a weight class value of 600 according to the OpenType specification.

demo (n)~ A partial or limited version of a software package distributed free of charge for advertising purposes. Demos often consist of animated presentations that describe or demonstrate the program's features.

demo (n)~ A computer in a store that is available for customers to test, to see if they wish to buy it.

demo (n)~ A demonstration of a product or service that a customer interacts with to see how features work.

demo version (n)~ A partial or limited version of a software package distributed free of charge for advertising purposes. Demos often consist of animated presentations that describe or demonstrate the program's features.

demographic information (n)~ Information such as age, education, income, and gender about the population in particular areas.

demote (v)~ To move an item to a lower level within a tree structure.

demultiplexing (n)~ The separating of multiple signals, which were combined into a common physical signal for simultaneous transmission across a single physical channel, back into multiple signals.

denial (n)~ The event in which a permission is not granted. By denying a permission, a method can prevent its callers from exercising the privilege represented by that permission. If a method on the call stack denies permission A, a stack walk checking for permission A will fail unless a valid assertion is found on the stack between the method doing the denial and the method that initiated the check for permission A.

denial of service attack (n)~ An attempt by a malicious (or unwitting) user, process, or

system to prevent legitimate users from accessing a resource (usually a network service) by exploiting a weakness or design limitation in an information system.

denial-of-service attack (n)~ An attempt by a malicious (or unwitting) user, process, or system to prevent legitimate users from accessing a resource (usually a network service) by exploiting a weakness or design limitation in an information system.

denormalize (v)~ To introduce redundancy into a table to incorporate data from a related table.

density (n)~ The degree of darkness of an image.

Deny (PN)~ The button in Yammer that allows a group administrator to deny access to a particular group of users that have requested access to that group.

DEP (n)~ A security feature that monitors programs on a computer to determine if they use system memory safely. To do this, DEP software works alone or with compatible microprocessors to mark some memory locations as non-executable.' If a program tries to run code that is malicious or is not from a protected location

Department (PN)~ An instance of Parature that houses the data, files, and information for one client or organization. Clients and organizations can have and operate multiple Departments for various purposes and each Department has its own segregated Support Portal by default. Departments owned by the same client or organization are capable of sharing certain information; to learn more about sharing information between Departments, consult the Parature Knowledgebase.

department code (n)~ A unique alphanumeric name used to identify a department.

department organization code (n)~ A code that represents the department in which an employee performs a job.

dependence (n)~ The state in which one entity relies upon specific hardware, software, or specific events for its own definition or functionality.

dependency (n)~ A directed relationship between two objects, such as components, objects, or features. For example, if feature A depends on feature B, B is a dependency of A.

dependency graph (n)~ A code map to visualizes direct relationships across code and shows how the code fits together without reading through files and lines of code.

dependency property (n)~ In Windows Presentation Foundation and Silverlight, a property represented by a DependencyProperty identifier that is registered with the property system. Dependency properties can be defined only by DependencyObject types, which typically expose the identifier as a public static field. The property system determines their effective value based on a precedence evaluation of all possible value sources.

dependency tree (n)~ A diagram for visualizing the dependency relationships between resources.

dependent (n)~ A cell that contains a formula that refers to another cell. For example, if cell D10 contains the formula =B5, cell D10 is a dependent of cell B5.

dependent (n)~ A role assumed by one person, place, or thing that participates in a relationship.

dependent animation (n)~ An animation that changes the value of a property and runs on the UI thread.

dependent change management activity (n)~ A change management activity that is used to link change requests to a release record.

dependent client (n)~ For Message Queuing, a computer that requires synchronous access to a Message Queuing server to perform all standard message queuing operations, such as sending and receiving messages and creating queues.

dependent component (n)~ A component that requires the current component to work properly. For example, a dependent component of a global Option Set is an -€œattribute-€? that references that Option Set.

dependent module (n)~ A module that contains dependencies from other modules.

dependent party (n)~ A party who assumes a dependent role when it participates in a relationship with another party.

dependent program (n)~ A program that requires that another program run first.

dependent workflow (n)~ A workflow instance that is generated by a parent workflow instance.

deploy (v)~ To put into use.

deploy (v)~ To build a DAC instance, either directly from a DAC package or from a DAC previously imported to the SQL Server Utility.

deploy (v)~ To roll out a software package as a cloud service in Microsoft Azure. Users can make staging or production deployments of the cloud service.

deployed environment (n)~ A group of virtual machines located on a team project host group and controlled by Microsoft Test Manager. A deployed environment can be running or stopped.

deployment (n)~ The process of distributing and installing a software program throughout an entire organization.

deployment (n)~ The process of moving the configuration files for a virtual machine from the Virtual Machine Manager library to a virtual machine host.

deployment (n)~ A version of the Microsoft Azure cloud service deployed to the staging or production environment.

deployment (n)~ The result of a deployment.

Deployment Administration Server (PN)~ In Microsoft Dynamics CRM, a server that encompasses the Deployment Manager Tool and Deployment Service.

Deployment Agent (PN)~ The deployment agent component is a Windows service that lives on the Target Servers where the application components managed by release management are installed.

Deployment and Imaging Tools Environment (PN)~ The shortcut used to open a command prompt that includes predefined system variables for Windows ADK tools.

Deployment Designer (PN)~ The designer used to create and manage Deployment Diagrams.

deployment diagram (n)~ The diagram used to define and evaluate deployment for applications in an application system. The deployment diagram (.dd) file contains information based on the System Definition Model (SDM).

Deployment Image Servicing and Management (PN)~ A framework that provides a single point for IT professionals and OEMs to service and maintain Windows images offline through a scriptable command line utility and an easily extensible infrastructure.

Deployment Manager (n)~ A set of system administrator tools for configuring and monitoring a software application and its servers. It supports deploying updates throughout the system.

deployment manifest (n)~ The file used in ClickOnce applications that describes the current version of this deployment, and whether it should be installed on the client computer or only run online.

deployment package (n)~ A set of files that can be delivered as a unit to a client computer or device for installation.

deployment purpose (n)~ An application state that is associated with the deployment of software, such as Available or Required.

deployment report (n)~ A report in XML- or HTML-format that is associated with a deployment diagram. You can use these reports to create installation and deployment scripts.

deployment type (n)~ A technology that is used to deploy an application to devices. A deployment type is contained within an application; for example, Windows Installer could be a deployment type for the -€œVisio 2007-€? application.

deposit (n)~ Funds added to an account.

deposit (v)~ To add money to an account.

deposit slip (n)~ A form that shows the date and the items that make up a deposit, including receipt and payment information, the currency, check and coin totals and the amount of cash received.

depository financial institution (n)~ The bank or financial institution that the payment format file is transmitted to for processing.

deprecated (adj)~ Pertaining to a software feature or programming object that is outdated and should not be used. A deprecated item is currently supported for backward compatibility, but it might become obsolete and unsupported in the future.

deprecated object (n)~ An object from a previous version of an operating system that is going to be invalid or obsolete in the current OS version.

depreciation (n)~ An allocation of part of the original value of a fixed asset to current income during a specific period. Depreciation represents the declining value of the fixed asset as a cost of the specified period.

depreciation (n)~ The expiration of a portion of the original cost of a fixed asset during a specific time period.

depreciation book (n)~ A specific book used for reporting purposes that contains all depreciation transactions for assets that are valid for that book.

depreciation convention (n)~ One of several predefined rules for calculating depreciation in the year of the acquisition of the asset and the year of the disposal of the asset.

deprovision (v)~ To remove an account from a connected data source.

depth axis (n)~ The third axis in a three-dimensional coordinate system, used in computer graphics to represent depth.

depth bias (n)~ A value that controls the drawing order for polygons along- the z-axis (depth of view).

depth buffer (n)~ A buffer that stores a depth value for each pixel in a scene. Pixels with a small z-value overwrite pixels with a large z-value.

depth of field (n)~ The measurement of the area in front of and behind the subject that is in focus.

depth stencil (n)~ In three-dimensional graphics, a buffer to limit the area of rendering when handling Z-coordinates.

dequeue (v)~ To remove from a queue.

dereference (v)~ In programming, to access information at the address contained by a pointer. The syntax for dereferencing varies among computer languages.

dereference (v)~ To programmatically access a memory address assigned to a pointer variable or reference variable.

derivation rule (n)~ A rule to determine a classifier for classifying the financial consequences of an accounting event.

derived class (n)~ In object-oriented programming, a class created from another class, called the base class. A derived class inherits all the features of its base class. It can then add data elements and routines, redefine routines from the base class, and restrict access to base-class features.

derived class (n)~ A class that assumes a child role when it participates in an inheritance relationship with a parent (or base) class whose methods can be extended or redefined and whose member access can be restricted.

derived column (n)~ A transformation that creates new column values by applying expressions to transformation input columns.

derived depreciation book (n)~ A specific book used to copy transactions entered for a value model to the specific depreciation book. Can be used when assets are acquired so that the acquisition transaction needs to be entered only once instead of for each value model and depreciation book.

derived element (n)~ An element, such as an attribute or association, that can be calculated or derived from other information. For example, an age attribute for the class Person can be derived if you know the Person's date of birth.

derived input (n)~ The set of input events that are derived from input primitives. This set is loosely defined as an identifiable pattern of input primitives over a limited period of time. Like input primitives, derived input does not require application context to be identified. Derived input includes such things as touch and flick.

derived key (n)~ A cryptographic key created by a call to CryptDeriveKey. A derived key can be created from a password, or any other user data. Derived keys allow applications to create session keys as needed, eliminating the need to store a particular key.

derived production (n)~ A subproduction order that is created based on the main production order.

derived session key (n)~ A session key created by an application as needed. Before creating a derived session key, an application prompts the user for a password.

derived table (n)~ A table that assumes a child role when it participates in an inheritance relationship with another table.

DES (n)~ An encryption algorithm that uses a 56-bit key and maps a 64-bit input block to a 64-bit output block. The key appears to be a 64-bit key, but one bit in each of the eight bytes is used for odd parity, resulting in 56 bits of usable key.

descendant (n)~ In a tree data structure, a node that is one or more steps farther from the

root (one or more levels lower) than the ancestor node.

descent (n)~ The pixel offset of the bottom of an element with respect to its baseline.

description area (n)~ The area in the results pane that describes the purpose of the selected snap-in.

description bar (n)~ The bar above the results pane. Contains the name of the selected node.

deserialization (n)~ The process of converting an object from a serial storage format to binary format in the form of an object that applications can use. This happens when the object is retrieved from the cache cluster with the Get client APIs.

deserialize (v)~ To change from serial (by bit) to parallel (by byte).

Design (n)~ A format used by the Bentley MicroStation CAD program to store drawing files.

Design (PN)~ The Sway feature that allows users to make Style- and Structure-based changes to their sway.

Design Accents (PN)~ A gallery of design elements that can be used to embellish publications.

design element (n)~ An item (such as a page, frameset, item type, form, view, script file, text file, cascading style sheet, or image) that contributes to an overall pattern, scheme, or layout.

design grid (n)~ The grid that you use to design a query or filter in query Design view or in the Advanced Filter/Sort window. For queries, this grid was formerly known as the QBE grid.

Design Manager (PN)~ A feature that guides the user through the process of using an HTML editor to design and customize a SharePoint site.

Design Master (n)~ The only member of the replica set in which you can make changes to the database structure that can be propagated to other replicas.

design mode (n)~ The InfoPath design environment in which you can create or modify a form template.

design once (adj)~ Characterized by the ability to design, build, code, and publish an element a single time and have it function in more than one environment.

Design panel (PN)~ The Sway panel that provides users with all the Style and Structure options.

design pattern (n)~ A design pattern in architecture and computer science is a formal way of documenting a solution to a design problem in a particular field of expertise.

design set (n)~ A collection of publications that share a consistent color scheme, font scheme, and design.

design surface (n)~ The main area of the Macro Designer where macro actions are placed to be made into a macro.

design template (n)~ A file that contains the styles in a presentation, including the type and size of bullets and fonts; placeholder sizes and positions; background design and fill; color schemes; and a slide master and optional title master.

design time (n)~ The time during which you create and modify the design of the objects and code in your application.

Design tools (PN)~ The Developer tools subcategory containing apps to help developers

with design aspects of building an app.

Design view (n)~ A window that shows the design of these database objects - tables, queries, forms, reports, macros, and data access pages. In Design view, you can create new database objects and modify the design of existing ones.

Design view (n)~ A window that shows a visual representation of the code behind a web page.

Design view (n)~ A window that shows a visual representation of a document on the artboard.

design workspace (n)~ A user interface area where general authoring tasks are performed.

designated account (n)~ The Microsoft Exchange Server user account that is the sender of control messages.

designated router (n)~ An OSPF router that forms adjacencies with all other routers on a multiple access network.

designer (n)~ A visual design surface.

Designer (PN)~ The portion of InfoPath used to design forms.

design-time control (n)~ An ActiveX control that is used while designing or editing a Web page. Design-time controls are installed on the client computer.

desired configuration management (n)~ A Configuration Manager feature that provides a set of tools and resources for assessing and tracking configuration compliance of client computers in the enterprise.

desired zone (n)~ The zone in which AppleTalk network integration appears on the network.

desk phone (n)~ A telephone that sits on a desk and is to be used with Lync Server and Office Communications Server.

deskband (n)~ A customized toolbar that can be added to the regular program taskbar and that contains shortcuts to frequently performed tasks.

desktop (n)~ The work area on a computer screen that simulates the top of an actual desk. The desktop contains the Recycle Bin and other icons (shortcuts to programs, files, folders, and various types of documents such as letters, reports, or pictures) that you can arrange on the electronic desktop just as you would arrange real objects on top of a desk.

desktop (n)~ The work area on a computer screen that contains different groups- of apps or content open and available for different tasks or aspects of your life. Each group of items is called a desktop or virtual desktop.

Desktop ~ A computer designed to sit on a desk (as opposed to a laptop). InWindows, it also means the screen you see when you aren't running any programs, with 'My Computer', the Recycle Bin and so on.

desktop ~ A computer designed to sit on a desk (as opposed to a laptop). In Windows, it also means the screen you see when you aren't running any programs, with 'My Computer', the Recycle Bin and so on.

desktop alert window (n)~ A window that pops up on the Windows desktop in response to an event, for example, receiving email.

desktop app (n)~ An application that is meant to run on a desktop computer.

desktop app bar (n)~ The workspace at the bottom of the application that displays alerts and notifications.

desktop application (n)~ An application that is meant to run on a desktop computer.

desktop application (n)~ ?An application that is built using the traditional Win32 app model, typically makes use of the COM or .NET runtime, and runs only on the desktop of Windows.

desktop background (n)~ In a graphical user interface such as Windows, a pattern or picture in the screen background that can be chosen by the user.

desktop composition (n)~ A feature, introduced in Windows Vista, that enables individual windows to be drawn to off-screen surfaces in video memory instead of being drawn directly to the primary display device.

desktop dashboard account (n)~ An account that is required to certify desktop apps for Windows.

desktop device app (n)~ A device app built in C++/Win32/COM.

desktop experience (n)~ The experience a user has when actively engaged with the computer.

Desktop Experience (PN)~ The feature that installs in-box Windows Client applications and adds missing components that enable other applications written for Windows Client to work on Windows Server.

desktop gadget (n)~ A gadget that users can display on their desktop, rather than on the Windows Sidebar. Examples are clocks, news headlines, slide shows, and weather forecasts.

Desktop Gadget Gallery (PN)~ An organizer used to add, uninstall, and search for desktop gadgets.

desktop ISP sign-up offer (n)~ A set of HTML pages that offer the end user the opportunity to sign up for Internet access. To view the offer, the end user clicks a link from the OEM link on the Start menu.

Desktop Language Pack (PN)~ A free add-on that users can use to switch the language that's displayed in the Visual Studio user interface.

Desktop Management Interface (n)~ A system for managing the configurations and status of PCs on a network from a central computer. In DMI an agent program runs in the background on each machine and returns information or performs some action (as specified by a file on that machine) in response to a query received from the central computer. The actions to be performed by the agent might include watching for errors and reporting them to the central computer as they occur; for example, a printer might be set up to report to the central computer when paper runs out or jams. DMI was developed by the DMTF (Desktop Management Task Force), a consortium of computer equipment manufacturers, and competes with SNMP (although the two can coexist on the same system).

desktop pattern (n)~ In a graphical user interface such as Windows, a pattern or picture in the screen background that can be chosen by the user.

desktop program (n)~ An application that is meant to run on a desktop computer.

desktop program (n)~ ?An application that is built using the traditional Win32 app model, typically makes use of the COM or .NET runtime, and runs only on the desktop of Windows.

desktop publishing (n)~ The use of a computer and specialized software to combine text

and graphics to create a document that can be printed on either a laser printer or a typesetting machine.

desktop registration (n)~ The opportunity given to the end user to register with Microsoft and the OEM, if the user failed to register during Windows Welcome.

desktop session (n)~ A period of time when one user is logged on to a computer. When a user logs on to a computer, the session is created. When that user logs off, the session is ended.

desktop sharing (n)~ A feature that allows a user to display his or her desktop to a meeting or to conversation participants.

desktop theme (n)~ A collection of visual elements and sounds for your computer desktop or device User Interface. A theme determines the look of the various visual elements of your User Interface, such as windows, icons, fonts, and colors, and it can include sounds.

desktop toolbar (n)~ A toolbar that docks to the desktop, similar to the taskbar.

Desktop Viewer (PN)~ A viewer that displays generated reports and lets users add comments to a report, create charts or graphs from report data, view various levels of a financial report, and export the report to other file types.

desktop window (n)~ A system-defined window that paints the background of the screen and serves as the base for all windows displayed by all applications.

Desktop Window Manager (PN)~ A component of Windows that manages window policies, behaviours and visual appearance.

despooler (n)~ An SMS thread component that processes instruction files sent from the sender component of the parent site and performs actions based on such instruction files.

destination (n)~ The location (drive, folder, or directory) to which a file is copied or moved.

destination (n)~ The SSIS data flow component that loads data into data stores or creates in-memory datasets.

destination (n)~ A synchronization provider that provide its current knowledge, accept a list of changes from the source provider, detect any conflicts between that list and its own items, and apply changes to its data store.

destination adapter (n)~ A data flow component that loads data into a data store.

destination area (n)~ The range of cells that you select to hold the summarized data in a consolidation. The destination area can be on the same worksheet as the source data or on a different worksheet. A worksheet can contain only one consolidation.

destination company account (n)~ The legal entity that is the recipient of a liability in an intercompany economic transaction.

destination computer (n)~ The computer that will be distributed to customers on which you install Windows. You can either run Windows Setup on the destination computer or copy a master installation onto a destination computer.

destination distribution line (n)~ The distribution line for the destination company on an allocation transaction.

destination document (n)~ A document to which information is copied or moved.

destination file (n)~ The file that a linked or embedded object is inserted into, or that data is saved to. The source file contains the information that is used to create the object. When

you change information in a destination file, the information is not updated in the source file.

destination inventory location (n)~ An inventory location where materials required by a final kanban production activity or transfer activity are received.

destination model (n)~ The model to which data will be moved.

destination provider (n)~ A synchronization provider that provide its current knowledge, accept a list of changes from the source provider, detect any conflicts between that list and its own items, and apply changes to its data store.

destination set (n)~ A set into which a resource moves because of a request that changes that resource's attributes.

destination subscription (n)~ A new subscription that is created as a result of a conversion or a merge.

destination-based sales tax (n)~ A sales tax levied in some states in the United States on a product based on the destination in which the buyer takes ownership or receives the product.

destruction marker (n)~ In a collaboration diagram, a marker used to indicate object roles and association roles, or links, that are destroyed during the operation.

destructor (n)~ A function used to destruct instances of classes.

detach (v)~ To remove uninstalled application files from a destination computer.

detach (v)~ To stop exposing a surfaced virtual disk to the user.

detail area (n)~ The part of PivotTable view that contains detail and total fields.

detail data (n)~ For automatic subtotals and worksheet outlines, the subtotal rows or columns that are totaled by summary data. Detail data is typically adjacent to and either above or to the left of the summary data.

detail field (n)~ A field that displays all rows, or records, from the underlying record source.

Detail section (n)~ A report section used to contain the main body of a form or report. This section usually contains controls bound to the fields in the record source, but can also contain unbound controls, such as labels that identify a field's contents.

detail unit (n)~ A reporting unit that draws information directly from the general ledger.

Detail view (PN)~ The Sway feature that allows a user to click on content and see it full screen.

detailed inventory (n)~ The reading of the header area of a tape in the library to identify the on-media identifier (OMID) on each tape.

Detailed Process (PN)~ A SmartArt graphic layout used with large amounts of Level 2 text to show a progression through stages.

details info part (n)~ An info part that relates directly to the open entity or the selected entity (the line in focus in the content area). If a details info part relates to a line in either a document or a list, the information in the info part changes when the user selects a new line.

details pane (n)~ A pane that displays details about an item selected in another portion of the user interface. For example, in Microsoft Management Console (MMC), the details pane is the right pane that displays details for the selected item in the console tree.

Details pane (n)~ The lower left pane in the DPM Administrator Console. The Details

pane provides detailed information about an item selected in the Display pane.

detectable (adj)~ Pertaining to a state in which computers on a network can be located by other computers and devices on the same network in order to communicate. This state is determined by a firewall setting, which also affects access to shared files and printers.

Detected Events (PN)~ A feature that identifies a possible meeting request or event in an email message and enables the user to take action on it from within the message.

detection tool (n)~ The software code used by antivirus or anti-spyware programs to find malicious software or potentially unwanted software on a computer.

Detective (n)~ Skill level in the Purble Place game. Once a Purble Place game is completed, a player gets a skill level rank assigned automatically by the game (based on number of guesses and hints during the game).

detectoid (n)~ A logical condition that is evaluated on a client computer to detect the presence of software, drivers, or their updates. A detectoid is identified by a Globally unique identifier (GUID) and described by metadata. It is represented as an update with no associated content.

detectoid (n)~ An XML document consisting of applicability rules and used to factor out common applicability rules for packages.

detectoid (n)~ An application that detects data and state changes related to a particular security application.

determinant (n)~ In database design theory, any attribute or combination of attributes on which any other attribute or combination of attributes is functionally dependent.

deterministic (adj)~ In computing, being able to predict an outcome or to know in advance how data will be manipulated by a processing system. A deterministic simulation, for example, is one in which a certain input always produces the same output.

detrended price oscillator formula (n)~ A formula that calculates the difference between the daily price and the moving average. This is useful for identifying cycles and overbought and oversold price levels.

Develop Skills Needs - Hiring Plan - Hiring Forecast (n)~ A template that provides a framework for the general activities, from a Human Resources departmental perspective, that are undertaken to perform an analysis of forecasted skills needs and the potential hiring and/or training plans needed to address the gap between needed skills and available skills.

developer (n)~ An individual who designs and develops software.

developer account (n)~ An account that is required to submit an app in the Windows Store.

Developer BizTalk unit (n)~ A unit of measure for the compute capacity and memory used by the Developer tier of Microsoft Azure BizTalk Services.

Developer Command Prompt for VS2013 (n)~ A command-line interpreter for developers in Visual Studio 2013.

developer license (n)~ A license for developers so they can launch an app to test it before submitting it to the Windows Store

Developer Site (PN)~ ??A site template that is designed to help developers to test the apps they are building and get feedback about their apps from others.

Developer Support (PN)~ The lowest Microsoft Azure support plan that includes basic

support plus support for billing and subscription management-related issues as well as break-fix issues; response time is within 8 hours.

Developer tools (PN)~ An app category that contains apps to help developers create apps.

developer unit (n)~ A Surface unit that is optimized for developers to create new Surface applications. A developer unit includes software that is required to develop applications with the Surface SDK, including Microsoft Visual C# 2008 Express Edition, Microsoft Expression Web, and Microsoft XNA Framework. In contrast, a commercial unit is optimized for user environments and includes only the software that is needed to run Surface applications.

development (n)~ Any computer code or materials, other than Products, Fixes or Pre-existing Work, developed by Microsoft or in collaboration with Customer, which is provided to Customer in the course of performance of a Statement of Services.

Development Accelerator Core (PN)~ An integrated set of Microsoft components, templates, and guidance designed to solve specific customer business problems.

Development Accelerator Extended (PN)~ An integrated set of Microsoft components, templates, and guidance designed to solve specific customer business problems.

development cycle (n)~ The process of application development from definition of requirements to finished product, including the following stages: analysis, design and prototyping, software coding and testing, and implementation.

Development kits (PN)~ The Developer tools subcategory containing apps to help developers with many aspects of building an app.

Development Server (PN)~ The web server that ships with Visual Studio.

development task (n)~ An assigned unit of development work usually created to build part of a scenario or quality of service requirement. The development task describes the objective of the developer in the context of an iteration.

Development Tools Environment (n)~ A set of interfaces that enable developers to programmatically achieve several of the key tasks achievable from the Integrated Development Environment (IDE).

development workstation (n)~ The computer that runs Platform Builder and is used to develop code for Portable Media Center.

device (n)~ Any piece of equipment that can be attached physically or wirelessly to a network or computer, for example, printers, keyboards, external disk drives, or other peripheral equipment.

device (n)~ A handheld portable telephone that operates through a radio network.

device (n)~ The server, laptop, desktop, or mobile device on which Configuration Manager runs.

device (n)~ A piece of equipment that is running an operating system.

Device Access API (PN)~ A set of COM interfaces that a device companion app can use to send requests, to a specialized device, synchronously or asynchronously.

device adapter (n)~ An ASP.NET page framework class that adapts the behavior of mobile pages and controls based on the target device.

device agent (n)~ An application that a desktop application deploys and executes on a smart device. Usually, a device agent communicates or exchanges data with the desktop application that deployed it.

device bar (n)~ The minimum requirements a LUN device has to meet in order to be included in MPIO transfers.

Device Bay (n)~ An industry specification that defines a mechanism for adding and upgrading computer peripheral devices without opening the chassis.

device capability (n)~ A device functionality available through the HasCapability method or the <Choice> element.

Device Center (n)~ An application designed for managing Microsoft Windows Mobile-® devices via a Windows Vista client computer. When the mobile device is connected to the computer by cable, cradle, infrared, or wireless LAN, the mobile user uses Windows Mobile Device Center to create a partnership between the desktop computer and the mobile device to configure the device, manage settings, add & remove applications, and synchronize data. After the partnership is created, the mobile user can manage the device using any of the connection mechanisms. While connected, the mobile user can also use the Windows Vista client computer without a partnership to do such things as browse the device and configure settings for the device.

device channel (n)~ In a site collection, a group of settings that is configured to include certain mobile devices based on defined criteria, and that can be mapped to a SharePoint master page to optimize a publishing site for those devices.

Device Channels (PN)~ A SharePoint feature that enables a single publishing site to be rendered differently for different mobile devices in order to optimize the user experience.

device claim (n)~ A statement that a device makes to indicate that it can be trusted to access secure resources, such a folder on a file share.

device conflict (n)~ A conflict that occurs when the same system resources have been allocated to two or more devices. System resources include interrupt request (IRQ) lines, direct memory access (DMA) channels, input/output (I/O) ports, and memory addresses.

device context (n)~ A data structure that defines the graphic objects, their associated attributes, and the graphic modes that affect output on a device.

device coordinate (n)~ The coordinate used by the physical device being drawn on, such as a screen or sheet of paper.

device definition (n)~ The characteristics of a device available through the MobileCapabilities class and the DeviceSpecific control.

device driver (n)~ Software that enables hardware or peripherals (such as a printer, mouse, or keyboard) to work with your computer or mobile device.

device driver interface (n)~ A set of functions that are implemented by the operating system for use by drivers.

Device Driver Wizard (PN)~ A wizard that helps a driver developer get the new driver packages up and going quickly in Visual Studio.

device encryption (n)~ The use of encryption to protect local device data from offline hardware attacks.

Device Encryption (PN)~ The out-of-the-box encryption capabilities that- are automatically included- on PCs running Windows RT. -

device experience (n)~ The combination of device, device driver, device metadata, and Windows Store device app.

device family (n)~ ?The combination of API contracts, user experience, and system

characteristics and behaviors that a developer can expect when targeting an app to a particular type of device.

device filter (n)~ A section of the Web.config file where you specify values for specific mobile devices. These values are used to create device-specific content.

device font (n)~ A font residing in or intended for a printer. Font cartridges are available for laser printers that allow your printer print additional fonts. Printer fonts are distinct from screen fonts, which are designed for displaying text on a computer

device handle (n)~ A piece of software code or an ID that allows a user to programmatically access the mobile device.

Device Handling (per device) (PN)~ The unit of measure for handling of storage devices in the framework of the Microsoft Azure Import/Export service.

device ID (n)~ A unique ASCII string for the device created by enumerators to identify a hardware device and used to cross-reference data about the device stored in the registry. Distinguishes each logical device and bus from all others on the system.

device independent pixel (oth)~ A unit of measure that equals 1/96 of an inch.

device independent unit (oth)~ A unit of measure that equals 1/96 of an inch.

device license (n)~ A software license assigned to a client computer; it allows any authorized person access to the software by using that computer.

device lock (n)~ A feature that provides enhanced protection for data by locking the device and requiring user authentication through a password.

device management (n)~ The exchange of requests and responses that control and configure the operational state of a device. Device management requires the use of a Communication Class interface.

device management point (n)~ A Configuration Manager site system that communicates with mobile device clients and that must be hosted on a Configuration Manager management point.

Device Manager (n)~ An administrative tool that you can use to manage the devices on your computer. Using Device Manager, you can view and change device properties, update device drivers, configure device settings, and uninstall devices.

device metadata package (n)~ A .cab file that can only have one locale support and that provides all the hardware display components in order for your device information to be shown in the Control Panel.

Device Metadata Retrieval Client (PN)~ A feature that provides an interface for acquiring rich metadata in order to support showing device detail information in the Device Center and the Device Stage.

device name (n)~ A user-defined description of a particular device.

device password (n)~ A passcode that a user enters on a mobile device that supports the Exchange ActiveSync protocol. The device password unlocks the device and allows access to the data stored on the device.

device PC (n)~ A computer that is part of a OneCare circle but is not a hub PC or a monitor PC. A device PC has no privileges to monitor or make changes to any other computer in the OneCare circle.

device registration (n)~ The process of verifying a user's credentials and the server certificate, as well as to register information about the device on the server.

Device Security Manager (PN)~ A feature in Visual Studio that allows you to configure device security and manage certificates on Windows Mobile-based devices.

device stack (n)~ A chain of device objects that represent the drivers for a device. Each device stack contains a device object for each driver that is part of handling input/output (I/O) to a particular device. The parent bus driver has a physical device object (PDO), the function driver has a functional device object (FDO), and each filter driver has a filter device object (DO).

Device Stage (PN)~ A Windows feature that provides a rich environment for configuring and interacting with devices connected to your PC such as mobile phones, printers and cameras.

Device Sync options (n)~ A dialog for synchronizing photos to a device.

device type (n)~ A value from a developer-defined list that specifies the types of devices that a given application will support.

device type (n)~ Descriptor of the type of network device used in a table view of devices.

Devices (PN)~ The link to the website where customers add computers (both PCs and Macs), mobile phones, and digital photo frames so they can access their synced folders and connect remotely to their devices.

Devices (PN)~ The charm that provides access to the devices commands.

Devices (PN)~ The unit of measure for storage devices in Azure.

Devices charm (n)~ A user interface element that provides access to external devices like media players or printers.

device-specific module (n)~ A storage array manufacturer's module that incorporates knowledge of the manufacturer's hardware and interacts with the MPIO driver. The DSM plays a crucial role in device initialization and I/O request handling, including I/O request error handling.

DFE (n)~ Method for calculating folic acid intake taking into account the lower availability of mixed folates in food compared with synthetic tetrahydrofolate used in food enrichment and supplements.

DFI (n)~ The bank or financial institution that the payment format file is transmitted to for processing.

DFS (n)~ A service that allows system administrators to organize distributed network shares into a logical namespace, enabling users to access files without specifying their physical location and providing load sharing across network shares.

DFS folder (n)~ In Distributed File System (DFS), an object in a namespace that virtualizes multiple shared folders (referred to as folder targets), or in the case of folders without targets, adds hierarchy to the namespace.

DFS namespace (n)~ In Distributed File System (DFS), a virtual grouping of shared folders potentially located on different servers that appears to users as a single shared folder with a series of subfolders. The underlying structure of the namespace can consist of multiple shared folders that are located on different servers and in multiple sites.

DFS Replication (PN)~ A feature based on a replication engine that can replicate data between multiple servers over limited-bandwidth network connections.

DFS topology (n)~ The overall logical hierarchy of the Distributed File System (DFS), including elements such as roots, links, shared folders, and replica sets, as depicted in the

DFS administrative console. This is not to be confused with the DFS namespace, which is the logical view of shared resources seen by users.

DFSS (PN)~ A method, used for scheduling threads, that dynamically scales quotas based on load instead of requiring the administrator to explicitly specify quotas. It also adds the flexibility of aggregating thread quotas based on sessions instead of just users.

DGN (n)~ A format used by the Bentley MicroStation CAD program to store drawing files.

DHCP (n)~ A TCP/IP service protocol that offers dynamic leased configuration of host IP addresses and distributes other configuration parameters to eligible network clients. DHCP provides safe, reliable, and simple TCP/IP network configuration, prevents address conflicts, and helps conserve the use of client IP addresses on the network.

DHCP client (n)~ Any network-enabled device that supports the ability to communicate with a DHCP server for the purpose of obtaining dynamic leased IP configuration and related optional parameters information.

DHCP Enforcement (n)~ A technology comprised of a DHCP NAP ES component and a DHCP NAP EC component and which allows DHCP servers to enforce system health requirements any time a computer attempts to lease or renew an IP address configuration on the network.

DHCP Failover (PN)~ A feature that allows for configuration of two DHCP servers in a failover relationship so that continuous availability of DHCP service to clients is ensured.

DHCP guard (n)~ A feature that protects against a malicious VM representing itself as a Dynamic Host Configuration Protocol (DHCP) server for man-in-the-middle attacks.

DHCP Manager (PN)~ The primary tool used to manage DHCP servers. The DHCP Manager is a Microsoft Management Console (MMC) tool that is added to the Administrative Tools menu when the DHCP service is installed.

DHCP NAP EC (n)~ A NAP Enforcement Client for DHCP-based IPv4 address configuration that uses industry standard DHCP messages to exchange system health messages and limited network access information.

DHCP NAP enforcement client (n)~ A NAP Enforcement Client for DHCP-based IPv4 address configuration that uses industry standard DHCP messages to exchange system health messages and limited network access information.

DHCP NAP enforcement server (n)~ A NAP Enforcement Server for DHCP-based IP address configuration that uses industry standard DHCP messages to communicate with DHCP NAP ECs on NAP clients.

DHCP NAP ES (n)~ A NAP Enforcement Server for DHCP-based IP address configuration that uses industry standard DHCP messages to communicate with DHCP NAP ECs on NAP clients.

DHCP server (n)~ A computer running the Microsoft DHCP service that offers dynamic configuration of IP addresses and related information to DHCP-enabled clients.

DHTML (n)~ An extension of Hypertext Markup Language (HTML) that adds multimedia, database access, and an object model that programs can use to change styles and attributes of page elements (objects) and to replace existing elements (objects) with new ones.

DIA SDK (n)~ An SDK that provides access to debug information stored in program

database (.pdb) files generated by Microsoft post-compiler tools.

diacritic (n)~ A mark placed over, under, or through a character, usually to indicate a change in phonetic value from the unmarked state.

diacritical mark (n)~ A mark placed over, under, or through a character, usually to indicate a change in phonetic value from the unmarked state.

diagnostic content (n)~ The set of files that represent a set of diagnostics that the end user will run to troubleshoot and resolve a problem.

diagnostic data adapter (n)~ An assembly that has functionality to enable a user to either collect diagnostic data to understand what is happening on a system when a test is running, or perform actions on the system while a test is running.

diagnostic event (n)~ Any event that happens during a run of your application that can be recorded by IntelliTrace.

Diagnostic Execution Wizard (PN)~ A wizard that provides a guide for the end user to troubleshoot and resolve a problem.

diagnostic manager (n)~ The process (agent) that runs on a role instance and provides remote access to configure the diagnostic monitor also running on the role instance.

diagnostic monitor (n)~ The process (agent) running on a role instance that collects log data for troubleshooting a cloud service deployment.

diagnostic package (n)~ The set of files that represent a set of diagnostics that the end user will run to troubleshoot and resolve a problem.

Diagnostic Policy Service (n)~ A service in Windows that improve reliability by detecting impending failures and taking action to handle them by either initiating automatic corrective action or logging the appropriate diagnostic information for later root cause analysis, and/or notifying the user of an impending failure.

diagnostic provider (n)~ A component that monitors and collects statistics about a system. Those statistics can be compared to a set of thresholds to assess system performance, identify and resolve problems, and perform other diagnostic and administrative tasks.

Diagnostic Service Host (n)~ A service that hosts the WDI (Windows Diagnostic Infrastructure) components that need to run in Local Service context and enables problem detection, troubleshooting and resolution for Windows components.

Diagnostic System Host (n)~ A service that hosts the WDI (Windows Diagnostic Infrastructure) components that need to run in Local System context and enables problem detection, troubleshooting and resolution for Windows components.

Diagnostics (n)~ A feature of Windows that checks for problems associated with network connections.

diagram (n)~ A performance management tool for visually presenting an organization's or organizational unit's objectives and goals, their groupings of objectives and goals, and their mappings of objectives and goals to themes, initiatives, KPIs, targets, business processes, and action plans. Each item in the visualization contains a set of metadata, which itself is customizable.

diagram designer (n)~ A visual design surface that is used to create diagrams, for example, logical datacenter diagrams, class diagrams, and so on.

diagram effect option (n)~ An animation enhancement that lets you apply effects to a

diagram piece by piece; for example, from top to bottom of a pyramid diagram.

diagramming feature (n)~ A feature that enables customers to build diagrams.

dial (v)~ To enter numbers on a telephone or mobile device in order to make a phone call.

dial (n)~ A circular control with one or more sliders that a user moves to change values.

Dial by Name (n)~ A feature that enables a caller to enter a person's name using the keys on a telephone.

dial in manually (v)~ Dial in to the audio conferencing provider from your physical telephone when the audio conferencing provider service cannot call you.

dial location (n)~ The country code, area code, and specific dialing requirements for the place you are dialing from. Once you have created a dial location, you can select it to apply the dialing requirements to all your calls. To change dialing locations, select or create a different one.

Dial Pad (n)~ A button on Phone Controls that opens a numeric keypad where you can click keys to enter information over the phone.

dial pad (n)~ A numeric keypad that is part of a device, is displayed on a device, or is in a computer program that you use to enter information in the context of a phone call.

dial plan (n)~ A grouping of telephony users with some specific properties, such as unique telephone extension numbers, that allow the Private Branch eXchange (PBX) to determine what action to take with dialed digits.

dial tone (n)~ A sound emitted by the receiver of a telephone that indicates that a number can be dialed.

dialect (n)~ The syntax and general rules used to parse a string or a query statement.

dialed number identification service (n)~ A service that provides a string of digits that the telephone network passes to the ACD to indicate the number that the caller dialed.

dialer (n)~ A form of trojan that causes systems equipped with modems to dial phone numbers without the consent of the user. In most cases, the phone numbers dialed are premium rate numbers which result in unexpected charges on the affected user's phone bill.

dialer (n)~ An electronic device attached to a telephone to call preselected numbers automatically when activated.

dialer (n)~ An app to make a phone call.

dial-in conferencing (n)~ A feature that merges public switched telephone network (PSTN) and Voice over IP (VoIP) conferences, which allows participants to dial in to a conference from anywhere as an authenticated user without having to be on the corporate network. Typically, a local number is provided to avoid long-distance fees.

dial-in permission (n)~ Permission to access a network remotely.

Dialing (PN)~ A status notification that the device is in the process of dialing a phone number.

dialing command (n)~ A command you tell your modem to dial to perform certain actions. For example, ATX3D will switch the modem from voice to data, ATH will hang up the phone, etc.

dialing keys (n)~ A set of characters that Live Meeting uses to simulate pauses or telephone keystrokes so that it can automatically dial an audio conferencing partner and connect to a meeting. For example, a comma represents a pause.

dialing rules (n)~ A feature that allows the user to define a set of rules that are used repeatedly when dialing from a specific place.

DialKeys (n)~ A software keyboard application that enables users to interact with their touch-enabled computer when a hardware keyboard is not attached.

DialKeys style (n)~ An appearance and layout that can be selected by the user and applied to the DialKeys keyboard.

dialog (n)~ In computing, the exchange of human input and machine responses that forms a conversation' between an interactive computer and the person using it.'

dialog (n)~ A type of process that displays the input forms and the data that a user needs at each step while interacting with a customer or following a process that requires user input.

dialog bar (n)~ A control bar that contains standard Windows controls. A dialog bar has dialog-box characteristics in that it contains controls and supports tabbing between them, and it uses a dialog template to represent the bar. Dialog bars can be aligned to the top, bottom, left, or right side of a frame window.

dialog box (n)~ A secondary window that allows users to perform a command, asks users a question, or provides users with information or progress feedback.

Dialog Box Launcher (n)~ A specific Office icon that is used within a group to launch a related dialog box.

dialog sheet (n)~ A workspace for creating Forms — or Dialog windows — that serve as VBA-driven User Interface tools. The controls that can be added to them facilitate, restrict, or focus data entry and, if properly used, ensure that entered data goes to the right places.

dialog unit (n)~ A device-independent measure to use for layout. One horizontal unit is equal to one-fourth of the average character width for the current system font. One vertical unit is equal to one-eighth of an average character height for the current system font.

dial-out conferencing (n)~ A feature whereby the A/V Conferencing Server calls the user, and the user answers the phone to join the conference.

Dialup ~ An early kind of internet connection, using a phone line and amodem. Much slower than broadband, it has to make a phone call to the server and establish a connection before you can use it.

dial-up ~ This is a telephone line that is connected to a server. When it is called, tones are exchanged between the server and the devise calling in order to attach.

dial-up connection (n)~ A connection to other computers or to the Internet using a device that uses the telephone network.

Dial-Up Networking (n)~ A Windows CE-based application that enables remote users to connect to a network.

dial-up networking (n)~ Connecting to other computers or to the Internet by using a modem and a telephone line.

diamond-shape relationship (n)~ A chain of attribute relationships that splits and rejoins but that contains no redundant relationships. For example, Day->Month->Year and Day->Quarter->Year have the same start and end points, but do not have any common relationships.

DIB sequence (n)~ In DirectShow Editing Services, a series of device-independent

bitmap (DIB) files rendered in a sequence as video frames.

DICOM (n)~ A non-proprietary data interchange protocol, digital image format, and file structure standard for biomedical images.

DICT ~ dictionary network protocol created by the- DICT Development Group

dictation mode (n)~ A speech mode that converts your dictated words into typed text, and then inserts the text into a program.

dictation time (n)~ The quota of words the user can dictate to the phone in a period of 24 hours.

dictionary (n)~ A collection of properties.

dictionary (n)~ A set of words that a recognizer uses to determine matches and alternates.

dictionary (n)~ A collection of keys or key and value pairs that is used for content or query processing in search.

dictionary attack (n)~ A method of guessing a user's password or PIN by trying every word in the dictionary until successful.

Dictionary property (n)~ A property whose value can be set to the Uniform Resource Identifier (URI) of the dictionary, an error message, or an empty string if no dictionary URI is found.

Did You Mean feature (PN)~ A module that suggests alternate words in response to a user search. Suggested words reflect spelling corrections or alternate forms of a word that are more likely to return results.

dieresis (n)~ The sign -¨ ' marking a division of one syllable into two

Diet Tracker (PN)~ A feature that allows the user to track eating patterns to make healthier food choices and identify food habits.

dietary folate equivalents (n)~ Method for calculating folic acid intake taking into account the lower availability of mixed folates in food compared with synthetic tetrahydrofolate used in food enrichment and supplements.

dietary intake (n)~ A set of guidelines for the daily intake of vitamins, protein, fats and fiber that include recommended daily allowances.

difference additive (n)~ A type of concentration adjustment method which means simply consuming more or less of a material based on its concentration.

differencing chain (n)~ A linked set of differencing drives, in which a differencing drive can have another differencing drive as a parent.

differencing virtual hard disk (n)~ A virtual hard disk that stores the changes or differences' to an associated parent virtual hard disk for the purpose of keeping the parent intact. The differencing disk is a separate .vhd file that is associated with the .vhd file of the parent disk. Changes continue to accumulate in the differencing disk until it is merged to the parent disk.'

differential backup (n)~ A backup containing only changes made to the database since the preceding data backup on which the differential backup is based.

differential base (n)~ The most recent full backup of all the data in a database or in a subset of the files or filegroups of a database.

Differentiated Services Code Point (n)~ A marking in the registry that enables packets that pass through network devices that operate on Layer 3 information (such as routers) to have their relative priorities differentiated from one another.

differentiating factor (n)~ The part of a scenario that determines its uniqueness from other scenarios.

diffuse material (n)~ A type of material that determines the color of the 3D object with direct light (white light) applied to it much like the paint on a wall.

diffuser (n)~ A layer in the Surface tabletop that enables images to be displayed on the Surface screen. The diffuser is also the surface where the Vision System tracks contacts on the Surface screen.

diffusion (n)~ The property of a cryptographic algorithm that ensures that a change in a few input bits leads to potential changes in many of the output bits.

dig deeper (oth)~ A content descriptor that introduces related and advanced topics in Visual Studio documentation.

Digest Access protocol (n)~ A lightweight authentication protocol for parties involved in communications that are based on Hypertext Transfer Protocol (HTTP) or Simple Authentication and Security Layer (SASL).

Digest authentication (n)~ An authentication method that prompts the user for a user name and a password, also called credentials, which are hashed with other data before being transmitted over the network. Digest authentication is available only on domains that have domain controllers that are running Microsoft Windows Server operating systems.

digest delivery (n)~ A method of sending notifications that combines multiple notifications within a batch and sends the resulting message to a subscriber.

DigiD (oth)~ A standard security code issued by the Netherlands government to businesses and private citizens for interacting electronically with the government (for submitting tax returns or other documents electronically, requesting information, checking on status, etc.).

DigiD-token (n)~ The token that DigiD provides when a request for authentication is submitted.

digit (n)~ One of the characters used to indicate a whole number (unit) in a numbering system. In any numbering system, the number of possible digits is equal to the base, or radix, used. For example, the decimal (base-10) system has 10 digits, 0 through 9; the binary (base-2) system has 2 digits, 0 and 1; and the hexadecimal (base-16) system has 16 digits, 0 through 9 and A through F.

digital (adj)~ In computing, a characteristic of data that is represented as binary digits (zeros and ones).

Digital ~ Literally 'to do with numbers'. Often used to describe a device using computer technology to replace older, traditional technologies. For example, a digital camera is one that stores images electronically rather than on chemical film.

digital audio receiver (n)~ A device that receives digital audio wirelessly from your computer and broadcasts it to TV sets or stereos around your home.

digital audio renderer (n)~ A device that receives digital audio wirelessly from your computer and broadcasts it to TV sets or stereos around your home.

digital audio tape (n)~ A magnetic-tape storage medium for recording digitally encoded audio information. In addition to the tape cassette, DAT indentifies a type of digital tape recorder and player.

digital broadcasting (n)~ The transmission of digital media from one point to many points over diverse digital networks.

Digital Cable Ready (adj)~ Of, pertaining to, or characteristic of a High Definition Television (HDTV) that conforms to the plug-and-play digital cable TV standard; thus, removing the need for a separate set-top box.

digital certificate (n)~ A digital document that is commonly used for authentication and to help secure information on a network. A certificate binds a public key to an entity that holds the corresponding private key. Certificates are digitally signed by the certification authority that issues them, and they can be issued for a user, a computer, or a service.

Digital Dashboard (PN)~ A Microsoft framework that User Portal uses as its foundation.

digital download code (n)~ The app as a card' capability that retailers purchase from Microsoft and sell to consumers.'

digital envelope (n)~ Private messages encrypted using the recipient's public key. Enveloped messages can only be decrypted by using the recipient's private key, allowing only the recipient to understand the message.

digital fingerprint (n)~ A long, random-looking string of letters and numbers (with punctuation marks for readability) that is used to authenticate the real-world identities of Groove contacts you see in workspaces and contact lists.

Digital ID (n)~ A combination of a digital certificate and a public and private encryption key set.

digital image (n)~ A pictorial graphic such as a digital photograph or illustration.

Digital Imaging and Communications in Medicine (n)~ A non-proprietary data interchange protocol, digital image format, and file structure standard for biomedical images.

digital ink (n)~ The writing or drawing strokes that you make with your stylus.

digital license (n)~ A package of signed XML files which Software Licensing Services (SLS) recognizes and uses to activate the product.

Digital Living Network Alliance (PN)~ An alliance of leading companies in the consumer electronics, mobile and personal computer industries focused on delivering an interoperability framework of design guidelines based on open industry standards to complete the cross-industry digital convergence. Microsoft is a member of this alliance.

Digital Locker (PN)~ A Microsoft web-based service that provides customized accounts to users so that they can select, purchase, download, and update software applicable to Microsoft Windows from multiple retailers.

digital photo (n)~ An image that has been captured electronically with a digital camera or scanner.

digital rights management (n)~ Any technology used to protect the interests of owners of digital content and services (such as copyright owners). Typically, authorized recipients or users must acquire a license in order to use the content.

digital rights management component (n)~ The component of a player that handles all functions of digital rights management, such as decrypting packaged files or initiating license acquisition.

Digital Roam (PN)~ A feature that allows the user to use the device outside the usual service area or when traveling outside of the home' service area defined by a service

provider. Roaming service can be digital or analog.'

digital signature (n)~ Data that binds a sender's identity to the information being sent. A digital signature may be bundled with any message, file, or other digitally encoded information, or transmitted separately. Digital signatures are used in public key environments and provide authentication and integrity services.

Digital Signature Algorithm (n)~ The U.S. government standard for digital signatures, as specified by the National Institute of Standards and Technology, in FIPS 186, Digital Signature Standard. DSA is based on signature encryption based on a public and a private key.

Digital Subscriber Line (n)~ A type of high-speed Internet connection using standard telephone wires.

digital video (n)~ Video images and sound stored in a digital format.

Digital Video Broadcasting (PN)~ A set of standards that define the use of satellite, cable, and terrestrial frameworks already in place to enable digital broadcasting.

digital video disk (n)~ A form of storage characterized by high capacity (roughly 650 MB) and the use of laser optics rather than magnetic means for reading data. Optical disk storage commonly used for audio, video, and computer data. DVDs range in capacity from 4.7 GB to 17 GB, and can store significantly more than a CD-ROM.

digital video recorder (n)~ A hardware device that records broadcast television programming in a digital format. A DVR often saves video to a buffer, which enables viewers to pause a live broadcast or replay video from the buffer.

Digitale Identiteit (oth)~ A standard security code issued by the Netherlands government to businesses and private citizens for interacting electronically with the government (for submitting tax returns or other documents electronically, requesting information, checking on status, etc.).

digitally signed (adj)~ Having a digital signature.

digitizer (n)~ A high-resolution hardware device that recognizes input from a pen or fingers.

digitizing tablet (n)~ A device used to input graphics position information in engineering, design, and illustration applications. A flat rectangular plastic board is equipped with a puck or a pen (also called a stylus) and sensing electronics that report the position of the puck or stylus to the computer, which translates that data into a cursor position on the screen.

DIGRAM FOR HEAVENLY EARTH (n)~ The Unicode character U+1D301, which represents a Tai Xuan Jing symbol.

Dijkstra ~ Algorithm sometimes used to calculate routes given link and nodal state topology database.

dim (v)~ To cause text or an image to visually fade.

dimension (n)~ A structural attribute of a cube that organizes data into levels. For example, a Geography dimension might include the members Country, Region, State or Province, and City.

dimension (n)~ A classifier that characterizes the magnitude or extent of a quantifiable property of an object or activity.

Dimension (n)~ A representation of Parature field response data that is used in Premium

Reports.

dimension association (n)~ A relationship between source model dimensions and destination model dimensions. One or more of these can exist for each model association.

dimension derivation rule (n)~ A rule to determine a ledger dimension for classifying the financial consequences of an accounting event.

dimension expression (n)~ A valid Multidimensional Expressions (MDX) expression that returns a dimension.

dimension filter (n)~ In a column definition, the list of dimensions that limit the data that is displayed for a report.

dimension granularity (n)~ The lowest level available to a particular dimension in relation to a particular measure group. The natural' or physical grain is always that of the key that joins the main dimension table to the primary fact table.'

dimension hierarchy (n)~ A logical tree structure that organizes the members of a dimension such that each member has one parent member and zero or more child members.

dimension level (n)~ The name of a set of members in a dimension hierarchy such that all members of the set are at the same distance from the root of the hierarchy. For example, a time hierarchy may contain the levels Year, Month, and Day.

dimension member (n)~ A single position or item in a dimension. Dimension members can be user-defined or predefined and can have properties associated with them.

dimension member property (n)~ A characteristic of a dimension member. Dimension member properties can be alphanumeric, Boolean, or Date/Time data types, and can be user-defined or predefined.

dimension set (n)~ A named group of accounts or dimensions that contains either account values for the account or dimension values for a single dimension.

dimension table (n)~ A table in a data warehouse whose entries describe data in a fact table.

dimension value (n)~ A unique identifier for a given dimension. The length of a dimension value is variable. The values for a given dimension can have different numbers of characters. For example, a division dimension might have values San Francisco and Denver.

dimension value set (n)~ A named group of dimension values.

dimensional (adj)~ Pertaining to data that is distributed or organized on two or more axes.

dimensionality (n)~ OLAP data cube axes. For instance, if the OLAP data shows transition by time sequence, the data has a dimensionality of time.

Dimension-based configuration (n)~ A configuration technology used to create product variants by selecting values for product dimensions.

dimensionless measurement (n)~ A measurement whose dimension is one and whose unit of measure is either a dimensionless unit of measure or the unit one.

Dimensions workspace (n)~ In PerformancePoint Planning Business Modeler, a user interface area that displays a summary of a specific dimension.

DIMM (n)~ A type of memory board comprised of RAM chips mounted on a circuit board with a 64-bit data path and pins on each side that are on different circuits and that respond to different signals.

DIMM ~ (Dual In-line Memory Module; pr. 'dim') A module of- RAM(memory) for a PC, replacing the older- SIMM- specification.

dimmed (adj)~ Pertaining to the state of a control in which normal functionality is not available to a user.

DIP (oth)~ A unit of measure that equals 1/96 of an inch.

diphtheria and tetanus toxoids vaccine (n)~ A vaccine for immunization against diphtheria and tetanus.

diphtheria, tetanus toxoids and accellular pertussis vaccine (n)~ A vaccine for immunization against diphtheria, tetanus, and pertussis (also known as whooping cough). The term acellular means that the pertussis component is cell-free, which improves safety by reducing the incidence of side effects.

diphtheria, tetanus toxoids and pertussis vaccine (n)~ A vaccine for immunization against diphtheria, tetanus, and pertussis (also known as whooping cough).

direct access (n)~ A way of accessing properties and methods supplied by WMI in a script as if they were automation properties and methods of an object instance.

direct access (n)~ The ability of a computer to find and go directly to a particular storage location without having to search sequentially from the beginning location. The human equivalent of random access would be the ability to find a desired address in an address book without having to proceed sequentially through all the addresses. A computer's semiconductor memory (both RAM and ROM) provides random access. Certain types of files stored on disk under some operating systems also allow random access. Such files are best used for data in which each record has no intrinsic relationship to what comes physically before or after it, as in a client list or an inventory.

direct access storage device (n)~ A data storage device by which information can be accessed directly, instead of by passing sequentially through all storage areas. For example, a disk drive is a DASD, but a tape unit is not, because, with a tape unit, the data is stored as a linear sequence.

direct cable connection (n)~ A link between the input/output (I/O) ports of two computers created with a single cable rather than a modem or other interfacing devices. In most cases, a direct cable connection is made with a null modem cable.

direct compensation (n)~ The fixed and variable compensation awarded to an employee in exchange for services rendered.

direct connect (n)~ The state of being connected to a back-end database, so that any changes you make to a database diagram automatically update your database when you save the diagram or selected items in it.

direct cost (n)~ A cost that can be directly allocated to a cost object, such as a material purchase for a specific product.

direct debit (n)~ A payment instrument for the debiting of a payer's payment account whereby a payment transaction is initiated by the payee on the basis of authorization given by the payer.

direct delivery (n)~ The delivery of goods directly from the vendor to the customer.

Direct Dial number (n)~ A phone number allocated for the Skype user, allowing the user to call pre-configured landlines or mobile phones. A type of Skype To Go number.

direct e-mail (n)~ The distribution of marketing materials in e-mail over an intranet or the

Internet, usually to a large number of recipients. The e-mail goes directly from the organization to each recipient individually, giving the appearance of the communication being sent personally.

direct event handling (n)~ An event handling strategy that does not involve routing.

Direct Formatting Guides (PN)~ A feature which, when activated, highlights the areas of text where styles, such as bold or italic, have been manually applied.

direct hosting (n)~ For Microsoft networking, the sending of file and print sharing traffic using the Server Message Block (SMB) protocol (also known as the Common Internet File System (CIFS) protocol) without the use of network basic input/output system (NetBIOS). Direct hosting for the Microsoft redirector (the Workstation service) and file server (the Server service) is supported over both TCP/IP and Internetwork Packet Exchange (IPX). Although direct hosting may be more efficient, a direct hosting client can connect only to a direct hosting server.

direct mail (n)~ A mail message that is targeted toward specific users that meet the specific requirements of a marketing campaign.

direct mail campaign (n)~ A marketing campaign to distribute e-mail message ads to a targeted group of users. The objective is to achieve a high response rate from the mailings.

Direct Mailer (n)~ A Commerce Server global resource that sends personalized e-mail messages from a Web page, or non-personalized mailings from a flat text file, to large groups of recipients. It processes lists of recipients, constructs personalized message bodies from either Web pages or static files, and sends the mail message to the recipients. Use Commerce Server Manager to configure and manage Direct Mailer, and to specify the database connection string to the Direct Mailer database.

Direct Mailer database (n)~ A SQL Server database that contains e-mail message bodies, event data, and job data. Commerce Server Setup installs the Direct Mailer database Commerce Server Direct Mailer is installed. The database is installed on the same computer as Direct Mailer. Use Commerce Server Manager to specify the connection string from Direct Mailer to the Direct Mailer database.

Direct Mailer job file (n)~ A text file that specifies information about the Direct Mailer job such as whether it delivers personalized message bodies, the format of mail message headers, and the location of the list of recipients. A Direct Mailer job file is used only for the stand-alone mode of Direct Mailer.

Direct Mailer Pipeline (n)~ The infrastructure that processes a list of direct mail recipients. It links stages and pipeline components.

direct membership rule (n)~ A collection membership rule that targets an individual resource, such as a user, user group, or an SMS/Configuration Manager client. This allows you to gather a diverse group of resources.

direct memory access (n)~ A technology that allows certain devices, such as hard disks and CD or DVD drives, to transfer information directly through the computer's memory without using the computer's processor. DMA improves the performance of the device and frees the computer's processor so it can perform other tasks.

direct message (n)~ A message sent through a social network between two users, where only the involved users are allowed to read the message.

direct method (n)~ A method of deriving the net income provided by operating activities

from the components of operating cash receipts and payments, instead of adjusting the net income for items.

direct price (n)~ A price that is associated with a specific product in a catalog rather than with a pricing category.

Direct Push (n)~ A technology that ensures that a mobile device automatically retrieves new e-mail from the Microsoft Exchange server. Direct Push uses a longstanding HTTPS connection that is maintained by the mobile device to push new e-mail messages, Calendar, Contacts, and Tasks notifications from the server to the device.

direct report (n)~ An employee who in the organizational hierarchy is immediately below the manager in question and who can either be a manager or an individual contributor.

direct response mode (n)~ The default mode in which SQL Server statistics are gathered separately from the SQL Server Statistics display.

direct routing (n)~ An event routing strategy where the event instance does not move in the tree and behaves like a standard common language runtime event.

Direct Selection (PN)~ A tool that lets you select and manipulate an individual anchor point or segment on a vector path.

direct synchronization (n)~ A method used to synchronize data between replicas that are connected directly to the local area network and are available through shared network folders.

Direct3D (PN)~ A virtualized representation of dedicated graphics hardware resources. Direct3D provides a standardized implementation of the common graphics processing pipeline.

DirectAccess (PN)~ A Windows feature that provides a direct connection to a corporate network for people working outside of the office. It is a superior alternative to VPN.

DirectComposition (PN)~ A Windows API that enables user experiences that are smooth and fluid and allow developers to compose content from multiple rendering libraries to the same top-level window, removing the dependency on a specific rendering or user interface framework to create a general solution that can satisfy a broad range of scenarios. (This API is not for Windows Store app development.)

DirectDraw (PN)~ Software that helps display two-dimensional visual effects on a computer monitor. Computer games, 2-D graphics packages, and Windows system components (such as digital video codecs) all use DirectDraw.

directed discovery (n)~ The discovery of resources or devices on a network beyond the local subnet.

Directed to Older Children - Fantasy Violence (oth)~ A TV ratings system used by TV networks in the United States to indicate to viewers that a particular show is designed for children age 7 and older, but may include more intense fantasy violence.

DirectInput (n)~ Software that makes it possible for game control devices, such as joysticks and gamepads, to work with your computer.

direction (n)~ The orientation of an asymmetrical association. Direction is specified with FromRole and ToRole attributes of a NavigationProperty or ReferentialConstraint element in a schema.

direction code (n)~ A value in a fax or phone activity that indicates the direction of the message. Typically the values are incoming or outgoing.

directional light (n)~ A light source that is attached to a frame but appears to illuminate all objects with equal intensity, as if it were at an infinite distance from the objects. Directional light has orientation but no position, and it is commonly used to simulate distant light sources, such as the sun.

directional map (n)~ A map created with transportation and mass transit shapes, such as highways, parkways, intersections, road and street signs, routes, railroad tracks, transit terminals, rivers, and buildings.

directional pad (n)~ The Action button and associated Direction keys that allow the user to move up, down, right, left, and center to perform an action.

directions (n)~ In the Maps application, instructions for how to get from one location to another, either driving or walking.

directive (n)~ An instruction in a text template that tells the engine and the host how to process the template.

directive prologue (n)~ A JavaScript syntactic unit that defines the mode for the code block to which it applies.

Director (n)~ An Office Communications Server that authenticates remote users and inbound traffic from federated partners and that routes traffic to the appropriate Enterprise Edition pool for further processing.

directory (n)~ An information source that contains data about users, computer files, or other objects. In a file system, a directory stores information about files. In a distributed computing environment (such as a Windows domain), the directory stores information about objects such as printers, fax servers, applications, databases, and users.

directory (n)~ A catalogue of all Skype users.

Directory ~ An area on a disk for storing files, particularly in- DOS. Usually called a- folder- in Windows.

directory browsing (n)~ A feature that automatically provides a default Web page of available directories and files to browsers that submit a Uniform Resource Locator (URL) that does not specify a particular file.

directory character (n)~ A character that is used to denote the directory, for instance ' or '/' or ':'. Depending on what OS you're running on e.g. c:\bin\dos\ would be a directory on your machine.'

directory control block (n)~ An internal NT file system (NTFS) structure in which the file system maintains the state for an open instance of a directory file.

Directory Extension (n)~ A software component designed to enable application developers to extend the directory and develop richer applications without worrying about the limitations imposed by an external store.

directory harvest attack (n)~ An attempt to collect valid e-mail addresses from a particular organization so that the e-mail addresses can be added to a spam database.

directory ID (oth)~ An identifier that is given to a customer record to indicate that the customer is the same as a corresponding customer record in another company that shares the same directory ID.

Directory Management Service (n)~ A service used to manage distribution lists.

directory partition (n)~ A contiguous subtree of Active Directory that is replicated as a unit to other domain controllers in the forest that contain a replica of the same subtree. In

Active Directory, a single domain controller always holds at least three directory partitions: schema (class and attribute definitions for the directory), configuration (replication topology and related metadata), and domain (subtree that contains the per-domain objects for one domain). Domain controllers running Windows Server 2003 can also store one or more application directory partitions.

directory replication (n)~ The copying of a master set of directories from a server (called an export server) to specified servers or workstations (called import computers) in the same or other domains. Replication simplifies the task of maintaining identical sets of directories and files on multiple computers because only a single master copy of the data must be maintained.

directory server (n)~ A computer that lists the names and e-mail addresses of people who are running NetMeeting and who are logged on to the server. This information is used to connect to their computers.

directory service (n)~ A service that provides access to data and objects in a directory or network environment.

Directory Services (PN)~ A feature of the Hosted Filtering service that verifies intended recipients against an approved user list before e-mail is processed for spam, viruses, and other malicious software.

Directory Services Markup Language (n)~ An open, extensible, standards-based format for publishing directory service schemas and exchanging directory contents.

Directory Services options (n)~ The options on the Directory Services page for how mail to users in the Directory Services user lists is handled: Pass Through, Reject Test, Reject, Group Filtering, and Intelligent Routing.

Directory Services Upload mode (n)~ The method of adding new users to an organization's service. There are three upload modes: Administration Center mode, Directory Synchronization Tool mode, and Secure FTP mode.

directory store (n)~ The physical storage for Active Directory directory partition replicas on a specific domain controller. The store is implemented using the Extensible Storage Engine.

directory synchronization (PN)~ The process of matching user accounts and mail-enabled contacts and groups from the local Active- Directory directory service.

Directory Synchronization Tool mode (n)~ A mode for uploading an address list file to Directory Services via the Directory Synchronization Tool. This is one of the three upload modes in EHS. It automatically synchronizes the on-site e-mail address list with the organization's hosted services.

directory system agent (n)~ The Active Directory process that manages and provides access to stored directory information.

directory tree (n)~ A hierarchy of objects and containers in a directory that can be viewed graphically as an upside-down tree, with the root object at the top. Endpoints in the tree are usually single (leaf) objects, and nodes in the tree, or branches, are container objects. A tree shows how objects are connected in terms of the path from one object to another.

DirectPlay (PN)~ Software that supports game connections over a modem, the Internet, or a LAN. DirectPlay helps start multiplayer games, preserves game data from session to session, and enables voice communication.

DirectShow (PN)~ Software that allows your computer to capture video, play DVDs, edit and mix video, use hardware-accelerated video decoding, and to tune into analog or digital television signals.

DirectSound (PN)~ Software that improves audio performance on a computer. DirectSound is designed to enable mixing and other playback features in movie and computer game sound, regardless of the audio software or hardware on a particular computer.

DirectX (n)~ A set of Microsoft technologies that provide developers with the tools needed to create sophisticated multimedia applications on Windows-based computers.

directX ~ A set of multimedia APIs that Microsoft provides.

DirectX Graphics Infrastructure (PN)~ The infrastructure that manages low-level graphics-related tasks, such as output adapter and swap chain configuration, and provides a common framework for managing virtualized graphics components and resources.

DirectX Immediate Mode (PN)~ A rendering API in which client calls directly cause rendering of graphics objects to the display

DirectX Media Object (n)~ A COM object that processes multimedia data streams from buffers allocated by the client.

DirectX Retained Mode (PN)~ A COM-based scene graph API.

dirty (n)~ Of, pertaining to, or characteristic of the condition where something has changed in memory but the change has not been saved to a more permanent storage device such as a disk.

dirty bit (n)~ A bit used to mark modified data in a cache so that the modifications may be carried over to primary memory.

dirty page (n)~ A buffer page that contains modifications that have not been written to disk.

dirty range (n)~ An area in a markup container where changes have occurred.

dirty read (n)~ A read that contains uncommitted data.

disable (v)~ To make a device, component, or feature nonfunctional. For example, if you disable a device in a hardware configuration, you cannot use the device when your computer uses that hardware configuration. Disabling a device frees the resources that were allocated to the device.

Disable for Yammer (PN)~ Control in the Post Rule Configurations area on the ribbon that disallows Yammer posts on a record.

disabled (adj)~ Pertaining to the state of a control in which normal functionality is not available to a user.

disabled control (n)~ A control that appears dimmed on a form or data access page. A disabled control cannot get the focus and will not respond to mouse clicks.

disabled index (n)~ Any index that has been marked as disabled. A disabled index is unavailable for use by the database engine. The index definition of a disabled index remains in the system catalog with no underlying index data.

disabled user account (n)~ A user account that does not permit logging on.

disallowed vendor (n)~ A vendor that is not authorized to supply products to one or more legal entities.

disassembly (n)~

disassembly (n)~ The act of taking apart components, resources, or items.

disaster recovery (n)~ The process of gaining back access to the data, hardware and software necessary for critical business operations after a natural or human-induced disaster.

disc (n)~ A round, flat piece of nonmagnetic, shiny metal encased in a plastic coating, designed to be read from and written to by optical (laser) technology.

disc burner (n)~ A device used to copy files to recordable CDs and DVDs.

discard (v)~ To remove something.

discard (v)~ To remove a file from the Microsoft Office Document Cache without deleting it on the server.

discard changes (v)~ To remove a user's changes from the Microsoft Office Document Cache without deleting the file on the server or removing the latest version downloaded from the server from the Office Document Cache.

discharge (n)~ The point at which the patient leaves the hospital.

discharge instruction (n)~ The medical instructions given to a patient after being discharged from a hospital.

discharge summary (n)~ A clinical report prepared by a health professional at the end of a hospital stay that describes the patient's main complaint, the therapy administered, and recommendations on discharge.

discipline (n)~ A particular specialization that categorizes activities and guidance within a process according to a common theme; these may relate to one or to many roles.

disclaimer (n)~ A notice that warns that the manufacturer of the product limits liability in certain situations/uses.

disclaimer (n)~ Text that is added to e-mail messages in transport to provide information that supports the sending organization's compliance policies, warnings about unknown or unverified e-mail senders, or other information as determined by the sending organization. Exchange Server 2007 allows the administrator to use transport rules to target disclaimers based on specific criteria.

disclose (v)~ To reveal knowledge or information.

Disco (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 4.

disconnect (v)~ To break a connection.

disconnected (adj)~ Pertaining to a connection, session, or call that has, unintentionally or not, ended.

discontinued (adj)~ The quality of a product or service that Microsoft no longer offers or supports.

discount (n)~ A specific type of promotion in which customers are invited to save money on specific products or product groups if they meet certain specified conditions.

discount (n)~ A reduction in the selling price of products or services usually offered by the seller when the buyer agrees to meet specific conditions.

discount (n)~ A fixed amount or percentage deducted from a quoted price or price total.

discount list (n)~ A group of price reductions that can be applied to a product based on volume purchased.

discount period (n)~ The time period within which a customer can discount their payment obligation.

discount variance (n)~ The difference between an expected discount and an actual discount.

discoverable (adj)~ Pertaining to a state in which a computer or device can be detected and recognized by another computer or device.

discoverable mode (n)~ A mode in which a Bluetooth device will let any other Bluetooth device discover and connect with it.

discovered group (n)~ Any computer group found by Operations Manager.

discovery (n)~ The usually pretrial disclosure of pertinent facts or documents by one or both parties to a legal action or proceeding.

discovery (n)~ The process of finding content related to an investigation, litigation, or audit so that it can be properly tracked and maintained.

discovery (n)~ An element in a management pack that defines logic for locating monitored objects and their properties and relationships between different objects.

Discovery and Risk Assessment (PN)~ A Microsoft Office product that identifies business-critical Excel spreadsheets and Access databases by discovering files across network shares and SharePoint libraries, and that provides flexible risk assessment and categorization based on relevance, materiality and business impact.

discovery data (n)~ A set of properties that identifies an SMS/Configuration Manager resource. For example, discovery data for an SMS/Configuration Manager client can include the IP address of the network connection, the operating system type and version, and the SMS/Configuration Manager unique identifier that is assigned to the client.

discovery data record (n)~ The file format (.ddr) and the actual file that is used by Configuration Manager to report discovery data to a Configuration Manager site database.

discovery mailbox (n)~ A special type of mailbox in which copies of the mailbox search results are stored.

Discovery Management (PN)~ The role group that gives users the permissions needed to use Multi-Mailbox Search.

discovery manager (n)~ A person who has a business need to search the mailboxes in their organization for e-mail and other message types that contain specific keywords.

discovery method (n)~ A procedure that detects and acquires information about resources on the network.

Discovery Pack (PN)~ The offer for a fixed amount of Cloud Services, storage, data transfers, Service Bus, CDN and SQL Database at a fixed monthly price. It is now no longer available for new customers.

Discovery Service (PN)~ A service that establishes a simple flow for learning about and using authenticated Microsoft Online Services endpoints for a given user. It is a single point where a developer can start, pass the user identity, get information to initiate authorization flows, get the hosting location of services for that user, and get the endpoints to the service.

Discovery Wizard (PN)~ The System Center Essentials wizard that helps select the computers and devices to be managed.

discrete interpolation (n)~ One of three methods used to describe how an animation

transitions between values over its duration. This method produces a jump from one value to the next, without generating in-between values.

discrete signal (n)~ A time series consisting of a sequence of quantities, that is a time series that is a function over a domain of discrete integers.

discretionary access control list (n)~ An access control list that is controlled by the owner of an object and that specifies the access particular users or groups can have to the object.

discretionary hyphen (n)~ A hyphen that is used to control where a word or phrase breaks if it falls at the end of a line. For example, you can specify that the word nonprinting' breaks as 'non-printing' rather than 'nonprint-ing."

discretization (n)~ The process of putting values of a continuous set of data into groups so that there are a discrete number of possible states.

discretized column (n)~ A column that represents finite, counted data

Discrimination (n)~ A content descriptor developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

discriminator (n)~ A text label on a generalization path that indicates the name of a partition of the general class that the more specific class is in. The default discriminator is an empty string.

discriminator property (n)~ A column in a database table that contains a value that determines which class any given record belongs to.

discussion (n)~ A post, comments, and responses made within a conversation space, such as a message board, help board, community, newsgroup, or blog. These exchanges are usually publicly viewable. Participation may require credentials, such as a Windows Live ID.

discussion board (n)~ A Web site component that enables users to participate in topics of discussion by posting and replying to comments.

discussion comment (n)~ A remark or topic of discussion that is associated with a Web page or Microsoft Office file and is stored on a discussion server.

discussion entry (n)~ A message that appears in a newsgroup, public folder, or other forum, such as Facebook or Twitter, accessible by a number of individuals.

discussion group (n)~ A forum on the Internet for discussions on a specified range of subjects.

discussion rights (n)~ Rights that allow a user to view, add, modify, and close discussion comments that are attached to a Web page or document.

discussion server (n)~ A computer that stores discussion text and information about the location of the file being discussed.

discussion thread (n)~ In an online forum, such as a newsgroup, a series of messages or articles in which replies to an message are nested directly under it instead of arranged in chronological or alphabetical order.

disfavored persona (n)~ A disfavored persona or persona with the objective of gaining access to an asset. Examples of adversaries include hackers.

disjoint selection (n)~ A selection that consists of a set of objects that are not logically sequential or physically adjacent to each other.

disk (n)~ A device used to store information. There are two types of disks. Hard disks are

permanent and installed into your computer. Floppy disks are portable and can be inserted into and removed from a floppy disk drive.

disk (n)~ A reusable magnetic storage medium. The floppy disk used today is the rigid 3.5-inch microfloppy that holds 1.44 MB. It is called floppy because the first varieties were housed in bendable jackets.

Disk ~ Generic term for a type of storage device, such as a- hard disk- or a- floppy disk- (diskette). So called because the important part, where the information is actually stored, is circular, although you can't see it because it is hidden away inside a protective shell.

disk access time (n)~ The time needed for a read/write head in a disk drive to locate a track on a disk. Access time is usually measured in milliseconds and is used as a performance measure for hard disks and CD-ROM drives.

disk arbitration (n)~ The process that occurs when the cluster node that owned the quorum resource fails or is unavailable, and the remaining nodes determine which node will take ownership.

disk bottleneck (n)~ A condition that occurs when disk performance is reduced to the extent that overall system performance is affected.

disk cache (n)~ A portion of a computer's random access memory (RAM) set aside for temporarily holding information read from disk. A disk cache does not hold entire files, as does a RAM disk (a portion of memory that acts as if it were a disk drive). Instead, a disk cache is used to hold information that either has recently been requested from disk or has previously been written to disk. If the required information remains in a disk cache, access time is considerably faster than if the program must wait for the disk drive mechanism to fetch the information from disk.

disk configuration information (n)~ Information in the Windows registry on assigned drive letters, simple volumes, striped volumes, mirrored volumes, spanned volumes, and RAID-5 volumes. You can change the disk configuration by using Disk Management.

disk directory (n)~ An index of the files on a disk, analogous to a card catalog. A disk directory includes information about the files, such as their names, sizes, dates of creation, and physical locations on the disk.

disk drive (n)~ A hardware device that reads data from and writes data to floppy disks.

disk duplication (n)~ The process of using third-party hardware or software to copy a full master Windows installation onto the hard disks of multiple destination computers. The master computer and destination computers must have compatible hardware abstraction layers (HALs). The destination computer can be delivered directly to customers, or it might require additional processing on the factory production line.

disk extent (n)~ A contiguous run of sectors on one disk.

disk flush (n)~ A write operation that completes only when the associated data has been effectively written to disk.

disk partition (n)~ A section of space on a physical disk that functions as if it were a separate disk.

disk space (n)~ The amount of data that can be stored on a disk, usually measured in bytes.

Disk Utilization report (n)~ A DPS report that provides statistics on disk capacity,

allocation, usage, and availability.

disk-based web site (n)~ A web site hosted on a local computer.

Diskette ~ Also known as a floppy disk. Now obsollete. Called a diskette because it was smaller than the original huge floppy disks.

diskpart.exe (n)~ A command-line utility for formatting and managing disk partitions and volumes.

dislike (PN)~ A button label to note that the user does not like a suggestion in Local Scout.

DISM (PN)~ A framework that provides a single point for IT professionals and OEMs to service and maintain Windows images offline through a scriptable command line utility and an easily extensible infrastructure.

DISM Transmogrify Provider (PN)~ The Deployment Image Servicing and Management (DISM) provider that exposes the ability to transmogrify an edition.

dismiss (v)~ To reject or turn off a system notification such as a reminder, a new message alert or an alarm.

dismount (v)~ To remove a removable tape or disc from a drive.

dispatch (v)~ To plan, allocate, and send out technicians, spare parts, and special equipment to solve a service problem.

dispatch (v)~ To make adjustments to production jobs on a selected work center to prepare them for shipping.

dispatch ID (n)~ A 32-bit integer that identifies a property set.

dispatcher (n)~ In some multitasking operating systems, the set of routines responsible for allocating CPU (central processing unit) time to various applications.

display (v)~ To show something.

display (n)~ A visual output device aimed at displaying various type of information.

display adapter (n)~ The electronic components that generate the video signal sent through a cable to a video display. The video adapter is usually located on the computer's main system board or on an expansion board, but it is sometimes built into the terminal.

display calibration (n)~ The act of adjusting a display so that its response to RGB input signals matches a predefined standard such as sRGB.

Display Color Calibration (PN)~ A wizard that guides users through a series of adjustments to their display to produce a more accurate rendering of sRGB color content.

Display Color Calibration Wizard (PN)~ A wizard that guides users through a series of adjustments to their display to produce a more accurate rendering of sRGB color content.

Display Configuration wizard (n)~ A wizard that guides the user to configure their TV or monitor to get the best picture. The wizard helps the user to center and resize the picture, select the correct aspect ratio, and adjust the brightness, contrast, and sharpness settings.

display device (n)~ A visual output device aimed at displaying various type of information.

Display Emoticons in Instant Messages (oth)~ An item on the Edit menu that converts specific text strings to emoticons in instant messages.

display field (n)~ A field that appears in a form, report, or class and that contains and displays data but is not stored as a record in a table. A display field can be calculated data.

display item (n)~ A folder into which attributes, measures, calculated members, KPIs, and PerformancePoint items can be organized to facilitate browsing by users.

display mode (n)~ The mode in which a Web Parts page can be displayed. It enables users to modify a page in specified ways. The states that ship with the Web Parts control set are: catalog, connect, design, edit, and browse. The default or normal mode for a Web page is browse. Developers can extend this display mode feature by adding custom display modes, which requires extending the WebPartManager class.

display name (n)~ In SMS/Configuration Manager software inventory, the company or product name that appears in Resource Explorer when you view software inventory information. This name may differ from the company or product name—the inventoried name—that is read from the file header information of the product files.

display name (n)~ A descriptive or user-friendly label for a control or object, displayed on the screen. The display name may differ from the internal name.

display name (n)~ An alias for the application name that uniquely identifies an application in all phases of monitoring, from configuration to monitoring, viewing, and reporting in Application Diagnostics. The default display name is the IIS property 'Application name' for web applications.

display name (n)~ A name of a person as it is shown in a user interface.

Display pane (n)~ The upper left pane in the DPM Administrator Console. The Display pane provides information and access to functionality for the selected task area.

display picture (n)~ The image or avatar someone adds to their profile to represent themselves.

display pointer (n)~ A pointer that marks a position in the markup text of an HTML document during editing in relation to the onscreen position of the rendered page. A display pointer is controlled by an GetDisplayGravity interface. Display pointers work in conjunction with markup pointers.

Display Properties (n)~ An icon in Windows Vista Control Panel that opens a dialog allowing user to change display options including screen resolution, refresh rate, color depth, and orientation.

display setting (n)~ The number of colors that your computer display software supports.

display system (n)~ The combination of monitor, video adapter, and display software.

disposal date (n)~ The date that an asset is sold or discarded.

disposition code (n)~ A code that indicates the method by which a returned item should be processed.

Disqualify Lead (oth)~ To render or declare something, such as a lead, unqualified or unfit.

disregarded entity (n)~ A business that is owned by an individual but is not treated as a separate entity from the business owner for tax purposes.

distance vector multicast routing protocol (n)~ An Internet routing protocol that provides an efficient mechanism for connectionless datagram delivery to a group of hosts across an Internet network. It is a distributed protocol that dynamically generates IP multicast delivery trees using a technique called Reverse Path Multicasting (RPM).

distinct count measure (n)~ A measure commonly used to determine for each member of a dimension how many distinct, lowest-level members of another dimension share rows in

the fact table.

distinct customer (n)~ A customer who may visit a Web site several times within a certain timeframe, but is counted only once.

distinct product (n)~ A uniquely identifiable product.

distinguished folder (n)~ A folder in a mailbox that can be referenced by Web services requests to identify a folder by name.

distinguished name (n)~ A name that uniquely identifies an object by using the relative distinguished name for the object, plus the names of container objects and domains that contain the object. The distinguished name identifies the object as well as its location in a tree. Every object in Active Directory has a distinguished name.

distribute (v)~ To allocate among locations or facilities, as in a data-processing function that is performed by a collection of computers and other devices linked together by a network.

distribute (v)~ To move three or more objects so that there is an equal amount of space between them.

distribute (v)~ In the Business Store and Education Store, to get apps and other digital goods into the hands of employees or students.

Distributed COM (n)~ The version of Microsoft's Component Object Model (COM) specification that stipulates how components communicate over Windows-based networks. It permits the distribution of different components for a single application across two or more networked computers, running an application distributed across a network so that the distribution of components is not apparent to the user, and remotely displaying an application. Because DCOM is language-neutral, any language that uses COM components can also produce DCOM applications.

Distributed Component Object Model (n)~ The version of Microsoft's Component Object Model (COM) specification that stipulates how components communicate over Windows-based networks. It permits the distribution of different components for a single application across two or more networked computers, running an application distributed across a network so that the distribution of components is not apparent to the user, and remotely displaying an application. Because DCOM is language-neutral, any language that uses COM components can also produce DCOM applications.

distributed computing (n)~ A form of information processing in which work is performed by separate computers linked through a communications network. Distributed processing is usually categorized as either plain distributed processing or true distributed processing. Plain distributed processing shares the workload among computers that can communicate with one another. True distributed processing has separate computers perform different tasks in such a way that their combined work can contribute to a larger goal. The latter type of processing requires a highly structured environment that allows hardware and software to communicate, share resources, and exchange information freely.

distributed database (n)~ A database implemented on a network. The component partitions are distributed over various nodes (stations) of the network. Depending on the specific update and retrieval traffic, distributing the database can significantly enhance overall performance.

Distributed File System (PN)~ A service that allows system administrators to organize

distributed network shares into a logical namespace, enabling users to access files without specifying their physical location and providing load sharing across network shares.

Distributed Link Tracking (n)~ A service that tracks links in scenarios where the link is made to a file on an NTFS volume, such as shell shortcuts and OLE links.

distributed partitioned view (n)~ A view that joins horizontally partitioned data from a set of member tables across more than one server, making the data appear as if from one table.

distributed password authentication (n)~ An advanced, distributed method of user authentication from Microsoft, allowing for single user log-on.

distributed processing (n)~ A form of information processing in which work is performed by separate computers linked through a communications network. Distributed processing is usually categorized as either plain distributed processing or true distributed processing. Plain distributed processing shares the workload among computers that can communicate with one another. True distributed processing has separate computers perform different tasks in such a way that their combined work can contribute to a larger goal. The latter type of processing requires a highly structured environment that allows hardware and software to communicate, share resources, and exchange information freely.

distributed query (n)~ A single query that accesses data from multiple data sources.

Distributed Relational Database Architecture (n)~ A connection protocol for distributed relational database processing used by IBM relational database products that comprises protocols for communication between an application and a remote database, and communication between databases. DRDA also provides the connections for remote and distributed processing. The Distributed Data Management Architecture provides the base architecture for DRDA.

Distributed Replay (PN)~ The tool which allows you to replay a workload from multiple computers and better simulate a mission-critical workload.

distributed routing table (n)~ A routing table with entries that are distributed across a group of machines that can be used to map numeric keys to application endpoints and find routes through the network of peers.

Distributed Scan Management (PN)~ A feature that offers a collection of Web services, applications, and Windows services that work together to create an end-to-end experience that allows users to walk up to a copy room MFD and scan a document to a destination.

Distributed Scan Server (PN)~ A role service, under Print and Document Services, that provides the service which receives scanned documents from network scanners and routes them to the correct destinations. It also includes the Scan Management snap-in.

Distributed System Designer (PN)~ A set of design tools in Visual Studio 2005 Team Architect Edition that help reduce the complexity of developing and deploying service-oriented applications.

distributed transaction (n)~ A transaction that spans multiple data sources.

distribution (n)~ The process of managing the flow of goods and services from the producer to the customer.

distribution cleanup agent (n)~ A scheduled job that runs under SQL Server Agent. After all Subscribers have received a transaction, the agent removes the transaction from the distribution database. It also cleans up snapshot files from the file system after entries

corresponding to those files have been removed from the distribution database.

distribution database (n)~ A database on the Distributor that stores data for replication including transactions, snapshot jobs, synchronization status, and replication history information.

distribution folder (n)~ The folder created on the distribution server to contain the Setup files.

distribution group (n)~ A collection of users, computers, contacts, and other groups that is used only for e-mail distribution, and addressed as a single recipient.

distribution group (n)~ A mail-enabled Active Directory group object. In Exchange 2007, a distribution group refers to all mail-enabled groups, whether they are an Active Directory security group or an Active Directory distribution group. When an e-mail message is sent to a distribution group, all members of that list receive a copy of the message.

distribution list (n)~ A collection of users, computers, contacts, and other groups that is used only for e-mail distribution, and addressed as a single recipient.

distribution list (n)~ A logical grouping of send ports. When a message is sent to a send port group, it is routed to all of the associated send ports.

distribution point (n)~ A site system that has the role of storing package source files. Clients contact distribution points to obtain source files when they run advertised programs.

distribution point group (n)~ A set of distribution points that you can manage as a single entity. A distribution point group simplifies management tasks when a site includes too many distribution points to manage individually.

distribution retention period (n)~ In transactional replication, the amount of time transactions are stored in the distribution database.

distribution share (n)~ A folder that contains the source files for Windows products that you install. It may also contain additional device drivers and application files.

distributor (n)~ A database instance that acts as a store for replication-specific data associated with one or more Publishers.

dither (v)~ To create the illusion of varying shades of gray on a monochrome display or printer or of additional colors on a color display or printer.

dithered (adj)~ Produced with the use of dithering.

dithering (PN)~ A method to display a range of colors with a limited palette. Each pixel on the source image is represented by multiple pixels (usually a 2x2 square) on the destination image. From a distance, the eye blends the multiple pixels into one color that has more shades than the original palette. The techniques results in a better visual appearance than the removal of low precision bits.

Diverging Arrows (PN)~ A SmartArt graphic layout used to show ideas or concepts that progress outward from a central source. Works best with Level 1 text only.

Diverging Radial (PN)~ A SmartArt graphic layout used to show relationships to a central idea in a cycle. The first Level 1 line of text corresponds to the central circular shape. Emphasizes the surrounding circles rather than the central idea. Unused text does not appear, but remains available if you switch layouts.

divide (v)~ To combine two or more shapes or paths to result in a single compound path

where overlapping areas are split apart. If you release the compound path, the individual shapes are put into their own path objects.

Dividend Yield (PN)~ A financial ratio that shows how much a company pays out in dividends each year relative to its share price. In the absence of any capital gains, the dividend yield is the return on investment for a stock.

divider (n)~ A moveable strip in the user interface that divides the screen between two apps.

division (n)~ An organizational level of a company. Divisions can be based on geography, (East Division, West Division); product specializations, (New Technologies Division); or any other characteristics.

Division (PN)~ A group of teams that play a sport at a similar competitive level.

division sign (n)~ The Ã· character.

DIVISION SIGN (n)~ The Ã· character.

DIY (PN)~ The Lifestyle subcategory containing apps to help you with Do-It-Yourself.

DKK (n)~ The official currency of Denmark.

DL-BASE (n)~ The type of Base used by Host Integration Server 2004 3270 emulation programs. DL-BASE supports a single Host Integration Server 2004 component or a single user application and has entry points for initialization, sending messages, receiving messages, and termination.

DLC (n)~ An error-correction protocol in the Systems Network Architecture (SNA) responsible for transmission of data between two nodes over a physical link. Supported by Microsoft Windows NT and Windows 2000, DLC is designed to provide access to IBM mainframe computers and to Hewlett-Packard printers connected to the network.

DLL (n)~ An operating system feature that allows executable routines (generally serving a specific function or set of functions) to be stored separately as files with .dll extensions. These routines are loaded only when needed by the program that calls them.

DLL preloading (n)~ An attack that tricks an application into loading a malicious library when it thinks it's loading a trusted library.

DLNA (PN)~ An alliance of leading companies in the consumer electronics, mobile and personal computer industries focused on delivering an interoperability framework of design guidelines based on open industry standards to complete the cross-industry digital convergence. Microsoft is a member of this alliance.

DLP policy (n)~ A collection of transport rules and classification logic that applies specific filtering based on specific regulatory requirements, for example, HIPAA (Health Insurance Portabililty and Accountability Act).

DLP policy template (n)~ A collection of transport rule configurations and classification logic installed in an Exchange deployment from which data loss protection (DLP) policies are created.

DLU (n)~ A device-independent measure to use for layout. One horizontal unit is equal to one-fourth of the average character width for the current system font. One vertical unit is equal to one-eighth of an average character height for the current system font.

DMA (n)~ A technology that allows certain devices, such as hard disks and CD or DVD drives, to transfer information directly through the computer's memory without using the computer's processor. DMA improves the performance of the device and frees the

computer's processor so it can perform other tasks.

DMF (n)~ One of a set of built-in functions that returns server state information about values, objects, and settings in SQL Server.

DML (n)~ The subset of SQL statements that is used to retrieve and manipulate data. DML statements typically start with SELECT INSERT UPDATE or DELETE.

DML trigger (n)~ A stored procedure that executes when data in a specified table is modified.

DMO (n)~ A COM object that processes multimedia data streams from buffers allocated by the client.

DMRC (PN)~ A feature that provides an interface for acquiring rich metadata in order to support showing device detail information in the Device Center and the Device Stage.

DMV (n)~ A set of built-in views that return server state information about values, objects, and settings in SQL Server.

DMX (n)~ In Analysis Services, a statement that performs mining tasks programmatically.

DNIS (n)~ A service that provides a string of digits that the telephone network passes to the ACD to indicate the number that the caller dialed.

DNS (n)~ A hierarchical, distributed database that contains mappings of DNS domain names to various types of data, such as IP addresses. DNS enables the location of computers and services by user-friendly names, and it also enables the discovery of other information stored in the database.

DNS (PN)~ An Azure service to host DNS and manage DNS records using the same credentials, billing and support contract as the other Azure services, thus integrating Azure-based services with corresponding DNS updates.

DNS ~ (Domain Name Service/System)- An internet service that converts a human web address such as www.jonstorm.com into the numeric address that computers use, called the- IP address. 'Can't resolve DNS' usually means that this conversion has failed and therefore the website can't be found.

DNS client (n)~ A client computer that queries DNS servers in an attempt to resolve DNS domain names. DNS clients maintain a temporary cache of resolved DNS domain names.

DNS hosting provider (n)~ A provider that offers DNS hosting services.

DNS hosting service (n)~ A service that runs Domain Name System (DNS) servers. Most, but not all, domain name registrars include DNS hosting service with registration.

DNS name (n)~ The name registered in DNS for a computer. For example, srv1.contoso.com is the DNS name for a hypothetical server named srv1.

DNS query (n)~ A query by the domain name server.

DNS server (n)~ A server that maintains information about a portion of the DNS database and that responds to and resolves DNS queries.

DNS suffix (n)~ For DNS, a character string that represents a domain name. The DNS suffix shows where a host is located relative to the DNS root, specifying a host's location in the DNS hierarchy. Usually, the DNS suffix describes the latter portion of a DNS name, following one or more of the first labels of a DNS name.

DNT (PN)~ A preference set by users in web browsers to indicate to websites that they do not want to be tracked.

DNT header (n)~ A HTTP header that requests that a website avoid tracking an individual

user.

Do more (PN)~ The Windows Mobile header link that opens a menu that contains more options.

Do Not Disturb (PN)~ An item on the user's My Status menu that the user can select to notify other users that he or she does not want to be interrupted.

Do Not Disturb (PN)~ The status that appears automatically when a user is watching a movie on their device, or when a user has manually selected that they are not available to be contacted at this time.

Do Not Track (PN)~ A preference set by users in web browsers to indicate to websites that they do not want to be tracked.

Do Not Track header (n)~ A HTTP header that requests that a website avoid tracking an individual user.

doc (n)~ Any self-contained piece of work created with an application program and, if saved on disk, given a unique filename by which it can be retrieved.

dock (v)~ To connect a laptop or notebook computer to a docking station.

dock (v)~ To manipulate an interface element, such as a toolbar or panel, in order to align it with the edge of another interface element, typically a window or pane.

dock (n)~ A physical hardware unit that can connect portable computers to a power source and to peripherals, such as a monitor, printer, full-sized keyboard, or mouse. The connection can be wireless or physical.

dock management (n)~ A warehouse process where you can control inventory items for multiple orders, shipments, loads, or waves at the docks when inbound items are received or outbound items are loaded.

dock panel (n)~ A layout container that arranges its child elements around the edge of the screen based on compass direction: North, South, East, and West.

dock position (n)~ The configuration in which an interface element, such as a toolbar or panel, is docked to another interface element, typically a window or pane.

dockable pane (n)~ A window that may float and dock at a designated site known as a dock site.

docked mode (n)~ A keyboard layout in which the onscreen keyboard is attached to one edge of the window.

docked toolbar (n)~ A toolbar that is attached to one edge of the program window. When you drag a toolbar below the program title bar or to the left, right, or bottom edge of the window, the toolbar snaps into place on the edge of the program window.

docking (station) ~ A hardware device that enables a mobile computer to function as a desktop computer.

docking container (n)~ A UI control that allows the arrangement of child controls, both horizontally and vertically, relative to other controls within the container and within set boundaries.

docking station (n)~ A physical hardware unit that can connect portable computers to a power source and to peripherals, such as a monitor, printer, full-sized keyboard, or mouse. The connection can be wireless or physical.

document (n)~ Any self-contained piece of work created with an application program and, if saved on disk, given a unique filename by which it can be retrieved.

document (n)~ All the information entered for a single complete transaction including distribution amounts (if any).

document (n)~ An electronic instance of one-to-many schemas. Usually documents are sent between two processes.

document ACL (n)~ A managed property of a document that defines who has rights to view the document.

document blocking (n)~ A method of placing an operations process on hold while ordered items are in a quality assurance process.

document colors (n)~ A portion of the color bar that allows the user to select one color from the set of colors in the current document.

Document Connection for Mac (PN)~ A Microsoft application used to connect to Sharepoint Services and Office Live Workspaces from the Mac.

Document Deletion Policy (PN)~ A collection of rules to automatically delete documents in a site collection within a specified time period. Deletion policies can be assigned to a site collection or a site collection template. Site administrators can then select specific deletion policies and rules, and apply to document libraries in their site.

document element (n)~ The element in an XML document that contains all other elements. It is the top-level element of an XML document and must be the first element in the document.

document element (n)~ A reusable piece of content, formatting information or other document parts that are stored in galleries.

Document Explorer (n)~ A utility in Windows that enables the user to locate and open files and folders.

Document Fingerprinting (PN)~ A feature that converts a standard form into a sensitive information type, which can then be used to define transport rules and Data Loss Protection (DLP) policies. For example, an admin might create a document fingerprint based on a blank 1040 EZ tax form, and then create a DLP policy that detects all 1040 EZ forms with sensitive content filled in.

Document ID (n)~ A unique, persistent identifier assigned to a document or other item in SharePoint Server that allows it to be referenced and retrieved regardless of its location.

Document ID Lookup URL (n)~ A URL that is based on a query using the Document ID rather than the physical location of the item.

Document Information Panel (n)~ A pane that displays document property information for Word, Excel, and PowerPoint files stored in a WSS library. The pane is displayed below the ribbon and is actually a hosted custom InfoPath form. Information is synced automatically between the document and the WSS library.

Document Inspector (n)~ A feature that allows users to check and remove personal and other sensitive information from a document.

Document Integrity (PN)~ A feature that ensures that all components of a file are preserved, even if they are supported only by the rich client and not viewable in Web Companions.

document library (n)~ A location on a SharePoint site where a collection of files and their associated metadata are stored.

document management (n)~ The capability to view and manage SharePoint documents

from Microsoft Dynamics CRM.

document management system (n)~ An application service for storing and handling an organization's documents.

Document Manager (PN)~ A business application that contains a document library and a picture library and is used to store, share, and monitor the versions of business documents in a central location.

Document Map (n)~ A vertical pane along the left edge of the document window that displays an outline of the document's headings, and enables the user to navigate to or manipulate different parts of the document.

Document Object Model (PN)~ A World Wide Web Consortium specification that describes the structure of dynamic HTML and XML documents in a way that allows them to be manipulated through a Web browser.

document parsing (n)~ The process of detecting the file type of an item during content processing, and converting the item to text.

document profile (n)~ A set of properties applied to similar documents in the backward-compatible document library.

document properties (n)~ Properties, such as title, subject, and author, that are stored with each data access page.

Document Review (n)~ A feature in Office Server that provides a workflow for document review.

document root (n)~ The root directory for a Web site, where the content files are stored. In (IIS), the home directory and all its subdirectories are available to users by default. Also, the root directory for an IIS service. Typically, the home directory for a site contains the home page.

document service (n)~ Specifies the services that have been set up for document storage and usage.

document services (n)~ The application integration services that provide create, read, update, delete, and find operations for XML documents mapped using an Application Object Tree (AOT) query element.

document set (n)~ A special type of folder that enables users to manage a deliverable or work product spanning multiple documents as a single entity.

document stencil (n)~ A stencil stored in a drawing file that contains an inventory of the masters used in all of the drawings in the file. Masters on the document stencil are linked to their instances in the drawings.

document template (n)~ A file that contains some pre-defined formatting, layout, and/or text and graphics and that serves as the basis for new documents with a similar look or purpose.

document type (n)~ A designation that identifies a document's purpose.

document type definition (n)~ A set of syntax rules for mark-up tags and their interpretation. Within an HTML (or XML) document, a DTD provides specific information on what tags are used in the document (and in what order those tags should appear), which tags can appear inside other ones, which tags have attributes, and so forth. Originally developed for use with Standard Generalized Markup Language (SGML), DTD defines the relationships between document elements.

Document Virtual Folder (n)~ A feature that allows the user to group files by any criteria and display them in one place.

document window (n)~ In windowing environments, such as the Apple Macintosh and Microsoft Windows, an on-screen window (enclosed work area) in which the user can create, view, or work on a document.

Document Workspace (n)~ A Web site based on the Document Workspace template that workspace members use for discussing, editing, and working together on a document.

Document Workspace site (n)~ A Web site based on the Document Workspace template that workspace members use for discussing, editing, and working together on a document.

documentation (n)~ The information provided with a product by a manufacturer describing how to use a product.

document-based content type (n)~ A content type that inherits settings from a base content type that was designed for document libraries.

document-centric (adj)~ Of, pertaining to, or characteristic of an operating system in which the user opens document files and thus automatically invokes the applications (such as word processors or spreadsheet programs) that process them. Many graphical user interfaces, such as the Macintosh Finder, as well as the World Wide Web, are document-centric.

DocumentDB (PN)~ A cloud-first/cloud-only service that is part of the Data Services service family and provides scalability with NoSQL/schema-less database technology.

document-level customization (n)~ A supplemental program that modifies or adds functionality to an existing program or application, but only when a specific document is open.

Documents (PN)~ The link to the free online workspace for accessing, editing, and sharing Excel, Word, PowerPoint and OneNote documents across your PC, smartphone, and web browser.

doing business as (Adverb) ~ The assumed, fictitious name under which an organization is registered in the United States.

doing business as name (n)~ The registration of an assumed, fictitious, or trade name under which a business operates, which must be included on U.S. tax reports. In the U.S., any business that operates under a name other than a personal or corporate legal name must register a DBA name with the appropriate government agency.

dollar sign (n)~ The $ character.

DOLLAR SIGN (n)~ The $ character.

DOM (PN)~ A World Wide Web Consortium specification that describes the structure of dynamic HTML and XML documents in a way that allows them to be manipulated through a Web browser.

DOM Explorer (n)~ A tool used to see the state of your webpage's DOM (Document Object Model), examine HTML structure and CSS styles, and test changes to solve display issues.

domain (n)~ The set of possible values that you can specify for an independent variable in a function, or for a database attribute.

domain (n)~ In the Internet and other networks, the highest subdivision of a domain name in a network address, which identifies the type of entity owning the address (for example,

.com for commercial users or .edu for educational institutions) or the geographical location of the address (for example, .fr for France or .sg for Singapore). The domain is the last part of the address (for example, www.acm.org).

domain (n)~ A collection of computers in a networked environment that share a common database, directory database, or tree. A domain is administered as a unit with common rules and procedures, which can include security policies, and each domain has a unique name.

domain (n)~ A set of records defined by a table, a query, or an SQL expression.

domain (n)~ In Active Directory, a collection of computer, user, and group objects defined by the administrator. These objects share a common directory database, security policies, and security relationships with other domains.

domain (n)~ In DNS, any tree or subtree within the DNS namespace.

Domain ~ An internet address owned by a company, organisation or individual, such as jonstorm.com, nasa.gov or bbc.co.uk. See alsoTLD,- How web addresses work.

domain ~ The unique name that identifies an internet site. Domain names always have two or more parts separated by dots.

domain administrator (n)~ A person who is a member of the Domain Admins group. Domain administrators can create, delete, and manage all objects that reside within the domain in which they are administrators. They can also assign and reset passwords and delegate administrative authority for network resources to other trusted users.

domain class (n)~ A diagram element that represents a class in a domain-specific language.

domain configuration (n)~ A configuration object that is used to model Active Directory domains.

domain consolidation (n)~ The process of combining two or more domains into a larger domain.

domain context (n)~ A client-side representation of a domain service.

domain controller (n)~ In an Active Directory forest, a server that contains a writable copy of the Active Directory database, participates in Active Directory replication, and controls access to network resources.

domain enrollment (n)~ The process of joining a Windows Mobile powered device to a company domain.

domain entity (n)~ A conceptual structure that represents an independent entity that is capable of separate existence.

domain event (n)~ The occurrence of an activity in the organization resource management domain.

Domain Folder Sharing Wizard (n)~ A wizard that guides the user through sharing a folder with members of the same domain.

domain function (n)~ A function, such as DAvg or DMax, that is used to calculate statistics over a set of records (a domain).

domain highlighting (n)~ An Internet Explorer feature where the domain of the site you are visiting is darker and the rest of the URL is lighter.

domain integrity (n)~ The validity of entries for a specific column of data.

domain join (n)~ The process of connecting an individual PC to a domain.

domain local group (n)~ A security or distribution group that can contain universal groups, global groups, other domain local groups from its own domain, and accounts from any domain in the forest. Domain local security groups can be granted rights and permissions on resources that reside only in the same domain where the domain local group is located.

Domain Manager (n)~ An account settings page that is used to manage domain names.

domain name (n)~ The name given by an administrator to a collection of networked computers that share a common directory. Part of the DNS naming structure, domain names consist of a sequence of name labels separated by periods.

domain name registrar (n)~ The owner of the customer relationship with customers who buy second-level domains. There may be many registrars for a single top-level domain. Registrars maintain detailed customer information in their databases, such as the customer's contact address, telephone number, and e-mail address. Customers usually manage their second-level domains at the registrar's Web site, and the registrar updates the registry database when necessary (for example, when a customer renews a domain name).

domain name registry (n)~ An organization that controls a top-level domain. Although it does not own the relationship with the customer (a domain name registrar does), it keeps basic information about second-level domains in its database, such as the domain's registration date, expiration date, lock' status

domain name reseller (n)~ The entity that resells domain names from a registrar. For example, Office Live Small Business is a reseller of domain names provided by the registrar Melbourne IT.

domain name server (n)~ A server that maintains information about a portion of the DNS database and that responds to and resolves DNS queries.

Domain Name Service (n)~ The Internet utility that implements the Domain Name System. DNS servers, also called name servers, maintain databases containing the addresses and are accessed transparently to the user.

Domain Name System (n)~ A hierarchical, distributed database that contains mappings of DNS domain names to various types of data, such as IP addresses. DNS enables the location of computers and services by user-friendly names, and it also enables the discovery of other information stored in the database.

Domain Name System resolver (n)~ A software feature that communicates with DNS servers to create and resolve name-resolution queries. DNS resolvers exist on DNS clients and DNS servers.

domain namespace (n)~ The database structure used by DNS.

domain naming master (n)~ A domain controller that holds the domain naming operations master role in Active Directory. The domain naming master controls the addition or removal of domains in the forest. At any time, the domain naming master role can be assigned to only one domain controller in the forest.

domain network (n)~ A network location value that is displayed in the Network and Sharing Center. This setting specifies that the network connection is connected to an organizalion network that includes domains. Other possible network location values are public network and home network. Each location value has a different set of security and other settings designed to provide the user with the best connectivity and the appropriate

security levels for the connection. For domain network locations, network, connectivity, and security settings are determined by the network administrators.

domain operation (n)~ A method on a domain service that is exposed to a client application. It enables client applications to perform an action on the entity such as, query, update, insert, or delete records.

domain redelegation (n)~ The process of telling your current domain name registrar to point your domain name to a new Web site. You do this by changing the name server information at your domain name registrar. When you redelegate a domain, your domain name registration remains with your current registrar and you will continue to be responsible for domain name fees and renewal with that organization.

domain relationship (n)~ A diagram element that represents an embedding or reference relationship in a domain-specific language.

domain role (n)~ A behavior pattern that is assumed by domain entities when participating in role relationships.

domain service (n)~ A service that encapsulates the business logic of an application. It exposes a set of related domain operations in a service layer.

Domain Services Hours (n)~ A unit of measure for billing usage of the domain services service in Azure

domain settings (n)~ The settings, related to the domain, a user needs to configure to get messaging up and running.

domain transfer (n)~ The process of transferring your domain name registration from one registrar to another.

domain tree (n)~ In DNS, the inverted hierarchical tree structure that is used to index domain names. Domain trees are similar in purpose and concept to the directory trees used by computer filing systems for disk storage. For example, when numerous files are stored on disk, directories can be used to organize the files into logical collections. When a domain tree has one or more branches, each branch can organize domain names used in the namespace into logical collections.

domain tree (n)~ In Active Directory, a hierarchical structure of one or more domains, connected by transitive, bidirectional trusts, that forms a contiguous namespace. Multiple domain trees can belong to the same forest.

domain-based namespace (n)~ A type of Distributed File System (DFS) namespace in which the namespace information is stored in Active Directory and replicated to other namespace servers.

Domains page (n)~ The page where customer administrators activate and customize filtering services at the domain level.

Domains Quickstart (n)~ The Office 365 web workflow that leads small business customers step-by-step through adding a domain and setting up user. They find this through clicking Add a user or Add a domain in the Getting Started experience.

domain-specific language (n)~ A custom language that targets a problem domain and defines the problem at a high level of abstraction.

domestic (adj)~ Within the borders of one's own country/region.

dominant control (n)~ The control to which other selected controls are aligned and sized. When aligning controls, selected controls align to the dominant control. When sizing

controls, selected controls are assigned the dimensions of the dominant control.

donation (n)~ A gift or contribution of money, time, goods or services.

Done (oth)~ Indicates that a certain task is complete.

dongle (n)~ A security device connected to an input/output port to permit the use of a particular software package on that computer. The use of the hardware key hash permits backup copying of software but prevents its unlicensed use on additional computers.

Dongle ~ A small hardware device used for copy protection with some software. The dongle must be plugged in to a port on the computer, often the printer port, or the software won't function. They are unpopular with users because if the dongle gets lost or broken, the software won't function.

dormant session (n)~ Session in pre-login state. Sessions can be initiated or ended to modify their state, but they generally remain in either a sleep/idle' state

DoS (n)~ An attempt by a malicious (or unwitting) user, process, or system to prevent legitimate users from accessing a resource (usually a network service) by exploiting a weakness or design limitation in an information system.

DOS (n)~ A generic term describing any operating system that is loaded from disk devices when the system is started or rebooted.

DOS ~ (Disk Operating System; pr. 'doss') Usually refers to MS-DOS, which was the standard operating system for PCs until- Windows 95- came out, now pretty much obsolete. Controlled by typing in text commands and has several serious limitations, but requires a much less powerful computer than Windows 95.

DoS ~ (Denial of Service)- A form of attack on (usually) an internet service, which aims to prevent the service from operating properly, often by bombarding it with more information than it can process. See also- Mailbomb.

dots per inch (n)~ The standard used to measure screen and printer resolution, expressed as the number of dots that a device can display or print per linear inch. The greater the number of dots per inch, the better the resolution.

DOTTED OBELOS (n)~ A UNICODE character; commercial minus sign that resembles a percentage sign (%) with the small circles replaced by smaller dots.

double bang (n)~ A double negation operator (!!), used to force a Boolean return value.

double byte character set (n)~ A character set that can use more than one byte to represent a single character. A DBCS includes some characters that consist of 1 byte and some characters that consist of 2 bytes. Languages such as Chinese, Japanese, and Korean use DBCS.

Double Data Rate Synchronous DRAM (n)~ A type of SDRAM that supports data transfers on both edges of each clock cycle (the rising and falling edges), effectively doubling the memory chip's data throughput.

Double data type (n)~ A fundamental data type that holds double-precision floating-point numbers. It's stored as a 64-bit number ranging in value from approximately -1.797E308 to -4.940E-324 (negative), from 4.94E-324 to 1.797E308 (positive), and 0.

double density disk (n)~ A disk created to hold data at twice the density (bits per inch) of a previous generation of disks. Early IBM PC floppy disks held 180 KB of data. Double-density disks increased that capacity to 360 KB. Double-density disks use modified frequency modulation encoding for storing data.

double entry accounting (n)~ An accounting process in which equal credit and debit amounts are entered for each transaction.

double-byte character set (n)~ A character set that can use more than one byte to represent a single character. A DBCS includes some characters that consist of 1 byte and some characters that consist of 2 bytes. Languages such as Chinese, Japanese, and Korean use DBCS.

double-byte characters (n)~ A set of characters in which each character is represented by two bytes. Some languages, such as Japanese, Chinese, and Korean, require double-byte character sets.

double-click (v)~ To press and release a mouse button twice in rapid succession without moving the mouse. Double-clicking is a means of rapidly selecting and activating a program or program feature.

double-density disk (n)~ A disk created to hold data at twice the density (bits per inch) of a previous generation of disks. Early IBM PC floppy disks held 180 KB of data. Double-density disks increased that capacity to 360 KB. Double-density disks use modified frequency modulation encoding for storing data.

double-hop connection (n)~ A connection that goes from one computer to another computer to a third one.

double-peak contour (n)~ A contour that contains two high points in the curve.

double-precision (adj)~ Characteristic of a number stored in twice the amount (two words; typically 8 bytes) of computer memory that is required for storing a less precise (single-precision) number. Commonly handled by a computer in floating-point form.

double-precision floating-point format (n)~ A computer number format that occupies 8 bytes (64 bits) in computer memory and represents a wide dynamic range of values by using floating point.

double-tap (v)~ To tap twice quickly on a screen or touchpad.

doughnut chart (n)~ A chart that displays data in rings, where each ring represents a data series.

downcast (n)~ An expression that modifies an object type into the type of a derived class.

download (v)~ To transfer a copy of a file from a remote device to a requesting device by means of a modem or network.

download (n)~ The transfer of a copy of a file from a remote device to a requesting device by means of a modem or network.

download (n)~ Usually apps, games, and music downloaded from Windows Phone Store.

Download ~ To transfer information (files) from a network (such as the Internet) onto a user's PC. See also- upload.

download cache (n)~ A cache that is part of the assembly cache and stores code downloaded from Internet or intranet sites, isolated to the application that caused the download so that code downloaded on behalf of one application or page does not impact other applications.

Download File (n)~ A piece of content that Customers can save to their local machine from Parature that is hosted on the Support Portal.

Download Manager (n)~ A feature that lists files downloaded from the Internet, shows the location of each downloaded file, and allows the user to pause downloads, open files,

and take other actions.

download package for Windows Library for JavaScript (PN)~ The set of tools and APIs for JavaScript developers that is delivered in Visual Studio and downloadable from the web.

downloadable font (n)~ A set of characters that are copied from a computers disk to a printers memory when requested for printing a document. Downloadable fonts are most commonly used with laser printers, although dot matrix printers can accept some of them.

downloader (n)~ A trojan that accesses remote Web sites in order to download and install malicious or potentially unwanted software to the computer that the Trojan has infected.

download-only article (n)~ An article in a merge publication that can be updated only at the Publisher or at a Subscriber that uses a server subscription.

Downloads (PN)~ The link to the site to download client versions of Windows Live products such as Windows Live Mail, Windows Live Messenger, etc.

downsample (v)~ To decrease the number of audio samples or pixels, by applying an operation such as averaging. Popular internet music formats, such as MP3, use down-sampling to reduce file size.

downstream (Adverb) ~ Pertaining to the direction in which the signal flow is sent from the head-end station (or central office), towards the subscriber (or front-end), on a network.

downtime (n)~ The amount or percentage of time a computer system or associated hardware remains nonfunctional. Although downtime can occur because hardware fails unexpectedly, it can also be a scheduled event, as when a network is shut down to allow time for maintenance.

DOWNWARDS ANCORA (n)~ A UNICODE character; supplemental punctutation.

DPA (n)~ An advanced, distributed method of user authentication from Microsoft, allowing for single user log-on.

DPI (n)~ The standard used to measure screen and printer resolution, expressed as the number of dots that a device can display or print per linear inch. The greater the number of dots per inch, the better the resolution.

dpi ~ (Dots Per Inch)- A measure of picture quality, often used to measure printer capabilities.- The higher the number, the better the quality.

DPI awareness level (n)~ The degree to which an application renders on the basis of DPI settings.

DPI scaling (n)~ The process of adjusting display resolution based on monitor resolution.

DPI-aware (adj)~ Pertaining to an application that is either system-DPI aware or per monitor-€"DPI aware.

DPL-enabled (oth)~ Compatible with the IBM Distributed Program Link (DPL) protocol.

DPM (n)~ Microsoft server software that supports continuous disk-based backup and recovery on Windows Server-based networks.

DPM Administrator Console (n)~ A Microsoft Management Console (MMC) snap-in that provides access to the administrative functions of DPM. DPM Administrator Console allows administrators to configure data protection, perform data recovery operations, and monitor and report on these activities.

DPM Agent Coordinator (n)~ The service that manages installation and uninstallation of

the DPM protection agent.

DPM Alerts log (n)~ A log that stores DPM alerts as Windows events so that the alerts can be displayed in Microsoft Operations Manager (MOM).

DPM database (PN)~ The SQL Server database that stores DPM settings and configuration information.

DPM engine (n)~ A policy-driven engine that DPM uses to protect and recover data.

DPM File Agent service (n)~ The component of DPM that synchronizes replicas of protected volumes with the data sources. The DPM File Agent service receives changes to protected data from the file servers and applies the changes to the replicas on the DPM server.

DPM Management Pack (PN)~ A licensed set of processing rules, filters, and alerts, which can be imported onto a MOM Management Server to enable an administrator to centrally monitor data protection, state, health, and performance of multiple DPM servers in Microsoft System Center.

DPM Management Shell (n)~ The command shell, based on Windows PowerShell (Powershell.exe), that makes available the cmdlets that perform functions in Data Protection Manager.

DPM protection agent (n)~ Software, installed on a server, that tracks changes to protected data and transfers the changes to the DPM server. The protection agent also identifies data on a server that can be protected and is involved in the recovery process.

DPM protection agent service (n)~ The component of DPM that synchronizes replicas of protected data with the data sources. The DPM protection agent service receives changes to protected data from the servers and applies the changes to the replicas on the DPM server.

DPM role (n)~ The grouping of users, objects, and permissions that is used by DPM administrators to manage DPM features that are used by end users.

DPM Self-Service Tool for SQL Server (PN)~ A tool for SQL Server that enables backup administrators to authorize end users to recover backups of SQL Server databases from DPM, without further action from the backup administrator.

DPM service (n)~ The core component of DPM. The DPM service manages all core DPM operations, including replica creation, synchronization, and shadow copy creation.

DPM SRT (PN)~ Software provided with DPM to facilitate a Windows Server 2003 bare metal recovery for the DPM server and the computers that DPM protects.

DPM SST for SQL Server (PN)~ A tool for SQL Server that enables backup administrators to authorize end users to recover backups of SQL Server databases from DPM, without further action from the backup administrator.

DPM System Recovery Tool (PN)~ Software provided with DPM to facilitate a Windows Server 2003 bare metal recovery for the DPM server and the computers that DPM protects.

DPM Writer service (n)~ A service that manages backup shadow copies of DPM replicas, and backups of the DPM and Report databases, for purposes of data archival. The DPM Writer service is invoked by the DpmBackup command-line tool.

DPMADSchemaExtension (PN)~ A command-line tool that enables a schema administrator to configure Active Directory for the purpose of enabling end-user recovery.

DpmBackup (PN)~ A command-line tool that enables an administrator to archive the contents of a DPM server by using tape backup software that is not specifically designed for use with DPM.

DPMDBReaders group (n)~ A group, created during DPM installation, that contains all accounts that have read-only access to the DPM database. The DPMReport account is a member of this group.

DpmPathMerge (PN)~ A command-line tool that removes extraneous path information from data that has been restored to a DPM server from tape.

DPMReport account (n)~ The account that the Web and NT services of SQL Server Reporting Services use to access the DPM database. This account is created when an administrator configures DPM reporting.

DpmSync (PN)~ A command-line tool that provides disaster recovery functionality for DPM. DpmSync restores the DPM database and the Report database, and synchronizes the DPM database with the state of the storage pool and the installed DPM File Agents.

DPS (n)~ A service in Windows that improve reliability by detecting impending failures and taking action to handle them by either initiating automatic corrective action or logging the appropriate diagnostic information for later root cause analysis, and/or notifying the user of an impending failure.

DPS Database (n)~ The SQL Server database that stores DPM settings and configuration information.

DQS (PN)~ A knowledge-based data-quality system that enables users to perform knowledge discovery and management, data cleansing, data matching, integration with reference data services, and integrated profiling.

draft (n)~ A preliminary version.

Draft (n)~ A status that indicates an article is being written.

draft quality (n)~ A low grade of printing generated by the draft mode on dot-matrix printers. Draft quality varies among printers, ranging from suitable for most purposes to nearly useless.

draft view (n)~ A view that shows text formatting and a simplified page layout.

drag (v)~ To move an item on the screen (1) by touching the item on a screen and then sliding the finger across the screen or (2) by pressing and holding down the left mouse button while moving the mouse.

drag ~ To move an image or a window from one place on the screen to another by grabbing it with a mouse or other pointing device and pulling it to a new location.

drag-and-drop (adj)~ Pertaining to an operation or feature that involves moving objects on the screen with a mouse, a similar input device or a eventually a finger.

DRAM (n)~ A form of semiconductor random access memory (RAM).

draw (v)~ To prepare a bill of exchange or a promissory note.

Draw Freehand tool (n)~ An annotation tool used to draw lines, arrows and shapes on a slide.

Draw Text tool (n)~ An annotation tool used to add notes or comments to a slide.

drawing (n)~ Any ink that you add to a file that is not recognized as handwriting.

drawing brush (n)~ A tile brush that paints an area with shapes, text, images, and video.

drawing canvas (n)~ An area upon which you can draw multiple shapes. Because the

shapes are contained within the drawing canvas, they can be moved and resized as a unit.

drawing container (n)~ In SVG, an element that groups graphics elements, used as a partial canvas.

Drawing Exchange Format (n)~ A computer-aided design file format originally developed by Autodesk; for use with the AutoCAD program to facilitate transfer of graphics files between different applications.

Drawing Explorer (n)~ A window that shows a hierarchical view of a document and updates to reflect the current drawing hierarchy as items (such as shapes or pages) are added or deleted.

drawing file (n)~ A Visio file with a .vsd extension that contains a drawing.

drawing guide (n)~ A guide used to position shapes and objects on slides.

drawing object (n)~ Any graphic you draw or insert, which can be changed and enhanced. Drawing objects include AutoShapes, curves, lines, and WordArt.

drawing page (n)~ The page in a drawing window that contains a drawing. A page can be either a foreground or a background page. Each page has a size, which usually corresponds to a standard paper size, and it has a scale.

drawing scale (n)~ The ratio of distance on the printed page to distances in the real world. For example, a drawing scale of 1 cm = 1 m means that 1 centimeter on the printed page represents 1 meter in the real world.

drawing type (n)~ A Visio file (template) with a .vst extension that opens with the stencils, styles, and settings you need to create a particular type of drawing.

DrawingSurface (PN)~ A class that defines an area within which 3-D content can be composed and rendered.

DRC (n)~ A cache of recent requests, used by most NFS version 3 protocol server implementations, for the processing of duplicate non-idempotent requests. The duplicate request cache provides a short-term memory mechanism in which the original completion status of a request is remembered and the operation attempted only once. If a duplicate copy of this request is received, then the original completion status is returned.

DRC hit (n)~ A successful retrieval of a record from a duplicate request cache (DRC).

DRDA (n)~ A connection protocol for distributed relational database processing used by IBM relational database products that comprises protocols for communication between an application and a remote database, and communication between databases. DRDA also provides the connections for remote and distributed processing. The Distributed Data Management Architecture provides the base architecture for DRDA.

DREAD (n)~ A ranking of the risk that is associated with a vulnerability or a security requirement.

Dream (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 55.

Dreamweaver ~ A superb graphical editor for websites, widely used by professional web designers.

drill down (v)~ To navigate through levels of data starting from the most summarized (up) to the most detailed (down).

drill through (n)~ A feature that displays all rows from the fact table that combine to

form the value for that cell. The rows resulting from drill through are displayed in a new worksheet so that you can view detailed data for a particular cell.

drill through (v)~ To explore or browse through data elements that are in the same level in a hierarchy.

Drill to Dynamics (PN)~ A feature that allows a user to access the Microsoft Dynamics ERP system from the account level of a report to obtain more information.

drill up (v)~ To navigate through levels of data starting with greater detail and moving to more summarized information.

drilling (n)~ The process of navigating from one item to a set of related items. Drilling can involve navigating up or down in a hierarchy, or to other elements at the same level.

drillthrough (n)~ In Analysis Services, a technique to retrieve the detailed data from which the data in a cube cell was summarized.

drill-through report (n)~ A secondary report that is displayed when a user clicks an item in a report. Detailed data is displayed in the same report.

drive (n)~ An area of storage that is formatted with a file system and has a drive letter. The storage can be a floppy disk, a CD or DVD, a hard disk, or another type of disk.

drive (n)~ A hardware device that reads data from and writes data to floppy disks.

Drive Extender (n)~ A storage technology that enables the use of internal and external hard drives for additional storage on a home server and allows folder duplication for specific shared folders on home servers. Maintaining two copies of a shared folder on separate hard drives helps protect against the failure of a single hard drive.

drive letter (n)~ The naming convention for disk drives or partitions on most computers, consisting of an alphabetical letter followed by a colon.

Drive Restrictions (n)~ A feature on the Windows Restrictions tab of the User Settings tool that allows the administrator to select which drives on the computer are accessible and visible to the users of the shared user profile.

drive sanitation (n)~ The forced recovery of a BitLocker-protected volume through the removal of all the key binary large objects (BLOBs) that could have decrypted the disk.

driver (n)~ Software that enables hardware or peripherals (such as a printer, mouse, or keyboard) to work with your computer or mobile device.

Driver ~ A small program used by the operating system to control hardware such as a sound or video card. Often downloading the latest driver for a device from the manufacturer's website will improve its functionality.

driver injection (n)~ The process of installing mass storage drivers into an offline Windows installation, such as from Windows Preinstallation Environment (WinPE) into a restored system.

driver key (n)~ A system-generated, device-specific, registry subkey that contains information about the driver software associated with a device.

driver package (n)~ A collection of files that comprise a driver.

Driver Project Conversion Tool (PN)~ A tool to help driver developers convert their existing driver source files into Windows 8 device drivers by using Visual Studio.

driver protection list (n)~ A list of drivers known to cause instabilities when installed under Microsoft Windows XP and later versions. The list is checked at the following times: during installation of Windows; each time the system is rebooted; each time a

device or application is installed.

driver reflection (n)~ The process by which a driver file is copied to a location on the destination computer and the corresponding service is created.

driver stack (n)~ A device object that forwards input/output request objects (IRPs) to other device objects. Stacking always occurs from the bottom up and is taken down from the top.

Driving mode (PN)~ A setting to minimize distractions while driving.

driving resource (n)~ The resource whose assignment to a task determines the finish date of the task.

DRM (n)~ Any technology used to protect the interests of owners of digital content and services (such as copyright owners). Typically, authorized recipients or users must acquire a license in order to use the content.

DRM ~ (Digital Rights Management)- Software intended to prevent the unauthorised duplication of copyrighted audio, video or software. Unpopular with users because if there is ever a problem with it, such as the rights management company folding, your legally-purchased content becomes unplayable. Following a lot of problems of this kind it has largely been abandoned by the music industry.

DRM component (n)~ The component of a player that handles all functions of digital rights management, such as decrypting packaged files or initiating license acquisition.

DRM Licenses (in 1,000s) (PN)~ The unit of measure for digital rights management licenses in units of 1,000.

drop (v)~ To remove an association or connection.

drop area (n)~ An area in a PivotTable or PivotChart report where you can drop fields from the Field List dialog box to display the data in the field. The labels on each drop area indicate the types of fields you can create in the report.

drop cap (n)~ A large capital letter at the beginning of a text block that occupies the vertical depth of two or more lines of regular text.

drop directory (n)~ A disk directory in which an SMTP service can deposit incoming mail messages.

drop folder (n)~ In the Macintosh environment, a folder for which you have the Make Changes permission but not the See Files or See Folders permission. You can copy files into a drop folder, but you cannot see what files and subfolders the drop folder contains.

drop folder (n)~ The location where the built binaries, build log files and the test results log files are published during the build process.

drop lines (n)~ In line and area charts, lines that extend from a data point to the category (x) axis. Useful in area charts to clarify where one data marker ends and the next begins.

Drop Off Library (PN)~ A SharePoint document library where users can upload files that are then routed automatically to the correct library or folder in the site based upon rules defined by the site administrator.

drop shadow (n)~ A shaded outline that appears behind an object or text and creates the illusion of depth.

drop shipment (n)~ The delivery of goods directly from the vendor to the customer.

drop target (n)~ The target of a drag-and-drop operation.

drop zone area (n)~ The area in the Add-in for Excel Authoring pane where the user can

drag and drop dimensions to and from the Filters, Columns, and Rows boxes.

dropbox ~ Dropbox is a Web-based file hosting service operated by Dropbox, Inc. that uses cloud storage to enable users to store and share files and folders with others.http://www.dropbox.com/

drop-down arrow (n)~ An arrow associated with a drop-down combo or list box or some toolbar buttons, indicating a list the user can view by clicking the arrow.

drop-down button (n)~ A command button that is clicked to display a drop-down menu instead of performing a command.

drop-down combo box (n)~ A standard Windows control that combines the characteristics of a text box with a drop-down list box.

drop-down list (n)~ A list that can be opened to reveal all choices for a given field.

drop-down list box (n)~ A control on a menu, toolbar, dialog box, or data access page that displays a list of options when you click the small arrow next to the list box.

drop-down menu (n)~ A menu that drops from the menu bar when requested and remains open without further action until the user closes it or chooses a menu item.

dropper (n)~ A trojan that contains malicious or potentially unwanted software, which the trojan places and installs on the host computer.

DRT (PN)~ A routing table with entries that are distributed across a group of machines that can be used to map numeric keys to application endpoints and find routes through the network of peers.

DRT API (n)~ The Application Programming Interface (API) that allows applications to publish and resolve numeric keys in a peer network.

DRT mesh (n)~ A group of computer systems sharing a cache of routing information, and a network protocol that is used to map numeric keys to application endpoints and find routes through the mesh. Each node in a route has an ID numerically closer to the target than its predecessor.

DRT protocol (n)~ The protocol used to exchange cache information and find routes in the DRT mesh.

drug allergy (n)~ An allergic reaction to a drug.

drug order (n)~ A written order for an user of any drug or device issued and signed by a practitioner.

Drug Reference (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Drugs (n)~ A content descriptor developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

Drugs (n)~ A content descriptor developed by Microsoft.

Drugs (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

Drum & Bass (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 127.

Drum Solo (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 122.

DSA (n)~ The U.S. government standard for digital signatures, as specified by the National Institute of Standards and Technology, in FIPS 186, Digital Signature Standard. DSA is based on signature encryption based on a public and a private key.

DSCP (n)~ A marking in the registry that enables packets that pass through network devices that operate on Layer 3 information (such as routers) to have their relative priorities differentiated from one another.

DSI (PN)~ A broad Microsoft and industry initiative uniting hardware, software, and service vendors around a new software architecture based on the System Definition Model (SDM).

DSL (n)~ A type of high-speed Internet connection using standard telephone wires.

DSM (n)~ A storage array manufacturer's module that incorporates knowledge of the manufacturer's hardware and interacts with the MPIO driver. The DSM plays a crucial role in device initialization and I/O request handling, including I/O request error handling.

DSML (n)~ An open, extensible, standards-based format for publishing directory service schemas and exchanging directory contents.

DSN (n)~ The collection of information used to connect an application to a particular ODBC database.

DSN (n)~ A notification made up of a DSN code and a DSN message, that reports the result of an attempt to deliver an e-mail message.

DSN code (n)~ A three-digit string of numbers, such as 5.1.2., that indicates the status of an attempt to deliver an e-mail message.

DSN message (n)~ The text that explains the delivery status of an e-mail message, and may recommend user action.

DSN-less connection (n)~ A type of data connection that is created based on information in a data source name (DSN), but is stored as part of a project or application.

DSS (n)~ A set of programs and related data designed to help with analysis and decision making. A decision support system provides more help in formulating decisions than a management information system (MIS) or an executive information system (EIS). It includes a database, a body of knowledge about the subject area, a language' used to formulate problems and questions

DT (n)~ A vaccine for immunization against diphtheria and tetanus.

DTaP (n)~ A vaccine for immunization against diphtheria, tetanus, and pertussis (also known as whooping cough). The term acellular means that the pertussis component is cell-free, which improves safety by reducing the incidence of side effects.

DTC (n)~ An ActiveX control that is used while designing or editing a Web page. Design-time controls are installed on the client computer.

DTD (n)~ A set of syntax rules for mark-up tags and their interpretation. Within an HTML (or XML) document, a DTD provides specific information on what tags are used in the document (and in what order those tags should appear), which tags can appear inside other ones, which tags have attributes, and so forth. Originally developed for use with Standard Generalized Markup Language (SGML), DTD defines the relationships between document elements.

DTD file (n)~ A document type definition that contains the definitions for the GdPDU INDEX.XML file.

DTE (n)~ In the RS-232-C hardware standard, any device, such as a remote access server or client, that has the ability to transmit information in digital form over a cable or a communications line.

DTE (n)~ A set of interfaces that enable developers to programmatically achieve several of the key tasks achievable from the Integrated Development Environment (IDE).

DTMF (n)~ The signaling system used in telephones with touchtone keypads, in which each digit is associated with two specific frequencies.

DTP (n)~ A vaccine for immunization against diphtheria, tetanus, and pertussis (also known as whooping cough).

DTR (n)~ A signal used in serial communications sent, for example, by a computer to its modem to indicate that the computer is ready to accept an incoming transmission.

DTU (n)~ The average number of bits, characters or symbols, or blocks per unit time passing between equipment in a data transmission system.

dual boot (n)~ A computer configuration in which two different operating systems are installed and either can be loaded at start-up.

Dual Chinese Search (PN)~ A search feature that allows a user to query on a word in Simplified Chinese and have results returned for that word and also for the same word in Traditional Chinese, or vice versa.

dual core ~ a- CPU- structure. The difference between a single core and dual core is that a dual core system has two CPU's that are electronically wired together. These two CPU's wired together in parallel gives twice the performance than that of its single core counterpart.

Dual core, dual-core ~ PC- processors which have two complete processors on the same chip, allowing computers to handle multiple tasks faster. See alsoquad-core.

dual forking (n)~ A configuration by which Lync Server or Office Communications Server operates in co-existence with the PBX.

dual inline memory module (n)~ A type of memory board comprised of RAM chips mounted on a circuit board with a 64-bit data path and pins on each side that are on different circuits and that respond to different signals.

Dual layer ~ A technology allowing two layers of data to be written to a DVD instead of the usual one, thus increasing its capacity.

dual stack (n)~ For Windows CE .NET, an IP protocol stack that supports IPv4 and IPv6 independently or jointly. The DNS name resolution may yield both IPv4 and IPv6 addresses. Algorithms are used to determine source and destination addresses, thus determining which stack - IPv4 or IPv6 - to use.

dual-screen mode (n)~ A mode that allows using one app on your mobile screen while using a different app on a second screen that you're projecting from the mobile device.

dual-tone multiple-frequency (n)~ The signaling system used in telephones with touchtone keypads, in which each digit is associated with two specific frequencies.

ducking (n)~ A type of attenuation (commonly used in radio music) where a reduction in the volume of an audio stream is triggered by some external event, e.g. when you are using your PC to place or receive phone calls.

due date (n)~ The date by which some task or action should be completed.

Due diligence ~ the requirement that organizations must develop and deploy a protection

plan to prevent fraud, abuse, and additional deploy a means to detect them if they occur.

Duet (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 120.

Duet end-user application (n)~ A set of metadata and code artifacts that together enable a specific business scenario on top of the mySAP ERP 2004 system. For example, Budget Monitoring, Leave Management, Team Management, and Time Management applications.

Duet engine (PN)~ A Microsoft .NET Framework Version 2.0 and Information Bridge Framework based client runtime that interprets Duet end-user application metadata, creates the end-user experience in Microsoft Office, and executes the application logic.

Duet Enterprise Report Template (PN)~ The reusable definitions of programs stored in SAP for generating Duet Enterprise Reports.

Duet Enterprise Reports (PN)~ A feature that enables integration of SAP Reports with SharePoint 2010.

Duet Enterprise Reports Receiver (PN)~ A SharePoint feature that manages publishing and authorization of Duet Enterprise Reports.

Duet Enterprise Reports Router (PN)~ A SharePoint feature that manages distribution of SAP Reports to valid Duet Enterprise Reports sites across the SharePoint farm.

Duet Enterprise Reports Routing Rule (PN)~ A SharePoint content type for the rules that govern distribution of Duet Enterprise Reports.

Duet Enterprise SAP Roles Claims Provider (PN)~ A feature that augments the Duet Enterprise user's SharePoint security context with roles defined in SAP.

Duet Metadata Service (n)~ A Duet server component that facilitates the transfer of application metadata from the SAP system to the Duet client computer.

Duet Request Handler (PN)~ A Duet server component that enables handling and routing of requests from the SAP system to Microsoft Office Outlook via Microsoft Exchange Server.

Duet schema (n)~ An XML-based document that contains Duet framework- and application-related information in a format that the Duet engine understands.

Duet Settings Manager (PN)~ An administrative tool that is used to configure settings for the Duet client component and to administer the local metadata cache. This tool includes two components: Configuration Manager and Metadata Cache Manager.

dump (n)~ A duplicate of a program, a disk, or data, made either for archiving purposes or for safeguarding files.

dump (n)~ A binary file that a programmer can load into a debugger to analyze the cause of the crash. It contains the contents of the memory when the crash occurred.

dump ~ A large mass of information that shows the exact contents of computer memory at a particular time.

dump ~ To send a large volume of information to somewhere specific such as a printer or a screen.

dump ~ A backup or a backup file created by the UNIX dump utility.

dump ~ A tape or CD backup in a batch process.

dump ~ The general appearance of a real programmer's work area.

dumpster (n)~ The deleted item recovery feature. When the dumpster is enabled, items

emptied from the Deleted Items folder are placed in the dumpster for a server-configured number of days. A client can retrieve the items from the dumpster until the number of days has passed. Each folder has its own dumpster.

DUN (n)~ A Windows CE-based application that enables remote users to connect to a network.

duotone (n)~ An image that uses only varying levels of a single color to display the image. For example, a black and white image uses varying levels of gray to display an image; a duotone would use varying levels of a color, such as green, to display that same image.

Duplex ~ The ability to send and receive data over the same communications line.

duplex channel (n)~ A communications link that allows for duplex (two-way) transmission.

duplicate (v)~ To make a copy of.

duplicate (n)~ Something that exists twice.

duplicate alert suppression (n)~ A feature that combines multiple identical alerts within a specified period of time into one alert.

duplicate detection (n)~ A data management process that identifies similar or identical data.

Duplicate Detection Rule Publication (PN)~ A system job that publishes a duplicate detection rule.

Duplicate Files (n)~ A storage report that lists files that appear to be duplicates (files with the same size and last-modified date). This report can be used to identify and reclaim disk space that is wasted because of duplicate files.

duplicate link (n)~ A Team Foundation link between two work items that represent the same work item. In practice, this occurs when two people report the same bug.

duplicate removal (n)~ A type of grouping that removes documents with duplicate or near-duplicate content from search results.

duplicate request cache (n)~ A cache of recent requests, used by most NFS version 3 protocol server implementations, for the processing of duplicate non-idempotent requests. The duplicate request cache provides a short-term memory mechanism in which the original completion status of a request is remembered and the operation attempted only once. If a duplicate copy of this request is received, then the original completion status is returned.

durability (n)~ The ability of a transaction to persist, even during system failure.

durable file handle (n)~ A file handle that allows a connection to an SMB server to survive brief network outages without having to incur the overhead of re-negotiating a new session.

durable good (n)~ An good that is not consumed completely at first use, but yields service over time.

durable workflow (n)~ A workflow whose state can be persisted to a storage medium to withstand system failures and to release memory, which improves the scalability of workflow execution.

duration (n)~ A value, in seconds, that indicates the amount of time an animated object remains active or displayed.

duration (n)~ The amount of time that an activity takes to be performed.

duration field (n)~ A type of field whose content is expressed as a duration of time. Examples include the Work, Duration, and Delay fields. A duration field includes the duration unit, such as hour, day, or week.

duration of trial (n)~ The length of time for which a trial of an application is valid.

duty (n)~ A responsibility to perform one or more tasks or to provide services for a job.

duty (n)~ In the security model, a set of application access privileges that are required for a user to carry out their responsibilities.

DV (n)~ Video images and sound stored in a digital format.

DV Stream (PN)~ An Apple movie format that can be edited in Apple iMovie.

DV-AVI (NTSC) (n)~ Movie file format for captured video streams from a DV camera. Uses the NTSC television standard as opposed to PAL format.

DV-AVI (PAL) (n)~ Movie file format for captured video streams from a DV camera. Uses the PAL television standard as opposed to NTSC format.

DVB (PN)~ A set of standards that define the use of satellite, cable, and terrestrial frameworks already in place to enable digital broadcasting.

DVB-RCC (PN)~ A DVB standard for bi-directional communications (upstream or downstream) in cable TV distribution systems.

DVD (n)~ A form of storage characterized by high capacity (roughly 650 MB) and the use of laser optics rather than magnetic means for reading data. Optical disk storage commonly used for audio, video, and computer data. DVDs range in capacity from 4.7 GB to 17 GB, and can store significantly more than a CD-ROM.

DVD ~ (Digital Versatile Disk)- A more advanced version of the standard CD which can hold far more information, now standard on most PCs. Widely used for high-quality digital movies and software. DVD drives can also read ordinary CDs.

DVD boot (n)~ The process of starting a computer from the retail product DVD and then installing Windows on the hard disk by using Windows Setup.

DVD drive (n)~ A disk storage device that uses digital video disc (DVD) technology.

DVD Player (PN)~ First-party Windows app for playing commercial and homemade DVD-Video discs.

DVD RW, DVD Writer ~ (Digital Versatile Disk ReWriter)- A- DVD- drive that can create ('write') rewriteable DVDs. There are several competing formats at the moment, but most recent drives support more than one format. It is likely that one of these formats will become standard in time, but at the moment it is not clear which. To add to the confusion, they tend to have very similar names : for example DVD+RW and DVD-RW are completely different formats, and incompatible with each other.

DVD-Audio (n)~ An audio-only format of DVD. The format uses PCM audio combined with a lossless compression algorithm that achieves 2:1 compression. It also includes an optional subset of DVD features.

DVI ~ (Direct Video Interface)- A special type of connector for computer monitors, particularly flat panels.

DVMRP (n)~ An Internet routing protocol that provides an efficient mechanism for connectionless datagram delivery to a group of hosts across an Internet network. It is a distributed protocol that dynamically generates IP multicast delivery trees using a

technique called Reverse Path Multicasting (RPM).

DVR (n)~ A hardware device that records broadcast television programming in a digital format. A DVR often saves video to a buffer, which enables viewers to pause a live broadcast or replay video from the buffer.

DVR (n)~ A functionality in Live Smooth Streaming that is similar to Digital Video Recorder (DVR) devices that record live video in a digital format to a disk drive or other memory medium within a device. In Live Smooth Streaming, you can enable and specify the duration of a Live Smooth Streaming event to save to a temporary archive. Clients that join the live event late (in-progress) can use controls similar to the DVR transport controls on cable/satellite TV remote control units, to access any part of the elapsed live event that has been archived. The temporary archive is discarded when the publishing point is shut down.

DWDataMart database (n)~ The database that includes the reporting data, stored for the long-term.

DWG (n)~ A standard format used by CAD programs (such as Autodesk AutoCAD) to store drawing files.

DWM (PN)~ A component of Windows that manages window policies, behaviours and visual appearance.

dword (n)~ A data type consisting of a 32-bit unsigned integer.

DWORD (n)~ A data type consisting of a 32-bit unsigned integer.

DWORD value (n)~ The value that is applied to a specific DWORD.

DWRepository database (n)~ The database that includes the transformed data from the DWStagingAndConfig database.

DWStagingAndConfig database (n)~ The database that includes copies of management packs, configuration items, and work items.

DWU (n)~ A billing meter for the usage of the SQL Data Warehouse service in Azure.

DXF (n)~ A computer-aided design file format originally developed by Autodesk; for use with the AutoCAD program to facilitate transfer of graphics files between different applications.

DXGI (PN)~ The infrastructure that manages low-level graphics-related tasks, such as output adapter and swap chain configuration, and provides a common framework for managing virtualized graphics components and resources.

dynamic access control (n)~ The ability for IT pros to define how users access a system based on dynamic qualities, such as a user's location or role.

Dynamic Access Control (PN)~ A feature that enables data governance across file servers to control who can access information and to audit who has accessed information.

dynamic adapter (n)~ An adapter that has a custom user interface.

Dynamic backgrounds (PN)~ The UI heading for the user's collection of animated backgrounds.

dynamic canary (n)~ A canary whose value changes depending on the request context.

dynamic collection evaluation (n)~ A Configuration Manager feature that enables you to evaluate only new or changed members of a query-based collection independently of a full collection evaluation.

dynamic connector (n)~ A one-dimensional (1-D) connector shape that changes its path

to avoid crossing through two-dimensional (2-D) placeable shapes that lie between the two shapes the connector connects.

dynamic control (n)~ A Web Parts control that is persisted in a personalization store; it does not appear in the declarative markup of an .aspx page. After it has been added to a page, the WebPartManager control automatically creates an instance of the control from the personaization store on future requests.

Dynamic CPU Fair Share (PN)~ A feature that dynamically distributes processor time across all Remote Desktop Services sessions on the same RD Session Host server, based on the number of sessions and the demand for processor time within each session.

dynamic cursor (n)~ A cursor that can reflect data modifications made to the underlying data while the cursor is open.

Dynamic Data (PN)~ In ASP.NET, a framework that facilitates the creation of data-driven Web applications. Dynamic Data uses customizable page and field templates, scaffolding, user-definable metadata, and convention-based naming to create UI that displays data, lets users navigate relationships between tables, and lets users edit and create data (create, read, update and delete (CRUD) operations).

Dynamic Data Exchange (PN)~ An interprocess communication method that allows two or more applications running simultaneously to exchange data and commands.

dynamic data exchange channel (n)~ An active link between Microsoft Windows programs over which data can be exchanged.

dynamic data exchange conversation (n)~ The interaction between two applications that are communicating and exchanging data through special functions and code known as dynamic data exchange (DDE).

dynamic data field (n)~ A field that can be used in a workflow rule or template as a placeholder for specific values or text in an e-mail. When you send an e-mail, these placeholders are replaced with the data that meet the conditions that have been set in the workflow rule. For example, if you send an e-mail to an account holder about a contract cancellation date, you can use a dynamic data field to automatically find and insert the correct cancellation date for that contract.

dynamic disk (n)~ A physical disk that provides features that basic disks do not, such as support for volumes that span multiple disks. Dynamic disks use a hidden database to track information about dynamic volumes on the disk and other dynamic disks in the computer. You convert basic disks to dynamic by using the Disk Management snap-in or the DiskPart command-line tool. When you convert a basic disk to dynamic, all existing basic volumes become dynamic volumes.

Dynamic Disk Fair Share (PN)~ A feature that prevents sessions from over-utilizing disk usage by equal distribution of disk I/O among sessions.

dynamic display picture (n)~ A display picture that can be customized and may be animated.

dynamic distribution group (n)~ A distribution group that uses recipient filters and conditions to derive its membership at the time the message is sent.

dynamic exposure (n)~ A feature for taking photos in low light, capturing both short and long exposure images. The user can dynamically blend the two exposures afterwards, as preferred

Dynamic Fair-Share Scheduling (PN)~ A method, used for scheduling threads, that dynamically scales quotas based on load instead of requiring the administrator to explicitly specify quotas. It also adds the flexibility of aggregating thread quotas based on sessions instead of just users.

dynamic filter (n)~ A row filter available with merge replication that allows you to restrict the data replicated to a Subscriber based on a system function or user-defined function (for example: SUSER_SNAME()).

dynamic filter (n)~ A property on the dataset that determines how report filters are created for a report.

dynamic flash (n)~ A mode for taking photos that automatically captures images with and without flash. The user can choose the amount of flash in the photo after it has been taken.

dynamic grid (n)~ Dotted lines that show the most desirable location for the center of the next shape being dropped on the page, based on where previous shapes have been placed.

dynamic guides (n)~ A feature that allows the user to move and reshape text boxes etc. on PowerPoint slides.

Dynamic Host Configuration Protocol (n)~ A TCP/IP service protocol that offers dynamic leased configuration of host IP addresses and distributes other configuration parameters to eligible network clients. DHCP provides safe, reliable, and simple TCP/IP network configuration, prevents address conflicts, and helps conserve the use of client IP addresses on the network.

dynamic HTML (n)~ An extension of Hypertext Markup Language (HTML) that adds multimedia, database access, and an object model that programs can use to change styles and attributes of page elements (objects) and to replace existing elements (objects) with new ones.

Dynamic IP ~ Each computer or device connected to the internet needs its own IP address. Devices and sites that are constantly connected to the internet usually have a static IP address so the DNS can reliably route traffic to the right place.

Dynamic IP Restrictions (PN)~ An IIS extension that enables administrators to configure IIS to block access for IP addresses that exceed the specified number of requests and determine the behavior when an IP address is blocked.

Dynamic IP Restrictions Extension for IIS (PN)~ An IIS extension that enables administrators to configure IIS to block access for IP addresses that exceed the specified number of requests and determine the behavior when an IP address is blocked.

Dynamic IP Restrictions for IIS (PN)~ An IIS extension that enables administrators to configure IIS to block access for IP addresses that exceed the specified number of requests and determine the behavior when an IP address is blocked.

dynamic landing page (n)~ An individual page in a topic series, or any page that is primarily search-driven.

dynamic locking (n)~ The process used by SQL Server to determine the most cost-effective locks to use at any one time.

dynamic management function (n)~ One of a set of built-in functions that returns server state information about values, objects, and settings in SQL Server.

dynamic management view (n)~ A set of built-in views that return server state information about values, objects, and settings in SQL Server.

dynamic membership (n)~ A group in which the membership of the group is determined by a filter.

Dynamic Memory (PN)~ A Hyper-V feature in which the memory available to a running virtual machine is adjusted in response to changes in the amount of memory required by the virtual machine.

dynamic method invocation (n)~ A technique that defers until runtime the decision as to which specific method to call.

Dynamic Network Fair Share (PN)~ A feature that dynamically distributes available bandwidth across sessions based on the number of active sessions to enable equal bandwidth utilization.

dynamic online service (n)~ An online service that is updated frequently to provide users with current information.

dynamic optimization (n)~ The capability to perform resource balancing by automatically migrating virtual machines within host clusters that support live migration.

dynamic page (n)~ A Hypertext Markup Language (HTML) document that contains animated GIFs, Java applets, ActiveX Controls, or dynamic HTML (DHTML).

dynamic page (n)~ A Web page that is created automatically, based on information that is provided by the user, or that is generated on the fly with Active Server Pages (ASP).

dynamic policy update (n)~ The run-time retrieval of policies using the Rules Engine Update service.

dynamic RAM (n)~ A form of semiconductor random access memory (RAM).

dynamic random access memory (n)~ A form of semiconductor random access memory (RAM).

dynamic range (n)~ The difference (in decibels) between the quietest and loudest sounds in a single piece of audio content.

dynamic recovery (n)~ The process that detects and/or attempts to correct software failure or loss of data integrity within a relational database management system (RDBMS).

Dynamic Reordering (PN)~ A feature that simplifies and quickens the process of visualizing and arranging the order of layered objects on a page or slide.

dynamic report (n)~ An Excel workbook that contains at least one matrix that is created by the report wizard.

dynamic resource consumption for Search (n)~ The ability of Search to automatically consume fewer server resources such as memory and CPU when server resources are constrained due to transient load.

Dynamic Shared Library (n)~ Executable routines stored in files that can be linked with a variety of applications and are loaded only when needed by the program that calls them.

dynamic snapshot (n)~ In merge replication, a snapshot that includes only the data from a single partition.

dynamic storage (n)~ A storage method in Windows that allows disk and volume management without requiring operating system restart.

Dynamic Suite Composition (n)~ An Application Virtualization feature that enables a virtual application package to allow dependent plug-ins or middleware packages to use the virtual environment. This feature enables plug-ins and middleware packages to use the

primary package's registry settings,- and the packages behave and interact with one another in the same way as if they were installed locally on a machine.

Dynamic Systems Initiative (n)~ A broad Microsoft and industry initiative uniting hardware, software, and service vendors around a new software architecture based on the System Definition Model (SDM).

dynamic text field (n)~ A text field that displays changing text, most often used in conjunction with a progress bar in order to indicate progress.

dynamic update (n)~ An update to the Domain Name System (DNS) standard that permits DNS clients to dynamically register and update their resource records in zones.

dynamic verb (n)~ A verb that depends on the state of a Shell item or of the system; the appearance of the item is state based and requires that the executing code determine whether the item should appear.

dynamic volume (n)~ A volume that resides on a dynamic disk. Windows supports five types of dynamic volumes: simple, spanned, striped, mirrored, and RAID-5. A dynamic volume is formatted by using a file system, such as file allocation table (FAT) or NTFS, and has a drive letter assigned to it.

dynamic web template (n)~ An HTML-based master copy of a web page that you can create to contain settings, formatting, and page elements such as text, graphics, page layout, styles, and regions of a web page that can be modified.

dynamically expanding virtual hard disk (n)~ A virtual hard disk that grows in size each time it is modified. This type of virtual hard disk starts as a 3 KB .vhd file and can grow as large as the maximum size specified when the file was created. The only way to reduce the file size is to zero out the deleted data and then compact the virtual hard disk.

dynamic-link library (n)~ An operating system feature that allows executable routines (generally serving a specific function or set of functions) to be stored separately as files with .dll extensions. These routines are loaded only when needed by the program that calls them.

dynamic-link library file (n)~ A file that contains executable routines that an application can load on demand.

dynaset (n)~ A database recordset with dynamic properties. Unlike a snapshot, which is a static view of the data, a recordset object in dynaset mode stays synchronized with the data source and data updates made by other users.

E (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

E.164 (PN)~ A standard industry format for number normalization. The E.164 format consists of a country code (1-3 digits) and a National Significant Number (12-14 digits) for a total of 15 digits. The National Significant Number consists in turn of a National Destination Number and a Subscriber Number (extension). For example, (425) 555-1212 ext. 3011 is represented in E.164 format as 42555512123011.

E10+ (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

E9-1-1 (n)~ A service that provides information about the location of a caller who calls 9-1-1.

EA (PN)~ An extension of the internal activation feature that allows users to move the logic for receiving and processing Service Broker messages from the database engine service to an application executable outside the database engine service.

EAC (n)~ The expected total cost of a task or project, based on performance as of the status date. EAC is calculated as follows: EAC = ACWP + (BAC-BCWP)/CPI.

eager loading (n)~ A pattern of loading where a specific set of related objects are loaded along with the objects that were explicitly requested in the query.

EAI (oth)~ The process of coordinating the operation of the various programs, databases, and existing technologies of a business or enterprise so that they function as an efficient, business-wide system.

EAI (PN)~ One of the integration services in Microsoft Azure that enables connections between different systems using multiple and varied message formats.

EAN (PN)~ A 13-digit international barcode standard maintained by GS1.

EAP type (PN)~ A feature that allows the user to select the type of Extensible Authentication Protocol used.

eApproval (PN)~ A workflow that provides a hierarchical organizational chart from which you can select the approvers and allow the approvers to use a stamp control instead of a signature.

early binding (n)~ Binding (converting symbolic addresses in the program to storage-related addresses) that occurs during program compilation or linkage.

Early Childhood (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

early finish date (n)~ The earliest date that a task could possibly finish, based on early finish dates of predecessor and successor tasks, other constraints, and any leveling delay.

Early Launch Antimalware driver (n)~ An antimalware driver that loads early in the boot process, to evaluate the safety of the other drivers being loaded. Based on a comparison against historical data for those drivers, the antimalware driver returns information to the kernel, which makes initialization decisions for each driver.

Early learning (PN)~ The Education subcategory containing apps to help pre-school age children learn.

early media (n)~ Audio and video on a call that are exchanged before the recipient accepts the call. Examples include announcements, requests for input, and caller voice

commands.

early upgrade (n)~ A service update that is released to a group of users before it is made available to all of the users at your organization. Unlike a pilot, early update cannot be rolled back or cancelled.

early-launch boot driver (n)~ An antimalware driver that loads early in the boot process, to evaluate the safety of the other drivers being loaded. Based on a comparison against historical data for those drivers, the antimalware driver returns information to the kernel, which makes initialization decisions for each driver.

early-peak contour (n)~ A contour that peaks near the beginning of the curve and then slopes downward more gradually.

Earmuffs (PN)~ A mode where the user instructs Cortana not to pay attention to or remember anything the user does with Cortana for a specified period of time.?

earned value (n)~ A measure of the cost of work performed up to the status date or current date. Earned value uses your original cost estimates saved with a baseline and your actual work to date to show whether the actual costs incurred are on budget.

earned value analysis (n)~ A method for determining project performance which involves comparing the value of the work that was planned with the budgeted cost of the work performed to date, with what was actually spent. These comparisons provide invaluable information about actual conditions within the project and trends that may be developing in terms of schedule and cost performance.

earning code (n)~ A code that represents the type of earnings paid to an employee.

earnings (n)~ The net income (revenue minus all expenses) of a business entity.

Earnings Per Share (PN)~ The portion of a company's profit allocated to each outstanding share of common stock. Earnings per share serves as an indicator of a company's profitability.

earpiece (n)~ The part of the phone used for listening.

Ease In (v)~ A filter effect in Windows Movie Maker.

ease in (v)~ To modify how the property value changes as time approaches the keyframe. A value of 100% would make the property change slow down as time approached the keyframe.

ease of access (PN)~ A set of features providing accessibility options and settings to help users interact more easily with the phone.

Ease of Access Center (PN)~ An area within the Control Panel that provides accessibility options and settings to help users interact more easily with the computer.

Ease Out (v)~ A filter effect in Windows Movie Maker.

ease out (v)~ To modify how the property value changes as time moves away from the keyframe. A value of 100% would make the property change start slowly as time left the keyframe.

ease-in interpolation (n)~ A kind of animation interpolation that modifies how the property value changes as time approaches the keyframe. A value of 100% would make the property change slow down as time approached the keyframe.

ease-out interpolation (n)~ A kind of animation interpolation that modifies how the property value changes as time moves away from the keyframe. A value of 100% would make the property change start slowly as time left the keyframe.

EASI ID (PN)~ A Windows Live ID created in a domain, and using the domain name, before the domain was enrolled in Outlook Live. After the Windows Live ID is imported into the Outlook Live domain, it is subject to the security and privacy policies of the organization.

easily (Adverb) ~ Without difficulty.

easing behavior (n)~ A behavior that controls how quickly or slowly a property change is animated between keyframes.

easing function (n)~ A mathematical formula to produce more realistic animations. For example, an easing function can be used to create objects that bounce or spring realistically.

East-West (adj)~ A node placement style that specifies that the nodes are placed east-west in relation to the MOM Management Server.

Easy Listening (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 98.

easy-to-use (adj)~ Capable of being used with little or no difficulty.

eat+drink (PN)~ A list of restaurants and bars in a specific neighborhood.

eBay ~ eBay Inc. (NASDAQ: EBAY) is an American internet consumer-to-consumer (c2c) corporation that manages eBay.com, an online auction and shopping website.http://www.ebay.com/

eBook (n)~ An electronic book product offered by Microsoft.

E-book readers ~ a class of devices the primary purpose of which is to- enable the reading of 'trade books' and other content not dependent on color, rich graphics or video.

EC (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

ECC (n)~ An approach to public key cryptography based on properties of elliptic curves. The primary advantage of ECC is efficiency, which becomes important as devices get smaller and security requirements get more demanding. For example, ECC keys between 163 bits and 512 bits are one-sixth to one-thirtieth the size of equivalent security-level RSA keys. As key size increases the relative efficiency of ECC increases.

eccentricity handle (n)~ A handle that allows you to adjust the angle and magnitude of an elliptical arc's eccentricity.

ECCN (PN)~ A five character alpha-numeric classification used in the Commerce Control List to identify items for export control purposes as defined in licensing information by the US government.

ECDH (adj)~ Pertaining to a key agreement protocol which enables two users to create a shared secret agreement over a nonsecure, public medium, using elliptic curve cryptography without having previously exchanged any private information using. It is based on the Diffie-€"Hellman protocol.

ECG (n)~ An exam that shows the electrical activity of the heart.

Echelon ~ an officially unacknowledged U.S.-led global spy network that operates an automated system for the interception and relay of electronic communications. Monitored transmissions are said to include up to 3 billion communications daily.

echo (n)~ The process of Access updating or repainting the screen while a macro is

running.

echo request (n)~ Simple troubleshooting message used to check IP connectivity to a desired host.

Eclipse ~ Open-source application development tools,- www.eclipse.org

ECMA (PN)~ An organization based in Geneva, Switzerland, whose American counterpart is CBEMA (Computer and Business Equipment Manufacturers Association). Its standard, ECMA-101, is used for transmitting formatted text and graphical images while retaining their original formatting.

Ecma International (PN)~ An organization based in Geneva, Switzerland, whose American counterpart is CBEMA (Computer and Business Equipment Manufacturers Association). Its standard, ECMA-101, is used for transmitting formatted text and graphical images while retaining their original formatting.

ECN (n)~ A group of geographically dispersed cache servers that distributes and delivers contents faster by serving the contents from the cache servers that are closest to the users. An ECN routes the requests efficiently to reduce the network latency and to reduce the load on the origin servers.

ECN (n)~ A frame relay network technology for, monitoring and adapting to the network bandwidth available for delivery of data packets between source and destination nodes. Either the source or the destination node may set a bit in a packet header to request that the transmission or request rate be decreased.

e-commerce (n)~ Commercial activity that takes place by means of computers connected through a network. Electronic commerce can occur between a user and a vendor through the Internet, an online information service, or a bulletin board system (BBS), or between vendor and customer computers through electronic data interchange (EDI).

E-commerce ~ Conducting business over the internet, and particularly the World Wide Web.

economic event (n)~

economic resource (n)~ A resource that is consumed, produced, and used to add value to an organization's product delivery activities.

ecosphere (n)~ The general environment, which is usually specified as being the air, water, or ground.

ECP (n)~ The Network Control Protocol for negotiating the use of encryption over PPP links. ECP is defined in RFC 1968.

edge (n)~ A relationship between two functions where one (caller) is calling the other (callee).

edge (n)~ The boundary of a physical or rendered object, such as a display screen or window.

edge cache server (n)~ A disk-based cache/proxy server that is at the network edge. In a multi-tiered cache hierarchy, requests for cacheable content use intelligent DNS routing to route the first content received to the edge cache nodes.

edge caching network (n)~ A group of geographically dispersed cache servers that distributes and delivers contents faster by serving the contents from the cache servers that are closest to the users. An ECN routes the requests efficiently to reduce the network latency and to reduce the load on the origin servers.

edge display (n)~ An auxiliary display positioned on the edge of a laptop, where it can be seen while the laptop is both closed and open.

edge event (n)~ An event whose event payload is valid for a given interval; however, only the start time is known upon arrival to the CEP server. The valid end time of the event is provided later in a separate edge event.

edge handle (n)~ A handle indicating that a swipe gesture was detected, which allows the user to ignore and dismiss it or to invoke the relevant edge UI.

edge network (n)~ One or more computers that have a connection to the Internet through an external screening router and a connection to the internal network through an interior screening router. Computers that are linked to the perimeter network have limited access to both the Internet and the internal network. This architecture is convenient if multiple hosts require direct Internet access.

Edge pool (n)~ A single computer pool or a multiple computer pool that, by default, supports remote users in your organization who sign in to Lync Server from outside the firewall by using a virtual private network (VPN).

edge server (n)~ A server running Lync Server or Office Communications Server that resides in the perimeter network and routes traffic between the internal deployment and users who sign in from outside the firewall.

Edge Subscription (n)~ The record of an Edge Transport server that has been subscribed to an Exchange organization and to which the Microsoft Exchange EdgeSync service propagates recipient and configuration data. The Microsoft Exchange EdgeSync service relies on Edge Subscriptions. Also, Edge Subscription is the process that is required to establish an Edge Subscription for a given Edge Transport server.

Edge Subscription file (n)~ The XML file that is exported on the Edge Transport server and imported on the Hub Transport server to establish an Edge Subscription.

edge time (n)~ The time contributed to the total time of a callee function when called from a specific caller function. The sum of the edge time of all the incoming edges to a function equals this function's total time.

edge total time (n)~ The time a particular function takes to run when called from a specific parent function.

Edge Transport server role (n)~ An Exchange Server 2007 and 2010 server role that provides anti-spam and antivirus protection and applies messaging security policies to messages in transport between organizations by using a series of agents that act on messages as they are processed by the message transport components. This server role is deployed in the perimeter network outside the Active Directory directory service forest. Computers that have the Edge Transport server role installed handle all Internet-facing mail flow and provide Simple Mail Transfer Protocol (SMTP) relay and smart host services for the Exchange organization.

EdgeSync (n)~ A collection of processes that are run on the Exchange Server 2007 Hub Transport server role to establish one-way replication of recipient and configuration information from the Active Directory directory service to the Active Directory Application Mode (ADAM) instance on a computer that has the Edge Transport server role installed. EdgeSync copies only the information that is required for the Edge Transport server to perform anti-spam and message security configuration tasks, and

information about the Send connector configuration that is required to enable mail flow from the Exchange 2007 organization's Hub Transport servers to the Internet through one or more Edge Transport servers. EdgeSync performs scheduled updates so that the information in ADAM remains current.

EdgeSync synchronization (n)~ The task or process that the Microsoft Exchange EdgeSync service performs to propagate data from the Active Directory directory service to the subscribed Edge Transport server.

EDI (n)~ A standard for exchanging bundles of data between two companies via telephone lines or the Internet. EDI transmits much larger bundles of data than can be transmitted via e-mail. For EDI to be effective, users must agree on certain standards for formatting and exchanging information, such as the X.400 protocol.

EDIFACT (n)~ Electronic Data Interchange for Administration, Commerce, and Trade. A worldwide electronic data interchange (EDI).

EDIFACT UNOA syntax (n)~ An EDIFACT syntax that allows the following characters only: uppercase letters, all digits, blank, exclamation mark (!), quotation mark ()

EDIFACT UNOB syntax (n)~ An EDIFACT syntax that allows the following characters only: lowercase and uppercase letters, all digits, blank, exclamation mark (!), quotation mark ()

eDiscovery (n)~ The process by which organizations find, retain, and preserve electronic documents related to a legal action.

edit (v)~ To make a change to an existing file or document.

edit (n)~ A change made to a file or a document.

Edit (n)~ The name of a menu in a conversation window from which the user can cut, copy, paste, or delete text; undo recent actions, select all text, and change font and text size settings.

edit box (n)~ A rectangular control in an application that allows the user to enter or edit text.

edit browse control (n)~ An edit box control that allows the user to browse and select files and directories.

edit command (n)~ A command such as Copy, Paste, Undo, Redo, and so on that enables a user to modify a document, Web page, or application.

Edit Contacts (v)~ A button that opens the Address Book so that the user can edit, remove, or add contact information.

edit control (n)~ A rectangular window in which a user can enter and edit text from the keyboard.

Edit Field Value Lists (v)~ A list, accessed on the Business Contact Manager menu, in which the user can manage the format and content of user-defined field values.

Edit Labels (v)~ An option that allows a user to edit the labels for a certain image or set of images.

Edit menu (n)~ A common drop-down menu that includes general purpose commands for editing objects displayed within a window, such as Cut, Copy, and Paste.

edit mode (n)~ A mode that provides full functionality for creating or editing a file.

Edit mode (PN)~ A mode that provides full functionality for creating or editing a file.

Edit Virtual Hard Disk Wizard (PN)~ A wizard that is used by advanced users to

perform specific operations on their existing virtual hard disks such as compacting their virtual hard disk, merging it, converting it to another type or expanding its size.

editable region (n)~ A defined region in a template that is editable by the user.

editing command (n)~ A command such as Copy, Paste, Undo, Redo, and so on that enables a user to modify a document, Web page, or application.

editing flick (n)~ A gesture you can make with a tablet pen to quickly navigate and perform shortcuts. Editing pen flicks include copy, paste, delete, and undo.

editing pen flick (n)~ A gesture you can make with a tablet pen to quickly navigate and perform shortcuts. Editing pen flicks include copy, paste, delete, and undo.

Editing View (PN)~ A view in Web Companions and Applications that is optimized for editing a document, and looks like the traditional document view in the client application (i.e. contains full Ribbon).

edition (n)~ Any of the various forms in which a product is offered or presented.

edition detection (n)~ A feature that enables IT professionals to determine the edition of the Windows operating system that is installed on computers on their network.

editor (n)~ A program that creates files or makes changes to existing files.

Editor Part (n)~ A control that can be used to set the properties for and to manipulate Web Parts on a Web Parts page.

EDITORIAL CORONIS (n)~ A UNICODE character; part of the UNICODE block for supplemental punctuation.

Editors' picks (PN)~ The collection title for items recommended by the store without attribution to any specific real-life staff member on the site.

Editor's Picks (PN)~ A category title for what the editor recommends for a user.

EDM (PN)~ A data model for defining application data as sets of entities and relationships to which CLR types and storage structures can be mapped.

EDM schema (n)~ An XML text file that describes entity and relationship types. The schema also defines a container within which instances of these types are logically organized.

EDO RAM (n)~ A type of dynamic RAM that keeps data available for the CPU while the next memory access is being initialized, resulting in increased speed. Pentium-class computers using Intel's Triton chip set are designed to take advantage of EDO RAM.

education (PN)~ An app category that facilitates user education.

Education (PN)~ An app category that facilitates user education.

educational (PN)~ A game category that facilitates player education.

educator (n)~ A person who is responsible for teaching a class.

edutainment (n)~ Multimedia content in software, on CD-ROM, or on a Web site that purports to educate the user as well as entertain.

Edutainment (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

EEPROM (n)~ A type of EPROM that can be erased with an electrical signal. It is useful for stable storage for long periods without electricity while still allowing reprogramming. EEPROMs contain less memory than RAM, take longer to reprogram, and can be reprogrammed only a limited number of times before wearing out.

EF (n)~ A class for the delivery of audio media streams.

Effect Compiler (n)~ A compiler that assembles shader code from the central processing unit (CPU) and the graphics processing unit (GPU) and executes shader computations on the CPU before the shader runs.

effective date (n)~ The date at which something goes into effect or becomes applicable.

effective hint (n)~ A hint that has been extracted from a hint file.

effective policy (n)~ The set of enabled policies for a target.

Effective Stock-out Threshold (n)~ The value of Stock-Out Threshold if Floor Is Stock-Out Threshold is True.

efficiency bonus (n)~ In computer games, an additional score or points given for efficient play.

Efficient File Storage (PN)~ A storage method in which a file is split into pieces that are stored and updated separately, and streamed together when a user requests the file.

Efficient File Transfer (PN)~ A feature that breaks a file up into granular chunks so that during re-open and re-save scenarios only the differences between client and server are sent over the network.

effort (n)~ A subjective unit of measure that captures the size of a bug or product backlog item. If you assign more effort to an item, you indicate that more work is required to implement it.

effort-driven scheduling (n)~ The default method of scheduling in Project; the duration of a task shortens or lengthens as resources are added or removed from a task, while the amount of effort necessary to complete a task remains unchanged.

EFI (n)~ A type of interface between a computer, firmware, hardware, and the operating system. EFI defines a new partition style called GUID partition table (GPT). EFI serves the same purpose as the basic input/output system (BIOS) found in most x86-based computers.

EFI system partition (n)~ A small portion on a GUID partition table (GPT) disk that is formatted with the file allocation table (FAT) file system and contains the files necessary to start the computer and pass execution to an operating system which resides on another partition.

EFS (n)~ A Microsoft file-based encryption technology that enables users to encrypt files and folders on NTFS volumes. EFS helps protect the confidentiality of data by ensuring that only authorized users can decrypt the encrypted files or folders.

EFT (n)~ The transfer of funds from one organization's bank account to another organization's bank account, using an electronic intermediary.

EFT (oth)~ A networked system for transferring funds from one bank account to another.

EFTA (n)~ A group of European countries/regions (including Iceland, Liechtenstein, Norway, and Switzerland) that have agreed to free trade among themselves.

E-Gov-Project (n)~ A sample E-Government template for a state or local government agency. It uses an electronic payment system as an example of a Government to Citizen e-Gov project.- It is defined as a Program with three- projects (Technical Architecture, Security Extranet and e-Payment) to show how government projects can be organized as programs with more than one interrelated project.

EHS (PN)~ Hosted spam and virus filtering from an Exchange Hosted Services provider. Users' e-mail is filtered according to rules managed by the organization's administrators.

Users and administrators are given varying rights to adjust the filtering rules.

EIA (n)~ An association based in Washington, D.C., with members from various electronics manufacturers. It sets standards for electronic components. RS-232-C, for example, is the EIA standard for connecting serial components.

EIDE ~ (Enhanced Integrated Drive Electronics)- A popular- hard diskformat. As its name implies, an upgraded version of- IDE.

EIF (n)~ A compiled version of a document schema. The EIF is used to expedite translations for distribution among other users in a closed user group. The EIF is automatically compiled whenever an XML Schema Definition language (XSD) schema is generated or edited, using BizTalk Server.

EIN (n)~ In the United States, a 9-digit number that identifies a business entity to the government. A business must have an EIN if it has employees or meets other criteria specified by the federal government.

EIP (n)~ The environment in which enterprise application integration occurs. This scenario is actually a class of scenarios grouped together as a single scenario.

EISA ~ (Extended Industry Standard Architecture; pr. 'ee-icer') An upgraded version of- ISA, now obsolete; usually used with reference to expansion cards.

eject (v)~ To remove something or someone from their current location.

EKG (n)~ An exam that shows the electrical activity of the heart.

EKU (n)~ An extended property value that specifies the uses for which a certificate is valid.

ELAM driver (n)~ An antimalware driver that loads early in the boot process, to evaluate the safety of the other drivers being loaded. Based on a comparison against historical data for those drivers, the antimalware driver returns information to the kernel, which makes initialization decisions for each driver.

Elapsed (adj)~ Completed or passed. The measured duration of an event.

elapsed duration (n)~ The amount of time that a task will take to finish, based on a 24-hour day and a 7-day week, including holidays and other nonworking days. For example: emin = elapsed minute, ehr = elapsed hour, eday = elapsed day, ewk = elapsed week.

elapsed exclusive time (n)~ Time spent in function, excluding time spent in items it calls.

elapsed inclusive time (n)~ Time spent in function and items it calls.

elapsed time (n)~ The total time after estimated profiling overhead has been subtracted from wall clock time.

Elastic Database (PN)~ A pool of database throughput units (DTUs), and storage (GBs) that are shared by multiple databases and that can be added to, and removed from the pool at any time, with the databases in the pool utilizing only the resources they require from the pool, freeing up available resources for only the active databases that need them.

Elastic Database job (n)~ An Azure service enabling SaaS developers to run T-SQL scripts against all of the databases in an elastic database pool.

Elastic Database pool (n)~ A collection of available resources to leverage from shared among a group of databases within a budget.

elastic job (n)~ A collection of available resources to leverage from shared among a group of databases within a budget.

elastic job (n)~ An Azure service enabling SaaS developers to run T-SQL scripts against

all of the databases in an elastic database pool.

elastic pool (n)~ An Azure service enabling SaaS developers to run T-SQL scripts against all of the databases in an elastic database pool.

elastic pool (n)~ A collection of available resources to leverage from shared among a group of databases within a budget.

electrical sensor (n)~ A category of sensor that can respond to an applied stimulus by generating an electrical signal.

electrically erasable programmable read-only memory (n)~ A type of EPROM that can be erased with an electrical signal. It is useful for stable storage for long periods without electricity while still allowing reprogramming. EEPROMs contain less memory than RAM, take longer to reprogram, and can be reprogrammed only a limited number of times before wearing out.

electrocardiogram (n)~ An exam that shows the electrical activity of the heart.

Electronic (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 52.

electronic banking (n)~ The use of electronic technologies, such as automated teller machines (ATMs), direct payroll deposits, automatic bill payments, and debit cards, to perform financial transactions. Electronic banking replaces paper transactions and visits to brick-and-mortar facilities.

Electronic Business Card (n)~ A card-like layout on an Outlook Contact that provides the user with the look of a real world business card.

electronic data interchange (n)~ A standard for exchanging bundles of data between two companies via telephone lines or the Internet. EDI transmits much larger bundles of data than can be transmitted via e-mail. For EDI to be effective, users must agree on certain standards for formatting and exchanging information, such as the X.400 protocol.

Electronic Data Interchange for Administration, Commerce, and Trade (n)~ Electronic Data Interchange for Administration, Commerce, and Trade. A worldwide electronic data interchange (EDI).

electronic discovery (n)~ The process by which organizations find, retain, and preserve electronic documents related to a legal action.

electronic filing (n)~ The process of submitting documents to an authority using an electronic communications medium.

electronic funds transfer (n)~ The transfer of funds from one organization's bank account to another organization's bank account, using an electronic intermediary.

electronic funds transfer (n)~ A networked system for transferring funds from one bank account to another.

electronic mail (n)~ The exchange of text messages and computer files over a communications network, such as a local area network or the Internet.

electronic mail system (n)~ A utility that allows the user to send and receive e-mail.

Electronic paper ~ several reflective display technologies that do not require a backlight and can be viewed in conditions of moderate to good ambient illumination.

Electronic Product Code (n)~ A standard for electronically marking products so that they can be tracked by using radio frequency identification (RFID). An EPC is 96 bits divided

into four partitions: header, manager number, object class, and serial number.

electronic signature (n)~ A symbol, or a series of symbols, compiled by a computer and authorized by an individual to be the legally binding equivalent of the individual's handwritten signature.

Electronics Industries Association (n)~ An association based in Washington, D.C., with members from various electronics manufacturers. It sets standards for electronic components. RS-232-C, for example, is the EIA standard for connecting serial components.

element (n)~ A unit of information within a markup language that is defined by a tag, or a pair of tags surrounding some content, and includes any attributes defined within the initial tag.

element (n)~ The most basic part of a control or object.

element (n)~ The representation of an object in a XAML file.

element binding (n)~ Data binding the property of one object to a property of another object.

element declaration (n)~ A statement defining a declared element. Declared elements include variables, constants, enumerations, classes, structures, modules, interfaces, procedures, procedure parameters, function returns, external procedure references, operators, properties, events, and delegates.

element initializer (n)~ A sequence of object initializers that are assigned to the collection elements in the same statement in which the collection is constructed.

elementary data type (n)~ A simple data type, such as Boolean, Long, or Decimal.

Elements Gallery (PN)~ The ribbon as used in Office for Mac.

elevated command prompt (n)~ A command prompt that is run in a privileged administrator security context that allows actions that would normally be restricted. Without elevation, command prompts in Windows Client and Windows Server run in a restricted state.

elevated privilege (n)~ A privilege to access system resources and objects outside of the standard access control checks. A process running with an administrator's full access token is running with elevated privileges.

elevated program (n)~ A program that is run in a privileged administrator security context that allows actions that would normally be restricted. Without elevation, programs in Windows Client and Windows Server run in a restricted state.

elevated trust (n)~ In Silverlight, a security level that gives out-of-browser applications greater access to the local system.

elevation (n)~ The process by which a user obtains a higher level of privilege than that for which he has been authorized. A malicious user may use elevation of privilege as a means to compromise or destroy a system, or to access unauthorized information.

elevation of privilege (n)~ The process by which a user obtains a higher level of privilege than that for which he has been authorized. A malicious user may use elevation of privilege as a means to compromise or destroy a system, or to access unauthorized information.

elevation prompt (n)~ A dialog box that appears when a user is requested to confirm whether an administrative process should be permitted to start. An elevation prompt will

either be displayed as a consent prompt or a credential prompt, depending upon Group Policy settings and user account type.

eliminations entry (n)~ Removal of amounts relating to subsidiary investments and intercompany balances in a consolidation report. Some examples of eliminations entries include: intercompany or subsidiary profit, sales, purchases, receivables, and payables.

ellipsis (n)~ The -€¦ character. Can also be represented by entering three dots with no spaces in between (…). Used to convey incompleteness.

ellipsoidal coordinate system (n)~ A coordinate system in reference to a flattened sphere.

elliptic curve cryptography (n)~ An approach to public key cryptography based on properties of elliptic curves. The primary advantage of ECC is efficiency, which becomes important as devices get smaller and security requirements get more demanding. For example, ECC keys between 163 bits and 512 bits are one-sixth to one-thirtieth the size of equivalent security-level RSA keys. As key size increases the relative efficiency of ECC increases.

elliptic curve Diffie-Hellman (adj)~ Pertaining to a key agreement protocol which enables two users to create a shared secret agreement over a nonsecure, public medium, using elliptic curve cryptography without having previously exchanged any private information using. It is based on the Diffie-€"Hellman protocol.

Elliptic Curve Digital Signature Algorithm (PN)~ A Digital Signature Algorithm which operates on elliptic curve groups.

em (n)~ A measurement of font size

em space (n)~ A typographical unit of measure that is equal in width to the point size of a particular font. For many fonts, this is equal to the width of a capital M, from which the em space takes its name.

email (n)~ The exchange of text messages and computer files over a communications network, such as a local area network or the Internet.

email (v)~ To transmit a message or file through a communications channel.

email (n)~ A string that identifies a user so that the user can receive Internet email. An email address on the Internet typically consists of an account name, followed by the @ (at) symbol, a host name, and a domain name.

email (n)~ A message that is sent over a communications network such as a local area network or the Internet.

Email (or e-mail) ~ (Electronic mail- ; pr. 'ee-mail') A way to send messages between computers, or more to the point their users, either over a network or the Internet. E-mail is usually just text, but can have pictures or other files attached. See- Attachment.

e-mail account (n)~ The server name, user name, password, and e-mail address used to connect to an e-mail service. You create the e-mail account using information provided by your mail administrator or Internet service provider (ISP).

email address (n)~ A string that identifies a user so that the user can receive Internet email. An email address on the Internet typically consists of an account name, followed by the @ (at) symbol, a host name, and a domain name.

e-mail address (n)~ A string that identifies a user so that the user can receive Internet email. An email address on the Internet typically consists of an account name, followed by the @ (at) symbol, a host name, and a domain name.

e-mail address harvesting (n)~ The process of collecting new e-mail addresses, through legitimate or illegitimate means, for the purpose of adding them to a spam database.

e-mail alias (n)~ The portion of the e-mail address that appears to the left of the @ symbol.

e-mail as sign in ID (PN)~ A Windows Live ID created in a domain, and using the domain name, before the domain was enrolled in Outlook Live. After the Windows Live ID is imported into the Outlook Live domain, it is subject to the security and privacy policies of the organization.

E-mail Auto-linking (n)~ A feature that enables the user to automatically store links to e-mails sent to or received from a selected e-mail address.

e-mail coexistence (n)~ A strategy of using of an existing local Exchange Server e-mail environment to host some mailboxes while using Exchange Online to host others, usually done during migration.

Email Connector (n)~ A feature in Microsoft Dynamics CRM that allows users to connect to the email service of their choice from CRM.

e-mail filter (n)~ A feature in e-mail-reading software that automatically sorts incoming mail into different folders or mailboxes based on information contained in the message.

e-mail flooder (n)~ A type of trojan that overwhelms an e-mail inbox with messages.

e-mail harvesting (n)~ The process of collecting new e-mail addresses, through legitimate or illegitimate means, for the purpose of adding them to a spam database.

e-mail header (n)~ Information at the top of an e-mail message, including the name and address of the sender and recipient, the date and time sent, the subject, and other information that is not part of the body text of the message. The mail header is used by an e-mail client or program.

e-mail marketing (n)~ An organized process of communicating with prospects and customers via e-mail.

E-Mail Marketing Service (n)~ An online service for your Marketing Campaign that allows you to acquire and manage e-mail lists, and to track the results.

E-mail Merge (n)~ A task pane with options that enable the user to send a Publisher file as personalized, individually addressed e-mail to the recipients in the specified list.

e-mail message (n)~ A message that is sent over a communications network such as a local area network or the Internet.

Email Migration (PN)~ The name of an Outlook Live feature in the Web management interface that enables migration of the contents of user mailboxes from an on-premises IMAP messaging system to Outlook Live (or Exchange Online).

e-mail notification (n)~ A message automatically generated by the occurrence of an event.

Email opt in (PN)~ A tab on the contact maintain page to record the history of contacts opting in and opting out of marketing or promotional emails.

e-mail publishing (n)~ The process of publishing photos or blog entries by sending an e-mail message to a service.

e-mail quick key (n)~ A key that you use in some e-mail programs to enter text that is commonly used.

email reminder (n)~ An email sent at a specified time to a user to remind them of an

upcoming event. Users can create reminder emails for themselves for any event in their calendars and for all attendees (when users are also the organizers). The email contains all details of the event and optional notes that users might add.

E-mail Router configuration profile (n)~ A profile that contains the information, such as the e-mail server name and type, that the Microsoft Dynamics CRM system needs to establish a functional E-mail Router.

E-mail Router Configuration Wizard (PN)~ A wizard that guides users in creating an incoming e-mail configuration, an outgoing e-mail configuration, and a link to an existing Microsoft Dynamics CRM deployment. After they install and configure these components using this wizard, the Microsoft Dynamics CRM E-mail Router will transport incoming and outgoing Microsoft Dynamics CRM e-mail.

email server (n)~ A computer that stores email messages.

e-mail server (n)~ A computer that stores email messages.

e-mail settings (n)~ Options that allow members to change their e-mail address, message delivery, community report delivery, requested notifications, and e-mail format.

Email Settings page (n)~ A web page where you specify email addresses that can create pages in your OneNote notebooks. When messages from an enabled email address are sent to me@onenote.com, OneNote creates a new page in your OneNote notebook on OneDrive.

e-mail signature (n)~ Text that is automatically added to outgoing e-mail messages, typically used to identify the sender.

Email strategy (PN)~ A company-level setting that allows the user to set whether emails in an email campaign will be sent as one email per contact or one email per email inbox (email ID). The choices are Send one email per contact' and 'Send one email per email ID."

Email Template (n)~ A pre-written message that can be sent in response to a Ticket Action or a Business Rule.

Email to OneNote (PN)~ A feature that enables users to send content via email to their OneNote notebooks. Users must first enable their email addresses in the Email Settings page in OneNote. Then, they can email content to me@onenote.com, which automatically copies the content to a new page in their notebook.

E-mail to Site (PN)~ A feature that integrates E-mail and SharePoint functionality by enabling these applications to share certain data and management tasks.

embed (v)~ To insert information created in one program, such as a chart, an equation, an image, a video or a font, into another program or Web page.

Embed (v)~ The Sway card that allows users to embed content into their sway from the web.

embed ~ When adding an element from one document to another document. Example: A sound file is created in one document, then it is embedded in an HTML document for publication to the Web.

embed a video (v)~ To add a video to a blog entry by entering the embed code for the video.

embed code (n)~ HTML code that adds an object, such as a video, to a Web site, blog, or HTML page.

Embed videos (PN)~ A UI element that links to a text box where the user can enter the embed code to add a video to his or her blog.

embedded audio clip (n)~ An audio clip that has been inserted into another file or Web page.

embedded chart (n)~ A chart that is placed on a worksheet rather than on a separate chart sheet. Embedded charts are beneficial when you want to view or print a chart or a PivotChart report with its source data or other information in a worksheet.

embedded controller (n)~ The general class of microcontrollers used to support OEM-specific implementation, mainly in mobile environments. The embedded controller performs complex low-level functions through a simple interface to the host microprocessor(s).

embedded controller interface (n)~ A standard hardware and software communications interface between an operating system driver and an embedded controller, such as Smart Battery and AML code. This allows any operating system to provide a standard driver that can directly communicate with an embedded controller in the system, thus allowing other drivers to communicate with and use the resources of the system embedded controllers.

embedded file (n)~ Graphics, sounds, and other types of multimedia file that have been inserted in a Web page.

embedded image (n)~ A picture that is stored within a document rather than being linked to a source file outside of the document.

embedded object (n)~ An object created with one program and embedded into a document created by another. Embedding the object, rather than simply inserting or pasting it, ensures that the object retains its original format. If you double-click the embedded object, you can edit it with the toolbars and menus from the program used to create it.

embedded picture (n)~ A picture that is stored within a document rather than being linked to a source file outside of the document.

embedded resource (n)~ The files used by an application that are stored in binary format in the compiled application.

Embedded Shell Launcher (PN)~ A feature that allows the replacement of the Windows shell (explorer.exe) with a custom shell for specialized device scenarios.

embedded style sheet (n)~ A cascading style sheet that is embedded on a page. Styles in an embedded style sheet can be applied only to the page containing the style sheet and will extend or override styles in any external style sheet linked to the page.

embedded system ~ A specialized computer system that is part of a larger system or machine. Typically, an embedded system is housed on a single microprocessor board with the programs stored in ROM.

embedded video clip (n)~ A video clip that has been inserted into another file or Web page.

emergency access code (n)~ An emergency access code is a set of letters and numbers that can be included on your emergency profile wallet card or sheet.

emergency call (n)~ A call made to an emergency number.

Emergency Callback Mode (PN)~ A mode the phone goes into after a user calls an emergency number (ex: 911) and the call ends. When the phone is in this mode, only the

emergency operator can call the person on their phone, so that the emergency operator can call back or determine where the user is at. The phone is in this mode for about 5 minutes or until the user cancels out of the mode.

emergency change request (n)~ A change request that is used for urgent changes which should be implemented in less than, for example, 24 hours and cannot follow normal change process.

Emergency Management Services (n)~ Services that enable the administrator to interact with a system that might not be available through the usual network mechanisms.

emergency number (n)~ A telephone number that connects to a country or region's emergency system (for example, police and fire department).

emergency phone number (n)~ A telephone number that connects to a country or region's emergency system (for example, police and fire department).

emergency profile (n)~ An emergency profile contains key medical information that others can view when providing emergency treatment to you or a family member.

emergency room (n)~ The section of a health care facility staffed and equiped to provide rapid treatment for patients requiring immediate medical care.

emissive material (n)~ A type of material that causes the object to appear as if it is giving off light. The color of the light is determined by the color of the material.

Emoji ~ Similar to- emoticons, but instead of creating sideways 'faces' out of standard keyboard symbols, emoji use a special font where all the letters and symbols have been replaced with small pictures. Originally from Japan. However, if the device you are sending to doesn't support emoji, which many older devices don't, it will usually just leave them out altogether.

emoticon (n)~ A string of text characters that, when viewed sideways, form a face expressing a particular emotion.

emoticon (n)~ A small graphical symbol the user can insert into instant messages.

Emoticon ~ (EMOTion ICON)- A group of symbols used to indicate emotions in- email- or- newsgroups. The most popular is the- smiley- :-) or :) (look at it sideways), but there are lots of variations including the sad face - :-(, the wink ;-) , and the astonished face :-0 .

Emphasize (PN)~ The button in Sway that allows users to emphasize or deemphasize content in relationship to other content.

employee (n)~ A person who works for your company and receives payment for the work that he or she does.

employee (n)~ A role assumed by a person who participates in an employee-employer relationship with a legal entity.

employee compensation (n)~ Direct or indirect monetary and nonmonetary rewards offered to an employee by an organization.

employee ID (n)~ A unique alphanumeric identifier that is associated with an employee.

employee type (n)~ A category of employees for which a specific compensation plan is designed, such as Executive, Salaried, or Hourly.

employer identification number (n)~ In the United States, a 9-digit number that identifies a business entity to the government. A business must have an EIN if it has employees or meets other criteria specified by the federal government.

Empower (PN)~ A 12-month program that provides members of the Microsoft Partner Program with software licenses for various Microsoft products, an MSDN subscription, support newsgroups, etc.

empty (adj)~ The state of an uninitialized Variant variable (which returns a VarType of 0).

empty console start page (n)~ The start page that appears when no snap-ins have been added to a snap-in console (.msc file).

empty GUID (n)~ A 128-bit, 16-byte identification number that is represented by all zeros.

EMS (n)~ Services that enable the administrator to interact with a system that might not be available through the usual network mechanisms.

emulate (v)~ For a hardware or software system to behave in the same manner as another hardware or software system.

emulate / emulation ~ a program or device that has the ability to imitate another.

emulate / emulation ~ A method by which an imitating system can accept the same data, execute the same computer programs and achieve the same results as the original system.-

emulator (n)~ Hardware or software designed to make one type of computer or component act as if it were another. By means of an emulator, a computer can run software written for another machine. In a network, microcomputers might emulate terminals in order to communicate with mainframes.

en dash (n)~ The -€" character, based on the width of an uppercase N and used primarily as a connecting element, especially with numbers.

EN DASH (n)~ The -€" character, based on the width of an uppercase N and used primarily as a connecting element, especially with numbers.

enable (v)~ To activate or turn on.

Enable device syncing in Digital Image Library (v)~ A checkbox that turns the Device Syncing feature on or off. If it is off, no UI is exposed to the user.

Enable for Yammer (PN)~ Control in the Post Rule Configurations area that allows records to have Yammer posts.

Enable opting in for marketing emails (PN)~ A company-level setting where the admin can allow new contacts to choose (opt in) to receive future promotions and offers from the company.

Enable Referential Integrity (PN)~ A property that enables referential integrity.

encapsulated PostScript (n)~ A Post-Script file format that can be used as an independent entity. The EPS image must be incorporated into the Post-Script output of an application such as a desktop publisher. Many high-quality clip-art packages consist of such images.

encapsulating security payload (n)~ A standard for providing integrity and confidentiality to IP (Internet Protocol) datagrams. In some circumstances, it can also provide authentication to IP datagrams.

encapsulation (n)~ The ability of an object to hide its internal data and methods, making only the intended parts of the object programmatically accessible.

encapsulation (n)~ The method used to pass data from one protocol over a network within a different protocol. Data from one protocol is wrapped with the header of a different protocol. Encapsulation is described in RFC 1483.

encapsulation ~ A software design technique in which data and procedures related to the data are undled together within a single entity, called the object.

encipherment (n)~ The process of converting readable data (plaintext) into a coded form (ciphertext) to prevent it from being read by an unauthorized party.

encode (v)~ To convert audio and video content to a specified digital format, usually involving compression technology or encryption technology.

encoder (n)~ In general, any hardware or software that encodes information: that is, converts the information to a particular form or format. For example, the Windows Media Encoder converts audio and video to a form that can be streamed to clients over a network.

encoding (n)~ The process of turning data into a stream of bits. Encoding is part of the serialization process that converts data into a stream of ones and zeros.

encoding agreement (n)~ An agreement between the business profiles of two trading partners to use a specific encoding protocol (X12 or EDIFACT) while exchanging messages.

encoding class (n)~ A class which represents a character encoding.

Encoding Data Processed (GB) (PN)~ The unit of measure for the amount of encoded Media Services data.

encoding protocol (n)~ A protocol that governs the structure and content of a business-to-business message. The encoding protocol settings for a business profile define the encoding protocol that a business division uses to send and receive business-to-business messages. Some examples of encoding protocols are X12, EDIFACT, HIPAA, and EANCOM.

encoding reserved unit (n)~ A resource unit reserved for encoding tasks.

encounter (n)~ An one-on-one meeting between a patient and a health professional.

encrpytion ~ The process of converting data into an unreadable format so that unauthorized views of the data can be blocked.

encrypt (v)~ To programmatically disguise content to hide its substance.

Encrypt (PN)~ An item in a drop-down list that a user sees when taking action to encrypt a message.

Encrypt rule option (n)~ An option reached from the Rule Management area of the Policy Filter page for outbound mail. With this rule, e-mail messages that are sent by users in the organization can be encrypted automatically based on rule matching by subject and message keywords, regular expressions, sending and receiving e-mail address, and domains.

Encrypt, encryption ~ Coding data so that it can't be read by- hackers- etc when transmitted over the internet. For example, any reputable website selling goods by credit card will encrypt your credit card number and personal details.

encrypted data (n)~ Data that has been converted from plaintext into ciphertext. Encrypted messages are used to disguise the content of a message when it is sent or stored.

Encrypted E-mail service (PN)~ A feature that enables customers who subscribe to the Hosted Encryption service to send and receive encrypted e-mail messages by using the Zero Download Messenger Web site.

Encrypting File System (n)~ A Microsoft file-based encryption technology that enables users to encrypt files and folders on NTFS volumes. EFS helps protect the confidentiality

of data by ensuring that only authorized users can decrypt the encrypted files or folders.

encryption (n)~ The process of converting readable data (plaintext) into a coded form (ciphertext) to prevent it from being read by an unauthorized party.

Encryption Control Protocol (n)~ The Network Control Protocol for negotiating the use of encryption over PPP links. ECP is defined in RFC 1968.

encryption key (n)~ A bit string that is used in conjunction with an encryption algorithm to encrypt and decrypt data.

encryption provider (n)~ Software that provides encryption for sensitive data, such as passwords, in applications.

encryption setting (n)~ A configuration element that specifies a type of encryption, such as 128-, 56-, or 40-bit encryption.

encumbrance (n)~ A commitment made by legal entities to reserve budget funds for expenditure obligations.

end (v)~ To stop communications or a network connection.

End (PN)~ A menu item that initiates the process of terminating a phone call.

End (PN)~ A participating entity in an association.

end (v)~ To end a phone call.

end a call (v)~ To end a phone call.

end address (n)~ The last valid address within a range of IP addresses.

end call (PN)~ An infotip for the button on the phone and video controls that ends the conversation.

end cap (n)~ For paths that contain unconnected ends, such as lines, the end of a stroke. You can change the way the stroke looks at each end by applying one of four end cap styles: flat cap, round cap, square cap, and triangle cap.

end date (n)~ The date on which a schedule or task ends.

end date parameter (n)~ A parameter to set an end date.

end date-based (adj)~ Pertaining to a computer running FlexGo technology that meters computer usage until a defined usage expiration date. The usage expiration date can be extended by days or months, on a recurring basis.

end mark (n)~ A symbol that designates the end of some entity, such as a file or word processing document.

end name (n)~ A name that appears as a text string near the end of a binary association. It indicates the role played by the class attached to the association end, so each end can have its own end name.

end of day procedure (n)~ A retail accounting procedure for a register at the end of the business day.

End of Line (n)~ A menu item that allows the user to choose a character with which to search for the end of a line.

end of shift procedure (n)~ A retail accounting procedure for the end of a cashier's shift.

end of support (n)~ The date when Microsoft no longer provides automatic fixes, updates, or online technical assistance.

end panel (n)~ The panel that covers a short side of a central processing unit or Surface unit.

end tag (n)~ A tag that closes an element: </>. An end tag follows the syntax </Name>,

where Name matches the element name declared in the start tag.

End the call (oth)~ An infotip for the Hang Up button. The Hang Up button is a button on Phone Controls and Audio Controls.

end user (n)~ The ultimate user of a computer or computer application in its finished, marketable form.

endnote (n)~ A reference that follows the body text. An endnote consists of two linked parts: the note reference mark and the corresponding note text.

end-of-file (n)~ A value returned by an I/O routine when the end of a file (or, in some cases, an error) is encountered.

end-of-sector marker (n)~ A two-byte data structure written at the end of the boot sector after the bootstrap code. Used by the bootstrap loader to determine that the end of boot sector has been reached.

endorsement key (n)~ A key pair, consisting of a public key and a private key, which is used to verify that a TPM is genuine.

endpoint (n)~ Either of the handles that appear at the beginning or end of a selected line, arc, or other one-dimensional (1-D) shape.

endpoint (n)~ A company or entity that participates in a business-to-business (B2B) or application-to-application (A2A) data exchange.

endpoint (n)~ The logical representation of a location, typically expressed in URL form, providing a physical address for data received or sent.

endpoint (n)~ A device connected to a computer network.

endpoint (n)~ A construct that consists of an address, a binding, and a contract used for communicating with a WCF service.

endpoint (n)~ A consumer in a Web Part connection that receives data from a provider, used in connections for PerformancePoint Web Parts.

endpoint action data policy (n)~ A policy that determines which XML elements in a document are valid for a particular action associated with an endpoint.

endpoint action policy (n)~ A policy that determines which actions are valid for a particular endpoint.

endpoint address (n)~ A uniform resource identifier (URI) that specifies the location of an endpoint. Every endpoint has an address associated with it, which is used to locate and identify the endpoint.

endpoint mapper (n)~ A service on a remote procedure call (RPC) server that maintains a database of dynamic endpoints and allows clients to map an interface/object UUID pair to a local dynamic endpoint.

Endpoint Protection (PN)~ A security solution that helps enhance the security of client computers by providing real-time protection against potential threats; keeping malicious software, or malware, definitions up-to-date; and automatically running scans.

Endpoint Protection Manager (PN)~ A security role that grants permissions to administrative users so that they can define and monitor security policies.

Endpoint Protection point (n)~ A site system role that Configuration Manager uses to accept the Endpoint Protection license terms and to configure the default membership for Microsoft Active Protection Service.

end-to-edge (adj)~ Of, pertaining to, or characteristic of a QoS signaling path that

traverses an underlying network from an end host to the edge node of a domain (or from an edge node to an end host).

end-to-end authentication (n)~ An authentication method in which credentials are validated at the endpoints instead of at a central server.

end-user license (n)~ The license that enables end users to consume protected content.

end-user recovery (n)~ A feature that enables an end user to independently recover data by retrieving a shadow copy. This feature requires the shadow copy client software.

End-User Spam Notification (PN)~ An email message that contains a spam report for individual users who don't have access to quarantine or the junk email folder.

e-newsletter (n)~ A newsletter sent by e-mail to educate, alert, and persuade recipients, known as subscribers, about a company, its products, and other communications messages. This type of campaign is part of an integrated set of electronic marketing techniques.

enforcement mode (n)~ A mode determined by the level of network access granted to noncompliant computers. There are three available enforcement modes: reporting mode, deferred enforcement, and full enforcement.

enforcement period (n)~ The length of time that a provisioning packet is valid. It determines the frequency with which the Provisioning Server will automatically generate a new provisioning packet. Used only with automated subscription renewal.

engagement (n)~ The users' reaction to a product or service that is perceived as valuable. When a product or service engages users, they want to interact with it and continue doing so.

engagement (n)~ A measure of how long a user watched a video delivered by the Web server.

engagement manager (n)~ An employee who is responsible for closing services sales opportunities and developing new customer engagement opportunities.

engine (n)~ A system component that provides complex capability and performs operations on objects.

engine adapter (n)~ An adapter that performs various core biometric operations: cleanup of sensor data, feature extraction, template generation, matching, and indexing. These functions can either be implemented by software in the engine adapter, or by the engine adapter making use of some piece of processing hardware.

Engine Input File (n)~ A compiled version of a document schema. The EIF is used to expedite translations for distribution among other users in a closed user group. The EIF is automatically compiled whenever an XML Schema Definition language (XSD) schema is generated or edited, using BizTalk Server.

English Assistance (PN)~ A set of integrated linguistic references and resources that are designed to help Office users for whom English is not a first language to write better English text.

enhance (v)~ To automatically correct and improve the user's photos with adjustments to color, contrast, red eye, straightening, and more.

enhanced (adj)~ Possessing improved, advanced, or more sophisticated features.

Enhanced 9-1-1 (n)~ A service that provides information about the location of a caller who calls 9-1-1.

enhanced audio CD (n)~ An audio CD that contains both audio and other multimedia

content.

Enhanced Document Availability (n)~ A set of Microsoft Exchange features that offers increased access to documents even when the documents are located on an internal network or the software required to view the documents is not installed on the client computer.

enhanced DVD movie (n)~ A DVD from which the video section can be played on the DVD set top box. When inserted in the PC, the user can access additional features such as games, web links etc.

enhanced federation (n)~ An organization-to-organization federation using DNS-SRV resolution to identify the Access Proxy or Access Edge Server for each partner.

enhanced folder (n)~ A folder in a backward-compatible document library that supports document management tasks such as check-in, check-out, versioning, approval, and publishing.

enhanced hunt group (n)~ A workflow which supports an announcement message and business hours support in addition to the basic hunt group workflow.

enhanced key usage (n)~ An extended property value that specifies the uses for which a certificate is valid.

enhanced presence (n)~ The capability of publishing customized status information that depends on a presence subscriber's relationship to the source of the status information.

enhanced presenter controls (n)~ A collection of Lync Meeting host and presenter controls that optimizes for the type of meeting, size of audience, content, and/or video sources available to participants.

Enhanced ScreenTip (n)~ A new type of ScreenTip that is larger and can contain more detailed information, including graphics.

enhanced security (n)~ The security type that is used to describe the encrypted protocol used by Application Virtualization to provide secure communications on the various virtual application streaming deliveries leveraging Real Time Streaming Protocol Secure (RTSPS).

enhanced security (n)~ A security type that helps prevent unauthorized persons from discerning that a user is going to the Windows Live sign-in page. Otherwise, an unauthorized person might be able to intercept and manipulate the code on the sign-in page, which could result in user information being transmitted to an unauthorized website.

Enhanced Single File (PN)~ A mechanism that enables IntelliSense, browsing and other features for standalone files that are not part of an existing project.

Enhanced Storage (PN)~ A Windows feature that provides an interface following the IEEE 1667 industry standard to lock devices with a password and allow companies to manage Enhanced Storage devices using Windows Group Policy.

Enhanced Storage device (n)~ A storage device that provides storage function and authentication. Such devices are usually small form-factor devices such as USB thumb drives.

Enhanced Windows Metafile (n)~ An enhanced 32-bit vector graphics format for Windows-compatible computers used mostly as a clip art format in word-processing documents.

enlightenment (n)~ An enhancement made to the operating system to help reduce the cost

of certain operating system functions like memory management.

enlist (v)~ To associate an orchestration with the physical environment in which it will run.

enlistment (n)~ The process of associating an orchestration with the physical environment in which it will run.

enlistment object (n)~ An object that represents the relationship between a resource manager and a transaction object on which the resource manager has enlisted.

enqueue (v)~ To place (an item) in a queue.

enrich (v)~ To add to or augment data that is in the system, usually from an outside data service provider.

enroll (v)~ To add an instance of SQL Server to the set of SQL Server instances managed by a utility control point.

enroll (v)~ To register for a class or academic program.

enrollment (n)~ The process of requesting, receiving, and installing a certificate.

Enrollment Agent (n)~ A user account used to request smart card certificates on behalf of another user account. A specific certificate template is applied to an Enrollment Agent.

Enrollment for Microsoft Azure (PN)~ An Enterprise Agreement licensing program that allows organizations to subscribe to, and manage, Microsoft Azure services under a single agreement.

enrollment point (n)~ A Configuration Manager site system role that uses PKI certificates to complete mobile device enrollment and provision Intel AMT-based computers.

enrollment proxy point (n)~ A Configuration Manager site system role that manages enrollment requests from mobile devices so that they can be managed by Configuration Manager.

enter (v)~ To enter information by means of the keyboard or other input method.

enter gesture (n)~ In Tablet PC Input Panel, an action gesture that performs the same action as pressing the ENTER key on the keyboard.

ENTER key (n)~ The key that is used at the end of a line or command to instruct the computer to process the command or text. In word processing programs, the Enter key is used at the end of a paragraph. Also called: Return key.

Enter phone URI (v)~ An option in the Manually Configure Phone Integration dialog box where the user enters his phone number in the required format. To access this dialog box, click the Configure button in the Options dialog box, on the Accounts tab.

Enter remote call control URI (v)~ An option in the Manually Configure Phone Integration dialog box where the user enters his phone number in the required format. To access this dialog box, click the Configure button in the Options dialog box, on the Accounts tab.

entered field (n)~ A field in which you may type or edit information.

enterprise (n)~ An organization with more than 1000 employees and more than 500 personal computers.

Enterprise 2015 (PN)~ The edition of Visual Studio 2015 including all of the features available with the development tools to build mission-critical enterprise solutions.

enterprise application integration (n)~ The process of coordinating the operation of the various programs, databases, and existing technologies of a business or enterprise so that

they function as an efficient, business-wide system.

Enterprise Application Integration (PN)~ One of the integration services in Microsoft Azure that enables connections between different systems using multiple and varied message formats.

enterprise CA (n)~ A computer service that issues digital certificates that can only be used inside a business or organization.

enterprise certification authority (n)~ A computer service that issues digital certificates that can only be used inside a business or organization.

Enterprise Cloud Suite (PN)~ The offer for commercial companies that includes Office 365 Enterprise E3, the Enterprise Mobility Suite and Windows Enterprise SA.

Enterprise Collaboration (n)~ The capability of working together within an organization that may encompass the use of a collaboration platform, enterprise social networking tools, a corporate intranet and the public Internet.

Enterprise Edition pool (n)~ One or more computers running Office Communciations Server Enterprise Edition, that share user data through a common back-end SQL database.

Enterprise Edition pool, consolidated configuration (n)~ A configuration where IIS and all internal conferencing, IM, and presence services, except the back-end database, are collocated on the Front End Servers. The back-end database is hosted on a separate server running SQL Server.

Enterprise Edition pool, expanded configuration (n)~ A configuration including separate servers for IIS, Front End, A/V Conferencing, Web Conferencing, and SQL Server. Note that in all configurations, IM Conferencing (group IM) and Telephony Conferencing Servcies are always collocated on the Front End server.

enterprise global template (n)~ A collection of default settings, such as views, tables, and fields, that are used by all projects across the organization. These settings exist within a special project in Project Server.

Enterprise Integration Platform (n)~ The environment in which enterprise application integration occurs. This scenario is actually a class of scenarios grouped together as a single scenario.

enterprise license (n)~ A license that authorizes protection of both file and application resources on a single computer.

enterprise metadata (n)~ Metadata pertaining to content across an enterprise.

Enterprise Mobility Suite (PN)~ The offer that includes Microsoft Azure Active Directory Premium, Microsoft Intune, and Microsoft Azure Rights Management.

Enterprise Mode (PN)~ A compatibility mode that runs on Internet Explorer 11 on Windows 8.1 Update and Windows 7 devices.

Enterprise Mode Site List Manager (PN)~ A GUI tool used to create and manage lists that tell Internet Explorer 11 which websites to run in Enterprise Mode.

enterprise portal (n)~ A Web site that provides a single point of entry for internal and external users of an organization to access a wide variety of business information.

enterprise project (n)~ A project that is stored in Project Server to ensure information integrity. To make changes to an enterprise project, users with access permissions are required to check it in and out from Project Server.

Enterprise Project Management (PN)~ A Partner Portal specialization that helps

companies improve their ability to manage and align projects, allocate and balance resources, and track and report on projects and tasks. Solutions are based on Microsoft Office Project Server 2007, Project Portfolio Server 2007, and Project Professional 2007.

enterprise project management (n)~ The generic field of organizational development that supports organizations in managing in an integrated fashion and adapting to changes.

enterprise resource (n)~ A resource that is part of an organization's entire list of resources. Enterprise resources can be shared across projects.

enterprise resource management (n)~ The business area related to managing the financial, human, and physical assets and resources of a company. Software solutions are designed and implemented specifically to manage these assets and resources.

Enterprise Search (PN)~ A search engine that enables users to search data from disparate sources across an organization. It is a shared service that provides extensive and extensible content gathering, indexing, and querying. This service supports full-text searching using a Structured Query Language (SQL)-based query syntax, and provides a keyword syntax to support keyword searches.

enterprise service-oriented architecture (n)~ The SAP blueprint for services-based, enterprise-scaled business solutions that offer increased levels of adaptability, flexibility and openness required to reduce total cost of ownership.

enterprise SOA (n)~ The SAP blueprint for services-based, enterprise-scaled business solutions that offer increased levels of adaptability, flexibility and openness required to reduce total cost of ownership.

enterprise social network (n)~ A social network used for private communication within organizations or between organizational members and pre-designated groups.

Enterprise Storage (n)~ Computer data storage designed to meet the requirements of modern enterprises and other medium and large-sized organizations. Enterprise storage can be used to describe a variety of technologies that provide storage at larger scales than consumer and small business solutions, and offer higher levels of resiliency, reliability, performance, and flexibility. Modern enterprise storage often includes some connection to cloud services.

enterprise user (n)~ A user who has an identity in Active Directory Domain Services.

Enterprise Voice (PN)~ Implementation by Microsoft of VoIP telephony based on the industry-standard SIP protocol.

Enterprise Voice client (n)~ A voice client that is part of the Enterprise Voice solution from Microsoft; for example, Lync or Office Communicator.

enterprise wiki (n)~ A wiki that allows people across a company or organization to capture and share knowledge using a solution that is integrated into and enhanced by their SharePoint environment.

enterprise-level project (n)~ A major project that is related to an organization, such as a team coordination project or a project created to establish consistency across the organization.

entertainment (n)~ Amusment, pleasure, or diversion.

entertainment (PN)~ An app category that seeks to amuse users or provide access to entertainment media.

Entertainment (PN)~ An MSN site allows the user to explore entertainment articles,

galleries, news and reviews on top stars and celebrities.

Entertainment (PN)~ An app category that seeks to amuse users or provide access to entertainment media.

Entertainment Software Rating Board (n)~ A self-regulatory body which independently applies and enforces interactive game ratings adopted by the industry in the United States.

entire failover set (n)~ Within a given availability group, the set of all availability replicas whose operational state is currently ONLINE, regardless of availability mode and of failover mode.

entitlement (n)~ In a service contract, defines the amount and type of support a customer should receive.

Entitlement Channel (PN)~ A drop-down list from which users can select the method of distribution (for a campaign activity), or the method of how a customer's case will be handled (for an entitlement).

entity (n)~ An object (such as a customer, item, or employee) that shares a set of defined attributes or characteristics, and that is used to manage rules for data.

entity (n)~ In Reporting Services, a logical collection of model items, including source fields, roles, folders, and expressions, presented in familiar business terms.

entity (n)~ A class or object that represents application data such as customers, products, and orders.

entity (n)~ The representation of all the instances of a particular record. When changes are made to a record type, those changes will affect all individual records of that type.

entity (n)~ An object that can be uniquely identified.

entity container (n)~ A container of specified entity sets and association sets that will be implemented in a specified namespace.

Entity Data Model (PN)~ A data model for defining application data as sets of entities and relationships to which CLR types and storage structures can be mapped.

Entity Data Model schema (n)~ An XML text file that describes entity and relationship types. The schema also defines a container within which instances of these types are logically organized.

Entity Designer (PN)~ A tool that enables point-and-click modification of an .edmx file, visually creating and modifying entities, associations, mappings, and inheritance relationships as well as validating an .edmx file.

entity extraction (n)~ The process of extracting information from unstructured text in an item and storing that information as additional managed properties for the item.

entity extractor (n)~ A content processing feature that extracts information from unstructured text in an item and stores that information as additional managed properties for the item. The additional managed properties can be used to refine results.

Entity Framework (PN)~ A set of technologies that supports development of data-oriented software applications by enabling developers to work with conceptual models that are mapped to logical schemas in data sources.

Entity Framework Code First Migrations (PN)~ A feature that allows a database created by Code First to be incrementally changed as a developer's Code First model evolves.

Entity Framework Designer (PN)~ A tool that enables point-and-click modification of

an .edmx file, visually creating and modifying entities, associations, mappings, and inheritance relationships as well as validating an .edmx file.

Entity Framework Tools (PN)~ The toolset available as part of Entity Framework.

Entity Hours (in 100s) (PN)~ The unit of measure of time that Service Bus entities are being used.

entity integrity (n)~ A state in which every row of every table can be uniquely identified.

entity key (n)~ A reference to an entity of a specific entity type.

entity object (n)~ An instance of an entity type that exists within an object context.

entity relationship (n)~ A relationship between records of one record type and records of another record type. An entity relationship is represented in both the structure of the Microsoft Dynamics CRM database and the user interface. A custom entity relationship may be created. There are three types of custom entity relationship: N:1, 1:N, and N:N.

entity set (n)~ A logical container for entities of a given type and its subtypes mapped to tables in a database.

Entity SQL (PN)~ A storage-independent dialect of SQL that works directly with conceptual entity schemas and that supports entity data model features such as inheritance and relationships.

entity type (n)~ The specification for a data type that includes a named set of properties and represents a top-level item in a data model.

EntityClient (PN)~ A storage-independent ADO.NET data provider that contains classes such as EntityConnection, EntityCommand, and EntityDataReader.

entry (n)~ The lowest level element in the registry.

entry (n)~ The process of inputting information.

entry animation effect (n)~ An animation effect that is applied to text or pictures entering a PowerPoint presentation.

entry criteria (n)~ A set of circumstances that must be present before an effort can begin successfully

entry page (n)~ The page on which a visitor entered a web site (e.g. Home page, About Us page, or Contact Us page).

entry page count (n)~ The number of visitors who entered a web site on a particular page on that site.

entry point (n)~ An interface provided by the system that might also be used to gain access to the assets or resources of a system.

entry point (n)~ The top-level function that is the point from which Application Performance Monitoring (APM) begins measuring the processing time of a transaction. A separate performance event is generated for each entry point whose processing time exceeds the alerting threshold set for it.

entry pruning (n)~ The process of removing entries from the catalog.

entry type (n)~ The kind of tool used to store Account History, Business Contact History or Opportunity (for example, an e-mail message, note, task, or appointment). The type of utility used to store an entry.

enumerated data type (n)~ A data type consisting of a sequence of named values given in a particular order.

enumerated field (n)~ A type of field whose content is selected from a list of predefined

choices. For example, in the Accrue At field you can select the way resource costs are accrued from a list that includes Start, Prorated, and End.

enumerated type (n)~ A user-defined type consisting of a set of named constants called enumerators.

enumeration (n)~ A list of named constants.

enumerator (n)~ A system component that discovers PnP devices based on a PnP hardware standard. For Microsoft Windows 2000 and later, these tasks are carried out by PnP Bus Drivers in partnership with the PnP manager. A device is typically enumerated by its parent bus driver, such as the PCI or PCMCIA bus driver. Some devices are enumerated by a bus filter driver, such as the ACPI Driver.

enumerator (n)~ An object or routine for traversing the items in a list, array, collection, or stream one at a time.

envelope (n)~ A structured set of information that wraps and accompanies an instance message, often describing delivery and processing information. Envelopes can be nested.

envelope (n)~ Header and footer information, or header information only, which encapsulates or precedes document data for transport.

envelope journaling (n)~ A type of message journaling in which the original unaltered message is included as an attachment in the journal report.

envelope schema (n)~ A type of schema that specifies the structure of an envelope, using several extra properties that are specific to envelopes and which specify information such as identifying the envelope contents in an enveloped data stream.

envelopes formula (n)~ A financial formula that calculates envelopes' above and below a moving average using a specified percentage as the shift. The envelopes indicator is used to create signals for buying and selling. You can specify the percentage the formula uses to calculate the envelopes.'

environment (n)~ A global context in which to access data.

environment (n)~ A set of roles that are required to run a specific application and the machines to be used for each role.

environment (n)~ One of two deployment destinations within a Microsoft Azure cloud service: staging or production.

environment snapshot (n)~ A file-based snapshot of the state, disk data, and configuration of all virtual machines in an environment at a specific point in time.

environment template (n)~ A resource, consisting of virtual machines, that is stored in a team project library share and can be used to create new virtual environments.

environment variable (n)~ One of a set of dynamic values maintained by the operating system that provides configuration and status information.

environment viewer (n)~ An application that enables a user to start, pause, stop, or create a snapshot of the virtual machines in an environment.

environmental sensor (n)~ A category of sensor that tracks environmental changes such as temperature, atmospheric pressure, humidity, wind speed and wind direction.

EOF (n)~ A value returned by an I/O routine when the end of a file (or, in some cases, an error) is encountered.

EP (oth)~ A Web site that provides a single point of entry for internal and external users of an organization to access a wide variety of business information.

EPC (n)~ A standard for electronically marking products so that they can be tracked by using radio frequency identification (RFID). An EPC is 96 bits divided into four partitions: header, manager number, object class, and serial number.

EPC (PN)~ An international non-profit association that supports and promotes the Single Euro Payments Area (SEPA) banking industry initiative.

EPE (adj)~ A Lean- concept- that is used to establish- a regular repeating production cycle.

epilog (n)~ The machine code that follows the last executable statement of an assembly language routine, up to and including the return instruction. This code restores preserved register values, releases the allocated stack frame, and returns to the calling routine.

episode (n)~ One in a series of broadcasts belonging to a TV show or podcast.

EPM (n)~ The generic field of organizational development that supports organizations in managing in an integrated fashion and adapting to changes.

epoch (n)~ The period in which a domain has a specific name.

EPS (n)~ A Post-Script file format that can be used as an independent entity. The EPS image must be incorporated into the Post-Script output of an application such as a desktop publisher. Many high-quality clip-art packages consist of such images.

eQoS (n)~ A group policy setting that alleviates network congestion issues by enabling central management of Windows Vista network traffic. Without requiring changes to applications, you can define flexible policies to prioritize the Differentiated Services Code Point (DSCP) marking and throttle rate.

equal sign (n)~ The = character.

Equation (PN)~ A SmartArt graphic layout used to show sequential steps or tasks that depict a plan or result. The last Level 1 line of text appears after the equals sign (=).Works best with Level 1 text only.

Equation Builder (n)~ A feature that allows creation of mathematical formulas in documents, including the insertion of mathematical symbols inside designated math zones' which perform automatic formatting to convert fractions

Equation Editor (PN)~ A feature that allows the user to build complex equations by picking symbols from a toolbar and typing variables and numbers.

equijoin (n)~ A join in which the values in the columns being joined are compared for equality, and all columns are included in the results.

equipment (n)~ The tools or assets used to perform a service activity.

equipment mailbox (n)~ A type of resource mailbox that is assigned to a non-location-specific resource such as a laptop projector, microphone, or company car. Equipment mailboxes can be included as resources in meeting requests, providing a simple and efficient way to utilize resources for an organization.

equirectangular projection (n)~ In a map report item, a very simple equidistant cylindrical projection in which the horizontal coordinate is the longitude and the vertical coordinate is the latitude.-

equity (n)~ The owners' rights or claims to the assets of a business.

equity (n)~ The net worth of an organization after deducting liabilities from assets.

equivalence class (n)~ A regular expression of the form [= expr =] where expr is a collating symbol. The characters that expr matches are added to the surrounding bracket

expression.

equivalent dial plan group (n)~ A container object in Active Directory that holds equivalent dial plans that are from separate Active Directory forests.

equivalent objects (n)~ Different files (for example, .vhd files) on which a user has set the same family and release properties to indicate that the different files are related.

ER (n)~ The section of a health care facility staffed and equiped to provide rapid treatment for patients requiring immediate medical care.

erase (v)~ To remove data permanently from a storage medium. This is usually done by replacing existing data with zeros or meaningless text or, in magnetic media, by disturbing the magnetic particles' physical arrangement, either with the erase head or with a large magnet.

E-reader (PN)~ The Books & reference subcategory containing apps to help you to read electronic copies of books.

Erlang ~ In telecommunications, a unit of traffic intensity. One Erlang is the intensity at which one traffic path would be continuously occupied.

ERP (n)~ An approach to business information management that relies on integrated application software to provide data on all aspects of the enterprise, such as manufacturing, finance, inventory, human resources, sales, and so on. The objective of Enterprise Resource Planning software is to provide data, when and as needed, to enable a business to monitor and control its overall operation.

error (n)~ A value or condition that is not consistent with the true, specified, or expected value or condition.

error bar (n)~ Usually used in statistical or scientific data, an error bar shows the potential error or degree of uncertainty relative to each data marker in a series.

Error Checking (n)~ An Excel feature that identifies invalid worksheet data, formulas, or formatting and proposes corrections.

error code (n)~ One of four fields of an SCODE. It is a unique number that is assigned to represent the error or warning.

error code (n)~ A return code that begins with E_ or DB_E_ and indicates that the method failed completely and was unable to do any useful work. Usually indicates a programming error.

error correction (n)~ In Windows Media Player, a process to ensure that digital audio data is read from the CD-ROM drive accurately during playback or copying. Using error correction can prevent undesirable noises that are not part of the original material.

error correction (n)~ A process for correcting invalid values in a spreadsheet formula or function.

error detection (n)~ A technique for detecting when data is lost during transmission. This allows the software to recover lost data by notifying the transmitting computer that it needs to retransmit the data.

error handling (n)~ The process of dealing with errors (or exceptions) as they arise during the running of a program. Some programming languages, such as C++, Ada, and Eiffel, have features that aid in error handling.

Error List (n)~ A window that helps you speed application development by displaying errors, warnings and messages produced as you edit and compile code.

Error List (PN)~ The name of a pane that shows T-SQL syntax or dependency errors.

error log (n)~ A file that lists errors that were encountered during an operation.

error message (n)~ A message from the system or a program advising the user of a problem that requires human intervention in order to be solved.

error notification (n)~ A notification that temporarily appears to users to indicate that an application that is running in the background failed or stopped responding. An error notification does not cause the computer, device, or Surface unit to stop working or to display the full-screen out-of-order screen.

error number (n)~ A whole number in the range 0 - 65,535 that corresponds to the Number property setting of the Err object. When combined with the Description property setting of the Err object, this number represents a particular error message.

error reporting (n)~ A feature that automatically captures key information at the time of a program or system crash and allows users to report the collected information.

error screen (n)~ A screen that indicates that the current application failed or stopped responding so the computer, device, or Surface unit will stop working. The error screen appears temporarily and then transitions to the out-of-order screen.

error state number (n)~ A number associated with SQL Server messages that helps Microsoft support engineers find the specific code location that issued the message.

error string (n)~ A string from the system or a program advising the user of a problem that may require human intervention in order to be solved.

Error tab (n)~ In Setup wizards for Virtual Machine Manager, a tab that provides details about the error condition that caused an installation to fail.

error trapping (n)~ The process of writing a function, program, or procedure such that it is capable of continuing execution despite an error condition.

error value (n)~ A value shown in Excel when there is an error in a formula, for example #VALUE! or #REF!.

ESC key (n)~ A keyboard key that sends the escape (ESC) character to the computer. Often this key moves the user back one level in the menu structure or exits the program.

escalated approver (n)~ A configuration element of an approval activity: the e-mail address of a user who will receive approval request messages if the approvers fail to respond.

escalation (n)~ The process of delegating a task if the user has not acted on the task in the alloted time frame.

escalation path (n)~ A series of workflow escalation actions that can be taken to complete a workflow work item when it cannot be complete by the current assignee.

escape character (n)~ A single character that suppresses any special meaning of the character that follows it.

escape sequence (n)~ A character combination consisting of an escape character, usually a backslash, followed by a letter or by a combination of digits.

ESE (PN)~ A method that defines a low-level API to the underlying database structures in Exchange Server. Extensible Storage Engine is also used by other databases, such as the Active Directory directory service database.

ESP (n)~ A standard for providing integrity and confidentiality to IP (Internet Protocol) datagrams. In some circumstances, it can also provide authentication to IP datagrams.

Espresso Database file (n)~ A LocStudio file of software strings and other resources (e.g., product information, binary data, graphics, sizing information) created to localize a particular product.

ESR (n)~ A payment order with reference number in Swiss banking.

ESRB (n)~ A self-regulatory body which independently applies and enforces interactive game ratings adopted by the industry in the United States.

Essentials management server (n)~ The computer on which the server components of System Center Essentials are deployed.

estimate (n)~ A formal offer for products or services, proposed at specific prices and related payment terms.

estimate at completion (n)~ The expected total cost of a task or project, based on performance as of the status date. EAC is calculated as follows: EAC = ACWP + (BAC-BCWP)/CPI.

estimated cost (n)~ The approximate cost incurred in the performance of an activity.

estimated duration (n)~ A duration for which you have only enough information to determine a tentative value. So that its status is clearly visible, an estimated duration is clearly marked by a question mark immediately following the duration unit.

ETF Movers (PN)~ Exchange-traded funds that have shown high trading activity.

Ethernet (PN)~ A networking standard that uses cables to provide network access. Ethernet is the most widely installed technology for connecting computers.

Ethernet ~ The system used to connect computers to a- network- or the internet with a physical cable, including most- broadband- internet connections. Usually much faster than a wireless connection.

ethernet ~ Baseband LAN specification invented by Xerox Corporation and developed jointly by Xerox, Intel, and Digital Equipment Corporation. Ethernet networks use CSMA/CD and run over a variety of cable types at 10- Mbps.- more…

Ethernet address (n)~ A 12-digit hexadecimal address that is preprogrammed into a computer's network adapter, and that uniquely identifies that computer on the network.

Ethical Hacker ~ The dream job for a generation of hackers: A company paying you to break into its network. By simulating attacks from the net or from an internal source, ethical hackers locate weak spots in a company's network.

ethical wall (n)~ A zone of non-communication between distinct departments of a business or organization to prevent conflicts of interest that might result in the inappropriate release of sensitive information.

Ethnic (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 48.

ETL (n)~ The act of extracting data from various sources, transforming data to consistent types, and loading the transformed data for use by applications.

ETW (n)~ A general-purpose, high-speed tracing feature of Windows.

ETW-based log sink (n)~ A means of capturing trace events on the cache client or cache host with the Event Tracing for Windows (ETW) framework inside Windows.

EU North (PN)~ The Northern European region within the Azure region taxonomy.

EU sales list (n)~ A value-added tax (VAT) report required in EU member countries. The

EU sales list reports the value of goods that were sold to VAT-registered customers in other EU member countries.

EU West (PN)~ The Western European region within the Azure region taxonomy.

EUR (n)~ The internationally accepted currency code that represents the Euro currency.

euro (n)~ A currency used in a number of European Union countries.

EURO SIGN (n)~ The -,¬ character.

euro symbol (n)~ The -,¬ character.

Eurodance (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 54.

Euro-house (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 124.

Europe (PN)~ The European geo within the Azure region taxonomy.

European Article Number (PN)~ A 13-digit international barcode standard maintained by GS1.

European Free Trade Association (n)~ A group of European countries/regions (including Iceland, Liechtenstein, Norway, and Switzerland) that have agreed to free trade among themselves.

European Payment Council (PN)~ An international non-profit association that supports and promotes the Single Euro Payments Area (SEPA) banking industry initiative.

European Union (n)~ The union of European countries into one single market established under the Treaty of Rome in 1957. (Formerly known as the European Community or EC.) Directives have been developed to standardize member states in Europe into a common market by removing frontier fiscal barriers.

Euro-Techno (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 25.

Evaluate Formula (PN)~ An option that enables the user to see the different parts of a nested formula evaluated in the order the formula is calculated.

Evaluating Offshoring Strategy for HR Functions (n)~ A template that addresses, from a Human Resources perspective, the general activities that define an evaluation of an off-shoring strategy for Human Resource functions.

evaluation (n)~ The determination, by a program, of the value of an expression or the action that a program statement specifies. Evaluation can take place at compile time or at run time.

evaluation criteria (n)~ The categories of assignments for a given class, along with a percentage value that indicates how much each category weighs into the overall grade. Other factors, such as class participation, may also be considered.

evaluation software (n)~ Typically a demo version of the software that will expire in 120 days after it is installed.

even parity (n)~ Parity bit set so that there is an even number of 1 bits.

event (n)~ An action or occurrence to which a program might respond. Examples include state changes, data transfers, key presses, and mouse movements.

event (n)~ Any significant occurrence in the system or an application that requires a user to be notified or an entry to be added to a log.

event (n)~ An occurrence, activity or happening of significance that occurs.

event (n)~ The occurrence of an action in a system.

event (n)~ The basic unit of data processed by the StreamInsight server. Each event contains a header that defines the event kind and the temporal properties of the event. An event (except the CTI event) typically contains an event payload, which is a .NET data structure that contains the data associated with the event.

Event (n)~ A milestone for CSRs that serves as a reminder for a specific time period on the calendar.

event address (n)~ An address similar to a URL that provides network access to an event, such as a live broadcast. Attendees go to this address to view the event from their computers.

event bubbling (n)~ In Windows Presentation Foundation, an event routing strategy where the event instance moves up the element tree (starting with the source and ending at the root of the visual tree).

event category (n)~ In SQL Trace, a grouping of similar and logically related event classes.

event chronicle (n)~ A table that stores event state information.

event chronicle rule (n)~ One or more Transact-SQL statements that manage the data in the event chronicle.

event class (n)~ In SQL Trace, a collection of properties that define an event.

Event class (n)~ The class that indicates whether an event is a '.NET Performance- Event', '.NET Exception- Event', 'Client-Side Exception Event', or a 'Client-Side Performance Event'.

event classification (n)~ A means of differentiating types of events that occur on the cache client and cache host. The Windows Server AppFabric log sinks follow the classification established with the System.Diagnostics.TraceLevel enumeration.

event collection stored procedures (n)~ System-generated stored procedures that an application can call to submit events to the event table in the application database.

event consolidation (n)~ A feature that combines multiple events into one event. The single event identifies the number of consolidated events and when the first and last consolidated events occurred.

event consumer (n)~ A recipient of notifications that report an occurrence of an event. An event consumer is either temporary or permanent.

event consumer provider (n)~ A provider that determines which permanent event consumer handles a given event.

Event Data Recorder (PN)~ A tool that captures error report data, such as information about what the software was doing when it experienced a problem and about the machine's configuration, and sends it to Microsoft via the Internet.

event filter (n)~ A filter that registers to receive notification of a specific type of event.

event framework (n)~ The combination of runtime event processing, support programs, code libraries, a scripting language, or other software to help develop and glue together the different components of a software project. In Microsoft Dynamics CRM, the plug-ins

and workflows are included in a single event model.

event handler (n)~ A software routine that executes in response to an event.

event header (n)~ The portion of an event that defines the temporal properties of the event and the event kind. Temporal properties include a valid start time and end time associated with the event.

Event Hub throughput unit (n)~ The amount of messages processed/ingested per seconds (ingress/egress) by Event Hub.

Event Hubs (PN)~ A managed platform service that acts as the -€œfront door-€? for an event pipeline to provide a foundation for large-scale data ingestion in a broad variety of scenarios such as behavior tracking in mobile apps, traffic information from web farms, in-game event capture in console games, or telemetry data collected from industrial machines or connected vehicles.

event kind (n)~ Event metadata that defines the event type.

event listener (n)~ A function or object that invokes an event handler when a specific condition occurs in an application.

event log (n)~ A record of activities on a computer system. Events can include attempts to establish communication, successful establishment of sessions, failures of system components, attempts to use files that are damaged or missing, configuration problems, and responses from remote systems.

Event Log service (n)~ A service that records events in the system, security, and application logs.

event logging (n)~ The process of recording an audit entry in the audit trail whenever certain events occur, such as services starting and stopping or users logging on and off and accessing resources.

event model (n)~ The event metadata that defines the temporal characteristics (shape) of the event.

event notification (n)~ A special kind of trigger that sends information about database events to a service broker.

event notification (n)~ A call from a UI Automation provider to a client, in which the provider notifies the client of an event that might affect the state or appearance of a UI item.

event payload (n)~ The data portion of an event in which the data fields are defined as CLR (common language runtime) types. An event payload is a typed structure.

event procedure (n)~ A procedure that is automatically executed in response to an event initiated by the user or program code, or that is triggered by the system.

event property (n)~ A named attribute of a control, form, report, data access page, or section you use to respond to an associated event. You can run a procedure or macro when an event occurs by setting the related event property.

event provider (n)~ A provider that monitors a source of events and notifies the event table when events occur.

event publisher (n)~ An application, service, or driver that creates an event and delivers it to an event log.

event query (n)~ A WMI Query Language statement that event consumers use to register to receive notification of specific events. An event provider uses an event query to register

to generate notifications of specific events.

event registration (n)~ An item that resides in a folder that uses an event sink. The item provides the store with information that includes what events will trigger the sink, the name of the sink, and options such as restrictions for when the event will fire.

event registration item (n)~ A hidden item that contains information about an event sink, information about what events will trigger the event sink, and options that tell when or under what conditions the event sink will be triggered. The event registration item is created in the same folder that is being monitored for events.

event routing (n)~ In Windows Presentation Foundation and Silverlight, the movement of an event in a tree of elements. There are three types of event routing: direct, bubbling, and tunneling. With direct routing, the event does not move in the tree. With bubbling, the event moves up to the top of the tree. With tunneling, the event starts at the top of the tree and moves down to the source of the event. In Silverlight, event routing and routed events are used, but tunneling is not implemented.

event source (n)~ The point of origin of an event.

event table (n)~ A table in the application database that stores event data.

event throttling (n)~ Constraining the rate at which events are sent to the APM service to keep CPU utilization low. Events are constrained by the number of events collected in an event group over time.

Event Trace for Windows (n)~ A general-purpose, high-speed tracing feature of Windows.

Event Tracing for Windows (PN)~ A general-purpose, high-speed tracing feature of Windows.

Event Tracing for Windows (ETW)-based log sink (n)~ A means of capturing trace events on the cache client or cache host with the Event Tracing for Windows (ETW) framework inside Windows.

event trigger (n)~ The mechanism by which a system or application event triggers either an instant or an animated change in one or more properties.

event type (n)~ The event- type for a performance- event is 'information', and the event type for an exception- event is 'error'.

Event view (PN)~ The Operations console pane that displays specified events in the management group that the console user has the rights to see.

Event Viewer (PN)~ A component you can use to view and manage event logs, gather information about hardware and software problems, and monitor security events. Event Viewer maintains logs about program, security, and system events.

event-based asynchronous pattern (n)~ A design pattern that uses events to expose asynchronous features of a class.

Events (PN)~ The link to the online shared event organiser on Windows Live Events.

events and attractions (PN)~ A sub-heading in Local Scout. Events are activities in the area that are taking place over the next few days, and attractions are places or ongoing activities taking place in that area.

Every Product Every (adj)~ A Lean- concept- that is used to establish- a regular repeating production cycle.

Everyone (n)~ A type of user account.

Everyone (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

Everyone (n)~ A game rating symbol developed by Unterhaltungssoftware Selbstkontrolle (USK).

EVERYONE (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

Everyone (public) (PN)~ The UI label for a permissions setting that indicates an item is being shared with (made available to) anyone on the Internet.

Everyone 10 and older (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

Everyone 10+ (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

evict (v)~ To place a windows Live ID in a forced rename state, while the Windows Live ID and all of its existing settings, including the password, Xbox Live points, or Zune points are preserved. The user can sign in using the Windows Live ID and its password, but they're immediately asked to rename the Windows Live ID. They must specify an e-mail address that's outside the Outlook Live domain.

eviction (n)~ The physical removal of a cached object from the memory of the cache host or hosts that it is stored on. This is typically done to keep the memory usage of the cache host service in check.

evidence (n)~ The properties of code, such as a digital signature or the zone or site of its origin, that are used by security policy to grant permissions to code.

EWM (n)~ An enhanced 32-bit vector graphics format for Windows-compatible computers used mostly as a clip art format in word-processing documents.

exabyte (n)~ Approximately one quintillion bytes, or one billion billion bytes.

exact cost reversing (n)~ The reversal of an inventory transaction, using the same cost for the reversing transaction, for example a return order or a credit memo, as was used in the original transaction.

exact word extraction dictionary (n)~ A custom extraction dictionary that lists words or phrases that are matched to exact words in the content in a case-sensitive way. For example, the system matches anchor' to 'anchor

exact word part extraction dictionary (n)~ A custom extraction dictionary that lists words or phrases that are matched anywhere in the content in a case-sensitive way. For example, the system matches anchor' and 'anchorage

Exactly N Matches (PN)~ A menu item that allows the user to search for any pattern A that is represent in pattern B exactly n times. Patterns could be strings, characters, etc.

Excel ~ The most popular- spreadsheet- program for PCs, part of the Microsoft Office suite.

Excel 2016 (PN)~ The year 2016 edition of Excel.

Excel 2016 for Mac (PN)~ The year 2016 edition of Excel for Mac.

Excel add-in (n)~ Components that can be installed on your computer to add commands and functions to Excel. These add-in programs are specific to Excel. Other add-in programs that are available for Excel or Office are Component Object Model (COM) add-ins.

Excel Calculation Server (n)~ The core component of the Excel Server that includes the full Excel calculation functionality. It loads and saves Excel workbooks, queries and refreshes external data, calculates workbooks, and provides the calculated results to the caller.

Excel Calculation Services (n)~ The main Excel Services component, which loads the spreadsheet and workbook, calculates the spreadsheets, updates external data, and maintains session state for interactivity.

Excel Cube Functions (n)~ Functions used to extract and display OLAP data (sets and values).

Excel for Android (PN)~ The version of Excel that runs on the Android operating system.

Excel for iPad (PN)~ The version of Excel that runs on iPad.

Excel for Mac (PN)~ The version of Excel that runs on the Mac operating system.

Excel for Mac for Office 365 (PN)~ The version of Excel from Office 365 that runs on the Mac operating system.

Excel for Mac Preview (PN)~ The public preview for Excel for Mac.

Excel interactive view (n)~ An online view of data that provides an enhanced visual experience through tables, slicers, charts, and other Excel objects.

Excel Mobile Viewer (PN)~ A viewer that allows users to display Excel workbooks on a phone's browser. A file is rendered as an HTML page with sufficient fidelity to convey important data or charts and illustrations.

Excel Online Viewer (PN)~ An Excel Web App technology that enables users to view in full fidelity an Excel document that is stored online.

Excel Services (PN)~ A server technology enabling users to load, calculate, and display Excel workbooks on Microsoft Office SharePoint Server.

Excel table (n)~ A range of cells in a worksheet that has been formatted as a table and can be managed independently from the data in other rows and columns on the worksheet.

Excel Web Services (PN)~ The Excel Services component that provides programmatic access to its Web service.

Excel XML Format (n)~ The formal name for Excel 12 file format. The Excel XML Format has an open, royalty-free specification, and is the technology licensed to external parties.

exception (n)~ An abnormal condition or error that occurs during the execution of a program. An exception requires the execution of software outside the normal flow of control.

exception (n)~ An instruction that tells Windows Firewall to open a port briefly, allow a program or service to pass a specific piece of information through, and then close the port. These instructions are called exceptions' because normally the firewall blocks all unsolicited attempts to send information.'

Exception Assistant (n)~ A Visual Studio debugging tool that provides information about the cause of an exception in a Visual Basic or Visual C# program.

exception event (n)~ A diagnostic event in IntelliTrace that occurs within the Visual Studio Debugger. Exception events include exceptions thrown, exceptions caught, and unhandled exceptions.

exception events (n)~ Critical application and system errors. Application Performance

Monitoring (APM) defines critical errors as being those that lead to a monitored component's failure. For ASP.NET- applications, a critical exception results in the user seeing either the standard or a custom error page.- For web services, critical exceptions- are those that ASP.NET serializes into valid SOAP- messages on the server-side, and deserializes to SoapExceptions- on the ASP.NET client.

exception handler (n)~ A block of code that reacts to a specific type of exception.

exception handler (n)~ An application function that is called in exception catch blocks to report errors and perform some error handling.

exception report (n)~ A report that shows the general ledger account balances that were not included in the financial report.

exception string (n)~ A string that contains information about an abnormal condition or error that occurs during the execution of a program.

exceptional threshold (n)~ The maximum limit of an individual transaction value that is a part of a cumulative transaction value, up to which a tax on the transaction value is not calculated. The exceptional threshold is applied to an individual transaction value that is a part of a cumulative transaction value that is within the cumulative threshold.

EXCH50 binary large object (n)~ A set of properties, generated and managed by Exchange Server, which is stored with each message and contains metadata about a given message. Often referred to as EXCH50 BLOB.

EXCH50 BLOB (n)~ A set of properties, generated and managed by Exchange Server, which is stored with each message and contains metadata about a given message. Often referred to as EXCH50 BLOB.

exchange (v)~ To provide Wi-Fi credentials to Outlook.com contacts, Skype contacts, and Facebook friends.

Exchange (PN)~ A marketplace in which securities, commodities, derivatives, and other financial instruments are traded.

Exchange ActiveSync (n)~ A protocol that makes it possible for users to sync their e-mail, calendar, contact, and task data from Exchange Server to supporting devices.

exchange adjustment (n)~ The process of recalculating an account balance to reflect a change in the exchange rate for transactions in foreign currencies. The transaction gain or loss is considered unrealized if the adjustment is calculated for reporting purposes alone, and realized if the debt is paid or the revenue is received.

Exchange admin center (PN)~ A web-based management tool for Microsoft Exchange administrators and enterprise e-mail users.

Exchange Administration Center (PN)~ A web-based management tool for Microsoft Exchange administrators and enterprise e-mail users.

Exchange administrator (n)~ The administrator account with privileges to administer Exchange services.

Exchange by Phone (n)~ A feature that allows a Unified Messaging-enabled user to access their Microsoft Exchange Server mailbox over the telephone. Users can navigate through their mailboxes using telephone-key or Speech input.

Exchange Conferencing Services (n)~ A service that allows users to meet in virtual rooms on a server running Exchange.

Exchange Control Panel (PN)~ A web-based management tool for Microsoft Exchange

administrators and enterprise e-mail users.

Exchange Enterprise CAL Services (EOP, DLP) for Government (PN)~ The offer for government organizations that are also Exchange Enterprise CAL customers that includes Exchange Online Protection (EOP) and data loss prevention (DLP) and that is hosted in the government cloud environment.

Exchange Fast Access (PN)~ A feature that enables Exchange users to see new email messages and up-to-date calendar items as soon as they open Outlook, without waiting for it to finish synchronizing.

Exchange Hosted Services (PN)~ Hosted spam and virus filtering from an Exchange Hosted Services provider. Users' e-mail is filtered according to rules managed by the organization's administrators. Users and administrators are given varying rights to adjust the filtering rules.

Exchange hybrid deployment (n)~ A connection established between on-premises and cloud email systems that not only allows users to use email from either location with the same set of credentials, but provides a richer management experience.

Exchange Management Console (n)~ The Exchange 2007 graphical user interface (GUI) from which administrators can perform tasks to configure and manage Exchange servers. The Exchange Management Console is based on Windows Microsoft Management Console (MMC) 3.0.

Exchange Management Shell (n)~ A command-line interface and associated command-line plug-ins for Exchange Server that enable automation of administrative tasks. The Exchange Management Shell is built on Windows PowerShell technology, formerly codenamed Monad.

Exchange Online (Plan 1) (Government Pricing) (PN)~ The offer for government organizations for Exchange Online (Plan 1) that is hosted in the commercial cloud environment.

Exchange Online (Plan 1) for Government (PN)~ The offer for government organizations for Exchange Online (Plan 1) that is hosted in the government cloud environment.

Exchange Online (Plan 2) (Government Pricing) (PN)~ The offer for government organizations for Exchange Online (Plan 2) that is hosted in the commercial cloud environment.

Exchange Online (Plan 2) for Government (PN)~ The offer for government organizations for Exchange Online (Plan 2) that is hosted in the government cloud environment.

Exchange Online Archiving (EOA) for Exchange Online Customers (Government Pricing) (PN)~ The offer for government organizations for Exchange Online Archiving (EOA) for Exchange Online Customers that is hosted in the commercial cloud environment.

Exchange Online Archiving (EOA) for Exchange Server (Government Pricing) (PN)~ The offer for government organizations for Exchange Online Archiving (EOA) for Exchange Server that is hosted in the commercial cloud environment.

Exchange Online Archiving for Nonprofits (PN)~ An offer from Microsoft Office 365 for nonprofit organizations that is a personal email archive for users who have mailboxes

on Microsoft Exchange Server 2010.

Exchange Online Kiosk (Government Pricing) (PN)~ The offer for government organizations from Office 365 for Exchange Online Kiosk, and that is hosted in the commercial cloud environment.

Exchange Online Protection (PN)~ The stand-alone email filtering service for customers that run Exchange or another messaging solution on-site but use the Exchange Online Protection service that is hosted in the Microsoft cloud environment.

Exchange Online Protection (Government Pricing) (PN)~ The offer for government organizations for Exchange Online Protection that is hosted in the commercial cloud environment.

Exchange Online Protection for Government (PN)~ The offer for government organizations for Exchange Online Protection that is hosted in the government cloud environment.

Exchange Organization Administrators role (n)~ One of four Exchange 2007 administrator roles. Members of this role have full access to all Exchange properties and objects in the Exchange organization.

exchange rate (n)~ The rate at which the currency of one country or region can be traded against that of another country or region.

exchange rate (n)~ The value of one exchange currency unit relative to another exchange currency unit.

exchange rate adjustment (n)~ A modification to a converted monetary amount when the exchange rate between the quotation unit and the base unit change.

exchange rate type (n)~ A classification that groups exchange rates.

Exchange Recipient Administrators role (n)~ One of four Exchange 2007 administrator roles. Members of this role have permissions to modify any Exchange property on an Active Directory user, contact, group, dynamic distribution group, or public folder object.

Exchange Server (PN)~ Microsoft client/server messaging and collaboration software.

Exchange server (n)~ A server that has Microsoft Exchange Server installed.

Exchange Server Administrators role (n)~ One of four Exchange 2007 administrator roles. Members of this role have access to only local server Exchange configuration data, either in Active Directory or on the physical computer on which Active Directory is installed.

Exchange Server connector (n)~ A Configuration Manager technology that connects to Exchange Server to discover and manage mobile devices.

Exchange services (n)~ Exchange-specific services that run on a server that has Microsoft Exchange Server installed.

Exchange store (n)~ A storage platform that provides a single repository for managing multiple types of unstructured information in one infrastructure. The Exchange store combines the features and functionality of the file system, the Web, and a collaboration server (such as Microsoft Exchange) through a single, URL-addressable location for storing, accessing, and managing information, as well as building and running applications. The Exchange store is also known as the Web Storage System.

Exchange System Manager (n)~ A collection of Microsoft Management Console (MMC) snap-ins that Microsoft Exchange provides.

Exchange View-Only Administrators role (n)~ One of four Exchange 2007 administrator roles. Members of this role have read-only access to the entire Exchange organization tree in the Active Directory configuration container, and read-only access to all Windows domain containers that have Exchange recipients.

Exchange Web Services (n)~ A set of features that provides a programming interface for accessing Microsoft Exchange data through the Client Access server role by using Web services.

Exchangeable Image File Format (n)~ A standard for storing metadata, e.g. shutter speed and focal length, in image files, especially files using JPEG compression.

exclamation point (n)~ The ! character.

Exclude Author (PN)~ Feature to remove specific publishers from the acquisition.

exclude dictionary (n)~ A dictionary with words that the main dictionary recognizes as being spelled correctly, but that you want to verify during a spelling check.

exclude overlap (v)~ To combine two or more shapes or paths to result in a single compound path that omits the areas where overlaps occurred. If you release the compound path, the individual shapes are put into their own path objects.

Excluded sources (PN)~ The list in the Settings area that shows the domains and subdomains that are excluded from the analysis.

Excluded terms (PN)~ List of words or phrases that are excluded from the analysis. The post won't appear in the analysis.

exclusion (n)~ Term or sentence that must not appear in conjunction with a search phrase.

exclusion interval (n)~ The amount of time that an unresponsive or malfunctioning component remains marked as unavailable. During this time, no requests are sent from the client to the excluded component.

exclusion list (n)~ A set of files or processes that will be factored out from a certain command.

exclusion range (n)~ A small range of one or more IP addresses within a DHCP scope excluded from the DHCP service. Exclusion ranges ensure that these scope addresses will never be offered to clients by the DHCP server.

exclusions (PN)~ A Windows feature (in CSS) that allows web designers and developers to wrap text and other inline content around specified elements and fragments. Figures can be absolutely positioned on a web page while still remaining part of the document flow. Figures can be positioned some specified distance from the top, bottom, left or right sides of the containing block.

exclusive (adj)~ Pertaining to a type of access to data in a database that is shared over a network. When you open a database in exclusive mode, you prevent others from opening the database.

exclusive lock (n)~ A lock that prevents any other transaction from acquiring a lock on a resource until the original lock on the resource is released at the end of the transaction.

exe (or .exe) ~ (EXEcutable; pr. 'exie', 'dot exie') A- file- which is usually the main part of a program. A program mmay consist of just an exe file and nothing else, or there may be dozens of files, including more .exes.

executable (adj)~ Of, pertaining to, or being a program file that can be run. Executable files have extensions such as .bat, .com, and .exe.

executable (n)~ A file in portable executable (PE) file format that can be loaded into memory and executed by the operating system loader. It can be either an .exe or a .dll file. In the .NET context, a PE file must be translated by the common language runtime into code before it can be executed by the operating system.

executable file (n)~ A file in portable executable (PE) file format that can be loaded into memory and executed by the operating system loader. It can be either an .exe or a .dll file. In the .NET context, a PE file must be translated by the common language runtime into code before it can be executed by the operating system.

executable folder (n)~ A folder in a Web site from which scripts and executable programs can be run.

executable image (n)~ A program that can be run at the command line.

execute (v)~ To perform an instruction.

execute buffer (n)~ A fully self-contained, independent packet of information that describes a 3-D scene. An execute buffer contains a vertex list followed by an instruction stream. The instruction stream consists of operation codes and the data that is operated on by those codes.

execution context (n)~ In the Concurrency Runtime, an abstraction of an operating system thread.

execution cycle (n)~ The assertion of facts, evaluation of conditions, and execution of actions within the Business Rule Engine.

Execution Plan pane (n)~ One of the tabs that hosts the output for an estimated or actual execution plan that SQL Server uses.

execution tree (n)~ The path of data in the data flow of a SQL Server 2005 Integration Services package from sources through transformations to destinations.

executive planner (n)~ The employee who is responsible for the overall sales and operations plan.

executive resource (n)~ A resource that is designed for use with data structures that require exclusive access for writing, but that can be read by several threads concurrently. Executive resources are not maintained in the system's dispatcher database, so they usually are faster and more efficient than kernel dispatcher objects.

exempt ID (n)~ An identification number that is issued by a tax authority to indicate that a company is not required to pay sales tax.

exempt payee (n)~ An individual or entity that has no tax liability under US tax laws because they are not a citizen, resident alien, or an organization created or organized under the laws of the United States.

exempt user agent (n)~ A user agent, commonly a search bot, that can receive InfoPath forms instead of a Web page in response to an HTTP request.

Exercise Tracker (PN)~ A feature that allows the user to track cardio activities, including distance, time, pace and calories.

EXIF (n)~ A standard for storing metadata, e.g. shutter speed and focal length, in image files, especially files using JPEG compression.

exit (v)~ In a program, to move from the called routine back to the calling routine. A routine can have more than one exit point, thus allowing termination based on various conditions.

Exit (PN)~ An item on the right-click menu for the Communicator icon that appears in the Windows taskbar that signs the user out of Communicator and closes all open Communicator windows and dialog boxes.

exit (v)~ To close a program or application.

exit animation effect (n)~ An animation effect that is applied to text or pictures exiting a PowerPoint presentation.

exit criteria (n)~ A set of circumstances that a product or service must meet before a particular milestone is complete. The presence of exit criteria signal the end of a successful effort.

Exit HTML Source (v)~ An option that switches the view from the display of HTML source code to the display of Web page content.

exit module (n)~ A Certificate Services component that performs post-processing after a certificate is issued, such as the publication of an issued certificate to Active Directory.

exit page (n)~ The last page a visitor sees before leaving a Web site.

exit plan ~ The plan developed for coping with the end of the contract — whether because the term is up or because termination clauses have been invoked.

expand (v)~ To display the subentries contained within a folder or outline view.

expand control (n)~ A control that, when clicked, expands or collapses a grouped record to display or hide its detail records.

expand indicator (n)~ A control that, when clicked, expands or collapses a grouped record to display or hide its detail records.

expanded memory (n)~ Type of memory that can be added to IBM personal computers. The use of expanded memory is defined by the Expanded Memory Specification (EMS), which supports memory boards containing RAM that can be enabled or disabled by software.

expanded screen mode (n)~ A visual setting that is similar to -€œstretch-€? - the resolution of the phone screen is refitted to fill as much of the external screen as possible without compromising its dimensionality.

expansion card (n)~ A card that connects to an expansion bus and contains one or more devices.

Expansion card (or board) ~ A circuitboard which can be plugged in to an expansion slot on the PC's- motherboard, to give the PC extra capabilities. A lot of the features originally provided by expansion cards, like sound, graphics and network connections, are now built in.

expansion depth (n)~ The number of levels to which a minimized hierarchical scorecard can be opened.

expansion slot (n)~ A socket in a computer, designed to hold expansion boards and connect them to the system bus.

expansive stemming (n)~ The process of expanding stems (root forms of words) to their inflected forms. For example, the word swim' is expanded to the forms 'swimming' and 'swam.' Expansive stemming can create a list of all possible word forms that can be used by the query processor alongside the query string. '

expected deployment results (n)~ The complete deployment information associated with a pre-staged or unknown device, based on parameters defined by the user in the Expected

Deployment Results Wizard and Windows Deployment Services configuration, which would be the result of performing a production deployment with a client device that matched the parameters specified in the Wizard.

expected duration (n)~ The total span of active working time expected for a task, that is, the amount of time from the expected start to the expected finish of a task.

expected purchase order net amount (n)~ The anticipated currency amount for a purchase order line, calculated as follows: Purchase order Net unit price * Invoice quantity.

expected revenue (n)~ The amount of money an opportunity is expected to generate.

Expedited Forwarding (n)~ A class for the delivery of audio media streams.

expenditure (n)~ A cost or expense that is expended during an accounting period.

expenditure cycle (n)~ A recurring set of procurement, receipt, payment, and transfer activities controlled by one or more parties that participate in exchange and nonexchange transactions.

expenditure recognition accounting rule (n)~ A recognition accounting rule that prescribes the recognition of expenditure in accounts and on financial statements.

expense (n)~ A cost incurred by a business in an attempt to obtain revenue.

expense (n)~ A cost that expires when the benefits that incurred the cost are received during an accounting period.

expense deduction (n)~ Allowance under U.S. Tax Section 179 for expensing all or a portion of the cost of an asset in the year of acquisition, rather than expensing, or depreciating, over the life of the asset. A Section 179 deduction and depreciation are mutually exclusive.

expense product (n)~ A received product that is a current asset, not held for sale or consumed in production, and for which there is no stock control policy requiring quantity tracking or inventory control policy requiring stock value tracking, and for which there is an accounting policy requiring the recording of the cost as an expense.

experience (n)~ A set of scenarios that lead to a desired outcome by a customer segment.

Expertise (PN)~ The field in users' Yammer profiles that allows them to list skills or knowledge that they have.

expiration (n)~ The point at which an object has exceeded the cache time-out value. When an object expires, it is evicted.

expiration date (n)~ The date on which something ceases to be effective.

expiration date (n)~ The date after which information or a resource is no longer valid.

Expiration Date option (n)~ An option on the Policy Filter page for setting an expiration date. This option can be specified for any policy rule.

expire interval (n)~ For DNS, the number of seconds that DNS servers operating as secondary masters for a zone will use to determine if zone data should be expired when the zone is not refreshed and renewed.

expired virtual machine (n)~ A virtual machine that can no longer be managed by the self-service user who owns it because the virtual machine's expiration date has passed.

Explicit (PN)~ In Store, label for songs or videos whose content contains explicit sexuality, violence, or curse words.

explicit cap (n)~ An explicit hierarchy used as the top level of a derived hierarchy

structure.

Explicit Congestion Notification (n)~ A frame relay network technology for, monitoring and adapting to the network bandwidth available for delivery of data packets between source and destination nodes. Either the source or the destination node may set a bit in a packet header to request that the transmission or request rate be decreased.

explicit data context (n)~ A binding to a data source within the data context that is specified for the current object or one of its parents.

explicit discovery (n)~ A feature that defines the logic for locating only the network devices that you specify and that you want Operations Manager to monitor.

explicit hierarchy (n)~ In Master Data Services, a hierarchy that uses consolidated members to group other consolidated and leaf members.-

explicit interface implementation (n)~ The implementation of a class or structure member that is accessible only through the interface that the class or structure implements.

Explicit Language (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

explicit loading (n)~ A pattern of loading where related objects are not loaded until explicitly requested by using the Load method on a navigation property.

explicit permission (n)~ A type of object permission that is defined when the object is created, specifically assigned, or changed by the owner of the object.

explicit profiling (n)~ An information collecting process in which customers visiting a Web site supply profile data about themselves.

explicit selection (n)~ A selection that a user intentionally makes with an input device.

explicit targeting (n)~ The process of delivering targeted content by using existing data about the customers who browse your site.

explicit transaction (n)~ A group of SQL statements enclosed within transaction delimiters that define both the start and end of the transaction.

explode (v)~ To determine the total quantities of components needed for a manufactured item.

exploded doughnut chart (n)~ A doughnut chart that displays the contribution of each value to a total while emphasizing individual values, by showing each slice of the doughnut as pulled out

exploded pie (n)~ A pie chart that displays the contribution of each value to a total while emphasizing individual values, by showing each slice of the pie as pulled out

exploded pie chart (n)~ A pie chart that displays the contribution of each value to a total while emphasizing individual values, by showing each slice of the pie as pulled out

Exploding (n)~ A credit animation in Windows Movie Maker.

Exploding Outline (n)~ A title animation in Windows Movie Maker.

exploit (n)~ Malicious code that takes advantage of vulnerabilities in other software in order to take unwanted and unexpected action on impacted systems. An exploit is often used to install other malicious or potentially unwanted software on a target computer without the knowledge or consent of the affected user.

exploit (v)~ To use malicious code that takes advantage of vulnerabilities in other software in order to take unwanted and unexpected action on impacted systems.

exploit ~ an attack on a computer system, especially one that takes advantage of a

particular vulnerability that the system offers to intruders. Used as a verb, the term refers to the act of successfully making such an attack.

exploit vulnerability (n)~ The vulnerability that makes a computer susceptible to an exploit.

exploratory testing (n)~ The testing of an application without a set of tests defined in advance.

explosion (n)~ The process of determing the total quantities of components needed for a manufactured item.

exponential moving average (n)~ A moving average of data that gives more weight to the more recent data in the period and less weight to the older data in the period. The formula applies weighting factors which decrease exponentially. The weighting for each older data point decreases exponentially, giving much more importance to recent observations while still not discarding older observations entirely.

exponential trendline (n)~ A curved trendline that is used when data values rise or fall at constantly increasing rates.

exponentiation (n)~ The operation in which a number is raised to a given power, as in 23. In computer programs and programming languages, exponentiation is often shown by a caret (^), as in 2^3.

export (v)~ To output data and database objects to another database, spreadsheet, or file format so another database, application, or program can use the data or database objects. You can export data to a variety of supported databases, programs, and file formats.

Export (n)~ A report that lists all files under the specified namespace. A number of useful file system properties are included for each file. The generated data is suitable for importing into data processing applications for further analysis.

Export (PN)~ UI feature that allows you to export data to another program like Excel.

Export Commodity Classification Number (PN)~ A five character alpha-numeric classification used in the Commerce Control List to identify items for export control purposes as defined in licensing information by the US government.

export format (n)~ UI text for subscriptions and HTML viewer. Corresponds to rendering extensions.

export format (n)~ The file format for the export of payments.

Export XML Wizard (n)~ A feature in Microsoft CRM Customization that exports customized forms and views.

expose (v)~ To host and make available a Web service so that it can be used by other applications or services.

exposure (n)~ The amount of light emitted onto a film or image sensor.

exposure bias (n)~ A control on most digital cameras that lets you control the under -or over- exposure of the image.

exposure bias compensation (n)~ A control on most digital cameras that lets you control the under -or over- exposure of the image.

exposure bracketing (n)~ A photographic technique of taking multiple photos of the same scene with different exposure settings.

exposure compensation (n)~ A control on most digital cameras that lets you control the under -or over- exposure of the image.

exposure limit (n)~ The number of times a piece of content can be shown to a customer within a session. By default, the exposure limit is set to no exposure limit. It is recommended that the upper exposure limit is not set to more than 10 exposures per customer per session.

exposure time (n)~ The amount of time a shutter is open during exposure to allow the light to reach the film or, in digital cameras, the image sensor.

express full backup (n)~ A synchronization operation in which the protection agent transfers a snapshot of all blocks that have changed since the previous express full backup (or initial replica creation, for the first express full backup).

Express License description (n)~ A description of the Express license.

express message (n)~ For Message Queuing, a message that uses fewer resources and is faster than a recoverable message. However, because express messages are mapped to memory, they are lost if the computer storing them fails.

Express Upgrade (PN)~ The promotional program that encourages OEM Direct and SBC to upgrade to Windows Vista.

express writer (n)~ A scheme for applications to only identify their components requiring to be backed up without the necessity of creating a full VSS writer.

expression (n)~ Any combination of operators, constants, literal values, functions, and names of fields (columns), controls, and properties that evaluates to a single value.

expression box (n)~ A control on a form that displays read-only data as the result of a lookup or calculation against the data using an XPath expression.

Expression Builder (n)~ A tool you use to create an expression. The Expression Builder includes a list of common expressions that you can select from to define the properties you want to target.

expression host assembly (n)~ All expressions found within a report are that are compiled into an assembly. The expression host assembly is stored as a part of the compiled report.

expression store (n)~ The tables in a Commerce Server database that store expression information.

expression tree (n)~ A tree-form data representation of the structure of language-level code expressions.

ExpressRoute (PN)~ The Microsoft Azure service that enables users to create private connections between Azure datacenters and infrastructure on premises or in a colocation environment.

extended affinity (n)~ A type of client affinity that is preserved when configuring a change to a Network Load Balancing cluster. It also allows clients to keep affinity to a cluster host even if there are no existing connections from the client to the host.

extended amount (n)~ The figure calculated by multiplying the quantity of a service or product by the amount of the item.

extended character (n)~ Any of the 128 additional characters in the extended ASCII (8-bit) character set. These characters include those in several non-English languages, such as accent marks, and special symbols used for creating pictures.

extended desktop (n)~ A computer desktop area that extends across all displays that are connected to a computer.

eXtended Development Environment (n)~ An extended development environment integrating Microsoft Visual Studio .NET and Rational Application Developer.

extended form registration (n)~ A service from BGC that includes a supplementary registration in order to receive reports of all reference numbers on payments made by giro transfer/deposit slip. This service can be extended with controls of the reference number.

Extended Industry Standard Architecture (n)~ A bus standard for the connection of add-on cards to a PC motherboard, such as video cards, internal modems, sound cards, drive controllers, and cards that support other peripherals. EISA was introduced in 1988 by a consortium of nine computer industry companies. The companies—AST Research, Compaq, Epson, Hewlett-Packard, NEC, Olivetti, Tandy, Wyse, and Zenith—were referred to collectively as the Gang of Nine'. EISA maintains compatibility with the earlier Industry Standard Architecture (ISA) but provides for additional features introduced by IBM in its Micro Channel Architecture bus standard. EISA has a 32-bit data path

extended key usage (n)~ An extended property value that specifies the uses for which a certificate is valid.

extended member (n)~ A member that is added to a TypeName or MshObject instance by developers (cmdlet or script).

extended memory (n)~ Memory beyond one megabyte in 80286, 80386, 80486, and Pentium computers.

extended network (n)~ The people in someone's network -€" their Messenger and profile contacts -€" plus the profile contacts of people in their network.

extended partition (n)~ A type of partition that you can create only on basic master boot record (MBR) disks. Extended partitions are useful if you want to create more than four volumes on a basic MBR disk. Unlike primary partitions, you do not format an extended partition with a file system and then assign a drive letter to it. Instead, you create one or more logical drives within the extended partition. After you create a logical drive, you format it and assign it a drive letter. An MBR disk can have up to four primary partitions or three primary partitions, one extended partition, and multiple logical drives.

extended permission (n)~ A permission that is specific to an object added to the standard Active Directory object schema. The permission associated with the new object extends the existing default permission set.

extended price (n)~ The item price that is entered on a purchase order.

extended price (n)~ The price of a quantity of product expressed in purchase units calculated from the sales unit price, multiplied by the product quantity in purchase units, divided by the sales unit quantity.

Extended property (n)~ User-defined text (descriptive or instructional including input masks and formatting rules) specific to a database or database object. The text is stored in the database as a property of the database or object.

Extended Protection for Authentication (PN)~ A security feature that helps protect against man-in-the-middle (MITM) attacks.

extended registration (n)~ A registration that requires meeting participants or viewers of a recording to supply their e-mail address and company name, in addition to their name, when logging in to the Live Meeting service.

extended selection (n)~ A selection technique that is optimized for the selection of a single object or single range using contiguous selection techniques. However, it also supports modifying an existing selection using disjoint selection techniques.

extended stored procedure (n)~ A function in a dynamic link library (DLL) that is coded using the SQL Server Extended Stored Procedure API. The function can then be invoked from Transact-SQL using the same statements that are used to execute Transact-SQL stored procedures.

extended verb (n)~ A verb (shortcut menu item) that is invoked by a Shell object when a user right-clicks the object while pressing the SHIFT key in the context menu.

extended view (n)~ The display of additional data or information that does not appear in the standard view.

extended-selection list box (n)~ A list box that supports multiple selection, but is optimized for a selection of a single object or single range. See also extended selection and list box.

extender control (n)~ In ASP.NET, a control that encapsulates functionality that is implemented in JavaScript and that defines behavior in the browser. Extender controls are associated with existing Web server controls to add the extender's behavior to that control. For example, an extender control can add a watermark to any TextBox control or drag-and-drop behavior to a variety of ASP.NET Web server controls.

extender object (n)~ An object implemented by the container, generally by aggregating with the control. An Extender object wraps around an ActiveX control to add properties, methods, and events such as TabStop, Move, GotFocus, and Validate.

extensibility (n)~ The capacity to extend or stretch the functionality of the development environment - to add something to it that didn't exist there before.

extensibility application (n)~ An external software application that adds a new service or feature to a program or environment.

Extensible Application Markup Language (PN)~ An XML-based language used to represent a tree of objects. Events generated by these objects can be handled using any .NET programming language.

eXtensible Business Reporting Language (oth)~ An XML language for the electronic communication of business and financial data.

Extensible Firmware Interface (oth)~ A type of interface between a computer, firmware, hardware, and the operating system. EFI defines a new partition style called GUID partition table (GPT). EFI serves the same purpose as the basic input/output system (BIOS) found in most x86-based computers.

Extensible Firmware Interface system partition (n)~ A small portion on a GUID partition table (GPT) disk that is formatted with the file allocation table (FAT) file system and contains the files necessary to start the computer and pass execution to an operating system which resides on another partition.

Extensible HTML (PN)~ A markup language that extends HTML and reformulates it as XML.

Extensible Markup Language (n)~ A markup language for describing and exchanging structured data in a format that is independent of operating systems and applications. XML is a World Wide Web Consortium (W3C) specification and is a subset of Standard

Generalized Markup Language (SGML).

eXtensible Metadata Platform (n)~ An extensible markup language that records metadata in a syntax that is a subset of XML. It is used in PDF, photography and photo editing applications and was first introduced by Adobe Systems in April 2001.

extensible rights markup language (n)~ A proposed standard digital rights management (DRM) markup language which enables users to specify rights and conditions associated with resources, such as digital content or Web services.

Extensible Storage Engine (PN)~ A method that defines a low-level API to the underlying database structures in Exchange Server. Extensible Storage Engine is also used by other databases, such as the Active Directory directory service database.

Extensible Stylesheet Language (n)~ An XML vocabulary that is used to transform XML data to another form, such as HTML, by means of a style sheet that defines presentation rules.

Extensible Stylesheet Language Transformations (n)~ A declarative, XML-based language that is used to present or transform XML data.

extension (n)~ A set of characters added to the end of a file name that identifies the file type or format.

extension (n)~ A program or program module that adds functionality to or extends the effectiveness of a program.

Extension ~ The part of a PC filename after the dot (.), often used to tell Windows what type of file it is. For example, files ending in .exe are programs, and files ending .jpg or .gif are pictures. Note that Windows is often set up not to display the extension in Windows Explorer or My Computer, another helpful idea to confuse beginners from our friends at Microsoft.

extension handler (n)~ A handler that specifies additional actions to be taken on Shell items beyond that which can be defined through registry entries or .ini files, such as actions specific to members of a given file type.

extension method (n)~ A static method that can be invoked by using instance method syntax. In effect, extension methods make it possible to extend existing types and constructed types with additional methods.

extension point (n)~ A location within a use case at which an action sequence from another use case may be inserted. Within a use case, each extension point name must be unique. Extension points appear in a compartment at the bottom of the Use Case shape.

extent (n)~ The width or height of the viewport.

extent (n)~ On a disk or other direct-access storage device, a continuous block of storage space reserved by the operating system for a particular file or program.

external (adj)~ Imported from an accounting system. Refers to the product or service item list that was imported from the accounting system into Business Contact Manager for Outlook.

external access (n)~ Authenticated access that can be granted to external partners and clients to enable sharing of selected SharePoint Online content.

External Application XML (n)~ XML that provides information about an external application and about the Web Part that hosts it.

External Cache 1.0 (PN)~ A disk-based cache module for IIS 7 that is used to manage the

host name affinity data between multiple instances of Application Request Routing (ARR) servers.

external contact (n)~ People outside the Outlook Live organization who can be added to public groups and displayed in your organization's address book and other address lists. External contacts have e-mail addresses outside the organization and can't sign in to your domain.

External Contacts (PN)~ A privacy relationship setting that allows a small amount of information to be viewed, typically for nonfederated contacts.

external content type (PN)~ An object (such as a customer, item, or employee) that shares a set of defined attributes or characteristics, and that is used to manage rules for data.

External Content Type Collaboration (PN)~ A feature that turns on the Collaborate On functionality for a site collection.

External Content Type data source (n)~ A type of data source used to connect to an external data source.

External Content Type Designer (PN)~ A modeling tool in SharePoint Designer that enables users to create external content types, external lists and forms without writing code.

External Content Type Picker (PN)~ ?A BCS feature that allows users of a composite solution to select an external content type from within an Office client application.

external context (n)~ In the Concurrency Runtime, a context that is created by an application component that is external to the Task Scheduler. An external context generates parallel work for a Task Scheduler and participates in that work.

external customer (n)~ An outside organization or individual that submits a sales order for goods or services.

external data (n)~ Data that is stored outside of the application that is currently in use.

external data column (n)~ A column type that allows data from external systems to be incorporated into SharePoint lists.

External Data Grid (PN)~ A Web Part that displays a list of external items from a business application registered in the BDC Metadata Store.

External Data Grid Web Part (PN)~ A Web Part that displays a list of external items from a business application registered in the BDC Metadata Store.

External Data Item (PN)~ A Web Part that can display a single item in an external list.

External Data Item Builder (PN)~ A Web Part that creates an external item based on parameters in the query string and provides it to other Web Parts. This Web Part is used only on external data profile pages.

External Data Item Builder Web Part (PN)~ A Web Part that creates an external item based on parameters in the query string and provides it to other Web Parts. This Web Part is used only on external data profile pages.

External Data Item Web Part (PN)~ A Web Part that can display a single item in an external list.

external data part (n)~ A set of controls that interact with external data through BCS.

external data provider (n)~ A business entity, typically a company, that provides up to date data to a Microsoft Dynamics CRM user.

external data range (n)~ A range of data that is brought into a worksheet but that originates outside of Excel, such as in a database or text file.

External Data Related List (PN)~ A Web Part that displays a list of related external items from a business application.

External Data Related List Web Part (PN)~ A Web Part that displays a list of related external items from a business application.

External Data Web Parts (n)~ Out-of-the-box Web Parts that are shipped as part of Business Connectivity Services.

external database (n)~ The source of the table that is to be linked or imported to the current database, or the destination of a table that is to be exported.

external delivery system (n)~ A system, such as Microsoft Exchange Server, that delivers formatted notifications to destination devices.

external dependency (n)~ A relationship in which the start or finish date of a task depends on a task in another project.

external display (n)~ A computer monitor that supplements the main monitor.

external drive (n)~ A stand-alone drive that is externally connected by a cable to the computer system.

external endpoint (n)~ The endpoint on which a role instance receives inbound traffic.

external hyperlink (n)~ A hyperlink pointing to a page or file that is outside of the current web.

External Identity Authentication (n)~ In the Multi-Factor Authentication service of the Azure Identity Service, the process to grant access to resources to external users using third-party credentials.

external item (n)~ An specific occurence of an external content type.

External Item Picker (PN)~ A BCS feature that allows users of a composite solution to select external data from within an Office client application.

external key (n)~ A file that contains information to access cryptographically locked data, which is stored away from the system, such as on a USB flash drive.

external key file (n)~ A file that contains the external key and is stored on an external media device. The name and contents of the file are internal to Microsoft and can change from version to version.

external list (PN)~ A Windows SharePoint Services or SharePoint Server list from an external content type.

external list deployment (n)~ Automated deployment of a simple solution for BCS, using ClickOnce technology. An example would be taking an external list offline to Outlook or SharePoint Workspace.

external load balancer (n)~ A load-balancing mechanism that is located externally to a firewall server, e.g. a hardware-based solution.

external network number (n)~ A 4-byte hexadecimal number used for addressing and routing purposes on NetWare networks. The external network number is associated with physical network adapters and networks.

external port (n)~ A port on a computer that is available on the Internet.

external predecessor (n)~ A predecessor to a task in the current project that resides in another project, represented by a task that appears dimmed in the task list.

external project (n)~ A project with a direct customer relation.

External sharing (PN)~ A feature that manages the ability to share various components of the Office 365 site (such as Outlook calendars, SharePoint sites, and Lync meetings) with visitors or external users.

external source system (n)~ A data repository, such as a data warehouse, data mart, or OLTP system, that is outside a specific deployment.

external storage card (n)~ A device for data storage that is external to a computer's main memory.

external style (n)~ A style in an external style sheet.

external style sheet (n)~ A cascading style sheet (CSS) in a file with a .css file name extension.

external style sheet (n)~ A style sheet defined in a user control in an .ascx file.

external successor (n)~ A successor to a task in the current project that resides in another project, represented by a task that appears dimmed in the task list.

External System (PN)~ A supported source of data that can be modeled by Business Connectivity Services, such as a database, Web service, or custom .NET Framework assembly.

external table (n)~ A table outside the open database or project.

external task (n)~ A task that represents a linked task in another project, providing an easy way to review the attributes of linked tasks without switching between projects. An external task can be changed only in the source project.

external task (n)~ A line item in a timesheet that does not correspond to a project task in Project Server.

external URL mapping (n)~ A URL mapping for objects that are not part of the WSS system.

external user (n)~ A user who connects to an account from outside the firewall.

external user invitation report (n)~ A report that lists the email address, invitation date, invitation status, and invitation submitter for external users invited to a SharePoint site collection.

external virtual network (n)~ A virtual network configured to use a physical network adapter. External virtual networks are used to connect virtual machines to external networks.

extra color (n)~ A color that is not part of a color scheme.

extra-bold (adj)~ Having a font weight that corresponds to a weight class value of 800 according to the OpenType specification.

extract (v)~ To remove or duplicate items from a larger group in a systematic manner.

extract (v)~ To decompress, or pull out, files from a compressed form. When you extract a file, an uncompressed copy of the file is placed in the folder you specify. The original file remains in the compressed folder. Compressed files frequently have a .zip file name extension.

extract (v)~ To build a DAC package file that contains the definitions of all the objects in an existing database, as well as instance objects that are associated with the database.

extract ~ A data synopsis from a given system which is passed to another system to complete processing.

extraction rule (n)~ A rule that copies a string from a Web test response and puts it in the test context for use later in the test.

extraction, transformation, and loading (n)~ The act of extracting data from various sources, transforming data to consistent types, and loading the transformed data for use by applications.

extra-light (adj)~ Having a font weight that corresponds to a weight class value of 200 according to the OpenType specification.

extranet (n)~ An extension of an organization's intranet used to facilitate communication with the organization's trusted partners. An extranet allows such trusted partners to gain limited access to the organization's internal business data.

Extranet ~ A virtual intranet. Companies desiring an intranet but not having the internal bearer network on which to provide it, can look to an external service provider to supply it.

Extranet ~ Two or more autonomous and separately owned intranets, connected together in order to form an extended intranet. For example, a car manufacturer and its suppliers may each have their own Intranets, accessible only to their respective employees.

Extras Library (PN)~ A renaming of the Vista Program Library experience that showcases and allows quick access to installed Media Center Extras.

extrinsic event (n)~ An extrinsic event is a predefined occurrence that cannot be linked directly to changes in the WMI data model. Therefore, WMI enables an event provider to define an event class that describes the event.

eyeballs ~ an industry term for the raw number of people who look at a website.

eyedropper (n)~ A tool that enables a user to sample the color of any pixel on a screen and apply that color to an object.

EZ Answer (PN)~ A Ticket deflection feature that automatically performs a Knowledgebase search using text from specific Fields on the Ticket submission form.

F ~

F Sharp (PN)~ A strongly typed, multi-paradigm programming language that encompasses functional, imperative, and object-oriented programming techniques, most often used as a cross-platform CLI language, but also to generate JavaScript and GPU code.

F# Tools for Visual Studio Express 2013 for Web (n)~ The tools related to F#, which is a strongly-typed, functional-first programming language for writing simple code to solve complex problems using Visual Studio and the .NET Framework. F# is designed to reduce the time-to-deployment and complexity of software components such as calculation engines and data-rich analytical services in the modern enterprise.

F12 Developer Tools (PN)~ Web development tools that are accessible in Internet Explorer by pressing F12 or clicking Developer Tools on the Tools menu.

fabric (n)~ In VMM, the infrastructure resources (for example, virtual machine hosts, networking, and storage) that are used to create and deploy virtual machines and services to a private cloud.

fabric (n)~ The network of interconnected nodes consisting of servers, high-speed connections, switches, and load balancers that collectively makes up the physical underpinnings of the Microsoft Azure platform. Conceptually, the repetitive pattern of nodes and connections suggests a woven or fabric-like nature.

fabric controller (n)~ The service that acts as the kernel of the Microsoft Azure distributed cloud operating system, providing scheduling, resource allocation, device management, and fault tolerance for nodes in the fabric. It also manages the complete application lifecycle including service deployment, health monitoring, service healing, upgrading, and deactivation.

face (n)~ A set of characters that share common characteristics, such as stroke width and the presence or absence of serifs (short lines at the upper and lower edges of characters).

face down (oth)~ An orientation of printed paper where the printed side is against a surface. For example, paper is face down when it is placed in a copier with the printed side against the copying surface.

face recognition ~ A biometric technique that uses the geometry of a person's face to authenticate identity. Limited deployments, such as those for check cashing, are in place.

face scanner (n)~ A biometric sensor that analyses data points on your face to recognize or authenticate identity.

face up (oth)~ An orientation of printed paper where the printed side is away from a surface. For example, paper is face up when it is placed in a copier with the printed side away from the copying surface.

face value (n)~ The stated value that is displayed on the face of a monetary unit, such as a bill, coin, or gift card. For gift cards, the face value is the starting balance, which was paid when the gift card was issued.

Facebook post (n)~ A text message that can contain a link to multimedia content, that functions as opinion or comment, and that's published in a user's space or a common area of the online social-networking service named Facebook.

facet (PN)~ A set of logical pre-defined properties that model the behavior or characteristics for certain types of managed targets (such as a database, table, login, view,etc) in policy-based management.

Facet (PN)~ A set of logical pre-defined properties that model the behavior or characteristics for certain types of managed targets (such as a database, table, login, view,etc) in policy-based management.

facet (n)~ A constraint, such as Nullable, MaxLength, or Precision, that limits the allowable values for a property.

facet property (n)~ A predefined property that applies to a specific facet in Policy-Based Management.

faceted navigation (n)~ The process of refining a search for information by filtering on individual properties or facets of the items being searched.

facility (n)~ A physical space, such as a room or hall, where a service activity can be performed.

facility field (n)~ One of four fields of an SCODE that indicates the system service responsible for the error. It consists of a unique number that is assigned to represent the error or warning.

fact (n)~ User data to which rule conditions are applied. At design time, a fact is a reference to that data.

fact (n)~ A row in a fact table in a data warehouse. A fact contains values that define a data event such as a sales transaction.

fact base (n)~ A collection of facts against which rule conditions are evaluated.

fact data (n)~ Measures of facts that exist in context with one or more dimensions. A fact is a result of an event.

fact dimension (n)~ A relationship between a dimension and a measure group in which the dimension main table is the same as the measure group table.

Fact pane (PN)~ A feature in the Desktop Viewer that displays the comments in a report and any charts that were created from report data.

fact retriever (n)~ A component that implements an IFactRetriever interface to retrieve user-specific fact information from a custom store.

fact store (n)~ The database that stores information, including role and attributes, about actors. The fact store also provides hierarchy navigation so that actions can determine the relative positions of actors within an organization.

fact store manager (n)~ The component that retrieves the fact information from the various FactRetriever objects.

fact table (n)~ A central table in a data warehouse schema that contains numerical measures and keys relating facts to dimension tables.

FactBox (PN)~ A UI part on the right-side of a list place or task page that can contains graphs, lists, details or links. It provides an at-a-glance view of relevant information in a convenient way, helping to provide insights and intelligence about customer accounts, supplies, shipping status, financial status of an account, etc.

factor (n)~ In mathematics, an item that is multiplied in a multiplication problem; for example, 2 and 3 are factors in the problem 2 x 3. The prime factors of a number are a set of prime numbers that, when multiplied together, produce the number.

factor depreciation method (n)~ A method of depreciation that uses a progressive or digressive factor. For example, if the factor is >50, the depreciation is progressive, which means that the amount of depreciation increases each depreciation period. If the factor is <50, the depreciation is digressive, and the amount of depreciation decreases each depreciation period.

factorial (n)~ Expressed as n! (n factorial), the result of multiplying the successive integers from 1 through n; n! equals n x (n - 1) x (n - 2) x … x 1.

factory (n)~ A server component that instantiates other server components.

factory image (n)~ The original Windows operating system image file or the OEM custom Windows operating system image.

factory method (n)~ A method, usually defined as static, whose purpose is to return an instance of a class.

fade (n)~ The period between the central, or sustain, portion of a effect and its end.

Fade (n)~ An option that allows the user to specify the degree of transparency of an image.

Fade, Bounce Wipe (n)~ A title animation in Windows Movie Maker.

Fade, Ellipse Wipe (n)~ A title animation in Windows Movie Maker.

Fade, In and Out (n)~ A credit or title animation in Windows Movie Maker.

Fade, Slow Zoom (n)~ A title animation in Windows Movie Maker.

Fade, Wipe (n)~ A title animation in Windows Movie Maker.

fail fast exception (n)~ An exception that cannot be caught by any exception handler and that immediately causes the application to terminate and launch error reporting.

failback (n)~ In a failover cluster or server cluster, the process of returning a clustered service or application to its preferred node after the node has failed and then come back online.

failback policy (n)~ A set of parameters that an administrator can set for a failover cluster or server cluster that affect failback operations.

failed (n)~ A state that applies to a resource or a node in a failover cluster or server cluster. A resource or a node is placed in the failed state after a specified number of unsuccessful attempts to bring it online.

failed function (n)~ The function call from the call stack that actually caused an exception, for example, the last method called from the user code or a call to a web service or .NET Remoting call.

failed transaction (n)~ A transaction that encountered an error and was not able to complete.

failover (n)~ In a failover cluster or server cluster, the process of taking a clustered service or application offline on one node and bringing it back online on another node.

failover ~ Failover is a backup operational mode in which the functions of a system component are assumed by secondary system components when the primary component becomes unavailable through either failure or scheduled down time.

Failover Cluster Management snap-in (PN)~ A Microsoft Management Console (MMC) snap-in that is used to validate failover cluster configurations, create and manage failover clusters, and migrate certain settings to a cluster running the Windows Server 2008 operating system.

Failover Cluster Manager (PN)~ A Microsoft Management Console (MMC) snap-in that is used to validate failover cluster configurations, create and manage failover clusters, and migrate certain settings to a cluster running the Windows Server 2008 R2 operating system.

Failover Cluster Manager snap-in (PN)~ A Microsoft Management Console (MMC) snap-in that is used to validate failover cluster configurations, create and manage failover clusters, and migrate certain settings to a cluster running the Windows Server 2008 R2 operating system.

failover cluster snap-in (n)~ A Microsoft Management Console (MMC) snap-in that is used to validate failover cluster configurations, create and manage failover clusters, and migrate certain settings to a cluster.

failover clustering (n)~ A high availability process in which an instance of an application or a service, running over one machine, can fail-over onto another machine in the failover cluster in the case the first one fails.

Failover Manager (PN)~ A Windows Fabric system service responsible for failure detection and failover of services, for coordinating the placement of replicas across failure domains, for reconfiguration of the replica-set based on complaints in the system, for balancing the load across all the nodes, and for ensuring availability and reliability of the services.

failover partner (n)~ The server used if the connection to the partner server fails.

failover relationship (n)~ The configuration assigned to two DHCP servers that provide for continuous availability of DHCP service to clients.

failover time (n)~ The amount of time it takes a resource, either individually or in a group, to complete the failover process.

failover unit (PN)~ A set of consistency units that will failover together and that can be split and merged for load balancing reasons without requiring co-ordination with the service.

fail-safe operator (n)~ A user who receives the alert if the designated operator cannot be reached.

failure (n)~ The inability of a computer system or related device to operate reliably or to operate at all.

failure notification (n)~ A type of cache notification triggered when the cache client misses one or more cache notifications.

Fair Usage Policy (n)~ The policy that states the rules of acceptable use, determined by Skype.

fallback action (n)~ The action that an Exchange Server 2007 transport rule takes if a disclaimer cannot be applied to an e-mail message as, for example, when a message is encrypted.

fallback element (n)~ An alternate code to run if the XSL processor does not support an XSL element.

fallback form (n)~ A form that is displayed when another form option isn't explicitly set. An example would be if an administrator fails to define a form for a particular security group that has access to the application.

fallback site (n)~ The site in the hierarchy that clients are assigned to when they are

installed by using automatic site assignment and they are not in a boundary group that has an assigned site.

fallback status point (n)~ A Configuration Manager site system role that helps you monitor client installation and identify clients that are unmanaged because they have problems communicating with their management point.

fallback trading partner agreement (n)~ A collection of settings that BizTalk Server uses for business-to-business message handling, when no explicit agreement is present.

false positive (n)~ A positive test or filter result in a subject or body of data that does not possess the attribute for which the filter or test is being conducted.

false-positive submission copy (n)~ The capability for users to enter a specific e-mail address to receive a copy of every message submitted as a false positive

familiar Office program (n)~ One of the classic Microsoft applications that can be considered to be easily recognizable by consumers. For example, Word, Excel, and PowerPoint.

family (n)~ A series of hardware or software products that have some properties in common, such as a series of personal computers from the same company, a series of CPU chips from the same manufacturer that all use the same instruction set, a set of 32-bit operating systems based on the same API (for example, Windows 95 and Windows 98), or a set of fonts that are intended to be used together, such as Times New Roman.

family (n)~ An account holder who is the primary administrator (parent) and the family members they manage.

family (PN)~ A game category designed for children or all-ages family play.

Family (PN)~ A section of account.microsoft.com where people can manage their Microsoft family.

Family & kids (PN)~ A game category designed for children or all-ages family play.

family history (n)~ Information about the diseases that run on the patient's family.

family member (n)~ An account holder who is a parent or a child.

Family Room (PN)~ The default room name in the Rooms feature of the People Hub. Based on the concept of the family room' in many homes

Family Safety (n)~ An item in the Windows Control Panel that enables users to access Parental Controls and other third-party parental control features, such as web filters.

Family Safety (n)~ Software that enables parents and guardians to customize children's web experiences in order to help protect their safety and privacy online.

Family Safety (PN)~ The link to the site to manage online access rights for, and monitor internet usage of, family members on Windows Live Family Safety.

family-friendly content (n)~ Text or images appropriate for all users including children; often selected via a UI element, such as a dictionary parental control.

fan out (v)~ To split a message for routing purposes to deliver to multiple recipients.

fan-out query (n)~ A technique for querying data across many members of a database federation. Fan-out queries are composed of member queries and summary queries.

fan-out thread (n)~ A thread that creates multiple message copies and places them in the appropriate link queues. The dispatcher then triggers XFER OUT threads to process the fan-out message copies.

Fantasy Violence (n)~ A content descriptor developed by the Entertainment Software

Rating Board (ESRB).

fantasy violence (n)~ A label in a voluntary content-based rating system used by TV networks in the United States to indicate to viewers if a particular show has higher levels of sex, violence or adult language.

FAQ (n)~ A document listing common questions and answers on a particular subject.

FAQ ~ (Frequently Asked Questions). A document on a website or in a newsgroup which gives answers to common problems and questions. Look for an FAQ if you have a problem with something, before you email or phone support.

far clipping plane (n)~ The far boundary of a viewing frustum or camera beyond which objects are not rendered.

fast card (n)~ An NFC-enabled card (like a credit card) that users can use for payments or other transactions even when the phone is locked.

fast first logon (n)~ A folder redirection functionality that frees users from waiting while files are copied to the server the first time they log on after a Folder Redirection policy has been applied that redirects the path of a user folder to a network location. It also optimizes network usage on WAN links by synchronizing files as a background task.

fast forward (n)~ To advance audio or video playback at a speed that is faster than normal.

Fast Forward (PN)~ This function quickly injects content hosted by Parature into the specified field.

Fast Fusion (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 84.

fast inventory (n)~ The reading of the barcode of each tape in the library.

fast page mode DRAM (n)~ An older form of DRAM, used in personal computers before EDO RAM was introduced, with typical clock timings of 6-3-3-3.

fast page-mode RAM (n)~ A specially designed dynamic RAM that supports access to sequential memory locations with a reduced cycle time.

fast roaming (n)~ A subset of the IEEE 802.11k and 802.11v protocols that provides the wireless client with a more detailed understanding of nearby Wi-Fi access points and does not require the client to undergo complete re-authentication when transitioning from one access point to the other.

Fast Start (PN)~ A feature in Bit Rate Throttling that delivers a maximum amount of data to a client's buffer before throttling is applied. Fast Start reduces startup latency in the client.

fast startup (n)~ A method of starting the computer that speeds boot time by ending the user session and hibernating the computer, rather than shutting down all running services.

Fast User Switching (n)~ A feature in Windows that allows you to switch to a different computer user account without closing programs and files first.

FastIP ~ An IP switching protocol developed by 3Com. Fast IP differs from other IP switching in that the end user initiates the process, not a router or switch.

FastTab (n)~ A container for label and control pairs and for complex controls such as grids. It groups and organizes complex information into simple, manageable groups. As it displays the information that makes up the form it cannot be removed from the page.

FastTabs are used on task pages and they can be collapsed and expanded. The FastTab is an essential part of the form it is on and is the evolution of the tabs in Navision.

FAT (n)~ A file system used by MS-DOS and Microsoft Windows operating systems to organize and manage files.

FAT ~ (File Allocation Table; pr. 'fat') A sort of index of where data is stored on a hard disk, used by the operating system.

FAT32 (n)~ A derivative of the file allocation table (FAT) file system. FAT32 supports smaller cluster sizes and larger volumes than FAT, which results in more efficient space allocation on FAT32 volumes.

fatal error (n)~ An error that causes the system or a program to fail abruptly with no hope of recovery. An example of a fatal error is an uncaught exception that cannot be handled.

fault (n)~ A physical defect, such as a loose connection, that prevents a system or device from operating as it should.

fault (n)~ A programming error that can cause the software to fail.

Fault Detection and Isolation (n)~ A technique for monitoring a system, identifying when a fault has occurred, and pinpointing the type of fault and its location.

fault domain (n)~ The physical point of failure in a data center for a cloud service role. For roles with more than one instance, Microsoft Azure deploys the instances in different fault domains to guard against outages due to physical computer failures in the data center.

fault injection (n)~ A technology allowing users to inject faults into an executable without requiring rebuilding the binary or modifying the source code; thus, providing a means of simulating errors and testing recovery.

fault tolerance (n)~ The ability of computer hardware or software to ensure data integrity when hardware failures occur. Fault-tolerant features appear in many server operating systems and include mirrored volumes, RAID-5 volumes, and server clusters.

fault tolerant heap (n)~ A heap manager that can tolerate some types of programming errors (faults) which in the default Windows heap manager would result in crashes.

fault tree analysis diagram (n)~ A type of diagram commonly used to illustrate events that might lead to a failure so the failure can be prevented.

Fault-tolerance ~ Ability of a system or component to continue normal operation despite equipment failures, power outages or other catastrophic events.

favorite (n)~ A user-defined shortcut to the most commonly used forms, reports, websites, etc.

favorite (n)~ A webpage link saved as a .url file in someone's Favorites' folder on Windows OneDrive. Favorites can be created directly within OneDrive

favorite (v)~ To add something to one's Favorites folder.

favorite contact (n)~ A contact that someone has tagged in Messenger to appear in the group of favorite contacts' that appears at the top of the Messenger display window.'

Favorite Folders (n)~ A pane located on top of the Navigation Pane that has copies of your Inbox, Sent Items, and so on. You can add, remove, and arrange folders in this pane. Collapse or expand the pane by clicking the arrow in the Favorite Folders header.

Favorite view (PN)~ A view available from the My Workspace area of the Operations console where you can save views that you regularly use, similar to how you save a Web page to your Favorites list in Internet Explorer

favorites (n)~ The list of shortcuts to frequently-accessed websites.

Favorites (PN)~ A user-specified list of people who can be accessed quickly across Office communication and collaboration products.

favorites (n)~ The pictures that you can select to appear in the animated Pictures tile on Start, and in the Photos hub.

Favorites (PN)~ The Design feature that allows users to save particular Designs, Styles, or Structures for easy use or access later.

fax (n)~ An activity that tracks call outcome and number of pages. Optionally stores the electronic copy of the actual document.

fax account (n)~ A collection of settings for sending and receiving faxes using a particular fax modem or fax server. Before you can send or receive faxes in Windows, you must set up a fax account.

fax call (n)~ An attempt to send a fax to a computer (or to an external fax modem) via an analog phone line.

fax machine (n)~ A device that scans pages, converts the images of those pages to a digital format consistent with the international facsimile standard, and transmits the image through a telephone line. A fax machine also receives such images and prints them on paper.

fax modem (n)~ A modem that sends (and possibly receives) data encoded in a fax format (typically CCITT fax format), which a fax machine or another modem decodes and converts to an image.

fax server (n)~ A network server that receives incoming faxes and sends them directly to the intended recipient. A fax server can also accept outgoing faxes from the network and transmit them to their intended recipients.

fax-enabled (adj)~ Able to send or receive fax messages.

FCI (PN)~ A Windows Server feature that automates classification processes to manage data more effectively, reduce costs and mitigate risks. File Classification Infrastructure automatically classifies files, runs reports, and applies policies based on the data's business value.

FCS (n)~ The extra checksum characters added to a frame in a communication protocol for error detection and correction. Source: Wikipedia

FDA (n)~ A U.S. governmental agency that is responsible for protecting public health by regulating things such as food, drugs, medical devices, and biological products.

FDD ~ (Fixed Disk Drive, Floppy Disk Drive). The slot on the PC which accepts- floppy disks, almost always referred to as 'Drive A:' by the computer. Now obsolete.

FDI (n)~ A technique for monitoring a system, identifying when a fault has occurred, and pinpointing the type of fault and its location.

FDI server (n)~ A software program for detecting, isolating, and, when possibile, resolving errors in a Windows-based system.

FDN (PN)~ A mode that restricts outgoing calls to a fixed set of numbers.

Fear (n)~ A content descriptor developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

feature (n)~ A set of logically related functional requirements that provides a capability to the user and enables the satisfaction of a business objective.

feature (n)~ A set of software functionality designed to solve a specific problem or to provide a new functionality to the user.

feature (n)~ In Server Manager, a software program or logical collection of software programs that, though not part of a role, can support the functionality of one or more roles, or enhance the functionality of an entire server, regardless of which roles are installed. For example, the Failover Clustering feature augments the functionality of other roles, such as File Services and DHCP Server, by enabling them to join server clusters for increased redundancy and improved performance.

feature (n)~ In a computing system, the functional part of Windows that can be enumerated, indirectly detected, or measured, such as Wi-Fi support.

feature activation dependency (n)~ A relationship in which a feature is activated automatically when another feature is activated or a feature must be activated manually before another feature can be activated.

feature delegation (n)~ The process of granting access to feature areas. Access is granted to a particular user at a particular scope. For example, user -€œPeter-€? has access to the -€œLogging-€? feature at scope -€?Default Web Site.-€?

feature dissatisfaction (n)~ A condition where users believe that a feature does not meet the expectations set by the market, competitors, previous experiences, or promises.

feature event receiver (n)~ A server-side code routine that is called when a feature is activated, deactivated, installed, uninstalled, or upgraded on a computer, server farm, or server cluster.

feature selection (n)~ The process of choosing the attributes that are most relevant to analysis, or most valuable. Some data mining algorithms can perform automatic feature selection, or recommend the columns that contain useful features.

feature stapling (n)~ The process of associating a feature with a site definition, without modifying the site definition itself or using code routines. The associated feature is added automatically to new sites that are based on that site definition.

Feature Upgrade (PN)~ A feature that allows IT pros and developers to upgrade features such as UI, lists, content types, actions, and workflows.

Featured (PN)~ The collection title for items emphasized by the store through placement on the site.

Featured albums (PN)~ The collection title for music albums emphasized by the store through placement on the site.

Featured artists (PN)~ The collection title for musical artists emphasized by the store through placement on the site.

Featured badges (PN)~ The group label for badges that are elevated as part of a promotion or business arrangement.

Featured Chefs (PN)~ Selected top celebrity chefs or star cooks currently featured on MSN site.

Featured Cocktails (PN)~ Selected or favorite cocktails currently featured on MSN site.

featured content (n)~ A photo or video in Photos that appears as one of the initial five pieces of content that appear when Photos first starts.

Featured emoticons (PN)~ The group label for emoticons that are elevated as part of a promotion or business arrangement.

Featured Ingredients (PN)~ Selected or favorite ingredients currently featured on MSN site.

Featured movies (PN)~ The collection title for movies emphasized by the store through placement on the site.

Featured music (PN)~ The collection title for music items emphasized by the store through placement on the site.

Featured Partners (PN)~ Selected Food & Drink providers currently featured on MSN site.

Featured pictures (PN)~ The group label for pictures that are elevated as part of a promotion or business arrangement.

Featured Recipes (PN)~ Selected or favorite recipes currently featured on MSN site.

Featured scenes (PN)~ The group label for scenes that are elevated as part of a promotion or business arrangement.

Featured selection (PN)~ The collection title for items chosen by merchandizers.

Featured sets (PN)~ The collection title for boxed sets of movies or TV series emphasized by the store through placement on the site.

Featured TV (PN)~ The collection title for TV shows emphasized by the store through placement on the site.

Features (PN)~ A hub where users can learn about the different features of Windows Phone.

Federal Information Processing Standard (n)~ A system of standards, guidelines, and technical methods for information processing within the U.S. federal government.

federal tax ID (n)~ In the United States, a 9-digit number that identifies a business entity to the government. A business must have an EIN if it has employees or meets other criteria specified by the federal government.

federal tax identification number (n)~ In the United States, a 9-digit number that identifies a business entity to the government. A business must have an EIN if it has employees or meets other criteria specified by the federal government.

federated (n)~ Pertaining to a contact who is external to the user's organization or enterprise but with whom the user's organization or enterprise is linked.

federated application (n)~ A Web-based application that is AD-FS-enabled, meaning that it can be accessed by federated users.

federated conference (n)~ A conference with federated partners.

federated contact (n)~ A contact who is not part of the user's enterprise but with whom the user's enterprise is linked.

federated database servers (n)~ A set of linked servers that shares the processing load of data by hosting partitions of a distributed partitioned view.

federated domain (n)~ A domain that is engaged in a trust relationship with another domain, which is also called a federation. This relationship is between two federation servers, and allows a system to provide controlled access to its resources or services to a user that belongs to another security realm without requiring the user to authenticate directly to the system and without the two systems sharing a database of user identities or passwords.

federated IM (n)~ An instant message with a federated contact.

federated instant messaging (n)~ Instant messaging with federated contacts.

federated location definition (n)~ The configuration settings that describe how to issue a query for a given federated location and display the search results.

federated search (n)~ A type of search that provides users with results from multiple search and retrieval systems.

federated table (n)~ A table that contains data that is distributed by the federation.

federated user (n)~ An external user who has valid credentials from a federated partner, which is a trusted outside organization that is enabled for access to your Lync Server or Office Communications Server deployment.

federated user (n)~ A user whose account resides in an account partner organization and who can access federated applications that reside in a resource partner organization. In the context of Office 365, a federated user is one that is sourced (mastered, authenticated, created, and managed) in an organization's on-premises Active Directory. The on-premises Active Directory has a trust relationship with the cloud that allows authenticated Active Directory users to access cloud resources (or ‑€œservices,‑€? such a SharePoint Online, Exchange Online, etc).

federation (n)~ A trust relationship between two or more SIP domains that permits users in separate organizations to communicate in real time across network boundaries.

federation (n)~ A pair of realms or domains that have established a federation trust.

Federation ~ A technical approach where one security domain has a system to authenticate users and another security domain has a system that trusts the authenticating system

federation member (n)~ A database that contains parts of the federation's data and is there to provide the computational and storage capacity for parts of the federation's workload and data.

federation server (n)~ A computer that has been configured to host the Federation Service component of Active Directory Federation Services (AD- FS). Federation servers can authenticate or route requests from user accounts in other organizations and from clients that can be located anywhere on the Internet.

federation server proxy (n)~ A computer that has been configured to host the Federation Service Proxy component of Active Directory Federation Services (AD- FS). Federation server proxies provide intermediary proxy services between an Internet client and a federation server that is located behind a firewall on the corporate network.

Federation Service (n)~ An installable role service of Active Directory Federation Services (AD- FS) that is used to create a federation server. When it is installed, the Federation Service provides tokens in response to requests for security tokens. Multiple federation servers can be configured to provide fault tolerance and load balancing for a single Federation Service.

Federation Service Proxy (n)~ An installable role service of Active Directory Federation Services (AD- FS) that is used to create a federation server proxy. When it is installed, the Federation Service Proxy role service uses WS-Federation Passive Requestor Profile (WS-F PRP) protocols to collect user credential information from browser clients and Web applications and send the information to the Federation Service on their behalf.

fee transaction (n)~ A transaction that registers revenue with no matching cost.

feed (n)~ A distribution mechanism for frequently-updated content that is aggregated by an RSS reader and delivered or published in a standard XML format. The content is often summarized, with links to a more complete version.

Feed Discovery (n)~ A feature of Internet Explorer in Windows Vista that finds XML feeds on a webpage. User can view the feeds and subscribe to them.

feedback (n)~ The return of a portion of system output as input to the same system. Often feedback is deliberately designed into a system, but sometimes it is unwanted. In electronics, feedback is used in monitoring, controlling, and amplifying circuitry.

Feedback (PN)~ A UI element that provides access to a site or process for submitting feedback on the product or service being used.

feedback (n)~ A color-coded status, which is displayed on the Seating Chart, that a user can set to communicate with the meeting presenter.

feedback (n)~ Comments about a completed assignment that an educator makes during review and grading and that are available to the student once the grade is posted.

feedback (n)~ Comments or opinions about and reactions to something, intended to provide useful information for future business decisions and development.

Feedback Client 2013 (n)~ The name of application, which can help your development team gather both solicited and unsolicited feedback about your software projects, from your customers and other stakeholders.

Feedback Client 2013 Language Pack (n)~ Language Pack is a free add-on that you can use to switch the language that's displayed in the Feedback Client user interface.

feedback document (n)~ A document which is sent from Navision to Outlook as a response for a synchronization query. The feedback document contains all errors or conflicts detected by the C/AL code at the Navision Service Tier during the synchronization.

feedback form (n)~ An online form that allows its users to submit their questions, comments and suggestions with a view to enabling improvements.

feedback hub (n)~ A remote server that supports generating and aggregating the response to feedback requests.

Feedback Tool (PN)~ A Windows tool that users may use to report their issues to Microsoft.

feeder flow (n)~ A production flow that can- supply other downstream production flows.

feeding tube (n)~ A tube used to provide nutrition to patients who are unable to obtain nutrition by mouth.

FEFO (n)~ A method used for determining the order in which goods should be taken out of inventory, so that items with the earliest expiration dates are taken first.

female connector ~ A cable connector that has holes and plugs into a port or interface to connect one device to another.

fencing (n)~ The process of isolating a failed node from shared resources to assure data integrity.

fetch (v)~ To retrieve an instruction or an item of data from memory and store it in a register. Fetching is part of the execution cycle of a microprocessor; first an instruction or item of data must be fetched from memory and loaded into a register, after which it can be executed (if it is an instruction) or acted upon (if it is data).

Fetch (PN)~ A proprietary XML-based query language that is used in Microsoft Dynamics CRM to retrieve information.

fetch (v)~ To remotely view, stream, or copy files stored on a PC running OneDrive from any other device.

fetch ~ The process of 'fetching' a data or instruction item from memory and writing it to a register. The 'fetched' item is then either executed (instruction), or acted upon (data).

FetchXML (PN)~ A proprietary XML-based query language that is used in Microsoft Dynamics CRM to retrieve information.

FEV (n)~ The volume of air coming out of the lung under forced conditions.

FF (n)~ A printer command that tells a printer to move to the top of the next page. In the ASCII character set, the form-feed character has the decimal value 12 (hexadecimal 0C). Because its purpose is to begin printing on a new page, form feed is also known as the page-eject character.

FFL (n)~ The process of creating an event log that is written to a UTF-8 formatted text file.

FFS ~ (For F***'s Sake)- Internet slang, not suitable for polite company.

FFU (PN)~ A tool that can be used to apply Windows images to multiple devices at once. This can be used on the manufacturing floor.

FIB (n)~ A focused beam of gallium ions that can be used to image the surface of a PCB or other object.

fiber mode (n)~ A situation where an instance of SQL Server allocates one Windows thread per SQL scheduler, and then allocates one fiber per worker thread, up to the value set in the max worker threads option.

fiber optics (n)~ A technology for the transmission of light beams along optical fibers. A light beam, such as that produced in a laser, can be modulated to carry information. Because light has a higher frequency on the electromagnetic spectrum than other types of radiation, such as radio waves, a single fiber-optic channel can carry significantly more information than most other means of information transmission. Optical fibers are thin strands of glass or other transparent material, with dozens or hundreds of strands housed in a single cable. Optical fibers are essentially immune to electromagnetic interference.

fiber optics ~ A technology that transmits infrared and visible light frequencies through strands of glass or plastic fiber.

Fibre Channel (n)~ A networking standard developed to connect devices that require the transmission of large volumes of data at a very high speed. A leading implementation of Fibre Channel technology has been in storage area networks (SANs). Although the term Fibre Channel implies the use of fiber-optic technology, copper coaxial cable is also supported.

Fiction (PN)~ The Books & reference subcategory containing apps with fictional stories and other content.

fidelity (n)~ The accuracy with which an image is reproduced on your personal computer.

fidelity (n)~ The degree of precision and exactness with which one entity represents another.

field (n)~ An area in a window or record that stores a single data value.

field (n)~ A member that represents a variable associated with an object or class.

Field (n)~ An area where CSRs or Customers may enter data that will be stored by Parature.

field access profile (n)~ The set of field-level access permissions that have been granted to a user or users.

field button (n)~ A button that identifies a field in a PivotTable or PivotChart report. You can drag the field buttons to change the layout of the report, or click the arrows next to the buttons to change the level of detail displayed in the report.

field code (n)~ Placeholder text that shows where specified information from your data source will appear; the elements in a field that generate a field's result. The field code includes the field characters, field type, and instructions.

field data type (n)~ A property of a field that defines the kinds of data the field can store.

field data types (n)~ A characteristic of a field that determines what kind of data it can store. For example, a field whose data type is Text can store data consisting of either text or number characters, but a Number field can only store numerical data.

Field Dependency (n)~ A relationship between two Parature Fields where a Child Field or Child Field Option is not available until a Parent Field or Parent Field Option has been selected.

Field Explorer (PN)~ A UI section that displays the fields available for customizing a form.

field internal name (n)~ A string that uniquely identifies a field in a content type or a SharePoint list.

field length (n)~ In bulk copy, the maximum number of characters needed to represent a data item in a bulk copy character format data file.

Field List pane (n)~ A pane that lists all the fields in the underlying record source or database object.

field mapping (n)~ A relationship created between a field value in one document and a possibly different field in another document.

field marshaller (n)~ A SQL Server feature that handles marshaling for fields.

field name (n)~ The name of a category of information in a mail-merge data source. For example, City

field results (n)~ Text or graphics inserted in a document when Microsoft Word carries out a field's instructions. When you print the document or hide field codes, the field results replace the field codes.

field selector (n)~ A small box or bar that you click to select an entire column in a datasheet.

field terminator (n)~ In bulk copy, one or more characters marking the end of a field or row, separating one field or row in the data file from the next.

field type (n)~ The name that identifies the action or effect the field has in the document. Examples of field types are AUTHOR, COMMENTS, and DATE.

field value (n)~ The contents of a database field displayed inside a database results region, as shown in a Web browser.

field-level access (n)~ The permission that is assigned to a user or users that allow them to read, update, or create a specific field.

field-level synchronization (n)~ The ability to select specific fields for an entity (record

type) and specify how they should synchronize between CRM and Exchange, either in both ways or in one direction (from CRM to Exchange or from Exchange to CRM).

FIF (n)~ The speed of air coming into the lung under forced inspiration.

FIFO (n)~ A method for processing a queue in which items in the queue are removed in the same order in which they were added.

FIFO inventory valuation method (n)~ A method of inventory valuation in which inventory is assumed for accounting purposes to move in the order it was received, regardless of its actual physical movement.

Fighting (PN)~ The Games subcategory containing games that simulate fighting, such as martial arts or boxing.

figures (n)~ A Windows feature (in CSS) that allows web designers and developers to wrap text and other inline content around specified elements and fragments. This way, they can create complex and intricate layouts. For example, in Digital Publishing this capability allows text to wrap around objects such as images. Figures can be absolutely positioned on a web page while still remaining part of the document flow. Figures can be positioned some specified distance from the top, bottom, left or right sides of the containing block.

file (n)~ A collection of information that is stored on a computer or device under a single name.

File (n)~ The name of a menu in a conversation window from which the user can save the text of the current conversation, open received files, or close the conversation window.

File ~ All information on a computer is stored in files, whether it is part of a program, a document created by a user, a picture, or anything else. Most software is made up of dozens, sometimes hundreds, of different files.

file adapter (n)~ An adapter that can read messages from the file system and submit them to the server, as well as write messages from the server to a file on the file system.

file allocation table (n)~ A file system used by MS-DOS and Microsoft Windows operating systems to organize and manage files.

File and Registry Virtualization (PN)~ A feature that allows standard users to run applications that normally write to per-computer files and registry keys. If these write operations fail, they are automatically redirected to equivalent per-user locations.

File as Printout (n)~ A command that will use a print driver installed by OneNote to create an image of a wide variety of filetypes. Files are printed to the print driver and inserted as images into OneNote.

file association (n)~ For a particular file name extension, the association array elements that define where handlers and other attributes can be registered.

file attachment control (n)~ A control that allows users to attach files to their form when they fill it out.

file backup (n)~ A backup of all the data in one or more files or filegroups.

File Block (PN)~ A feature that allows end users and IT admins to control which file types and versions can be opened and saved in the application.

file buffer (n)~ A reserved portion of memory used to temporarily store data, pending an instruction to complete its transfer to or from a file.

file cache (n)~ File-based storage that is created on the client computer when the client

components are installed.

File Classification Infrastructure (PN)~ A Windows Server feature that automates classification processes to manage data more effectively, reduce costs and mitigate risks. File Classification Infrastructure automatically classifies files, runs reports, and applies policies based on the data's business value.

file collection (n)~ The process of copying specified files from SMS/Configuration Manager clients to the site server during a software inventory cycle.

file compression (n)~ The process of reducing the size of a file for transmission or storage.

file control block (n)~ A small block of memory temporarily assigned by a computer's operating system to hold information about an opened file. A file control block typically contains such information as the file's identification, its location on a disk, and a pointer that marks the user?s current (or last) position in the file.

file conversion (n)~ The process of transforming the data in a file from one format to another without altering the data—for example, converting a file from a word processor's format to its ASCII equivalent. In some cases, information about the data, such as formatting, may be lost. Another, more detailed, type of file conversion involves changing character coding from one standard to another, as in converting EBCDIC characters (which are used primarily with mainframe computers) to ASCII characters.

file copy (n)~ The first of the three stages of Setup, where the Windows program files and any additional files specified are copied to the computer's hard disk.

file differential backup (n)~ A backup of one or more files containing only changes made to each file since its most recent file backup. A file differential backup requires a full file backup as a base.

file DSN (n)~ file Data Source Names. File-based data sources shared among all users with the same drivers installed. These data sources are not dedicated to a user or local to a computer.

File Explorer (PN)~ A utility that enables the user to locate and open files and folders.

File extension ~ .gif .txt .doc .log etc. are all examples of file extensions. These are the letters after the period in a file name that indicates the type of file.

file filter (n)~ A DLL that controls the transfer of data between devices.

file filter (n)~ A file mask through which files are passed to separate specified items.

file fork (n)~ One of the two parts of a file recognized by the Mac OS. A Macintosh file has a data fork and a resource fork. Most or all of a typical user-produced document is in the data fork; the resource fork usually contains application-oriented information, such as fonts, dialog boxes, and menus.

file format (n)~ The structure or organization of data in a file.

file format escape (n)~ In regular expressions, the usual C language character escape sequences, \'

file group (n)~ A File Server Resource Manager option that is used to define a namespace for a file screen, file screen exception, or storage report. It consists of a set of file name patterns, which in turn determine whether files are included or excluded from a group.

file handle (n)~ In MS-DOS, OS/2, and Windows, a token (number) that the system uses to identify or refer to an open file or, sometimes, to a device.

File History (PN)~ A Windows feature designed to help users avoid data loss by automatically saving versions of files and copies of deleted files so that users can recover them.

file license (n)~ A license that authorizes protection of file resources on a single server.

file list (n)~ The list of files in the current project, located in the file pane of Visual SourceSafe Explorer.

file lock (n)~ An operating system mechanism that prevents a file that is used in one process from being accessed, modified, or deleted from another process.

File management (PN)~ The Business subcategory containing apps to help businesses manage their computer files.

file manager (n)~ A module of an operating system or environment that controls the physical placement of and access to a group of program files.

File managers (PN)~ The Utilities & tools subcategory containing apps to help you manage your computer files.

file mapping (n)~ The association of a file's contents with a portion of the virtual address space of a process.

File menu (n)~ A common drop-down menu that includes commands for file operations, such as Open, Save, and Print.

file mode (n)~ The mode -€"Input, Output, Append, Random, or Binary-€" that determines which methods can be used to read and write files.

file name (n)~ The set of letters, numbers, and allowable symbols assigned to a file to distinguish it from all other files in a particular directory on a disk. A file name is the label under which a computer user saves and requests a block of information.

file name extension (n)~ A set of characters added to the end of a file name that identifies the file type or format.

File Open Picker contract (PN)~ A contract that enables developers to- create apps that- use the file picker to offer files to other apps.

file pair (n)~ A unit of a data file and the corresponding delta file.

file picker (n)~ A UI element that enables users to locate and select files.

file port (n)~ An application-specific location that includes extra information that the application requires.

file property (n)~ A detail about a file that helps identify it, such as a descriptive title, the author name, the subject, or a keyword that identifies topics or other important information in the file.

file protection (n)~ A process or device by which the existence and integrity of a file are maintained. Methods of file protection range from allowing read-only access and assigning passwords to covering the write-protect notch on a disk and locking away floppy disks holding sensitive files.

file replication schedule (n)~ The schedule by which Directory Services user lists that are newly uploaded are added to the Administration Center and to e-mail servers worldwide.

file replication service (n)~ A service that provides multimaster file replication for designated directory trees between designated servers running Windows Server 2003. The designated directory trees must be on disk partitions formatted with the version of NTFS used with the Windows Server 2003 family. FRS is used by Distributed File System (DFS)

to automatically synchronize content between assigned replicas and by Active Directory to automatically synchronize content of the system volume information across domain controllers.

file restore (n)~ An operation that restores one or more files of a database.

file rollover (n)~ The process when a program closes a file, based on a certain event, and creates a new file.

File Save Picker contract (PN)~ A contract that- enables devs to set up their app as a save location that the user can choose when they use the file picker to save files.

file screen (n)~ A File Server Resource Manager option that is used to block certain files from being saved on a volume or in a folder tree. A file screen is applied at the folder level and affects all folders and subfolders in the designated path.

file screen exception (n)~ A file screen that overrides any file screening that would otherwise apply to a folder, and all its subfolders, in a designated exception path. That is, it creates an exception to any rules derived from a parent folder.

File Screening Audit (n)~ A storage report that lists file screening audit events on the server for a specified period. Use this report to identify users or applications that violate screening policies.

File server ~ A type of computer used on- networks- to provide files and other services to other computers. Often just called a server.

File Server for Macintosh (n)~ A service that allows users of Macintosh computers to store, access, and share files on servers running Services for Macintosh.

File Server Resource Manager (n)~ A suite of tools that allows administrators to understand, control, and manage the quantity and type of data stored on their servers.

file share witness (n)~ A new type of Majority Node Set (MNS) quorum in Windows Server 2003. In Exchange Server 2007, cluster continuous replication (CCR) uses the MNS quorum with file share witness instead of the traditional voter node.

file sharing program (n)~ A peer-to-peer file sharing client used to connect to file sharing networks in order to download or share files.

file size (n)~ The length of a file, typically given in bytes.

file specification (n)~ The path to a file, from a disk drive through a chain of directory files to the file name that serves to locate a particular file.

file system (n)~ In an operating system, the overall structure in which files are named, stored, and organized. NTFS, FAT, and FAT32 are types of file systems.

file system cache (n)~ An area of physical memory that holds frequently used pages. It allows applications and services to locate pages rapidly and reduces disk activity.

File tab (n)~ A tab on the ribbon that takes users to Microsoft Office Backstage view.

file to exclude (n)~ A file that is not included in the file group.

file to include (n)~ A file that is included in the file group.

file transfer (n)~ The process of moving or transmitting a file from one location to another, as between two programs or over a network.

File Transfer Protocol (PN)~ A member of the TCP/IP suite of protocols, used to copy files between two computers on the Internet. Both computers must support their respective FTP roles: one must be an FTP client and the other an FTP server.

file type (n)~ The format of a file, commonly indicated by its file name extension. The file

type indicates which program the file was created in and can be opened with.

file type association (n)~ For a particular file name extension, the association array elements that define where handlers and other attributes can be registered.

file/registry virtualization (PN)~ A feature that allows standard users to run applications that normally write to per-computer files and registry keys. If these write operations fail, they are automatically redirected to equivalent per-user locations.

file-based imaging (n)~ The process of capturing information at the file level into a single volume, with metadata describing the files.

file-based storage (n)~ Storage that takes place in local files (as opposed to a database), which are copies of the metadata in the client computer. It is used when the client is working offline.

filegroup (n)~ A named collection of one or more data files that forms a single unit of data allocation or for administration of a database.

file-mapping object (n)~ An object that maintains the association of a file's contents with a portion of the virtual address space of a process.

filer (n)~ A user who regularly files mailbox items into folders.

filer user (n)~ A user who regularly files mailbox items into folders.

Files (PN)~ An optional downloadable app that allows a person to browse the files stored in the phone using a file explorer like interface.

Files by File Group (n)~ A storage report that lists files that belong to specified file groups. Use this report to identify file group usage patterns and to identify file groups that occupy large amounts of disk space. This can help you determine which file screens to configure

Files by Owner (n)~ A storage report that lists files, grouped by owner. Use this report to analyze usage patterns on the server and to identify users who use large amounts of disk space.

filestream (n)~ A sequence of bytes used to hold file data.

FileTable (PN)~ A feature that provides internal storage to the core SQL Server product.

FileZilla ~ FileZilla is free, open source, cross-platform FTP software, consisting of FileZilla Client and FileZilla Server. Binaries are available for Windows, Linux, and Mac OS X. It supports FTP, SFTP, and FTPS (FTP over SSL/TLS).- http://filezilla-project.org/

fill (n)~ In computer graphics, the colored or patterned paint' inside an enclosed figure

fill (v)~ To add color or a pattern to the enclosed portion of a circle or other shape.

fill effect (n)~ An effect that applies to the appearance of the interior of an enclosed text character or other shape.

fill factor (n)~ An attribute of an index that defines how full the SQL Server Database Engine should make each page of the index.

fill handle (n)~ The small black square in the lower-right corner of a selected cell that can be used to copy data and to fill adjacent cells with a series of data.

fill in the blank question (n)~ A type of question (for example, in a poll, survey or test) where the user must enter a response in the blank space or spaces provided.

fill out (v)~ To enter information into a form.

fill rate (n)~ The percentage of ad requests where an ad is displayed to the user.

fill series (v)~ A sequence of data such as numbers, number and text combinations, dates,

or time periods, based on an established pattern and used to automatically fill data into worksheet cells.

Fill Transform (PN)~ A tool that lets you alter the appearance of a gradient or pattern fill. For example, you can use the Fill Transform tool to rotate or scale a pattern fill inside a path or shape.

Fill With Color tool (n)~ A tool that allows the user to change the color of a group of pixels at once.

filled map (n)~ A chart type for geographic data using color progression for numeric values or discrete colors for categorical values and relationships on locations over a map.

filler ingredient (n)~ A type of ingredient in a formula that is used to increase the total quantity of a product. The filler ingredient has no chemical influence on any of the active ingredients in the formulation.

Film Age, Old (n)~ A filter effect in Windows Movie Maker.

Film Age, Older (n)~ A filter effect in Windows Movie Maker.

Film Age, Oldest (n)~ A filter effect in Windows Movie Maker.

Film Grain (n)~ A filter effect in Windows Movie Maker.

filmstrip (n)~ A form of Launcher that scrolls from right to left and displays both a strip of smaller application icon images on the sides, and a single larger application preview image in the center.

filter (n)~ A pattern or mask through which data is passed to separate specified items.

filter (n)~ A set of conditions and associated actions that may be applied to certain tasks. For example, an email rule might stipulate that all messages from a particular sender be placed into a specific folder.

filter (v)~ To display only the rows in a list that satisfy the conditions you specify. You use the AutoFilter command to display rows that match one or more specific values, calculated values, or conditions.

filter (v)~ To display files that meet certain criteria. For example, you might filter files by a particular author so that you only see the files written by that person. Filtering does not delete files, it simply changes the view so that you only see the files that meet your criteria.

filter (v)~ To define the types of UI Automation elements to be included in a view of the UI Automation tree.

filter (n)~ A tool that you can use to categorize inventory items for quick searching. Filters also restrict the availability of items to customers, vendors, and warehouse processes.

filter (n)~ Words, phrases, sources, languages, time frame, authors, or an author's reach that the data set does or doesn't contain.

Filter ~ 1) A device which allows you to use an ordinary phone over a telephone line set up for an- ADSL- internet connection. Also called a micro-filter. 2) A program or set of programs that automatically removes- spam- from your- email.

filter area (n)~ The part of PivotTable or PivotChart view that contains filter fields.

Filter By Form (v)~ A technique for filtering data that uses a version of the current form or datasheet with empty fields in which you can type the values you want the filtered records to contain.

Filter By Selection (v)~ A technique for filtering records in a form, datasheet, or data access page in which you retrieve only records that contain the selected value.

filter criteria (n)~ Conditions that users specify to limit which records are included in the result set of a query.

Filter Excluding Selection (v)~ A technique in which you filter records in a form, datasheet, or data access page to retrieve only those records that don't contain the selected value.

filter field (n)~ A field in the filter area that you can use to filter data displayed in PivotTable or PivotChart view. Filter fields perform the same functions as page fields in Microsoft Excel PivotTable reports.

Filter For Input (v)~ A technique for filtering records that uses a value or expression you enter to find only records that contain the value or satisfy the expression.

filter handler (n)~ A handler that scans documents for text and properties.

filter icon (n)~ The icon that appears next to filtered data in a form.

filter link (n)~ An association between a filter control and a parameter. This association is defined on a report or scorecard in a dashboard. Items with links to a filter change when the filter is modified.

filter section (n)~ Area below the nav bar where users define and edit filters.

Filter Web Part (PN)~ A feature that enables users to modify dashboard views by changing the subset of data that is displayed in reports or scorecards.

filtered access token (n)~ An access token with the least administrative privileges required for the session. It is a restricted access token where all elevated privileges have been filtered out. A filtered access token is created by default for all interactive users that are not standard users, except the built-in administrator.

filtered group (n)~ A local security group that is removed from an access token. When User Account Control (UAC) creates the filtered access token, the filtered groups are removed.

filtered HTML (n)~ An HTML format with Microsoft Office-specific tags removed.

filtered view (n)~ A view to which a set of conditions have been applied to reduce the total number of displayed objects.

FilterKeys (n)~ A Windows 9x accessibility control panel feature that enables users with physical disabilities to use the keyboard. With FilterKeys, the system ignores brief and repeated keystrokes that result from slow or inaccurate finger movements.

final assembly (n)~ Final end-item product assembly before customer fulfillment.

final state (n)~ In a statechart or activity diagram, a representation of the completion of activity in the enclosing state or action state. The final state is indicated by a bull's eye.

finalizer (n)~ A method that frees resources and performs other cleanup operations.

Finance (PN)~ An app category that facilitates management of personal finances.

Finance and Accounting System Implementation (n)~ A template that outlines the steps needed to implement a finance and accounting system. It assumes an existing system or process is in place and a new system will be replacing it. It also assumes that the new application software system has already been chosen.

financial dimension (n)~ A financial data classifier created from the parties, locations, products, and activities in an organization and used for management reporting.

financial dimension value (n)~ A data element in the domain of a financial dimension.

financial dimension value constraint (n)~ A hierarchical financial dimension relationship that restricts the set of all possible financial dimension value combinations to a set of valid financial dimension value combinations.

financial information (n)~ A tab on a record that lists the Account or Business Contact's financial information, which was retrieved from Small Business Accounting.

Financial Integration (n)~ A feature that enables the user to access information from an accounting system from within Business Contact Manager for Outlook.

Financial Modernization Act of 1999 (n)~ A U.S. law containing financial provisions that require all financial institutions to disclose to consumer customers their policies and practices for protecting the privacy of non-public personal information. Non-public personal information includes any PII provided by a customer, resulting from transactions with the financial institution or obtained by a financial institution through providing products or services.

Financial Reporting Instance Standard (oth)~ A standard that places additional constraints on instance documents that are used for financial reporting. All instance documents that are valid under FRIS are valid XBRL documents. However, not all XBRL documents are valid under FRIS.

Financial Reporting Taxonomy Architecture (oth)~ A standard that places additional constraints on XBRL taxonomies that are intended to express information used in financial reporting. All taxonomies that are valid under FRTA are valid XBRL documents. However, not all XBRL documents are valid under FRTA.

financial statement (n)~ A statement of a company's financial state as of the end of a defined period. A financial statement may include an operating statement (an income statement showing the results in terms of profit and loss of normal business activities), a balance sheet (assets and liabilities), and other financial information.

financial statement (n)~ A report that documents the financial information and financial position of an organization.

financial template document (n)~ An XML schema that contains all the necessary elements that are needed to capture awizard selection and to drive the screens in the wizard.

find (v)~ To seek specific data within a file or data structure.

Find (v)~ A field in the main Communicator window where a user can search for a person by name or e-mail address. Communicator searches the corporate address book.

find (v)~ To locate text or a specific item on a Web page or in a document.

find (v)~ To locate or come upon through action.

Find (PN)~ A UI element that enables the user to locate text, and go to other locations wherever the text occurs in a document.

Find Message view (n)~ A reporting view that enables users to find messages based on tracked message properties.

Find My Phone (PN)~ A feature that lets you ring, lock, erase, or show your Windows phone on a map from account.microsoft.com.

Find similar picture or video (v)~ A feature that searches the Library to find and group pictures and videos with similar color, tone, and intensity.

fine tune (v)~ To manually edit and make adjustments to your photos.

fine tuning setting (n)~ A setting that shifts all inserted images by the same amount to align them properly on a full sheet of labels or stickers.

fine-grained lock (n)~ A lock that applies to a small amount of code or data.

Fine-Grained Permissions (n)~ A security feature that allows for greater granularity and customization of user permissions.

finger (n)~ An Internet utility, originally limited to UNIX but now available on many other platforms, that enables a user to obtain information on other users who may be at other sites (if those sites permit access by finger). Given an e-mail address, finger returns the user's full name, an indication of whether or not the user is currently logged on, and any other information the user has chosen to supply as a profile. Given a first or last name, finger returns the logon names of users whose first or last names match.

Finger ~ A program that you point at the username of someone on a networked system. It uncovers that person's full name, most recent log-in time, and other information. It's also used as a verb, meaning to apply the program to the user name.

Finger ~ A Unix command that provides information about users logged in; and it can also be used to retrieve the .plan and .project files from a user's home directory.

Finger ~ A gesture by a programmer to another person that has ripped off his code without even recognition.

finger input (n)~ A specific type of touch input in which fingertips only are used to touch the Surface screen.

fingerprint reader (n)~ An authentication device that digitally scans an individual's fingerprint, records the unique pattern of the individual's ridges and valleys, and determines if the pattern matches the pattern of the person who has access permission to a particular device, such as a computer or a phone, or to a Web site.

Finish (PN)~ A navigation button used to complete and close a wizard.

finish date (n)~ The date that a project or task is scheduled to be completed. This date is based on the task's start date, duration, calendars, predecessor dates, task dependencies, and constraints.

finished good (n)~ An item assembled for sale using a bill of materials.

finished unit (n)~ A Surface developer unit that has acrylic panels on all sides. You have to remove the appropriate end panel to access the I/O connections.

finite capacity (n)~ The capability of a resource (worker, machine, work center, plant, or organization) to produce output within a specified period of time without exceeding the available capacity.

finite loading (n)~ A scheduling method that assumes that limited capacity for labor and machines is available.

finite material (n)~ A method for scheduling resources that assumes that all the component materials needed for production are available when the production process starts.

finite property (n)~ A method for scheduling resources that considers limits to the type of work a work center can perform at a given time. Finite property specifies the type of products or operations to be carried out at the same time at a work center.

finite scheduling (n)~ A scheduling method that assumes that limited capacity for labor

and machines is available.

FIPS (PN)~ A system of standards, guidelines, and technical methods for information processing within the U.S. federal government.

Fire- Fighting ~ Desperately working to fix bugs to avoid being fired.

Firefox ~ A popular alternative- browser, available free from- Mozilla, which you can use instead of Internet Explorer.

firewall (n)~ A security solution that segregates one portion of a network from another portion, allowing only authorized network traffic to pass through according to traffic filtering rules.

Firewall ~ Originally a dedicated computer between you and the internet, preventing hackers, spammers and similar undesirables from taking over your PC. Now often just a program running on your PC, performing the same task. Recent versions of Windows have one built-in.

firewall rule (n)~ A rule permitting or blocking communication through Windows Firewall via a particular protocol and port or range of ports.

firewall traversal (n)~ A technology that provides secure pathways through a firewall and enables multiple data streams to pass thru the firewall on the same port (e.g., audio and video data on the same port).

Firewire ~ A standard for very fast data transfer, created by- Apple, popular for applications that use very large files, particularly video editing. Requires special hardware, generally added to a computer as an- expansion card.

firewire ~ technology that allows a computer to have an almost unlimited number of devices running without using up all the hardware interrupts. the registered trademark of Apple's IEEE 1394 digital connection.

firm planned order (n)~ An order that is generated to fulfill an item requirement and that cannot be modified as to quantity or time.

firmware (n)~ The software that is embedded in a hardware device and controls how the device interacts with the operating system.

Firmware ~ A computer program or software stored permanently in PROM or ROM or semi-permanently in EPROM.

Firmware ~ Software stored in PROM, ROM or EPROM; essential programs that remain even when the system is electrically turned off. Firmware is considerably easier to modify than hardware but more permanent than software stored on disk or volatile memory.

firmware system binary (PN)~ A feature that enables partners to place a system binary from firmware into Windows without modifying a Windows binary or executable file. OEMs can use this to make sure that, even after a user has removed or reinstalled the operating system, features such as theft-recovery applications, remote data-deletion software, or the ability to provide a missing device driver are still available to the user.

first boot (n)~ A phase of Windows Setup that starts the first time an end user boots Windows.

First Expiry First Out (oth)~ A method used for determining the order in which goods should be taken out of inventory, so that items with the earliest expiration dates are taken first.

first in, first out (n)~ A method for processing a queue in which items in the queue are

removed in the same order in which they were added.

first in, first out inventory valuation method (n)~ A method of inventory valuation in which inventory is assumed for accounting purposes to move in the order it was received, regardless of its actual physical movement.

first match (n)~ A matching criteria used in regular expressions that chooses the subsequence that was found first when the regular expression is matched.

First Name (n)~ In the Add a Contact Wizard, one of the fields by which you can search for a contact.

first name (n)~ The given name for an individual.

fiscal period (n)~ A division of a fiscal year that is reflected on financial statements.

fiscal period (n)~ A time period division of a fiscal year.

fiscal printer (n)~ A printer with security features for tax authorities to confirm the taxes collected by the retailer.

fiscal year (n)~ A span of time during which the financial activities of an organization are calculated. A fiscal year is divided into fiscal periods, typically defined as semesters, quarters, or months. The organization determines the dates that begin and end its fiscal year, which may not correspond to a traditional calendar year.

fiscal year (n)~ An approximate 12-month fiscal period used by an organization that prepares annual financial statements.

fishbone diagram (n)~ A type of diagram that documents all the factors that contribute to or affect a given situation (all the causes that lead to a certain effect).

fit (n)~ One of the criteria used for evaluating the success of a data mining algorithm. Fit is typically represented as a value between 0 and 1, and is calculated by taking the covariance between the predicted and actual values of evaluated cases and dividing by the standard deviations of the same predicted and actual values.

fit (n)~ Something that fits, or is suitable or appropriate, for a situation.

five 9s ~ The five 9s of accuracy: 99.999% accuracy

fix (n)~ A single cumulative package composed of one or more files used to address a problem in a product. Hotfixes address a specific customer situation and may not be distributed outside that customer organization.

Fix it button (n)~ A UI element that allows the user to have an automated step through a resolution to a problem.

Fix pane (n)~ An area in Windows Photo Gallery that includes an assortment of picture editing tools for common editing tasks. The Fix pane is opened by clicking the Fix button on the toolbar in Photo Gallery.

fixed amount off (n)~ The exact amount subtracted from the list price to arrive at a custom price.

fixed asset (n)~ An accounting classifier used to classify any long-term asset whose cost expiration is recognized over more than one year.

fixed asset addition (n)~ An add-on item to a fixed asset that is considered part of the fixed asset and is not tracked as its own fixed asset, such as an extra battery for a laptop. Typically, an add-on item is maintenance or an improvement and relates to a write-up adjustment.

fixed asset group (n)~ A set of characteristics that are assigned to a fixed asset. The fixed

asset inherits the characteristics (such as type, number sequences, and default value models) from the group.

fixed compensation (n)~ Compensation, independent of performance, that is awarded to an employee by an organization.

fixed compensation plan (n)~ A compensation structure that is used to determine fixed compensation levels (bands, grades, or steps) and the compensation ranges associated with each level. This plan is often used for employees of the same employee type that are within a specific geographical area.

fixed cost (n)~ A cost that does not vary with changes in product delivery throughput or output.

fixed currency (n)~ A currency that has a fixed exchange rate in relation to another currency.

fixed database role (n)~ A predefined role that exists in each database. The scope of the role is limited to the database in which it is defined.

fixed date (n)~ A date to which a task is tied either because the date was entered in the Actual Start or Actual Finish field or because the task is constrained by an inflexible constraint.

fixed dialing (n)~ A feature that allows a user to restrict the device to dial only the numbers or area codes that are specified.

Fixed Dialing Number (PN)~ A mode that restricts outgoing calls to a fixed set of numbers.

fixed distribution allocation method (n)~ A method for calculating allocations based on a specified percentage.

fixed document (n)~ One instance of an XPS document in an XPF document package. A fixed document has the extension .fdoc, is listed in the FixedDocumentSequence element, its root element is <FixedDocument> and it is comprised of fixed pages.

fixed exchange rate (n)~ An exchange rate that pegs one currency's value to another currency's value.

fixed file location (n)~ The full or absolute address of a file - for example, www.microsoft.com/location/sublocation/filename.htm.

fixed grid (n)~ Grid lines on the drawing page that stay the same distance apart when you zoom in or zoom out of a drawing.

fixed layout (n)~ A layout that does not change as the screen size, aspect ratio, app size, or orientation changes.

fixed location (n)~ A permanent location that is assigned to an item in a warehouse. Multiple items can have the same fixed location, and a single item can have multiple fixed locations.

fixed markup (n)~ The exact amount added to the list price to arrive at a custom price.

fixed material consumption (n)~ Absolute quantity of a material resource to be used to complete an assignment. A fixed consumption rate indicates that the amount of material used will be constant, regardless of changes to task duration or assignment length.

fixed page (n)~ A page in an XPS fixed document. A fixed page has the extension .fpage, is listed in the FixedDocument element, its root element is FixedPage and it contains text, layout information, and references to images, fonts, and other custom resources.

fixed percentage allocation method (n)~ A method for calculating allocations based on a specified percentage.

fixed positioning (n)~ Placement of an element relative to either the element's parent or, if there isn't one, the body. Values for the element's Left and Top properties are relative to the upper-left corner of the element's parent.

fixed quantity kanban (n)~ A type of kanban that is used when the number of kanbans that are assigned to a kanban rule is constant.

fixed rate (n)~ The multiplier used for converting the base currency of the Web site to the buyer currency or supplier currency.

fixed server role (n)~ A predefined role that exists at the server level. The scope of the role is limited to the SQL Server instance in which it is defined.

fixed value (n)~ A user-entered value or value from a static source that does not change unless manually altered by the user.

fixed version (n)~ A file version that prohibits the viewer from making edits.

fixed weight allocation method (n)~ A method for calculating allocations by using weighted values.

fixed-duration task (n)~ A task in which the duration is a fixed value and any changes to the work or the assigned units [that is, resources] don't affect the task's duration. This is calculated as follows: Duration x Units = Work.

fixed-length (adj)~ Pertaining to anything whose size is predetermined and constant.

fixed-price project (n)~ A type of project in which the customer pays a predetermined amount for the entire project.

fixed-price project estimate (n)~ The estimated total cost to complete a fixed-price project.

fixed-rate agreement (n)~ An exchange rate that is frozen for the entire project period.

fixed-size virtual hard disk (n)~ A virtual hard disk with a fixed size that is determined and for which all space is allocated when the disk is created. The size of the disk does not change when data is added or deleted.

fixed-width text file (n)~ A file containing data, where each field has a fixed width.

flag (n)~ Broadly, a marker of some type used by a computer in processing or interpreting information; a signal indicating the existence or status of a particular condition. Flags are used in such areas as communications, programming, and information processing.

flag (v)~ To associate a flag with a message or other item.

flag (n)~ A graphic that indicates follow-up action is required, or otherwise identifies an important item.

flagged (adj)~ Marked with a flag.

Flame ~ Internet slang for an email, forum or newsgroup post insulting or telling someone off.

Flamewar ~ A public trading of insults in a- newsgroup- or forum. Sometimes flamewars get so out of hand that there are hundreds of flames in the newsgroup and almost nothing else.

Flash (n)~ A Macromedia development environment containing video, multimedia, and application development features to help create rich user interfaces, online advertising, e-learning courses, and enterprise application front-ends.

flash (v)~ To alternate between calls when there is an active call and a call on hold.

Flash ~ A technology for displaying animations and videos on webpages, created by the Macromedia Corporation. The Flash Player is a plugin which enables internet browsers to display the animations.

flash ~ Flash memory (FLEXIBLE ARCHITECTURE for SHARED MEMORY):- This type of non-volatile memory has the ability to retain its information even when there is no power source.

flash ~ FLASH is erased (or bulk erased) electrically erasable programmable read-only memory (EEPROM). FLASH has the electrically erasable benefits of EEPROM but the small, economical cell size of EPROM technology

flash ~ A bandwidth friendly and browser independent vector-graphic animation technology. As long as different browsers are equipped with the necessary plug-ins, Flash animations will look the same. As of late 2005, Macromedia is now owned by- Adobe

flash auto (n)~ A flash mode used to set off the flash automatically according to the ambient light conditions.

Flash drive ~ A removable data storage device, usually thumb sized and plugged into a- USB- port.

Flash Fill (PN)~ A feature that extends AutoComplete functionality to show a live preview of suggested values for an entire range of cells based on what the user is typing.

flash memory card (n)~ A device used by many digital cameras to store pictures and video. Flash memory cards store computer information such as text, pictures, and music, and can be copied, erased, and used many times.

flash off (n)~ A flash mode when the phone's built-in camera flash is set to off.

flash on (n)~ A flash mode when the phone's built-in camera flash is set to on.

Flashing (n)~ A title animation in Windows Movie Maker.

Flashpix (n)~ A multi-resolution, tiled file format for digital images.

flat appearance (n)~ The recommended visual display of a control when it is nested inside another control or scrollable region.

flat cap (n)~ For paths that contain unconnected ends, the end of the stroke that is left as a flat edge.

flat file (n)~ A file consisting of records of a single record type in which there is no embedded structure information that governs relationships between records.

flat file format (n)~ An image file format in which individual objects cannot be edited. Files stored in JPEG, GIF, and BMP formats are all flat files. The PhotoDraw MIX file format is not a flat file format.

flat list (n)~ A result set in which any member hierarchies are ignored and all members are presented as equal. Regardless of how the members are presented however, hierarchical information is always maintained in the member metadata.

flat namespace (n)~ A namespace that is unstructured and cannot be partitioned, such as the network basic input/output system (NetBIOS) namespace. In a flat namespace, every object must have a unique name.

flat navigation pattern (n)~ The navigation structure recommended to be used for Windows Store apps that contain a small number of pages and its information is not organized in a hierarchy, i.e., the pages, tabs, and modes are logical peers.

flat structure (n)~ The navigation structure recommended to be used for Windows Store apps that contain a small number of pages and its information is not organized in a hierarchy, i.e., the pages, tabs, and modes are logical peers.

flat-file logging (n)~ The process of creating an event log that is written to a UTF-8 formatted text file.

flatrate ~ pricing plan for Telco

flatten (v)~ In digital graphic creation and manipulation programs, to combine all layers of text, images, and other graphic elements into a single layer. Elements cannot be edited after the graphic is flattened, so a graphic is not usually flattened until the final step when all adjustments have been made to the individual layers. Flattening an image significantly reduces its file size and allows it to be saved in a wider range of formats. Flattening is similar to grouping in that both actions combine a set of objects. However, flattening is a permanent action, whereas a group of objects can be ungrouped.

flatten (v)~ To convert a nested structure into a flat structure.

flattened interface (n)~ An interface created to combine members of multiple interfaces.

flattened rowset (n)~ A multidimensional data set presented as a two-dimensional rowset in which unique combinations of elements of multiple dimensions are combined on an axis.

flexbox (n)~ A control that- allows designers and developers to position and align child elements within a parent container and can be used to create flexible containers that proportionally expand to fill any remaining space in an HTML layout.- These capabilities allow immersive application developers to build key application layouts, such as toolbars of navigation elements.

FlexGo (PN)~ The technology and business model behind a Microsoft licensing program that enables low-entry-cost personal computing through subscription and pay-as-you-go software licensing.

FlexGo Management Portal (PN)~ A Web site used by customer service representatives and support personnel to perform administrative functions such as updating information for computers that are already in the system or creating batch updates.

FlexGo technology (PN)~ The technology and business model behind a Microsoft licensing program that enables low-entry-cost personal computing through subscription and pay-as-you-go software licensing.

flexible authentication (n)~ An authentication process where users in a variety of identity management systems can be authenticated.

flexible constraint (n)~ A constraint that does not tie a task to a single date. Flexible constraints are As Soon As Possible, As Late As Possible, Finish No Earlier Than, Finish No Later Than, Start No Earlier Than, and Start No Later Than.

flexible ID (n)~ An identifier that is assigned to various synchronization entities, such as replicas. The identifier can be of fixed or variable length.

flexible identifier (n)~ An identifier that is assigned to various synchronization entities, such as replicas. The identifier can be of fixed or variable length.

flick (v)~ A quick, straight stroke of a finger or pen on a screen. A flick is recognized as a gesture, and interpreted as a navigation or an editing command.

flick (v)~ To put your finger on a touchscreen and then swipe it quickly, lifting your finger

off the screen, in the direction you want.

flicker (n)~ Rapid, visible fluctuation in a screen image, as on a television or computer monitor. Flicker occurs when the image is refreshed (updated) too infrequently or too slowly for the eye to perceive a steady level of brightness. In television and raster-scan displays, flicker is not noticeable when the refresh rate is 50 to 60 times per second. Interlaced displays, in which the odd-numbered scan lines are refreshed on one sweep and even-numbered lines on the other, achieve a flicker-free effective refresh rate of 50 to 60 times per second because the lines appear to merge, even though each line is actually updated only 25 to 30 times per second.

flicks set (n)~ A collection of gestures you can make with a tablet pen to quickly navigate and perform shortcuts.

Flight Search (PN)~ A feature that allows a user to search for flights on airlines.

Flight Status (PN)~ A feature that allows a user to check the status of a given airline flight.

flip (v)~ To change the orientation of a selected object horizontally, vertically, or in both directions.

flip ahead (v)~ To go to the next page on a site quickly by swiping across the page or clicking the Forward button.

flip ahead (n)~ A feature in Internet Explorer that enables users to go to the next page on a site quickly by swiping across the page or clicking the Forward button.

flip bar (n)~ The list of documents that are currently open displayed in the order which you opened them.

flip chip packaging (n)~ A packaging technique that connects die bond pads to a package substrate without using wire bonds. The bumped die is placed on the package substrate where the bumps connect to the package pins.

FlipView (PN)~ The control for Windows Store apps that enables users to flip through content.

float (n)~ A data type that holds floating-point number data from -1.79E + 308 through 1.79E + 308. float, double precision, and float(n) are SQL Server float data types.

float (v)~ To manipulate an interface element, such as a panel or a toolbar, in order to make it a window separate from the application window.

floating (adj)~ Able to move freely as its own window. A floating window is always on top. Toolbars, menu bars, the toolbox, and palettes can float.

floating column chart (n)~ A stacked column chart that creates the effect of floating columns by making the first data series invisible. The result is a chart that depicts mininum and maximum values.

floating object (n)~ A graphic or other object that is inserted in the drawing layer so that you can position it precisely on the page or in front of or behind text or other objects.

floating point (n)~ A number represented by a mantissa and an exponent according to a given base. The mantissa is usually a value between 0 and 1. To find the value of a floating-point number, the base is raised to the power of the exponent, and the mantissa is multiplied by the result. Ordinary scientific notation uses floating-point numbers with 10 as the base. In a computer, the base for floating-point numbers is usually 2.

floating toolbar (n)~ A toolbar that is not attached to the edge of the program window.

You can change the shape of some floating toolbars.

floating version rights (n)~ The categories of software licenses that are available for purchase from Microsoft and that grant the purchaser the right to use the latest version of a software title as it becomes available, throughout the term of the customer's volume license agreement.

floating-point number (n)~ A number represented by a mantissa and an exponent according to a given base. The mantissa is usually a value between 0 and 1. To find the value of a floating-point number, the base is raised to the power of the exponent, and the mantissa is multiplied by the result. Ordinary scientific notation uses floating-point numbers with 10 as the base. In a computer, the base for floating-point numbers is usually 2.

floating-point unit (n)~ A circuit that performs floating-point calculations.

flood attack (n)~ A denial-of-service attack in which a server is flooded' with requests that cannot be completed. Once flooded

Flood Mitigation (n)~ A feature in the General Configuration Settings that enables the user to specify how ISA Server will prevent flood attacks.

flooding ~ An attack that attempts to cause a failure in (especially, in the security of) a computer system or other data processing entity by providing more input than the entity can process properly.

Floor Is Stock-Out Threshold (n)~ A site-level setting that overrides the Stock-Out Threshold value of each product.

floor plan (n)~ A drawing that shows the layout of individual rooms or entire floors of a building including the wall structure, building core, and electrical symbols. A type of building plan.

floppy disk (n)~ A reusable magnetic storage medium. The floppy disk used today is the rigid 3.5-inch microfloppy that holds 1.44 MB. It is called floppy because the first varieties were housed in bendable jackets.

Floppy disk ~ Also known as a- diskette. Now obsolete. Originally called floppy disks because they were round and non-rigid, but later the actual floppy disk was enclosed inside a rigid, near-square protective casing. Most programs used to be released on floppy disks, but modern programs are so large that they are now released on CD ROM or DVD instead.

floppy disk drive (n)~ A hardware device that reads data from and writes data to floppy disks.

FLOPS (n)~ A measure of the speed at which a computer can perform floating-point operations.

flow (n)~ Any of the different members of the Flow dimension.

flow (n)~ A content processing or query processing pipeline that contains operators that determine how the content or the query is processed.

flow control (n)~ The management of data transmission between two devices, such as between the CPU and a peripheral device or between nodes in a network. It ensures that the receiver can handle all the incoming data and usually depends on a set of protocols established at the beginning of the transmission session that define how and when a sender may transmit. Flow control also enables slower-speed devices to communicate with

higher-speed ones.

Flow dimension member (n)~ Any of the different members of the Flow dimension.

flow layout (n)~ A way of designing a form in which all elements are positioned one immediately after the other.

flowchart (n)~ A graphic map that can document procedures, analyze processes, indicate work or information flow, or track cost and efficiency.

flowchart symbol (n)~ An icon that illustrates one of the various flowcharting functions.

Fluent (adj)~ Characterized by design and functional elements introduced in the 2007 Microsoft Office suite user interface.

Fluent user interface (PN)~ The user interface introduced with the 2007 Microsoft Office suite. It includes components and features such as the Ribbon, Galleries, Live Preview, the Mini Toolbar, and Contextual Tabs.

fluid application model (n)~ A model that enables secure, cross-domain, integration between external applications and SharePoint Foundation deployments.

flush (adj)~ Aligned in a certain way on the screen or on paper. Flush left, for example, means aligned on the left side; flush right means aligned on the right side.

flushing principle (n)~ The method that is used to register item consumption for a BOM line against a production order.

Fly In, Fades (v)~ A title animation in Windows Movie Maker.

Fly In, Fly Out (v)~ A title animation in Windows Movie Maker.

Fly In, Left and Right (v)~ A credit or title animation in Windows Movie Maker.

Fly In, Top Left (v)~ A title animation in Windows Movie Maker.

Fly Out (v)~ A title animation in Windows Movie Maker.

flyer (n)~ A circular or pamphlet for distribution, normally used for advertisements.

flyout (n)~ A control to expose lightweight, contextual UI.

flyout anchor (n)~ A button-like control in the Ribbon that pops up a menu with more options when clicked.

flyout control (n)~ A control that developers use to create a flyout.

flyweight patching (n)~ A process that reduces the time that is required to apply updates to installed applications whereby only the parts of an application that are modified by an update actually change.

FM (PN)~ A Windows Fabric system service responsible for failure detection and failover of services, for coordinating the placement of replicas across failure domains, for reconfiguration of the replica-set based on complaints in the system, for balancing the load across all the nodes, and for ensuring availability and reliability of the services.

FMP (PN)~ A Web site used by customer service representatives and support personnel to perform administrative functions such as updating information for computers that are already in the system or creating batch updates.

f-number (n)~ In photography, the diameter of the aperture expressed in terms of the focal length of the camera lens. The greater the f-number, the less light reaches the film and the more in focus the objects in the foreground and the background will be. For example, with an f-number = 16 the objects in the far background will be in focus. Whereas, with an f-number = 2 the background will be blurry (while foreground objects are in focus).

FOAD ~ (Off And Die)- Internet slang. Pretty self-explanatory really.

FOB (oth)~ A shipping method that establishes the point at which ownership of goods passes to the buyer. The FOB can establish ownership when an item is damaged in transit.

focal length (n)~ The distance between the camera's lens and the image plane.

Focus (n)~ A feature of Lync Server or Office Communications Server that manages conference state.

Focus (PN)~ The search topic selector menu from which you can select an item that an analysis focuses on.

Focus Factory (n)~ A feature of Lync Server or Office Communications Server that helps to manage conferences and schedule meetings.

focus of control (n)~ In a sequence diagram, the time period during which an object or actor is performing an action. Activation is represented by a thin rectangle.

focusable (adj)~ Pertaining to anything (e.g. elements) that can receive focus.

Focused Ion Beam (n)~ A focused beam of gallium ions that can be used to image the surface of a PCB or other object.

fold count (n)~ A value that represents the number of partitions that will be created within the original data set.

folder (n)~ A named storage area on a computer or device containing files and other folders. Folders are used to organize information electronically, the same way actual folders in a filing cabinet do.

folder (n)~ In Distributed File System (DFS), an object in a namespace that virtualizes multiple shared folders (referred to as folder targets), or in the case of folders without targets, adds hierarchy to the namespace.

folder (n)~ A feature that allows users to group tiles and Live Tiles on the Start Screen and keep apps better organized.

Folder ~ An area on a disk for storing- files- in. Folders can also contain other folders, which in turn can contain more folders, and so on almost to infinity.

folder hierarchy (n)~ A bounded namespace that uniquely identifies all reports, folders, shared data source items, and resources that are stored in and managed by a report server.

folder home page (n)~ An Internet Web page or intranet page that is associated with an Outlook folder. If a page has been associated with the folder and the option is set, the Web page appears in the Outlook window whenever you select the folder.

Folder List (n)~ A menu option that displays the folders available in your mailbox.

Folder List (PN)~ The list of folders that appears in the Navigation Pane when viewing mail in Outlook for Mac.

Folder Pane (PN)~ A pane in the Outlook window that contains folders for each view, such as Mail or Calendar.

folder picker (n)~ A UI element that enables users to locate and open folders.

Folder Redirection (n)~ A Group Policy option that allows you to redirect designated folders to the network.

folder tree (n)~ A hierarchy of folders in the Exchange store very similar in structure to the standard file system. A single folder can contain child folders, which, in turn, can contain other child folders.

folder watching (n)~ A feature that instructs the application to monitor folders for newly added content.

Folders view (n)~ The view of a web site that shows how the content of the site is organized. You can create, delete, copy, and move folders and files in Folders view.

Folk (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 80.

Folklore (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 115.

Folk-Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 81.

follow (v)~ To track content, people or other entities by adding them to a list of things that you care about and for which you would like to surface updates about changes and activities.

Follow Up (PN)~ A button on the toolbar that opens the Form Assistant pane, where a user can create a related activity.

follow up (adj)~ To act on or make further investigations on a contact or lead, on the basis of information received.

followed hyperlink (n)~ A hyperlink on a Web page that a site visitor has activated by using a mouse device, keyboard, or other type of pointing device.

follower (n)~ A person who subscribes to receive updates of another person's activities.

follow-up activity (n)~ An activity created using the Follow Up form in the Form Assistant.

font (n)~ A graphic design applied to a collection of numbers, symbols, and characters. A font describes a certain typeface, along with other qualities such as size, spacing, and pitch.

Font ~ Another word for typeface, ie the style of lettering.

Font Cache Service (PN)~ A Win32 service process that optimizes performance of applications by caching commonly used font data. Applications will start this service if it is not already running. It can be disabled, though doing so will degrade application performance.

font cartridge (n)~ A plug-in unit available for some printers that contains fonts in several styles and sizes. As with downloadable fonts, printers using font cartridges can produce characters in sizes and styles other than those created by the fonts built into it.

Font choices (PN)~ The option that shows the set of fonts that can be applied to a sway.

font embedding (n)~ The act of inserting font information into the publication or the compiled application. Once the font is embedded, the information becomes part of the publication or the application.

font family (n)~ The set of available fonts representing variations of a single typeface. For example, Times Roman and Times Roman Italic are members of the same font family. When the user indicates italic, the system selects the correct italic font for the font family, with its characteristic appearance. If there is no italic font in the family, the system simply slants, or obliques'

font manager (n)~ A software program that helps you increase or decrease the sets of

available fonts.

font previewer (n)~ A tool or feature that allows users to see different fonts, typography formats, and lettershapes that display on the computer and/or on Web sites.

font resource (n)~ A graphic design applied to a collection of numbers, symbols, and characters. A font describes a certain typeface, along with other qualities such as size, spacing, and pitch.

font resource file (n)~ A file that contains information about a font.

font scheme (n)~ A pre-designed combination of fonts that work well together.

font size (n)~ The point size of a set of characters in a particular typeface.

font style (n)~ The stylistic attributes of a font -€" such as bold, italic, and underline.

font subsetting (n)~ Embedding a limited number of characters specific to one font, reducing file size.

font substitution (n)~ A substitution that occurs when Windows or your printer uses a font similar to the one you used in your publication to display or print your publication.

font weight (n)~ An indication of the amount of vertical thickness in the characters of a font.

Food & Dining (PN)~ A list of restaurants and bars in a specific neighborhood.

Food & Drink (PN)~ An application that provides recipes and tools for meal-planning, instructional views, and an extensive wine guide.

Food and Drug Administration (n)~ A U.S. governmental agency that is responsible for protecting public health by regulating things such as food, drugs, medical devices, and biological products.

foot (v)~ To total amounts vertically. The resulting sum can be checked against a total obtained by cross-footing (adding amounts horizontally).

footer (n)~ One or more lines of text in the bottom margin area of a page. A footer may contain elements such as the page number, the name of the file, or the date.

footer ~ A formatting style designated in HTML by a specific tag and used at the end of an HTML file.

force feedback (n)~ A technology that generates push or resistance in an input/output device. Force feedback enables an input/output device, such as a joystick or a steering wheel, to react to the user's action in appropriate response to events displayed on the screen. For example, force feedback can be used with a computer game to react to a plane rising in a steep ascent or a race car turning a tight corner.

Force Removal (v)~ A link that allows the user to trigger removal of a database from a group of databases.

forced expiratory volume (n)~ The volume of air coming out of the lung under forced conditions.

forced failover (n)~ For an availability group, a form of failover (with possible data loss) that can be initiated by a database administrator in response to the loss of the primary replica when automatic failover did not occur.

forced inspiratory flow (n)~ The speed of air coming into the lung under forced inspiration.

forced manual failover (n)~ For an availability group, a form of failover (with possible data loss) that can be initiated by a database administrator in response to the loss of the

primary replica when automatic failover did not occur.

forced quorum (n)~ The process to start a WSFC cluster even though only a minority of the elements that are required for quorum are in communication.

forced rename state (n)~ The state that a Windows Live ID takes when the user account with which it is associated is deleted from Outlook Live, but the Windows Live ID for the account isn't deleted. The credentials for that Windows Live ID are still valid and recognized, but the Windows Live ID is put into a forced rename state. If someone tries to sign in using that Windows Live ID and its password, they're asked to rename the Windows Live ID. They can rename the Windows Live ID, but because the new e-mail address can't exist in the Outlook Live domain, the Windows Live ID is no longer functional in Outlook Live.

forced service (n)~ In a database mirroring session, a failover initiated by the database owner upon the failure of the principal server that transfers service to the mirror database while it is in an unknown state. Data may be lost.

forced vital capacity (n)~ The volume of air that can forcibly be blown out after full inspiration, measured in liters.

forecast (n)~ A prediction of future events, such as income, sales, or weather.

forecast dimension (n)~ A dimension that is used to characterize the level of detail for which a forecast is defined.

forecast plan (n)~ A long-range plan for estimating capacity, quantities of finished goods to be sold, and quantities of components needed, and for establishing financial priorities.

forecasting (n)~ A planning tool that helps management in its attempts to cope with the uncertainty of the future, relying mainly on data from the past and present and analysis of trends. Forecasting starts with certain assumptions based on the management's experience, knowledge, and judgment.

foreground (n)~ The brush color of displayed characters and graphics, for example, the color of the text that is displayed in a TextBox control.

foreground color (n)~ The color that is currently selected for drawing or displaying text on the screen. In monochrome displays, the foreground color is the color of a bitmap or other graphic.

foreground page (n)~ The top page of a drawing.

foreground program (n)~ The program that runs in the active window (the uppermost window with the highlighted title bar). The foreground program responds to commands issued by the user.

foreign address (n)~ Any address type that the MS Mail postoffice does not have a gateway or access component installed for routing.

foreign computer (n)~ A computer that uses another message queuing system but, through a connector application, can exchange messages with computers that run Message Queuing.

Foreign connector (PN)~ An Exchange Server 2007 connector that uses a Drop directory on a Hub Transport server to send messages to a local messaging server that doesn't use the Simple Mail Transfer Protocol (SMTP) as its primary transport mechanism.

foreign currency (n)~ Any form of money in public circulation that is not your base (local) currency.

foreign currency revaluation (n)~ A procedure for recording revalued assets and liabilities that account for differences in exchange rates between an original transaction currency unit and accounting currency unit conversion and a period end transaction currency and accounting currency conversion.

foreign currency translation (n)~ The process of restating foreign currency accounts of subsidiaries into equivalent currency (usually the reporting currency of the parent company), in order to prepare consolidated financial statements in the native currency of the parent company.

foreign currency translation (n)~ A procedure for recording revalued functional currency account balances when restating account balances in a reporting currency.

foreign currency unit (n)~ A currency unit of a country/region that is not the functional currency unit of the primary legal entity.

foreign key (n)~ A key in a database table that comes from another table (also know as the referenced table') and whose values match the primary key (PK) or unique key in the referenced table.'

foreign key (n)~ A set of fields whose values are migrated from a primary key or an alternate key from a parent table.

foreign key association (n)~ An association between entities that is managed through foreign key properties.

Foreign Principal Group (n)~ A type of group within a forest (B) that enables that group to access the resources of a different forest (A) by assigning the FPG group with the same ID as a group within the A forest and enabling it to mimic the access permissions of the group with the same ID of Forest A.

foreign table (n)~ A table that contains a foreign key.

foreign-address (n)~ A deprecated function in List Processor (Lisp), specifying the location of a foreign object which takes the form of a Lisp integer, a Lisp vector, or a foreign-pointer instance.

foreseeable loss (n)~ An expected loss on a project that is treated as an expense transaction because it is likely that the total project cost will exceed the total project revenue or capitalization limit.

forest (n)~ One or more Active Directory domains that share the same class and attribute definitions (schema), site and replication information (configuration), and forest-wide search capabilities (global catalog). Domains in the same forest are linked with two-way, transitive trust relationships.

forest ~ A collection of one or more- domain- trees with a common schema and implicit trust relationships between them.

forest configuration (n)~ A configuration object used to model Active Directory forests.

forest root domain (n)~ The first domain created in a new forest. The forest-wide administrative groups, Enterprise Admins and Schema Admins, are located in this domain. As a best practice, new domains are created as children of the forest root domain.

forest trust (n)~ A trust between two Windows Server 2003 forests that forms trust relationships between every domain in both forests. A forest trust can be created only between the forest root domains in each forest. Forest trusts are transitive, and they can be one-way or two-way. An administrator must manually establish a forest trust, unlike an

automatically established trust, such as a parent-child trust.

fork ~ A stream of data that can be opened and accessed individually under a common filename. The Mac OS Standard and Extended file systems store a separate data fork and resource fork as part of every file.

fork ~ In BSD, fork is a system call that creates a new process.

form (n)~ In some applications (especially databases), a structured window, box, or other self-contained element that serves as a visual filter for the underlying data it is presenting.

form (n)~ A structured document or template with spaces reserved for entering information and often containing special coding (e.g. to trigger data processing).

form (n)~ A form targeted at either the Web or the console.

form area (n)~ The area of the InfoPath workspace that displays the form you are working with.

form assignment (n)~ Assignment of responsibility, by a contributor, to submit data, review data, or approve data on a data entry form.

form control (n)~ On a Web site, an individual box or button with which you enter information on an electronic form.

form definition file (n)~ An XML file with an .xsf extension that contains information about all other files and components used within a form, including user interface customizations, XML Schemas, views, business logic, events, and deployment settings.

form editor (n)~ The user interface control in Microsoft Dynamics CRM where you can create and edit forms for an entity.

form factor (n)~ The size, shape, and configuration of a piece of computer hardware. The term is often applied to subcomponents such as disk drives, circuit boards, and small devices, such as handheld PCs. It can also be used more broadly to include the arrangement and positioning of external switches, plugs, and other components of the device, or it can refer to the footprint of an entire computer.

form factor (n)~ A category of devices that share a property or properties relating to size, aspect ratio, input mechanisms, and other physical characteristics.

form feed (n)~ A printer command that tells a printer to move to the top of the next page. In the ASCII character set, the form-feed character has the decimal value 12 (hexadecimal 0C). Because its purpose is to begin printing on a new page, form feed is also known as the page-eject character.

form field (n)~ A data-entry field on a page. A site visitor supplies information in a field either by typing text or by selecting a field.

form files (n)~ A collection of files that are used to implement a form. File types can include .html, .xml, .xsd, .xslt, script, and other file types that are necessary to support the functionality of the form.

form footer (n)~ Use to display instructions for using a form, command buttons, or unbound controls to accept input. Displays at the bottom of the form in Form view and at the end of a printout.

form handler (n)~ A program on a server that runs when a site visitor submits a form.

form header (n)~ Use to display a title for a form, instructions for using it, or command buttons that open related forms or carry out other tasks. Displays at the top of the form in Form view and at the beginning of a printout.

form instance (n)~ An instance, or copy, of a PerformancePoint Planning form template that is pushed to a PerformancePoint Add-in for Excel contributor, reviewer, or approver via an assignment.

form library (n)~ A folder in which a collection of forms based on the same template is stored and shared. Each form in a form library is associated with user-defined information that is displayed in the content listing for that library.

Form Library URL Repair Tool (PN)~ A feature that updates absolute URLs in form templates associated with SharePoint Form Libraries (i.e., InfoPath XSNs) as well as Universal Data Connection files.

Form Mode (n)~ The option that lets users choose, be default, what mode they will view records in forms in.

form module (n)~ A module that includes code for all event procedures triggered by events occurring on a specific form or its controls.

form properties (n)~ Attributes of a form that affect its appearance or behavior. For example, the DefaultView property is a form property that determines whether a form will automatically open in Form view or Datasheet view.

form region (n)~ A customizable extension to Microsoft Office Outlook forms.

form selector (n)~ The box where the rulers meet, in the upper-left corner of a form in Design view. Use the box to perform form-level operations, such as selecting the form.

form template (n)~ A file or set of files that defines the data structure, appearance, and behavior of a form.

form template library (n)~ The location, in the top-level site of a site collection, where the form templates that have been activated by an administrator are stored.

Form view (n)~ A window that displays a form to either show or accept data. Form view is the primary means of adding and modifying data in tables. You cannot change the design of a form in this view.

formal agent (n)~ An agent who may be signed in into UC throughout the day, and they may sign in and out of the ACD system during the day. They are fully aware of their role as an agent and want to be able to see the numbers of calls in the queues they are serving, and so on.

format (n)~ The overall layout or pattern of a document.

format (v)~ To prepare a disk for use by organizing its storage space into a collection of data compartments'

format (v)~ To arrange objects in a specified form or layout.

format (n)~ The attributes of a cell in a spreadsheet, such as its being alphabetic or numeric, the number of digits, the use of commas, and the use of currency signs.

format (n)~ The structure or organization of data in a file.

format (n)~ The structure or appearance of a unit of data, such as a field, or text in a message body.

format bar (n)~ A toolbar within an application used for modifying the format of the document being displayed, such as changing font size or type.

format file (n)~ A file containing meta information (such as data type and column size) that is used to interpret data when being read from or written to a data file.

Format Object task pane (PN)~ A task pane that provides functionality for formatting

objects.

Format Painter (v)~ A feature that replicates formatting from a source item -€" such as text in Word, a cell in Excel, a control in Access, or a shape in Publisher -€" to one or more target items.

format switch (n)~ A switch (*) or instruction that specifies the capitalization, numeral style, and character formatting that Microsoft Word uses in a field result.

formatting (n)~ The elements of style and presentation that are added to documents through the use of margins, indents, and different sizes, weights, and styles of type.

formatting dimension (n)~ The dimension that numeric formatting is applied to.

Formatting Palette (PN)~ A free floating utility in Microsoft Office for Mac that puts the right formatting options at users' fingertips when they need them.

forms cache (n)~ A location on a computer's hard drive to store a local copy of a form to improve performance when opening a form subsequent times.

forms-based authentication (PN)~ A service that enables applications to provide their own logon UI and to verify credentials independently.

formula (n)~ A sequence of values, cell references, names, functions, or operators in a cell that together produce a new value.

formula (n)~ A numeric relationship among production process inputs and production process outputs.

Formula AutoComplete (PN)~ An AutoComplete feature for Excel formulas.

formula bar (n)~ A bar at the top of the Excel window that you use to enter or edit values or formulas in cells or charts. Displays the constant value or formula stored in the active cell.

Formula Builder (PN)~ A tool that helps you create or edit a formula and also provides information about functions and their arguments.

formula item (n)~ An output of a batch process controlled by a formula.

Formula Palette (n)~ A tool that helps you create or edit a formula and also provides information about functions and their arguments.

Forum ~ A public or semi-public area on a website or bulletin board where you can read and post messages on a particular topic, allowing public debate.

forward (v)~ To send a received e-mail message or calendar item, either modified or in its entirety, to a new recipient.

forward (v)~ To move a call to another phone before the call is answered.

Forward (adj)~ A navigation button used to return to a page from which the user has navigated away via the Internet Explorer Back command.

forward lookup (n)~ In DNS, a query process in which the friendly DNS domain name of a host computer is searched to find its IP address. In DNS Manager, forward lookup zones are based on DNS domain names and typically hold host address (A) resource records.

forward mailbox (n)~ A mailbox used by the E-mail Router to route incoming Microsoft Dynamics CRM e-mail messages and create activities for individual users.

forward planning (n)~ A method for determining a production schedule by beginning with the production start date and working forward to determine the production completion date.

forward proxy (n)~ An intermediate server that sits between the client and the origin

server. To retrieve content from the origin server, the client sends a request to the proxy naming the origin server as the target. The proxy then requests the content from the origin server and returns the content to the client.

forward scheduling (n)~ A method for determining a production schedule by beginning with the production start date and working forward to determine the production completion date.

forward slash (n)~ The / character.

forwarding proxy (n)~ An Office Communications Server used to forward SIP traffic within an organization.

forward-only cursor (n)~ A cursor that cannot be scrolled; rows can be read only in sequence from the first row to the last row.

foster (v)~ To encourage or facilitate.

four character code (n)~ A 32-bit unsigned integer that is created by concatenating four ASCII characters to identify a data format.

FOURCC code (n)~ A 32-bit unsigned integer that is created by concatenating four ASCII characters to identify a data format.

four-headed arrow (n)~ Two arrows in shape of a cross, with two heads each pointing in opposite directions.

Fourier transform (n)~ A mathematical method, developed by the French mathematician Jean-Baptiste-Joseph Fourier (1768-1830), for signal processing and signal generation tasks such as spectral analysis and image processing. The Fourier transform converts a signal value that is a function of time, space, or both into a function of frequency. The inverse Fourier transform converts a function of frequencies into a function of time, space, or both.

FPM DRAM (n)~ An older form of DRAM, used in personal computers before EDO RAM was introduced, with typical clock timings of 6-3-3-3.

FPM RAM (n)~ A specially designed dynamic RAM that supports access to sequential memory locations with a reduced cycle time.

FPS (n)~ The number of video frames displayed per second. Higher frame rates generally produce smoother movement in the picture.

FPS ~ 1- (Frames Per Second)- A measure of the smoothness and quality of animations, particularly in computer games. The more frames per second, the better the quality.

FPS ~ 2- (First Person Shooter)- A computer game where you shoot things, played from a first person perspective, ie with you standing behind the gun(s). Also known as
a- shoot-'em-up.

FPSE (PN)~ A set of programs you can use to administer, author, and browse a FrontPage-extended Web site.

FPU (n)~ A circuit that performs floating-point calculations.

FQDN (n)~ A DNS name that has been stated to indicate its absolute location in the domain namespace tree. In contrast to relative names, an FQDN has a trailing period (.) to qualify its position to the root of the namespace (host.example.contoso.com).

fraction (n)~ A number that is not a whole number, such as -½ (vulgar fraction) or 0.5 (decimal fraction), formed by dividing one quantity into another.

fraction (n)~ A small part, amount, or proportion of something.

fraction bar (n)~ A line that separates the numerator and denominator of a fraction.

frag ~ Shoot someone in a computer game.

fragment (n)~ A subtree of UI Automation elements within a host framework such as a window.

fragment (n)~ A concrete sequence of media samples of a track that correspond to a particular interval in an IIS Smooth Streaming presentation.

fragment caching (n)~ The process of storing only parts of a Web page. You accomplish this by caching the output of a user control, such as navigation bars, headers, and footers.

fragmentation (n)~ The breaking apart of files as they are stored by the operating system into small, separate segments on disk.

frame (n)~ In synchronous communications, a package of information transmitted as a single unit. Every frame follows the same basic organization and contains control information, such as synchronizing characters, station address, and an error-checking value, as well as a variable amount of data.

frame (n)~ One of many sequential images that make up video or animation.

frame (n)~ An independent section on a webpage. Each frame is actually a separate webpage and can have its own scrollbars.

frame (n)~ In asynchronous serial communications, a unit of transmission that is sometimes measured in elapsed time and begins with the start bit that precedes a character and ends with the last stop bit that follows the character.

frame (n)~ A space, shown onscreen as a box, that contains a particular element of your publication.

frame ~ A packet of data including start and end of frame delimiters.

frame ~ An HTML feature that allows web designers to segment the window of a web browser into distinct sections.

frame buffer (n)~ A portion of a computer's display memory that holds the contents of a single screen image.

frame check sequence (n)~ The extra checksum characters added to a frame in a communication protocol for error detection and correction. Source: Wikipedia

frame format (n)~ The way in which a network type, such as Ethernet, formats data to be sent over a network. When multiple frame types are allowed for a particular network type, the packets are structured differently and are, therefore, incompatible. All computers on a network must use the same frame type to communicate.

frame grabber (n)~ A device used in computer graphics that uses a video camera, rather than a scan head, to capture a video image and then stores it in memory with the aid of a special-purpose circuit board.

frame rate (n)~ The number of video frames displayed per second. Higher frame rates generally produce smoother movement in the picture.

frame type (n)~ The way in which a network type, such as Ethernet, formats data to be sent over a network. When multiple frame types are allowed for a particular network type, the packets are structured differently and are, therefore, incompatible. All computers on a network must use the same frame type to communicate.

Frame Zoom Control (n)~ A control that contains a slider.

frames page (n)~ A page that divides a Web browser's window into different areas called

frames that can independently display Web pages.

frames per second (n)~ The number of video frames displayed per second. Higher frame rates generally produce smoother movement in the picture.

frameset (n)~ A page that divides a Web browser's window into different areas called frames that can independently display Web pages.

framework (n)~ In object-oriented programming, a reusable basic design structure, consisting of abstract and concrete classes, that assists in building applications.

Framework (n)~ An integral Windows component that supports building, deploying, and running the next generation of applications and XML Web services. It provides a highly productive, standards-based, multilanguage environment for integrating existing investments with next generation applications and services, as well as the agility to solve the challenges of deployment and operation of Internet-scale applications. The .NET Framework consists of three main parts: the common language runtime, a hierarchical set of unified class libraries, and a componentized version of ASP called ASP.NET.

framework package (n)~ A package that can be used by other packages.

fraudulent (n)~ Engaging in fraud or deceptive.

free (adj)~ Free time appears with a clear availability indicator and is seen as available when others view your Calendar. An appointment of zero duration, while visible in the selected block of time when viewing days, shows as free time to others.

Free (adj)~ An Azure Web site hosting tier, used for pricing calculation.

Free App Service (PN)~ The new name for Free Websites, a resource of the Azure App Service service ideal for experimenting with the platform and for development and test scenarios.

free cell (n)~ In the FreeCell game, the four card locations in the upper-left corner of the screen. Each cell holds one card.

Free Database (Hours) (n)~ A resource of the 'MySQL Database on Azure' service type of the 'Data Services' service for 'Pay-As-You-Go' billing based on the number of usage hours.

free media pool (n)~ A logical collection of unused data-storage media that can be used by applications or other media pools. When media are no longer needed by an application, they are returned to a free media pool so that they can be used again.

Free Mobile Services unit (n)~ A unit of measure for the Free tier of the Microsoft Azure Mobile Services service.

Free Notification Hub unit (n)~ A unit of measure for the Free tier of the Microsoft Azure Notification Hubs service.

Free On Board (oth)~ A shipping method that establishes the point at which ownership of goods passes to the buyer. The FOB can establish ownership when an item is damaged in transit.

free slack (n)~ The amount of time that a task can slip before it delays another task.

free space (n)~ The space available on a hard disk for creating primary partitions and extended partions, on which logical drives can be created, formatted, and assigned drive letters.

free tape (n)~ A tape that is available to be written to by operations such as backup or copy.

Free tier (n)~ An Azure offer for Windows 10 store developers who can get access to cloud services (including Application Insights) at no cost.

free trial (n)~ A version of a product that can be used at no cost for a limited period of time for purposes of evaluation.

free/busy information (n)~ Information regarding the availability of a user.

free/busy status (n)~ Information regarding the availability of a user.

free/busy time (n)~ In Calendar, time status and user defined labels are indicated by colors and patterns.

freeform (n)~ Any shape that you draw by using the Curve, Freeform, and Scribble tools. Freeform shapes can include straight lines and freehand curves. They can be drawn opened or closed and can be edited by using the drawing tools.

freeform curve (n)~ A curved line, made up of segments and defined by control points.

freeform path (n)~ A line that is drawn as if by a pencil. A pixel is placed everywhere that the mouse cursor moves, so long as the mouse button is pressed. All paths can be stroked or filled.

FreeLibrary (n)~ A function that processes call after they explicitly linked to a DLL module when that module is no longer needed, decrements the module's reference count and, if the reference count is zero, unmaps it from the address space of the process.

Freestyle (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 119.

free-text searchable (n)~ A Yes/No flag in a property definition that indicates whether the property can be found through a free-text search. To set this flag to Yes, the property type must be string or enumerated. A free-text search locates exact matches and words that are inflectionally generated from the one(s) you specified. For example, the word drive' would return matches for drives

free-threaded component (n)~ A COM component that can reside on multiple threads of execution. Free-threaded components support access by multiple clients and do not rely on COM to synchronize calls to them.

freeze (v)~ In I/O operations, to prevent execution of a thread.

freeze (v)~ To lock specific rows or columns in place in order to keep them in view while scrolling in a worksheet.

freeze horizontal (v)~ To hold a row of a report in a static position so that the row continues to be displayed as you scroll up or down in the report.

freeze vertical (v)~ To hold a column of a report in a static position so that the column continues to be displayed as you scroll right or left in the report.

freight (n)~ An amount paid to a carrier for transporting goods.

freight forwarder (n)~ A person or company contracted by a customer to consolidate loads into shipments and then transport and deliver those loads to specified destinations.

Freight term (n)~ A field label on the accounts form. It provides the choices No Charge or FOB for the Freight Term.

freight terms (n)~ The agreed-upon method for handling shipping costs. Freight terms identify the party responsible for the payment of freight charges.

frequency (n)~ The measure of how often a periodic event occurs, such as a signal going

through a complete cycle. Frequency is usually measured in hertz (Hz), with 1 Hz equaling 1 occurrence (cycle) per second. Frequency is also measured in kilohertz (kHz, or 1,000 Hz), megahertz (MHz, or 1,000 kHz), gigahertz (GHz, or 1,000 MHz), or terahertz (THz, or 1,000 GHz).

frequency (n)~ In Windows Media Player, the number, such as 88.5 or 101.7, used to locate a radio station.

frequency (n)~ The number of events divided by the reach of the events.

frequency hopping (n)~ The switching of frequencies within a given bandwidth during a point-to-point transmission.

Frequent Restart Mode (PN)~ A state that the computer goes into when it has used up all usage time, including borrowed usage time or reserve time. In this mode, the computer is restarted with a set amount of additional borrowed usage time or reserve time and restarts again every time that the borrowed usage time or reserve time is used up.

friend (n)~ A person with whom a Windows Live user has established a mutual social connection.

friend (n)~ A person someone has established a mutual connection with. The connection could have been made on Windows Live or in any connected social networking service.

friend assembly (n)~ An assembly that can access another assembly's internal types and members. Ordinarily, types and members with internal scope (in C#) and friend scope (in Visual Basic) are visible only in the assembly in which they are defined. In the .NET Framework, you can make the types and members visible to additional (friend) assemblies by using the InternalsVisibleToAttribute attribute.

friend assembly (n)~ A collection of types and resources forming a logical unit of functionality and built to work together that is permitted to access types and members of another collection of the same kind.

friendly (adj)~ Referring to features built into hardware or software that make a computer or computer program easy to learn and easy to use. Friendliness is emphasized by most developers and sought after by most users.

friendly name (n)~ A way of displaying contact names that uses the first and last name instead of the email address or sign-in name, for each contact in the user's contact list.

friendly name (n)~ A name the developer provides to help them recognize each Client ID.

friends (PN)~ The webpage subheading for the view in Messenger that displays someone's friends and contacts that aren't friends but that can be interacted with in Messenger (those are often legacy entries).

Friends (PN)~ The UI label for a permissions setting that indicates an item is being shared with (made available to) all of someone's friends.

Friends and Family (PN)~ A privacy relationship setting that allows the most amount of information to be viewed.

friends list (n)~ A list of people, invited by the user, that includes the display picture, notes, and tags for each friend.

Friends module (n)~ A module that shows a photo list of your friends and provides for adding, editing, and deleting people from your friends list.

FRIS (oth)~ A standard that places additional constraints on instance documents that are used for financial reporting. All instance documents that are valid under FRIS are valid

XBRL documents. However, not all XBRL documents are valid under FRIS.

Frixo ~ UK road travel reporting website, that provides our users with the most up-to-date road traffic information. Our data is updated every 5 minutes using sensors placed on motorways and common A / B roads.- www.frixo.com

From clause (n)~ The clause that introduces a data source and a range variable in a query expression.

front (n)~ A camera on the front of an electronic device (such as a smartphone), which faces the user. This allows the user to video chat with another person also using a front-facing device. It may also be used to take videos and pictures.

front clipping plane (n)~ The near boundary of a viewing frustum or camera. Any object closer to the camera than this clipping plane is not rendered.

front end (n)~ In applications, software or a feature of software that provides an interface to another application or tool. Front ends are often used to supply a common interface for a range of tools produced by a software manufacturer. A front end generally offers a more user-friendly interface than that of the application running behind' it.'

Front End pool (n)~ A set of Front End Servers, configured identically, that work together to provide services for a common group of users.

Front End Server (PN)~ The principal server role in Lync Server and Office Communications Server. The Front End Server runs services for instant messaging, presence, web conferencing, audio/video conferencing, and telephony.

front side bus (n)~ The bus within a microprocessor that connects the CPU with main memory. It is used to communicate between the motherboard and other components in a computer system.

FrontBridge (PN)~ The company that originally owned the Microsoft spam and virus filtering service that is now part of Exchange Hosted Services. The word FrontBridge' still appears in URLs

front-end database (n)~ In a two-database approach, the client-side database that contains all the forms, queries, reports, macros, and modules, and that links to a back-end database containing the tables.

front-end server (n)~ A server that accepts requests from clients and sends them to the appropriate back-end server for processing.

front-end Web server (n)~ A server that hosts Web pages, performs processing tasks, and accepts requests from protocol clients and sends them to the appropriate back-end server for further processing.

front-end/back-end application (n)~ An application consisting of a back-end' database file that contains tables

front-loaded contour (n)~ A contour that begins at its highest point, and then slopes downward.

FrontPage Server Extensions (PN)~ A set of programs you can use to administer, author, and browse a FrontPage-extended Web site.

FRS (n)~ A service that provides multimaster file replication for designated directory trees between designated servers running Windows Server 2003. The designated directory trees must be on disk partitions formatted with the version of NTFS used with the Windows Server 2003 family. FRS is used by Distributed File System (DFS) to automatically

synchronize content between assigned replicas and by Active Directory to automatically synchronize content of the system volume information across domain controllers.

FRTA (oth)~ A standard that places additional constraints on XBRL taxonomies that are intended to express information used in financial reporting. All taxonomies that are valid under FRTA are valid XBRL documents. However, not all XBRL documents are valid under FRTA.

FS (PN)~ An installable role service of Active Directory Federation Services (AD- FS) that is used to create a federation server. When it is installed, the Federation Service provides tokens in response to requests for security tokens. Multiple federation servers can be configured to provide fault tolerance and load balancing for a single Federation Service.

FSA (n)~ A service that is used to grant or restrict user access to items in a search index.

FSB (n)~ The bus within a microprocessor that connects the CPU with main memory. It is used to communicate between the motherboard and other components in a computer system.

FSP (PN)~ An installable role service of Active Directory Federation Services (AD- FS) that is used to create a federation server proxy. When it is installed, the Federation Service Proxy role service uses WS-Federation Passive Requestor Profile (WS-F PRP) protocols to collect user credential information from browser clients and Web applications and send the information to the Federation Service on their behalf.

FsPathMerge (PN)~ A command-line tool that removes extraneous path information from data that has been restored to a protected file server from tape.

FSRM (n)~ A suite of tools that allows administrators to understand, control, and manage the quantity and type of data stored on their servers.

f-stop (n)~ In photography, a unit on a scale used on camera lenses to indicate a sequence of f-numbers where each stop corresponds to an f-number and with each stop the light that reaches the film is halved.

FTH (n)~ A heap manager that can tolerate some types of programming errors (faults) which in the default Windows heap manager would result in crashes.

FTP (n)~ A member of the TCP/IP suite of protocols, used to copy files between two computers on the Internet. Both computers must support their respective FTP roles: one must be an FTP client and the other an FTP server.

FTP ~ (File Transfer Protocol). A way of transferring files to or from an internet server. Often how you- upload- webpages to the internet.

FTP adapter (n)~ An adapter that enables exchange of files between BizTalk Server and FTP servers.

FTP Logon Attempt Restrictions (PN)~ An IIS feature that restricts the number of failed logon attempts that can be made to an FTP account in a specified time period.

FTP over SSL (n)~ An extension to the File Transfer Protocol (FTP) that supplies secure data communication through data encryption and decryption.

FTP server (n)~ A server that uses the FTP protocol to enable clients to upload and downlaod files.

FTP Service for IIS 7.0 (n)~ An industry-standard server-side implementation of the File Transfer Protocol (FTP) that was designed for Windows Server 2008.

FTPS (n)~ An extension to the File Transfer Protocol (FTP) that supplies secure data communication through data encryption and decryption.

full access (n)~ A privilege on a computer system that allows a user to read, write, and delete data.

full access token (n)~ An access token with the maximum privileges authorized for the account. Used by User Account Control (UAC).

Full Administrator (n)~ A security role that grants all permissions in Configuration Manager to an administrative user.

full backup (n)~ A backup of an entire database.

full calibration (n)~ The calibration process to capture the blank reference image and white reference image for a Surface unit and to properly align the infrared cameras within the Surface unit.

full computer name (n)~ A fully qualified domain name (FQDN). The full computer name is a concatenation of the computer name (for example, client1) and the primary DNS suffix of the computer (for example, reskit.com.).

full crawl (n)~ A crawl that scans a content source in its entirety and refreshes the index to reflect new, changed or deleted content, as well as existing, unchanged content.

full delegation (n)~ A delegation in which a layout behavior requests complete control over the visual layout of elements.

full differential backup (n)~ A backup of all files in the database, containing only changes made to the database since the most recent full backup. A full differential backup requires a full backup as a base.

full duplex (n)~ A system capable of simultaneously transmitting information in both directions over a communications channel.

full enforcement mode (n)~ The enforcement mode in which client computers immediately have their network access restricted if they are not in compliance with network health requirements.

full import (n)~ An import of all data from a file, or a scoped view, of a connected data source to the connector space. Data from the connected data source is compared with data in the connector space. If there are no attribute changes, the object is not changed in the connector space.

full installation (n)~ A type of update installation in which all the files needed to complete the installation are in a single package.

full logging (n)~ A type of logging available to capture information about mailbox searches that includes information about all results that meet the search criteria.

full mode (n)~ The default operational state of Windows Media Player in which all of its features are displayed. The Player can also appear in skin mode.

full name (n)~ A user's complete name, usually consisting of the last name, first name, and middle initial. The full name is information that Local Users and Groups or Active Directory Users and Computers can maintain as part of the information identifying and defining a user account.

full outer join (n)~ A type of outer join in which all rows in all joined tables are included, whether they are matched or not. For example, a full outer join between titles and publishers shows all titles and all publishers, even those that have no match.

full path (n)~ In a hierarchical filing system, a path name containing all the possible components of a pathname, including the network share or drive and root directory, as well as any subdirectories and the file or object name.

full PIDL (n)~ A PIDL that uniquely describes an object relative to the desktop folder.

full privilege access token (n)~ An access token with the maximum privileges authorized for the account. Used by User Account Control (UAC).

full recovery model (n)~ A database recovery mode that fully logs all transactions and retains all the log records until after they are backed up. The database can be recovered to the point of failure if the tail of the log is backed up after the failure. All forms of recovery are supported.

full screen (adj)~ Capable of using or being displayed on the full area of a display screen. Applications running in windowing environments, although they might use the entire area of the screen, commonly allocate different areas to different windows, any of which can be enlarged to fill the entire screen.

full server (n)~ A single physical or virtual server that contains all the server roles.

full trust (n)~ A code access security (CAS) state assigned to managed assemblies. The level of trust granted to an application or Web service affects its ability to use system resources while executing. Assemblies that have full trust can access any resource that is subject to operating system security, and all privileged operations are supported.

full version (n)~ The default version that includes drag-and-drop functionality, right-click menus, and a reading pane.

full version (n)~ A software package that includes all features and does not require a previous version of the relevant software to be installed on the user's computer.

full volume encryption (n)~ The process of converting volumes into a coded form so they cannot be read without first authenticating to Windows; or, if on different hardware, without an escrowed recovery key.

full volume encryption key (n)~ The algorithm-specific key that is used to encrypt (and optionally, diffuse) data on disk sectors. Currently, this key can be either 128 bits or 256 bits advanced encryption standard (AES). The default encryption algorithm that BitLocker Drive Encryption uses is AES 128 bit with diffuser.

full zone transfer (n)~ The standard query type supported by all DNS servers to update and synchronize zone data when the zone has been changed. When a DNS query is made using AXFR as the specified query type, the entire zone is transferred as the response.

full-height number (n)~ A number represented in a style where all numeric glyphs are the same height and position and do not extend below the baseline.

full-screen mode (n)~ A display mode that shows as much content as possible by hiding elements such as navigation and toolbars.

full-screen program (n)~ A program that displays in the entire computer screen.

full-text catalog (n)~ A collection of full-text index components and other files that are organized in a specific directory structure and contain the data that is needed to perform queries.

full-text enabling (n)~ The process of allowing full-text querying to occur on the current database.

full-text index (n)~ An index that enables full-text search for a group of managed

properties.

full-text query (n)~ As a SELECT statement, a query that searches for words, phrases, or multiple forms of a word or phrase in the character-based columns (of char, varchar, text, ntext, nchar, or nvarchar data types). The SELECT statement returns those rows meeting the search criteria.

full-text search (n)~ A search for one or more documents, records, or strings based on all of the actual text data rather than on an index containing a limited set of keywords.

full-text search index (n)~ An index that enables full-text search for a group of managed properties.

Full-Text service (n)~ The SQL Server component that performs the full-text querying.

full-width character (n)~ In a double-byte character set, a character that is represented by 2 bytes and typically has a half-width variant.

fully localized language (n)~ A language in which 100 percent of Windows resources have been translated. Fully localized languages are always included in full language packs.

fully qualified (adj)~ Pertaining to a name, identifier, etc., that is unique. For example, the fully qualified name of an interface member consists of the name of the interface in which the member is declared, followed by a dot, followed by the name of the member.

fully qualified account number (n)~ A ledger account number in which all segments of an account structure are entered and validated.

fully qualified domain name (n)~ A DNS name that has been stated to indicate its absolute location in the domain namespace tree. In contrast to relative names, an FQDN has a trailing period (.) to qualify its position to the root of the namespace (host.example.contoso.com).

fully qualified path (n)~ A path to a file that begins with the drive identifier and root directory or with a network share and ends with the complete file name (for example, C:\docs\work\contract.txt or \netshare\docs\work\contract.txt).

fully trusted (adj)~ Pertaining to applications or forms that have greater security permissions and complete access to the system resources and other components on a user's computer.

fully-featured site (n)~ A Web site that has a lot of content and is visually attractive.

function (n)~ A piece of code that operates as a single logical unit. A function is called by name, accepts optional input parameters, and returns a status and optional output parameters. Many programming languages support functions.

function (n)~ A component which can be included in a synchronization rule or a workflow definition to process data values.

function (n)~ A prewritten formula that simplifies the process of entering calculations and enables the user to use formulas that might be difficult to build from scratch.

function (n)~ A data service operation that is bound to a URI that does not have a side-effect on data exposed by the data service.

function activity (n)~ A workflow activity for simple data manipulations as a result of a request, e.g. concatenating the first name and last name of a user to produce the display name.

function call (n)~ A program's request for the services of a particular function.

function declaration (n)~ A statement consisting of a return type, followed by the function name, followed by a list of the names and types of formal parameters enclosed in parentheses.

function key (n)~ Any of the 10 or more keys labeled F1, F2, F3, and so on, that are placed along the left side or across the top of a keyboard (or both) and are used for special tasks by different programs. The meaning of a function key is defined by a program or, in some instances, by the user. Function keys are used in application programs or the operating system to provide either a shortcut for a series of common instructions (such as calling up a program's on-screen help facility) or a feature that is not otherwise available.

function library (n)~ A collection of routines compiled together.

function offset (n)~ Permits using Ildasm.exe to locate the actual line of source code corresponding to the particular stack frame. Function offsets appear in the event detail stack area (at the end of each stack frame).

Function procedure (n)~ A procedure that returns a value and that can be used in an expression. You declare a function with the Function statement and end it with the End Function statement.

Function tablet button (oth)~ A tablet button that you can use in combination with other tablet buttons to do a task. This is similar to using a key combination on a standard keyboard.

functional band (n)~ A shape that represents a functional unit, such as a department, in which process steps occur. You use either horizontal or vertical functional band shapes depending on the orientation you want for your diagram.

functional currency unit (n)~ A currency unit of a country/region in which a primary legal entity locates its business activities and in which it generates most of its revenue and expenses.

functional specification (n)~ A document that describes a solution, product feature set, or other final project deliverable in explicit detail. It includes the conceptual, logical and physical designs.

functional test (n)~ A test that verifies that all of the functions of a feature are correctly implemented.

functionality (n)~ The features, operations, functions, or capability supported by a program or program component.

functoid (n)~ An executable module that performs a specific calculation or data manipulation, and that is used graphically when constructing BizTalk Server maps to provide the basis for richer transformations than what is provided by XSLT on its own.

Functoid IntelliSense (n)~ A BizTalk Mapper functionality in which visual cues are provided on the grid surface, when there are errors in functoid configuration.

functoid toolbox (n)~ A dockable window in Visual Studio that serves as the palette of functoids available for use during map construction. Functoids are organized into different toolbox tabs based on their intended purpose.

funding limit (n)~ A limit set on a funding source so that it is not invoiced more than a specified amount toward a project.

funding rule (n)~ Rules that contain the criteria for how to allocate charges to different funding sources for a project.

funding source (n)~ In projects that have multiple funders, these are the parties that contribute to the funding of an advanced funding project.

Funk (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 5.

Funnel (PN)~ A SmartArt graphic layout used to show the filtering of information or how parts merge into a whole. Emphasizes the final outcome. Can contain up to four lines of Level 1 text; the last of these four Level 1 text lines appears below the funnel and the other lines correspond to a circular shape. Unused text does not appear, but remains available if you switch layouts.

FUP (n)~ The policy that states the rules of acceptable use, determined by Skype.

furigana (n)~ Tiny Japanese kana characters written above or next to kanji characters. The kana characters indicate the correct pronunciation of the word written in kanji.

Fusion (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 30.

futures date (n)~ An order due date, generated by master scheduling, that is based on lead times for all levels of an item.

fuzz testing (n)~ A testing process that supplies structured but invalid input to software application programming interfaces (APIs) and network interfaces to maximize the likelihood of detecting errors that might lead to software vulnerabilities.

fuzzing (n)~ A testing process that supplies structured but invalid input to software application programming interfaces (APIs) and network interfaces to maximize the likelihood of detecting errors that might lead to software vulnerabilities.

fuzzy grouping (n)~ In Integration Services, a data cleaning methodology that examines values in a dataset and identifies groups of related data rows and the one data row that is the canonical representation of the group.

fuzzy logic ~ a formal system of reasoning developed by Lotfi Zadeh in which the values -€œtrue-€? and -€œfalse-€? are replaced by numbers on a scale from 0 to 1.

fuzzy matching (n)~ In Integration Services, a lookup methodology that uses an approximate matching algorithm to locate similar data values in a reference table.

FVC (n)~ The volume of air that can forcibly be blown out after full inspiration, measured in liters.

G (n)~ A game rating symbol developed by the Office of Film and Literature Classification (OFLC).

G ~

G.7xx ~ A series of- ITU- standards for voice and data communications. e.g. G.703: Specifications for plesiochronous digital hierarchy

GAAP (n)~ A widely accepted set of accounting conventions, rules, and standards for United States companies.

gadget (n)~ A lightweight and task-specific add-in program that integrates with applications to expose data at a glance.

gain ~ Gain refers to the ratio of the output amplitude of a signal to the input amplitude of a signal. This ratio typically is expressed in dBs.

gain adjustment (n)~ A microphone feature that allows your input to be amplified so that it is made louder for use by the system.

gain insight (v)~ To attain deeper knowledge or a clearer perception of a given situation.

gain sharing (n)~ A variable compensation plan that rewards employees based on their achievement of a predetermined goal which is usually associated with a program or project that promotes cost-cutting or other productivity improvements.

GAL (n)~ An Address Book that contains entries for every group, user, and contact within an organization's implementation of Exchange Server.

GAL synchronization (n)~ The process of synchronizing the global address list from one Exchange deployment with another.

gallery (n)~ A window or menu that presents an array or grid of visual choices to a user for selection.

Gallery (PN)~ An area of the user interface that displays the available templates and recently used files within an Office for Mac applications. The gallery opens automatically when you open an application. You can also open the gallery from the File menu and a toolbar button.

gallery (n)~ The location in Azure where new services and resources can be evaluated and purchased.

gallery item (n)~ A service or resource that can be evaluated or purchased from the gallery.

Gallery View (PN)~ A view that displays a profile photo of everyone who is part of an e-mail thread or calendar item.

Gambling (n)~ A content descriptor developed by Microsoft.

Gambling (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

Gambling (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

game (n)~ A class of computer program in which one or more users interact with the computer as a form of entertainment. Computer games run the gamut from simple alphabet games for toddlers to chess, treasure hunts, war games, and simulations of world events. The games are controlled from a keyboard or with a joystick or other device and are supplied on disks, on CD-ROMs, as game cartridges, on the Internet, or as arcade devices.

Game (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 36.

Game bar (PN)~ ?The menu invoked with a shortcut key (Windows + G) when gaming that allows users to take a screenshot, take a 30 second clip of a game, and adjust volume controls.

game controller (n)~ A device used to control a video game. For example, a joystick, mouse, or gamepad.

game hub (n)~ A feature that lets customers extend their gaming experience across multiple devices, play with other users, and show off scores and achievements.

game pad (n)~ An action-control device used with arcade-type games played on PCs and game consoles such as the Nintendo 64 and Sony PlayStation. A game pad, unlike a joystick, is meant to be held in the player's hands.

game port (n)~ An input/output connector to which you attach a joy stick or other game device to your computer. It is typically a 15-pin socket on the back of a PC.

game provider (n)~ A digital distribution provider of games such as MSN Games, Yahoo Games, Steam, Stardock, GameTap, and so on.

game rating system (n)~ A rating system for online games.

game ratings board (n)~ An organization that establishes age-based game ratings for video game content for different regions and countries.

Game trailers (PN)~ The collection title for Game merchandizing.

gamertag (n)~ An Xbox Live online profile name.

Games (PN)~ The service on the phone where you can purchase and download games.

Games (PN)~ An application that includes free games, deluxe downloads, puzzle games, word and trivia games, multiplayer and board games, action and arcade games, poker and casino games.

Games (PN)~ A category in the Store that shows games the user can download.

Games Store (PN)~ The service on the phone where you can purchase and download games.

gamma ~ The curve that describes how the middle tones of your images appear. Often incorrectly referred to as 'brightness' and/or 'contrast', gamma is a non-linear function. Changing the value of the gamma affects middle tones while leaving the white and black of the image alone. Used to compensate for differences between Macintosh and PC monitors.

gamma correction (n)~ The process of adjusting an image input signal to correctly display on a particular device.

gamma ramp (n)~ A lookup table (LUT) of numeric values that is used to compensate for a particular monitor's color response. The table has three parts (one each for red, green, and blue), and each part has 256 lookup values. A gamma ramp is used to map the range of possible intensities for each color to a limited number (256) of values. An independent hardware vendor (IHV) chooses these values so that the transition from one color intensity to the next is as smooth as possible (since the eye perceives changes in light intensity nonlinearly).

GAMP (n)~ Guidelines, originally developed for the pharmaceutical industry and used in

the healthcare industry, for validating that automated systems meet agreed-upon specifications and comply with regulations.

gamut (n)~ The particular range of colors that a device or color model is able to produce.

Gangsta (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 59.

Gantt bar (n)~ A graphical element on the chart portion of the Gantt Chart view representing the duration of a task.

Gantt chart (n)~ A type of bar chart that typically shows the timing of tasks or activities as they occur over time.

GAP (PN)~ A Windows feature that helps administrators tune their audit policies at a more detailed level by using numerous subcategories, and better control what events are recorded in the event log.

gap density (n)~ The fraction of RTP data packets in the gaps between bursts since the beginning of reception that were either lost or discarded.

gap depth (n)~ A measure that specifies the distance between data series that are displayed along distinct rows, as a result of clustering.

gap duration (n)~ The mean duration, expressed in milliseconds, of the gap periods that have occurred since the beginning of reception.

gap length (n)~ The mean duration, expressed in milliseconds, of the gap periods that have occurred since the beginning of reception.

gapless (oth)~ Existing in reference to the removal of silences or clicks between tracks when they are burnt to an audio CD or when they are played back from the CD.

gapless burning (n)~ A feature of Windows Media Player that allows users to remove gaps between tracks that they burn to audio CDs.

gapless CD burning (n)~ A feature of Windows Media Player that allows users to remove gaps between tracks that they burn to audio CDs.

garbage collection (n)~ A process for automatic recovery of heap memory. Blocks of memory that had been allocated but are no longer in use are freed, and blocks of memory still in use may be moved to consolidate the free memory into larger blocks.

garbage collection interval (n)~ A measurement of time indicating how often a domain controller examines its database for expired tombstones that can be collected.

garbage collector (n)~ The part of the operating system that performs garbage collection.

gate (n)~ A data structure used by 80386 and higher microprocessors to control access to privileged functions, to change data segments, or to switch tasks.

gate (n)~ A workflow activity that is used in the authentication phase of request processing.

gated check-in (n)~ A feature that enables you to validate changes before you check them in. Gated check-in builds the code and runs the necessary tests. If the build succeeds, it lets you check in your changes. Otherwise, it rejects them.

gateway (n)~ A device that connects networks using different communications protocols so that information can be passed from one to the other. A gateway both transfers information and converts it to a form compatible with the protocols used by the receiving network.

gateway ~ A hardware or software set-up that translates between two dissimilar protocols

gateway ~ A link from one computer system to a different computer system.

gateway hour (n)~ A unit of measure for connection hours provisioned and available between a VPN gateway and on-premises servers.

gateway hours (n)~ A unit of measure to charge for the Windows Azure Virtual Network resource based on the amount of time that the VPN gateway that connects to on-premises and other VNETs in Azure is provisioned and available.

Gateway script (n)~ A standard method of extending Web server functionality by executing programs or scripts on a Web server in response to Web browser requests, such as in form processing. Use of a common gateway interface can make a web page more dynamic.

gateway server (n)~ A server role in Operations Manager that enables the monitoring of computers that lie outside of the Kerberos trust boundaries (Kerberos realm) of the management group.

gatherer (n)~ Software that manages the content crawling process and has rules that determine what content is crawled.

gatherer log (n)~ A log that is updated each time Microsoft Office SharePoint Portal Server updates a content index. Log entries contain data about URLs accessed while creating an index.

gather-write operation (n)~ A performance optimization where the Database Engine collects multiple modified data pages into a single write operation.

Gaussian Blur (PN)~ A production effect that simulates looking at an object through an out-of-focus lens. Edges are softened using a mathematical formula based on the radius setting. The larger the Radius setting, the more blurry the objects or images will become.

GB (n)~ A unit of computer or device memory equal to 1,024 megabytes (1,024 1,048,576, [230] bytes).

GB ~ See- Gigabyte.

GBO (oth)~ The Netherlands government agency that is responsible for the management and development of the OTP and related IT infrastructure.

GBP (n)~ The official currency of the United Kingdom.

GC (n)~ A process for automatic recovery of heap memory. Blocks of memory that had been allocated but are no longer in use are freed, and blocks of memory still in use may be moved to consolidate the free memory into larger blocks.

GCC (PN)~ A compiler system produced by the GNU Project supporting various programming languages.

GCP (n)~ A standardized set of best practices and principles for the design, conduct, performance, monitoring, auditing, recording, analysis, and reporting of clinical trials.

GDI (PN)~ An executable program that processes graphical function calls from a Windows-based application and passes those calls to the appropriate device driver, which performs the hardware-specific functions that generate output. By acting as a buffer between applications and output devices, GDI presents a device-independent view of the world for the application while interacting in a device-dependent format with the device.

GDI+ (n)~ A class-based API for C/C++ programmers that enables applications to use graphics and formatted text on both the video display and the printer. Applications based

on the Microsoft Win32 API do not access graphics hardware directly. Instead, GDI+ interacts with device drivers on behalf of applications. GDI+ is also supported by Microsoft Win64.

GDPdU (oth)~ A German law that requires tax authorities to be capable of digitally checking data from electronic bookkeeping systems.

GDR (n)~ A release process used internally at Microsoft to track the extra processes, such as additional testing, required to post a hotfix on Microsoft public Web sites or to allow a third party the ability to distribute a hotfix, such as an OEM pre-installing a hotfix prior to shipping to a customer.

GDT (n)~ A memory segment that contains descriptors for code, data, and descriptor table segments. All processor tasks have access to a common GDT.

Gear (PN)~ A SmartArt graphic layout used to show interlocking ideas. Each of the first three lines of Level 1 text corresponds to a gear shape, and their corresponding Level 2 text appears in rectangles next to the gear shape. Unused text does not appear, but remains available if you switch layouts.

GEIN (oth)~ A joint project by the Ministries of Economic Affairs and Justice in the Netherlands to create one standard taxonomy and IT infrastructure (portal) to improve communications between businesses and the government.

Gemeenschappelijke Beheerorganisatie (oth)~ The Netherlands government agency that is responsible for the management and development of the OTP and related IT infrastructure.

General (adj)~ The tab that presents the most basic information about an entity/record type or instance/record in the system.

General alignment (n)~ A format that normally left aligns text and right aligns numbers. When right-to-left features are active, General alignment is extended to include Text mode (always available) and Interface mode (sometimes available).

general budget reservation (n)~ A document that is often used by public sector entities to set aside or earmark budgeted funds so that those funds are not available for other purposes.

general distribution release (n)~ A single, cumulative package composed of one or more files used to address a problem in a product. It is intended for public use and is made available on external websites.

general distribution release fix (n)~ A single, cumulative package composed of one or more files used to address a problem in a product. It is intended for public use and is made available on external websites.

general ledger (n)~ The register of debit and credit entries classified using accounts listed in a chart of accounts.

General Packet Radio Service (n)~ A third-generation enhancement to the Global System for Mobile Communications (GSM), which supports non-voice applications such as Web browsing and other servicing requiring transfer of data packets without limits in message size.

general protection fault (n)~ The error condition that occurs in an 80386 or higher processor running in protected mode (such as Windows 3.1) when an application attempts to access memory outside of its authorized memory space or when an invalid instruction is

issued.

General Purpose Batch Instances (PN)~ The service type of the Batch service for general batch processing.

General tab (n)~ In the Exchange Server user interface, the main tab on the properties page.

generalized image (n)~ A software image that you can apply and restore to any computer with similar hardware.

Generally Accepted Accounting Principles (n)~ A widely accepted set of accounting conventions, rules, and standards for United States companies.

generated allocation (n)~ A method of allocating posted amounts to destination accounts based on a set of predefined rules.

generated code (n)~ Code that is automatically generated for the client project based on operations and entities exposed in the middle tier when a RIA Services link exists between the server and client projects.

generation (n)~ A category that distinguishes products, such as computers or programming languages, according to the technological advances they represent.

generator (n)~ The component of Notification Services that matches events to subscriptions and produces notifications.

generic application (n)~ A user-defined application that supports user definable settings only.

Generic Application (PN)~ A resource type in a failover cluster or server cluster that supports an application that was not originally designed to run on a cluster.

Generic C++ Class Wizard (PN)~ A wizard that adds a C++ class to a project. This generic C++ class does not inherit from ATL or MFC.

generic delegate (n)~ A delegate method that is declared with type parameters.

generic engine (n)~ An engine that determines the apportionment of freight charges by weight.

generic method (n)~ A method whose definition has placeholders, called generic type parameters, for one or more types used in the body of the method or as the types of the method's parameters. A user specifies real types (generic type arguments) for the type parameters when calling the generic method. Note that a method is not generic just because it is declared in a generic type. A method is generic only if it has type parameters of its own.

generic programming (n)~ Programming using parametric polymorphism.

generic resource (n)~ A placeholder resource that is used to specify the skills required for a specific task.

Generic Script (PN)~ A resource type in a failover cluster or server cluster that supports an application controlled by a script that runs in Windows Script Host.

Generic Security Services Application Programming Interface (n)~ A generic API for performing client-server authentication that can be implemented over any authentication system. GSS-API makes it possible for applications to use the same API with different authentication mechanisms.

Generic Service (PN)~ A resource type in a failover cluster or server cluster that supports a service that was not originally designed to run on a cluster.

generic test (n)~ A known Visual Studio test type that encapsulates an unknown test or tool and allows Visual Studio to treat it as a known type.

generic type (n)~ A class, interface, or structure whose definition has placeholders, called generic type parameters, for one or more types that are used in its member definitions. A user specifies real types (generic type arguments) for the type parameters when creating an instance of a generic type.

generic type argument (n)~ The type that the user specifies when creating instances of a generic type or when calling a generic method.

generic type definition (n)~ The definition of a generic type, in which type parameters act as placeholders for types that the user supplies when creating instances to use. These instances are not instances of the generic type definition, but of the constructed type formed by specifying type arguments.

generic type parameter (n)~ In a generic type definition, a placeholder for a type that the user specifies (generic type argument) when creating instances of a generic type or when calling a generic method.

generic type parameter constraint (n)~ A way of limiting the types that can be specified for a generic type parameter. For example, types substituted for the type parameter can be constrained to inherit from a particular type, to implement a specific interface, to provide a parameterless constructor, and so on.

generic type parameter list (n)~ The list of generic type parameters of a generic type or method, specified as part of the definition of the generic type or generic method.

generics (n)~ A feature of the common language runtime, conceptually similar to C++ templates, that allows classes, structures, interfaces, and methods to have placeholders (generic type parameters) for the data types they store and manipulate. Generic types are a form of parameterized types.

Generieke Infrastructuur (n)~ A joint project by the Ministries of Economic Affairs and Justice in the Netherlands to create one standard taxonomy and IT infrastructure (portal) to improve communications between businesses and the government.

genlocking (n)~ The repeated rendering of a 3-D primitive while blending on a texture with each pass. This technique is widely used to achieve a variety of special effects.

genre (n)~ A category for grouping or describing multimedia or games, such as music categorized as classical' or 'jazz'.'

genre (n)~ In Windows Media Technologies, the type of music, such as rock or classical.

genuine (adj)~ Pertaining to Microsoft software which is published by Microsoft, properly licensed, and fully supported by Microsoft or a trusted partner.

Genuine Microsoft label (PN)~ A label designated by Microsoft that is attached to a computer and represents physical evidence that the operating system on the device is genuine.

Genuine Microsoft Software (PN)~ Software that is published by Microsoft, properly licensed, and fully supported by Microsoft or a trusted partner.

genuine validation (n)~ A process that verifies whether installed software is genuine.

geo (n)~ A large geopolitical area in Azure region taxonomy.

geofence (n)~ A virtual perimeter around a real-world geographic area.

GeoFlow (PN)~ A 3D geospatial and temporal visualization tool that enables users to

map, explore, and interact with information across multiple dimensions, allowing them to draw new insights from large data sets.

geographic (adj)~ Pertaining to data types in an ellipsoidal coordinate system.

geographic data (n)~ A type of spatial data that stores ellipsoidal (round-earth) data, such as GPS latitude and longitude coordinates.

geography (n)~ An abstract data type that is the base type for all geospatial data types in ellipsoidal coordinate systems.

Geolocation (PN)~ A SharePoint field type that enables annotation of a SharePoint list with latitude and longitude.

geometric (adj)~ Pertaining to data types in a planar coordinate system.

geometric data (n)~ A type of spatial data that supports planar, or Euclidean (flat-earth), data.

geometry (n)~ An abstract data type that is the base type for all geospatial data types in planar coordinate systems.

geo-redundant storage (n)~ Storage of data in two locations within the same geo.

geo-replication (n)~ A storage account feature that automatically replicates blobs, tables, and queues to a secondary location and fails over to that location in the event of a problem in the primary location.

geospatial (adj)~ Pertaining to the relative position of things in an area on Earth.

geospatial collection (n)~ A shape representing a union of all the positions in a set of disjoint regions.

geotag (n)~ A metadata tag that includes GPS latitude and longitude coordinates to specify a location. Geotags are typically used to find and organise photos and videos.

geotagging (n)~ The process of adding geospatial metadata (e.g. longitude, latitude) to media (e.g. Websites, RSS feeds, or images).

gesture (n)~ A quick movement of a finger or pen on a screen that the computer interprets as a command, rather than as a mouse movement, writing, or drawing.

Gesture Engine (PN)~ An engine that specifically recognizes and processes touch input and multi-touch input as commands.

gesture recognition (n)~ A feature of the Pencil tool. As you begin to move the mouse, Visio quickly calculates the path the mouse pointer travels. If the path of the mouse is straight, the Pencil tool draws a straight line segment.

Gesture Recognition ~ involves determining the movement of a user's fingers, hands, arms, head or body in three dimensions through the use of a camera; or via a device with embedded sensors that may be worn, held or body-mounted.

Gesture Recognition Engine (PN)~ An engine that specifically recognizes and processes touch input and multi-touch input as commands.

gesture recognizer (n)~ An engine that recognizes and processes ink input as either system or application commands.

Get Genuine Windows (PN)~ An application that comes with a product key and DVD that allows users them to purchase Windows and activate their current copy of Windows from the client.

get operation (n)~ An operation in a source-controlled database that replaces the workspace version of a file with the specified repository version. By default, the

repository version is the latest version.

Get Started (PN)~ ?The built-in app that teaches customers the basic tasks of getting started with Windows 10 and what's new in each update.

Get started page (n)~ The first page that IWs (end users) see when they sign in to Office 365. Admins (both P and E) can also see this page, but they don't see it first.

Get Windows 10 (PN)~ ?An app that assists customers in upgrading from Windows 7 Service Pack 1 (SP1) or Windows 8.1 Update 1- to Windows 10.- It notifies them of the option to upgrade, checks their PC for compatibility, and allows them to reserve a free upgrade.

Getting Started (n)~ A drop-down item under the Help menu that opens up a quick overview help file.

Getting Started (n)~ The title of instructions for setting up and preparing the device for first use.

Getting Started (n)~ A page in the Shared Computer Toolkit which provides an overview of the tools and resources available in the Toolkit and advice to help you start using the Toolkit quickly.

Getting Started (PN)~ A feature that serves as a launching point for several optional Windows tasks and OEM-defined tasks.

Getting Started CD (n)~ The title of a CD that contains ActiveSync and additional programs.

Getting Started pane (n)~ A UI element that displays Help topics that describe basic Live Meeting concepts and procedures.

Getting Started pane (n)~ The upper portion of the Office 365 Small Business Premium admin landing page, which contains links to -€œGetting started-€? tasks for the P admins when they sign in to Office 365 for the first time. After exploring the -€œGetting started-€? tasks, the admin can hide the pane.

ghost (v)~ To produce a duplicate, such as duplicating an application in memory.

ghost record (n)~ Row in the leaf level of an index that has been marked for deletion, but has not yet been deleted by the database engine.

ghost row (n)~ Row in the leaf level of an index that has been marked for deletion, but has not yet been deleted by the database engine.

Ghost site ~ a Web site that remains live but is no longer updated or maintained or only done so very infrequently.

ghosting (n)~ The process of turning a regular file-backed item into a ghosted item.

ghosting (n)~ A Desktop Window Manager feature that lets the user minimize, move, or close the primary window of an application that is not responding.

GHz ~ Gigahertz - billions of cycles per second. Often used as a measurement of a PC processor chip's speed and power, with bigger numbers meaning a bit more speed, and a higher price. 1000 MHz = 1.0 GigaHertz. See also- MHz.

GID (n)~ An identifier in UNIX that associates a user with a group of other users that have something in common. A user can be a member of one or more groups.

GIF (n)~ A graphic stored as a file in the GIF format.

GIF ~ (Graphics Interchange Format)- A popular type of compressed graphics (picture) file, widely used on the WWW. Best for artwork with 256 colours or less. See

also- jpg,- compression.

GIF animation (n)~ A file containing a series of graphics that are displayed in rapid sequence in a Web browser.

gift card (n)~ A physical or electronic card storing currency that customers can use to buy apps and similar items.

gift card reload (n)~ A point of sale (POS) operation that is used to add money to an empty gift card or to the open balance of a gift card.

gifted badge (n)~ A badge that is awarded to a member at the discretion of the community owner or moderators rather than being granted automatically based on that member's earned points in the reputation system.

gigabyte (n)~ A unit of computer or device memory equal to 1,024 megabytes (1,024 1,048,576, [230] bytes).

Gigabyte (or Gig) ~ Unit of measurement for pieces of information : approximately 1 billion bytes, 1 million kilobytes, or 1000 megabytes.- Hard disk sizes are usually measured in gigabytes. Often shortened to 'GB', 'Gig' or just G.

GIGO ~ (Garbage In Garbage Out;- pr. 'guy-go') A fundamental principle of computing, that if you feed a computer bad data, you will get bad results, even if the program is working perfectly.

giro (n)~ An electronic funds transfer system available in the European Union that permits a payer to transfer funds from their bank account to a payee's bank account.

GIT (PN)~ A distributed revision control system with an emphasis on speed, data integrity, and support for distributed, non-linear workflows.

GIT branch (n)~ An independent line of development serving as an abstraction for the edit/stage/commit process in the GIT system.

git push origin master (n)~ A statement in the GIT system to transfer commits from a local repository to a remote repository and publish changes.

Give Control (v)~ A Sharing slide option that allows the presenter to give application control to another meeting participant.

Give us feedback (v)~ A UI element that provides access to a site or process for submitting feedback on the product or service being used.

GKDS (PN)~ An Active Directory Domain Services service that provides cryptographic keys that correspond to arbitrary sets of security principals in AD DS to users who are authorized to access those keys.

GL (n)~ The register of debit and credit entries classified using accounts listed in a chart of accounts.

glass (n)~ A visual effect that imparts a quality of translucency to windows.

glassiness (n)~ The appearance of the Start menu and the taskbar after the glass visual style has been applied to customize the color, intensity, and opacity of window borders.

GLB (n)~ A U.S. law containing financial provisions that require all financial institutions to disclose to consumer customers their policies and practices for protecting the privacy of non-public personal information. Non-public personal information includes any PII provided by a customer, resulting from transactions with the financial institution or obtained by a financial institution through providing products or services.

gleam (n)~ A small, star-shaped insignia that indicates new or changed content, as when a

contact has posted new photos. It is also can be used to indicate conditions that may require action, as when someone's online storage is running out.

global (adj)~ Pertaining to an entire document, file, or program rather than to a restricted segment of it.

Global (PN)~ A privilege level that specifies the user has access to objects anywhere within the organization. The application refers to this level as Organization.

global account (n)~ In an Active Directory network, a normal user account in a user's domain.

global address book (n)~ A complete list of party records.

global address list (n)~ An Address Book that contains entries for every group, user, and contact within an organization's implementation of Exchange Server.

Global Address List (n)~ An Address Book that contains entries for every group, user, and contact within an organization's implementation of Exchange Server.

global address list synchronization (n)~ The process of synchronizing the global address list from one Exchange deployment with another.

global administrator (n)~ The chief administrator of Microsoft Online Services for a customer. The global administrator appoints any subordinate administrative roles.

global administrator role (n)~ An administrative role for PerformancePoint Server that allows members to configure settings on the entire PerformancePoint Server system and on all computers running PerformancePoint Server within the system.

global assembly cache (n)~ A computer-wide code cache that stores assemblies specifically installed to be shared by many applications on the computer.

global assumption (n)~ An assumption that can be referenced by all models within a PerformancePoint Server application.

global attribute (n)~ An attribute associated with a skin definition file as a whole, which can be accessed from any element.

global conditions (n)~ A setting or an expression that is used to define rules that specify how an application is deployed on client devices.

global data (n)~ A set of administrator-created objects that are replicated to all sites throughout the hierarchy. Secondary sites receive a subset of this data.

global default (n)~ A default that is defined for a specific database and is shared by columns of different tables.

global descriptor table (n)~ A memory segment that contains descriptors for code, data, and descriptor table segments. All processor tasks have access to a common GDT.

global domain identifier (n)~ An identifier that specifies the country/region, the administration management domain (ADMD), and the private management domain (PRMD) of an X.400 e-mail address. For example c=us; a=MCI; p=msft.

global file (n)~ A Project file [Global.mpt] that contains information you can use for different projects. Information in a global file can include views, calendars, forms, reports, tables, filters, toolbars, menu bars, macros, and options settings.

global group (n)~ A security or distribution group that can contain users, groups, and computers from its own domain as members. Global security groups can be granted rights and permissions for resources in any domain in the forest.

global ID (n)~ A unique identifier that is assigned to a data item. The identifier must be

unique across all clients. A global identifier is a flexible identifier and so can be any format, but it is typically a GUID and an 8-byte prefix.

global identifier (n)~ A unique identifier that is assigned to a data item. The identifier must be unique across all clients. A global identifier is a flexible identifier and so can be any format, but it is typically a GUID and an 8-byte prefix.

global menu bar (n)~ A special custom menu bar that replaces the built-in menu bar in all windows in your application, except where you've specified a custom menu bar for a form or report.

Global mode (PN)~ A network selection mode that enables the phone to bounce between CDMA and GSM network types.

global policy (n)~ An Office Communications Server policy that applies to all SIP users in an Active Directory forest.

Global Positioning System (PN)~ A radio navigation system developed by the U.S. Department of Defense that uses a constellation of 24 earth satellites, which are monitored by ground-based control stations, to provide precise, continuous worldwide positioning and timing information.

global replica (n)~ A replica in which changes are fully tracked and can be exchanged with any global replica in the set. A global replica can also exchange changes with any local or anonymous replicas for which it becomes the hub.

global resource (n)~ A resource that is available for use by all sites. Such global resources might also be referenced and used by other sites.

global resource pointer (n)~ A resource object exposed at the site level that serves to reference a global resource being used by that site.

global roaming (n)~ Roaming to lower-level sites, higher-level sites, and sibling sites. This roaming method requires Active Directory and the SMS/Configuration Manager Active Directory schema extensions and applies only to the Advanced Client.

global rule (n)~ A rule that is defined for a specific database and is shared by columns of different tables.

global rule (n)~ In Exchange Server 2007, a journal rule that processes all e-mail messages that pass through a Hub Transport server. This includes e-mail messages that were already processed by the external and internal rules.

global search (n)~ A search operation that finds a desired string or record located anywhere in an application, document, or set of files.

Global Service Monitor (PN)~ A cloud-based service that monitors the availability of external web-based applications from multiple locations around the world.

global shortcut menu (n)~ A custom shortcut menu that replaces the built-in shortcut menu for the following objects - fields in table and query datasheets; forms and form controls in Form view, Datasheet view, and Print Preview; and reports in Print Preview.

global subscription (n)~ A subscription to a merge publication with an assigned priority value used for conflict detection and resolution.

global system key (n)~ A tool used to configure the startup key, a random, 128-bit, symmetric cryptographic key created at system startup and used to encrypt all of the user`s symmetric cryptographic keys.

global template (n)~ An add-in that stores macros, AutoText entries, and custom toolbar,

menu, and shortcut key settings that you can use while you work with documents based on any template. By default, the Normal template is a global template.

global term set (n)~ A term set that is created by using the term store management tool.

Global text direction (n)~ Defines the flow of text in text entry boxes and edit controls. You can choose a left-to-right or right-to-left direction, or base the direction on the context of the first strong character that is detected.

global theme (n)~ A collection of control properties, stylesheets, and images that can be applied as a unit to a page or Web site to define an overall appearance.

global trade identification number (n)~ A 14-digit data structure used to uniquely identify trade items, products, and services at a unit level.

Global Universal Identification (n)~ A 16-byte value generated from the unique identifier on a device, the current date and time, and a sequence number. It is used to identify a particular device, component, user, or session.

global variable (n)~ A variable that is accessible from anywhere in a program.

globalization (n)~ The process of designing and developing a software product to function in multiple locales. Globalization involves identifying the locales that must be supported, designing features that support those locales, and writing code that functions equally well in any of the supported locales.

Globalization API (PN)~ An API that contains features enabling apps for a global audience.

globally routable user agent URI (n)~ A URI that a SIP program can use to route a call to a specific agent.

globally unique identifier (n)~ A 16-byte value generated from the unique identifier on a device, the current date and time, and a sequence number. It is used to identify a particular device, component, user, or session.

globally-unique identifier (n)~ A 16-byte value generated from the unique identifier on a device, the current date and time, and a sequence number. It is used to identify a particular device, component, user, or session.

globbing (n)~ In DNS, the supported use of wildcard characters such as the asterisk (*) in domain names for DNS queries that resolve to multiple names. When wildcarding is used, DNS servers must support resolving name queries that use wildcard characters, and resolvers must be able to parse multiple records from any resource record sets (RRsets) issued in wildcard query responses.

gloss optimizer (n)~ A pigment ink/cartridge used in digital printing which provides resistance to water, fading and smudging, thus producing photographic prints with uniform gloss coverage.

glossary (n)~ An alphabetical list of technical terms in some specialized field of knowledge, generally used in the context of a specific project or with a specific text.

glow (n)~ An effect that applies a halo of color around the perimeter of an object.

glow effect (n)~ An effect that applies a halo of color around the perimeter of an object.

GLP (n)~ A standardized set of best practices and principles for conducting non-clinical laboratory studies.

glue (v)~ To connect shapes such that they remain connected even when one of the shapes is moved.

glue chasing (n)~ The process of performing follow-up queries or successive lookups to resolve glue records in a zone to other remote DNS servers that are authoritative for a derivative zone.

glue record (n)~ A delegation resource record used for locating the authoritative DNS servers for a delegated zone. These records are used to connect zones together and provide an effective delegation and referral path for other DNS servers to follow when resolving a name.

glyph (n)~ A graphical representation of either a character, a part of a character, or a sequence of characters.

glyph run (n)~ A continuous sequence of characters that share a common format.

GML (PN)~ A label designated by Microsoft that is attached to a computer and represents physical evidence that the operating system on the device is genuine.

GMP (n)~ Current good manufacturing practices for the manufacture, packaging, and holding of finished pharmaceuticals and drugs.

GN (n)~ Personal Area Networks (PAN) that communicate directly between one or more Bluetooth-enabled computers or devices.

Gn SQL Server DW VM (n)~ A service type of the Virtual Machines service in Azure Data Warehouse. Gn (1 to 5) refers to the size of the virtual machine.

GNU Compiler Collection (PN)~ A compiler system produced by the GNU Project supporting various programming languages.

Go (v)~ A button on the address bar that enables the user to navigate to the specified location (such as a folder path or web address).

go back (v)~ To return to Windows 7 after upgrading to Windows 10.

Go Daddy ~ Go Daddy is an Internet domain registrar and Web hosting company that also sells e-business related software and services.- http://www.godaddy.com/

Go To Tab (PN)~ An item on the View menu that opens the selected tab in the current window.

go/no go (adj)~ A determination to proceed with or abandon a plan or project.

Goa (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 126.

goal (n)~ An objective that the persona is attempting to achieve. A system helps the persona reach these goals.

goal (n)~ A value that is defined in the assessment manifest and that establishes the points at which a metric is rated.

goal seek (n)~ A method to find a specific value for a cell by adjusting the value of one other cell. When goal seeking, Excel varies the value in a cell that you specify until a formula that's dependent on that cell returns the result you want.

goal template (n)~ A set of default goals that have predefined descriptions to help an organization create specific goals for employees.

goaling (n)~ Determining the number of ads to deliver in a specified amount of time. You can goal by any event, such as clicks or amount sold.

Gold (adj)~ The highest level of service that can be allocated to a case. The service contract a customer purchases determines the service level for its associated cases.

gold competency (n)~ A qualification that distinguishes a Microsoft partner company that has demonstrated the highest level of expertise within a specific skill set. A gold competency indicates that a company is within the top 1 percent of Microsoft partners worldwide.

golden release (n)~ A release candidate that has been accepted as the final release of the product.

good (n)~ A tangible item for sale or use, often produced for later consumption.

Good Automated Manufacturing Practice (n)~ Guidelines, originally developed for the pharmaceutical industry and used in the healthcare industry, for validating that automated systems meet agreed-upon specifications and comply with regulations.

good clinical practice (n)~ A standardized set of best practices and principles for the design, conduct, performance, monitoring, auditing, recording, analysis, and reporting of clinical trials.

good laboratory practice (n)~ A standardized set of best practices and principles for conducting non-clinical laboratory studies.

good manufacturing practice (n)~ Current good manufacturing practices for the manufacture, packaging, and holding of finished pharmaceuticals and drugs.

Goods and Services Tax (PN)~ A value-added tax levied in some countries/regions.

goods in transit (n)~ Items that have been dispatched from the shipping location but have not yet arrived at the delivery location.

goods transport agency (n)~ A provider of services that are related to the transportation of goods by road. The GTA issues a consignment note.

goodwill (n)~ The difference between the perceived value and the book value of an asset.

goodwill (n)~ An intangible asset that arises as a result of the acquisition of one company by another for a premium value, including brand name, solid customer base, good customer relations, good employee relations and any patents or proprietary technology.

Google ~ Started out as search engine and rapidly became so much better at it than everyone else that 'to google' was (and is) widely used to mean 'to look up via the internet'. Now a huge, rich and influential corporation with fingers in many pies, owners of theAndroid- operating system for- smartphones- and- tablets. Its headquarters are in California and it has offices and data centers all over the world.

googling ~ searching through the- Google- search engine

Googol ~ 1 googol = 10 raised to the power 100. The number was named in 1983 by Milton Sirotta after his uncle (the mathematician Edward Kasner) asked him to think up a name for the number. The search engine- Google- is rumoured to be named as a play on the word Googol.

GOP (n)~ A group of successive pictures, starting with an I-frame and followed by zero or more predicted (P and B) pictures.

Gopher (oth)~ An Internet utility for finding textual information and presenting it to the user in the form of hierarchical menus, from which the user selects submenus or files that can be downloaded and displayed.

Gopher ~ A consistent user interface and gateway into many on-line white pages and other address databases.

Gopher server (n)~ The software that provides menus and files to a Gopher user.

Gospel (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 38.

Gothic (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 49.

Gothic Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 91.

Government (PN)~ An app category that facilitates engagement with government or politics.

Government & politics (PN)~ An app category that facilitates engagement with government or politics.

government + politics (PN)~ An app category that facilitates engagement with government or politics.

Government Pricing (n)~ Pricing of Office 365 offers applicable to Government entities only.

GP fault (n)~ The error condition that occurs in an 80386 or higher processor running in protected mode (such as Windows 3.1) when an application attempts to access memory outside of its authorized memory space or when an invalid instruction is issued.

GPF (n)~ The error condition that occurs in an 80386 or higher processor running in protected mode (such as Windows 3.1) when an application attempts to access memory outside of its authorized memory space or when an invalid instruction is issued.

GPF ~ (General Protection Fault)- An common error message in early versions of- Windows, seen when a program tried to do something Windows thought it shouldn't, often locking up the PC.

GPMC (n)~ An administrative tool used to manage and edit domain-based Group Policy objects.

GPO (n)~ A collection of Group Policy settings.

GPRS (n)~ A third-generation enhancement to the Global System for Mobile Communications (GSM), which supports non-voice applications such as Web browsing and other servicing requiring transfer of data packets without limits in message size.

GPS (n)~ A radio navigation system developed by the U.S. Department of Defense that uses a constellation of 24 earth satellites, which are monitored by ground-based control stations, to provide precise, continuous worldwide positioning and timing information.

GPS receiver (n)~ A device that includes an antenna, a radio receiver, and a processor for use with the worldwide GPS (Global Positioning System). A GPS receiver uses position and time information from four GPS satellites to calculate precise information about its current location, its speed of travel, and the current time.

GPS Tracker (PN)~ A feature that allows the users to compute the distance they have run or walked and the calories they have burned.

GPT (n)~ A disk-partitioning scheme that is used by the Extensible Firmware Interface (EFI). GPT offers more advantages than master boot record (MBR) partitioning because it allows up to 128 partitions per disk, provides support for volumes up to 18 exabytes in

size, allows primary and backup partition tables for redundancy, and supports unique disk and partition IDs (GUIDs).

GPU (n)~ A processor on a graphics card that is used as a video encoding accelerator.

GPU (n)~ A dedicated, heavily parallelized processor used to perform graphics or other floating point-€"intensive calculations.

GPU overlay scaling (n)~ A feature that draws two frame buffers at different resolutions and efficiently composites them into a single frame buffer for display.

grab (v)~ To command or capture.

grace days (n)~ A period of days added to a due date during which a customer can delay a payment without incurring interest or a late fee.

grace period (n)~ A period of days added to a due date during which a customer can delay a payment without incurring interest or a late fee.

grace period (n)~ The time period during which a product or service will remain functional before the user or customer must license, register, renew, or otherwise (re)activate their product or subscription.

grace period (n)~ The time period beyond a specified date during which an obligation can be fulfilled without penalty.

grace time (n)~ The time period during which a product or service will remain functional before the user or customer must license, register, renew, or otherwise (re)activate their product or subscription.

graceful recovery (n)~ Termination of a process that allows the operating system or parent process to regain normal control. Does not crash the machine or result in a general protection default (GPF) or blue screen. The user is not required to close the application, and can continue to use the other functionality.

graceful shutdown (n)~ The shutdown of a cache host in Windows Server AppFabric that first moves all cached items off of that host to other running hosts before completing the shutdown.

grade (n)~ A rank or category assigned to a material resource that denotes functional use but not level of quality. A low-grade resource is not necessarily a low-quality resource.

grade (n)~ A numeric or non-numeric score that represents a student's performance on an assignment.

Grade Values (PN)~ An assignment property that indicates whether grades for the assignment are numeric or non-numeric.

Gradebook (PN)~ A worksheet that contains the collection of grades for all students enrolled in a particular class.

graded question (n)~ A question for which an educator has scored a student's response.

gradient (n)~ A gradual progression. For example, a progression from one color to another color, or from one shade to another shade of the same color.

gradient brush (n)~ A brush that paints an area in a gradual progression from one color to another or from one shade to another shade of the same color.

gradient slider (n)~ A user interface control (typically a slider bar) that lets you select a color for a gradient stop and where the color appears in the gradient spectrum that is applied to a brush.

gradient stop (n)~ A marker on a gradient spectrum that denotes where a different color is

introduced. The color (and alpha) values can be unique to each stop along the gradient that a user creates.

Gradient Transform (PN)~ A tool that lets you alter the appearance of a gradient fill or stroke. For example, you can use the Gradient Transform tool to change where the first and last points of a gradient should appear in an object.

grain (n)~ Visible particles in a photographic image, often considered undesireable.

grammar checker (n)~ A software accessory that checks text for errors in grammatical construction.

Grammar pane (PN)~ A pane that provides functionality to correct grammar errors in your document.

grandchild (n)~ In a tree structure, the relationship of a node to its predecessor's predecessor.

granted permissions (n)~ The permissions, determined by security policy, that code will be given, allowing it access to resources and giving it identity. The granted permissions are determined by both the requested permissions and what is allowed by the security policy configuration.

Granular Audit Policy (PN)~ A Windows feature that helps administrators tune their audit policies at a more detailed level by using numerous subcategories, and better control what events are recorded in the event log.

granularity (n)~ A description, from coarse' to 'fine'

granularity attribute (n)~ The single attribute is used to specify the level of granularity for a given dimension in relation to a given measure group.

Graph (PN)~ A capability of Microsoft Azure Active Directory that accesses user, group, and role objects within a social enterprise graph to easily surface user information and relationships.

Graph API (PN)~ A set of RESTful web services that provides access to the entire identity system that is running in Microsoft's cloud (Microsoft Azure Active Directory - WAAD).

graph index (n)~ An index that stores graph nodes and edges and their associated data.

Graph Query Language (PN)~ A query language used to query the graph index.

graphic (n)~ A visual representation such as a picture, chart or table.

graphic filter (n)~ A program that transforms a picture stored in one file format to another format so that it can be displayed in a specific graphics program.

graphic region (n)~ The area on a Web page where graphics overlap.

graphical query designer (n)~ A query designer provided by the Reporting Services that allows the user to interactively build a query and view the results for data source types SQL Server, Oracle, OLE DB, and ODBC.

graphical user interface (n)~ A display format, like that of Windows, that represents a program's functions with graphic images such as buttons and icons. GUIs enable a user to perform operations and make choices by pointing and clicking with a mouse.

graphics (n)~ An API that facilitates rendering for geometry, images, bitmaps, text, color, and special effects.

Graphics ~ A catch-all term for anything involving drawing images on a PC screen. A game with great graphics is one that is visually spectacular.

graphics accelerator (n)~ A video card that contains a graphics coprocessor. A graphics accelerator can update the video display much more quickly than the CPU can, and it frees the CPU for other tasks. A graphics accelerator is a necessity for modern software such as graphical user interfaces and multimedia applications.

Graphics Device Interface (PN)~ An executable program that processes graphical function calls from a Windows-based application and passes those calls to the appropriate device driver, which performs the hardware-specific functions that generate output. By acting as a buffer between applications and output devices, GDI presents a device-independent view of the world for the application while interacting in a device-dependent format with the device.

graphics filter (n)~ A program that transforms a picture stored in one file format to another format so that it can be displayed in a specific graphics program.

Graphics Frame Analysis (PN)~ A component of the Visual Studio Graphics Diagnostics toolset that can be used to analyze and optimize the rendering performance of a Direct3D game or app.

Graphics Interchange Format (n)~ A graphic stored as a file in the GIF format.

Graphics Interchange Format (n)~ A graphics file format developed by CompuServe and used for transmitting raster images on the Internet. An image may contain up to 256 colors, including a transparent color. The size of the file depends on the number of colors actually used. The LZW compression method is used to reduce the file size still further.

graphics memory (n)~ A type of memory used by video cards to store information that will be displayed on a monitor. The amount of video memory dictates the maximum resolution and color depth available for the display.

graphics method (n)~ A method in code that performs a graphics-related function such as drawing a line or shape or repainting a background with a solid color.

graphics platform (n)~ The foundation technology by which a computer displays graphic images.

graphics primitive (n)~ A basic shape (a point, a line, circle, curve, or polygon) that a graphics adapter can manipulate as a discrete entity.

graphics processing unit (n)~ A processor on a graphics card that is used as a video encoding accelerator.

graphics processing unit (n)~ A dedicated, heavily parallelized processor used to perform graphics or other floating point-€"intensive calculations.

grave accent (n)~ The ` character.

GRAVE ACCENT (n)~ The ` character.

Gray Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of gray colors.

grayscale (n)~ A sequence of shades ranging from black through white, used in computer graphics to add detail to images or to represent a color image on a monochrome output device.

Grayscale (PN)~ A filter effect in Windows Movie Maker.

greater than or equal to sign (n)~ The ? character.

greater than sign (n)~ The > character.

GREATER-THAN OR EQUAL TO (n)~ The ? character.

GREATER-THAN SIGN (n)~ The > character.

great-looking (adj)~ Impressive or compelling in appearance.

greedy repetition (n)~ A matching criteria used in regular expresions where quantifiers match as many characters as they can.

Green Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of green colors.

green IT ~ Technology assets, services, and operational best practices that allow organizations to reduce harmful environmental impacts while at the same time achieving their financial and risk imperatives within and outside of IT.

greenfield deployment (n)~ An Enterprise Voice deployment in an environment where no legacy PBX system exists. A new company or new facility are typical examples.

greeting (n)~ ?The string that appears on Cortana home to greet you. If Cortana knows the user's name, she may use it.

Gregorian calendar (n)~ A calendar in widespread use. It was introduced in 1582 A.D. as a revision to the Julian calendar.

grep (n)~ A UNIX command used to search a file or files by keyword.

grid (n)~ A set of intersecting lines or linear elements at right angles to each other.

Grid (PN)~ The Sway card that places content into a tighter arrangement, aligning content by rows and/or columns.

Grid computing ~ applying the resources of many computers in a network to a single problem at the same time - usually to a scientific or technical problem that requires a great number of computer processing cycles or access to large amounts of data.

grid lines (n)~ The faint vertical and horizontal lines that appear in the drawing window when the grid is turned on. You can use grid lines to help position shapes precisely.

Grid Matrix (PN)~ A SmartArt graphic layout used to show the placement of concepts along two axes. Emphasizes the individual components rather than the whole. The first four lines of Level 1 text appear in the quadrants. Unused text does not appear, but remains available if you switch layouts.

grid origin (n)~ The point that defines the layout of grid lines on the drawing page. A vertical grid line and a horizontal grid line pass through the grid origin, and all other grid lines are drawn at specified intervals from these reference lines.

grid panel (n)~ A layout container that arranges its child elements in rows and columns that form a grid.

gridline (n)~ A line added to a chart that makes it easier to view and evaluate data. Gridlines extend from the tick marks on an axis across the plot area.

gripper (n)~ A handle (often, a tall, thin rectangle) that appears on a rebar or command band. By touching and dragging a gripper bar with a stylus or mouse, a user can reposition or resize a rebar or command band.

gripper bar (n)~ A handle (often, a tall, thin rectangle) that appears on a rebar or command band. By touching and dragging a gripper bar with a stylus or mouse, a user can reposition or resize a rebar or command band.

groom (v)~ To permanently remove data from the data warehouse.

Groove (PN)~ An app, delivered in-box with Windows, that can be used to buy, stream, store, and sync music.

Groove Calendar Tool (PN)~ A tool that lets the user mark important dates and build collaborative schedules with other members of a workspace.

Groove Documents Tool (PN)~ A tool in Groove for storing and sharing files; primary use is intended to be as connection to SharePoint (via Site Client).

Groove Meetings Tool (PN)~ A tool in Microsoft Office Groove that helps users to organize, conduct, and record meetings.

Groove Music (PN)~ An app, delivered in-box with Windows, that can be used to buy, stream, store, and sync music.

Groove Music Pass (PN)~ A Microsoft paid subscription service (monthly or yearly) that offers streaming and download access to millions of songs in the Groove music catalog.

gross amount (n)~ The total amount of anything before any deductions or additions are applied.

gross amount (n)~ An amount excluding deductions, charges, and adjustments.

gross margin (n)~ The difference between the sales and the direct costs of the products sold.

gross margin (n)~ The ratio of gross profit to sales revenue.

gross profit (n)~ The ratio of gross profit to sales revenue.

group (v)~ In a drawing program, to transform a number of objects into a group.

group (n)~ A collection of elements that can be treated as a whole.

group (v)~ To arrange or associate one or more resources.

group (n)~ A labeled collection of commands and controls that are grouped together on a ribbon tab.

group (n)~ A collection of users, computers, contacts, and other groups that is used as security or as e-mail distribution collections. Distribution groups are used only for e-mail. Security groups are used both to grant access to resources and as e-mail distribution lists.

group (n)~ A set of agents who handle calls. Each group defines a routing method (how should the agents be contacted) and some presence policies (when should the agents be contacted, or whether agents are formal or informal agents).

group (n)~ To join query two clauses with a Boolean operator in the work item query builder.

group (n)~ A collection of users, computers, contacts, and other groups that is used only for e-mail distribution, and addressed as a single recipient.

group (n)~ A collection of e-mail addresses that is treated as a single recipient for e-mail distribution purposes, and that is created by and available to an individual Outlook user.

group (n)~ In Microsoft Azure Connect, an exclusive set of endpoints whose members have network connectivity with other groups of either on-premises IT resources or Microsoft Azure role instances.

group (n)~ A set of objects that share a common relation.

Group (PN)~ The Sway button that allows the user to change a set of cards into a group of cards.

group account (n)~ A collection of user accounts in a workgroup, identified by group name and personal ID (PID). Permissions assigned to a group apply to all users in the group.

Group Ad-hoc Network (n)~ Personal Area Networks (PAN) that communicate directly

between one or more Bluetooth-enabled computers or devices.

group box (n)~ A standard Windows control that groups a set of controls.

group calendar (n)~ A calendar for a group.

Group Calendar (PN)~ The shared calendar that you can create in Office for a group of users to schedule events, track milestones, create meetings, and engage in conversations around events. Users can add events from a group calendar to their personal calendars.

group call (n)~ A call to a call group that rings the group owner and call group simultaneously. When a member of the group answers the call, the other members get a notification with the status of the call.

group call (n)~ A voice call with up to 25 participants in Skype.

group card (n)~ A Sway card that takes a set of cards and creates a group out of them with a particular visualization pattern.

group chat (n)~ An instant message session with multiple parties, exchanged via IM (not through your mobile operator).

Group Contacts by Availability (PN)~ An item on the View menu that rearranges the user's contacts based on each contact's current status.

group conversation (n)~ An instant message session with multiple parties, exchanged via IM (not through your mobile operator).

group expansion (n)~ Expansion of an Exchange Distribution Group for the purpose of inviting some or all of its members to a conference.

Group Expansion service (n)~ A service that expands distribution groups so that members of a group can be viewed individually.

group filter control (n)~ A drop-down list box control on a data access page that retrieves records from an underlying recordset based on the value you select from the list. On a grouped page, the control retrieves a specific group of records.

Group Filtering (PN)~ A feature of Directory Services that provides the ability for different groups of users to have their own sets of filtering rules, even if all users share the same domain. -

group footer (n)~ Use to place information, such as group name or group total, at the end of a group of records.

group header (n)~ A place for information, such as group name or group total, at the beginning of a group of records.

group identifier (n)~ An identifier in UNIX that associates a user with a group of other users that have something in common. A user can be a member of one or more groups.

group IM (n)~ An instant message session with multiple parties, exchanged via IM (not through your mobile operator).

group inheritance (n)~ A means of defining the permissions of a group role within the Safe Editing feature. Administrators can create user groups and the authoring rights of each group member will be restricted according to the group permission.

group instant message (n)~ An instant message session with multiple parties, exchanged via IM (not through your mobile operator).

group instant messaging (n)~ A feature that allows instant messages to be sent to a group of contacts.

Group Key Distribution Service (PN)~ An Active Directory Domain Services service

that provides cryptographic keys that correspond to arbitrary sets of security principals in AD DS to users who are authorized to access those keys.

group level (n)~ The depth at which a group in a report or data access page is nested inside other groups. Groups are nested when a set of records is grouped by more than one field, expression, or group record source.

group member (n)~ A contact within a group in the Contacts list.

group metrics (n)~ Data about the size of a distribution group and whether the recipients include people who are out of office or external to the organization.

group moderator (n)~ A person who is assigned the ability to approve and reject any messages sent to a public group or a dynamic distribution group.

group name (n)~ A unique name identifying a local group or a global group to Windows. A group's name cannot be identical to any other group name or user name in its own domain or computer.

group name (n)~ A unique name that identifies a group of contacts in the Contacts list.

group naming policy (n)~ A template applied to the distribution group names in your Microsoft Exchange organization. Specifically, you can specify that a prefix, a suffix, or both be applied to all distribution group names. You can also block certain words from being used in the names.

group nesting (n)~ A field of a group definition that specifies whether the group will contain the names of other groups as members of the current group.

group of pictures (n)~ A group of successive pictures, starting with an I-frame and followed by zero or more predicted (P and B) pictures.

group owner (n)~ A person authorized to manage and make certain changes to a group, such as to approve a membership request.

Group Policy (n)~ A feature introduced with Windows 2000 that allows administrators to enforce computer-specific and user-specific settings to domain-based computers.

Group Policy Client (n)~ A local service that queries Active Directory at policy application time (at boot/logon or scheduled intervals) for the policy objects which pertain to it and applies them.

group policy engine (n)~ The framework that handles common functionalities across client-side extensions including scheduling of Group Policy application, obtaining GPOs from relevant configuration locations, and filtering and ordering of GPOs.

Group Policy Management (PN)~ An administrative tool designed to manage Group Policy across an enterprise. This includes day-to-day tasks, such as creating, deleting, linking, and copying Group Policy objects (GPOs), as well as setting security on GPOs. The Group Policy Management snap-in also provides reporting of GPO policy settings, as well as extended lifecycle functions such as backup and restore of GPOs.

Group Policy Management Console (n)~ An administrative tool used to manage and edit domain-based Group Policy objects.

Group Policy Management Editor (PN)~ The editor window used to edit domain-based Group Policy in the Group Policy Management Console.

Group Policy Modeling (PN)~ A tool in Group Policy Management console that simulates what Group Policy settings are applied, given a specific set of criteria, including location of user or computer object in the directory, security group membership, and status

of Windows Management Instrumentation (WMI) filters. You can use Group Policy Modeling to test new policy deployments before you deploy them. Also known as Resultant Set of Policy-€"Planning Mode.

Group Policy Object Editor (PN)~ The Microsoft Management Console snap-in used to edit Group Policy objects.

Group Policy object link (n)~ A method of applying settings in a Group Policy object (GPO) to an Active Directory container (site, domain, or organizational unit). Linking a GPO applies the settings of that GPO to the users and computers in a site, domain, or organizational unit and, by default, to the users and computers in all child containers.

Group Policy Results (PN)~ A tool in Group Policy Management console that gathers information about which Group Policy settings have actually been applied to a specific computer, user, or both. You can use this tool to troubleshoot the application of Group Policy settings. Also known as Resultant Set of Policy — Logging Mode.

Group Policy Security Settings (PN)~ The subtrees of the Group Policy Object Editor that allow a security administrator to manually configure security levels assigned to a Group Policy object (GPO) or local computer policy.

Group Policy Software Installation (PN)~ An extension to the editor that accompanies the Group Policy Management Console (GPMC). The extension is used to deploy software packages by using a domain-based Group Policy object.

group prefix (n)~ A group name that appears to the left of the @ symbol followed by the Windows- domain name. For example, in the group name allusers@fabrikam.com'

group scope (n)~ The value of the Active Directory property that determines the allowed membership in the group, and the resources that may be secured by the group. The allowed values are global, universal, and domain local.

group screen sharing (n)~ A feature that enables users to share their desktops with several contacts at one time.

group text (n)~ A text message thread between a group of people (usually more than 2). It allows you to keep all the replies from people in one thread, so that you can see the whole conversation.

group theming (n)~ A feature that enables group owners to change their group's image and colors for a better representation.

group transition (n)~ An outgoing transition segment with an outgoing arrow that begins on the state context and has no chained incoming transition.

group type (n)~ The value that specifies whether the group is used for e-mail distribution, securing resources, or both.

group validation activity (n)~ A workflow activity that determines whether a group management request would violate the ILM or Active Directory configuration or policy.

group video (n)~ A feature that allows calls with at least three Skype users where at least one participant shows video.

group video calling (n)~ A feature that allows calls with at least three Skype users where at least one participant shows video.

group window (n)~ A drawing window you can open to edit individual components of a group. The group appears unrotated in the group window even if it is rotated on the drawing page.

Group Work Site (PN)~ A team site template that provides group collaboration capabilities based on standard business practices. Integrated functions include a group calendar, Whereabouts, Announcements, Phone Call Memo, and Schedule and Reservations.

grouped controls (n)~ Two or more controls that can be treated as one unit while designing a form or report. You can select the group instead of selecting each individual control as you're arranging controls or assigning properties.

Grouped Grid (PN)~ A grouped and ordered list of HTML blocks in ListView.

Grouped List (PN)~ A SmartArt graphic layout used to show groups and sub-groups of information, or steps and sub-steps in a task, process, or workflow. Level 1 text corresponds to the top-level horizontal shapes, and Level 2 text corresponds to vertical sub-steps under each related top-level shape. Works well for emphasizing sub-groups or sub-steps, hierarchical information, or multiple lists of information.

grouping (n)~ A set of data that is grouped together in a report.

grouping (n)~ The process of collapsing search results that share the same value for a given managed property or group identifier.

grouping pane (n)~ The area of the grouping window in which most user interaction takes place.

GroupLens (PN)~ A commonly used dataset for movie recommendation in a Mahout compatible format provided by GroupLens Research, headed by faculty from the department of computer science and engineering at the University of Minnesota and partially funded by the National Science Foundation.

group-level setting (n)~ One of the settings that BizTalk administrators can modify in the BizTalk Settings Dashboard. Examples include properties like the configuration refresh interval, maximum message batch size, and group-level tracking.

Groups (PN)~ The link to the online communities on Windows Live Groups.

Groups (PN)~

groupware (n)~ Software intended to enable a group of users on a network to collaborate on a particular project. Groupware may provide services for communication (such as e-mail), collaborative document development, scheduling, and tracking. Documents may include text, images, or other forms of information.

groupware ~ Software tools and technology to support groups of people working together on a project, often at different sites

groupware ~

growth rate (n)~ The amount of growth of an account within a set amount of time.

GRS (n)~ Storage of data in two locations within the same geo.

Grundsätze zum Datenzugriff und zur Prüfbarkeit digitaler Unterlagen (oth)~ A German law that requires tax authorities to be capable of digitally checking data from electronic bookkeeping systems.

Grunge (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 6.

GRUU (n)~ A URI that a SIP program can use to route a call to a specific agent.

GSM (n)~ A digital cellular phone technology (standard) first deployed in 1992. GSM

uses narrowband TDMA, which allows eight simultaneous calls on the same radio frequency.

GSM network (n)~ A network used by phones that have SIM cards.

GSS-API (n)~ A generic API for performing client-server authentication that can be implemented over any authentication system. GSS-API makes it possible for applications to use the same API with different authentication mechanisms.

GST (PN)~ A value-added tax levied in some countries/regions.

GTIN (n)~ A 14-digit data structure used to uniquely identify trade items, products, and services at a unit level.

g-tube (n)~ A tube used to provide nutrition to patients who are unable to obtain nutrition by mouth.

guard (n)~ In a statechart or activity diagram, a condition that specifies when an event can take place. Whenever its event fires, a guard is evaluated only once.

guard (n)~ A clause that specifies an additional condition that the variable must satisfy to match a pattern.

guard clause (n)~ A clause that specifies an additional condition that the variable must satisfy to match a pattern.

guest (n)~ A user who does not have a user account or who does not provide a password.

guest (n)~ The software that is running within a virtual machine (i.e., guest operating systems and guest applications).

guest access (n)~ A type of access that allows visitors to use their own desktop computers on limited resources (such as the Internet or LAN printers) without compromising a company's internal network security.

Guest account (n)~ A built-in account used to log on to a computer running Windows when a user does not have an account on the computer or domain or in any of the domains trusted by the computers domain.

guest link (n)~ A unique link that provides external users anonymous access to selected documents stored in SharePoint Online, with no sign in required.

Guest Mode (PN)~ An account attribution that allows users to use the computer in the exploratory mode which will automatically discard changes and actions upon logoff. Guest Mode can be applied to the standard user account in Windows 7 enabling PC owners to safely share the computer with guests, children, or other family member, with a peace of mind knowing no damaging changes or unauthorized disk writes will be made to their computer.

guest operating system (n)~ The operating system running on a virtual machine.

guest operating system profile (n)~ A library resource containing the most common settings from a Sysprep.inf file, including the computer name and domain or workgroup settings, which can be applied to a virtual machine template.

guest OS (n)~ The operating system running on a virtual machine.

guestbook (n)~ A module in Spaces where visitors can leave comments.

Guestbook (PN)~ The checkbox customers select to include their guestbook in the updates that they share about themselves. This text links to Spaces.

GUI (n)~ A display format, like that of Windows, that represents a program's functions with graphic images such as buttons and icons. GUIs enable a user to perform operations

and make choices by pointing and clicking with a mouse.

GUI ~ (Graphical User Interface; pr. 'gooey')- means that a program's controls are represented pictorially, with symbols, buttons and so forth, and mostly controlled by pointing and clicking with a mouse rather than having to type in text commands. Almost all modern software is GUI controlled. (see also- Windows,WYSIWYG).

GUID (n)~ A 16-byte value generated from the unique identifier on a device, the current date and time, and a sequence number. It is used to identify a particular device, component, user, or session.

GUID partition table (n)~ A disk-partitioning scheme that is used by the Extensible Firmware Interface (EFI). GPT offers more advantages than master boot record (MBR) partitioning because it allows up to 128 partitions per disk, provides support for volumes up to 18 exabytes in size, allows primary and backup partition tables for redundancy, and supports unique disk and partition IDs (GUIDs).

guide (n)~ A non-printing line or point that can be used to help position or align objects or text.

guide point (n)~ A guide consisting of two short, intersecting lines that can be placed anywhere on a drawing page or on a shape.

Guided Help (n)~ An interactive help topic that not only describes how to accomplish a task, but also completes it. Guided Help can either perform the task automatically or show users how to do it by leading them through each step.

guideline award (n)~ For increases in fixed pay rate or variable awards, the calculated award after performance factors (or leverages) are applied to the budgeted or target award.

guideline increase (n)~ For increases in fixed pay rate or variable awards, the calculated increase after performance factors (or leverages) are applied to the budgeted or target award.

Gumdrop Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a gumdrop decoration for their cake.

gutter (n)~ The blank area between two or more columns of text or between two facing pages in a publication.

gutter margin (n)~ A margin setting that adds extra space to the side or top margin of a document you plan to bind. A gutter margin ensures that text isn't obscured by the binding.

GxP critical record (n)~ An electronic record considered critical by the FDA.

GxP Predicate Rules (n)~ FDA rulings that are observed within the pharmaceutical industry.

gyroscope (n)~ A sensor for measuring rotational velocity, or orientation.

H ~

H.264 (PN)~ An International Telecommunications Union (ITU) digital video standard with a high level of data compression that can potentially provide full-motion video over wireless, satellite, and ADSL Internet connections.

H.x ~ A series of computing standards from the- ITU. e.g. H.323: a standard in 1996 to promote compatibility in videoconference transmissions over- IP- networks.

haa (n)~ Name of the 26th letter in the Arabic alphabet. The sound is similar to that of the letter H in English.

HAB (n)~ A feature of Outlook that allows members of an organization to be displayed in a tree view control, grouped by department.

Hack / hacker ~ Term used to describe the unauthorised access of a computer as a means to gain information that the hacker is not entitled to or to access services and facilities for malicious purposes.

Hack / hacker ~ Originally used to describe a computer enthusiast who pushed a system to its highest performance through clever programming. More commonly it is becoming synonymous with 'cracker' which is used to describe people who break into secured computer systems.

Hack / hacker ~ An expert programmer who likes to spend a lot of time figuring out the finer details of computer systems or networks, as opposed to those who learn only the minimum necessary.

hacker (n)~ A programmer or computer user who attempts illegal access to a computer system or network.

Hacker ~ Person who uses computers to access ('hack') systems they are not supposed to have access to, eg other people's financial details, personnel files, military secrets etc. Hacking can get you arrested.

haemophilus influenzae type b vaccine (n)~ A vaccine for immunization against serious infections caused by a type of bacteria called Haemophilus influenzae type b, such as meningitis and pneumonia.

HAL (n)~ A thin layer of software provided by the hardware manufacturer that hides, or abstracts, hardware differences from higher layers of the operating system. By means of the filter provided by the HAL, different types of hardware look alike to the rest of the operating system. This enables the operating system to be portable from one hardware platform to another. The HAL also provides routines that enable a single device driver to support the same device on all platforms.

half-duplex (adj)~ Of or pertaining to two-way communication that takes place in only one direction at a time.

half-duplex (n)~ Two-way electronic communication that takes place in only one direction at a time.

halftone (n)~ A printed reproduction, typically of a photographic image, that uses a screen of dots whose size varies depending on the density of the image.

half-width character (n)~ In a double-byte character set, a character that is represented by one byte and typically has a full-width variant.

Halo ~ A light line around object edges in an image, produced by the USM (sharpening) technique.

hammering attack (n)~ A key search attack in which an unauthorized user guesses at a PIN or password many times.

HAND ~ (Have A Nice Day)- Internet slang, often used ironically.

handheld (n)~ A single handed device used in a number of industries, including retail, hospitality, healthcare, manufacturing, and automotive.

handheld scanner (n)~ A type of scanner used as follows: the user passes the scan head, contained within a handheld unit, over the medium being scanned, such as a piece of paper.

hand-held scanner (n)~ A type of scanner used as follows: the user passes the scan head, contained within a handheld unit, over the medium being scanned, such as a piece of paper.

handle (n)~ A user interface control that facilitates modification of an object's appearance, position, or behavior.

handle (n)~ A pointer to a pointer; that is, a variable that contains the address of another variable, which in turn contains the address of the desired object.

handle (n)~ Any token that a program can use to identify and access an object such as a device, a file, a window, or a dialog box.

handle count (n)~ In Task Manager, the number of object handles in a process`s object table.

handler (n)~ A routine that manages a common and relatively simple condition or operation, such as error recovery or data movement.

handler (n)~ A COM object that provides functionality for a Shell item.

handling unit (n)~ A uniquely identifiable logistics unit of material that can be transferred, stored, received, and shipped.

handoff (n)~ A process by which an administrator can manually move a clustered mailbox server between nodes in a cluster. A handoff should only be performed by using the Move-ClusteredMailboxServer cmdlet in the Exchange Management Shell.

handoff animation (n)~ A method of blending animation storyboards together so that the transition is smooth. For example, if one animation is running when interrupted by a second animation that modifies the same property, the second animation picks up at the current value of the animated property instead of jumping to a static starting point. This is achieved by not setting a keyframe at the 0-second mark of the second animation.

handout (n)~ A printed version of a presentation that can include multiple slides per page and space for audience notes.

handouts folder (n)~ Storage allocated on a per-meeting basis on the conference center server for handouts.

Hands Free (PN)~ A feature that allows hands-free communication by using a headset.

handset (n)~ The part of a telephone that includes a speaker and a voice transmitter and that you hold with your hand up to your ear.

hands-free installation (n)~ An installation that runs unattended and does not require any user input after it has been started.

hands-free kit (n)~ Wireless phone accessory that allows users to make calls without

holding the phone. A basic kit includes a headset or an earpiece with a microphone. More elaborate sets for use in automobiles may include a power amplifier, dashboard microphone, phone cradle, and speakers.

hands-free setup (n)~ An installation that runs unattended and does not require any user input after it has been started.

handshake (n)~ A process that two devices use to begin communicating. One device sends a message to the other, signaling that it wants to communicate. A number of messages are exchanged to establish the rules they will use for communication.

Handshake ~ Exchange of predetermined signals between two devices establishing a connection.

handwriting (n)~ Text that is entered by drawing or writing on a screen, rather with a keyboard.

handwriting dictionary (n)~ A large dictionary of common words and handwriting samples. There is a separate handwriting dictionary for each person who logs on to a Tablet PC. Tablet PC Input Panel can convert your handwriting to the words and characters that are in the handwriting dictionary. You can add your own words, such as names and acronyms, to your dictionary.

handwriting panel (n)~ The input panel where users can input text through handwriting. The system converts the handwriting to text that users can insert into the active text area.

handwriting recognition (n)~ The ability of a program to interpret handwritten text and convert it into computer-readable text. Handwriting recognition programs accept input from a pen or other handwriting input device, not from a keyboard.

Handwriting recognition personalization tool (n)~ A feature of Windows Vista for Tablet PC that allows users to tailor handwriting recognition results to their own personal handwriting style.

handwriting recognizer (n)~ A feature that converts writing into typed text.

handwriting sample (n)~ An example of the user's handwriting that is used in handwriting recognition.

hang up (v)~ To end a call.

Hang Up (v)~ A button on Audio Controls and Phone Controls that disconnects the current call.

hanging indent (n)~ Paragraph formatting in which the second and subsequent lines of a paragraph are indented more than the first line.

Haptic ~ Haptic is the science and physiology of the sense of touch.- more…

hard affinity (n)~ A mechanism by which a thread can only run on a fixed set of one or more processors.

hard booking (n)~ A project booking that commits a resource to a project or activity, usually for a specified period of time on a project schedule.

hard copy (n)~ Printed output on paper, film, or other permanent medium.

hard delete (n)~ The process of permanently removing an item from the store or moving it to the dumpster when dumpster functionality is enabled. The dumpster is enabled/disabled by means of a registry setting on the computer running Exchange.

hard disk (n)~ An inflexible platter coated with material in which data can be recorded magnetically with read/write heads.

Hard disk ~ A computer's main (and fastest and most convenient) storage for programs and data. Originally named to distinguish it fromfloppy disks. Almost all PCs are fitted with hard disks, sometimes more than one. The first (or only) hard disk is usually called C: by the computer, for historical reasons.

hard disk drive (n)~ A hardware device, or a logical partition of it, that reads data from and writes data to hard disks.

hard link (n)~ A directory entry for a file.

hard mount (n)~ The processes during which an NFS client will infinitely try to mount a file system to make it available for access. NFS clients which hard mount a file system could encounter problems if the NFS server becomes unavailable.

hard page-break renderer (n)~ A rendering extension that maintains the report layout and formatting so that the resulting file is optimized for a consistent printing experience, or to view the report online in a book format.

hard quota (n)~ A quota that prevents users from saving files after the space limit is reached, and generates notifications when the volume of data reaches each configured threshold.

hard recovery (n)~ The process that changes a restored database back to a consistent state by playing transactions into the database from transaction log files.

hard reset (n)~ A type of reset on a mobile device that clears all installed software and restores the device to its original factory configuration.

hard return (n)~ A character input by the user to indicate that the current line of text is to end and a new line is to begin. In word-processing programs that automatically break lines within the margins of a page, a hard return indicates the end of a paragraph. In text-entry programs that lack wordwrap, on the other hand, a hard return is required to end each line, and often two or more hard returns are needed to end a paragraph.

Hard Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 79.

hard-coded ~ Referring to instructions that are written directly into a program and therefore cannot be easily modified, rather than instructions that can be modified by a user.

hard-coding (n)~ The process of putting string or character literals in the main body of code, instead of in external resource files.

hard-coding (n)~ Basing numeric constants on the assumed length of a string; assumptions about language or culture-specific matters fixed in the code - e.g., string length, date formats, etc.

Hardcore (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 129.

hardening (n)~ The use of physical and firmware modifications that make the hardware more difficult to alter without damaging the hardware. These modifications can also prevent hacking that can disable the metering of a prepaid or subscription computer.

Hardening ~ Hardening is the process of identifying and fixing vulnerabilities on a system.

hardware (n)~ The physical components of a computer system, including any peripheral equipment such as printers, modems, and mouse devices.

Hardware ~ The physical parts of a computer.

hardware abstraction layer (n)~ A thin layer of software provided by the hardware manufacturer that hides, or abstracts, hardware differences from higher layers of the operating system. By means of the filter provided by the HAL, different types of hardware look alike to the rest of the operating system. This enables the operating system to be portable from one hardware platform to another. The HAL also provides routines that enable a single device driver to support the same device on all platforms.

hardware acceleration (n)~ The use of computer hardware designed to accelerate computer functions.

Hardware and Devices troubleshooter (n)~ A troubleshooter that helps find and fix problems about hardware and devices.

hardware branch (n)~ The hardware archive root key in the registry that is a superset of the memory-resident hardware tree. Although the hardware tree contains information only about those devices currently detected and running in the system, the registry contains a complete list of all hardware ever installed on the particular computer. The hardware root key is \HKEY-LOCAL-MACHINE\Hardware.

hardware button (n)~ A button on a piece of hardware.

Hardware Compatibility List (n)~ A registry of products that have been tested by Microsoft Windows Hardware Quality Labs (WHQL). These products passed Windows compatibility testing.

Hardware Compatibility Test kit (n)~ A collection of tests that verify hardware and device driver operations under a specific operating situation on Microsoft Windows operating systems. The tests exercise the combination of a device, a software driver, and an operating system under controlled conditions and verify that all components operate properly.

hardware compression (n)~ A feature available on some tape devices that automatically compresses the data that is being stored on the device. This is usually an option that is turned on or off in a backup program.

hardware configuration (n)~ Resource settings that have been allocated for a specific device. Each device on your computer has a hardware configuration, which can consist of interrupt request (IRQ) lines, direct memory access (DMA), an input/output (I/O) port, or memory address settings.

hardware dashboard account (n)~ An account that is required to submit hardware certification packages, device metadata, service metadata, and drivers for Windows.

hardware failure (n)~ A malfunction of a physical component such as a disk head failure or memory error.

hardware history (n)~ Historical hardware inventory data of a client. You can browse a client's hardware history by opening its Hardware History folder in Resource Explorer.

hardware ID (n)~ The most specific device identifier that the vendor of the device defines.

hardware interface (n)~ A card, plug, or other device that connects pieces of hardware with the computer so that information can be moved from place to place. For example,

standardized interfaces such as RS-232-C standard and SCSI enable communications between computers and printers or disks.

Hardware Inventory Client Agent (PN)~ A component of the SMS/Configuration Manager hardware inventory feature. It is a program running on an SMS/Configuration Manager client that gathers detailed information- about the hardware in use on the client.

Hardware Locked Mode (n)~ A mode in which the computer is not under the control of the operating system; rather, the boot sequence is halted at a firmware screen and the user is told to call customer support.

hardware overlay (n)~ A method to render images to a display with a dedicated memory buffer inside video hardware.

hardware profile (n)~ Data that describes the configuration and characteristics of specific computer equipment. This information can be used to configure computers for using peripheral devices.

hardware profile (n)~ A library resource containing hardware specifications that can be applied to a new virtual machine or a virtual machine template. A hardware profile can contain specifications for CPU, memory, network adapters, a DVD drive, afloppy drive, COM ports, and the priority given the virtual machine when allocating resources on a virtual machine host.

hardware router (n)~ A router that performs routing as a dedicated function and has specific hardware designed and optimized for routing.

hardware security module (n)~ A secure device that provides cryptographic capabilities, typically by providing private keys used in Public-key cryptography.

hardware thread (n)~ A hardware element that executes a stream of instructions.

hardware token (n)~ A secure device that provides cryptographic capabilities, typically by providing private keys used in Public-key cryptography.

hardware tree (n)~ A record in RAM of the current system configuration based on the information for all devices in the hardware branch of the registry. The hardware tree is created each time the system is started or whenever a dynamic change occurs to the system configuration.

hardware type (n)~ A classification for similar devices. For example, Imaging Device is a hardware type for digital cameras and scanners.

hardware version (n)~ A number that identifies the type of computer hardware that is responsible for metering and securing a computer.

hardware-assisted virtualization (n)~ A virtualization method that takes advantage of the processor assisted virtualization support that is available with recent processor technology.

Harmonised Sales Tax (PN)~ A value-added tax (VAT) levied in some Canadian provinces that combines the Goods and Services Tax (GST) and the provisional sales tax.

Has Floor status (v)~ A status given by the presenter to a meeting participant who has asked a question by using the Questions and Answers pane so that an online chat session between the participant and presenter is displayed to all meeting participants.

hash (n)~ In many FTP client programs, a command that instructs the FTP client to display a pound sign (#) each time it sends or receives a block of data.

hash (n)~ A fixed-size result that is obtained by applying a one-way mathematical

function (sometimes called a hash algorithm) to an arbitrary amount of data. If there is a change in the input data, the hash changes. The hash can be used in many operations, including authentication and digital signing.

hash ~ A scrambled, or encrypted, form of a password or other text.

hash algorithm (n)~ An algorithm that produces a hash value of some piece of data, such as a message or session key. With a good hash algorithm, changes in the input data can change every bit in the resulting hash value; for this reason, hashes are useful in detecting any modification in a data object, such as a message. Furthermore, a good hash algorithm makes it computationally infeasible to construct two independent inputs that have the same hash. Typical hash algorithms include MD2, MD4, MD5, and SHA-1.

hash bucket (n)~ A bucket which contains all index keys and corresponding rows that hash to the same value.

hash code (n)~ A fixed-size result that is obtained by applying a one-way mathematical function (sometimes called a hash algorithm) to an arbitrary amount of data. If there is a change in the input data, the hash changes. The hash can be used in many operations, including authentication and digital signing.

hash function (n)~ An algorithm that produces a hash value of some piece of data, such as a message or session key. With a good hash algorithm, changes in the input data can change every bit in the resulting hash value; for this reason, hashes are useful in detecting any modification in a data object, such as a message. Furthermore, a good hash algorithm makes it computationally infeasible to construct two independent inputs that have the same hash. Typical hash algorithms include MD2, MD4, MD5, and SHA-1.

hash join (n)~ A join algorithm that implements a join using a hash table to compare rows from the two sources.

hash partitioning (n)~ A way of partitioning a table or index by allowing SQL Server to apply an internal hash algorithm to spread rows across partitions based on the number of partitions specified and the values of one or more partitioning columns.

hash table (n)~ A data structure that carries out a mathematical calculation on a field identifier to determine where a data element in a large table or index is located.

hassle-free (adj)~ Without difficulty, trouble or aggravation.

HAT (n)~ A user interface that enables specified data to be tracked. This interface can be used to monitor the health of the BizTalk server farm and to track and view specific events and messages.

hat switch (n)~ Movement pad on a joystick that gives 3D games players the ability to pan the view with a touch of the thumb.

hatch (n)~ Shading made up of regularly spaced, intersecting lines.

hate speech (n)~ Words or phrases that convey hatred or contempt or is intended to intimidate or cause harm to a group of people based on race, religion, ethnic origin, sexual orientation or disability.

Hate speech (n)~ A content descriptor developed by Microsoft.

HCK (PN)~ The test automation framework used to certify devices or systems for Windows.

HCL (n)~ A registry of products that have been tested by Microsoft Windows Hardware Quality Labs (WHQL). These products passed Windows compatibility testing.

HCT kit (n)~ A collection of tests that verify hardware and device driver operations under a specific operating situation on Microsoft Windows operating systems. The tests exercise the combination of a device, a software driver, and an operating system under controlled conditions and verify that all components operate properly.

HD (PN)~ A high definition optical disc format which uses a smaller focus blue-violet 405 nm laser allowing higher precision and storage density. A competitor to Blu-ray Disc.

HD DVD (n)~ A high definition optical disc format which uses a smaller focus blue-violet 405 nm laser allowing higher precision and storage density. A competitor to Blu-ray Disc.

HD movie (n)~ A high definition optical disc format which uses a smaller focus blue-violet 405 nm laser allowing higher precision and storage density. A competitor to Blu-ray Disc.

HD, HDD ~ (Hard Disk Drive)- The main data storage unit in a computer. Seehard disk.

HDCD (n)~ A patented encode/decode process that improves the quality of all forms of digital audio recording and playback by increasing resolution and reducing distortion that occurs during analog-to-digital (A/D) and digital-to-analog (D/A) conversion, digital pro

HDCD Low Level Extension (n)~ A compressor/expander algorithm that produces a dynamic range and resolution beyond the capability of the 16-bit standard.

HDCD Peak Extension (n)~ A soft peak limiter algorithm applied to the audio signal that allows encoding of peak signal levels up to 6 decibels (dB) above 0 decibels full scale (dBfs) without clipping.

HDInsight (PN)~ The Microsoft Azure big-data service based on Apache Hadoop that allows you to manage, analyze, and report on structured or unstructured data.

HDL (n)~ A class of lipoproteins that carry cholesterol from the body's tissues to the liver.

HDLC (n)~ A protocol for information transfer adopted by the ISO. HDLC is a bit-oriented, synchronous protocol that applies to the data-link (message-packaging) layer (layer 2 of the ISO/OSI reference model) for computer-to-microcomputer communications.

HDMI (n)~ A digital interface specification for delivering digital content and connecting consumer electronic devices.

HDTV (n)~ A type of television that provides much higher resolution, sharpness, sound quality, and picture quality than traditional televisions. HDTVs can usually be used as computer monitors.

head (n)~ In HTML, a section of coding that precedes the body of a document and is used to describe the document itself (title, author, and so on) rather than the elements within the document.

head node (n)~ A server that provides management and job scheduling services to compute nodes in an HPC cluster.

header (n)~ One or more identifying lines printed at the top of a page. A header may contain a page number, a date, the author's name, and the document title, the name of chapter.

header (n)~ An information structure that precedes and identifies the information that follows.

Header (PN)~ The Sway card that allows the user to select one or more pieces or types of content and change what is selected into a heading.

header ~ A formatting style designated in HTML by a specific tag and used to set titles and subtitles apart from plain text.

header file (n)~ A file that is identified to be included at the beginning of a program in a language such as C and that contains the definitions of data types and declarations of variables used by the functions in the program.

header row (n)~ The first row in a spreadsheet. The header row contains category labels that describe the contents of the columns.

header source (n)~ A document that contains the header row (or header record) to be used with the data source specified for a mail-merge main document.

headered control (n)~ A control that includes a child element that labels the control. Headered controls can either include content (headered content control), or a collection of items (headered items control).

heading (n)~ A paragraph style that displays text in a font that is larger than normal text.

heading style (n)~ Formatting applied to a heading. Microsoft Office Word has nine different built-in styles: Heading 1 through Heading 9.

headless (adj)~ Not requiring a keyboard, pointing device, or monitor for display or input.

headless queue (n)~ A queue type used for reports that are reported silently. It is utilized when a user is not to be notified when the event occurs or prior to reporting the event.

headless server (n)~ A server that you can administer by using a different computer. You typically access this type of server by using a network connection. A remotely administered server can have a local keyboard, mouse, or video card and monitor.

Headphone Virtualization mode (n)~ An audio effect setting that allows users with stereo headphones to experience stereo and multi-channel content without the need to set up an extensive multi-channel speaker system.

headroom (n)~ Additional capacity that allows a network to accommodate an increase in traffic.

headset (n)~ Combined earphone and microphone set that enables hands-free communication.

health (n)~ Information about a client computer that Network Access Protection (NAP) uses to allow or deny access to a network and which is encapsulated in a statement of health (SoH), which is issued by a system health agent (SHA) on the client computer.

Health & Fitness (PN)~ An application that includes exercise and workout videos; nutritional and medical references; and a tracker for diet, exercise, and health.

Health & Fitness (PN)~ An app category that facilitates nutrition, fitness, or general well-being.

health + fitness (PN)~ An app category that facilitates nutrition, fitness, or general well-being.

health analyzer (n)~ An administrative tool that examines a computer, server farm, or server cluster and provides statistics that indicate the degree to which the configuration meets expected demands.

Health and Activity Tracking tool (n)~ A user interface that enables specified data to be tracked. This interface can be used to monitor the health of the BizTalk server farm and to track and view specific events and messages.

Health Assessment (n)~ A subtab under System Health in Centro Admin Console that

helps the user monitor applications, components, and servers for the purposes of preempting or fixing problems.

health certificate (n)~ An X.509 certificate that asserts the health of a client computer. Client computers can use this certificate to prove their identities and health through security services and mechanisms such as Internet Protocol security (IPsec) and Internet Key Exchange (IKE), which recognize the X.509 standard.

health device (n)~ A variety of health and fitness devices that can be connected with HealthVault, including blood pressure monitors, peak flow meters, blood glucose meters, pedometers, and scales.

Health Explorer (PN)~ A feature of Operations Manager that allows you to view and then take action on alerts, state changes, and other significant issues generated by monitoring objects on your network.

health history (n)~ An assessment of all components affecting a patient's health status, including information about psychologic, social, cultural, familial, and economic aspects of the patient's life.

Health Insurance Portability and Accountability Act (n)~ A US federal law that provides rights and protections for participants and beneficiaries in group health plans.

Health Monitor (PN)~ An application included with Windows Small Business Server which provides a view of data collected from the Event Viewer and System monitor.

health monitoring (n)~ The process of monitoring applications, components, and servers on which a BizTalk Server solution is implemented for the purposes of preempting or fixing problems.

health packet (n)~ A data structure containing health information about pseudo and physical logical unit numbers (LUNs).

health policy (n)~ A collection of software requirements, security update requirements, and required configuration settings for NAP client computers.

health policy validation (n)~ The process of verifying that a NAP client computer meets your defined health requirements.

health provider (n)~ An individual or institution that provides preventive or curative health care services to individuals or families.

health record (n)~ A chronological written record of a patient's examination and treatment, including the patient's medical history.

Health Registration Authority (n)~ A component of Network Access Protection (NAP) that validates statements of health (SoHs) and approves the issuance of a health certificate to clients that pass health policy verification.

Health Service (PN)~ The Windows-based service responsible for executing management packs as part of the Operations Manager agent and server components.

health state (n)~ In reference to Health column in Results pages, indicates whether thresholds for devices or transactions are exceeded. Health is indicated by health alert icons in simulation results.

health status (n)~ A collection of statistics that indicates the degree to which a computer, server farm, or server cluster meets security, capacity, performance, usage, and other demands.

health tracking indicator (n)~ A statistic that indicates the degree to which a computer,

server farm, or server cluster meets a specific demand for that configuration. It also indicates which log information to copy to a central location for review.

healthcare provider (n)~ An individual or institution that provides preventive or curative health care services to individuals or families.

HealthKit (PN)~ Apple software platform for collecting data from various health and fitness apps.

HealthVault Connection Center (n)~ HealthVault Connection Center is a utility you can use to add data to health records in your HealthVault account from personal health devices such as heart-rate monitors, blood pressure monitors, and so on.

heap (n)~ A portion of memory reserved for a program to use for the temporary storage of data structures whose existence or size cannot be determined until the program is running.

heap corruption (n)~ A type of corruption that affects the data in the Windows heap, such as damages caused by a buffer overrun, writing to a stray pointer or a double-free.

heap manager (n)~ A form of memory manager that is invoked by applications to allocate and free memory (heaps) dynamically.

heap or B-tree (PN)~ A table structure whose index configuration can be either a heap or a b-tree.

heap pointer (n)~ An address of a memory location within the locations managed by the system and belonging to a heap. All Win32 and NT level heap interfaces take as first parameter a pointer to the heap where the operation should happen.

Heart Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a heart decoration for their cake.

Heart Pan Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a heart-shaped pan to bake their cake in.

heart rate monitor (n)~ A device for observation of the heart function.

heartbeat (n)~ A message generated by an agent that tells its management server that the agent is functioning. It also informs Operations Manager about the current rules that are evaluated by the agent, and if it is necessary, it requests updates.

heartbeat checking (n)~ The process of checking the heartbeat. The user can specify how and how often the heartbeat of an agent is checked.

Heartbeat Discovery method (n)~ A Configuration Manager discovery method that is used to update data discovery records (DDRs) for each Configuration Manager client on a set schedule to ensure that they remain current in the site database.

heartbeat interval (n)~ The amount of time that can elapse before the Exchange server asks a mobile device running Exchange ActiveSync to connect again.

heat (n)~ A measure of the relative frequency with which data is accessed.

heat map (n)~ A type of map presentation where the intensity of color for each polygon corresponds to the related analytical data. For example, low values in a range appear as blue (cold) and high values as red (hot).

heat sink ~ A metal plate on some processors that helps dissipate heat.

heaviest resource (n)~ The resource call or calls that exceeded its threshold more than other resources.

heavy (adj)~ Having a font weight that corresponds to a weight class value of 900 according to the OpenType specification.

heavy event (n)~ A performance event that occurs regularly and for which detailed information is collected.

Heavy metal (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 137.

heijunka (n)~ A method of production scheduling that levels the production flow and that places the production schedule in a visible location so that any production issues can be seen at an early stage.

Hekaton database engine (PN)~ The memory-optimized OLTP engine of SQL Server.

Hekaton engine (PN)~ The memory-optimized OLTP engine of SQL Server.

Hello (PN)~ The ability to unlock your device by detecting your face, iris, or fingerprint.

help (n)~ The capability of many programs and operating systems to display advice or instructions for using their features when so requested by the user, as by a screen button or menu item or a function key.

Help (n)~ A UI element that provides access to online Help or other forms of user assistance.

Help and how-to (PN)~ A section of windowsphone.com containing procedural topics, videos, and links to support information about Windows Phone and related technologies.

Help and Support Center (n)~ A unified place where a user can access all Help and Support content and services from Microsoft, the OEM, and the corporation.

Help bubble (n)~ A bubble that appears when a user clicks in a field or on a control in the user interface. The Help bubble contains information that helps the user know what to do.

Help Central (PN)~ The centralized Windows Live Help system.

Help Collection (n)~ A collection of help files about a particular topic.

Help Desk (PN)~ The role group that gives users the permissions to reset passwords for users and manage settings on the Options page for users' Outlook Live account. To help troubleshoot user issues, members can also view, but not modify, all mailboxes, public groups, and external contacts in the organization.

help desk (n)~ An individual or team of support professionals that provide technical assistance for an organization's network, hardware devices, and software.

Help Documentation for Team Foundation (n)~ The Help resources designed for Team Foundation, which is a collection of collaborative technologies that support a team effort to deliver a product.

Help improve this product (v)~ A button related to the Customer Experience Improvement Program.

Help Improvement program (n)~ A feature that helps Microsoft identify trends in the way Help is used so that Microsoft can improve the search results and the relevancy of the content.

help topic (n)~ The primary unit of information in a Help (.HLP) file. A topic is a self-contained body of text and graphics, similar to a page in a book.

Help Topics (n)~ An item on the Help menu that opens online Help for Communicator.

Help viewer (PN)~ The tool or window that contains the Help content.

Help window (n)~ A separate program window that displays Help information.

Help+Tips (PN)~ The app that provides easy access to Help and how-to content as well as

helpful tips for users.

helpdesk (n)~ An individual or team of support professionals that provide technical assistance for an organization's network, hardware devices, and software.

helper (n)~ An application intended to be launched by a Web browser when the browser downloads a file that it is not able to process itself. Examples of helper applications are sound and movie players. Helper applications generally must be obtained and installed by users; they usually are not included in the browser itself.

helper (n)~ A component used in ASP.NET MVC and ASP.NET Web Pages that packages a typical programming task and lets developers carry out the task using a single line of code.

helper application (n)~ An application intended to be launched by a Web browser when the browser downloads a file that it is not able to process itself. Examples of helper applications are sound and movie players. Helper applications generally must be obtained and installed by users; they usually are not included in the browser itself.

helper DC (n)~ A supporting domain controller used to source SYSVOL from the restored backup media if only one domain controller is installed in the domain (SYSVOL has not replicated at least once between two domain controllers in the domain).

HepA (n)~ A vaccine for immunization against hepatitis A virus infection.

hepatitis A vaccine (n)~ A vaccine for immunization against hepatitis A virus infection.

hepatitis B vaccine (n)~ A vaccine for immunization against hepatitis B virus infection.

HepB (n)~ A vaccine for immunization against hepatitis B virus infection.

heterogeneous data (n)~ Data stored in multiple formats.

heterogeneous selection (n)~ A selection that includes objects of different types or with different properties.

heuristic (n)~ An approach or algorithm that leads to a correct solution of a programming task by non-rigorous or self-learning means. One approach to programming is first to develop a heuristic and then to improve on it.

Heuristics ~ Heuristics means 'rule based'. Normally, for an Anti-Virus product to detect a virus, the virus must have been seen before, analyzed and detection added to the signature update files.

hex (adj)~ Pertaining to the base-16 number system represented by the digits 0 through 9 and the uppercase or lowercase letters A (equivalent to decimal 10) through F (equivalent to decimal 15). Hexadecimal values are commonly used in HTML code to identify colors.

hex dump ~ a hexadecimal view of computer data, from RAM or from a file or storage device.

hex val (n)~ A value that follows a format of 4 channels—including an alpha channel—and is composed in the following format: #AARRGGBB. Hex is commonly used for Web and screen design as many browsers render colors based upon hex values.

hexadecimal (adj)~ Pertaining to the base-16 number system represented by the digits 0 through 9 and the uppercase or lowercase letters A (equivalent to decimal 10) through F (equivalent to decimal 15). Hexadecimal values are commonly used in HTML code to identify colors.

hexadecimal escape sequence (n)~ In regular expressions, a backslash followed by the letter 'x' followed by a sequence of hexadecimal digits. It matches a character in the target

sequence that has the value that is specified by the two digits.

hexadecimal value (n)~ A value that follows a format of 4 channels—including an alpha channel—and is composed in the following format: #AARRGGBB. Hex is commonly used for Web and screen design as many browsers render colors based upon hex values.

Hey Cortana (PN)~ A feature that provides the ability to invoke Cortana using your voice (Hey Cortana') to put her in listening mode.'

HFS (n)~ A tree-structured file system used on the Apple Macintosh in which folders can be nested within other folders.

hi5 ~ hi5 is a social networking website based in San Francisco, California.- http://hi5.com/

Hib (n)~ A vaccine for immunization against serious infections caused by a type of bacteria called Haemophilus influenzae type b, such as meningitis and pneumonia.

hibernate (v)~ For a computer system, to be in an inactive state, but not shut off. When the computer is switched back on, the desktop is restored exactly as it was.

hibernation (n)~ A power-saving state that saves your open documents and programs to your hard disk and then turns off your computer. When you're ready to use the computer again, it comes out of hibernation in seconds and restores all of your open programs and documents that were saved. Of all the power-saving states that Windows uses, hibernation uses the least amount of power.

hibernation file (n)~ A file created during hibernation that contains all CPU memory and registers information.

Hibernation File Cleaner (n)~ A feature that allows deletion of the files created during hibernation.

HID minidriver (n)~ A minidriver that abstracts the operation of a hardware bus or port that a HID device is attached to. After the HID minidriver registers with the HID class driver, the HID class driver communicates with the minidriver by calling the minidriver's standard driver routines.

hidden (adj)~ Not visible to the user.

Hidden field (n)~ A form field that is invisible to a site visitor but supplies data to a form handler. When a form is submitted, hidden fields are passed to the form handler along with name-value pairs for each visible form field.

hidden helper (n)~ An input element used to store information about the state of a webpage.

hidden network (n)~ An Institute of Electrical and Electronics Engineers (IEEE) 802.11 wireless network in which Service Set Identifier (SSID) suppression is enabled.

hidden partition (n)~ A partition that is not visibly exposed to the user. To create a hidden partition, set the partition type to one not recognized by Windows.

hidden text (n)~ Text that does not display in the normal view of a document's content.

hide (v)~ To temporarily remove the onscreen display of an object on the design surface at design time.

hide (v)~ To temporarily remove the onscreen display of an application's active window while leaving the application running. Windows that have been hidden are returned to active display by issuing the appropriate command to the operating system.

hierarchical (adj)~ Of, relating to, or organized as a hierarchy.

hierarchical address book (n)~ A feature of Outlook that allows members of an organization to be displayed in a tree view control, grouped by department.

hierarchical menu (n)~ A type of drop-down menu that appears when a user points to a command on a higher-level menu.

hierarchical namespace (n)~ A namespace, such as the DNS namespace or Active Directory namespace, that is hierarchically structured and provides rules that allow the namespace to be partitioned.

hierarchy (n)~ A logical structure that organizes the members of a set into parent-child relationships.

Hierarchy (PN)~ A SmartArt graphic layout type that includes layouts designed to show a hierarchical structure, such as an organization chart, or a decision tree.

Hierarchy (PN)~ A SmartArt graphic layout used to show hierarchical relationships progressing from top to bottom.

hierarchy branch (n)~ A group of sites, interconnected via child/parent site connections, that report up to the same primary site.

hierarchy diagram (n)~ A diagram that shows the hierarchical relationships among objects/nodes (for example, an organization chart).

hierarchy level (n)~ A classification that applies to members within a hierarchy.

Hierarchy List (PN)~ A SmartArt graphic layout used to show hierarchical relationships progressing across groups. Can also be used to group or list information.

hierarchy provider (n)~ A code structure that defines a hierarchy.

hierarchy tree (n)~ A structure in which elements are related to each other hierarchically.

high availability (n)~ The ability of a system or device to be usable when it is needed. When expressed as a percentage, high availability is the actual service time divided by the required service time. Although high availability does not guarantee that a system will have no downtime, a network often is considered highly available if it achieves 99.999 percent network uptime.

high availability (n)~ A Windows Server AppFabric feature that supports continuous availability of cached data by storing copies of that data on multiple cache hosts.

High Contrast (n)~ A feature that heightens the color contrast of some text and images on your computer screen, making those items more distinct and easier to identify.

High Definition Compatible Digital (n)~ A patented encode/decode process that improves the quality of all forms of digital audio recording and playback by increasing resolution and reducing distortion that occurs during analog-to-digital (A/D) and digital-to-analog (D/A) conversion, digital pro

high density lipoprotein (n)~ A class of lipoproteins that carry cholesterol from the body's tissues to the liver.

high importance (n)~ A flag that can be set for Lync and Communicator calls or instant messages to indicate the urgency of the conversation.

high memory (n)~ Memory locations addressed by the largest numbers.

high performance computing (n)~ The type of computing that uses supercomputers or computer clusters to address computation problems which require high bandwidth, low latency networking, very high compute capabilities, etc.

High Precision Event Timer (n)~ A hardware timer used in personal computers .

high priority (n)~ A priority level that indicates that a task needs to be executed before other tasks that are assigned a normal or a low priority level.

high priority update (n)~ A classification used on the Windows Update web site and by the Windows Update Service to recommend Microsoft software updates and drivers that help protect against the latest publicly known security threats and reliability issues. All software updates and drivers that can be installed by turning on Automatic Updates on your computer are classified as high priority. These can also be installed by visiting the Windows Update web site.

High Quality Video (n)~ A video call quality standard.

high watermark (n)~ A memory consumption threshold on each cache host that specifies when objects are evicted out of memory, regardless of whether they have expired or not, until memory consumption goes back down to the low watermark.

high-definition DVD (n)~ A high definition optical disc format which uses a smaller focus blue-violet 405 nm laser allowing higher precision and storage density. A competitor to Blu-ray Disc.

high-definition multimedia interface (n)~ A digital interface specification for delivering digital content and connecting consumer electronic devices.

High-Definition Television (n)~ A type of television that provides much higher resolution, sharpness, sound quality, and picture quality than traditional televisions. HDTVs can usually be used as computer monitors.

high-density disk (n)~ A floppy disk that can hold up to 1.44 MB.

high-density multichip interconnect (n)~ A digital interface specification for delivering digital content and connecting consumer electronic devices.

high-DPI (adj)~ Pertaining to a DPI setting with more than 96 DPI.

higher-level site (n)~ A parent site to which the current site reports, directly (via child-parent relationships) or indirectly (via multiple child-parent relationships).

high-impact (adj)~ Having a strong effect or influence.

highlight (v)~ To emphasize displayed characters, as by displaying them in reverse video (light on dark rather than dark on light, and vice versa) or against a colored background.

highlight (oth)~ The points of interest in a given neighborhood.

highlight (n)~ A color formatting option for emphasizing text in a Word document or Excel workbook on the phone.

Highlight Viewer (PN)~ An available button for Windows Live Toolbar that highlights, in color, search words on the search results page. It also highlights the search words on the websites included in the search results.

highlighter (n)~ A tablet pen mode that enables you to apply transparent ink.

highlighter setting (n)~ A setting that you can use to change the appearance of highlighter ink.

Highlighter tool (n)~ An annotation tool that is used to highlight an area of a slide.

highlighting filter (n)~ A filter that displays all information and highlights the data that match the filter criteria.

highlights (PN)~ The UI label in Messenger for the aspect of the social view that displays prioritized recent social activity of friends.

high-low lines (n)~ In 2-D line charts, lines that extend from the highest to the lowest

value in each category. High-low lines are often used in stock charts.

HighMAT (n)~ A recording format that can store audio, video, and pictures on a CD or DVD. HighMat discs play on any Windows computer and on some DVD players.

high-performance computing (n)~ The type of computing that uses supercomputers or computer clusters to address computation problems which require high bandwidth, low latency networking, very high compute capabilities, etc.

High-Performance Media Access Technology (n)~ A recording format that can store audio, video, and pictures on a CD or DVD. HighMat discs play on any Windows computer and on some DVD players.

high-precision currency value (n)~ A currency value represented as a 64-bit integer.

high-privilege workflow (n)~ Any workflow that either uses a tiered activity or contains a high privilege scope, regardless of the contents of that scope.

high-trust app (n)~ An app that uses the server-to-server (S2S) protocol, where the app is responsible for creating the user portion of the access token, and therefore is trusted to assert any user identity.

hint (n)~ An option or strategy specified for enforcement by the SQL Server query processor on SELECT, INSERT, UPDATE, or DELETE statements. The hint overrides any execution plan the query optimizer might select for a query.

hint file (n)~ A file that helps the Visual Studio integrated development environment (IDE) interpret Visual C++ identifiers, such as the names of functions and macros.

HIP challenge (n)~ A challenge meant to be easily solved by humans, while remaining too hard to be economically solved by computers.

HIPAA (n)~ A US federal law that provides rights and protections for participants and beneficiaries in group health plans.

HIPAA Privacy Rule (n)~ A rule issued by the U.S. Department of Health and Human Services to implement the privacy requirements of the Health Insurance Portability and Accountability Act (HIPAA), a federal law that provides rights and protections for participants and beneficiaries in group health plans. The rule establishes national standards for the protection of certain health information, including standards addressing the use and disclosure of individuals' health information and standards for individuals' privacy rights to understand and control how their health information is used.

Hip-Hop (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 7.

hiring requisition (n)~ A formal request to hire an employee to fill a specific position within the organization.

histogram (n)~ A chart consisting of horizontal or vertical bars, the widths or heights of which represent the values of numerical data.

histogram (n)~ A graphic representation of the range of tones from dark to light in a photo.

history (n)~ A list of the user's actions within a program, such as commands entered in an operating system shell, menus passed through using Gopher, or links followed using a Web browser.

history (v)~ Record of changes to a file or project since it was initially added to a Visual

SourceSafe database. The database can return to any point in the file history and recover the file as it existed at that point.

history (n)~ A record of all the changes to an object's properties and relationships. History exists for all objects, such as configuration items and work items.

history (PN)~ A User Interface (UI) element in various communications apps and in contact cards that provides access to a list of previous communication via that app or with a particular contact.

history (n)~ A catalogue of all activities (calls and IMs) done in Skype.

history chart (PN)~ The visualization of chronologically sorted data points in a defined time frame.

History list (n)~ A list of the last 10 files you jumped to in the current program session using hyperlinks.

History Log (n)~ The section in an Account, Business Contact, or Opportunity record that contains all items (such as phone logs, business notes, and e-mail messages) that are linked to the record.

history point (n)~ A logical navigation point in a Web application that can be represented through state information. The state information can be used to restore the Web application to a previous state, either directly with state data or through some identifier to state information that is stored elsewhere.

History worksheet (n)~ A separate worksheet that lists changes being tracked in a shared workbook, including the name of the person who made the change, when and where it was made, what data was deleted or replaced, and how conflicts were resolved.

hit (n)~ Retrieval of a file from a Web site. Each separate file accessed on a Web page, including html documents and graphics, counts as a hit.

hit (n)~ A successful retrieval of data from a cache rather than from the slower hard disk or RAM.

hit (n)~ A single action (for example, a click on an advertisement) taken by a customer at a Web site that results in one line of data being added to the Web server log file.

hit (n)~ A line of code executed by a test.

hit ~ As used in reference to the world wide web, hit means a single request from a web browser for a single item from a web server

hit count (n)~ The number of times a function or line of source code is called (or hit), as reported by the profiler when analyzing a program at run time.

hive (n)~ A file in which the system stores a portion of the registry (named for their resemblance to the cellular structure of a beehive). A hive is backed by a single file and a .log file, which are in either the systemroot\System32\Config folder or the systemroot\Profiles\username folder.

HKEY (oth)~ In Windows 9x, Windows NT, and Windows 2000, a handle to a Registry key in which configuration information is stored. Each key leads to sub-keys containing configuration information that, in earlier versions of Windows, was stored in .ini files. For example, the handle key HKEY_CURRENT_USERControl Panel leads to the subkey for the Windows Desktop.

HLM (n)~ A mode in which the computer is not under the control of the operating system; rather, the boot sequence is halted at a firmware screen and the user is told to call

customer support.

HLS (oth)~ A color model in which hue is the color itself as placed on a color wheel, where 0-° is red, 60-° is yellow, 120-° is green, 180-° is cyan, 240-° is blue, and 300-° is magenta; saturation is the percentage of the specified hue in the color; and brightness is the percentage of white in the color.

h-node (n)~ A NetBIOS node type that uses a hybrid of b-node and p-node to register and resolve NetBIOS names to IP addresses. An h-node computer uses a server query first and reverts to broadcasts only if direct queries fail.

hoax (n)~ An unsolicited message distributed via the Internet with the intent of misleading recipients. These messages usually arrive in the form of an email and contain misinformation on topics such as new computer viruses and promotions that sounds too good to be true.

Hobbies & toys (PN)~ The Kids & family subcategory containing apps for hobby enthusiasts and people who love toys.

HoBt (PN)~ A table structure whose index configuration can be either a heap or a b-tree.

hold (n)~ A restriction that prevents a document from being posted or transactions from being entered for a specified record.

Hold (PN)~ A button on Phone Controls that places the current phone call on hold.

hold (v)~ To temporarily suspend an active phone call.

Hold and eDiscovery (PN)~ A feature that supports automatic eDiscovery based on matches against a fixed search query.

hold down (v)~ To continue to press a keyboard key or mouse button.

Hold In (v)~ A UI element referring to a descriptor for a type of keyframe, known as discrete keyframe, that does not interpolate to its own value from the value of the keyframe before it (as most keyframes do). A keyframe exists at a keytime. Clicking Hold In causes the keyframe to maintain (or hold), until its own keytime, the value of the keyframe before it. Only when the keyframe's keytime is reached does it apply its own value and it does so instantaneously. The value (or time) curve would therefore be a flat line with an immediate vertical step at the keytime of the Hold In keyframe.

hold status (n)~ The status of a feature to exempt items on SPS from being subject to the policy set on the site.

hold tone (n)~ The sound that the caller hears when he or she is placed on hold.

holding company (n)~ A company that owns enough voting stock in another company to control management and operations by influencing or electing its board of directors.

holdout (n)~ A percentage of training data that is reserved for use in measuring the accuracy of the structure of the data mining model.

holdout data (n)~ A percentage of training data that is reserved for use in measuring the accuracy of the structure of the data mining model.

holdout store (n)~ The data mining structure that is used to cache the holdout data. It contains references to the holdout data.

hole (n)~ An unspecified part of an F# expression that must be provided later for the expression to be usable.

holiday (n)~ A date on which a hunt group is not available to take phone calls, regardless of whether that date would normally be part of business hours.

Holiday Schedule (PN)~ Section of Service Management where you can configure holidays, times when services won't be performed, to be used as part of a service level agreement (SLA).

home (n)~ A beginning position, such as the upper left corner of a character-based display, the left end of a line of text, cell A1 of a spreadsheet, or the top of a document.

Home (n)~ Root folder in report server folder namespace.

Home (n)~ An item that appears on the Forwarding Calls To menu. When the user selects Home, Communicator automatically forwards incoming calls to the number the user has published for his home phone.

Home (PN)~ A button that directs the user to the Home section of an application.

Home (n)~ A menu command on the Go To menu. It returns you to the CRM 3.0 Mobile start page.

Home (n)~ The default tab on the ribbon interface that provides the basic features that users need most frequently for each application.

Home (PN)~ A field for a contact's home telephone number.

Home (PN)~ The navigation heading that links to the main entry page.

Home (PN)~ The link to the main landing/start page on Windows Live.

Home (n)~ An icon that directs users to their customized home page.

Home (PN)~ ?The place where Cortana shows cards to the user that include suggestions, questions, feedback, etc.

Home & garden (PN)~ The Lifestyle subcategory containing apps to help you plan and do improvements to your house or outdoor areas.

home automation (n)~ The process of programmatically controlling appliances, lighting, heating and cooling systems, and other devices in a home network.

home automation controller (n)~ A software or device that helps control your home smart devices automatically.

home cell (n)~ One of the four card locations in the upper-right corner of the screen.

home folder (n)~ A folder (usually on a file server) that administrators can assign to individual users or groups. Administrators use home folders to consolidate user files onto specific file servers for easy backup. Home folders are used by some programs as the default folder for the Open and Save As dialog boxes.

home network (n)~ Home devices that are connected together. A home network consists of a home computer or home server that controls other (non-computer) devices such as lighting, media services, appliances, etc. A home network can include a home computer network.

home network (n)~ A mobile operator's default network connection.

home page (n)~ A document that serves as a starting point in a hypertext system. On the World Wide Web, an entry page for a set of Web pages and other files in a Web site. The home page is displayed by default when a visitor navigates to the site using a Web browser.

Home Phone (PN)~ A button in the Options dialog box, on the Phones tab, that the user clicks to enter his or her home phone number.

home phone (PN)~ An Outlook contact's residential telephone number (usually a land line).

home plan (n)~ A drawing that shows the layout of a house. It can be used to draw new house plans or remodeling plans, kitchen and furniture arrangements, or plans to add a new room to your home. A type of building plan.

home realm URL (n)~ The URL where the user is originally authenticated.

Home Screen (PN)~ The main or default (start-up) screen.

home screen (n)~ The main or default (start-up) screen.

home server (n)~ The Exchange server that contains a user's mailbox.

home server (n)~ An Office Communications Server that hosts users.

Home service (PN)~ A status message displayed for the current network when a user changes the network selection to something other than the network of the main provider.

Home Use Program (n)~ A Microsoft software licensing option for employers that enables employees to obtain and use a copy of Microsoft Office applications at home.

Home Use Rights (PN)~ A Microsoft software licensing option for employers that enables employees to obtain and use a copy of Microsoft Office applications at home.

homegroup (n)~ A group of computers on a home network that can share pictures, music, videos, documents, and printers. A homegroup is created by using the HomeGroup feature; it is protected with a password.

HomeGroup (PN)~ A Windows feature that enables users to share pictures, music, videos, documents, and printers with other people on a home network.

homegroup computer (n)~ A computer that belongs to a homegroup.

homegroup password (n)~ A password that helps prevent unauthorized access to homegroup files and printers.

HomeGroup troubleshooter (n)~ A troubleshooter that helps find and fix problems with viewing computers or shared files in a homegroup.

homepage (n)~ A document that serves as a starting point in a hypertext system. On the World Wide Web, an entry page for a set of Web pages and other files in a Web site. The home page is displayed by default when a visitor navigates to the site using a Web browser.

Homepage ~ A page on the- World Wide Web. Confusingly 'homepage' is used indiscriminately to describe several slightly different things : an amateur's website; the front or main page of any website; or the page which your browser first goes to when you start it up.

homework app (n)~ An app chosen by a parent that a child can use at any time and for as long as necessary outside of curfew hours.

homework list (n)~ A list of apps and websites of any type that a parent chooses which a child can use at any time and for as long as necessary outside of curfew hours.

homework website (n)~ A website that a child has permission to use anytime outside of curfew hours.

homogeneous data (n)~ Data that comes from multiple data sources that are all managed by the same software.

homogeneous selection (n)~ A selection that includes objects of the same type or with the same properties.

honeypot ~ a trap for people who tamper with computers maliciously through the Internet, just as a pot of honey traps flies.

honored bill (n)~ A bill of exchange that has been settled.

hook (n)~ A location in a routine or program in which the programmer can connect or insert other routines for the purpose of debugging or enhancing functionality.

hook (v)~ The telephone switch on a desk telephone that opens or closes the call connection. If the telephone has a handset, hanging up the handset depresses the switch so that the call is disconnected.

hop (n)~ In data communications, one segment of the path between routers on a geographically dispersed network.

hop count (n)~ The value in the Transport Control field that indicates the number of Internetwork Packet Exchange (IPX) routers that have processed the IPX packet.

hopping window (n)~ A type of window in which consecutive windows hop' forward in time by a fixed period. The window is defined by two time spans: the period P and the window length L. For every P time unit a new window of size L is created.'

horizontal axis (n)~ The horizontal reference line on a grid, chart, or graph that has horizontal and vertical dimensions.

Horizontal Bullet List (PN)~ A SmartArt graphic layout used to show non-sequential or grouped lists of information. Works well with large amounts of text. All text has the same level of emphasis, and direction is not implied.

horizontal cone chart (n)~ A variation on a bar chart that uses cone shapes instead of horizontal rectangles.

horizontal cylinder chart (n)~ A variation on a bar chart that uses cylinder shapes instead of horizontal rectangles.

HORIZONTAL ELLIPSIS (n)~ The -€¦ character. Can also be represented by entering three dots with no spaces in between (…). Used to convey incompleteness.

Horizontal Hierarchy (PN)~ A SmartArt graphic layout used to show hierarchical relationships progressing horizontally. Works well for decision trees.

Horizontal Labeled Hierarchy (PN)~ A SmartArt graphic layout used to show hierarchical relationships progressing horizontally and grouped hierarchically. Emphasizes heading or level 1 text. The first line of Level 1 text appears in the shape at the beginning of the hierarchy, and the second and all subsequent lines of Level 1 text appear at the top of the tall rectangles.

Horizontal Line (n)~ A Web page editor command that inserts a horizontal line onto a Web page.

horizontal offset (n)~ The distance, in device independent pixels, that the viewport has been scrolled from its left side.

horizontal partitioning (n)~ To segment a single table into multiple tables based on selected rows.

Horizontal Picture List (PN)~ A SmartArt graphic layout used to show non-sequential or grouped information with an emphasis on related pictures. The top shapes are designed to contain pictures.

horizontal pyramid chart (n)~ A variation on a bar chart that uses pyramid shapes instead of horizontal rectangles.

horizontal ruler (n)~ A bar marked off in units of measure (such as inches) that is displayed across the top of the document window.

horizontal solution (n)~ An add-on software solution that complements the functionality of a product and that focuses on specific business processes.

horizontal split (n)~ A horizontal orientation of the CIDER shell.

Horror (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

host (n)~ A computer that acts as a source of information or signals. The host computer provides services, such as news, mail, or data, to computers that connect to it. The term can refer to almost any kind of computer, from a centralized mainframe that is a host to its terminals, to a server that is host to its clients, to a desktop PC that is host to its devices, such as printers and scanners.

host (n)~ A physical computer that is running virtualization software, such as Hyper-V, on which virtual machines can be deployed.

host (n)~ In the .NET Framework add-in programming model, a host application assembly that communicates with an add-in over the communication pipeline.

host (n)~ Any device on a TCP/IP network that has an Internet Protocol (IP) address. Examples of hosts include servers, workstations, network-interface print devices, and routers. Sometimes used to refer to a specific network computer that is running a service used by network or remote clients., For Network Load Balancing, a cluster consists of multiple hosts connected over a local area network (LAN).

host (n)~ A UI element, such as a window or control, that contains other UI elements. A host performs UI automation services on behalf of the hosted elements.

host ~ Any computer on a network that is a repository for services available to other computers on the network.

host ~ The ISP's computer complex. The host process members' requests and keeps track of members' online experience.

host adapter (n)~ An hardware device for connecting a peripheral to the main computer, typically in the form of an expansion card.

host adapter (n)~ A software component that lets you run tests in a specific environment. This hosting environment may be a specific process such as sqprsqext or a process with particular traits such as limited security or custom environment variables.

host address (n)~ The portion of the IP address that identifies a computer within a particular network ID.

host application (n)~ An application that has some sort of customization, such as an application-level add-in or a document-level customization, for which the application acts as a host.

host bus adapter (n)~ An hardware device for connecting a peripheral to the main computer, typically in the form of an expansion card.

host compatibility check (n)~ An action that is performed in VMM that determines whether the hardware of a destination host is compatible with the virtual machine that you are migrating to the host.

host computer (n)~ A computer that acts as a source of information or signals. The host computer provides services, such as news, mail, or data, to computers that connect to it. The term can refer to almost any kind of computer, from a centralized mainframe that is a host to its terminals, to a server that is host to its clients, to a desktop PC that is host to its

devices, such as printers and scanners.

host control (n)~ An object that is native to a host application (such as Microsoft Office Word or Microsoft Office Excel) to which data binding and events have been added. Examples of host controls include Bookmark controls and ListObject controls.

host distribution rule (n)~ A rule that applies to a specific host and a specific crawl component. It is used to ensure that documents from that host are crawled by that crawl component.

host domain (n)~ The domain in which a DFS namespace has been configured.

host group (n)~ A custom group of virtual machine hosts, which an administrator can create in Virtual Machine Manager for ease of monitoring and management. Host groups can be used to determine the resources reserved for host operating systems and to administer virtual machine self-service.

host header (n)~ A piece of information that enables IIS to resolve a request based on the domain name specified by the browser, rather than one based only on the IP address and port number. For example, the host header name for the URL http://www.microsoft.com is www.microsoft.com. By using host headers, you can use the same IP address and port for multiple IIS Web sites.

host ID (n)~ The portion of the IP address that identifies a computer within a particular network ID.

host instance-€"level setting (n)~ One of the settings that BizTalk administrators can modify in the BizTalk Settings Dashboard. Examples include .NET CLR settings and properties related to an orchestration memory throttling. Specific to a given host instance, host-level settings essentially govern the use of a computer's resources (such as RAM or I/O). An example is Max. I/O Threads.

host item (n)~ An object that is native to a host application (such as Microsoft Office Word or Microsoft Office Excel) to which you can add host controls. Examples of host items include Document and Worksheet.

Host key (n)~ The key (right ALT key by default) that must be pressed with Virtual Server to move keyboard and mouse focus from a guest operating system back to the host operating system.

host machine (n)~ A physical computer that is running virtualization software, such as Hyper-V, on which virtual machines can be deployed.

host name (n)~ The DNS name of a device on a network, used to locate computers on the network.

host operating system (n)~ The operating system of the physical computer running the Virtual Server or Virtual PC software.

host path (n)~ A sequence of host group names that specifies the location of a virtual machine host or host group within the hierarchy of host groups. All host paths begin with the root host group, Managed Computers.

host priority (n)~ For Network Load Balancing, a host's precedence for handling default network traffic for TCP and UDP ports. It is used if a host within the cluster goes offline, and it determines which host within the cluster will assume responsibility for the traffic previously handled by the offline host.

host profile (n)~ A Virtual Machine Manager library resource that contains hardware and

operating system configuration settings to convert a bare-metal computer to a managed Hyper-V host.

host rating (n)~ A rating, consisting of zero through five stars, that is assigned to each host during virtual machine placement to indicate the host's suitability for hosting the virtual machine. The host rating is based on the virtual machine's hardware and software requirements and anticipated resource usage. Host ratings also take into consideration the placement goal: either resource maximization on hosts or load balancing among hosts. The metrics for rating hosts can be customized for Virtual Machine Manager, for host groups, and for individual virtual machines.

host reserve (n)~ A resource that is set aside on the physical host computer for the use of the host operating system.

host type (n)~ A property that determines whether the host is controlled within or outside of the BizTalk Server process. Host types are In-process or Isolated.

host view of the add-in (n)~ In the .NET Framework add-in programming model, an assembly that contains interfaces or abstract base classes, and represents the host's view of the methods and types used to communicate with an add-in.

host web (n)~ A SharePoint site to which an app is installed.

hosted (adj)~ Pertaining to an application on Microsoft Dynamics Live CRM and partner-hosted versions of Microsoft Dynamics CRM. Deployments where the Microsoft Dynamics CRM server is maintained for an organization by a third-party, such as Microsoft or a partner.

Hosted BlackBerry service (n)~ A separately-purchased service available to Exchange Online and Business Productivity Online Standard Suite customers who need support for a range of BlackBerry(R) Enterprise Server capabilities, including wireless access to people and information on the go, and advanced security features.

hosted cache (n)~ A server or WAN appliance in a branch office which aggregates all data cached by peers to ensure higher availability.

hosted control (n)~ A configured .NET component or CRM window in the Contact Center Desktop (CCD) for CRM that is hosted, usually in a tab, in the Agent Desktop.

hosted management agent (n)~ An Identity Lifecycle Management (ILM) component that consists of properties, rules, and rule extensions that determine how an object is processed and that provides services to client computers or organizations that connect from remote locations.

hoster (n)~ A service provider that offers shared or dedicated space on servers for websites, in data centers, etc.

hosting (n)~ In the .NET Framework, the loading and activation of the common language runtime in a process, and the subsequent communication between the loaded runtime and the host application.

hosting environment (n)~ A Web or desktop application, such as a Windows Forms application, into which an InfoPath form is embedded.

hosting process (n)~ An application that is designed to host services. These include Internet Information Services (IIS), Windows Process Activation service (WAS), and Windows services. In these hosted scenarios, the host controls the lifetime of the service. For example, using IIS you can set up a virtual directory that contains the service

assembly and configuration file. When a message is received, IIS starts the service and controls its lifetime.

hosting relationship (n)~ In a model, the relationship according to which one object exists only within the context of a parent object. In this relationship there can be a one to many ratio of parent objects to child objects, but only a 1:1 ration between a child object and its parent. For example, any given logical drive can only belong to one computer, though a single computer may have multiple logical drives. Also, the logical drive must have a computer on which it exists, if the computer that hosts the logical drive ceases to exist, so does the logical drive itself.

hosting service provider (n)~ A service provider that offers shared or dedicated space on servers for websites, in data centers, etc.

host-level setting (n)~ One of the settings that BizTalk administrators can modify in the BizTalk Settings Dashboard. Examples include host tracking, and properties related to resource-based throttling, rate-based throttling, and orchestration throttling. Host-level settings tweak the way all instances of host behave in a given deployment. For example, if for Host1 the setting Max. engine threads is changed to 200, all instances of Host1 will work with a maximum of 200 engine threads.

hostname (n)~ The DNS name of a device on a network, used to locate computers on the network.

Hot (n)~ An option on the Ratings drop-down list on the General tab that indicates that a lead or opportunity has high interest.

hot (adj)~ Pertaining to the highest rating of perceived interest that an account, opportunity, or lead has in a product or service.

hot docking (n)~ The process of attaching a laptop computer to a docking station while the computer is running, and automatically activating the docking station's video display and other functions.

hot file (n)~ A file that is frequently accessed and frequently stored in memory.

hot line (n)~ In a profiler performance report, a source code line that is marked as a code segment that performed the most work.

Hot Path view (oth)~ The Profiler Performance Report view that helps to automate the process of locating a performance bottleneck.

hot plugging (n)~ A feature that allows equipment to be connected to an active device, such as a computer, while the device is powered on.

hot potato routing ~ A form of routing in which the nodes of a network have no buffer to store packets in before they are moved on to their final predetermined destination.

hot spot (n)~ In the cursor, a pixel that marks the exact screen location that is affected by a mouse event, such as clicking a mouse button.

hot spot (n)~ An area on an object containing a hyperlink. An entire object can be a single hot spot, or an object can contain multiple hot spots.

hot standby (n)~ A standby server that can support rapid failover without a loss of data from committed transactions.

hot standby server (n)~ A standby server that can support rapid failover without a loss of data from committed transactions.

Hot Swap ~ A hot swap is the replacement of a hard drive, CD-ROM drive, power supply,

or other device with a similar device while the computer system using it remains in operation. The replacement can be because of a device failure or, for storage devices, to substitute other data.

hot swapping (n)~ A feature that allows equipment to be connected to an active device, such as a computer, while the device is powered on.

hot zone (n)~ The interaction area of a particular object or location with which a pointer or pointing device's hot spot must come in contact.

Hotel Search (PN)~ A feature that allows a user to search for hotels at a given location.

Hotels (PN)~ The Travel subcategory containing apps to help you book a hotel room.

hotfix (n)~ A single cumulative package composed of one or more files used to address a problem in a product. Hotfixes address a specific customer situation and may not be distributed outside that customer organization.

hotfix package (n)~ A single cumulative package composed of one or more files used to address a problem in a product. Hotfixes address a specific customer situation and may not be distributed outside that customer organization.

Hotmail (PN)~ The web email service for domains supported by Microsoft account, including @hotmail.com and @live.com.

Hotmail (PN)~ An app that enables use of Hotmail accounts on mobile devices.

Hotmail ~ Windows Live Hotmail, formerly known as MSN Hotmail and commonly referred to simply as Hotmail, is a free web-based email service operated by Microsoft.http://www.hotmail.com/

hotpatching (n)~ The process of installing updates onto computers without having to restart the server.

hotspot (n)~ A public place (such as a coffee shop, airport, or hotel) with a wireless network that you can use to connect to the Internet.

hotspot (n)~ An area on an object containing a hyperlink. An entire object can be a single hot spot, or an object can contain multiple hot spots.

hotspot (n)~ An object that a user can create to add runtime click navigation to Deep Zoom Composer.

Hotspot ~ A location where a computer can connect to a wireless network (see- Wi-Fi).

hotspot ~ A wireless Internet connection available for public use. Beyond mere convenience, hotspots offer broadband Internet access with connection speeds similar to cable and DSL. While some hotspots charge for access, more and more are opening their networks for free.

hot-swap (v)~ To replace an assembly file with a revised assembly file in a running system. In-progress sessions continue to access the original assembly from active memory.

hot-swapping (n)~ The replacement of an assembly file with a revised assembly file in a running system. In-progress sessions continue to access the original assembly from active memory.

HotSync (PN)~ Software application from Palm that permits data synchronization between a Palm handheld computing device and another computing device, such as a laptop or personal computer. The synchronization occurs via a cable connection or wirelessly (for example, via infrared signals).

hour transaction (n)~ A transaction that registers employee costs based on number of

hours.

hourglass ~ In computing, especially by means of the Windows operating system, an icon that replaces the pointer when the computer is performing a function and cannot receive new input.

hourglass cursor (n)~ A cursor displayed in the form of an hourglass that indicates that the program is performing a lengthy task. The cursor can be displayed as a large hourglass, or as a smaller hourglass with an arrow.

House (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 35.

house ad (n)~ An ad that is served when paid ads are ahead of their Need of Delivery (NOD) schedule.

hover (v)~ To move the pointer over a UI element for a specified duration with the intent of interacting with that element.

hover fill (n)~ A design property in Project Siena that determines the background color of a control to which a user is pointing with a mouse, a trackpad, or a similar device.

hover rectangle (n)~ The specified area around a control that activates the display of a tooltip when the mouse pauses on it.

hover selection (n)~ A selection technique designed to optimize selection and activation of an object. Selection is initiated when the user moves the pointer over the object for a length of time that is longer than a time-out.

How do I (PN)~ A page that presents a categorical view of select Help content that the user can browse. Depending on the edition, multiple How Do I pages might be available for use.

How to Tell (PN)~ A marketing initiative to assist consumers in identifying genuine Microsoft software.

How-to (PN)~ A hub where users can read Help and How-to topics, FAQs, and other guides.

how-to video (n)~ An instructional video showing how to perform certain functions on Windows Phone.

HPC (n)~ The type of computing that uses supercomputers or computer clusters to address computation problems which require high bandwidth, low latency networking, very high compute capabilities, etc.

HPET (n)~ A hardware timer used in personal computers .

HPFS (n)~ A fixed-disk file system that organizes the disk into volumes, rather than partitions and logical drives. HPFS supports long, mixed-case filenames and extended attributes, and implements several levels of caching, for improved operating-system performance. The IBM OS/2 operating system supports HPFS.

HPV vaccine (n)~ A vaccine for immunization against infection with certain species of human papillomavirus associated with the development of cervical cancer and genital warts.

HRA (n)~ A component of Network Access Protection (NAP) that validates statements of health (SoHs) and approves the issuance of a health certificate to clients that pass health policy verification.

HREF (n)~ An attribute in an HTML document that defines a link to another location within a document, a document on the Web, or an e-mail address.

HSB (n)~ A color model in which hue is the color itself as placed on a color wheel, where 0-° is red, 60-° is yellow, 120-° is green, 180-° is cyan, 240-° is blue, and 300-° is magenta; saturation is the percentage of the specified hue in the color; and brightness is the percentage of white in the color.

HSL (n)~ A color model that defines a color by three values: Hue, the color itself; Saturation, the purity of the color; and Luminance, the amount of light that is either reflected or absorbed by the color.

HSM (n)~ A secure device that provides cryptographic capabilities, typically by providing private keys used in Public-key cryptography.

HST (PN)~ A value-added tax (VAT) levied in some Canadian provinces that combines the Goods and Services Tax (GST) and the provisional sales tax.

HT (n)~ A technology that uses a high-speed, low latency, point-to-point link to increase the communication speed between integrated circuits in computers, servers, embedded systems, and networking and telecommunications equipment up to 48 times faster than some existing technologies.

HTH ~ (Hope This Helps)- Internet slang, often added at the end of an email or newsgroup post answering a question.

HTML (n)~ An application of the Standard Generalized Markup Language that uses tags to mark elements, such as text and graphics, in a document to indicate how Web browsers should display these elements to the user and should respond to user actions.

HTML ~ (HyperText Markup Language)- The system used for creatingWorld Wide Web- pages, ordinary text with commands for special effects like pictures, colour and links enclosed between < > symbols. You can add the various HTML commands to ordinary text by hand - it's not difficult, see- Absolute Beginner's HTML- - or have it generated for you by software, either one of the many specialist editors or even a word processing program like Microsoft Word (although Word isn't very good at it).

HTML attribute (n)~ A value used within an HTML tag to assign additional properties to the element being defined.

HTML Bridge (PN)~ In Silverlight, an integrated set of types and methods that enable you to expose managed types to JavaScript and call JavaScript event handlers from managed types.

HTML code (n)~ The code that is used to create web pages.

HTML code fragment (n)~ HTML code that you add to your Web page to create features such as a script, a counter, or a scrolling marquee.

HTML element (n)~ A unit of information specific to HTML that includes everything from the start tag to the end tag.

HTML extension (n)~ A feature or setting that is an extension to the formal HTML specification. Extensions may not be supported by all Web browsers, but they may be used widely by Web authors. An example of an extension is marquee scrolling text.

HTML file (n)~ A file format that can be viewed using a Web browser. With this file format, you can publish your reports directly to your Intranet or web site.

HTML notification (n)~ An HTML e-mail reminder that gives users a snapshot of the

new spam messages delivered to their Spam Quarantine mailbox since their last notification, or since the last time they logged in to Spam Quarantine, whichever is most recent. From this reminder e-mail, users can scan the list of messages that have been filtered and salvage messages or report them as false positives directly from the notification.

HTML server control (n)~ An ASP.NET server control that belongs to the System.Web.UI.HtmlControls namespace. An HTML server control maps directly to an HTML element and is declared on an ASP.NET page as an HTML element marked by a runat=server' attribute

HTML source (n)~ The unrendered HTML code including tags and syntax.

HTML tag (n)~ A text string used in HTML to identify a page element's type, format, and appearance. Many elements have start and end tags that define where the element starts and stops.

HTML template (n)~ A ready-made or pre-designed web page that can be modified for a custom design.

HTML Viewer (n)~ UI element consisting of a report toolbar and other navigation elements used to work with a report.

HTML viewing service (n)~ A service that automatically converts native Office file formats to HTML, enabling users to view file content in a Web browser, even if the original applications are not installed on their computer.

http (n)~ The Internet protocol used to deliver information over the World Wide Web.

HTTP (n)~ The Internet protocol used to deliver information over the World Wide Web.

http ~ (HyperText Transfer Protocol)- The- protocol- or 'language' computers use to send web pages over the internet. Almost every WWW address starts 'http://', though many browsers understand if you omit it.

HTTP adapter (n)~ An adapter that enables exchange of messages between BizTalk Server and any application using the HTTP or HTTPS protocol.

HTTP handler (n)~ A component registered with ASP.NET (typically with an .axd extension) that produces Web output dynamically.

HTTP method (n)~ A remote method invocation sent from a client (typically a web browser) to a web server over the HTTP protocol. Examples include GET, POST, PUT, etc.

HTTP module (n)~ A component that can be registered as part of the ASP.NET request lifecycle and that can read or change the request or response as it is processed. HttpModules are often used to perform special tasks that need to monitor each request, such as security or site statistics.

HTTP request (n)~ A request to an Internet site that asks for content to be retrieved.

HTTP reverse proxy (n)~ A proxy server that forwards incoming requests to one or more servers.- To a client, the reverse proxy appears as the final destination regardless of whether the client's requests are forwarded to one or more servers.

HTTP server (n)~ A server computer that hosts Web pages and responds to requests from browsers.

HTTP verb (n)~ An instruction sent in a request message that notifies an HTTP server of the action to perform on the specified resource. For example, GET' specifies that a

resource is being retrieved from the server. Common verbs include 'GET'

HTTPS (n)~ A message transfer protocol used by the World Wide Web to service page requests, and which adds a security layer using Secure Socket Layer (SSL) technology.

hub (n)~ A device used to connect computers on a network that sends information received from one computer to all other computers on the network.

Hub (n)~ A place to access a set of related content and experiences. A Hub brings together apps, services and content of the same theme. A Hub weaves apps, services and content together in a way that makes sense, so that everyday tasks are easier, with fewer steps.

Hub (PN)~ A feature that brings together browser history and favorite content into one place for fast and easy access.

Hub ~ A basic device for connecting computers together to form anetwork. See- Router.

hub ~ Generally, a term used to describe a device that serves as the center of a star-topology network.

hub computer (n)~ The computer that manages the OneCare settings for all computers in a OneCare circle.

hub control (n)~ A control that developers use to create apps with hub-like navigation patterns when data is arranged in multiple ListViews.

hub database (n)~ In a hub-spoke topology, a database joining communication lines at a central location, providing a common connection to all databases on the network.

hub member (n)~ In replication topology, a member to which spoke members are connected. Files replicate from the hub member to the spoke members and vice versa.

hub PC (n)~ The computer that manages the OneCare settings for all computers in a OneCare circle.

hub server (n)~ A server that sends out data to a spoke server.

Hub Transport server role (n)~ An Exchange Server 2007 server role that provides routing within a single organizational network by using the Active Directory directory service site. Deployed inside the Active Directory forest, computers that have the Hub Transport server role installed handle all mail flow inside the organization, apply transport rules, apply journal rules, and deliver messages to recipients' mailboxes. Messages that are sent to the Internet are relayed by the Hub Transport server to the Edge Transport server role that is deployed in the perimeter network. Messages that are received from the Internet are processed by the Edge Transport server before they are relayed to the Hub Transport server. The Hub Transport server role stores all its configuration information in Active Directory. This information includes transport rules settings, journal rule settings, and connector configurations.

hubbed mode (n)~ A mode in which the Address Resolution Protocol/multicast address resolution service (ARP/MARS) provides asynchronous transfer mode (ATM) addresses to requesting clients in the form of a multicast server (MCS) list value. In this mode, ARP/MARS acts as a multicast server, providing active forwarding of all multicast and broadcast traffic destined for IP addresses contained within the ranges specified in the list.

Hubot (PN)~ A virtual agent modeled after GitHub's Campfire to automate a company's chat room and create work items, queue builds, recall the last worked item, and more.

hub-spoke topology (n)~ A topology based on a central hub, from which nodes radiate in

a star-shaped pattern.

hue (n)~ In the HSB color model, one of the three characteristics used to describe a color. Hue is the attribute that most readily distinguishes one color from other colors. It depends on the frequency of a light wave in the visible spectrum.

Hue, Cycles Entire Color Spectrum (n)~ A filter effect in Windows Movie Maker.

hue-lightness-saturation (n)~ A color model in which hue is the color itself as placed on a color wheel, where 0-° is red, 60-° is yellow, 120-° is green, 180-° is cyan, 240-° is blue, and 300-° is magenta; saturation is the percentage of the specified hue in the color; and brightness is the percentage of white in the color.

hue-saturation-brightness (n)~ A color model in which hue is the color itself as placed on a color wheel, where 0-° is red, 60-° is yellow, 120-° is green, 180-° is cyan, 240-° is blue, and 300-° is magenta; saturation is the percentage of the specified hue in the color; and brightness is the percentage of white in the color.

Huffman coding (n)~ An entropy encoding method for lossless data compression. It uses a variable length code table for encoding a source symbol (such as a character in a file) where the variable-length code table has been derived in a particular way based on the estimated probability of occurrence for each possible value of the source symbol.

Huffman tree (n)~ A binary tree that minimizes the product of a leaf's weight and its distance from the root, for all leaves.

Human Augmentation ~ sometimes referred to as 'Human 2.0', creating cognitive and physical improvements as an integral part of the human body.

human capital management cycle (n)~ A recurring set of recruitment, hiring, training, compensation, and performance evaluation activities performed by parties that compensate employees and contractors in exchange for services.

human papillomavirus vaccine (n)~ A vaccine for immunization against infection with certain species of human papillomavirus associated with the development of cervical cancer and genital warts.

Human Resources Information System Implementation (n)~ A template that outlines the steps, from an HR perspective and at a very high level, needed to implement a Human Resources Information System (HRIS).

Human Workflow Services (n)~ A set of workflow services consisting of actors that create or participate in an action, an activity flow, or an activity model that performs some process for an actor.

Human Workflow Services Administration (n)~ A set of activities including the installation, configuration, and deployment of HWS actions, and activity models. It also includes adding, removing, and updating constraints, and stopping, deleting, and archiving action instances or activity flows.

Human Workflow Services workflow (n)~ Any action, activity flow, or activity model that performs a process for an actor.

Humour (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 100.

Hung ~ If a computer (or sometimes just a program) gets completely stuck and refuses to do anything, it has hung. See also- lockup.

hunt group (n)~ A set of telephone extensions that are organized into a group, over which the Private Branch eXchange (PBX) hunts' to find an available extension. A hunt group is used to direct calls to identically-capable endpoints or to an application

hunt group (n)~ A set of addresses that can be treated as a logical unit so that calls of a specific type (for example, support calls as opposed to sales calls) can be routed to it.

hunting ~ Automatic routing of calls to an idle circuit in a prearranged group when the circuit called is busy.

hunting ~ The movement of a call as it progresses through a group of lines.

HVAC plan (n)~ A drawing that shows the layout of heating, ventilation, and cooling ductwork. A type of building plan.

HWS (n)~ A set of workflow services consisting of actors that create or participate in an action, an activity flow, or an activity model that performs some process for an actor.

HWS Administration (n)~ A set of activities including the installation, configuration, and deployment of HWS actions, and activity models. It also includes adding, removing, and updating constraints, and stopping, deleting, and archiving action instances or activity flows.

HWS workflow (n)~ Any action, activity flow, or activity model that performs a process for an actor.

hybrid cloud (n)~ The cloud infrastructure is a composition of two or more distinct cloud infrastructures (private, community, or public) that remain unique entities, but are bound together by standardized or proprietary technology that enables data and application portability (e.g., cloud bursting for load balancing between clouds).

hybrid disk (n)~ A hard disk that contains a small amount of solid-state nonvolatile memory which, when used as a cache, can realize significant benefits such as faster booting, extended battery life, and a more rugged PC.

hybrid drive (n)~ A hard disk that contains a small amount of solid-state nonvolatile memory which, when used as a cache, can realize significant benefits such as faster booting, extended battery life, and a more rugged PC.

hybrid hard disk (n)~ A hard disk that contains a small amount of solid-state nonvolatile memory which, when used as a cache, can realize significant benefits such as faster booting, extended battery life, and a more rugged PC.

Hybrid network ~ A hybrid network is one that doesn't just rely on a singly type of bearer or leased line.

hybrid OLAP (n)~ A storage mode that uses a combination of multidimensional data structures and relational database tables to store multidimensional data.

Hybrid Runbook Worker (n)~ A feature of Azure Automation to designate one or more computers in a local data center to access resources in that data center, and then store, manage, and deliver them to one or more on-premise machines where they are run.

hybrid sleep (n)~ A power-saving sleep state in which any open documents and programs are saved to your hard disk, in addition to being saved to memory, before the computer enters the low-power state.

Hybrid Worker (n)~ A role in Azure to store runbooks in the cloud but execute them in an on-premise environment.

Hype Cycle ~ A Gartner model designed to help clients make intelligent decisions about

when to implement emerging technologies.

hyperlink (n)~ A connection between an element in a hypertext document, such as a word, phrase, symbol, or image, and a different element in the document or in another location, a webpage, file, or script.

Hyperlink ~ Any kind of link on a webpage. Unless you typed this page's URL in by hand, you got here by clicking on a hyperlink.

hyperlink address (n)~ The path to a destination such as an object, document, or Web page. A hyperlink address can be a URL (address to an Internet or intranet site) or a UNC network path (address to a file on a local area network).

hyperlink base (n)~ When a relative link is based on a path you specify (the first part of the path that is shared by the file containing the hyperlink and the destination file), that path is the hyperlink base.

Hyperlink data type (n)~ A data type for an Access database field that stores hyperlink addresses. An address can have up to four parts and is written using the following format: A data type for an Access database field that stores hyperlink addresses. An address can have up to four parts and is written using the following format: displaytext#address#subaddress#.

hyperlink display text (n)~ The part of a hyperlink in a document or Web page that displays as text on the screen.

hyperlink field (n)~ A field that stores hyperlink addresses.

Hypertext ~ A way of presenting text so that you can click on a link within it, say a cross-reference, and instantly be transported to the relevant text, whether it is elsewhere in the current document or in another document entirely. The most obvious examples are- World Wide Web- pages.

Hypertext ~ Generally, any text that contains links to other documents - words or phrases in the document that can be chosen by a reader and which cause another document to be retrieved and displayed.

Hypertext Markup Language (PN)~ An application of the Standard Generalized Markup Language that uses tags to mark elements, such as text and graphics, in a document to indicate how Web browsers should display these elements to the user and should respond to user actions.

Hypertext Transfer Protocol (n)~ The Internet protocol used to deliver information over the World Wide Web.

Hypertext Transfer Protocol over Secure Sockets Layer (n)~ A message transfer protocol used by the World Wide Web to service page requests, and which adds a security layer using Secure Socket Layer (SSL) technology.

Hypertext Transfer Protocol Secure (n)~ A message transfer protocol used by the World Wide Web to service page requests, and which adds a security layer using Secure Socket Layer (SSL) technology.

hyperthreading (n)~ Microprocessor technology that enables the concurrent execution of multiple separate threads on a single physical processor.

Hyper-Threading Technology (PN)~ Intel's implementation of simultaneous multithreading that allows a single physical processor to execute multiple threads (instruction streams) simultaneously.

HyperTransport (n)~ A technology that uses a high-speed, low latency, point-to-point link to increase the communication speed between integrated circuits in computers, servers, embedded systems, and networking and telecommunications equipment up to 48 times faster than some existing technologies.

HyperTransport technology (n)~ A technology that uses a high-speed, low latency, point-to-point link to increase the communication speed between integrated circuits in computers, servers, embedded systems, and networking and telecommunications equipment up to 48 times faster than some existing technologies.

Hyper-V Extensible Switch (PN)~ A feature that provides extensibility capabilities to the virtual switch. It enables independent software vendors (ISVs) to create extensible plug-ins (known as Virtual Switch Extensions) that can provide enhanced networking and security capabilities.

Hyper-V Network Virtualization (PN)~ A feature that enables scalable, multi-tenancy for datacenters via policy-based, software-controlled network virtualization providing for flexible virtual machine placement, overlapping IP addresses, reducing the management overhead of IaaS clouds.

Hyper-V Replica (PN)~ A feature that transmits changes that occur on the primary virtual machine running on the primary server to the Replica virtual machine, which is stored on the Replica server. This enables the Replica virtual machine to smoothly assume operations if the primary virtual machine must go offline for any reason.

Hyper-V Replica Broker (PN)~ An entity that represents a clustered server to Hyper-V Replica. Because a clustered server comprises more than one physical server, each with a different name, and because Replica requires a physical server name in order to configure replication, the Hyper-V Replica Broker provides a single name that Hyper-V Replica can use to make reference to the Replica server -€" without having to keep track of which physical server is actually running, even after a (clustering) failover. The Hyper-V Replica Broker is configured using Failover Cluster Manager prior to setting up Hyper-V Replica.

Hyper-V Server 2012 (PN)~ A Windows Server 2012 product.

hypervisor (n)~ A layer of software that exists above the hardware and below one or more operating systems. It creates partitions to provide isolated execution environments and manages each partition's access to hardware resources.

hypervisor ~ a form of control software layer that enables multiple operating systems to run on the same physical hardware. The oldest hypervisor is IBM's VM -€" but this only runs on S/370-style hardware (where it hosted MVS, VSE, and other operating systems).

hyphen (n)~ The ? character, used to break a word between syllables at the end of a line or to separate the parts of a compound word.

HYPHEN (n)~ The ? character, used to break a word between syllables at the end of a line or to separate the parts of a compound word.

hyphenation (n)~ The process of breaking a word between syllables at the end of a line or to separate the parts of a compound word.

I ~

I/E port (n)~ A port in a library that transports tapes to and from library slots.

I/O (n)~ The complementary tasks of gathering and distributing data. Input is data that is acquired from a device or entered by the user through a device. Output is data that is sent to a device.

I/O port (n)~ A channel through which data is transferred between a device and the microprocessor. The port appears to the microprocessor as one or more memory addresses that it can use to send or receive data.

I/O request packet (n)~ Data structures that drivers use to communicate with each other.

I/O stack location (n)~ The part of an I/O request packet (IRP) that is allocated for each driver in a chain of layered drivers. Each driver owns one of the stack locations in the packet and obtains driver-specific information about what input/output (I/O) operation to perform on the specified device. The driver must use the supplied parameters.

I/O Unit Hours (n)~ The unit of measure to compute the total CPU time of a Data Lake workload.

IaaS (n)~ The capability provided to the consumer of provisioning processing, storage, networks, and other fundamental computing resources where the consumer is able to deploy and run arbitrary software, which can include operating systems and applications. The consumer does not manage or control the underlying cloud infrastructure but has control over operating systems, storage, and deployed application, and possibly has limited control of select networking components (e.g., host firewalls).

IANAL ~ (I Am Not A Lawyer)- Internet slang. Amazing how often this one comes up.

IAP (n)~ A business that supplies Internet connectivity services to individuals, businesses, and other organizations. An ISP provides a telephone number, a user name, a password, and other connection information so that users can access the Internet through the ISP's computers.

IAP (n)~ A supplementary item that can be purchased by a user from within an app, and for use with that app.

IA-PC (n)~ Any computer built with a processor that conforms to the architecture defined by the Intel processor family based on the 486 instruction set and has an industry-standard computer architecture.

IAS (n)~ A part of an IrDA infrared communication protocol used so that devices can learn about the services offered by another device.

IAS Server (n)~ A server component that coordinates the output from all the system health validators (SHVs) and determines whether Quarantine Enforcement Server (QES) components should isolate a client from the network or not based on health policy compliance.

IB (oth)~ An income tax on profits used in the Netherlands.

IBAN (n)~ An account number scheme that is recognized by banks internationally to facilitate credit transfers across national/regional borders.

I-beam (n)~ A mouse cursor used by many applications, such as word processors, when in text-editing mode. The I-beam cursor indicates sections of the document where text can be

inserted, deleted, changed, or moved. The cursor is named for its I shape.

I-beam pointer (n)~ A mouse cursor used by many applications, such as word processors, when in text-editing mode. The I-beam cursor indicates sections of the document where text can be inserted, deleted, changed, or moved. The cursor is named for its I shape.

IBM ~ (International Business Machines)- The company that designed and built the first PCs, and still a giant of the industry. Standard PCs were originally referred to as 'IBM compatible', although IBM no longer controls the PC standard, nor even builds PCs.

IBS (n)~ A process that uses installation technologies that install Windows images (.wim files).

iCalendar (n)~ The file name extension of a file containing calendar information that can be shared among different calendar programs.

ICF (n)~ A Network Connections feature that is used to set restrictions on what traffic is allowed to enter your network from the Internet.

ICM (PN)~ Microsoft's implementation of device-independent color management support, as defined by the International Color Consortium (ICC).

ICMP (n)~ A required maintenance protocol in the TCP/IP suite that reports errors and allows simple connectivity. ICMP is used by the Ping tool to perform TCP/IP troubleshooting.

ICO file (n)~ The file for the icon on the client's desktop used to launch a sequenced application.

icon (n)~ A small picture that represents a file, folder, program, or other object or function.

Icon ~ Small pictogram either representing a- file, or providing shortcuts for carrying out common tasks such as- saving- and printing inside an- application.

icon ~ Symbols or illustrations on the desktop or computer screen that indicate program files, documents, or other functions.

icon ~

icon character (n)~ The animated icon from the Help and Support Center that guides users through their first-run experience or Windows Welcome.

icon overlay (n)~ An image superimposed on an icon in MMC to indicate a condition or status.

icon overlay (n)~ An icon that appears on top of the taskbar button icon, used to communicate alerts, notifications, and status. Icon overlays are a feature of pinned sites in Internet Explorer 9.

Icon Source Root (n)~ A registry key that allows specification of a source location for icon retrieval for a sequenced application package during publication. Icon Source Roots support UNC formats only (not URLs).

Icon view (n)~ A UI element that enables a user to display Works tasks as icons with text available on mouseover.

ICRA (n)~ An international nonprofit group that has developed a content advisory service for the Internet. ICRA's aim is to protect children from potentially harmful material on the Internet.

ICS (n)~ A Microsoft Windows technology that provides home and small-office computer users who have networked computers with the ability to share a single connection to the

Internet.

ICT (PN)~ A window that, by default, opens immediately after operating system installation is complete and each time a member of the Administrators group logs on to the computer. By using commands in the Initial Configuration Tasks window, you can complete the configuration required to identify the computer to other computing resources on your network, secure the computer, enable administrators to perform tasks on the computer, and customize the computer by adding roles or features.

ICU (n)~ A section of a hospital that provides comprehensive care for critically ill patients requiring immediate and continuous attention.

ID (n)~ A unique identifier of an object or person.

ID number (n)~ An ID that consists of one or more numbers.

ID selector (n)~ In a cascading style sheet style definition (or style rule), a selector that is used to define a style for an individual page element, usually as an inline style.

IDC/HTX files (n)~ Microsoft Internet Information Server uses an IDC file and an HTX file to retrieve data from an ODBC data source and format it as an HTML document.

IDE (n)~ A type of disk-drive interface in which the controller electronics reside on the drive itself, eliminating the need for a separate adapter card. IDE offers advantages such as look-ahead caching to increase overall performance.

IDE (n)~ A set of integrated tools for developing software. The tools are generally run from one user interface and consist of a compiler, an editor, and a debugger, among others.

IDE ~ (Integrated Drive Electronics)- A type of PC hard disk, now obsolete, the foreunner of- EIDE.

Idea management ~ a structured process of generating, capturing, discussing and improving, organizing, evaluating and prioritizing valuable insight or alternative thinking that would otherwise not have emerged through normal processes.

IDEF1X (n)~ A specification language for describing data structures. Visio includes an IDEF1X template. You can use the IDEF1X entity and relationship shapes to diagram the structure of databases.

idempotency check (n)~ A check to ensure that each unique document is received once and only once.

idempotent (n)~ An initialization subroutine that completes an action only once, even if the routine is called more than once.

idempotent (adj)~ Characteristic of an action that has the same effect, whether performed once or multiple times.

identification (n)~ The process of mapping an object onto the supported identification schemas or getting the unique user identifier (UID). The operating system, IIS, or Commerce Server usually provides this identification.

identification (n)~ A unique identifier of an object or person.

identification (n)~ Proof or evidence that supports an identity claim.

identifier (n)~ Any text string used as a label, such as the name of a procedure or a variable in a program or the name attached to a hard disk or floppy disk.

identifier (n)~ An element of an expression that refers to the value of a field, control, or property.

identifier (n)~ A distinguishing label assigned to data entities.

identifier type character (n)~ A character that that forces a literal to assume a data type other than the one its form indicates. You do this by appending the character to the end of the literal. For example, %' forces the Integer data type of the literal 'L' in the following declaration: Dim L%.'

identifying field (n)~ A field or group of fields that identify an entity as a unique object.

identifying relationship (n)~ A relationship where the primary key of the principal entity is part of the primary key of the dependent entity. In this kind of relationship, the dependent entity cannot exist without the principal entity.

identity (n)~ A person or entity that must be verified by means of authentication, based on criteria such as password or a certificate.

identity (n)~ The digital persona' by which other users recognize and interact with you.'

identity (n)~ A set of attributes that define a user's access to a given service or application.

identity (n)~ The category of services in Microsoft Azure that includes Microsoft Azure Active Directory.

identity column (n)~ A column in a table that has been assigned the identity property.

identity escape (n)~ In regular expressions, a backslash followed by a single character. It matches that character and is required when the character has a special meaning; by using the identity escape, the special meaning is removed.

identity federation (n)~ A process in Microsoft Online Services that uses Active Directory Federation Services 2.0 and Microsoft Federation Gateway to securely represent identities in the cloud and tie those identities to corporate credentials (user name and password). Users can then use their corporate credentials to sign in once to access the services in Microsoft Online Services.

identity increment (n)~ The incremental value that is added to the identity value of the previous row that was loaded.

identity life cycle (n)~ The stages an identity goes through from the time it is conceived until the time it is destroyed.

identity management (n)~ The the management of the identity life cycle of entities (e.g. people, computers) during which the identity is created, documented and destroyed.

Identity Management for UNIX (n)~ A feature of Windows that integrates computers running Windows into an existing UNIX enterprise.

identity property (n)~ A property that generates values that uniquely identify each row in a table.

identity provider (n)~ A service that authenticates user or client identities and issues consumable security tokens.

identity service (n)~ The category of services in Microsoft Azure that includes Microsoft Azure Active Directory.

identity store (n)~ An area on a computer where identities are stored.

Identity synchronization (PN)~ The service underlying the process of reconciling a user's credentials that define his/her access to a given service or application from an Active Directory directory service and keep them up to date automatically.

identity tag (n)~ A tag on a physical object that defines two 64-bit values that can be read by the Surface Vision System and used to interact with Surface applications. The two 64-

bit values represent a series and a value. The intent is to have several values associated with a single series.

identity verification (n)~ The process of confirming the identity of an individual or business who is applying to the store as a developer/vendor.

ideograph (n)~ A character in an Asian writing system that represents a concept or an idea, but not a particular word or pronunciation.

ideographic character (n)~ A character in an Asian writing system that represents a concept or an idea, but not a particular word or pronunciation.

IDL (n)~ In object-oriented programming, a language that lets a program or object written in one language communicate with another program written in an unknown language. An IDL is used to define interfaces between client and server programs. For example, an IDL can provide interfaces to remote CORBA objects.

idle (adj)~ Operational but not in use.

idle loop (n)~ A loop in which no statement is being executed.

idle sleep (n)~ A sleep state that occurs when a system or device remains idle for a predefined length of time, as specified by the user in Power Options.

idle time (n)~ The period during which the application has an empty message queue. Idle time permits the processing of background tasks.

IDMIF file (n)~ A type of Management Information Format (MIF) file that can be used to add new architectures or updates to existing architectures in the SMS/Configuration Manager site database to accommodate custom hardware inventory properties.

IDN (n)~ An Internet domain name that can accommodate non-ASCII characters such as the diacritical marks of European language or non-Latinate characters such as those found in Chinese, Korean or Arabic.

IDP (n)~ An extension that indicates if the CRL is limited to revocations for end-entity certificates or for CA certificates.

IDR (n)~ The official currency of Indonesia.

IE ~ (Internet Explorer)- Microsoft's web browser, included free in Windows. If followed by a number (IE9, IE8 etc), it refers to a particular version of that browser.

IEAK (n)~ A set of tools that enables corporate administrators, ISPs, and ICPs to create, distribute, and manage customized Internet Explorer packages across an organization. The IEAK contains the Internet Explorer Customization Wizard, the IEAK Profile Manager and the IEAK Toolkit.

IEC (n)~ One of two international standards bodies responsible for developing international data communications standards. The International Electrotechnical Commission (IEC) works closely with the International Organization for Standardization (ISO) to define standards of computing. They jointly published the ISO/IEC SQL-92 standard for SQL.

IECE (PN)~ A compatibility evaluator that works with Internet Explorer 7 to verify whether a Web application or Web site will have compatibility issues when used on a new operating system, such as Microsoft Windows- Vista. IECE also works with Internet Explorer to create and process log files regarding visited Web sites and applications. The log files show compatibility issues for both the user and the ACT Log Processing Service.

IEEE (n)~ A society of engineering and electronics professionals based in the United

States but boasting membership from numerous other countries/regions. The IEEE (pronounced eye triple ee') focuses on electrical

IEEE 1394 (n)~ A standard for high-speed serial devices such as digital video and digital audio editing equipment.

IEEE 1394 connector (n)~ A type of connector that enables you to connect and disconnect high-speed serial devices. An IEEE 1394 connector is usually on the back of your computer near the serial port or the parallel port.

IEEE 1394 port (n)~ A port that supports either a 6-pin plug whose size is 11 mm by 5.4 mm or a 4-pin plug whose size is 5.35 mm by 3.45 mm.

IEEE 1667 (PN)~ The IEEE industry standard that defines methods for authenticating transient removable storage devices (e.g. USB flash drives, memory cards, and portable hard disks) when they are mounted to host computers in corporate, government, academic, and other environments.

IEEE 1667 compatible silo (n)~ A silo that is defined outside of the IEEE 1667 Working Group but uses the IEEE 1667 protocol to provide extensibility to allow people outside the IEEE 1667 Working Group (e.g. other standards, individuals, companies) to define a silo that uses the IEEE 1667 protocol for host to device communication.

IEEE 802.1X security standard (n)~ An Institute of Electrical and Electronics Engineers (IEEE) standard that defines port-based network access control which either allows or denies connection requests to IEEE 802.3 wired Ethernet networks or IEEE 802.11 wireless networks.

IEEE Standard Protocol for Authentication in Host Attachments of Transient Storage Devices (PN)~ The IEEE industry standard that defines methods for authenticating transient removable storage devices (e.g. USB flash drives, memory cards, and portable hard disks) when they are mounted to host computers in corporate, government, academic, and other environments.

IETF (n)~ A worldwide organization of individuals interested in networking and the Internet. Managed by the IESG (Internet Engineering Steering Group), the IETF is charged with studying technical problems facing the Internet and proposing solutions to the IAB. The work of the IETF is carried out by various Working Groups that concentrate on specific topics, such as routing and security.

IF/THEN/ELSE statement (PN)~ A text statement that can be used for calculations, and that specifies certain conditions for the data and the resulting behavior for when those conditions are met. The statement uses the terms If, Then, and Else to identify the conditions and results.

IFD (n)~ A method of deploying on-premises CRM so that remote users can connect to the application from the Internet.

IFRS (n)~ Accounting standards that must be used as of January 1, 2005 for European Union-based companies with publicly traded shares or debt, subsidiaries for which consolidated accounts must be prepared, or companies with subsidiary or associate companies of a European Union-listed company.

IFS (n)~ A file system that is accessed through a file system driver (FSD) that is loaded onto a device by the user, rather than accessed by the built-in file system. An installable file system may be implemented differently from the built-in file system. For example, an

installable file system may prevent a user from deleting files, provide automatic compression of files, or use a structure for internal information different from that used by the built-in file system.

IFSC code (n)~ A series of 11 alphanumeric characters used by the Indian Financial System to identify banks participating in the NEFT system and to route transactions between banks.

IGMP (n)~ A protocol used by Internet Protocol version 4 (IPv4) hosts to report their multicast group memberships to any immediately neighboring multicast routers.

IGN ~ IGN is an entertainment website that focuses on video games, films, music and other media.- http://www.ign.com/

ignore (v)~ To take action to not answer a call. The call goes to voice mail if that service is available.

ignore (v)~ To mark an e-mail conversation so that all current and future messages in the conversation are automatically moved to the Deleted Items folder.

IGP (n)~ A protocol used for distributing routing information among routers (gateways) in an autonomous network-that is, a network under the control of one administrative body. The two most often used interior gateway protocols are RIP (Routing Information Protocol) and OSPF (Open Shortest Path First).

IHV (n)~ A company that manufactures hardware devices and the associated device drivers.

IIRC ~ (If I Recall Correctly)- Internet slang.

IIS (n)~ Microsoft Web server software, utilizing the Hypertext Transfer Protocol (HTTP) to deliver World Wide Web documents. Supports the Common Gateway Interface (CGI), the File Transfer Protocol (FTP), and Gopher.

IIS 7 Deployment Handler (PN)~ A deployment handler that integrates with the Web Management service (WMSVC) and enables non-administrators or administrators to perform remote operations.

IIS 7 Manager (PN)~ The tool that manages services that are hosted in the Windows Process Activation service (WAS).

IIS 7 Manager for Remote Administration (PN)~ A software product that provides the ability to securely manage remote IIS 7 servers from Windows 7, Windows Vista, Windows XP, and Windows Server 2003.

IIS Admin Objects (n)~ A set of methods, provided by Internet Information Services (IIS), that allow applications to access and modify configuration settings in the metabase.

IIS Advanced Logging (PN)~ An extension for IIS 7 that provides flexibility in logging user requests and client data. The extension can be managed by using IIS Manager and other tools that can work with the IIS- 7 configuration system.

IIS CPU Throttling (PN)~ An IIS feature that limits CPU, memory, and bandwidth consumption by a single application pool in a multitenant deployment.

IIS Database Manager (PN)~ An extension to IIS for managing local and remote databases from within IIS Manager.

IIS instance (n)~ A system for organizing sites on a server. Each server can have more than one IIS instance, and each IIS instance can have more than one top-level site.

IIS Manager module (n)~ A set of extension to IIS Manager. Windows Server AppFabric

extensions to IIS Manager allow you to configure, control, query, and monitor WCF and WF services (in .NET Framework 4).

IIS Media Pack 1.0 (PN)~ Media-specific extensions that make delivering media from IIS simple and cost-effective. Built on IIS 7, the IIS Media Pack supports all media file types, protects media assets, and increases scalability by supporting more concurrent users per server.

IIS Media Services (PN)~ A set of media-related extensions for IIS 7 that provides an integrated HTTP-based media delivery platform.

IIS Media Services 2.0 (PN)~ A set of media-related extensions for IIS 7 that provides an integrated HTTP-based media delivery platform. IIS Media Services 2.0 contains three extensions: smooth streaming, bit rate throttling, and Web playlists.

IIS Site Analyzer (PN)~ A Search Engine Optimization Toolkit that performs detailed analysis and provides recommendations to improve a Web site's relevance in search results.

IIS Transform Manager (PN)~ An extension for Internet Information Services (IIS) 7 that batch-converts on-demand media files to alternate file and container formats.

IIS Web Management Service (PN)~ A service that enables remote and delegated management of a Web server and its Web sites and applications.

IKE (n)~ A protocol that establishes the security association and shared keys necessary for computers to communicate by using Internet Protocol security (IPsec).

IL (n)~ A number that represents how trustworthy a particular process, application, or object is.

iLink ~ iLink is the registered trademark of Sony's IEEE 1394 digital connection.

illustrated audio (n)~ A stream that combines audio with synchronized still images to make up an online slide show that runs at low bandwidths.

Illustration & graphic design (PN)~ The Multimedia design subcategory containing apps to help with creating designs.

ILM (n)~ A product for managing the entire lifecycle of user identities and their associated credentials. It provides identity synchronization, certificate and password management, and user provisioning in a single solution that works across Microsoft Windows and other organizational systems.

ILS server (n)~ A computer that lists the names and e-mail addresses of people who are running NetMeeting and who are logged on to the server. This information is used to connect to their computers.

IM (n)~ Pertaining to a message sent in real time through a network to a private chat area.

IM (n)~ A message sent in real time through a network to a private chat area.

IM (n)~ A method of real-time communication over the Internet in which a sender types a message to one or more recipients and the recipient immediately receives the message in a chat area.

IM ~ (Instant Messenging)- A program that allows you to 'chat' live via keyboard over the internet. Both parties must be running the same IM software - there are several different brands, mostly incompatible with each other.

IM Conferencing Server (n)~ A service that runs on a Lync Server or Office Communications Server front-end server to mix and manage inputs from multiple clients

in a multiparty instant messaging (IM) session.

IM Conferencing service (n)~ A service that runs on a Lync Server or Office Communications Server front-end server to mix and manage inputs from multiple clients in a multiparty instant messaging (IM) session.

IM Requests (n)~ An area on the app bar that displays requests from other users to see your presence and requests to start a conversation in Lync.

IM service provider (n)~ A public or private organization that provides instant messaging services for multiple domains.

IM service providers table (n)~ A table configured on an Access Edge Server or Access Proxy containing the names and FQDNs (fully qualified domain names) of IM service providers, including public IM service providers, allowed to connect to that Access Edge Server or Access Proxy. These providers typically are responsible for routing to multiple domains.

image (n)~ A pictorial graphic such as a digital photograph or illustration.

image (n)~ A collection of files and folders (sometimes compressed into one file) that duplicates the original file and folder structure of an operating system. It often contains other files added by the OEM or corporation.

Image Annotator (PN)~ The app that enables users to quickly annotate images, create simple drawings, and share them.

image brush (n)~ A tile brush that paints an area with an image source, such as a bitmap image.

image codec (n)~ Software or an algorithm that converts images to a specified file format (encoder) or from file format to displayed image (decoder).

image editing (n)~ The process of changing or modifying a bitmapped image, usually with an image editor.

image editor (n)~ A computer program that enables users to adjust a photo to improve its appearance.

image encoder/decoder (n)~ Software or an algorithm that converts images to a specified file format (encoder) or from file format to displayed image (decoder).

image file (n)~ A file containing graphics (illustrations, photographs, etc.) or other visual information.

Image Flashing Tool (PN)~ A tool that can be used to apply Windows images to multiple devices at once. This can be used on the manufacturing floor.

Image Gallery (n)~ A repository for storing and managing visual resources, such as images and themes.

image group (n)~ A collection of Windows image files in the Windows Deployment Services image store that share security options and file resources.

image map (n)~ An image that contains more than one hyperlink on a Web page. Clicking different parts of the image links the user to other resources on another part of the Web page or a different Web page or in a file.

image object (n)~ An object defined by pixels.

Image Picker (n)~ The dialog box in Microsoft Office Live that contains the images users have uploaded to Image Gallery and from which users can select images to place on their Web pages.

image pyramid (n)~ A construct of an image loading process in which a pyramid-like shape is created out of an image.

image resolution (n)~ The fineness or coarseness of an image as it is digitized, measured in dots per inch (DPI), typically ranging from 200 to 400 DPI.

image sensor (n)~ A device used in digital cameras to capture visual information.

image sequence (n)~ A consecutive series of images created from consecutive video frames.

image stabilization (n)~ A technique that increases sharpness and fidelity by compensating for some effects that camera movement has on images in videos.

image store (n)~ The repository where Windows image files used for deployment are stored.

image well (n)~ A collection of images of the same size and color depth that are stored as a row of images in a single bitmap.

image-based setup (n)~ A process that uses installation technologies that install Windows images (.wim files).

imagesetter (n)~ A high resolution output device that prints to paper or film, or directly to a press plate.

imaging (n)~ The process of capturing an installation of Windows for deployment to one or more destination computers.

imaging device (n)~ A hardware type for digital cameras and scanners.

IMAP (n)~ A method computers use to send and receive e-mail messages. It allows you to access e-mail without downloading it to your computer or device.

IMAP ~ (Internet Message Access Protocol)- A system for checking email that leaves the email on the server instead of deleting it after it has been downloaded, widely used in tablets and phones and becoming more popular on desktop and laptop computers.

IMAP4 (n)~ A standard client/server protocol for receiving e-mail. The user (or the user's e-mail client) can view just the heading and the sender of the letter and then decide whether to download the mail.

IMDB (n)~ A COM service that maintains durable state information and transient state information in a consistent manner. It is an in-memory, fully transactional database system designed to provide extremely fast access to data on the machine on which it resides.

IMDB catalog (n)~ A COM service that maintains durable state information and transient state information in a consistent manner. It is an in-memory, fully transactional database system designed to provide extremely fast access to data on the machine on which it resides.

IME (PN)~ A tool that lets you enter complex characters and symbols, such as those used in East Asian written languages, using a standard keyboard.

immediate query (n)~ A LINQ query that is evaluated immediately. Any query that returns a single value, as opposed to a sequence of values, or that is terminated by a call to ToList, ToArray, ToDictionary, or ToLookup.

immediate updating subscription (n)~ A subscription to a transactional publication for which the user is able to make data modifications at the Subscriber. The data modifications are then immediately propagated to the Publisher using the two-phase commit protocol (2PC).

immersive (adj)~ Pertaining to the chrome-free UI presentation mode that fills all or a portion of the display.

immutable ID (n)~ A unique user identifier that must not change for the user over the lifetime of the user being in the system.

IMO, IMHO ~ (In My (Honest) Opinion)- Internet slang.

imperative security check (n)~ A security check that occurs when a security method is called within the code that is being protected. This type of check can be data-driven and can be isolated to a single location within an object or method. For example, if the name of a file to be protected is known only at run time, an imperative security check can be invoked by passing the file name as a parameter to a security method.

impersonation (n)~ The ability of a thread to run in the security context of a security principal different from the security principal that started the process. This is usually so that a process can gain access to resources on behalf of a user.

impersonation token (n)~ An access token that captures the security information of a client process, allowing a service to impersonate' the client process in security operations.'

implementation class (n)~ In a static structure diagram, a class that defines the physical data structures and procedures of an object as implemented in a traditional programming language, such as C++. An object may have only one implementation class.

implicit cursor conversion (n)~ The return of a different type of cursor than the user had declared.

implicit intersection (n)~ A reference to a range of cells instead of a single cell that is calculated like a single cell. If cell C10 contains the formula =B5: B15*5, Excel multiplies the value in cell B10 by 5 because cells B10 and C10 are in the same row.

implicit keyframe (n)~ A type of keyframe that is present when one animation is interrupted by another, and the second animation has no keyframe set at the 0 second mark. The resulting transition is called handoff animation.

implicit profiling (n)~ An information collection process in which the actions and behaviors of a user visiting a Web site are recorded as the user moves around in and interacts with the Web site.

implicit selection (n)~ A selection that is the result of inference or the context of some other operation.

implicit targeting (n)~ The process of delivering targeted content by using existing user data to extrapolate unknown information about users who browse your site.

implicit transaction (n)~ A connection option in which each SQL statement executed by the connection is considered a separate transaction.

implicitly typed local variable (n)~ A local variable whose type is inferred from the expression that initializes the variable.

implied permission (n)~ Permission to perform an activity specific to a role.

import (v)~ To bring information from one system or program into another. The system or program receiving the data must somehow support the internal format or structure of the data.

Import Data Wizard (PN)~ A wizard used to import multiple records from a comma-delimited text file into Microsoft Dynamics CRM as records.

Import Document (PN)~ The Sway option button under -€œAdd Content-€? that allows

users to select an office document and import it into Sway.

Import File Parse (PN)~ A system job that parses a file used in data migration or import.

import format (n)~ The file format for the import of payments.

Import from a device (v)~ An option that allows user to import images from a device as opposed to some form of media. Device denotes an electronic device capable of showing or transmitting digital images.

import media pool (n)~ A logical collection of data-storage media that has not been cataloged by Removable Storage. Media in an import media pool is cataloged as soon as possible so that they can be used by an application.

import process (n)~ The process of provisioning new users using a CSV file.

Import users (v)~ The name of the administrator user interface in Outlook Live used to import new users with a CSV file.

Import Video (n)~ A Windows wizard that helps the user import digital video to the computer from digital video cameras and other sources.

Import XML Wizard (n)~ A feature in Microsoft CRM Customization that imports customized forms and views.

Import/Export (PN)~ The Microsoft Azure service which allows users to import or export large amounts of data to or from Blob storage via a physical disk.

imported tape (n)~ A tape that contains content that was created by another DPM server.

impression (n)~ An opportunity to deliver an advertising element to a Web site visitor. Requests are generated by events on the site, such as a request for a particular page or the purchase of a specific item. The ad used to fulfill the request is determined by the Need of Delivery.

impression (n)~ An ad that is served to a user's screen either as a pushed (sent by e-mail) or pulled ad (requested by a user's browser). This includes measurement of responses from an ad delivery system to a user's browser.

Improve This Product (v)~ Menu item related to the Customer Experience Improvement Program

in a call (Adverb) ~ Pertaining to a user engaged in a phone conversation.

In a conference (PN)~ The status label that indicates that a user is speaking with more than one person via phone.

In a meeting (PN)~ The status label that indicates that a user has an accepted current meeting, marked Busy, on his or her calendar.

in a meeting (oth)~ Pertaining to a user who has an accepted meeting on his or her calendar that is marked Busy.

in call volume (n)~ The volume that can be changed during a call.

in collection (oth)~ The title of a screen showing a list of all digital media (including music and videos) from Xbox Music that can be played on the phone.

in progress (oth)~ Pertaining to a scheduled service activity status that denotes that the service activity is being performed.

inactive (adj)~ Pertaining to the state of an object when it is not the focus of a user's input.

Inactive (adj)~ Pertaining to a user who hasn't used his or her mouse, keyboard, computer, mobile phone, or communications device for a specified time.

inactive data source (n)~ A data source that has been backed up on the DPM server but is no longer being actively protected.

inactive window (n)~ In an environment capable of displaying multiple on-screen windows, any window other than the one currently being used for work. An inactive window can be partially or entirely hidden behind another window, and it remains inactive until the user selects it.

Inactivity (n)~ A time-out setting in Web playlists after which a user session is terminated if the connected client is not actively downloading content references in the playlist.

in-air packet (n)~ A pen input event which is created when a user moves a pen near the tablet and the cursor is within the ink collector object's window or the user moves a mouse within the ink collector object's associated window.

in-app offer (n)~ A feature that a developer provides in an app for consumers to buy from within the app through an in-app purchase transaction.

in-app product (n)~ A supplementary item that can be purchased by a user from within an app, and for use with that app.

in-app purchase (n)~ A transaction performed by a consumer from within the context of an app to buy additional features for that app.

in-app search (n)~ An end-to-end search functionality in an app.

in-app search control (n)~ A control that developers use to implement the primary entry point for in-app search.

in-app subscription (n)~ An agreement in which a customer prepays for periodic or regular services.

in-app up (n)~ Within a particular app, an affordance that enables the user to navigate back in that app's UI hierarchy.

in-band access (n)~ Access to host via a connection that does use the IP Network.

inbound dock (n)~ An area in a warehouse where items are stored when they are received in inventory.

Inbound Mail Server (PN)~ The IP address that inbound e-mail is delivered to after it has been processed by the Hosted Filtering service. Inbound Mail Server addresses are defined for each domain in your organization.

inbound port (n)~ A port for servicing inbound requests.

inbound router (n)~ An application on a front-end server that manages the routing of inbound messages to unified communications users.

Inbox (n)~ The folder that by default receives new messages.

in-box driver (n)~ A driver contained in the default Windows installation.

Inbox folder (n)~ The folder that by default receives new messages.

Inbox rule (n)~ A rule that is defined by an end-user using Outlook or Outlook Web App. When a message that meets the conditions of the rule is sent or received, the rule triggers an action that is performed automatically.

In-Call (PN)~ The phone's volume mode when in a call.

In-call alert volume (PN)~ An option that allows the user to predetermine the volume of alert sounds generated by the device during a call.

incident (n)~ A way of tracking any event that is not part of the standard operation of a service and that causes, or may cause, an interruption to, or a reduction in, the quality of

that service.

incident report (n)~ A report that is created when a user exceeds a quota threshold or tries to save an unauthorized file.

included column index (n)~ A nonclustered index containing both key and nonkey columns.

inclusion (n)~ Term or sentence that must be found in conjunction with a search phrase.

income statement (n)~ A report that summarizes a company's costs, expenses, and revenues for a specific accounting period.

Incoming (PN)~ A label that indicates a call made to the phone.

incoming area (n)~ A conversation area where incoming conversations, including phone calls, conference calls, and instant messages, are displayed.

incoming call (n)~ A current attempt by a second party to establish communication with a user.

incoming conversation (n)~ A conversation initiated by another user.

incoming conversation alert (n)~ A notification that the user receives when someone is sending an invitation to the user to begin a conversation in Lync or Communicator.

incoming conversation area (n)~ A conversation area where incoming conversations, including phone calls, conference calls, and instant messages, are displayed.

incoming instant message alert (oth)~ A notification that the user receives when someone sends an instant message to that user.

incoming link (n)~ A hyperlink on an outside domain that points into the user's domain.

incoming mail (n)~ A message that has been sent across one or more messaging systems. It may have been sent only to you or to many other recipients. Incoming messages are placed in a receive folder designated to hold messages of a particular class. You can set up a different receive folder for each message class that you handle or use one folder for all of the classes.

incoming message (n)~ A message that has been sent across one or more messaging systems. It may have been sent only to you or to many other recipients. Incoming messages are placed in a receive folder designated to hold messages of a particular class. You can set up a different receive folder for each message class that you handle or use one folder for all of the classes.

incoming URL (n)~ The original URL from the request context or higher level OM call.

incoming video (n)~ A video stream from a source that is external to the user's computer.

incompatible (adj)~ Unable to be used together.

in-country number format (n)~ The string that is used to define how to create an in-country/region number to use when making calls from a dial plan.

in-country/region number format (n)~ The string that is used to define how to create an in-country/region number to use when making calls from a dial plan.

increase (n)~ A transaction where items come into inventory.

increment (n)~ A scalar or unit amount by which the value of an object such as a number, a pointer within an array, or a screen position designation is increased.

increment (v)~ To increase a number by a given amount. For example, if a variable has the value 10 and is incremented successively by 2, it takes the values 12, 14, 16, 18, and so on.

increment operator (n)~ An operator that increases an integer typically by 1.

incremental (adj)~ Increasing gradually by regular degrees or additions.

incremental backup (n)~ A backup that copies only those files created or changed since the last normal or incremental backup. It marks files as having been backed up (in other words, the archive attribute is cleared). If you use a combination of normal and incremental backups to restore your data, you will need to have the last normal backup and all incremental backup sets.

incremental collection evaluation (n)~ A feature that enables you to evaluate new or changed members of a collection.

incremental collection member evaluation (n)~ A process that periodically scans for new or changed resources from the previous collection evaluation and then updates the collection membership with only these resources.

incremental crawl (n)~ A crawl that operates on a defined schedule to scan and index new and modified content from a source.

incremental publish to the Web (oth)~ A feature that allows you to publish updates to a previously published Web site quickly by publishing only those files you have updated.

incremental search (n)~ A type of search that looks for a string in an automatic and progressive way. As the user types a string, possible matches are found, thus enabling the user to stop typing the complete string as soon as the right match is found.

incremental synchronization (n)~ In e-mail migration, the stage when the mailboxes in the on-premises Exchange organization and the corresponding cloud-based mailboxes are synchronized every 24 hours, after the initial synchronization. This means that any new messages sent to the mailboxes on the Exchange server are copied to the corresponding cloud-based mailboxes. Incremental synchronization continues until the administrator completes the overall migration.

incremental update (n)~ The set of operations that either adds new members to an existing cube or dimension, or adds new data to a partition.

incremental zone transfer (n)~ In DNS, a zone transfer request involving only incremental resource record changes between each version of the zone. An IXFR contrasts with a full zone transfer (AXFR) request for all resource records.

indent (n)~ Displacement of the left or right edge of a block of text in relation to the margin or to other blocks of text.

indent (v)~ To displace the left or right edge of a text item, such as a block or a line, relative to the margin or to another text item.

indent (v)~ To move a task to a lower outline level [to the right] in the Task Name field. When you indent a task, it becomes a subtask of the nearest preceding task at a higher outline level.

indentation (n)~ Displacement of the left or right edge of a block of text in relation to the margin or to other blocks of text.

independent animation (n)~ An animation that changes the value of a property and runs on a separate, hardware-accelerated system thread.

independent association (n)~ An association between entities that is represented and tracked by an independent object.

independent composition (n)~ The sequencing of two actions where the second action

does not depend on a sync message from the first action before the second action begins processing business logic; the second action can begin immediately.

independent developer (n)~ A software developer who is working on their own behalf, rather than on the behalf of a company.

independent hardware vendor (n)~ A company that manufactures hardware devices and the associated device drivers.

independent software vendor (n)~ A third-party software developer; an individual or an organization that independently creates computer software.

index (n)~ In programming, a scalar value that allows direct access into a multi-element data structure such as an array without the need for a sequential search through the collection of elements.

index (v)~ In a database, to find data by using keys such as words or field names to locate records.

index (n)~ A listing of keywords and associated data that point to the location of more comprehensive information, such as files and records on a disk or record keys in a database.

index (n)~ A marker produced by the Windows Media Format Software Development Kit (SDK) to enable seeking in a video file.

index (n)~ A value multiplied by the base price to calculate a subscription price.

Index (PN)~ The dynamic alphabet bar that runs along the bottom of the list views in the Microsoft Dynamics CRM Web application window. When a user clicks a letter, the list view filters the available records by that letter.

index (v)~ To create an index.

index (v)~ To locate data based on an index.

index ~ The name on some operating systems for a directory listing of files.

index ~ The starting point of a data set. For example, say a record within a sector of a cylinder of a disk. The first bit of the container does not have user data. It is the pointer to the index of that container.

index ~ A file of information, usually small amounts of the same information in another file that is much larger. The smaller file also keeps track of the exact record number of the record in the large file containing the same information, only in much greater detail.

index allocation (n)~ A NTFS File Attribute Type used to implement folders and other indexes.

Index Allocation Map (PN)~ A page that maps the extents in a 4-GB part of a database file that is used by an allocation unit.

index entry (n)~ A field code that marks specific text for inclusion in an index. When you mark text as an index entry, Microsoft Office Word inserts an XE (Index Entry) field formatted as hidden text.

index page (n)~ A database page containing index rows.

index partition (n)~ A logical portion of the search index.

index propagation (n)~ The process of distributing an index from a content index server to one or more Web servers for the purposes of providing search.

index replica (n)~ A copy of a search index within an index partition.

index role (n)~ The role name of a server that services indexing in the farm topology.

index server (n)~ A server that crawls content and uses that content to create the content index.

index update (n)~ A physical operator that updates rows from its input in the nonclustered index specified in the Argument column.

indexed sequential access method (n)~ A technique for indexing database records that allows sequential or random access of records. When records are accessed sequentially they are accessed in the order in which they were entered in the database, and when records are accessed randomly, the records are accessed through an index.

indexed view (n)~ A view with a unique clustered index applied on it to improve the performance of some types of queries.

indexer (n)~ A class member that permits instances of a class or structure to be accessed in the same way as arrays. Indexers are similar to properties, except that the get and set accessor methods of indexers take parameters, whereas property accessor methods do not.

indexer (n)~ An application that performs or coordinates indexing.

Indexer Input Hours (n)~ A resource of the 'Media Services' service type of the 'Media' service for 'Pay-As-You-Go' billing based on the number of hours for indexer inputs.

India Central (PN)~ An Azure geo/region designation for the Central region states of Indian peninsular boundary.

India West (PN)~ An Azure geo/region designation for the Western region states of Indian peninsular boundary.

indicator (n)~ A set of graphics, text, and colors for defining different levels of performance when comparing an actual value and a target value within a KPI.

indicator (n)~ A graphic that provides information about the state of an assignment, resource, or task. For example, a check mark indicator shows that a task is completed.

indicator margin (n)~ A gray area on the left side of the Visual Studio Code Editor where items such as breakpoints, bookmarks, and shortcuts are displayed.

Indie (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 131.

indirect compensation (n)~ The fixed compensation awarded to an employee in order to promote employee retention.

indirect cost (n)~ A cost that is not directly attributed to the production of an item or the performance of a service.

indirect price (n)~ A price that is associated with a pricing category. The price field in the product record is ignored.

indirect reconciliation method (n)~ A method of deriving the net income provided by operating activities by adjusting for revenue and expense items that do not result from cash transactions.

indirection (n)~ The ability to reference data using a name, reference, or container instead of the value itself. The most common form of indirection is the act of manipulating a value through its memory address.

individual detail (n)~ A detail entered as account information for an individual, rather than a company.

indoor map (n)~ A Maps feature that shows the layout and location of stores in a

shopping mall.

in-doubt transaction (n)~ A transaction that has been prepared but hasn't received a decision to commit or abort because the server coordinating the transaction is unavailable.

Industrial (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 19.

Industry (n)~ The label for a DropDown list of industry types to be associated with an Account.

industry code (n)~ A code used to identify different industries such as automotive, aviation, and beverage. You use industry codes to identify the associated industry of an advertisement, thus preventing two ads from competing companies in the same industry from appearing on the same page.

industry vertical (n)~ A segment of the marketplace, not all of it at once.

infect (v)~ To install malicious software on a computer or insert malicious software code into a file or load malicious code into memory.

inference rule (n)~ The command that runs if the dependency is not current.

inference training (n)~ A time-based assistant (TBA) that parses emails and makes internal inferences based on them. Inferences are used to allow the system to gain insight into a user's mailbox based on user patterns. Those inferences are then used to populate features for users, such as People View in Outlook Web App.

inference training feeder (n)~ A component that feeds data (such as mailbox messages) to the inference training assistant in batches. It controls performance by giving the inference training assistant a fixed amount of work to process at each interval.

infinite loop (n)~ A loop that, because of semantic or logic errors, can never terminate through normal means.

infinite loop (n)~ A loop that is intentionally written with no explicit termination condition but will terminate as a result of side effects or direct intervention.

infinite material (n)~ A method for scheduling resources that assumes that all the component materials needed for production are available at the time they are needed.

infinite scroll (oth)~ A feature that provides image results that are easy to browse without having to click to a new page.

infix pattern (n)~ The middle bytes in a given stream of bytes.

inflation (n)~ The overall price movement (generally upward) of goods and services in an economy.

inflexible constraint (n)~ A constraint that ties a task to a date. The inflexible constraints are Must Finish On and Must Start On.

info (n)~ The meaning of data as it is intended to be interpreted by people. Data consists of facts, which become information when they are seen in context and convey meaning to people. Computers process data without any understanding of what the data represents.

Info Bar (PN)~ An area in a browser or mail program that displays various information or messages for the user.

info mode (n)~ UI state where functionality on widgets is disabled and colored overlays are presented to the user.

info part (n)~ A UI part on the right-side of a list place or task page that can contain

graphs, lists, details or links. On task pages and list places the info part relates specifically to the selected line or lines on the grid. There are two types of info parts, supporting info parts and details info parts.

InfoBar (n)~ Banner near the top of an open e-mail message, appointment, contact, or task. Tells you if a message has been replied to or forwarded, along with the online status of a contact who is using Instant Messaging.

infocode (n)~ A message to the cashier that is triggered by events at the register.

InfoPath 2016 (PN)~ The year 2016 edition of InfoPath.

InfoPath Filler (PN)~ An environment in the InfoPath client that enables users to fill out forms (as opposed to designing them). It must be used if the forms to be filled out are not browser-compatible.

InfoPath Form Web Part (n)~ A Web Part that displays a browser-enabled InfoPath form.

InfoPath Forms Services (PN)~ A server built upon and integrated with the Microsoft Windows SharePoint Services platform to enable Web-based use of InfoPath form templates, by rendering editable InfoPath forms in HTML in the browser.

InfoPath importer for Excel workbooks (PN)~ A feature that creates a new InfoPath form template from an existing Microsoft Excel form.

InfoPath importer for Word documents (PN)~ A feature that creates a new InfoPath form template from an existing Microsoft Word form.

informal agent (n)~ An agent who is not dedicated to contact center activity. An informal agent doesn't see agent information in his or her communications client and may not even be aware that he or she is considered as an agent by the system. On the server side, an informal agent is considered as always signed in.

Information Access Service (n)~ A part of an IrDA infrared communication protocol used so that devices can learn about the services offered by another device.

information alert (n)~ An alert that indicates that the data source and its protected namespace elements are doing well. Examples of these types of messages are the completion (either successful or not) of long running tasks that would normally be followed by further action on the part of the administrator or interesting changes in the namespace (for example, new shares or volumes on protected servers).

Information bar (n)~ An area in a browser or mail program that displays various information or messages for the user.

information card (n)~ In CardSpace, a set of identity information, representing a user.

information control block (n)~ A control node in Universal Disk Format containing metadata describing file and directory structures.

information disclosure (n)~ The exposure of information to individuals who normally would not have access to it.

information model (n)~ An object-oriented schema that defines metadata constructs used to specify the structure and behavior of an application, process, component, or software artifact.

information packet (n)~ A collection of material for the information of a specific audience.

information page (n)~ A type of page that is designed to display detailed information

about one particular entity.

Information Protection and Control (PN)~ A Microsoft technology that is implemented by Azure Rights Management service through a set of methods and capabilities to control how data is used and distributed beyond the use of simple access control and prevent accidental and unauthorized distribution of sensitive information.

Information Rights Management (n)~ A policy tool that gives authors control over how recipients use the documents and e-mails they send.

Information Rights Management Services (PN)~ An information protection technology that works with RMS-enabled applications to help safeguard digital information from unauthorized use.

information systems (n)~ The formal name for a company's data processing department.

information technology (n)~ The formal name for a company's data processing department.

Informational (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

informational alert (n)~ An alert that indicates that the data source and its protected namespace elements are doing well.

informational announcement (n)~ An audio message that is played when a user first dials in to a Unified Messaging system that describes some temporary condition of interest to all users.

informational message (n)~ A message from the system or a program to users to provide information that they need to be aware of.

informed decision (n)~ A decision made with up-to-date information.

infotip (n)~ A small pop-up window that describes the object being pointed to, such as a control, icon, or links. It contains more information than a standard tooltip.

infotip (n)~ In BizTalk Mapper, a display of information about the functoid name, the functoid label, the functoid comment, and the input parameters (if existing).

infrared (adj)~ Having a frequency in the electromagnetic spectrum in the range just below that of red light.

infrared connection (n)~ A way to wirelessly connect computers and devices, using infrared light to send information.

Infrared Data Association (n)~ The industry organization of computer, component, and telecommunications vendors who have established the standards for infrared communication between computers and peripheral devices such as printers.

infrared device (n)~ A computer, or a computer peripheral such as a printer, that can communicate using infrared light.

infrared file transfer (n)~ Wireless file transfer between a computer and another computer or device using infrared light.

infrared network connection (n)~ A direct or incoming network connection to a remote access server using an infrared port.

infrared port (n)~ An optical port that can enable communication between computers, peripherals and mobile devices by using infrared light, without cables.

Infrastructure Administrator (n)~ A security role that grants permissions to administrative users so that they can perform migration tasks and create, delete, and

modify the Configuration Manager server infrastructure.

Infrastructure APIs for the Windows Runtime (PN)~ A set of C++ APIs that are used by the Windows Runtime to gain access to operating system functionality. They are primarily designed for the infrastructure of the Windows Runtime, but they could be used in advanced C++ Windows Store app development.

infrastructure architecture (n)~ The topology of the deployment environment including protocols, security levels, and services. This architecture provides a logical mapping to the deployment environment, such as the datacenter.

infrastructure as a service (n)~ The capability provided to the consumer of provisioning processing, storage, networks, and other fundamental computing resources where the consumer is able to deploy and run arbitrary software, which can include operating systems and applications. The consumer does not manage or control the underlying cloud infrastructure but has control over operating systems, storage, and deployed application, and possibly has limited control of select networking components (e.g., host firewalls).

infrastructure layer (n)~ The layer that represents the IT administration of the physical hardware and operating systems that support the services layer.

infrastructure master (n)~ A domain controller that holds the infrastructure operations master role in Active Directory. The infrastructure master updates the group-to-user reference whenever group memberships change and replicates these changes across the domain. At any time, the infrastructure master role can be assigned to only one domain controller in each domain.

ingestion (n)~ The intake of content by a service.

ingress event (n)~ An event marked by an inbound data transfer.

inherit (v)~ To acquire the characteristics of another class, in object-oriented programming. The inherited characteristics may be enhanced, restricted, or modified.

inheritance (n)~ A mechanism that allows a given access control entry (ACE) to be copied from the container where it was applied to all children of the container. Inheritance can be combined with delegation to grant administrative rights to a whole subtree of the directory in a single update operation.

inheritance (n)~ The transfer of the characteristics of a class in object-oriented programming to other classes derived from it. For example, if vegetable' is a class

Inherited (adj)~ An assignment type meaning that the user or group has been granted access at a parent node of the resource hierarchy.

inherited permissions (n)~ Permissions on an object that are automatically inherited from its parent object. Inherited permissions cannot be modified.

inheritor (n)~ The developer who creates a derived class from an existing class in object-oriented programming.

inhibit (v)~ To prevent an occurrence. For example, to inhibit interrupts from an external device means to prevent the external device from sending any interrupts.

in-house (oth)~ Produced or available within one's own company.

Inicis (PN)~ A company that provides payment gateway services for Korean markets.

initial communication (n)~ The first contact, for example by email or telephone, with a lead or customer.

Initial Configuration Tasks (PN)~ A window that, by default, opens immediately after

operating system installation is complete and each time a member of the Administrators group logs on to the computer. By using commands in the Initial Configuration Tasks window, you can complete the configuration required to identify the computer to other computing resources on your network, secure the computer, enable administrators to perform tasks on the computer, and customize the computer by adding roles or features.

initial deployment (n)~ The process of downloading and preparing files for the first time in order to enable use of a software application.

Initial master (n)~ A shared folder whose existing files and folders are replicated to other shared folders when replication is initially configured. After replication is complete, there is no initial master, since any of the replicas can accept changes and propagate them to the other replicas. The initial master then becomes another replica.

Initial page (n)~ The page that is initially displayed in a frame when a site visitor browses to a frames page containing the frame.

initial snapshot (n)~ Files that include schema and data, constraints, extended properties, indexes, triggers, and system tables that are necessary for replication.

initial state (n)~ In a statechart or activity diagram, a representation of the starting point of an object before any events included in the diagram have acted upon it. An initial state is indicated by a solid filled circle.

initial synchronization (n)~ The first synchronization for a subscription, during which system tables and other objects that are required by replication, and the schema and data for each article, are copied to the Subscriber.

initial tape (n)~ In a media set using tape backup devices, the first tape in a media family.

initialization (n)~ The process of assigning initial values to variables and data structures in a program.

initialization file (n)~ A text file used by the operating system and by individual applications to store persistent settings related to applications, drivers, or hardware. Supported for backward compatibility. Use the registry to store these settings.

initialization variable (n)~ A variable whose value determines a desired behavior. For example, Append_EOL Initialization Variable' specifies Yes if all text files must end with an end-of-line character

initialize (v)~ To set a variable to an initial value.

initialize (v)~ To prepare a disk, computer or device for use.

initiator (n)~ A device that creates or initiates requests or events.

initiator role (n)~ A particular user role of your choice that is automatically assigned to users who open your forms for the first time, overriding any other role assignments.

injected source (n)~ Code that an attribute provider or another component of the compiler inserts into the symbol store or that the compiler or linker generates automatically.

Ink (n)~ An option that allows you to enter text in handwritten form. Instead of converting your handwritten text to typed text, the text is converted to an object and displayed exactly as you wrote it.

ink (n)~ The writing or drawing strokes that you make with your stylus.

Ink and Handwriting Services (PN)~ A Tablet PC feature that provides ink support and handwriting recognition.

Ink Art (n)~ A program in the Microsoft Experience Pack for Tablet PC that simulates an

artist's toolset. It enables you to paint with your tablet pen by choosing from different textured canvases, paint brushes, chalks, crayons, and more.

Ink Art (PN)~ A ribbon group that provides options for drawings created with pen and ink tools.

ink cartridge (n)~ A disposable module that contains ink and is typically used in an ink-jet printer.

ink collection mode (n)~ The collection mode that determines whether ink, gestures, or both are recognized as the user writes.

Ink Crossword (n)~ A program in the Microsoft Experience Pack for Tablet PC with 12 crossword puzzles that you complete by using your tablet pen. You can also download a free daily puzzle and purchase more puzzle packs online.

Ink Desktop (n)~ A program in the Microsoft Experience Pack for Tablet PC that you can use to write notes on your Tablet PC screen by using your tablet pen. Any notes you take are automatically saved and remain on your desktop until you delete them.

ink entry mode (n)~ The environment in which you can fill out a form by writing in ink.

ink equation (n)~ An equation written using a stylus on a Tablet PC.

ink guide (n)~ A shaded area that increases in size as you write in a form field with a tablet pen.

ink jet (adj)~ Type of print technology.

Ink Serialized Format (PN)~ A Microsoft format used to store ink data. The format is mainly used for mobile devices.

ink space (n)~ The virtual coordinate space to which the coordinates of the tablet context are mapped.

ink stroke (n)~ The set of data that is captured in a single pen down, up, or move sequence.

ink support (n)~ Support for the use of a pen or stylus on a Tablet PC, including pen flick-support and application programming interfaces (APIs) for calling handwriting recognition.

inking (n)~ The process of using a tablet pen to create drawings or handwriting.

inking gap (n)~ The empty space that can be found between two handwritten words.

inkjet (adj)~ Type of print technology.

Inkjet ~ A very popular colour printer technology, which works by squirting tiny jets of ink onto paper with great precision.

Inkomstenbelasting op winst (n)~ An income tax on profits used in the Netherlands.

inline (adj)~ In HTML code, referring to graphics displayed along with HTML-formatted text. Inline images placed in the line of HTML text use the tag <IMG>. Text within an inline image can be aligned to the top, bottom, or middle of a specific image.

inline (adj)~ In programming, referring to a function call replaced with an instance of the function's body. Actual arguments are substituted for formal parameters. An inline function is usually done as a compile-time transformation to increase the efficiency of the program.

inline alert (n)~ A data validation alert that marks controls that contain invalid or missing data with a dashed red border or red asterisk. Users can display custom error messages by right-clicking the control or by clicking a link for more information.

inline discussion (n)~ Discussion comments that are associated with a particular paragraph, image or table. In Web browsers, inline discussions are displayed in the body of the document; in a Microsoft Word document, they are displayed in the discussion pane.

inline editing (n)~ The process of editing items directly in the list view, rather than navigating to an edit form and submitting changes from there.

inline element (n)~ An HTML element that typically does not start a new line, such as EM, FONT, and SPAN.

inline object (n)~ A picture or other object placed within a line of text that retains its place next to adjacent text when text is added or deleted.

inline positioning (n)~ Placement of an element in the natural HTML flow of a document, but such that its position is offset from the preceding content.

Inline Previews (PN)~ A feature that allows a preview of a webpage or YouTube video. The preview will show a photo, title, and description of the webpage or video.

inline reply (PN)~ An email response that is composed directly in the reading pane.

inline style (n)~ A cascading style sheet rule whose properties and values apply only to a specific element on a Web page, such as a table or a graphic. The style sheet rule is part of the HTML tag for that element.

inline SVG (n)~ SVG markup that is included in the markup for a webpage.

inline warning control (n)~ The ability to control whether warnings are reported for a particular region of code by specifying a compiler directive.

in-memory database (n)~ A COM service that maintains durable state information and transient state information in a consistent manner. It is an in-memory, fully transactional database system designed to provide extremely fast access to data on the machine on which it resides.

in-memory metabase (n)~ An image of the Internet Information Services (IIS) metabase that has been loaded from disk into the computer's random access memory (RAM) and is used while IIS is running.

inner circle (PN)~ A feature in Cortana's Notebook where the user can add the people he cares about most. The user can allow people in the inner circle to contact him even during quiet hours.

inner join (n)~ An operation that retrieves rows from multiple source tables by comparing the values from columns shared between the source tables. An inner join excludes rows from a source table that have no matching rows in the other source tables.

innermost exception (n)~ The handler that is evaluated first.

inode (n)~ A file identifier in UNIX. Each inode is identified by a unique number and contains user and group ownership information, access settings, file type, size, links, and modification information.

inpatient (n)~ A patient who has been admitted to a hospital or other health care facility for treatment that requires an overnight stay.

in-person authentication (n)~ Physical authentication to complete a certificate request transaction. For example, an end user requesting his/her personal identification number (PIN) be unblocked will visit a certificate manager in person to provide in-person authentication with identification, such as an employee badge or drivers license.

in-place activation (n)~ The ability to activate or edit and embedded object from within an OLE control.

In-Place Archive (n)~ An additional mailbox enabled for a mailbox user.

In-Place Archiving (PN)~ In Microsoft Exchange Server 2013, a feature that provides users with an alternate storage location for historical messaging data.

in-place editing (n)~ The ability to activate or edit and embedded object from within an OLE control.

In-Place Hold (n)~ A feature that allows for preservation of content documents, pages, and messages in Exchange and SharePoint so that when they are modified or deleted, the original version can still be accessed for electronic discovery and other legal purposes.

in-place upgrade (n)~ An upgrade that takes place on the same hardware as your previous version installation.

InPrivate (PN)~ An Internet Explorer feature that allows users to surf the Web without leaving a browsing history, cookies or other information on the PC so they can do online banking on a shared computer, for example.

InPrivate Browsing (PN)~ A feature that prevents Internet Explorer from storing data about your browsing session. This helps prevent anyone else who might be using your computer from seeing where you visited and what you looked at on the Web.

InPrivate Feed (PN)~ A list of URLs that you can subscribe to from independent sources on the Web that Internet Explorer should block when InPrivate Blocking is turned on.

InPrivate Filtering (PN)~ The feature that blocks third-party web content that could potentially track someone's web activity.

InPrivate Filtering data (n)~ Saved data used by InPrivate Blocking to detect where Web sites may be automatically sharing details about your visit.

InPrivate Subscription (PN)~ A list of Web sites from which to block or allow content downloads. Users are able to visit these Web sites but content such as images, scripts, and style sheets may be blocked.

in-process (adj)~ A host type that operates within the BizTalk Server process space. Any orchestration can be enlisted to an in-process host, and any send handler can be hosted by it. In-process hosts can only host receive handlers for in-process hosts (File and MSMQT).

in-process (adj)~ Pertaining to Internet Server API (ISAPI) extensions that are hosted in the worker process address space.

in-process server (n)~ An object application that runs in the same process space as the Automation controller.

input adapter (n)~ An adapter that accepts incoming event streams from external sources such as databases, files, ticker feeds, network ports, manufacturing devices and so on.

input cell (n)~ The cell in which each input value from a data table is substituted. Any cell on a worksheet can be the input cell. Although the input cell does not need to be part of the data table, the formulas in data tables must refer to the input cell.

input device (n)~ A peripheral device whose purpose is to allow the user to provide input to a computer system. Examples of input devices are keyboards, mice, joysticks, and styluses.

input endpoint (n)~ The endpoint on which a role instance receives inbound traffic.

input event (n)~ The set of software events that provide applications with information

about changes on the device, computer or Surface screen. There are two types of input events: input primitives and derived input.

input field (n)~ A space in an on-screen form where the user can enter a specific item of information.

input focus (n)~ The location where the user is currently directing input.

input focus appearance (n)~ The visual display of a control or other object that indicates it has the input focus.

input mask (n)~ A format that consists of literal display characters (such as parentheses, periods, and hyphens) and mask characters that specify where data is to be entered as well as what kind of data and how many characters are allowed.

input member (n)~ A member whose value is loaded directly from the data source instead of being calculated from other data.

input method editor (PN)~ A tool that lets you enter complex characters and symbols, such as those used in East Asian written languages, using a standard keyboard.

Input Panel (n)~ A Tablet PC accessory that enables you to use handwriting, speech, or an on-screen keyboard to enter text, symbols, numbers, or keyboard shortcuts. You can use it to interact with any Windows-based program.

input panel (n)~ A software accessory that enables you to use a variety of direct input methods (such as handwriting, speech, touch, stylus, gestures, and so on) to interact with Windows-based programs. An input panel can include a writing pad and a character pad to convert handwriting into typed text or mathematical equations, and an on-screen keyboard to enter individual characters.

input primitive (n)~ The type of input event that serves as a basis from which all other events are derived. Input primitives are the lowest level of input event and are not impacted by application context. Input primitives include ObjectAdded, ObjectRemoved, and ObjectUpdated.

input scope (n)~ The type of handwritten or voice-dictated value being entered in an input control on the TabletPC, for example, Number, Date or Currency. This allows for better and faster recognition by the TabletPC recognizer.

input scope (n)~ A set of words, numbers, punctuation, and syntactical orderings that are allowed within a specific language model.

input set (n)~ The set of data provided to a Multidimensional Expressions (MDX) value expression upon which the expression operates.

input source (n)~ Any table, view, or schema diagram used as an information source for a query.

Input Source Identification API (PN)~ A native API that, when an app gets input, tells the app what kind of hardware it came from.

input stream (n)~ A flow of information used in a program as a sequence of bytes that are associated with a particular task or destination. Input streams include series of characters read from the keyboard to memory and blocks of data read from disk files.

input VAT (n)~ The tax on an organization's purchases or input supplies, which is levied on the purchase price.

input/output (n)~ The complementary tasks of gathering and distributing data. Input is data that is acquired from a device or entered by the user through a device. Output is data

that is sent to a device.

input/output port (n)~ A channel through which data is transferred between a device and the microprocessor. The port appears to the microprocessor as one or more memory addresses that it can use to send or receive data.

INR (n)~ The official currency of India.

In-Role Cache (PN)~ The Microsoft Azure Cache feature that provides caching functionality hosted on a role instance.

In-Role Cache for Microsoft Azure Cache (PN)~ The Microsoft Azure Cache feature that provides caching functionality hosted on a role instance.

in-schema property (n)~ A metabase property predefined in the metabase schema file.

insensitive cursor (n)~ A cursor that does not reflect data modification made to the underlying data by other users while the cursor is open.

insert (n)~ A mode in which any data to the right of the cursor is moved to the right as you type.

insert (v)~ To add new text, objects or cells without overwriting existing data.

insert event (n)~ The event kind used to signify the arrival of an event into the stream. The insert event type consists of metadata that defines the valid lifetime of the event and the payload (data) fields of the event.

Insert Into query (n)~ A query that copies specific columns and rows from one table to another or to the same table.

INSERT key (n)~ A key on the keyboard, labeled Insert' or 'Ins'

Insert Screen Shot (PN)~ A feature that allows the user to insert the contents of an open window or a screen clipping into the current document without the need to utilize external applications.

Insert Values query (n)~ A query (SQL statement) that creates a new row and inserts values into specified columns.

insert/eject port (n)~ A port in a library that transports tapes to and from library slots.

insertion point (n)~ The location where text or graphics will be inserted. Also used for text box controls to indicate input focus.

inset window (n)~ The window in the lower left corner of the screen. The inset window displays currently playing TV, video, DVDs, or the album art for music that is playing.

inside-out activation (n)~ A technique that allows a user to directly interact with the content of an embedded object without executing an explicit activation command.

Insider (PN)~ Promotional newsletter sent to Windows Live customers containing feature tips and links to web content.

Insider Fast (PN)~ An option for getting Insider preview builds first before most Insider users.

Insider Hub (PN)~ The app in the operating system where the user can manage the builds in the Windows Insider- Program.

Insider Program (PN)~ ?An external program that enables participants (called Insiders') to provide feedback on Windows new features.'

Insider Slow (PN)~ An option for getting Insider preview builds after first Insider users.

insourcing ~ The process of separating the IS organization from the enterprise, usually as a business unit measured by its own profit and loss. The insourced IS organization

provides the enterprise with IT services on a business-rules basis.

inspection (n)~ The examination of a good or service to ensure that it complies with specifications.

inspection item (n)~ An itemized product that participates in an inspection process.

Inspection Mode (PN)~ The mode in which Page Inspector provides instantaneous visual mapping between the integrated browser, Source view, and CSS. Selecting an element in the browser shows the exact lines of code or markup that generated the element that was selected.

Instagram (PN)~ An app that users can install on an iPhone or Android device to share photos and videos with other people who have the app or who have accounts on Facebook, Flikr, or Twitter.

Instagram ~ Instagram is an online mobile photo-sharing, video-sharing and social networking service that enables its users to take pictures and videos, and share them on a variety of social networking platforms. The name 'Instagram' is a portmanteau of 'instant camera' and 'telegram'

install (v)~ When referring to hardware, to physically connect the device to your computer, to load device drivers onto your computer, and to configure device properties and settings.

install (v)~ When referring to software, to load the program and installation files onto your computer or device so that the program runs correctly.

Install ~ To transfer a program or programs from CD ROM or DVD onto a PC's hard disk. Most programs need to be installed before they can be used, though a few can be run directly from the floppy or CD.

Install and Configure Mode (PN)~ A mode that enables administrators to configure User Account Control to run in auto-elevation mode (i.e. -€œauto-approval-€?) for specific times.

install point (n)~ A folder on a network or a location that is available to client computers for the installation of a program or application.

installable ISAM (n)~ A driver you can specify that allows access to external database formats such as dBASE, Excel, and Paradox. The Microsoft Access database engine installs (loads) these ISAM drivers when referenced by your application.

installation (n)~ The process of adding software to a computer system.

Installation directory (n)~ The directory where the installer for the application virtualization sequencer places its files.

installation folder (n)~ The location where a software is installed.

installation history (n)~ A chronological list of activities associated with license management.

installation item (n)~ A unit of deployment that can be included in a deployment package. An installation item can include an executable a configuration setting or a data file. For example the GPRS Network Settings installation item configures the GPRS settings on the device.

installation manifest (n)~ The settings and dependency information that ACT Data Collector needs to install and run the compatibility evaluators. The installation manifest includes installation information for every compatibility evaluator.

installation phase (n)~ The phase where one of the three Sequencing Wizards (the Installation Wizard) gathers information for monitoring an application's installation and launch.

Installation Wizard (n)~ The wizard that installs the Windows Server Centro' software.'

Installation Wizard (n)~ The wizard that gathers information for monitoring an application's installation and launch during the installation phase.

installed language (n)~ The base language used that governs how several language characteristics will behave, such as the language of the primary dictionary, and the direction and alignment of text (left-to-right or right-to-left).

installer (n)~ A program, provided with the Apple Macintosh operating system, that allows the user to install system upgrades and make bootable (system) disks.

installer (n)~ A program that unpacks installation data and writes it on the user's hard drive.

instance (n)~ An object in relation to the class to which it belongs. For example, an object myList that belongs to a class List is an instance of the class List.

instance (n)~ A copy of SQL Server running on a computer.

instance (n)~ A copy of a master, which you create by dragging the master from a stencil to a drawing.

instance (n)~ A unique occurrence of a runbook that is running on a runbook server.

instance (n)~ A unique occurrence of an application, such as Microsoft Dynamics CRM or Netbreeze, for online customers.

instance count (n)~ The number of virtual machines to deploy for a given tier of a service.

instance hour (n)~ A unit of measure of time for a resource instance.

instance message (n)~ A discrete unit of run-time data flowing through BizTalk Server, usually representing a particular business document such as a purchase order, and as differentiated from the BizTalk Server schema that defines its structure.

instance provider (n)~ A COM server that supplies instances of classes and implements methods of the IWbemServices interface to support data retrieval, modification, deletion, enumeration, or query processing.

Instance-level Public IP (PN)~ The service type of the Networking service that enables users to obtain and assign public IP addresses to virtual machines so that they become directly addressable.

Instant Answers (PN)~ A feature in Live Search that provides answers to basic search queries, such as What is the population of Mumbai?"

Instant Answers (n)~ A search feature that enables users to instantly find answers on the results page for topics such as weather, reference, celebrities, movies, books, and top local listings without having to hunt for it from link to link.

instant message (n)~ A message sent in real time through a network to a private chat area.

instant message (v)~ To send an instant message.

instant message conversation (n)~ A real-time communication over the Internet in which a sender types a message to one or more recipients and the recipient(s) immediately receives the message in a pop-up window.

instant message session (n)~ A real-time communication over the Internet in which a

sender types a message to one or more recipients and the recipient(s) immediately receives the message in a pop-up window.

instant messaging (n)~ Pertaining to a message sent in real time through a network to a private chat area.

instant messaging (n)~ A method of real-time communication over the Internet in which a sender types a message to one or more recipients and the recipient immediately receives the message in a chat area.

instant messaging session (n)~ A real-time communication over the Internet in which a sender types a message to one or more recipients and the recipient(s) immediately receives the message in a pop-up window.

Instant Search (PN)~ A search feature associated with folders and programs that begins to display results as soon as a keyword is entered. When you enter text, files in the current view are automatically filtered to show only those that match what you typed.

Instant Search (PN)~ A search feature that provides immediate results to users.

Instant Viewer (n)~ A feature that enables instant access to any open window. With a single click, all open windows are scaled down and rearranged to be viewed in a grid fashion.

InstantGo (PN)~ The collection of networking and system components that lets devices turn on instantly, keep apps and data up to date even when devices are sleeping, and use batteries more efficiently.

instantiate (v)~ To create an instance of an object in object-oriented programming.

Institute of Electrical and Electronic Engineers (PN)~ A society of engineering and electronics professionals based in the United States but boasting membership from numerous other countries/regions. The IEEE (pronounced eye triple ee') focuses on electrical

in-stock (adj)~ Describes an item that is in inventory in a quantity above the Stock-Out Threshold.

instruction (n)~ An action statement in any computer language, most often in machine or assembly language. Most programs consist of two types of statements: declarations and instructions.

Instructional tools (PN)~ The Education subcategory containing apps for teachers.

instrument (v)~ To tag the source code in order to measure the amount of time spent in each area.

Instrumental (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 33.

Instrumental pop (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 46.

Instrumental rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 47.

instrumentation (n)~ A profiling technique that involves inserting diagnostic probes into the program being profiled.

instrumentation overhead (n)~ An increase in the time it takes code to run when you instrument a binary. The increase is caused by additional code, known as a probe, that is inserted to monitor application performance.

instrumented module (n)~ A binary file that contains profiling probe functions.

intangible cost (n)~ A cost that cannot be physically measured, such as the cost of poor quality.

intangible fixed asset (n)~ A non-physical fixed asset that a company uses to conduct its business.

integer (n)~ A data type representing whole numbers. Calculations involving only integers are much faster than calculations involving floating-point numbers, so integers are widely used in programming for counting and numbering purposes. Integers can be signed (positive or negative) or unsigned (positive). They can also be described as long or short, depending on the number of bytes needed to store them. Short integers, stored in 2 bytes, cover a smaller range of numbers (for example, -32,768 through 32,767) than do long integers (for example, -2,147,483,648 through 2,147,483,647), which are stored in 4 bytes.

integer (n)~ A natural number, zero, or the negative of a natural number.

Integer data type (n)~ A fundamental data type that holds integers. An Integer variable is stored as a 16-bit (2-byte) number ranging in value from -32,768 to 32,767.

integer field (n)~ A type of field whose content is a whole number. Examples include the ID and Unique ID fields.

integral (adj)~ Of or pertaining to a data type representing whole numbers.

integral data type (n)~ A C++ type that represents only whole numbers.

integral type (n)~ A C++ type that represents only whole numbers.

integrated development environment (n)~ A set of integrated tools for developing software. The tools are generally run from one user interface and consist of a compiler, an editor, and a debugger, among others.

integrated device electronics (n)~ A type of disk-drive interface in which the controller electronics reside on the drive itself, eliminating the need for a separate adapter card. IDE offers advantages such as look-ahead caching to increase overall performance.

integrated drive electronics (n)~ A type of disk-drive interface in which the controller electronics reside on the drive itself, eliminating the need for a separate adapter card. IDE offers advantages such as look-ahead caching to increase overall performance.

Integrated mode (n)~ A compatibility mode for managed content. When an application pool is configured to use Integrated mode, the server will use the integrated, request-processing pipelines of IIS and ASP.NET to process the request.

integrated pipeline (n)~ A unified request processing pipeline that is running in Integrated mode. In the integrated pipeline, custom modules and handlers in a Web application can be configured to subscribe to notifications for all requests to the application, not just requests for ASP.NET-specific resources.

integrated security (n)~ A security mode that leverages the Windows authentication process.

Integrated Services Digital Network (n)~ A high-speed digital technology that uses existing telephone lines to provide Internet access.

Integrated Windows authentication (n)~ A configuration setting that enables negotiation

of authentication protocols in Internet Information Services (IIS).

Integration (INT) data center environment (n)~ An environment that is intended for internal testing, integration, evaluations, and demonstration computers. It is also used the first time you complete the process of creating the master image and testing the image and recovery process.

Integration environment (n)~ An environment that is intended for internal testing, integration, evaluations, and demonstration computers. It is also used the first time you complete the process of creating the master image and testing the image and recovery process.

integration pack (n)~ A collection of custom activities that is specific to a product or a technology.

integration service (n)~ The category of services in Microsoft Azure that includes Service Bus, Workflow, and EAI.

integration services (n)~ A collection of services and software drivers that maximize performance and provide a better user experience within a virtual machine. Integration services are only available for supported guest operating systems.

integrity (n)~ The accuracy of data and its conformity to its expected value, especially after being transmitted or processed.

integrity checking (n)~ A task that the Trusted Platform Module (TPM) performs by confirming that the SHA-1 computed hash of each system component that runs during boot matches the values that are stored in platform configuration registers (PCRs) at the time BitLocker Drive Encryption was turned on. If the state of early boot components is different from the static root of trust measurement, BitLocker boots to recovery mode until the authorized user enters the recovery password.

integrity constraint (n)~ A property defined on a table that prevents data modifications that would create invalid data.

integrity level (n)~ A number that represents how trustworthy a particular process, application, or object is.

integrity SID (n)~ A security ID (SID) that represents an integrity level. An object's system access control list (SACL) and access token can contain one or more integrity SIDs. Integrity SIDs in the access token determine the level of access given to a process attempting to access an object.

Intel ~ The Intel Corporation is the leading manufacturer of- processorchips for PCs, most famously the- Pentium.

Intel Active Management Technology (n)~ An Intel networking management technology that is supported by Configuration Manager out of band management, which enables a Configuration Manager administrator to manage desktop computers independently from the Configuration Manager client or the computer operating system.

Intel Architecture Personal Computer (n)~ Any computer built with a processor that conforms to the architecture defined by the Intel processor family based on the 486 instruction set and has an industry-standard computer architecture.

intellectual genre (n)~ A classification that describes the nature of content, e.g. sermon, interview, etc., rather than the content itself.

intelligent drive electronics (n)~ A type of disk-drive interface in which the controller

electronics reside on the drive itself, eliminating the need for a separate adapter card. IDE offers advantages such as look-ahead caching to increase overall performance.

Intelligent IM Filter (n)~ A security feature of Office Communications Server, or Live Communications Server 2005 with SP1, that administrators can configure to prevent specified types of URLs and files from being transferred in an instant message conversation.

Intelligent Instant Message Filter (n)~ A security feature of Office Communications Server, or Live Communications Server 2005 with SP1, that administrators can configure to prevent specified types of URLs and files from being transferred in an instant message conversation.

Intelligent Message Filter (n)~ The underlying technology of the Exchange Server content filter that evaluates inbound mail and assesses the probability that an inbound e-mail message is either a legitimate message or spam.

Intelligent Routing (PN)~ A feature of Group Filtering that routes SMTP addresses to specific delivery locations based on group names and associations, even if all users share the same domain.

Intelligent Systems Service (PN)~ The service type of the App Services service that provides a management service for intelligent systems through Microsoft Azure.

IntelliSense (PN)~ A feature of an integrated development environment (IDE) that provides logical code elements that the user can select from a drop-down menu while coding.

IntelliSense in Zone (n)~ A Visual Basic IntelliSense feature that displays certain items in the statement completion list in a different color if they do not have enough permission to run in the security zone specified. This design-time support allows you to run applications in partial trust.

IntelliTrace (PN)~ A feature for debugging a managed application at specific points in time. It captures and records what the application does while it is running. When an error occurs, you can view the state of the application at any time from the start to the point of the error.

Intellitrace Collection Plan Fragment (n)~ A fragment of the collection plan, which is a set of options that details to the actual IntelliTrace.exe program (which is executed under the covers by Visual Studio or Microsoft Test Manager) exactly what data should be collected, when that data should be collected and how to create the resulting log file.

IntelliTrace Collector for Visual Studio (PN)~ The IntelliTrace collector is a standalone tool that you can use to collect IntelliTrace data from apps that are running in production environments.

IntelliTrace file (n)~ The file containing information that is collected by IntelliTrace. The file name extension is .iTrace.

Intense Violence (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

intensive care unit (n)~ A section of a hospital that provides comprehensive care for critically ill patients requiring immediate and continuous attention.

intent lock (n)~ A lock that is placed on one level of a resource hierarchy to protect shared or exclusive locks on lower-level resources.

intent share (n)~ A lock that is placed on one level of a resource hierarchy to protect shared or exclusive locks on lower-level resources.

Inter VNET Data Transfer (PN)~ The resource of the Virtual Network service type of the Networking service for data transfers between virtual networks.

interaction (n)~ A pattern or sequence of message exchanges that accomplishes a purpose, such as performing an operation. Objects in a collaboration interact by exchanging messages. Messages can be signals or calls and can include conditions and time events.

interaction (n)~ The direct manipulation (e.g. a gesture and inertia) of an element.

interaction designer (n)~ A designer who develops user interfaces and determines how a user will interact' with a piece of software (i.e. click through menus

Interaction Role (PN)~ A user role within Social Engagement that defines the permissions a user has in regard to interacting with posts.

interactive (adj)~ Characterized by conversational exchange of input and output, as when a user enters a question or command and the system immediately responds. The interactivity of microcomputers is one of the features that makes them approachable and easy to use.

Interactive Button (n)~ An animated button on a web page that is activated when a mouse pointer is moved over the button or when the button is clicked.

interactive demo (n)~ A demonstration of a product or service that a customer interacts with to see how features work.

interactive desktop (n)~ A Windows desktop session running with an interactive user's access token applied.

interactive dialog box (n)~ A dialog box that requires a response from the user. Intermediary devices such as a security host require such a dialog box as an added layer of security between the client and the remote access server. In such dialog boxes, the user types an access code or a user name and password on the remote access terminal screen.

interactive logon (n)~ The process of logging on to a local computer using a keyboard.

interactive structured query language (n)~ An interactive command prompt utility provided with SQL Server that lets users run Transact-SQL statements or batches from a server or workstation and view the results that are returned.

interactive user (n)~ A user that is interacting directly with the user interface of the computer, by using the local console, Remote Desktop Services, or Remote Desktop.

interactive view gallery (n)~ A gallery of objects that provides different ways of visualizing data.

interactive voice response (n)~ An automated telephone information system that interacts with a caller through fixed voice menus and real-time data from databases.

interactivity (n)~ The quality of a web page that enables an action by the user as an opportunity for the user to interact with the objects and elements on the page.

interceptor (n)~ A mechanism used to extract and store data from processing streams.

interchange (n)~ A collection of one or more document instances that comprises a single transmission and is exchanged from application to application within an organization or from one trading partner to another.

interchange header (n)~ In EDI, a part of an interchange, or group of logically associated

documents, used to indicate the start of the interchange.

interchange trailer (n)~ In EDI, a part of an interchange, or group of logically associated documents, used to indicate the end of the interchange.

intercompany (adj)~ Relating to interactions between two or more internal companies.

intercompany (adj)~ Occurring between or relating two or more legal entities that are part the same organization that consolidates the accounts of all legal entities.

intercompany account (n)~ An account used to post intercompany transactions.

intercompany customer (n)~ An internal company that acts as a customer to another internal company. When a company does not satisfy an original sales order, that company becomes an intercompany customer when it directs a purchase order to another internal company to satisfy the original sales order.

intercompany customer invoice (n)~ A customer invoice that documents a customer payment request from one legal entity to another legal entity that is part of the same organization that consolidates the accounts of both legal entities.

intercompany dimension (n)~ A system-maintained dimension that consists of only those entities that are involved in intercompany transactions with other entities in the system.

intercompany economic transaction (n)~ An economic transaction between legal entities that are part of the same organization that consolidates the accounts of the legal entities.

intercompany elimination (n)~ The elimination of intercompany transactions during preparation of a consolidated balance sheet or income statement. Such transactions can include, for example, intercompany loans or investments between parent and subsidiary.

intercompany master plan (n)~ A master plan that is used for intercompany master scheduling.

intercompany master scheduling (n)~ The process for generating a timetable for two or more legal entities that are part the same organization.

intercompany payment journal (n)~ A journal that is used to post intercompany payments.

intercompany purchase order (n)~ A purchase order that one legal entity generates from a sales order sent by another legal entity that is part of the same organization that consolidates the accounts of both legal entities.

intercompany purchase order invoice (n)~ A purchase order invoice that is created from an intercompany purchase order and posted to an intercompany account.

intercompany reconciliation (n)~ The elimination of intercompany transactions during preparation of a consolidated balance sheet or income statement. Such transactions can include, for example, intercompany loans or investments between parent and subsidiary.

intercompany sales invoice (n)~ A sales invoice that is created from an intercompany sales order and posted to an intercompany account.

intercompany sales order (n)~ A sales order that one legal entity places with another legal entity that is part of the same organization that consolidates the accounts of both legal entities.

intercompany trade (n)~ Trade between subsidiaries or distribution centers within the same enterprise.

intercompany transaction (n)~ A transaction that contains distributions to another

company within the same legal entity.

intercompany vendor (n)~ A legal entity that assumes the role of a vendor that is authorized to supply products to one or more legal entities that are part of the same organization that consolidates the accounts of all of the legal entities.

intercompany vendor invoice (n)~ A vendor invoice that documents a vendor payment request from one legal entity to another legal entity that is part of the same organization that consolidates the accounts of both legal entities.

interconnect (n)~ A private network that connects nodes in a cluster.

interest (n)~ An amount charged for the use of money or credit.

interest (n)~ A subject that Cortana shows the user in Cortana home either because the user explicitly added the subject using the Interests feature or because Cortana inferred this subject interests the user from questions the user answered.

interest note (n)~ A source document that documents an interest payment obligation.

Interest Tracker (PN)~ A Web Part that displays recent activities corresponding to identified areas of interest.

interesting function (oth)~ A function is 'interesting' if APM has been configured to collect it. Operations Manager comes with a predefined list of well known functions; additional methods can be added to customize monitoring.

interests (PN)~ A feature in Cortana's Notebook where the user can add anything he would like to keep track of in Cortana. Tracking an interest means that Cortana will show updates related to that interest whenever the user opens Cortana.

interface (n)~ Software that enables a program to work with the user (the user interface, which can be a command-line interface, menu-driven, or a graphical user interface), with another program such as the operating system, or with the computer's hardware.

interface (n)~ A card, plug, or other device that connects pieces of hardware with the computer so that information can be moved from place to place. For example, standardized interfaces such as RS-232-C standard and SCSI enable communications between computers and printers or disks.

interface (n)~ The point at which a connection is made between two elements so that they can work with each other or exchange information.

interface (n)~ A defined set of properties, methods, and collections that form a logical grouping of behaviors and data.

interface (n)~ A reference type that defines a contract. Other types implement an interface to guarantee that they support certain operations. The interface specifies the members that must be supplied by classes or other interfaces that implement it. Like classes, interfaces can contain methods, properties, indexers, and events as members.

interface ~ Connection between two systems or devices.

interface ~ A display technique, used primarily in the early 1990s, that enables a monitor to provide more resolution inexpensively.

interface ~ The preparation a graphic image so that alternating rows are displayed in separate passes. Interlaced images give a unique effect because the entire image is displayed quickly and then details are filled in gradually.

interface definition language (n)~ In object-oriented programming, a language that lets a program or object written in one language communicate with another program written in

an unknown language. An IDL is used to define interfaces between client and server programs. For example, an IDL can provide interfaces to remote CORBA objects.

interface flapping (n)~ In computer networking and telecommunications, a situation that occurs when an interface on a router experiences a hardware failure that causes the router to announce itself alternately as available or unavailable.

interface implication (n)~ If an interface implies another interface, then any class that implements the first interface must also implement the second interface. Interface implication is used in an information model to get some of the effects of multiple inheritance.

intergroup adapter (n)~ A BizTalk Server adapter that targets intranet/LAN communication between two BizTalk Server groups without requiring intermediate storage.

interim plan (n)~ A set of task start and finish dates that you can save at certain stages of your project. You can compare an interim plan with the baseline plan or current plan to monitor project progress or slippage. You can save up to 10 interim plans.

interior gateway protocol (n)~ A protocol used for distributing routing information among routers (gateways) in an autonomous network-that is, a network under the control of one administrative body. The two most often used interior gateway protocols are RIP (Routing Information Protocol) and OSPF (Open Shortest Path First).

interlace (v)~ To display a video frame in two fields. One field contains the even lines of the frame, the other field contains the odd lines. During playback, the lines in one field are displayed first, then the lines in the second field are displayed.

Interlaced GIF (n)~ A picture in GIF format that is gradually displayed in a Web browser, showing increasingly detailed versions of the picture until the entire file has finished downloading.

interlaced video (n)~ The traditional television system of display in which separate fields of odd-numbered scan lines and even-numbered lines are interlaced between each other.

intermediate CA (n)~ A certification authority that has the ability to issue the intermediate certificates needed to certify the subject identified by the end certificate.

intermediate certificate (n)~ A certificate that authenticates another certificate in a certificate chain.

intermediate certification authority (n)~ A certification authority that has the ability to issue the intermediate certificates needed to certify the subject identified by the end certificate.

intermittent (adj)~ Pertaining to something, such as a signal or connection, that is not unbroken but occurs at periodic or occasional intervals.

internal command (n)~ A routine that is loaded into memory along with the operating system and resides there for as long as the computer is on.

internal company (n)~ A company that is part of an intercompany organization and that is linked to other internal companies within the same organization, either as a customer or as a vendor.

internal context (n)~ In the Concurrency Runtime, a context that the Task Scheduler creates and uses to run tasks.

Internal hyperlink (n)~ A region in text or graphics that you click to access another page

within the same web site.

internal IM (n)~ Instant messaging with internal users.

internal IP address (n)~ An IP address that is assigned for the internal network of an organization.

internal lead time (n)~ The lead time for an intercompany sales order.

internal message (n)~ A message originating within a given domain, where all the recipients are within the same domain.

internal modem (n)~ A modem constructed on an expansion card to be installed in one of the expansion slots inside a computer.

internal movement (n)~ The process that warehouse employees follow to move items from one bin to another bin without using a source document.

internal network number (n)~ A 4-byte hexadecimal number used for addressing and routing purposes. The internal network number identifies a virtual network inside a computer. The internal network number must be unique to the IPX internetwork.

internal note (n)~ A note added by an internal party, such as Support, to use for their own reference. Customers will not see these notes.

internal port (n)~ A port on a computer that is available only on to users who are connected to an organization's network.

internal private queue (n)~ For Message Queuing, a queue that stores various types of administrative messages, or an interim queue for storing and forwarding messages in transit to a destination queue. Internal private queues are not displayed in Microsoft Management Console (MMC) snap-ins, and they cannot be deleted.

internal processing time (n)~ The amount of time a function spends doing internal execution, as opposed to calling other functions.

internal project (n)~ A project without a direct customer relation.

internal release (n)~ The process of getting the product to a known state and incrementally building upon it.

internal release (n)~ An interim milestone of the developing phase, leading to the scope complete milestone.

internal release (n)~ Early or incomplete releases of one's own product, software, or services that aren't final and are put into use to test the viability, compatibility, or stability of a planned release. Although a dogfood release is often thought of as being used only internally, partners or enthusiasts may also be invited to try it.

Internal Revenue Service (PN)~ The federal revenue agency under the United States Department of the Treasury that is responsible for the collection of taxes in addition to the interpretation and enforcement of federal tax laws.

internal router (n)~ A router for which all the networks that it is connected to belong in the same area.

internal self-transition (n)~ A transition segment that begins and ends on the same state context, and that has neither a chained incoming transaction nor a chained outgoing transaction. This transition is a combination of the group and history transitions.

internal style (n)~ A style in an internal style sheet.

internal style sheet (n)~ A style sheet contained in an ASP.NET mobile Web Forms page.

Internal Use Rights (n)~ A benefit for Microsoft Partners that gives partner organizations

firsthand knowledge of product features and capabilities.

internal user (n)~ A user with Active Directory credentials who connects from locations inside the corporate firewall.

internal users only meeting (n)~ A meeting in which all participants have Active Directory credentials and connect from within the corporate firewall.

internal virtual network (n)~ A virtual network that is configured to use no network adapter. Internal virtual networks are used to connect virtual machines running on the same instance of Virtual Server. All network traffic is confined to the computer running Virtual Server.

internal Web site (n)~ A Web site created within an organization and available only on the intranet for that organization. An internal Web site is accessible only to members of that organization.

international access code (n)~ The prefix that is used to direct a call internationally. The International Access Code is 011 in the United States and 00 in much of the rest of the world.

international ACH transaction (n)~ An Automated Clearing House (ACH) funds transfer between an originating party and a receiving party that involves at least one depository financial institution that is not located in the territorial jurisdiction of the United States.

International assist (PN)~ A feature that helps correct some common mistakes while dialing internationally or dialing while abroad.

International Bank Account Number (n)~ An account number scheme that is recognized by banks internationally to facilitate credit transfers across national/regional borders.

International Date Line West (PN)~ A standardized time zone where the local time is 12 hours earlier than Coordinated Universal Time/Greenwich Mean Time.

International Electrotechnical Commission (n)~ One of two international standards bodies responsible for developing international data communications standards. The International Electrotechnical Commission (IEC) works closely with the International Organization for Standardization (ISO) to define standards of computing. They jointly published the ISO/IEC SQL-92 standard for SQL.

International Financial Reporting Standards (n)~ Accounting standards that must be used as of January 1, 2005 for European Union-based companies with publicly traded shares or debt, subsidiaries for which consolidated accounts must be prepared, or companies with subsidiary or associate companies of a European Union-listed company.

international format (n)~ A phone number format for dialing any call from any location or with a calling card.

International List (n)~ A list that includes two lists. One list allows you to block top-level domain names, including country codes, and the other list allows you to block a language encoding or character set.

international number format (n)~ The string that is used to define how to dial someone from outside of their country/region.

International Organization for Standardization (n)~ An international association of 157 countries/regions, each of which is represented by its leading standard-setting

organization-for example, ANSI (American National Standards Institute) for the United States. The ISO works to establish global standards for communications and information exchange. Primary among its accomplishments is the widely accepted ISO/OSI reference model, which defines standards for the interaction of computers connected by communications networks.

International System of Units (PN)~ The international metric system of units of measurement.

International Telecommunication Union (PN)~ An international organization based in Geneva, Switzerland, that is responsible for making recommendations and establishing standards governing telephone and data communications systems for public and private telecommunications organizations. Founded in 1865 under the name International Telegraph Union, it was renamed the International Telecommunication Union in 1934 to signify the full scope of its responsibilities. ITU became an agency of the United Nations in 1947. A reorganization in 1992 aligned the ITU into three governing bodies: the Radiocommunication Sector, the Telecommunication Standardization Sector (ITU-TSS, ITU-T, for short; formerly the CCITT), and the Telecommunication Development Sector.

internationalized domain name (n)~ An Internet domain name that can accommodate non-ASCII characters such as the diacritical marks of European language or non-Latinate characters such as those found in Chinese, Korean or Arabic.

internet (n)~ Two or more network segments connected by routers.

Internet (n)~ The worldwide collection of networks and gateways that use the TCP/IP suite of protocols to communicate with one another.

Internet ~ A vast worldwide network of computers, accessible to anyone with a computer and a phone line. Provides access to e-mail and the World Wide Web. The Internet grew out of the need of academics to swap information with colleagues all over the world, and of the US military's need for a- computer and communications network that couldn't easily be knocked out. As a result it is very difficult to censor, since anything placed on the World Wide Web from anywhere is instantly available everywhere in the world.

Internet ~ The word 'internet' literally means 'network of networks'. In itself, the Internet is comprised of thousands of smaller regional networks scattered throughout the globe.

Internet access (n)~ The capability of a user to connect to the Internet.

Internet access provider (n)~ A business that supplies Internet connectivity services to individuals, businesses, and other organizations. An ISP provides a telephone number, a user name, a password, and other connection information so that users can access the Internet through the ISP's computers.

Internet account (n)~ A generic term for a registered username at an Internet Service Provider (ISP). An Internet account is accessed via username and password. Services such as dial-in PPP Internet access and e-mail are provided by ISPs to Internet account owners.

Internet address (n)~ An address for a resource on the Internet that is used by Web browsers to locate Internet resources. An Internet address typically starts with a protocol name, followed by the name of the organization that maintains the site; the suffix identifies the kind of organization it is.

Internet APN (n)~ An APN (Access Point Name) that determines the cellular data networks to which a phone can connect. It includes information about what kind of

connection, security, and type of IP address the phone should use for the Internet connection.

Internet audio broadcasting (n)~ One-way transmission over the Internet of Live Meeting audio.

Internet Backgammon (PN)~ An Internet game that is played by two players on a virtual board with pieces called stones that move forward according to the roll of dice until the winner removes all of his stones from the board.

Internet Calling (PN)~ A feature that lets you use the Internet to make a phone call.

Internet Checkers (PN)~ An Internet game that is played by two players on a virtual chessboard of 64 squares. Players only play on the dark squares and aim at capturing all of their opponent's pieces by jumping over them.

Internet connection (n)~ A connection between the user's device and a server that provides access to the Internet, typically through an Internet service provider.

Internet Connection Firewall (n)~ A Network Connections feature that is used to set restrictions on what traffic is allowed to enter your network from the Internet.

Internet Connection Sharing (n)~ A Microsoft Windows technology that provides home and small-office computer users who have networked computers with the ability to share a single connection to the Internet.

Internet Connectivity Evaluation Tool (PN)~ An online tool that checks your existing Internet router to see if it supports certain technologies and advanced features, such as improved download speeds and face-to-face collaboration using Windows Meeting Space. This tool is intended to be run from a home network behind a home Internet (NAT) router.

Internet content provider (n)~ An organization that prepares content for posting on the Web.

Internet Content Rating Association (n)~ An international nonprofit group that has developed a content advisory service for the Internet. ICRA's aim is to protect children from potentially harmful material on the Internet.

Internet Control Message Protocol (n)~ A required maintenance protocol in the TCP/IP suite that reports errors and allows simple connectivity. ICMP is used by the Ping tool to perform TCP/IP troubleshooting.

Internet Directory (n)~ Storage place for information such as names, Web addresses, organizations, departments, countries/regions, and locations. Typically, Internet Directories are used to find e-mail addresses that are not in a local address book or a corporate-wide directory.

Internet domain name (n)~ An address of an Internet connection that identifies the owner of that address in a hierarchical format. For example, www.whitehouse.gov identifies the Web server at the White House, which is a government agency.

internet e-mail address (n)~ A string that identifies a user so that the user can receive Internet email. An email address on the Internet typically consists of an account name, followed by the @ (at) symbol, a host name, and a domain name.

Internet Engineering Task Force (n)~ A worldwide organization of individuals interested in networking and the Internet. Managed by the IESG (Internet Engineering Steering Group), the IETF is charged with studying technical problems facing the Internet and proposing solutions to the IAB. The work of the IETF is carried out by various

Working Groups that concentrate on specific topics, such as routing and security.

Internet Explorer (PN)~ The Microsoft web browser.

Internet Explorer 10 (PN)~ The touch-optimized, immersive web browser for Windows.

Internet Explorer 10 Consumer Preview (PN)~ A nonfinal release of Internet Explorer 10.

Internet Explorer 10 Release Preview (PN)~ A nonfinal release of Internet Explorer 10 that follows the consumer preview.

Internet Explorer Administration Kit (n)~ A set of tools that enables corporate administrators, ISPs, and ICPs to create, distribute, and manage customized Internet Explorer packages across an organization. The IEAK contains the Internet Explorer Customization Wizard, the IEAK Profile Manager and the IEAK Toolkit.

Internet Explorer Compatibility Evaluator (PN)~ A compatibility evaluator that works with Internet Explorer 7 to verify whether a Web application or Web site will have compatibility issues when used on a new operating system, such as Microsoft Windows- Vista. IECE also works with Internet Explorer to create and process log files regarding visited Web sites and applications. The log files show compatibility issues for both the user and the ACT Log Processing Service.

Internet Explorer Compatibility Test Tool (PN)~ A tool that provides a user interface that enables you to display data about your Internet Explorer issues in real-time, including allowing you to filter your results and upload your data to your ACT database using the ACT Log Processing Service.

Internet Explorer Developer Toolbar (PN)~ A toolbar for developers in Internet Explorer that provides a variety of tools for quickly creating, understanding, and troubleshooting Web pages.

Internet Explorer for the desktop (PN)~ The web browser component of Windows that provides a traditional and familiar browsing experience.

Internet forum (n)~ A medium provided by an online service for users to carry on written discussions of a particular topic by posting messages and replying to them.

Internet game (n)~ A desktop application that connects to a public game service on the Internet. The game service is hosted by the MSN Gaming Zone.

Internet Group Management Protocol (n)~ A protocol used by Internet Protocol version 4 (IPv4) hosts to report their multicast group memberships to any immediately neighboring multicast routers.

Internet Information Services (n)~ Microsoft Web server software, utilizing the Hypertext Transfer Protocol (HTTP) to deliver World Wide Web documents. Supports the Common Gateway Interface (CGI), the File Transfer Protocol (FTP), and Gopher.

Internet Information Services 7 Manager (PN)~ The tool that manages services that are hosted in the Windows Process Activation service (WAS).

Internet Information Services 7 Manager for Remote Administration (PN)~ A software product that provides the ability to securely manage remote IIS 7 servers from Windows 7, Windows Vista, Windows XP, and Windows Server 2003.

Internet Key Exchange (PN)~ A protocol that establishes the security association and shared keys necessary for computers to communicate by using Internet Protocol security (IPsec).

Internet Locator Service server (n)~ A computer that lists the names and e-mail addresses of people who are running NetMeeting and who are logged on to the server. This information is used to connect to their computers.

Internet Message Access Protocol (n)~ A method computers use to send and receive e-mail messages. It allows you to access e-mail without downloading it to your computer or device.

Internet Message Access Protocol 4 (n)~ A standard client/server protocol for receiving e-mail. The user (or the user's e-mail client) can view just the heading and the sender of the letter and then decide whether to download the mail.

Internet of Things (PN)~ A platform on which the operating system can run on form factors other than PCs, tablets, and phones.

Internet Protocol (n)~ A routable protocol in the TCP/IP protocol suite that is responsible for IP addressing, routing, and the fragmentation and reassembly of IP packets.

Internet Protocol multicasting (n)~ The extension of local area network multicasting technology to a TCP/IP network. Hosts send and receive multicast datagrams, the destination fields of which specify IP host group addresses rather than individual IP addresses. A host indicates that it is a member of a group by means of the Internet Group Management Protocol (IGMP).

Internet Protocol security (n)~ A set of industry-standard, cryptography-based services and protocols that help to protect data over a network.

Internet Protocol version 4 (n)~ An Internet Protocol that has 32-bit source and destination addresses. IPv4 is the predecessor of IPv6.

Internet Relay Chat (PN)~ A service that enables an Internet user to participate in a conversation online in real time with other users.

Internet SCSI (n)~ An industry standard developed to enable transmission of SCSI commands over the existing Internet Protocol (IP) network by using the TCP/IP protocol. iSCSI offers the possibility of delivering both messaging traffic and block-based storage over IP networks without installing a separate Fibre Channel network.

Internet Server API (n)~ An application programming interface (API) that resides on a server computer for initiating software services tuned for Windows operating systems. In Microsoft Provisioning System, ISAPI resides on the Web server.

Internet Server Application Programming Interface (n)~ An application programming interface (API) that resides on a server computer for initiating software services tuned for Windows operating systems. In Microsoft Provisioning System, ISAPI resides on the Web server.

Internet service (n)~ One of any of a number of technologies for making information accessible to users over the Internet. Each Internet service is defined by a protocol, such as Hypertext Transfer Protocol (HTTP), and each is enabled using client/server applications, such as Web browsers and Web servers. Internet protocols are defined in the Request for Comments (RFC) documents that are published by the Internet Engineering Task Force (IETF).

Internet service manager (n)~ A utility included with IIS and Personal Web Server that allows you to configure the Web sites your server supports

Internet service provider (n)~ A business that supplies Internet connectivity services to

individuals, businesses, and other organizations. An ISP provides a telephone number, a user name, a password, and other connection information so that users can access the Internet through the ISP's computers.

Internet Services Manager (n)~ A snap-in for MMC used to manage many IIS 5.0 Web sites from a single location anywhere on the Internet. With this snap-in, you can create Web sites and virtual directories. You can also set levels of permission, fine-tune logging, and enable throttling.

Internet settings file (n)~ A file that provides Windows Update Setup with Internet settings that configure the browser and associated components. You can create multiple versions of your browser package by changing the .ins file used by each package. Use the Profile Manager to create, save, and load .ins files.

Internet Sharing (PN)~ A Microsoft Windows technology that provides home and small-office computer users who have networked computers with the ability to share a single connection to the Internet.

Internet site (n)~ A web site available on the Internet.

Internet Storage Name Service (n)~ A lightweight protocol designed to make the automated discovery, management, and configuration of iSCSI and Fiber Channel Protocol (FCP) devices on a TCP/IP network easier by providing a common mechanism for initiators and targets to discover one another and for handling zoning and authentication of both targets and initiators.

Internet synchronization (n)~ A feature in Microsoft Jet and Microsoft Access that allows replicated information to be synchronized in an environment in which an Internet server is configured with Microsoft Replication Manager, a tool included with Microsoft Office 2000 Developer.

Internet telephony ~ Use of Internet protocols for transmitting two-way audio signals in real time, as an alternative to traditional telephone carriers.

Internet zone (n)~ A security zone in Internet Explorer that contains Web sites that are not on your computer or on your local intranet, or that are not already assigned to another zone.

Internet-based client management (n)~ A feature in Configuration Manager that allows you to manage computers that have the Configuration Manager client agent but do not connect into the network through a VPN or dial-up connection.

Internet-based site system (n)~ A site system role that allows connections from clients when they are managed over the Internet.

Internet-based software update point (n)~ The software update point for a site that accepts communication from only client computers on the Internet. There can be only one active Internet-based software update point.

Internet-facing deployment (n)~ A method of deploying on-premises CRM so that remote users can connect to the application from the Internet.

Internet-facing URL (n)~ A URL that is directly accessible over the Internet and that does not require special credentials or network access to connect to it.

internetwork (n)~ Two or more network segments connected by routers.

Internetwork Packet Exchange (n)~ A network protocol native to NetWare that controls addressing and routing of packets within and between LANs. IPX does not guarantee that

a message will be complete (no lost packets).

Internetwork Packet Exchange/Sequenced Packet Exchange (n)~ Transport protocols used in Novell NetWare networks, which together correspond to the combination of TCP and IP in the TCP/IP protocol suite. Windows implements IPX through NWLink.

InterNIC ~ the entity that controls the registration of most domain names on the Internet. The InterNIC is a cooperative activity between the National Science Foundation, Network Solutions, Inc. and AT&T.- HTTP://WWW.INTERNIC.NET.

interning (n)~ A feature of ASP.NET that enables assemblies that are initially deployed in the Bin folder of individual applications be copied to a central location and then loaded by other applications.

interop (n)~ The technology that one software component uses to interoperate with another software component.

interop assembly (n)~ An assembly containing definitions of COM types described in metadata. An interop assembly is typically produced by the Type Library Importer (Tlbimp.exe).

interop marshaling (n)~ The process of packaging parameters and return values into equivalent data types as they move to and from COM objects.

interoperability (n)~ The ability for two or more software applications to work together with little effort from the user.

interoperating control (n)~ A control whose state affects that of another.

interpolate (v)~ To estimate intermediate values between two known values in a sequence.

interpolation (n)~ A kind of interpolation that animates the property values between successive key times.

interpolation (n)~ A kind of interpolation that averages pixel information when scaling an image. When reducing the size of an image, pixels are averaged to create a single new pixel; when an image is scaled up in size, additional pixels are created by averaging pixels of the smaller image.

interpolation (n)~ A method of estimating (a value or a function) between the values already known or determined.

interprocess communication (n)~ The ability of one task or process to communicate with another in a multitasking operating system. Common methods include pipes, semaphores, shared memory, queues, signals, and mailboxes.

inter-project dependency (n)~ A way to show that your project, or a specific task in your project, requires a deliverable in another project. Your project and task dates are not affected by changes to the dates in the project you are dependent upon.

interrupt (n)~ A signal sent by a device to get the attention of the processor when the device is ready to accept or send information.

interrupt request (n)~ A signal sent by a device to get the attention of the processor when the device is ready to accept or send information.

interrupt request line (n)~ A hardware line over which a peripheral device, bus controller, other processor, or the kernel signals a request for service to the microprocessor.

interrupt service routine (n)~ A kernel-mode interrupt that is small, very fast pieces of

assembly code that map physical interrupts onto logical interrupts. ISRs are used to provide hooks back to the kernel as well as device drivers.

interruptible orchestration (n)~ An orchestration that can be interrupted in mid-process at well-defined points.

intersect (v)~ To combine two or more shapes or paths to result in a single path that shows only the areas where all shapes and paths overlapped.

intersite messaging service (n)~ A service that supports transports for asynchronous, site-to-site messaging. Each transport serves two major roles: send/receive and topology queries (such as, what are the various sites connected by this transport, and at what cost?).

intersite topology generator (n)~ A server in an Active Directory architecture that is responsible for managing the inbound replication connection objects for all the server contact points in the server's site.

interunit accounting (n)~ An accounting process where due-to and due-from account entries are automatically created to ensure that an accounting entry is balanced for one or more specified financial dimensions in a legal entity.

interval (n)~ The number of times a cycle should occur for a given instance of the cycle frequency. An interval value of 1 indicates that the cycle should occur for each instance of the cycle frequency. An interval value of 2 indicates that the cycle should occur every second instance of the cycle frequency.

interval event (n)~ An event whose payload is valid for a given period of time. The metadata of the interval event requires that both the start and end time of the interval be provided in the event metadata. Interval events are valid only for this specific interval.

interval event model (n)~ The event model of an interval event.

intranet (n)~ A network within an organization that uses Internet technologies and protocols, but is available only to certain people, such as employees of a company.

Intranet ~ A private miniature internet, usually belonging to a single company or organization, connecting the organization's computers together while (usually) restricting access from the internet proper.- Often just called 'the network'.

intranet ~ An intranet is a constrained version of the Internet usually owned and controlled by a single company or organisation. Intranets can still be world-wide, use- TCP/IP- protocols, and be structured as a collection of networks but the greatest difference is that access is limited to a set of authorised users using firewalls and other mechanisms.

in-transit lead time (n)~ The lead time required for an item to leave the shipping party and arrive at the receiving party.

Intrastat (n)~ The system for collecting and generating statistics on the trade of items between countries/regions in the European Union.

intravenous line (n)~ A device used to administer medications or other fluids directly into the bloodstream through a vein.

intrinsic constant (n)~ A constant that is part of Microsoft Access or a referenced library.

intrinsic event (n)~ An event that occurs in response to a change in the standard WMI data model. Each intrinsic event class represents a specific type of change and occurs when WMI or a provider creates, deletes, or modifies a namespace, class, or class instance.

intrinsic function (n)~ A function that the compiler generates as inline code, not as function calls.

intrusion detection system (n)~ A type of security management system for computers and networks. Intrusion detection systems (IDS) provide real-time monitoring of network traffic. An IDS can detect a wide range of hostile attack signatures (patterns), generate alarms to alert operations staff and, in some cases, cause routers to terminate communications from hostile sources.

invalid (adj)~ Erroneous or unrecognizable because of a flaw in reasoning or an error in input. Invalid results, for example, might occur if the logic in a program is faulty.

inventoried name (n)~ In software inventory, the name of a company or product exactly as it appears in the header of the product files.

inventory (n)~ A list of software and hardware for each client in a site.

inventory (n)~ Items that an owning organization uses in its product delivery activities. The value of an item is calculated by using an inventory valuation method and is recorded in inventory accounts.

inventory (v)~ To create, maintain, and report a list of clients software and hardware.

Inventory & logistics (PN)~ The Business subcategory containing apps to help businesses with inventory and logistical tasks.

inventory blocking (n)~ Method to restrict on-hand inventory from being issued out of a warehouse.

inventory catalog (n)~ Data storage that holds inventory data for the products and variants for single or multiple product catalogs. Inventory catalogs are one of two types: the default inventory catalog that is always present and custom inventory catalogs which are added by users.

Inventory Collector (PN)~ A component of the ACT that examines each of your organization's computers, identifies the installed applications and system information, and returns the results to the Analyze screen of the Application Compatibility Manager.

Inventory Condition (n)~ The state of items in the inventory. Can be one of four values: Out of Stock, In Stock, Back-Ordered, or Pre-Ordered.

inventory decrease (n)~ A transaction where items go out of inventory.

inventory increase (n)~ A transaction where items come into inventory.

inventory item (n)~ An itemized product that participates in an inventory process.

inventory location (n)~ A functional storage facility where the stock value is recorded in accounting journals using inventory account classifications.

inventory management (n)~ The branch of management that plans and controls the holding of inventory. Inventory management does not manage the inventory itself, but rather plans for such things as levels to maintain.

inventory on hand (n)~ Items that are physically in stock and available to be used or sold.

inventory order (n)~ A request for items from inventory. Items might be requested by a sales order or by production.

inventory period (n)~ A defined interval of time in which users can post inventory transactions. An inventory period can be closed to prevent any value changes to inventory (expected or invoiced) from being posted with a posting date in the closed period. It is, however, possible to apply an item quantity to an open item ledger entry in a closed

period.

inventory receipt (n)~ A transaction for the acceptance of items into inventory. An inventory receipt increases inventory on hand.

inventory registration policy (n)~ A policy that controls when stock that is stored in a supermarket is registered as inventory.

inventory transaction (n)~ A transaction for items moving to inventory (receipts) or from inventory (issues).

inventory turnover (n)~ The number of times in a year that a company turns inventory (sells an amount of product equal to the average investment in the product). Inventory turnover is calculated by dividing the annual cost of goods sold by the average inventory investment. Inventory turnover measures the performance of inventory.

inverse multiplexing (n)~ The process whereby bandwidth enables a call to transmit more information at the same time in the same timeframe than information from a single signal transmitted over a single channel. This is accomplished by splitting a single high-speed channel into multiple signals, transmitting the multiple signals over multiple facilities operating at a lower rate than the original signal, and then recombining the separately transmitted portions into the original signal at the original rate.

inverse telecine (n)~ The process that removes the frames that were added when 24-fps film was converted to 30-fps video.

invert (v)~ To reverse something or change it to its opposite.

Inverted Pyramid (PN)~ A SmartArt graphic layout used to show proportional, or interconnected, or hierarchical relationships with the largest component on the top and narrowing down. Level 1 text appears in the pyramid segments and Level 2 text appears in shapes alongside each segment.

investment project (n)~ A project that has no immediate earnings and that is used to track and control costs. An investment project includes item, hour, and expense costs.

invisible (adj)~ Not displayed.

Invisible (PN)~ The status that a user selects when they are signed in but want to appear as offline to their contacts. They can send and receive IMs when invisible.

invisible element (n)~ An element that is not displayed on a web page.

invitation (n)~ An email message that a user sends to others to invite them to a meeting.

invitation (n)~ A notification for sharing items, such as calendars, documents or folders, with others.

invitation (n)~ An email message asking someone who is not part of something, such as Yammer, a forum, or a group, to join it.

invite (v)~ To ask someone to engage in an instant conversation.

Invite (PN)~ A UI element, in a conversation window, that accesses the Invite Someone' menu item. The user can then select a contact to add to the current conversation.'

Invite (PN)~ The button in Yammer that allows users to invite colleagues to join Yammer.

invite (n)~ An invitation message to selected persons to join in a service.

Invite Someone (PN)~ A UI element that sends an instant message to the selected person inviting them to join the current conversation.

Invite to New Conversation… (PN)~ An item on the right-click menu for a person in a multi-party conversation that invites the selected person to a new conversation, separate

from the current conversation.

Invited (PN)~ The contact picture label that indicates someone has been invited to do something, but has not responded yet.

invitee (n)~ A person who has been invited to a conference but has not accepted or who has accepted but the conference has not started yet (i.e., he or she is not yet a participant).

inviter (n)~ The user who invites other users to join a shared space.

invoice (n)~ A source document that documents a payment request from another party.

invoice company (n)~ The company that is associated with an invoice transaction.

Invoice ID (PN)~ A text field in the Invoice form. An auto-generated number.

invoice line net amount (n)~ The actual currency amount that is represented by an invoice line, calculated as follows: Purchase order quantity * (Unit price/Price unit) - Trade agreement discount + Item miscellaneous charge

invoice matching (n)~ A practice of matching vendor invoice prices and product quantities to purchase orders and product receipts.

invoice net unit price (n)~ The actual currency amount per unit that is represented by the vendor invoice, calculated as follows: Invoice line net amount / Quantity on the invoice.

invoice PO (n)~ A commercial document or contract, or the number identifying a commercial document or contract, that is issued by a buyer to a seller that identifies agreed upon prices, goods, payments, and services.
