invoice price variance (n)~ The difference between the price on a packing slip and the invoice line price. The invoice price variance is determined when purchase invoices are compared to purchase receipts.

invoice product (n)~ A line item in an invoice containing detailed billing information.

invoice project (n)~ A set of projects that are invoiced from the same invoice proposal.

invoice register (n)~ A journal in which vendor invoices are entered as they arrive.

invoiced revenue (n)~ Revenue from an hour, expense, fee, or item transaction.

invoke operation (n)~ A domain operation that is executed without tracking or deferred execution.

IOCtl (n)~ A command that enables a program to communicate directly with a device driver. This is done, for example, by sending a string of control information recognized by the driver. None of the information passed from the program to the device driver is sent to the device itself (in other words, the control string sent to a printer driver is not displayed on the printer).

iOS (PN)~ A mobile operating system developed by Apple Inc. and distributed exclusively for Apple hardware that powers many of the company's iDevices.

iOS ~ (iphone Operating System)- The operating system for- Apple's smartphones (iPhone) and tablets (iPad).

IoT (PN)~ A platform on which the operating system can run on form factors other than PCs, tablets, and phones.

IP (n)~ A routable protocol in the TCP/IP protocol suite that is responsible for IP addressing, routing, and the fragmentation and reassembly of IP packets.

IP ~ (Internet Protocol)- A- protocol- (computer language) which computers use to communicate with and over the internet.

IP address (n)~ A binary number that uniquely identifies a host (computer) connected to

the Internet to other Internet hosts, for the purposes of communication through the transfer of packets.

IP address ~ (Internet Protocol address)- A unique number assigned to any computer connected to the internet, including yours, in the format 255.255.255.255. Each of the four blocks of numbers can be any value from 0 to 255. They can either be assigned permanently ('static IP') or per session ('dynamic IP'). Most ISPs assign them dynamically, ie when you connect to the internet.

IP address array (n)~ A list of IP addresses of DNS servers.

IP Address Hours (PN)~ The unit of measure for the Reserved IP Azure service.

IP Address Management (PN)~ A built-in framework for discovering, monitoring, auditing, and managing the IP address space used on a corporate network. IPAM provides for administration and monitoring of servers running Dynamic Host Configuration Protocol (DHCP) and Domain Name Service (DNS).

IP address mask (n)~ A range of IP addresses defined so that only computers with IP addresses within the range are allowed access to an Internet service. To mask a portion of the IP address, replace it with the asterisk wild card character (*).

IP address pool (n)~ A range of contiguous IP addresses allocated by the lab service to virtual machines in a network isolated environment.

IP Allow list (n)~ A filtering list that is used by the Connection Filter agent in Exchange Server 2007. IP addresses on the IP Allow list are considered safe' and are exempted from processing by other anti-spam agents.'

IP allow list (n)~ A list of IP addresses that are considered safe' by an authority. IP addresses in this list are allowed access to a given resource or web service and are thereby excluded from further processing of access control policies that would otherwise be used to determine the validity of that clients request for access. For example

IP Allow List provider (PN)~ In Exchange Server 2007, the feature that the Exchange administrator configures to enable functionality provided by IP Allow List Provider services that compile lists of IP addresses that are known not to have sent spam in the past. The Connection Filter agent queries the service to determine if a given IP address is safe."

IP Allow List provider configuration (PN)~ Configuration that is used by the Connection Filter agent to query an IP Allow List provider.

IP Allow List provider service (PN)~ A business that compiles and distributes lists of IP addresses that are known not to have sent spam in the past.

IP Block list (n)~ A filtering list that is used by the Connection Filter agent in Exchange Server 2007. IP addresses on the IP Block list are considered spam. Messages originating from an IP address that is on the IP Block list are stopped from entering the Exchange organization.

IP Block List provider (PN)~ In Exchange Server 2007, the feature that the Exchange administrator configures to enable functionality provided by IP Block List Provider services that compile lists of IP addresses from which spam has originated in the past.

IP Block List provider configuration (PN)~ The configuration that is used by the Connection Filter agent to query an IP Block List provider.

IP Block List provider service (PN)~ The business that compiles and distributes lists of IP addresses from which spam has originated in the past.

IP Exceptions (n)~ A list of IP addresses for which flood mitigation custom limits, instead of the default settings, will be applied.

IP object (n)~ A performance object that includes counters that describe the rates at which internet protocol (IP) datagrams are transmitted by a computer using the IP protocol. It also describes various error counts for the IP protocol.

IP range (n)~ A span of IP addresses.

IP Reservation (PN)~ The service type that lets customers reserve IP addresses.

IP Restrict Spam Quarantine option (n)~ The option on the Spam Filter page that restricts access to monitoring and managing Spam Quarantine by IP address.

IP safelist (n)~ The collection of IP addresses that are in a gateway servers list or internal mail servers list of IP addresses that should not be treated as spam.

IP SSL (PN)~ The unit of measure for IP address SSL connections.

IP/VoIP gateway (n)~ A third-party hardware device or product that connects a legacy PBX to a LAN. An IP/VoIP gateway translates or converts TDM or telephony circuit-switched protocols to packet switched protocols that can be used on a VoIP-based network.

iPad (PN)~ A line of tablet computers designed and marketed by Apple, Inc.

iPad ~ A popular- tablet- computer from Apple.

IPAM (PN)~ A built-in framework for discovering, monitoring, auditing, and managing the IP address space used on a corporate network. IPAM provides for administration and monitoring of servers running Dynamic Host Configuration Protocol (DHCP) and Domain Name Service (DNS).

IPC (n)~ The ability of one task or process to communicate with another in a multitasking operating system. Common methods include pipes, semaphores, shared memory, queues, signals, and mailboxes.

IPC (PN)~ A Microsoft technology that is implemented by Azure Rights Management service through a set of methods and capabilities to control how data is used and distributed beyond the use of simple access control and prevent accidental and unauthorized distribution of sensitive information.

iPhone ~ An extremely popular- smartphone- from Apple.

IP-in-IP tunnel (n)~ The encapsulation of an IP multicast datagram within an IP unicast datagram, so as to forward information between endpoints in an IP internetwork that have differing capabilities, thus acting as a logical link between the endpoints.

iPod ~ The- Apple- Corporation's massively successful portable music player, no longer manufactured as a standalone device because it is built into the iPhone. See also- iTunes.

IPsec (n)~ A set of industry-standard, cryptography-based services and protocols that help to protect data over a network.

IPsec Denial of Service Protection (PN)~ A feature that helps client machines to provide basic protection against denial-of-service attacks.

IPV (n)~ The difference between the price on a packing slip and the invoice line price. The invoice price variance is determined when purchase invoices are compared to purchase receipts.

IPV (n)~ A vaccine for immunization against poliomyelitis.

IPv4 (n)~ An Internet Protocol that has 32-bit source and destination addresses. IPv4 is

the predecessor of IPv6.

IPV6 transition technology (n)~ A technology such as Teredo, 6to4 and ISATAP that allows you to deploy and use IPv6 even if your network infrastructure does not yet support it. Transition technologies can simplify and save money during an IPv6 deployment.

IPX (n)~ A network protocol native to NetWare that controls addressing and routing of packets within and between LANs. IPX does not guarantee that a message will be complete (no lost packets).

IPython (PN)~ A command shell for interactive computing in multiple programming languages, originally developed for the Python programming language, that offers enhanced introspection, rich media, additional shell syntax, tab completion, and rich history.

IRC (PN)~ A service that enables an Internet user to participate in a conversation online in real time with other users.

IRC script (n)~ A type of code that is exchanged between an IRC server and a remote computer. When malicious software connects to an IRC server through a backdoor on an infected computer, an IRC script may be used by an attacker to send commands and respond to events on the infected computer.

IrDA (n)~ The industry organization of computer, component, and telecommunications vendors who have established the standards for infrared communication between computers and peripheral devices such as printers.

iris (n)~ An adjustable component of a camera lens that allows varying levels of light to pass through.

iris diaphragm (n)~ An adjustable component of a camera lens that allows varying levels of light to pass through.

IRM (n)~ A policy tool that gives authors control over how recipients use the documents and e-mails they send.

IRP (n)~ Data structures that drivers use to communicate with each other.

IRQ (n)~ A signal sent by a device to get the attention of the processor when the device is ready to accept or send information.

IRS (PN)~ The federal revenue agency under the United States Department of the Treasury that is responsible for the collection of taxes in addition to the interpretation and enforcement of federal tax laws.

ISA (PN)~ A bus design specification that allows components to be added as cards plugged into standard expansion slots in IBM Personal Computers and compatibles. Originally introduced in the IBM PC/XT with an 8-bit data path, ISA was expanded in 1984, when IBM introduced the PC/AT, to permit a 16-bit data path. A 16-bit ISA slot actually consists of two separate 8-bit slots mounted end-to-end so that a single 16-bit card plugs into both slots. An 8-bit expansion card can be inserted and used in a 16-bit slot (it occupies only one of the two slots), but a 16-bit expansion card cannot be used in an 8-bit slot.

ISA ~ (Industry Standard Architecture; pr. 'icer') A once-common type of PC- expansion card, now obsolete; see also- EISA,- PCI.

ISA expansion slot (n)~ A connection socket for a peripheral designed to the Industry Standard Architecture (ISA) on a computer motherboard.

ISAM (n)~ A technique for indexing database records that allows sequential or random access of records. When records are accessed sequentially they are accessed in the order in which they were entered in the database, and when records are accessed randomly, the records are accessed through an index.

ISAPI (n)~ An application programming interface (API) that resides on a server computer for initiating software services tuned for Windows operating systems. In Microsoft Provisioning System, ISAPI resides on the Web server.

ISAPI filter (n)~ A program that responds when the Web server receives an HTTP request. ISAPI filters are different from applications in that they are driven primarily by Web server events rather than by a client request. Those events, however, may be the result of client requests. You can associate an ISAPI filter with a particular Web server event; the filter is notified each time the associated event occurs.

iSCSI (n)~ An industry standard developed to enable transmission of SCSI commands over the existing Internet Protocol (IP) network by using the TCP/IP protocol. iSCSI offers the possibility of delivering both messaging traffic and block-based storage over IP networks without installing a separate Fibre Channel network.

iSCSI initiator (n)~ A logical entity that enables a server to communicate with an iSCSI device over an Internet Protocol (IP) network. Each iSCSI initiator can have one or more network adapters through which communication is established.

iSCSI target (n)~ A logical entity created in order to manage the connections between an iSCSI device and the servers that need to access it over an Internet Protocol (IP) network. A target defines the portals (IP addresses) that can be used to connect to the iSCSI device, as well as the security settings (if any) that the iSCSI device requires in order to authenticate the servers that are requesting access to its resources.

ISDN (n)~ A high-speed digital technology that uses existing telephone lines to provide Internet access.

ISDN ~ (Integrated Services Digital Network)- An early high speed (for its time) internet connection system mainly aimed at business, now largely obsolete. Requires a special type of- modem- called aTerminal Adaptor.

ISF (PN)~ A Microsoft format used to store ink data. The format is mainly used for mobile devices.

Ishikawa diagram (n)~ A type of diagram that documents all the factors that contribute to or affect a given situation (all the causes that lead to a certain effect).

Islamic (Shia) Religious Holidays (PN)~ The list item in Outlook that allows users to add standard Islamic Shia holidays to their calendar.

Islamic (Sunni) Religious Holidays (PN)~ The list item in Outlook that allows users to add standard Islamic Sunni holidays to their calendar.

ISM (n)~ A service that supports transports for asynchronous, site-to-site messaging. Each transport serves two major roles: send/receive and topology queries (such as, what are the various sites connected by this transport, and at what cost?).

iSNS (n)~ A lightweight protocol designed to make the automated discovery, management, and configuration of iSCSI and Fiber Channel Protocol (FCP) devices on a TCP/IP network easier by providing a common mechanism for initiators and targets to discover one another and for handling zoning and authentication of both targets and

initiators.

ISO (n)~ An international association of 157 countries/regions, each of which is represented by its leading standard-setting organization-for example, ANSI (American National Standards Institute) for the United States. The ISO works to establish global standards for communications and information exchange. Primary among its accomplishments is the widely accepted ISO/OSI reference model, which defines standards for the interaction of computers connected by communications networks.

ISO 14000 (PN)~ Standards and guidelines that were developed by the International Organization for Standardization (ISO) to help organizations minimize the negative effect their operations have on the environment and to comply with applicable laws and regulations.

ISO image (n)~ An image file typically used to create optical disks including CD-ROMs and DVDs. The ISO format is supported by many commercially-available software products.

ISO speed (n)~ A rating of a film's sensitivity to light. Though digital cameras don't use film, they have adopted the same rating system for describing the sensitivity of the camera's image sensor. Generally, as ISO speed climbs, image quality drops.

isochronous (adj)~ Pertaining to processes where data must be delivered within certain time constraints. Multimedia streams require an isochronous transport mechanism to ensure that data is delivered as fast as it is displayed, and to ensure that the audio is synchronized with the video.

IsoHunt ~ isoHunt is a BitTorrent index with over 1.7 million torrents in its database and 20 million peers from indexed torrents.- http://isohunt.com/

isolated development environment (n)~ A private copy of the database that is created from the database project and typically filled with data by using a data generation plan.

isolated receive adapter (n)~ The receive adapter that is hosted in a process other than a BizTalk Server process. This adapter is created and controlled by external process and it registers with BizTalk server at run time to submit messages.

isolated storage (n)~ A data storage mechanism that provides isolation and safety by defining standardized ways of associating code with saved data.

isolation (n)~ The Plug and Play process by which cards on an ISA bus are distinguished from each other after system startup.

isolation (n)~ A characteristic whereby two transactions running in parallel produce the illusion that there is no concurrency. It appears that the system is running one transaction at a time.

isolation level (n)~ The property of a transaction that controls the degree to which data is isolated for use by one process, and is guarded against interference from other processes.

isometric (adj)~ One of the presets for 3D rotation effects. When selected, specifies that the object will be rotated isometrically.

ISP (n)~ A business that supplies Internet connectivity services to individuals, businesses, and other organizations. An ISP provides a telephone number, a user name, a password, and other connection information so that users can access the Internet through the ISP's computers.

ISP ~ (Internet Service Provider)- A company which provides a connection to the internet,

or internet services.

ISP signup offer (n)~ A set of HTML pages in Windows Welcome that enables end users to sign up for Internet access from a particular Internet service provider.

ISP sign-up server (n)~ An HTTP server that automates the task of adding new customers to an ISP's customer database. The Internet sign-up server collects information from each customer, adds the information to the ISP's customer database, and then passes a configuration packet back to the customer's desktop computer. The configuration packet contains information that is used to configure the customer's Internet browser for subsequent connection to the ISP's services.

ISQL (n)~ An interactive command prompt utility provided with SQL Server that lets users run Transact-SQL statements or batches from a server or workstation and view the results that are returned.

ISR (n)~ A kernel-mode interrupt that is small, very fast pieces of assembly code that map physical interrupts onto logical interrupts. ISRs are used to provide hooks back to the kernel as well as device drivers.

ISS (PN)~ The service type of the App Services service that provides a management service for intelligent systems through Microsoft Azure.

issue (n)~ The release of items from inventory.

issue (v)~ To release an item, or items, from inventory.

issue (n)~ A problem that an assessment identifies. The issue description may also include a solution for the problem and links to information about how to perform further investigation.

issue date (n)~ The date on which bonds, policies, stock, etc. are issued.

issue margin (n)~ A number of days added to issues from inventory, such as sales order transactions, to protect against unplanned delays.

issue slip (n)~ A report that is generated by a bailor when items are shipped to a bailee for storage purposes.

issuer (n)~ The certification authority which issued the certificate to the subject.

issuer (n)~ The company or organization that issued the user the card they're adding to their wallet. For example, an issuer could be a bank.

issuing CA (n)~ In a public key infrastructure hierarchy, the certification authority that that issues certificates to users and computers.

issuing certificate (n)~ The certificate the issuer used to sign a subject's certificate.

issuing certification authority (n)~ In a public key infrastructure hierarchy, the certification authority that that issues certificates to users and computers.

issuing distribution point (n)~ An extension that indicates if the CRL is limited to revocations for end-entity certificates or for CA certificates.

ISTG (n)~ A server in an Active Directory architecture that is responsible for managing the inbound replication connection objects for all the server contact points in the server's site.

ISTM ~ (It Seems To Me)- Internet slang.

ISTR ~ (I Seem To Recall)- Internet slang.

ISV (n)~ A third-party software developer; an individual or an organization that independently creates computer software.

ISV Advisory Service (PN)~ A phone-based support option that provides assistance to Independent Software Vendors who are members of the Microsoft Partner Program.

ISV.config file (n)~ An XML configuration document, with the .config file name extension, that contains settings that are used to update the navigation structure of Microsoft Dynamics CRM, including adding custom buttons, tabs, and menus to entity forms.

IT ~ (Information Technology)- What computers are all about - using technology to manage information. The computer industry is often called the IT industry, and computer departments often refer to themselves as the IT department.

italic (adj)~ Pertaining to characters that are evenly slanted to the right or in the direction of text flow.

Itanium (PN)~ An Intel microprocessor that uses explicitly parallel instruction set computing and 64-bit memory addressing. Itanium-based' refers to systems or platforms that are based on the Itanium processor. 'Itanium2-based' refers to systems or platforms that are based on the Itanium2 processor. 'Itanium architecture-based' refers to systems or platforms that are based on the Itanium and Itanium2 processors.'

Itanium ~ A new processor generation introduced by Intel in 2001, based on IA-64 architecture.

Itau (PN)~ A banking and financial services company in Brazil.

item (n)~ A product or service that a company buys from a vendor and/or sells to a customer.

item (n)~ The basic element that holds information in Outlook (similar to a file in other programs). Items include e-mail messages, appointments, contacts, tasks, journal entries, notes, posted items, and documents.

item (n)~ A unit of data or metadata that is being synchronized. A typical item of data might be a file or record, whereas a typical item of metadata might be a knowledge item.

item (n)~ A unique element of data within a field.

item (n)~ A tangible or intangible thing.

item allocation key (n)~ A product family grouping that is used for forecast and demand scheduling.

item comment (n)~ A comment attached to an item and entered by a cashier or appearing at the point of sale or on receipts.

item consumption (n)~ The items used to process an order.

item dimension (n)~ A classification used to describe an item's physical characteristics, physical location, or relationship to other items. For example, the item SHIRT can be classified by the dimensions COLOR, SIZE, and STYLE.

item discount group (n)~ A grouping of items to which the same discount structure applies.

item expiration (n)~ The date after which an item is no longer usable.

item expiration date (n)~ The date after which an item is no longer usable.

item group (n)~ A user-defined description that is used to classify a group of items that have common characteristics.

item identifier list (n)~ An ordered sequence of one or more item identifiers. Each item in the list corresponds to a namespace object.

item number (n)~ A number that identifies one type of inventory item.

item package (n)~ Several different items and quantities ordered from a supplier as one lot.

Item Picker Contract (n)~ In Windows, the feature that allows users to select or access a single item located on the local PC, a connected storage device or from an application under a specified agreement.

item price tolerance group (n)~ A group of items that controls the allowable price variance percentage for invoice matching.

Item Ratings (PN)~ A feature that allows people to rate list items and documents on a SharePoint site using a 5-star rating system.

item relation (n)~ A reference to the item allocation group or the item and its product dimensions in a kanban rule.

item requirement (n)~ The reservation of items from inventory for a project. One item requirement can include multiple items.

item sales tax group (n)~ A group of one or more sales tax codes that define sales tax (including duty) for an item. A sales tax group and an item sales tax group must be connected to each transaction that is subject to sales tax. Sales tax is calculated only for the sales tax codes that are included in both the sales tax group and the item sales tax group.

item template (n)~ The portion of a DataRepeater control that is used to provide a visual interface for the repeated items in the control. At design time, controls can be added to the item template, and properties can be set to modify the appearance of the DataRepeater.

item type (n)~ The data definition for a class of items stored in a Web application. An item type consists of its name and references to the default set of fields (properties) associated with items of that class.

item-based content type (n)~ A content type that inherits settings from a base content type that was designed for any type of SharePoint list item.

item-level role assignment (n)~ A security policy that applies to an item in the report server folder namespace.

item-level role definition (n)~ A security template that defines a role used to control access to or interaction with an item in the report server folder namespace.

items control (n)~ A control that can be used to present a collection of items.

Items Manager (PN)~ A universal interface for fetching items from a data source. Items Manager provides a single unified API enabling controls to enumerate over a large set of items, in a way that virtualizes (scales to a large number of items) and works asynchronously (to avoid blocking the browser's UI thread, while waiting for the data). It also provides a pluggable interface into different templating mechanisms.

iterate (v)~ To execute one or more statements or instructions repeatedly. Statements or instructions so executed are said to be in a loop.

iteration (n)~ Repeated execution of one or more statements or instructions. Statements or instructions so executed are said to be in a loop.

iteration (n)~ A fixed period of calendar time, generally between 1 and 6 weeks, for scheduling tasks and planning activities. Typically, iterations are consecutively numbered and follow one another sequentially.

iteration (n)~ A node on the Common Structure Service hierarchy that represents a schedule abstraction.

iteration budget (n)~ The budget used for planning the development activity for an iteration, based on rough order of magnitude estimates. The iteration budget is obtained from the velocity report and is measured in ideal person days.

iteration length (n)~ The length of the fixed period of time that comprises an iteration. The iteration length usually stays constant over the entire project.

iteration plan (n)~ The list of scenarios, quality of service requirements, and tasks for the upcoming iteration.

iteration test (n)~ A test that is run after the build verification tests. These tests verify the functionality called for in the iteration plan.

iterative development (n)~ The development of a solution by building, testing, and deploying a core set of basic features first, then adding features in successive versions.

iterator (n)~ An object or routine for traversing the items in a list, array, collection, or stream one at a time.

ITF (n)~ A fee imposed by some financial and banking institutions on international financial transactions.

iTunes ~ The- Apple- Corporation's online music store, where you can download millions of digital music tracks - for a fee, of course. Now sells- apps- and movies too. Apple go to a lot of trouble to make it difficult and inconvenient to buy digital content from anywhere else on their devices.

IV line (n)~ A device used to administer medications or other fluids directly into the bloodstream through a vein.

IVR (n)~ An automated telephone information system that interacts with a caller through fixed voice menus and real-time data from databases.

IXFR (n)~ In DNS, a zone transfer request involving only incremental resource record changes between each version of the zone. An IXFR contrasts with a full zone transfer (AXFR) request for all resource records.

J ~

J# ~ pronounced -€œJ sharp-€?, a programming language very similar to JAVA but implemented in the Microsoft .NET Framework; essentially a combination of Java and C#.

J2EE (n)~ An application server framework from Sun Microsystems, Inc., for the development of distributed applications. It includes all the previous Java APIs targeted for multitiered distributed enterprise information systems. The J2EE platform consists of a set of services, application programming interfaces (APIs), and protocols that provide the functionality for developing multitiered, Web-based applications.

JA East (PN)~ The Eastern Japanese region within the Azure region taxonomy.

JA West (PN)~ The Western Japanese region within the Azure region taxonomy.

Jaarrekening (n)~ The annual financial statement all business in the Netherlands must file with the chamber of commerce.

jabber ~ An error in which a faulty device (usually a NIC) continuously transmits corrupted or meaningless data onto a network.

jack ~ A connecting device having springs which make electrical contact with mating contacts of a plug.-

Jailbreaking ~ the act of bypassing the App Store as a means for distributing applications after installing unsupported software.

Japanese yen (n)~ The official currency of Japan.

Java (n)~ An object-oriented programming language, developed by Sun Microsystems, Inc.

Java ~ A programming language used to create small programs calledapplets, often to produce special effects on web pages.

Java ~ A high level programming language, developed by Sun Microsystems. Compiled Java code can run on most computers because Java interpreters and run time environments, known as Java VMs.- http://www.java.com

Java applet (n)~ A small software program written in the Java language, a programming language that is used primarily on the World Wide Web. A Java applet is located within an HTML document and can be used to add to animation, music, page updates, etc.

Java development environment (n)~ An integrated development environment for the Java programming language.

Java IDE (n)~ An integrated development environment for the Java programming language.

Java integrated development environment (n)~ An integrated development environment for the Java programming language.

Java Virtual Machine (n)~ The environment in which Java programs run.

JavaBean (n)~ A Java component architecture defined in the JavaBeans specification developed by Sun Microsystems. A JavaBean, or Bean, is a reusable application component—an independent code segment—that can be combined with other JavaBean components to create a Java applet or application. The JavaBean concept emphasizes the platform-independence of the Java language, in which ideally a program, once written, can run on any computing platform. JavaBeans are similar to Microsoft's ActiveX controls.

ActiveX controls, however, can be developed in different programming languages but executed only on a Windows platform. JavaBeans can be developed only in the Java programming language but ideally can run on any platform.

JavaScript (PN)~ A scripting language used to create interactive or animated content for the Internet, such as games or advanced financial applications.

Javascript ~ A set of program instructions, vaguely similar to- Java- but not actually related, written straight into the HTML of a webpage instead of as an applet.

JavaScript ~ A scripting language targeted specifically to the Internet. It is the first scripting language to fully conform to ECMAScript, the Web's only standard scripting language. Despite its name, JavaScript is not a derivative of Java; its origin is Netscape's Livescript language.

JavaScript API for Office (n)~ A JavaScript API that provides simple and consistent programmatic access to Office documents and applications across Office client environments through common as well as application-specific data types, objects, functions and events.

JavaScript Object Notation (PN)~ A text-based, data interchange format that is used to transmit structured data, typically in Ajax Web applications.

Jazz (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 8.

Jazz+Funk (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 29.

JCB (PN)~ An international credit card company based in Japan or a term used to describe the brand of cards issued by JCB.

Jenkins (PN)~ An open source server-based system providing continuous integration services for software development.

Jet engine (PN)~ A client/server data engine that provides local data storage on a smaller computer system and that is compatible with Microsoft SQL Server 2000 and prior.

Jewel Tones (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of deep, rich, and glowing colors and reminds the viewer of gems (such as turquoise, amethyst, emerald, and rubies).

Jewish Religious Holidays (PN)~ The list item in Outlook that allows users to add standard Jewish holidays to their calendar.

JFIF (n)~ A means of saving photographic images stored according to the Joint Photographic Experts Group image compression technique. JFIF represents a common language' file format in that it is designed specifically to allow users to transfer JPEG images easily between different computers and applications.'

JIT (adj)~ Pertaining to something that happens when it becomes necessary.

JIT compilation (n)~ The compilation that converts Microsoft intermediate language (MSIL) into machine code at the point when the code is required at run time.

JIT compiler (n)~ A compiler takes the Java bytecode (which is machine-independent) and compiles it on demand into native code for the target machine, giving faster execution. Since JIT compilers operate on the client machine, they preserve the platform-

independence of the compiled Java program.

JIT debugging (n)~ A technique that catches faults that occur while the program is running outside the development environment. You must set this option in the development environment before executing your program.

Jitter ~ A slight movement of a transmission signal in time or phase, which can introduce errors and loss of synchronization for high-speed, synchronous communications.

job (n)~ A specified amount of processing performed as a unit by a computer.

job (n)~ A specified series of operations, called steps, performed sequentially by a program to complete an action.

job (n)~ A series of business activities that when completed will fulfill a high-level objective.

job (n)~ A customer service issue or problem reported by a customer and the activities that customer service representatives use to resolve it.

job (n)~ A grouping of responsibilities, duties, and job functions that compose an activity.

job (n)~ An occurrence of an activity performed between specific start and end times and at specific locations.

job (n)~ A request to run a runbook.

job card (n)~ A mechanism to provide feedback about the production process. A job card lists the individual job numbers of a specific operation, along with actual consumption statistics.

job definition (n)~ A persistent container that defines and stores instructions for a job to be run on a server, server farm, or server cluster. To run, a job must have an associated job definition, and a definition must be associated with a service or a Web application.

job definition (n)~ An XML file that maps a job template to a watch folder in which asset files to be transformed are input and output.

job description (n)~ A statement of the essential responsibilities, duties, job functions, and requirements of a job.

job function (n)~ One or more tasks, duties, and responsibilities that are assigned to a job.

job group (n)~ A series of jobs that perform a complex action in Virtual Machine Manager, such as performing a physical-to-virtual machine conversion.

job history (n)~ Log that keeps a historical record of jobs.

job ID (n)~ A unique identifier that is associated to an employee's job.

job instance (n)~ A job that is running or is queued to run through the Windows Assessment Console or Windows Assessment Services.

job instance (n)~ The occurrence of a job.

job manager (n)~ A service that creates, submits, monitors, and manages jobs.

job manifest (n)~ An XML-formatted file that contains Resource Description Framework (RDF) metadata that describes the job for the tasks in a workflow.

job market pricing (n)~ A method of determining compensation by comparing individual jobs to market benchmark data for similar jobs in order to identify a value-relative basis. With this method, a specific pay range is associated with an individual job, but not with a compensation level (grade or band). Job market pricing is a feature of broad-banding compensation structures, but not of grades or steps.

job object (n)~ A system-level structure that allows processes to be grouped together and

managed as a single unit.

job order costing (n)~ A costing method that uses production orders to assign incurred production costs to specific jobs.

job processing (n)~ A computing method in which a series of jobs, each consisting of one or more tasks grouped together as a computationally coherent whole, is processed sequentially.

job role (n)~ The tasks and activities of an individual in a certain professional position.

job schedule (n)~ The optimal dates and times for performing jobs at a work center.

job scheduler (n)~ A system service that queues jobs and tasks, allocates resources, dispatches tasks to nodes in a computer cluster, and monitors the status of the job, tasks, and nodes.

Job Status Tracking window (n)~ A window, opened by using the My Jobs command, that enables administrators to monitor detailed status of their current jobs while working in any view.

job template (n)~ A template that is used to define and store instructions for a job. A job template can be used to run a job more than once.

job template (n)~ An XML file that describes the sequence of tasks to be performed in a job.

job title (n)~ A short description of the position held by an employee.

job type (n)~ A classification of jobs based on the sequence in which they occur, from the time a job enters the work center to the time it leaves the work center.

Job Units (n)~ The unit of measure to run Business Analytics jobs in Azure.

Jobs view (PN)~ The view in the Virtual Machine Manager Administrator Console in which the administrator views status, details, and results of jobs. The view can be filtered by job status, owner, and start date.

Joe job ~ an e-mail spoofing exploit in which someone sends out huge volumes of spam that appear to be from someone other than the actual source. A Joe job is sometimes conducted as an act of revenge on someone who reports a spammer to their- ISP- or publicly advocates anti-spam legislation.

Joe job, joe-job ~ Spam- email apparently promoting a website that actually has nothing to do with it, intended to get the owner of the website in trouble.

join (n)~ A connection between multiple tables where records from related fields that match are combined and shown as one record. Records that don't match may be included or excluded, depending on the type of join.

join (v)~ To combine the contents of two or more tables and produce a result set that incorporates rows and columns from each table. Tables are typically joined using data that they have in common.

join (v)~ To create an additional replica of an existing ADAM configuration set during setup.

join (v)~ To connect one or more people together in a conversation.

Join (PN)~ A UI element the user clicks to connect to a conference.

Join an Existing Conference… (oth)~ An item on the Actions menu that adds the user to an existing conference.

join column (n)~ A column referenced in a join condition.

join condition (n)~ A comparison clause that specifies how tables are related by their join columns.

Join Conference option (n)~ An optional function in integrated audio conferencing that enables Live Meeting to dial a participant's phone instead of requiring the participant to dial in.

join filter (n)~ A filter used in merge replication that extends the row filter of one table to a related table.

join gesture (n)~ A revision gesture that is used to remove space from between two words (join words).

Join Launcher (PN)~ Part of the existing Lync Web App IIS web component. Lets users optionally join meetings by using a mobile device.

join line (n)~ A line that connects fields between two tables and shows how the data is related. The type of join indicates which records are selected for the query's result set.

join operator (n)~ A comparison operator in a join condition that determines how the two sides of the condition are evaluated and which rows are returned.

join path (n)~ A series of joins indicating how two tables are related.

join style (n)~ A style that specifies how the ends of connected lines are joined.

Joining property (n)~ A property of which the value for an entry in one directory can be expected to match the value of a given property of the corresponding entry in another directory.

Joint List View (PN)~ A feature that allows a view to be created from multiple lists of stored data.

Joint Photographic Experts Group (n)~ A raster graphics file format for displaying high-resolution color graphics on the World Wide Web. JPEG graphics apply a user-specified compression scheme that can significantly reduce the file sizes of photo-realistic color graphics. A higher level of compression results in lower quality, whereas a lower level of compression results in higher quality. JPEG-format files have a .jpg file name extension.

joke program (n)~ A program designed to amuse or scare a user, for example by imitating the actions of a virus, without actually harming the computer.

Joomla! ~ a free, open source content management system written with PHP for publishing content on the world wide web and intranets using a MySQL database.

journal (n)~ For Message Queuing, a queue where journal messages are stored.

journal (n)~ A chronological list of transactions, in the form of debits and credits, for a particular account or group of accounts, such as sales or cash disbursements.

Journal (n)~ The Tablet PC accessory that you use to create notes in your own handwriting.

journal (n)~ A personal record of experiences, occurrances or proceedings, like a Baby Book or Life Book.

journal (n)~ A register of original accounting entries.

journal (n)~ A feature that tracks changes to NTFS volumes, including additions, deletions, and modifications. The change journal exists on the volume as a sparse file.

journal entry (n)~ An entry to a company account to record a business transaction.

journal entry (n)~ An item in the Journal folder that acts as a shortcut to an activity that

has been recorded.

journal entry (n)~ A record of the financial consequence an accounting event.

journal entry adjustment (n)~ An end-of-period journal entry that notes the accrued expenses, accrued revenue, prepaid expenses, and unearned revenue that are associated with an account for the period prior to the reporting period.

journal line (n)~ An entry in a journal.

journal quota (n)~ For Message Queuing, a property that specifies the cumulative limit for journal messages in a journal queue. The limit is based on cumulative journal message size. When a journal queue`s quota is reached, messages are no longer stored.

journal report (n)~ The message that is generated when a message matches a journal rule. The body of the journal report contains information from the original message such as the sender e-mail address, message subject, message-ID, and recipient e-mail addresses. The journal report also includes the original unaltered message as an attachment.

journal rule (n)~ An Exchange rule that is used to record the e-mail messages sent to or from specific recipients.

journaling (n)~ The ability to record all communications, including e-mail communications, in an organization for use in the organization's e-mail retention or archival strategy.

journaling agent (n)~ A compliance-focused agent that is configured to journal e-mail messages that are sent or received by departments or individuals in an Exchange Server 2007 organization, to and from recipients outside the organization, or both for use in the organization's e-mail retention or archival strategy.

journaling mailbox (n)~ A mailbox used only for collecting journal reports in an Exchange Server organization.

journalize (v)~ To record the financial consequences of accounting events in the subledger journal.

joypad (n)~ An action-control device used with arcade-type games played on PCs and game consoles such as the Nintendo 64 and Sony PlayStation. A game pad, unlike a joystick, is meant to be held in the player's hands.

joystick (n)~ A pointing device used mainly but not exclusively for computer games. A joystick has a base, on which control buttons can be mounted, and a vertical stem, which the user can move in any direction to control the movement of an object on the screen.

JPEG (n)~ A raster graphics file format for displaying high-resolution color graphics on the World Wide Web. JPEG graphics apply a user-specified compression scheme that can significantly reduce the file sizes of photo-realistic color graphics. A higher level of compression results in lower quality, whereas a lower level of compression results in higher quality. JPEG-format files have a .jpg file name extension.

JPEG Rotate (PN)~ An Expression Media feature that enables the user to perform lossless JPEG image rotations of 90, -90 and 180 degrees.

JPEG rotation (n)~ A method of changing the orientation of a JPEG image by rotating it by varying degrees. Rotation can be either lossy or lossless, depending upon your choice of rotation.

JPEG, jpg ~ (Joint Picture [Experts] Group; pr. 'jay-peg') A standard type of compressed graphics file, widely used on the WWW. Particularly good for photographs. See

also- compression.

JPop (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 146.

jQuery ~ a library that makes it quicker and easier to build JavaScript webpages and web apps. Often with jQuery you can write a single line of code to achieve what would have taken 10-20 lines of regular JavaScript code.- jQuery

jQuery Countdown ~ A jQuery plugin that sets a div or span to show a countdown to a given time.

JSON (PN)~ A text-based, data interchange format that is used to transmit structured data, typically in Ajax Web applications.

JSP (n)~ A technology created by Sun Microsystems to enable development of platformindependent Web-based applications. Using HTML and XML tags and Java scriptlets, JSP helps Web site developers create cross-platform programs. JSP scriptlets run on the server, not in a Web browser, and generate dynamic content on Web pages, with the ability to integrate content from a variety of data sources, such as databases, files, and JavaBean components. Web site developers can concentrate on design and display of a Web site without the need for application development expertise.

j-tube (n)~ A feeding tube inserted surgically through the abdomen and into the jejunum (a section of the small intestine).

jumbo frames ~ Jumbo frames are large IP frames used in high-performance networks to increase performance over long distances.

Jump List (PN)~ A feature of Windows that provide right-click access from taskbar program buttons to the documents, pictures, songs, or websites a user frequently accesses.

jump list (PN)~ A feature of Windows that provide right-click access from taskbar program buttons to the documents, pictures, songs, or websites a user frequently accesses.

jump menu (n)~ A menu that is structured as a drop-down list of options. When an option is selected, the user is redirected to the associated page in the drop-down menu.

jump statement (n)~ A statement that either transfers control immediately to another location in the function or returns control from the function. In C++, the jump statements are break, continue, return, and goto.

jump table (n)~ A table of identifiers and addresses for a certain class of routines such as interrupt handlers (routines carried out in response to certain signals or conditions).

jumper (n)~ A small plug or wire that can be connected between different points in an electronic circuit in order to alter an aspect of a hardware configuration.

Junction (n)~ In Process Engineering, the shape used to connect pipelines when one pipeline is split by another pipeline. The default junction shape is Junction. However, you can specify any shape on the document stencil as a junction.

junction (n)~ A runbook activity that synchronizes multiple branches of a runbook.

junction point (n)~ A physical location on a hard disk that points to data located at another location on your hard disk or another storage device. Junction points are created when you create a mounted drive. You can also create a junction point using the linked command.

junction table (n)~ A table that establishes a relationship between other tables.

Jungle (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 63.

Junior Detective (n)~ Skill level in the Purble Place game. Once a Purble Place game is completed, a player gets a skill level rank assigned automatically by the game (based on number of guesses and hints during the game).

junk (n)~ E-mail that a customer does not want delivered to their inbox, including spam and phishing messages (identified by the mail service) and messages from blocked senders and domains.

junk e-mail (n)~ An unsolicited and typically unwelcome message, often commercial or political in nature, transmitted via the Internet as a mass mailing (sometimes as if from a fictitious user or domain) to a large number of recipients.

junk e-mail (n)~ E-mail that a customer does not want delivered to their inbox, including spam and phishing messages (identified by the mail service) and messages from blocked senders and domains.

junk e-mail filter (n)~ An e-mail filter that enables the user to set the strictness level that keeps junk e-mail from being delivered to their Inbox.

Junk E-Mail folder (n)~ Page where users can store unsolicited advertisements and e-mail messages.

junk e-mail folder (n)~ The folder where junk e-mail is delivered.

junk e-mail protection (n)~ A feature that provides options for automatically identifying and filtering out junk e-mail messages.

Junk E-mail Reporting Tool (PN)~ The plug-in for Microsoft Office Outlook that alerts a user to incoming junk e-mail and lets the user delete the mail and report it to Microsoft with a single mouse click.

junk mail (n)~ An unsolicited and typically unwelcome message, often commercial or political in nature, transmitted via the Internet as a mass mailing (sometimes as if from a fictitious user or domain) to a large number of recipients.

Junk Mail ~ Unsolicited email.

Junk Mail folder (n)~ Page where users can store unsolicited advertisements and e-mail messages.

Jupyter (PN)~ The spin-off project from IPython of the language-agnostic projects that began as part of IPython.

Just me (PN)~ The UI label for a permissions setting that indicates an item is being shared with (made available to) no one. (It's private.)

Just My Code (PN)~ A Visual Studio .NET debugging feature that allows the user to step through all the user-written code in the current project as well as in any referenced project, and skip over designer-generated code. Also, Just My Code affects breakpoints as well as stepping.

justification (n)~ The process of aligning text along both the left and right margins.

justify (v)~ To adjust horizontal spacing so that text is aligned evenly along both the left and right margins. Justifying text creates a smooth edge on both sides.

just-in-time (adj)~ Pertaining to something that happens when it becomes necessary.

just-in-time compilation (n)~ The compilation that converts Microsoft intermediate

language (MSIL) into machine code at the point when the code is required at run time.

just-in-time compiler (n)~ A compiler takes the Java bytecode (which is machine-independent) and compiles it on demand into native code for the target machine, giving faster execution. Since JIT compilers operate on the client machine, they preserve the platform-independence of the compiled Java program.

just-in-time debugging (n)~ A technique that catches faults that occur while the program is running outside the development environment. You must set this option in the development environment before executing your program.

JVM (n)~ The environment in which Java programs run.

Jython ~ an implementation of PYTHON based on JAVA. See- www.jython.org.

K ~

Ka-Band ~ the bandwidth of electromagnetic wave between 33 GHz to 36 GHz, which is primarily used in satellites operating at 30 GHz uplink and 20 GHz downlink for mobile voice communications.

Kagi chart (n)~ A chart, mostly independent of time, used to track price movements and to make decisions on purchasing stock.

Kamer van Koophandel (n)~ The Dutch chamber of commerce. All businesses in the Netherlands are required to submit annual financial statements to the chamber of commerce.

kanban (n)~ A signal that communicates a requirement for a quantity of product.

kanban card (n)~ A printed document that represents a kanban on the shopfloor, on a physical kanban board or Heijunka board, in a shipment, or in inventory.

kanban flow (n)~ Defines the sequence of activities that are performed for kanbans that are created for a kanban rule.

kanban job (n)~ A process or transfer activity in a production flow that is triggered by a kanban.

kanban job consumption (n)~ The withdrawal of product components from inventory in order to complete the kanban production jobs.

kanban product quantity (n)~ The number of item requirements that are carried on a kanban based on a kanban rule.

kanban quantity (n)~ The numeric parameter in a kanban rule that controls the number of kanbans to create when the rules product requirement condition is met and the rule is evaluated.

kanban rule (n)~ A rule in a lean manufacturing system that realizes material planning and replenishment policies by controlling how process and transfer activities are coordinated in production flows.

Kanban- board (n)~ One of the tools which can be used to implement the kanban method for a Project that is perceived as a variation on traditional kanban cards where, instead of the signal cards that represent demand or capacity, the board utilizes magnets, plastic chips, colored washers or sticky notes to represent item in a production process.

kashidas (n)~ The special characters used to extend the joiner between two Arabic characters. Used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. Can also function like a hyphen.

KB (n)~ A data unit of 1024 bytes.

KB (n)~ A Microsoft Web site that provides customers with access to a database of articles written by Microsoft Support professionals.

KB (n)~ A searchable collection of articles and facts about a particular subject area.

KB article (n)~ A technical document in the Microsoft Knowledge Base accessible through Microsoft.com.

KB Manager (n)~ A feature in Microsoft Dynamics CRM that provides a process for drafting, submitting, reviewing, and publishing knowledge base articles.

Kbps (n)~ Data transfer speed, as through a modem or on a network, measured in

multiples of 1,024 bits per second.

KBps (n)~ Data transfer speed, as on a network, measured in multiples of 1,024 bytes per second.

Kbps ~ (KiloBits Per Second)- A measure of speed of information flow, usually over a modem. A Kilobit is a thousand- bits. See also- bps,Mbps.

KD (n)~ A debugging application that refines and debugs an operating system image. The kernel debugger works like an application debugger except that it is capable of debugging operating systems in addition to applications.

KDC (PN)~ A network service that supplies session tickets and temporary session keys to users and computers within an Active Directory domain. The KDC runs on each domain controller as part of Active Directory Domain Services (AD DS).

KDC proxy service (n)~ A service that runs on corporate network edge servers to proxy Kerberos protocol messages to domain controllers which are situated on the corporate network. This permits Kerberos authentication to edge services such as Remote Desktop Services Gateway or DirectAccess Server.

KDF (n)~ A cryptographic function that generates key material from a secret value.

Keep your life in sync (PN)~ The title of the screen prompting the user to sign in to his existing Microsoft account or to create a Microsoft account. By using the Microsoft account, Windows Phone will keep the user's important information and belongings synchronized in one place, helping keep the user's life organized and harmonious.

keep-alive connection (n)~ An HTTP connection that is not closed after an exchange is completed.

keiretsu ~ a collection of companies that band together for mutual benefit. This Japanese word came into popular use as venture capitalists began building startup keiretsu, companies that benefit from each other's success.

Kerberos (n)~ An authentication protocol that provides a mechanism for mutual authentication between a client and a server, or between one server and another, before a network connection is opened between them.

Kerberos ~ derived from Greek mythology which refers to the three-headed dog that guarded the gates of Hades. Kerberos is most widely used in a network to provide secure network authentication. Usually to authenticate users of the network.

Kerberos authentication (n)~ An authentication protocol that provides a mechanism for mutual authentication between a client and a server, or between one server and another, before a network connection is opened between them.

Kerberos constrained delegation (n)~ A form of authentication delegation in which Kerberos can be used to impersonate users that send requests for certain services, as opposed to all services.

Kerberos V5 authentication protocol (n)~ An authentication mechanism used to verify user or host identity. The Kerberos V5 authentication protocol is the default authentication service. Internet Protocol security (IPsec) can use the Kerberos protocol for authentication.

kermit ~ A terminal program and file transfer protocol, kermit can be used to download files from a remote system to your home computer.

kermit ~ A protocol used for transferring files over a dial-up connection that is commonly used on BBS systems.

kernel (n)~ The core of layered architecture that manages the most basic operations of the operating system and the computer's processor. The kernel schedules different blocks of executing code, called threads, for the processor to keep it as busy as possible and coordinates multiple processors to optimize performance. The kernel also synchronizes activities among Executive-level subcomponents, such as I/O Manager and Process Manager, and handles hardware exceptions and other hardware-dependent functions. The kernel works closely with the hardware abstraction layer.

kernel (n)~ In C++ Accelerated Massive Parallelism (C++ AMP), a unit of computation on a data-parallel compute node.

kernel ~ The heart of an operating system. The kernel is the part of the operating system that interconnects with the hardware.

kernel debugger (n)~ A debugging application that refines and debugs an operating system image. The kernel debugger works like an application debugger except that it is capable of debugging operating systems in addition to applications.

kernel function (n)~ A program designed to be executed on an accelerator in a C++ Accelerated Massive Parallelism (C++ AMP) application.

kernel mode (n)~ A highly privileged mode of operation where program code has direct access to all memory, including the address spaces of all user-mode processes and applications, and to hardware.

kernel time (n)~ The approximate time spent executing in kernel mode during the execution of a user mode application. Includes time spent in disk I/O and waiting for synchronization events.

kernel-mode driver (n)~ A driver for a logical, virtual, or physical device.

Kernel-Mode Driver Framework (PN)~ A library that you can use to develop kernel-mode device drivers that support the Microsoft Windows Driver Model (WDM).

kerning (n)~ The adjustment of the spacing between two characters to create the appearance of even spacing, fit text to a given space, and adjust line breaks.

key (n)~ In database management, an identifier for a record or group of records in a datafile.

key (n)~ In encryption, authentication, and digital signatures, a value used in combination with an algorithm to encrypt or decrypt information.

key (n)~ On a keyboard, the combination of a plastic keycap, a tension mechanism that suspends the keycap but allows it to be pressed down, and an electronic mechanism that records the key press and key release.

key (n)~ A piece of data that is required to unlock a packaged Windows Media file. This key is included in a separate license.

key (n)~ In Registry Editor, a folder that appears in the left pane of the Registry Editor window. A key can contain subkeys and entries. For example, Environment is a key of HKEY_CURRENT_USER.

key (n)~ In IP security (IPSec), a value used in combination with an algorithm to encrypt or decrypt data. Key settings for IPSec are configurable to provide greater security.

key (n)~ An alpha, numeric, or alphanumeric value which uniquely identifies elements that are created and referenced as resources, and which exist within a ResourceDictionary.

key (n)~ A column or group of columns that uniquely identifies a row (primary key),

defines the relationship between two tables (foreign key), or is used to build an index.

key (n)~ In an array, the field by which stored data is organized and accessed.

key (n)~ The attribute of an entity type that specifies which property or set of properties is used to identify unique instances of the entity type.

key ~ In cryptography, a key is a value that determines the output of an encryption algorithm when transforming plain text to encrypted text.

key action (n)~ Term used to describe program behavior when a certain key is pressed on the keyboard. Key actions are associated with items within a source document.

key attribute (n)~ The attribute of a dimension that links the non-key attributes in the dimension to related measures.

key certification authority (n)~ A trusted entity that typically keeps a secure database of compound messages signed with the KCA's private key. In practical implementations, the compound messages consist of the user's name, the user's public key, and any other important information about the user. When the receiving application gets a signed message from a user, the application can then verify the public key received with the message by comparing it to the public key stored in the KCA database.

key chain drive (n)~ A small device used to store information. USB flash drives plug into computer USB ports so you can copy information to or from them, making it easy to share and transport information.

key column (n)~ A column whose contents uniquely identify every row in a table.

key combination (n)~ Any combination of keystrokes that can be used to perform a task that would otherwise require a mouse or other pointing device.

key combination (n)~ Any combination of keys that must be pressed simultaneously.

key derivation function (n)~ A cryptographic function that generates key material from a secret value.

key dictation (n)~ The action by a Trusted Intermediary Agent of determining the key that will be used in an IPsec connection.

Key Distribution Center (PN)~ A network service that supplies session tickets and temporary session keys to users and computers within an Active Directory domain. The KDC runs on each domain controller as part of Active Directory Domain Services (AD DS).

Key Distribution Center proxy service (n)~ A service that runs on corporate network edge servers to proxy Kerberos protocol messages to domain controllers which are situated on the corporate network. This permits Kerberos authentication to edge services such as Remote Desktop Services Gateway or DirectAccess Server.

key drive (n)~ A small device used to store information. USB flash drives plug into computer USB ports so you can copy information to or from them, making it easy to share and transport information.

key encipherment (n)~ The creation of a randomly-generated symmetric key to encrypt file data.

key encryption (n)~ The creation of a randomly-generated symmetric key to encrypt file data.

key exchange (n)~ Confidential exchange of secret keys online, which is commonly done with public key cryptography.

key filter (n)~ A metadata column or field in a Key Filters control.

Key Filters (PN)~ A metadata navigation control that enables users to limit the items displayed in a list or library to those that match selected values.

key frame (n)~ A video frame in which starting and ending positions of an object are given, and all frames in between are interpolated by a computer to produce smooth automated animation. Most ray-traced computer animation is created using this technique.

key generator (n)~ A hardware or software component that is used to generate encryption key material.

key ID (n)~ A value that identifies the key for a packaged Windows Media file.

key ID (n)~ A globally unique identifier that uniquely identifies content for the purposes of licensing.

key identifier (n)~ A globally unique identifier that uniquely identifies content for the purposes of licensing.

key index (n)~ The location where a specific network key for a wireless access point is stored.

Key lock (PN)~ An option that locks the keypad to avoid accidental key presses.

key logger (PN)~ A type of malware that sends key strokes or screen shots to an attacker.

Key logging ~ Key logging software runs in the background, in a stealth mode that isn't easy to detect on a PC. It collects every keystroke and hides that information in a file.

Key Management Server (n)~ The Exchange computer on which the Key Management Service has been installed. There can be one Key Management Server per administrative group.

Key Management Service (n)~ An optional Microsoft Exchange 2000 Server component that is installed on a designated server in an administrative group. It provides centralized administration and archival of private keys, and maintains every user s private encryption key in an encrypted database. The keys are used for encrypting e-mail messages and signing messages with digital signatures.

Key Management Service (PN)~ A Windows role service installed on a KMS host to issue and validate volume software licenses to local computers, enabling individual computers on a network to validate their software licenses locally rather than with Microsoft.

Key Master (PN)~ A DNS server role that is responsible for all DNSSEC key management for a specific DNSSEC-signed DNS zone. Different DNS zones can have different Key Masters. The Key Master role can be moved from one DNS server to a different DNS server, but a DNS zone can have only one Key Master at a given time. To be a Key Master, the DNS server must be authoritative for the DNS zone, the zone must be signed with DNSSEC, and the DNS server must be selected to be the Key Master for the DNS zone.

Key Metrics (n)~ A tab in Application Diagnostics that provides an at-a-glance view of a selected application. The graph displays 1) the average performance based on the Monitored Requests counter, and 2) the number of requests. By looking at the graph, you can easily determine the traffic load and make inferences about problems that might be occurring.

key object (n)~ A type of object that is defined by the configuration manager and

represents an entry in the registry database. Each instance of a key object either represents a registry node (part of a registry path to a set of subkeys) or contains value entries.

key pair (n)~ A private key and its related public key.

key performance indicator (n)~ A predefined measure that is used to track performance of a strategic goal, objective, plan, initiative, or business process. A KPI is evaluated against a target. An explicit and measurable value taken directly from a data source. Key performance indicators (KPIs) are used to measure performance in a specific area, for example, revenue per customer.

Key press (PN)~ An option in ringtones & sounds' settings. When this option is selected

key protector (n)~ A blob (binary large object) that is used to restrict access to a BitLocker-protected disk.

key range lock (n)~ A lock that is used to lock ranges between records in a table to prevent phantom additions to, or deletions from, a set of records. Ensures serializable transactions.

key recovery (n)~ The process of recovering a user's private key.

Key Recovery Agent (n)~ A designated user that works with a certificate administrator to recover a user's private key. A specific certificate template is applied to a Key Recovery Agent.

key repeat rate (n)~ The rate at which characters repeat when a user holds down a key.

key risk indicator (n)~ A quantifiable, standardized measurement of the risk of loss resulting from inadequate or failed business processes.

key rollover (n)~ The process by which an existing cryptographic key is replaced with a new cryptographic key and associated signatures are updated.

key search attack (n)~ An attack by a malicious user or malicious software on a computer or operating system to find a secret password or a symmetric encryption key by guessing passwords or keys until the correct password or key is discovered.

key seed (n)~ A Base64-encoded 30-byte value that is used in conjunction with a key ID to create a content key.

key sequence (n)~ Any combination of keys that must be pressed sequentially.

key signing key (n)~ A public key corresponding to a private key that is used to sign one or more DNS record sets at the zone apex.

key spline (n)~ A graphical representation of the changes in a property value between two keyframes that animate the property.

key storage provider (n)~ A container for storing key material. Currently, keys can be stored in software, smart cards, or the trusted platform module (TPM).

key-based renewal (n)~ A method of renewing a certificate using the existing key material as the sole form of authentication.

keyboard (n)~ An input device consisting of a set of individual keys similar to those on a typewriter. It is used to convey information from a user to a computer or data communications circuit.

keyboard (n)~ A split on-screen keyboard that is optimized for thumb typing.

keyboard (n)~ A contiguous on-screen keyboard.

Keyboard Access System (n)~ A set of accelerator keys with associated icons.

keyboard handler (n)~ Code that determines and responds to keys or key combinations

pressed by the user.

keyboard language (n)~ The language you want to use when you type. Some programs that are designed for the Windows platform recognize this setting. When you add a new keyboard language, a keyboard layout for that language is also added.

keyboard layout (n)~ The key arrangement used for a particular keyboard, including such factors as the number of keys (101 is the current standard) and the configuration of the keys (QWERTY is the United States standard). Some proprietary systems use different layouts, and many allow you to map the keys to characters according to your preferences.

keyboard mapping (n)~ A set of keystroke combinations that you can use while working in the integrated development environment. You can choose from several predefined schemes or define your own.

keyboard mapping scheme (n)~ A set of keystroke combinations that you can use while working in the integrated development environment. You can choose from several predefined schemes or define your own.

keyboard shortcut (n)~ Any combination of keystrokes that can be used to perform a task that would otherwise require a mouse or other pointing device.

Keyboard Wedge ~ a hardware device installed between a computer's keyboard and- POS- terminal that translates digital signals from a barcode reader or magnetic strip reader- into keyboard strokes

keyframe (n)~ A video frame in which starting and ending positions of an object are given, and all frames in between are interpolated by a computer to produce smooth automated animation. Most ray-traced computer animation is created using this technique.

keyframe (n)~ A marker on the timeline that indicates when a property change occurs.

keyframe (n)~ Describing animation in which starting and ending positions of an object are given, and all frames in between are interpolated by a computer to produce smooth automated animation. Most ray-traced computer animation is created using this technique.

keyhole navigator (n)~ A user interface element in Deep Zoom Composer that provides a means to see a broader view of a composition so that a user can quickly move to another area of the composition.

keylogger (n)~ A type of trojan that records user activity, such as keystrokes. This information can be sent to an attacker using e-mail or other methods.

keypad (n)~ A calculator-style block of keys, usually at the right side of a keyboard, that can be used to enter numbers.

keypad (n)~ The on-screen representation of the phone keypad or dial pad on the device.

keyset-driven cursor (n)~ A cursor that shows the effects of updates made to its member rows by other users while the cursor is open, but does not show the effects of inserts or deletes.

key-signing key (n)~ A public key corresponding to a private key that is used to sign one or more DNS record sets at the zone apex.

keystroke (n)~ The act of pressing a key on a keyboard to enter a character or initiate a command in a program. The efficiency and ease of use of certain applications is often measured in terms of how many keystrokes it takes to perform common operations.

keytime (n)~ The time at which a keyframe is located on Expression Blend's timeline.

KeyTip (PN)~ A keyboard shortcut that is displayed over the option to which it

corresponds in the user interface and tells the user which key(s) can be used to access or activate that feature or command.

key-value pair (n)~ A set of data items that contains a unique identifier, called a key, and a value that is the actual data for the key.

keyword (n)~ Any of the set of words that comprises a given programming language or set of operating-system routines.

keyword (n)~ A characteristic word, phrase, or code that is used to conduct sorting or searching operations.

keyword (n)~ In Visual SourceSafe, a version marker that you can place in a text file for later use in keyword expansion.

keyword filter (n)~ A filter that searches for specified words or terms, and displays the analysis of the posts that contain these words.

keyword query syntax (n)~ A query syntax for enterprise search that supports free-text expressions, property restrictions, and specified operators.

kick plate (n)~ A protective metal strip that surrounds the bottom of the Surface unit frame. On finished units, users must remove the end panel and kick plates to access the I/O connections.

kid-friendly website (n)~ A website whose content is understandable and usable by kids and that is appropriate for them. The language is typically aimed at a grade-school reading level, and the concepts presented are accessible to younger minds.

Kids & family (PN)~ An app category that facilitates parenting or entertains and educates children.

kids + family (PN)~ An app category that facilitates parenting or entertains and educates children.

Kid's Corner (PN)~ An app that helps parents provide their children with controlled access to their phones. In Kid's Corner, kids can only use the apps, games, and other content that parents select.

kill bit (n)~ A registry value that contains the CLSID of all controls that are vunerable to security flaws.

Killer app ~ (Killer application)- A program that is so obviously massively useful to someone that they will rush out and buy it immediately, and a computer to run it on.

killer app (application) ~ a computer program that is so useful or desirable that it proves the value of some underlying technology, such as a gaming console, operating system, or piece of computer hardware or deploying an entire network. Killer applications are very rare.

kilobit (n)~ A data unit equal to 1024 bits.

kilobits per second (n)~ Data transfer speed, as through a modem or on a network, measured in multiples of 1,024 bits per second.

kilobyte (n)~ A data unit of 1024 bytes.

Kilobyte ~ Unit of measurement for pieces of information : actually 1024 Bytes (characters), but in practice almost always rounded down to 1000. Often written as just K, eg 250 K is 250 Kilobytes (250,000 bytes/characters - well not exactly, but close enough). See alsoMegabyte,- Gigabyte, Terabyte.

kilobytes per second (n)~ Data transfer speed, as on a network, measured in multiples of

1,024 bytes per second.

Kind (PN)~ A property that provides a user-friendly name, and can be associated with a list of properties and a layout pattern.

Kind (n)~ In the Azure REST API, the variant of a computing service chosen by the customer, when multiple ones exist for the same type.

Kindle ~ The Amazon Kindle is a series of e-book readers designed and marketed by Amazon.com. The Kindle name was devised by branding consultant Michael Cronan who was asked by Lab 126 to name the product. Cronan and partner Karin Hibma suggested Kindle, meaning to light a fire. They felt this was an apt metaphor for reading and intellectual excitement.

Kinect sensor (n)~ The Kinect device.

kiosk (n)~ A freestanding computer or terminal that provides information to the public, usually through a multimedia display.

Kiosk ~ Free-standing, interactive devices installed for customer self-service. Besides the computer monitor, a kiosk can have a keyboard or scanner attached for input and a printer attached for output.

kiosk mode (n)~ A display mode in which a single window takes over the whole screen, the toolbar and menu bar are not displayed, and the desktop is inaccessible.

kit (n)~ A single item with an item number that consists of one or more component items from inventory or a product catalog.

kit item (n)~ A single item with an item number that consists of one or more component items from inventory or a product catalog.

kit line (n)~ An individual item that is a component of a kit.

Kitchen Trainee (n)~ A skill level in the Comfy Cakes game. Once you have completed a Comfy Cakes game, a player gets a skill level rank assigned automatically by the game (based on the score you hit during the game).

Klez ~ pronounced KLEHZ, an Internet worm that launches automatically when a user previews or reads an e-mail message containing Klez on a system that has not been patched for a vulnerability in Microsoft Internet Explorer mail clients. It is not necessary for a user to explicitly open an attachment in order for Klez to execute. There have been more than a half-dozen variations of Klez since it was first reported in October of 2001.

KMDF (PN)~ A library that you can use to develop kernel-mode device drivers that support the Microsoft Windows Driver Model (WDM).

KMS (PN)~ The Exchange computer on which the Key Management Service has been installed. There can be one Key Management Server per administrative group.

KMS (PN)~ A Windows role service installed on a KMS host to issue and validate volume software licenses to local computers, enabling individual computers on a network to validate their software licenses locally rather than with Microsoft.

knock knock' (n)~ The password' that a user can say to get through when they are in someone's inner circle and that person has set quiet hours on.'

knockout (n)~ The process of eliminating background color behind an object in the foreground.

Know Your Client (PN)~ An acronym for Know your client.' This is a section in the Party form. '

knowledge (n)~ The metadata about all the changes that a participant has seen and maintains.

knowledge (n)~ Information that can help an end-user or analyst solve a problem.

knowledge article (n)~ A document that documents unique characteristics for a case.

Knowledge Base (n)~ A Microsoft Web site that provides customers with access to a database of articles written by Microsoft Support professionals.

knowledge base (n)~ A searchable collection of articles and facts about a particular subject area.

Knowledge Base (PN)~ A feature in Microsoft Dynamics CRM that provides a process for drafting, submitting, reviewing, and publishing knowledge base articles.

Knowledge Base Manager (n)~ A feature in Microsoft Dynamics CRM that provides a process for drafting, submitting, reviewing, and publishing knowledge base articles.

knowledge base template (n)~ A template that allows the user to create users to structure and manage product knowledge entries.

Knowledge Consistency Checker (n)~ A built-in process that runs on all domain controllers and generates the replication topology for the Active Directory forest. At specified intervals, the KCC reviews and makes modifications to the replication topology to ensure propagation of data either directly or transitively.

knowledge entry (n)~ An entry in the product knowledge base established by the user. In general, an entry contains information on cause, resolution as well as a summary.

knowledge management (n)~ A system for managing shared corporate knowledge.

knowledge worker (n)~ An individual whose job centers on using a computer to collect, process, and apply information, especially when meaningful value is added to purely factual information. A knowledge worker is someone with both formal education and the ability to apply that education knowledge in a work situation.

Korean won (n)~ The official currency of Korea.

KPI (n)~ A predefined measure that is used to track performance of a strategic goal, objective, plan, initiative, or business process. A KPI is evaluated against a target. An explicit and measurable value taken directly from a data source. Key performance indicators (KPIs) are used to measure performance in a specific area, for example, revenue per customer.

KPI details report (PN)~ A report type that shows information about a KPI that is selected in a scorecard.

KRA (n)~ A designated user that works with a certificate administrator to recover a user's private key. A specific certificate template is applied to a Key Recovery Agent.

KRI (oth)~ A quantifiable, standardized measurement of the risk of loss resulting from inadequate or failed business processes.

KSK (n)~ A public key corresponding to a private key that is used to sign one or more DNS record sets at the zone apex.

KSP (n)~ A container for storing key material. Currently, keys can be stored in software, smart cards, or the trusted platform module (TPM).

Ku-Band ~ the bandwidth of electromagnetic wave between 12 GHz to 14 GHz, which is primarily used in satellites operating at 14 GHz uplink and 11 GHz downlink in supporting braodband TV and- DBS- system (DSS).

KvK (oth)~ The Dutch chamber of commerce. All businesses in the Netherlands are required to submit annual financial statements to the chamber of commerce.

KYC (PN)~ An acronym for Know your client.' This is a section in the Party form. '

KYMC (n)~ A color model that describes color information in terms of the black (K), yellow (Y), Magenta (M) and Cyan (C) intensities that make up the color.

KYMC quad (n)~ A quad that identifies a color from its black, yellow, magenta and cyan components.

L ~

L2CAP (n)~ A protocol used in personal wireless network applications that provides connection-oriented and connectionless data services to upper layer protocols with protocol multiplexing capability, segmentation and reassembly operation, and group abstractions.

L2TP (n)~ An industry-standard Internet tunneling protocol that provides encapsulation for sending Point-to-Point Protocol (PPP) frames across packet-oriented media. For IP networks, L2TP traffic is sent as User Datagram Protocol (UDP) messages. In Microsoft operating systems, L2TP is used in conjunction with Internet Protocol security (IPSec) as a virtual private network (VPN) technology to provide remote access or router-to-router VPN connections. L2TP is described in RFC 2661.

lab (n)~ A collection of non-production machines that are used to test an Internet Explorer Package. The lab is not the same as a pilot group.

Lab administration service for Visual Studio Lab Management 2010 (n)~ The service of managing the virtual laboratory environment, which is designed for using in Visual Studio Lab Management 2010.

lab agent (n)~ A background process that runs on a virtual machine to configure, monitor, and report on status and errors. The lab agent communicates with the lab service running on the Team Foundation Server application tier.

lab environment (n)~ An environment, consisting of virtual machines, that is managed by a lab service.

Lab framework service for Visual Studio Lab Management 2010 (n)~ The service of managing the virtual laboratory platform, which is designed for using in Visual Studio Lab Management 2010.

Lab Management (n)~ A product within the Visual Studio Team System suite that enables you to manage virtual environments for use within team projects. The environments can be used for application development, deployment, and testing.

Lab Management service for Visual Studio Lab Management 2010 (n)~ The service of Lab Management designed for using in Visual Studio Lab Management 2010.

lab service (n)~ A Team Foundation Server Web service used to manage virtual environments.

lab test (n)~ A procedure that is intended to detect and quantify substances or identify the nature of a disease.

Lab test integration service for Visual Studio Lab Management 2010 (n)~ The service of integrating the laboratory tests for Visual Studio Lab Management 2010.

Lab workflow integration service for Visual Studio Lab Management 2010 (n)~ The service of integrating the laboratory workflow stages in Visual Studio Lab Management 2010.

Lab Workflow Parameters (n)~ The parameters of a workflow being performed in the lab.

Lab Workflow Parameters wizard (n)~ A wizard which enables you to define the parameters of a workflow in the lab.

label (v)~ To attach a label to.

label (n)~ In DNS, each part of a DNS domain name that represents a node in the domain namespace tree. For example, the three labels example, microsoft, and com make up the DNS domain name example.microsoft.com. Each label used in a DNS name cannot exceed 63 octets, 255 bytes including the terminating dot, for the fully qualified domain name (FQDN).

label (v)~ To identify or designate with a label; describe or classify.

label (n)~ A sticker or tag affixed to an item to provide identifying or descriptive information.

label (n)~ A word, symbol, or other group of characters used to identify a file, a storage medium, an element defined in a computer program, or a specific item in a document such as a spreadsheet or a chart.

label (n)~ A graphical control you can use to display text that a user can't change directly.

label (n)~ User-defined name attached to a specific version of a file or project.

label promotion (n)~ The promotion of a different version (usually the latest version) of a file to become part of the already labeled code. The goal could be to perform minor updates to the code base of the original release.

Labeled Hierarchy (PN)~ A SmartArt graphic layout used to show hierarchical relationships progressing from top to bottom and grouped hierarchically. Emphasizes heading or level 1 text. The first line of Level 1 text appears in the shape at the beginning of the hierarchy, and all subsequent lines of Level 1 text appear to the left of the tall rectangles.

Labels View (n)~ Name of one of the Library Views. This appears on the main Library window title bar. Under the toolbar, from the View By drop down list, select Label.

laboratory test (n)~ A procedure that is intended to detect and quantify substances or identify the nature of a disease.

LACP (PN)~ Protocol that standardizes the link aggregation process among different vendors.

lag (n)~ The number of periods in a time dimension level to move backward from the last non-empty member to retrieve a current or a previous value.

lag time (n)~ A delay between tasks that have a dependency. For example, if you need a two-day delay between the finish of one task and the start of another, you can establish a finish-to-start dependency and specify a two-day lag time [has a positive value].

lambda function (n)~ A block of programming language code that operates as a function but is not named and cannot be called or referenced except through normal flow of operation. For example, the instruction within the braces in the following code is a lambda function: for (int x=0; x<10; x++) { int y = 2*x; }.

lambda operator (n)~ The C# => operator that is used to separate the parameters and the body of a lambda expression.

lamp (n)~ The light source in a Surface unit.

lamp access door (n)~ The metal door in the I/O connections area that you must remove to access the lamp assembly.

lamp assembly (n)~ A collection of parts, including the lamp, that help illuminate the Surface screen.

LAN (n)~ A network of computers, printers, and other devices located within a relatively limited area (for example, a building). A LAN enables any connected device to interact with any other on the network.

LAN ~ (Local Area Network; pr.'lan') A network of computers connected together, usually in a single department or building. See also- WAN.

LAN emulation (n)~ A group of software components that allows asynchronous transfer mode (ATM) to work with legacy networks and applications. With LANE, you can run your traditional local area network (LAN)-aware applications and protocols on an ATM network without modification. LANE makes the ATM protocol layers appear to be an Ethernet or Token Ring LAN to overlying protocols and applications. LANE provides an intermediate step between fully exploiting ATM and not using ATM at all.

LAN emulation client (n)~ The client on an emulated local area network (ELAN) that performs data forwarding, address resolution, and other control functions. The LEC resides on end stations in an ELAN.

LAN emulation configuration server (n)~ A server that assigns individual local area network emulation (LANE) clients to particular emulated local area networks (ELANs) by directing them to the LAN emulation server (LES).

land attack (n)~ A denial-of-service attack (DoS) in which the attacker opens a legitimate TCP session with a spoofed source IP address and port number that match the IP address and port number of the targeted computer so that the targeted computer will try to establish a TCP session with itself, causing some TCP implementations to go into a loop and the computer to fail.

landing page (n)~ The page that a visitor lands on after clicking an ad with a link to a Web site.

landline (n)~ A traditional phone, which has a wired connection (as opposed to a mobile phone).

landline ~ A telephone circuit that travels over land-based circuits

landscape (n)~ An orientation where the long dimension of a rectangular area (for example, screen or paper) is horizontal.

landscape orientation (n)~ An orientation where the long dimension of a rectangular area (for example, screen or paper) is horizontal.

LANGID (n)~ A standard international numeric abbreviation for a country or geographical region. A language identifier is a 16-bit value that consists of a primary language identifier and a secondary language identifier.

Language (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

language (n)~ An artificial language that specifies instructions to be executed on a computer. The term covers a wide spectrum, from binary-coded machine language to high-level languages.

Language (PN)~ Language a post was written in or the system calculated for the post.

Language (PN)~ The Education subcategory containing apps to help you learn or translate another language.

Language bar (n)~ A toolbar that appears on your desktop automatically when you add text services, such as input languages, keyboard layouts, handwriting recognition, speech

recognition, or input method editors (IMEs).

Language for non-Unicode programs (n)~ A Regional and Language Options setting that specifies the default code pages and associated bitmap font files for a specific computer that affects all of that computer's users. The default code pages and fonts enable a non-Unicode application written for one operating system language version to run correctly on another operating system language version.

language group (n)~ A group that controls which system locale, user locales, input locales, and user interface (UI) languages can be selected.

Language ID (n)~ A standard international numeric abbreviation for a country or geographical region. A language identifier is a 16-bit value that consists of a primary language identifier and a secondary language identifier.

language identifier (n)~ A standard international numeric abbreviation for a country or geographical region. A language identifier is a 16-bit value that consists of a primary language identifier and a secondary language identifier.

Language Interface Pack (PN)~ Add-in software that provides partially localized user interfaces for particular computer programs in languages not supported by localized versions of those programs.

language pack (n)~ A collection of binaries that can be installed on top of the core product and enables users to select a preferred language so that the user interface and Help files appear in that preferred language.

language pack (n)~ A solution package that contains only a DLL that stores localized versions of strings in another solution package. After a language pack is deployed to a site, users can display the corresponding user interface in that language.

Language Profile Service (PN)~ A Windows service that automatically manages user language preferences. Localized apps can inherit these settings, saving developers time and effort by making it unnecessary for applications to manage user language preferences on their own.

language service (n)~ A service in Visual Studio that provides language-specific support for editing source code in the integrated development environment (IDE).

language service parser (n)~ A component that is used to describe the functions and scope of the tokens in source code.

language service scanner (n)~ A component that is used to identify types of tokens in source code. This information is used for syntax highlighting and for quickly identifying token types that can trigger other operations, for example, brace matching.

language-dependent (adj)~ Varying from one language to another.

language-integrated query (n)~ A query syntax that defines a set of query operators that allow traversal, filter, and projection operations to be expressed in a direct, declarative way in any .NET-based programming language.

language-neutral (adj)~ Having no language-dependent or language-specific content.

language-specific (adj)~ Specific to a single language.

LANlord ~ The alpha geek responsible for an office's Local Area Network.

lap (n)~ An interval of time that it takes to complete a circuit in a race or exercise course, which the user can record with a stopwatch.

laptop (n)~ A portable computer that combines a processor, screen, and keyboard in a

single case. The screen folds down onto the keyboard when not in use.

Laptop ~ A portable PC, with system unit, screen and keyboard crammed into one package. They can do pretty much everything a desktop PC can do, but are more expensive because of the extra miniaturisation required. Also called a- notebook.

laptop ~ A portable PC, with system unit, screen and keyboard crammed into one small package. They can do pretty much everything a desktop PC can do, but are substantially more expensive because of the extra miniaturisation required.

laptop mode (n)~ A mode on a convertible Tablet PC that enables you to type comfortably on the keyboard while viewing the screen.

Large Files (n)~ A storage report that lists files that are a specified size or larger. Use this report to quickly identify the files that are consuming the most disk space on the server. These can help you quickly reclaim large quantities of disk space.

large organization (n)~ An organization with more than 1000 employees and more than 500 personal computers.

large tile (n)~ A square tile of 310 x 310 pixels on the Start screen.

Larger (adj)~ An item on the Text Size menu, which is opened from the Edit menu. Larger is one of the text size choices for the user's instant messages

Largest (adj)~ An item on the Text Size menu, which is opened from the Edit menu. Largest is one of the text size choices for the user's instant messages

Laser Pointer (PN)~ A feature that allows the user to superimpose a dot over a presentation and control its position with the mouse. The appearance of the dot is similar to that of a traditional laser pointer, and it is broadcast to all presentation viewers and can be recorded into video (Save to Video).

Laser printer, laserprinter ~ A high speed printer intended mainly for office use, usually better for text than graphics, especially in color.

Lasso (PN)~ A tool that defines a free-form area that encloses all the shapes to be selected.

Lasso tool (n)~ A tool that defines a free-form area that encloses all the shapes to be selected.

Last chance rentals (PN)~ The collection title for video items whose rental contract between the distributor and Microsoft is near expiration.

Last Heartbeat (n)~ The title of a column or data field which specifies the date and time that the last heartbeat was received from the monitored computer.

last in, first out inventory valuation method (n)~ An inventory valuation method in which inventory that is received most recently is considered sold or used first for accounting purposes.

last mile ~ The final leg in delivering connectivity in a telecommunications network. Often perceived as the most critical in terms of both service provision, cost and bandwidth.

Last Modified Date/Time (n)~ The timestamp of the most recent modification of a Navision entity. The modified entries are retrieved from the Change Log. If the Last Modified Date/Time is older than the last synchronization time, then entities will not be synchronized. If The Last Modified Date/Time is more recent, the synchronization will be performed.

Last Name (n)~ In the Add a Contact Wizard, this is one of the fields by which you can search for a contact.

last name (n)~ The surname, or family name of an individual.

Last night (PN)~ The collection title for TV series episodes that aired the previous night.

Last Sequence Number (n)~ A number that's assigned by the Provisioning Server to the most recent transaction processed for a specified computer.

Last Synchronization Time (n)~ The time when the most recent synchronization process was successfully completed. The last synchronization time determines when the next automatic synchronization will take place. The next automatic synchronization is performed at predefined points in time starting from the last synchronization time.

last transaction (n)~ The most recent transfer of data recorded by the server.

Lastschriftenverfahren (n)~ An electronic payment method used in Switzerland that allows companies to deduct customer payments directly from a customer's bank through the Swiss Interbank Clearing system.

LAT (n)~ A DEC-specific, non-routable network protocol designed to provide connection between remote desktop servers and DEC hosts.

latch (n)~ A short-term synchronization object protecting actions that need not be locked for the life of a transaction. A latch is primarily used to protect a row that the storage engine is actively transferring from a base table or index to the relational engine.

late finish date (n)~ The latest date that a task can finish without delaying the finish of the project. It is based on the task's late start date, as well as the late start and late finish dates of predecessor and successor tasks, and other constraints.

late start date (n)~ The last possible date a task could be started if all predecessor and successor tasks also start and finish on their late start and late finish dates.

late-bound code (n)~ A code that defers the assignment of a meaning to an identifier (such as a variable) until runtime.

latency (n)~ The time required for a signal to travel from one point on a network to another.

latency (n)~ The delay that occurs while data is processed or delivered.

latency (n)~ The amount of time it takes for the client request for a fragment to be fulfilled (that is, the amount of time it takes for the requested fragment to be viewable in the Silverlight-enabled browser). Typically, this is a few seconds.

Latency ~ The time interval during which a network station seeks access to a transmission channel and access is granted or received.

late-peak contour (n)~ A contour that slopes up gradually, peaks near the end of the curve, and then drops off.

latest version (n)~ The most recent or current version of a software release.

lathe object (n)~ An object that appears as if made by a machine for shaping a piece of material, such as wood or metal, by rotating it rapidly along its axis while pressing against a fixed cutting or abrading tool.

Latin (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 86.

Latin America (PN)~ The geographic location, covering Latin America, within the Azure

region taxonomy in Zone 2.

lattice (n)~ A structure that passes handwriting recognition results to tablet PC platform libraries.

launch (n)~ To activate an application program from the operating system's user interface.

launch (v)~ To activate an application program (especially on the Macintosh) from the operating system's user interface.

launch (n)~ The activities leading up to and through a product's release into the marketplace.

Launchbar (n)~ A window where Groove users start new activities. It contains two panels, one for creating and managing workspaces, and the other for managing contacts.

launcher (PN)~ In Mac OS, a program that organizes frequently used applications and programs and that allows the user to execute them with a single mouse click.

Launcher (n)~ A program that lets users easily find and open programs, accessories, control panel settings, and Web sites using their fingers on a touch-screen Tablet PC.

Launcher (PN)~ A menu that users can scroll through and where they open applications from on a Surface unit in user mode. Launcher contains icons, videos, and text that describe each application. Launcher is the primary visual component of the Surface software.

launcher style (n)~ A function that allows the user to specify how tasks are displayed in the launcher (list view or icon view).

layer (n)~ The protocol or protocols operating at a particular level within a protocol suite, such as IP within the TCP/IP suite.

layer (n)~ A container that holds page elements, such as text and graphics. You can overlap, nest, and show or hide layers on a page. You can also animate layers.

layer (n)~ A logical (not physical) structuring of a software application into related tasks.

layer ~ In the- OSI- reference model, a layer is a collection of related network-processing functions that constitute one level of a hierarchy of functions.

Layer Two Tunneling Protocol (n)~ An industry-standard Internet tunneling protocol that provides encapsulation for sending Point-to-Point Protocol (PPP) frames across packet-oriented media. For IP networks, L2TP traffic is sent as User Datagram Protocol (UDP) messages. In Microsoft operating systems, L2TP is used in conjunction with Internet Protocol security (IPSec) as a virtual private network (VPN) technology to provide remote access or router-to-router VPN connections. L2TP is described in RFC 2661.

layered driver (n)~ One of a collection of drivers that responds to the same IRPs. Layered driver describes the highest-level and lowest-level drivers in a chain of layered drivers that process the same IRPs, along with all intermediate drivers in the chain.

layered window (n)~ A window that features special visual effects such as translucency, transparency and custom border shapes or colors.

layout (n)~ In computer design, the arrangement of circuits and other components of the system.

layout (n)~ The overall plan or design of a document system.

layout (n)~ In programming, the order and sequence of input and output.

layout (n)~ The organization (the arrangement, size, and position) of the visual elements

in your application, with respect to each other and the overall application window.

Layout (PN)~ A tool that allows you to quickly draw one of a collection of layout panels (containers).

layout (n)~ The overall design of a page or content set, including text elements, controls, and graphics.

layout (n)~ The layout and general resiliency of data across multiple disks in a virtual disk or storage space.

layout cell (n)~ A cell in a layout table.

layout container (n)~ An element that controls the positioning, size and dimensions, and arrangement of other elements contained within them. Layout containers are adaptive in the sense that they can be implemented implicitly, meaning the layout automatically resizes, or auto-sizes, according to the window size.

Layout Gallery (PN)~ The Sway feature that allows users to choose between different Layouts for the selected content.

Layout page (n)~ A web page named _Layout.cshtml that provides a template for the content of another page in an ASP.NET Web pages site.

layout panel (n)~ A panel that controls the positioning, size and dimensions, and arrangement of other elements contained within them. Layout panels are adaptive in the sense that they can be implemented implicitly, meaning the layout automatically resizes, or auto-sizes, according to the window size.

layout pass (n)~ A process that calculates the size and position of elements in the user interface.

layout path (n)~ A dynamic layout of objects or elements along one or more paths.

layout pattern (n)~ One of several arrangements for displaying properties.

Layout Preview (n)~ A feature that uses a minimum amount of data to display the general layout of a report.

layout style (n)~ A pre-defined table style that allows users to change the look and feel of a form.

layout table (n)~ A framework that includes rows and columns for organizing and arranging content on a form, including controls, control labels, sections of a form, logos, and other types of graphics.

layout table (n)~ A predefined layout that defines the structure of a Web page as a table. A layout table can also include formatting such as rounded corners, borders, and visual effects.

layout transform (n)~ A type of transformation that is applied before the layout pass. After the transform is applied, the layout system processes the transformed size and position of the element. Use a layout transform property only when scaling, rotating, or skewing and you need the parent of the element to adjust to the transformed size of the element. Otherwise, use a render transform, which is more efficient.

Lazy Area Location Reporting (PN)~ A type of location reporting that specifies the area into which users performed their last session, country, region and locality associated to devices, based on CELL ID or WIFI.

Lazy evaluation ~ a computation optimization technique that attempts to delay computation of expressions until the results of the computation are known to be needed.

lazy flusher (n)~ A task that flushes the in-memory transmission objects to a work table.

lazy initialization (n)~ The deferral of object initialization or instantiation until the first time the object is referenced.

lazy loading (n)~ A pattern of data loading where related objects are not loaded until a navigation property is accessed.

lazy schema validation (n)~ An option that delays checking the remote schema to validate its metadata against a query until execution in order to increase performance.-

LB (oth)~ The payroll tax for the Netherlands that is related to income tax withholding and information related to personnel.

LBA (n)~ A method used with SCSI and IDE disk drives to translate the cylinder, head, and sector specifications of the drive into addresses that can be used by an enhanced BIOS. LBA is used with drives that are larger than 528MB.

LCD (n)~ A type of display that uses a liquid compound having a polar molecular structure, sandwiched between two transparent electrodes. When an electric field is applied, the molecules align with the field, forming a crystalline arrangement that polarizes the light passing through it. A polarized filter laminated over the electrodes blocks polarized light. In this way, a grid of electrodes can selectively turn on' a cell

LCD ~ (Liquid Crystal Display) A type of computer screen, originally used only on- laptops but now widely used for desktop PCs and televisions.

LCID (n)~ A 32-bit value which consists of the language ID in the low word (bits 0-15) and the sorting ID (bits 16-19) and a reserved value (bits 20-31) in the high word.

LCP (n)~ A PPP control protocol that negotiates link and PPP parameters to dynamically configure the data-link layer of a PPP connection.

LCR (n)~ A replication that uses a single server and built-in technology to create and maintain a copy of a storage group on a second set of disks that are connected to the same server as the primary storage group. LCR provides asynchronous log shipping, log replay, and a quick manual switch to a copy of the data.

LCR (n)~ A process that performs reverse number lookup on one-number calls and then routes the call over an IP connection to the public switched telephone network (PSTN) gateway that is nearest to the location of the destination phone number.

LDAP (n)~ The primary access protocol for Active Directory. LDAP is an industry-standard protocol, established by the Internet Engineering Task Force (IETF), that allows users to query and update information in a directory service. Active Directory supports both LDAP version 2 and LDAP version 3.

LDD (n)~ The designer used to create and edit diagrams of interconnected logical servers that represent the logical structure of a datacenter.

LDL (n)~ A class of lipoproteins that carry cholesterol through the blood and around the body, for use by cells.

lead (n)~ A potential customer who must be contacted by a salesperson and either qualified or disqualified as a sales opportunity. Leads will be converted into accounts, contacts, or opportunities if they are qualified. Otherwise they are deleted or archived.

lead byte (n)~ The byte value that is the first half of a double-byte character.

lead host (n)~ A cache host that has been designated to work with other lead hosts and to keep the cluster running at all times.

lead scoring (n)~ The process of assigning points to prospects, based on specifically defined criteria, generally to identify the prospects or leads most likely to become customers.

lead time (n)~ The minimum amount of time required for production of an item.

lead time (n)~ An overlap between tasks that have a dependency. For example, if a task can start when its predecessor is half-finished, you can specify a finish-to-start dependency with a lead time of 50 percent for its successor [has a negative lag value].

leader (n)~ A line or row of characters used to lead the eye from a data label to a data point, or from a callout to the appropriate part of an illustration.

leader (n)~ A teleconferencing participant who can activate and deactivate a phone conference.

leader (n)~ A video that plays before the main video begins.

leader character (n)~ A dot, hyphen, or other character used to create a line that fills the space before a tab stop.

leader clip (n)~ A video that plays before the main video begins.

leader code (n)~ An access code that is needed in order for a user to join a conference as a leader. This string is entered in the Options dialog box, on the Accounts tab, under Conferencing Information.

leader video (n)~ A video that plays before the main video begins.

leaderboard (n)~ List of the top players in a game or other competition on Xbox Live.

leading (n)~ The amount of space from the bottom of one line of text to the bottom of the next line.

leading clip (n)~ A video that plays before the main video begins.

leading video (n)~ A video that plays before the main video begins.

lead-time offset (n)~ An offset value that changes the due date of any assembly order component that belongs to the assembly BOM during replenishment planning. The assembly line due date is then calculated as Due Date = Starting Date - Lead-Time Offset.

leaf (n)~ A node with no child objects represented in the tree.

leaf disk (n)~ The last disk in a chain with no child disks attached to it.

leaf level (n)~ The bottom level of a clustered or nonclustered index, or the bottom level of a hierarchy.

leaf member (n)~ A member that has no descendents.

leaf node (n)~ A node with no child objects represented in the tree.

lean manufacturing (n)~ A philosophy in which manufactuaring operations promote lean production flows and business activities.

lean schedule group (n)~ A way in which to aggregate items for production, for example, based on a setup group, shipping group, or transport group.

learning management system (n)~ A system that enables the management and delivery of learning content and resources to students.

learning path (n)~ The training courses that can help a partner reach particular goals according to Microsoft products, competencies, partner type and role.

learning plan (n)~ A list of required and elective courses that are taken to satisfy a goal. Required courses can be based on Microsoft corporate mandates; company-wide, business-group or regional initiatives; or the learner's career stage profile.

lease (n)~ The length of time for which a DHCP client can use a dynamically assigned IP address configuration. Before the lease time expires, the client must either renew or obtain a new lease with DHCP.

lease time (n)~ The length of time for which a DHCP client can use a dynamically assigned IP address configuration. Before the lease time expires, the client must either renew or obtain a new lease with DHCP.

leased line (n)~ A communications channel that permanently connects two or more locations. Dedicated lines are private or leased lines, rather than public ones. T1 lines, which are used by many organizations for Internet connectivity, are examples of dedicated lines.

Leased Line ~ A private telephone line without inter-exchange switching arrangements. Also called Private Line and Dedicated Line

Least Recently Accessed Files (n)~ A storage report that lists files that have been accessed least recently. Use this report to identify rarely used data.

least recently used (n)~ The type of eviction used by the cache cluster, where least recently used objects are evicted before the most recently used objects.

least-cost routing (n)~ A process that performs reverse number lookup on one-number calls and then routes the call over an IP connection to the public switched telephone network (PSTN) gateway that is nearest to the location of the destination phone number.

least-squares method (n)~ A method that assigns values to unknown quantities in a statistical model, based on the values found by minimizing the sum of squared deviations from the mean.

Leave Management (PN)~ The Duet end-user application that allows users to self-manage their absence or availability for payroll purposes. Users can create and manage leave requests in Microsoft Office Outlook in the form of Calendar items, which are integrated with approval guidelines and business-defined processes defined in SAP systems.

LED (n)~ A semiconductor device that converts electrical energy into light, used, for example, for the activity lights on computer disk drives. Light-emitting diodes work on the principle of electroluminescence and are highly efficient, producing little heat for the amount of light output.

ledger (n)~ The part of an accounting system that is used for classifying the monetary value of economic transactions by using a chart of accounts, a fiscal calendar, and one or more currencies.

ledger account (n)~ An account in the general ledger that records financial transactions, balances, or totals that pertain to assets, liabilities, revenues, expenses, and owner equity.

ledger account (n)~ A classifier created from the combination of main account value and other financial dimension values listed in a chart of accounts and used to classify the financial consequences of economic activity.

ledger dimension (n)~ A classifier created from the combination of financial dimension values listed in a chart of accounts and used to classify the financial consequences of economic activity.

ledger reconciliation (n)~ The practice of reconciling general ledger accounts.

Ledger Sheets (PN)~ A feature that enables users to perform common financial

management tasks, such as balancing a checkbook, tracking accounts, or managing investment porfolios, by using a set of Excel templates.

ledger update transaction (n)~ A system transaction that tracks and reports what has been posted to the ledger.

left align (v)~ To align text along the left margin.

left angle bracket (n)~ The < character.

left arrow (n)~ The key on the keyboard that is labeled with a left arrow.

left brace (n)~ The { character.

left bracket (n)~ The [character.

LEFT DOUBLE QUOTATION MARK (n)~ The -€œ character.

left end (n)~ The short side of a Surface unit where the AC/Main rocker switch and AC power connector are located and that provides access to the hard disk drive of the Surface unit.

left mouse button (n)~ The button on your pointing device that you use most often for clicking and double-clicking.

left outer join (n)~ A type of outer join in which all rows from the left-most table in the JOIN clause are included. When rows in the left table are not matched by rows in the right table, all result set columns that come from the right table are assigned a value of NULL.

left pane (n)~ The navigational pane at the left of most webpages and Windows folders.

left square bracket (n)~ The [character.

Left voicemail (oth)~ Check box on Phone Call form that indicates that, when the call was made, a voicemail was left for the recipient.

left-aligned (adj)~ Pertaining to text that is aligned along the left margin.

left-to-right (adj)~ Pertaining to keyboard settings, document views, user interface objects, and languages for which text is displayed in a left-to-right direction. English and most other European languages are left-to-right languages.

legacy (adj)~ Of or pertaining to documents, data, software, or hardware that existed prior to a certain time.

legacy (n)~ Any feature in the computer system based on older technology for which compatibility continues to be maintained in other system components.

Legacy ~ Term used to describe enterprise applications or systems installed in the distant past, but still being used. Typically, they are characterized by outdated technologies, but are still critical to day-to-day operations.

legacy agent (n)~ Any agent version that is older than MOM 2004.

legacy application (n)~ When used in the context of the User Account Control (UAC) infrastructure, an application that does not have an application manifest that indicates whether or not an administrative privilege is required for the application to run properly.

Legacy Automation (PN)~ A check box on the campaign record summary form that a user checks to enable automation for campaigns built using previous versions of the Microsoft Dynamics Marketing.

Legacy Client (n)~ An SMS 2003 (or earlier) client type supported on Windows operating systems released prior to the Windows 2000 family of operating systems.

legacy device (n)~ A device that does not use (PCI), (USB), 1394, or later physical interconnect, but is fully (PnP) compliant. A legacy device cannot be configured or

managed by using either mechanisms or PnP methods to specify resource configurations.

legacy network adapter (n)~ A virtual network adapter that emulates a specific physical network adapter, the multiport DEC 21140 10/100TX 100 MB. A legacy network adapter also supports network-based installations because it includes the ability to boot to the Pre-Execution Environment (PXE boot).

legacy system (n)~ A computer, software program, network, or other computer equipment that remains in use after a business or organization installs new systems. Compatibility with legacy systems is an important consideration when a new version is installed. For example, will a new spreadsheet software release be able to read the existing business records without expensive and time-consuming conversion to a new format? Legacy systems in many organizations are based on mainframe computers, which may be either augmented or slowly replaced by client/server architectures.

LegacyExchangeDN (n)~ An attribute attached to mail during migration to a new environment that keeps continuity with the old environment.

Legal & HR (PN)~ The Business subcategory containing apps to help businesses with legal or human resource tasks.

legal discovery (n)~ The usually pretrial disclosure of pertinent facts or documents by one or both parties to a legal action or proceeding.

legal entity (n)~ An organization with a registered or legislated legal structure that is granted the authority to enter into legal contracts and that is required to prepare statements that report on its performance.

legal hold (n)~ A function that assists in managing the legal discovery process by superseding the retention policy on a record under discovery, so that it is not disposed of even when the expiration trigger is reached.

legal name (n)~ The name of an organization used for legal and governmental documents.

legend keys (n)~ Symbols in legends that show the patterns and colors assigned to the data series (or categories) in a chart. Legend keys appear to the left of legend entries. Formatting a legend key also formats the data marker that's associated with it.

Lemon Batter Button (n)~ A button on the Comfy Cakes game interface that allows the player to select lemon batter for their cake.

Lemon Icing Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a lemon icing for their cake.

length (n)~ The distance or period of time between a specified start point and a specified end point. For example, the length of an audio or video clip is usually measured in minutes and seconds.

lens (n)~ A first or third-party application that works with the Windows Phone camera to offer additional features and functionality for users taking and editing pictures.

lens (n)~ The section of the customizable area in the welcome page of the Microsoft Azure preview portal containing components that provide reusable units of functionality grouped in theme.

lens picker (n)~ An option in the viewfinder for available lens apps.

less than or equal to sign (n)~ The ? character.

less than sign (n)~ The < character.

lesson (n)~ ?A unit of learning that addresses a portion of the content for a class and may

include assignments, materials, and other lessons.

lessons learned (n)~ A review of best practices, project insights, and client information. As the project team disbands and new projects begin, reviewing the lessons learned lets you record information gathered and generated through the project.

LESS-THAN SIGN (n)~ The < character.

letter (n)~ An activity that tracks the delivery of a letter. The activity can contain the electronic copy of the letter.

letter of guarantee (n)~ An undertaking by a bank (the guarantor) to pay an agreed-upon amount of money to another person (the beneficiary) if the bank's customer (the principal) defaults in a debt or in its obligation to the beneficiary.

letterbox (n)~ A video display format in which black bars appear above and below the video image while it is played. The letterbox format maintains the original aspect ratio of an image when it is displayed in a window with a different aspect ratio.

level (n)~ The name of a set of members in a dimension hierarchy such that all members of the set are at the same distance from the root of the hierarchy. For example, a time hierarchy may contain the levels Year, Month, and Day.

leveling (oth)~ Resolving resource conflicts or overallocations by delaying or splitting certain tasks. When Project levels a resource, its selected assignments are distributed and rescheduled.

leveling delay (n)~ The amount of time that an assignment or task is to be delayed from the original scheduled start date as a result of resource leveling or of manually entering a leveling delay.

leverage (v)~ To take advantage of; capitalize on.

lexicon (n)~ The words of a language and their definitions.

lexicon (n)~ In programming, the identifiers, keywords, constants, and other elements of a language that make up its vocabulary."

LF (n)~ A control character that tells a computer or printer to advance one line below the current line without moving the position of the cursor or print head.

liability (n)~ A monetary debt or obligation of future services.

liability (n)~ A classifier used to classify the value of economic resources that are owned by creditors.

library (n)~ In Windows Media Player, a database that contains information about digital media files on a computer, a network drive, or the Internet.

library (n)~ A location on a SharePoint site where a collection of files and their associated metadata are stored.

library (n)~ The catalog of resources that can be used to create virtual machines in Virtual Machine Manager.

library (n)~ A collection of items, such as files and folders, assembled from various locations. The locations might be on your computer, an external hard drive, removable media, or someone else's computer.

library database (n)~ A collection of procedures and database objects that you can call from any application. In order to use the items in the library, you must first establish a reference from the current database to the library database.

library file (n)~ In programming, a collection of routines stored in a file. Each set of

instructions in a library has a name, and each performs a different task.

library refresh (n)~ The process by which Virtual Machine Manager indexes files stored on library shares, and then updates Library view and resource listings. Periodic library refreshes can be scheduled, or individual library shares can be refreshed as needed.

library request (n)~ A request for a library or stand-alone drive to perform a task. This request can be issued by an application or by Removable Storage.

library server (n)~ A server that makes shares available to store resources in the Virtual Machine Manager library. The library is managed centrally through the Library view of the Virtual Machine Manager Administrator Console. A Virtual Machine Manager agent installed on the library server provides metadata about the shares and resources to Virtual Machine Manager.

library share (n)~ A share that has been added to the Virtual Machine Manager library. To be available for use in creating virtual machines, a resource must be stored on a library share and must be added to the Virtual Machine Manager library. When a library server is added to Virtual Machine Manager, shares on the library server are automatically discovered.

Library view (n)~ The view in the Virtual Machine Manager Administrator Console in which the administrator manages library servers, shares, resources, and stored virtual machines.

license acquisition (n)~ The process of obtaining a license to play content that is protected with usage rights and restrictions policies.

License Advantage (PN)~ A specific type of full software license that can be purchased from Microsoft.

license chain (n)~ A license for digital media content that is composed of connected elements that include a root license and one or more leaf licenses, each of which contains a subset of rights for the content.

license code (n)~ An alphanumeric key that grants a party the right to use software or software components as prescribed in the terms of the license agreement, and that activates and inactivates software modules, software capabilities, and software functions.

License Installation Report (n)~ A report that compares installed software on computers in an organization with that organization's current license agreement coverage. This report can be used to determine whether an organization has sufficient license agreement coverage.

License Manager (n)~ A wizard interface for adding, deleting, and viewing Professional and Standard Microsoft CRM Module Licenses.

license plate number (n)~ A unique number that is assigned to a warehouse entity such as a pallet, bin, cart, or individual item for tracking inventory. You can use this number to ascertain the item location, item quantity, product dimension, and tracking dimension of the entity.

License Purchase Report (n)~ A report that displays the software titles for all licensed software in selected license groups, based on their licensing agreements. This report can be used to find gaps in coverage for the license agreements in an organization.

license server (n)~ A computer on which the RD Licensing role service is installed. A license server issues RDS CALs to users or devices that connect to a remote desktop

server.

license server discovery mode (n)~ A mode that is configured on the terminal server that determines which method to use to find (-€œdiscover-€?) a Terminal Services license server in order to request Terminal Services client access licenses (TS CALs).

license set (n)~ A collection of Groove licenses assigned to management of a domain group or member.

license terms (n)~ A legal agreement between a software or hardware manufacturer and the end user, with regard to the terms of use and transfer of the software.

licensed file (n)~ A Windows Media file that has an associated license that defines how the file can be played. The restrictions stated in the license vary depending on the license creator.

Licenses workspace (n)~ A workspace in Windows Intune and Asset Inventory Service that lets administrators add and manage license agreement information for software that was purchased through Microsoft Volume Licensing agreements, and for Microsoft or non-Microsoft software that was purchased by other means.

LicenseWise (PN)~ A -€œone-stop shop-€? that can help partners recommend product and licensing solutions for their customers, optimize the sales process, and build new revenue opportunities.

licensing (n)~ The process of issuing licenses to clients, so that they may use content that is protected with usage rights and restrictions policies.

licensing key (n)~ A short character string that serves as a password during the installation of licensed commercial software. The use of licensing keys is a security device aimed at reducing illegal duplication of licensed software.

Licensing Manual (PN)~ The statement published by Microsoft (updated from time to time) at http://www.microsoft.com/licensing/contracts or at a successor site. The Licensing Manual includes details about the processes supporting an agreement.

Licensing Solution Provider (PN)~ A partner supporting the analysis of Microsoft customers' licenses and cloud options on their Enterprise Agreement(s) and advise them regarding changes to programs over the past three years and how they will impact their organization, as well as all contract management activities required.

LID (n)~ A standard international numeric abbreviation for a country or geographical region. A language identifier is a 16-bit value that consists of a primary language identifier and a secondary language identifier.

life cycle (n)~ The phases a solution goes through from the time it is conceived until the time it is retired from service.

life cycle model (n)~ A partitioning of the life of a product into phases that guide the project from identifying customer needs through product retirement.

lifestyle (PN)~ An app category that facilitates activities in daily life, such as shopping or dining.

Lifestyle (PN)~ An MSN site designed as a guide to better living, with article, tips and galleries on beauty and fashion, food, style and home dÃ©cor, diet and cuisine, health and fitness, parenting, friends and relationships.

Lifestyle (PN)~ An app category that facilitates activities in daily life, such as shopping or dining.

lifestyle snapshot (n)~ A documented day in the life of a persona. A lifestyle snapshot is created by a business analyst through interactions with the users.

lifetime (n)~ The time period that begins when an object is allocated in memory and ends when the garbage collector deletes the object from memory.

Lifetime (PN)~ A time-out setting in Web playlists after which clients cannot access the playlist.

Lifetime calls (PN)~ The name of a section in Call Timers that displays the cumulative duration of all calls since the device was first activated.

LIFO inventory valuation method (n)~ An inventory valuation method in which inventory that is received most recently is considered sold or used first for accounting purposes.

lift chart (n)~ In Analysis Services, a chart that compares the accuracy of the predictions of each data mining model in the comparison set.

ligature (n)~ In typography, a single character created from two joined letters that replaces the two separate letters.

light (n)~ A property in graphic design software that makes objects visible, much like light in the natural world.

light (n)~ A theme that consists of a light background.

light (adj)~ Having a font weight that corresponds to a weight class value of 300 according to the OpenType specification.

light bulb menu (n)~ A dropdown menu marked with a light bulb icon providing automatic fixes to code issues or, if no automatic fix is available, a link to documentation describing how to fix the issue.

light dismiss (n)~ An effect in which a UI element, such as a flyout, disappears when the user touches anywhere on the screen outside of the element.

light event (n)~ A performance event that occurs only occasionally and for which limited information is collected.

light sensor (n)~ A category of sensor that responds to a pre-defined amount of light.

light source (n)~ The element that is providing the light that illuminates a photographic subject.

light source (n)~ In computer graphics, the imaginary location of a source of light, which determines the shading in an image.

lightness (n)~ The quality of a color that makes it appear brighter (closer to white) or darker (closer to black).

LightSwitch Desktop Application (n)~ A computer application which is used to build business applications and provides a simplified development environment so that you can concentrate on the business logic instead of the application infrastructure.

LightSwitch for Visual Studio 2013 (n)~ The name of a computer application for Visual Studio 2013, which is used to build business applications and provides a simplified development environment so that you can concentrate on the business logic instead of the application infrastructure.

LightSwitch HTML Application (n)~ The name of a application that makes it easy to create professional, data-centric, business applications that can consume a variety of data sources and create clients that can run on a variety of devices.

LightSwitch V3.6 Client project (n)~ The project of a client in the environment of LightSwitch V3.6.

LightSwitch v3.6 Server project (n)~ The project of a server in the environment of LightSwitch V3.6.

Lightweight Directory Access Protocol (n)~ The primary access protocol for Active Directory. LDAP is an industry-standard protocol, established by the Internet Engineering Task Force (IETF), that allows users to query and update information in a directory service. Active Directory supports both LDAP version 2 and LDAP version 3.

lightweight pooling (n)~ An option that provides a means of reducing the system overhead associated with the excessive context switching sometimes seen in symmetric multiprocessing (SMP) environments by performing the context switching inline, thus helping to reduce user/kernel ring transitions.

lightweight task (n)~ In the Concurrency Runtime, an asynchronous function call. A lightweight task is typically shorter-running and contains less internal state than an asynchronous agent, and the caller is not notified when the task is completed.

like (v)~ Action taken by a Microsoft Dynamics CRM user on a post that expresses that the user liked or agreed with that particular post.

like (PN)~ A Facebook term for showing approval of a friend's post or connecting with a page.

limited access (n)~ Access to fewer features than the computer normally has. This reduced access will last for a short amount of time before the computer becomes inoperable.

limited account (n)~ A type of account that allows customers to use a limited set of Windows Live services without signing up for a new e-mail address or providing an existing alternate one. The ID that is created can't be used to send or receive e-mail. A customer with this account type can only reset their password if they subsequently add an alternate e-mail address to their account.

limited capacity (n)~ The capability of a resource (worker, machine, work center, plant, or organization) to produce output within a specified period of time without exceeding the available capacity.

limited liability company (n)~ A business entity allowed for by state statutes in the United States that protects each owner (member) from personal liabilities but is not taxed since it passes all profits and losses to each member who is taxed accordingly.

limited material (n)~ A method for scheduling resources that assumes that all the component materials needed for production are available when the production process starts.

limited properties of work centers (n)~ A method for scheduling resources that considers limits to the type of work a work center can perform at a given time. Finite property specifies the type of products or operations to be carried out at the same time at a work center.

limited user account (n)~ A type of user account that prohibits users from changing most computer settings and deleting important files. While such a user can access applications, they generally cannot install software or hardware, among other things.

line (n)~ In communications, a connection, usually a physical wire or other cable, between

sending and receiving (or calling and called) devices, including telephones, computers, and terminals.

line (n)~ In word processing, a string of characters displayed or printed in a single horizontal row.

line (n)~ In programming, a statement (instruction) that occupies one line of the program. In this context, the common reference is to a program line' or a 'line of code'.'

line (n)~ A vector path defined by two points and a straight or curved segment between them.

line appearance (n)~ In telephony systems, the instance of an extension or phone number on a phone. For example, if a user's desk phone is provisioned with his extension, then you can say that his phone has his line appearance. Business phones may have more than one line appearance.

line break (n)~ The point at which one line ends and another begins.

line chart (n)~ A chart that shows trends in data at equal intervals, with values from one or more sets of data connected by lines.

line editor (n)~ A text-editing program that numbers each line of text, working with the document on a line-by-line rather than on a word-by-word basis.

line feed (n)~ A control character that tells a computer or printer to advance one line below the current line without moving the position of the cursor or print head.

Line Image Generator (n)~ A feature that enables you to configure the style of the lines or images that are displayed between nodes in a TreeView control.

Line Item Order (PN)~ The display name of an attribute that specifies the position of an item in the list of contract line items.

line item workflow (n)~ A workflow created for each line item in a workflow document.

line item workflow work item (n)~ A workflow work item that is created by a line item workflow instance.

line join (n)~ The common area that is formed by two lines whose ends meet or overlap.

line layer (n)~ The layer in a map report that displays spatial data as lines, for example, lines that indicate paths or routes.

line number (n)~ A number assigned by a line editor to a line of text and used to refer to that line for purposes of viewing, editing, or printing. The line numbers are sequential.

line of code (n)~ An executable line of text that excludes white space, comments, type declarations, and namespace declarations.

line pencil (n)~ A pencil tool that simulates the look and feel of drawing lines with a pencil.

line price variance amount (n)~ The currency amount of the price variance between a vendor invoice line and the corresponding purchase order line, calculated as follows: (Invoice net unit price - Purchase order net unit price) * Update invoice quantity

line printer (n)~ Any printer that prints one line at a time as opposed to one character at a time (as with many dot-matrix printers) or one page at a time (as with some dot-matrix and most laser printers). Line printers typically produce the familiar 11-by-17-inch fanfold computer printouts. They are high-speed devices and are often used with mainframes, minicomputers, or networked machines rather than with single-user systems.

Line Printer Daemon (n)~ A service on a print server that receives print jobs from Line

Printer Remote (LPR) tools that are running on client computers.

Line Printer Remote (n)~ A connectivity utility that runs on client systems and is used to print files to a computer running an LPD server.

line property (n)~ A code that specifies which transactions in a journal are chargeable and which are non-chargeable.

line screen angle (n)~ The angle of the lines of dots for each of the halftone screens that are used in process color printing.

line screen frequency (n)~ The fineness or coarseness of a halftone screen represented by lines per inch (LPI).

line segment (n)~ A portion of a line, defined by its beginning and ending points.

line spacing (n)~ The amount of space from the bottom of one line of text to the bottom of the next line.

line string (n)~ A shape representing a single path in a coordinate system. It uses linear interpolation between control points for the definition of line which is appropriate to the coordinate system.

line weight (n)~ The thickness of a line in a document.

line width (n)~ The length of a line of type measured from the left margin to the right margin on a piece of paper or on a computer screen. On a typewriter, line width is usually measured in terms of the number of monospace alphanumeric characters that can fit on the line; on a computer monitor or printer, line width is normally measured in inches, centimeters, points, or picas.

line wrap (n)~ The ability of a word-processing program or a text-editing program to break lines of text automatically to stay within the page margins or window boundaries of a document without the user having to do so with carriage returns, as is typically necessary on a typewriter.

linear (adj)~ Proceeding sequentially. For example, a linear search is one that moves from A to B to C.

linear (adj)~ In mathematics and electronics, having a direct and proportional relationship among characteristics or variables. For example, the output of a linear amplifier is directly proportional to the input.

linear attenuation (n)~ The intensity of a beam of light that diminishes at a constant rate as it gets further from the light source.

linear expression (n)~ An option that changes a 2-dimensional linear expression, such as 5^2, to a built-up (3-dimensional) format.

linear fraction (n)~ A fraction that is written on a single line: the numerator is placed on the left, followed by the fraction bar, and the denominator on the right. Example: 3/4

linear gradient (n)~ A brush where one color gradually transitions into another along a line.

linear interpolation (n)~ One of three methods used to describe how an animation transitions between values over its duration. This method produces a constant rate of change.

linear search (n)~ A simple, though inefficient, search algorithm that operates by sequentially examining each element in a list until the target element is found or the last item has been completely processed. Linear searches are primarily used for very short

lists.

Linear Venn (PN)~ A SmartArt graphic layout used to show overlapping relationships in a sequence. Works best with Level 1 text only.

lined guide (n)~ In lined mode, a ruled recognition guide that minimally draws a suggested base line, and can also include a midline, or even ascender or descender lines.

lined mode (n)~ A Tablet PC input mode that provides a non-restrictive writing surface with a lined guide that enables users to write freeform (i.e. cursive, print, or a mix of these). In lined mode, user's ink is continuously recognized and converted to text as soon as the user starts writing the next word.

line-of-business (n)~ The type of enterprise in which businesses or organizations are engaged.

line-of-business application (n)~ An application that is vital to running enterprises, such as payroll, resource planning, supply chain management, and accounting.

line-of-business data (n)~ Any piece of data originated in or targeted to be processed by the LOB system.

line-of-business entity (n)~ A data structure exposed by the LOB system consisting of a set of related fields grouped together under a unique ID.

line-of-business identifier (n)~ An identifier used by the LOB system to perform create, update, and delete operations on an LOB entity. This identifier is unique per LOB entity type, but may not be unique across different types, solutions, and LOB systems.

line-of-business service (n)~ A service that exposes access to LOB data sources

lingering object (n)~ A domain controller that was offline for longer than the value of the tombstone lifetime can contain objects that have been deleted on other domain controllers and for which tombstones no longer exist.

link (v)~ To connect or associate items or data such as contacts, accounts, or worksheets.

link (n)~ A connection between an OLE object and its OLE server, or between a dynamic data exchange (DDE) source document and a destination document.

link (n)~ A connection between an element in a hypertext document, such as a word, phrase, symbol, or image, and a different element in the document or in another location, a webpage, file, or script.

link (v)~ To establish a connection to data from another application so that users can view and edit the data in both the original application and in the destination application.

link (n)~ A connection between multiple contact profiles in the People hub.

Link (PN)~ The Sway button that allows users to create a hyperlink embedded in their sway.

Link Aggregation Control Protocol (PN)~ Protocol that standardizes the link aggregation process among different vendors.

link bar (n)~ A collection of graphic or text buttons representing hyperlinks to pages both within your Web site and to external sites.

link chain (n)~ A series of redirecting web links that are designed to hide malicious websites.

link column (n)~ In a row definition of a report, the column that contains the links to dimensions and external worksheet files that will be used in a report.

Link Control Protocol (n)~ A PPP control protocol that negotiates link and PPP

parameters to dynamically configure the data-link layer of a PPP connection.

Link Data Sources Wizard (n)~ A wizard dialog title to create a linked data source, where you can link multiple data sources into one single data source such as two different tables in a SQL database.

link extension (n)~ A Web Deploy feature that makes it possible to perform additional custom tasks during deployment.

link layer (n)~ The lowest layer of the Internet Protocols, concerned with the physical interconnection of computers.

Link Library Dependency (n)~ An option to dictate the builder to automatically pass the library as an input to the linker.

link line (n)~ On the Gantt Chart and Network Diagram, the line that appears between two tasks to indicate a task dependency.

link path (n)~ The descriptive form, or explicit connecting points, of referring to the location of a link source.

Link redirect (n)~ A tab name in the General Settings dialog that enables the user to specifiy a public, published URL to which clients will be redirected when links in publshed Web content navigate to an unpublished page.

link time (adj)~ The period during which a program is being linked.

Link Time Code Generation (n)~ An option that tells the linker to call the compiler and perform whole program optimization.

Link to Record (v)~ A button, located in the Business Contact Manager group, that enables the user to link an item to a record.

link translation mapping (n)~ A mapping that translates the internal name (or IP address) of a Web site to the public name (or IP address) of the Web site.

link type (n)~ The type of task dependency. The four dependency types are Finish-to-start [FS], Finish-to-finish [FF], Start-to-start [SS], and Start-to-finish [SF].

LinkAccess (n)~ A feature that allows access to SharePoint documents and sites and documents on shares inside of a corporate network through Outlook Web Access when it is used remotely.

linked dimension (n)~ A reference in a cube to a dimension in a different cube (that is, a cube with a different data source view that exists in the same or a different Analysis Services database). A linked dimension can only be related to measure groups in the source cube, and can only be edited in the source database.

linked ID (n)~ A Windows Live ID that is connected to at least one other Windows Live ID. When customers link IDs, they can sign in with one ID and switch to others without having to sign out from the first. Customers set up linked IDs in Windows Live Account.

linked inbox (n)~ A list of two or more email inboxes that have been linked so that users can view their email from all linked accounts at the same time. The accounts themselves are not combined.

linked list (n)~ A data structure consisting of nodes or elements connected by pointers. A singly linked list has one pointer in each node, pointing to the next node in the list; a doubly linked list has two pointers in each node, pointing to the next and previous nodes. In a circular list, the first and last nodes of the list are linked together.

linked measure group (n)~ A reference in a cube to a measure group in a different cube

(that is, a cube with a different data source view that exists in the same or a different Analysis Services database). A linked measure group can only be edited in the source database.

linked object (n)~ An object that is inserted into a document but still exists in the source file. When information is linked, the new document is updated automatically if the information in the original document changes.

linked picture (n)~ A picture that links to a high-resolution image file that is stored outside of the publication file. If the linked picture is changed in an image-editing program, you can update the linked picture in the publication file.

linked project (n)~ A project that contains task dependencies to and from tasks in other project files. A link to a task in another project is represented with a placeholder or ghost task.

linked server (n)~ A definition of an OLE DB data source used by SQL Server distributed queries. The linked server definition specifies the OLE DB provider required to access the data, and includes enough addressing information for the OLE DB provider to connect to the data.

linked style sheet (n)~ A type of cascading style sheet that exists in a separate file and is referenced throughout one or more Web pages.

linked table (n)~ An OLE DB rowset exposed by an OLE DB data source that has been defined as a linked server for use in SQL Server distributed queries.

linked virtual hard disk (n)~ A virtual hard disk that points to and uses an entire physical disk for the purpose of converting a data disk to a virtual hard disk. You cannot turn on a virtual machine if a linked disk is attached to the virtual machine.

LinkedIn ~ a social networking site (www.linkedin.com) designed for business professionals to use for work contacts and communication.

linker (n)~ A program that links compiled modules and data files to create an executable program. A linker can also have other functions, such as creating libraries.

linking (oth)~ In a project, establishing a dependency between tasks. Linking tasks defines a dependency between their start and finish dates. In OLE, establishing a connection between programs so that data in one document is updated when it changes in another.

linking (n)~ A feature that allows users to easily add links to content within other content (e.g. pages, sections, section groups) and provides quick navigation through these links. The feature operates in the same manner that links work in wikis.

linking table (n)~ A table that has associations with two other tables, and is used indirectly as an association between those two tables.

Links Web Part (n)~ A customizable component of the Microsoft Office Live Web site that allows users to place a list of links to other Web sites on their Web pages.

link-state database (n)~ A map of an area maintained by OSPF routers. It is updated after any change in the network topology. The link state database is used to compute IP routes, which must be computed again after any change in the topology. See also: adjacency; Open Shortest Path First (OSPF)

LINQ (n)~ A query syntax that defines a set of query operators that allow traversal, filter, and projection operations to be expressed in a direct, declarative way in any .NET-based

programming language.

LINQ pattern (n)~ The set of standard query operators that is available in all LINQ queries, and the rules that define the structure of a LINQ query.

LINQ provider (n)~ A library that implements the functionality of the Standard Query Operators for a specific kind of data source. The LINQ provider runs the query or passes it to some other execution engine.

LINQ to ADO.NET (PN)~ A technology that makes it possible to query over any enumerable object in ADO.NET by using the LINQ programming model. LINQ to ADO.NET consists of three related LINQ technologies: LINQ to DataSet, LINQ to SQL, and LINQ to Entities.

LINQ to DataSet (PN)~ A LINQ technology that makes it easier and faster to query over data cached in a DataSet object. The queries are expressed in the programming language itself and not as string literals embedded in the application code.

LINQ to Entities (PN)~ A LINQ technology that enables developers to create flexible, strongly typed queries against the Entity Framework by using LINQ expressions and the LINQ Standard Query Operators.

LINQ to Objects (PN)~ The use of LINQ to query in-memory data such as arrays and lists.

LINQ to SQL (PN)~ A LINQ technology that provides a run-time infrastructure for managing relational data as objects. In LINQ to SQL, the data model of a relational database is mapped to an object model expressed in the programming language of the developer.

LINQ to XML (PN)~ An in-memory programming interface that makes it possible to work with XML from within the .NET Framework programming languages.

Linux ~ A rival PC- operating system- to Microsoft Windows, but unlike Windows it is 'open source', which means that anyone can create their own version of it without having to pay royalties, and requires a much less powerful computer. Initially required a lot of technical knowledge, but is rapidly being made much more- user-friendly.

Linux (-€œLinus' UNIX-€?) ~ A widely used Open Source Unix-like operating system. Linux was first released by its inventor Linus Torvalds in 1991. There are versions of Linux for almost every available type of computer hardware from desktop machines to IBM mainframes.

Linux Support (n)~ The Microsoft Azure support plan for certain Linux offerings available through the Azure Gallery. For some Linux offerings, support is provided by the publisher free of charge. For other Linux offerings, there is a charge for the right to receive support for Linux VMs by the minute.

LIP (PN)~ Add-in software that provides partially localized user interfaces for particular computer programs in languages not supported by localized versions of those programs.

lipid profile (n)~ A pattern of lipids in the blood. It usually includes the levels of total cholesterol, high-density lipoprotein (HDL) cholesterol, triglycerides, and the calculated low-density lipoprotein (LDL) 'cholesterol.

liquid asset (n)~ An asset that is cash or easily converted into cash.

liquid crystal display (n)~ A type of display that uses a liquid compound having a polar molecular structure, sandwiched between two transparent electrodes. When an electric

field is applied, the molecules align with the field, forming a crystalline arrangement that polarizes the light passing through it. A polarized filter laminated over the electrodes blocks polarized light. In this way, a grid of electrodes can selectively turn on' a cell

liquidity (n)~ The ability of a party to use current assets to settle current liabilities.

liquidity account (n)~ A ledger account that records cash transactions for a particular bank or for cash held at the company. For some companies, a liquidity account records transactions in liquid investments that can be sold from day to day.

liquidity classification (n)~ A systematic organization of time intervals that predict the liquidity of a party.

liquidity ratio (n)~ The proportion of a party's current assets that can be used to settle current liabilities.

list (v)~ To make or include in a list.

list (n)~ A collection of links to items (such as files, folders, or even other lists). You can create a list to help you find or organize information on your computer.

list (n)~ A table of records located in the main area for each entity in the user interface.

List (PN)~ A SmartArt graphic layout type that includes layouts designed to show nonsequential information.

list (n)~ A site element that stores and displays a collection of data that team members and other site users can share.

list (n)~ An administrator-defined customization that enables users to classify objects such as incidents, change requests, activities, or configuration items. For example, a list might be Location' or 'Organization."

list (n)~ A module someone can add to their Windows Live Space to contain personal interest items such as music, books, and movies.

list box (n)~ A control in Windows that enables the user to choose one option from a list of possibilities.

List Builder (PN)~ An online service for your marketing campaign that allows you to acquire and manage e-mail lists, and to track the results.

List Builder Subscriber (n)~ An individual who has indicated his or her desire to be on a mailing list.

list control (n)~ A control on a form, that repeats as needed, into which users can enter text. The control can be formatted as a bulleted, numbered, or plain list.

list frame (n)~ A border that outlines the list that is maintained by the List Manager.

list index (n)~ The sequence of numbers for items in a list, starting with 0 for the first item, 1 for the second item, and so forth.

list item (n)~ An option that constrains the values that users can enter for a specific list. For example, Redmond' might be a list item for 'Location."

List Manager (PN)~ A feature that maintains lists as simple databases consisting of rows and columns contained within a list frame. This makes it easy to keep lists separate, maintain data integrity, and find the data you want.

list place (n)~ A navigation place that contains a list in the content area and where the user can search, filter, select and perform actions on multiple entities.

List Publisher (PN)~ A module used to publish a Business Applications or Contact Manager list onto your public-facing Web site and to design its layout. Changes to the list

are automatically displayed on the public Web page.

List Relationships (PN)~ A feature that supports referential integrity between two lists via the lookup field.

list separator (n)~ A character that separates items in a list.

list sheet (n)~ A worksheet that is dedicated to a single list, which is maintained by the List Manager.

list view (n)~ A common Windows control that allows users to view and interact with a collection of data objects, using either single selection or multiple selection.

List view (n)~ A UI element that enables a user to display Works tasks in list format.

List View Threshold (PN)~ A threshold in the Resource Throttling feature that specifies the maximum number of items that a database operation can involve at one time. Operations that exceed this limit are prohibited.

listen (v)~ To wait for incoming traffic, calls or connection requests on a port.

listener adapter (n)~ A component that establishes communication between the Windows Process Activation Service (WASW) and protocol listeners, such as HTTP.sys. This allows listeners to get configuration information about applications and namespaces they monitor. Listener adapters also notify the Windows Process Activation Service about incoming messages for applications that have not connected to a worker process.

Listening MOS (n)~ A prediction of the wideband listening quality MOS (MOS-LQ)) of the audio stream that is played to the user. This value takes into account the audio fidelity and distortion and speech and noise levels.

listening quality MOS (n)~ Within the VoIP industry, a commonly used class of MOS values that measures the quality of audio for listening purposes only, without taking into account any bidirectional effects, such as delay and echo.

listing (n)~ A printed copy of program source code. Some compilers and assemblers produce optional assembly listings during compilation or assembly. Such listings of code often have additional information such as line numbers, nested block depth, and cross-reference tables. See also assembly listing.

listing type (n)~ The type of application that a developer wants to publish or list in a Microsoft marketplace; for example, an App for Office, an App for SharePoint, or a Microsoft Azure Catalog App.

list-separator character (n)~ A character, usually a comma or semicolon, that separates elements in a list.

LISTSERV ~ a commercial software package for operating e-mail mailing lists and discussion groups, produced by L-Soft International (www.lsoft.com)

ListView (PN)~ A Windows UI control that enables easy creation and management of a data collection using web-based technologies.

literal (n)~ A value used exactly as you see it. For example, the number 25 and the string Hello' are both literals.'

literal content (n)~ The content inside an element's opening and closing tags. This content is not parsed or rendered by MSHTML.

literal type character (n)~ A textual representation of a particular value of a data type. For example, 2147483647 represents a value of integer data type.

litigation hold (n)~ A feature that allows the preservation of items in user mailboxes and

the protection of the items from deletion by users or automated processes.

little endian (adj)~ Pertaining to a processor memory architecture that stores numbers so that the least significant byte is placed first.

Live (PN)~ The cloud service that enables users to communicate and collaborate with people online and access their conversations, photos, documents, contacts, appointments, settings, and services across PC, phone, and other devices.

Live App (PN)~ Any app from the app list with Start screen tile notifications.

live chat customer support (n)~ A client service where users can ask for help via a live chat and a customer support agent will answer.

Live Connect (PN)~ The program that enables developers to connect to Live and easily use Microsoft account, OneDrive, Hotmail, and Messenger within their apps, websites, and devices. Live Connect provides a set of standards-based APIs and the downloadable Live SDK.

live effect (n)~ A filter that changes the appearance of objects (e.g. vectors, texts, or bitmapped objects) depending on the effect type chosen. It is referred to as live' effect

Live Encoder Input Hours (n)~ A resource of the 'Media Services' service type of the 'Media' service.

live export (n)~ The process of exporting a virtual machine and its snapshots while the virtual machine is running.

Live File System (n)~ A file storage system that can be used to create CDs and DVDs. Discs formatted with Live File System allow you to copy files to the disc at any time, instead of copying (burning) them all at once.

Live Folder (PN)~ A feature that allows users to group tiles and Live Tiles on the Start Screen and keep apps better organized.

Live Icon (n)~ A scalable thumbnail used throughout Windows Vista that allows users to see the first page of documents, the actual image of a photo, or the album art for individual songs in a music collection.

live layout (n)~ A layout that is updated in real time as an object on the page is moved, resized, or rotated, enabling the user to preview the end result before the action is completed.

Live Lock Screen (PN)~ A lock screen featuring dynamically updated content.

Live Lock Screen app (PN)~ An application that either takes advantage of the ability to set a dynamic wallpaper or that takes advantage of the new lock extensibility framework (examples include the Metro Refresh and Inking applications).

Live Meeting administrator (n)~ A person who assigns user accounts and manages the Live Meeting service for an organization.

Live Meeting console (n)~ The array of windows and tools that display on each participant's web browser when a Live Meeting session is in progress.

Live Meeting Manager (n)~ A Web-based tool that is used to access and manage meetings and recordings, join meetings, and change Live Meeting user preferences.

Live Meeting Replay (n)~ A meeting recording format that includes Sharing slides and annotations with the recording.

Live Meeting session (n)~ A meeting that is conducted by using Live Meeting, whether a scheduled meeting or a Meet Now meeting.

Live Mesh (PN)~ A -€œsoftware-plus-services-€? platform and experience that enables PCs and other devices to -€œcome alive-€? by making them aware of each other through the Internet, enabling individuals and organizations to manage, access, and share their files and applications seamlessly on the Web and across their world of devices.

Live Migration (PN)~ A feature that allows a running virtual machine instance to be moved from one physical machine to another physical machine with minimal downtime.

live migration (n)~ The process of moving a running virtual machine from one physical computer to another without noticeable downtime.

Live Preview (PN)~ A feature that allows you to preview the appearance of a formatting option or command before actually applying it to selected text or objects.

live region (n)~ A perceivable region of a webpage that is typically updated as a result of an external event when user focus may be elsewhere.

Live SDK (PN)~ The actual software bits available to developers to enable them to use the Live Connect program.

Live Services (PN)~ A portfolio of Microsoft products, specifically adCenter, Office Live, Windows Live.

live session (n)~ A session in which multiple users can work together and see each other's changes immediately.

Live Sharing Session (n)~ A session in which multiple users can work together and see each other's changes immediately.

Live Smooth Streaming (PN)~ A feature for Microsoft Internet Information Services (IIS) 7.0 or greater that delivers fragments from live streams to Smooth Streaming-compatible clients by using a proprietary Microsoft implementation of the adaptive streaming format.

live streaming (n)~ A feature that enables sharing video with other users live over the Internet.

Live Tile (PN)~ A tile that updates dynamically to show content directly from the Start screen.

Live@edu Organization (PN)~ A new feature set available to educational institutions enrolled in the Live@edu offering that are using Outlook Live. This new feature set provides significant administrative flexibility and is the default for all new Live@edu customers who select Outlook Live.

LMAO ~ (Laughing My Ass Off)- Internet slang.

LMDT (n)~ The timestamp of the most recent modification of a Navision entity. The modified entries are retrieved from the Change Log. If the Last Modified Date/Time is older than the last synchronization time, then entities will not be synchronized. If The Last Modified Date/Time is more recent, the synchronization will be performed.

LMZL (PN)~ A Windows security feature for Internet Explorer that secures the Local Machine Zone by tightening restrictions on several URL actions. Any time one of these URL actions is attempted, a new security user interface (UI) element, called the Information Bar, appears. The user can click the Information Bar to remove the lockdown from the restricted content.

load (n)~ The total computing burden a system carries at one time.

load (n)~ The maximum amount of activity that can be performed by a resource in a time

period.

load balance (v)~ To redistribute work to available resources or to reschedule to available times.

load balancer (n)~ A device or software that distributes the work between several computers, processes, hard disks, or other resources to get optimal resource utilization. A network load balancer, in the context of Application Request Routing, is a proxy-based load balancer that distributes network traffic among several Web servers.

Load Balancer (PN)~ A Layer-4 (TCP, UDP) type load balancer that distributes incoming traffic among healthy service instances in cloud services or virtual machines defined in a load balancer set.

load balancing (n)~ In distributed processing, the distribution of activity across two or more servers in order to avoid overloading any one with too many requests from users.

load balancing (n)~ In client/server network administration, the process of reducing heavy traffic flows either by dividing a busy network segment into multiple smaller segments or by using software to distribute traffic among multiple network interface cards working simultaneously to transfer information to a server.

load balancing ~ In routing, the capability of a router to distribute traffic over all its network ports that are the same distance from the destination address. Good load-balancing algorithms use both line speed and reliability information.

load pattern (n)~ The number of virtual users that are active during a load test and the rate at which new users are started.

load planning (n)~ The process of scheduling, picking, packing, and consolidating one or more shipments of warehouse inventory items for transportation and delivery.

load profile (n)~ The simulated workload for a load or stress test. The load profile can be constant or increased dynamically through stepping.

load simulation (n)~ An attempt to model the effect of many users accessing a server at the same time. Load tests do not generate actual load with actual users, but rather simulated load with virtual users.

load test (n)~ A test that studies the behavior of the program when it is working at its limits. Types of load tests include volume tests, stress tests, and storage tests. Volume tests study the largest tasks the program can deal with. Stress tests study the program's response to peak bursts of activity. Storage tests study how memory and space is used by the program, either in resident memory or on disk. A test that is designed to put a server application under heavy user load to pinpoint performance and/or scalability problems.

Load Test Analyzer (n)~ A Visual Studio window that displays results of any load test run, after it has run. It is used to examine any load test results that have already ended.

Load Test Editor (n)~ The Visual Studio editor in which a .loadtest file is opened. It displays a tree structure of nodes.

Load Test Monitor (n)~ A Visual Studio window that displays results during a load test run.

load test scenario (n)~ A scenario used to model how a group of users interacts with a server application. A scenario consists of a test mix, a load profile, a network mix, and a browser mix. A load test can have more than one scenario.

Load Test Wizard (n)~ A wizard that guides you through the process of creating a load

test.

load testing (n)~ Testing at or beyond the limits of a specified requirement to understand its behavior and failure trigger points.

Load Testing VUser Minutes (PN)~ The offer that enables users to create load tests in Visual Studio Ultimate 2013 (or later) and run them on Visual Studio Online. Load tests are measured and billed in virtual user minutes.

loaded site (n)~ A Web site that has a lot of content and is visually attractive.

loader (n)~ A utility that loads the executable code of a program into memory for execution. On most microcomputers, the loader is an invisible part of the operating system and is automatically invoked when a program is run.

loading screen (n)~ The screen that appears while the system is loading an application that a user has selected. The loading screen displays a wait indicator until the application starts.

LOB (n)~ The type of enterprise in which businesses or organizations are engaged.

LOB data (n)~ Any piece of data originated in or targeted to be processed by the LOB system.

LOB entity (n)~ A data structure exposed by the LOB system consisting of a set of related fields grouped together under a unique ID.

LOB Id (n)~ An identifier used by the LOB system to perform create, update, and delete operations on an LOB entity. This identifier is unique per LOB entity type, but may not be unique across different types, solutions, and LOB systems.

LOB service (n)~ A service that exposes access to LOB data sources

lobby (n)~ A virtual waiting area where conference call invitees are held before the conference is activated. The invitees perceive that they are on hold.

lobby page (n)~ A page of information about the broadcast that is displayed in the viewer's browser before the broadcast begins. It can contain a title, subject, host's name, information about the broadcast, and a countdown to the time of the broadcast.

local (adj)~ In programming, a variable that is restricted in scope, that is, used in only one part (subprogram, procedure, or function) of a program.

local administrators group (n)~ The group of users who have permission to perform administration tasks on the local server computer. The permissions for this group are set by using the administration tools for the operating system.

local area network (n)~ A network of computers, printers, and other devices located within a relatively limited area (for example, a building). A LAN enables any connected device to interact with any other on the network.

local area transport (n)~ A DEC-specific, non-routable network protocol designed to provide connection between remote desktop servers and DEC hosts.

local cache (n)~ A feature that enables deserialized copies of cached objects to be saved in the memory of the same process that runs the cache-enabled application.

local call (n)~ A call made in a customer's geographic area that does not carry any additional toll charges. The local call area can be a neighborhood, a city or even a country.

local computer (n)~ The computer that you are currently logged on to as a user. More generally, a local computer is a computer that you can access directly without using a communications line or a communications device, such as a network adapter or a modem.

Local Content Diagnostic Provider (PN)~ The set of logic which exposes information about diagnostic content stored locally on the end user's machine to the Aggregate Diagnostic Provider.

local context (n)~ A security context in Windows that controls capabilities. Windows Store apps written in HTML/JavaScript can contain content stored in a local or web context. Script files acquired from the Windows Store (and originally packaged with the application) can access WinRT APIs but content dynamically downloaded from the web runs with restricted capabilities, much like those afforded to browser-based script today.

local continuous replication (n)~ A replication that uses a single server and built-in technology to create and maintain a copy of a storage group on a second set of disks that are connected to the same server as the primary storage group. LCR provides asynchronous log shipping, log replay, and a quick manual switch to a copy of the data.

local copy (n)~ A copy of a file stored in a user's working folder on the local computer. The local copy differs from the master copy if the local copy is changed since the last checkout, or if the master copy is changed by another user while the local copy is checked out.

local cube (n)~ A cube saved to a local computer and not connected to a data source.

local data (oth)~ A set of objects that are automatically created by Configuration Manager. This data is not replicated to other sites.

local database (n)~ A local copy of a shared remote database, which you work in on your computer, and which is periodically synchronized with the remote database.

local Distributor (n)~ A server that is configured as both a Publisher and a Distributor for SQL Server Replication.

local echo (n)~ A terminal setting that enables all transmitted information to be immediately displayed on the terminal's screen.

local formatting (n)~ Individual formatting attributes such as line width, fill color, or font size, that you apply to a selected shape by using a command on the Format menu, such as Line, Fill, or Text.

local formula (n)~ A formula that is stored in a cell of a shape instead of being inherited from a master or a style. A local formula overrides changes to the corresponding cell in the master of which the shape is an instance.

local group (n)~ A security group that can be granted rights and permissions only to resources on the computer on which the group is created. Local groups can have any user accounts that are local to the computer as members, as well as users, groups, and computers from a domain to which the computer belongs.

Local Group Policy Editor (PN)~ The Microsoft Management Console snap-in used to edit Group Policy objects.

local listings (n)~ Bing Local lets users find businesses near them, or near where they want to go.

local machine (n)~ The computer that you are currently logged on to as a user. More generally, a local computer is a computer that you can access directly without using a communications line or a communications device, such as a network adapter or a modem.

Local Machine Zone Lockdown (PN)~ A Windows security feature for Internet Explorer that secures the Local Machine Zone by tightening restrictions on several URL actions.

Any time one of these URL actions is attempted, a new security user interface (UI) element, called the Information Bar, appears. The user can click the Information Bar to remove the lockdown from the restricted content.

local messaging (n)~ In Silverlight, a feature that enables communication between two Silverlight-based applications running on the same computer.

local object (n)~ A table, query, form, report, macro, or module that remains in the replica or Design Master where it was created. Neither the object nor changes to the object are copied to other members in the replica set.

local override (n)~ A formula that is stored in a cell of a shape instead of being inherited from a master or a style. A local formula overrides changes to the corresponding cell in the master of which the shape is an instance.

Local Pack (n)~ A package of market-specific content delivered in Windows for 20 target markets. A Local Pack contains market-customized themes (wallpapers, sound schemes, etc.) and locally flavored Internet Explorer favorites and RSS feeds.

local partitioned view (n)~ A view that joins horizontally partitioned data from a set of member tables across a single server, making the data appear as if from one table.

local printer (n)~ A printer that is directly connected to one of the ports on a computer.

local procedure call (n)~ A message-passing service provided by Windows NT that allows client processes (i.e. applications) and subsystems to communicate with each other on the same computer.

local property (n)~ A non-system property defined for a class, but not inherited from a superclass.

Local Provisioning System (n)~ A Windows component that resides in the operating system and enforces pay-as-you-go and subscription metering rules.

local registration authority (n)~ An intermediary between a software publisher and a certification authority (CA). The local registration authority can, for example, verify a publisher's credentials before sending them to the CA.

local replica (n)~ A replica that exchanges data with its hub or a global replica, but not with other replicas in the replica set.

local report (n)~ An Excel file that has been saved to the user's local file system.

local roaming boundary (n)~ A roaming boundary in which the site distribution points are local (well-connected) to the Advanced Client and software packages are available locally to that client.

Local Scout (PN)~ A feature accessed from Search or Maps that displays things to see and do, shopping, and restaurants in a user's current location and the surrounding area.

local security authority (n)~ A protected subsystem that authenticates and logs users on to the local computer. In addition, the LSA maintains information about all aspects of local security on a computer (collectively known as the local security policy), and it provides various services for translation between names and identifiers.

Local Security Authority Subsystem Service (PN)~ An interface for managing local security, domain authentication, and Active Directory processes. It handles authentication for the client and for the server. It also contains features that are used to support Active Directory utilities.

local server (n)~ An OLE server object implemented as an executable file that runs on the

same computer as the client application. Because the server application is an executable file, it runs in its own process.

local service (n)~ A service that performs a specific function for other local processes on the computer.

local storage (n)~ For the Windows Server 2003 family, NTFS file system disk volumes used as primary data storage. Such disk volumes can be managed by Remote Storage by copying infrequently accessed files to remote (secondary) storage.

local storage resource (n)~ A reserved directory in the file system of a virtual machine that is running an instance of a cloud service role.

local storage services (n)~ The Blob, Queue, and Table services running in the Microsoft Azure storage emulator.

local style (n)~ A style or template that is defined in the active document.

local subscription (n)~ A subscription to a merge publication that uses the priority value of the Publisher for conflict detection and resolution.

Local System account (n)~ A predefined local account that is used to start a service and provide the security context for that service.

local term set (n)~ A term set that is created when a user defines a column.

local type inference (n)~ A process in which the compiler infers the type of a local variable that is declared with the var keyword in C# or without an As clause in Visual Basic. The compiler infers the type of the variable from the type of the initializer expression.

local user (n)~ A person who uses a computer that is not connected to a network. A local user is most likely someone using a computer at home.

local user account (n)~ A user account on a specific computer. A local user account is available only on the computer where the local account is defined

local user profile (n)~ A computer-based record about an authorized user that is created automatically on the computer the first time a user logs on to a workstation or server computer.

local variable (n)~ A program variable whose scope is limited to a given block of code, usually a subroutine.

Local Video (n)~ A button in a Video conversation that displays the video feed from the user's computer.

local volume (n)~ An area of storage that is located locally.

locale (n)~ A collection of rules and data specific to a language and a geographic area. Locales include information on sorting rules, date and time formatting, numeric and monetary conventions, and character classification.

locale ID (n)~ A 32-bit value which consists of the language ID in the low word (bits 0-15) and the sorting ID (bits 16-19) and a reserved value (bits 20-31) in the high word.

locale identifier (n)~ A 32-bit value which consists of the language ID in the low word (bits 0-15) and the sorting ID (bits 16-19) and a reserved value (bits 20-31) in the high word.

localhost (n)~ The name used to represent the same computer on which a TCP/IP message originates. If you access a server-based web site by using http://localhost, the request does not actually go out to the Internet.

localizable field (n)~ An out-of-the-box attribute that can be exported, translated into a specified language, and then imported back into CRM.

localization (n)~ The process of adapting a product and/or content (including text and non-text elements) to meet the language, cultural, and political expectations and/or requirements of a specific local market (locale).

localized version (n)~ A version of a program that has been translated into another language, also known as an international version. For example, France, Hungary, and the United States all use different localized versions of Microsoft Word.

locally redundant storage (n)~ Storage of account data that is replicated three times within the same data center.

locally-unique identifier (n)~ A 64-bit value that is guaranteed to be unique on the operating system that generated it until the system is restarted.

locate (v)~ To find.

location (n)~ A specific, delimited physical place, such as a bin, shelf, rack, or aisle.

location (n)~ Any disk drive, folder, or other place in which you can store files and folders. Programs will commonly ask you to choose a location to save a file.

location (n)~ The street address or geographical coordinates of a user, and (by way of extensions) of the user's computer or devices.

location (n)~ A geographic point or region.

location (n)~ A physical address.

location (n)~ An electronic address.

location (n)~ A functional facility.

Location and Other Sensors (PN)~ An area within the Windows Control Panel that provides support for sensors such as enabling, disabling or uninstalling sensors and sensor-enabled applications, changing sensor settings, etc.

Location Aware Printing (PN)~ A feature that automatically configures the default printer based on the user's network location. When a mobile user changes network locations, the default printer also changes to the correct one for that network, as defined by the user.

location card (n)~ A card that appears on the card screen or map screen that describes more information about a point of interest, such as its address, a picture, and its operating hours.

location code (n)~ A code that represents the physical location where an employee works in the organization.

location data (n)~ Metadata that defines where the post is originating from or where an author indicates where he or she is located.

location filter (n)~ An element in the UI that allows users to see subsets of data, according to the selected locations.

location group (n)~ A subset of all available locations (that is countries/regions) summarized in an aggregated entity.

Location Information Server (PN)~ A network node originally defined in the National Emergency Number Association i2 network architecture that addresses the intermediate solution for providing Enhanced 9-1-1 (E9-1-1) service for VoIP telephony users.

Location Information service (n)~ A web service that manages a table of network

elements and locations for use by clients of Enhanced 9-1-1 (E9-1-1).

location profile (n)~ A method of converting phone numbers that can be dialed from a named location to a single standard format for purposes of routing both incoming and outgoing calls. Location profiles specify valid number strings and normalization rules and are maintained on the server.

location reminder (n)~ A reminder set by the user to go off when the user arrives at or leaves a particular location.

location sensor (n)~ A category of sensor that can detect the current location of your computer.

location services (n)~ A set of services used by Windows Phone, Windows, and other applications to access the user's current location.

location type filter (n)~ An element in the UI that allows users to see a subset of their data set, according to the selected location types.

location-based forwarding (n)~ An option in the Options dialog box, on the Phones tab, that forwards incoming phone calls based on the user's current location.

locator (n)~ An endpoint for accessing files in an asset.

lock (n)~ A software security feature that requires a key or dongle in order for the application to run correctly.

lock (v)~ To block other meeting participants from controlling the Office Live Meeting 2007 client during a presentation.

lock (v)~ To prevent users from joining a conference, whether or not they have an invitation.

lock (v)~ To allow the shared user profile configuration set by the administrator to remain static from one user session to another.

lock (n)~ A restriction on access to a resource in a multiuser environment.

lock (v)~ To protect an object from being modified.

lock (v)~ Ensure that two processes do not affect the same file or project in a database at the same time.

lock ~ A data structure used to synchronize access to a shared resource. The most common use for a lock is in multithreaded programs where multiple threads need access to global data.

lock app (n)~ An application that either takes advantage of the ability to set a dynamic wallpaper or that takes advantage of the new lock extensibility framework (examples include the Metro Refresh and Inking applications).

Lock Conference (oth)~ A button on Conference Controls that prevents anybody else from joining the current conference.

lock escalation (n)~ The process of converting many fine-grain locks into fewer coarse-grain locks, thereby reducing system overhead.

lock grace period (n)~ The time period (in seconds) within which users can reestablish file locks after the server restarts.

lock screen (n)~ The screen that appears when a user locks the PC.

Lock Session (oth)~ A button on the conference leader's Conference Controls that prevents anybody else from joining the current sharing session.

lock token (n)~ The value that is returned on successful execution of the WebDAV LOCK

method. This value is used to transact subsequent requests.

Lock Tracking (v)~ An option that turns on change tracking and lets you set a password to prevent unauthorized users from turning it off.

lockdown (n)~ A collection of features that administrators can use to prevent end users from accessing unauthorized applications or device settings.

locked (adj)~ The condition of a field, record, recordset, or database that makes it read-only to all users except the user currently modifying it.

locked cell (n)~ A cell in an Add-in for Excel matrix that is not modified when spreading is conducted.

locked file (n)~ A file on which one or more of the usual types of manipulative operation cannot be performed: typically, one that cannot be altered by additions or deletions.

locked mode (n)~ A mode in which BitLocker Drive Encryption prevents access to the encrypted drive, either because the system components have changed or because it needs an authentication key. In this circumstance, the user investigates why BitLocker triggered recovery mode and can either repair the system or enter the recovery password to exit recovery mode.

locked resource (n)~ A resource property that requires project managers to seek approval from resource managers before assigning a resource to a particular project.

locked user profile (n)~ A user account whose user profile settings return to a state defined by Windows SteadyState every time a user logs on to the account; no matter where the user profile settings are physically located.

locked-down client (n)~ A computer that is highly secured so that most users and processes cannot change characteristics of the computer, applications, or files on the computer. Clients are often locked down to enforce standards and to prevent damage due to malicious processes or user error.

Lockout duration (n)~ An integer control that specifies the duration in minutes the user is locked out for after hitting the Lockout Threshold. The default setting for this is -€œ15-€? minutes. The lower limit for this setting is -€œ1-€? and the upper limit is -€œ9999-€?. The upper limit allows the administrator to set the upper limit to greater than one day.

lockout gate (n)~ A workflow activity in the authentication phase of request processing to lockout a user who has failed to authenticate.

Lockout threshold (n)~ An integer control that specifies the number of times a user can fail to complete the authentication workflow before they are locked out for the Lockout Duration specified in the next step. The default setting for this is -€œ3-€?. The lower limit is -€œ0-€? and the upper limit is -€œ99-€?.

Lockout Threshold before Permanent Lockout (n)~ An integer control that allows the administrator to configure a numeric value for the number of times a user can hit the Lockout Threshold before being permanently locked out. Permanent lockout implies that the user must be unlocked by the system administrator to someone with rights to perform the unlock operation. By default, this is set to -€œ3-€?. The range for this setting is between -€œ1-€? and -€œ99-€?.

Lockup, locked up ~ An event which causes a computer to get stuck and refuse to do anything is a lockup. The computer is then said to be- hung- or locked up.

LocStudio Glossary file (n)~ A LocStudio translation memory that contains software

strings and their translations as well as metadata (e.g., string category, term note, instructions, product information) and is used mainly as reference material and for translation recycling.

Lo-Fi (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 71.

log (n)~ A record of transactions or events that take place within an IT managed environment.

log ~ A record of a computer's or application's activity, used for system information, backup, and recovery.

log backup (n)~ A backup of transaction logs that includes all log records not backed up in previous log backups. Log backups are required under the full and bulk-logged recovery models and are unavailable under the simple recovery model.

log chain (n)~ A continuous sequence of transaction logs for a database. A new log chain begins with the first backup taken after the database is created, or when the database is switched from the simple to the full or bulk-logged recovery model. A log chain forks after a restore followed by a recovery, creating a new recovery branch.

log definition (n)~ Configuration information for a related set of log files, including the base file name that is used in the log files that are created, the logging fields that are recorded, the rollover interval, and so on.

log directive (n)~ Information that precedes the log entries in a log file, which defines the information and format contained in each log entry. Each directive in the log file begins with the # character. The directives Version (#Version) and Fields (#Fields) are required. The Version directive defines the version of the W3C Extended Log Format that is used, and the Fields directive specifies the data recorded in the log fields of each entry.

log entry (n)~ A record in a log file.

log file (n)~ A file that stores messages generated by an application, service, or operating system. These messages are used to track the operations performed. Log files are usually plain text (ASCII) files and often have a .log extension.

log file path (n)~ The location of the log file on a computer.

log filter (n)~ A set of algorithms that selectively pass the log entries that are written to log files. For example, a filter can be created to only pass log entries that contain a specific logging field with a specific value.

log level (n)~ The amount of information that is stored in a log file for a transaction. Log levels can be represented by numbers or by words from the most to the least verbose.

Log Level Manager (PN)~ A Project Server logging infrastructure that improves efficiency by enabling admins to customize logging levels for project entities.

log listener (n)~ A component that hooks up to a log object.

log off (v)~ To terminate a session with a computer accessed through a communications line usually a computer that is both distant and open to many users.

log on (v)~ To gain access to a specific computer, program, or network by identifying oneself with a username and a password.

log provider (n)~ A provider that logs package information at run time. Integration Services includes a variety of log providers that make it possible to capture events during

package execution. Logs are created and stored in formats such as XML, text, database, or in the Windows event log.

log sequence number (n)~ A unique number assigned to each entry in a transaction log. LSNs are assigned sequentially according to the order in which entries are created.

log shipping (n)~ Copying, at regular intervals, log backup from a read-write database (the primary database) to one or more remote server instances (secondary servers). Each secondary server has a read-only database, called a secondary database, that was created by restoring a full backup of the primary database without recovery. The secondary server restores each copied log backup to the secondary database. The secondary servers are warm standbys for the primary server.

log shipping configuration (n)~ A single primary server, one or more secondary servers (each with a secondary database), and a monitor server.

log shipping job (n)~ A job performing one of the following log-shipping operations: backing up the transaction log of the primary database at the primary server (the backup job), copying the transaction log file to a secondary server (the copy job), or restoring the log backup to the secondary database on a secondary server (the restore job). The backup job resides on the primary server; the copy and restore jobs reside on each of the secondary servers. See also: primary database, primary server, secondary database, secondary server.

log sink (n)~ A tracing function of the cache client and cache host. Log sinks capture trace events from the cache client or cache host and can display them in a console, write them to a log file, or report them to the Event Tracing for Windows (ETW) framework inside Windows.

logarithm (n)~ In mathematics, the power to which a base must be raised to equal a given number. For example, for the base 10, the logarithm of 16 is (approximately) 1.2041 because 101.2041 equals (approximately) 16. Both natural logarithms (to the base e, which is approximately 2.71828) and common logarithms (to the base 10) are used in programming. Languages such as C and Basic include functions for calculating natural logarithms.

logarithmic trendline (n)~ A best-fit curved trendline that is used when the rate of change in the data increases or decreases quickly and then levels out.

logger (n)~ A tool used to relay the information from build events, messages, warnings, and errors to a log that is easily read and interpreted.

logger assembly (n)~ An assembly that contains a class that implements the Microsoft.Build.Framework.ILogger interface

logger class (n)~ A class that implements the Microsoft.Build.Framework.ILogger interface.

logging (n)~ The process of recording actions that take place on a computer, network, or system.

logging (n)~ The process of recording an audit entry in the audit trail whenever certain events occur, such as services starting and stopping or users logging on and off and accessing resources.

logging database (n)~ The Microsoft SQL Server, MSDE, or WMSDE database that stores health monitoring and usage data temporarily, and can be used for reporting and

diagnostics.

logging field (n)~ A location in a log entry in which a particular type of data is stored.

logging framework (n)~ The overall structure for recording, collecte and aggregate information from multiple machines about what is happening within each component of a program to allow operational staff and developers to get a full picture of what was going on when a particular problem occurred and focus on a particular misbehaving component, or a particular machine, without generating a lot of noise that can be distracting and slow down the application significantly.

logging mode (n)~ The operational state of the tool during which all of the output generated by the selected application is entered into a text log file for later review.

logging table (n)~ A system table that captures failures and other events for Access Services.

Logic Apps (n)~ A feature of App Service that automates the access and use of data across clouds without writing code.

logic error (n)~ An error, such as a faulty algorithm, that causes a program to produce incorrect results but does not prevent the program from running. Consequently, a logic error is often very difficult to find.

logical AND (n)~ A logical operation combining the values of two bits (0, 1) or two Boolean values (false, true) that returns a value of 1 (true) if both input values are 1 (true) and returns a 0 (false) otherwise.

logical block addressing (n)~ A method used with SCSI and IDE disk drives to translate the cylinder, head, and sector specifications of the drive into addresses that can be used by an enhanced BIOS. LBA is used with drives that are larger than 528MB.

logical datacenter (n)~ A logical representation of an actual or physical deployment datacenter environment.

Logical Datacenter Designer (n)~ The designer used to create and edit diagrams of interconnected logical servers that represent the logical structure of a datacenter.

logical datacenter diagram (n)~ The diagram used to create a logical representation of a datacenter. The logical datacenter diagram (.ldd) file contains information based on the System Definition Model (SDM).

logical design (n)~ A design process that details the elements of the solution and how they interrelate with each other. This design does not provide technical implementation details, and thus is prior to making specific technology decisions.

logical device (n)~ A volume that you create within an extended partition on a basic master boot record (MBR) disk. Logical drives are similar to primary partitions, except that you are limited to four primary partitions per disk, whereas you can create an unlimited number of logical drives per disk. A logical drive can be formatted and assigned a drive letter.

logical drive (n)~ A volume that you create within an extended partition on a basic master boot record (MBR) disk. Logical drives are similar to primary partitions, except that you are limited to four primary partitions per disk, whereas you can create an unlimited number of logical drives per disk. A logical drive can be formatted and assigned a drive letter.

logical name (n)~ A name used by SQL Server to identify a file.

logical network (n)~ A user-defined named grouping of IP subnets and virtual local area networks (VLANs) that is used to organize and simplify network assignments.

logical operator (n)~ An operator that manipulates binary values at the bit level. In some programming languages, logical operators are identical to Boolean operators, which manipulate true and false values.

logical operator (n)~ The and/or operator used when constructing a rule.

logical printer (n)~ The software interface between the operating system and the printer in Windows. While a printer is the device that does the actual printing, a logical printer is its software interface on the print server. This software interface determines how a print job is processed and how it is routed to its destination (to a local or network port, to a file, or to a remote print share). When you print a document, it is spooled (or stored) on the logical printer before it is sent to the printer itself.

logical record (n)~ A merge replication feature that allows you to define a relationship between related rows in different tables so that the rows are processed as a unit.

logical schema (n)~ In the Data Warehouse a conceptual model that maps to the data in the physical store and provides an understandable view of the data. When a developer creates code to access or change data in the Data Warehouse the developer interacts with the logical schema. Commerce Server processes data in the Data Warehouse through the logical schema.

logical server (n)~ A representation of the run-time environment in which an application will deploy.

logical server endpoint (n)~ An endpoint which represents a connection point for a logical server and is of client or server type.

logical server prototype (n)~ A preconfigured logical server in the Toolbox that you can use to define logical servers on the logical datacenter diagram.

logical structure (n)~ The comprehensive organization of elements of a solution or a system, without regard to how it is implemented.

logical tree (n)~ In Windows Presentation Foundation, the tree containing all the elements and content that are directly created by an application and used for a user interface element. For the specified element, the logical tree is not a strict subset of its visual tree, because elements derived from the Visual base class might contain elements that are not derived from the Visual class. For example, the elements might contain a String, a TextElement, or any other common language runtime object.

logical unit number (n)~ A logical reference to a portion of a storage subsystem. For example, in a disk storage subsystem, a LUN can comprise a disk, a section of a disk, a whole disk array, or a section of a disk array in the subsystem.

Login ~ Noun or a verb. Noun: The account name used to gain access to a computer system. Not a secret (contrast with Password). Verb: the act of connecting to a computer system by giving your credentials (usually your 'username' and 'password')

login ID (n)~ A string that is used to identify a user or entity to an operating system, directory service, or distributed system. For example, in Windows-® integrated authentication, a login name uses the form DOMAIN\username."

login information (n)~ The user name and password provided by a user to access a specific computer, program, or network.

login script (n)~ A file, typically a batch file, that runs automatically every time a user logs on to a computer or network. It can be used to configure a user's working environment whenever a user logs on, and it allows an administrator to influence a user's environment without managing all aspects of it. A logon script can be assigned to one or more user accounts.

login security mode (n)~ A security mode that determines the manner in which an instance of SQL Server validates a login request.

logistic regression (n)~ A statistical method for analyzing the probability that multiple factors contribute to a state.

logo (n)~ A distinctive symbol that identifies you, your business, or your organization. It can combine a name, motto, and graphics.

logon (n)~ The process of identifying oneself to a computer after connecting to it over a communications line.

logon domain (n)~ The domain used to authenticate a user logging on to a computer, program, or network.

logon rights (n)~ User rights that are assigned to a user and that specify the ways in which a user can log on to a system.

logon script (n)~ A file, typically a batch file, that runs automatically every time a user logs on to a computer or network. It can be used to configure a user's working environment whenever a user logs on, and it allows an administrator to influence a user's environment without managing all aspects of it. A logon script can be assigned to one or more user accounts.

logon script path (n)~ A sequence of directory names that specifies the location of the logon script. When a user logs on, the authenticating computer locates the specified logon script (if one has been assigned to that user account) by following that computer's local logon script path (usually systemroot\\System32\\Repl\\Import\\Scripts).

logon session (n)~ A period of time when one user is logged on to a computer. When a user logs on to a computer, the session is created. When that user logs off, the session is ended.

LOL ~ (Laughing Out Loud)- Internet slang.

lollipop interface (n)~ In a UML Static Structure or UML Component diagram, one of two types of interfaces that can be connected to class or component shapes and has a lollipop shape.

Long data type (n)~ A fundamental data type that holds large integers. A Long variable is stored as a 32-bit number ranging in value from -2,147,483,648 to 2,147,483,647.

long date (n)~ The standard long formats to display a date.

long distance call (n)~ A call made outside a customer's immediate geographic/service area that may carry additional toll charges.

long file name (n)~ A folder or file name longer than the 8.3 file name standard (up to eight characters followed by a period and an extension of up to three characters). Most versions of Windows, including WindowsXP, Windows2000, WindowNT, Windows95, and Windows98 support long file names up to 255 characters.

long grain (adj)~ Of, pertaining to, or characteristic of a type of paper which grain direction runs parallel to the long edge of the sheet.

long message (n)~ A message in a persistent chat room that exceeds the character limit. If the character limit is exceeded, the message will show as long message."

long parsing (n)~ In the SQL system there are two typical types of threads: - short thread: it is a process that use the resources for a short time and - long thread: it is a process that use the resources for a long time. long parsing: is the analysis of the threads that lived for a long time Note: the definition of short/long is based on the system calculation/statistic for each process.

Long tones (PN)~ A setting for the phone keyboard that causes a key to continue to produce a tone as long as the key is pressed.

longest idle routing (n)~ A routing method in which the agent who has the longest idle in the hunt group is offered the call first.

longest match (n)~ In regular expressions, if there is more than one subsequence that matches at some location in the target sequence, the longest subsequence from the ones that match at that point or, if there is more than one subsequence that has the maximal length, the one that was found first.

Longhorn ~ internal code name used for Windows Vista (Windows 6.0) before its release.

long-term cash incentive (n)~ Variable compensation that is typically awarded on an annual (or sometimes biannual) basis but which is often paid out over time, with payments beginning at a future point. This compensation can be determined as a percent of an employee's annual fixed compensation or it can be related to the number or value of shares in a stock option award.

Look Up (v)~ The UI element that initiates the process of seeking a particular file or specific data. A search is carried out by a program through comparison or calculation to determine whether a match to some pattern exists or whether some other criteria have been met.

lookahead fragment (n)~ In IIS Live Smooth Streaming, an MPEG-4 (MP4) fragment that is buffered by the Web server. The Web server includes the timestamps for the buffered fragment in the current fragment response to Smooth Streaming-compatible clients so that clients can optimize requests for the buffered fragment.

look-at point (n)~ The point in the 3D world where the camera is supposed to point. By default, this is the origina (0,0,0). Typically the look-at point specifies where light is focused.

look-from point (n)~ The point in the 3D world where the camera is looking from.

lookup ~ searching a data structure for an item that satisfies some specified property.

Lookup field (n)~ A field in a table that draws data from another table.

lookup table (n)~ A lookup table consists of rows and columns of data. A lookup function examines the table either horizontally or vertically and then retrieves the data that corresponds to the argument specified as part of the lookup function.

lookup view (n)~ The view used when a user clicks a lookup field.

Loonbelasting (n)~ The payroll tax for the Netherlands that is related to income tax withholding and information related to personnel.

loop (v)~ To execute a group of statements repeatedly.

loop (v)~ To repeat a stream continuously.

loop (n)~ A series of instructions that is repeated a fixed number of times or until a

terminating condition is reached.

loop (n)~ A section of a storyboard between two keyframes that is played repeatedly. A loop may play a finite number of times or indefinitely.

loop duration (n)~ The number of times that a portion of an animation storyboard is repeated.

loopback (n)~ An advanced Group Policy setting that is useful in certain closely managed environments, such as laboratories, classrooms, public kiosks, and reception areas.

loopback ~ A diagnostic test that returns the transmitted signal back to the sending device after it has passed through a network or across a particular link. The returned signal can then be compared to the transmitted one. The discrepancy between the two help to trace the fault.

loopback address (n)~ The address of the local computer used for routing outgoing packets back to the source computer. This address is used primarily for testing.

Loose XAML (n)~ A feature that allows you to open any XAML file on your hard disk (or a hyperlink on a web page) and run it within a browser without compilation.

LORG (n)~ An organization with more than 1000 employees and more than 500 personal computers.

LoRIE (n)~ A mechanism for running Internet Explorer processes in a restricted security context to protect the system against malware and viruses that depend on IE running in elevated privilege on a users machine.

lossless JPEG rotation (n)~ A method of rotating JPEG images in which the image is not recompressed upon rotation and, as a result, retains its original quality.

lossless rotation (n)~ A method of rotating JPEG images in which the image is not recompressed upon rotation and, as a result, retains its original quality.

lossy ~ If a process is lossy, it means that a little quality is lost when it is performed. If a format is lossy, it means that putting data into that format will cause some slight loss. Lossy processes and formats are typically used for performance or resource utilization reasons.

lossy JPEG rotation (n)~ A method of rotating JPEG images in which the image is recompressed upon rotation and, as a result, may display artifacts.

lossy rotation (n)~ A method of rotating JPEG images in which the image is recompressed upon rotation and, as a result, may display artifacts.

lost data (n)~ Information that cannot be found or recovered.

lot (n)~ A quantity of one item or a number of items of the same kind.

lot ID (n)~ A unique identifier that is assigned by the manufacturer for a quantity of material produced as a single lot.

lot inheritance (n)~ The practice of configuring items so that their product characteristics and shelf life information can be updated based on their ingredients.

lot number (n)~ A unique identifier that is assigned by the manufacturer for a quantity of material produced as a single lot.

Lotus cc:Mail (PN)~ An e-mail program originally introduced by cc:mail, Inc., and currently produced by the Lotus Development Corporation. Lotus cc:Mail runs on multiple networking platforms and the Internet and is closely integrated with Lotus Notes collaborative software.

Low Box (PN)~ The lowest value of a box on a Box Plot chart.

low density lipoprotein (n)~ A class of lipoproteins that carry cholesterol through the blood and around the body, for use by cells.

low integrity access token (n)~ A filtered access token that is created with a low integrity level. This access token is used by Internet Explorer Protected Mode, but can also be used by other applications.

low level format (n)~ A process that creates the physical format, the positions of the tracks and sectors, that defines where the data is stored on a hard disk.

LOW LINE (n)~ The _ character.

low memory problem (n)~ A difficulty in computer operation caused by insufficient memory resources.

low vision (n)~ Visual impairment that results in great reduction in vision capabilities and that cannot be aided by glasses or contact lenses. It could, however, be aided by special devices.

low watermark (n)~ A memory consumption threshold on each cache host that specifies when expired objects are evicted out of memory.

low whisker (PN)~ The lowest value that is not an outlier on a box plot chart.

low-cost asset (n)~ In Australia, a depreciating asset that costs less than $1,000 (after GST credits or adjustments) as of the end of the income year when an organization starts to use it or when it is installed and ready for use for a taxable purpose.

Lower Provisioning Module (n)~ A component of the Local Provisioning System (LPS) that is hosted within a Secured Execution Environment (SEE) and carries out provisioning, metering, and enforcement for pay-as-you-go and subscription computers.

lowercase (adj)~ Of, pertaining to, or characterized by non-capital letters.

low-level format (n)~ A process that creates the physical format, the positions of the tracks and sectors, that defines where the data is stored on a hard disk.

Low-rights IE (n)~ A mechanism for running Internet Explorer processes in a restricted security context to protect the system against malware and viruses that depend on IE running in elevated privilege on a users machine.

Low-rights Internet Explorer (n)~ A mechanism for running Internet Explorer processes in a restricted security context to protect the system against malware and viruses that depend on IE running in elevated privilege on a users machine.

low-value asset (n)~ In Australia, a depreciating asset that is not a low-cost asset but which has an opening net book value less than $1,000 (as of July 1 in the year that it is allocated to the pool), and for which the organization has previously worked out any deduction using the reducing balance depreciation method.

low-value pool depreciation (n)~ In Australia, a fixed-asset depreciation method. Depreciation is calculated as the sum of low-cost assets (acquisitions) added to the pool in the current fiscal year + second element costs (acquisition adjustments) added in the current fiscal year (depreciated using the low-value pool percentage first-year rate regardless of when they were acquired in the year) + low-value assets added to the pool in the current fiscal year + closing net book value from the previous year (depreciated using the low-value pool percentage rate).

loyalty program (n)~ A structured program that rewards customers with incentives or

other benefits for loyal buying behavior.

LPC (n)~ A message-passing service provided by Windows NT that allows client processes (i.e. applications) and subsystems to communicate with each other on the same computer.

LPD (n)~ A service on a print server that receives print jobs from Line Printer Remote (LPR) tools that are running on client computers.

LPI (n)~ The measurement of the line screen frequency of a halftone screen that is used when printing a bitmap picture. For commercial printing, using higher lines per inch typically results in a more finely detailed picture.

LPM (n)~ A component of the Local Provisioning System (LPS) that is hosted within a Secured Execution Environment (SEE) and carries out provisioning, metering, and enforcement for pay-as-you-go and subscription computers.

LPR (n)~ A connectivity utility that runs on client systems and is used to print files to a computer running an LPD server.

LPS (n)~ A Windows component that resides in the operating system and enforces pay-as-you-go and subscription metering rules.

LRA (n)~ An intermediary between a software publisher and a certification authority (CA). The local registration authority can, for example, verify a publisher's credentials before sending them to the CA.

LRS (n)~ Storage of account data that is replicated three times within the same data center.

LRU (n)~ The type of eviction used by the cache cluster, where least recently used objects are evicted before the most recently used objects.

LSA (n)~ A protected subsystem that authenticates and logs users on to the local computer. In addition, the LSA maintains information about all aspects of local security on a computer (collectively known as the local security policy), and it provides various services for translation between names and identifiers.

LSASS (n)~ An interface for managing local security, domain authentication, and Active Directory processes. It handles authentication for the client and for the server. It also contains features that are used to support Active Directory utilities.

LSN (n)~ A unique number assigned to each entry in a transaction log. LSNs are assigned sequentially according to the order in which entries are created.

LSN (n)~ A number that's assigned by the Provisioning Server to the most recent transaction processed for a specified computer.

LST (n)~ The time when the most recent synchronization process was successfully completed. The last synchronization time determines when the next automatic synchronization will take place. The next automatic synchronization is performed at predefined points in time starting from the last synchronization time.

LSV (oth)~ An electronic payment method used in Switzerland that allows companies to deduct customer payments directly from a customer's bank through the Swiss Interbank Clearing system.

LTCG (n)~ An option that tells the linker to call the compiler and perform whole program optimization.

LUA (n)~ A type of user account that prohibits users from changing most computer

settings and deleting important files. While such a user can access applications, they generally cannot install software or hardware, among other things.

LUID (n)~ A 64-bit value that is guaranteed to be unique on the operating system that generated it until the system is restarted.

Lumia Moments (PN)~ In Lumia Camera, a feature that allows users to create high-definition photos and videos by capturing a short, high-definition video recording.

Lumia Refocus (PN)~ An app that allows the user to capture multiple images simultaneously with different focus settings.

Lumia Selfie (PN)~ An- app for capturing, editing, and sharing photos of oneself that can be automatically enhanced with various effects.

luminance (n)~ The perceived brightness component of a given color, as opposed to its hue or its saturation.

luminosity (n)~ The perceived brightness component of a given color, as opposed to its hue or its saturation.

LUN (n)~ A logical reference to a portion of a storage subsystem. For example, in a disk storage subsystem, a LUN can comprise a disk, a section of a disk, a whole disk array, or a section of a disk array in the subsystem.

Lunar calendar (n)~ A calendar that is based on cycles of the moon phase.

luring attack (n)~ An attack in which the client is lured to voluntarily connect to the attacker.

lurker ~ A user who does not participate in an online discussion (e.g., in a chat room), but merely observes the activity.

lycos ~ An Internet search engine (http://www.lycos.com/) created at Carnegie Mellon University.

Lync admin center (PN)~ A web-based management portal for Lync Online services.

Lync Meeting (n)~ Denotes the experience with Lync that can be scheduled, or ad-hoc. A Lync Meeting provides the ability to interact with people through video, audio, instant messaging, and content sharing.

Lync Meeting window (n)~ Denotes the Conversation window that handles escalations (peer-to-peer to conference) and scalable views that display people and content together inside a Lync Meeting.

Lync Online (Plan 1) (Government Pricing) (PN)~ The offer for government organizations for Lync Online (Plan 1) that is hosted in the commercial cloud environment.

Lync Online (Plan 1) for Government (PN)~ The offer for government organizations for Lync Online (Plan 1) that is hosted in the government cloud environment.

Lync Online (Plan 2) (Government Pricing) (PN)~ The offer for government organizations for Lync Online (Plan 2) that is hosted in the commercial cloud environment.

Lync Online (Plan 2) for Government (PN)~ The offer for government organizations for Lync Online (Plan 2) that is hosted in the government cloud environment.

Lync Online (Plan 3) for Government (PN)~ The offer for government organizations for Lync Online (Plan 3) that is hosted in the government cloud environment.

Lync Online administrator controls (n)~ Provide Lync Online administrators with the

ability to run Lync Online PowerShell cmdlets and assign role-based access control (RBAC) roles to other administrators in the organization.

Lync Online Partner (n)~ An individual or organization that does business with, by, or on behalf of Microsoft and that is a member of the Microsoft Partner Network using the IM and online meetings technology provided by Lync Online.

Lync Server Management Shell (PN)~ The management command line interface built on Windows PowerShell technology that includes a set of cmdlets to help control administration and automation.

Lync Web Scheduler (PN)~ A web-based meeting scheduling and management tool for users who don't have access to Microsoft Outlook, or are on an operating system not based on Windows. With Lync Web Scheduler, you can create new meetings, change your existing meetings, and send invitations using your favorite email program.

Lync-to-phone (PN)~ An optional feature of Lync Online that enables users to make calls to, and receive calls from, the traditional network by using Lync. This feature is available to Voice Plan customers only, and administrators must sign in with a Lync-to-phone provider to get the feature.

Lyrics (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

M (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

M (n)~ A game rating symbol developed by the Office of Film and Literature Classification (OFLC).

M ~

MAA (PN)~ A toolbar application that allows users to use a combination of a computer ID and an activation code to activate Windows, without using a product key.

MAC (n)~ The sublayer of the IEEE 802 specifications that defines network access methods and framing.

MAC (n)~ An algorithm that allows a receiver to ensure that a block of data has retained its integrity from the time it was sent until the time it was received.

MAC address (n)~ A 12-digit hexadecimal address that is preprogrammed into a computer's network adapter, and that uniquely identifies that computer on the network.

Mac address ~ (Media Access Control) The unique serial number of an- Ethernet card- or other networking device. (Nothing to do with Apple Macs, despite the name). It is mostly used to identify which device is talking to which on a network, and is usually only needed when troubleshooting network problems. In the UK, a 'MAC code' is a unique number used for switching broadband providers smoothly.

Mac OS (n)~ The name given to the Macintosh operating system, beginning with version 7.5 in September 1994, when Apple started licensing the software to other computer manufacturers.

Mac, Macintosh, Macbook ~ The- Apple- Corporation's alternative to the- PC, much loved by its devotees. It is the only widely available personal computer that doesn't use Microsoft Windows. Most popular Windows software is also released in Mac format. The Macbook is a laptop.

MacFile (PN)~ A service that allows users of Macintosh computers to store, access, and share files on servers running Services for Macintosh.

machine (n)~ A computer, either physical or virtual, capable of processing information to produce a desired result.

Machine Dependent Intermediate Language (n)~ A method for compiling code to native assembly instructions whenever possible, and compiling the rest to pseudo instructions that can quickly be translated to native instructions on the target device.

Machine Learning (PN)~ A group of Microsoft Azure services that allow users to build predictive analytics models, operationalize them and bring them to the cloud.

machine translation (n)~ The process of using a -€œmachine-€? (in most cases computer software) to translate text from one human language to another.

macro (n)~ A set of keystrokes and instructions recorded and saved as a key combination (such as CTRL + X) or file name. When the macro is used, all of the recorded steps are performed automatically. Macros save time by replacing a series of frequently performed steps with a simple key combination or name.

Macro ~ A small program used to automate repetitive or complex tasks. The Windows equivalent is a- wizard.

macro ~ A file containing a sequence of instructions that can be executed as one command. These commands can be in the form of a key, symbol or name. As an example, one symbol could represent a predefined list of commands.

Macro Builder (PN)~ The object tab in which you create and modify a macro.

Macro Catalog (PN)~ A catalog that is part of the Macro Designer and contains all available macros and actions.

Macro Designer (PN)~ A feature that helps users to define logic for Access forms and tables that run in the browser.

Macro Explorer (n)~ A window in the Visual Studio IDE that lists all macros available in the current solution.

macro group (n)~ A collection of related macros that are stored together under a single macro name. The collection is often referred to simply as a macro.

macro language (n)~ The collection of macro instructions recognized by a given macro processor.

Macro Manager (PN)~ A dialog that shows all the data macros in the database. Data macros can be deleted or renamed here.

macro project (n)~ A collection of components, including forms, code, and class modules, that make up a macro. Macro projects created in Microsoft Visual Basic for Applications can be included in add-ins and in most Microsoft office programs.

Macro window (n)~ The window in which you create and modify macros.

macro-enabled (adj)~ Pertaining to a file format that allows for VBA code. Examples of file extensions for macro-enabled formats are .docm, .pptm, .xlsm.

macro-free (adj)~ Pertaining to a file format that does not allow for VBA code. Office 12 default file formats are macro-free. Examples of file extensions for macro-free formats are .docx, .pptx, .xlsx.

Macromedia Flash (n)~ A Macromedia development environment containing video, multimedia, and application development features to help create rich user interfaces, online advertising, e-learning courses, and enterprise application front-ends.

MACRS (oth)~ A method of accelerated depreciation permitted by tax codes that classifies depreciable assets into one of several recovery periods, each of which has a designated pattern of allowable depreciation.

MADCAP (n)~ An extension to the DHCP protocol standard used to support dynamic assignment and configuration of IP multicast addresses on TCP/IP-based networks.

made-with knowledge (n)~ In synchronization processes, the current knowledge of the source replica, to be used in conflict detection.

maelstrom light (n)~ The bottom triangular blue light located furthest from the entrance to the hyperspace chute in 3D Pinball for Windows - Space Cadet.

magic number (n)~ A hard-coded number whose digits give no indication as to what the number represents.

magic quadrant ~ A two-dimensional graphical framework developed by Gartner that places a particular set of vendors from a specific technology industry sector into a strategic matrix.

magnetic ink character recognition (n)~ A character recognition system for reading and processing data that uses special inks and characters.

magnetic ink character recognition line (n)~ A line of characters that is encoded with a special type of ink that can be magnetized and then translated into characters. MICR lines are used on bank checks to identify the bank, account, and check.

magnetic stripe reader (n)~ A device used to interpret data that is encoded on a magnetic

stripe card.

Magnifier (n)~ A display utility that makes the computer screen more readable by people who have low vision by creating a separate window that displays a magnified portion of the screen.

magnitude (n)~ The numeric component of a measurement.

MAHJONG TILE ONE OF CHARACTERS (n)~ The Unicode character U+1F007, which represents a Mahjong tile.

Mahjong Titans (n)~ A game that is part of the Windows operating system.

Mahout (PN)~ A machine learning library for Apache Hadoop containing algorithms for processing data, such as filtering, classification, and clustering.

mail (n)~ The exchange of text messages and computer files over a communications network, such as a local area network or the Internet.

Mail (PN)~ The link to Windows Live Hotmail.

Mail (PN)~ The Microsoft app for sending and receiving email.

Mail (PN)~ The Outlook app for sending and receiving email.

Mail and Calendar (PN)~ The two Microsoft apps that allow users to send and receive mail, as well as manage events.

mail app (n)~ An app for Office that appears only in Outlook or Outlook Web App.

mail app for Outlook (n)~ An app for Office that appears only in Outlook or Outlook Web App.

mail contact (n)~ A mail-enabled Active Directory contact that contains information about people or organizations that exist outside an Exchange Server organization. Each mail contact has an external e-mail address.

Mail Control (PN)~ The primary navigation tab for mailflow management features in Outlook Live: Transport rules, called -€œrules-€? in Outlook Live service; Supervision policies, including closed campus supervision policy and bad words supervision policy, and anti-bullying supervision policy; IP safelisting; Domain types: hosted or shared.

mail exchange record (n)~ A type of resource record in the Domain Name System (DNS) specifying how Internet e-mail should be routed using the Simple Mail Transfer Protocol (SMTP). Each MX record contains a preference and a host name, so that the collection of MX records for a given domain name point to the servers that should receive e-mail for that domain, and their priority relative to each other.

mail filter (n)~ A feature in e-mail-reading software that automatically sorts incoming mail into different folders or mailboxes based on information contained in the message.

mail flow (n)~ A series of contiguous processing steps through which one or more messages flow.

mail header (n)~ Information at the top of an e-mail message, including the name and address of the sender and recipient, the date and time sent, the subject, and other information that is not part of the body text of the message. The mail header is used by an e-mail client or program.

mail merge (n)~ A mass-mail facility that takes names, addresses, and sometimes pertinent facts about recipients and merges the information into a form letter or another such basic document.

mail merge (n)~ The process of merging information into a document from a data source,

such as an address book or database, to create customized documents, such as form letters or mailing labels.

Mail Migration add-on (n)~ A tool that allows users to upload email messages, email folders, and contacts from an email account on their PC to the cloud to facilitate access from multiple devices.

mail recipient (n)~ The individual, or account, to whom an e-mail message is sent.

mail relaying (n)~ A practice in which an attacker sends e-mail messages from another system's e-mail server in order to use its resources and/or make it appear that the messages originated from the other system.

mail server (n)~ A computer that stores email messages.

mail system (n)~ A utility that allows the user to send and receive e-mail.

mail user (n)~ A mail-enabled Active Directory user that represents a user outside the Exchange organization. Each mail user has an external e-mail address. A mail user is similar to a mail contact, except that a mail user has Active Directory logon credentials and can access resources.

Mailbomb ~ One or more very large emails, sent to someone maliciously to stop them being able to use their mailbox and/or internet connection, because all the available- bandwidth- is being used up downloading the mailbomb(s). Most- ISPs will close down any account responsible for mailbombing. See also- DoS- (Denial of Service).

mailbox (n)~ The location where email is delivered.

mailbox (n)~ The combination of an Active Directory user object that has mailbox attributes and the associated mailbox data that is stored in the mailbox database.

mailbox audit log (n)~ A log that is generated for each mailbox that has mailbox audit logging enabled. Log entries are stored in the Audits subfolder of the audited mailbox Recoverable Items folder.

mailbox database (n)~ A database for storing mailboxes in Exchange Server. The mailbox database manages the data in mailboxes, tracks deleted messages and mailbox sizes, and assists in message transfers. A mailbox database is stored as an Exchange database (.edb) file.

mailbox delivery queue (n)~ A group of temporary queues that hold messages that are being delivered to a Mailbox server by using encrypted Exchange RPC. Mailbox delivery queues exist on Hub Transport servers only. A different mailbox delivery queue exists for each Mailbox server destination. The destination Mailbox server must exist in the same Active Directory directory service site as the Hub Transport server. Mailbox delivery queues are dynamically created as needed and are automatically removed.

mailbox name (n)~ The name or label (in a UI) of a specific user mailbox.

mailbox plan (n)~ A template that automatically populates multiple mailbox properties when a mailbox is created in the service. A mailbox plan also assigns default permissions to the corresponding user account.

mailbox search (n)~ One instance of a multi-mailbox search.

Mailbox server role (n)~ An Exchange Server 2007 server role that provides e-mail storage and advanced scheduling services for Microsoft Office Outlook users. The Mailbox server role also includes public folders, which provide a foundation for workflow, document sharing, and other forms of collaboration.

mailbox store (n)~ A database for storing mailboxes in Exchange Server. Mailbox stores store data that is private to an individual and contain mailbox folders generated when a new mailbox is created for an individual. A mailbox store consists of a rich-text, .edb file, as well as a streaming native Internet content .stm file.

mailbox subscription (n)~ Metadata specifying that a user is logged on their e-mail account. After the user has successfully logged on, the mailbox subscription is considered active.

mailbox user (n)~ A mail-enabled Active Directory user object that has mailbox attributes.

mail-enabled object (n)~ A type of object that has an e-mail address on a domain in the organization, but the object does not have a mailbox in the domain at which to receive messages. The object appears in the global address list, which allows other people in the organization to easily locate or send a message to that person, but the administrator does not need to manage an unnecessary mailbox. Contacts, users, and even folders can be mail-enabled.

mail-enabled universal distribution group (n)~ A group of recipients that are created to expedite the mass e-mailing of messages and other information. When e-mail is sent to a mail-enabled universal distribution group, all members of that list receive a copy of the message. Mail-enabled universal distribution groups cannot be used to assign permissions.

mail-enabled universal security group (n)~ A group of recipients that are created to expedite the mass e-mailing of messages and other information. Unlike a mail-enabled universal distribution group, a mail-enabled USG can also be used to assign permissions. When e-mail is sent to a mail-enabled USG, all members of that group receive a copy of the message.

mail-enabled user (n)~ An Active Directory security principal object that has at least one associated SMTP address

mailer (n)~ A worm that propagates through e-mail.

mailer-daemon ~ an automated program, adopted by some ISPs, that returns Internet mail to you if it is undeliverable for one reason or another.

mailing address (n)~ The location to which products that have been ordered should be sent.

mailing address (n)~ The primary address that is used in mail merges.

mailing label (n)~ A label that is printed with a recipient's address and is used to mail or ship an item.

mailing list (n)~ A list of names and e-mail addresses that are grouped under a single name. When a user places the name of the mailing list in a mail client's To: field, the client sends the message to the machine where the mailing list resides, and that machine automatically sends the message to all the addresses on the list (possibly allowing a moderator to edit it first).

mailing list (n)~ A list used by Direct Mailer to send pieces of mail to selected recipients. It can either be a static list of user e-mail (recipients) or it can be an expression that evaluates to a list of users.

Mailing List Manager (PN)~ A feature that allows a user to organize and control mails from the mailing lists that they may have joined.

mailslot (n)~ A port in a library that transports tapes to and from library slots.

MailTip (n)~ Extra information displayed to a user while they are composing an e-mail message. MailTips are displayed in an InfoBar, similar to the banner that appears saying This message has not been sent.' MailTips reveal anything that might be unexpected about the delivery or audience of the message

MailTips (PN)~ A feature that alerts users to potential issues with e-mail recipients before the message is sent.

mailto (PN)~ An Internet protocol used for sending electronic mail.

main account (n)~ A classifier of economic resource value based on the claims parties make on the economic resources owned by a legal entity and that is used to classify debit and credit entries in an accounting system.

main account category (n)~ A classifier of a main account.

main account code segment (n)~ A segment of a general ledger account code that corresponds to the type of account (for example, cash, sales, or travel expense).

main account derivation rule (n)~ A rule to determine a main account dimension for classifying the financial consequences of an accounting event.

main app (n)~ The wider of the two apps that can appear on the screen simultaneously after a second app is snapped to the screen.

main document (n)~ In a mail-merge operation, the document that contains the text and graphics that are the same for each version of the merged document, for example, the return address or salutation in a form letter.

main form (n)~ A form that contains one or more subforms.

main map (n)~ The map that users can access by touching the map card on the card screen in Concierge. The main map can be a Virtual Earth map or a custom map.

main memory (n)~ The amount of memory physically installed on your device (as opposed to on a storage card.)

main operator extension (n)~ The extension at which Attendant console users who are answering calls for the corporate main phone number can be reached internally.

main quotation (n)~ The primary quotation issued to a customer.

main video (n)~ The large video feed in a conversation window.

main window (n)~ The window that contains the Contacts list.

main window (n)~ The window in which the main interaction with an object takes place.

mainframe ~ A large-capacity computer system with processing power that is significantly superior to PCs or midrange computers. Traditionally, mainframes have been associated with centralized, rather than distributed, computing environments.

mainstream support (n)~ Basic customer support for software, hardware, multimedia, and Business Solutions included in the Microsoft Support Lifecycle policy, such as no-charge incident support, paid incident support, support charged on an hourly basis, support for warranty claims, and hotfix support.

maintainability index (n)~ A value between 0 and 100 that represents the relative ease of maintaining the code. A high value means better maintainability.

maintenance (n)~ The process of taking measures to ensure that a hardware, software, or database system is functioning properly and is up to date.

Maintenance Mode (n)~ A status indicator informing that the server is being maintained.

Maintenance Mode Computer (n)~ The title of a column or data field for a Computer Groups view that specifies the number of computers in a computer group that are in maintenance mode and were changed from managed to unmanaged computers.

maintenance rule (n)~ A rule that is executed by the SharePoint Maintenance Manager to identify problems that are related to configuration settings, data integrity, performance, security, and other issues.

Maintenance troubleshooter (n)~ A troubleshooter that performs common maintenance tasks in Windows, such as cleaning up unused files and shortcuts.

maintenance window (n)~ A period of time, defined by administrators, when changes can be made on the systems that are members of a Configuration Manager collection.

major change request (n)~ A change request that is used for high-risk and high-impact changes according to the Change Policy of your organization.

major version (n)~ A version that is ready for a larger group to see or that has changed significantly since the previous major version.

major version (n)~ Component of the strong name that specifies an assembly's identity. A strong name includes a simple text name, major version number, minor version number, and culture information (if provided), plus a public key and a digital signature. It is generated from an assembly file using the corresponding private key. (The assembly file contains the assembly manifest, which contains the names and hashes of all the files that make up the assembly.)

MAK (n)~ A volume license key that is used for one-time activation with activation services that are hosted by Microsoft.

Make Brush Resource (v)~ A tool that is used to make a re-usable brush from an existing brush.

Make Button (v)~ A tool that is used to make a re-usable button from selected elements.

Make Changes (v)~ The Macintosh-style privilege that allows you to change the contents of folders for which you have this privilege. If you have the Make Changes privilege, you can modify, rename, move, create, and delete files in folders for which you have that privilege.

Make Control (v)~ A tool that is used to make a re-usable control from selected elements.

Make Same (v)~ A tool that is used to make two or more object the same width, height, or size.

Make Table query (n)~ A query (SQL statement) that creates a new table and then creates records (rows) in it by copying records from an existing table.

makefile (n)~ A file that contains rules that describe how to compile source code or link object modules.

make-good (n)~ Placements to make up for placements that were ordered but not run or that were run improperly.

make-table query (n)~ A query (SQL statement) that creates a new table and then creates records (rows) in it by copying records from an existing table.

MAL (n)~ The layer that resides between users (both application developers and end-users) and SQL Server and SQL Server Analysis Services data.

malicious advertising (n)~ The spreading of malicious content through online advertising.

malicious call reporting (n)~ A feature that enables phone users to report disturbing calls to the system administrator. When the user selects to report a malicious call, data from the last call received is captured and sent to the system administrator.

malicious software (n)~ Software that fulfills the deliberately harmful intent of an attacker when run.

Malicious Software Removal Tool (PN)~ A tool that checks your computer for infection by specific, prevalent malicious software and helps to remove the infection if it is found.

malicious user (n)~ A user who intentionally accesses a system with the intent to cause harm to the system or to use it in an unauthorized manner.

malvertising (n)~ The spreading of malicious content through online advertising.

malware (n)~ Software that fulfills the deliberately harmful intent of an attacker when run.

Malware ~ A catch-all term for software installed by stealth onto a PC for malevolent purposes (hence the name). These may include displaying unwanted ads (adware), installing software you didn't ask for, or spying on your activities (spyware) and reporting them back to the culprit so that he can steal your bank account, address book etc.

malware scanner (n)~ Software used to scan for and eradicate malicious software.

MAM (n)~ Software and services responsible for provisioning and controlling access to internally developed and commercially available mobile apps used in business settings on both company-provided and -€œbring your own-€? smartphones and tablet computers.

MAN (n)~ A highspeed network that can carry voice, data, and images at up to 200 Mbps or faster over distances of up to 75 km. Based on the network architecture, the transmission speed can be higher for shorter distances. A MAN, which can include one or more LANs as well as telecommunications equipment such as microwave and satellite relay stations, is smaller than a wide area network but generally operates at a higher speed.

Manage (v)~ A UI element that enables a user to control a specific object.

manage (v)~ To adjust the action or aspects of a group of items, typically done more than once.

Manage Calendars (v)~ A UI element that enables a user to control calendars, such as adding, deleting, renaming, and re-ordering calendars.

Manage Database (v)~ An option, located on the Business Contact Manager menu, in the Database Tools selection, that enables a user to manage their databases.

Manage Lists right (n)~ A right that allows a user to add, modify, and remove lists, document libraries, discussion boards, and surveys.

Manage Privacy Relationships (PN)~ The menu that enables users to assign a privacy relationship to contacts.

Manage User-Defined Fields (v)~ An option, found on the Business Contact Manager menu, that enables the user to customize multiple fields.

managed (adj)~ Executed by the common language runtime environment rather than directly by the operating system.

managed ACS namespace (n)~ An ACS namespace that is partially managed by another Microsoft service.

managed bean (n)~ A Java object that allows you to implement access to the instrumentation of a resource.

Managed Cache Service (PN)~ A secure, dedicated Azure cache offering based on the App Fabric Cache engine, that is managed by Microsoft.

managed client object model (n)~ A set of managed libraries based on the Microsoft .NET Framework that enable the user to write code for client computers to work with many of the common objects in SharePoint sites.

managed code (n)~ Code that is executed by the common language runtime environment rather than directly by the operating system. Managed code applications gain common language runtime services such as automatic garbage collection, runtime type checking and security support, and so on. These services help provide uniform platform- and language-independent behavior of managed-code applications.

managed code extension (n)~ An application-level add-in or document-level customization. Generally, an extension to Microsoft Office that is created by using Visual Studio Tools for Office.

managed computer (n)~ A computer that has been discovered, on which a SCE agent is installed, and which is monitored and managed by SCE.

Managed Computers (PN)~ The default host group, which contains all host groups managed by Virtual Machine Manager.

managed computers (n)~ Computers that are being managed by using Windows Intune.

Managed Computers list (n)~ A list of computers matching the Managed Computer rule for an Agent Manager.

managed content settings (n)~ Settings that are applied to the managed folders in users' mailboxes to control the retention and journaling of messages for messaging records management (MRM). Managed content settings define when messages that are no longer needed are to be removed or journaled (copied) to a separate storage location outside the mailbox.

managed custom folder (n)~ A type of managed folder that is created by an Exchange administrator and placed in a user's mailbox for messaging records management (MRM) purposes. The retention and journaling of messages in managed custom folders are controlled by managed content settings that are applied to the folder.

managed data (n)~ Objects whose lifetimes are managed by the common language runtime. The runtime automatically handles object layout and manages references to these objects, releasing them when they are no longer being used.

managed default folder (n)~ A mailbox folder (such as the Inbox folder) that appears in Office Outlook by default and to which messaging records management (MRM) has been applied. The retention and journaling of messages in managed default folders are controlled by managed content settings that are applied to the folder.

managed deployment (n)~ A deployment performed in a managed environment, that is on desktops where security settings are enforced and managed by IT personnel.

Managed E-mail Folder (n)~ An e-mail folder with associated retention, archive, or expiration policies that are applied to its contents. Organizations can facilitate policy enforcement by providing such folders for users to classify e-mail messages.

Managed Extensibility Framework (PN)~ A composition layer for the .NET Framework that improves the flexibility, maintainability, and testability of large applications. MEF can be used for third-party plug-in extensibility, or it can bring the benefits of a loosely

coupled architecture that is similar to a plug-in to regular applications.

Managed Extensions for C++ (PN)~ A set of language extensions to C++ that help Visual C++ developers write .NET Framework applications. Managed Extensions allow you to mix unmanaged and managed C++ code within the same application.

managed folder (n)~ A folder in a user's mailbox to which messaging records management (MRM) has been applied. There are two types of managed folders: -€œmanaged default folders-€? (such as the Inbox) appear, by default, in a user's Office Outlook mailbox; -€œmanaged custom folders-€? are created by Exchange administrators specifically for MRM. The retention and journaling of messages in managed folders are controlled by managed content settings that are applied to the folder.

managed folder mailbox assistant (n)~ A Microsoft Exchange Mailbox Assistant that creates managed folders in users' mailboxes and applies managed content settings to them for messaging records management (MRM).

managed folder mailbox policy (n)~ A logical grouping of managed folders. When a managed folder mailbox policy is applied to a user's mailbox, all the managed folders that are linked to the policy are deployed in a single operation, thereby making the deployment of messaging records management (MRM) easier.

managed host (n)~ A virtual machine host that is managed by Virtual Machine Manager.

managed instance (n)~ An instance of SQL Server monitored by a utility control point.

managed keyword (n)~ A word or phrase that is added to a SharePoint item, either as a value in the Managed Keyword column or as a social tag.

Managed Memory (n)~ The memory which is managed by developers.

managed metadata (n)~ A hierarchical collection of centrally managed terms that you can define, and then use as attributes for items in SharePoint Server.

managed metadata connection (n)~ A connection to a managed metadata service that allows sites within a Web application to access the service's term store and, optionally, content types.

managed metadata service (n)~ A shared service that publishes a term store and, optionally, a set of content types.

managed navigation (n)~ A feature that enables SharePoint customers to build their site navigation around a metadata term set, and that enables friendly URLs for pages in the navigation structure.

managed object (n)~ An object that is managed using SCE, such as managed computers or managed network devices.

Managed Object Format (n)~ The file type, based on the Interface Definition Language (IDL), that describes management information. The MOF syntax is a way to describe object definitions in textual form.

managed program (n)~ A program that is offered to be installed via Windows Update or the operator (as opposed to being already installed when the user acquires the device).

managed property (n)~ A property that defines how items will be saved to the search index, how you may search for the property and whether or not the property is shown in search results.

Managed Provider (PN)~ A .NET Framework data provider that is used for connecting Host Integration Server 2013 applications to a database, executing commands, and

retrieving results.

managed service account (n)~ A new type of domain account designed to provide applications such as SQL Server or Exchange with automatic password management and simplified service principal name (SPN) management.

managed solution (n)~ A complete solution that has been packaged. After this solution has been installed, the extent to which it can be modified is specified by the publisher.

managed term (n)~ A word or a phrase that can be associated with an item in SharePoint Server.

managed volume (n)~ A local NTFS file system 5.0 volume whose disk space is managed by Remote Storage. Remote Storage frees up disk space by automatically moving infrequently accessed files to a remote storage device.

management agent (n)~ A component that consists of properties, rules, and rules extensions that determine how an object is processed in the metadirectory. A single management agent can have one or more run profiles that determine the management agent's behavior, such as how or when the management agent runs.

Management API (PN)~ An API that contains controls and features for deploying, administering, and managing apps.

management application (n)~ An application or Windows 2000/Windows NT service that uses information originating from one or more managed objects in a managed environment. Management applications retrieve this information through calls to the CIM Object Manager API from the CIM Object Manager and from providers.

management certificate (n)~ An X.509 v3 certificate used to authenticate an agent (such as, the Microsoft Azure Tools for Visual Studio) acting on behalf of the subscription owner to manage subscription resources (such as hosted services).

management console (n)~ A network-enabled host running Simple Network Management Protocol (SNMP) management software. This software requests information from SNMP agents.

management controller (n)~ The hardware and firmware component on computer motherboards that supports out of band management.

management data warehouse (n)~ A relational database that is used to store data that is collected.

Management Group (PN)~ A collection of all the components of an SCE deployment, consisting of a Management Server, a database server, at least one console, and managed objects. By default, the Management Group name is set by SCE during setup, using the format <Management_Server_name>_MG.

management group (n)~ The basic functional unit of an Operations Manager 2007 implementation that can perform monitoring. It must contain a SQL Server 2005 database server, a Root Management Server, one or more Operations Consoles and one or more agents. In addition it can also contain a Reporting Server, gateway server, Audit Collection Services server, and additional collector management servers.

Management Information Format file (n)~ A file that can be used to modify the SMS/Configuration Manager database by creating architectures, object classes, and attributes.

management mode (n)~ The status of a computer that specifies whether the computer is

agent-managed, unmanaged, etc.

management pack (n)~ A set of files that you install for use with Operations Manager and that allow you to monitor applications and add functionality to Operations Manager.

management pack file (n)~ A file that is associated with an Operations Manager management pack and that incorporates overrides, custom monitors, and custom rules.

Management Pack Import/Export Wizard (PN)~ The wizard to import and export management packs.

management point (n)~ The Configuration Manager site system role that serves as the primary point of contact between Advanced Clients and the Configuration Manager site server.

management point (n)~ A secondary Configuration Manager site management point that services the Configuration Manager clients that are within its boundaries.

management policy (n)~ A definition of the workflows used for managing certificates within a Certificate Lifecyle Manager (CLM) profile template. A management policy defines who performs specific management tasks within the workflows, and provides management details for the entire lifecycle of the certificates within the profile template.

Management Policy Rule (PN)~ A rule in ILM that defines a condition and the subsequent action to take when that condition is met. Management policy rules are used to model the business processing rules for incoming requests to ILM.

Management Portal (PN)~ The secure Web portal for managing Microsoft Azure hosted applications and services.

Management Portal for Microsoft Azure SQL Database (PN)~ A web-based, lightweight database management tool for SQL Azure databases that supports database development tasks, schema modification, Transact-SQL, and extract/deploy operations with data-tier applications.

Management Server (n)~ The server that hosts the Windowns Midmarket Server Administration Console, System Center Essentials, and other administrative components.

Management Server (n)~ The server that hosts all SCE's server components.

management server (n)~ The component of an Operations Manager management group that is responsible for communication with agents, databases, and the root management server.

management server (n)~ The communication layer between the Runbook Designer and the deployment manager to the database.

Management Studio (PN)~ A suite of management tools included with Microsoft SQL Server for configuring, managing, and administering all components within Microsoft SQL Server.

management system (n)~ A network-enabled host running Simple Network Management Protocol (SNMP) management software. This software requests information from SNMP agents.

management system (n)~ The management server for Operations Manager for System Center 2012.

Manager (PN)~ A user role in the Engagement functionality of Social Listening. A person with the Manager role can create and share watch lists and social accounts, and can assign and edit user roles for other Engagement users.

managing editor (n)~ A label that refers to the e-mail address of the person responsible for editorial content.

Manchester encoding ~ a method of transmitting bits that allows the receiver to easily synchronize with the sender.

mandate (n)~ The authorization given by a payer to a payee, or by the institution with which the payer's account is held, consenting to the debiting of the payer's account.

mandate (n)~ An authorization or command issued by a government authority.

mandatory attribute (n)~ An object attribute for which values must be specified.

mandatory constraint (n)~ A constraint that requires every instance of an object type's population to play that role. With a disjunctive mandatory role constraint, each member of the object type's population must play at least one of the roles indicated.

mandatory field (n)~ A field that must contain a value if a record is updated or inserted into the database.

Mandatory Integrity Control (PN)~ A mechanism for controlling access to securable objects based on integrity levels and mandatory policy in addition to discretionary access control. For example, a process may be required to have an integrity level that is equal to or higher than the integrity level of an object to obtain certain kinds of access to that object.

mandatory parameter (n)~ A parameter that must be specified when the program is executed.

mandatory profile (n)~ A type of pre-configured roaming user profile that is not updated when the user logs off.

mandatory property (n)~ A property that requires a value when it exists as an object in the Directory Navigator and in the diagram. Mandatory properties that are defined for a class cannot be deleted.

mandatory user profile (n)~ A type of pre-configured roaming user profile that is not updated when the user logs off.

manifest (n)~ An integral part of every assembly that renders the assembly self-describing. The assembly manifest contains the assembly's metadata. The manifest establishes the assembly identity, specifies the files that make up the assembly implementation, specifies the types and resources that make up the assembly, itemizes the compile-time dependencies on other assemblies, and specifies the set of permissions required for the assembly to run properly. This information is used at run time to resolve references, enforce version binding policy, and validate the integrity of loaded assemblies. The self-describing nature of assemblies also helps makes zero-impact install and XCOPY deployment feasible.

manifest (n)~ An XML document that describes requirements for an application. The application manifest can be a separate file or embedded in the application's .exe file.

manifest file (n)~ A file containing a list of resources, such as grammar files and prompt databases, that Speech Server preloads and caches to improve performance. Speech Server automatically creates a manifest file (Manifest.xml) when a new project is created.

Manifest Generation and Editing Tool (PN)~ The Manifest Generation and Editing Tool (Mage.exe) is a command-line tool that supports the creation and editing of application and deployment manifests. As a command-line tool, Mage.exe can be run from both batch

scripts and other Windows-based applications, including ASP.NET applications.

man-in-the-middle attack (n)~ A security attack in which an attacker intercepts and possibly modifies data that is transmitted between two users. The attacker pretends to be the other person to each user. In a successful man-in-the-middle attack the users are unaware that there is an attacker between them intercepting and modifying their data.

manipulation (n)~ An identifiable pattern of input events over a period of time as interpreted for a given application context.

manipulation chaining (n)~ A mechanism that developers can enable to manage user interactions with a child element. When a user can start manipulating a child element and the element reaches the boundary, the parent element begins responding to input.

manual (adj)~ Pertaining to a process that is performed by a person, rather than automated.

manual caching (n)~ A method of manually designating network files and folders so they are stored on a user's hard disk and accessible when the user is not connected to the network.

Manual configuration (PN)~ An option in the Advanced Phone Integration Configuration dialog box that enables the user-entered settings for phone integration instead of the automatic configuration settings.

manual depreciation method (n)~ A method of depreciation in which depreciation amounts are entered manually into a schedule instead of being calculated from a table.

manual discount (n)~ The amount subtracted from the set price of a product or service prior to multiplying the price by the quantity purchased.

manual failover (n)~ In a database mirroring session, a failover initiated by the database owner, while the principal server is still running, that transfers service from the principal database to the mirror database while they are in a synchronized state.

manual line break (n)~ A nonprinting mark you insert to end the current line and continue the text on the next line.

manual link (n)~ A link that requires you to take action to update your data after the data in the source document changes.

manual scheduling (n)~ A type of scheduling that gives the user control over start and finish dates of their tasks. Tasks do not automatically get moved by the scheduling engine. The user can enter blank dates, textual dates, or dates that do not follow dependencies, calendar, and other scheduling engine rules.

manual style application mode (n)~ A mode in which the default style settings defined in Page Options > CSS tab will be not be used, but rather the styles defined in the Manage Styles task pane for the entire page or for individual items on a page will need to be applied by the user. The style application mode can also be set to auto.

manual test (n)~ A test performed by a human.

manual test template (n)~ A template used by the system to give the tester a consistent experience when documenting a manual test.

Manually Configure Phone Integration (oth)~ A dialog box that opens when the user clicks Configure in the Options dialog box, on the Accounts tab. The user enters phone configuration information in this dialog box for the phone that is integrated with Communicator.

many-to-many dimension (n)~ A relationship between a dimension and a measure group in which a single fact may be associated with many dimension members and a single dimension member may be associated with a many facts. To define this relationship between the dimension and the fact table, the dimension is joined to an intermediate fact table and the intermediate fact table is joined, in turn, to an intermediate dimension table that is joined to the fact table.

many-to-many relationship (n)~ An association between two tables in which one record in either table can relate to many records in the other table.

many-to-one relationship (n)~ A relationship between two tables in which one row in one table can relate to many rows in another table.

map (n)~ A path in a system that defines the transfer of data from a source location to a destination location.

map (v)~ To associate data with a specified location in memory.

MAP (PN)~ A powerful inventory, assessment, and reporting tool that can run securely in small or large IT environments without requiring the installation of agent software on any computers or devices. The data and analysis provided by this toolkit can significantly simplify the planning process for migrating to Windows.

map (v)~ To display an address or location on a map.

map card (n)~ A card that appears on the card screen that users can touch to open the main map of Concierge.

map control (n)~ A JavaScript control that contains the objects, methods, and events that you need to display maps powered by Bing Maps-„¢ on your Web site.

map layer (n)~ A child element of the map, each map layer including elements for their map members and map member attributes.

map resolution (n)~ The accuracy at which the location and shape of map features can be depicted for a given map scale. In a large scale map (e.g. a map scale of 1:1) there is less reduction of features than those shown on a small scale map (e.g. 1:1,000,000).

map screen (n)~ The screen within Concierge that displays a map that users can interact with. The map can be a Virtual Earth map or a custom map that you have added. Users can view the map screen in a road or aerial view.

map tile (n)~ One of a number of 256 x 256 pixel images that are combined to create a Bing map. A map tile contains a segment of a view of the earth in Mercator projection, with possible road and text overlays depending on the style of the Bing map.

map viewport (n)~ The area of the map to display in the map report item. For example, a map for the entire United States might be embedded in a report, but only the area for the northwestern states are displayed.-

MAPI (n)~ A messaging architecture that enables multiple applications to interact with multiple messaging systems across a variety of hardware platforms. MAPI is built on the Component Object Model (COM) foundation.

mapped data field (n)~ A field that represents commonly used information, such as First Name.' If a data source contains a 'First Name' field or variation

mapped drive (n)~ In the Windows environment, a network drive that has been assigned a local drive letter and is locally accessible.

mapped file (n)~ A file whose contents are associated with a portion of the virtual address

space of a process. It can be used to share a file or memory between two or more processes.

mapped range (n)~ A range in an XML list that has been linked to an element in an XML map.

mapper (n)~ A component that maps objects.

Mapper grid (n)~ The multi-layered middle area of the main BizTalk Mapper window, between the source and destination schemas, in which data mapping is defined.

mapping (n)~ A specification of the correspondences between items in a conceptual model and items in a storage model.

mapping schema (n)~ A document which defines how Navision records and Outlook items are correlated. The Navision Synchronization Add-in which is installed on Outlook side receives the mapping schema from Navision in the XML format and keeps it in the isolated storage.

mapping specification language (n)~ An XML-based language that is used to map items defined in a conceptual model to items in a storage model.

MapReduce (PN)~ A software framework for writing applications which process vast amounts of data.

Maps (PN)~ The Bing service that allows search and view of maps and satellite images.

Maps (PN)~ A universal app for Windows and Windows Phone, used for maps and directions.

margin (n)~ The blank space outside the printing area on a page.

margin (n)~ The space between a control and the other, adjoining controls on a form or page.

margin guide (n)~ One of the layout guides on the top, bottom, left, and right sides of a page that is used to define its margins.

Mark as Final (v)~ An option that applies a read-only state to a document inside client applications.

mark read (v)~ To remove unread markers from specified elements in the workspace.

marker (n)~ A text string that is associated with a designated time in Windows Media-based content. Markers often denote convenient points to begin playback, such as the start of a new scene.

marker (n)~ A visual indicator that identifies a data point. In a map report, a marker is the visual indicator that identifies the location of each point on the point layer.

marker map (n)~ A map that displays a marker at each location (for example, cities) and varies marker color, size, and type.

market (n)~ A geographic region in which a product is available. Typically, market boundaries are determined by country/region boundaries.

market basket analysis (PN)~ A standard data mining algorithm that analyzes a list of transactions to make predictions about which items are most frequently purchased together.

market segment (n)~ A classification of customers or potential customers based on shared traits, such as geography, demographics, or other personal characteristics, for the purpose of targeting products and services.

marketing automation (n)~ A subset of customer relationship management (CRM) that

focuses on the definition, scheduling, segmentation and tracking of marketing campaigns.

Marketing Campaign (n)~ A feature that helps a business owner market/sell/bring visibility/increase awareness about their business through advertising.

marketing campaign (n)~ A marketing program designed to accomplish a specific result, such as introducing a new product or increasing market share. The main way to accomplish this result is through communicating the benefits of a product or service to people and businesses. Campaigns often include more than one communication method, such as print advertisements, promotional discounts, and direct mail.

Marketing Campaign Planning (n)~ A template that outlines the various considerations you might need in order to plan a marketing campaign in your organization. Planning a marketing campaign begins with understanding you position in the marketplace and ends with collecting data and analyzing campaign effectiveness.

Marketing Event Planning and Execution (n)~ A template that outlines the main categories that you should consider when beginning to plan a marketing event.- Use this template to assist you in walking through key event elements while you are in the planning stages.

marketing list (n)~ A group of accounts contacts or leads who are identified through their demographics as people or businesses who might be the most receptive to a campaign. For example to introduce a new product you can create a marketing list of accounts that have previously purchased similar products and send them brochures about the new product.

Marketing Manager (n)~ A person who handles marketing programs for the products or product families that his or her company sells. This person assists and informs senior management about marketing needs. This person also works closely with vendors to get marketing materials prepared and campaigns run. This person facilitates co-marketing and branding efforts with partners.

marketing portal (n)~ A view into Dynamics CRM by a salesperson so the salesperson can see contact information for potential customers.

marketing preferences (n)~ Product settings that someone chooses to receive or reject promotional mailings from Microsoft or partners.

Marketplace (n)~ A feature that provides an area of the Office Live Small Business Web site where third-party and partner solution and service providers are listed.

Marketplace (PN)~ An Internet site that makes it easy for users to discover the software and hardware that work best for their Windows PC or mobile device use, find the newest and most popular products on the market, compare product details, and read reviews from other users.

Marketplace (PN)~ An Internet site that makes it easy for users to discover the software and hardware that work best for their Microsoft Dynamics CRM use, find the newest and most popular products on the market, compare product details, and read reviews from other users.

markup (n)~ Comments and tracked changes such as insertions, deletions, and formatting changes.

markup (n)~ The tags to mark elements, such as text and graphics, in a document to indicate how Web browsers should display these elements to the user and should respond to user actions.

markup (n)~ An amount added to the current or standard cost that is used to determine the sale price of various items.

markup balloon (n)~ An outlined container that displays a markup element, such as a comment or revision, in the margin of a document.

markup compatibility (n)~ The ability for a document expressed in one a markup language to facilitate interoperability between applications, or versions of an application, with different feature sets.

Markup Compatibility namespace (n)~ A set of XML elements and attributes defined in a markup specification.

markup container (n)~ The staging area for editing an HTML document or HTML fragments.

markup extension (n)~ An extension to XAML that can provide values for properties of an attribute, properties of a property element, or both.

markup language (n)~ A set of codes in a text file that instruct a computer how to format it on a printer or video display or how to index and link its contents. Examples of markup languages are Hypertext Markup Language (HTML) and Extensible Markup Language (XML), which are used in Web pages, and Standard Generalized Markup Language (SGML), which is used for typesetting and desktop publishing purposes and in electronic documents. Markup languages of this sort are designed to enable documents and other files to be platform-independent and highly portable between applications.

markup order (n)~ The stacking order of objects in a document that is based upon the order the objects appear in markup, such as XAML.

markup overlay (n)~ Translucent shapes, ink shapes, or comments that are superimposed over a drawing without changing the underlying drawing.

marquee (n)~ Moving text that is used on a data access page to draw the user's attention to a specific page element, such as a headline or an important announcement.

marquee component (n)~ A control or component on a page that displays moving text.

MARS (n)~ A service for resolving multicast IP addresses to the asynchronous transfer mode (ATM) addresses of the clients that have joined that multicast group. MARS can work in conjunction with the multicast server (MCS) and clients to distribute multicast data through point-to-multipoint connections.

MARS (n)~ A SQL Server 2005 feature that provides the ability to have more than one pending request per connection, in particular to have more than one default result set open per connection. SQL Server 2000 and earlier restricted the programming model such that at any point in time there would be at most one pending request on a given session, blocking the driver from sending requests to the server until the entire result set is consumed.

marshal (v)~ To package and send interface method parameters across thread or process boundaries.

marshaling (n)~ The process of packaging and sending interface method parameters across thread or process boundaries.

mashup (n)~ A web application that combines functionality or data from multiple sources into a single, integrated service, application, or medium.

Mashup Runtime (PN)~ The execution container for hosting applications that context-

sensitively retrieve, mix, and match components, data and functionality from more than one source to create a single new service displayed in a single graphical interface.

mask (n)~ A filter that selectively includes or excludes certain values.

mask placeholder (n)~ A character used in a masked control when there is no user input to display.

masking group (n)~ A group of logical disks, target ports, and initiator ports used for bulk mask/unmask operations.

masquerade ~ a type of attack where the attacker pretends to be an authorized user of a system in order to gain access to it or to gain greater privileges than they are authorized for. A masquerade may be attempted through the use of stolen logon IDs and passwords, through finding security gaps in programs, or through bypassing the authentication mechanism.

mass mailer (n)~ A worm that propagates through e-mail by sending a copy of itself as an e-mail attachment to numerous e-mail addresses.

mass storage device (n)~ A generic term for disk, optical disk, or other device that provides persistent storage for computer data.

massively multiplayer on-line game (n)~ A game conducted over the Internet in which a large number of players (hundreds or thousands) participate simultaneously.

mass-storage controller (n)~ A device on which mass-storage devices rely for access to a computer subsystem. For example, a SCSI card or IDE functionality on the motherboard is a mass-storage controller; the physical hard drive is a mass-storage device.

master (n)~ A slide view or page on which you define formatting for all slides or pages in your presentation. Each presentation has a master for each key component: slides, title slides, speaker's notes, and audience handouts.

master (n)~ A shape on a stencil that you use repeatedly to create drawings.

master boot code (n)~ A small amount of executable code contained in the master boot record that scans the partition table for the active partition, finds the starting sector of the active partition, loads a copy of the boot sector from the active partition into memory, and transfers control to the executable code in the boot sector.

master boot record (n)~ The first sector on a hard disk, which begins the process of starting the computer. The MBR contains the partition table for the disk and a small amount of executable code called the master boot code.

Master Category List (n)~ The list of categories that you can use to group items or to find items. This list contains general categories such as Business, Personal, and Phone Calls. You can add categories to and delete categories from this list.

master copy (n)~ The most recently checked-in version of a file or project stored in a Visual SourceSafe database.

master data (n)~ The critical data of a business, such as customer, product, location, employee, and asset. Master data fall generally into four groupings: people, things, places, and concepts and can be further categorized. For example, within people, there are customer, employee, and salesperson. Within things, there are product, part, store, and asset. Within concepts, there are things like contract, warrantee, and licenses. Finally, within places, there are office locations and geographic divisions.

master data (n)~ Entities that describe the parties, locations, products, and activities that

are referenced by entities that document and record economic, resource flow, and accounting events.

master data management (n)~ The technology, tools, and processes required to create and maintain consistent and accurate lists of master data of an organization.

Master Data Services (PN)~ A master data management application to consistently define and manage the critical data entities of an organization.

Master Data Services Configuration Manager (PN)~ A SQL Server configuration manager used to create and configure Master Data Services databases, Web sites, and Web applications.

master database (n)~ The system database that records all the system-level information for an instance of SQL Server.

master design set (n)~ A design set that includes a broad collection of common business publications.

master document (n)~ A container' for a set of separate files (or subdocuments). You can use a master document to set up and manage a multipart document

master element (n)~ An element in a parent document to which a child document is attached. Examples of master elements are input, frame, iframe, or elements created by an element behavior.

Master Explorer (n)~ A window that shows a hierarchical view of the masters and styles.

master file (n)~ The file installed with earlier versions of SQL Server used to store the master, model, and tempdb system databases and transaction logs and the pubs sample database and transaction log.

master file table (n)~ An NTFS system file on NTFS-formatted volumes that contains information about each file and folder on the volume. The MFT is the first file on an NTFS volume.

master image (n)~ The hard disk image from which the manufacturer creates all other operating system images on the computers being manufactured. The master image is the final operating system image that contains all of the software, configuration settings and other customizations requested by the solution provider. It is installed on every computer in a particular offering during manufacturing.

master installation (n)~ A customized installation of Windows that an Original Equipment Manufacturer (OEM) or corporation plans to duplicate onto one or more destination computers.

master key (n)~ The key used by the client and server for all session key generation. The master key is used to generate the client-read key, the client-write key, the server-read key, and the server-write key. Master keys can be exported as simple key BLOBs.

master page (n)~ A page that defines the layout and common elements for a set of web pages. It is merged at run time with content pages that define page-specific content.

master page (n)~ A page that contains the design and layout elements that you want to repeat on multiple pages in a publication. Using master pages for these common elements gives your publication a more consistent appearance.

Master Page Gallery (n)~ A collection of pages with the .master extension that define shared page elements and content place holders.

master planning (n)~ A planning process that encompasses many manufacturing

activities, such as demand management, production and resource planning, and master scheduling.

master project (n)~ A project containing one or more inserted projects. These can retain links to their source projects and may be linked to one another.

master project plan (n)~ A deliverable of the planning phase for a development project. It consolidates feature team and role plans. The master project plan includes a budget plan, capacity plan, communications plan, deployment plan, development plan, pilot plan, purchasing and facilities plan, security plan, test plan, and training plan.

master project schedule (n)~ A schedule that identifies all the project's activities and milestones, consolidating all team and role schedules. The master project schedule is a deliverable of the planning phase.

master scheduling (n)~ The process for generating a timetable for matching supply with demand.

master secret (n)~ A security key generated by the master secret server when an Enterprise Single Sign-On (SSO) Administrator requests it. This secret key is stored in the registry as a Local Security Authority (LSA) secret on the master secret server. Only SSO Administrators can access this secret key.

master secret server (n)~ A protocol server that stores and can provide a master secret in response to a request from a protocol client.

master server (n)~ A server that distributes jobs and receives events from multiple servers.

master shape (n)~ A shape on a stencil that you use repeatedly to create drawings. When you drag a shape from a stencil onto the drawing page, the shape becomes an instance of that master.

master text (n)~ The slide text on the slide master. The master text determines the format of text on all slides as well as the shape of text placeholders and their placement on slides.

master user domain (n)~ A Windows NT domain that holds user account data.

Master/Slave ~ Bus access method whereby the right to transmit is assigned to one device only, the Master, and all the other devices, the Slaves may only transmit when requested.

master/subordinate (adj)~ Pertaining to an architecture in which one device (the primary device) controls one or more other devices (the secondary devices)

MasterCard SecureCode (PN)~ A code that credit card companies use to authorize credit card charges. For example, American Express uses a four-digit number on the front of the credit card, and Visa, MasterCard, and Discover use a three-digit number on the back.

Mastered (adj)~ A file system used to create CDs and DVDs. Discs created using the Mastered format are more likely to be compatible with older computers, but an additional step is required to burn the collection of files to the disc.

master-level guide (n)~ A guide that is created and edited in Slide Master view, and that applies to slides that use the master layout in which it was created.

Match Code Update (PN)~ A system job that scans the system for records for which match codes are not updated and persist their corresponding matchcodes in the database (this wakes up every 5 mins).

matchcode (n)~ An alphanumeric identifier that is used to determine whether a record is unique. Each matchcode is derived from the data in selected fields in a record.

Matched Name Selection Method (n)~ The mechanism used to help a caller differentiate between users with names that match the touch-tone or speech input.

matched name selection method (n)~ The mechanism used to help a caller differentiate between users with names that match the touch-tone or speech input.

matching (n)~ Linking transactions from the electronic bank site to open documents in payment processing or to internal bank account ledger entries in bank reconciliation.- - -

matching discrepancy (n)~ Any type of variance that is detected when a vendor invoice is matched to a purchase order and a packing slip. This may include variances in price, quantity, and miscellaneous charges.

matching policy (n)~ A policy that controls the purchase order, product receipt, and vendor invoice matching requirements in the accounts payable process. The policy can mandate no matching requirement or a combination of unit price matching, extended price matching, quantity matching, line matching, or total matching requirements.

matching principle (n)~ A rule that specifies whether matching cost and revenue on a fixed-price project should be handled as one transaction (sales value) or as two transactions (production + profit).

matchmaking (n)~ The process where the ACD finds an agent to connect to.

material (n)~ A part' of 3D content that provides texture to 3D geometries. Combined with light

material label (n)~ The unit of measure for a material resource, such as tons, cubic yards, or board feet.

material resource (n)~ A supply or other consumable item that is used to complete tasks in a project.

materialize (v)~ To convert a snapshot of a virtual catalog to a base catalog. A virtual catalog that has been materialized has the performance of a base catalog for all search and browse operations, but is edited as a virtual catalog.

materials (n)~ Content and resources that are made available as part of a class and that can be associated with individual lessons or assignments.

Math Autocorrect (n)~ A feature that allows various mathematical symbols to be entered using the keyboard.

math expression (n)~ An expression that uses numeric values, such as integers, fixed-point numbers, and floating-point numbers, and operators, such as addition, subtraction, multiplication, and division.

Math Ink Panel (PN)~ The ActiveX control of the Math Input Panel and Math Input Control that handles inking, recognizer calls, and correction experience.

Math Input Control (PN)~ A control that provides integration of math handwriting recognition functionality into other applications. This control is for applications that want to include math recognition functionality but do not want to fully implement their own math recognition user interface.

Math Input Panel (PN)~ A Windows accessory that enables handwritten input of math expressions as well as easy-to-use correction of recognition results. Its functionality is analogous to that of Tablet Input Panel.

math recognizer (n)~ The underlying engine below Math Ink Panel and Math Result Panel that enables converting handwritten math expressions into electronic format

(MathML) thus facilitating writing math formulas in a natural way.

Math Result Panel (PN)~ The ActiveX control of the Math Input Panel and Math Input Control in charge of displaying handwriting recognition result in real time, the recognizer state, error messages and hints.

mathematical equation (n)~ A mathematical statement that asserts the equality of two mathematical expressions.

mathematical expression (n)~ A mathematical statement whose symbols comprise numbers, variables, and mathematical operations.

mathematical formula (n)~ A mathematical statement in a formal language that can be given a semantic meaning.

mathematical statement (n)~ A combination of symbols that form a logical sentence that is true or false under a given interpretation.

Mathematics Add-in (PN)~ An add-in for Word and OneNote that helps users to perform mathematical calculations and plot graphs in their Word documents and OneNote notebooks.

MathML (PN)~ An application of XML for describing mathematical notation and capturing both its structure and content. The goal of MathML is to enable mathematics to be served, received, and processed on the Web, just as HTML has enabled this functionality for text.

matrix (n)~ An arrangement of rows and columns used for organizing related items, such as numbers, dots, spreadsheet cells, or circuit elements.

Matrix (PN)~ A SmartArt graphic layout type that includes layouts designed to show how parts relate to a whole.

matrix data region (n)~ A report item on a report layout that displays data in a variable columnar format.

matrix organization (n)~ An organizational structure in which employees report to multiple managers for different purposes, such as to one manager for administrative purposes and to another for project purposes.

Mature (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

Mature (n)~ A game rating symbol developed by the Office of Film and Literature Classification (OFLC).

Mature Audience Only (n)~ A TV ratings system used by TV networks in the United States to indicate to viewers that a particular show is intended for a mature audience only.

Mature content (n)~ A content descriptor developed by Microsoft.

Mature Humor (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Mature Sexual Themes (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

maturity level (n)~ The degree of process improvement across a predefined set of process areas in which all goals within the set are attained.

Maturity Rating (PN)~ A rating outlining any age restrictions or recommendations for a given film.

max duration (oth)~ The longest event time for any performance event in the group.

max heart rate (n)~ The fastest heart rate (measured per minute) an individual can safely achieve through exercise stress.

max points (n)~ The highest numeric score that a student can receive on an assignment, without being awarded extra credit.

maximize (v)~ To enlarge a window to its largest size by double-clicking the title bar, clicking the Maximize button (at the right of the title bar), or by pressing ALT+SPACEBAR and then pressing X.

maximized window (n)~ A window displayed at its maximum size. A maximized window has the WS_MAXIMIZE style.

maximum capitalization (n)~ The maximum WIP value that can be posted to an investment project.

maximum concurrent calls (n)~ A configuration setting that represents the maximum number of concurrent calls to service instances that are executing.

maximum concurrent sessions (n)~ A configuration setting that represents the maximum number of client sessions that can be active at the same time for service instances in memory.

maximum difference (n)~ A parameter reported in the conformance test results that indicates the maximum number of differences between two files that are being compared.

Maximum Transmission Unit (n)~ The largest packet of data that can be transmitted on a network. MTU size varies, depending on the network—576 bytes on X.25 networks, for example, 1500 bytes on Ethernet, and 17,914 bytes on 16 Mbps Token Ring. Responsibility for determining the size of the MTU lies with the link layer of the network. When packets are transmitted across networks, the path MTU, or PMTU, represents the smallest packet size (the one that all networks can transmit without breaking up the packet) among the networks involved.

maximum units (n)~ The maximum percentage or number of units that a resource is available to be scheduled for any tasks. The maximum units value indicates the highest capacity at which the resource is available for work; the default value is 100 percent.

MB (n)~ Usually 1,048,576 bytes. It is sometimes interpreted as 1 million bytes.

MB/month (PN)~ The unit of measure for the Cache Memory resource that is equal to 1,024 Cache Memory (MB/month) units.

MBCS (n)~ A mixed-width character set, in which some characters consist of more than 1 byte. An MBCS is used in languages such as Japanese, Chinese, and Korean, where the 256 possible values of a single-byte character set are not sufficient to represent all possible characters.

MBean (n)~ A Java object that allows you to implement access to the instrumentation of a resource.

MBOX file (n)~ A specially-constructed text file, usable by any text editor, that contains mail messages within the file.

mbps (n)~ A measurement of data transfer speed over a given connection equal to one million bits per second.

Mbps ~ (MegaBits Per Second)- A measure of speed of information flow over a network (and if it's measured in Mbps, it's reasonably quick.)- A Megabit is one million- bits. (Actually slightly more if you want to egt pedantic about it). See also- bps,- Kbps.

MBR (n)~ A characteristic of a data stream in which the same content is encoded at several different bit rates in oder to optimize content delivery.

MBR (n)~ The first sector on a hard disk, which begins the process of starting the computer. The MBR contains the partition table for the disk and a small amount of executable code called the master boot code.

MBR disk (n)~ A disk that uses the master boot record (MBR) partition style.

MCDI (n)~ A standard of video compression and file format developed by the Moving Pictures Experts Group for description and search of multimedia content data.

MCF (n)~ A framework used to connect MOM systom to other management systems, such as IBM tivoly, HP Openview etc.

MCGA (n)~ An older video adapter included in the IBM PS/2 Models 25 and 30. The MCGA was capable of emulating the CGA (Color/Graphics Adapter) and provided two additional graphics modes: the first mode had 640 horizontal pixels by 480 vertical pixels with 2 colors chosen from a palette of 262,144 colors; the second had 320 horizontal pixels by 200 vertical pixels with 256 colors chosen from a palette of 262,144 colors.

MCITP (PN)~ A set of certifications proving a comprehensive set of skills to perform a particular IT job role based on older versions of Microsoft technologies, such as database administrator or enterprise messaging administrator.

MCP (n)~ A professional who has the skills to successfully implement a Microsoft product or technology as part of a business solution in an organization.

MCS (n)~ A service that manages zero or more multicast groups and distributes multicast data sent to it by clients of those multicast groups through point-to-multipoint connections.

MCS (PN)~ A feature that allows multiple TCP/IP connections from the initiator to the target for the same iSCSI session.

MCV (n)~ A vaccine for immunization against infections caused by meningococcal bacteria.

MD5 (n)~ An industry-standard one-way, 128-bit hashing scheme, developed by RSA Data Security, Inc., and used by various Point-to-Point Protocol (PPP) vendors for encrypted authentication.

MDAC (n)~ A suite of data access APIs that ship with the Windows operating system. Data Access Components includes three major API surfaces-€"ADO, OLE DB, and ODBC-€"each of which is optimized for a different set of applications. All three major components of Data Access Components employ the provider model, which allows access to a variety of data sources using a virtually identical set of programmatic calls.

MDE file (n)~ Microsoft Access database (.mdb) file with all modules compiled and all editable source code removed.

MDI (n)~ A specification according to which documents are opened into windows (sometimes called child windows) that are constrained to a single primary (parent) window.

MDI (PN)~ A graphical user interface that allows the user to display multiple documents at the same time, with each document displayed in its own window. Documents (or child windows) are contained in a parent window, which provides a workspace for all the child windows in the application.

MDIL (n)~ A method for compiling code to native assembly instructions whenever

possible, and compiling the rest to pseudo instructions that can quickly be translated to native instructions on the target device.

MDM (n)~ Software that secures, monitors, manages, and supports mobile devices deployed across mobile operators, service providers, and enterprises.

MDN (n)~ A request for disposition information from a recipient after a message has been successfully delivered. The information might include whether the message was displayed, printed, or deleted without display, or if a recipient refused to send notification.

MDS (PN)~ A master data management application to consistently define and manage the critical data entities of an organization.

MDT (PN)~ The recommended process and toolset to automate desktop and server deployment.

MDX (n)~ A language for querying and manipulating data in multidimensional objects (OLAP cubes).

MDX Editor (PN)~ The dialog box that allows users to enter custom MDX for an Add-in for Excel matrix.

MDX formula (n)~ The online analytical processing (OLAP) equivalent of an SQL query.

me (oth)~ The UI label in Messenger for the aspect of the social view that displays unprioritized recent social activity of the user.

Me (PN)~ A tile in the Start screen that provides to the user quick access to post messages, check in to locations, or review notifications from various services and social networks.

mean opinion score (n)~ A widely accepted numerical indication of perceived audio quality of transmitted spoken material. It is the mean of values (from 1 to 5) assigned by subjects to test sentences in an ACR test or the mean of values objectively predicted by software algorithms, such as those provided by the Microsoft UC solution.

measles, mumps and rubella vaccine (n)~ A vaccine for immunization against measles, mumps, and rubella.

measles, mumps, rubella and chickenpox vaccine (n)~ A vaccine for immunization against measles, mumps, rubella, and varicella (chickenpox).

measure (n)~ A property of an object that can be quantified numerically.

measure (n)~ In a cube, a set of values that are usually numeric and are based on a column in the fact table of the cube. Measures are the central values that are aggregated and analyzed.

Measure (n)~ A representation of metadata associated with Parature data that is used in Premium Reports.

measure dimension (n)~ A dimension used to characterize the magnitude of a measurement.

measure group (n)~ A collection of related measures in an Analysis Services cube. The measures are generally from the same fact table.

Measured Boot (PN)~ A feature that validates, signs, and stores boot information in the Trusted Platform Module chip to verify the integrity of the PC.

measurement (n)~ The magnitude of the property of an object calibrated against one or more units of measure.

Measurement Converter (PN)~ An action that can be enabled to identify and provide

conversions for international units of measurement.

measurement unit (n)~ The size or distance in the real world.

MEBx Account (n)~ The functionality in the Management Engine BIOS extension (MEBx) on AMT-based computers used for initial authenticated access to the AMT firmware on AMT-based computers in Configuration Manager 2007 SP1 and later.

mechanical sensor (n)~ A category of sensor that is used for mechanical measurement of force, scale, pressure, strain, etc.

media (n)~ Any fixed or removable objects that store computer data. Examples include hard disks, floppy disks, tapes, and compact discs.

media (n)~ Video files, audio files, image files, 3D object files, or any other files that can be used in your project.

Media (PN)~ An API for audio, imaging, and video multimedia.

media access control (n)~ The sublayer of the IEEE 802 specifications that defines network access methods and framing.

media asset (n)~ A digital media file.

media asset (n)~ A unit of media programming, such as a television program, a movie, or a digital music track, that are delivered to a subscriber in exchange for on-demand fees or subscription fees. Assets are usually files that are stored on a media server.

Media Browser (PN)~ A panel within the Toolbox that provides browsing and previewing of music, movies, images, and other media files.

Media Center Extender (n)~ A hardware device that, when connected to a TV, includes the ability to extend the Windows Media Center experience and media on that TV.

Media Center Extras (PN)~ A collection of third-party extensibility applications for Windows Media Center.

media clip (n)~ A single media file, including art, sound, animation, or movies.

media entry (n)~ An individual entry in a playlist that specifies the location of a media asset, and for Web playlists, additional attributes such as whether the media asset can be sought or skipped by clients during playback.

media family (n)~ Data written by a backup operation to a backup device used by a media set. In a media set with only a single device, only one media family exists. In a striped media set, multiple media families exist. If the striped media set is unmirrored, each device corresponds to a family. A mirrored media set contains from two to four identical copies of each media family (called mirrors). Appending backups to a media set extends its media families.

media file (n)~ A file that contains audio, video, or script data.

Media Foundation (PN)~ A COM-based multimedia platform and infrastructure for digital media in Microsoft Windows. It focuses on content protection, audio and video quality, and interoperability for digital rights management (DRM).

media header (n)~ A label that provides information about the backup media.-

Media Indexer (PN)~ A media processor that leverages natural language processing (NLP) technology from Microsoft Research to make media files and content searchable by exposing this meaningful metadata to the end-user automatically in the form of a keyword file (XML), a set of closed caption files (SAMI/TTML), and a powerful binary index file (AIB).

media information (n)~ Information about digital media content such as the artist, title, album, rating, producer, and so forth. Also known as metadata or tags.

media link entry (n)~ An entry in a data feed that contains a reference to a related media resource. This is the Open Data Protocol (OData) representation of an entity that has related binary large object data that is not serialized in the data feed.

media outlet (n)~ A publication, such as a magazine, or a place that broadcasts programs, such as a radio station, that transmits feature stories and news to the public through various distribution channels.

media parser plug-in (n)~ A type of plug-in that that can read different file formats.

Media Player (PN)~ A free player solution built to playback media content from Microsoft Azure Media Services with the ability to reach a wide variety of browsers and devices with a simple HTML and JavaScript code.

media pool (n)~ A logical collection of removable media that have the same management policies. Media pools are used by applications to control access to specific tapes or discs within libraries managed by Removable Storage.

media processor (n)~ A processor that transforms media content into a different output.

media query (n)~ A media type and zero or more expressions that check for the conditions of particular media features, such as width, height, and color.

media relay (n)~ A server, in the perimeter network, that has two separate network interfaces or edges (one for accepting connections from internal clients and another for accepting connections from external clients) and that is used to enable applications to pass audio and video data across NATs and firewalls.

media relay server (n)~ A server, in the perimeter network, that has two separate network interfaces or edges (one for accepting connections from internal clients and another for accepting connections from external clients) and that is used to enable applications to pass audio and video data across NATs and firewalls.

media resource (n)~ Any media item that can be transferred over any network as a binary stream. One media item could have multiple binary streams depending on the encoding features. For example, some media items could have three streams (or resources): WMV encoded stream for a 2 Mbps throughput, WMV encoded stream for a 500 Kbps throughput, and MPEG-2 encoded stream for a 5 Mbps throughput.

media sense thread (n)~ The thread, or object within a process, that detects the presence of media.

media server (n)~ A server that hosts and delivers media across a network.

Media Services (PN)~ The Microsoft Azure service that allows you to create workflows for the creation, management, and distribution of digital media.

media set (n)~ An ordered collection of backup media written to by one or more backup operations using a constant number of backup devices.

Media Sharing Center (PN)~ The primary interface used to enable sharing media to other computers and devices, and to access media sharing settings and devices that interact with the media sharing feature. If you enable sharing you can play your favorite music, videos, and pictures on any computer or device in any room in your home.

Media Stream Source (n)~ The service that allows apps to send audio and video samples to the media pipeline to decode, encode into a file, and stream to Xbox using Play To.

media streaming (n)~ A method of delivering digital media across a network in a continuous flow. The digital media is played by client software as it is received. Typically, streaming makes it unnecessary for users to download a file before playing it.

Media Tablet ~ a device based on a touchscreen display whose primary focus is the consumption of media.

media usage rights (n)~ Permissions to use a protected Windows Media-based file in a particular way. For example, a content provider, such as an online music store, can grant you the right to play a song on your computer (a play right), to burn the song to an audio CD (a burn right), or to sync the song to a portable device (a sync right). The content provider dictates the terms of the rights (for example, which rights it grants to you and for how long) and Windows Media Digital Rights Management(DRM) enforces those rights.

medialess license kit (n)~ A kit that can be purchased by an end-user to license or activate software.

median (n)~ The middle value in a set of ordered numbers. The median value is determined by choosing the smallest value such that at least half of the values in the set are no greater than the chosen value. If the number of values within the set is odd, the median value corresponds to a single value. If the number of values within the set is even, the median value corresponds to the sum of the two middle values divided by two.

median price formula (n)~ A formula that calculates the average of the high and low prices.

median value (n)~ The middle value in a set of ordered numbers. The median value is determined by choosing the smallest value such that at least half of the values in the set are no greater than the chosen value. If the number of values within the set is odd, the median value corresponds to a single value. If the number of values within the set is even, the median value corresponds to the sum of the two middle values divided by two.

Mediation Server (n)~ A server running Lync Server or Office Communications Server that mediates signaling and voice between the Enterprise Voice IP network and the public switched telephone network.

mediator (n)~ A process, controlled by the Process Control service, used to preserve information when the service starts and stops.

Medical (PN)~ An app category that contains apps for people interested in medical issues and information.

medical device (n)~ A medical instrument used in the diagnosis, treatment or prevention of a disease.

medical image (n)~ An image of body parts, tissues, or organs, for use in clinical diagnosis.

Medical Lookup (PN)~ A feature that allows a user to search conditions, medicines and procedures.

medical record (n)~ A chronological written record of a patient's examination and treatment, including the patient's medical history.

Meditative (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 45.

medium (adj)~ Of or relating to the middle part of a range of possible values.

medium (n)~ A substance in which signals can be transmitted, such as a wire or fiber-optic cable.

Medium (n)~ An item on the Text Size menu, which is opened from the Edit menu. Medium is one of the text size choices for the user's instant messages

medium (adj)~ Having a font weight that corresponds to a weight class value of 500 according to the OpenType specification.

medium organization (n)~ An organization with between 50-999 employees and between 25-499 personal computers.

medium tile (n)~ A square tile of 150 x 150 pixels on the Start screen.

Meet Now (n)~ An application feature that one uses to join an unscheduled meeting. It is a virtual office to which a user can invite participants for an impromptu web conference.

meeting (n)~ A calendar item that includes reserved resources and/or invited attendees.

meeting (n)~ An online gathering of people facilitated by software that allows participants to view, and optionally control, shared content and communicate with each other using various means, such as a telephone conference call.

Meeting (PN)~ An option that creates a meeting request from the selected e-mail message.

Meeting Information panel (n)~ The Live Meeting console element that displays the Web address and audio conference line (if specified) for a Live Meeting session.

meeting key (n)~ A password that is required to join a meeting.

Meeting Lobby (PN)~ A virtual waiting area where people can request access to join a meeting when they either do not have an invitation or they have been invited, but the meeting is locked.

meeting organizer (n)~ A user who can schedule meetings, send invitations, do all the sharing activities in a meeting, and admit participants from the lobby.

meeting participant (n)~ A presenter or attendee in a meeting.

meeting request (n)~ An email message that a user sends to others to invite them to a meeting.

meeting response (n)~ An e-mail reply to a meeting request that indicates whether the sender will attend the meeting.

Meeting Workspace (n)~ A Web site based on a Meeting Workspace site template that is used for planning, posting, and working together on meeting materials, and following up after a meeting or series of meetings.

Meeting Workspace site (n)~ A Web site based on a Meeting Workspace site template that is used for planning, posting, and working together on meeting materials, and following up after a meeting or series of meetings.

MEF (PN)~ A composition layer for the .NET Framework that improves the flexibility, maintainability, and testability of large applications. MEF can be used for third-party plug-in extensibility, or it can bring the benefits of a loosely coupled architecture that is similar to a plug-in to regular applications.

MEF catalog (n)~ An object that provides a collection of MEF parts from a specific source, such as a type, an assembly, or a directory, to a MEF composition container. A catalog is responsible for discovering MEF parts that a MEF composition container can make available to MEF apps.

MEF composition (n)~ The process of matching MEF imports to MEF exports, performed by the MEF composition engine.

MEF composition container (n)~ A MEF composition engine that is based on MEF catalogs and MEF part instances.

MEF composition engine (n)~ An object that resolves a MEF part's dependencies and exposes its capabilities to other MEF parts and apps through composition, that is, by binding MEF imports to MEF exports.

MEF contract (n)~ An identifier that determines how MEF imports and exports are matched. The contract consists of a name that identifies the contract and a type, which specifies the exported type. Both the contract name and the contract type can be either automatically generated or specified.

MEF export (n)~ An object that a MEF part provides to make its services available to other MEF parts.

MEF import (n)~ A dependency that a MEF part specifies and fulfills from exports provided by other MEF parts. For example, common services can be provided in a MEF part and declared as an import by other MEF parts.

MEF part (n)~ An object that is the basic building block of a MEF application. Each MEF part declares its dependencies (imports) and capabilities (exports), which are matched with the imports and exports of other MEF parts and made available to MEF apps.

megabits per second (n)~ A measurement of data transfer speed over a given connection equal to one million bits per second.

megabyte (n)~ Usually 1,048,576 bytes. It is sometimes interpreted as 1 million bytes.

Megabyte ~ Unit of measurement for pieces of information : approximately 1 million bytes or a thousand kilobytes. Often shortened to Meg or just M. See also- Gigabyte,- Kilobyte,- Byte.

megahertz (n)~ A measure of frequency equivalent to 1 million cycles per second.

MegaHertz ~ See- MHz.

Megapixel ~ A million- pixels. Often used to measure the quality of digital cameras : the higher the number the better the camera.

member (n)~ A person who is part of a group.

member (n)~ An individual who is an authorized user of a Live Meeting account. Associated information includes user login and user role.

member (n)~ A single position or item in a dimension. Dimension members can be user-defined or predefined and can have properties associated with them.

member (n)~ In Distributed File System (DFS) Replication, a server that belongs to a replication group.

member (n)~ An individual Active Directory user account or an Active Directory group that is assigned to one or more user roles. A user role can consist of one or more members.

member association (n)~ A relationship between a source dimension member and a destination dimension member. One or more of these can exist for each dimension association.

Member Count (n)~ Number of members (accounts, leads, or contacts) that are included in a marketing list.

member database (n)~ In a hub-spoke topology, a database that is joined to other databases by a hub database at a central location.

member delegation (n)~ A modeling concept that describes how interface members are mapped from one interface to another.

member expression (n)~ A valid Multidimensional Expressions (MDX) expression that returns a member.

member property (n)~ A characteristic of a dimension member. Dimension member properties can be alphanumeric, Boolean, or Date/Time data types, and can be user-defined or predefined.

member query (n)~ The part of a fan-out query that is sent over to all members involved in the query.

member server (n)~ A server that is joined to a domain but is not a domain controller. Member servers typically function as file servers, application servers, database servers, Web servers, certificate servers, firewalls, or remote access servers.

member set (n)~ A collection of members from a dimension.

member view (n)~ A hierarchy of dimension members that is organized according to member properties.

membership (n)~ In ASP.NET, an application feature that manages a store of user credentials for a Web site. Membership can be integrated with login controls or other ASP.NET authentication features to provide login security for your site.

membership (n)~ A relationship of being a member of an organization, such as a gym or club.

membership in a group (n)~ A user's status as a member of a group.

membership provider (n)~ A server control that allows you to store and manage membership information.

membership rule (n)~ The criteria by which Configuration Manager evaluates whether a resource belongs to a particular collection.

membership user (n)~ An authenticated user of a Web site.

Memo (n)~ A field data type that can contain up to 65,535 characters.

memo (n)~ A type of column that contains long strings, typically more than 255 characters.

memory (n)~ Any temporary storage space used within or in conjunction with a computer, such as RAM or a USB flash drive.

memory (n)~ The amount of memory physically installed on your device (as opposed to on a storage card.)

Memory ~ Also known as- RAM. Where the computer holds whatever you are currently working on. The contents of memory are lost when the computer is switched off.

memory address (n)~ A portion of computer memory that can be allocated to a device or used by a program or the operating system. Devices are usually allocated a range of memory addresses.

memory allocation (n)~ In operating systems, the process of reserving memory for use by a program.

memory broker (n)~ A software component that manages the distribution of memory resources in SQL Server.

memory card (n)~ In a server cluster, a resource that can act as the cluster's quorum resource. To be quorum-capable, a resource must provide shared storage and a means of persistent arbitration. The cluster service defines only physical disk resources as quorum-capable.

memory clerk (n)~ A memory management component that allocates memory.

memory consumer (n)~ An entity or process that uses memory.

Memory Intensive Batch Instances (PN)~ The service type of the Batch service for batches that require large amounts of memory.

memory key (n)~ A small device used to store information. USB flash drives plug into computer USB ports so you can copy information to or from them, making it easy to share and transport information.

memory leak (n)~ A condition that occurs when an application allocates memory for use but does not free allocated memory when finished.

memory map (n)~ A representation of the layout of objects in an area of memory.

memory page (n)~ In virtual memory systems, a unit of data storage that is brought into random access memory (RAM), typically from a hard drive, when a requested item of data is not already in RAM.

memory pressure (n)~ The demand placed on the memory subsystem by an application.

memory requirement (n)~ A minimum memory configuration of a computer, its components or other devices (typically relates to size of RAM, free space on hard disk, etc.) needed to run within or in conjunction with a computer.

Memory Usage (n)~ In Task Manager, the current working set of a process, in kilobytes. The current working set is the number of pages currently resident in memory.

Memory Usage Delta (n)~ In Task Manager, the change in memory, in kilobytes, used since the last update.

memory-optimized (adj)~ Pertaining to table and index structures that are optimized for in-memory access.

memory-resident (adj)~ Permanently located in a computer's memory, rather than swapped in and out of memory as needed.

meningococcal conjugate vaccine (n)~ A vaccine for immunization against infections caused by meningococcal bacteria.

meningococcal polysaccharide vaccine (n)~ A vaccine for immunization against infection by certain groups of meningococcal bacteria that cause meningococcal disease.

mention (n)~ Part of a post that refers to a Microsoft Dynamics CRM record.

menu (n)~ A list of options from which a user can choose. The options can be represented as text or graphics. A menu can contain other menus (submenus).

menu bar (n)~ A rectangular bar displayed in an application program's on-screen window, often at the top, from which menus can be selected by the user. Names of available menus are displayed in the menu bar; choosing one with the keyboard or with a mouse causes the list of options in that menu to be displayed.

menu bar macro (n)~ A macro containing AddMenu actions that you can use to create a custom menu bar or shortcut menu.

menu button (n)~ A command button that is clicked to display a drop-down menu instead of performing a command.

menu command (n)~ A choice on a menu.

menu flyout (n)~ A flyout that contains a contextual list of menu items.

menu flyout control (n)~ A control that developers use to create a menu flyout.

menu item (n)~ A choice on a menu, selectable by either the keyboard or a mouse. In some instances, a menu item that is not available (that is, not appropriate) for a given situation is grayed' (dimmed in comparison to the valid menu choices).'

menu label (n)~ A text or graphic label that describes a particular menu. For drop-down menus, the label is the entry in the menu bar; for cascading menus, the menu label is the name of its parent menu command.

menu macro (n)~ A macro group that contains the macros for the menu's commands.

menu option (n)~ A choice on a menu, selectable by either the keyboard or a mouse. In some instances, a menu item that is not available (that is, not appropriate) for a given situation is grayed' (dimmed in comparison to the valid menu choices).'

menu separator (n)~ A special type of menu item that appears as a dividing bar between two active menu items.

menu separator bar (n)~ A special type of menu item that appears as a dividing bar between two active menu items.

menu title (n)~ The menu name that is displayed in the menu bar.

MercadoPago (PN)~ An eCommerce payment and escrow service available in a number of Latin American countries/regions.

merchant (n)~ A partner in scenarios where the partner providing the offer is different than the partner providing the service, for example, Xbox selling Messenger products.

merchant (n)~ A business or organization that has provided a coupon that can be used at their store.

Merengue (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 142.

merge (v)~ To copy the contents of a differencing disk to the parent disk, or to combine the contents of the differencing disk and the parent disk onto a new virtual hard disk. Merging to the parent disk modifies the parent disk and then deletes the differencing disk. Merging to a new disk leaves both the differencing disk and the parent disk intact.

merge (n)~ The process of combining the changes in two distinct branches. A merge operation takes changes that have occurred in the source branch and integrates them into the target branch. Merging integrates all types of changes in the source branch including name changes, file edits, file additions, and file deletions.

merge (v)~ Replace a set of subscriptions with a new subscription.

Merge a Conversation (PN)~ The heading, in the Invite menu, for the list of available conversations that a user can bring into the current conversation.

merge a conversation (v)~ To bring a separate conversation, including all its participants, into the current one.

merge calls (PN)~ A button that appears during an active phone call, allowing the user to go back to the previous on-hold call(s) and combine all active calls for a conference call.

Merge Cases (PN)~ An option on the command bar where you can select cases, and then specify which case will be the case that the other selected cases will merge into.

merge field (n)~ A placeholder for text or pictures that you insert into your document.

merge module (n)~ A module that packages components together with any related files, resources, registry entries, and setup logic. Merge modules can be used to install components that multiple applications share. Merge modules cannot be installed directly; they must be merged into deployment projects.

merge operation (n)~ The process of combining the changes in two distinct branches of a source-controlled database.

merge replication (n)~ A type of replication that allows sites to make autonomous changes to replicated data, and at a later time, merge changes and resolve conflicts when necessary.

Merge Shapes (PN)~ A tool that enables users to create custom shapes by combining multiple shapes into a single shape, using one of five geometric Boolean operations: Union, Combine, Fragment, Intersect, and Subtract.

merged cell (n)~ A single cell that is created by combining two or more selected cells. The cell reference for a merged cell is the upper-left cell in the original selected range.

merger (n)~ The combination of two or more companies into one, where the corporate identity of one then serves for the new single company.

mesh (n)~ An object whose surface contains faces, each of which is described by a simple polygon.

mesh network ~ each of the nodes are joined together by telecom 'lines' — wireless or wired.

message (n)~ An individual unit of data transported between endpoint locations. A message consists of a document plus a header (information about the transfer).

message (n)~ An electronic instance of one-to-many schemas. Usually documents are sent between two processes.

message (n)~ A message that is sent over a communications network such as a local area network or the Internet.

Message Authentication Code (n)~ An algorithm that allows a receiver to ensure that a block of data has retained its integrity from the time it was sent until the time it was received.

message bar (n)~ A user-interface element that contains information about actions that you recently performed in a list. You can double click on the message bar to get more information about a specific action that you performed.

Message Bar (PN)~ A yellow bar with a warning icon appearing below the ribbon that provides information or alerts the user. Information can be security alerts, errors, or notifications.

message body (n)~ The content that is delivered in an e-mail message.

Message Center (PN)~ The area in Social Engagement where users manage alerts and see an overview of the emails and notifications that the application sends to them.

message class (n)~ Used by Microsoft Exchange to identify, locate, and open a form.

Message Details view (n)~ In the Health and Activity Tracking (HAT) tool a detailed view of all known information for a given message in the Message Box. This view is available through the shortcut menu in the PivotTable field list in one of two Operations views.

message dialog (n)~ A new Windows user interface surface used to elicit an immediate response from the user. Until the user responds, the screen behind the dialog is dimmed and touch events are blocked from passing to the app's canvas.

message digest (n)~ A fixed-size result that is obtained by applying a one-way mathematical function (sometimes called a hash algorithm) to an arbitrary amount of data. If there is a change in the input data, the hash changes. The hash can be used in many operations, including authentication and digital signing.

message disposition notification (n)~ A request for disposition information from a recipient after a message has been successfully delivered. The information might include whether the message was displayed, printed, or deleted without display, or if a recipient refused to send notification.

message envelope (n)~ The information contained in an e-mail message that is required to send and deliver a message between messaging servers by using SMTP protocol commands. The message envelope contains the sender e-mail address and the recipient e-mail address information. Recipients never see the message envelope, because it is not part of the message content, and it is discarded when the message reaches its destination. The X.400 messaging standard equivalent to the message envelope is called the P1 header.' The message envelope is often referred to as the 'P1 header."

Message Facts cube (n)~ An online analytical processing (OLAP) cube that aggregates information about messages and services. Two cubes included out of the box are: Message Facts and Service Facts.

message flow (n)~ A series of contiguous processing steps through which one or more messages flow.

Message Flow view (n)~ A view in the Health and Activity Tracking tool that displays a history of processing events for specific messages.

message handler (n)~ A Component Object Model (COM) object that implements the ITranslate interface in an in-process COM object.

message header (n)~ A hidden section of an e-mail message. From the time a message is first created, information about it is added to the message header, including technical details, such as who created the message and the software used to compose it.

message history (n)~ A list of messages that you have sent or received.

message item (n)~ An implementation of the Internet Message Format defined by RFC2822. A message item is stored in the Exchange store.

message journaling (n)~ The ability to record all communications, including e-mail communications, in an organization for use in the organization's e-mail retention or archival strategy.

message label (n)~ An arrow label that indicates the message sent, its arguments and return values, and the sequencing of the message within the larger interaction (including call nesting, iteration, branching, concurrency, and synchronization).

Message Layer Security (n)~ A cryptographic protocol that provides domain-to-domain secure transmission of SMTP messages on the Internet by using cryptography. The protocol enables SMTP servers to communicate directly or by using an SMTP relay over the Internet in a manner designed to prevent eavesdropping, tampering, and message forgery.

message line (n)~ The part of the Information bar that displays security-related information to the user. In Internet Explorer, the message line may be clicked to unblock certain content.

message list (n)~ The middle part of the main Outlook window that displays the contents of the selected folder.

message number (n)~ A number that identifies a SQL Server error message.

message operation (n)~ An action carried out on a message.

Message Operations (in 10,000s) (PN)~ The unit of measure for operations performed on messages.

Message Policy (n)~ A set of rules that are applied to e-mail messages. These rules govern how messages are processed and stored, based on a set of requirements. The requirements are typically based on regulatory requirements for an industry or geographic region.

Message Queuing (n)~ A Microsoft technology that enables applications running at different times to communicate across heterogeneous networks and systems that may be temporarily offline.

message rule (n)~ A set of criteria for updating a project file with the information in Project Server workgroup messages. For example, project managers can specify that updates from all workgroup members be automatically accepted.

message sink (n)~ A callback function that receives messages for a form or a control. Forms or controls that need to be notified of messages implement a message sink.

message subject (n)~ Text indicating the topic of an instant message or an alert. It is entered by the user or generated by the computer based on conversation information. It is displayed in the title bar.

Message Trace (PN)~ A feature that enables you to search for a specific message using basic information, such as the sender, recipient, date, and message ID, to obtain the status of that message.

message trailer (n)~ In EDI, a part of the message used to indicate the end of a document, which is a bundle of logically combined segments containing information about one transaction. In ANSI X.12, a message is equivalent to a transaction set.

message transfer agent (n)~ An application process, as described in the X.400 message-handling system, responsible for delivering e-mail messages. After receiving a message, an MTA stores it temporarily and either delivers it or forwards it to another MTA. During this process, the MTA can change the message headers.

message transfer envelope (n)~ A MAPI message that holds the delivery information for a message.

message transfer system (n)~ The X.400 term for a messaging system, which is a product that enables electronic communication over a network.

message type (n)~ A definition of a Service Broker message. The message type specifies the name of the message and the type of validation Service Broker performs on incoming messages of that type.

message validation (n)~ The process of validating a message for format, range, type, and length, by using a schema, as a way to detect malicious messages.

message window (n)~ A window which displays a particular message for the user.

Message/Partial (n)~ An option on the Policy Filter page that blocks messages that use

special header information to split e-mails into several messages, which could be used to send viruses.

MessageBox node (n)~ In the BizTalk Administration console, the node used to view a list of the currently running MessageBox databases.

message-only window (n)~ A window that dispatches messages. Message-only windows are not visible, have no z-order, cannot be enumerated, and do not receive broadcast messages.

Messages (in 10,000s) (PN)~ The unit of measure for the Microsoft Azure Service Bus messaging infrastructure.

Messages pane (n)~ One of the tabs that hosts the messages returned from SQL Server after a TSQL query has been executed.

messaging (n)~ The use of computers and data communication equipment to convey messages from one person to another, as by e-mail, voice mail, or fax.

Messaging (PN)~ An app that facilitates SMS and instant messaging.

Messaging Application Programming Interface (n)~ A messaging architecture that enables multiple applications to interact with multiple messaging systems across a variety of hardware platforms. MAPI is built on the Component Object Model (COM) foundation.

messaging records management (n)~ Records management technology in Exchange 2007 that helps organizations to reduce the risks that are associated with e-mail and other communications. MRM makes it easier to keep messages that are needed to comply with company policy, government regulations, or legal needs, and to remove content that has no legal or business value.

Messaging Server (PN)~ The server that provides messaging capabilities and manages network services for Windows Essential Business Server.

Messenger (PN)~ An instant messaging and video chat service designed for a consumer audience (not for the enterprise). Messenger is available via a desktop app, on the web (no installation needed), and on mobile devices.

Messenger service (n)~ A service that sends and receives messages sent by administrators or by the Alerter service.

Messenger social (PN)~ The UI label for the social activity stream that Windows Live programmatically displays in a collection. Items listed may originate within a Windows Live program, service, or landing page (Messenger, OneDrive, Windows Live Photos), or in third-party activities people connect to their profiles, such as Facebook.

MEST (n)~ The ability for an entity type to be defined in more than one entity set.

meta ~ In computer science, meta is a common prefix that means 'about'. As an example, metadata is data that describes other data (data about data). A metalanguage is a language used to describe other languages. A metafile is a file that contains other files.

meta ~ The HTML META tag is used to describe the contents of a Web page.

META tag (n)~ An HTML tag that appears in the HEAD portion of the Web page. META tags supply information about a page but do not affect its appearance. A standard META tag generator' is used to indicate the content of a Web page.'

metabase (n)~ A hierarchical store of configuration information and schema that is used to configure IIS. The metabase performs some of the same functions as the system registry, but it uses less disk space. In physical terms, the metabase is a combination of the

MetaBase.xml and MBSchema.xml files and the in-memory metabase.

metabase configuration file (n)~ A file that stores IIS configuration settings to disk. This file is named MetaBase.xml by default. When IIS is started or restarted, the configuration settings are read from MetaBase.xml into the IIS cache in memory, which is called the in-memory metabase.

metabase schema (n)~ The master configuration file (MBSchema.xml) supplied with IIS that contains all of the predefined properties from which metabase entries are derived.

metaclass (n)~ In a static structure diagram, a class whose instances are classes. It is shown in UML notation as a class with the stereotype metaclass.

metadata (n)~ Information about the properties or structure of data that is not part of the values the data contains.

metadata (n)~ Information that describes every element managed by the common language runtime: an assembly, loadable file, type, method, and so on. This can include information required for debugging and garbage collection, as well as security attributes, marshaling data, extended class and member definitions, version binding, and other information required by the runtime.

Metadata ~ Information about a web page hidden inside it to help search engines find it. It often includes a description of the page which will be picked up by search engines.

metadata cache (n)~ A file-based cache maintained on the client computer for the purpose of storing metadata for the end-user applications.

Metadata Cache Manager (n)~ An administrative tool included in Duet Settings Manager. This tool can be used to manage the metadata cache maintained on the Duet client computer.

metadata database (n)~ A relational database used for maintaining metadata for download by client components.

metadata package (n)~ A .cab file that can only have one locale support and that provides all the hardware display components in order for your device information to be shown in the Control Panel.

metadata publisher (n)~ The entity that writes or copies metadata files into the metadata database.

metadata publishing (n)~ The act of writing or copying metadata files into the metadata database.

metadata scope (n)~ A namespace that defines the operations, schemas, and entities for a service.

Metadata Service (n)~ A Duet server component that facilitates the transfer of application metadata from the SAP system to the Duet client computer.

metadata service provider (n)~ A Web service that facilitates publishing of metadata into the metadata database and updating of the same later on.

Metadata Store (PN)~ The collection of XML files, stored in the Business Data Connectivity Service, that contain definitions of models, external content types, and external data sources.

metadata workspace (n)~ A class that represents the metadata runtime service component that provides support for retrieving metadata.

MetadataExchange (PN)~ A protocol to help automatically identify the details of the

web-service being called.

metafile (n)~ A file that stores an image as graphical objects (lines, circles, polygons) rather than as pixels. Metafiles preserve an image more accurately than pixels when the image is resized.

Metal (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 9.

metamodel (n)~ A CIM component that describes the entities and relationships representing managed objects.

metaverse (n)~ The data store that is used by ILM to contain the aggregated identity information from multiple connected data sources, providing a single global, integrated view of all combined objects.

metaverse entry (n)~ An Identity Lifecycle Manager (ILM) 2007 object that has been projected into the metaverse from a connector space object and is linked to at least one object in the connector space. A metaverse entry represents the aggregated view of objects from one or several connected data sources.

meter (v)~ To measure and record usage.

metered connection (n)~ An Internet connection created using a metered data plan.

metered data plan (n)~ A mobile broadband or other network or data plan that bills according to data use, such as megabytes downloaded, messages sent, or webpages viewed.

metered Internet connection (n)~ An Internet connection created using a metered data plan.

metered network (n)~ A mobile broadband or other network for which the provider bills according to data used, such as megabytes downloaded, messages sent, or webpages viewed.

metering (n)~ In photography, the process of measuring the light in a scene to automatically adjust the exposure setting.

metering aggregation service (n)~ A service that collects and processes metering data.

method (n)~ In object-oriented programming, a named code block that performs a task when called.

method of contact (n)~ The preferred method of communication with the Business Contact; for example, phone, e-mail message, letter, fax, and so on.

method-based query (n)~ A query expressed as a direct method call to one or more Standard Query Operators.

methodology template (n)~ A template that makes it possible to define and encapsulate all of the data regarding a team project. Team Foundation Server uses the methodology information to automatically configure a new team project, including creating the team project Web site.

metric (n)~ A number used to indicate the cost of a route in the Internet Protocol (IP) routing table that enables the selection of the best route among possible multiple routes to the same destination.

metric (n)~ A single value that an assessment collects. Metrics can be defined by data type, unit, name, description, and other metadata.

Metrics (n)~ A Web part that uses the cue control to display record counts. The record counts are determined by a predefined query and can be linked to an existing form.
metrics (oth)~ The statistics that help analyze both an application's load and its ability to respond to it.
Metrics Explorer (n)~ A a detailed view of the measured values and counts of events that are sent in telemetry from an Azure application to help detect performance issues and watch trends in how the application is being used.
MEX (PN)~ A protocol to help automatically identify the details of the web-service being called.
MFA (n)~ The service that provides additional layers of authentication for on-premises and cloud applications. Multi-Factor Authentication verifies user sign-ins and transactions using a phone call, text message, and mobile app.
MFC (PN)~ A C++ class library developed by Microsoft. The Microsoft Foundation Class library, or MFC, provides the framework and classes that make it easier and faster for programmers to build Windows applications. MFC supports ActiveX and is bundled with several C++ compilers, including Microsoft Visual C++, Borland C++, and Symantec C++.
MFC Smart Device DLL Wizard (n)~ A wizard in Smart Device Development. It is used to create an MFC DLL project. The users get a working starter application that has built-in functionality that, when it is compiled, will implement the basic features of a DLL.
MFD (n)~ A piece of hardware that supports multiple discrete capabilities, such as audio, mixer, and music, on a single card. This device is sometimes treated as a bus that can be enumerated to locate the devices on that bus.
MFD ~ (Multi Function Device). A combined printer, scanner, photocopier and fax machine.
MFLOPS (n)~ A measure of computing speed.
MFT (n)~ An NTFS system file on NTFS-formatted volumes that contains information about each file and folder on the volume. The MFT is the first file on an NTFS volume.
MFU list (n)~ A list of applications that the end user has recently used or uses frequently.
MHTML (n)~ A standard method for sending an HTML document encapsulated with inline graphics, applets, linked documents, and other items referred to in the HTML document.
MHz ~ (Megahertz). Millions of cycles per second. Most often used as a measurement of a PC processor chip's speed and power, with bigger numbers meaning more speed and a higher price. See alsoGHz.
MIC (PN)~ A mechanism for controlling access to securable objects based on integrity levels and mandatory policy in addition to discretionary access control. For example, a process may be required to have an integrity level that is equal to or higher than the integrity level of an object to obtain certain kinds of access to that object.
mickey (n)~ The amount that a mouse has to move for the mouse to report that it has moved.
MICR (n)~ A character recognition system for reading and processing data that uses special inks and characters.
MICR line (n)~ A line of characters that is encoded with a special type of ink that can be

magnetized and then translated into characters. MICR lines are used on bank checks to identify the bank, account, and check.

Micro ~ (Microcomputer)- When desktop computers first appeared in the 1970's, they were often called microcomputers, later shortened to micro, to distinguish them from the so-called minicomputers of the day, which far from sitting on a desk were a good deal bigger than it! There was also a popular early home computer in the UK called the BBC Micro, now long obsolete.

Micro Channel Architecture (n)~ The design of the bus in IBM PS/2 computers (except Models 25 and 30). The Micro Channel is electrically and physically incompatible with the IBM PC/AT bus. Unlike the PC/AT bus, the Micro Channel functions as either a 16-bit or a 32-bit bus. The Micro Channel also can be driven independently by multiple bus master processors.

micro server ~ may also be written as microserver or MicroServerm, small server appliance that works like a server. Micro servers are off-the-shelf appliances that are designed for ease of installation and maintenance.

microblogging (n)~ A form of blogging that emphasizes brief posts.

Microblogging ~ a narrow-scope mode of social communication pioneered by the social network siteTwitter.com- and followed by similar services from- Plurk,- Yammer,- Socialcast- and- Identi.ca.

microcomputer (n)~ A computer built around a single-chip microprocessor. Less powerful than minicomputers and mainframes, microcomputers have nevertheless evolved into very powerful machines capable of complex tasks. Technology has progressed so quickly that state-of-the-art microcomputers—essentially, in today's terms, a desktop PC —are as powerful as mainframe computers of only a few years ago, at a fraction of the cost.

microdots (n)~ Small translucent elastomeric dots or beads on the inside surface of the diffuser. Microdots help maintain a consistent air gap between the diffuser and an optical-grade Plexiglas panel (which provides rigidity and mechanical support for the diffuser).

Micro-filter ~ A device which allows you to use an ordinary phone over a telephone line set up for an- ADSL- internet connection. Sometimes just called a filter.

micropayments ~ Electronic payment for information or services ranging from a few cents to a tenth of a cent.

micropayments ~

microphone (n)~ A device that converts sound waves into analog electrical signals. Additional hardware can convert the microphone's output into digital data that a computer can process; for example, to record multimedia documents or analyze the sound signal.

microphone noise (n)~ Unwanted sound that is captured when objects touch a microphone inadvertently.

Microphone Wizard (n)~ A tool that you can use to fine-tune your microphone.

microprocessor (n)~ The computational and control unit of a computer. The CPU is the device that interprets and executes instructions. Mainframes and early minicomputers contained circuit boards full of integrated circuits that implemented the CPU. Single-chip central processing units, called microprocessors, made possible personal computers and workstations.

Microsoft (PN)~ The public multinational corporation that develops, manufactures, licenses, and supports a wide range of products and services predominantly related to computing.

Microsoft ~ The largest business software provider for desktop PCs and laptops, and the only major operating system provider apart from Apple, they created Windows, Microsoft Office (which includes Word, Excel, Access and Powerpoint), Internet Explorer, Outlook and many other widely used programs. They are belatedly moving into the tablet and phone markets too, but they are way behind in these markets, and their first attempt to create a unified Windows for all devices, Windows 8, was a bit of a disaster.

Middle East/Africa (PN)~ The geographic location, covering the Middle East and Africa, within the Azure region taxonomy in Zone 2.

middle tier (n)~ The logical layer between a user interface or Web client and the database. This is typically where the Web server resides and where business objects are instantiated.

middleware (n)~ Software that sits between two or more types of software and translates information between them. Middleware can cover a broad spectrum of software and generally sits between an application and an operating system, a network operating system, or a database management system.

Middleware ~ Middleware is software that allows elements of applications to interoperate across networks links, despite differences in underlying communications protocols, system architectures, operating systems, and databases and other application services.

MIDI (n)~ A specification of the MIDI Manufacturers Association (MMA). The specification defines a protocol for describing music data, such as note on and note off messages; a file format for storing music data, called Standard MIDI; and a standard hardware interface.

MIDI ~ (Musical Instrument Digital Interface; pr. 'middy') A very popular standard for controlling musical instruments connected to computers.- A MIDI file is a list of instructions to play particular notes at particular intervals in particular styles, not a sound recording.

MIDL (PN)~ Microsoft implementation and extension of the Interface Definition Language (IDL).

midmarket (n)~ A business with revenues between US$ $5 million and $3 billion per year.

midpoint (n)~ A handle that appears in the middle of a selected line, arc, or other one-dimensional (1-D) shape.

midpoint (n)~ The reference point that is midway between a range minimum and maximum in a graded compensation plan. It represents the intended average pay for all employees at a certain compensation level.

midtone (n)~ A tone in a picture that is in the middle of the tonal range, between the lightest and darkest tones

MIF file (n)~ A file that can be used to modify the SMS/Configuration Manager database by creating architectures, object classes, and attributes.

migrate (v)~ To move files or data from one software product, format, or protocol, to another.

migration (n)~ The process of moving a deployed virtual machine from its current virtual

machine host to another host.

migration (n)~ The process of taking structural metadata and data from one deployment to another deployment.

migration (n)~ The process of making existing applications and data work on a different computer or operating system.

migration batch (n)~ A collection of user accounts that are being submitted in a CSV file for migration from an on-premises messaging system to an e-mail system in the cloud.

migration batch request (n)~ The action of submitting a migration batch for migration from an on-premises messaging system to an e-mail system in the cloud.

Migration Endpoint (PN)~ A management object that contains the connection settings and administrator credentials for the source server that hosts the mailboxes that you want to migrate to Exchange Online.

migration mode (n)~ A mode in SharePoint Online that defines whether file metadata is allowed to be edited after migration. When migration mode is enabled, the site collection administrator can edit the audit-specific metadata (created by, created date, modified by and modified date) for the migrated files.

mike (n)~ A device that converts sound waves into analog electrical signals. Additional hardware can convert the microphone's output into digital data that a computer can process; for example, to record multimedia documents or analyze the sound signal.

Mild Language (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Mild Lyrics (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Mild Violence (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

mileage engine (n)~ An engine that determines the mileage that freight will travel between its origin and destination points, and calculates the shipping rate for the freight accordingly.

milestone (n)~ A point on the project schedule at which the project team assesses progress and quality, and reviews deviations in scope and specifications. A project may have many interim milestones for internal use only, which signal a transition within a phase and help divide large projects into workable pieces. External milestones or major milestones typically occur at the end of major phases of work and are associated with the completion of major deliverables. External milestones are the points where the team and customer review work to date and agree to proceed with the project, appear as a task with a duration of zero work units, and are exposed on customer reports.

milestone billing (n)~ A method of requesting payment when predefined milestones are reached.

milk run (n)~ A freight delivery route that entails two or more stops, where the carrier delivers loads either from a single supplier to multiple buyers or from multiple suppliers to a single buyer.

millions of instructions per second (n)~ A common measure of processor speed.

millisecond (n)~ One thousandth of a second.

MIM (PN)~ V next for FIM - added functionality and PAM feature for Identity

Management customers

MIM CM (PN)~ A MIM service component for providing support to certificate and smart card managemen and credential management to both Windows Server and 3rd party certification authorities (CAs).

MIME (n)~ A common method for transmitting non-text data through Internet e-mail. MIME encodes non-text data as ASCII text and then decodes it back to its original format at the receiving end. A MIME header is added to the file which includes the type of data contained and the encoding method used.

MIME ~ (Multipurpose Internet Mail Extension; pr. 'mime') An encoding system used in- email, mainly for sending attachments. Email was originally designed to just use plain text, so programs, graphics etc have to be sort of disguised as text for email systems to be able to handle them. MIME is more powerful than its predecessor, UUENCODE (pr. you-you-encode), but not all systems accept it.

MIME mapping (n)~ A method of configuring browsers to view files that are in multiple formats. An extension of the Internet mail protocol that enables the sending of 8-bit-based e-mail messages, which are used to support extended character sets, voice mail, facsimile images, and so on.

min/max method (n)~ An item replenishment policy used in the master scheduling calculation.

Mini toolbar (n)~ A set of UI controls that appear in context when an object is selected and contain actions that act upon the object.

Mini Toolbar (PN)~ A menu that contains the most commonly used contextual commands such as Cut, Copy, Paste, Comment, and Proofing.

Mini Translator (PN)~ A feature that displays a definition or translation of a word or piece of text in a ScreenTip when the pointer is moved over the selection.

minidriver (n)~ A relatively small, simple driver or file that contains additional instructions needed by a specific hardware device to interface with the universal driver for a class of devices.

minidump (n)~ Small files that contain a useful subset of the information contained in a crash dump file, so that they can be easily sent over the Internet to technical support.

MinIE (PN)~ The new default mode in Internet Explorer that enables more web content to be visible and reduces the visible controls in the top-level frame.

MinIE Frame (PN)~ The new default mode in Internet Explorer that enables more web content to be visible and reduces the visible controls in the top-level frame.

minification (n)~ The compression of files (typically JavaScript, CSS) by removing white space, comments and other compression methods to reduce download size.

minifilter driver (n)~ A driver used by anti-malware software, backup agents, and encryption products to intercept requests that are targeted at a file system, or another file system driver, before the request reaches its intended destination.

mini-frame (n)~ A floating window that contains a pane.

mini-frame window (n)~ A floating window that contains a pane.

minimize (v)~ To reduce a window to a button on the taskbar by clicking the Minimize button (leftmost button on the right side of the title bar) or by pressing ALT+SPACEBAR and then pressing N.

minimize button (n)~ In Windows 3.x, Windows 9x, Windows NT, and Windows 2000, a button in the upper right-hand corner of a window that when clicked hides the window. In Windows 3.x and Windows NT 3.5 and earlier, an icon appears on the desktop that represents the window; in Windows 95, Windows NT 4, and later versions, the name of the window appears on the taskbar at the bottom of the desktop screen. When the icon or the name is clicked, the window is restored to its previous size.

minimized window (n)~ A window removed from view and replaced with a placeholder, typically a taskbar button. A minimized window has the WS_MINIMIZE style.

MiniMode (n)~ A minimized version of the Properties panel. MiniMode displays a bar of icons with each icon representing a category within the Properties panel.

minimum installation (n)~ An installation where only the necessary components are installed on a system.

minimum inventory (n)~ The minimum desired inventory level. Inventory is replenished when it reaches the minimum level so that on-hand inventory stays above the minimum.

minimum TTL (n)~ In DNS, a default Time to Live (TTL) value that is set in seconds and used with all resource records in a zone. This value is set in the start of authority (SOA) resource record for each zone. By default, the DNS server includes this value in query responses. It is used to inform recipients how long they can store and use resource records, which are provided in the query answer, before they must expire the stored records data. When TTL values are set for individual resource records, those values override the minimum TTL.

mining model (n)~ An object that contains the definition of a data mining process and the results of the training activity. For example, a data mining model may specify the input, output, algorithm, and other properties of the process and hold the information gathered during the training activity, such as a decision tree.

mining structure (n)~ A data mining object that defines the data domain from which the mining models are built.

mini-notebook (n)~ A notebook that is smaller in size and lighter in weight than a full-sized notebook, while retaining the same functionality.

Mini-Setup (n)~ A subset of GUI-mode Setup, Mini-Setup is the first-run experience on the Windows Server2003 family. Mini-Setup prompts for user-specific information, detects new hardware, and regenerates system IDs.

Mini-Setup wizard (n)~ A wizard that starts the first time a computer boots from a hard disk that has been duplicated. The wizard gathers any information that is needed for the newly duplicated hard disk.

minishell (n)~ A packet of a set of cmdlets and providers, along with a standard console host, into a single executable.

miniversion (n)~ A version of a file that a transacted writer creates during a transaction. The miniversion can be opened later in the transaction with read-only access.

minor change request (n)~ A change request that is used for low-risk and low-impact changes according to the Change Policies of your organization. Minor change requests can be approved by the change owner.

minor tick mark (n)~ A tick mark that corresponds to a minor scaling unit on an axis.-

minor version (n)~ A version that is in progress or that has changed only slightly since

the previous version.

minority interest (n)~ The percent of ownership for a shareholder who owns fewer than 50% of a company's outstanding shares.

Mint Filling Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a mint filling for their cake.

MintCream (PN)~ A property of the Brushes class in .NET Framework 4.5 that gets the solid fill color that has a hexadecimal value of #FFF5FFFA.

minus sign (n)~ The -€" character, based on the width of an uppercase N and used primarily as a connecting element, especially with numbers.

minute ventilation (n)~ The volume of gas inhaled or exhaled from a person's lungs in one minute.

minute-based (adj)~ Pertaining to a computer running FlexGo technology that meters computer usage time in increments of minutes.

MINY (n)~ A UNICODE character; mathematical symbol; minus sign.

MIPS (n)~ A common measure of processor speed.

Mirror (n)~ A credit or title animation in Windows Movie Maker.

mirror (n)~ A volume that duplicates data across two or three physical disks in a Microsoft Storage Spaces storage pool.

mirror (adj)~ Pertaining to the resiliency type for a volume that duplicates data across two or three physical disks in a Microsoft Storage Spaces storage pool.

mirror database (n)~ In a database mirroring session, the copy of the database that is normally fully synchronized with the principal database.

mirror file (n)~ A file separate from your database model diagram in which you can save the code from your model.

mirror image (n)~ An image that is an exact duplicate of the original with the exception that one dimension is reversed. For example, a right-pointing arrow and a left-pointing arrow of the same size and shape are mirror images.

mirror margins (n)~ Margins of the left page are a mirror image of those of the right page. That is, the inside margins are the same width, and the outside margins are the same width.

mirror server (n)~ In a database mirroring configuration, the server instance where the mirror database resides. The mirror server is the mirroring partner whose copy of the database is currently the mirror database. The mirror server is a hot standby server.

mirror site (n)~ A file server that contains a duplicate set of files to the set on a popular server. Mirror sites exist to spread the distribution burden over more than one server or to eliminate the need to use high-demand international circuits.

mirror site ~ A site that's identical to another. These are usually set up on different servers to handle heavy traffic on popular sites to eliminate bottlenecks. Many international sites have mirror sites in various countries to speed up access.

Mirror, Horizontal (n)~ A filter effect in Windows Movie Maker.

Mirror, Vertical (n)~ A filter effect in Windows Movie Maker.

mirrored (adj)~ Of or pertaining to data on a network that is protected by duplication on a second disk.

mirrored media set (n)~ A media set that contains two to four identical copies (mirrors)

of each media family. Restore operations require only one mirror per family, allowing a damaged media volume to be replaced by the corresponding volume from a mirror.

mirrored server (n)~ A server whose data has been duplicated either on a second hard drive or on a remote server.

mirrored volume (n)~ A fault-tolerant volume that duplicates data on two physical disks. A mirrored volume provides data redundancy by using two identical volumes, which are called mirrors, to duplicate the information contained on the volume. A mirror is always located on a different disk. If one of the physical disks fails, the data on the failed disk becomes unavailable, but the system continues to operate in the mirror on the remaining disk. You can create mirrored volumes only on dynamic disks on computers running the Windows 2000 Server or Windows Server 2003 families of operating systems. You cannot extend mirrored volumes.

mirrored-page layout (n)~ A layout in which left and right facing pages are mirror images of each other.

mirroring (n)~ Immediately reproducing every update to a read-write database (the principal database) onto a read-only mirror of that database (the mirror database) residing on a separate instance of the database engine (the mirror server). In production environments, the mirror server is on another machine. The mirror database is created by restoring a full backup of the principal database (without recovery).

mirroring ~ Replicating data on different computers or devices to provide backup or improved performance

mirroring ~ In a storage sense, 'mirroring' refers to duplicating data on multiple disk storage devices to provide backup in the event of a system failure.

mirroring ~ In an Internet sense, 'mirroring' refers to replicating the contents of a Web site at another site to minimize load on the main server, or to speed up connectivity in a specific geographic region.

miscellaneous charge (n)~ An additional charge, not related to quantity, for an item.

miscellaneous charge code (n)~ A code that represents miscellaneous charges on a transaction, such as invoice fees, freight, and insurance.

miss (n)~ A line of code that was not executed by a test.

missed call (n)~ A telephone call the user has failed to answer.

missed call notification (n)~ An e-mail message that is sent to a Unified Messaging subscriber that indicates that someone called but did not leave a message.

missed conversation (n)~ An incoming conversation that was not acknowledged by the user. Missed conversation notifications are saved and reported to the user.

missing account analysis (n)~ A feature that uses the highest and lowest values from a row definition or reporting tree definition to search for accounts or dimensions that are missing from the row definition or reporting tree definition, but that exist in the financial data.

missing event (n)~ An event that was supposed to occur within a specified time interval, but did not occur.

mission-critical (adj)~ Pertaining to information, equipment, or other assets of a business or project that are essential to the successful operation of the organization. For example, accounting data and customer records are often considered mission critical information.

miter join (n)~ The join style where the ends of two consecutive lines or paths form a sharp or a clipped corner, depending on whether the length of the miter exceeds the miter limit.

miter limit (n)~ The limit of the thickness of the join on a mitered corner. The miter limit controls how long the corner point of a miter join can get before it is automatically squared off into a bevel join.

mitigation (PN)~ The act of creating a strategy for handling a problem or set of problems that will either fix the problem or make its effects as painless as possible.

mix control (n)~ A control that allows the creator of a load test scenario to adjust the distribution of tests, browser types, and network types, expressed as percentages. You adjust the percentages by moving sliders.

mix view (n)~ A view displaying a mix of the most relevant content and shortcuts for a Live Tile.

mixed cell reference (n)~ In spreadsheets, a cell reference (the address of a cell needed to solve a formula) in which either the row or the column is relative (automatically changed when the formula is copied or moved to another cell) and the other is absolute (not changed when the formula is copied or moved).

mixed mode (n)~ An operating mode setting that allows interoperability between versions.

mixed mode (n)~ A deployment method in which a service is deployed and runs locally in the compute emulator, but the data is hosted in storage services on the Microsoft Azure platform.

mixed-value appearance (n)~ The visual display for a control which reflects a mixed set of values.

ML Studio (PN)~ A Microsoft Azure Machine Learning service that provides an environment for data scientists or emerging analytics developers to build predictive analytics models from scratch.

MLA (PN)~ A license agreement that is signed by OEMs who wish to preinstall Microsoft software on their customer systems and distribute and sublicense the preinstalled software to end users. It consists of core terms and various schedules.

MLM ~ (Multi-Level Marketing)- A scam similar to pyramid selling, once much in evidence on the internet, particularly in- spam. Despite the claims of those promoting MLM, it is of dubious legality in most jurisdictions.

MMC (n)~ A Microsoft management display framework that provides a unified view for administering multiple integrated network applications.

MMC snap-in (n)~ A program that is hosted by the Microsoft Management Console (MMC) console.

MMOG (n)~ A game conducted over the Internet in which a large number of players (hundreds or thousands) participate simultaneously.

MMORPG ~ (Massively Multiplayer Online Role-Playing Game). An online role-playing game (RPG) designed to played by thousands of players simultaneously, such as Everquest or Warcraft.

MMR (n)~ A vaccine for immunization against measles, mumps, and rubella.

MMRV (n)~ A vaccine for immunization against measles, mumps, rubella, and varicella

(chickenpox).

MMS (PN)~ A telecommunications standard that lets users send and receive messages that include rich text, images, audio, and video.

MMS APN (n)~ The APN (Access Point Name) a phone can use to send MMS messages (text messages with multimedia files attached).

MMS protocol (n)~ A Microsoft protocol that enables content to be streamed over the Internet or an intranet as a unicast stream.

MMSC (n)~ A server that stores MMS message content sent from phones on a mobile operator's network.

mnemonic (n)~ A word, rhyme, or other memory aid used to associate a complex or lengthy set of information with something that is simple and easy to remember. Mnemonics are widely used in computing. Programming languages other than machine language, for example, are known as symbolic languages because they use short mnemonics, such as ADD (for addition) and def (for define) to represent instructions and operations. Similarly, operating systems and applications based on typed commands use mnemonics to represent instructions to the program. MSDOS, for example, uses dir (for directory) to request a list of files.

mnemonic (n)~ A single key, used in combination with CTRL, ALT, or SHIFT keys, that activates a menu command in an open menu. The mnemonic is shown as an underlined letter in each menu item.

m-node (n)~ A NetBIOS node type that uses a mix of b-node and p-node communications to register and resolve NetBIOS names. M-node first uses broadcast resolution; then, if necessary, it uses a server query.

Mobile (n)~ An item that appears on the Forwarding Calls To menu. When the user selects Mobile, Communicator automatically forwards incoming calls to the number the user has published for his mobile phone.

Mobile (adj)~ A field that contains a contact's mobile phone number.

Mobile (PN)~ The link to the Windows Live site where users can register their mobile phone and find information about the Windows Live for Mobile services.

Mobile Access for Windows SharePoint Services (n)~ A feature that enables mobile devices, such as cellular phones, to access some SharePoint services.

mobile address (n)~ An email address that's attached to a mobile phone by a mobile provider and used for messaging transmitted over an email service.

mobile app (n)~ An Internet application that runs on smartphones and other portable devices.

mobile app bar (n)~ The workspace along the bottom edge of the screen that enables the user to access Office 365 services or sign out.

mobile application management (n)~ Software and services responsible for provisioning and controlling access to internally developed and commercially available mobile apps used in business settings on both company-provided and -€œbring your own-€? smartphones and tablet computers.

Mobile Application Stores ~ offer downloadable applications to mobile users, mostly consumers, via a storefront that is either embedded in the mobile handset or found on the fixed or mobile Web.

Mobile Apps (n)~ A feature of App Service that allows developers to create mobile apps that engage employees, partners, and customers on any device at any time.

mobile browser (n)~ A web browser designed for use on a mobile phone or device.

mobile code (n)~ Any code placed on a central server that is meant to be downloaded and run by multiple clients. Mobile code can be distributed using Web servers, FTP servers, file shares, and so on. Typically, users run mobile code from the intranet and Internet zones.

mobile computing device (n)~ A mobile device such as PDA, Pocket PC, smartphone that support mobile computing.

mobile controls (n)~ Controls for building mobile Web applications.

mobile credentials (n)~ A mobile phone number and PIN. Adding mobile credentials to an account makes it easier for the account holder to sign in on their mobile device.

Mobile Deployment Manager (n)~ A tool you use to create a deployment package for each mobile device that must be configured. You choose which installation items to include in the deployment package for each device, and specify the method of transferring the deployment package to the device, either ActiveSync or copying the package onto an external storage card. This tool is installed as part of Microsoft CRM Mobile server-side setup, and can also be installed as a stand-alone tool on any computer running Microsoft Windows XP.

Mobile Deployment Package Manager (n)~ A set of CRM Mobile server components that are used to synchronize data between mobile devices and the Microsoft CRM server.

mobile device (n)~ A piece of handheld equipment such as a portable music or video player, PDA (personal digital assistant), mobile phone, or Windows Mobile device that works on its own but can also connect to a computer. Many of these devices can sync information with Windows.

mobile device (n)~ A piece of handheld equipment such as a portable music or video player, PDA (personal digital assistant), mobile phone, or warehouse device that works on its own but can also be connected to a computer. Many of these devices can sync information with Windows. Warehouse mobile devices use barcode technology to process inventory operations.

mobile device management (n)~ Software that secures, monitors, manages, and supports mobile devices deployed across mobile operators, service providers, and enterprises.

mobile emulators save state (n)~ The file containing the operating system image and the memory state, configurations, shared folders and so on to represent the complete state of the emulator at the time that it simulates a suspend-to-RAM operation.

mobile hotspot (n)~ A device that shares its Internet connection with other Wi-Fi-enabled devices.

Mobile Link (PN)~ A feature that enables users to easily discover and use their cell phone's data capabilities to connect their laptop to the Internet.

mobile messaging (n)~ A feature that enables a customer to send a text message to any contact who uses a supported mobile device.

mobile operator (n)~ A company that provides telephone and other communications services to consumers.

mobile operator app (n)~ A privileged app that enables a mobile operator to build an

account experience that links their SIM to the Connection Manager under Mobile Broadband connections.

mobile PC (n)~ A portable computer that runs a full version of Windows.

Mobile PCI Express Module (n)~ An industry standard connector used in mobile platforms for attaching peripherals to the PCI bus.

Mobile Phone (PN)~ A button in the Options dialog box, on the Phones tab, that the user clicks to enter his or her mobile phone number.

mobile phone (n)~ A handheld portable telephone that operates through a radio network.

mobile printing (n)~ The feature which enables printing from a Windows mobile device.

Mobile Robots ~ move and navigate in an autonomous or semiautonomous manner and have the ability to sense or influence their local environments.

mobile service provider (n)~ A company that provides text messaging services.

Mobile Services (PN)~ The Microsoft Azure service that enables developers to add a cloud-based backend service to an app.

Mobile site (PN)~ The Windows Mobile footer link to the site that is built for viewing from mobile devices.

mobile user control (n)~ An ASP.NET mobile control derived from the System.Web.UI.MobileControls.MobileUserControl class. User controls provide containers for custom controls built from other ASP.NET mobile controls.

Mobile VPN (PN)~ The extension of a private network that encompasses encapsulated, encrypted, and authenticated links across shared or public mobile networks. Mobile VPN connections typically provide remote access and router-to-router connections to private networks over the Internet through mobile devices.

mobile web (n)~ Websites or services that are available to a web browser on a mobile device via WAP technology.

MobileMe ~ MobileMe (formerly .Mac and iTools) is a subscription-based collection of online services and software offered by Apple Inc.- http://www.me.com/

mock object (n)~ A class used as a proxy for gaining greater code coverage in unit testing.

mock-up (n)~ A sketch or representation that shows the layout of the publication that you plan to create.

modal dialog (n)~ A dialog that requires the user to take some action before the focus can switch to another form or dialog box. Dialog boxes and messages are usually modal.

modal dialog box (n)~ A dialog box that requires the user to supply information or close the dialog box before allowing the application to continue.

modal window (n)~ A window that requires the user to take some action before the focus can switch to another form or dialog box. Dialog boxes and messages are usually modal.

modality (n)~ The method of communication. For example, voice call, instant message, e-mail, text message, voice message, voice mail message, file sharing, application sharing, and so on.

mode (n)~ The operational state of a computer or a program. For example, edit mode is the state in which a program accepts changes to a file.

Mode Switcher (PN)~ A button that allows you to quickly toggle between Player Mode and Library Mode in Windows Media Player.

model (n)~ A mathematical or graphical representation of a real-world situation or object. For example, a mathematical model of the distribution of matter in the universe, a spreadsheet (numeric) model of business operations, or a graphical model of a molecule.

model (n)~ In Operations Manager, a software representation of hardware, software, services and other logical components that are in your environment. The model captures the nature of those components and the relationships between them.

model (n)~ A representation of a declarative structure and behavior.

model association (n)~ A relationship that allows users to define links between reference data elements to enable fact data movement.

model binder (n)~ A feature of ASP.NET that automatically converts data that is posted in an HTML form to a .NET Framework data type.

model binding (n)~ The process of automatically converting data that is posted in an HTML form to a .NET Framework data type.

model database (n)~ A database that is installed with Microsoft SQL Server and that provides the template for new user databases. SQL Server creates a database by copying in the contents of the model database and then expanding the new database to the size requested.

model dependency (n)~ A relationship between two or more models in which one model is dependent on the information of another model.

Model First (PN)~ A set of features in the Entity Framework for defining a model by using the Entity Data Model Designer.

model site (n)~ An object that organizes data within a PerformancePoint Planning Server application. A model site is a container for models and their related elements (such as dimensions, security and mapping information, and business process definitions) that are used to structure business intelligence data. Each model site can inherit data and structure from the root model site of the application.

model store (n)~ A Microsoft SQL Server database where all objects in the Application Object Tree (AOT) are stored.

modeler role (n)~ An administrative role for PerformancePoint Server that allows members to perform any modeling operation within their scope (application or model site).

modeless (adj)~ Pertaining to non-restrictive or non-limited interaction. Modeless often describes a secondary window that does not restrict a user's interaction with other windows.

modeless dialog box (n)~ A dialog box that allows the user to supply information and return to a previous task without closing the dialog box.

modeling abstraction layer (n)~ The layer that resides between users (both application developers and end-users) and SQL Server and SQL Server Analysis Services data.

modem (n)~ A communications device that converts between digital data from a computer or terminal and analog audio signals that can pass through a standard telephone line.

Modem ~ (MOdulator/DEModulator)- A device for allowing computers to communicate over a phone line.

modem compression (n)~ A technique used to reduce the number of characters transmitted without losing data content. The transmitting modem compresses the data and

the receiving computer or modem decompresses the data back to its original state.

Modified Accelerated Cost Recovery System (n)~ A method of accelerated depreciation permitted by tax codes that classifies depreciable assets into one of several recovery periods, each of which has a designated pattern of allowable depreciation.

modifier key (n)~ A keyboard key that, when pressed (and held), changes the actions of ordinary input.

Modify Report (v)~ A button, found on the Report toolbar, that enables the user to customize a report.

Modify Subject storage option (n)~ The option on the Policy Filter page for delivering spam e-mail messages to the recipient with an identifying word or phrase in the subject line.

modulation standards (n)~ Protocols that determine how modems convert digital data into analog signals that can be transmitted over telephone lines.

modulator/demodulator (n)~ A communications device that converts between digital data from a computer or terminal and analog audio signals that can pass through a standard telephone line.

module (n)~ In programming, a collection of routines and data structures that performs a particular task or implements a particular abstract data type. Modules usually consist of two parts: an interface, which lists the constants, data types, variables, and routines that can be accessed by other modules or routines, and an implementation, which is private (accessible only to the module) and which contains the source code that actually implements the routines in the module.

module (n)~ A component that can be registered as part of the ASP.NET request lifecycle and that can read or change the request or response as it is processed. Modules are often used to perform special tasks that need to monitor each request, such as security or site statistics.

module (n)~ A loadable unit, which can contain type declarations and type implementations. The module contains enough information to enable the common language runtime to locate all implementation bits when the module is loaded. The format for modules is an extension of the Windows portable executable (PE) file format. When deployed, a module is always contained in an assembly.

module (n)~ A content element a user can add to their space.

module (oth)~ An executable program file or a dynamic link library (DLL).

module level (n)~ Describes any variable or constant declared in the Declarations section of a module or outside a procedure. Variables or constants declared at the module level are available to all procedures in a module.

module-level variable (n)~ A variable that's declared in the Declarations section of a module by using the Private keyword. These variables are available to all procedures in the module.

modulo (n)~ An arithmetic operation whose result is the remainder of a division operation. For example, 17 modulo 3 = 2 because 17 divided by 3 yields a remainder of 2. Modulo operations are used in programming.

MOF (n)~ The file type, based on the Interface Definition Language (IDL), that describes management information. The MOF syntax is a way to describe object definitions in

textual form.

MOF file (n)~ A text file that contains definitions of classes and instances using the Managed Object Format language.

MOH (n)~ A feature that enables the playing of prerecorded music/audio for callers while they are on hold.

MOICE (PN)~ A feature that is added to the Microsoft Office Compatibility Pack to open Word, Excel, and PowerPoint binary format files and securely convert them to the Office 2007 file formats.

moirÃ© pattern (n)~ Video artifacts that occur when recording an object that has many thin, parallel lines.

MOM (n)~ A family of Microsoft server applications designed to provide the event management, proactive monitoring and alerting, reporting and trend analysis services needed to support mission-critical network applications and systems.

MOM Administrator Console (PN)~ A console based on Microsoft Management Console (MMC) technology, used for monitoring and event management. Can include the Microsoft Operations Manager 2005 Information Center, Operations, Management Packs, and Administration snap-ins.

MOM agent (n)~ The agent installed on a computer to monitor it.

MOM Connector Framework (n)~ A framework used to connect MOM systom to other management systems, such as IBM tivoly, HP Openview etc.

MOM database (n)~ A Microsoft SQL Server database that stores configuration information and operations data that is produced by the monitoring process.

MOM Database Server (n)~ The server where the MOM database is located.

MOM Management Server (n)~ A computer that is responsible for monitoring and managing other computers. The MOM Management Server consists of the DAS, and the MOM Server and MOM Agent components. The MOM Management Server is an essential part of a management group.

MOM report (n)~ A predefined report that is provided with the Microsoft Operations Manager (MOM) 2005 Management Pack. Reports are organized by three categories: Microsoft Operations Manager, Operational Data Reporting, Operational Health Analysis.

MOM Reporting Server (n)~ A component that uses SQL Server Reporting Services to generate and display reports.

MOM Service (n)~ The service that the Microsoft Operations Manager provides.

moment (n)~

Monad (n)~ The code name for the Windows command-line shell technology and scripting language that provides a task automation solution for the Windows platform.

monetary amount (n)~ A class of measurement that represents a characteristic of the financial consequence of an economic, resource flow, or accounting event.

money (n)~ An 8-byte, fixed-point data type that is useful for calculations involving money or for fixed-point calculations in which accuracy is extremely important. The Currency data type is used to store numbers with up to 15 digits to the left of the decimal point and 4 digits to the right. The type-declaration character in Microsoft-© Visual Basic-© is an at sign (@). Currency can range from -922,337,203,685,477.5808 to 922,337,203,685,477.5807.

money (n)~ A medium for exchanging ownership of the economic values represented by one or more currency units.

Money (PN)~ An application that allows the user to track financial market conditions, including personal portfolio tracking, finance articles, tools and calculator for common financial tasks.

moniker (n)~ The descriptive form, or explicit connecting points, of referring to the location of a link source.

moniker (n)~ A short name that locates a namespace, class, or instance in WMI.

monitor (n)~ The device on which images generated by the computer's video adapter are displayed. The term monitor usually refers to a video display and its housing. The monitor is attached to the video adapter by a cable.

monitor (n)~ In Operations Manager, an element in a management pack that defines logic for determining the health state of an object. A monitor can set health state.

monitor (n)~ An activity that continuously runs and that initiates a runbook when the monitor matches the criteria that you specify.

Monitor ~ The screen of a PC.

Monitor page (n)~ The page where administrators set up notifications for a situation in which their e-mail is being deferred by the filtering service.

monitor PC (n)~ A computer that is not the hub PC but that monitors the activity of other computers in the OneCare circle. The OneCare subscription administrator designates which, if any, computers in the circle have monitoring privileges. A monitor PC cannot make changes to any other computer in the OneCare circle.

monitor server (n)~ In a log shipping configuration, a server instance on which every log shipping job in the configuration records its history and status. Each log shipping configuration has its own dedicated monitor server.

monitored mailbox (n)~ A mailbox that ILM Service monitors to receive approval and request e-mails from the ILM Outlook Client.

monitored system (oth)~ The system where a monitored ASP.NET application or web service runs and where the APM service is started.

Monitoring Central (PN)~ A Web site from which users can install and run Dashboard Designer, view product documentation, and open the Dashboard Web Preview site.

monitoring level (n)~ A combination of settings across WCF analytic tracing, workflow tracking, and the Event Collector service that define the amount and types of monitoring information that are collected and stored at a given scope in IIS.- Windows Server AppFabric predefines five monitoring levels: Off, ErrorsOnly, HealthMonitoring, EndToEndMonitoring, and Troubleshooting. - When you customize these configuration settings to fall outside a predefined level, Windows Server AppFabric considers your level to be Custom."

monitoring pack (n)~ A kind of management pack that contains the definition of the model against which an application will be monitored and the logic to monitor the health and availability of that application.

Monitoring Plug-in for Report Designer (PN)~ A data processing extension (DPE) that is deployed to Report Designer, a Visual Studio component. This DPE allows Report Designer to communicate with the Monitoring System database and allows Visual Studio

users to customize the PerformancePoint Monitoring metadata that is contained within reports.

Monitoring Server (PN)~ A computer or group of computers that host the PerformancePoint Monitoring Server database and PerformancePoint Monitoring Server Web Service.

Monitoring Server Configuration Manager (PN)~ The administration wizard that is used for installing and configuring Monitoring Server, including such tasks as adding or removing components, specifying the location of the Monitoring System database, and configuring the server for SQL Server Reporting Services and Windows SharePoint Services or Microsoft Office SharePoint Services.

monitoring software (n)~ Software that monitors activity, such as keystrokes or screen images. These programs are often installed by the computer owner or administrator, and are only a threat if they are unexpected.

Monitoring task area (n)~ An area in DPS Management Console that displays alerts when problems or certain events occur. It also shows a list of jobs running, completed and scheduled for a selected time period, allowing the user to monitor the status of data protection and data recovery.

Monitoring Web Service (PN)~ A collection of application programming interfaces (APIs) that provide the core functionality of PerformancePoint Monitoring Server, connecting PerformancePoint Dashboard Designer to the Monitoring Server database, Dashboard Viewer for SharePoint, and data sources.

Monkey King (n)~ An Office Assistant character.

monochrome (adj)~ Of, pertaining to, or being a monitor that displays images in only one color-black on white (as on early monochrome Macintosh screens) or amber or green on black (as on early IBM and other monochrome monitors). The term is also applied to a monitor that displays only variable levels of a single color, such as a gray-scale monitor.

monolithic driver (n)~ A driver that is structured to handle all storage command processing from the driver class to the host bus attachment, residing in the code path either alongside Microsoft-supplied monolithic drivers, or alongside a Microsoft-supplied port driver and vendor-supplied miniport drivers.

Month view (n)~ A calendar view that displays information for a one-month period.

monthly reset date (n)~ A setting where the user provides the date when their monthly data usage resets to 0.

mood definition (n)~ The interpretation, whether system-supplied or organizer-specified, of a particular color that indicates an attendee's mood.

mood indicator (n)~ A feature that shows a participant's color-coded status, as displayed in the Seating Chart panel.

mood message (n)~ A piece of information supplied by the user that appears in the mood panel beside the user's Skype Name for other users to see.

mood panel (n)~ A field next to the user's Skype Name for typing a mood message.

Moore's Law ~ The idea that computing power doubles every 18 months, originally conceived by Intel co-founder Gordon Moore in 1965.

More (n)~ An item on the Actions menu that displays additional actions the user can select.

More (PN)~ The link to the list of more links to other Microsoft sites.

More menu (n)~ A menu that appears on the nav bar to accommodate additional links that cannot be displayed due to a low screen resolution or small size of the browser window. The More menu is represented on the nav bar as an ellipsis.

MorphX (PN)~ The Microsoft Dynamics AX integrated development environment (IDE).

MorphX report (n)~ A report that is developed using the MorphX integrated development model.

MorphX Type Hierarchy Browser (PN)~ A view that displays the structure of the selected Application Object Tree (AOT) class node and its inheritance hierarchies.

MOS (n)~ A widely accepted numerical indication of perceived audio quality of transmitted spoken material. It is the mean of values (from 1 to 5) assigned by subjects to test sentences in an ACR test or the mean of values objectively predicted by software algorithms, such as those provided by the Microsoft UC solution.

MOSA (PN)~ The agreement between Microsoft Corporation and a client on the subscription of Online Services.

Mosaic ~ The original WWW browser developed at University of Illinois, given to public domain. Mosaic has been outdated by commercial browsers like Netscape's Navigator and IE.

MOS-CQ (n)~ A class of MOS values that takes into account listening quality in each direction, as well as bidirectional effects, such as delay and echo.

MOS-LQ (n)~ Within the VoIP industry, a commonly used class of MOS values that measures the quality of audio for listening purposes only, without taking into account any bidirectional effects, such as delay and echo.

Most Frequently Used List (n)~ A list of applications that the end user has recently used or uses frequently.

Most Recently Accessed Files (n)~ A storage report that lists files that have been accessed most recently. Use this report to identify frequently used data that needs to be highly available.

most recently used (adj)~ Pertaining to items that were selected most recently.

motherboard (n)~ The primary circuit board in a computer that contains most of the basic components of the system.

Motherboard ~ The main circuitboard in the computer - all the other bits and pieces are plugged into it.

motion data (n)~ The data from motion sensors which is processed to create information such as step counts or activities (such as walking, running).

motion focus (n)~ A photo that illustrates motion by blurring together multiple frames of a short video to create the effect of motion in the still image.

motion path (n)~ The path that a specified object or text will follow as part of an animation sequence for a slide.

motion search (n)~ A method used by the codec to determine and predict motion in an image.

motion sensor (n)~ A category of sensor that may use all or some of the following applied stimulus to detect movement: ultrasound, infrared, heat and vibration.

mount (v)~ To make a physical disk or tape accessible to a computer's file system.

mount (n)~ An operation that requests a file system to make a volume available to the I/O Manager. The file system makes the volume available by filling in the information in a VPB to indicate the serial number and label of the volume and by filling in the pointer to the file system's device object that represents the volume mounted on the real device.

mount ~ This term comes from the days when tape media had to be physically mounted at the instruction of an operating system.

mount call (n)~ A call to the mount function in UNIX. The mount function requests that a removable file system contained on the block special file identified by spec be mounted on the directory identified by dir. The spec and dir arguments are pointers to path names. After a successful call to mount, all references to the file dir refer to the root directory on the mounted file system. The mounted file system is inserted into the kernel list of all mounted file systems. This list can be examined through the mounted file system table.

mount point (n)~ A directory on one volume that an application can use to mount a different volume, that is to set it up for use at the location a user specifies. In other words, you can use a mount point as a gateway to the volume. When a volume is mounted at a mount point, users and applications can refer to the mounted volume by the path of the mount point or a drive letter. For example, with a mount point set the user might refer to drive D as C:\mnt\Ddrive' as well as 'D:'.'

mounted drive (n)~ A drive attached to an empty folder on an NTFS volume. Mounted drives function the same as any other drive, but are assigned a label or name instead of a drive letter. The mounted drive's name is resolved to a full file system path instead of just a drive letter. Members of the Administrators group can use Disk Management to create mounted drives or reassign drive letters.

mounted file system (n)~ A file system located on a removable medium, such as a PC Card storage device. The operating system loads, or mounts, the file system when the medium is inserted into the device. It unloads, or unmounts, the file system when the medium is removed or when the user issues a command to do so.

mouse (n)~ An input device with the following features: a flat-bottomed casing designed to be gripped by one hand; one or more buttons on the top; a multidirectional detection device (a ball, laser or optical device) on the bottom; and a cable or wireless connection to the computer.

Mouse ~ A device used to move a pointer around on the computer screen. Essential to get the most out of Windows, though it is not quite impossible to use Windows without one.

mouse button (n)~ A movable piece on a device that is pressed to activate some function.

mouse click (n)~ The action of pressing and releasing one of the mouse buttons.

Mouse elbow ~ A repetitive strain injury that is caused by repeatedly using a mouse.

mouse over (v)~ To pause the mouse pointer on a particular area of the screen, without clicking.

mouse pointer (n)~ An on-screen element whose location changes as the user moves the mouse. Depending on the location of the mouse pointer and the operation of the program with which it is working, the area of the screen where the mouse pointer appears serves as the target for an action when the user presses one of the mouse buttons.

mouse shortcut (n)~ A predefined command for a single mouse click or a double mouse click, with or without a modifier key, that can be used to perform a task.

mouse wheel (n)~ A hard plastic disc on a mouse that is perpendicular to the mouse surface. It is normally located between the left and right mouse buttons and is used for scrolling.

MouseKeys (n)~ A keyboard feature that enables you to use the numeric keypad to move the mouse pointer and to click, double-click, and drag.

move (v)~ To transfer a file from one location to another. After the file is transferred, there is only one copy of the file, in the new location.

Move Contact to (PN)~ An item on the right-click menu for a contact that moves the selected contact to the contact group the user selects from a list.

move handle (n)~ A handle that is displayed on some objects such as toolbars, tables, or on individual rows or columns, that allows the user to drag them to another location.

Move mode (n)~ The mode in which you can move columns in Datasheet view by using the left and right arrow keys.

move mode (n)~ A mode in which the user can manipulate a 3D object by moving it.

move semantics (n)~ A C++ feature that enables a developer to write code that transfers resources (such as dynamically allocated memory) from one object to another by enabling resources to be transferred from temporary objects that cannot be referenced elsewhere in the program.

movie (n)~ A self-running slide show that plays in the QuickTime player and has the file name extension .mov.

movie controller bar (n)~ A bar that allows a user to pause, play, back up or rewind a movie as well as to adjust the volume.

movie file (n)~ A file created by combining the audio, video, and still images contained in your project. Movie files are created when you publish your movie in Windows Movie Maker, and are saved as a Windows Media file with a .wmv file name extension.

Movie genres (PN)~ The genres channel title for movies.

Movie Maker (PN)~ Software for capturing, editing, and arranging audio and video source material to create movies.

Movie Moments (PN)~ The app that enables users to create and edit short videos to highlight memorable moments.

Movie studios (PN)~ The studios channel title for movies.

Movies (PN)~ An MSN site that provides exclusive movies features, trailers and movie clips, movie listing and showtimes, celebrity photos, gossips and news.

Movies & TV (PN)~ An app that can be- used to play and record movies and TV shows.

moving average (n)~ A sequence of averages computed from parts of a data series. In a chart, a moving average smooths the fluctuations in data, thus showing the pattern or trend more clearly.

moving average envelope (n)~ A band that contains values within a specified percentage above and below a moving average.

moving average trendline (n)~ A trendline that smoothes out fluctuations in data to show a pattern or trend more clearly.

moving border (n)~ An animated border that appears around a worksheet range that has been cut or copied. To cancel a moving border, press ESC.

Moving Picture Experts Group (n)~ The committee that creates international standards

for coding audio-visual information to a digital, compressed format. The acronym MPEG is appended to the beginning of individual specifications developed by the committee. For example, MPEG-2 refers to the standard, ISO/IEC - 11172.

Moving Titles, Layered (n)~ A title animation in Windows Movie Maker.

MP3 (n)~ A digital audio coding scheme used to distribute recorded music over the Internet. MP3 shrinks the size of an audio file by a factor of 10 to 12 without degrading the quality (CD-recording level) of the sound.

MP3 ~ (MPeg-1 audio layer 3). A very popular standard for compressing audio and particularly music files down to a reasonable size with little or no perceptible loss of quality, and the files created using it - 'an MP3' is an audio file.
See- MPEG,- Compression.

MPAA (n)~ Advocate group for the American motion picture, home video and television industries.

MPD (PN)~ A record-based Access-compliant file format that you can use for saving an entire project.

MPEG (n)~ The committee that creates international standards for coding audio-visual information to a digital, compressed format. The acronym MPEG is appended to the beginning of individual specifications developed by the committee. For example, MPEG-2 refers to the standard, ISO/IEC - 11172.

MPEG ~ (Motion Picture Experts Group; pr. 'em-peg') A set of standards for compressing video and audio files, and the committee that came up with them. Also, often used to mean movie files created to the MPEG standard.

MPEG Audio Layer-3 (n)~ A digital audio coding scheme used to distribute recorded music over the Internet. MP3 shrinks the size of an audio file by a factor of 10 to 12 without degrading the quality (CD-recording level) of the sound.

MPEG-7 (n)~ A standard of video compression and file format developed by the Moving Pictures Experts Group for description and search of multimedia content data.

MPF (n)~ A provisioning platform and engine for building, maintaining, and extending a set of hosted commercial services. MPF includes several components that work together to automate the implementation and administration of specific resources, including directory services, mail services, and storage.

MPIO (n)~ A Microsoft multipathing solution that enables more than one read/write path to a logical unit number (LUN). With MPIO, multipathing is achieved by assigning multiple Fibre Channel host bus adapter ports or multiple iSCSI initiator adapters on a server to the same LUN, and then configuring that server to use MPIO.

MPNS (PN)~ A notification service that sends new events, such as an instant messaging invitation or a missed call, to the Windows Phone mobile device.

MPOP (n)~ The ability of a single user to sign in to a Lync Server or Office Communications Server server with multiple clients.

MPR (PN)~ A rule in ILM that defines a condition and the subsequent action to take when that condition is met. Management policy rules are used to model the business processing rules for incoming requests to ILM.

MPSV (n)~ A vaccine for immunization against infection by certain groups of meningococcal bacteria that cause meningococcal disease.

MPX (PN)~ A record-based ASCII text format that is used to import data into Project.

MRM (n)~ Records management technology in Exchange 2007 that helps organizations to reduce the risks that are associated with e-mail and other communications. MRM makes it easier to keep messages that are needed to comply with company policy, government regulations, or legal needs, and to remove content that has no legal or business value.

MRU (adj)~ Pertaining to items that were selected most recently.

MS Activity Purpose (PN)~ A field that allows the user to indicate the reason for an action taken (email, fax, meeting, etc.).

MS DTC (n)~ A system service that enables client applications to include several different sources of data in one transaction. MSDTC coordinates the committing of the distributed transaction across all the servers enlisted in the transaction.

MS Influence (PN)~ A field that allows the user to enter the name of an organization that is not involved in an opportunity, but whose work with the company (customer) may affect the demands that a customer company has on the company offering services.

MS Online Directory Service (PN)~ The place where passwords and password policy is managed.

MSAA (PN)~ A technology that improves the way programs and the operating system work with accessibility aids, such as screen readers.

MSBuild (PN)~ The Microsoft Build Engine is a platform for building applications. This engine, which is also known as MSBuild, provides an XML schema for a project file that controls how the build platform processes and builds software. Visual Studio uses MSBuild, but it doesn't depend on Visual Studio. By invoking msbuild.exe on your project or solution file, you can orchestrate and build products in environments where Visual Studio isn't installed.

MSCSAuth ticket (n)~ A ticket that Commerce Server creates for registered users.

MSCSProfile ticket (n)~ A ticket created by Commerce Server for anonymous (guest) users.

msdb (n)~ A database that stores scheduled jobs, alerts, and backup/restore history information.

MSDN (n)~ A Microsoft Web site (and subscription program) that provides developers with the latest tools as well as information, code samples, and training materials for Microsoft development tools. (http://msdn.microsoft.com)

MSDN Dev/Test Pay-As-You-Go (PN)~ The offer for MSDN subscribers that allows them to create multiple MSDN Dev and Test Pay-As-You-Go subscriptions.

MSDN Platforms (PN)~ The offer that provides IT Pros and non-Microsoft Developers comprehensive access to the Microsoft platform, services, tools and resources, to support the development and testing of high-quality applications for the Web, Cloud and Windows.

MS-DOS (n)~ A Microsoft computer operating system with a command-line interface that is used to control many internal computer functions, such as running programs and organizing and maintaining files.

MS-DOS icon (n)~ The icon at the left end of the title bar. Clicking this icon displays the System menu for the MS-DOS window.

MS-DOS prompt (n)~ The visual indication from the MS-DOS command processor that

the operating system is ready to accept a new command. The default DOS prompt is a path followed by a greater-than sign (for example, C:>); the user can also design a custom prompt with the PROMPT command.

MS-DOS-based program (n)~ A program that is designed to run with MS-DOS and therefore may not be able to take full advantage of all Windows features.

MSDPMTrustedMachines group (n)~ A group that contains the domain accounts for file servers that are authorized to communicate with the DPM server. DPM uses this group to ensure that only file servers that have the DPM File Agent installed from a specific DPM server can respond to calls from that server.

msDS-ResultantPSO (oth)~ A user object attribute that can be queried to retrieve the distinguished name of the Password Settings object (PSO) that is applied to the user.

MSDT (n)~ A system used by PSS for gathering customer configuration information for diagnostics through an improved process and tool.

MSDTC (n)~ A system service that enables client applications to include several different sources of data in one transaction. MSDTC coordinates the committing of the distributed transaction across all the servers enlisted in the transaction.

MSF (PN)~ A framework developed by Microsoft for planning, building, and managing distributed computing systems. MSF is a set of proven practices that can be applied to planning and implementing almost any form of computing technology.

MSFT (PN)~ The public multinational corporation that develops, manufactures, licenses, and supports a wide range of products and services predominantly related to computing.

MSI (PN)~ A feature of Windows that defines and manages a standard format for application setup and installation, and tracks components such as groups of files, registry entries, and shortcuts.

msinfo32.exe (PN)~ A program that shows details about a computer's hardware configuration, computer components, and software, including drivers.

MSJVM (n)~ A Microsoft program that interprets and runs java applets and applications within Microsoft Windows.

MSL (n)~ An XML-based language that is used to map items defined in a conceptual model to items in a storage model.

MSMQ (n)~ A Microsoft technology that enables applications running at different times to communicate across heterogeneous networks and systems that may be temporarily offline.

MSN (n)~ An Internet connectivity service with which you can exchange messages with people worldwide; read news, sports, weather, and financial information; find answers to technical questions; and download from a collection of thousands of programs.

MSN Apps (PN)~ Microsoft's portal site, offering news, sports, weather, finance, autos, food & drink, health & fitness, autos, travel, weather, music, videos, TV, and entertainment & celebrity gossip and shopping.

MSN Food & Drink (PN)~ An application that provides recipes and tools for meal-planning, instructional views, and an extensive wine guide.

MSN Health & Fitness (PN)~ An application that includes exercise and workout videos; nutritional and medical references; and a tracker for diet, exercise, and health.

MSN Home (PN)~ MSN Homepage

MSN Mobile (PN)~ MSN optimized for mobile devices. The layout and the links are specially crafted to display well on small displays.

MSN Money (PN)~ An application that allows the user to track financial market conditions, including personal portfolio tracking, finance articles, tools and calculator for common financial tasks.

MSN News (PN)~ An application that aggregates news in customized views from a variety of Internet partner news sources, featuring news articles, videos, articles, and photography.

MSN Sports (PN)~ An application that allow the user to follow sports headlines, teams, scores, schedules and standings.

MSN Toolbar (PN)~ A Microsoft add-in that integrates access to MSN content and services into the Microsoft Internet Explorer user interface.

MSN Toolbar for Internet Explorer (PN)~ A Microsoft add-in that integrates access to MSN content and services into the Microsoft Internet Explorer user interface.

MSN Travel (PN)~ An application for travel planning, including destination photos and panoramas, travel guides, booking tools, currency conversions, and weather forecasts.

MSN Weather (PN)~ An application that provides current weather forecasts with customized locations and interactive weather maps.

MSN Worldwide (PN)~ An MSN page that allows the user to choose a required worldwide location.

MSODS (PN)~ The place where passwords and password policy is managed.

MSR (n)~ A device used to interpret data that is encoded on a magnetic stripe card.

MSR partition (n)~ A required partition on every GUID partition table (GPT) disk. System components can allocate portions of the MSR partition into new partitions for their own use. For example, when you convert a basic GPT disk to dynamic, the system allocates a portion of the MSR partition to be used as the Logical Disk Manager (LDM) metadata partition. The MSR partition varies in size based on the size of the GPT disk. For disks smaller than 16 GB, the MSR partition is 32 MB. For disks larger than 16 GB, the MSR partition is 128 MB. The MSR partition is not visible in Disk Management, and you cannot store data on the MSR partition or delete it.

MSRC severity (n)~ A rating that describes the severity of a security issue addressed by a software update, as determined by the Microsoft Security Response Center (MSRC).

MSXML (n)~ A Microsoft collection of application programming interfaces, language standards, programming vocabularies, parsing engines, and documentation for developing XML-based applications.

MTA (n)~ An application process, as described in the X.400 message-handling system, responsible for delivering e-mail messages. After receiving a message, an MTA stores it temporarily and either delivers it or forwards it to another MTA. During this process, the MTA can change the message headers.

MTA (n)~ An apartment that consists of one or more threads.

MTE (n)~ A MAPI message that holds the delivery information for a message.

MTS (n)~ The X.400 term for a messaging system, which is a product that enables electronic communication over a network.

mtype (n)~ A command-line argument that specifies the default mount type. This value

must be either hard or soft. The default is soft.

MUI Pack (n)~ A set of language-specific resources for multiple supported languages. MUI technology enables users to set the user-interface language according to their preferences, provided the required language resource files are present on the computer. It is designed to enable large corporations to deploy a single version of Windows worldwide, while enabling their local users to select the user-interface language.

Multi Line Mode (n)~ A text box mode that allows data entry on multiple lines.

multi session-capable disc (n)~ A recordable media to which you can write several times without reformatting.

multi-activation key (n)~ A product key that is provided to Microsoft customers who choose a Microsoft Volume Licensing program for their organizations and that allows multiple installations of a particular product. The key is assigned to a company or institution intended for their sole use and only for distribution to employees or third parties who are authorized to install and distribute licenses pursuant to the terms of their license agreement.

multibase differential (n)~ A differential backup that includes files that were last backed up in distinct base backups.

multiboot (n)~ A computer configuration in which two or more different operating systems are installed on the same computer hard disk, and you can choose which operating system to use when the computer starts.

multibuy discount (n)~ The amount subtracted from the unit of a product or service based on the volume purchased.

multibyte character set (n)~ A mixed-width character set, in which some characters consist of more than 1 byte. An MBCS is used in languages such as Japanese, Chinese, and Korean, where the 256 possible values of a single-byte character set are not sufficient to represent all possible characters.

multicast (n)~ A content delivery method in which a single stream is transmitted from a media server to multiple clients.

Multicast ~ single packets copied by the network and sent to a specific subset of network addresses. These addresses are specified in the Destination Address Field.

Multicast Address Dynamic Client Allocation Protocol (n)~ An extension to the DHCP protocol standard used to support dynamic assignment and configuration of IP multicast addresses on TCP/IP-based networks.

Multicast Client Auto Removal (PN)~ Ability to automatically remove a client from a multicast group (usually a client with lower bandwidth - to be served via unicast deployment), have it join a different multicast group or to terminate deployment.

multicast delivery (n)~ A method for delivering notifications that formats a notification once and sends the resulting message to multiple subscribers.

multicast discovery (n)~ The discovery of resources or devices on the local subnet.

multicast group (n)~ A group of member TCP/IP hosts configured to listen for and receive datagrams sent to a specified destination IP address.

multicast heartbeat (n)~ A message sent by nodes in a cluster to continuously maintain communication between cluster nodes. The multicast heartbeat detects and communicates a failure within the cluster. Using a multicast heartbeat lets several unicast messages be

replaced by one multicast message.

multicast scope (n)~ A range of multicast group IP addresses in the Class D address range that are available to be leased or assigned to multicast DHCP clients by DHCP.

multicast server (n)~ A service that manages zero or more multicast groups and distributes multicast data sent to it by clients of those multicast groups through point-to-multipoint connections.

multicast-enabled network (n)~ A network that has routers that can interpret Class D IP addresses.

multichannel audio (n)~ An audio reproduction system that processes several, typically more than two, channels of sound. For example, 5.1 multichannel audio refers to a surround sound system in which there are five primary channels and a subwoofer channel.

Multi-Color Graphics Array (n)~ An older video adapter included in the IBM PS/2 Models 25 and 30. The MCGA was capable of emulating the CGA (Color/Graphics Adapter) and provided two additional graphics modes: the first mode had 640 horizontal pixels by 480 vertical pixels with 2 colors chosen from a palette of 262,144 colors; the second had 320 horizontal pixels by 200 vertical pixels with 256 colors chosen from a palette of 262,144 colors.

Multi-Column Layout (PN)~ A Windows feature that allows designers and developers to lay out a single column of HTML content in multiple parallel columns of equal width and height. This layout style allows designers to make better use of available display space, and is common to newspapers and magazines in both the print and digital world.

multi-core processor (n)~ A processor with two or more cores (normally a CPU) that are combined to leverage the processor's ability to execute multiple tasks. It offers a higher level of computing power and functionality than single-core processors.

multicurrency (adj)~ Pertaining to anything involving multiple currencies.

multicurrency feature (n)~ A feature that enables customers to store financial information and perform financial transactions in more than one form of currency in a single implementation.

multicurrency order (n)~ An online purchase of items that are priced in different currencies.

multicurrency transaction (n)~ An exchange of money for goods or services between a buyer and a business or between a supplier and a business, in which the preferred currency of the buyer or supplier is different than the base currency specified for the site.

multi-curve (n)~ A shape representing a union of all the positions in a set of curves.

multidimensional analysis (n)~ A methodology often used to design OLAP systems that involves describing numeric facts (such as revenue) by business descriptors (such as customers, time, products, and so on).

multidimensional array (n)~ An array that has more than one dimension.

multidimensional expression (n)~ A language for querying and manipulating data in multidimensional objects (OLAP cubes).

multidimensional measurement (n)~ A measurement with many characterizations of the magnitude or extent of the property of an object.

multidimensional OLAP (n)~ A storage mode that uses a proprietary multidimensional structure to store a partition's facts and aggregations or a dimension.

multidimensional structure (n)~ A database paradigm that treats data as cubes that contain dimensions and measures in cells.

Multidirectional Cycle (PN)~ A SmartArt graphic layout used to represent a continuing sequence of stages, tasks, or events that can occur in any direction.

Multi-Entity Quick Find (n)~ A search field that allows the user to search across multiple entities such as contacts, accounts, and leads.

Multi-Factor Authentication (PN)~ The service that provides additional layers of authentication for on-premises and cloud applications. Multi-Factor Authentication verifies user sign-ins and transactions using a phone call, text message, and mobile app.

multi-factor authentication (n)~ An authentication method that requires two or more authentication methods, which may include something the user has, such a certificate; something the user knows, such as user names, passwords, or pass phrases; physical attributes, such as a thumbprint; and personal attributes, such as a personal signature.

Multi-Factor Authentication app (PN)~ An application that can be installed on a user's mobile device to receive notifications and to verify that their sign in attempt was valid.

Multi-Factor Authentication Management Portal (PN)~ The portal used by administrators to manage company-wide Multi-Factor Authentication settings and view centralized usage reports.

Multi-Factor Authentication Server (PN)~ A software application that an administrator can use to configure Multi-Factor Authentication functionality.

Multi-Factor Authentication Service (PN)~ A service that places an automated phone call, sends a text message, or pushes a notification to the Multi-Factor Authentication app on the user's mobile device and processes the result.

Multi-Factor Authentication User Portal (PN)~ The portal that allows users to complete the Multi-Factor Authentication enrollment process and manage their settings, such as phone number and PIN, through a simple web interface.

multifunction device (n)~ A piece of hardware that supports multiple discrete capabilities, such as audio, mixer, and music, on a single card. This device is sometimes treated as a bus that can be enumerated to locate the devices on that bus.

multihomed computer (n)~ A computer that has multiple network adapters or that has been configured with multiple IP addresses for a single network adapter.

multihomed server (n)~ A computer that has multiple network adapters or that has been configured with multiple IP addresses for a single network adapter.

multihoming ~ For TCP/IP, the ability to specify multiple interfaces per line description

multihosting (n)~ The ability of a Web server to support more than one Internet address and more than one home page.

Multilanguage (MUI) Resource Management (PN)~ A centralized mechanism for managing language resources, helping developers create contextually tailored and consistent experiences by reducing code complexity and fragility.

multilevel undo (n)~ A command that reverses the last used commands.

Multiline (PN)~ A Windows Phone interface supporting dual SIM configured devices.

multiline discount (n)~ A discount granted if the combination of one or more lines fulfill some predefined conditions.

multiline purchase (n)~ An order that consists of multiple items.

multi-line string (n)~ A shape representing a union of all the positions in a set of line strings.

Multilingual App Toolkit (PN)~ A Visual Studio extension that enables translation support through tools and guides.

Multilingual User Interface (PN)~ A technology that allows for the installation and use of multiple user-interface languages.

Multilingual User Interface Pack (n)~ A set of language-specific resources for multiple supported languages. MUI technology enables users to set the user-interface language according to their preferences, provided the required language resource files are present on the computer. It is designed to enable large corporations to deploy a single version of Windows worldwide, while enabling their local users to select the user-interface language.

multilink dialing (n)~ The combination of two or more physical communications links' bandwidth into a single logical link to increase your remote access bandwidth and throughput by using remote access Multilink. Based on the Internet Engineering Task Force (IETF) standard RFC 1990, Multilink combines analog modem paths, Integrated Services Digital Network (ISDN) B-channels, and mixed analog and digital communications links on both your client and server computers. This increases your Internet and intranet access speed and decreases the amount of time you are connected to a remote computer.

Multi-Mailbox Search (PN)~ A feature in Exchange 2010 and Outlook Live that enables users to search the mailboxes in their organization for e-mail and other message types that contain specific keywords. The results of a search are then copied to a mailbox that you have specified so that you can review, organize, and export the search results.

multimedia (adj)~ Pertaining to the delivery of information that combines different content formats, such as video, audio, still images, graphics, animation, and text.

multimedia choreography presentation (n)~ A PowerPoint template that incorporates transitions, animations and multimedia choreography in a wide-screen format.

multimedia clip (n)~ A single media file, including art, sound, animation, or movies.

Multimedia Content Description Interface (n)~ A standard of video compression and file format developed by the Moving Pictures Experts Group for description and search of multimedia content data.

Multimedia design (PN)~ An app category to help with creating designs, music, photography, or videos.

multi-object (adj)~ In a collaboration diagram, a set of object roles on the "many" end of an association role. Using a multi-object shows that an operation addresses an entire set rather than a single object within the set.

multi-part message type (n)~ A definition of the structure of a message, including the data types of its elements. A multi-part message type can contain a single part or many parts.

multipartite (n)~ A virus that combines characteristics and techniques of both boot sector and file viruses. Multipartite viruses first infect either system sectors or files and then spread quickly to infect the entire system. Because of their multiple capabilities, multipartite viruses are difficult to remove from an infected system.

multipartite virus (n)~ A virus that combines characteristics and techniques of both boot

sector and file viruses. Multipartite viruses first infect either system sectors or files and then spread quickly to infect the entire system. Because of their multiple capabilities, multipartite viruses are difficult to remove from an infected system.

multipass texture blending (n)~ The technique of combining the colors of a texture with the colors of the surface to which the texture is applied.

Multipath I/O (n)~ A Microsoft multipathing solution that enables more than one read/write path to a logical unit number (LUN). With MPIO, multipathing is achieved by assigning multiple Fibre Channel host bus adapter ports or multiple iSCSI initiator adapters on a server to the same LUN, and then configuring that server to use MPIO.

multipathing (n)~ In storage technologies, a solution that increases availability and path failover by providing multiple paths from a server or cluster to a storage subsystem. In the event that the path being used fails, multipathing logic uses an alternate path for I/O so that applications can still access their data.

multiple activation key (n)~ A volume license key that is used for one-time activation with activation services that are hosted by Microsoft.

multiple active result set (n)~ A SQL Server 2005 feature that provides the ability to have more than one pending request per connection, in particular to have more than one default result set open per connection. SQL Server 2000 and earlier restricted the programming model such that at any point in time there would be at most one pending request on a given session, blocking the driver from sending requests to the server until the entire result set is consumed.

multiple bit rate (oth)~ A characteristic of a data stream in which the same content is encoded at several different bit rates in oder to optimize content delivery.

multiple bit rate encoding (n)~ An encoding method where a single WMV file contains several streams of varying bit rates.

multiple boot (n)~ A computer configuration in which two or more different operating systems are installed on the same computer hard disk, and you can choose which operating system to use when the computer starts.

multiple choice question (n)~ A type of question (for example, in a poll, survey or test) where the user must select a response from a set of pre-defined options.

multiple column sort mode (n)~ The state of a header control in which two or more header columns can participate in a sort.

Multiple Connected Session (PN)~ A feature that allows multiple TCP/IP connections from the initiator to the target for the same iSCSI session.

multiple critical paths (n)~ A series of tasks that must be completed on schedule for a project to finish on schedule. Identify and track multiple critical paths to be more effective in managing conditions that could affect your project's finish date.

multiple entity sets per type (n)~ The ability for an entity type to be defined in more than one entity set.

multiple forest group validation (n)~ A mode of the group validation activity that places cross forest members of a group in the FSP set associated with the forest in which the group resides.

multiple forest topology (n)~ A topology that includes more than one Active Directory forest, each of which forest can have one or more trees.

multiple identities (n)~ Multiple Web sites that are hosted on one computer.

Multiple Image Uploader (PN)~ An image uploader that reduces the steps necessary to upload images on the Web.

multiple inheritance (n)~ A feature of some object-oriented programming languages that allows a new class to be derived from several existing classes. Multiple inheritance both extends and combines existing types.

multiple masters (n)~ A feature that allows multiple design templates to be applied to a single presentation.

multiple points of presence (n)~ The ability of a single user to sign in to a Lync Server or Office Communications Server server with multiple clients.

multiple projects (n)~ Several project plans that may or may not be linked or consolidated. If you are working on several projects at one time, you can compare information about critical paths, resource sharing, or priorities among all of the projects.

multiple selection (n)~ The process of selecting nonadjacent and adjacent files and objects.

Multiple UNC Provider (n)~ A kernel-mode component responsible for channeling all remote file system accesses using a Universal Naming Convention (UNC) name to a network redirector (the UNC provider) that is capable of handling the remote file system requests.

multiple-choice property (n)~ A property that contains a set of predefined values. For example you could create a multiple-choice property named Shirt_Size and define the following possible values: S M and L.

multiple-document interface (n)~ A specification according to which documents are opened into windows (sometimes called child windows) that are constrained to a single primary (parent) window.

multiple-document interface (n)~ A graphical user interface that allows the user to display multiple documents at the same time, with each document displayed in its own window. Documents (or child windows) are contained in a parent window, which provides a workspace for all the child windows in the application.

multiple-level category labels (n)~ Category labels in a chart that, based on worksheet data, are automatically displayed on more than one line in a hierarchy. For example, the heading Produce might appear above a row with headings Tofu, Apples, and Pears.

multiple-selection list box (n)~ A list box that is optimized for making multiple, independent selections.

multiplex (n)~ A method for combining two or more signals into one.

multiplexed (adj)~ Of, or pertaining to, a method for combining two or more signals into one.

multiplexer (n)~ A device that funnels several different streams of data over a common communications line.

multiplexing (n)~ A technique used in communications and input/output operations to transmit a number of separate signals simultaneously over a single channel or line. To maintain the integrity of each signal on the channel, multiplexing can separate the signals by time, space, or frequency. The device used to combine the signals is a multiplexer.

multiplication sign (n)~ The Ã— character.

MULTIPLICATION SIGN (n)~ The Ã— character.

multiplicity (n)~ The number of entities that can exist on each side of a relationship.

multiplier (n)~ In arithmetic, the number that indicates how many times another number (the multiplicand) is multiplied.

multi-point (n)~ A shape representing a union of a set of positions in a coordinate system.

MultiPoint Server 2012 Premium (PN)~ A Windows Server 2012 product.

MultiPoint Server 2012 Standard (PN)~ A Windows Server 2012 product.

multi-polygon (n)~ A shape representing a union of all the positions in a set of polygons.

Multipress time out (PN)~ A menu item that lets the user set the length of time between key presses when entering text in Multipress mode.

multiprocessing (n)~ A mode of operation in which two or more connected and roughly equal processing units each carry out one or more processes (programs or sets of instructions) in tandem. In multiprocessing, each processing unit works on a different set of instructions or on different parts of the same process. The objective is increased speed or computing power, the same as in parallel processing and in the use of special units called coprocessors.

multiprocessor computer (n)~ A computer that contains two or more connected and roughly equal processors that can each carry out one or more processes (programs or sets of instructions) in tandem.

Multipurpose Internet Mail Extensions (n)~ A common method for transmitting non-text data through Internet e-mail. MIME encodes non-text data as ASCII text and then decodes it back to its original format at the receiving end. A MIME header is added to the file which includes the type of data contained and the encoding method used.

Multipurpose Internet Mail Extensions mapping (n)~ A method of configuring browsers to view files that are in multiple formats. An extension of the Internet mail protocol that enables the sending of 8-bit-based e-mail messages, which are used to support extended character sets, voice mail, facsimile images, and so on.

Multipurpose Internet Mail Extensions type (n)~ A method used by Web browsers to associate files of a certain type with applications that display files of that type.

multisample texture (n)~ In OpenGL, an object that contains one or more images that all have the same image format and where each pixel at the edge of a polygon is sampled multiple times to improve image quality.

multiserver administration (n)~ The process of automating administration across multiple instances of SQL Server.

multiserver job (n)~ A job that runs in a multiserver environment, first defined on the master server and then downloaded to the target servers.

multisite functionality (n)~ A set of features that enable a customer to configure multiple sites to reflect its business model and support its operations and process flows.

multi-stop slider (n)~ A slider control where the maximum and minimum values of the range can be modified.

multi-subnet cluster (n)~ A failover cluster in which each node is located in a different subnet.

multi-surface (n)~ A shape representing a union of all the positions in a set of surfaces.

Multi-tap guide (PN)~ A feature that shows multi-tap users how many times they need to

tap a key to input a particular character.

multitargeting (n)~ The ability to target code to specific versions (for example, 2.0, 3.5, 4, or 4.5) of the .NET Framework.

multitasking (n)~ A form of processing supported by most current operating systems in which a computer works on multiple tasks-roughly, separate pieces' of work-seemingly at the same time by parceling out the processor's time among the different tasks. Multitasking can be either cooperative or preemptive. In the former

multitenancy (n)~ An architectural principle where a single instance of software is used to run a service for multiple clients (tenants).

multitenant (adj)~ Pertaining to multiple client organizations (tenants) that are served by a single software-as-a-service (SaaS) vendor's servers.

multithreaded apartment (n)~ An apartment that consists of one or more threads.

multithreaded server application (n)~ An application that creates multiple threads within a single process to service multiple user requests at the same time.

multithreaded unsynchronized access (n)~ The operation in which two or more threads attempt to call simultaneously into the heap.

multithreading (n)~ Running several processes in rapid sequence within a single program, regardless of which logical method of multitasking is being used by the operating system. Because the user's sense of time is much slower than the processing speed of a computer, multitasking appears to be simultaneous, even though only one task at a time can use a computer processing cycle.

multitouch (n)~ A real-time, physical action applied to an object, in which multiple contact points are used simultaneously.

multi-touch (n)~ A real-time, physical action applied to an object, in which multiple contact points are used simultaneously.

multi-touch (n)~ The combination of hardware (touchscreen or touchpad) and software elements that provides a way to control programs by touching multiple points on the screen simultaneously.

multi-touch emulation (n)~ The process of simulating multi-finger touch by using the mouse.

multi-touch gesture (n)~ An extension of the conventional touch input feature to allow multiple fingers touching the computer or device screen at the same time.

multi-touch input (n)~ An extension of the conventional touch input feature to allow multiple fingers touching the computer or device screen at the same time.

multiuser (adj)~ Pertaining to any computer system that can be used by more than one person. Although a microcomputer shared by several people can be considered a multiuser system, the term is generally reserved for machines that can be accessed simultaneously by several people through communications facilities or via network terminals.

multiuser shared database (n)~ A database that permits more than one user to access and modify the same set of data at the same time.

multivalued field (n)~ A lookup field that can store more than one value.

MUP (n)~ A kernel-mode component responsible for channeling all remote file system accesses using a Universal Naming Convention (UNC) name to a network redirector (the UNC provider) that is capable of handling the remote file system requests.

Music (PN)~ A Surface application from Microsoft where users can browse through albums, select songs, and play them from the playlist.

Music (PN)~ An app that facilitates the playing of music.

music (PN)~ A Bing feature that allows the user to find out information about a recording song that is playing on the radio.

Music (PN)~ The title of the hub for music and video.

music (PN)~ A game category that emphasizes rhythm, musicality, or auditory experiences.

Music (PN)~ An MSN site that provides artist, album information and latest music news.

Music (PN)~ An app category that contains apps for music enthusiasts.

Music & Video (PN)~ An app category that facilitates listening to and viewing music and video content.

music + video (PN)~ An app category that facilitates listening to and viewing music and video content.

Music Configuration tool (n)~ The tool that you use to configure the Music application.

music on hold (n)~ A feature that enables the playing of prerecorded music/audio for callers while they are on hold.

Music Pass (PN)~ The Music Store subscription-based account.

Music production (PN)~ The Multimedia design subcategory containing apps to help with creating music.

music search (n)~ A Bing feature that allows the user to find out information about a recording song that is playing on the radio.

music searches (PN)~ A feature in Cortana's Notebook that stores the history of songs that the user has searched for using Bing Music Search.

Music Store (PN)~ The area of Windows Store and Microsoft Store where music is sold

Music Virtual Folder (n)~ A feature that allows the user to group music files by any criteria and display them in one place. This is similar to making a playlist.

Music+videos (PN)~ A default folder on the Start screen that replaces the Music app. The folder contains Xbox Music, Xbox Video, Podcasts, and FM radio.

Musical (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 77.

Musical Instrument Digital Interface (n)~ A specification of the MIDI Manufacturers Association (MMA). The specification defines a protocol for describing music data, such as note on and note off messages; a file format for storing music data, called Standard MIDI; and a standard hardware interface.

mute (v)~ To eliminate or temporarily suppress the sound produced by a device, such as a computer or digital media device. A device in such a state has a volume level of zero.

Mute (adj)~ An option that allows the user to temporarily suppress the device's microphone during a call so that no sound is transmitted to other call participants.

mute (v)~ To disable on-screen and sound notification.

Mute All Except Me (PN)~ A button on Conference Controls that mutes the microphones of all conference participants except the user's microphone.

Mute Me (PN)~ A button on Conference Controls that mutes the user's microphone in a

conference.

Mute Microphone (PN)~ A button on Audio Controls that mutes the user's microphone.

Mute Speakers (PN)~ A button on Audio Controls that mutes the user's speakers.

mutex (n)~ A programming technique that ensures that only one program or routine at a time can access some resource, such as a memory location, an I/O port, or a file, often through the use of semaphores, which are flags used in programs to coordinate the activities of more than one program or routine.

mutual exclusion (n)~ A programming technique that ensures that only one program or routine at a time can access some resource, such as a memory location, an I/O port, or a file, often through the use of semaphores, which are flags used in programs to coordinate the activities of more than one program or routine.

MX record (n)~ A type of resource record in the Domain Name System (DNS) specifying how Internet e-mail should be routed using the Simple Mail Transfer Protocol (SMTP). Each MX record contains a preference and a host name, so that the collection of MX records for a given domain name point to the servers that should receive e-mail for that domain, and their priority relative to each other.

MX token (n)~ The set of numbers found in the MX server field in the MX Record Configuration section on the Domain Settings page of the Windows Live Admin Center. The MX token value is unique for each domain. It is required to create an MX record or a CNAME record at DNS hosting services.

MxM (n)~ An industry standard connector used in mobile platforms for attaching peripherals to the PCI bus.

MXN (n)~ The official currency of Mexico.

My Account (PN)~ A web experience on Office.com that enables users to manage their Office licenses and subscriptions.

My account (PN)~ The section of the Store where the user can set and update the Store account settings.

My Active (adj)~ A view that lists all the active records of the current record type that belong to the mobile user, for example all the accounts with a status of Active for which the mobile user is listed as the owner.

My apps (PN)~ The section of the Store showing the group of apps that the user owns.

My apps (PN)~ The webpage that displays all the apps that a particular user has a license to and that is scoped to the individual user.

My Closed (adj)~ A view that lists all the activities with a status of Closed that belong to the mobile user.

My Code (n)~ A debugging feature that hides non-user code so that it does not appear in the debugger windows.

My Computer (n)~ A standard Windows icon that represents a user's private, usually local, storage.

My Day (n)~ An application partnered with Entourage that allows users to display a customized summary of their daily activities.

My Device (n)~ A menu choice or remote button that offers access to the user's portable media device.

My Documents (n)~ A folder that provides you with a convenient place to store

documents, graphics, or other files you want to access quickly. When you save a file in a program such as WordPad or Paint, the file is automatically saved in My Documents, unless you choose a different folder.

My Family (PN)~ A section of windowsphone.com where users can register family members' Windows Phone 8 phones in order to enable app purchases for kids, set app and game download permissions for kids, share app purchase history with family members, and locate family members on a map.

My friends and their friends (PN)~ The UI label for a permissions setting that indicates an item is being shared with (made available to) all of someone's friends, and all of those friends' friends.

My Home page (n)~ A Web page, which is displayed when users log in, that allows them to manage their account.

My Inactive (adj)~ A view that lists all the inactive accounts or contacts that belong to the mobile user.

My Music (n)~ A folder that stores the user's music library.

My Notes (PN)~ A home part that allows the user to view all notes that are addressed to them. We will not be able to implement Notifications as described in the POR for Dynamics NAV 5.0. Therefore we will implement My Notes instead. When the user clicks the note link in their My Notes home part, the task page that contains the note will appear. My Notes is a list-based system where users can view all note that are addressed to them. Users will be able to view the following fields: To, From, Description. On task pages, users can write a note and then select users they want to whom they send the note.

My Notes (PN)~ A OneNote notebook that is automatically created for every student and every educator. It contains tabs for each of their classes.

My object (n)~ In Visual Basic, the feature that makes programming faster and easier by giving you intuitive access to commonly needed objects in the .Net Framework Base Class Library.

My Office (PN)~ A tab available to users who are signed in on Office.com where they can launch Office on Demand and access their most recently used online documents and folders.

My Open (adj)~ A view that lists all the activities with a status of Open that belong to the mobile user.

My Phone (PN)~ A hub on WindowsPhone.com where users can manage their own Windows Phone experience, including finding a lost phone, reinstalling apps or viewing purchase history, tracking their Xbox achievements, and viewing photos, videos, and Office docs saved to OneDrive.

My Places bar (PN)~ An area at the left side in some dialog boxes, such as Save As, Open, and Insert Picture that contains shortcuts to various folders.

My Playlists (n)~ A menu choice or remote button that offers access to the user's playlists.

My profile (n)~ The control that lets users change their photo, presence, and other public information.

My Queries (PN)~ A folder under the work items node of every Team Foundation project that contains queries defined by, and seen only by the current user.

My Reports (n)~ A personalized workspace.

My Site (PN)~ A personal SharePoint site intended for individual users in an organization. It provides a central location where a user can store, manage, and share content and personal profile information, and incorporates elements of social networking.

My Status (PN)~ A menu item that opens another menu from which the user can change status settings.

my stuff (n)~ A broad set- of all- the user's local and cloud-based content, including documents, apps, settings, photos, videos, music, and email.- Cortana or Bing can search this content and return it in search results.

My Subscriptions (n)~ A page that lists all subscriptions that a user owns.

My Support (n)~ A resource area where you can learn about using Windows XP Starter Edition and find answers to your questions. In My Support, you will find Help topics, tutorials, links to online support sites, and other important information.

My Tasks (PN)~ A feature that provides a search-based aggregation of tasks assigned to a My Site user across SharePoint, Project Server and Exchange to help the user organize and complete these tasks.

My Videos (n)~ A menu choice or remote button that offers access to the user's video library.

My videos (PN)~ The filter in the context of a particular channel that shows only the videos uploaded or owned by the user who is currently logged in.

My Watchlist (oth)~ A feature of the Bing Finance app that lets users choose stocks to watch and personalize the app with these choices.

My Windows Phone (PN)~ A free online service that's accessible through www.windowsphone.com. The main feature of this service is that users can find a lost phone.

mySAP ERP (PN)~ The back-end SAP line-of-business system that Microsoft Office applications communicate with using Duet technology.

MySQL ~ popular open-source database software. See SQL;- www.mysql.com/

N ~

N + 1 ~ A configuration of clustered servers or storage subsystems that provides redundancy for improved reliability by using multiple primary systems and one backup system. This provides for improved scalability and reduced cost compared to two-times (1+1) configurations.

N to M Matches (oth)~ A menu item that allows the user to search for a pattern A to be represented in pattern B between N and M times. Patterns could be strings, characters, etc.

N.T. dollar (n)~ The official currency of Taiwan.

n/a (oth)~ Pertaining to something for which an answer is not available or appropriate.

N/A (oth)~ Pertaining to something for which an answer is not available or appropriate.

NACHA (PN)~ An organization that operates the Automated Clearing House (ACH)

Network.

nagling (n)~ An optimization process for HTTP over TCP that increases efficiency by trying to minimize the number of packets that are required before data is sent.

NAK (n)~ A control code, ASCII character 21 (hexadecimal 15), transmitted to a sending station or computer by the receiving unit as a signal that transmitted information has arrived incorrectly.

Name AutoCorrect (n)~ A feature that automatically corrects common side effects that occur when you rename forms, reports, tables, queries, fields, or controls on forms and reports. However, Name AutoCorrect cannot repair all references to renamed objects.

name devolution (n)~ The process by which a DNS resolver attempts to resolve a name by appending the DNS search suffix to the name and, if that query fails, by iteratively querying for the name in the next higher level of the domain hierarchy.

name registration request (n)~ A message sent to a NetBIOS name server when a TCP/IP host begins an attempt to register the domain name.

name release (n)~ A message sent to a NetBIOS server to indicate that a domain name has been released and is available for use by another server.

name resolution (n)~ The process of having software translate between names that are easy for users to work with and numerical IP addresses, which are difficult for users but necessary for TCP/IP communications. Name resolution can be provided by software components such as DNS or WINS.

name server (n)~ A server that maintains information about a portion of the DNS database and that responds to and resolves DNS queries.

name/value pair (n)~ The name of a form field and the value of the field at the time the form is submitted.

named argument (n)~ An argument that has a name that is predefined in a field. Instead of providing values for arguments in the order expected by the syntax, you can use named arguments to assign values in any order.

named binding (n)~ A way of binding to a directory where users may be able to set attributes and may have access to more areas of the directory, if the administrator allows it.

named cache (n)~ A configurable unit of in-memory storage that has policies associated with it and that is available across all cache hosts in a cache cluster.

named entity (n)~ A code that's used in HTML to describe symbols, international letters, and other special characters. Character entities are maintained by the International Standards Organization (ISO).

named instance (n)~ An installation of SQL Server that is given a name to differentiate it from other named instances and from the default instance on the same computer.

named item view (PN)~ A Web Part that renders named objects or named items in a workbook, such as tables, charts, slicers or a named range of cells.

named object (n)~ A list, PivotTable-® report, chart, or range that can be referenced by name. A sheet is not a type of named object.

named pipe (n)~ A portion of memory that can be used by one process to pass information to another process, so that the output of one is the input of the other. The second process can be local (on the same computer as the first) or remote (on a networked

computer).

named set (n)~ A grouping of dimension members or items from a data source that are named and treated as a single unit and can be referenced or reused multiple times.

named skin (n)~ A control skin with a SkinID property set.

named stream (n)~ Binary data that is associated with an entry in an Open Data Protocol (OData) feed, but that is not a media resource as defined by the Atom Publishing Protocol (AtomPub).

named update (n)~ A custom service operation that performs an action which is different than a simple query, update, insert, or delete operation.

named update method (n)~ A custom service operation that performs an action which is different than a simple query, update, insert, or delete operation.

Named Users (PN)~ A unit of measure for the Remote App' service type of the 'App Services' Service where accounts are associated to each individual who will have access to the software in such a way as to identify that individual and bill the customer either per user or consumption.'

Nameserver ~ An internet server which translates the alphabetic web addresses favoured by humans into the numeric ones used by computers.

namespace (n)~ A collection of names, identified by a URI reference, that are used in XML documents as element types and attribute names.

namespace (n)~ A naming convention that defines a set of unique names for resources in a network. For DNS, a hierarchical naming structure that identifies each network resource and its place in the hierarchy of the namespace. For WINS, a flat naming structure that identifies each network resource using a single, unique name. For DFS Namespaces, a virtual tree of folders that begins with \ServerOrDomainName\RootName.

namespace (n)~ In Distributed File System (DFS), a virtual grouping of shared folders potentially located on different servers that appears to users as a single shared folder with a series of subfolders. The underlying structure of the namespace can consist of multiple shared folders that are located on different servers and in multiple sites.

namespace (n)~ A grouping of one or more names that represent individual objects within the group in a shared computing environment.

namespace root (n)~ The top-level folder in a Distributed File System (DFS) namespace.

namespace server (n)~ A server that hosts a namespace. You can increase the availability of a domain-based namespace by specifying additional namespace servers to host the namespace.

name-value pair (n)~ The name of a form field and the value of the field at the time the form is submitted.

naming container (n)~ Any ASP.NET control that implements the INamingContainer interface. This is a marker interface that enables a control to create a new naming scope under itself so that ID attributes assigned to its child controls are unique within the entire ASP.NET page that contains the control.

naming context (n)~ A specific subtree of a directory information tree that is identified by its distinguished name (also known as DN). In Sun ONE Directory Server 4.0 and 5.1, specific types of directory information are stored in naming contexts.

naming convention (n)~ Any standard used more or less universally in the naming of

objects, etc.

NaN (n)~ A value that represents the result of an invalid calculation.

NAP (n)~ A set of operating system components that can help protect access to a private network by enforcing health policies. System administrators establish health policies which NAP enforces by inspecting and assessing the health of client computers, restricting network access when client computers are deemed noncompliant, and remediating noncompliant client computers for full network access. NAP also provides ongoing health compliance enforcement while a client computer is connected to a network.

NAP EC (n)~ A component in a NAP client architecture that integrates with network access technologies, such as DHCP, VPN, 802.1X, IPsec, and RD Gateway. The NAP enforcement client requests access to a network, communicates a client computer's health status to the NAP server that is providing the network access, and communicates the restricted status of the client computer to other components of the NAP client architecture.

NAP enforcement client (n)~ A component in a NAP client architecture that integrates with network access technologies, such as DHCP, VPN, 802.1X, IPsec, and RD Gateway. The NAP enforcement client requests access to a network, communicates a client computer's health status to the NAP server that is providing the network access, and communicates the restricted status of the client computer to other components of the NAP client architecture.

NAP enforcement point (n)~ A server or network access device that uses NAP or can be used with NAP to require the evaluation of a NAP client's health state and provide restricted network access or communication. HRA servers, 802.1X switches and wireless access points, NAP-enabled VPN, DHCP, and RD Gateway servers are examples of NAP enforcement points.

NAP enforcement server (n)~ A component of the NAP architecture that enforces restricted network access for noncompliant NAP clients. Depending on the NAP enforcement method, the NAP enforcement server can be a component of a NAP enforcement point.

NAP ES (n)~ A component of the NAP architecture that enforces restricted network access for noncompliant NAP clients. Depending on the NAP enforcement method, the NAP enforcement server can be a component of a NAP enforcement point.

NAP-capable client (n)~ A Windows-based client that supports Network Access Protection.

Napster ~ A pioneering- peer-to-peer- internet file-sharing system. Because much of the data shared was copyrighted, and thus being distributed illegally, the operators of Napster were hit with a number of large lawsuits by the music industry, and later closed down. The name was bought and is now used by a legal pay-to-download service.

narcissus ~ A defect in infrared systems that appears as a dark circular area on a displayed image, caused by radiation reflecting into a detector. It can be reduced by low-reflective coatings or by altering the lens surface.

narration (n)~ A recording that can be added to a presentation.

Narrator (PN)~ A feature that audibly reads the text on the screen aloud and describes some events to users.

narrowband ~ A low information capacity, equivalent to one speech channel (4kHz

analogue or 64kbit/s digital signal).

narrowband audio (n)~ Audio transmission that uses conventional telephony bandwidths for voice.

narrowband audio codec (n)~ An audio codec that provides voice by using a sampling rate of 8 kHz.

narrowband codec (n)~ An audio codec that provides voice by using a sampling rate of 8 kHz.

nary (adj)~ Pertaining to an operator that can hold an arbitrary number of arguments, or to a function that can hold an arbitrary number of operators.

n-ary (adj)~ Pertaining to an operator that can hold an arbitrary number of arguments, or to a function that can hold an arbitrary number of operators.

n-ary association (n)~ In a static structure diagram, an association among three or more classes (a single class may appear more than once). Each instance of the association is an ordered set of values from the respective classes.

NAS (n)~ The device that accepts Point-to-Point Protocol (PPP) connections and places clients on the network that the NAS serves.

NAS (n)~ A storage unit directly connected to the network using standard protocols such as Ethernet and TCP/IP for providing file access services.

NAT (n)~ An Internet Protocol (IP) translation process that allows a network with private addresses to access information on the Internet.

NAT editor (n)~ A component of a network address translator that performs additional translation and payload adjustment beyond the IP, TCP, and UDP headers. A NAT editor is an installable component that can properly modify otherwise non-translatable payloads so that they can be forwarded across a NAT.

National Automated Clearing House Association (PN)~ An organization that operates the Automated Clearing House (ACH) Network.

National Folk (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 82.

national language support API (n)~ Set of system functions in 32-bit Windows containing information that is based on language and cultural conventions.

National Register of Legal Entities (PN)~ A 14-digit identification number issued to Brazilian companies by the Brazilian Ministry of Revenue for tax purposes.

native (adj)~ Of, pertaining to, or characteristic of something that is in its original form.

Native American (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 64.

native boot (n)~ An operating-system installation and configuration that uses a virtual hard disk as the running operating system. There is no host operating system or hypervisor in a native-boot configuration.

native code (n)~ Code that has been compiled to processor-specific machine code.

native format (n)~ A data format that maintains the native data types of a database. Native format is recommended when you bulk transfer data between multiple instances of Microsoft SQL Server using a data file that does not contain any extended/double-byte

character set (DBCS) characters.

native image generation (n)~ A pre-compilation technology for managed code that compiles Common Intermediate Language (CIL) to native code on the end-user computer prior to application run time. It is an alternative to JIT compilation.

native integration (n)~ In Silverlight, the use of platform-specific functionality in a Silverlight-based application.

native language (n)~ The machine language of a CPU.

native mode (n)~ In Windows2000 domains, the domain mode in which all domain controllers in a domain are running Windows2000 and a domain administrator has switched the domain operation mode from mixed mode to native mode. Native mode supports universal groups and nesting of groups. In native mode, domain controllers running WindowsNT4.0 or earlier are not supported. In Windows Server2003 domains, native mode is referred to as 'Windows2000 native', and it is one of three domain functional levels available.

native resolution (n)~ The resolution a display is designed to use. Unlike cathode ray tube technology, liquid crystal displays cannot stretch or shrink images gracefully. The pixels are either stretched or shrunk over greater or fewer cells, so upsizing or downsizing images to non-native resolutions degrades visual quality.

native-activity (n)~ A sample provided with Android NDK based on an abstract base class for custom activities that implement execution logic using the Execute method, which has full access to the runtime's features.

natural account code segment (n)~ A segment of a general ledger account code that corresponds to the type of account (for example, cash, sales, or travel expense).

natural hierarchy (n)~ A hiearchy in which at every level there is a one-to-many relationship between members in that level and members in the next lower level.

natural key (n)~ A primary key or alternate key whose values identify objects in the real world.

natural language (n)~ A language spoken or written by humans, as opposed to a language used to program or communicate with computers.

natural language searching (n)~ A search method that lets you direct your search using conversational language.

natural pencil (n)~ A pencil tool that works with texture and simulates a real life pencil in stroke.

Natural Persons Register (PN)~ An 11-digit identification number issued to Brazilians and resident aliens by the Brazilian Ministry of Revenue for identification and tax purposes.

natural query syntax (n)~ A search method that lets you direct your search using conversational language.

natural segment (n)~ A segment of a general ledger account code that corresponds to the type of account (for example, cash, sales, or travel expense).

natural sizing (n)~ The default layout and sizing of a collection of elements, as determined by MSHTML.

nav bar (n)~ An app bar that appears along the top edge of the screen and may include app commands or navigation.

nav bar (n)~ A surface that appears on the phone screen with a -€œsoft-€? key for the Back, Start and Search button. User gets to choose whether it should be visible or not.

nav bar control (n)~ A control that developers use to create a navigation bar.

navigate (v)~ To move around in a document.

Navigate ~ To find one's way around the Internet.

Navigation & maps (PN)~ An app category that contains apps with maps, GPS, or other tools to help you find your way.

navigation bar (n)~ On a Web page, a grouping of hyperlinks for getting around in that particular Web site.

Navigation Bar (n)~ A control bar in Outlook that enables the user to navigate quickly to different areas or views within the application.

navigation bar (n)~ An app bar that appears along the top edge of the screen and may include app commands or navigation.

navigation bar (n)~ A surface that appears on the phone screen with a -€œsoft-€? key for the Back, Start and Search button.

navigation bar control (n)~ A control that developers use to create a navigation bar.

navigation button (n)~ A button that is used to move through records or through the pages of a document.

navigation connection (n)~ The connection between two navigation nodes in the Application Flow panel in SketchFlow.

navigation frame (n)~ A framework that all navigation places are built on that allows users to move throughout the application. The basic elements of the navigation frame are the Address bar, travel buttons, menu bar, navigation pane and a status bar.

Navigation mode (n)~ The mode in Microsoft Access in which an entire field is selected and the insertion point is not visible. In Navigation mode, you can move between fields by using the arrow keys.

navigation node (n)~ A node in the Application Flow panel of a SketchFlow prototype that represents a point in the application flow.

navigation pane (n)~ An area of an application window that enables the user to navigate quickly to different parts of the program.

navigation pane (n)~ A section of the window displayed to the user, to the right side of the workspace shortcuts area, that provides access to the overview area and additional items for each workspace through a tree view of the hierarchy for the workspace, except for the System Overview and Software workspaces.

navigation place (n)~ A window that is part of the navigation layer in the Dynamics NAV application.

navigation property (n)~ A property of entity types that uses an association to reference related entities.

navigational flick (n)~ A gesture you can make with a tablet pen to quickly navigate and perform shortcuts. Navigational pen flicks include scroll up, scroll down, page back, and page forward.

navigational pen flick (n)~ A gesture you can make with a tablet pen to quickly navigate and perform shortcuts. Navigational pen flicks include scroll up, scroll down, page back, and page forward.

NBV (n)~ The value of a fixed asset calculated as the difference between the original cost of the fixed asset minus its accumulated depreciations.

NCB (n)~ NetBIOS data structures that contain information about the command to perform an optional post routine, an optional event handle, and a pointer to a buffer that is used for messages or other data.

nchar (PN)~ The fixed-length data type with a maximum of 4,000 Unicode characters.

NDA (n)~ A contract that restricts disclosure of confidential information or proprietary knowledge.

NDR (n)~ A notification that an e-mail message was not delivered to the recipient.

NDS (n)~ On networks running Novell NetWare 4.x and higher, a distributed database that maintains information about every resource on the network and that provides access to these resources.

near clipping plane (n)~ The near boundary of a viewing frustum or camera. Any object closer to the camera than this clipping plane is not rendered.

near field communication (n)~ A communication technology based on short range (4cm or less) wireless data exchange.

near field communication sensor (n)~ A type of sensor (such as a proximity sensor) that uses near field communication (NFC).

nearest neighbor (n)~ A rendering method used to map a source image to a target image. This method uses only the nearest source pixel to define a target pixel.

Nederlandse Taxonomie Project (n)~ A standard taxonomy (v1.0 based on XBRL 2.1 and IFRS) that is defined for all businesses operating in the Netherlands for reporting financial, tax, and statistical data to government agencies.

Need of Delivery (n)~ The formula used to determine the time and frequency with which a piece of content is delivered. This formula takes into account the total quantity of content to be delivered, and the length of time over which the quantity must be delivered.

needle cap (n)~ One of the two appearance properties that can be applied to a radial gauge.

negative acknowledgment (n)~ A control code, ASCII character 21 (hexadecimal 15), transmitted to a sending station or computer by the receiving unit as a signal that transmitted information has arrived incorrectly.

negative balance (n)~ A quantity or amount that has fallen below zero.

negative goodwill (n)~ The difference between the fair market value and purchase price of an asset, when the fair market value is higher than the price paid.

negative indent (n)~ An indent where the text is displaced into the left margin if text direction is set to left-to-right, or toward the right margin if text direction is set to right-to-left.

negative inventory (n)~ A temporary negative quantity of an item, such as may occur when items have been purchased and received but for which a packing slip has not yet been processed.

neglected account (n)~ A Business Contact with whom there has been no interaction with for over 30 days.

neglected business contact (n)~ A Business Contact with whom there has been no interaction with for over 30 days.

neglected contact (n)~ A Business Contact with whom there has been no interaction with for over 30 days.

negotiable instrument (n)~ A formal written document that unconditionally promises to pay money and that can be transferred from one person to another.

nest (v)~ To embed one construct inside another. For example, a database may contain a nested table (a table within a table), a program may contain a nested procedure (a procedure declared within a procedure), and a data structure may include a nested record (a record containing a field that is itself a record).

nested frames page (n)~ A frames page containing another frames page inside one of its frames.

nested loops join (n)~ A join algorithm which compares each row from one source (known as the outer source) to each row from the other source (known as the inner source) looking for rows that satisfy the join predicate. A source could be a table.

nested query (n)~ A SELECT statement that contains one or more subqueries.

nested table (n)~ A table inserted within a table cell. If you use a table to lay out a page, and you want to use another table to arrange the information, you can insert a nested table.

Nested Target (PN)~ A SmartArt graphic layout used to show containment relationships. Each of the first three lines of Level 1 text correspond to the upper left text in the shapes, and Level 2 text corresponds to the smaller shapes. Works best with minimal Level 2 lines of text. Unused text does not appear, but remains available if you switch layouts.

nested type (n)~ A type defined within the scope of another type. A nested type is typically used for encapsulating implementation details of the top-level type.

nesting (n)~ A media entry in a Web playlist that references another Web playlist file.

nesting ~ programming commands that are inside of another command. The term does not lend itself to any single language but generally to all that support nesting. Not all commands can be nested and not all combinations of commands can be nested.

net (adj)~ Pertaining to the remainder after all deductions, charges, or losses are subtracted from a total.

net amount (n)~ The amount including all deductions, charges, and adjustments.

net book value (n)~ The value of a fixed asset calculated as the difference between the original cost of the fixed asset minus its accumulated depreciations.

net change master scheduling (n)~ A master scheduling principle in which net requirements are calculated only for items that have had a change in demand since the last master schedule was calculated.

Net Logon service (n)~ A user-mode service that runs in the Windows security subsystem. The Net Logon service passes the user`s credentials through a secure channel to the domain database and returns the domain security identifiers and user rights for the user. In addition, the Net Logon service performs a variety of other functions related to the user logon process, such as periodic password updates for computer accounts and domain controller discovery.

Netbeans ~ Open-source application development tools,- www.netbeans.org

NetBEUI (n)~ A network protocol native to Microsoft Networking. It is usually used in small, department-size local area networks (LANs) of 1 to 200 clients. NetBEUI can use Token Ring source routing as its only method of routing. NetBEUI is the Microsoft

implementation of the NetBIOS standard.

NetBIOS (n)~ An application programming interface (API) that can be used by programs on a local area network (LAN). NetBIOS provides programs with a uniform set of commands for requesting the lower-level services required to manage names, conduct sessions, and send datagrams between nodes on a network.

NetBIOS Extended User Interface (n)~ A network protocol native to Microsoft Networking. It is usually used in small, department-size local area networks (LANs) of 1 to 200 clients. NetBEUI can use Token Ring source routing as its only method of routing. NetBEUI is the Microsoft implementation of the NetBIOS standard.

NetBIOS name (n)~ A 16-byte name of a process using network basic input/output system (NetBIOS). The NetBIOS name is a name that is recognized by WINS, which maps the name to an IP address.

NetBIOS Node Type (n)~ A designation of the exact mechanisms by which network basic input/output system (NetBIOS) names are resolved to IP addresses.

NetBIOS over TCP/IP (n)~ A feature that provides the NetBIOS programming interface over the TCP/IP protocol. It is used for monitoring routed servers that use NetBIOS name resolution.

netbook (n)~ A small, affordable laptop that is designed to perform a limited number of tasks such as web browsing and e-mail.

Netbook ~ A smaller version of the popular laptop computer format.

netbook ~ basically a small, inexpensive yet Internet-ready computer with less computing power than a standard laptop.

NetBT (n)~ A feature that provides the NetBIOS programming interface over the TCP/IP protocol. It is used for monitoring routed servers that use NetBIOS name resolution.

netgroup (n)~ The Unix industry standard for grouping computers (hosts) based on NIS domain name and host name. Netgroups can be defined both on a NIS server (UNIX) or on LDAP server (e.g. Active Directory) which are called netgroup sources.

netgroup source (n)~ A NIS server (UNIX) or a LDAP server (e.g. Active Directory) that is used by the Microsoft Services for Network File System (NFS) to define and grant permissions to netgroups.

Netgroup Source Wizard (PN)~ A wizard that allows you to configure a netgroup source and review your settings.

Netherlands Taxonomy Project (n)~ A standard taxonomy (v1.0 based on XBRL 2.1 and IFRS) that is defined for all businesses operating in the Netherlands for reporting financial, tax, and statistical data to government agencies.

Net-Library (PN)~ A SQL Server communications component that isolates the SQL Server client software and the Database Engine from the network APIs.

NetView (PN)~ A reporting system that runs on an IBM host mainframe system. NetView forwards alerts and other information between the host, personal computers, and other network addressable units connected to the host.

NetView alert (n)~ A message sent to the NetView reporting system, indicating an abnormal event or a failure.

NetWare ~ Novell-developed NOS. Provides file and printer sharing among networks of PCs. Each network must have at least one file server, and access to other resources is

dependent on connecting to and logging into file server.

NetWare Directory Services (n)~ On networks running Novell NetWare 4.x and higher, a distributed database that maintains information about every resource on the network and that provides access to these resources.

network (n)~ A group of computers or other devices, such as printers and scanners, that communicate either wirelessly or by using a physical connection, such as an Ethernet cable or a phone line.

network (n)~ A group of people someone communicates and shares with on Windows Live. Someone's network includes people they've added to their profile, to their Messenger contacts, or both. People in someone's network can see information about their latest activities in the what's new list, and may see other information, depending on permissions settings.

network (n)~ A system of dividing up territory into independent areas for mobile telephony (voice and data connections), managed by mobile operators.

Network ~ A way of linking several computers together so that their users can share resources such as printers and documents, often via a central computer called a- server. See also- LAN,- WAN,Ethernet.

Network & Internet (PN)~ The UI label for network and Internet settings in Windows desktop.

Network & wireless (PN)~ The UI label for network and wireless (mobile) settings in Windows 10 Mobile.

Network Access Protection (n)~ A set of operating system components that can help protect access to a private network by enforcing health policies. System administrators establish health policies which NAP enforces by inspecting and assessing the health of client computers, restricting network access when client computers are deemed noncompliant, and remediating noncompliant client computers for full network access. NAP also provides ongoing health compliance enforcement while a client computer is connected to a network.

network access server (n)~ The device that accepts Point-to-Point Protocol (PPP) connections and places clients on the network that the NAS serves.

network adapter (n)~ An expansion card or other device used to provide network access to a computer or other device, such as a printer. Mediates between the computer and physical media, such as cabling, over which transmissions travel.

network adapter driver (n)~ A device driver that works directly with the network adapter, acting as an intermediary between the adapter and the protocol driver.

network address translation (n)~ An Internet Protocol (IP) translation process that allows a network with private addresses to access information on the Internet.

network administrator (n)~ A person responsible for planning, configuring, and managing the day-to-day operation of the network.

network agent (n)~ A background process within a virtual machine that updates the network configuration of that machine in order to support network isolation.

Network and Sharing Center (PN)~ A task page in the Windows Control Panel from where customers can get real-time status information about their network, and also make changes to settings.

network architecture (n)~ The underlying structure of a computer network, including hardware, functional layers, interfaces, and protocols, used to establish communication and ensure the reliable transfer of information. Network architectures are designed to provide both philosophical and physical standards for the complexities of establishing communications links and transferring information without conflict. Various network architectures exist, including the internationally accepted seven-layer ISO Open Systems Interconnection (OSI) model and IBM's Systems Network Architecture (SNA).

Network Awareness (n)~ A service of Windows Vista that collects network information available to Windows on behalf of applications and enables them to easily and effectively adapt to changes in network environments.

network bandwidth throttling (n)~ The process of setting the maximum portion of total network capacity that a service is allowed to use. An administrator can deliberately limit a servers Internet workload by not allowing it to receive requests at full capacity, thus saving resources for other programs, such as e-mail.

network bandwidth usage throttling (n)~ A performance optimization in DPM that limits the percentage of network bandwidth that protection and recovery jobs can consume.

network basic input/output system (n)~ An application programming interface (API) that can be used by programs on a local area network (LAN). NetBIOS provides programs with a uniform set of commands for requesting the lower-level services required to manage names, conduct sessions, and send datagrams between nodes on a network.

network bridge (n)~ Software or hardware that connects two or more networks so that they can communicate, and that operates at the data-link layer (layer 2) of the OSI model.

network card driver (n)~ A device driver that works directly with the network card, acting as an intermediary between the card and the protocol driver.

Network card, Network Interface Card ~ An- Expansion card- which lets a PC communicate with anetwork, required for- broadband- Internet access. See alsoEthernet,- NIC.

Network Center (n)~ A control panel that provides the status of your network and access to networking activities.

network configuration (n)~ The entire interconnected set of hardware, or the way in which a network is laid out—the manner in which elements are connected.

network connection (n)~ A link between a user's computer and a group of computers and other devices that enables the user to access printers, servers etc. The link can be through a wire, cable, phone line or wireless transmissions.

network control block (n)~ NetBIOS data structures that contain information about the command to perform an optional post routine, an optional event handle, and a pointer to a buffer that is used for messages or other data.

network control program (n)~ In a communications network that includes a mainframe computer, a program that usually resides in a communications controller and takes over communications tasks such as routing, error control, line control, and polling (checking terminals for transmissions), leaving the main computer free for other functions.

network database (n)~ A database that runs in a network.

Network Device Enrollment Service (n)~ A Public Key Infrastructure (PKI)

communication protocol that defines the communication between network devices and a Registration Authority (RA) for certificate enrollment.

Network Diagram (n)~ A diagram that shows dependencies between project tasks. Tasks are represented by boxes, or nodes, and task dependencies are represented by lines that connect the boxes.

Network Discovery method (n)~ An SMS/Configuration Manager discovery method that enables the SMS/Configuration Manager administrator to discover any network resources that are IP addressable.

network drive (n)~ On a local area network (LAN), a drive that other computers on the network can connect to. A network drive allows people to access shared files and folders.

Network Explorer (n)~ A utility in Windows Vista that presents a view of all PCs, devices, and printers on the network, and is significantly faster and more reliable than My Network Places in Windows XP.

network file system (n)~ A distributed file system that allows users to access remote files and directories on a network as if they were local. NFS is compatible with Microsoft Windows and UNIX-based systems, including Linux and Mac OS X.

network gateway (n)~ A device that connects networks using different communications protocols so that information can be passed from one to the other. A gateway both transfers information and converts it to a form compatible with the protocols used by the receiving network.

network ID (n)~ A number used to identify the systems that are located on the same physical network bounded by routers. The network ID should be unique to the internetwork.

Network Information Service (PN)~ A network naming and administration system that was developed by Sun Microsystems and is constructed on the client-server model of computing. Formerly known as Yellow Pages (yp), NIS provides a simple network look-up service that consists of databases and processes.

Network Information Service map (n)~ A database served by Network Information Service (NIS). The NIS lookup calls require a map (database) name and an NIS domain name. An NIS domain consists of a collection of such maps.

Network Inspection System (PN)~ A detection system that helps guard against intrusion attempts targeting known and newly discovered vulnerabilities in network protocols.

network inter-site policy (n)~ Defines bandwidth limitations between sites that are directly linked within a call admission control (CAC) configuration.

network isolation (n)~ The use of an IP address pool to enable multiple copies of a lab environment to be run concurrently without causing network conflicts such as conflicts in computer names, DNS registration, and so forth.

network isolation environment (n)~ A virtual environment that is run with network isolation, thereby protecting it from network conflicts.

network key (n)~ A password that can help protect wireless networks from unauthorized access. A network security key encrypts information sent from one network computer to another so that the information can only be read by someone who has the key.

network latency (n)~ The time required for a signal to travel from one point on a network to another.

network layer (n)~ Layer three of the OSI model. A layer that addresses messages and translates logical addresses and names into physical addresses. It also determines the route from the source to the destination computer and manages traffic problems, such as switching, routing, and controlling the congestion of data packets.

Network Level Authentication (PN)~ An authentication method that completes user authentication before you establish a Remote Desktop connection and the logon screen appears.

Network Load Balancing (n)~ A Windows network component that uses a distributed algorithm to load-balance Internet Protocol (IP) traffic across a number of hosts, helping to enhance the scalability and availability of mission-critical, IP-based services, such as Remote Desktop Services, Web services, virtual private networking, and streaming media. It also provides high availability by detecting host failures and automatically redistributing traffic to the surviving hosts.

network location (n)~ In a URL, a unique name that identifies an Internet server. A network location has two or more parts, separated by periods, as in microsoft.com.

network location awareness service (n)~ A service of Windows Vista that collects network information available to Windows on behalf of applications and enables them to easily and effectively adapt to changes in network environments.

network logon (n)~ The process of logging on to a computer by means of a network. Typically, a user first interactively logs on to a local computer, then provides logon credentials to another computer on the network, such as a server, that he or she is authorized to use.

network mask (n)~ The bit mask that is used to match a destination IP address to the value in the Destination field in the IP routing table for a host or a router. In the Windows 2000 IP routing table, this column is named Netmask.

network mix (n)~ The probability of a virtual user running a given network profile. For example: 75% use LAN and 25% use DSL 56K.

network modem (n)~ A modem that is shared by users of a network for calling an online service provider, an ISP, a service bureau, or other online source.

Network Monitor (n)~ A packet capture and analysis tool used to view network traffic.

Network MOS (n)~ A prediction of the wideband listening quality MOS (MOS-LQ) of audio that is played to the user. This value takes into account only network factors such as codec used, packet loss, packet reorder, packet errors and jitter.

network name (n)~ A name identifying an SNA network. The network name is often used in combination with other identifiers, such as a control point name or an LU name. The combination of a network name with a control point name is sometimes called a network qualified control point name.

network name (n)~ A resource that Exchange 2007 Setup assigns to a clustered mailbox server. This resource represents the network name of the clustered mailbox server.

Network Name resource (n)~ In a Windows Server Failover Clustering (WSFC), a logical server name that is managed as a cluster resource. A network name resource must be used with an IP address resource.

Network News Transfer Protocol (n)~ A member of the TCP/IP suite of protocols used to distribute network news messages to NNTP servers and clients (newsreaders) on the

Internet. NNTP is designed so that news articles are stored on a server in a central database, thus enabling a user to select specific items to read.

network number (n)~ In the Macintosh environment, the routing address or range of addresses assigned to the physical network that AppleTalk Phase 2 routers use to direct information to the appropriate network.

network partition (n)~ A state in which one or more of the nodes in a cluster cannot communicate with the other cluster nodes. In this case, the cluster may be split into two or more partitions that cannot communicate with each other.

network password (n)~ A password that you use to log on to a network. You can make this the same as your Windows password, so you have only one password to remember.

network place (n)~ A folder on a Web server.

Network Policy Server (n)~ The Microsoft implementation of a Remote Authentication Dial-In User Service (RADIUS) server and proxy. In the NAP architecture, the NPS server includes the NAP administration server and the system health validator (SHV) components.

Network Printer Installation Wizard (PN)~ A wizard that guides the user through installing a printer on their network.

network profile (n)~ A specific simulation of network bandwidth at the application layer; for example, LAN and Dialup 56K. The network profile does not simulate latency.

network profile (n)~ A profile that determines the network settings for the phone, and then activates or updates that phone.

network protocol (n)~ A set of rules and parameters that defines and enables communication through a network.

network range (n)~ In the Macintosh environment, the routing address or range of addresses assigned to the physical network that AppleTalk Phase 2 routers use to direct information to the appropriate network.

network regions (n)~ The network hubs or backbones that are used in the configuration of call admission control, E9-1-1, and media bypass. They interconnect parts of a network across multiple geographic areas, and every network region must be associated with a central site.

network resource (n)~ An individual computer on an internal corporate or private network that users can connect to through an RD Gateway server. The computer can be either a remote desktop server running RemoteApp programs or a computer with Remote Desktop enabled.

network scanner (n)~ A scanner that is not connected directly to a computer, but is instead connected directly to a network through a wired or wireless connection.

network scanning (n)~ A process of finding, or identifying characteristics of, computers or other resources that are accessible on a network.

network security scan (n)~ An examination of servers for viruses, spyware, and malware.

network server (n)~ On the Internet or other network, a computer or program that hosts web pages and responds to commands from a client.

network service (n)~ A service, such as file and printer sharing on your computer or automatic backup to a network server.

network service set identifier (n)~ A unique set of letters or numbers that identifies a

wireless network. For a computer or device to connect to a wireless network, it must supply that network's SSID. An SSID can be up to 32 characters.

Network Services (PN)~ The family of network services in Microsoft Azure.

network share (n)~ A folder or directory on a computer that is set up to be readable or writeable for certain users on other computers.

network site (n)~ A collections of subnets with similar bandwidth, for example, a branch office location, a set of buildings, or a campus.

network software (n)~ Software that enables groups of computers to communicate, including a component that facilitates connection to or participation in a network.

network topology (n)~ The physical layout of computers, cables, switches, routers, and other components of a network.

Network Topology ~ The physical and logical relationship of nodes in a network; the schematic arrangement of the links and nodes of a network typically in the form of a star, ring, tree or bus topology.

Network Trace (n)~ An SMS Administrator console tool that calculates and diagrams communication routes between an SMS site server and any site system role that you select, based on the discovery data in the SMS site database.

Network Traffic report (n)~ A DPS report that provides information about the impact of synchronization jobs on network traffic.

network user (n)~ A user that is accessing resources on a remote system. A network user may not have a UI or desktop on the remote computer.

network-attached storage (n)~ A storage unit directly connected to the network using standard protocols such as Ethernet and TCP/IP for providing file access services.

networked projection (n)~ A feature of Windows Vista that allows a Windows Vista computer to detect a nearby projector that is a network-connected device and lets the user establish a connection through a wired or wireless, ad hoc, or infrastructure network.

networking (n)~ The category of services in Microsoft Azure that includes Virtual Networks, Microsoft Azure Connect, and Traffic Manager.

Networking (PN)~ The Developer tools subcategory containing apps to help developers with networking aspects of building an app.

Networking API (PN)~ The API for networking.

networking service (n)~ The category of services in Microsoft Azure that includes Virtual Networks, Microsoft Azure Connect, and Traffic Manager.

Networks (PN)~ The networking service in Microsoft Azure that lets customers create and manage virtual private networks in Microsoft Azure and securely link them to other virtual networks or to their own on-premises networking infrastructure.

neutral character (n)~ A character that does not have strong right-to-left or left-to-right language attributes.

neutral protamine hagedorn insulin (n)~ An intermediate-acting insulin given to lower the blood sugar level of diabetics.

New & Rising (PN)~ The category of items (apps or games) that are suggested to users due to their recent popularity.

New & rising apps (PN)~ The category of items (apps or games) that are suggested to users due to their recent popularity.

New & rising games (PN)~ The category of items (apps or games) that are suggested to users due to their recent popularity.

New + Rising Apps (PN)~ The category of items (apps or games) that are suggested to users due to their recent popularity.

New + Rising Games (PN)~ The category of items (apps or games) that are suggested to users due to their recent popularity.

New Age (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 10.

New albums (PN)~ The collection title for music albums that were recently released.

New Calendar (n)~ A UI element that allows the user to create a new Calendar page.

New Connection Wizard (PN)~ A tool that helps users sign up for Internet service and automatically handles the software configuration steps necessary for gaining access to the Internet.

New episode this week (PN)~ The collection title for TV series episodes that aired this week.

New Group (PN)~ The default name for a group of contacts created by the user.

New Last Week (n)~ A view that lists all the active opportunities that belonging to the mobile user that were created during previous calendar week.

new line character (n)~ A control character that causes the cursor on a display or the printing mechanism on a printer to move to the beginning of the next line.

new mail (n)~ A notification on the app bar that appears whenever the user receives a new email.

New movies (PN)~ The collection title for movies that were recently released.

New music (PN)~ The collection title for music items that were recently released.

New Number… (PN)~ The UI element that opens a dialog box where the user can enter a new phone number for call forwarding.

New Protection Group Wizard (n)~ A wizard that is used to create a new protection group which will protect data on a user's file servers.

New Quick Contact (n)~ UI that allows a user to open a Quick Contact form to create a contact record without opening an entire record form.

New releases (PN)~ The category that lists new music or video releases.

New releases (PN)~ The category of items that have recently become available.

New This Week (n)~ A view that lists all the active opportunities belonging to the mobile user that have been created during the current calendar week.

New Ticket Routing Rule (n)~ A Business Rule that fires when a new Ticket is submitted to your Parature Department.

New To Do (n)~ A UI element that allows the user to add a new To Do to the To Do list.

New toolbar (n)~ The toolbar, in wizards and property sheets for creating hardware configurations for virtual machines and for configuring virtual machine hosts, that contains tools for configuring new hardware components. In hardware configurations, the New toolbar contains tools for configuring SCSI adapters, DVDs, and network adapters for virtual machines. In host properties, the New toolbar contains a tool for configuring a virtual network on the host.

New TV shows (PN)~ The collection title for TV episodes or seasons that were recently released.

New Virtual Hard Disk Wizard (PN)~ A wizard that is used by advanced users to create custom virtual hard disks for virtual machines. The purpose of the New Virtual Hard Disk Wizard is to gather the basic information from the user necessary to create a new virtual hard disk.

New Wave (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 66.

new Windows experience (PN)~ The new way of interacting with Windows introduced in Windows 8.

new Windows UI (PN)~ The new way of interacting with Windows introduced in Windows 8.

new Windows user interface (PN)~ The new way of interacting with Windows introduced in Windows 8.

new+rising (PN)~ The category of items (apps or games) that are suggested to users due to their recent popularity.

Newbie ~ (New beginner)- Internet slang for someone who hasn't been using computers or the internet long.

Newest (PN)~ The filter for videos within an Office 365 Video channel that allows the user to sort videos according to when they were uploaded.

News (PN)~ An application that aggregates news in customized views from a variety of Internet partner news sources, featuring news articles, videos, articles, and photography.

News (PN)~ The News & weather subcategory containing apps that help you keep up with current events.

News & Weather (PN)~ An app category that provides news or weather information.

news + weather (PN)~ An app category that provides news or weather information.

news account (n)~ An online account, usually provided by an Internet service provider (ISP), that lets users access newsgroups.

News Banner (n)~ A title animation in Windows Movie Maker.

news server (n)~ A computer or program that exchanges Internet newsgroups with newsreader clients and other servers.

News Updates page (n)~ The page that contains general information, virus updates, and network alerts.

News Video, Inset (n)~ A title animation in Windows Movie Maker.

newsfeed (n)~ A feed that provides information, notifications and updates based on people, documents, and tags you are following.

newsgroup (n)~ A forum on the Internet for discussions on a specified range of subjects.

Newsgroup (or just News) ~ A public area where you can read and post messages on a particular topic or theme, allowing public discussion, either on the Internet or a Bulletin Board. Largely replaced by internetforums.

newsletter (n)~ A report containing news or information, can be printed or distributed electronically.

Newspaper (n)~ A title animation in Windows Movie Maker.

newsreader (n)~ A Usenet client program that enables a user to subscribe to Usenet newsgroups, read articles, post follow-ups, reply by e-mail, and post articles. Many Web browsers also provide these functions.

next-of-kin process (n)~ A process that allows for the release of contents-€"for example emails and their attachments, address books, and contact lists-€"to the next of kin of a deceased or incapacitated email account holder and/or for the closure of an email account.

Nexus ~ Cisco Nexus (introduced 2008), modular network switches designed for data centers

Nexus ~ Google Nexus (released 2010), a line of Android Devices produced

NFC (n)~ A communication technology based on short range (4cm or less) wireless data exchange.

NFC reader (n)~ An external device that interacts with an NFC-enabled phone. These devices exchange data, such as contact details or secure payment information, with NFC-enabled phones through contactless communication.

NFC sensor (n)~ A type of sensor (such as a proximity sensor) that uses near field communication (NFC).

NFC transaction (n)~ An exchange of information between two devices using NFC, or near field communication. Using NFC transactions, a person can use their phone to make payments in a store or as a bus pass.

NFS (n)~ A distributed file system that allows users to access remote files and directories on a network as if they were local. NFS is compatible with Microsoft Windows and UNIX-based systems, including Linux and Mac OS X.

NFS client (n)~ A computer running client software to access shared Network File System (NFS) resources.

NFS server (n)~ A computer providing Network File System (NFS) disk resources to NFS clients.

NGen (n)~ A pre-compilation technology for managed code that compiles Common Intermediate Language (CIL) to native code on the end-user computer prior to application run time. It is an alternative to JIT compilation.

NIC ~ (Network Interface Card)- An- Expansion card- which lets a PC communicate with a- network- or use a- broadband- internet connection. Almost all modern NICs are- Ethernet- cards.

NIC Teaming (PN)~ A feature that enables users to group two or more physical network adapters into a single logical network device.

nickname (n)~ A user-friendly name displayed in place of a network location, e-mail address, contact name, or other, more formal name.

nickname (n)~ When used with merge replication system tables, a name for another Subscriber that is known to already have a specified generation of updated data.

niladic functions (n)~ Functions that do not have any input parameters.

NIS (n)~ A network naming and administration system that was developed by Sun Microsystems and is constructed on the client-server model of computing. Formerly known as Yellow Pages (yp), NIS provides a simple network look-up service that consists of databases and processes.

NIS (PN)~ A detection system that helps guard against intrusion attempts targeting known

and newly discovered vulnerabilities in network protocols.

NIS map (n)~ A database served by Network Information Service (NIS). The NIS lookup calls require a map (database) name and an NIS domain name. An NIS domain consists of a collection of such maps.

NLA2 (n)~ A service of Windows Vista that collects network information available to Windows on behalf of applications and enables them to easily and effectively adapt to changes in network environments.

NLB (n)~ A Windows network component that uses a distributed algorithm to load-balance Internet Protocol (IP) traffic across a number of hosts, helping to enhance the scalability and availability of mission-critical, IP-based services, such as Remote Desktop Services, Web services, virtual private networking, and streaming media. It also provides high availability by detecting host failures and automatically redistributing traffic to the surviving hosts.

NLS API (n)~ Set of system functions in 32-bit Windows containing information that is based on language and cultural conventions.

NMI (n)~ A hardware interrupt that bypasses and takes priority over interrupt requests generated by software and by the keyboard and other such devices. A nonmaskable interrupt cannot be overruled (masked) by another service request and is issued to the microprocessor only in disastrous circumstances, such as severe memory errors or impending power failures.

NNTP (n)~ A member of the TCP/IP suite of protocols used to distribute network news messages to NNTP servers and clients (newsreaders) on the Internet. NNTP is designed so that news articles are stored on a server in a central database, thus enabling a user to select specific items to read.

No Charge (oth)~ A shipping method that means the business pays for the cost of shipping the order, rather than making the customer pay.

No Control (oth)~ A quantity selling option that specifies that a product can be sold only in existing units in the product catalog. A salesperson cannot create new units for sale.

No longer in CRM UI.Help Visor (PN)~ A UI element that contains links to Help topics, videos, and wizards that guide the customer through basic Dynamics CRM concepts and procedures.

No service (PN)~ A status notification that the device is not within the wireless service range.

No watermark (oth)~ An option the user can click to remove any existing watermark in the document. If there is no watermark already in the document, clicking this option activates the OK button.

no-bar fraction (n)~ A fraction that is written vertically with the numerator on top and denominator below, with no fraction bar between them.- - - -

NOD (n)~ The formula used to determine the time and frequency with which a piece of content is delivered. This formula takes into account the total quantity of content to be delivered, and the length of time over which the quantity must be delivered.

node (n)~ A fundamental unit of data structures which can be labeled and which can have data stored in it.

node (n)~ For local area networks (LANs), a device that is connected to the network and

is capable of communicating with other network devices.

node (n)~ For failover clusters or server clusters, a computer system that is an active or inactive member of the cluster.

Node ~ A collection of modems that provide local access to a system. When you dial your local access number, you are dialing into a generally local node which then connects you to the main ISP system.

Node ~ a single station on a network.

node group (n)~ A named collection of nodes in an HPC cluster.

NOIDMIF file (n)~ A custom Management Information Format (MIF) file that SMS/Configuration Manager administrators can use to modify or append object classes and properties to existing client inventory data.

NOIDMIF file (n)~ A custom Management Information Format (MIF) file that Configuration Manager administrators can use to modify or append object classes and properties to existing client inventory data.

Noise (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 39.

noise ~ Unplanned energy introduced onto a communications path, resulting in transmission errors. Undesirable signals bearing no desired information

noise ~ The unpredictable difference between the observed data and the true process.

noise word (n)~ A word such as 'the' or 'an' that is not useful for searches, or that a crawler should ignore when creating an index.

NOK (n)~ The official currency of Norway.

nominal account (n)~ An account that is closed out each fiscal period and whose balance is transferred to retained earnings account.

nonadjacent selection (n)~ A selection of two or more cells or ranges that don't touch each other.

non-authoritative recovery (n)~ A restore operation performed on an Active Directory domain controller in which the objects in the restored directory are not treated as authoritative. The restored objects are updated with changes held on other domain controllers in the domain.

nonauthoritative restore (n)~ A restore operation performed on an Active Directory domain controller in which the objects in the restored directory are not treated as authoritative. The restored objects are updated with changes held on other domain controllers in the domain.

nonbreaking hyphen (n)~ A hyphen that is used to prevent a hyphenated word, number, or phrase from breaking if it falls at the end of a line.

non-broadcast network (n)~ An Institute of Electrical and Electronics Engineers (IEEE) 802.11 wireless network in which Service Set Identifier (SSID) suppression is enabled.

nonce (n)~ A key used only once in a cryptographic communication.

nonchargeable transaction (n)~ A transaction that cannot be included on an invoice and charged to a customer.

nonclustered hash index (n)~ A hash-table-based index, available only for memory-optimized tables, in which rows are not ordered.

nonclustered index (n)~ A B-tree-based index in which the logical order of the index key values is different than the physical order of the corresponding rows in a table. The index contains row locators that point to the storage location of the table data.

non-compliant card (n)~ An SD card that does not meet the requirements for use in a Windows Phone.

nonconformance (n)~ Describes an item that has a quality problem and does not comply with predefined performance or quality standards.

non-contained database (n)~ A SQL Server database that stores database settings and metadata with the instance of SQL Server Database Engine where the database is installed, and requires logins in the master database for authentication.

noncontiguous namespace (n)~ A namespace based on different DNS root domain names, such as that of multiple trees in the same forest.

non-customizable component (n)~ A component that, once protected and installed, cannot be modified.

nondefault drag-and-drop operation (n)~ A drag (transfer) operation whose interpretation is determined by a user's choice of command. These commands are included in a shortcut menu displayed at the destination where the object is dropped.

non-delivery report (n)~ A notification that an e-mail message was not delivered to the recipient.

non-direct item (n)~ An item that is not calculated by Master Planning.

Nondirectional Cycle (PN)~ A SmartArt graphic layout used to represent a continuing sequence of stages, tasks, or events in a circular flow. Each shape has the same level of importance. Works well when direction does not need to be indicated.

NONE member (n)~ A dimension member that is used for information that has no defined relationship to a specific member.

non-enterprise project (n)~ A project that has not been published to Project Server, either because it is being saved by someone who is not a project manager on the project, or because there is not a valid connection to the server.

Nonfiction (PN)~ The Books & reference subcategory containing apps with true-life stories and other content.

non-generalized image (n)~ A software image that you can apply and restore only to the computer where the image was taken.

nonhubbed mode (n)~ A mode in which (ATM) Address Resolution Protocol/multicast address resolution service (ARP/MARS) does not forward multicast and broadcast traffic for multicast group clients. In this mode, the service returns a dynamic listing of ATM hosts currently registered for the multicast group address to requesting clients. Clients then use this list to initiate and establish their own point-to-multipoint virtual connections with each of the members in the multicast list.

Nonkey index column (n)~ Column in a nonclustered index that does not participate as a key column. Rather, the column is stored in the leaf-level of the index and is used in conjunction with the key columns to cover one or more queries.

nonleaf member (n)~ A member with one or more descendants.

nonmaskable interrupt (n)~ A hardware interrupt that bypasses and takes priority over interrupt requests generated by software and by the keyboard and other such devices. A

nonmaskable interrupt cannot be overruled (masked) by another service request and is issued to the microprocessor only in disastrous circumstances, such as severe memory errors or impending power failures.

non-negotiable check (n)~ A non-negotiable instrument ordering a drawee organization to pay a specified amount of money to the holder.

non-negotiable instrument (n)~ A document of title or written order that cannot be bought, sold, exchanged, or transferred.

nonnullable parameter (n)~ A parameter which cannot take a NULL value.

nonoperating income (n)~ Income that includes profits or losses from activities that are not related to an organization's core operations. Examples of nonoperating income include revenue from dividend income, profits and losses from investments and foreign exchanges, and asset write-down income.

nonpaged memory (n)~ Memory that cannot be paged to disk.

nonpaged pool (n)~ Operating system memory that is never paged to disk.

non-peak power plan (n)~ A Configuration Manager power plan that you can configure with power settings that are applied outside peak hours or business hours.

Non-Plug and Play (adj)~ Pertaining to a device, such as a game controller or printer, that does not automatically work when you plug it in to your computer. After connecting it to your computer, you have to install the necessary drivers and configure the hardware settings.

non-printable character (n)~ A character used to control the format of displayed or printed information, rather than to represent a particular letter, digit, or other special character. The space is one of the more important nonprinting characters.

nonprinting character (n)~ A character used to control the format of displayed or printed information, rather than to represent a particular letter, digit, or other special character. The space is one of the more important nonprinting characters.

nonprinting region (n)~ The area along the edges of a page that cannot be printed on. Different printers have different nonprinting regions.

non-printing row (n)~ A row that is included in the data of a report but that is not printed or displayed when the report is generated, such as for complex calculations, or the graphic design of a report.

non-recoverable sales tax (n)~ A sales tax levied on purchased products that is not deducted from the sales tax levied on the sale of the purchased products when both sales taxes are paid by the same party.

nonrepeatable read (n)~ An inconsistency that occurs when a transaction reads the same row more than once, and a separate transaction modifies that row between reads.

nonrepudiation (n)~ The use of cryptography to ensure that someone performing an action on a computer cannot falsely deny that they performed that action. A system with nonrepudiation provides undeniable proof that a user took a specific action such as transferring money, authorizing a purchase, or sending a message.

non-spacing character (n)~ A character, such as diacritic, that has no meaning by itself, but overlaps a base character to modify it.

nonsquare pixel (n)~ A pixel that generally has an aspect ratio of 3:4, 32:27, or 8:9, meaning that it is slightly less tall than it is wide, or vice versa. Nonsquare pixels are

standard in digital video.

non-transacted pipeline (n)~ A pipeline that does not support COM+ transactions. MtsPipeline and PooledPipeline are the only objects that support non-transacted pipelines.

nontransitive trust (n)~ A trust relationship in a multiple-domain environment that is restricted to just two domains. For example, if domain A has a nontransitive trust with domain B, and domain B trusts domain C, then there is no trust relationship between domain A and domain C. Nontransitive trusts can be one-way or two-way.

non-uniform memory access (n)~ Access by a CPU of local as well as foreign memory. This process, which is enabled by NUMA architecture, results in different access speeds.

nonvolatile memory (n)~ A storage system that does not lose data when power is removed from it.

nonvolatile storage (n)~ A storage system that does not lose data when power is removed from it.

nonworking time (n)~ Time devoted to non-work activities. Out-of-office time.

Non-Working Time (n)~ Time devoted to non-work activities. Out-of-office time.

Normal (adj)~ The name of a device profile that handles incoming calls by always notifying the user.

normal (adj)~ Having a font weight that corresponds to a weight class value of 400 according to the OpenType specification.

normal award (n)~ The amount of a variable compensation award that is calculated by the plan before company or individual performance is taken into account. The target award is what an employee will receive if all targets are reached.

normal backup (n)~ A backup that copies all selected files and marks each file as having been backed up (in other words, the archive attribute is cleared).

Normal style (n)~ The default paragraph style used in documents based on the Normal template (Normal.dot).

Normal template (n)~ A global template that you can use for any type of document. You can modify this template to change the default document formatting or content.

normalization (n)~ The process of taking a single-table database and breaking it into a set of smaller, related tables, with each table focused on a single topic or grouping of information.

normalization factor (n)~ A factor that enables comparisons and assessments of disparate subjects on a single rating scale.

normalization rule (n)~ A design rule that minimizes data redundancy and results in a database in which the Database Engine and application software can easily enforce integrity.

normalize (v)~ To minimize the duplication of information in a relational database through effective table design.

normalized value (n)~ A value calculated by dividing the actual value by the weighted target value.

North America (PN)~ The US-American geo within the Azure region taxonomy.

northbridge ~ the chip or chips that connect a- CPU- to- memory, the- PCI- bus,- Level 2 cache- and- AGPactivities. The Northbridge chips communicate with the CPU through the- FSB. other isSouthbridge.

North-South (adj)~ A node placement style that specifies that the nodes are placed north-south in relation to the MOM Management Server.

NOT (n)~ A Boolean operator that performs logical negation, effectively reversing the input, if and when its input is false.

not a number (oth)~ A value that represents the result of an invalid calculation.

not applicable (oth)~ Pertaining to something for which an answer is not available or appropriate.

not available (adj)~ A status pertaining to a call or IM recipient, who is signed out of Communicator or who has selected the Do Not Disturb status.

not DPI-aware (adj)~ Pertaining to an application that always renders at 96 DPI.

Not For Resale (oth)~ A license policy under which software may be used for development and demonstration purposes only.

not sufficient funds (n)~ The lack of enough funds in an account to cover a payment or withdrawal.

Not Synced view (n)~ The name of a view that shows all new or changed records that the mobile device user has entered, but not yet synchronized.

Not Synchronized (adj)~ A view that lists all the new or changed information for a record type that the mobile user has entered, but not yet synchronized. In other words, the information currently resides only on the mobile devices local store.

not valid (adj)~ Erroneous or unrecognizable because of a flaw in reasoning or an error in input. Invalid results, for example, might occur if the logic in a program is faulty.

note (n)~ An Outlook item that can be attached to a record's history log. Typically a note contains information regarding a conversation with a customer or other people in the company they work for.

note (n)~ Text entered by the user that is displayed to contacts.

note board (n)~ An area for storing comments about a Web page. A note board can appear on a Web page or in a separate dialog box. The notes can be viewed, managed, and shared by using My Site.

note container (n)~ A flexible bounding box that contains the notes that you type or paste on a page.

note tag (n)~ A marker that can be applied to content or items (like photos or text) to identify certain types of information. This allows the user to find, view and sort tagged items with ease.

notebook (n)~ A group of OneNote sections.

Notebook (PN)~ ?The space where Cortana stores all of the information she knows about you.

Notebook (PN)~ A web application for interactive authoring of literate computations, in which explanatory text, mathematics, computations and rich media output may be combined, and in which input and output are stored in persistent cells that may be edited in-place, using plain text documents, called notebooks, for recording and distributing the results of the rich computations.

Notebook ~ A portable PC, with system unit, screen and keyboard in one portable package. Also called a- laptop.

notebook layout view (n)~ A document view in Word that enables users to take notes

more easily.

Notebook List (n)~ A list of OneNote notebooks stored on OneDrive that you either own or is shared with you, and that is available at OneNote.com/notebooks.

Notebook Presence (PN)~ A feature that broadcasts user presence in a OneNote notebook and supports real-time synchronization for users who are editing the same page.

Notes (n)~ The heading for a field where users can enter notes about their To Do.

Notes E-mailed To Me (oth)~ The name of a folder that contains any .one files that have been sent to you as an e-mail message attachment.

notes page (n)~ A printed page that displays author notes beneath the slide that the notes accompany.

notes pane (n)~ The pane in normal view in which you type notes that you want to accompany a slide. You print these notes as notes pages or have them display when you save a presentation as a Web page.

note-taking tool (n)~ A feature that enables users to capture notes, such as text, images, audio, video and Web content.

notice (n)~ A privacy principle that requires reasonable disclosure to a consumer of an entity's personally identifiable information (PII) collection and use practices. This disclosure information is typically conveyed in a privacy notice or privacy policy. Notice is addressed in Fair Information Practices.

notification (n)~ A message or announcement sent to the user or administrator of a system. The recipient may be a human or an automated notification manager.

notification (n)~ Information displayed to a user about someone else adding him or her to a contact list, a contact's offline or online status, a missed conversation, voice mail message, service problem, or other item.

notification (n)~ A communication generated by the occurrence of an event that a system or user asynchronously sends for receipt. A notification message is a communication that is intended to be read by a recipient.

notification (n)~ A message or other indicator that informs users of events that are unrelated to their current activity, such as the number of new messages received while their computer is locked.

notification activity (n)~ A workflow activity within the action phase of request processing in which ILM 2' sends e-mails to one or more users to notify them of the request.'

Notification API (PN)~ A Windows API that is used for sending user notifications to the system, such as telling the system that the user is busy. It provides intelligence regarding when to draw a notification or perform some other custom action, and mechanisms for anchoring these notifications around the system.

notification area (n)~ The area on the right side of the Windows taskbar. It contains shortcuts to programs and important status information.

Notification bar (n)~ A bar at the bottom of the Internet Explorer view pane that alerts the user to status changes and provides possible actions the user can take.

notification channel (n)~ A shareable, server-side object capable of routing notifications from a server to appropriately registered clients.

notification count (n)~ A number in the app bar to indicate that the user needs to take

some action (such as an alert or a reminder) or that new activity has occurred (such as new mail).

notification group (n)~ A list of operators and scheduled availability for receiving page or e-mail responses.

Notification Hubs (PN)~ The highly scalable, cross-platform push notification infrastructure that enables users to either broadcast push notifications to millions of users at once or tailor notifications to individual users.

Notification Language option (n)~ The option on the Spam Filter page for selecting a language other than English for Spam Quarantine notifications.

notification message (n)~ A human-readable message sent by the backend system to the client user.

notification message (n)~ An e-mail message that is sent by a notification activity.

notification recipient (n)~ The individual, or account, to whom a notification is sent, usually a DPS administrator.

Notification Services (PN)~ A Microsoft SQL Server add-in that provides a development framework and hosting server for building and deploying notification applications.

notification subscriber (n)~ The user who receives notifications.

notification subscriber address (n)~ A package that contains information about how to reach a particular user. It includes items such as the protocol to use and the target address.

notification subscription (n)~ A package that contains the notification subscriber, the notification subscriber address, and any additional information, such as when to send specific types of notifications

notification threshold (n)~ A threshold set up by the user to determine the event that is triggered, when a quoty limit is reached. Examples are: send e-mail notifications, log an event, run a command or script, or generate storage reports.

notifications (n)~ E-mail messages that alert you when new activity has occurred in particular areas of your community.

notifications (n)~ A transient message to the user on the app bar, that contains relevant, time-sensitive information, and provides quick access to the subject of that content in an app.

Notify (v)~ A permission setting in which Communicator prompts the user to allow or block any person or domain who attempts to add the user to contact lists or send instant messages to the user.

notify list (n)~ A list maintained by the primary master for a zone of other DNS servers that should be notified when zone changes occur. The notify list is made up of IP addresses for DNS servers configured as secondary masters for the zone. When the listed servers are notified of a change to the zone, they will initiate a zone transfer with another DNS server and update the zone.

Notify when new spam is received option (n)~ The check box that has users receive periodic e-mail reminders to review their newly filtered spam mail.

Now Playing (n)~ A tab in Windows Media Player that enables the user to view the digital media item that is currently playing.

now playing (PN)~ Currently selected media that is playing.

Now Presenting pane (n)~ A client element that displays the name and, optionally, a

photograph of the current presenter.

NPH insulin (n)~ An intermediate-acting insulin given to lower the blood sugar level of diabetics.

NSControl (n)~ The command prompt utility for administering Notification Services instances and applications.

ntext (n)~ A variable-length data type that can hold a maximum of $2^{30} - 1$ (1,073,741,823) characters.

NTFS (n)~ An advanced file system designed for use specifically with the Windows NT operating system. It supports long filenames, full security access control, file system recovery, extremely large storage media, and various features for the Windows NT POSIX subsystem. It also supports object-oriented applications by treating all files as objects with user-defined and system-defined attributes.

NTFS file system (n)~ An advanced file system designed for use specifically with the Windows NT operating system. It supports long filenames, full security access control, file system recovery, extremely large storage media, and various features for the Windows NT POSIX subsystem. It also supports object-oriented applications by treating all files as objects with user-defined and system-defined attributes.

n-tier (adj)~ Pertaining to something with n layers.

n-tier architecture ~ n' represents the number of tiers in an application architecture. Often, this will be a two- or three-tier client/server architecture. A three-tier client/server platform architecture is defined such that the server-based applications are separated from the DBMS or data repository.

NTLM (n)~ A protocol using a challenge-response mechanism for authentication in which clients are able to verify their identities without sending a password to the server. It consists of three messages, commonly referred to as Type 1 (negotiation), Type 2 (challenge) and Type 3 (authentication).

NTP (oth)~ A standard taxonomy (v1.0 based on XBRL 2.1 and IFRS) that is defined for all businesses operating in the Netherlands for reporting financial, tax, and statistical data to government agencies.

NTSC (n)~ The dominant television standard in the United States and Japan. The National Television System Committee (NTSC) delivers 30 interlaced frames per second at 525 lines of resolution. It is the sponsor of the NTSC standard for encoding color, a coding system compatible with black-and-white signals, and the system used for color broadcasting in the United States.

NTSC DV-AVI (n)~ Movie file format for captured video streams from a DV camera. Uses the NTSC television standard as opposed to PAL format.

nudge (v)~ To move an object one pixel at a time.

nudge (n)~ A tool that enables a user to get another user's attention by shaking the user's conversation window and playing a sound.

Nudge (PN)~ The checkbox that enables or disables the playing of a sound when a nudge is received.

Nudity (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

nuisance call (n)~ Any type of unwanted, unsolicited, telephone call. Common types of

nuisance calls include prank calls, telemarketing calls, and silent calls.

nuke ~ To intentionally delete the entire contents of a given directory, hard drive, or storage volume.

Nuker ~ Now a generic term for several- TCP/IP- DoS- attacks, but originally made (in)famous by the WinNuke DoS attack which crashed Windows machines that had not been suitably patched or firewalled.

NUL (n)~ A character code with a null value; literally, a character meaning nothing.' Although it is real in the sense of being recognizable

NUL (n)~ A device

null (adj)~ Pertaining to a value that indicates missing or unknown data.

null ~ When a variable has no value, it considered to be null. Having a null value is different than having a value of 0, since 0 is an actual value. However, when used in a boolean test, both null and zero result in a FALSE value.

null character (n)~ A character code with a null value; literally, a character meaning nothing.' Although it is real in the sense of being recognizable

null field (n)~ A field containing a Null value. A null field isn't the same as a field that contains a zero-length string (') or a field with a value of 0.'

null key (n)~ A null value that is encountered in a key column.

null modem (n)~ Special cabling that eliminates the modem's need for asynchronous communications between two computers over short distances. A null modem cable emulates modem communication.

null object (n)~ An object with no members.

null pointer (n)~ A pointer to nothing: usually a standardized memory address, such as 0. A null pointer usually marks the last of a linear sequence of pointers or indicates that a data search operation has come up empty.

null reference (n)~ In C++, a reference that has not been assigned an object.

nullable property (n)~ A property which controls if a field can have a NULL value.

nullable type (n)~ In C#, an instance of the System.Nullable struct that can represent the normal range of values for its underlying value type, plus an additional null value.

NUMA (n)~ Access by a CPU of local as well as foreign memory. This process, which is enabled by NUMA architecture, results in different access speeds.

NUMA architecture (n)~ A multiprocessor architecture that divides a system into nodes. Each node might include one or more processors, some memory, and a bus. A node's memory is local' to its processors

NUMA-Aware Scalability (PN)~ An IIS feature that enables a processor to successfully handle growing workloads by using NUMA architecture.

number (n)~ A sequence of alphanumeric characters in a number system.

number normalization (n)~ The process of converting user phone numbers of differeing formats into numeric strings of uniform format.

number of events (oth)~ In consolidated- events, how many events are in the group and therefore related to the same root problem.

number of posts (n)~ The total number (the volume) of posts in a set of filters/dataset.

Number of Queries report (n)~ A Web analytics report that provides information on the number searches performed.

number pattern (n)~ A specific phone number or area code that users enter to restrict the device to fixed dialing.

NUMBER SIGN (n)~ The # character.

number sign (n)~ The # character.

number system (n)~ Any system for representing numbers. The four number systems available are decimal, hexadecimal, octal, and binary.

numbered list (n)~ A list in which each item or block of text is preceded by a number.

Numbered list (PN)~ The Sway button that allows users to create a numbered list out of their text.

numeric array (n)~ An array composed of a collection of keys and a collection of values, where each key is associated with one value. The values can be of any type, but the keys must be numeric.

numeric expression (n)~ Any expression that evaluates to a number. The expression can be any combination of variables, constants, functions, and operators.

numeric keypad (n)~ A calculator-style block of keys, usually at the right side of a keyboard, that can be used to enter numbers.

numeric picture switch (n)~ A switch (\#) or instruction that specifies how Microsoft Word will display the numeric result of a field.

nvarchar (PN)~ The variable-length data type with a maximum of 4,000 Unicode characters.

NWLink (n)~ The Microsoft implementation of the Internetwork Packet Exchange/Sequenced Packet Exchange (IPX/SPX) protocol used on NetWare networks. NWLink allows connectivity between Windows-based computers and NetWare networks running IPX/SPX. NWLink also provides network basic input/output system (NetBIOS) functionality and the Routing Information Protocol (RIP).

NWLink IPX/SPX/NetBIOS Compatible Transport Protocol (n)~ The Microsoft implementation of the Internetwork Packet Exchange/Sequenced Packet Exchange (IPX/SPX) protocol used on NetWare networks. NWLink allows connectivity between Windows-based computers and NetWare networks running IPX/SPX. NWLink also provides network basic input/output system (NetBIOS) functionality and the Routing Information Protocol (RIP).

Nx64k ~ This refers to a circuit bandwidth or speed provided by the aggregation of nx64 kbps channels (where n= integer 1).

nym (server) ~ A computer that allows a subscribing user to send and receive e-mail messages using a nym, or assumed name, without revealing the user's true identity.

NZD (n)~ The official currency of New Zealand.

O ~

O notation (n)~ An indication of the relative performance of an algorithm. An algorithm or the method that implements it is said to be O(1) if its execution is a constant, O(log n) if its execution is proportional to the natural log of n, or O(n) if its execution is proportional to n. O notation is frequently used as a way to compare the relative performance of operations on collections, in which case n is usually the number of elements in the collection.

O/R Designer (PN)~ A tool that provides a visual design surface for creating LINQ to SQL entity classes and associations (relationships) based on objects in a database. The Object Relational Designer also provides functionality to map stored procedures and functions to System.Data.Linq.DataContext methods for returning data and manipulating entity classes.

OAB (n)~ A snapshot of information from an address book that has been downloaded so that an Outlook user can access it while disconnected from the server. It contains the properties of a user, such as e-mail addresses, that Outlook requires to send an e-mail message and display information about the sender.

OAB distribution (n)~ The method by which the offline address book (OAB) can be accessed by users when they are working remotely or over a dial-up connection. To distribute the OAB, administrators can use Web-based distribution, public folder distribution, or both. Public folder distribution is required for Outlook 2003 or earlier clients.

OAB distribution point (n)~ The HTTP Web address or public folder where client computers can download an offline address book. Public folder distribution is required for Outlook 2003 or earlier clients.

OAB generation (n)~ The process by which Exchange Server creates and updates the OAB. Administrators can define when the OAB generation process will run.

OAuth (PN)~ An open standard for authorization which allows users to share resources stored on one site with another site without having to share credentials.

OAuth Client ID (PN)~ A type of client ID that allows Open Authorization (OAuth).

OAuth token (n)~ An entity encapsulating the security credentials for an OAuth login session.

Obfuscation (n)~ In software development, the deliberate act of creating obfuscated code to make it difficult for humans to understand and conceal its purpose or its logic, to prevent tampering, deter reverse engineering, or as a puzzle or recreational challenge for someone reading the source code.

object (n)~ An entity, such as a file, folder, shared folder, printer, or Active Directory object, described by a distinct, named set of attributes. For example, the attributes of a File object include its name, location, and size; the attributes of an Active Directory User object might include the user's first name, last name, and e-mail address.

object (n)~ In object-oriented programming, an instance of a class. An object comprises data and methods that act on the data, and is treated as a discrete entity.

object (n)~ A table, chart, graphic, equation, or other form of information.

object (n)~ A drawing, image, shape, text, or other form of information that has been added to the artboard.

object (n)~ An entity within SQL Server.

object (n)~ An entity in a graph edge that the action is performed on.

object anchor (n)~ A format code in a desktop publishing or word processing document that keeps an element in the document, such as a figure or a caption or a label associated with the figure, in a certain position in the document. The anchored object is generally attached to another element in the document.

object browser (PN)~ A dialog box that displays information about objects, properties, methods, and constants in the current project and in referenced object libraries, and that you use to search for an element, get help on it, or paste it into a module.

Object Browser (PN)~ A dialog box that displays information about objects, properties, methods, and constants in the current project and in referenced object libraries, and that you use to search for an element, get help on it, or paste it into a module.

object cache GC count (n)~ The total number of objects from the object cache that have been removed from memory by the garbage collector.

object cache live count (n)~ The total number of objects that are currently active in the object cache. These objects can quickly be retrieved from the cache.

object caching (n)~ A type of caching that allows a reference to an object to remain accessible when the user navigates to a new domain.

object class (n)~ A category of objects that share a common set of characteristics.

object construction (n)~ A COM+ service available to .NET Framework classes that passes a persistent string value to a class instance on construction of the instance.

object context (n)~ The entity container defined in the conceptual schema. It contains a connection to the underlying data store and provides services such as change tracking.

Object data type (n)~ A fundamental data type representing any object that can be recognized by Visual Basic. Although you can declare any object variable as type Object, it is best to declare object variables according to their specific types.

Object Dependencies pane (n)~ A pane that shows objects that have a dependency on the selected object. Also shows objects on which the selected object has dependencies.

object dependency (n)~ A dependency at the object level.

Object Description Language (n)~ A scripting language used to describe exposed libraries, objects, types, and interfaces. ODL scripts are compiled into type libraries by the MIDL compiler.

Object Explorer (PN)~ The section of the Visual Studio integrated development environment (IDE) that contains nodes that represent database objects.

object file (n)~ A file containing object code and/or data generated by a compiler or an assembler from the source code of a program.

object flow (n)~ In an activity diagram, a dashed arrow that indicates that an object is input or output by an action. An object flow arrow connects an object flow state either to a control flow arrow or to an action state.

object flow state (n)~ In an activity diagram, a state that defines an object flow between actions. An object flow state signifies the availability of an instance of a classifier in a given state, usually as the result of an operation.

object frame (n)~ A control you place on a form or report to contain an object.

object handler (n)~ A DLL loaded into an OLE container's process space that acts on behalf of a local server. The object handler responds to container requests that do not require the attention of the server, such as requests for drawing.

object ID (n)~ An attribute type in which the value of the attribute is a globally unique identifier (GUID) assigned by ILM2' to each resource when it is created.'

object identifier (n)~ An attribute type in which the value of the attribute is a globally unique identifier (GUID) assigned by ILM2' to each resource when it is created.'

object in state (n)~ In an activity diagram, an object that is manipulated by a number of successive activities. Each appearance of the object indicates a different phase in its life.

object initializer (n)~ A set of name/value pairs or unnamed variable initializers that are assigned to the public fields of an object in the same statement in which the object is declared.

object layout (n)~ The positioning of an object, such as a chart, shape, image or text box, on a page, along with related options such as text-wrapping styles.

object library (n)~ A file that contains definitions of objects and their methods and properties.

object lifeline (n)~ In a sequence diagram, a representation of the existence of an object at a particular time. If the object is created or destroyed during the time period the diagram represents, then the lifeline stops or starts at the appropriate point.

object lifetime (n)~ The span of time a cached object resides in cache and is available to be retrieved by cache clients. The object expires when its lifetime ends. Expired objects cannot be retrieved by cache clients, but remain in memory of the cache host until they are evicted. Specified as time to live (TTL).

object linking and embedding (n)~ A technology for transferring and sharing information among applications. When an object, such as an image file created with a paint program, is linked to a compound document, such as a spreadsheet or a document created with a word processing program, the document contains only a reference to the object; any changes made to the contents of a linked object will be seen in the compound document. When an object is embedded in a compound document, the document contains a copy of the object; any changes made to the contents of the original object will not be seen in the compound document unless the embedded object is updated.

Object Linking and Embedding Database (PN)~ A component database architecture that provides efficient network and Internet access to many types of data sources, including relational data, mail files, flat files, and spreadsheets. OLE DB comprises a specialized set of COM interfaces that expose data from a variety of data stores, both relational and nonrelational.

object linking and embedding for POS (n)~ A widely-adopted POS device standard initiated by Microsoft, NCR, Epson, and Fujitsu-ICL to help integrate POS hardware into applications for the Windows-„¢ family of operating systems.

object model (n)~ A hierarchical set of objects and its members - methods, properties, and events - that a particular component provides.

object model diagram (n)~ A graphical representation of the objects and collections that are contained within a specified object model.

object owner (n)~ The security account with special permissions for an object, usually the creator of the object.

Object Palette (PN)~ A tab in the Toolbox where you can go to insert objects into your document.

object path (n)~ A formatted string used to access namespaces, classes, and instances. Each object on the system has a unique path that identifies it locally or over the network. Object paths are conceptually similar to Universal Resource Locators (URL).

object permission (n)~ A permitted create, read, update, delete, or execute operation on a securable object.

object pooling (n)~ An automatic service provided by COM+ that enables you to configure a component so that instances of itself are kept active in a pool, ready to be used by any client that requests the component.

object protection level (n)~ The integrity level of an object, stored in a token or an object's system access control list (SACL). The access check algorithm uses the object protection level to perform Mandatory Integrity Control (MIC).

object query (n)~ A query executed against an EDM within an object context that returns data as objects.

Object Relational Designer (PN)~ A tool that provides a visual design surface for creating LINQ to SQL entity classes and associations (relationships) based on objects in a database. The Object Relational Designer also provides functionality to map stored procedures and functions to System.Data.Linq.DataContext methods for returning data and manipulating entity classes.

object scope (n)~ A set of objects about which a request can be submitted.

Object Services (PN)~ The services provided by the Entity Framework that enable application code to operate on entities in terms of .NET Framework objects.

object tab (n)~ A tab that you use to display or work with a database object, such as a table, query, form, or report.

Object Test Bench (n)~ A tool that creates instances of a project's objects, calls their methods, and evaluates the results.

Object Test Bench (PN)~ A Visual J# feature that is designed for simple object-level testing.

object type (n)~ An opaque data structure that defines a protected entity that is implemented and manipulated by the operating system. For example, the system service that reads a file operates on an open file object.

object type (n)~ A part of a schema that defines the representation of a resource in ILM 2'.'

object type mapping (n)~ A relationship between an object type that is used to represent a resource in ILM 2' and an object class that is used to represent that object in the metaverse.'

object variable (n)~ A variable that contains a reference to an object.

Object Visualization Configuration (n)~ Configuration objects that are used to render UI in the Universal Object Control for authoring a specific object type in ILM 2'.'

object zoom (n)~ A view that shows a close-up of an object within a document.

object-action paradigm (n)~ The basic interaction model for the user interface in which

the object to be acted upon is specified first, followed by the command to be executed.

objective (n)~ A group of key performance indicators (KPIs) that correspond to the functional areas or strategic initiatives of an organization.

objective KPI (n)~ A KPI that derives its target value and score from a rollup of its child KPIs.

object-level keyframe (n)~ A type of keyframe that applies to entire objects, such as a rectangle object, or a grid that contains multiple objects.

ObjectLink (n)~ An OLE data format that describes a linked object, identifying the class, document name, and name of an object. Each of these data items is a null-terminated string.

object-oriented (adj)~ Of, pertaining to, or being a system or language that supports the use of objects.

object-oriented database (n)~ A flexible database that supports the use of abstract data types, objects, and classes and that can store a wide range of data, often including sound, video, and graphics, in addition to text and numbers. Some object-oriented databases allow data retrieval procedures and rules for processing data to be stored along with the data or in place of the data. This allows the data to be stored in areas other than in the physical database, which is often desirable when the data files are large, such as those for video files.

Objects (in 100s) (PN)~ The unit of measure for Active Directory objects.

Objects and Timeline (n)~ The area of the workspace that displays all of the objects on the artboard and the animation timeline.

objects view (n)~ The list of objects that appear on the artboard. This list shows the general structure of the content on the artboard, reflecting Z-order or markup order as well as nesting.

ObjectSpaces (n)~ An Object/Relational mapping tool fully integrated with Microsoft ADO.NET and Microsoft .NET technologies that puts an abstraction layer between your business tier and the raw-data tier where the physical connection to the data source is handled.

obligation (n)~ A legally binding commitment.

oblique (adj)~ Describing a style of text created by slanting a roman font to simulate italics when a true italic font isn't available on the computer or printer.

observational (adj)~ Pertaining to data that represents a set of observations and their associated space-time regions, typically on the earth.

obsolete (adj)~ Pertaining to a software feature, component or technology that has not been enhanced or updated in several product releases and that will be excluded from future product releases. Obsolete technologies might not be supported.

occupation code (n)~ A code that represents the type of work performed by an employee within the organization.

occupational illness (n)~ An illness caused by exposure to environmental factors in the work environment.

occupational injury (n)~ An injury resulting from an accident in the work environment.

OCR (oth)~ A method of translating images of printed text into machine-encoded text.

OCR ~ (Optical Character Recognition)- A program which attempts to convert a scanned

image (ie a picture) of text into text that can be edited in a word processor. The result is rarely 100% accurate and must be carefully proofread, but it can save a lot of retyping.

OCR line (n)~ A line of characters that is read by special character recognition equipment and translated into computer text.

OCR reference control (n)~ A service from BGC that confirms the validity of an OCR reference number in the BG Max file. The user can confirm only the digits or also confirm the character length.

OCSP (n)~ A protocol that allows real-time validation of a certificate's status by having the CryptoAPI make a call to an OCSP responder and the OCSP responder providing an immediate validation of the revocation status for the presented certificate. Typically, an OCSP responder responds with the revocation status check request based on the certificate revocation list (CRL) or other forms of revocation status it retrieves from the certification authorities.

OCSP responder (n)~ A computer on which the Online Responder service and Online Responder web proxy are running.

OCSP responder service (n)~ A service that is part of the Online Responder role service and that decodes a revocation status request for a specific certificate, evaluates the status of this certificate, and sends back a signed response containing the requested certificate status information.

OCT (n)~ A one-stop shop for customizing Office deployment and setup behaviors.

OCT (n)~ An imaging method used to obtain high resolution cross-sectional images of the retina.

octal (adj)~ The base-8 number system consisting of the digits 0 through 7, from the Latin octo, meaning eight'. The octal system is used in programming as a compact means of representing binary numbers.'

octal escape sequence (n)~ In regular expressions, a backslash followed by one, two, or three octal digits (0-7). It matches a character in the target sequence that has the value that is specified by those digits.

octet (n)~ A unit of data that consists of exactly 8 bits, regardless of the number of bits a computer uses to represent a small amount of information such as a character.

OData Connector (n)~ A feature that enables connectivity from SharePoint to external systems that use the OData protocol.

OData Extension Provider (PN)~ A Business Connectivity Services feature that enables developers to extend functionality that is provided by the OData connector.

ODBC (n)~ In the Microsoft WOSA (Windows Open System Architecture) structure, an interface providing a common language for Windows applications to gain access to a database on a network.

ODBC data source (n)~ Data and the information needed to access that data from programs and databases that support the Open Database Connectivity (ODBC) protocol.

ODBC database (n)~ A database for which an Open Database Connectivity (ODBC) driver that you can use for importing, linking to, or exporting data is supplied.

ODBC driver (n)~ A program file used to connect to a particular database. Each database program, such as Access or dBASE, or database management system, such as SQL Server, requires a different driver.

ODBC resource dispenser (n)~ A DLL that manages pools of database connections for COM+ components that use the standard open database connectivity (ODBC) programming interfaces.

ODC file (n)~ A file that stores information about a connection to a data source, such as an Access database, spreadsheet, or text file, and that facilitates data source administration.

odd parity (n)~ Parity bit set so that there is an odd number of 1 bits.

ODL (n)~ A scripting language used to describe exposed libraries, objects, types, and interfaces. ODL scripts are compiled into type libraries by the MIDL compiler.

ODM (n)~ A manufacturer that designs and manufactures its own products and sells them to other companies with established brand names. Established brand name companies add their logos and sell ODM products as their own.

ODS library (n)~ A set of C functions that makes an application a server. ODS library calls respond to requests from a client in a client/server network. Also manages the communication and data between the client and the server. ODS library follows the tabular data stream (TDS) protocol.

ODS log file (n)~ A log file used to store Open Data Services (ODS) error messages. The default log file for ODS is Srv.log.

OEAT (PN)~ A comprehensive scanning tool that helps assess your configuration and the compatibility of existing add-ins and applications in your environment with Office prior to deployment.

OEM ~ (Original Equipment Manufacturer)- A company that actually builds computers, as opposed to just retailing them. 'OEM software' is ordinary software bought in bulk at a discount by the OEM and pre-installed on a new machines, usually without printed manuals. OEM software cannot legally be sold separately from a computer, so when offered for sale at huge discounts is either pirated, or not what it claims to be.

OEM Activation (n)~ Technology that helps restrict legitimately licensed operating system software to use with the computer system upon which it was originally distributed by a royalty OEM, all in accordance with the license rights granted in the applicable Microsoft Software License Terms.

OEM branding (n)~ The inclusion of a company name, logo, support information, and Help files into the Microsoft Windows installation.

OEM License Agreement (n)~ A legal agreement between Microsoft Licensing, Inc., and OEMs, regarding the terms of preinstalling, customizing, and distributing Microsoft Windows XP. For system builders, the corresponding agreement is affixed to the side of every OEM Distribution Pack. By opening the package, you agree to all the terms of the Microsoft OEM System Builder Agreement. For royalty OEMs, the license agreement is a signed contract. The specific requirements and customization options that apply to either or both license agreements are documented in the OPK User's Guide.

OEM link (n)~ A link on the Start menu where OEMs can place any desired links or shortcuts.

OEM manufacturer (n)~ The maker of a piece of equipment. In making computers and related equipment, manufacturers of original equipment typically purchase components from other manufacturers of original equipment, integrate them into their own products,

and then sell the products to the public.

OEM picks (PN)~ A collection of items (such as apps and games) selected by a device manufacturer.

OEM Preinstallation Kit (n)~ A set of tools, documentation, and samples that enable OEMs to preinstall Windows efficiently on new computers according to the terms of the OEM Licensing Agreement.

OEM Setup Analyzer (PN)~ A Windows extensible tool that is used by both Microsoft and OEMs to have a common depth analysis of the first boot experience and address any issues.

Off Work (PN)~ An item on the user's My Status drop-down menu. This is a status the user can select to say that he or she is not working right now, but is on personal time.

off-axis (adj)~ One of the presets for 3D rotation effects. When selected, specifies that the object will be rotated off-axis.

offer (n)~ A set of information that describes the details of a subscription.

offer (n)~ A set of information that describes the details of a subscription to Office 365.

Offer Hyperlink Text (PN)~ The text of the hyperlink that will appear in an email marketing email messages that links to the offer description.

Offer URL (PN)~ The optional URL to the user-managed offer pages.

offering (n)~ Something that is offered to a client or customer, or the act of offering.

Office 2007 Embedded Storage (PN)~ An extension module that stores information (metadata) within Office 2007 files.

Office 365 admin center (PN)~ The web portal from which each company's service administrator can manage user accounts and settings for each of the Office 365 services to which they subscribe.

Office 365 APIs (PN)~ A set of web services built on top of the Office 365 platform that makes available Office 365 components or data, such as documents, spreadsheets, presentations, calendars, mail, contacts, and tasks. These services are available from within apps for Office, apps for SharePoint, and also from third-party sites or applications who want to use Office 365 components, but are hosted on another platform, such as Microsoft Azure.

Office 365 Business (PN)~ The Office 365 subscription that provides Word, Excel, PowerPoint, Outlook, and Publisher and that includes OneDrive and cannot be licensed for more than 300 users per organization.

Office 365 Business Essentials (PN)~ The Office 365 subscription that provides a suite of cloud services that includes Exchange Online, SharePoint Online, Lync Online, and Office Online and cannot be licensed for more than 300 users per organization.

Office 365 Business Premium (PN)~ The Office 365 subscription to Word, Excel, PowerPoint, Outlook, and Publisher that also includes cloud services such as Exchange Online, Lync Online, and SharePoint Online and cannot be licensed for more than 300 users per organization.

Office 365 Compliance Admin Center (n)~ An administrative portal in the Office 365 suite that offers compliance features for Office 365 services.

Office 365 Developer (n)~ A person who develops applications that run on Office 365.

Office 365 Education E1 for Faculty (PN)~ The Office 365 subscription for faculty that

allows them to access communication and collaboration tools from virtually anywhere, at any time and that includes document viewing and lightweight editing with Office Online.

Office 365 Education E1 for Students (PN)~ The Office 365 subscription for students that allows them to access communication and collaboration tools from virtually anywhere, at any time and that includes document viewing and lightweight editing with Office Online.

Office 365 Education E3 for Faculty (PN)~ The Office 365 subscription that provides faculty and staff with the familiar Office desktop suite of apps, as well as Office Online, document sharing and collaboration, instant messaging and enterprise-class email, while including voice mail and advanced archiving capabilities.

Office 365 Education E3 for Students (PN)~ The Office 365 subscription that provides students with the familiar Office desktop suite of apps, as well as Office Online, document sharing and collaboration, instant messaging and enterprise-class email and includes voice mail and advanced archiving capabilities.

Office 365 Education E4 for Faculty (PN)~ The Office 365 subscription that provides faculty and staff with the familiar Office desktop apps, as well as Office Online, document sharing and collaboration, instant messaging and enterprise-class email, while including advanced archiving capabilities and enterprise voice capabilities.

Office 365 Education E4 for Students (PN)~ The Office 365 subscription that provides students with the familiar Office desktop apps, as well as Office Online, document sharing and collaboration, instant messaging and enterprise-class email, while including advanced archiving capabilities and enterprise voice capabilities.

Office 365 Enterprise (PN)~ A subscription offering that provides an online service version of the familiar Office desktop suite, plus cloud-based versions of communications and collaboration services such as Exchange Online, SharePoint Online, and Lync Online, and other enterprise-level features.

Office 365 Enterprise E1 (n)~ An Office 365 online subscription for businesses that need communication and collaboration tools accessible from PCs, the Web and mobile devices.

Office 365 Enterprise E1 (Government Pricing) (PN)~ The Office 365 subscription for government organizations that need communication and collaboration tools and the ability to read and do lightweight editing of documents with the Office Online that is hosted in the commercial cloud environment.

Office 365 Enterprise E1 Trial (n)~ A limited-day trial for an Office 365 online subscription for businesses that need communication and collaboration tools accessible from PCs, the Web and mobile devices.

Office 365 Enterprise E2 (n)~ An Office 365 online subscription for businesses that need communication and collaboration tools and the ability to read and do lightweight editing of documents with the Office Web Apps.

Office 365 Enterprise E3 (n)~ An Office 365 online subscription for businesses that need full productivity, communication and collaboration tools with the familiar Office suite, including Office Web Apps.

Office 365 Enterprise E3 (Government Pricing) (PN)~ The Office 365 subscription that is the best plan for government organizations that need full productivity, communication and collaboration tools with the familiar Office suite, including Office Online, and that is

hosted in the commercial cloud environment.

Office 365 Enterprise E3 (Government Pricing) Trial (PN)~ The the limited-day trial for government organizations for the offer for Office 365 Enterprise E3 that is hosted in the commercial cloud environment.

Office 365 Enterprise E3 Trial (n)~ A limited-day trial for an Office 365 online subscription for businesses that need full productivity, communication and collaboration tools with the familiar Office suite, including Office Web Apps.

Office 365 Enterprise E4 (n)~ An Office 365 online subscription for businesses that need full productivity, communication and collaboration tools with the familiar Office suite, including Office Web Apps and on-premises server rights to information protection and enterprise voice capabilities.

Office 365 Enterprise E4 (Government Pricing) (PN)~ The Office 365 subscription, hosted in the commercial cloud environment, for government organizations that need full productivity, communication and collaboration tools with the familiar Office suite, including Office Online and on-premises server rights to information protection and enterprise voice capabilities.

Office 365 Enterprise E4 Trial (n)~ A limited-day trial for an Office 365 online subscription for businesses that need full productivity, communication and collaboration tools with the familiar Office suite, including Office Web Apps and on-premises server rights to information protection and enterprise voice capabilities.

Office 365 Enterprise K1 (n)~ An Office 365 online subscription for people in your business without a dedicated PC that need occasional access to Web email and internal sites.

Office 365 Enterprise K1 Trial (n)~ A limited-day trial for an Office 365 online subscription for people in your business without a dedicated PC that need occasional access to Web email and internal sites.

Office 365 Enterprise K2 (n)~ An Office 365 online subscription for people in your business without a dedicated PC that need occasional access to Web email, internal sites and documents with Office Web Apps.

Office 365 Enterprise K2 Trial (n)~ A limited-day trial for an Office 365 online subscription for people in your business without a dedicated PC that need occasional access to Web email, internal sites and documents with Office Web Apps.

Office 365 Extra File Storage (Government Pricing) (PN)~ The offer for government organizations for Office 365 Extra File Storage that is hosted in the commercial cloud environment.

Office 365 First Release program (PN)~ An opt-in release track that gives Office 365 tenant admins the ability to decide whether users in their organization receive new features as soon as they are released by Microsoft.

Office 365 global navigation (n)~ A control used in Office 365 mobile applications to indicate navigation between applications in Office 365.

Office 365 Government (n)~ The Office 365 online subscription for government organizations that need communication and collaboration tools accessible from PCs, the Web and mobile devices.

Office 365 Message Encryption (PN)~ A service that enables users to send encrypted

email messages to any recipient on the Internet.

Office 365 Midsize Business (PN)~ A subscription offering designed for midsize businesses with fewer than 250 users that want business-class email, file-sharing, web conferencing plus familiar Office applications -€" Word, Excel, PowerPoint, Outlook, OneNote, Access, Publish and Lync.

Office 365 Midsize Business Trial (n)~ A limited-day trial for an Office 365 online subscription for midsize businesses (fewer than 250 users) that need that need Office suite, email, instant messaging, document/content management, and web conferencing. Includes Microsoft Office for Windows, Mac, mobile, Office Web Apps and IT management capabilities.

Office 365 Partner Admin (PN)~ The web app that provides the key functionality of the O365 Partner Admin Center on mobile devices.

Office 365 Preview (n)~ The public preview version of Office 365 (An online suite of services from Microsoft that combines the familiar Office desktop suite with cloud-based versions of communications and collaboration services.)

Office 365 ProPlus (PN)~ An enterprise-level subscription offering that includes online service versions of Word, PowerPoint, Excel, Outlook, OneNote, Access, Publisher, and Lync.

Office 365 ProPlus (Government Pricing) (PN)~ The offer for government organizations for Office 365 ProPlus that is hosted in the commercial cloud environment.

Office 365 ProPlus A for Faculty (n)~ Office ProPlus Subscription for Faculty and Staff at K12 and Higher Education institutions.

Office 365 ProPlus A for Students (n)~ Office ProPlus Subscription for Students at K12 and Higher Education institutions.

Office 365 ProPlus for Government (PN)~ The offer for government organizations for Office 365 ProPlus that is hosted in the government cloud environment.

Office 365 service update (n)~ The customer-facing term for an update of Office 365. Internally, we recognize this as an update from one version to another (e.g. from wave 14 to wave 15). Externally, we do not use the term version' for a service update.'

Office 365 settings (PN)~ The web page were users can find and modify all of their Office 365 settings.

Office 365 Small Business (PN)~ The Office 365 subscription that provides a suite of cloud services that includes Exchange Online, SharePoint Online, Lync Online, and Office Online and cannot be licensed for more than 300 users per organization.

Office 365 Small Business Premium (PN)~ A premium subscription offering for small businesses (fewer than 10 users) and professionals that need familiar Office applications -€" Word, Excel, PowerPoint, Outlook, OneNote, Access, Publisher and Lync - plus email, instant messaging, web conferencing, and a public website. Includes Microsoft Office for Windows, Mac, and mobile.

Office 365 Small Business Premium Trial (n)~ A limited-time trial for small businesses and professionals (fewer than 25 users) that need Office suite, email, instant messaging, document/content management, and web conferencing. Includes Microsoft Office for Windows, Mac, mobile and Office Web Apps. Simple setup and deployment.

Office 365 University (PN)~ A consumer subscription offering for higher education

students that includes Word, Excel, PowerPoint, OneNote, Outlook, Publisher and Access across multiple devices plus Office services such as personalized experience, Office on Demand, Skype world minutes, additional OneDrive storage and ongoing access to upgrades.

Office Anytime Upgrade (PN)~ A program that lets users try out and purchase applications that are part of a higher value suite than the one they purchased.

Office Automation Services (PN)~ Collectively, the SharePoint service applications that write to ULS logs using shared code for automated document processing.

Office Auto-Revisions (PN)~ A feature that makes automatic versions of user documents during each autosave operation and allows the user to revert to previous copies of the document with ease.

Office Business App (PN)~ The Microsoft Office system provides a set of servers, clients, and tools to make it easier for enterprises and software vendors to build and deploy composite applications in the enterprise. These solutions, called Office Business Applications (OBAs), are quick to build and deploy; empower end users through extensive personalization capabilities; are easy to change when business needs require; and are built using familiar Microsoft Office tools and applications.

Office Business Application (PN)~ A composite application that uses Microsoft Office programs as the presentation layer for line-of-business systems, data and processes.

Office Button (PN)~ A button that replaces the File menu beginning with some 2007 Microsoft Office system programs.

Office Casual (PN)~ A series of videos and blog entries that show you simple ways to get the most out of Microsoft Office, your devices, and your online services.

Office Communications Server (n)~ A computer that runs Microsoft Office Communications Server software.

Office Communications Server Certificate Wizard (PN)~ The wizard that guides users through the process of configuring certificates for Office Communications Server.

Office compatibility definition file (n)~ A file that stores information about compatibility issues and workarounds and makes it available to the Office Telemetry Log and Office Telemetry Dashboard.

Office Customization Tool (n)~ A one-stop shop for customizing Office deployment and setup behaviors.

Office data connection file (n)~ A file that stores information about a connection to a data source, such as an Access database, spreadsheet, or text file, and that facilitates data source administration.

Office Deployment Tool (PN)~ A tool in Office 365 that enables IT professionals to manage how Office is installed for their users. Users receive the correct language and configurations individually tailored to them automatically, without the need to install anything themselves.

Office Developer Center (PN)~ A website that provides content and resources to help developers create custom solutions with Microsoft Office.

Office Developer Tools (PN)~ You can extend Office 2013 and Office 2010 by using Office developer tools in Visual Studio to create apps and solutions. Apps focus on web integration, and solutions target the .NET Framework and are more deeply integrated with

the Office object model.

Office Diagnostics (n)~ A feature that may be able to identify the root cause of crashes if an Office application is repeatedly crashing.

Office Document Cache (PN)~ A client-side cache for documents that are stored on Web servers. Documents are seamlessly replicated from this local cache, and uploaded to servers as required, enabling faster and more robust file access.

Office enabled device (n)~ A removable storage device that has been configured with Office applications using the Office To-Go Device Manager.

Office File Validation (PN)~ A security feature that validates files before allowing them to be loaded by the application, in order to protect against file format vulnerabilities.

Office Fluent (adj)~ Characterized by design and functional elements introduced in the 2007 Microsoft Office suite user interface.

Office Fluent user interface (PN)~ The user interface introduced with the 2007 Microsoft Office suite. It includes components and features such as the Ribbon, Galleries, Live Preview, the Mini Toolbar, and Contextual Tabs.

Office for Android (PN)~ The version of Microsoft Office that runs on the Android operating system.

Office for iPad, iPhone and iPod touch (PN)~ The version of Microsoft Office that runs on iPad, iPhone, and iPod touch.

Office for iPhone (PN)~ The version of Office that runs on iPhone.

Office for Mac (PN)~ The version of Microsoft Office that runs on the Mac operating system.

Office for Mac for Office 365 (PN)~ The version of Office from Office 365 that runs on the Mac operating system.

Office for Mac Preview (PN)~ The public preview of Office for Mac.

Office Forms Server (PN)~ A scalable, security-enhanced, standards-based solution that centralizes control and management of electronic forms by allowing customers to use a common Web browser to interact with information. It will help streamline organizations forms-driven business processes with existing systems.

Office Genuine Advantage (PN)~ A program for licensed Office software that provides access to updates, value-added downloads, free software trials, and special promotions.

Office Graph (PN)~ The graph that represents relationships and interactions between people, items, and people and items across office 365.

Office Home & Business (PN)~ The 2013 edition of the Office suite that supports common tasks for home and small business use, and that includes Word, Excel, PowerPoint, OneNote, and Outlook.

Office Home & Student (PN)~ The 2013 edition of the base consumer offering of the Office suite, which includes Word, Excel, PowerPoint and OneNote.

Office Home & Student 2013 RT (PN)~ The RT version of the Office Home & Student 2013 edition, our base consumer offering, that is included with Windows RT. It includes Word, Excel, PowerPoint and OneNote.

Office Home and Student 2010 (PN)~ The year 2010 edition of the suite of Microsoft productivity software that supports common business tasks, including word processing, e-mail, presentations, and data management and analysis, designed for home and students.

Office Installer (PN)~ An application that installs all program and support files associated with Microsoft Office.

Office Language Pack (PN)~ A set of resources for Microsoft Office software that provides support for features such as Help and proofing tools in a particular language or set of languages.

Office Lens (PN)~ An app that enables you to capture the content of a whiteboard or document as a picture and optionally save it in OneNote. You can also access this functionality from OneNote directly in OneNote for the Windows Store, Windows Phone, iOS, and Android.

office location (n)~ A contact's office number.

Office Migration Planning Manager (PN)~ A group of tools designed to help administrators during the planning and testing phases of Microsoft Office deployment.

Office Multi-Language Pack (n)~ A volume licensing solution that provides Office Language Pack support for all available languages.

Office on Demand (PN)~ A feature that enables subscription customers to launch Office rich client applications online from a computer on which those applications are not already installed.

Office Online Sharing Service (n)~ A service that allows users to share calendars through an Office Online website.

Office Presentation Service (PN)~ A free online service that enables Office users to share presentations with people who view them on the web.

Office Professional (PN)~ The Office suite that supports common business tasks, and that includes Word, Excel, PowerPoint, OneNote, Outlook, Publisher, and Access.

Office Professional 2010 (PN)~ The year 2010 edition of the suite of Microsoft productivity software that supports common business tasks, including word processing (Word), e-mail (Outlook with Business Contact Manager), presentations (PowerPoint and Publisher), and data management and analysis (Access and Excel).

Office Professional 2016 (PN)~ The year 2016 edition of Office Professional.

Office Professional Academic 2016 (PN)~ The year 2016 edition of Microsoft Office available only to eligible students who attend an educational institution geographically located in the United States.

Office Professional Plus (PN)~ The 2013 edition of the Office suite that supports common business tasks, and that includes Word, Excel, PowerPoint, OneNote, Outlook, Publisher, Access, Lync, and InfoPath.

Office Professional Plus 2016 (PN)~ The year 2016 edition of Office Professional Plus.

Office Ready (n)~ A program that separates the pre-installation of Microsoft Office software from the software license sale. Under this program, OEMs can preinstall a build of Office on their PCs without paying royalty to Microsoft. No royalty is due at the time of pre-installation because the software is not licensed perpetually until a product key is purchased and activated by the end-user.

Office Ready PC (n)~ A PC with a preinstalled build of Office that can be activated by the end-user through purchase of a license kit.

Office Roaming Service (PN)~ A feature that helps keep a user's Office settings up to date across devices running Office.

Office Scrapbook (PN)~ A feature designed to help users manage random clippings and tidbits of info.

Office Side-by-Side (PN)~ A Click-to-Run feature that enables two versions of Office to exist on the same computer to provide a seamless transition for users in supported scenarios.

Office Standard (PN)~ The 2013 edition of the Office suite that supports common business tasks, and that includes Word, Excel, PowerPoint, OneNote, Outlook, and Publisher.

Office Standard 2016 (PN)~ The year 2016 edition of Office Standard.

Office Start screen (PN)~ A screen that gives users quick access to recent documents and recommended templates when an Office application starts.

Office Starter To-Go (PN)~ A feature that enables users to take Office Starter programs with them on a USB drive or other portable device and use them on another computer while the device is plugged in.

Office Store (PN)~ An Internet site that provides a collection of products and services developed by Microsoft partners for Microsoft Office users.

Office Suite ~ A related group of programs for business use, usually including a word-processor, spreadsheet, database and a number of other programs. The best known is Microsoft Office.

Office Telemetry Agent (PN)~ A feature of the Office Telemetry Dashboard that supports collection and upload of inventory and usage data for Office related solutions on client computers across an organization.

Office Telemetry Dashboard (PN)~ A tool that enables IT pros to monitor usage, error, and compatibility issue information from Office related solutions on client machines across an organization.

Office Telemetry Log (PN)~ A feature that displays an Office event log in Excel format and helps the user to find and resolve known compatibility issues for Office files and solutions.

Office telemetry logging (n)~ The process that populates data to the Office Telemetry Log.

Office Telemetry Processor (PN)~ A Windows service application that reads data files uploaded by the Office Telemetry Agent and inserts the data into SQL Server.

Office Update (n)~ A web page on the Office Online website maintained by the Microsoft Office product group for the purpose of providing critical updates, add-ins, converters, and viewers that increase the performance and stability of currently released Office programs.

Office Upload Center (PN)~ A central hub for viewing pending uploads to http servers (mainly SharePoint) and correcting upload errors.

Office Viewing Architecture (PN)~ The end-to-end architecture that powers the Word and PowerPoint viewing experience in the browser. It includes the front-end machines to service the browser requests and the back-end machines which convert the document from a DOC or PPT file to PNG, each representing a page of your document.

Office Web Components (n)~ Microsoft COM controls that allow users to publish spreadsheets, charts, and databases to an intranet and edit published documents within a Web browser.

Office XML Handler (PN)~ A utility that launches the appropriate Office application when a user tries to open an XML file.

Office-enabled app for SharePoint (PN)~ An app that has both an Office and a SharePoint component.

offline (adj)~ A network status that indicates a client is not connected to a server.

offline (adj)~ In reference to a computing device or a program, unable to communicate with a primary database or controlling computer.

offline (adj)~ A state that marks a component in a failover cluster or server cluster as unavailable. A node in an offline state is either inactive or not running. Clustered services and applications, and the resources within them, also have an offline state.

Offline (PN)~ Pertaining to a user who, during business hours (or at any time if no business hours have been set), is not signed in to any Lync or Communicator, or IM device and cannot be contacted by phone (no call forwarding information is published).

offline (adj)~ Pertaining to a user who, during business hours (or at any time if no business hours have been set), is not signed in to any Lync or Communicator, or IM device and cannot be contacted by phone (no call forwarding information is published).

offline (adj)~ A user presence state of being unavailable.

Offline (PN)~ The status that appears when a user signs out. This status shows this user is not available to call and IM on Skype.

offline address book (n)~ A snapshot of information from an address book that has been downloaded so that an Outlook user can access it while disconnected from the server. It contains the properties of a user, such as e-mail addresses, that Outlook requires to send an e-mail message and display information about the sender.

offline address book distribution (n)~ The method by which the offline address book (OAB) can be accessed by users when they are working remotely or over a dial-up connection. To distribute the OAB, administrators can use Web-based distribution, public folder distribution, or both. Public folder distribution is required for Outlook 2003 or earlier clients.

offline address book distribution point (n)~ The HTTP Web address or public folder where client computers can download an offline address book. Public folder distribution is required for Outlook 2003 or earlier clients.

offline address book generation (n)~ The process by which Exchange Server creates and updates the OAB. Administrators can define when the OAB generation process will run.

Offline Contacts (n)~ A default contact group name that Communicator uses for all contacts who are currently offline.

offline cube file (n)~ A file you create on your hard disk or a network share to store OLAP source data for a PivotTable or PivotChart report. Offline cube files allow you to keep working when you are not connected to the OLAP server.

offline data source (n)~ A secondary data source that is accessible to users who fill out forms offline. When a user is online, data from the data source is stored on the user's computer so that it can appear in controls when the form is offline.

offline database (n)~ A local working copy of a remote shared database in which you can make changes while you are disconnected. You can synchronize changes with the remote shared database when you reconnect.

Offline Files (PN)~ A feature that makes network files available to an end user when a network connection to the server is unavailable or slow.

offline folder file (n)~ The file on your hard disk that contains offline folders. The offline folder file has an .ost extension. You can create it automatically when you set up Outlook, or when you first make a folder available offline.

offline Help (n)~ Help that is available to the user while not being connected to or part of a system or network.

offline installation (n)~ The process of installing packages and other updates to a Windows image that is not currently running. For example, you can update a Windows image with security updates, language packs, or other packages.

offline instant message (n)~ An instant message that is transmitted while the sender or recipient is offline.

offline mode (n)~ The state in which users fill out forms when working offline.

offline publishing (n)~ ?The process by which- a developer allows- an app to be purchased in bulk licensing and managed by business and IT managers offline.

offline restore (n)~ A restore during which the database is offline.

offline servicing (n)~ The process of installing packages and other updates to a Windows image that is not currently running. For example, you can update a Windows image with security updates, language packs, or other packages.

offline user state capture (n)~ A type of user state capture that can be performed within Windows Preinstallation Environment phase without needing to boot into full OS.

offloading (n)~ The process of transferring part of the processing demand to another device.

off-net (adj)~ Pertaining to dialing a number not serviced by the user's PBX or Unified Communications deployment.

off-network (adj)~ Pertaining to dialing a number not serviced by the user's PBX or Unified Communications deployment.

Off-Page Reference (n)~ A 2-D shape that you can use in large flowchart diagrams to link to another page in the drawing.

Off-peak times (PN)~ A feature that allows the user to schedule automatic synchronization between the device and the Exchange Server every time an item arrives or is changed in Exchange Server (if the organization is running Exchange Server with Exchange ActiveSync), and after the first full synchronization with Exchange Server when the volume of e-mail is low.

offset (v)~ To move an object from its initial X, Y, and Z (three-dimensional objects only) coordinates to new coordinates.

offset account (n)~ In double-entry accounting, the account used to balance a transaction so that debits equal credits.

offset account (n)~ An account used to reduce the gross amount of another account to create a net balance.

offset entry (n)~ In allocations, an entry used to balance the account, dimension, or other field information for the allocation destination. Offset entries typically clear or reduce the source amounts.

offset transaction (n)~ An accounting entry that balances a debit with a credit or a credit

with a debit.

offside (adj)~ Pertaining to, or characteristic of, code that triggers the end of a construct because it is not indented far enough. In other words, code to the left of an offside line is offside. In correctly indented code, you take advantage of the offside rule in order to delineate the end of constructs. If you use indentation improperly, an offside condition can cause the compiler to issue a warning or can lead to the incorrect interpretation of your code.

offside line (n)~ The column that determines the context for a coding construct, for example, a try-€¦with' construct. Code that appears to the left of this line is offside

Off-topic ~ A message which is not relevant to a particular- newsgroup- orforum- on the Internet is said to be 'off-topic'. Posting off-topic messages in newsgroups annoys people intensely, as they make it harder to follow the discussion properly.

OGC (PN)~ The standards body that defines standards for describing and communicating geospatial data.

OID (n)~ A number that identifies an object class or attribute. Object identifiers (OIDs) are organized into an industry-wide global hierarchy. An object identifier is represented as a dotted decimal string, such as 1.2.3.4, with each dot representing a new branch in the hierarchy. National/regional registration authorities issue root object identifiers to individuals or organizations, who manage the hierarchy below their root object identifier.

OIM (n)~ An information model published by the Metadata Coalition (MDC) and widely supported by software vendors. The OIM is a formal description of metadata constructs organized by subject area.

OIOXML (oth)~ In Denmark, a standard for XML electronic invoices that are used by the public sector. OIO is Danish for Offentlig Information Online (Public Information Online.)

OLAP (PN)~ A technology that uses multidimensional structures to provide rapid access to data for analysis. The source data for OLAP is commonly stored in data warehouses in a relational database.

OLAP cube (n)~ A set of data that is organized and summarized into a multidimensional structure that is defined by a set of dimensions and measures.

OLAP database (n)~ A relational database system capable of handling queries more complex than those handled by standard relational databases, through multidimensional access to data (viewing the data by several different criteria), intensive calculation capability, and specialized indexing techniques.

OLAP provider (n)~ A set of software that provides access to a particular type of OLAP database. This software can include a data source driver and other client software that is necessary to connect to a database.

Oldies (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 11.

old-style number (n)~ A number represented in a style where numeric glyphs have varying heights and positions and may extend below the baseline. Using old-style numbers in body text improves its overall look and readability.

OLE (n)~ A technology for transferring and sharing information among applications.

When an object, such as an image file created with a paint program, is linked to a compound document, such as a spreadsheet or a document created with a word processing program, the document contains only a reference to the object; any changes made to the contents of a linked object will be seen in the compound document. When an object is embedded in a compound document, the document contains a copy of the object; any changes made to the contents of the original object will not be seen in the compound document unless the embedded object is updated.

OLE container (n)~ An application that contains a linked or embedded OLE object from another application. For example, if an OLE object in an Access database contains a Microsoft Excel worksheet, Access is the OLE container.

OLE container control (n)~ A Visual Basic control that is used to link and embed objects from other applications in a Visual Basic application.

OLE DB (PN)~ A component database architecture that provides efficient network and Internet access to many types of data sources, including relational data, mail files, flat files, and spreadsheets. OLE DB comprises a specialized set of COM interfaces that expose data from a variety of data stores, both relational and nonrelational.

OLE DB provider (n)~ A program in the OLE DB architecture that enables native access to data, instead of accessing data using ODBC or IISAM drivers, which are external ways to access the data.

OLE embedded object (n)~ An object embedded within a compound document in which only a single piece of content can be active.

OLE for POS (n)~ A widely-adopted POS device standard initiated by Microsoft, NCR, Epson, and Fujitsu-ICL to help integrate POS hardware into applications for the Windows-„¢ family of operating systems.

OLE object (n)~ An object that supports the OLE protocol for object linking and embedding.

OLE Object data type (n)~ A field data type that you use for objects created in other applications that can be linked or embedded (inserted) in an Access database.

OLE server (n)~ An application or DLL that supplies a linked or embedded OLE object to another application. For example, if an OLE object in an Access database contains a Microsoft Excel worksheet, Excel is the OLE server.

OLE/DDE link (n)~ A connection between an OLE object and its OLE server, or between a dynamic data exchange (DDE) source document and a destination document.

OLMA (PN)~ The Microsoft Identity Lifecycle Manager (ILM) 2007 management agent provided by Microsoft to connect to Outlook Live. It is an ILM component that consists of properties, rules, and rules extensions that determine how an object is processed.

OLTP (n)~ A system for processing transactions as soon as the computer receives them and updating master files immediately in a database management system. OLTP is useful in financial record keeping and inventory tracking.

OMID (n)~ A label that is electronically recorded on each medium in a Removable Storage system. Removable Storage uses on-media identifiers to track media in the Removable Storage database.

on account (adj)~ The extension of credit for purchases.

on hold (adj)~ A status that indicates that an active telephone call has been temporarily

suspended.

on hold (adj)~ The state of an operational process that has been suspended or the status of a document and product that participate in a process that is suspended.

on mute (adj)~ A status showing on the phone when the speaker is turned off and the person on the other line can't hear you.

on order (adj)~ Having the status of being ordered but not yet delivered.

On/Standby power button (n)~ The power button that turns a device, computer, or Surface unit, on and off.

on-access protection (n)~ Virus protection (e.g. antivirus software) that is active continuously, as opposed to on demand.

on-account payment (n)~ A fixed installment payment that is agreed to in a payment plan.

on-account statement (n)~ A report of invoiced on-account transaction amounts for a project.

onboard (v)~ To move an application into the store. Involves the uploading and certification of an app's packages and listing data.

on-chip performance counter (n)~ A register on a CPU chip that stores very low-level information. This information can be queried.

on-demand publishing point (n)~ A type of publishing point that streams content to clients by request. Content streamed from an on-demand publishing point is always delivered as a unicast stream.

on-demand report (n)~ A report that is not scheduled, but created on an as-needed basis. For on-demand reports, as with scheduled reports, current data is gathered before the report is generated.

on-demand streaming (n)~ A technology and method for the interactive delivery of digital media across a network in a continuous flow and playing it as it is received when they choose to, rather than having to watch at a specific broadcast time.

on-demand workflow (n)~ A type of workflow that runs only when a user specifically starts it from within the Web application UI. User action is required to start the workflow.

One time (PN)~ A data limit plan where users purchase upfront a quota of data for a given time. For instance, pre-paid 500MB which expire in 6 months.

one way to source binding (n)~ A type of data binding where changes made to the target automatically update the source, while changes to the source don't update the target. Data binding is always set on the target object.

OneCare circle (n)~ The computers that share a OneCare subscription.

one-click publish (n)~ A feature in Visual Studio that lets you deploy a Web application from the development computer to a server by clicking a button on a toolbar, and to deploy changes by clicking the button again, without having to redeploy the full application. You can create multiple publishing profiles to define the settings for different publishing scenarios, such as deploying to a test server, to a production server, and so on.

One-click Subscribe (PN)~ A plug-in that enables users to quickly insert an HTML tag into the body of an email message that, when clicked, adds the email address of the email recipient to the specified list.

OneCore (PN)~ The unified, component-based software architecture model that provides

a large and highly consistent set of APIs across multiple Windows 10-based device families.

one-dimensional measurement (n)~ A measurement with a single characterization of the magnitude or extent of the property of an object.

OneDrive (PN)~ The Microsoft online service that lets users access and share documents, photos, and other files from anywhere.

OneDrive (PN)~ An app that facilitates online file storage.

OneDrive (cloud only) (PN)~ The source location of files that are stored on OneDrive and not synced to the local device. This is different from other OneDrive files (just called OneDrive')

OneDrive Business (PN)~ A document service that enables organizations to provision and manage online storage for their users.

OneDrive camera roll (n)~ A folder that's automatically added to OneDrive when photos are uploaded from Windows Phone.

OneDrive for Business (PN)~ A document service that enables organizations to provision and manage online storage for their users.

OneDrive for Business with Office Online (Government Pricing) (PN)~ The offer for government organizations for OneDrive for Business that includes Office Online, and that is hosted in the commercial cloud environment.

OneDrive for Business with Office Online (Government Pricing) Trial (PN)~ The limited-day trial for government organizations for the offer for OneDrive for Business that includes Office Online, and that is hosted in the commercial cloud environment.

OneDrive for Mac (PN)~ An app for Mac computers that creates a folder on the user's computer, downloads the contents of their OneDrive, and keeps the folder in sync with any file changes online and among additional computers.

OneDrive.com (PN)~ The URL for Microsoft OneDrive.

one-level interactive template (n)~ A workflow template which allows the administrator to define one question with two answers. The answer determines which queue the call is routed to.

OneNote 2016 (PN)~ The year 2016 edition of OneNote.

OneNote API (PN)~ A set of web-based API instructions and requirements for creating, retrieving, and modifying pages in OneNote.

OneNote Clipper (n)~ A browser-based tool that enables users to save web pages to OneNote.

OneNote for Android (PN)~ The version of OneNote that runs on the Android operating system.

OneNote for iPad (PN)~ The version of OneNote that runs on iPad.

OneNote for iPhone (PN)~ The version of OneNote that runs on iPhone.

OneNote for Mac (PN)~ The version of OneNote that runs on the Mac operating system.

OneNote for Mac for Office 365 (PN)~ The version of OneNote from Office 365 that runs on the Mac operating system.

OneNote Online Viewer (PN)~ A OneNote Web App technology that enables users to view in full fidelity a OneNote document that is stored online.

OneNote share (n)~ The feature that lets users create and share OneNote meeting notes in

a Lync Meeting. Notes appear as docked in a Lync Meeting, with participant lists that can be updated in meeting notes for participants to see.

OneNote Staff Notebook (PN)~ The SharePoint app that allows an administrator to set up a custom shared OneNote notebook and a content library for a team in a corporate environment, as well as a private notebook for each direct report that only the manager has access to.

OneNote Staff Notebook (PN)~ The SharePoint app for educators that allows an IT administrator to set up a custom shared OneNote notebook and a content library for groups in educational institutions (K-12 and college level), as well as a private notebook that only the educator and his/her supervisor have access to.

OneNote Staff Notebook for Education (PN)~ The SharePoint app for educators that allows an IT administrator to set up a custom shared OneNote notebook and a content library for groups in educational institutions (K-12 and college level), as well as a private notebook that only the educator and his/her supervisor have access to.

one-off address (n)~ An address that is used to send messages to recipients who do not have a corresponding entry in any of the session's address book containers.

one-pass encoding (n)~ An encoding method in which content is analyzed and compressed in the same pass through the encoder.

one-time bypass (n)~ To allow access one-time.

one-time password (n)~ Passwords produced by special password generating software or by a hardware token and that can be used only once.

one-to-many relationship (n)~ An association between two tables in which the primary key value of each record in the primary table corresponds to the value in the matching field or fields of many records in the related table.

one-to-one relationship (n)~ An association between two tables in which the primary key value of each record in the primary table corresponds to the value in the matching field or fields of one, and only one, record in the related table.

one-way trust (n)~ A trust relationship between two domains in which only one of the two domains trusts the other domain. For example, domain A trusts domain B, and domain B does not trust domain A. One-way trusts are often used to enable authenticated access to resource domains.

one-way trust relationship (n)~ A trust relationship between two domains in which only one of the two domains trusts the other domain. For example, domain A trusts domain B, and domain B does not trust domain A. One-way trusts are often used to enable authenticated access to resource domains.

OneX (n)~ An Institute of Electrical and Electronics Engineers (IEEE) standard that defines port-based network access control which either allows or denies connection requests to IEEE 802.3 wired Ethernet networks or IEEE 802.11 wireless networks.

OnExit event (n)~ An event triggered when transitioning from a given state regardless of the next state of the transition.

on-hand (adj)~ A quantity type assigned to the quantity of an item that is located in inventory and is available to be sold.

on-hand inventory (n)~ Items that are physically in stock and available to be used or sold.

on-hold fiscal period (n)~ The state of a fiscal period that can be reopened and that prevents its use as a time period classifier for account entries.

onion diagram (n)~ A type of block diagram with concentric and partial layer shapes.

online (Adverb) ~ A state that marks a component in a failover cluster or server cluster as available. When a node is online, it is an active member of the cluster and can own and run clustered services and applications, honor cluster database updates, contribute votes to the quorum algorithm, and maintain heartbeats. Clustered services and applications, and the resources within them, also have an online state.

online (adj)~ Pertaining to a user, a file or a computer currently connected a server.

Online (oth)~ An item on the user's My Status menu. This is a status the user can select while signed in, to make it appear to other users that he is currently online.

Online (PN)~ The status that appears when a user signs in. This status shows this user is available to call and IM on Skype.

Online ~ Connected to the internet, or of the internet.

Online -€" Experience Can Change (oth)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

online account (n)~ A single set of sign-in credentials (typically, e-mail address and password) that is used to access the services provided by an online service provider (OSP).

online analytical processing (n)~ A technology that uses multidimensional structures to provide rapid access to data for analysis. The source data for OLAP is commonly stored in data warehouses in a relational database.

Online Archive (PN)~ A repository that is separate from the user's mailbox and that allows items to be archived on the server.

Online Certificate Status Protocol (n)~ A protocol that allows real-time validation of a certificate's status by having the CryptoAPI make a call to an OCSP responder and the OCSP responder providing an immediate validation of the revocation status for the presented certificate. Typically, an OCSP responder responds with the revocation status check request based on the certificate revocation list (CRL) or other forms of revocation status it retrieves from the certification authorities.

Online Certificate Status Protocol responder (n)~ A computer on which the Online Responder service and Online Responder web proxy are running.

Online Contacts (n)~ A default contact group name that Communicator uses for all contacts who are currently online.

online content (n)~ Material that has been published on the Internet

online database (n)~ A remote shared database that is synchronized with your local copy.

online document storage (n)~ A document library such as SharePoint Online.

online event (n)~ An auditorium-style meeting that requires participants to register in order to attend.

online help (n)~ The capability of many programs and operating systems to display advice or instructions for using their features when so requested by the user, as by a screen button or menu item or a function key.

online identity (n)~ A single set of sign-in credentials (typically, e-mail address and password) that is used to access the services provided by an online service provider (OSP).

online identity association (n)~ The binding of an online identity with the user account

on a given PC. Once the association exists, the online identity can be used as a pointer to the user account. For example, with remote media connection, the online identity can be used to point to PC names and IP addresses.

online maintenance window (n)~ Period of time during which online maintenance occurs.

online manual (n)~ An electronic version of a user guide or manual that will release with the software.

online meeting (n)~ A collaborative-style meeting.

Online Responder (n)~ A computer on which the Online Responder service and Online Responder web proxy are running.

Online Responder (n)~ A service that is part of the Online Responder role service and that decodes a revocation status request for a specific certificate, evaluates the status of this certificate, and sends back a signed response containing the requested certificate status information.

Online Responder (n)~ A role service installed on a trusted server that receives and responds to individual client requests for information about the status of a certificate.

Online Responder role service (n)~ A role service installed on a trusted server that receives and responds to individual client requests for information about the status of a certificate.

Online Responder service (n)~ A service that is part of the Online Responder role service and that decodes a revocation status request for a specific certificate, evaluates the status of this certificate, and sends back a signed response containing the requested certificate status information.

Online Responder snap-in (n)~ A snap-in that allows you to configure and manage revocation configurations and Online Responder Arrays to support public key infrastructure (PKI) clients in diverse environments.

Online Responder web proxy (n)~ The web proxy for the Online Responder that receives and decodes requests, and caches responses for a configurable period of time.

online restore (n)~ A restore in which one or more secondary filegroups, files belonging to secondary filegroups, or pages are restored while the database remains online. Online restore is available only in the SQL Server 2005 Enterprise Edition (including the Evaluation and Developer Editions).

online safety (n)~ The protection of Internet users from phishing fraud, indentity threat, spyware, and malware (malicious software).

online service (n)~ A business that provides access to databases, file archives, conferences, chat groups, and other forms of information through dial-up, or dedicated communications links, or through the Internet. Most online information services also offer access to the Internet connections along with their own proprietary services. The largest consumer online information services in the U.S. are America Online, CompuServe, and MSN.

online service provider (n)~ A provider of online services like e-mail, messaging, and others (example: Windows Live, Yahoo, Google).

online servicing (n)~ The process of installing packages and other updates to a Windows image that is currently running.

Online Spotlight (n)~ A section of the Business Contact Manager Home page where links to Help topics and other information are provided. The links are included in the Online Spotlight section to call the user's attention to the information.

online status (n)~ The condition of a user that can be displayed to the user's contacts to communicate whether the user is currently online and available, offline and unavailable, and so on.

online storage (n)~ Storage space provided over the Internet that's allotted to users for keeping digital information, such as photos or documents.

online storefront (n)~ A business that displays its merchandise on the Internet and has provisions for contact or online sales.

online support (n)~ Customer assistance in the form of online Knowledge Base articles, FAQs, troubleshooting tools, and other resources. By using Self-help online support, many customers can resolve their issues without contacting Microsoft directly.

online training (n)~ A meeting or recording that is conducted for training purposes.

Online Video (PN)~ A feature that lets you insert a video from a web-based source into your document and play it back without leaving the document.

on-media identifier (n)~ A label that is electronically recorded on each medium in a Removable Storage system. Removable Storage uses on-media identifiers to track media in the Removable Storage database.

on-net (adj)~ Pertaining to dialing a number serviced by the user's PBX or Unified Communications deployment.

on-network (adj)~ Pertaining to dialing a number serviced by the user's PBX or Unified Communications deployment.

OnNow Power Initiative (n)~ A system-wide approach to power management. All components can be instantly on or off and work in conjunction with hardware and software components to alter their power state as system use requires.

on-object UI (n)~ A user interface that appears near a selected object, usually after the user right-clicks a selection, for example, a context menu that pops up above or beside a selected object and displays a list of commands that fit the selection.

on-object user interface (n)~ A user interface that appears near a selected object, usually after the user right-clicks a selection, for example, a context menu that pops up above or beside a selected object and displays a list of commands that fit the selection.

on-premises (adj)~ Pertaining to an application on a local server or client computer, which usually hosts users for business/commercial usage.

on-premises messaging system (n)~ The messaging system that an administrator runs on their own servers in their own company as compared to a messaging system that is run in the cloud (hosted).

on-screen instructions (n)~ Instructions for users displayed on the screen.

on-screen keyboard (n)~ A keyboard representation on the screen that allows users to type using touch, a stylus, or other input device.

on-the-wire compression (n)~ A performance optimization in DPM that reduces the size of data transferred during replica creation and synchronization, thereby increasing the rate of data throughput without negatively affecting network performance.

ontology (n)~ The science of being. It concerns itself with the types and structures of

objects, relationships, characteristics, events, processes.

OOBE (n)~ The experience that is presented to end users the first time they start a new computer.

OOBE application (n)~ An application that determines what the out-of-box experience will be.

oobe.xml file (n)~ A content file that can be used to store content to display in the customizable areas of Windows Welcome, Welcome Center, and the Get Connected Wizard.

OOUI (n)~ A user interface that appears near a selected object, usually after the user right-clicks a selection, for example, a context menu that pops up above or beside a selected object and displays a list of commands that fit the selection.

opacity (n)~ The quality that defines how much light passes through an object's pixels. If an object is 100 percent opaque, no light passes through it.

opacity mask (n)~ A path or shape that is applied to another object. The transparent portions of the path represent areas where the underlying image is hidden, whereas the opaque portions of the mask indicate where the masked object is allowed

opaque URL (n)~ A URL that has a scheme that is not followed by two slashes (//).

OPC (PN)~ The specification that describes the requirements for packages and for software that implements package-processing operations.

open (adj)~ Pertaining to the status assigned to records in the system that are in progress.

open (v)~ To make an object, such as a file, accessible.

open (adj)~ The state in a period in which activity can occur, the state of an operational process, or the status of a source document.

open appearance (n)~ The visual display of an object when the user opens the object into its own window.

Open Authorization (PN)~ An open standard for authorization which allows users to share resources stored on one site with another site without having to share credentials.

open content model (n)~ A set of XML document rules that states that an element in an XML document can have additional child elements and attributes that are not declared in the schema that the document references.

Open Data Services library (n)~ A set of C functions that makes an application a server. ODS library calls respond to requests from a client in a client/server network. Also manages the communication and data between the client and the server. ODS library follows the tabular data stream (TDS) protocol.

Open Database Connectivity (n)~ In the Microsoft WOSA (Windows Open System Architecture) structure, an interface providing a common language for Windows applications to gain access to a database on a network.

open department sale (n)~ The sale of an item that is not tracked individually (e.g. through a barcode or a key on the register).

Open Device Access Model (PN)~ The access model for horizontal solutions, which enables a horizontal strategy. Open Device Access enables many different Windows Store apps to access a specialized device. Examples: a smartphone with multiple apps that synchronize contacts; a pedometer that allows multiple apps to read its data and post it to a website.

open fiscal period (n)~ The state of a fiscal period that allows its use as a time period classifier for account entries.

open generic type (n)~ A constructed generic type in which one or more of the generic type arguments substituted for its generic type parameters is a type parameter of an enclosing generic type or method. Open generic types cannot be instantiated.

Open Geospatial Consortium (PN)~ The standards body that defines standards for describing and communicating geospatial data.

Open Information Model (n)~ An information model published by the Metadata Coalition (MDC) and widely supported by software vendors. The OIM is a formal description of metadata constructs organized by subject area.

open opportunity (n)~ An opportunity that has not yet been won or lost and is at any of the following sales stages: prospecting, qualification, needs analysis, proposal, price quote, negotiation, or review.

open order (n)~ An order that has not yet been posted to the ledger.

Open Packaging Conventions (PN)~ The specification that describes the requirements for packages and for software that implements package-processing operations.

open path (n)~ A vector path whose beginning and end points are not the same.

open proxy (n)~ A proxy server that accepts connection requests from anyone anywhere and forwards the traffic as if it has originated from the local hosts.

Open Received Files (oth)~ An item on the File menu that opens files that the user has received via Communicator conversations.

open shape (n)~ A shape such as a line, arc, or zigzag. You can format an open shape with line patterns and ends, such as by changing a solid line to a dashed line and adding an arrow to one end.

open shop floor bin (n)~ The bin at a dedicated area that contains items or components that are replenished manually. The items are included on component lists like a production BOM for obtaining an exact registration for cost and invoicing purposes, but they are not important or common enough to include on pick lines.

open shortest path first (n)~ A routing protocol for Internet Protocol (IP) networks. OSPF allows a router to calculate the shortest path to each node for sending messages. The router sends information on the nodes it is linked to, called link-state advertisements, to other routers on the network to accumulate link-state information to make its calculations.

Open Software Descriptor file (n)~ An XML-based file that instructs the client on how to retrieve the sequenced application from the Application Virtualization Management/Streaming Server and how to run the sequenced application in its virtual environment.

Open Source ~ Software (usually) that is created and distributed with either relaxed or no copyright restrictions.

Open Source ~ Open Source Software is software for which the underlying programming code is available to the users so that they may read it, make changes to it, and build new versions of the software incorporating their changes.

Open Sync Center (v)~ A button that opens Sync Center.

Open Systems Interconnection model (n)~ A networking model introduced by the

International Organization for Standardization (ISO) to promote multi-vendor interoperability. OSI is a seven-layered conceptual model consisting of the application, presentation, session, transport, network, data-link, and physical layers.

Open the new opportunity (v)~ Check box on Convert to Opportunity dialog box where the user chooses that the opportunity will be opened after they have converted it from a task.

open visit (n)~ In reports, a visit still in progress when a log file stops collecting data.

Open with (PN)~ A menu item that lets the user open a document using a different application than the one associated with the document type.

Open XML formats (n)~ An international open standard for word-processing documents, presentations, and spreadsheets that can be freely implemented across multiple applications and platforms.

open-authenticated meeting (n)~ An authenticated-users-only meeting that is open to all users with Active Directory credentials.

opening balance (n)~ The balance of an account at the start of an accounting period.

opening balance (n)~ The balance of an account at the beginning of a fiscal period.

opening chevron (n)~ The -« character.

opening curly quotation mark (n)~ The -€œ character.

opening date (n)~ The date on which an opening balance is entered.

opening parenthesis (n)~ The (character.

opening quotation mark (n)~ The -€œ character.

OpenLogic (PN)~ A company that provides open source support, scanning, provisioning and governance solutions so that other companies can leverage open source software safely and efficiently.

OpenType font (n)~ A type of computer font that can be rotated or scaled to any size. OpenType fonts are clear and readable in all sizes and can be sent to any printer or other output device that is supported by Windows.

Openview ~ A line of Hewlett-Packard network management tools offering system, network, desktop, IT service and Internet management functionality.

OpenVPN ~ OpenVPN- is an open source VPN solution. Unlike most VPN systems, OpenVPN uses SSL/TLS to manage and encrypt the connection's data stream.

Opera (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 103.

operand (n)~ Items on either side of an operator in a formula. In Excel, operands can be values, cell references, names, labels, and functions.

operating environment (n)~ The configuration of resources available to the user. Environment refers to the hardware and the operating system running on it. For example, Windows and Macintosh are called windowing environments because they are based on screen regions called windows.

operating system (n)~ The software that controls the allocation and usage of hardware resources such as memory, central processing unit (CPU) time, disk space, and peripheral devices. The operating system is the foundation on which programs are built.

Operating System ~ Every computer has an operating system, which is a sort of master

program that runs automatically when you switch the computer on, and continues running till you switch off. It is responsible for the many routine tasks required to keep a computer running : moving the pointer when you move the mouse, providing icons and menus, running other programs such as a word processor or a game which you may request, controlling the various disk drives, the screen and so on. The most widely used PC operating system is Microsoft- Windows.

operating system deployment (n)~ A Configuration Manager feature that allows you to create operating system images and deploy those images to target computers.

Operating System Deployment Manager (n)~ A security role that grants permissions to administrative users so that they can create, deploy, and manage operating system images.

operating system volume (n)~ A volume that contains an operating system (for example, Windows Vista) that can be loaded by Windows Boot Manager. A given system can have multiple operating system volumes. The operating system on the current volume can be started only if it has an entry in the Boot Configuration Data (BCD).

operating unit (n)~ An organization that divides the control of economic resources and operational processes among people who have a duty to maximize the use of scarce resources, to improve processes, and to account for their performance.

operation (n)~ In mathematics, an action performed on a set of entities that produces a new entity. Examples of mathematical operations are addition and subtraction.

operation (n)~ A specific action carried out by a computer in the process of executing a program.

operation (n)~ A specific task in the manufacturing process.

operation (n)~ A request or request-response pairing on a port that is associated with either a send or receive action.

operation type (n)~ Information that is requested on the resource managed by ILM through the Web service. This includes information on creating and deleting objects, and reading and modifying object attributes. In addition, Add/Remove operations let you apply further control to the modify operation to control only addition of attributes or their removal.

operational data (n)~ Data that is collected, typically in log files, on a daily or other periodic basis. After it is collected, operational data is often imported into the Data Warehouse.

operational database (oth)~ A SQL Server 2008 database, by default named OperationsManager, which stores configuration data, operations data, and security data.

operational log (n)~ A log that contains information about operations carried out by a computer in the process of executing a program.

operational workflow (n)~ A workflow that is synchronous and starts immediately.

Operations Administrator (n)~ A security role that grants permissions to administrative users so that they can perform all actions in Configuration Manager except for those that are required to manage security.

Operations console (n)~ The Operations Manager interface that you use to perform monitoring, administration, authoring, and reporting functions.

operations journal entry (n)~ A record of the operational and legal consequences of a resource flow event.

Operations Manager Connector Framework (PN)~ An interface to the System Center Data Access service that allows applications to synchronously communicate with the root management server.

Operations Manager database (n)~ A SQL Server 2005 or SQL Server 2008 database, named OperationsManager by default, which stores configuration data, operations data, and security data.

Operations Manager Health Explorer (n)~ A feature of Operations Manager that allows you to view and then take action on alerts, state changes, and other significant issues generated by monitoring objects on your network.

Operations Manager object (n)~ A member of a class of elements managed by Operations Manager. For example, an Operations Manager Computer object could refer to a particular computer that is a member of the Operations Manager Computer class.

Operations Manager reporting server (n)~ The server role that is responsible for building and presenting reports.

Operations Manager Shell (PN)~ A customized instance of Windows PowerShell that provides a collection of Operations Manager-specific cmdlets.

operations master (n)~ A domain controller that has been assigned one or more special roles in an Active Directory domain.

operations network (n)~ An organization of operations that synchronizes the dependencies between operations based on starting/ending times, costs, and other criteria. The organization forms a network that follows the manufacturing process from beginning to end. The three types of networks are simple network, simultaneous operations network, and complex network.

operations register (n)~ A register that is used to record the operational and legal consequences of resource flow events in an accounting system.

operations resource (n)~ An economic resource provided by products that flow into or flow out of operations activities.

operator (n)~ A person who controls a machine or system, such as a computer or telephone switchboard.

operator (n)~ A sign or symbol that specifies the type of calculation to perform within an expression. There are mathematical, comparison, logical, and reference operators.

operator (n)~ An element of a filter that specifies a relationship between data values, such as comparison or equality.

operator (n)~ An atomic unit of a query as scheduled by the StreamInsight server to process the events on which the query is applied. Examples include SELECT, PROJECT, AGGREGATE, UNION, TOP K and JOIN. Operators are fully composable and have a specific number of inputs and outputs. See Other Terms: query, query template, composable.

operator (n)~ An object that processes and enhances items in a content processing flow and processes and enhances queries in a query processing flow.

operator overloading (n)~ The assignment of more than one function to a particular operator, with the implication that the operation performed will vary depending on the data type (operands) involved. Some languages, such as Ada and C++, specifically allow for operator overloading.

operator procedure (n)~ A series of Visual Basic statements that define the behavior of a standard operator (such as *, <> or And) on a class or structure you have defined. This is also called operator overloading.

OPK (n)~ A set of tools, documentation, and samples that enable OEMs to preinstall Windows efficiently on new computers according to the terms of the OEM Licensing Agreement.

OPML (n)~ An XML format for outlines.

OPOS (n)~ A widely-adopted POS device standard initiated by Microsoft, NCR, Epson, and Fujitsu-ICL to help integrate POS hardware into applications for the Windows-„¢ family of operating systems.

OPP (n)~ The software infrastructure that links several components and runs them in sequence.

opportunistic lock (n)~ A lock placed by a client on a file residing on a server.

Opportunities Referred By (n)~ A field that holds the name of the person who provided the opportunity.

opportunity (n)~ A potential revenue-generating event, or sale to an account, that needs to be tracked through a sales process to completion.

opportunity competitor (n)~ A competitor to a particular sales opportunity.

opportunity funnel (n)~ Opportunities grouped by sales stage. If viewed in a chart format, the groupings could resemble an abstract funnel. The wide end consists of leads. The narrow end consists of actual sales.

Opportunity Record (n)~ The location for storing opportunity information, including information that is entered on the Opportunity form, linked records, and history items.

opportunity relationship (n)~ In a relationship role, a relationship between a customer (account or contact) and an opportunity.

Opportunity Type (PN)~ A field on the Details tab of the Create New Opportunity screen that allows the user to categorize a sales opportunity.

Opposing Arrows (PN)~ A SmartArt graphic layout used to show two opposing ideas, or ideas that diverge from a central point. Each of the first two lines of Level 1 text corresponds to an arrow. Unused text does not appear, but remains available if you switch layouts.

opposite account (n)~ An account used to balance the gross amount in part or in whole of one or more referenced accounts in an accounting equation.

opt in (oth)~ To explicitly consent to participate. Typically used in marketing programs and offerings, whereby an action (such as the use of personal information beyond the original, primary purpose for which it was collected) is not undertaken unless an individual explicitly consents. An element of choice.

opt out (v)~ To explicitly decline to participate. Typically used in marketing programs and offerings, whereby an action (such as the use of personal information beyond the original, primary purpose for which it was collected) is undertaken unless an individual explicitly declines. An element of choice.

optical character recognition (n)~ A method of translating images of printed text into machine-encoded text.

optical character recognition line (n)~ A line of characters that is read by special

character recognition equipment and translated into computer text.

optical coherence tomography (n)~ An imaging method used to obtain high resolution cross-sectional images of the retina.

optical zoom (n)~ The adjustment of the magnification of a content area or an object (such as a photograph). Developers can specify CSS (using just one line) to enable an element to be zoomed by the user via touch, mouse, and keyboard. This is visually zooming in on an image or document, etc.. When you zoom, the thing you're looking at gets bigger, maintaining proportionality

optimistic concurrency (n)~ A type of locking in which the data page or row containing one or more records (rows) — (including the data being edited) — is unavailable to other users only while the data is being updated, but is available between the Edit and Update operations.

optimistic concurrency (n)~ A method of managing concurrency by using a cached object's version information. Because every update to an object changes its version number, using version information prevents the update from overwriting someone else's changes.

optimistic duration (n)~ The best-case possibility for the total span of active working time expected for a task, that is, the amount of time from the optimistic start to optimistic finish of a task.

optimization (n)~ The process of a compiler or assembler in producing efficient executable code.

optimization (n)~ In programming, the process of producing more efficient (smaller or faster) programs through selection and design of data structures, algorithms, and instruction sequences.

optimize (v)~ To configure a device or application so that it performs better. For example, to fine-tune a program so that it runs more quickly or takes up less space.

optimize synchronization (n)~ An option in merge replication that allows you to minimize network traffic when determining whether recent changes have caused a row to move into or out of a partition that is published to a Subscriber.

optimized HTML (n)~ An HTML code that doesn't contain unnecessary formatting or tags.

optimized palette (n)~ A palette that you create and fill yourself. After you create an optimized palette, you can modify the colors in it or remove the palette altogether.

optimized patching (n)~ A process that reduces the time that is required to apply updates to installed applications whereby only the parts of an application that are modified by an update actually change.

optimizing compiler (n)~ A compiler that analyzes its output (assembly language or machine code) to produce more efficient (smaller or faster) instruction sequences.

optimizing on capacity (n)~ A limited capacity situation where production is scheduled around existing reservations for work centers. Production begins when capacity becomes available.

option button (n)~ A standard control that allows a user to select from a fixed set of mutually exclusive choices.

option group (n)~ A frame that can contain check boxes, toggle buttons, and option

buttons on a form, report, or data access page. You use an option group to present alternatives from which the user can select a single option.

option ROM (n)~ Firmware called by the system BIOS during the PC boot process.

option set (n)~ A type of field that contains a set of options.

optional (adj)~ Pertaining to a component, parameter and so on that is not required or automatic.

optional attendee (n)~ A person who is not required to attend a meeting.

optional field (n)~ A field that need not contain a value when a record is updated or inserted into the database.

optional hyphen (n)~ A hyphen that is used to control where a word or phrase breaks if it falls at the end of a line. For example, you can specify that the word nonprinting' breaks as 'non-printing' rather than 'nonprint-ing."

optional section (n)~ A control on a form that contains other controls and that usually does not appear by default. Users can insert and remove optional sections when filling out the form.

Options (n)~ A menu choice in many applications that allows the user to specify how the program will act each time it is used. For example, the user may be allowed to specify which view will be used when opening a file, or the default location in which certain file types will be saved.

Options (PN)~ A UI element that opens the Options dialog box, where the user can change Lync or Communicator settings and preferences.

option-set appearance (n)~ The visual display for a control when its value is set.

opt-out list (n)~ A list of users who have chosen to opt-out of a mailing list.

OPX (n)~ An organization chart file format with file extension .opx.

OR (n)~ A logical operation for combining two bits (0 or 1) or two Boolean values (false or true). If one or both values are 1 (true), it returns the value 1 (true).

OR constraint (n)~ An indicator of a situation in which any instance of a class can participate in only one association at one time. The constraint is shown as a dashed line connecting two or more associations, which must have a class in common.

Oracle Database Enterprise Edition (PN)~ The edition of the Oracle Database for customers deploying private database clouds and for SaaS vendors who need a secure and isolated multitenant model.

Oracle WebLogic Server Enterprise (PN)~ The enterprise edition of the Oracle WebLogic Server product for high availability and superior diagnostic capabilities. It includes all the features and benefits of Oracle WebLogic Server Standard Edition plus clustering technology, multi-domain management, and comprehensive diagnostic tooling.

Oracle WebLogic Server Standard (PN)~ The Standard edition of the Oracle WebLogic Server product that provides developers with the tools and technologies to write enterprise applications and services quickly. In production, Oracle WebLogic Server Standard Edition provides operations teams with the administration capabilities to keep enterprise applications and services up and running.

orange book ~ The format that enables CD-R drives to record discs that regular CD-ROM players can read. Orange Book defines how CD-R devices can append index data to an existing disc's directory if you add more data to the disc in multiple sessions.

orange book ~

Orange filter (n)~ One of the most common filters used in B&W photography. Increases contrast more than the yellow filter.

Orange Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of orange colors.

orbit (v)~ To move the camera around a 3D object.

orbit (n)~ A number assigned to a parked call by the call park server.

orchestration (n)~ An executable business process.

Orchestration console (n)~ A web-based console that you can use to start, stop, and view information about runbooks.

orchestration database (n)~ The Oracle or SQL Server database where configuration information, runbooks, and logs are stored.

Orchestration Designer (n)~ A graphical user-interface tool used to design and implement business processes.

orchestration instance (n)~ A running instance of a specific executable business process.

Orchestrator Integration Toolkit (PN)~ A set of software tools that you can use to create custom integration packs.

Orchestrator Management Server (PN)~ The computer that provides the communication layer between the Runbook Designer and the orchestration database.

Orchestrator Management Service (PN)~ The service that is responsible for maintaining the orchestration database, communicating with the Runbook Designers, and communicating with the Deployment Manager.

Orchestrator Orchestration Console (PN)~ A web application that runs runbooks. It requires the Orchestrator web service to connect to the orchestration database.

Orchestrator Runbook Server (PN)~ A server role that processes the activities for a running instance of a runbook and publishes any activity data.

Orchestrator Runbook Server Monitor (PN)~ A service that is installed on the management server to monitor the health of runbook servers.

Orchestrator Runbook Service (PN)~ A service that is installed on each runbook server that runs runbooks and communicates with the orchestration database.

order (n)~ The front-to-back placement of an object relative to other objects in a picture or document.

order (v)~ To arrange in a sequence, such as alphabetic or numeric.

order (n)~ A confirmed request for delivery of goods and services based on specified terms. An order is a quote that has been accepted by a customer.

order (n)~ An online purchase submitted by a user to your Web site.

order (n)~ The order in which objects are placed in a layer. An object higher in the stack will cover up (appear on top of) one lower in the stack.

order discount (n)~ A fixed amount or percentage deducted that applies to an order total.

order entry (n)~ A method of capturing sales orders and purchase orders using a software application.

order form object (n)~ The object that stores state data about the current, and possibly historical, purchases of a particular customer.

order header (n)~ The part of a sales order or purchase order that applies to the entire

order.

order ID (n)~ A number that the system assigns to an order for identification purposes.

order line (n)~ The part of a sales order or purchase order that specifies the detailed information about a requested item.

order processing pipeline (n)~ The software infrastructure that links several components and runs them in sequence.

order status code (n)~ A numerical data code that identifies the types of order status used on your Web site. For example, you may create order status codes to define saved orders, deleted orders, or unprocessed orders.

ordered set (n)~ A set of members returned in a specific order.

ordered test (n)~ A test that contains other tests, which are run in a specific order.

OrderForm header (n)~ The logical grouping of fields at the root of the OrderForm that map to the OrderFormHeader table in the Commerce Server Data Warehouse.

ordinal number (n)~ A number whose form indicates position in an ordered sequence of items, such as first, third, or twentieth.

ordinary character (n)~ In regular expressions, any valid character that does not have a special meaning in the current regular expression grammar.

org chart (n)~ A diagram that is used to show hierarchical relationships; for example, company management and employee structures.

organization (n)~ The top level of a business hierarchy.

organization (n)~ A work structure that divides the responsibility for economic resources and processes.

organization chart (n)~ A diagram that is used to show hierarchical relationships; for example, company management and employee structures.

Organization Chart (PN)~ A SmartArt graphic layout used to show hierarchical information or reporting relationships in an organization. The assistant shape and the Org Chart hanging layouts are available with this layout.

Organization Chart Add-in for Microsoft-® Office programs (n)~ Microsoft supplemental software that enables users to create and edit organization charts in Microsoft Office programs.

organization claim (n)~ A claim in intermediate or normalized form within an organization's namespace.

Organization Configuration node (PN)~ In Exchange Server 2007, a node in the Console pane of the Exchange Management Console that administrators use to configure administrative access roles for users or groups.

organization hierarchy (n)~ A structure that orders organizations using a superordinate-subordinate relationship.

organization model (n)~ Internal control, data access, and performance reporting structures designed to divide responsibility for human and operations resources and work processes.

organization profile (n)~ A set of properties that describe a company, division, department, or other business unit within a company. For example, name, account number, spending limits, company discount, and so forth, are all properties that can constitute an organization profile.

Organizational Health report (n)~ A report that provides you a quick view of your organization and its operating characteristics. This includes health and licensing information, and also a summary of the Exchange servers and recipients.

organizational unit (n)~ A type of entry that is used specifically for storing information on a section of an organization. It can represent a department or a group of people, for example, ou = Accounting Dept.

organizational unit (n)~ An Active Directory container object used within domains. An organizational unit is a logical container into which users, groups, computers, and other organizational units are placed. It can contain objects only from its parent domain. An organizational unit is the smallest scope to which a Group Policy object (GPO) can be linked, or over which administrative authority can be delegated.

organizationally unique identifier (n)~ An unique identifier assigned to organizations and managed by the IEEE.

Organizations page (n)~ The page in the Administration Center that details all hosted organizations in a customer's account.

Organizer (n)~ A user who can schedule meetings, send invitations, do all the sharing activities in a meeting, and admit participants from the lobby.

organizer (n)~ A user who can schedule meetings, send invitations, do all the sharing activities in a meeting, and admit participants from the lobby.

orientation (n)~ The direction a publication will be printed on a sheet of paper. You can choose either portrait, which is the taller-than-wide orientation, or landscape, which is the wider-than-tall orientation.

orientation (n)~ The alignment of an item, such as a control.

origin (n)~ The zero points of the axes of any coordinate system used to draw graphical objects. In 2-D the origin is (0, 0).

origin object (n)~ An object in a repository that is the origin in a directional relationship.

origin server (n)~ A server on which a given resource resides.

origin set (n)~ A set in which a resource belonged prior to a change in that resource's attributes.

original design manufacturer (n)~ A manufacturer that designs and manufactures its own products and sells them to other companies with established brand names. Established brand name companies add their logos and sell ODM products as their own.

original sales invoice (n)~ A sales invoice that is created from an original sales order.

original sales order (n)~ A normal sales order that is created in an intercompany company for an external customer and that automatically generates intercompany orders.

originating currency (n)~ The currency in which a business exchange is transacted and recorded.

Originating Lead (n)~ A look-up field in the opportunity, account, and contact forms in which users select the lead that was originally identified as a sales opportunity and that lead to the current opportunity, account, or contact.

originator (n)~ The person who started a workflow.

orphan (n)~ The first line of a paragraph printed by itself at the bottom of a page.

orphan line (n)~ The first line of a paragraph printed by itself at the bottom of a page.

orphaned client (n)~ A client that cannot communicate with its assigned site.

orphaned resource (n)~ A Virtual Machine Manager library resource on a library server that has been removed from VMM, but the resource is still used in a virtual machine template or a service template.

orphaned term (n)~ A term that was reused and whose source term was deleted.

orthographic camera (n)~ A camera that preserves the relative sizes of objects. Building plans typically use this projection because of this lack of distortion. It can also be useful for certain kinds of data visualization, such as bar charts.

OS upgrade mode (n)~ The options for applying guest OS upgrades to the VMs. Available options are automatic, in which the OS is upgraded whenever a new guest OS is released in Microsoft Azure, and manual, in which the user chooses when to upgrade the VMs and what guest OS version to upgrade to.

OS/2 (n)~ A protected-mode, virtual memory, multitasking operating system for personal computers based on the Intel 80286, 80386, i486, and Pentium processors. OS/2 can run most MS-DOS-based programs and can read all MS-DOS disks.

OS/2 ~ (Operating System 2)- A rival PC- operating system- to Microsoft Windows, produced by IBM in the 1990s. It still has a small, dedicated core of supporters, but didn't catch on and for most purposes is obsolete.

OSC (PN)~ A set of features that incorporates elements of social networking into the Outlook experience. It provides relevant contextual information about the people whom users interact with in Outlook, based on local data (e-mail and calendar items) and social activity (news feeds and status updates).

OSD file (n)~ An XML-based file that instructs the client on how to retrieve the sequenced application from the Application Virtualization Management/Streaming Server and how to run the sequenced application in its virtual environment.

OSD Source Root (n)~ A registry key that allows specification of a source location for OSD file retrieval for an application package during publication. OSD Source Roots only support UNC formats (not URLs).

OSI (n)~ A networking model introduced by the International Organization for Standardization (ISO) to promote multi-vendor interoperability. OSI is a seven-layered conceptual model consisting of the application, presentation, session, transport, network, data-link, and physical layers.

OSI model (n)~ A networking model introduced by the International Organization for Standardization (ISO) to promote multi-vendor interoperability. OSI is a seven-layered conceptual model consisting of the application, presentation, session, transport, network, data-link, and physical layers.

OSP (n)~ A provider of online services like e-mail, messaging, and others (example: Windows Live, Yahoo, Google).

OSPF (n)~ A routing protocol for Internet Protocol (IP) networks. OSPF allows a router to calculate the shortest path to each node for sending messages. The router sends information on the nodes it is linked to, called link-state advertisements, to other routers on the network to accumulate link-state information to make its calculations.

OTB (PN)~ A Visual J# feature that is designed for simple object-level testing.

OTC (oth)~ Medication which is available without a prescription.

Other (n)~ One of the music genres that appears under Genre classification in Windows

Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 12.

Other Contacts (PN)~ A default contact group name that Lync and Communicator use for all contacts who have not been placed in a user-defined contact group.

other e-mail address (n)~ The address by which a Exchange Server recipient object is recognized in a foreign messaging system. In Outlook Live, proxy addresses let people receive e-mail that is sent to different e-mail addresses.

Other Phone (PN)~ A button in the Options dialog box, on the Personal tab, that the user clicks to enter a phone number other than a work, home, or mobile phone number.

otherwise element (n)~ A logical 'else' statement in a workflow that defines an alternative action in all cases that do not match the criteria defined in condition or branch elements.

OTP (n)~ Passwords produced by special password generating software or by a hardware token and that can be used only once.

OTP (oth)~ A government transaction portal for the Netherlands that promotes and supports electronic communication between businesses and government agencies.

OTS (oth)~ A version of elevation prompt that allows an administrator to enter administrative credentials to allow a process to run with the full access token of the administrator during the standard user session.

OUI (n)~ An unique identifier assigned to organizations and managed by the IEEE.

out of band management (n)~ A feature in Configuration Manager that allows computers to be managed outside standard management channels by connecting to a supported management controller. This management channel is independent from the Configuration Manager client and the operating system.

out of band management console (n)~ An administrative console that provides powerful administrative control for AMT-based computers, including tasks such as power on and off, check system information and status, boot from an alternative location, reconfigure BIOS settings, and run commands and character-based diagnostic applications.

out of band service point (n)~ A Configuration Manager site system that has the role of provisioning computers for out of band management.

out of memory (n)~ Running low on memory.

Out of Office (PN)~ A status that can be applied to blocks of time in a user's Calendar to indicate that the user will be away.

Out of office (PN)~ A presence status displayed when a user sets up an Out of Office auto-reply in Microsoft Outlook. If the user doesn't have a personal note, their Outlook Out of Office message will appear as their personal note.

Out of Office Assistant (PN)~ A tool that allows the user to configure auto-replies.

Out of Office message (n)~ The auto-reply text specified using Outlook's Automatic Replies or Out of Office Assistant.

Outage ~ The time when a computer system, telecoms facilities, mains electricity supplies, etc. are unavailable for use due to some failure. Also known as downtime. Planned outages are scheduled in advance. outRages are what happens when they are not.

Outbound area (n)~ The area on the Organizations page that displays outbound addresses when the service is configured and set up. Hosted customers need to request EHS

Technical Support to add or remove addresses that are currently subject to outbound EHS filtering.

outbound attribute flow (n)~ The direction that the attribute flow takes when going from ILM to a connected system.

outbound dock (n)~ The platform in a warehouse where goods are loaded for shipment out of the warehouse.

Outbound Mail Server IPs (n)~ A list on the Organizations page that displays all outbound IP addresses that have been configured to use the outbound scanning services in the Hosted Filtering network.

outbound port (n)~ A port for servicing outbound requests.

outbound router (n)~ An application on the front-end server that manages the routing of outbound messages from unified communications users.

outbound translation rule (n)~ A rule that converts phone numbers to the local dialing format for interaction with private branch exchange (PBX) systems.

outbox (n)~ A folder that stores messages that have been created but not yet sent.

Outcome (PN)~ A field on the Partner Details form that allows the user to select the result of a sales opportunity.

outdent (n)~ An indent where the text is displaced into the left margin if text direction is set to left-to-right, or toward the right margin if text direction is set to right-to-left.

outdent (v)~ To move a task to a higher outline level [to the left] in the Task Name field.

outdialing (n)~ A process in which Unified Messaging dials calls. Unified Messaging generally receives calls, but sometimes dials calls. For example, outdialing occurs when Unified Messaging transfers a call to an auto attendant or a subscriber uses Play-on-Phone from Outlook.

Outdoor (adj)~ The name of a device profile that handles incoming calls by using certain notification settings specified by the user.

outer glow (n)~ An effect that applies a halo of color around the perimeter of an object.

outer join (n)~ A join that includes all the rows from the joined tables that meet the search conditions, even rows from one table for which there is no matching row in the other join table.

Outgoing (PN)~ A label that indicates a call made from the phone.

outgoing call (n)~ An attempt by a user to originate communication with a second party.

outgoing call (n)~ A call that originates from your mobile device.

outgoing line (n)~ The phone line being used to place phone calls.

outgoing message (n)~ A message that can be sent to one or more recipients across one or more messaging systems or be posted to a folder in a message store.

Outgoing Number (n)~ A string that appears in the conversation window status bar to display the number the user is currently calling.

outline (n)~ Worksheet data in which rows or columns of detail data are grouped so that you can create summary reports. The outline can summarize either an entire worksheet or a selected portion of it.

outline code (n)~ A custom tag that users define for tasks or resources to allow them to show a hierarchy of the tasks in their project that is different from WBS codes or outline numbers. You can create up to 10 sets of custom outline codes in your project.

outline effect (n)~ An effect that applies to the exterior border around each character of your text or shape.

outline font (n)~ A font (type design) stored in a computer or printer as a set of outlines for drawing each of the alphabetic and other characters in a character set. Outline fonts are templates rather than actual patterns of dots and are scaled up or down to match a particular type size.

outline layout view (n)~ A view that shows the headings of a document indented to represent their level in the document's structure. You can also use this view to work with master documents.

outline level (n)~ Paragraph formatting you can use to assign a hierarchical level (Level 1 through Level 9) to paragraphs in your document. For example, after you assign outline levels, you can work with the document in outline view or in the Document Map.

outline level (n)~ The number of levels that a task is indented from the top level of the outline. You can indent tasks up to 65,000 levels in Project.

outline number (n)~ A number that indicates the exact position of a task in an outline. For example, a task with an outline number of 7.2 indicates that it's the second subtask under the seventh top-level summary task.

outline numbered list (n)~ A list created to apply a hierarchical structure to any list or document. A document can have up to nine levels, and Microsoft Office Word does not apply built-in heading styles to the items in the list.

Outline Processor Markup Language (n)~ An XML format for outlines.

outline symbol (n)~ A symbol that is displayed beside a paragraph in outline view. You can use the symbol to display or hide subordinate levels of text and to reorganize text quickly.

Outlook 2016 (PN)~ The year 2016 edition of Outlook.

Outlook add-in (n)~ A tool that enables the integration of an application with Outlook.

Outlook Address Book (n)~ An address book that is automatically created from contacts in the Contacts folder. The contacts can be people inside and outside of your organization. When you update your contacts, the Outlook Address Book is updated as well.

Outlook Anywhere (PN)~ A feature that enables the user to access Outlook data over the Internet without a VPN connection.

Outlook Calendar (PN)~ The Outlook app that facilitates the management of events.

Outlook Connector Pack (PN)~ Software that enables management of Hotmail email, calendar, and contacts from within Outlook.

Outlook E-Mail Postmark (n)~ A computational proof that Outlook applies to outgoing messages to help recipient messaging systems distinguish legitimate e-mail from junk e-mail.

Outlook e-mail profile (n)~ Information that Outlook uses to remember the e-mail accounts and the settings that tell Outlook where your e-mail is stored.

Outlook for Mac (PN)~ The version of Outlook that runs on the Mac operating system.

Outlook for Mac data file (n)~ A file exported by Outlook for Mac that contains a user's e-mail messages, contacts, calendar events, and other information.

Outlook for Mac for Office 365 (PN)~ The version of Outlook from Office 365 that runs on the Mac operating system.

Outlook for Mac Preview (PN)~ The public preview of Outlook for Mac.

Outlook integration (n)~ Connectivity between Lync or Office Communicator, and Outlook where Lync or Office Communicator receives data from Outlook to make the functions of Lync or Office Communicator work.

Outlook item (n)~ The basic element that holds information in Outlook (similar to a file in other programs). Items include e-mail messages, appointments, contacts, tasks, journal entries, notes, posted items, and documents.

Outlook Live Management Agent (PN)~ The Microsoft Identity Lifecycle Manager (ILM) 2007 management agent provided by Microsoft to connect to Outlook Live. It is an ILM component that consists of properties, rules, and rules extensions that determine how an object is processed.

Outlook Mail (PN)~ The Outlook app for sending and receiving email.

Outlook Mail and Calendar (PN)~ The two Microsoft apps that allow users to send and receive mail, as well as manage events.

Outlook Mail and Outlook Calendar (PN)~ The two Microsoft apps that allow users to send and receive mail, as well as manage events.

Outlook Mobile Service (PN)~ A feature in Outlook that is used to create and send text messages as well as multimedia messages to a mobile device from within Outlook in a manner similar to e-mail messages.

Outlook on the web (PN)~ The Microsoft Office application-€"for use by both consumer and commercial users-€"that provides access to email, a personal calendar, group scheduling, task management, and collaboration applications via a web browser, running on Microsoft Exchange Server.

Outlook profile (n)~ A defined set of values that Microsoft Office Outlook uses to keep track of user accounts.

Outlook Synchronization (PN)~ The Outlook functionality which provides an interface for adjusting synchronization settings, specifying troubleshooting options, and performing the synchronization process.

Outlook Synchronization user (n)~ A person whose permissions are limited to setting up, viewing, and filtering synchronization-related data. The user cannot modify or remove any synchronization-related objects.

Outlook Today (PN)~ A unique view for displaying appointments, tasks, and other information in the form of a Web page. You can customize the Outlook Today page for your organization, or for individuals or groups within your organization, to display the information most relevant to them.

Outlook Voice Access (n)~ A feature that allows a Unified Messaging-enabled user to access their Microsoft Exchange Server mailbox over the telephone. Users can navigate through their mailboxes by using telephone-key or Speech input.

Outlook Web Access Light (n)~ A lightweight version of Outlook Web Access optimized for accessibility and compatibility with the widest array of browsers and operating systems.

Outlook.com (PN)~ The free web-based email service from Microsoft.

out-of-band access (n)~ Access to host via a connection that doesn't use the IP network.

out-of-box experience (n)~ The experience that is presented to end users the first time

they start a new computer.

out-of-box experience application (n)~ An application that determines what the out-of-box experience will be.

out-of-browser (n)~ Pertaining to, or characteristic of, a Silverlight-based application that a user installs from a Web page and runs outside the browser.

out-of-order screen (n)~ The screen that covers the entire device, computer, or Surface unit screen when they are out of order. This screen might appear when the current application fails and stops responding or when an administrator remotely logs on the unit for maintenance. When this screen appears, users see a sequence of images and text that indicates that the system is not currently working.

out-of-process component (n)~ A component that runs in a separate process space from its client.

out-of-stock (adj)~ Describes an item that is not in inventory.

outpatient (n)~ A patient who has been admitted to a hospital or other health care facility for treatment that does not require an overnight stay.

output (n)~ A part, subassembly, or product that is produced by a manufacturing process or resource.

output adapter (n)~ An adapter that receives events processed by the server, transforms the events into a format expected by the output device (a database, text file, PDA, or other device), and emits the data to that device.

output device (n)~ Any peripheral which purpose is to convey information from a computer to a user in the form of text, images, sounds or other.

output file (n)~ The packaged Windows Media file that is created with Windows Media Rights Manager SDK.

output GB (n)~ A unit of measure to charge for the Windows Azure Media Services Encoder based on the amount of data encoded (in GB).

output parameter (n)~ A parameter containing data that the server application is transmitting to the client application.

output product (n)~ The physical products that result from an activity.

output stream (n)~ A flow of information that leaves a computer system and is associated with a particular task or destination.

output VAT (n)~ The tax on an organization's sales, which is levied on the sales price.

Output Window (PN)~ A window that displays status messages for various features in the integrated development environment (IDE).

outrigger table (n)~ A table in the data warehouse that supports enumerations and that captures distinct values from a non-enumeration string property of a class.

outside line access code (n)~ The prefix that is used to access an outside line. In the United States, this prefix is typically 9.

Outside Voice Control (PN)~ The application that connects a mobile device to the enterprise network. Outside Voice Control enables mobile devices that are running the mobile application of Lync Server or Office Communicator Mobile to send and receive calls that come through the enterprise network, in addition to calls that come through the mobile carrier network.

outside-in activation (n)~ A technique that requires a user to perform an explicit

activation command to interact with the content of an embedded object.

outsourcing (n)~ The assignment of tasks to independent contractors, such as individual consultants or service bureaus. Tasks such as data entry and programming are often performed via outsourcing.

OVC (n)~ Configuration objects that are used to render UI in the Universal Object Control for authoring a specific object type in ILM 2'.'

over the counter (oth)~ Medication which is available without a prescription.

Over The Shoulder (oth)~ A version of elevation prompt that allows an administrator to enter administrative credentials to allow a process to run with the full access token of the administrator during the standard user session.

Overage Data Points (n)~ A method of measuring bandwith usage based on samples that allows users to exceed a specified threshold for brief periods of time without any financial penalty.

overallocation (n)~ The result of assigning more tasks to a resource than the resource can accomplish in the working time available.

overdelivery (n)~ A limit, specified as a percentage of quantity ordered, for how much the purchaser will accept over the amount ordered. Overdelivery typically applies to bulk items.

overdue (Adverb) ~ An account status indicating that payments are late or not yet received.

overfitting (n)~ A problem in data mining when random variations in data are misclassified as important patterns. Overfitting often occurs when the data set is too small to represent the real world.

overflow (n)~ The condition that occurs when data resulting from input or processing requires more bits than have been provided in hardware or software to store the data. Examples of overflow include a floating-point operation whose result is too large for the number of bits allowed for the exponent, a string that exceeds the bounds of the array allocated for it, and an integer operation whose result contains too many bits for the register into which it is to be stored.

overflow (v)~ To be filled beyond capacity.

overflow (n)~ The part of a data item that cannot be stored because the data exceeds the capacity of the available data structure.

overflow (n)~ Text that does not fit within a text box. The text is hidden until it can be flowed into a new text box, or until the text box it overflows is resized to include it.

overflow ~ In telephony, excess traffic, on a particular route, that is offered to another (alternate) route.

overflow ~ In computing, a condition where data is presented to a buffer or port faster than it can be processed, resulting in lost data.

overflow area (n)~ An area that holds overflow text and is not visible on the screen.

overflow chevron (n)~ The double angle bracket denoting an overflow button control.

overflow crumb (n)~ A subfolder in the breadcrumb bar's overflow menu.

overflow text (n)~ Text that does not fit within a text box. The text is hidden until it can be flowed into a new text box, or until the text box it overflows is resized to include it.

overhead (n)~ Work or information that provides support - possibly critical support-for a

computing process but is not an intrinsic part of the operation or data. Overhead often adds to processing time but is generally necessary.

overhead time (n)~ The estimated total time spent in instrumentation overhead.

Overheidstransactiepoort (n)~ A government transaction portal for the Netherlands that promotes and supports electronic communication between businesses and government agencies.

overlap (v)~ To extend over and cover a part of something.

overlap (n)~ A method of scheduling production so that one operation begins at one work center while another operation is still incomplete at another work center.

overlap mark (n)~ A mark that indicates the overlap area for lining up adjacent pages in a large publication, such as a poster or banner.

overlapped animations (n)~ More than one animation storyboard that runs at the same time. If the storyboards animate the same property, then the second animation takes over changing the property. If there is no keyframe set at the zero second mark of the second animation, then a smooth transition called a hand off' occurs. Otherwise

overlapped window (n)~ A top-level window that has a title bar, border, and client area; it is meant to serve as an application's main window. It can also have a window menu, minimize and maximize buttons, and scroll bars.

overlay (n)~ A UI or media segment that can display on top of or play concurrently with another UI or media segment.

overload (v)~ Declare at least two versions of a method that have the same name but different signatures.

overpick (n)~ A pick where the quantity handled is higher than the required quantity of the source document.

overprint (v)~ To print an element of one color over one of another color without removing, or knocking out, the material underneath.

overprinting (n)~ The process of printing an element of one color over one of another color without removing, or knocking out, the material underneath.

override (v)~ To prevent something from happening in a program or in an operating system. For example, a user can often override and thus abort a lengthy sorting procedure in a database program by pressing the Escape key.

override (v)~ To initiate another response.

override (n)~ A mechanism by which the default behavior of a rule, monitor, or discovery can be changed for a specific target, group, or object.

override criteria (n)~ Selected target and value pairs that specify when a rule does not apply to a value pair.

override management pack (n)~ A set of files for use with System Center Operations Manager to store overrides and change the default behavior of a rule, monitor, or discovery for a specific target, group, or object.

Override Price (PN)~ An option that allows the user to manually enter a price per unit to a product that is added to a quote, order, or invoice from the product catalog.

oversampling (n)~ The process of selecting more data rows that contain an underrepresented value so that the value is analyzed by the data mining model.

overtime (n)~ The amount of work on an assignment that is scheduled beyond the regular

working hours of an assigned resource and charged at the overtime rate.

Overture ~ Yahoo Search Marketing service after acquiring Overture Services, Inc. (formerly GoTo.com)

overtype mode (n)~ A setting in which existing characters are replaced with newly typed characters.

Overview (n)~ The main pages in Microsoft Office Live where subscribers can view and access their services as well as statistics regarding their accounts.

overview page (n)~ The page displayed for all workspaces except the Software workspace and encompassing the rightmost pane, displays status summaries, and including a Tasks area and a Search box.

overview ruler (n)~ In Eclipse for Visual Studio, the bar on the right side of the editor, which includes color-coded marks that indicate where warnings, errors, tasks, and search matches are within the current file for navigating files that do not fit entirely in the editor.

overwrite (v)~ To replace the existing data with the new one.

Overwrite ~ Replace a computer file such as a document or picture with a newer version, destroying the earlier version. If you make changes to a document and save it with the same filename, the previous version is overwritten and usually cannot be restored.

owner (n)~ The role that controls how permissions are set on objects and can grant permissions to other roles.

owner (n)~ In the Macintosh environment, an owner is the user responsible for setting permissions for a folder on a server. A Macintosh user who creates a folder on the server automatically becomes the owner of the folder, and can then transfer ownership to someone else. Each Macintosh-accessible volume on the server also has an owner.

owner (n)~ The user who is responsible for a particular record in the system. The owner is frequently allowed to perform actions on the record that other users cannot.

owner draw (n)~ A rendering mode in which you take responsibility for drawing a control, rather than relying on the control's default rendering behavior.

owner draw mode (n)~ A rendering mode in which you take responsibility for drawing a control, rather than relying on the control's default rendering behavior.

owner information (n)~ Personal data (such as name, phone number, e-mail address and notes) about the person who possesses the device.

owner password (n)~ A password that the user sets when the Trusted Platform Module (TPM) is enabled. An owner password is required to turn the TPM on or off, and to use certain TPM functions.

ownership (n)~ The way a company or business is owned by the people who run it.

Ownership (PN)~ A field which appears in the 'Company Information' section of the default 'Account' form.

ownership chain (n)~ When an object references other objects and the calling and the called objects are owned by the same user. SQL Server uses the ownership chain to determine how to check permissions.

p (n)~ A value that is used in Microsoft Points to enable efficient micropayments and prepaid purchase for cash based consumers (including kids/teens, as well as emerging and developing markets) and provide a mechanism to directly reward loyal customers.

P&ID (n)~ A diagram that shows how industrial process equipment is interconnected by a system of pipelines, including instruments and valves that monitor and control the flow of materials through the pipelines.

P&L statement (n)~ A report that summarizes a company's costs, expenses, and revenues for a specific accounting period.

P1 header (n)~ The information contained in an e-mail message that is required to send and deliver a message between messaging servers by using SMTP protocol commands. The message envelope contains the sender e-mail address and the recipient e-mail address information. Recipients never see the message envelope, because it is not part of the message content, and it is discarded when the message reaches its destination. The X.400 messaging standard equivalent to the message envelope is called the P1 header.' The message envelope is often referred to as the 'P1 header."

P2 header (n)~ A hidden section of an e-mail message. From the time a message is first created, information about it is added to the message header, including technical details, such as who created the message and the software used to compose it.

P2P ~ See- peer-to-peer

P2P share (n)~ A folder or directory used by peer-to-peer file-sharing software as a destination for receiving files from other users or a source from which other users may download files.

P2V conversion (n)~ The process by which a functioning physical computer is converted' to an identical

P3P (n)~ An open privacy specification developed and administered by the World Wide Web Consortium (W3C) that, when implemented, enables people to make informed decisions about how they want to share personal information with websites.

PaaS (n)~ The capability provided to the consumer of deploying onto the cloud infrastructure consumer-created or acquired applications created using programming languages, libraries, services, and tools supported by the provider. The consumer does not manage or control the underlying cloud infrastructure, including network, servers, operating systems, or storage, but has control over the deployed applications and possibly of the configuration settings for the application-hosting environment.

PAC (n)~ An item provided and signed by the DCE security server that is both a proof of identity and a list of group memberships.

pack (v)~ To package your publication files by using the Pack and Go Wizard.

pack (n)~ A set of components.

Pack and Go Wizard (PN)~ A wizard that packages a publication and its linked files into a single file that you can take to another computer to be edited, or to a commercial printer or a copy shop to be printed.

package (n)~ An object that contains the files and instructions for distributing software to a distribution point.

package (n)~ An icon that represents embedded or linked information. That information

may consist of a complete file, such as a Paint bitmap, or part of a file, such as a spreadsheet cell.

package (n)~ A collection of control flow and data flow elements that runs as a unit.

package (n)~ A group of files that modify Windows features. Package types include service packs, security updates, language packs, and hotfixes. Examples of packages include LanguagePack, Windows Foundation, and FeaturePack.

Package (n)~ A SCE object which is used with the software deployment and with the update management features.

package (n)~ A Configuration Manager object that contains the content files and instructions for distributing programs, software updates, boot images, operating system images, and drivers to Configuration Manager clients.

package configuration phase (n)~ The phase where one of the Sequencing Wizards (the Package Configuration Wizard) gathers information necessary for creating the OSD file.

Package Configuration Wizard (n)~ The Wizard that gathers information necessary for creating the OSD file during the package configuration phase.

Package Creation Tool (n)~ A tool in the Mobile Deployment Package Manager that users use to create deployment packages and installation items.

package definition file (n)~ An ASCII text file that contains predefined software distribution objects, such as programs and packages to be used for software deployment.

Package Deployer (PN)~ An application that lets you combine one or more CRM solutions, data files, and custom code operations into one package that can be deployed by any CRM environment.

Package Family Name (n)~ An app identity that is created when you reserve a name for an app in the Windows Store Dashboard.

package identity (n)~ The element of a .appx package that identifies the name of the package. This name is an internal data element of the .appx package and is not seen by the end-user customer.

Package Manager (n)~ A tool that installs, uninstalls, configures, and updates features and packages for Windows Vista. Called by Windows Setup during a standard installation or update, Package Manager can also be initiated from the command line to install or update Windows Vista feature packages on an offline destination computer, by using an unattended installation answer file.

package redistribution (n)~ A Configuration Manager software distribution operation in which the compressed package source files are redistributed to distribution points to repair a package.

package refresh (n)~ An SMS/Configuration Manager software distribution operation in which the compressed package source files are redistributed to distribution points to repair a package. A package refresh also resets the access control list (ACL) if you changed the package access account.

package resource index file (n)~ A binary file used in Windows Store apps to store resources for all languages, cultures, and scale factors.

Package Resource Indexer (PN)~ The Windows tool that indexes your resources and their contexts. By doing so, it supports tailoring for language and for getting the best assets for different scale (DPI), selecting assets for high-contrast accessibility modes, or

getting the best asset to fit a given target size.

package root directory (n)~ The directory on the sequencing computer on which files for the sequenced application package are installed. This directory also exists virtually on the computer to which a sequenced application will be streamed.

package share (n)~ A network share that includes the software installation files for a package.

Package Solution Wizard (PN)~ A wizard that guides the user through the process of bundling and deploying Microsoft Access database applications.

package source directory (n)~ A directory containing Configuration Manager package source files that are used for package distribution.

package source file (n)~ A file that is contained within an SMS/Configuration Manager package and that each advertised program needs before it can run.

package update (n)~ An SMS/Configuration Manager software distribution operation in which updated package source files are recompressed and then redistributed to distribution points.

Packaged Report (n)~ A representation of statistics and data that is created by Parature and cannot be edited.

packaged software (n)~ A commercial software program or collection of programs that is intended for a variety of users. Packaged software is normally put on a CD (or disks), packaged in a box and sold to the general public.

packaged Windows Media file (n)~ A Windows Media file encrypted with a key, which consumers cannot play unless they have a key provided by a license. A packaged Windows Media file is produced by and protected through the implementation of digital rights management using the Windows Media Rights Manager Software Development Kit(SDK) or a program based on the Microsoft Windows Media Format SDK.

packaging (n)~ The process that protects and signs a Windows Media file, producing a packaged Windows Media file. The packaging process includes generating or specifying a key, generating and signing the content header, and then ecrypting the Windows Media file with this information.

packaging material (n)~ The material used to bundle goods for protection during shipment.

packet (n)~ An Open Systems Interconnection (OSI) network layer transmission unit that consists of binary information representing both data and a header containing an identification number, source and destination addresses, and error-control data.

packet (n)~ A unit of information transmitted from one computer or device to another on a network.

packet (n)~ The set of data sent by the tablet device at each sample point in a stroke.

packet ~ Logical grouping of information that includes a header containing control information and (usually) user data. Packets most often are used to refer to network layer units of data.

packet assembler/disassembler (n)~ A device that connects a non-X.25 device such as a modem to an X.25 packet switching network.

packet data service (n)~ A Windows service for transferring data over mobile networks.

packet distribution service (n)~ The Web service that issues provisioning packets to the

computer enabled by FlexGo technology based on the client's certificate and hardware version. The Web service also updates the distribution database to delete the downloaded packet.

packet header (n)~ In network protocol communications, a specially reserved field of a defined bit length that is attached to the front of a packet for carry and transfer of control information. When the packet arrives at its destination, the field is then detached and discarded as the packet is processed and disassembled in a corresponding reverse order for each protocol layer.

packet privacy (n)~ An authentication level in which each data packet is signed and encrypted in order to protect the entire communication between the client and server.

packet switching (n)~ A technology for breaking data into packets and then sending the packets over a network. Each packet has a header containing its source and destination, a sequence number to reassemble the information, a block of data content, and an error-checking code. The data packets may take different routes to their destination, where the original information is reassembled after the packets arrive. The international standard for packet switching networks is X.25.

packing slip (n)~ A source document that documents the item quantities in a shipment.

packing unit (n)~ The way an item is bundled for shipment. A packing unit consists of packaging materials and one or more items or components of items.

PAD (n)~ A device that connects a non-X.25 device such as a modem to an X.25 packet switching network.

PAD (oth)~ A withdrawal from a customer's account to pay bills or make loan payments that is initiated by a company or financial institution which has the customer's written authority to do so.

Pad (v)~ The default gradient brush option where the color values at the ends of the gradient vector fill the remaining space.

pad color (n)~ The color of the extra space, when padding is applied.

Pad index (PN)~ An option that specifies the space to leave open on each page in the intermediate levels of the index.

padding (n)~ In data storage, the addition of one or more bits, usually zeros, to a block of data in order to fill it, to force the actual data bits into a certain position, or to prevent the data from duplicating a bit pattern that has an established meaning, such as an embedded command

padding (n)~ The space between the inside edge of a child element and its content.

PAE (n)~ A feature that allows x86-based computers to support more than 4 gigabytes (GB) of physical memory. Up to 64 GB of physical memory can be used as regular 4-kilobyte (KB) pages, and the number of bits that can be used by the kernel to address physical memory can be expanded from 32 to 36.

page (n)~ In virtual memory systems, a unit of data storage that is brought into random access memory (RAM), typically from a hard drive, when a requested item of data is not already in RAM.

page (n)~ In word processing, the text and display elements to be printed on one side of a sheet of paper, subject to formatting specifications such as depth, margin size, and number of columns.

page (v)~ To send a message to someone at a remote location, usually via a beeper.

page (n)~ A document on the World Wide Web. A Web page consists of an HTML file, with associated files for graphics and scripts, in a particular directory on a particular machine (and thus identifiable by an URL). Usually a Web page contains links to other Web pages.

page (n)~ In a virtual storage system, a fixed-length block of contiguous virtual addresses copied as a unit from memory to disk and back during paging operations.

page (n)~ The new designer tool added to the object designer for the RoleTailored interface of Microsoft Dynamics NAV (RoleTailored client).- Using the page designer, which is accessed through the object designer, you can create Task Pages, Places, UI Parts and other objects for the new Dynamics NAV UI (RoleTailored client).- The new RoleTailored client does not support forms designed in the Form Designer.

page (v)~ To return the results of a query in smaller subsets of data, thus making it possible for the user to navigate through the result set by viewing 'pages' of data.

page (n)~ A template of analysis that usually displays the same charts and KPI but adapts and displays user's defined filters.

page banner (n)~ A section of a web page containing a graphic element and text, such as the page title. Page banners are usually displayed at the top of a web page.

page blob (n)~ A blob that is a collection of pages. A page is a range of data that is identified by its offset from the start of the blob.

page break (n)~ The point at which one page ends and another begins.

page break preview (n)~ A worksheet view that displays the areas to be printed and the locations of page breaks. The area to be printed is displayed in white, automatic page breaks appear as dashed lines, and manual page breaks appear as solid lines.

page coordinate (n)~ A coordinate used by a drawing surface, such as a form or control.

page depth (n)~ The extent to which links are followed within sites when crawling for content. Measured in number of links.

PAGE DOWN key (n)~ A keyboard key (often labeled PgDn') that is often used to move the cursor down to the top of the next page or a specific number of lines. Its function may vary in different programs.'

Page Editor (n)~ A tool used to edit the content of web pages that the customer has created with Office Live.

page fault (n)~ The interrupt that occurs when software attempts to read from or write to a virtual memory location that is marked not present."

Page Faults Delta (n)~ In Task Manager, the change in the number of page faults since the last update.

page field (n)~ A field that is assigned to a page orientation in a PivotTable or PivotChart report. You can either display a summary of all items in a page field, or display one item at a time, which filters out the data for all other items.

page file (n)~ A hidden file on the hard disk that Windows uses to hold parts of programs and data files that do not fit in memory. The paging file and physical memory, or random access memory (RAM), comprise virtual memory. Windows moves data from the paging file to memory as needed and moves data from memory to the paging file to make room for new data.

page footer (n)~ One or more lines of text in the bottom margin area of a page. A footer may contain elements such as the page number, the name of the file, or the date.

page frame (n)~ A block of contiguous physical memory that stores the contents of a virtual page. The size of the virtual page and page frame are usually identical. However, the size of a page frame depends on the microprocessor.

page group (n)~ A set of related Web pages that is tagged with a particular page group name and used for targeting ads.

page header (n)~ One or more identifying lines printed at the top of a page. A header may contain a page number, a date, the author's name, and the document title, the name of chapter.

Page Inspector (PN)~ A tool that renders a web page (HTML, Web Forms, ASP.NET MVC, or Web Pages) in the Visual Studio IDE and lets you examine both the source code and the resulting output.

page layout (n)~ The arrangement of text and graphics on the page of a document.

page layout (n)~ A pre-defined layout that users can select for their InfoPath form pages. Options include layouts with titles, titles and headings, titles, headings and subheadings.

page layout view (n)~ A view of a document as it will appear on the printed page.

Page Manager (n)~ A tool used to manage web pages that the customer has created with Office Live.

page margin (n)~ The blank space outside the printing area on a page.

page orientation (n)~ The direction a publication will be printed on a sheet of paper. You can choose either portrait, which is the taller-than-wide orientation, or landscape, which is the wider-than-tall orientation.

page output cache (n)~ A special storage location of templatized pages for performance enhancement.

page pane (n)~ A type of pane that displays the page that is selected in the thumbnail pane in a larger size, and enables portions of the page to be selected and copied.

Page Performance Console (PN)~ A troubleshooting tool used for per-page performance testing.

page restore (n)~ An operation that restores one or more data pages. Page restore is intended for repairing isolated damaged pages.

page setup (n)~ A group of settings that affect how a file is printed on the page. Includes paper size and orientation, page margins, headers and footers.

page sheet (n)~ A ShapeSheet that represents a page.

page size (n)~ The size of the finished page of a printed publication, after trimming.

page sorter (n)~ One or more page-shaped controls, located in the lower left corner of the Publisher window, that represent each page of the publication and can be used to go to, rearrange, or work with publication pages.

Page template (n)~ A predesigned, generic web page you can use to create new custom pages. Some of the page templates in FrontPage provide typical page content, while others provide common page layouts.

page theme (n)~ A folder defining a theme, with control skins, style sheets, graphics files and other resources created as a subfolder of the \App_themes folder in your Web site.

page time (n)~ The time that a OneNote page was created.

page title (n)~ A descriptive text string that identifies a page.

page unit (n)~ The size or distance on the printed page.

PAGE UP key (n)~ A keyboard key (often labeled PgUp') that is often used to move the cursor up to the top of the previous page or a specific number of lines. Its function may vary in different programs.'

page usage (n)~ Information about the pages that visitors entered, exited, and viewed the most on a Web site.

page view (n)~ The request by a user's browser for a Web page. The number of requests to view a page can indicate the frequency with which an ad is viewed.

page zeroing (n)~ A process in which the data within a database is overwritten with characters that you have selected for that purpose. This makes the data unrecoverable by conventional means.

paged pool (n)~ The system-allocated virtual memory that has been charged to a process and that can be paged. Paging is the moving of infrequently used parts of a program's working memory from random access memory (RAM) to another storage medium, usually the hard disk.

paged view (n)~ A view that supports one or more visual pages. A paged view is used to break up large sets of data into smaller sets for increased performance and manageability.

page-description language (n)~ A computer language that describes the arrangement of text and graphics on a printed page.

pagefile (n)~ A hidden file on the hard disk that Windows uses to hold parts of programs and data files that do not fit in memory. The paging file and physical memory, or random access memory (RAM), comprise virtual memory. Windows moves data from the paging file to memory as needed and moves data from memory to the paging file to make room for new data.

page-mode RAM (n)~ A specially designed dynamic RAM that supports access to sequential memory locations with a reduced cycle time.

pager (n)~ A pocket-sized wireless electronic device that uses radio signals to record incoming phone numbers or short text messages. Some pagers allow users to send messages as well.

pager control (n)~ A control that is used with a window that does not have enough display area to show all of its content. The pager control allows the user to scroll to the area of the window that is not currently in view.

pagination (n)~ The process of dividing a document into pages for printing.

pagination (n)~ A mechanism that automatically separates the content in ASP.NET mobile Web Forms into smaller groups of rendered pages that are targeted to fit a specific device. It also renders user interface elements that can be used to browse to other pages.

paging (n)~ The process of moving virtual memory back and forth between physical memory and the disk. Paging occurs when physical memory limitations are reached and only occurs for data that is not already backed' by disk space. For example

paging file (n)~ A hidden file on the hard disk that Windows uses to hold parts of programs and data files that do not fit in memory. The paging file and physical memory, or random access memory (RAM), comprise virtual memory. Windows moves data from the paging file to memory as needed and moves data from memory to the paging file to make

room for new data.

paid ad (n)~ An advertisement that is served with specific delivery goals.

paid cellular data (n)~ Cellular- data that customers can buy from the Windows Store to connect to- their Windows device.

paid data network (n)~ A Wi-Fi data or cellular data network that customers can connect to by buying minutes from the Windows Store.

Paid Search Syndication (n)~ A type of contextual advertising consisting of incorporating results from online searches into the search results on third party sites.

paid Wi-Fi data (n)~ Wi-Fi data that customers can buy from the Windows Store to connect to their Windows device.

pain management (n)~ A variety of techniques including pharmacological and nonpharmacological methods to prevent, alleviate, or stop pain.

pain point (n)~ A particularly urgent and difficult to solve customer problem.

Paint Bucket (PN)~ A tool used to pick up' properties from an object A that are then applied to a later selected object B.'

Paint Drip (n)~ A title animation in Windows Movie Maker.

Paintbrush (PN)~ A tool that lets you draw a Bezier path by click-and-dragging in a continuous flow.

pair (v)~ To establish a Bluetooth link or connection between two Bluetooth-€"enabled devices.

pairing (n)~ The process of establishing a Bluetooth link or connection between two Bluetooth-€"enabled devices.

Pairing accessory (PN)~ The screen title prompting a user to enter the same PIN to pair the phone and the Bluetooth accessory.

PAL (n)~ The dominant television standard in Europe and China. Phase Alternating Line (PAL) delivers 25 interlaced frames per second at 625 lines of resolution.

PAL (n)~ The primary mechanism for securing the Publisher. It contains a list of logins, accounts, and groups that are granted access to the publication.

PAL DV-AVI (n)~ Movie file format for captured video streams from a DV camera. Uses the PAL television standard as opposed to NTSC format.

palette (n)~ An array that contains color values identifying the colors that can currently be displayed or drawn on the output device.

palette window (n)~ A modeless secondary window that displays a toolbar or other choices, such as colors or patterns.

palettized surface (n)~ A surface in which each pixel color is represented by a number that indexes into a color palette.

Palladium ~ a plan from Intel, AMD, and Microsoft to build security into personal computers and servers at the microprocessor level. Assuming that enough users buy computers with Palladium capabilities, each user may now for the first time be able to effectively filter out spam, ensure that only authorized programs can ever be run by the computer, and encrypt the data in your computer.

pallet (n)~ A portable platform that is used to hold and move materials and goods in places such as work centers and warehouses.

pallet transport (n)~ A system that moves items in bulk by using a pallet.

Palm ~ This brand name refers to Palm Inc.'s line of PDA devices, as well as its operating-system platform, the Palm OS. Palm once dominated the PDA market with an estimated 80 percent market share

palmtop (n)~ A portable personal computer whose size enables it to be held in one hand while it is operated with the other hand. A major difference between palmtop computers and laptop computers is that palmtops are usually powered by off-the-shelf batteries such as AA cells. Palmtop computers typically do not have disk drives; rather, their programs are stored in ROM and are loaded into RAM when they are switched on. More recent palmtop computers are equipped with PCMCIA slots to provide wider flexibility and greater capability.

Palmtop ~ A small computer which fits into the palm of your hand. They run similar software to conventional PCs, but (unlike- notebook- PCs) are more limited in what they can do than desktop PCs, because of the constraints of miniaturisation. See- PDA.

PAM (n)~ New feature enabling temporary admin capabilities to administrators

pan (n)~ In computer graphics, a display method in which a viewing window on the screen scans horizontally or vertically, like a camera, to bring offscreen extensions of the current image smoothly into view.

PAN (n)~ A small, Internet Protocol (IP)-based network. It is usually used for short-range, ad-hoc communication between devices and computers. A PAN may also be used to enable connectivity to a larger Local Area Network (LAN), Wide-Area Network (WAN), or the Internet. Windows XP supports the Bluetooth PAN service so you can create Personal Area Networks using Bluetooth.

Pan (PN)~ A tool to move around the document by clicking and dragging the cursor.

pan (n)~ A multi-touch gesture that consists of one or two fingers moving in the same direction, parallel to each other.

pan (v)~ To navigate through screens or menus at a controlled rate, performed by putting your finger(s) on and keeping contact with the phone's touch screen while moving it around.

PAN (PN)~ A 10-character alphanumeric identifier issued by the Indian Income Tax Department to all taxable entities for taxation and identification purposes.

pane (n)~ A portion of a software window bounded by and separated from other portions by vertical or horizontal bars and having a separate function.

pane (n)~ Small, boxed areas in the Windows Intune UI.

panel (n)~ A UI container that docks to a pane, can be part of a panel group, and is represented by a tab.

panel (n)~ One of the thin, distinct sections that covers each side of a central processing unit or Surface unit.

panning (n)~ A multi-touch gesture that consists of one or two fingers moving in the same direction, parallel to each other.

panning (n)~ In computer graphics, a display method in which a viewing window on the screen scans horizontally or vertically, like a camera, to bring offscreen extensions of the current image smoothly into view.

panning direction lock (n)~ Functionality that constrains the panning direction to a primary axis. A distance threshold is used to determine the user's intent and select the

primary axis.

Panning Hand (n)~ A menu item in Internet Explorer that turns on the tool for Tablet PC users that allows the user to move the content of the page up and down, like a mouse scroll wheel.

panning mode (n)~ A mode that enables the user to move a document by dragging it. Panning mode is available when a Word document is displayed on a preview pane.

panorama (n)~ A picture made by combining a series of photos into one large picture to provide a complete view of an area or location that cannot fit in a single shot.

panorama (n)~ A control that creates a panoramic view of items that can be panned side-to-side.

Panorama (PN)~ The Structure that places content along the horizontal axis and allows users to navigate through it from left and right.

panoramic photo (n)~ A picture made by combining a series of photos into one large picture to provide a complete view of an area or location that cannot fit in a single shot.

Panose (n)~ A font-classification method that measures values, such as serifs, weight, and stroke variations, for a TrueType font. These values are represented by a Panose number. The Panose number is then used to associate the font with other fonts of similar appearance but different names. The closer the Panose number of two fonts, the more similar they are.

pan-scan (n)~ A DVD display format in which a 16x9 video is cropped for display in a 4x3 window, by using parameters defined by the video author.

Pantone (n)~ A widely-used color-matching system that defines hundreds of spot-color inks or process colors made up of CMYK inks.

PANTONE (n)~ A widely-used color-matching system that defines hundreds of spot-color inks or process colors made up of CMYK inks.

PAP (n)~ A method for verifying the identity of a user attempting to log on to a Point-to-Point Protocol (PPP) server.

PAP (n)~ A mode of respiratory ventilation in which air is mechanically delivered into the airways and lungs.

paper size (n)~ The size of the sheet of paper on which you print the publication, before trimming.

paper source (n)~ The location (such as Upper Paper Tray or Envelope Feeder) of the paper at the printer.

paper space (n)~ In a CAD drawing, a two-dimensional workspace analogous to a sheet of paper in which a drafter can arrange different views of a 3-D drawing.

PAR (n)~ The ratio of a pixel's width to its height. Computer monitor pixels are square, and therefore have a pixel aspect ratio of 1:1.

paragraph formatting (n)~ Formatting that controls the appearance of a paragraph. Examples include indentation, alignment, line spacing, and pagination.

paragraph indent (n)~ Displacement of the left or right edge of a block of text in a paragraph in relation to the margin or to other blocks of text.

paragraph mark (n)~ The nonprinting -¶ character that Microsoft Office Word inserts when you press ENTER to end a paragraph. The paragraph mark stores the formatting you apply to the paragraph.

paragraph style (n)~ A combination of character and paragraph-formatting characteristics that are named and stored as a set. You can select a paragraph and use the style to apply all of the formatting characteristics to the paragraph at one time.

parallel branch (n)~ An element of workflow logic that defines an alternative wait condition with a corresponding set of additional steps that are only performed when the initial criterion is met.

parallel device (n)~ A device that uses a parallel connection.

parallel execution (n)~ The apparently simultaneous execution of two or more routines or programs. Concurrent execution can be accomplished on a single process or by using time-sharing techniques, such as dividing programs into different tasks or threads of execution, or by using multiple processors.

parallel port (n)~ The input/output connector for a parallel interface device. Printers are generally plugged into a parallel port.

Parallel Port ~ A special socket for plugging a printer into a computer. The computer usually refers to the parallel port as LPT1.

parallel routing (n)~ A routing method in which all available agents in the hunt group are offered the call. The first agent to accept the call will get it, and the other agents will be notified that the call was taken by someone else.

parameter (n)~ In programming, a value that is given to a variable, either at the beginning of an operation or before an expression is evaluated by a program.

parameter block (n)~ A buffer that contains the data for one or more properties, or a pointer to the data.

parameter query (n)~ A type of query that, when you run it, prompts for values (criteria) to use to select the records for the result set so that the same query can be used to retrieve different result sets.

parameterized class (n)~ In a static structure diagram, a template that describes a class with one or more unbound formal parameters. It defines a family of classes, each of which is specified by binding the parameters to actual values.

parameterized query (n)~ A query that accepts input values through parameters.

parameterized report (n)~ A published report that accepts input values through parameters.

parameterized row filter (n)~ A row filter available with merge replication that allows you to restrict the data replicated to a Subscriber based on a system function or user-defined function (for example: SUSER_SNAME()).

parameterized type (n)~ A type whose definition has placeholders for actual types that the user specifies when creating and using instances of the type. C++ templates and common language runtime generics are examples of parameterized types.

parameterless constructor constraint (n)~ A restriction on a generic type parameter, such that types substituted for that type parameter must provide a parameterless or default constructor.

parametric polymorphism (n)~ A feature of the common language runtime, conceptually similar to C++ templates, that allows classes, structures, interfaces, and methods to have placeholders (generic type parameters) for the data types they store and manipulate. Generic types are a form of parameterized types.

parcel (n)~ Any set of files that is transferred from one site to another with Courier Sender. Parcels are created in Courier Sender Manager.

parent (n)~ The controlling side of a hierarchical relationship. In a hierarchical structure, a parent has one or more child nodes directly beneath it in the hierarchy.

parent (n)~ A device, bus, function, or process at one level of a hierarchy. The parent controls the behavior of components below it in the hierarchy.

parent (n)~ In a tree structure, an element that contains subordinate elements called child elements.

parent account (n)~ An account that is above other accounts in the hierarchy to which any action taken on the main account entity can propagate to.

parent business (n)~ A business in which any action taken on the main business can propagate to the subordinate business.

parent business unit (n)~ A business unit that is immediately above another business unit in the business hierarchy of an organization.

parent cache server (n)~ In a multi-tiered cache hierarchy, a disk-based cache proxy/server that sits between the edge cache node and the origin server.

parent category (n)~ An entity used in catalogs to group a set of products in a hierarchy. For example Music is a parent category and Rock Jazz and Classical are child categories.

parent company (n)~ A company that owns more than one separate subsidiary.

parent container (n)~ The container that is above other containers in a tree hierarchy.

parent content type template (n)~ A type of content that exists prior to the association with an actual Windows SharePoint Services list. This distinction is made since items cannot use a type until it is associated with a WSS list.

parent customer (n)~ An account that is immediately above a contact entity. Any action taken on the account entity can propagate to the child contact entity.

parent element (n)~ In a tree structure, an element that contains subordinate elements called child elements.

parent folder (n)~ The folder above the current folder in the folder hierarchy. For example, C:\Shares is the parent folder of C:\Shares\public.

parent host group (n)~ A host group that contains another host group, which is known as a child host group."

parent keyword (n)~ A keyword that is associated with one or more subordinate keywords.

parent language (n)~ The language of the full language pack that a Language Interface Pack (LIP) can be installed onto.

parent network (n)~ A network that is superordinate to other networks.

parent node (n)~ A node with subordinate node(s), called children.

parent object (n)~ The object in which another object resides. A parent object implies relation. For example, a folder is a parent object in which a file, or child object, resides. An object can be both a parent and a child object. For example, a subfolder that contains files is both the child of the parent folder and the parent folder of the files.

parent partition (n)~ The partition that manages the virtual machines.

parent picklist (n)~ A drop-down list control that determines the values of another drop-down list (also known as a picklist) or a check box.

parent project (n)~ A project that has one or more subprojects.

parent record (n)~ The highest-level container of one or more work items that includes new and changed configuration items.

parent site (n)~ A site that has one or more child sites.

parent solution (n)~ A solution to which a component belongs to. A component can have only one parent solution.

parent table (n)~ A table that assumes a parent role when it participates in an integrity relationship with another table and whose attribute values migrate to foreign key attributes in the table assuming the child role in the relationship.

Parent Ticket (n)~ A Ticket that has related (Child) Tickets linked to it. Parent Tickets are usually related to issues that cause other issues or prevent Customers from using features as intended; the resulting issues are usually the subject of Child Tickets. A Parent Ticket can have multiple Child Tickets, but Child Tickets cannot have multiple Parent Tickets.

parent Web site (n)~ In a hierarchical structure, the Web site that contains the active site.

parent window (n)~ A primary window that provides window management for a set of child windows. See also child window and multiple-document interface.

parent workflow (n)~ A workflow that starts a child workflow. The child workflow communicates its outcome back to the parent workflow.

Parent: Child Business Units (PN)~ A security access level that allows a user access to record types in the user's business unit and all business units subordinate to the user's business unit.

Parental Controls (n)~ A Control Panel icon in Windows Vista that allows parents and guardians to customize key aspects of their children's online and computing experience through the use of features such as game ratings and activity reports.

parental controls (n)~ Settings that enable parents to restrict what their children see.

Parental Controls (n)~ A UI element that enables a user to block adult content.

Parental Guidance (BBFC) (n)~ A content descriptor developed by the British Board of Film Classification (BBFC).

PARENTHESIZED LATIN CAPITAL LETTER A (n)~ A Unicode character with hex value U+1F110

parenting (n)~ The process of managing the growth and delegation of a parent domain into further child domains, which are derived and delegated from the parent name.

Parenting Level (PN)~ A field on the Account Details portion of the Details tab that allows the user to specify the level of superordination of an account. Possible levels include unified, top, intermediate, and child.

parity (n)~ The quality of sameness or equivalence, in the case of computers usually referring to an error-checking procedure in which the number of 1s must always be the same —either even or odd— for each group of bits transmitted without error.

parity (adj)~ Pertaining to the resiliency type for a volume that stripes data and parity information across physical disks in a Microsoft Storage Spaces storage pool.

parity ~ In RAID storage, a data-protection method that provides the ability to reconstruct data. When data is protected by parity, it's still available if a drive fails.

parity bit (n)~ In asynchronous communications, an extra bit used in checking for errors in groups of data bits transferred within or between computer systems. In modem-to-

modem communications, a parity bit is often used to check the accuracy with which each character is transmitted.

park (v)~ To shut down a core processor for power saving purpose.

park (v)~ To transfer a call to a holding point instead of holding the call at the phone device. It is retrieved by dialing the associated number for the holding point.

Parking Lot (PN)~ An option on the Transfer button that lets you park a call.

parse (v)~ To break input into smaller chunks so that a program can act upon the information.

parser (n)~ An application or device that breaks data into smaller chunks so that an application can act on the information.

part (n)~ An element in a control template that has special, possibly mandatory, significance and semantics in the functioning of the control. For example, a template for a ScrollBar control should supply a Thumb part for the ScrollBar to function correctly, but it need not provide a small decrease or a small increase button.

part control (n)~ A control in the Web Parts control set that inherits directly or indirectly from the System.Web.UI.WebControls.WebParts.Part class and is used to create the primary user interface of Web Parts applications.

part number (n)~ A number that identifies one type of inventory item.

partial (n)~ A line of code that was partially executed by a test.

partial backup (n)~ A backup of all the data in the primary filegroup, every read-write filegroup, and any optionally specified files. A partial backup of a read-only database contains only the primary filegroup.

partial class (n)~ A class whose definition is split over two or more source files. Each source file contains a section of the class definition, and all parts are combined when the application is compiled.

partial database restore (n)~ A restore of only a portion of a database consisting of its primary filegroup and one or more secondary filegroups. The other filegroups remain permanently offline, though they can be restored later.

partial differential backup (n)~ A partial backup that is differential relative to a single, previous partial backup (the base backup). For a read-only database, a partial differential backup contains only the primary filegroup.

partial localization (n)~ The localization of only some user interface items into a particular language. A choice of fallback languages is provided for the non-localized items.

Partial Nudity (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

partial replica (n)~ A database that contains only a subset of the records in a full replica.

partial solution (n)~ A solution that contains only selected components. For example, if a user decides to export only a subset of components (for example, some but not all entities), the solution is considered to be partial.

partial type (n)~ A type of class whose definition is split over two or more source files.

partially localized language (n)~ A language which contains 100 percent of the resources for that language and locale, but not all of the resources are translated in the language pack. Partially localized languages are installed on top of a fully localized language pack.

For example, Arabic (Saudi Arabia) is a partially localized language pack and contains 80 percent of the language resources localized in Arabic. The remaining 20 percent of the language resources can be in either English or French. Both English and French are fully localized languages.

partially qualified account number (n)~ A ledger account number in which all segments of an account structure are not entered.

partially trusted (adj)~ Pertaining to applications or forms that have limited security permissions and access to the system resources and other components on a user's computer.

partial-page rendering (n)~ The process of refreshing only a region of a Web page during an asynchronous postback. This is typically accomplished by using UpdatePanel controls. Partial-page rendering is an important feature of AJAX technology.

partial-type definition (n)~ The definition of a class across mulitple source files.

participant (n)~ A presenter or attendee in a meeting.

participant (n)~ A person who is part of a conversation or conference, or a presenter or attendee in a meeting.

participant (n)~ A synchronization provider and its associated replica.

participant (n)~ A party that contributes to a process or assumes a role in a relationship.

participant code (n)~ An access code that is required for a user to join a conference as a participant. This code is entered in the Options dialog box, on the Accounts tab, under Conferencing Information.

participant list (n)~ In a conversation window, this is the list of people who are currently participating in the conversation.

particle (n)~ A very small piece or part; an indivisible object.

partition (n)~ A section of space on a physical disk that functions as if it were a separate disk.

partition (n)~ A class used as a proxy for gaining greater code coverage in unit testing.

partition (n)~ In database programming, a subset of a database table or file.

partition (n)~ A division of an application's processing into logical or functional parts.

partition boot sector (n)~ A portion of a hard disk partition that contains information about the disk's file system and a short machine language program that loads the Windows operating system.

partition function (n)~ A function that defines how the rows of a partitioned table or index are spread across a set of partitions based on the values of certain columns, called partitioning columns.

partition scheme (n)~ A database object that maps the partitions of a partition function to a set of filegroups.

partition table (n)~ On a hard disk, the data structure that stores the offset (location) and size of each primary partition on the disk. On MBR disks, the partition table is located in the master boot record. On GPT disks, the partition table is located in the GUID partition entry array.

partition(ing) ~ Partitions are physical or logical mechanisms for isolating operational environments within single or multiple servers.

partition(ing) ~ The act of creating a logical (as opposed to physical) drive.

partition(ing) ~ To break into smaller sections, such as a hard drive. Partitioning can also be used to allow multiple operating systems on the same drive of a given computer.

partitioned article (n)~ An article (generally a SQL Server table, but could also be a view) that has been filtered in some way.

partitioned index (n)~ An index built on a partition scheme, and whose data is horizontally divided into units which may be spread across more than one filegroup in a database.

partitioned snapshot (n)~ In merge replication, a snapshot that includes only the data from a single partition.

partitioned table (n)~ A table built on a partition scheme, and whose data is horizontally divided into units which may be spread across more than one filegroup in a database.

partitioned table parallelism (n)~ The parallel execution strategy for queries that select from partitioned objects. As part of the execution strategy, the query processor determines the table partitions that are required for the query and the proportion of threads to allocate to each partition. In most cases, the query processor allocates an equal or almost equal number of threads to each partition, and then executes the query in parallel across the partitions.

partitioning (n)~ The process of replacing a table with multiple smaller tables.

partitioning column (n)~ The column of a table or index that a partition function uses to partition a table or index.

partner (n)~ In database mirroring, refers to the principal server or the mirror server.

partner (n)~ A company or individual that regularly provides goods or services to another company.

partner (n)~ An independent company that does business with, by, or on behalf of Microsoft and that are members of the Microsoft Partner Program.

partner (n)~ A company authorized by Microsoft to sell Products to Customer.

Partner Center (PN)~ A service to Microsoft Partner Network (MPN) partners to- list their company, apps, and services on Pinpoint to market and sell their technology and Cloud solutions.

Partner Directory (n)~ A feature that provides an area of the Office Live Small Business Web site where third-party and partner solution and service providers are listed.

Partner group (n)~ In Business Activity Services (BAS), a group of similar partners categorized for ease of management.

Partner ID (PN)~ An ID that allows someone to sign in to a non-Microsoft website that uses the Windows Live ID service.

Partner ID (n)~ The ID assigned to businesses when they sign up as partners in the Microsoft Partner Network. This ID is used by Microsoft and its customers to identify the correct partner.

partner locations card (n)~ A card that appears on the card screen that you can use to highlight alternate venue locations or company branches. This card includes a list of such locations by country/region and can show images or a slide show of images about the locations. The default name of this card is Our Other Locations.

Partner of Record (n)~ A Microsoft authorized partner that officially represents and works with an organization to purchase and maintain volume licensing agreements for

Microsoft products and services.

Partner Point (PN)~ A unit of credit to track an organization's accomplishments to achieve elegibility for different levels in the Partner Program.

Partner Solution Profiler (PN)~ A tool used by Partners to highlight their business achievements and connect with other partners.

Partner Test (n)~ A test, written by a Microsoft partner, that uses the test framework's extensibility interfaces.

partnered device (n)~ A device that has been set to establish device-to-device connection with another one, such as by radio, Bluetooth or infrared.

partnership (n)~ The set of rules on a computer and a portable device that allow digital media files and other information to be synchronized.

parts requisition (n)~ A request for a specified amount of an item to be pulled from inventory.

party (n)~ An entity outside of BizTalk Server that interacts with an orchestration. All of the partners your organization deals with are considered parties, and your organization may have several thousand partners.

party (n)~ A person or organization that participates in economic activities.

party (n)~ An entity that assumes a legally binding role when participating in contractual relationships.

party enlistment (n)~ The mechanism that ties a party to a role. Enlisting a party in a role enables the orchestration to interact with the party.

pass order (n)~ The order of evaluation (from highest to lowest calculation pass number) and calculation (from lowest to highest calculation pass number) for calculated members, custom members, custom rollup formulas, and calculated cells in a multidimensional cube.

pass phrase (n)~ A sequence of words or other text used to gain access to a network, program, or data. A passphrase is generally longer for added security.

Pass Through mode (n)~ The option on the Accounts page that lists user addresses that will be filtered by the Message Switch. E-mail to all SMTP addresses not on the Pass Through list is delivered directly, without passing through the message filtering system.

passcode (n)~ An authentication credential similar to a password, consisting of numbers.

passing mechanism (n)~ The mechanism of passing arguments to procedures.

passive client (n)~ A Hypertext Transfer Protocol (HTTP) browser, which is capable of broadly supported HTTP, that can use cookies. Active Directory Federation Services (AD- FS) supports only passive clients, and it adheres to the WS-Federation Passive Requestor Profile (WS-F PRP) specification.

passive screening (n)~ A screening method that sends notifications, but does not prevent users from saving blocked files.

passphrase (n)~ A sequence of words or other text used to gain access to a network, program, or data. A passphrase is generally longer for added security.

pass-through query (n)~ An SQL-specific query you use to send commands directly to an ODBC database server.

pass-through statement (n)~ A SELECT statement that is passed directly to the source database without modification or delay.

password (n)~ A string of characters entered by a user to verify his or her identity to a

network or to a local computer, device, or client, or to sign in to an account, app, and so on.

password administrator (n)~ A Microsoft Online Services administrator who resets passwords, manages support tickets, and monitors services health.

password authentication (n)~ The process of verifying the identity of a user, computer, process, or other entity using a combination of a user name and a password as a credential.

Password Authentication Protocol (n)~ A method for verifying the identity of a user attempting to log on to a Point-to-Point Protocol (PPP) server.

password policy (n)~ A collection of policy settings that define the password requirements for a Group Policy object (GPO).

Password Policy option (n)~ The option on the Organizations page that sets parameters for passwords.

password propagation (n)~ A process that coordinates each user's password changes across multiple computers, devices, folders, or networks in password synchronization.

password protection (n)~ A feature that enables you to protect a file by using a password. You can specify a password and lock down the file so that other users cannot open or modify it.

password provider (n)~ A one-time-password generation and validation component for user authentication.

Password Replication Policy (PN)~ A set of access control lists (ACLs) that determine what credentials can or cannot be replicated on a read-only domain controller (RODC). Each RODC has a unique Password Replication Policy (PRP) that is enforced by the writable domain controller that is its replication partner.

password reset (n)~ The act of setting a password to a new value.

password reset (n)~ A procedure by which a user's password can be changed to a known value, in situations where the user has forgotten or lost their password.

Password Settings Container (PN)~ An object class in the Active Directory Domain Services (AD DS) schema that is created by default under the System container in the domain. The Password Settings Container stores Password Settings objects (PSOs) for that domain.

Password Settings object (PN)~ An Active Directory object that is stored in the Password Settings Container. The Password Settings object holds the attributes of a certain fine-grained password policy.

password stealer (n)~ A type of trojan that captures or transmits passwords to an attacker.

password synchronization (n)~ A service that replicates users' passwords between multiple computers, devices, folders, or networks, resulting in users having the same password in each environment.

paste (v)~ To insert content, such as text or a graphic, that has been cut or copied from one document into a different location in the same or a different document.

paste area (n)~ The target destination for data that has been cut or copied by using a clipboard.

pasteboard (n)~ The area of the document outside the document canvas. You can draw on the pasteboard, but live effects are not visible in this area.

pasteboard (n)~ The gray or light-blue area that surrounds a page. You can use it to

temporarily hold objects that are not currently on the page.

Pastel Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of pastel colors.

patch (v)~ To close a hole in a 3D model with a patching surface or plane.

Patch ~ A program which makes updates to computer software, usually to fix bugs which had not been detected when the software went on sale. The best place to look for a patch is on the software manufacturer's website.

patch ~ A software fix for a bug in a program

patch ~ A particular type of cable for networking that is a through cable; pin 1 to pin1, pin2 to pin 2 and so on.

patch layer (n)~ An application layer that is paired above an application layer, and used only for hotfixes and service packs. The name of each patch layer ends with the letter 'P', and one pair is named SYS and SYP.

path (n)~ A route through a structured collection of information, as in a database, a program, or files stored on disk.

path (n)~ A data flow element that connects the output of one data flow component to the input of another data flow component.

path (n)~ A sequence of folders (directories) that leads to a specific file or folder. A backslash is used to separate each folder in the path. For example, the path to a file called invoice.txt might be C:\Documents\July\invoice.txt.

path (n)~ A vector-based shape that is made up of one or more line segments connected by two or more anchor points. Paths can be made from a combination of straight lines and curves, each of which may be made up of many connecting points. All paths can be stroked or filled.

path segment (n)~ A portion of a line, defined by its beginning and ending points.

patient (n)~ A person under medical care.

pattern (n)~ An effect created by simple, repeating designs such as vertical or horizontal lines.

pattern (n)~ A rule for comparing input data with a logical structure, decomposing data into constituent parts, or extracting information from data.

pattern matching (n)~ In computer science, the act of checking a perceived sequence of tokens for the presence of the constituents of some template, generally in the form of either sequences or tree structures.

pattern-matching character (n)~ A keyboard character that can be used to represent one or many characters when conducting a query.

patterns (n)~ Principles that guide developers as they assign responsibilities to software classes and design system behavior. They are most useful when creating collaboration diagrams where messages imply responsibility.

pause (v)~ To stop the operation of a program or execution of a command temporarily.

Pause (PN)~ A button in a video conversation window that temporarily stops the video feed in the current video conversation. The infotip for this button toggles between Pause and Restart this video feed.

PAUSE key (n)~ A key on a keyboard that temporarily stops the operation of a program or a command. The Pause key is used, for example, to halt scrolling so that a multi-screen

listing or document can be read.

pause usage time (v)~ To stop metering computer usage time by putting the computer into standby.

paused (Adverb) ~ A state that applies to a node in a failover cluster or server cluster. The node is a fully active member in the cluster but cannot accept new clustered services or applications. For example, a clustered service or application cannot fail over or fail back to a paused node. You can administer and maintain a paused node.

pay as you go (oth)~ To pay for a paid feature at the moment the feature is used. For example, to pay for Skype's calling phones feature with Skype Credit that is either already owned or purchased specially for the occasion.

Pay As You Go (adj)~ Pertaining to a way for paying for Skype paid features in which the user pays with Skype Credit at the moment he/she uses the feature (Skype Credit can be either already owned or purchased specially for the occasion).

pay grade (n)~ A compensation level structure that defines discrete ranges of pay per level, and are generally defined by hierarchical levels of authority within a company. Jobs are typically evaluated by a point system that places them at a grade relative to others within the company. Pay rates for a grade are typically determined by using equivalent groups of jobs in the marketplace as benchmarks. Graded structures are narrower than bands, and are typically discrete (for example, pay ranges do not overlap). Grade pay ranges have a fixed minimum, midpoint (or control point), and maximum reference points. Compa-ratios and range utilization are measures used to analyze an employee's pay relative to their range. Companies can set additional reference points for a grade, such as 25th and 75th percentile, and base variable compensation on one of those points.

pay group (n)~ A set of employees who are paid in the same manner on the same date for the same period of time. This categorization is required by payroll departments that group employees into discrete payroll runs.

pay monthly (oth)~ To pay once a month for using Skype paid features such as calling phones or sending SMS messages; e.g., to pay for a monthly subscription.

Pay Monthly (v)~ A subscription offer for 6 months of 12 months commitment plans in which the user is billed monthly.

Pay per byte (PN)~ A data limit plan where users pay for data usage per byte sent/received.

pay per performance (n)~ An employee payment system that is based on measures of goals and reviews. Employees receive increased compensation for their work if they or their team, department, or company reaches certain targets.

pay rate (n)~ Resource cost per hour. Project includes two types of pay rates: standard rates and overtime rates.

pay run (n)~ A periodic processing of the payroll.

payable tax (n)~ The tax that is levied by the government on service providers for specific services. Under the reverse charge mechanism, the receiver of the services that are rendered is liable to pay the tax to the government.

pay-as-you-go (n)~ Pertaining to a way for paying for a service at the moment when it is used.

pay-as-you-go computing (n)~ A model in which a solution provider offers a computer to

the customer for a low initial payment, and the customer adds time to the computer by purchasing blocks of computer usage time. Once an agreed-upon amount of usage time is purchased, the customer has unlimited access to the computer and no longer needs to pay for computer usage time.

PAYG ~ (Pay As You Go)- A cellphone network connection where you add credit to the phone manually, rather than having a contract billed monthly.

payload (n)~ Goods carried by a vehicle that are not essential to the vehicle's operation.

payload (n)~ Essential data that is carried within a packet or other transmission unit, excluding the data required to get the packet delivered.

payment (n)~ A transaction to record money that is paid to a supplier or customer for goods or services received. A payment transaction decreases the balance for a customer or vendor.

payment (n)~ The amount of money that an employee receives in a check or direct deposit.

payment (n)~ A past, present, or future settlement of an obligation.

payment amount (n)~ A quantity of currency that is offered or accepted to settle a past, present, or future obligation.

payment company (n)~ The company that is associated with a payment transaction.

payment instrument (n)~ The actual physical or virtual object that facilitates a purchase or transaction, such as a physical credit card, financial services account, or payment escrow service account.

payment instrument challenge (n)~ A fraud prevention mechanism that attempts to verify that an individual using a payment instrument is authorized to use or is the owner of that instrument.

payment method (n)~ The mechanism by which payment is provided. Includes cash, check, credit card, wire transfer, etc.

payment provider (n)~ An organization authorized by a solution provider to add time to that solution provider's computers enabled by FlexGo technology.

payment provider (n)~ An entity that is responsible for deducting the money from the customer credit card account and moving the money to or from the merchant's account. The user of the payment service will have to sign up with one or more payment providers.

payment service (n)~ A service that provides the secure transfer of payment from a customer to a supplier for goods or services.

payment status (n)~ The condition of the payment schedule of an account or a business contact; possible values are 'current' or 'overdue'.

Payment Terms (n)~ A field label on the Opportunity form that enables the user to select terms from the list.

payout (n)~ The money a developer receives for selling their apps in the Windows Store.

PayPal (PN)~ An eCommerce payment escrow and financial services company or the service that the company provides.

payroll company (n)~ A set of employees who are paid in the same manner on the same date for the same period of time. This categorization is required by payroll departments that group employees into discrete payroll runs.

payroll statement (n)~ A report of payroll allocation amounts.

PBC (n)~ In some Wi-Fi Protected Setup networks, a method that enables users to push a physical or software-based button to automatically configure network names, connect devices to the network, and enable data encryption and authentication.

PBF (n)~ The interrelated processes of planning business activities, developing budgets based on the plans, and forecasting future expenditures and revenues based on budgeted and actual data.

PBM (n)~ A set of built-in functions that return server state information about values, objects, and settings in SQL Server. Policy Based Management allows a database administrator to declare the desired state of the system and checks the system for compliance with that state.

PBX (PN)~ A private telephone network in an organization. Individual telephone numbers or extension numbers are supported, and calls are automatically routed to them. Users can call each other using extensions. They can also place calls to outside numbers.

PBX phone (n)~ A proprietary phone connected to a PBX.

PC (n)~ A microcomputer designed for use by one person at a time. Personal computers do not need to share the processing, disk, and printer resources of another computer.

PC ~ (Personal Computer)- Originally just short for 'personal computer', PC is now an industry standard, partly evolved in the marketplace, partly agreed by a committee of the major players in the computer industry.

PC 2005 (2004, 2003 etc) ~ An agreed standard for new PCs, set each year by a committee of the major players in the computer industry.

PC Call (PN)~ A feature that enables customers to make voice calls from one computer to another.

PC Card (n)~ A removable device, approximately the size of a credit card, that can be plugged into a PCMCIA slot in a portable computer. PCMCIA devices can include modems, network adapters, and hard disk drives.

PC experience (n)~ The experience a user has when actively engaged with the computer.

PC Health (PN)~ A suite of technologies and features focused on providing end users with improved technical support by enabling Web-based support solutions. PC Health also provides better operating system reliability, and an enhanced end-user experience, by providing easier access to help content and support services.

PC protection (PN)~ The Security subcategory containing apps to help protect your PC.

PC settings (PN)~ A collection of Windows and device settings that users can change grouped into one location.

PC site (PN)~ The Windows Mobile footer link to the site that is built for viewing from a PC.

PCD (n)~ A graphics file format developed by Eastman Kodak Company.

PCH (n)~ In computer programming, an optimization developed for command-line compilers where a (C or C++) header file is compiled into an intermediate form that is faster to process for the compiler.

PCI (n)~ A specification introduced by Intel Corporation that defines a local bus system that allows up to 10 PCI-compliant expansion cards to be installed in the computer.

PCI ~ (Peripheral Component Interconnect)- A standard for PCexpansion cards, currently the most popular in desktop PCs. A 'PCI slot' is a socket on the- motherboard- for such

cards.

PCI expansion slot (n)~ A connection socket for a peripheral designed for the Peripheral Component Interconnect (PCI) local bus on a computer motherboard.

PCI Express ~ A special type of PCI slot for graphics cards, replacing- AGP- in most new computers.

PCL (n)~ The page-description language developed by Hewlett Packard for their laser and inkjet printers. Because of the widespread use of laser printers, this command language has become a standard in many printers.

PCL (n)~ A value between 1 and 8 that is assigned to a message based on its content and that reflects the liklihood that the message is phishing.

PCM (n)~ A technique for digitizing audio into an uncompressed format by assigning a value to the amplitude of the signal at fixed intervals.

PCMCIA ~ (Personal Computer Memory Card International Association)- A type of PC- expansion card, the size of an ordinary credit card, mainly intended for use with- notebooks.

PCMCIA device (n)~ A removable device, approximately the size of a credit card, that can be plugged into a PCMCIA slot in a portable computer. PCMCIA devices can include modems, network adapters, and hard disk drives.

p-code (n)~ A machine language for a nonexistent processor (a pseudomachine). Such code is executed by a software interpreter.

PCR (n)~ A register inside a Trusted Platform Module (TPM). This register is sufficiently large to contain a hash (currently only SHA-1).

PCT (n)~ A proposed protocol standard that supports authentication and encryption to secure privacy in Internet communications. PCT is similar to the Secure Sockets Layer (SSL) protocol.

PC-to-PC Sync (n)~ The process of reconciling the differences between a file stored on one PC and a copy of the same file stored on another PC.

PCV (n)~ A vaccine for immunization against disease caused by the bacterium Streptococcus pneumoniae (pneumococcus).

PDA ~ (Personal Digital Assistant)- A small handheld computer used for taking notes on the move, keeping contact information and so on. See also- palmtop.

PDB file (oth)~ A program database file (PDB). A PDB holds debugging and project state information that allows for incremental linking of a debug configuration of your program.

PDC (n)~ A computer running Windows NT 4.0 Server that authenticates logons and maintains the directory database for a Windows NT 4.0 domain. A primary domain controller is not used in a Windows 2000 domain. Instead, one domain controller is designated as the primary domain controller emulator for backward compatibility.

PDC emulator master (n)~ A domain controller that holds the primary domain controller (PDC) emulator operations master role in Active Directory. The PDC emulator services network clients that do not have Active Directory client software installed, and it replicates directory changes to any Windows NT backup domain controllers (BDCs) in the domain. The PDC emulator handles password authentication requests involving passwords that have recently changed and not yet been replicated throughout the domain. At any time, the PDC emulator master role can be assigned to only one domain controller in each

domain.

PDF (n)~ The Adobe specification for electronic documents that use the Adobe Acrobat family of servers and readers.

PDF (n)~ An ASCII text file that contains predefined software distribution objects, such as programs and packages to be used for software deployment.

PDF ~ (Portable Document Format)- A popular document format, used mainly for online computer manuals,- which retains the look of a printed book onscreen. PDFs are created using Adobe Acrobat, but can be read and displayed by many different programs including Internet Explorer.

PDF reflow (n)~ A process that converts a PDF file to flowing text and document elements that are native to the application being used.

PDF Reflow (PN)~ A feature that enables PDF reflow.

PDF Render (PN)~ A feature that renders a PDF document as a single or series of pictures in a page.

PDK (n)~ A development kit that includes all the tools, technology, and documentation that are required in each specific area of the Surface product, such as applications (including the SDK), Shell, hardware, and the Vision System.

PE file (n)~ The file format used for executable programs and for files to be linked together to form executable programs.

peak expiratory flow (n)~ The maximum volume of air exhaled during a forced expiration starting with the lungs fully inflated.

peak flow meter (n)~ A portable instrument that measures the flow of air during a forced expiration.

peak heart rate (n)~ The fastest heart rate (measured per minute) an individual can safely achieve through exercise stress.

Peak Memory Usage (n)~ In Task Manager, the peak amount of physical memory resident in a process since it started.

peak power plan (n)~ A Configuration Manager power plan that you can configure with power settings that are applied during the peak hours or business hours that you specify.

peak time (n)~ The period of time during the day in which the user experiences high e-mail volume, typically during regular business hours.

Peak times (PN)~ A feature that allows the user to schedule automatic synchronization between the device and the Exchange Server every time an item arrives or is changed in Exchange Server (if the organization is running Exchange Server with Exchange ActiveSync), and after the first full synchronization with Exchange Server when the volume of e-mail is high.

peak units (n)~ The highest level at which a resource is scheduled for all assigned tasks during a given period of time. Peak units are expressed as a percentage, number of units, or consumption rate.

peek (v)~ ?To hover over open browser tabs and see thumbnails of the underlying webpage.

peer (n)~ Any of the devices on a layered communications network that operate on the same protocol level.

peer (n)~ A node that makes cached data available to clients needing to retrieve the data.

Peer Channel (PN)~ A protocol that is used for broadcasting messages over a virtual network of cooperating nodes. It is used to send and receive messages between nodes in a named mesh.

peer discovery (n)~ The process of locating peers which have the data one would like to retrieve.

peer mesh (n)~ The worldwide collection of networks and gateways that use the TCP/IP suite of protocols to communicate with one another.

Peer Name Resolution Protocol (n)~ A standard set of formats and procedures which enables secure and dynamic publication, registration and resolution of computer names and IP addresses including the ability to register multiple names on a single computer, multiple computers to a single name, and have names registered by applications.

peer node (n)~ An instance of a channel endpoint participating in the mesh that implements the Peer Channel Protocol.

peer system (n)~ A mainframe, midrange, or personal computer that communicates with another computer as an equal partner, with both computers sharing control over the communication.

peer trust (n)~ A feature that allows a user to explicitly trust an end user certificate, without first trusting the root CA.

peer-caching (n)~ The process of temporarily storing recently accessed information in a special memory subsystem shared by two or more peer systems.

Peer-to-Peer (n)~ An item in Control Panel that opens a dialog box that allows the user to set preferences for a peer-to-peer network.

Peer-to-peer ~ A type of- network- where computers are connected together directly, rather than via a- server, allowing them to access each other's hard disk etc. Most home networs work like this.

peer-to-peer graph (n)~ The worldwide collection of networks and gateways that use the TCP/IP suite of protocols to communicate with one another.

peer-to-peer network (n)~ A group of computers that are connected on a network and share resources, such as printers and files.

peer-to-peer replication (n)~ A type of transactional replication. In contrast to read-only transactional replication and transactional replication with updating subscriptions, the relationships between nodes in a Peer to Peer replication topology are peer relationships rather than hierarchical ones, with each node containing identical schema and data.

peer-to-peer technology (n)~ A technology that enables computers to communicate directly with each other over the Internet or a private network without the need for a server.

PEF (n)~ The maximum volume of air exhaled during a forced expiration starting with the lungs fully inflated.

pegging (n)~ The process of tracing the quantity of a required item to its source.

pegging event (n)~ A resource flow event that signals the demand for a product.

PEGI (n)~ A self-regulatory body which independently applies and enforces interactive game ratings adopted by the industry in Europe.

PEGI 12+ (n)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

PEGI 16+ (oth)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

PEGI 18+ (oth)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

PEGI 3+ (n)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

PEGI 7+ (n)~ A game rating symbol developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

PEGI/BBFC (n)~ A game ratings system for the UK.

pel (n)~ The smallest element used to form the composition of an image on a computer monitor. Computer monitors display images by drawing thousands of very small pixels arranged in columns and rows.

PEL (n)~ The PerformancePoint language that is used to write business rules that automate operations and calculate performance data for a financial model.

Pen (PN)~ A tool that lets you draw a Bezier path by clicking (for corner anchor points) or click-and-dragging (for curves) a series of anchor points.

pen (n)~ A pointed input device that comes with a mobile device or tablet PC, and is used to navigate through applications and to input information.

pen button (n)~ A button on some tablet pens. You can use it to perform certain actions, including a mouse right-click equivalent.

pen comment (n)~ A comment created by using a stylus. Microsoft Office Word treats a pen comment like any other drawing object. Pen comments don't appear in the Reviewing Pane, and Word doesn't insert comment marks in the document window.

pen drive (n)~ A small device used to store information. USB flash drives plug into computer USB ports so you can copy information to or from them, making it easy to share and transport information.

pen flick (n)~ A gesture you can make with a tablet pen to quickly navigate and perform shortcuts.

Pen-Centric Tablet PCs ~ pen-centric and run full, user-controlled operating systems, such as- Apple's iPad

Pencil (PN)~ A tool used to draw freehand paths.

pencil (n)~ A pencil tool that simulates the look and feel of drawing lines with a pencil.

Pending (adj)~ A status that denotes that resources have been scheduled to perform work for a service activity, but may be subject to change.

pending (Adverb) ~ A state that refers to a resource in a failover cluster or server cluster when the resource is in the process of being brought online or taken offline.

pending action (n)~ Any action that has not be completed for a particular computer.

pending area (n)~ A conversation area where conversations that are not active (e.g., on hold) are displayed.

pending change (n)~ A change that has been made in one enlistment but has not yet been submitted to the database for publishing and permanent record.

pending closed (adj)~ The state when the period or operational process can only transition to a closed state, or when a source document can only transition to a closed status.

pending conversation area (n)~ A conversation area where conversations that are not

active (e.g., on hold) are displayed.

pending test (n)~ A test that has been selected to run but is not yet in progress. Pending tests can be viewed in the Test Results window.

pending user (n)~ A person who was invited to join Yammer but has not joined.

penetration test (n)~ A test that looks for attack paths that might be used to gain access to assets.

Penetration Test ~ Penetration tests attempt to exploit vulnerabilities to determine whether unauthorized access or other malicious activity is possible.

Pentium ~ The best known PC- processor- (or- CPU), manufactured by Intel.

People (PN)~ The link to the list of contacts from your mail and messenger accounts.

People (PN)~ An app that facilitates contact list and social update management.

People (PN)~ A view that aggregates rich information about your contacts and makes it easy to initiate communication with them.

People Directory (PN)~ The Yammer directory that allows users to search for other user profiles.

People Near Me (n)~ A feature that identifies people using computers near you so that you can use features and programs that use peer-to-peer technology.

People Near Me (n)~ A feature that allows the user to share items such as documents or folders with other devices on a layered communications network that operate on the same protocol level.

People Pane (PN)~ A pane in Outlook that displays a selected contact along with relevant information (photos, status messages or feeds, calendar items, etc.) from Outlook and other networks.

People peek (n)~ A contextual summary of the user's favorite contacts and People search functionality, which is displayed in a callout without switching to the People view.

people tag (n)~ A tag used to identify a person in a photo.

People tags (PN)~ The heading for the tags that identify people in a photo. This heading is used for the group of all people tags used in someone's photo gallery, and for the group of people tags in an individual photo.

People view (n)~ A feature that filters a user's Inbox to only display email messages from people who are the user's frequent contacts. When a frequent contact sends the user a new email, the sender's photo is displayed beneath -€œPeople-€? in the Folder Pane. When the user selects the sender's photo under -€œPeople,-€? email messages from that sender are displayed.

Peoples ~ Peoples is PCS operator in Hong Kong, now brand name 'PEOPLES' of China Mobile Hong Kong.- http://www.peoples.com.hk

Per Device licensing mode (PN)~ A mode in which the remote desktop server requests an RDS Per Device client access license (RDS Per Device CAL) from a Remote Desktop license server so that a device can connect remotely to the remote desktop server.

per diem (n)~ An allowance provided to an employee who is traveling for business. The per diem usually covers lodging, meals and incidental expenses.

per monitor-€"DPI aware (adj)~ Pertaining to an application that adjusts the size of UI elements dynamically to accommodate changes to the DPI setting.

Per User licensing mode (PN)~ A mode in which the remote desktop server requests an

RDS Per User client access license (RDS Per User CAL) from a Remote Desktop license server so that a user can connect remotely to the remote desktop server.

per user ownership (n)~ The virtual machine ownership under which, if a self-service policy is created for a group, each group member owns and manages his own computers and, if a virtual machine quota has been set, the quota places an individual limit on the virtual machines created by each group member.

percent complete (n)~ A field that you use to enter or display how much of a task has been completed. This value is expressed as the percentage of the task duration that has been completed.

percent margin (n)~ A pricing method that determines the unit price of the product, which is calculated as a percent of the profit that you want to receive.

percent markup (n)~ A pricing method that determines the unit price of the product is calculated as a percent markup of the current cost or standard cost that was entered in the Current Cost field on the Product form.

percent of list (n)~ A pricing method that determines the unit price of the product as a percent of the price that was entered in the List Price field on the Product form.

percent sign (n)~ The % character.

percent work complete (n)~ A percentage value that indicates the current status of a task, resource, or assignment, expressed as the percentage of work that has been completed.

percentage markup (n)~ The percentage amount that the list price is increased to arrive at a custom price. For example a 20 percent increase means that the price is 120 percent of the list price.

percentage off (n)~ The percentage amount that the list price is decreased to arrive at a custom price. For example a 20 percent discount means that the price is 80 percent of the list price.

perfect forwarding (n)~ Restoring the rvalue-ness of an argument's original value in order to perform overload resolution.

performance (n)~ The degree to which a product or service executes its specified function.

Performance (PN)~ Microsoft Edge developer tool to profile a web page frame rate. This tool helps you see what is happening behind the scenes when your pages are slowing down.

performance analysis (n)~ The assessment of actual performance against an established standard.

Performance Analyzer for HTML5 Apps (PN)~ A tool within the Windows SDK used to analyze the performance of Windows Store apps that use HTML5 and JavaScript.

Performance and Resource Optimization (PN)~ A feature that supports workload- and application-aware resource optimization within a virtualized environment. Based on performance and health data provided by PRO-enabled management packs, PRO can automatically or manually implement recommendations or Tips to minimize downtime and accelerate time to resolution.

Performance and Resource Optimization pack (n)~ A type of System Center pack that provides classes, monitors, alerts, and tasks for Performance and Resource Optimization (PRO) in Virtual Machine Manager.

Performance and Resource Optimization tip (n)~ A recommendation provided by a PRO-enabled management pack that can be implemented automatically or manually to optimize performance or reduce downtime for workloads running in virtualized environments.

Performance Center (n)~ Item on the Control Panel that allows the user to monitor PC performance.

Performance Collection Tools (PN)~ A set of tools that allow developers to measure, evaluate, and target performance-related issues in their code.

performance counter (n)~ A set of components that allow you to track the performance of an application.

performance data (n)~ Sampled numeric data collected from Windows NT performance counters.

performance data view (n)~ A window that displays specified performance information.

performance degradation (n)~ A reduction of performance.

performance dimension (n)~ A dimension used to distinguish and categorize key performance activity against objectives.

performance event (n)~ An event that is raised if a performance metric, such as the time from when a request was made until the response is sent, exceeds the configured threshold.

Performance Logs and Alerts (PN)~ A Distributed Component Object Model (DCOM) API that enables application programmers to log system performance and diagnosis data, and to generate alert notifications based on performance counter thresholds.

performance management (n)~ The modification of a process or task to improve performance to meet an established standard.

performance measure (n)~ Sampled numeric data collected for capacity planning.

performance monitor (n)~ A process or program that appraises and records status information about various system devices and other processes.

performance monitoring (n)~ The process of watching the message process/receive rate, number of running orchestrations, number of cache hits, memory usage over time, and so on.

performance object (n)~ In System Monitor, a logical collection of counters that is associated with a resource or service that can be monitored.

performance processing rules (n)~ Rules that govern process performance or capacity type counters.

Performance Reviews (PN)~ A template that addresses, from a Human Resources perspective, the general activities that define the typical quarterly or annual performance review cycle. This template assumes a performance review process has previously been established and assumes that performance is not tied to compensation.

performance rule (n)~ A rule that defines how Microsoft Operations Manager (MOM) processes performance counter data and Windows Management Instrumentation (WMI) numeric data.

performance test (n)~ A procedure used to assess performance.

performance threshold (n)~ A value against which sampled numeric data is compared. Operations Manager generates an alert if the threshold is crossed in either direction.

performance tools (n)~ Tools that you can use to evaluate the performance of a solution. Performance tools can have different purposes; some are designed to evaluate end-to-end performance while others focus on evaluating performance of a particular aspect of a solution.

Performance Tools for Visual Studio 2013 (PN)~ The tools which let developers measure, evaluate, and target performance-related issues in their applications in Visual Studio 2013.

Performance Tools for Visual Studio 2013 Language Pack (PN)~ Language Pack is a free add-on that you can use to switch the language that's displayed in the Performance Tools for Visual Studio 2013 user interface.

Performance troubleshooter (n)~ A troubleshooter that helps optimize performance settings in Windows.

Performance view (n)~ A window that displays specified performance information.

PerformancePoint Add-in for Excel (n)~ A component that is installed on your computer to add PerformancePoint Planning commands and functions to Excel. It takes, as input, disparate enterprise information portal (EIP) and line-of-business (LOB) data, which is collected by using PerformancePoint Planning models.

PerformancePoint common services (n)~ A set of commonly-used and shared services such as Logger, Configuration, Security Manager, Resource Manager, Transaction Management, Task and Schedule Manager, Type Library Manager, and Data Access Layer.

PerformancePoint Content List (PN)~ A list that stores the elements that are used to construct a PerformancePoint dashboard.

PerformancePoint Dashboard Designer (PN)~ A client application that you use to create and manage dashboards, scorecards, reports, and other PerformancePoint items prior to deploying them within a dashboard to a SharePoint site.

PerformancePoint Expression Language (n)~ The PerformancePoint language that is used to write business rules that automate operations and calculate performance data for a financial model.

PerformancePoint Monitoring Server (PN)~ A computer or group of computers that host the PerformancePoint Monitoring Server database and PerformancePoint Monitoring Server Web Service.

PerformancePoint Monitoring Server Configuration Manager (PN)~ The administration wizard that is used for installing and configuring Monitoring Server, including such tasks as adding or removing components, specifying the location of the Monitoring System database, and configuring the server for SQL Server Reporting Services and Windows SharePoint Services or Microsoft Office SharePoint Services.

PerformancePoint Monitoring Server Web Service (PN)~ A collection of application programming interfaces (APIs) that provide the core functionality of PerformancePoint Monitoring Server, connecting PerformancePoint Dashboard Designer to the Monitoring Server database, Dashboard Viewer for SharePoint, and data sources.

PerformancePoint Monitoring System database (PN)~ The database that stores the PerformancePoint Monitoring Server metadata, which consists of user permissions and settings for dashboard elements.

PerformancePoint Planning Administration Console (PN)~ A thin client that allows members of the global administrator role to make configurations to any computer that is running PerformancePoint Planning Server. Configurations include creating and editing applications, creating and editing model sites, adding users to PerformancePoint Planning Server applications, and adding users to or removing users from the global administrator role, the Modeler role, or the user administrator role.

PerformancePoint Planning Business Modeler (n)~ A component of PerformancePoint Planning Server that is the primary interface for designing and managing business applications that perform complex planning, budgeting, forecasting, and consolidation.

PerformancePoint Planning Server (PN)~ The Planning server component of PerformancePoint Server. It is an infrastructure that includes everything between the PerformancePoint Server client tier and the SQL Server 2005 databases and SQL Server Analysis Services cubes.

PerformancePoint Planning Server Configuration Manager (PN)~ The administration wizard that is used for configuring Planning Server, including such tasks as adding or removing Web services and creating or provisioning a new system database.

PerformancePoint Planning service (PN)~ The Windows service that manages and processes the work item queue in Performance Planning Server. PerformancePoint Planning Server work items can include job and cube processing, data writebacks, and audit and trace logging.

PerformancePoint Server (PN)~ A complete performance management (PM) application that includes business scorecarding, analytics and planning functionality. PerformancePoint Server enables companies to understand and manage the vast amounts of financial and other performance data generated by medium and large enterprises during the course of business.

PerformancePoint Service (PN)~ The SharePoint service application that enables dashboarding capabilities by means of scorecards, analytic grids and charts, and other decision-making tools for the enterprise.

PerformancePoint Service application (PN)~ A SharePoint Server service application that enables PerformancePoint functionality.

PerformancePoint Service application proxy (PN)~ The PerformancePoint Web Front End (WFE) service interface. It abstracts the communication layer between WFE components and the service application.

PerformancePoint Services (PN)~ A collection of services for Microsoft SharePoint Server that enables users to monitor organizational goals, to analyze performance information through up-to-date content and context-rich dashboards and scorecards, and to use that information to make business decisions.

PerformancePoint Services Central Administration (PN)~ A collection of SharePoint administration pages that the administrator can use to configure PerformancePoint Services for SharePoint.

PerformancePoint Services in Microsoft SharePoint Server (PN)~ A collection of services for Microsoft SharePoint Server that enables users to monitor organizational goals, to analyze performance information through up-to-date content and context-rich dashboards and scorecards, and to use that information to make business decisions.

PerformancePoint Settings Database (PN)~ A PerformancePoint-specific database that stores the annotations for each dashboard element, user-based filter selections, and other information about dashboard elements.

perimeter network (n)~ One or more computers that have a connection to the Internet through an external screening router and a connection to the internal network through an interior screening router. Computers that are linked to the perimeter network have limited access to both the Internet and the internal network. This architecture is convenient if multiple hosts require direct Internet access.

period (n)~ Menstrual flow, an instance of menstruation.

periodic discount (n)~ A price reduction in effect during a set time.

periodic spline (n)~ A closed spline with no defined endpoints.

peripheral (n)~ A device, such as a disk drive, printer, modem, or joystick, that is connected to a computer and is controlled by the computer's microprocessor.

Peripheral ~ Anything that plugs into the computer, such as keyboard, printer etc.

peripheral component interconnect (n)~ A specification introduced by Intel Corporation that defines a local bus system that allows up to 10 PCI-compliant expansion cards to be installed in the computer.

Perl (n)~ An interpreted language, based on C and several UNIX utilities. Perl has powerful string-handling features for extracting information from text files. Perl can assemble a string and send it to the shell as a command; therefore, it is often used for system administration tasks. A program in Perl is known as a script. Perl was devised by Larry Wall at the NASA Jet Propulsion Laboratory.

Perlin Noise (n)~ A technique developed by Ken Perlin which uses a texturing primitive (noise) in combination with mathematical expressions to render natural looking images and textures such as ice, wood grain and stone on computer generated surfaces in graphics and animations.

Permanent Account Number (PN)~ A 10-character alphanumeric identifier issued by the Indian Income Tax Department to all taxable entities for taxation and identification purposes.

permanent consumer (n)~ An event consumer whose registration lasts until it is explicitly cancelled.

permission (n)~ A rule associated with an object to regulate which users can gain access to the object and in what manner. Permissions are assigned or denied by the object's owner.

permission (n)~ Parental consent for a child to use a Windows Live service, view a website, or communicate with a person.

permission (n)~ One or more securable object permissions that secure access to logical units of application data and functionality.

Permission (PN)~ A setting that determines what actions a Customer or CSR may take and/or what content they can view on the Support Portal.

permission class (n)~ A class that defines access to a resource or defines an indentity by supporting authorization checks.

permission level (n)~ A set of permissions that can be granted to users or SharePoint groups on an entity such as a site, library, list, folder, item, or document.

permission object (n)~ An instance of a permission class that represents access rights to resources or identity. A permission object can be used to specify a request, demand, or a grant of permission.

permission policy (n)~ An approach to restricting permission for a given document, workbook, presentation, or message. The policy defines which Office features are available, which information can be accessed, and what level of editing is allowed.

permission setting (n)~ A configuration that enables the user to determine whether an individual or domain can add him to contact lists, see his status, or send instant messages to him. For individuals, the possible permissions are Allow and Block. For domains, the three types of permissions are Allow, Block, and Notify.

permission type (n)~ One of 2 or 3 possible permissions that a user can grant to users or domains in the Options dialog box, on the Permissions tab. For individual users, the possible permissions are Allow and Block. For domains, the three types of permissions are Allow, Block, and Notify.

permissions (n)~ Authorization to perform operations associated with a specific shared resource, such as a file, directory, or printer. Permissions must be granted by the system administrator to individual user accounts or administrative groups.

permissions level (n)~ The extent of access a user has to a site. The default permissions levels are Read, Edit, Design, and Full Control.

permissions list (n)~ A list in the Options dialog box, on the Privacy tab, that displays the people or domains for which the user has set permissions.

per-program IP virtualization (n)~ A Remote Desktop IP Virtualization mode that is configured on the remote desktop server in which specified programs are assigned unique virtual IP addresses, while all other programs use the IP address of the remote desktop server.

per-seat licensing (n)~ A licensing mode that requires a separate Client Access License for each client computer, regardless of whether all the clients access the server at the same time.

per-server licensing (n)~ A licensing mode that requires a separate Client Access License for each concurrent connection to the server, regardless of whether there are other client computers on the network that do not happen to connect concurrently.

per-session IP virtualization (n)~ A Remote Desktop IP Virtualization mode that is configured on the remote desktop server in which all programs in a client session use the same virtual IP address. Each client session is assigned a unique virtual IP address.

persisted computed column (n)~ A computed column of a table that is physically stored, and whose values are updated when any other columns that are part of its computation change. Applying the persisted property to a computed column allows for indexes to be created on it when the column is deterministic, but not precise.

persistence (n)~ The saving of the state of a workflow instance or a service to a storage medium, so that it can be unloaded from memory or recovered after a system failure.

persistence provider (n)~ A feature in the .NET Framework that saves and restores workflow instances to and from a storage medium.

persistence store (n)~ A set of database tables that store workflow instance state and workflow instance metadata.

persistent chat (n)~ A type of chat in which messages are posted to a chat room where they can be viewed and responded to in real time by multiple participants. Users can search for other rooms by name, member/owner, keywords, and content across groups from Lync.

persistent cookie (n)~ A cookie that remains on the user's computer between browser sessions; a cookie with an expiration time independent of when the browser is closed.

persistent file handle (n)~ A file handle that has a persistent value for the lifetime of the file system object to which it refers.

persistent object (n)~ A COM object that adheres to standards through which clients can request objects to be initialized, loaded, and saved to and from a data store, such as a flat file, structured storage, or memory.

persistent reservation (n)~ A reservation placed on a disk by Failover Clustering to prevent computers other than the appropriate cluster member from accessing the disk.

Persistent Shared Object Model (n)~ A custom protocol for transporting Web conferencing content.

persistent virtual machine (n)~ A virtual machine that will retain the data indefinitely, even after the reboot

persistent VM (n)~ A virtual machine that will retain the data indefinitely, even after the reboot

person record (n)~ The record that contains person-specific information (age, height, etc) in CRM.

person relationship (n)~ In the Business Network feature in CRM, the connection that a person has to another person, whether explicit, where the relationship is defined, or implicit, where the people may have had contact, but the relationship is not defined.

person reminder (n)~ A reminder set by the user to go off when the user contacts or is contacted by a particular person.

persona (n)~ A fictional reality, collecting together real data describing the important characteristics of a particular user group in a fictional character. A persona describes the typical skills, abilities, needs, desires, working habits, tasks ,and backgrounds of a particular set of users.

Personal (adj)~ A privacy relationship setting that allows the most amount of information to be viewed.

Personal (PN)~ A type of notebook listed in OneNote Notebooks screen.

Personal Address Book (n)~ A customizable address book used to store personal e-mail addresses you use frequently. However, Contacts offers more advanced features for this function. Personal Address Book files have a .pab extension and can be copied to disk.

Personal Area Network (n)~ A small, Internet Protocol (IP)-based network. It is usually used for short-range, ad-hoc communication between devices and computers. A PAN may also be used to enable connectivity to a larger Local Area Network (LAN), Wide-Area Network (WAN), or the Internet. Windows XP supports the Bluetooth PAN service so you can create Personal Area Networks using Bluetooth.

personal assistant (n)~ The personal assistant feature on Windows Phone and Windows.

personal card (n)~ An information card that a user has created. The user enters personal information which is then stored as a self-issued card in a secure store. Along with that

personal information, the self-issued card contains a -€œprivate personal identifier-€?, which is generated when the card is created.

personal certificate (n)~ A certificate that identifies an individual software user.

Personal Chat Link (n)~ A web address generated by a CSR that initiates a Chat Request for that CSR only.

personal computer (n)~ A microcomputer designed for use by one person at a time. Personal computers do not need to share the processing, disk, and printer resources of another computer.

personal desktop (n)~ A full desktop environment that is personalized for and -€œowned-€? by an individual user, as opposed to a shared desktop which does not carry much user personalization.

personal detail (n)~ An account detail which identifies a person, such as first name, last name, and email address.

personal digital assistant (n)~ A lightweight palmtop computer designed to provide specific functions like personal organization (calendar, note taking, database, calculator, and so on) as well as communications. More advanced models also offer multimedia features. Many PDA devices rely on a pen or other pointing device for input instead of a keyboard or mouse, although some offer a keyboard too small for touch typing to use in conjunction with a pen or pointing device. For data storage, a PDA relies on flash memory instead of power-hungry disk drives.

personal finance (PN)~ An app category that facilitates management of personal finances.

personal folder (n)~ A folder containing your most frequently used folders (such as Documents, Pictures, Music, Favorites, Contacts, and other folders that are specific to your user account). The personal folder is labeled with the name you use to log on to your computer and is located at the top of the Start menu.

Personal Folder (PN)~ The tooltip that is displayed when hovering over a personal folder on the Manage Folders webpage.

personal identification number (n)~ A unique and secret identification code similar to a password that is assigned to an authorized user and used to gain access to personal information or assets via an electronic device.

Personal Information Manager (n)~ An application that usually includes an address book and organizes unrelated information, such as notes, appointments, and names, in a useful way.

personal message (n)~ A customized message that someone sets in Windows Live Messenger, on Windows Live Home, or on their profile page. The status message is part of the share anything' control. The information is distributed to any connected service.'

personal note (n)~ A text note provided by a user that is displayed along with his or her presence status.

personal preview (n)~ A video preview for a Lync user that provides options to answer with video from within the notification.

personal schedule (n)~ A schedule of activities that are not related to work.

Personal security (PN)~ The Security subcategory containing apps to enhance your personal security.

Personal Settings (n)~ An area in the Works Calendar where the user can set options for individual calendars.

personal settings (n)~ Personal configurations of a program or operating system.

personal store (n)~ A certificate store associated with an individual user.

Personal Transfer (n)~ A UI element that allows the user to transfer a call to another one of his or her devices.

personal vault (n)~ A type of vault that contains Web passwords and secure notes that you can place on a USB flash drive and use on another computer.

personal view (n)~ A view of a list, SharePoint document library, or Web Part Page that is available only to a particular user.

Personal Virtual Assistant (n)~ A service that implements control of in-conference services for one PSTN user. It listens for request key commands from the user's PSTN device and executes them to control the phone functionality. For example, PVA implements #6 (mute) from the PSTN user.

personal virtual desktop (n)~ A virtual machine that is assigned to a specific user account in Active Directory Domain Services and made available to the user by using RemoteApp and Desktop Connection.

Personal Virtual Desktop service (n)~ A service that allows users to connect to their own, personally assigned virtual desktops.

personality (n)~ ?The set of characteristics that define what makes Cortana distinctive, recognizable, and compelling.

personalization (n)~ A feature with which you can direct Web-based content or e-mail messages to customers based on their user profile data and their previous requests for content.

personalization (n)~ A set of strategies for adjusting the recognizer to an individual's user's handwriting, e.g. the shapes of their characters or the specific words they use and don't use.

personalization (n)~ A feature of the Web Parts control set that enables end users to personalize (modify) Web Parts controls and save the personalized settings. Personalization can apply to individual users (user scope) or to all users (shared scope).

personalization (n)~ Icons next to Bing search results that indicate results that are liked by Facebook friends, near your location, or trending on Twitter.

personalization (n)~ A feature that enables the user to change a site's color scheme and background image.

Personalization (PN)~ An app category for people who like to customize their PC or Phone.

personalization provider (n)~ A server control that provides persistent storage for personalization state-state regarding the content and layout of Web Parts pages-generated by the Web Parts personalization service.

personalization scope (n)~ The state of a Web Parts page that determines the range of users to which personalization changes apply. The WebPartManager control determines the personalization scope for a Web Parts page. The PersonalizationScope enumeration provides two possible scopes (Shared and User) that a page can be in at any given time. In shared scope, personalization changes made to shared controls apply to all users. In user

scope, personalization changes made to shared and per-user controls apply only to the specific user.

Personalize (PN)~ The label for the Windows Live Devices task webpage where someone specifies a name and an icon for the computer that they plan to sync.

personalize (v)~ To add a personal touch to something.

personalized activity (n)~ The strongest signal from a specific user's graph that is shown in the activity area.

personalized menu (n)~ A menu that shows only basic commands and commands that you use often.

personalized Web Part (n)~ A shared Web Part that has been modified by a user in personal view. The changes made to a Web Part personalized in this way are visible only to the user who made those changes.

person-type entity (n)~ An entity that represents a person, declared as such in metadata.

perspective (n)~ A user-defined subset of a cube, whereas a view is a user-defined subset of tables and columns in a relational database.

perspective camera (n)~ A camera that works like a normal camera lens by making objects in the distance appear smaller than nearby objects.

perspective field of view (n)~ A view that changes the amount of the content that is visible through the camera and the amount that objects in the document appear to be distorted by the camera. Small values will reduce the amount that an object is distorted by perspective and large values will cause objects to become very distorted as with a fisheye lens.

PERT analysis (n)~ A process by which you evaluate a probable outcome based on three scenarios: best-case, expected-case, and worst-case.

PERT chart (n)~ A project optimization tool that enables scheduling and tracking of tasks, goal setting, and timelines.

per-use cost (n)~ A set fee for the use of a resource that can be in place of, or in addition to, a variable. For work resources, a per-use cost accrues each time that the resource is used. For material resources, a per-use cost is accrued only once.

per-user control (n)~ A dynamic Web Parts control that can be personalized and permanently deleted from a page for an individual user only. A per-user control appears on the page only when the page is in user scope. Note that a per-user control can have properties that are both user-scope and shared-scope for personalization purposes.

pessimistic concurrency (n)~ A method of managing concurrency by using a lock technique to prevent other clients from updating the same object at the same time.

pessimistic duration (n)~ The worst-case possibility for the total span of active working time expected for a task, that is, the amount of time from the pessimistic start to pessimistic finish of a task.

pessimistic locking (n)~ A type of locking in which the page containing one or more records, including the record being edited, is unavailable to other users when you use the Edit method, and remains unavailable until you use the Update method.

PET (n)~ A nuclear medicine imaging method similar to computed tomography that produces an image of functional processes in the body.

petite caps (n)~ A font effect in which lowercase text appears as capital letters in a font

size that is even smaller than small caps.

petty cash (n)~ The cash kept on hand for small purchases.

PFN (n)~ An app identity that is created when you reserve a name for an app in the Windows Store Dashboard.

p-frame (n)~ In MPEG and WMV compression, a frame that is composed of data from previous frames.

PG (n)~ A game rating symbol developed by the British Board of Film Classification (BBFC).

PG (n)~ A game rating symbol developed by the Office of Film and Literature Classification (OFLC).

PGO (n)~ A feature that allows you to optimize an application based on most-likely used scenarios.

phantom (adj)~ Pertaining to the insertion of a new row or the deletion of an existing row in a range of rows that were previously read by another task, where that task has not yet committed its transaction.

phantom bill of material (n)~ A bill of material used to describe the components of a parent part that will be built as part of a higher-level parent part. The term phantom' is used to indicate that the part never really exists as a stocked item

phantom bill of materials item (n)~ A bill of materials item that is produced but not stocked.

phantom BOM (n)~ A bill of material used to describe the components of a parent part that will be built as part of a higher-level parent part. The term phantom' is used to indicate that the part never really exists as a stocked item

phantom explosion (n)~ The process of calculating the demand for the materials required for a non-stocked subassembly that is built during the production process of the parent component.

phantom item (n)~ An item that is produced but not stocked.

phantom row (n)~ A row that matches the search criteria but is not initially seen.

phase (n)~ A distinct division within a process model or product life cycle, typically a fundamental transition in the development of a product or service, culminating in a major or external milestone, or representing a fundamental transition in the development of a product or service.

phase (n)~ A group of related tasks that completes a major step in a project.

Phase Alternating Line (n)~ The dominant television standard in Europe and China. Phase Alternating Line (PAL) delivers 25 interlaced frames per second at 625 lines of resolution.

phish(ing) ~ An e-mail or website designed to redirect you to a bogus website with the intention of gaining bank or credit card information, or to download malicious program onto a computer without the users knowledge.

phish(ing) ~ The technique is also often used to secure credit card numbers, bank account information, brokerage information, and generally anything that could yield a financial gain in line with fraud operations.

phisher (n)~ A malicious user who deceives people into revealing personal information, such as account passwords and credit card numbers. A phisher typically uses deceptive e-

mail messages or online advertisements as bait to lure unsuspecting users to fraudulent websites, where the users are then tricked into providing personal information.

phishing (n)~ A technique used to trick computer users into revealing personal or financial information. A common online phishing scam starts with an e-mail message that appears to come from a trusted source but actually directs recipients to provide information to a fraudulent Web site.

Phishing ~ An internet scam in which a forged message from a bank provides a link for you to go to their website and 'confirm your details' - but the website is a fake, and if you do enter your details they will be used to steal all your money. Note that a legitimate email from your bank should be addressed to you personally rather than 'Dear customer' etc, and will- never- ask you to enter your PIN.

phishing confidence level (n)~ A value between 1 and 8 that is assigned to a message based on its content and that reflects the liklihood that the message is phishing.

Phishing Filter (n)~ A filter that helps to identify fraudulent Web sites and protect against personal data theft.

phishing website (n)~ A Web site that impersonates a trustworthy Web site to obtain user's personal or financial information.

Phone (n)~ An item the user can select in the Options dialog box, Phones tab, from the Select the default device for calling phone numbers' drop-down list. When the user selects Phone as the default device for calling phone numbers

Phone (PN)~ An app that lets you make regular cellular phone calls OR Skype calls.

phone accessibility (n)~ Built-in accessibility features that can make it easier to see, hear, and use the phone.

phone book (n)~ A list of contacts users can call (i.e. only shows contacts that have phone numbers associated with them).

phone bridge (n)~ A telecommunications service that is used to manage conference calls and audio for meetings.

phone call (PN)~ An activity to track a telephone call.

phone call (n)~ A function that enables a user to make a call to a phone, as opposed to calling another computer or using a webcam.

Phone Companion (PN)~ A PC-only app that helps users to connect their phone (iOS, Android, or Windows) to their PC, mainly by installing apps on the phone and/or setting up services like OneDrive, Office 365, and Xbox Music.

Phone Controls (n)~ An Item on the View menu that displays the toolbar of controls for PBX phone calls. Includes a Call menu for the currently selected person, Hold, Hang Up, Announced Transfer, Unnanounced Transfer, and Dial Pad buttons.

phone integration (n)~ A process that enables the user to integrate their PBX phone with Lync or Communicator, so they can place and receive calls from these products.

phone language (n)~ The default language of hubs, tiles, settings, dates, and other headings on the phone.

phone lock (n)~ A setting that prevents use of the phone and that requires a password in order to be disabled.

phone log (n)~ The details of a phone call which may be linked with the history of an account, business contact, or opportunity.

phone mode (n)~ A selector that determines which cellular network type a phone will use.

Phone Settings-€¦ (n)~ An item on the user's My Status menu that opens the Phones tab of the Options dialog box.

Phones (PN)~ A section of account.microsoft.com where people can manage their Microsoft phones and devices, including finding a lost phone.

photo (PN)~ An app category for photo-related apps.

Photo (PN)~ An app category for photo-related apps.

Photo & video (PN)~ An app category to help you work with your photos or home videos.

Photo & video production (PN)~ The Multimedia design subcategory containing apps to help with creating photography, or videos.

photo album (n)~ A collection of photos in electronic format that have been grouped into a virtual album.

photo brush (n)~ A line style created from a photographic image, such as a chain, a snake, etc.

Photo CD (n)~ A graphics file format developed by Eastman Kodak Company.

photo editing (PN)~ The process of adjusting a digital photo when preparing rich Office documents. Effects applied to a photo can be adjusted or removed in future Office sessions.

photo e-mail (n)~ An e-mail message that has image attachements, inline images, inline video, or an inline album.

Photo Extras (PN)~ A feature that allows to integrate a photo altering application with the Windows Phone built-in photo application.

Photo Fuse (PN)~ A Photo Gallery feature that replaces a section of one photo with a similar section of another, providing there are areas of overlap in both. For example, if someone has two photos of a group of people, and in Photo 1 everyone is smiling but one person has their eyes closed, they can include the section of Photo 2 where that person has their eyes open.

Photo Gallery (PN)~ A photo organizer used to view, manage, and edit digital pictures.

Photo Gallery (PN)~ A desktop app that enables users to view, manage, edit, and share photos and videos.

photo loop (n)~ A series of pictures that are continuously stored in the Camera app so the user can go back' or 'forward' in time from the moment they actually pressed the button to capture a photo.'

photo mix (n)~ The automatic display of photos in Windows Photos in a grid-like pattern based on metadata from the photos that are connected to the user's account.

Photo Montage (n)~ Feature of the Expression Graphic Designer, Windows illustration tool, that allows user to create a single image composed of multiple photos stitched together.

photo sharing (n)~ A feature that enables users to preview photos and send them to contacts.

photo stamp (n)~ A line style created from stamping an image, such as a daisy or a shoe, along a path that you draw.

Photo Viewer (PN)~ A mode of Windows Photo Viewer which consists of a top level

window displaying one photograph at a time, with navigation controls.

Photobucket ~ Photobucket is an image hosting, video hosting, slideshow creation and photo sharing website.- http://photobucket.com/

photomosaic (n)~ A collection of images or photos combined in such a way that the composite of details, when viewed from a distance, create an identifiable shape or picture.

Photos (PN)~ The link to the webpage where a user manages photos and albums.

Photos (PN)~ A Surface application from Microsoft where users can browse and interact with photos and videos.

Photos (PN)~ An app that enables the users to view, organize, edit and share all of their photos from multiple sources.

Photos & camera (PN)~ A feature in Settings that provides options such as launching the camera, adding location info, and uploading pictures.

Photos Preview (PN)~ An app that enables the users to view, organize, edit and share all of their photos from multiple sources.

PHP (n)~ An open source scripting language that can be embedded in HTML documents to execute interactive functions on a Web server. It is generally used for Web development.

phrase list (n)~ A list of possible values for a particular Input Scope to enhance voice/handwritten recognition. For example, if you're sure the textbox only has months represented numerically, you can include 6' or '12' in the phrase list

physical address expansion (n)~ A feature that allows x86-based computers to support more than 4 gigabytes (GB) of physical memory. Up to 64 GB of physical memory can be used as regular 4-kilobyte (KB) pages, and the number of bits that can be used by the kernel to address physical memory can be expanded from 32 to 36.

physical address extension (n)~ A feature that allows x86-based computers to support more than 4 gigabytes (GB) of physical memory. Up to 64 GB of physical memory can be used as regular 4-kilobyte (KB) pages, and the number of bits that can be used by the kernel to address physical memory can be expanded from 32 to 36.

physical computer (n)~ A hardware-based computer, as opposed to a software-based virtual machine.

physical date (n)~ The date a transaction physically occurred, such as the date that an item was received.

physical design (n)~ The third major stage in the design process, in which the project team determines how to specifically implement the logical design. Physical design addresses the technology that will be used by the end user. The goal is to apply real-world technology constraints to the logical design, such as implementation and performance considerations. Physical design corresponds to a contractor's blueprints for the physical elements of a structure-wiring, plumbing, heating, and ventilation. The contractor's plans add detail to the architect's plans and reflect real-world construction constraints.

physical disk resource (n)~ A disk on a cluster storage device. Physical disks are supported as cluster resources by a Resource DLL.

physical environment (n)~ An environment composed of physical machines.

physical inventory (n)~ The actual count of inventory on hand.

physical layer (n)~ Layer one of the OSI model. A software layer that transmits bits from

one computer to another and regulates the transmission of a stream of bits over a physical medium. This layer defines how the cable is attached to the network and which transmission technique is used to send data over the cable.

physical machine (n)~ A hardware-based computer, as opposed to a software-based virtual machine.

physical memory (n)~ The amount of RAM memory in a system, as distinguished from virtual memory.

physical network adapter (n)~ The component of a computer's internal hardware that enables the computer to connect with another computer, server or any networking device over a wired or wireless LAN connection.

physical path (n)~ The physical location of a directory or file. May be either a path on the local computer or a universal naming convention (UNC) path on a remote computer.

physical percent complete (n)~ An alternative value to Percent [%] Complete or Percent [%] Work Complete that you enter per task. This may be useful when analyzing project performance through such means as variance analysis or earned value analysis.

physical presence interface (n)~ An interface to run device operations that require physical presence.

physical resource (n)~ A file (for example, .vhd files or script) that can be imported into or exported from the Virtual Machine Manager library.

physical store (n)~ The physical databases that comprise the Data Warehouse.

physical-to-virtual machine conversion (n)~ The process by which a functioning physical computer is converted' to an identical

PIC (n)~ A device that functions as an overall manager in an interrupt driven system.

PIC (n)~ A Microsoft license offered on a per-user, per-month subscription price which provides organizations with the capability to connect their existing base of Live Communications Server-enabled users to the top public IM service providers (MSN, AOL, and Yahoo!).

PIC provisioning (n)~ The exchange, through Microsoft, of connectivity information with one or more public IM service providers.

PIC S9(4) COMP Integer (n)~ A 16-bit COBOL data type that represents signed arithmetic operations occupying 2 bytes of storage, and can take on values from -9999 to +9999 or -32768 to +32767. A PIC S9(4) COMP integer is normally analogous to an Integer data type in Microsoft-© Visual Basic-© and a Short Integer in C when referring to 32-bit.

PIC S9(9) COMP Integer (n)~ A 32-bit COBOL data type that represents a 4 byte signed arithmetic operation, and can take on values from -999999999 to +999999999 or -2147483648 to +2147483647, depending on compiler options. A PIC S9(9) COMP Integer is similar to a Long Integer in C.

pica (n)~ A typographical unit of measure that is equal to one sixth of an inch.

pick (v)~ To withdraw items from inventory for production or distribution.

picking list (n)~ A list of the items, along with their quantities and locations, that are required to fill a manufacturing order or shipping order.

picking route (n)~ The prescribed sequence for withdrawing the required components from inventory for manufacturing a product.

picklist (n)~ A list that can be opened to reveal all choices for a given field.

Picks for you (PN)~ The category of items that is personalized for the current user.

Pickup directory (n)~ A directory that receives RFC-822 compliant files from the file system for the purpose of creating message objects that can be passed to the Submission queue.

Pickup folder (n)~ The directory from which messages are picked up.

Pico probe (n)~ A probe with an extremely small tip that allows for the detection of signals on small integrated circuits or traces.

picture (n)~ A pictorial graphic such as a digital photograph or illustration.

picture (n)~ A graphical representation that's associated with a user account for Windows and Windows Live.

Picture Accent List (PN)~ A SmartArt graphic layout used to show grouped or related information. The small shapes on the upper corners are designed to contain pictures. Emphasizes Level 2 text over Level 1 text, and is a good choice for large amounts of Level 2 text.

Picture Accent Process (PN)~ A SmartArt graphic layout used to show sequential steps in a task, process, or workflow. The rectangular shapes in the background are designed to contain pictures.

picture button (n)~ A control in a form that consists of an actionable image. At run time the user can click the image to run rules or actions similar to a button.

Picture Caption List (PN)~ A SmartArt graphic layout used to show non-sequential or grouped blocks of information. The top shapes are designed to contain pictures and pictures are emphasized over text. Works well for pictures with short text captions.

PICTURE clause (n)~ A COBOL clause that specifies the general characteristics and editing requirements of an elementary item. The PICTURE character string is made up of COBOL characters used as symbols and can contain a maximum of 30 characters.

picture content (n)~ An image that is bounded by a picture frame.

picture element (n)~ The smallest element used to form the composition of an image on a computer monitor. Computer monitors display images by drawing thousands of very small pixels arranged in columns and rows.

picture frame (n)~ A container that surrounds the picture content.

picture password (n)~ A picture-based sign-in method that authenticates a user by checking gestures made on a picture of the user's own choosing.

picture placeholder (n)~ A rectangle that represents an imported graphic in your document. You can increase scrolling speed by temporarily replacing graphics with picture placeholders.

Picture Presentation (PN)~ A feature that converts each slide in a presentation into a single image and rebuilds a new, compressed PPT presentation that can easily be shared, but not edited.

Picture Styles (PN)~ A gallery of effects that users can apply to images to create a customized, artistic look.

Picture Virtual Folder (n)~ A feature that allows the user to group image files by any criteria and display them in one place.

picture wrapping (n)~ A feature that consists of picture wrap functionality, allowing the

user to select from various styles to specify how pictures flow around other objects in a document.

picture-in-picture (n)~ A small, inset, secondary video window displayed inside the main video window.

Pictures (PN)~ A folder that stores the user's graphics, e.g. digital pictures. Many graphic design and photo-editing programs use this location by default to open or save graphic files.

PIDL (n)~ A pointer to an item identifier list. In the Shell API, namespace objects are usually identified by a PIDL.

pie chart (n)~ A round chart that shows the size of items in a single data series, proportional to the sum of the items.

pie of pie chart (n)~ A pie chart with user-defined values extracted and combined into a second pie.

piece code (n)~ A code that indicates how many units of piecework an employee produces.

piecemeal restore (n)~ A composite restore in which a database is restored in stages, with each stage corresponding to a restore sequence. The initial sequence restores the files in the primary filegroup, and, optionally, other files, to any point in time supported by the recovery model and brings the database online. Subsequent restore sequences bring remaining files to the point consistent with the database and bring them online.

piecework (n)~ Work that is paid per unit made or completed.

PIF (n)~ A file that provides information to Windows about how best to run MS-DOS-based programs. When you start an MS-DOS-based program, Windows looks for a program information file to use with it.program information files contain such items as the name of the file, a start-up directory, and multitasking options.

PIFF (PN)~ A standard multimedia file format for delivery and playback of multimedia content.

piid (n)~ The identifying information for a payment instrument.

piler (n)~ A user who doesn't file mailbox items regularly.

piler user (n)~ A user who doesn't file mailbox items regularly.

pillarbox (n)~ A video effect that occurs when vertical black bars display on both sides of an image on widescreen displays. This usually occurs when video content not intended for widescreen display is played back on widescreen televisions.

pilot (n)~ The introduction of the solution into the production environment, and trial by installers, systems support staff, and end users. Pilots are aimed at minimizing the impact of the deployment and providing valuable feedback on the project's suitability for completion.

pilot group (n)~ A representative sample of production machines that are used to test an Internet Explorer package before a full deployment to the entire organization. Unlike a test lab, a pilot group uses production machines and users.

pilot identifier (n)~ The string that is received with a new call that is used to associate the call with a dial plan.

pilot number (n)~ A telephone number that points to a hunt group and is the access number for calls that are routed to Unified Messaging servers.

PIM (n)~ A technology, which is designed to manage privileged identities and their access rights.

PIN (n)~ A unique and secret identification code similar to a password that is assigned to an authorized user and used to gain access to personal information or assets via an electronic device.

pin (v)~ To anchor the side of an image when resizing it.

pin (v)~ To fix an item, such as a tile, library, movie, game, or app, in a given area of the UI, so it is always accessible in that area (e.g., to make a library always visible in the navigation pane).

PIN code (n)~ A unique and secret identification code similar to a password that is assigned to an authorized user and used to gain access to personal information or assets via an electronic device.

PIN sign-in (n)~ The capability to sign in to a PC by using a four-digit code.

Pin this list (v)~ To fix a list in a given area of the UI, so it is always accessible in that area.

Pin to Home (PN)~ The UI label for the button on the app bar that affixes a tile to your Home screen.

pin to start (PN)~ To add a shortcut to an application or part of an application or contact by fixing its tile to the Start screen.

Pin to Start (PN)~ The UI label for the button on the app bar that affixes a tile to the Start screen.

pin to Startboard (v)~ To anchor an item in a given portion of the Azure preview portal home page so that it is always accessible.

PIN unlock key (n)~ An 8-digit code used to unlock the SIM card. A Personal Unlocking Key is a type of personal identification number (PIN).

pinch (n)~ A zoom out gesture represented by two fingers with at least one of them moving towards the other finger at any angle, within an acceptable tolerance.

pinch (v)~ To move two (or more) fingers toward each other.

pinch gesture (n)~ A zoom out gesture represented by two fingers with at least one of them moving towards the other finger at any angle, within an acceptable tolerance.

ping (v)~ To test whether a computer is connected to the Internet using the ping utility.

ping (n)~ A protocol for testing whether a particular computer is connected to the Internet by sending a packet to its IP address and waiting for a response.

Ping device (v)~ The action of testing a particular device on the network for troubleshooting purposes using the ping utility.

ping time out (n)~ The amount of time after which a ping attempt fails.

Pink Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of pink colors.

pinned site (n)~ A website that's pinned to the taskbar on the Windows desktop, which provides one-click access to the website.

PInvoke (n)~ The functionality provided by the common language runtime to enable managed code to call unmanaged native DLL entry points.

pip count (n)~ In Internet Backgammon, the minimum total of dice rolls that is needed to move a player's checkers around and off the board.

pipe (n)~ The | character.

pipe (v)~ In Windows PowerShell, to send the results of the preceding command as input to the next command in the pipeline.

pipebind (n)~ A special object that is unique to Windows PowerShell for SharePoint and provides a second layer of specialized parameter sets that are optimized for SharePoint Foundation.

pipebind object (n)~ A special object that is unique to Windows PowerShell for SharePoint and provides a second layer of specialized parameter sets that are optimized for SharePoint Foundation.

pipeline (n)~ A software infrastructure that defines and links together one or more stages of a business process, running them in sequence to complete a specific task. Each stage of a pipeline contains one or more pipeline components (COM objects) that can be configured to work with the unique requirements of the site.

pipeline (n)~ A potential sales transaction in process.

pipeline (n)~ A set of commands that chain the output of one command into the input of the next command.

pipeline (n)~ A series of commands connected by pipeline operators (|) (ASCII 124). Each pipeline operator sends the results of the preceding command as input to the next command.

pipeline component (n)~ The Component Object Model (COM) server object that implements the required pipeline component interfaces.

pipeline configuration file (n)~ A file containing the configuration data for a pipeline. The pipeline specified in the file is created and run by a pipeline object.

pipeline configuration template (n)~ The template file used to create new pipelines. The pipelines created using a pipeline configuration template are saved as pipeline configuration (.pct) files. The templates serve as the basis for creating custom pipelines. Stages and components can be added, deleted, or renamed in any template.

Pipeline Designer (n)~ A graphical user-interface tool used to create and configure pipelines in BizTalk Server.

pipeline mode (n)~ An application pool setting that determines how to process requests that involve managed resources. The options are integrated mode or classic mode.

pipeline object (n)~ An object that loads a pipeline configuration file and runs the pipeline components configured within it.

pipelining (n)~ The use of pipes in passing the output of one task as input to another until a desired sequence of tasks has been carried out.

piracy (n)~ Any unauthorized copying, distribution, and use of computer software, or software theft.

pitch (n)~ A measurement of the number of characters that fit in a horizontal inch. Pitch is generally used to measure monospaced fonts.

pitch (n)~ A rotation in 3D space around the x-axis.

pivot (v)~ To rotate a table-valued expression by turning the unique values from one column in the expression into multiple columns in the output, and perform aggregations where they are required on any remaining column values that are wanted in the final output.

pivot (n)~ A control that provides a quick way to manage the navigation of views within an application.

pivot area (n)~ The worksheet area into which you drag PivotTable or PivotChart fields to change the layout of the report. On a new report, dashed blue outlines indicate the pivot area on the worksheet.

pivot currency (n)~ The currency against which exchange rates are entered in the rate measure group.

PivotChart (PN)~ An interactive technology in Microsoft Excel or Access that can show dynamic graphical views of data from a list or a database.

PivotChart report (n)~ A chart that provides interactive analysis of data, like a PivotTable report. You can change views of data, see different levels of detail, or reorganize the chart layout by dragging fields and by showing or hiding items in fields.

PivotChart view (n)~ A view that shows a graphical analysis of data in a datasheet or form. You can see different levels of detail or specify the layout by dragging fields and items or by showing and hiding items in the drop-down lists for the fields.

PivotDiagram (PN)~ A collection of shapes arranged in a tree structure that helps analyze and summarize data in a visual, easy-to-understand format. It starts out as a single shape, called a top node, that contains information imported from a worksheet, table, view, or cube.

PivotTable (PN)~ An interactive technology in Microsoft Excel or Access that can show dynamic views of the same data from a list or a database.

PivotTable data (n)~ In a PivotTable report, the summarized data calculated from the data fields of a source list or table.

PivotTable form (n)~ An interactive table that summarizes large amounts of data by using format and calculation methods that you choose. You can rotate its row and column headings to view the data in different ways, similar to an Excel PivotTable report.

PivotTable grand totals (n)~ Total values for all cells in a row or all cells in a column of a PivotTable report. Values in a grand total row or column are calculated by using the same summary function used in the data area of the PivotTable report.

PivotTable list (n)~ A Microsoft Office Web Component that allows you to create a structure similar to an Excel PivotTable report. Users can view the PivotTable list in a Web browser and change its layout in a manner similar to an Excel PivotTable report.

PivotTable report (n)~ An interactive, cross tabulated Excel report that summarizes and analyzes data, such as database records, from various sources including ones external to Excel.

PivotTable subtotal (n)~ A row or column that uses a summary function to display the total of detail items in a PivotTable field.

PivotTable view (n)~ A view that summarizes and analyzes data in a datasheet or form. You can use different levels of detail or organize data by dragging the fields and items, or by showing and hiding items in the drop-down lists for the fields.

pixel (n)~ The smallest element used to form the composition of an image on a computer monitor. Computer monitors display images by drawing thousands of very small pixels arranged in columns and rows.

Pixel ~ (PICture ELement)- All computer screen or printed images are made up of pixels,

small square dots - the smaller the pixels, the higher the image quality.

pixel aspect ratio (n)~ The ratio of a pixel's width to its height. Computer monitor pixels are square, and therefore have a pixel aspect ratio of 1:1.

pixel format (n)~ The size and arrangement of pixel color components. The format is specified by the total number of bits used per pixel and the number of bits used to store the red, green, blue, and alpha components of the color of the pixel.

pixel shader (n)~ A graphics function which calculates computer image effects pixel by pixel allowing control of the lighting, shading and color of each individual pixel.

Pixelate (v)~ A filter effect in Windows Movie Maker.

pixelated ~ A picture that has been compressed so much that the pixels that make it up are large and visible to the naked eye, making the image look like it is made out of square blocks (which it is, but they shouldn't be visible).

pixels per inch (n)~ A measurement of the clarity or fineness of detail of an image displayed on a computer monitor.

pizza box (n)~ A chassis type that can be reported by the Win32_SystemEnclosure class in Windows Management Instrumentation (WMI) and that refers to the chassis type that consumes 1U of rack space on a standardized 42U rack.

PJL (n)~ The printer command language developed by Hewlett Packard that provides printer control at the print-job level. Using PJL commands, you can change default printer settings such as number of copies to print. PJL commands also permit switching printer languages between print jobs without action by the user. If bi-directional communication is supported, a PJL-compatible printer can send information such as printer model and job status to the print server.

PKCS (n)~ A family of standards for public key cryptography that includes RSA encryption, Diffie-Hellman key agreement, password-based encryption, extended-syntax, cryptographic message syntax, private key information syntax, and certificate request syntax, as well as selected attributes. Developed, owned, and maintained by RSA Data Security, Inc.

PKCS #10 (n)~ The Certification Request Syntax Standard, developed and maintained by RSA Data Security, Inc. A syntax for certificate requests.

PKCS #12 (n)~ Personal Information Exchange Syntax Standard, developed and maintained by RSA Data Security, Inc. This standard primarily provides a format for storing keys or a certificate in a file.

PKCS #7 (n)~ The Cryptographic Message Syntax Standard. It is a general syntax, developed and maintained by RSA Data Security, Inc., for data to which cryptography may be applied, such as digital signatures and encryption. It also provides a syntax for disseminating certificates or certificate revocation lists.

PKI (n)~ The laws, policies, standards, and software that regulate or manipulate certificates and public and private keys. In practice, it is a system of digital certificates, certification authorities, and other registration authorities that verify and authenticate the validity of each party involved in an electronic transaction. Standards for PKI are still evolving, even though they are being widely implemented as a necessary element of electronic commerce.

PKI certificate (n)~ A system of digital certificates, certification authorities, and other

registration authorities that verify and authenticate the validity of each party involved in an electronic transaction.

PKI hierarchy (n)~ A hierarchy in which the roles of the certification authority are separated into one root CA and one or more subordinate CAs.

PL/SQL (n)~ Oracle's data manipulation language that allows sequenced or grouped execution of SQL statements and is commonly used to manipulate data in an Oracle database. The syntax is similar to the Ada programming language.

PLA (PN)~ A Distributed Component Object Model (DCOM) API that enables application programmers to log system performance and diagnosis data, and to generate alert notifications based on performance counter thresholds.

place (n)~ A window that is part of the navigation layer in the Dynamics NAV application.

place in service date (n)~ The date that an asset is ready and available for service.

placeable shape (n)~ A 2-D shape that is set to work with routable connectors and automatic layout. If a shape is set as placeable, a routable connector can detect and avoid crossing through it.

placeholder (n)~ A symbolic value used in place of a real value that is unknown or unavailable at the current time, or that is not displayed for security reasons.

placeholder (n)~ A box with dotted borders in a slide layout that holds title and body text or objects such as charts, tables, and pictures.

placeholder text (n)~ Text or some other element used in an application as an indicator that the user should enter in his or her own text.

placement (n)~ The process of selecting the most suitable host to deploy a virtual machine on.

placement and load balancer (n)~ A Windows Fabric component that ensures that services running in the cluster are efficiently mapped to cluster nodes in order to distribute load across the cluster.

Places (n)~ A feature of the Windows 8 Bing Weather app that lets users choose geographic locations in which to track weather and personalize the app with these choices

places (n)~ Any disk drive, folder, or other place in which you can store files and folders. Programs will commonly ask you to choose a location to save a file.

places (PN)~ A feature in Cortana's Notebook that enables the user to add or edit the user's favorite places.

plain old CLR object (n)~ An object that does not inherit from another class or implement an interface.

plain old telephone service (n)~ Basic dial telephone connection to the public switched network, without any added features or functions. Until the 1970s, POTS was the only telephone service offered by local telecommunications providers.

plain text (n)~ A string of text that is displayed with one value for each text attribute: typeface, slant, and weight.

plaintext (n)~ Data in its unencrypted or decrypted form.

plaintext authentication (n)~ An authentication mechanism that is supported by most browsers, including Internet Explorer, and encodes (but does not encrypt) user name and password data before transmitting it over the network.

plan (n)~ A schedule of task start and finish dates and resource and cost data.

plan (n)~ An anticipated progression of interrelated activities that do not have assigned start and end times or assigned resources.

Plan A gateway (n)~ A SIP-PSTN gateway that meets the Unified Communications specifications.

plan cache (n)~ The part of the SQL Server memory pool that is used to store execution plans for Transact-SQL batches, stored procedures, and triggers.

plan guide (n)~ A SQL Server module that attaches query hints to queries in deployed applications, without directly modifying the query.

planar (adj)~ In computer graphics, lying within a plane.

planar coordinate system (n)~ A system of coordinates in reference to a planar space.

planar projection (n)~ The result of projecting an image onto a flat surface.

planned cost (n)~ The latest cost of tasks, resources, assignments, and the entire project, which Project displays in the Cost field as cost or total cost.

planned intercompany demand (n)~ Predicted demand for a product by a legal entity that assumes the role of a vendor. The planned demand is generated from planned demand for the product from a downstream legal entity.

planned manual failover (n)~ For an availability group, a failover without data loss that is initiated by a database administrator, typically, for administrative purposes.

planned order (n)~ An order generated to fulfill an item requirement.

planned production order (n)~ A source document that documents production requirements generated from a production plan.

planned purchase order (n)~ An order proposal generated by a master scheduling calculation to fulfill a requirement for a purchased item.

planned transfer order (n)~ An order proposal generated by a master scheduling calculation to fulfill a requirement for a transferred item.

planned work (n)~ Work that is anticipated to meet planned orders.

planner (n)~ A group of interests related to a particular subject or event.

Planning Administration Console (PN)~ A thin client that allows members of the global administrator role to make configurations to any computer that is running PerformancePoint Planning Server. Configurations include creating and editing applications, creating and editing model sites, adding users to PerformancePoint Planning Server applications, and adding users to or removing users from the global administrator role, the Modeler role, or the user administrator role.

Planning Business Modeler (n)~ A component of PerformancePoint Planning Server that is the primary interface for designing and managing business applications that perform complex planning, budgeting, forecasting, and consolidation.

Planning Command Utility (PN)~ A tool that assists in the administration and limited modification of the Planning Server. The tool consists of 12 commands that allow for scriptable actions with Planning Server.

Planning Process Service (PN)~ The Web service that supports the running of all scheduled and ad-hoc workflow processes and tasks for Planning Server applications.

Planning Server (PN)~ The Planning server component of PerformancePoint Server. It is an infrastructure that includes everything between the PerformancePoint Server client tier and the SQL Server 2005 databases and SQL Server Analysis Services cubes.

Planning System Database (PN)~ The database that tracks all Planning Server configurations, security, and applications.

Planning Web Service (PN)~ The Web service that is used by Planning Business Modeler and PerformancePoint Add-in for Excel to interact with Planning Server. The Web service supports user authentication, authorization, and the storage and retrieval of information that resides in Planning Server.

planning, budgeting, and forecasting (n)~ The interrelated processes of planning business activities, developing budgets based on the plans, and forecasting future expenditures and revenues based on budgeted and actual data.

Plasma ~ A type of very large screen, either TV or computer monitor.

platform (n)~ The foundation technology of a computer system, normally the type of computer and/or operating system being used.

platform (n)~ A set of subsystems and interfaces that form a common structure from which a stream of derivative products can be efficiently developed and produced. A given product may have platform deliverables (building blocks) from several areas that define its implementation.

platform as a service (n)~ The capability provided to the consumer of deploying onto the cloud infrastructure consumer-created or acquired applications created using programming languages, libraries, services, and tools supported by the provider. The consumer does not manage or control the underlying cloud infrastructure, including network, servers, operating systems, or storage, but has control over the deployed applications and possibly of the configuration settings for the application-hosting environment.

platform configuration register (n)~ A register inside a Trusted Platform Module (TPM). This register is sufficiently large to contain a hash (currently only SHA-1).

platform development kit (n)~ A development kit that includes all the tools, technology, and documentation that are required in each specific area of the Surface product, such as applications (including the SDK), Shell, hardware, and the Vision System.

platform invoke (n)~ The functionality provided by the common language runtime to enable managed code to call unmanaged native DLL entry points.

platform layer (n)~ The layer that includes the physical servers and services that support the services layer. The platform layer consists of many instances of SQL Server, each of which is managed by the SQL Azure fabric.

Platform Notification System (PN)~ A platform-specific infrastructure for push notification delivery with barebones functions.

platform preview (n)~ A rendering environment designed for developers to test and preview new or updated functionality.

platform provisioning (n)~ The process of synchronizing a secondary server with the Web platform components and applications that are installed on the primary server by using the Platform Provisioning feature. The components that can be provisioned are any of the Web server role services and any of the components that were installed on the primary server by using Microsoft Web Platform Installer.

Platform Server Role (n)~ A role that consists of the services that are used to process data. To run Microsoft Dynamics CRM, you must have at least one computer that is running the Platform Server role.

platformer (PN)~ A game category that emphasizes jumping to reach platforms, avoid obstacles, or attack enemies.

Platform-independent ~ If something is platform-independent, you don't need a particular type of computer or particular software to use it. For example is the internet, which you can access from a PC, Mac, tablet or any smartphone.

platform-independent ~ A term describing software that can run on a variety of hardware platforms or software architectures. Platform-independent software can be used in many different environments, requiring less planning and translation across an enterprise.

Play (PN)~ A button in a video conversation window that starts or restarts the video feed.

play (v)~ To start or continue the execution of a digital media file.

play count (n)~ A count of how many times a digital media file has been played.

Play in Background (PN)~ An audio style that sets your audio to play in the background as a soundtrack to your presentation.

Play Recorded Announcement (oth)~ An item on the right-click menu for a conference participant that prompts the conferencing service to play a pre-arranged recorded announcement to the conference participants.

Play Sound troubleshooter (n)~ A troubleshooter that helps find and fix problems that prevent your computer or audio devices from playing sound.

play to (v)~ To stream music, images or videos to a specific device on your home network.

Play To (PN)~ The feature that allows users to stream music, images or videos to a specific device on their home network.

Play To contract (n)~ A contract that allows developers to leverage the Play To button on the Connect Charm to invoke the remote-play behavior. In response to the button click, the developer can invoke the Windows Play To experience. Or the developer can provide a custom Play To experience.

playback (n)~ The replay of a digital media file.

playback (n)~ The replay of an animation storyboard.

Playback Manager (PN)~ An interface that manages audio and video playback for Windows Store apps.

playback order (n)~ A sequence of playback of selected music/videos

playback speed (n)~ The speed at which a voice message is played back to user in the Exchange Server 2007 Unified Messaging feature.

player (n)~ A client program or control that receives digital media content streamed from a server or played from local files. Windows Media Player is an example of a player.

player (n)~ A graphic object that controls audio within the Music application. Users can add songs from albums or custom collections to the playlist and then play, pause, stop, or remove them.

playhead (n)~ An icon that represents the current location being played within the selected media. As clips are being played it moves along the timeline of events to the nearest frame boundary. The positioning of the icon is always between two frames. The preview area will display the frame to the right of the current location.

playlist (n)~ A set of songs and/or albums selected by the customer, from the customer's music library. ?

playlist parser plug-in (n)~ A type of plug-in that parses system or custom playlist formats and transforms them into SMIL-compliant XML DOM objects supported by Windows Media Services.

PlayReady (PN)~ A content access and protection technology that enables business models for digital entertainment content, products, services, and devices.

PlayReady Secure Delivery (PN)~ The service type of the Media Service for PlayReady digital rights management.

PLB (n)~ A Windows Fabric component that ensures that services running in the cluster are efficiently mapped to cluster nodes in order to distribute load across the cluster.

PLD (n)~ A logic chip that is programmed by the customer, not the manufacturer. Like a gate array, a PLD is a collection of logic gates. Unlike a gate array, a PLD does not need to be programmed as part of the manufacturing process.

pledge (n)~ A promise for a future donation.

PLM (PN)~ An operating system process that closes apps that are not foreground apps to conserve system resources, enhance battery life, and remove the burden of app management, task management, or both, from the user. When the user switches back or re-launches the app, the app starts right where it left off.

plot (v)~ To create a graphic or a diagram by connecting points representing variables (values) that are defined by their positions in relation to a horizontal (x) axis and a vertical (y) axis (and sometimes a depth, or z, axis).

plot area (n)~ In a 2-D chart, the area bounded by the axes, including all data series. In a 3-D chart, the area bounded by the axes, including the data series, category names, tick-mark labels, and axis titles.

plotter (n)~ Any device used to draw charts, diagrams, and other line-based graphics. Plotters use either pens or electrostatic charges and toner. Plotters use three basic types of paper handling: flatbed, drum, and pinch roller.

plotter font (n)~ A font created by a series of dots connected by lines. Plotter fonts can be scaled to any size and are most often printed on plotters. Some dot-matrix printers also support plotter fonts.

Plug and Play (n)~ A type of device, such as a game controller or printer, that automatically works when you connect it to your computer. The computer configures the settings and installs the necessary drivers by itself.

Plug and Play BIOS (PN)~ A BIOS with responsibility for configuring Plug and Play cards and system-board devices during system power up. Provides runtime configuration services for system board devices after startup.

plug-and-play extensions (n)~ A technology that makes a loosely-connected device look like a tightly-coupled device and provides identical experience for network connected devices as directly connected devices.

pluggable authentication (n)~ A mechanism to integrate multiple low-level authentication schemes into a high-level API, which allows for programs that rely on authentication to be written independently of the underlying authentication scheme.

plug-in (n)~ An auxiliary software component that extends or enhances the features of other software.

Plug-in ~ A small piece of software that adds features to already existing, usually large,

programs.

Plug'n'play ~ (Plug and Play)- A system where Windows automatically detects any new hardware that is plugged into the PC and adjusts to it without human intervention.

plumb (v)~ To open a device, associate it with a physical interface or create a specific named logical interface, and set up the streams needed for IPv4 and IPv6 to use the device.

plus or minus sign (n)~ The -± character.

plus pointer (n)~ The pointer that appears when you move the pointer to the left edge of a field in a datasheet. When the plus pointer appears, you can click to select the entire field.

plus sign (n)~ The + character, used to indicate addition or a positive number.

PLUS SIGN (n)~ The + character, used to indicate addition or a positive number.

PLUS-MINUS SIGN (n)~ The -± character.

PMARGB32 (PN)~ One of the two common pixel formats supported by Microsoft DirectX. PMARG32 uses 8-bit values for alpha, red, green, and blue, for a total of 32-bits per pixel. Each color is alpha premultiplied, which makes alpha blending operations more efficient.

PMO (PN)~ A department responsible for establishing and maintaining project management standards and expectations for the organization.

pneumococcal conjugate vaccine (n)~ A vaccine for immunization against disease caused by the bacterium Streptococcus pneumoniae (pneumococcus).

pneumococcal polysaccharide vaccine (n)~ A vaccine for immunization against 23 types of pneumococcal bacteria.

PNG (n)~ A graphic file format that is supported by some World Wide Web browsers. PNG supports variable transparency of images (alpha channels) and control of image brightness on different computers (gamma correction). PNG files are compressed bitmaps.

p-node (n)~ A NetBIOS implementation that uses point-to-point communication with a WINS server to resolve names as IP addresses.

PnP device (n)~ A type of device, such as a game controller or printer, that automatically works when you connect it to your computer. The computer configures the settings and installs the necessary drivers by itself.

PnP-X (n)~ A technology that makes a loosely-connected device look like a tightly-coupled device and provides identical experience for network connected devices as directly connected devices.

PNRP (n)~ A standard set of formats and procedures which enables secure and dynamic publication, registration and resolution of computer names and IP addresses including the ability to register multiple names on a single computer, multiple computers to a single name, and have names registered by applications.

PNS (n)~ A platform-specific infrastructure for push notification delivery with barebones functions.

PO (n)~ A formal request for goods or services. The purchase order shows the quantity of goods or services ordered, expected receipt date, and supplier name. The purchase order may also include other information pertaining to the delivery of the goods or services.

POC (n)~ The verification that the selected technology performs according to pre-established criteria in a lab environment designed to simulate the production environment.

Pocket PC (n)~ A mobile, larger form-factor computing device small enough to fit in a coat pocket that uses the Microsoft Windows CE or Windows Mobile operating system.

pocket PC ~ A PDA platform launched by Microsoft and several partner hardware vendors in April 2000.

Pocket PC synchronization (oth)~ A function that allows the user to synchronize Address Book and Calendar information with a PC.

POCO (n)~ An object that does not inherit from another class or implement an interface.

POCO class (n)~ A class in the Entity Framework that does not inherit from another class or implement an interface.

POCO data class (n)~ A class in the Entity Framework that does not inherit from another class or implement an interface.

POCO entity (n)~ An entity in the Entity Framework that does not inherit or implement Entity Framework classes or interfaces.

POCO proxy (n)~ A proxy object that represents a POCO class.

POCO type (n)~ A class in the Entity Framework that does not inherit from another class or implement an interface.

podcast (n)~ A series of digital-media files that users can subscribe to online, that are sent to their computers and that can then be accessed on demand on the users' reader. The majority of podcasts are available as audio files in MP3 format, syndicated through an RSS (XML) file. Other formats and other types of files, such as video, can also be podcasted.

Podcast ~ An audio file that can be downloaded to a portable audio player or computer, usually speech.

podcast ~ A coined term to define a broadcast of multimedia files to an Apple IPod or other appropriate receiver. A podcast is an audio or video file that subscribers can hear or view online.

podcast feed (n)~ A digital media file (audio or video) released episodically and downloadable from the Internet.

point (v)~ To move a pointer (for example, an arrow) to a particular position on the screen, by using a pointing device such as a mouse or pen.

point (n)~ A unit of measure referring to the height of a printed character. A point equals 1/72 of an inch, or approximately 1/28 of a centimeter.

point (n)~ A value that is used in Microsoft Points to enable efficient micropayments and prepaid purchase for cash based consumers (including kids/teens, as well as emerging and developing markets) and provide a mechanism to directly reward loyal customers.

point (n)~ A shape that represents a single position in a coordinate system.

point (n)~ The highest point of a curve, the point where a curve ends, or the point where two line segments meet in a polygon or freeform path.

Point and Figure chart (n)~ A chart that plots day-to-day price movements without taking into consideration the passage of time.

point chart (n)~ A chart that plots numerical data along two value axes (x,y).

point depth (n)~ The depth of data points displayed in a 3D chart area.

point event (n)~ An event occurrence as of a single point in time. Only the start time is required for the event. The CEP server infers the valid end time by adding a tick (the

smallest unit of time in the underlying time data type) to the start time to set the valid time interval for the event. Point events are valid only for this single instant of time.

point event model (n)~ The event model of a point event.

Point in time restore (n)~ The recovery of a database to a point within the retention period from a recent backup.

point layer (n)~ The layer in a map report that displays spatial data as points, for examples, points that indicate cities or points of interest.

point light (n)~ A type of light that is cast outward from a single point in all directions much like a standard light bulb.

point name (n)~ A name used to identify a conversion point and associate it with a specific type of transaction (e.g. shoe sale, newsletter subscription).

point of interest (n)~ A location that you select to appear on a map in Concierge. These locations might be, for example, rides on a custom map or restaurants on a Virtual Earth map. A point of interest appears as a numbered circle on the map. You can also recommend points of interest and add more information about them.

point of sale (n)~ The place at which the ownership of products is transferred from the seller to the buyer in exchange for payment.

point of sale terminal (n)~ A computer terminal at the point of sale that records and tracks the ownership and transfer of products from the seller to the buyer in exchange for payment.

point of taxation (n)~ The point in time when a service that is rendered by a service provider is considered to be complete.

point of termination station (oth)~ Basic dial telephone connection to the public switched network, without any added features or functions. Until the 1970s, POTS was the only telephone service offered by local telecommunications providers.

point URL (n)~ The URL of the conversion point page.

point-and-click (adj)~ Pertaining to selecting data and activating programs by using a mouse or other pointing device to move a cursor to a desired location (point') and pressing a button on the mouse or other pointing device ('click').'

pointer (n)~ A graphical image displayed on the screen that indicates the location of a pointing device.

pointer (n)~ In programming and information processing, a variable that contains the memory location (address) of some data rather than the data itself.

pointer (n)~ An on-screen element whose location changes as the user moves the mouse. Depending on the location of the mouse pointer and the operation of the program with which it is working, the area of the screen where the mouse pointer appears serves as the target for an action when the user presses one of the mouse buttons.

pointer (n)~ A needle, marker, or bar that indicates a single value displayed against a scale on a report.

pointer resource record (n)~ A resource record used in a reverse lookup zone created within the in-addr.arpa domain to designate a reverse mapping of a host IP address to a host DNS domain name.

Pointer tool (n)~ An annotation tool used to point to information on a slide.

pointing device (n)~ An input device used to control an on-screen cursor for such actions

as pressing' on-screen buttons in dialog boxes

point-in-time plan (n)~ A compensation plan that is calculated against a base figure taken at a particular point in time. Long-term incentives, such as stock option awards, are often calculated in this way.

point-in-time recovery (n)~ The process of recovering only the transactions within a log backup that were committed before a specific point in time, instead of recovering the whole backup.

point-of-sale activation (n)~ The process of activating tokens during a purchase.

point-to-point connection (n)~ A method of connecting shapes such that the actual point of connection stays the same no matter how you move the connected shapes.

Point-to-Point Protocol (n)~ A set of industry-standard framing and authentication protocols that are included with Windows to ensure interoperability with other remote access software. PPP negotiates configuration parameters for multiple layers of the Open Systems Interconnection (OSI) model. The Internet standard for serial communications, PPP defines how data packets are exchanged with other Internet-based systems using a modem connection. PPP is documented in RFC 1661.

Point-to-Point Protocol over Ethernet (n)~ A specification for connecting users on an Ethernet network to the Internet through a broadband connection, such as a single DSL line, wireless device, or cable modem. Using PPPoE and a broadband modem, LAN users can gain individual authenticated access to high-speed data networks. By combining Ethernet and Point-to-Point Protocol (PPP), PPPoE provides an efficient way to create a separate connection for each user to a remote server.

Point-to-Point Tunneling Protocol (n)~ Networking technology that supports multiprotocol virtual private networks (VPNs), enabling remote users to access corporate networks securely across the Internet or other networks by dialing into an Internet service provider (ISP) or by connecting directly to the Internet. PPTP tunnels, or encapsulates, Internet Protocol (IP) or Internetwork Packet Exchange (IPX) traffic inside IP packets. This means that users can remotely run applications that depend on particular network protocols. PPTP is described in RFC 2637.

poison message (n)~ A message containing information that an application cannot successfully process. A poison message is not a corrupt message, and may not be an invalid request.

poison reverse (n)~ A process that, used with split horizon, improves Routing Information Protocol (RIP) convergence over simple split horizon by advertising all network IDs. However, the network IDs learned in a given direction are advertised with a hop count of 16, indicating that the network is unavailable.

poison-message queue (n)~ A subqueue of the application queue where poison messages get moved to be later processed by a poison-message handling application.

policy (n)~ The mechanism by which computer settings are configured automatically, as defined by the administrator. Depending on context, this can refer to Group Policy or Windows NT 4.0 System Policy.

policy (n)~ A versioned collection of business rules.

policy (n)~ As set of rules defined by the administrator. For example, the policy may require all users to change their passwords.

policy (n)~ One or more rules or procedures that operationalize internal controls.

policy (n)~ A group of settings that controls features on computers and mobile devices like software updates, Endpoint Protection, Windows Firewall settings, and the end-user experience in the Windows Intune Center.

policy bar code (n)~ An image that encodes a unique identifier for a Windows SharePoint Services object, where the value of the unique identifier can also be represented textually.

Policy Filter page (n)~ The page where administrators build customized rules for e-mail addresses and domains in the customer's organization.

policy module (n)~ A Certificate Services component that determines whether a certificate request should be automatically approved, denied, or marked as pending.

policy processing sequence (n)~ The order in which conflicts between policy rules are resolved. Policy rules defined at a lower level of the sequence always override conflicting policy rules at higher levels of the sequence.

policy rule (n)~ A rule in a policy that controls the actions that can or must be taken when the requirements of the condition are met.

policy setting (n)~ A single configuration item in a policy in Windows Intune.

policy template (n)~ A grouping of policy settings that cannot be changed and that serves as the basis for creating a policy.

Policy Tip (PN)~ The message that notifies users of OWA, MOWA, Outlook Desktop Excel, Word and PowerPoint that they might be violating a data loss prevention (DLP) policy.

policy update flag (n)~ A flag that is used to indicate that a workflow should be re-run as an effect of a change to the sets or Management Policy Rules referring to it.

policy-based management (n)~ A set of built-in functions that return server state information about values, objects, and settings in SQL Server. Policy Based Management allows a database administrator to declare the desired state of the system and checks the system for compliance with that state.

polio vaccine (n)~ A vaccine for immunization against poliomyelitis.

poliovirus vaccine (n)~ A vaccine for immunization against poliomyelitis.

Polka (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 75.

Poll slide (n)~ A resource slide that displays a poll question to which all participants can respond.

polling (n)~ The process of periodically determining the status of each device in a set so that the active program can process the events generated by each device, such as whether a mouse button was pressed or whether new data is available at a serial port. This can be contrasted with event-driven processing, in which the operating system alerts a program or routine to the occurrence of an event by means of an interrupt or message rather than having to check each device in turn.

polling interval (n)~ A value that defines the frequency of the polling process.

polling query (n)~ A singleton query that returns a value Analysis Services can use to determine if changes have been made to a table or other relational object.

Polsk Punk (n)~ One of the music genres that appears under Genre classification in

Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 134.

PolyBase (PN)~ A Microsoft technology available within the Microsoft Analytics Platform System to query Hadoop data that is stored in Hadoop clusters or in an Azure Blob Storage by using Transact-SQL (T-SQL) or to query semi-structured data and join the results with relational data sets stored in SQL Server, eliminating the need to extract, transform, and load data into the relational data warehouse and the requirement of additional manual processes, skills, or training in Hadoop.

polygon (n)~ A shape built from a regular pattern of points and segments. Examples of polygons include a triangle, a hexagon, or a 12-point star.

polygon (n)~ A shape representing a single area in a coordinate system. It may have holes, but it does not have multiple disconnected regions, nor does it have any infinitely-thin spurs. Its borders are representable as line strings in the same coordinate system.

polygon layer (n)~ The layer in a map report that displays spatial data as areas, for example, areas that indicate geographical regions such as counties.

polyline (PN)~ A Bezier path made of segments that are either straight lines or circular arcs.

Polyline (PN)~ A tool to create a Bezier path made of segments that are either straight lines or circular arcs.

polymorphic code (n)~ Malicious code that changes its code structure or method of infection to evade detection by virus scanners.

polymorphism (n)~ In an object-oriented programming language, the ability to redefine a routine in a derived class (a class that inherited its data structures and routines from another class).

polynomial trendline (n)~ A curved trendline that is used when data fluctuates.

pool (n)~ A group of things, such as invoices, sales orders, or productions, that have characteristics in common and are to be handled in a similar fashion.

pool (n)~ A combination of one or more front-end servers and a SQL database that is either hosted on the front-end server (Standard Edition configuration) or on one or more back-end servers (EE configurations).

pool (n)~ A collection of task virtual machines on which task applications run.

pooled pipeline (n)~ A pipeline object that takes advantage of COM+ object pooling to speed up pipeline loading and execution.

Pop (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 13.

pop (v)~ To fetch the top (most recently added) element of a stack, removing that element from the stack in the process.

POP aggregation (n)~ A feature that enables users to access their other POP3 enabled e-mail accounts from within their central e-mail account.

Pop Out (v)~ Button on a form that causes that section of the form you are in to open in a new window.

POP subscription (n)~ A subscription that gathers messages from POP3 mailboxes and delivers the messages to a designated Outlook Live mailbox so that the Outlook Live end

user can centralize their e-mail accounts and only have to check one mailbox.

Pop/Funk (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 62.

POP3 (n)~ An Internet standard protocol that allows a user to download e-mail from his or her inbox on a server to the client computer where messages are managed. This protocol works well for computers that are unable to maintain a continuous connection to a server.

POP3 ~ (Post Office Protocol version 3; pr. 'pop 3') A- protocol- for transmitting and receiving email.

POP-enabled account (n)~ An account that can receive mail using the POP3 protocol.

Pop-Folk (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 53.

Popular (PN)~ The filter for videos within Office 365 Video and its channels that sorts the videos according to popularity or what is trending.

Popular (PN)~ The collection title for items that meet a certain purchase/rental/play threshold.

Popular artists (PN)~ The collection title for musical atists that meet a certain purchase/rental/play threshold.

Popular movies (PN)~ The collection title for movies that meet a certain purchase/rental/play threshold.

Popular music (PN)~ The collection title for music albums that meet a certain purchase/rental/play threshold.

Popular on Xbox (PN)~ The collection title for items that meet a certain purchase/rental/play threshold on the Xbox console.

Popular Queries report (n)~ A Web analytics report that provides information on the most popular searches.

Popular shows (PN)~ The collection title for TV shows that meet a certain purchase/rental/play threshold.

Popular stations (PN)~ The collection title for music app radio stations that meet a certain purchase/rental/play threshold.

populate (v)~ To import prepared data using a software procedure rather than the end user entering the information.

population (n)~ The process of scanning content to compile and maintain an index.

pop-up (n)~ A new instance of the browser that occurs in the foreground of an html environment. Pop-up items include pop-up ads, pop-up forms, and other graphical browser-based items.

Pop-up ~ A form of online advertising where the advert pops up in a separate browser window when you go to a particular webpage. Many people find it intensely irritating, and some browsers now have the ability to block pop-ups from opening.

pop-up blocker (n)~ Software that prevents the display of pop-up items when browsing the Internet.

pop-up blocking (n)~ An Internet Explorer security feature that prevents an existing

window from opening another window without explicit permission.

pop-up control (n)~ A control that displays content in a separate window relative to an element or point on the screen.

pop-up form (n)~ A form that stays on top of other windows. A pop-up form can be modal or modeless.

pop-up menu (n)~ A menu that is related to the active window or item, accessible by right-clicking the mouse.

pop-up menu ~ A menu that appears in a dialog box.

pop-up window (n)~ A window that appears when an option is selected. Typically, the window remains visible until the mouse button is released.

pop-up window (n)~ An overlapped window used for dialog boxes, message boxes, and other temporary windows that appear outside an application's primary window.

Pornography (n)~ A content descriptor developed by Microsoft.

port (v)~ To move documents, graphics, and other files from one computer to another.

port (v)~ To change a program in order to be able to run it on a different computer.

port (n)~ A hardware- or software-based interface used to transfer information between a computer and other devices. Hardware ports are physical connections that are visible on the outside of the computer. Software ports are the numbered gateways in programs that software programs use to exchange information.

port (n)~ An entry point into BizTalk Server that connects adapters to pipelines.

port (n)~ An actor's interface component through which actors communicate with other actors.

port (n)~ An inbound or outbound service endpoint that binds a communications protocol and data contract with a network address.

Port ~ A socket on the back (usually) of a computer which allows you to plug in extra hardware such as a printer or modem.

port ~ Ports can be classified as hardware ports or network (software) ports. Hardware ports consist of the outlets on the computer where cables or plugs connect. Examples include USB, SCSI and Ethernet ports.

port classification (n)~ A name assigned to a set of virtual network adapter port profiles that share some configuration properties.

port connector line (n)~ A line showing the connection between a Send/Receive shape and an operation on a Port shape.

port ID (n)~ The method that Transmission Control Protocol (TCP) and User Datagram Protocol (UDP) use to specify which program running on the system is sending or receiving the data.

port number (n)~ A number that identifies a certain Internet application. For example, the default port number for the WWW service is 80.

portable computer (n)~ Any computer designed to be moved easily.

portable device (n)~ A device that is light enough, rugged enough, and free enough of encumbering external connections to be carried by a user.

Portable Document Format (n)~ The Adobe specification for electronic documents that use the Adobe Acrobat family of servers and readers.

portable executable file (n)~ The file format used for executable programs and for files to

be linked together to form executable programs.

portable license (n)~ A license that is created when a packaged Windows Media file is transferred to a portable device. The portable license is located on the portable device, and contains rights that are specified in the original license.

portable media player (n)~ A generic handheld device that can play music, videos, display pictures, etc. Specifically, a non-Microsoft-branded type of this device.

Portable Network Graphics (n)~ A graphic file format that is supported by some World Wide Web browsers. PNG supports variable transparency of images (alpha channels) and control of image brightness on different computers (gamma correction). PNG files are compressed bitmaps.

portal (n)~ A website that users who are assigned to an appropriate user role can use to create and manage their own virtual machines and services.

Portal ~ A virtual gateway between computer systems, or a website that provides links to lots of useful sites on a particular theme, eg shopping or news.

portal ~ Usually used as a marketing term to described a Web site that is or is intended to be the first place people see when using the Web. Typically a 'Portal site' has a catalog of web sites, a search engine, or both.

portal site (n)~ A type of SharePoint site that provides the top-level Web view (home page and related pages) of the portal.

portal URL (n)~ An internal Web address for accessing Live Meeting Manager on an intranet.

Ported In / Out ~ In: a telephone number is considered to be ported in when service provider

Ported In / Out ~ Out: telephone number is considered to be ported out when a number assigned to service provider A is moved from service provider A's switch to service provider B's switch

portfolio (n)~ A list of projects within an organization that may share common management of scope, budget, or resources.

portrait (n)~ An orientation where the long dimension of a rectangular area (for example, screen or paper) is vertical.

portrait orientation (n)~ An orientation where the long dimension of a rectangular area (for example, screen or paper) is vertical.

POS (n)~ The place at which the ownership of products is transferred from the seller to the buyer in exchange for payment.

POS terminal (n)~ A computer terminal at the point of sale that records and tracks the ownership and transfer of products from the seller to the buyer in exchange for payment.

POSA (n)~ The process of activating tokens during a purchase.

Position (n)~ An option that allows the user to specify the location of an element on the screen.

position ID (n)~ A unique identifier that is associated to a position, which is a role or occupation within the organization.

position index (n)~ An identifier associated with each address card in the Contacts database. The position index indicates the address card's position relative to the other address cards in the database. A position index is distinct from an object identifier.

position slider (n)~ A user interface control (typically a progress bar) that indicates the progress of the media clip currently being played by showing a thumb advancing along the bar.

positional flat file (n)~ A type of file format used to represent business documents in which the records and fields have a fixed length, eliminating the need for delimiters.

positional parameter (n)~ A parameter that can be specific without the parameter part (e.g. get item foo instead of get item name foo).

positioned update (n)~ An update, insert, or delete operation performed on a row at the current position of the cursor.

positioning (n)~ Placing elements, such as text and graphics, on a page to let the page author control the exact location and layer order of a page element.

positive airway pressure (n)~ A mode of respiratory ventilation in which air is mechanically delivered into the airways and lungs.

positron emission tomography (n)~ A nuclear medicine imaging method similar to computed tomography that produces an image of functional processes in the body.

possible owner (n)~ A node in a failover cluster or server cluster that can run a specific resource. By default, all nodes appear as possible owners, so the resource can run on any node. In most cases, it is appropriate to use this default setting.

post (n)~ A message that appears in a newsgroup, public folder, or other forum, such as Facebook or Twitter, accessible by a number of individuals.

post (v)~ To submit an article in a newsgroup or other online conference or forum. The term is derived from the posting' of a notice on a physical bulletin board.'

POST (n)~ A set of routines stored in read-only memory (ROM) that tests various system components such as RAM, the disk drives, and the keyboard, to see if they are properly connected and operating. If problems are found, these routines alert the user with a series of beeps or a message, often accompanied by a diagnostic numeric value. If the POST is successful, it passes control to the bootstrap loader.

post (n)~ To enter a debit or a credit into an account.

post (v)~ To record the monetary value of an economic event in a specific account, or to summarize and reclassify general and subsidiary journal account entries into general and subsidiary ledger account entries.

post (n)~ A message generated by Microsoft Dynamics CRM when an event occurs, or a message created by a CRM user.

POST ~ (Power On Self Test; pr. 'post') A routine PCs go through when first switched on, before loading the operating system, to make sure the hardware is working properly.

Post a note (PN)~ The link someone clicks to leave a brief note on someone else's profile.

post alert (n)~ Feature to receive new posts as email notifications.

post and transfer (v)~ The process of making temporary transactions a part of the permanent ledger and updating accounts by transaction amounts, if the line is error-free.

Post Bill and AR adjustments (PN)~ The total credits applied to a Microsoft Azure customer's account since a customer's last bill.

post grades (v)~ To publish grades and feedback so that they are available to students.

post list (n)~ The part of the product UI that displays posts as a list in a column. This list can be sorted chronologically.

post location (n)~ The geographical location data, defining the latitude/longitude (or location) of a post when it was published.

Post Office Protocol version 3 (n)~ An Internet standard protocol that allows a user to download e-mail from his or her inbox on a server to the client computer where messages are managed. This protocol works well for computers that are unable to maintain a continuous connection to a server.

post on Facebook (v)~ To post messages or upload photos to Facebook.

Post Rule Configurations (PN)~ Tab on the Records section of the ribbon in CRM that contains the controls for setting the rules about how posts are handled for Yammer.

post to (PN)~ A UI option to share a message on Windows Live, Facebook, or both.

post volume (n)~ The total number (the volume) of posts in a set of filters/dataset.

postal code (n)~ An alphanumeric code assigned to all addresses in order to facilitate mail delivery.

postback (n)~ The process in which a Web page sends data back to the same page on the server.

post-deployment action (n)~ A set of methods that run from within the Office ClickOnce installer after the Office solution is installed.

post-deployment script (n)~ A set of zero or more user-specified database scripts that are executed in a specific order after the database deployment script is executed.

poster (n)~ A large format printed notice, often with photographs or pictures, for placing on a wall.

Posterize (v)~ A filter effect in Windows Movie Maker.

posterizing operation (n)~ A lookup table operation that reduces the number of colors used in an image.

post-event (adj)~ Occurring after a core system operation has been completed.

post-event (n)~ An asynchronous event whose handler runs only after the action that raised the event is complete.

postfix notation (n)~ A form of algebraic notation in which the operators appear after the operands.

posting account (n)~ A financial account that tracks assets, liabilities, revenue, or expenses.

posting date (n)~ The date that a transaction is recorded.

posting definition (n)~ Defines the ledger line entries that will be generated when a match exists between an originating transaction and the match criteria that has been defined.

posting layer (n)~ A current, tax, or operations ledger classification that is assigned to accounting journal entries.

posting profile (n)~ A specification that defines which ledger accounts are to be updated by specific transaction types.

postmaster (n)~ The logon name (and therefore the email address) of an account that is responsible for maintaining email services on a mail server. When an account holder is having trouble with email, a message to postmaster or postmaster@machine.org.domain.name' will usually reach a human who can solve the problem.'

postmaster@mail.hotmail.com (n)~ The email address of the account responsible for

maintaining services on a mail server that often responds to problems account holders have in sending or receiving email.

postmaster@windowslivemail.com (n)~ The email address of the account responsible for maintaining services on a mail server that often responds to problems account holders have in sending or receiving email.

post-milestone review (n)~ The review of work products associated with key milestones to confirm quality and effective project processes. -

post-operational workflow (n)~ A workflow that is asynchronous or that starts at a later time, but does not have to wait for a previous workflow to finish.

post-processor (n)~ A compatibility evaluator module that takes volumes of raw data and produces actionable data in a format that matches the ACT schema, with extensions that are supplied by the compatibility evaluator provider. More than one post-processor may depend on a single data collector, and a post-processor may depend on data from more than one data collector.

postroll (v)~ To extend the amount of encoded video by a specified number of frames.

post-scan instructions (n)~ The instructions for the Distributed Scan Server to process the scanned images upon receipt. Includes which filters to run and any filter-specific attributes.

post-scan process (n)~ All the information created to accomplish an enterprise scan. It includes a destination server, scan ticket and post-scan instructions.

post-scan process filter (n)~ A processing unit on the Distributed Scan Server that is called by the post scan-instructions to process each file as requested and log the results.

PostScript (n)~ A page-description language from Adobe Systems that offers flexible font capability and high-quality graphics.

PostScript ~ A language that describes the appearance (text and graphics) of a printed page. PostScript is an industry standard for printing and imaging. Many printers contain or can be loaded with PostScript software.

PostScript file (n)~ A file created with PostScript page-description language. Nearly all high-resolution files are PostScript.

PostScript font (n)~ A type of computer font created by Adobe Systems. PostScript fonts are smooth, detailed, and of high quality.

PostScript printer (n)~ A printer that uses the PostScript page-description language (PDL) to create text and graphics on the output medium, such as paper or overhead transparency. Examples of PostScript printers include the Apple LaserWriter, the NEC LC-890, and the QMS PS-810.

potency (n)~ A relative measure of the strength characteristic of an item.

potency management (n)~ A method of classifying and managing active ingredients and items that contain a particular concentration of an active ingredient.

potentially unwanted software (n)~ Software that performs certain types of operations that the user does not expect, such as displaying advertisements, monitoring user activity, or collecting and transmitting private user information.

POTS (n)~ Basic dial telephone connection to the public switched network, without any added features or functions. Until the 1970s, POTS was the only telephone service offered by local telecommunications providers.

pound key (n)~ The # character.

Powdered Sugar Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a powdered sugar finish for their cake.

power (n)~ Strength exerted; might.

Power (PN)~ A button that shuts down or restarts the PC.

Power (PN)~ The UI option on the Start menu to shut down, restart the computer, or put the computer to sleep.

Power Analyst (PN)~ Middle level of user roles. Analysts can change sentiment value, and delete posts and publishers from the UI.

Power ballad (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 117.

Power BI (free) (Government Pricing) (PN)~ The basic version of PowerBI targeted to U.S. government customers to get started quickly allowing them to create, view, and share personal dashboards and reports.

Power BI (free) for faculty (PN)~ The basic version of PowerBI targeted to customers from academic institutions to get started quickly allowing them to create, view, and share personal dashboards and reports.

Power BI (free) for students (PN)~ The basic version of PowerBI targeted to students to get started quickly allowing them to create, view, and share personal dashboards and reports.

Power BI (free) Nonprofit (PN)~ The basic version of PowerBI targeted to customers from not-for-profit organizations to get started quickly allowing them to create, view, and share personal dashboards and reports.

Power BI Admin Center (PN)~ A portal for IT Administrators in Power BI.

Power BI API (PN)~ A REST API to connect to a data source and push data in Power BI whenever it becomes available and update reports that are dependent on this data in real time.

Power BI application programming interface (PN)~ A REST API to connect to a data source and push data in Power BI whenever it becomes available and update reports that are dependent on this data in real time.

Power BI Designer (PN)~ An end-to-end report authoring tool for building analytics for Power BI by connecting to multiple data sources, shaping data with queries, and building data models, and eventually creating reports to be shared with others.

Power BI Desktop (n)~ A stand-alone, content authoring tool that can be installed side-by-side with any version of Office or Excel on Windows to create Power BI content on the user's desktop.

Power BI for Android (PN)~ The Power BI app enabling users to monitor and access their business data and interact with and share their Power BI dashboards and reports from Android devices.

Power BI for Mobile (PN)~ The Power BI service bundle including the native Windows, Android, and iOS apps to interact with Power BI dashboards and reports.

Power BI for Office 365 (PN)~ The cloud-based, business intelligence service for Excel and Office 365.

Power BI for Office 365 Add-On for E3/E4 (Government Pricing) (PN)~ The offer for the cloud-based add-on to Office 365 for E3/E4 for Power BI that is hosted in the commercial cloud environment.

Power BI for Office 365 with SharePoint Online (Plan 2) with Yammer (Government Pricing) (PN)~ The offer for Office 365 for SharePoint (Plan 2) for Power BI that includes Yammer, and that is hosted in the commercial cloud environment.

Power BI for Office 365 with SharePoint Online (Plan 2) with Yammer (Government Pricing) Trial (PN)~ The limited-day trial offer for government organizations for Office 365 for SharePoint (Plan 2) for Power BI that includes Yammer and that is hosted in the commercial cloud environment.

Power BI for Windows (PN)~ The Power BI app enabling users to monitor and access their business data and interact with and share their Power BI dashboards and reports from Windows mobile devices.

Power BI Personal Gateway (PN)~ A a client agent providing secure connections and access to public and on-premises data through a private connection to Azure.

Power BI Pro (Government Pricing) (PN)~ The paid offer of PowerBI targeted to U.S. government customers with the full range of Power BI capabilities including extended data source support, enhanced data refresh options, and richer collaboration and sharing.

Power BI Pro (Government Pricing) Trial (PN)~ A limited-period free evaluation version of the paid offer of PowerBI targeted to U.S. government customers with the full range of Power BI capabilities including extended data source support, enhanced data refresh options, and richer collaboration and sharing.

Power BI Pro Developer (MSDN) (PN)~ The paid offer of PowerBI targeted to developers with a MSDN subscription, with the full range of Power BI capabilities including extended data source support, enhanced data refresh options, and richer collaboration and sharing.

Power BI Pro for faculty (PN)~ The paid offer of PowerBI targeted to customers from academic institutions, with the full range of Power BI capabilities including extended data source support, enhanced data refresh options, and richer collaboration and sharing.

Power BI Pro for faculty Trial (PN)~ A partial or limited version for evaluation purposes of the paid offer of PowerBI targeted to customers from academic institutions, with the full range of Power BI capabilities.

Power BI Pro for Nonprofits (PN)~ The paid offer of PowerBI targeted to customers from not-for-profit organizations with the full range of Power BI capabilities including extended data source support, enhanced data refresh options, and richer collaboration and sharing.

Power BI Pro for Nonprofits Trial (PN)~ A partial or limited version for evaluation purposes of the paid offer of PowerBI targeted to customers from not-for-profit organizations with the full range of Power BI capabilities.

Power BI Pro for students (PN)~ The paid offer of PowerBI targeted to students with the full range of Power BI capabilities including extended data source support, enhanced data refresh options, and richer collaboration and sharing.

Power BI Pro for students Trial (PN)~ A partial or limited version for evaluation purposes of the paid offer of PowerBI targeted to students with the full range of Power BI

capabilities.

Power BI Pro Trial (PN)~ A partial or limited version for evaluation purposes of the paid offer of PowerBI with the full range of Power BI capabilities.

Power BI Pro- (user purchased) (PN)~ The paid offer of PowerBI targeted to users who purchased the -€˜Power BI for Office 365 Add-On' or the -€˜Power BI for Office 365 Standalone' licenses, with the full range of Power BI capabilities including extended data source support, enhanced data refresh options, and richer collaboration and sharing.

Power BI Provisioning Guide (PN)~ The guide for IT administrators to learn how to provision Power BI.

Power BI service (n)~ A cloud-based business analytics service for non-technical business users..

Power BI- (free) (PN)~ The basic version of PowerBI to get started quickly allowing them to create, view, and share personal dashboards and reports, based on the capabilities of the consuming user, regardless of who created or published the content.

Power BI- Pro (PN)~ The paid offer of PowerBI with the full range of Power BI capabilities including extended data source support, enhanced data refresh options, and richer collaboration and sharing.

Power button (n)~ A hardware button or slider on all form factors that controls the power of the PC.

power conditioning (n)~ The process of removing spikes, surges, sags, and noise from the power supply and providing power without interruptions.

Power Efficiency Diagnostic (PN)~ A Wizard-based interface for maximizing battery life based on user preferences.

power management (n)~ Mechanisms in software and hardware to minimize system power consumption, manage system thermal limits, and maximize system battery life. Power management involves trade-offs among system speed, noise, battery life, processing speed, and power consumption.

Power Management (n)~ A menu item that accesses a feature that allows the user to check the battery and configure settings that prolong battery life.

Power Map (PN)~ The Excel feature that allows users to plot geographic and temporal data visually, analyze that data in 3D, and create interactive tours to share with others.

power optimization (n)~ The capability to automatically turn off a virtual host machine that is not needed to meet resource requirements within a host cluster and then turn the virtual host machine back on when it is needed again.

Power Options (n)~ A Control Panel icon in Windows Vista that takes user to the Power Options dialog box where the user can manage the battery life settings.

Power Pivot (PN)~ A SQL Server add-in for Excel.

power plan (n)~ A group of preset power-management options. For example, you can set elapsed times for putting your computer on standby and for turning off your monitor and hard disk. You save these settings as a named power scheme.

power plan (n)~ A group of Windows-based power settings that you can apply to computers by using Configuration Manager power management.

Power Query (PN)~ The Excel business intelligence add-in focused on data discovery and access.

power reader (n)~ A server role that grants read-only access to all dashboard elements on the PerformancePoint Server server, and is primarily used for alerts. It enables users to download dashboard elements from the PerformancePoint Server server.

power scheme (n)~ A group of preset power-management options. For example, you can set elapsed times for putting your computer on standby and for turning off your monitor and hard disk. You save these settings as a named power scheme.

power trendline (n)~ A curved trendline that is used with data sets that compare measurements that increase at a specific rate.

Power Users group (n)~ A group whose members can manage accounts, resources, and applications that are installed on a workstation, stand-alone server, or member server. This group does not exist on domain controllers. Administrative tasks that can be performed by members of this group include creating local users and groups; modifying and deleting accounts that they have created; removing users from the Power Users, Users, and Guests groups; installing most applications; and creating and deleting file shares.

Power View (PN)~ A feature that enables rich visualizations for interactive data exploration, presentation and reporting in SharePoint and Excel.

powered by (Adverb) ~ Pertaining to a process, tool, etc. that is enabled by a particular technology.

powered by Windows Live (oth)~ Pertaining to a process, tool, etc. that is enabled by Windows Live.

powerline network (n)~ A network that uses your existing electrical lines in your home or office, without the need to install specialised network cable.

Power-on password ~ A password which the computer will prompt you for whenever the computer is switched on, a good security measure provided you don't forget the password. Power-on passwords can usually only be bypassed by taking the computer to bits.

power-on self test (n)~ A set of routines stored in read-only memory (ROM) that tests various system components such as RAM, the disk drives, and the keyboard, to see if they are properly connected and operating. If problems are found, these routines alert the user with a series of beeps or a message, often accompanied by a diagnostic numeric value. If the POST is successful, it passes control to the bootstrap loader.

PowerPC (n)~ A microprocessor architecture developed in 1992 by Motorola and IBM, with some participation by Apple. A PowerPC microprocessor is RISC-based and superscalar, with a 64-bit data bus and 32-bit address bus. It also has separate data and instruction caches, although the size of each varies by implementation. All PowerPC microprocessors have multiple integer and floating-point units. The voltage and operating speed varies with the implementation. Starting with the PowerPC 740, the microprocessors were manufactured with copper, instead of aluminum, for better performance and reliability.

PowerPivot (PN)~ A SQL Server add-in for Excel.

PowerPivot data (n)~ A SQL Server Analysis Services cube that is created and embedded through Microsoft SQL Server PowerPivot for Microsoft Excel.

PowerPivot for SharePoint (PN)~ A Microsoft SQL Server technology that provides query processing and management control for PowerPivot workbooks published to SharePoint.

PowerPivot Gallery (PN)~ A special-purpose SharePoint document library that provides rich preview and document management for published Excel workbooks that contain PowerPivot data as well as other document types.

PowerPivot service (n)~ A middle tier service of the Analysis Services SharePoint integration feature that allocates requests, monitors server availability and health, and communicates with other services in the farm.

PowerPivot service application (n)~ A specific configuration of the PowerPivot service.

PowerPivot System Service (PN)~ The web service of PowerPivot for SharePoint that enables PowerPivot workbook access and server management in a SharePoint farm.

PowerPivot Web service (n)~ A Web service that performs request redirection for processing requests that are directed to a PowerPivot Engine service instance that is outside the farm.

PowerPivot workbook (n)~ An Excel 2010 workbook that contains PowerPivot data.

Powerpoint ~ A very popular program for creating graphical presentations, mostly for business use. Available separately or as part of Microsoft Office, Microsoft's office suite.

PowerPoint 2016 (PN)~ The year 2016 edition of PowerPoint.

PowerPoint add-in (n)~ An optional Live Meeting tool that allows users to create Live Meeting slides and add a presenter photo as part of a Microsoft PowerPoint file.

PowerPoint for Android (PN)~ The version of PowerPoint that runs on the Android operating system.

PowerPoint for iPad (PN)~ The version of PowerPoint that runs on iPad.

PowerPoint for Mac (PN)~ The version of PowerPoint the runs on the Mac operating system.

PowerPoint for Mac for Office 365 (PN)~ The version of PowerPoint from Office 365 that runs on the Mac operating system.

PowerPoint for Mac Preview (PN)~ The public preview of PowerPoint for Mac.

PowerPoint Mobile 2010 (PN)~ The year 2010 edition of the Microsoft presentation graphics product for creating presentations and adding graphic effects like multimedia objects and special effects with text, designed for use with handheld computing devices.

PowerPoint Mobile Clicker (PN)~ A PowerPoint add-in that allows your mobile device to be used to navigate through a PowerPoint presentation on your computer.

PowerPoint Mobile Viewer (PN)~ A viewer that allows users to display PowerPoint presentations on a phone's browser. A file is rendered as an HTML page with sufficient fidelity to display readable slide and outline views on a small screen.

PowerPoint Online Viewer (PN)~ A PowerPoint Web App technology that enables users to view in full fidelity a PowerPoint document that is stored online.

PowerPoint Previewer (n)~ A context menu that enables the user to preview the contents of a file with the Office Preview Handler (OPH) in Outlook (either documents attached to email or SharePoint documents in Outlook).

PowerPoint render (n)~ A converter that supports dynamic viewing of PowerPoint presentations (with animation) in a Web environment.

PowerPoint static (n)~ A converter that supports static viewing of PowerPoint presentations (without animation) in a Web environment.

PowerPoint XML Format (n)~ The formal name for PowerPoint 12 file format. This

format has an open, royalty-free specification, and is the technology licensed to external parties. This license is the subject in the messaging points where -€œOpen, royalty-free license-€? is discussed.

PowerShell Gallery (PN)~ ?The central repository for Windows PowerShell modules containing Windows PowerShell commands and Desired State Configuration (DSC) resources.

PowerShell pipe object (n)~ In PowerShell scripting, the file or process to which the script's output is directed.

PowerShell-based cache administration tool (n)~ The exclusive management tool for Windows Server AppFabric. With more than 130 standard command-line tools, this new administration-focused scripting language helps you achieve more control and productivity.

PPD (PN)~ Prearranged Payments and Deposits (PPD) - A unique Standard Entry Code (SEC) that is used to credit or debit a consumer account. Typically used for payroll direct deposits and preauthorized bill payments.

PPI (n)~ A measurement of the clarity or fineness of detail of an image displayed on a computer monitor.

PPP (n)~ A set of industry-standard framing and authentication protocols that are included with Windows to ensure interoperability with other remote access software. PPP negotiates configuration parameters for multiple layers of the Open Systems Interconnection (OSI) model. The Internet standard for serial communications, PPP defines how data packets are exchanged with other Internet-based systems using a modem connection. PPP is documented in RFC 1661.

PPPoE (n)~ A specification for connecting users on an Ethernet network to the Internet through a broadband connection, such as a single DSL line, wireless device, or cable modem. Using PPPoE and a broadband modem, LAN users can gain individual authenticated access to high-speed data networks. By combining Ethernet and Point-to-Point Protocol (PPP), PPPoE provides an efficient way to create a separate connection for each user to a remote server.

PPSV (n)~ A vaccine for immunization against 23 types of pneumococcal bacteria.

PPTP (n)~ Networking technology that supports multiprotocol virtual private networks (VPNs), enabling remote users to access corporate networks securely across the Internet or other networks by dialing into an Internet service provider (ISP) or by connecting directly to the Internet. PPTP tunnels, or encapsulates, Internet Protocol (IP) or Internetwork Packet Exchange (IPX) traffic inside IP packets. This means that users can remotely run applications that depend on particular network protocols. PPTP is described in RFC 2637.

Practical Extraction and Report Language (n)~ An interpreted language, based on C and several UNIX utilities. Perl has powerful string-handling features for extracting information from text files. Perl can assemble a string and send it to the shell as a command; therefore, it is often used for system administration tasks. A program in Perl is known as a script. Perl was devised by Larry Wall at the NASA Jet Propulsion Laboratory.

practice (n)~ A repeatable process that improves or maintains performance.

Pranks (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1

genre ID # 23.

preamplifier (n)~ An electronic device that increases the output level of a signal to match the required signal input level of another device.

preauthorized debit (n)~ A withdrawal from a customer's account to pay bills or make loan payments that is initiated by a company or financial institution which has the customer's written authority to do so.

pre-boot (oth)~ Before Windows loads.

Pre-Boot EXecution Environment (n)~ A remote boot technology based on Dynamic Host Configuration Protocol (DHCP) that is used to start or install an operating system on a client computer from a remote server. A WDS Server is an example of a PXE Server.

precedence (n)~ The order in which operators are evaluated in an expression, tasks are performed or rules are applied. For example, in a mathematical expression, multiplication and division are performed first, followed by addition and subtraction.

precedence ~ the property of arithmetic operations that determines which operations are done first in a complex expression.

precedence constraint (n)~ A control flow element that connects tasks and containers into a sequenced workflow.

precedent (n)~ A cell that is referred to by a formula in another cell. For example, if cell D10 contains the formula =B5, cell B5 is a precedent to cell D10.

Pre-Chat Questions (n)~ A series of questions that Customers are asked when they initiate a Chat Request.

precision touchpad (n)~ A touchpad that provides a consistent, accurate, and responsive experience for users.

precompilation (n)~ The process of submitting an entire Web site to a compiler. The resulting Web site output runs without needing to be compiled on first request and does not require source code to be deployed to a production server.

precompiled header (n)~ In computer programming, an optimization developed for command-line compilers where a (C or C++) header file is compiled into an intermediate form that is faster to process for the compiler.

precomposed character (n)~ A single character that represents a sequence of characters, usually a combination of a base character and one or more diacritics.

precomputed partition (n)~ A performance optimization that can be used with filtered merge publications.

predecessor (n)~ An activity that occurs before another activity in a series. A predecessor can be, but is not always, a prerequisite.

predefined bookmark (n)~ A bookmark that Microsoft Word automatically sets in each document. For example, the \Sel predefined bookmark refers to the current selection or the insertion point.

predefined dimension (n)~ A dimension that is assigned a certain dimension type that is recognized by PerformancePoint Planning Server. Predefined dimensions have specific member properties and behaviors associated with them; for example, Time or Account.

predefined key (n)~ A key that represents one of the main divisions of the registry. Each predefined key is displayed in a separate Registry Editor window, with the key's name appearing in the window's title bar. For example, HKEY_CLASSES_ROOT is a

predefined key.

predefined object (n)~ A system-generated object.

predefined rule (n)~ A system-generated rule.

pre-deployment script (n)~ A set of zero or more user-specified database scripts that are executed in a specific order before the database deployment script is executed.

predicate (n)~ In Exchange Server 2007, a function that is used as a condition or exception on a transport rule to determine whether an action should be applied to an e-mail message.

predictable column (n)~ A data mining column that the algorithm will build a model around based on values of the input columns. Besides serving as an output column, a predictable column can also be used as input for other predictable columns within the same mining structure.

prediction (n)~ A data mining technique that analyzes existing data and uses the results to predict values of attributes for new records or missing attributes in existing records. For example, existing credit application data can be used to predict the credit risk for a new application.

Prediction Calculator (PN)~ A new report that is based on logistic regression analysis and that presents each contributing factor together with a score calculated by the algorithm. The report is presented both as a worksheet that helps you enter data and make calculations of the probable outcomes, and as a printed report that does the same thing.

predictive analytics (n)~ A variety of statistical techniques from modeling, machine learning, and data mining that analyze current and historical facts to make predictions about future, or otherwise unknown, events.

Predictive Analytics ~ describe any approach to data mining with three attributes: rapid analysis measured in hours or days

predictive frame (n)~ In MPEG and WMV compression, a frame that is composed of data from previous frames.

pre-encumbrance (n)~ A commitment made by management to reserve budget funds for expenditure requests.

pre-event (adj)~ Occurring before a core system operation occurs.

pre-event (n)~ A synchronous event whose handler runs completely before the action that raised the event starts.

preference item (n)~ An object containing Group Policy settings related to a preference extension in a Group Policy object (GPO). Each preference extension allows you to create one or more types of preference item. Each type has different properties. A GPO can contain multiple preference items for each preference extension.

preference variable (n)~ A variable that customizes the behavior of Windows PowerShell.

Preferences (PN)~ The button in Yammer that directs users to where they can change their account settings.

preferred distribution point (n)~ A distribution point with an associated boundary group that includes the client's current location on the network.

preferred language (n)~ A language selected by the user for viewing menus, dialog boxes, messages, and Help files. If none is selected, the system-preferred language is

displayed.

preferred owner (n)~ The node on which you prefer each group to run.

preferred sender (n)~ The sender specified in the package properties to use when sending the package to a child site.

preferred server (n)~ The NetWare server that you connect to by default when you log on to your computer. The preferred server validates your user credentials and is queried when you request information about resources available on the NetWare network.

pre-filter (n)~ A filter that excludes an event from further processing by Microsoft Operations Manager 2005. The event is not inserted in the database.

prefix characters (n)~ A set of 1 to 4 bytes that prefix each data field in a native-format bulk-copy data file.

prefix length (n)~ The number of prefix characters preceding each noncharacter field in a bcp native format data file.

prefix pattern (n)~ The beginning bytes in a given stream of bytes.

pre-freight amount (n)~ The monetary total amount that is calculated from the detail amount after the percentage order discount and order discount amount are deducted.

preinstallation (n)~ The act of installing and configuring a program on new computers that are then distributed to end users.

preliminary data validation (n)~ The process of validating data before it is processed. This validation helps detect and exclude some errors from the intended process, which might be the import or migration of users using a CSV file, for example.

preload (v)~ To load content in the background before a user sees it.

Premier Support (PN)~ The highest Microsoft Azure support plan with customized features.

Premium (PN)~ A subscription that grants users a Premium account, that includes access to enhanced Skype features such as group video calling, group screen sharing, and live chat customer support.

Premium (5 GB) (PN)~ The unit of measure for five GB of cache consumed during use of the Premium edition of Microsoft Azure Cache.

Premium account (n)~ A type of paid account that includes access to enhanced Skype features such as group video calling, group screen sharing, and live chat customer support.

Premium Apps (n)~ A resource of the 'Application Insights' service type of the 'Visual Studio' service for monitoring the availability, performance, and usage of paid apps through an Azure implementation.

Premium Batch (n)~ The Premium tier for the Microsoft Azure service that enables large amounts of discrete, compute-intensive batches of tasks to be easily executed in Azure. Typical workloads include media transcoding, rendering, test suite execution, simulations, image analysis, and file processing.

Premium BizTalk unit (n)~ A unit of measure for the compute capacity and memory used by the Premium tier of Microsoft Azure BizTalk Services.

Premium Edition (PN)~ The edition of Microsoft Azure SQL Database that offers access to built-in business-class functionality and reserved capacity.

Premium for Microsoft Azure SQL Database (PN)~ The edition of Microsoft Azure SQL Database that offers access to built-in business-class functionality and reserved

capacity.

Premium for SQL Database (PN)~ The edition of Microsoft Azure SQL Database that offers access to built-in business-class functionality and reserved capacity.

Premium Large App Service Hours (PN)~ An Azure resource of the Azure App Service service, providing a unit of measure of time for the higher level of service.

Premium Medium App Service Hours (PN)~ An Azure resource of the Azure App Service service, providing a unit of measure of time for the middle level of service.

Premium Origin-Streamed Hours (PN)~ The premium resource for the Media Services service type of the Media service measured per hour streamed from the origin, per bitrate.

Premium Overage Data Points (1M) (n)~ A premium unit of measure for 'Pay-As-You-Go' billing for the SQL Data Warehouse service type based on bandwith usage using 1M as baseline.

Premium Overage Events (n)~ A resource of the 'Application Insights' service type of the 'Visual Studio' service for an amount of Microsoft Azure services usage that is consumed in excess of a customer's commitment limit.

Premium P1 Secondary Active Geo Database Days (PN)~ The resource of the Media Services service type of the Media service, for the Premium SQL Database edition and the service level P1, which supports active geo-replication to a secondary active database and which is charged in database days.

Premium P1 Secondary Geo Database Days (PN)~ The resource of the Media Services service type of the Media service, for the Premium SQL Database edition and the service level P1, which supports geo-replication and which is charged in database days.

Premium P3 Database Days (PN)~ The resource for the SQL Database service.

Premium Pn Database Days (PN)~ A purchase and performance level for the SQL Database' service designed. P stands for 'Premium' while the adjacent number 'n' indicates the service level corresponding to database throughput.'

Premium Pn Secondary Geo Database Days (PN)~ A purchase and performance level for the SQL Database' service designed. P stands for 'Premium' while the adjacent number 'n' indicates the service level with the creation of active secondary databases in any Azure region.'

Premium Report (n)~ A more advanced collection and representation of data that helps CSRs keep track of Key Performance Indicators (KPIs). Premium Reports allow CSRs to manipulate data on a more specific level and customize reports in order to display data that is more relevant to their specific use case.

Premium Small App Service Hours (PN)~ An Azure resource of the Azure App Service service, providing a unit of measure of time for the lower level of service.

Premium Storage (PN)~ An SSD-based storage offering low latency and high throughput designed to support demanding enterprise workload in the cloud, suitable for I/O intensive applications.

Premium VM Support hour (n)~ A unit of measure of time for the Premium level of support for a virtual machine.

prenote (n)~ A zero-currency transaction sent to a bank to confirm the accuracy of routing and account information.

pre-order (n)~ An order for an SKU that is currenty not available for delivery.

pre-order (v)~ To order an SKU that is currenty not available for delivery.

Pre-Order Limit (n)~ The value below zero beyond which it is not prudent to take pre-orders. Pre-ordering cannot occur beyond this value. This is to restrict overselling and thereby preventing failure to fulfill.

pre-order traversal (n)~ The act of recursively traversing a non-empty binary tree by visiting the root node first, then the left subtree, then the right subtree.

Pre-orders (PN)~ The collection title for items you can purchase before their street date.

prepaid card (n)~ A physical card that represents a specific value or amount of service for which the user has paid in advance.

prepaid card code (n)~ The unique, 25-character code on a prepaid card that adds computer use time to your prepaid computer or that pays for your subscription.

prepaid computer (n)~ A computer running Windows for Prepaid Computers.

Prepaid renewal (n)~ Reactivation of a Microsoft Office Prepaid edition subscription.

Preparation of an Opening Balance Sheet at the Date of Transition to IFRS (n)~ A template that addresses, from a Finance & Accounting perspective, the significant activities required of companies to prepare their opening balance sheet at the date of transition to IFRS within the context of a conversion from previous Generally Accepted Accounting Principles (GAAP) to International Financial Reporting Standards (IFRS).

Prepare (v)~ A menu item with options that can be applied to a file before it is shared with others (e.g. 'Mark as Final' or 'Add a Digital Signature').

prepare a conversation (v)~ To set up the participants of a call or instant message prior to placing the call or sending the instant message.

prepared conversation (n)~ A conversation in which you have set up the participants prior to placing the call or sending the instant message.

preparer (n)~ The person who creates a source document to initiate a request for economic resources.

prepay (v)~ To pay a charge in advance.

Pre-Pay (n)~ A subscription offer for 6 months of 12 months commitment plans in which the user pays in advance for the entire term and get an additional discount.

prepayment (n)~ An amount paid for something that is not yet received.

Prepayment % (n)~ The field that indicates the percentage of the sales invoice amount that a customer has to prepay.

prepayment amount deducted (n)~ The prepayment amount that has been deducted from ordinary invoices (that is, not prepayment invoices) for a sales or purchase line.

prepayment amount invoiced (n)~ The prepayment amount that has already been invoiced for a sales or purchase line.

prepayment invoice (n)~ The invoice created for a customer for the amount to be prepaid on a sales order or the invoice received for the amount to be prepaid on a purchase order.

prepayment journal voucher (n)~ An amount that is paid for items or services that have not been received.

prepayment percentage (n)~ The percentage of the sales invoice amount that a customer has to prepay.

prepmt (n)~ An amount paid for something that is not yet received.

prepopulation (n)~ A process of importing prepared data using a software procedure

rather than the end user entering the information.

preprocessing period (n)~ The three to five day period before the beginning of the next billing cycle. If automated subscription renewal is activated, the Provisioning Server automatically generates the next scheduled provisioning packet and makes it available for the subscription computer.

preprocessor (n)~ A text processor that manipulates the text of a source file as part of the first phase of translation. The preprocessor does not parse the source text, but it does break it up into tokens for the purpose of locating macro calls. Although the compiler ordinarily invokes the preprocessor in its first pass, the preprocessor can also be invoked separately to process text without compiling.

preroll (v)~ To capture or play a number of video frames or a portion of audio data before encoding or rendering begins, in order to allow the source device to stablize.

preroll (n)~ The portion of data to be prerolled.

prescription (n)~ A written direction for the preparation and use of a medicine.

presence (n)~ A collection of attributes that provides an indication of a person's status, activity, location, willingness to communicate, and contact information.

presence (n)~ An attribute that provides an indication of a person's status.

presence awareness (n)~ A feature that enables the user to see when people are working in a workspace, online, or offline

presence icon (n)~ A color-coded icon that indicates a user's presence.

presence information (n)~ A collection of attributes that provides an indication of a person's status, activity, location, willingness to communicate, and contact information.

presence status (n)~ One of the attributes that makes up presence and that indicates a person's availability and willingness to communicate.

Presence unknown (PN)~ Pertaining to a user for whom no information is known. The user might not even exist, or there could be a typo in the SIP address.

Present Online (v)~ A feature that enables users to present a document to remote viewers in a web browser or in Lync.

presentation (n)~ A set of slides that are imported or created for display in a meeting.

presentation area (n)~ The part of the client where presentation content is displayed.

presentation broadcast (n)~ A feature that allows you to run a presentation over the Web. The presentation is saved in HTML format and can contain audio and video. It can also be recorded and saved to be viewed later.

Presentation Clicker (PN)~ A PowerPoint add-in that allows your mobile device to be used to navigate through a PowerPoint presentation on your computer.

presentation layer (n)~ Layer six of the OSI model. A network layer that translates data from the application layer into an intermediary format. This layer also manages security issues by providing such services as data encryption, and compresses data so that fewer bits need to be transferred on the network.

Presentation Layer ~ The OSI layer that determines how application information is represented or encoded while in transit between two end systems.

presentation model (n)~ A data model that aggregates data from multiple entities in the data access layer. It is used to avoid directly exposing an entity to the client project.

presentation package (n)~ A package containing everything you need to show one or

many PowerPoint presentations on another computer. This package can be saved to a folder or burned to a CD.

Presentation panel (n)~ The Live Meeting console element that displays the slides in a Live Meeting presentation.

presentation section (n)~ A labeled group of consecutive slides that helps the user navigate and organize presentations.

Presentation toolbar (n)~ A toolbar that contains tools that presenters can use during a meeting.

presentation-level guide (n)~ A guide that applies to all slides in a presentation.

presenter (n)~ A meeting participant who can do all sharing activities, including presenting, showing, sharing, and whiteboard, and admit participants from the lobby.

presenter key (n)~ A meeting key that is used by meeting presenters.

presenter photo (n)~ A GIF image file that can be displayed in the Now Presenting pane during a presentation using the PowerPoint add-in.

presenter privileges (n)~ Privileges that enable a meeting organizer or participant to display documents, applications, and whiteboard notes to other participants.

presenter tools (n)~ A set of tools that presenters can use to create and present resources.

Presenter View (n)~ A view for delivering a presentation that provides the presenter with additional options for viewing and controlling its delivery.

preservation hold library (n)~ A SharePoint document library in which content is stored after being deleted or modified so that it can be accessed for electronic discovery or other legal purposes.

preset-to callback (oth)~ A form of security in which a remote access server verifies users by calling them back at numbers supplied by the network administrator at the time user privileges are granted. Only a network administrator can change a preset callback number. This ensures that no one can borrow a user's password and connect to the server from a location other than the user's normal one.

Pre-shared key (PN)~ An option that allows the user to view the code that can be used to authenticate IPSec/L2TP connections (typically VPN connections).

preshutdown (n)~ A feature of Vista, where services are alerted of an upcoming shutdown so they have time to close activities and clean-up resources.

preshutdown time-out (n)~ A specified time the service control manager will wait before preceding with other shutdown actions.

press and hold (v)~ To perform an action that entails pressing a finger or the tip of a pen to the screen, holding it down until a mouse icon or menu appears, and then lifting the finger or pen. Pressing and holding is equivalent to right-clicking with a mouse.

press and hold (v)~ To place a finger on the screen and hold it there for a part of a second or more.

press and hold (n)~ A gesture represented by placing a finger on the screen and holding it there for a part of a second or more

pressed appearance (n)~ The visual display for an object, such as a control, when it is being pressed.

pressure sensitive (adj)~ Of or pertaining to a device in which pressing on a thin surface produces an electrical connection and causes an event to be registered by the computer.

Pressure-sensitive devices include touch-sensitive drawing pens, membrane keyboards, and some touch screens.

pressure sensitivity (n)~ An optional hardware feature on a Tablet PC that you can use to create a thicker ink stroke by increasing pressure on the tablet pen.

pressure trail (n)~ The trail drawn with the Paintbrush tool. The size of the trail depends on the pressure applied to the drawing tool (e.g. stylus).

prestage (v)~ To create a compressed content file that contains the files and associated metadata for copying to the content library on a site server or a distribution point before distribution.

pre-staged client (n)~ A computer account object that is created within Active Directory Domain Services (AD DS) before the operating system of the computer is installed.

prestart command (n)~ A script or an executable file that supports operating system deployment and that can interact with the user in Windows PE before a task sequence runs.

pre-tax deduction (n)~ A benefit on taxable income to reduce the tax that an employee is liable to pay on gross wages.

preview (n)~ A placeholder on the Start screen that represents an app not yet installed on the PC.

Preview (PN)~ The Sway view that allows the user to see what the Sway would look and behave like to anyone else reading it by switching from the edit view to the reading view.

preview build (n)~ A build that is installed as part of the Windows Insider Program.

preview handler (n)~ A handler that displays a lightweight, read-only preview of a file's contents without launching the application associated with the file. For example, a preview handler displays a Shell item in the Windows Explorer preview pane.

preview instance (n)~ A non-production instance of CRM Online intended for the sole purpose of previewing future releases of CRM Online. (Betas, etc-€¦)

preview pane (n)~ An area of the window that displays a limited view of search results or other content.

Preview Pane (n)~ A window in an e-mail program where you can preview an item without opening it.

preview update (n)~ An update to a preview build that is part of the Windows Insider Program.

Previous (adj)~ A navigation button used to go to the previous page in wizards.

PRF (n)~ A function that takes a key, label, and seed as input, then produces an output of arbitrary length.

PRI (n)~ A binary file used in Windows Store apps to store resources for all languages, cultures, and scale factors.

price (n)~ A value, usually a currency amount, that is assigned to goods or to services.

price (n)~ The market value or exchange value of a product.

price adjustment (n)~ A modification to a quoted price.

price adjustment (n)~ An automatic update of the price of a service item based on the setup of service price adjustment groups.

price check (n)~ The process of looking up a price.

price discount (n)~ A discount applied to a quoted price.

price group (n)~ The price of any cost type (hour, expense, or fee) that is assigned to a specific group of customers or all customers.

price list (n)~ A compilation of the specific prices that can be charged for each unit in the unit group of a product.

price list item (n)~ The individual elements that represent the product and properties that compose a price list.

price match variance (n)~ A matching discrepancy between the invoice net unit price of one or more line items on a vendor invoice and the purchase order net unit price on the related purchase order.

Price per equity (n)~ In financial theory, the return that stockholders require for a company. A firm's cost of equity represents the compensation that the market demands in exchange for owning the asset and bearing the risk of ownership.

price quote (n)~ A formal offer for products or services, proposed at specific prices and related payment terms.

price tier (n)~ A price that reflects a representative value in other currencies. The specific price of a price tier that is shown in one currency will be close to the corresponding price in another currency. Foreign exchange, differences in taxation policies, and other market factors influence the determination of a price tier's price that is shown in another currency.

price tolerance percentage (n)~ The percentage of variance that is allowable between the prices on a purchase order and a vendor invoice that are used for invoice matching.

price unit (n)~ The quantity of items for which a price is set.

price variance (n)~ The difference between an expected price and an actual price.

price variance percentage (n)~ The actual percentage of variance between a purchase order and a vendor invoice, calculated as follows: For positive lines = (Invoice net unit price - Purchase order net unit price)/Purchase order net unit price; for negative lines = (Invoice net unit price - Purchase order net unit price) * -1/Purchase order net unit price

price variance tolerance (n)~ The allowable difference in prices between purchase order lines and vendor invoice lines that are used for invoice matching.

Price/Book Value (PN)~ A valuation ratio used by investors which compares a stock's per-share price (market value) to its book value (shareholders' equity).

pricing category (n)~ A category in which every product gets the price from the category. That is, the category overrules the price assigned at the product level.

Pricing Method (n)~ A label on a drop-down list on the Price List Item form in which you select how the pricing will be done.

pricing tier (n)~ A purchase level for an Azure service offering based on the features and services it makes available.

primary buffer (n)~ A buffer in which all data is mixed for the final time and then passed to the rendering device.

primary business contact (n)~ The main business contact linked to an Account.

primary calendar (n)~ The calendar selected in the regional settings in Windows Control Panel, or the system calendar.

primary client computer (n)~ A client computer on which synchronization takes place.

primary database (n)~ A read-write database containing the active data of an application.

primary device (n)~ A software deployment condition that defines one or more devices

that a specific user uses. A primary device is typically determined either by frequency of use or by business requirements.

primary dimension table (n)~ In a snowflake schema in a data warehouse, a dimension table that is directly related to, and usually joined to, the fact table.

Primary disk (n)~ The hard disk drive that contains the system and boot partitions used to start Windows.

primary domain controller (n)~ A computer running Windows NT 4.0 Server that authenticates logons and maintains the directory database for a Windows NT 4.0 domain. A primary domain controller is not used in a Windows 2000 domain. Instead, one domain controller is designated as the primary domain controller emulator for backward compatibility.

primary DPM server (n)~ A DPM server that protects file or application data sources.

primary e-mail address (n)~ The e-mail address that appears in the E-Mail Options section of the user's mailbox in the Web management interface for Outlook Live.

primary feature block (n)~ The minimum content in an application package that is necessary for an application to run. The content in the primary feature block is identified during the application phase of sequencing and typically consists of the content for the most used application features.

primary interop assembly (n)~ An assembly containing definitions of COM types that is distributed and digitally signed by the author of the COM component. Visual Studio uses a registered primary interop assembly by default when a developer references a type in the corresponding type library.

primary key (n)~ One or more fields that uniquely identify each record in a table. In the same way that a license plate number identifies a car, the primary key uniquely identifies a record.

primary key (n)~ A candidate key that is selected to be the principle identifier for uniquely identifying records in a database table.

primary Management Server (n)~ The server that an agent-managed computer is specifically assigned to communicate with.

primary mapping (n)~ The main mapping that associates the UNIX user name to one of several Windows user names who are both associated with one UNIX user name.

primary master (n)~ An authoritative DNS server for a zone that can be used as a point of update for the zone. Only primary masters have the ability to be updated directly to process zone updates, which include adding, removing, or modifying resource records that are stored as zone data. Primary masters are also used as the first sources for replicating the zone to other DNS servers.

primary mouse button (n)~ The button on your pointing device that you use most often for clicking and double-clicking.

primary parent category (n)~ The parent category of a product or category that is used to determine the canonical path to that product or category, or to apply category level pricing rules to the category or product.

primary partition (n)~ A type of partition created on basic disks that can host an operating system and functions as though it were a physically separate disk.

primary protection (n)~ A type of protection in which data on the protected server is

directly protected by a primary DPM Server.

primary region (n)~ An Azure region where the active geo-replication primary database resides.

primary replica (n)~ An availability replica that makes the primary databases of an availability group available for read-write connections from clients and sends transaction log records for each primary database to every secondary replica.

primary server (n)~ In a log shipping configuration, the server instance where the primary database resides.

primary site (n)~ An SMS/Configuration Manager site that has access to a SQL Server database.

primary storage device (n)~ A storage device that holds data in temporary memory such as RAM.

primary table (n)~ The one' side of two related tables in a one-to-many relationship. A primary table should have a primary key and each record should be unique.'

primary token (n)~ An access token assigned to a process to represent the default information for that process. It is used in security operations by a thread working on behalf of the process itself rather than on behalf of a client.

primary unit (n)~ The measurement used to define the most commonly sold unit of a product.

primary user (n)~ The main user of a device. (A device can have more than one primary user.)

primary virtual machine (n)~ A virtual machine hosted on the primary server and replicated to the machines on the Replica server.

primary window (n)~ The window in which the main interaction with an object takes place.

primary zone (n)~ A copy of the zone that is administered locally.

Primetime (PN)~ Block of broadcast programming taking place during the middle of the evening for television programming.

primitive (n)~ In computer graphics, a shape, such as a line, circle, curve, or polygon, that can be drawn, stored, and manipulated as a discrete entity by a graphics program. A primitive is one of the elements from which a large graphic design is created.

primordial pool (n)~ A storage pool that exposes physical disks that are currently available for inclusion in a storage pool on a particular storage subsystem.

Primus (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 108.

principal (n)~ In Windows-based computers, an account (such as a user, security group, device, or computer) that can be granted or denied access to resources.

principal database (n)~ In database mirroring, a read-write database whose transaction log is continuously sent to the mirror server, which restores the log to the mirror database.

principal server (n)~ In database mirroring, the partner whose database is currently the principal database.

principle (n)~ Basic beliefs and assumptions that define a methodology or process.

Principles for the data access and the testability of digital documents (n)~ A German

law that requires tax authorities to be capable of digitally checking data from electronic bookkeeping systems.

print (v)~ In computing, to send information to a printer.

Print and Document Services (PN)~ A server role that enables you to centralize print server and network printer management tasks. With this role, you can also receive scanned documents from network scanners and route the documents to a shared network resource, Windows SharePoint Services site, or e-mail addresses.

print area (n)~ One or more ranges of cells that you designate to print when you don't want to print the entire worksheet. If a worksheet includes a print area, only the print area is printed.

Print contract (n)~ A contract that allows developers to leverage the Print button on the Connect Charm to invoke the printing. In response to the button click, the developer can invoke the Windows Print experience. Or the developer can provide a custom Print experience.

print device (n)~ A device that puts text or images on paper or other print media.

print file (n)~ A file that can be sent directly from a computer to a printer port without being opened first. PhotoDraw saves print files with a .prn file extension.

print job (n)~ All of the information and the command that the printer needs from the computer to print. For example, the information about the layout, font, and spacing of a file is contained in the print job.

print layout view (n)~ A view of a document as it will appear on the printed page.

print preview (n)~ A view of a document as it will appear when you print it.

print processor (n)~ The component that, working in conjunction with the printer driver, receives and alters print jobs, as necessary, according to their data type to ensure that the jobs print correctly.

print quality (n)~ The quality of your printed picture. Microsoft PhotoDraw offers three print qualities - Good, Better, and Best.

print queue (n)~ The list of documents that are waiting to be printed.

Print Schema (n)~ A schema that provides an Extensible Markup Language (XML)-based format for expressing and organizing a large set of properties that describe either a job format or PrintCapabilities in a hierarchically structured manner. It includes two components: the Print Schema Keywords and the Print Schema Framework.

Print Schema Framework (n)~ A public schema that defines a hierarchically structured collection of XML element types, and specifies how the element types can be used together.

Print Schema Keywords (n)~ The Print Schema Keywords document is a public schema that defines a set of element instances that can be used to describe device attributes and print job formatting.

PRINT SCREEN key (n)~ A key on IBM PC and compatible keyboards that normally causes the computer to send a character-based -€œpicture-€? of the screen contents to the printer.

print server (n)~ A computer that is dedicated to managing the printers on a network. The print server can be any computer on the network.

print spooler (n)~ Software that accepts a document sent to a printer and then stores it on

disk or in memory until the printer is ready for it.

Print Spooler resource (n)~ Printer queues providing access to a network printer connected to the network by an IP address rather than by an individual name. Print spoolers are supported as cluster resources by a Resource DLL.

print style (n)~ A combination of paper and page settings that determines the way items print. Outlook provides built-in print styles, and you can create your own.

print titles (n)~ Row or column labels that are printed at the top of or on the left side of every page on a printed worksheet.

Print to PDF (v)~ An option that allows a participant to print a PDF version of a presentation from a meeting.

PrintCapabilities document (n)~ A document in Print Schema format that provides the settings for the printer configuration to the print subsystem and application.

printer (n)~ A device that puts text or images on paper or other print media.

Printer Control Language (n)~ The page-description language developed by Hewlett Packard for their laser and inkjet printers. Because of the widespread use of laser printers, this command language has become a standard in many printers.

printer driver (n)~ The device that communicates between your software program and your printer.

printer font (n)~ A font residing in or intended for a printer. Font cartridges are available for laser printers that allow your printer print additional fonts. Printer fonts are distinct from screen fonts, which are designed for displaying text on a computer

Printer Job Language (n)~ The printer command language developed by Hewlett Packard that provides printer control at the print-job level. Using PJL commands, you can change default printer settings such as number of copies to print. PJL commands also permit switching printer languages between print jobs without action by the user. If bi-directional communication is supported, a PJL-compatible printer can send information such as printer model and job status to the print server.

Printer Migration (n)~ A tool that allows moving (copying) print queues, settings, drivers, forms and spooler settings from one machine to another machine that has the same or a newer version of Windows.

printer permissions (n)~ Permissions that specify the type of access that a user or group has to a printer. The printer permissions are Print, Manage Printers, and Manage Documents.

Printer window (n)~ A window that shows information about any pending print jobs for the printer. For each printer you have installed or to which you are connected, you can view information such as how many documents are waiting to be printed, who owns them, and how large they are. Also called the queue view.

Printers and Faxes (n)~ The folder in Control Panel that contains the Add Printer Wizard and icons for all the printers installed on your computer.

printer's marks (n)~ marks printed outside the printable area on each page of your publication to help you or your commercial printing service trim, align, and control color in your publication.

Printing and Imaging Devices (n)~ A feature in Windows that allows users to access and manage printers, multi-function printers, digital cameras and scanners.

printing pool (n)~ Two or more identical printers that are connected to one print server and act as a single printer. In this case, when you print a document, the print job will be sent to the first available printer in the pool.

PrintTicket document (n)~ A document in Print Schema format that contains the settings for a print job prepared for a specific device configuration. The information is provided to the print subsystem and to the device.

prior period adjustment (n)~ An adjustment made in the current fiscal period that corrects an error in accounting for an economic event that occurred in a prior fiscal period.

prioritize (v)~ To give a unique cardinal position to each entry, as in stack rank.

priority boost (n)~ An advanced option that specifies whether Microsoft-® SQL Server-„¢ should run at a higher Microsoft Windows NT-® scheduling priority than other processes on the same computer.

Privacy (PN)~ A UI element that links to the Microsoft Online Privacy Statement.

Privacy (PN)~ The link to the Microsoft privacy statement.

privacy level (n)~ A setting that specifies the category of users who are allowed to view the personal information of other users, such as user profile properties, colleagues, or memberships.

privacy policy (n)~ An organization's requirements for complying with privacy regulations and directives.

Privacy Policy (n)~ An organization's requirements for complying with privacy regulations and directives.

privacy relationship (n)~ A setting that determines how much information a contact can view about you.

privacy settings (n)~ Settings that allow the administrator to control the collection, use, and distribution of personal data.

private (adj)~ Pertaining to an item that is only visible to the owner.

Private (PN)~ A status message displayed when the caller ID of an incoming call is blocked.

private (PN)~ A button that can be tapped during a conference call to have a private conversation with one person on the call.

private area (n)~ A secure space on a Web site in which administrators can manage restricted site functions.

private assembly (n)~ An assembly that is available only to clients in the same directory structure as the assembly.

Private Branch Exchange (PN)~ A private telephone network in an organization. Individual telephone numbers or extension numbers are supported, and calls are automatically routed to them. Users can call each other using extensions. They can also place calls to outside numbers.

Private Character Editor (n)~ An editor that allows the user to create and manage private characters.

private cloud (n)~ A cloud infrastructure that is dedicated to an organization (not shared with other organizations). A private cloud can be managed by the organization or hosted by a third-party service provider, in which case it is referred to as a hosted private cloud. A private cloud can be located on-premises or off-premises.

private cloud (n)~ The cloud created within and exposed by VMM systems running within an App Controller installation's trust boundary. There can be multiple private clouds.

private cloud (n)~ A grouping of virtual machine hosts and networking, storage, and library resources that is assigned to users to deploy services.

private cloud (n)~ The cloud infrastructure provisioned for exclusive use by a single organization comprising multiple consumers (e.g., business units). It may be owned, managed, and operated by the organization, a third party, or some combination of them, and it may exist on or off premises.

Private Cloud Computing ~ a form of cloud computing in which service access is limited, and/or the customer has some control/ownership of the service implementation.

Private Communication Technology (n)~ A proposed protocol standard that supports authentication and encryption to secure privacy in Internet communications. PCT is similar to the Secure Sockets Layer (SSL) protocol.

private FQDN (n)~ The FQDN of the private edge of an edge server.

private group (n)~ A type of Yammer group where messages and posted content are only visible to members of that group.

private IP address (n)~ An IP address that is assigned for the internal network of an organization.

private key (n)~ The secret half of a cryptographic key pair that is used with a public key algorithm. Private keys are typically used to decrypt a symmetric session key, digitally sign data, or decrypt data that has been encrypted with the corresponding public key.

private line (n)~ An additional phone number with a distinct ring tone that cannot be forwarded. A private line allows a person who delegates calls to have a direct, confidential line.

private message (n)~ A message sent through a social network between two users, where only the involved users are allowed to read the message.

private network (n)~ A network within an organization that uses Internet technologies and protocols, but is available only to certain people, such as employees of a company.

private note (n)~ A note sent in Yammer from one member of a private group to another.

private procedure (n)~ A Sub or Function procedure that has been declared as private by using the Private keyword in a Declare statement. Private procedures are available for use only by other procedures within the same module.

private view state (n)~ State information that is written as a hidden field, such as the form that is currently active or the pagination information for a form.

private Web Part (n)~ A Web Part added to a Web Part Page by a user who is working on the page in personal view.

privilege (n)~ A user's right to perform a specific task, usually one that affects an entire computer system rather than a particular object. Privileges are assigned by administrators to individual users or groups of users as part of the security settings for the computer.

privilege (n)~ One or more permissions a user requires to perform a task.

privilege attribute certificate (n)~ An item provided and signed by the DCE security server that is both a proof of identity and a list of group memberships.

privilege isolation (n)~ A window manager subsystem that blocks applications at a lower

UI privilege level from sending messages to or hooking threads belonging to processes with a higher UI privilege level.

Privileged Access Management (n)~ New feature enabling temporary admin capabilities to administrators

privileged app (n)~ A Windows Store device app that's explicitly declared in the Privileged Application fields of Microsoft digitally signed device metadata. Only privileged apps have access to that device.

Privileged Identity Management (PN)~ A technology, which is designed to manage privileged identities and their access rights.

privileged role (n)~ A set of access permission to sensitive resources, such as AD DS management console, a sensitive SP site or sensitive file-share.

privileged task (n)~ An operation that requires more resources than are allowed by a threshold, based on the number of items or amount of information that is processed during the operation.

PRO (n)~ A feature that supports workload- and application-aware resource optimization within a virtualized environment. Based on performance and health data provided by PRO-enabled management packs, PRO can automatically or manually implement recommendations or Tips to minimize downtime and accelerate time to resolution.

pro forma invoice (n)~ A business document that is a view of a customer invoice or vendor invoice that documents a payment request but is not an offer or a demand for payment.

PRO pack (n)~ A type of System Center pack that provides classes, monitors, alerts, and tasks for Performance and Resource Optimization (PRO) in Virtual Machine Manager.

PRO tip (n)~ A recommendation provided by a PRO-enabled management pack that can be implemented automatically or manually to optimize performance or reduce downtime for workloads running in virtualized environments.

proactive caching (n)~ A system that manages data obsolescence in a cube by which objects in MOLAP storage are automatically updated and processed in cache while queries are redirected to ROLAP storage.

Proactive Scanner (PN)~ An automated proactive scan that triggers when NTFS detects a corruption. The scan is equivalent to the scan phase of chkdsk and finds and logs all corruptions to an internal file. This scan runs during maintenance hours, can be triggered from the Explorer, or manually run from a command line. When this scan is running in the background, some NTFS operations may be blocked.

probability (n)~ The likelihood of something happening. For example, sale being made.

probability and impact matrix (n)~ A common way to determine whether a risk is considered low, moderate, or high by combining the two dimensions of a risk, its probability of occurrence, and its impact on objectives if it occurs.

Problem (n)~ An option available in the Case Type drop-down list. A customer service representative (CSR) can select this option for a customer who is reporting an issue with a product or service.

problem (n)~ A grouping that means that all events have the identical call stack. By consolidating events by problem, IT personnel can prioritize their efforts to correct an issue based on the number of events in the group.

problem management (n)~ The process by which the root cause of one or more incidents is identified and by which a workaround or a permanent fix is found.

problem record (n)~ A record that tracks the identification, investigation, and resolution of a root cause.

Problem Steps Recorder (PN)~ A utility that allows recording step-by-step user actions in Windows and storing them in an XML file to help developers reproduce and investigate applications problems easily. It also enables end users to share application problems (e.g. with Technical Support) with comprehensive descriptions.

procedural surface (n)~ A surface with pixel RGB color and alpha values defined dynamically. Only the procedure used to compute the surface is stored in memory.

procedure (n)~ A sequence of declarations and statements that are executed as a unit.

procedure (n)~ A repeatable sequence of steps that are followed in a specific order to meet the requirements of a task.

procedure (n)~ A series of steps performed on a patient with the goal of treating a disease or making a diagnosis.

procedure call (n)~ In programming, an instruction that causes a procedure to be executed. A procedure call can be located in another procedure or in the main body of the program.

procedure-level variable (n)~ A variable that is declared within a procedure. Procedure-level variables are always private to the procedure in which they are declared.

process (n)~ The virtual address space and the control information necessary for the execution of a program.

process (n)~ A structured set of activities designed to yield a specified result or output.

process (n)~ An operating system object that consists of an executable program, a set of virtual memory addresses, and one or more threads. When a program runs, a process is created.

Process (PN)~ A SmartArt graphic layout type that includes layouts designed to show steps in a process or timeline.

process (n)~ A functional work structure that an organization is responsible for designing, controlling, and improving. A process comprises a coordinated set of activities in which one or more participants consume, produce, and use economic resources to achieve one or more organizational goals.

process access token (n)~ A data structure that contains authentication and authorization information for a user. Windows creates the access token when the user logs on and the user's identity is confirmed. The access token contains the user's security ID (SID), the list of groups that the user is a member of, the list of privileges held by that user. Each process or thread started for the user inherits a copy of the access token. In some cases a user may have more than one access token, with different levels of authority.

process accounting (n)~ A feature of Internet Information Services (IIS) that administrators can use to monitor and log resource consumption of Common Gateway Interface (CGI) scripts and out-of-process applications.

Process Arrows (PN)~ A SmartArt graphic layout used to show information illustrating a process or workflow. Level 1 text appears in the circular shapes and Level 2 text appears in the arrow shapes. Works best for minimal text and to emphasize movement or direction.

process batch (n)~ The quantity of one or more items that is produced or that can be produced.

process color (n)~ One of the four transparent inks (cyan, magenta, yellow, and black) that are used in commercial printing to produce color photographic images and a wide range of solid colors.

process diagram (n)~ A diagram that shows the relationship of items in a list. It is primarily used when the items are sequential in nature.

process event (n)~ One or more recommendation work streams that are bundled and executed simultaneously and time-constrained, and which use compensation information for a group of employees to create date-specific employee compensation records. A process event can be as simple as an anniversary-based merit increase for one employee, or as complex as an annual enterprise-wide combined compensation process.

process identity (n)~ An operating system term that denotes the account that a process runs under.

Process Lifetime Management (PN)~ An operating system process that closes apps that are not foreground apps to conserve system resources, enhance battery life, and remove the burden of app management, task management, or both, from the user. When the user switches back or re-launches the app, the app starts right where it left off.

Process List (PN)~ A SmartArt graphic layout used to show multiple groups of information or steps and sub-steps in a task, process, or workflow. Level 1 text corresponds to the top horizontal shapes, and Level 2 text corresponds to vertical sub-steps under each related top-level shape.

process logging (n)~ A debugging technique that monitors the processes and threads on a target device.

process management pack (n)~ A type of management pack that implements all or part of a service management process.

process scheduling (n)~ The assignment of business intelligence tasks for users, roles, and PerformancePoint Planning Server.

processing instruction (n)~ An XML structural construct. A mechanism for embedding information in a file intended for proprietary applications rather than the XML parser or browser. The XML parser passes the instructions to the application. A processing instruction is a string of text included almost anywhere in an XML document's character data between ? and ? marks. It begins with the name of the application for which the PI is intended, followed by the data for the instruction. An example is the XML declaration that begins every valid XML file: ?xml version=1.0' standalone='yes' ?'

processing instructions (n)~ Information stored in the prologue of an XML document. This information is passed through the XML parser to any application that uses the XML document.

processor (n)~ The computational and control unit of a computer. The CPU is the device that interprets and executes instructions. Mainframes and early minicomputers contained circuit boards full of integrated circuits that implemented the CPU. Single-chip central processing units, called microprocessors, made possible personal computers and workstations.

Processor ~ The nerve centre of the computer : everything flows through it. Also called

the- CPU. The best known- is Intel's- Pentium- series. The most important single specification on any PC is the speed of its processor, usually measured in megahertz (MHz), or latterly gigahertz (GHz).

processor control block (n)~ An extension of the processor control region (PCR).

procure (v)~ To obtain the work and material resources required to complete a project.

procurement catalog (n)~ A listing of product offerings that are grouped by procurement category. A procurement catalog is used to request products for internal use by an organization.

procurement category hierarchy (n)~ A category hierarchy that orders categories that are created to group products that have similar procurement management and accounting characteristics.

procurement site (n)~ A site that employees can use to define items and services that they require for daily work activities.

Producer (PN)~ An add-in for PowerPoint used to create presentations that include audio, video, slides, and images.

product (n)~ An item, service, or right that is output from an economic activity.

Product (n)~ A good or service that your organization provides.

Product and Service Items (PN)~ A dialog box that allows a user to add a new product to an Opportunity or the Product and Service Items list.

Product and Service Items list (n)~ A tabulation of goods and services that one purchases or sells, or offers for purchase or sale.

product attribute (n)~ A representation of a product property.

product backlog (n)~ The product backlog (or backlog') is the requirements for a system

product backlog item (n)~ In Scrum, a product backlog item (PBI'

product catalog (n)~ A compilation of all products that are available for sale.

Product Catalog (PN)~ A site template that is designed to manage product catalogs for publishing purposes.

Product Catalog (n)~ The collection of Products that your organization offers, both currently and historically.

product catalog mapping (n)~ A link between a product catalog and an inventory catalog that determines which inventory catalog is used to hold SKU data for the product catalog.

Product Catalog resource (n)~ A Commerce Server resource with site-level properties, managed through Commerce Server Manager. Use the Product Catalog resource to configure the connection string to the database containing catalog data.

product component (n)~ A part of a product.

product connector (n)~ A software component that is used to synchronize data between Operations Manager and other management systems.

Product Development Planning (n)~ A template that outlines a strategic approach for product development. By understanding your business position in the marketplace, establishing product infrastructure, and a knowledge of your targets and competitors, this template establishes a framework to begin product development.

product dimension (n)~ The size, color, or configuration product attributes that are used for dimension-based configuration.

Product Evaluation Post Launch (n)~ A template that will walk you through key areas

of evaluating a product's performance after it has been placed in the marketplace.

product family (n)~ A group of functionally equivalent products or items that share similar features and that are grouped for planning purposes.

product family (n)~ A unique grouping of items, services, or rights that either participates in the same production or delivery activities or that are offered to the same market segments. In Microsoft Dynamics AX, the grouping is represented by using a forecast allocation key.

product group (n)~ A collection of products used for presentation, sales campaigns, or e-business.

product ID (n)~ A unique manually created alpha-numeric label that is used to identify a product.

product identifier (n)~ A required property that uniquely identifies products within a catalog, such as a stock-keeping unit (SKU). A product identifier cannot be removed from the product definition.

product item (n)~ An item that is a type of product.

product key (n)~ A sequence of 25 letters and numbers. To activate some software, you must enter a product key during the activation process.

product key card (n)~ A physical card on which a product key is printed.

product knowledge (n)~ Content, embedded in rules and monitors, that contains information from the management pack author about the causes of an alert and suggestions on how to fix the issue that caused an alert to be raised.

product line (n)~ A set of related products grouped together due to technical or marketing considerations.

product master (n)~ A standard or functional product representation that is the basis for configuring product variants.

product model (n)~ A specification of how items are to be customized. A product model can be used for sales orders, purchase orders, or production orders.

product property (n)~ One of the properties that forms a product definition.

product receipt (n)~ A source document that documents the receipt of products ordered, the receipt of products returned, or the receipt of products received on consignment.

product relationship (n)~ A relationship that associates one product in a catalog with another product or category. For example, printers may be related to printer ribbons or ink cartridges, but these products would be in different categories. A product relationship has a name, indicating the type of relationship (for example, Accessory')

product sequencing (n)~ The practice of classifying and managing characteristics of items so that products with similar characteristics can be scheduled to be produced together.

product transition (n)~ A move from one license, product, or license model to another. Some examples of transitions are: a step-up to a higher edition; a move from on-premises to the cloud, or cloud to on-premises; or a move to or from a license model that is a hybrid of an online service and an on-premises product.

product variant (n)~ A specific item that is grouped with related variants that together form a product. Variants usually vary from each other in one or more properties. For example, a medium-sized, green shirt with a stock-keeping unit (SKU) of 14678 is one

product variant of the Shirt product; together size, color, and SKU form one variant. A product variant always includes a unique identifier, such as an SKU, and a price. Each product variant is based on the same product definition.

product variant (n)~ A configuration of a product master.

product variant property (n)~ A property that varies among product variants. For example the product variant medium-sized green shirt has two product variant properties: size and color.

product vulnerability (n)~ A set of conditions that violates an implied or explicit security policy. A product vulnerability is normally addressed by a Microsoft security bulletin or a service pack.

production (n)~ The process of creating usable goods from raw materials and/or parts.

production environment (n)~ A deployment area in which a Microsoft Azure cloud service is released live to serve external end-users or clients.

production flow (n)~ A production process designed using Lean principles.

production flow model (n)~ A representation of the production capacity provided by a group of work cells in a production flow process.

production instance (n)~ A unique occurrence of an application, such as Microsoft Dynamics CRM or Social Engagement, for online customers that is to be used for production purposes.

production lead time (n)~ The lead time required to produce an item, starting from the time the order is released to production until the item is moved to inventory.

production line (n)~ The part of a production order that specifies detailed information about the components included in the order.

production order (n)~ A source document that documents the requirements for producing items to meet a demand.

production order line (n)~ The part of a production order that specifies detailed information about the components included in the order.

production order line (n)~ The part of a production order that specifies the parent item to be produced.

production planning period template (n)~ A user-defined timetable that is used- to structure and display- existing product requirements.

production schedule (n)~ A schedule to produce a specific item and item quantity at a specific time and by specific human and operational resources.

production signal (n)~ A documented notification of a resource flow event that triggers a production or transfer activity.

production variance (n)~ The difference between the cost price and the actual production price. The production variance is determined when the production order is calculated.

production Web server (n)~ A Web server that hosts a live web site. A production Web server can be browsed by an Internet or intranet audience.

Productivity (PN)~ An app category that augments or enhances your ability to get work done.

PRO-enabled management pack (n)~ A specially designed type of management pack in System Center Operations Manager that associates specific alerts with resolutions that can be implemented automatically in System Center Essentials.

Professional Direct (PN)~ The Microsoft Azure support plan for all issues covered by the Standard Support plan, a response time of under 1 hour and additional services.

Professional Information (n)~ A section label on the Contact form on the Details tab.

professional service (n)~ A product support service and/or Microsoft consulting service provided to Customer under an agreement. Professional Services do not include Online Services.

Professional user (n)~ A unit of measure for users of the Visual Studio Online Professional service offering.

professional-looking (adj)~ Pertaining to something that looks as though it has been created by a professional. (Even though it may, in fact, have been done by an amateur.)

profile (v)~ To analyze a program to determine how much time is spent in different parts of the program during execution.

profile (n)~ A computer-based record that contains software settings and identification information.

profile (n)~ A group of settings that match content type and bit rate with appropriate audio and video codecs.

profile (n)~ A set of characteristics that define any business-related item, such as a customer, a company, or a business process. Each profile is an individual instance of a profile definition.

profile (n)~ The descriptive information about a user that is shown to other users. This editable information is separate from the registration information they provide to establish their Windows Live account. This separation allows users to disclose or conceal personal information as they choose.

profile (n)~ In Expression Encoder, a group of settings that adjust the quality of the encoded video.

Profile (PN)~ The link to the personal page where users can store information (such as personal interests) and links (such as to friends and photos).

profile (n)~ In Windows PowerShell, a script that runs when Windows PowerShell or Windows PowerShell Integrated Scripting Environment (ISE) starts. The profile script sets up and customizes the Windows PowerShell environment and can contain cmdlets, scripts, functions, or any valid Windows PowerShell command.

Profile (PN)~ The portion of a user's Yammer account that contains descriptive information about him/her that is visible to other users.

profile album (n)~ An entity in Microsoft Dynamics CRM where the user's profile picture is stored as an attachment.

profile definition (n)~ The properties that are available in a particular profile type. Each profile is associated with a profile definition. For example, the New User profile definition could contain the following properties: name, age, gender, address, and so forth.

Profile Editor (n)~ A tool provided with Windows Media Encoder that creates and edits the encoding profiles.

profile group (n)~ A grouping of partner profiles with which you can associate an agreement.

profile location (n)~ The geographical location data, defining the latitude/longitude (or location) that users define in their profiles.

Profile Manager (n)~ A component of Windows Media Encoder that creates and edits the encoding profiles needed to identify the appropriate codec, the multimedia input streams, and the number and bit rate of the encoded output streams.

profile page (n)~ A page that displays the data for an item of an external content type.

profile path (n)~ The location of a user's profile on the local drive, for example C:\Users\jason. The user profile could be a local profile, which is stored on a single computer, or a roaming user profile, which is synchronized with a file server so that multiple PCs can use the same profile settings.

profile property (n)~ A characteristic that specifies which profile data is to be collected when a user visits your Web site.

profile property attribute (n)~ A characteristic that describes a profile property. Attributes provide information about the profile property. Profile property attributes include information such as the data type of the profile property, for example, number, text, and decimal, whether the property is single-valued (for example, only one First Name is allowed) or multi-valued, and whether the data is imported into the Data Warehouse.

profile provider (n)~ A data provider that specifies profile properties for each user and that is managed automatically by ASP.NET.

profile schema (n)~ A description of the content and structure of profiles.

profile template (n)~ The core of all Certificate Lifecycle Manager (CLM) management activities. The profile template provides a single administrative unit that includes all information necessary to manage the multiple certificates that might be required by a user community throughout the certificate's lifecycle. A profile template also includes information regarding the final location of those certificates, which can be software-based (that is, stored on the local computer) or hardware-based (stored on a smart card). A profile template cannot include both software-based and smart card-based certificates.

profile ticket (n)~ A ticket created by Commerce Server for anonymous (guest) users.

profile-guided optimization (n)~ A feature that allows you to optimize an application based on most-likely used scenarios.

profiler (n)~ A diagnostic tool for analyzing the run-time behavior of programs.

Profiles Schema Manager (n)~ A user profiling component of Commerce Server 2006 and BizTalk Server 2006. This component lets you manage profile data by creating data sources profile definitions and site terms. You can export the profile data to a Data Warehouse for analysis and/or expose the data to other applications through BizTalk Server 2006.

ProfileService (n)~ A service that provides run-time access to a profile object, which is a specific instantiation of a profile schema.

profiling (n)~ The collection of detailed performance data, such as memory, stack frame, and CPU utilization, during application execution. Analysis of the resulting data often leads to code optimizations that substantially improve application run-time behavior.

profit (n)~ The difference between revenue obtained from sales and expense incurred in product delivery activities.

profit and loss account (n)~ A revenue or expense account whose balance will be transferred to a retained earnings account at the end of a fiscal year. Balances in profit and loss accounts determine the net income or net loss for the year.

profit and loss statement (n)~ A report that summarizes a company's costs, expenses, and revenues for a specific accounting period.

profit and loss transaction (n)~ A posted ledger transaction that is associated with a profit and loss account, revenue account, or cost account.

profit chart (n)~ A diagram that displays the theoretical increase in profit that is associated with using various data models.

profit margin (n)~ A measure of profitability that is calculated by using the formula: profit margin = net income before tax and interest / revenue. It can be expressed as a percentage or a number.

profit sharing (n)~ A broad-based variable compensation plan that awards employees based on company profits and distributes some portion of company profits to employees. Profit sharing is a means to motivate employees to focus on profits.

ProgID (n)~ An identifier in the form OLEServerName.ObjectName (for example, Excel.Sheet or PowerPoint.Slide) that's used by the Windows registry to uniquely identify an object.

program (n)~ A set of instructions that a computer or device uses to perform a specific task, such as word processing, accounting, or data management.

program (n)~ A collective grouping of projects, usually including a common set of goals, plans and measurement of success, that is managed and delivered in a coordinated way.

Program ~ A program is essentially a list of instructions that tell a computer how to do something. Any- word processor,- spreadsheet,database, game or any other tool you may use on a computer is a program (often a group of programs). Also referred to assoftware.

program anniversary date (n)~ The calendar date which marks the enrollment of a partner into the Microsoft Partner Program, including payment of any applicable membership fees.

program code (n)~ A five-digit code that identifies which of the solution provider's program offerings the customer's computer belongs to.

Program Compatibility troubleshooter (n)~ An easy-to-use troubleshooter that helps find and fix program compatibility issues.

Program Evaluation and Review Technique chart (n)~ A project optimization tool that enables scheduling and tracking of tasks, goal setting, and timelines.

program event (n)~ An action or occurrence to which a program might respond. Examples include state changes, data transfers, key presses, and mouse movements.

Program Guide (n)~ An onscreen listing of upcoming programs and information available through media services such as cable television and satellite television.

program information file (n)~ A file that provides information to Windows about how best to run MS-DOS-based programs. When you start an MS-DOS-based program, Windows looks for a program information file to use with it.program information files contain such items as the name of the file, a start-up directory, and multitasking options.

Program Launcher (n)~ A program that lets users easily find and open programs, accessories, control panel settings, and Web sites using their fingers on a touch-screen Tablet PC.

program restrictions (n)~ Settings that limit customer use of, or access to, specific program attributes and features.

program stream format (n)~ A file format that supports the multiplexing of audio, video, and data. Program streams are exclusive to MPEG-1 and MPEG-2-compressed files and use variable-sized packets that have a common time base. Program streams are designed to be played back from reliable media, such as hard drives and DVDs.

Program, Evaluation and Review Technique analysis (n)~ A process by which you evaluate a probable outcome based on three scenarios: best-case, expected-case, and worst-case.

programmable interrupt controller (n)~ A device that functions as an overall manager in an interrupt driven system.

programmable logic device (n)~ A logic chip that is programmed by the customer, not the manufacturer. Like a gate array, a PLD is a collection of logic gates. Unlike a gate array, a PLD does not need to be programmed as part of the manufacturing process.

programmatic identifier (n)~ An identifier in the form OLEServerName.ObjectName (for example, Excel.Sheet or PowerPoint.Slide) that's used by the Windows registry to uniquely identify an object.

programmatic interface (n)~ A user interface dependent on user commands or on a special programming language, as contrasted with a graphical user interface. UNIX and MS-DOS have programmatic interfaces; the Apple Macintosh and Microsoft Windows have graphical user interfaces.

programming element attribute (n)~ A descriptive declaration that can be applied to programming elements such as types, fields, methods, and properties.

programming event (n)~ The occurrence of a programming action in a software system.

programming language (n)~ An artificial language that specifies instructions to be executed on a computer. The term covers a wide spectrum, from binary-coded machine language to high-level languages.

progress bar (n)~ A progress indicator that displays the percentage of completion of a particular process as a graphical bar.

progress billing (n)~ A method of requesting payment when work progress objectives or rate targets are reached.

progress indicator (n)~ An indicator that provides the user with information about the state of a process.

progress line (n)~ A visual representation of the progress of your project, displayed in the Gantt Chart view. Progress lines connect in-progress tasks, creating a graph on the Gantt Chart indicating work that is behind and peaks indicating work that is ahead.

Progress UI (PN)~ A dialog box that shows the progress of an operation.

progressive disclosure (n)~ A technique for hiding the complexity of an interface by presenting the user with the primary or common options or choices at the topmost level, and then revealing more advanced or complex options through another means, such as explicit user action or navigation.

Progressive JPEG (n)~ An enhancement to the JPEG graphics file format that gradually displays a photo-realistic picture in a Web browser, showing increasingly detailed versions of the picture until the entire file has finished downloading.

Progressive Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files.

Winamp genre ID # 92.

progressive scan (n)~ The method of displaying a video image one full frame at a time by scanning each line of an image in sequential order. Videos displayed using progressive scan contain fewer motion artifacts and are generally smoother and more stable than interlaced scan display. Progressive scan is a feature of computer monitors, many DVDs, and most HDTVs.

progressive video (n)~ A method of displaying video in which all the scan lines of a frame are displayed in order in a single pass.

project (n)~ A set of source files and related metadata, such as component references and build instructions, that helps you organize and perform common tasks on the items that you are developing. Projects are contained within a solution.

project (n)~ A file that keeps track of all programs, forms, menus, libraries, reports, labels, queries, and other types of files that are needed to create an application.

Project (n)~ A holding place for a group of linked documents or Works tasks / templates related to a single user activity.

project (n)~ A temporary endeavor undertaken to meet or exceed stakeholder expectations.

project (n)~ A program of work.

project (n)~ In Windows Assessment Services, the group of computers and images that comprise a subset of all the computers and images that have been added to an inventory. A project provides a contextualized, manageable view of computers within the pool of assets, and pairs each computer with an image and an answer file. A project does not contain assessments, but the project shows all the jobs that correspond to the project.

project (v)~ To show or share screen content in a display other than the primary display.

project administrator (n)~ An administrator allowed to make changes to work item tracking from the UI or the SDK.

Project Application Service (PN)~ A service that needs to be started on servers that are meant to be Project Server application servers.

project assumption (n)~ A factor that, for planning purposes, is considered to be true, real, or certain. Assumptions generally involve a degree of risk.

project budget revision (n)~ A change to a project budget that affects the current and remaining available budget funds.

Project Calculation Service (PN)~ A scheduling engine for Project Server that enables automated project updates and scheduling that is similar to that in Project Professional.

project calendar (n)~ The base calendar used by a project.

Project Center (PN)~ A location that allows the user to create a project where the user can manage, share and archive information that has been added for various projects.

project constraint (n)~ A factor that will limit the project management team's options. For example, a predefined budget is a constraint that may limit the team's scope, staffing, and schedule options.

Project Designer (n)~ A visual representation of the services ports and bindings that make up a project. Users can edit the visual items in the Project Designer by adding and removing services, and creating and removing bindings between compatible ports on the services in the designer.

project file (n)~ The file that contains information about the files that have been imported into or captured in the current project, and how files or clips have been arranged.

project file (n)~ A specific file in your project that contains settings for the project. The file name extension ends with proj

project funding rule (n)~ A rule in a project system that controls how project activities are funded by one or more funding sources based on project criteria and other conditions.

Project Gallery (PN)~ A visual directory of Microsoft Office files, templates, wizards and projects. It is launched every time you start Office and whenever you click Project Gallery on the File menu.

project group (n)~ A classification of projects that have characteristics in common, primarily for specifying the ledger accounts to use for posting.

project life cycle (n)~ A collection of generally sequential project phases whose name and number are determined by the needs of the organization or organizations involved in the project.

Project Lite (PN)~ The Office 365 add-in that allows users to manage timesheets and tasks, collaborate with other users, and store projects and documents from any device.

Project Lite (Government Pricing) (PN)~ The companion offer for government organizations for Project Online or Project Server, which enables them to manage tasks, collaborate and submit timesheets, and that is hosted in a commercial cloud environment

Project Lite (Government Pricing) Trial (PN)~ The limited-day trial for government organizations for the companion offer for Project Online or Project Server, which enables them to manage tasks, collaborate and submit timesheets, and that is hosted in a commercial cloud environment.

Project management (PN)~ The Business subcategory containing apps to help businesses manage, schedule, and budget projects.

Project Manager (PN)~ A business application used to organize and track projects.

project my screen (PN)~ A feature that allows the user to connect the phone to an external display (a PC monitor, for instance) and then display the phone screen on the external display.

Project My Screen App (PN)~ A Windows desktop application that is required to enable users to project their phone screen to a Windows device using a USB connection.

Project Online (PN)~ The online service for teams, departments and organizations that need a flexible portfolio and project management (PPM) solution.

Project Online (Government Pricing) (PN)~ The offer for government organizations for Project Online that is hosted in the commercial cloud environment.

Project Online (Government Pricing) Trial (PN)~ The limited-day trial for government organizations for the offer for Project Online that is hosted in the commercial cloud environment.

Project Online (Month to Month) (Government Pricing) (PN)~ The offer for the month-to-month subscription for government organizations for Project Online and that is hosted in the commercial cloud environment.

Project Online for Government (PN)~ The offer for government organizations for Project Online that is hosted in the government cloud environment.

Project Online with Project Pro for Office 365 (PN)~ The online service for teams,

departments and organizations that need a flexible portfolio and project management (PPM) solution including full project management capabilities on the desktop with Project Pro for Office 365.

Project Online with Project Pro for Office 365 (Government Pricing) Trial (PN)~ The Project offer for the limited-day trial for government organizations, hosted in the commercial cloud environment, that includes an offering of Project Pro for Office 365.

Project Online with Project Pro for Office 365 for Government (PN)~ The Project offer for the online service for government organizations, hosted in the government cloud environment, that includes an offering of Project Pro for Office 365.

Project Palette (n)~ A utility in Microsoft Office for Mac that allows the user to manage contents of projects created in the Project Center in Entourage from other applications (Word, PowerPoint and Excel).

project plan (n)~ A formal, approved document used to guide both project execution and project control.

project portal (n)~ The site used to store and present non-code work products and reports for a team project.

Project Pro for Office 365 (PN)~ The subscription offering of the Microsoft project management software used to plan, manage, and communicate a project schedule and other information among team members, project managers and stakeholders, which supports SharePoint Online task list sync, Lync Online presence and connecting to Project Online.

Project Pro for Office 365 (Month to Month) (Government Pricing) (PN)~ The Project Pro for Office 365 offer for the month-to-month subscription for government organizations that is hosted in the commercial cloud environment.

Project Pro for Office 365 for Government (PN)~ The Project Pro for Office 365 offer for government organizations that is hosted in the government cloud environment.

Project Professional 2016 (PN)~ The year 2016 edition of Project Professional.

project proposal (n)~ A suggested project plan. Proposals provide better high-level analysis, and enable you to apply your business processes to track potential projects.

project query (n)~ A query that is saved for all users of a project.

project quotation (n)~ A source document that documents an offer to supply a quantity of products output from project activities for a specified price and by a specified date in response to a request for quotation in a sales process.

project scope (n)~ The work agreed to and documented between the project sponsor and the project team in order to plan and deliver the solution.

Project Server 2016 (PN)~ The year 2016 edition of Microsoft Project Server.

Project Server Event Manager (PN)~ Part of the Project Server Eventing Service that loads and executes event handlers.

Project Server Eventing Service (PN)~ A mechanism to extend Office Project Server by adding new business logic. Developers can write event handlers that check business rules and cancel an operation through a pre-event (for example, before a project is published), or extend Office Project Server and integrate it with other applications such as workflow by using a post-event (for example, after a project is published).

Project Server Extensions for Team Foundation Server (PN)~ Required software for

Project Server integration with Team Foundation Server. By installing these Team Foundation Server Extensions for Project Server, project managers can use Microsoft Project Server to access up-to-date project status and resource availability across agile and formal software teams who work in Team Foundation. This integration enables data to flow from work items in Team Foundation Server (TFS) to tasks in enterprise project plans in Project Server.

Project Server permission model (n)~ A security model in which permissions are assigned directly in Project Server using global and category permissions.

Project Services (PN)~ A SharePoint application service that enables Project Server functionality.

Project Site (PN)~ A site template that is designed to provide lightweight project management functionality, including Tasks, Calendar, Timeline, and Project Summary.

Project Site Sync (PN)~ A mechanism that synchronizes permissions from Project Server to project sites throughout a site collection.

Project Standard 2016 (PN)~ The year 2016 edition of Project Standard.

project summary task (n)~ A task that summarizes the duration, work, and costs of all tasks in a project. The project summary task appears at the top of the project, its ID number is 0, and it presents the project's timeline from start to finish.

project task (n)~ One of the tasks that comprise the tasks in a business project.

Project Tasks (n)~ A SharePoint Web Part that displays a list of tasks as well as the Gantt chart of the schedule for these tasks.

project triangle (n)~ The interrelationship of time, money, and scope. If you adjust any one of these elements, the other two are affected. For example, if you adjust the project plan to shorten the schedule, you might increase costs and decrease scope.

project type (n)~ A classification that determines how a project is posted to the ledger. Project type identifies an external project as fixed price or time and materials and an internal project as cost, investment, or time.

project vision (n)~ The purpose, driving factors, and background for building the system. The goal of the project vision is to align the team around a central purpose.

Project Watch Folder (n)~ A folder that corresponds to a project created in the Project Center. Items in this folder will automatically be associated with the project.

Project Web App (PN)~ The Web browser-€"based interface of Microsoft Office Project that project team members and stakeholders can use to access and update information stored in Microsoft Project Server, without having to install Microsoft Project on their computers.

Project Web App Site Sync (PN)~ A mechanism that synchronizes permissions from Project Server to the Project Web App site.

projected available inventory (n)~ The inventory quantities that are expected to be available at a future point in time calculated by adding scheduled supply to on-hand inventory and subtracting scheduled demand.

projected depreciation (n)~ The forecasted allocation of the cost of an asset over a period of time for accounting and tax purposes.

projection (n)~ The selection in a query of a subset of the properties or columns in the data source.

Projects (n)~ A button that takes the user to the Projects page.

prolog (n)~ The machine code between the entry point for an assembly language routine and the code for its first executable statement. Prolog sets up the stack frame and preserves certain register values.

promise (n)~ In JavaScript asynchronous programming, the result of a potentially long running and not necessarily complete operation.

promissory note (n)~ A source document that documents an agreement between two parties based on an understanding that one party will commit to paying the other party at a specified time or on demand.

promo code (n)~ A code that can be used to offset the fee for a developer Account.

promote (v)~ To move an item to a higher level within a tree structure.

promote (n)~ In an outline, to change body text to a heading, or to change a heading to a higher level heading - for example, from Heading 6 to Heading 5.

promotion (n)~ The advancement of a product, service, etc. to encourage customers to make a purchase.

promotion code (n)~ The identification string included with a campaign activity that relates an individual piece of marketing collateral with the corresponding campaign.

promotional allowance (n)~ A payment offered to a customer by a vendor in exchange for promoting their products.

promotional balance (n)~ An amount of money credited to an account as the result of a promotional offer.

promotional image (n)~ An image uploaded by the developer that Microsoft can use as a part of promotion via Featured lists and/or marketing campaigns.

prompt (n)~ An audio message played over the telephone to explain valid options to users.

prompt (n)~ Text or symbols indicating that a computer program is waiting for input from the user.

prompt publishing point (n)~ A file share where storage space is available for Unified Messaging custom prompts. Each dial plan has only one prompt publishing point.

prompt tone (n)~ A sound that becomes audible to the user to trigger an action by the user.

prompted query (n)~ A query in which a dialog box prompts a user to supply more information. Prompted queries are constructed with a general expression, not a specific value. The SMS/Configuration Manager Administrator console prompts the user to supply the actual value when the query is run.

proof of concept (n)~ The verification that the selected technology performs according to pre-established criteria in a lab environment designed to simulate the production environment.

proof of purchase (n)~ The original receipt or other document which confirms acquisition of a particular product.

proofing tools (n)~ A collection of tools such as a spelling checker, grammar checker, and thesaurus.

propagate (v)~ To distribute an index from a content index server to one or more Web servers for the purposes of providing search.

propagation (n)~ The process of distributing an index from a content index server to one or more Web servers for the purposes of providing search.

Properties (n)~ A dockable window that displays the properties that are set on the selected object. In most cases, the property values can be edited in the window.

Properties (PN)~ A UI element that users can click to display information about a selected object.

properties page (n)~ A dialog box that displays information about an object in the interface.

Properties panel (n)~ A dockable window that displays the properties that are set on the selected object. In most cases, the property values can be edited in the window.

Properties window (n)~ A window that is used to display properties for objects selected in the two main types of windows available in the Visual Studio integrated development environment (IDE). These two types of windows are Tool windows (such as Solution Explorer, Class View, and Object browser) and Document windows (containing such editors and designers as the forms designer, XML editor, and HTML editor).

property (n)~ Attribute or characteristic of an object that is used to define its state, appearance, or value.

property bag (n)~ A container for storing native SharePoint objects and custom data from first and third parties.

property cache (n)~ For Indexing Service, a file that stores values for document properties.

property definition (n)~ The characteristics or properties that define how a property is used and interpreted. The group of properties that forms a property definition is stored in a dictionary.

Property Editor (n)~ A menu option on the Property Panel that enables the user to specify document properties.

property expression (n)~ An expression that is assigned to a property and updates the value of the property.

property group (n)~ A set of logically related properties that apply to an object.

property handler (n)~ A handler that translates data stored in a file into a structured schema that is recognized by and can be accessed by Windows Explorer, Windows Search, and other applications.

property inspector (n)~ A dynamic properties viewer that displays the properties of the current selection, usually of a particular type of object. Compare property sheet.

Property Manager (PN)~ A part of Managing Visual C++ Projects that enables you to modify project settings that are defined in property sheets.

property mapping (n)~ A mapping between a variable and a property of a package element.

property name (n)~ A string value that is used to identify a named property within a given property set. Note that property names and property IDs are mutually exclusive.

property page (n)~ A grouping of properties presented as a tabbed page of a property sheet.

property promotion (n)~ The propagation of properties via InfoPath forms from the underlying data into named properties in Outlook or SharePoint sites. Promoted properties

are used to group, filter, and sort data, files, and folders.

property promotion (n)~ The mechanism through which specific instance message content is elevated (copied) to the message context container for easier access by a wide variety of BizTalk Server components.

property schema (n)~ A schema that you associate with a BizTalk Server schema, and used to identify the element fields in a document that will be promoted to the message context as property fields.

property set (n)~ A list of properties.

property sheet (n)~ A window used to view or modify the properties of various objects such as tables, queries, fields, forms, reports, data access pages, and controls.

property sheet control (n)~ A standard Windows control used to create property sheet interfaces.

property store (n)~ The table of properties and their values used and maintained by the Search service.

Property Store (PN)~ A Windows feature that facilitates a convenient way to get and set properties. It provides access to properties by using friendly canonical names in a type safe manner without dealing with PROPVARIANT. Developers can easily store basic data in a property store.

property trigger (n)~ The mechanism by which a change in one property triggers either an instant or an animated change in one or more other properties.

property value (n)~ A specific characteristic or parameter that defines a property. For example, property values of a specific Microsoft Word document could include Size = 10,000 bytes, Created = Jan 2, 1999, and Characters = 5,250.

property-based search (n)~ A search method in which you can search a catalog for products that have properties with specific values (such as price > $20 and color = blue).

proposal (n)~ A formal bid for a job or sale of products.

proposal (n)~ A suggested project plan. Proposals provide better high-level analysis, and enable you to apply your business processes to track potential projects.

proposal (n)~ A meeting to review a suggested project plan, or a formal bid for a job or sale of products.

proposed resource (n)~ A resource with a pending resource allocation to a task assignment that has not yet been authorized. This resource assignment does not detract from the availability of the resource to work on other projects.

Proprietary ~ Refers to a technological design or architecture whose configuration is unavailable to the public and may not be duplicated without permission from the designer or architect. Apple's Macintosh? platform is the quintessential example of proprietary architecture.

prospect (v)~ To research potential customers.

prospect (n)~ A potential customer.

prospect (n)~ A participant that has the existing and potential ability to provide a service or probable future economic benefit to a legal entity.

prospect (n)~ A potential customer that a salesperson can contact and either qualify or disqualify as a sales opportunity.

prospecting (adj)~ A type of contact or meeting with a person to gauge his or her level of

interest in your product or offer.

prospective vendor (n)~ A vendor whose abilities or capabilities to supply products to one or more legal entities are under review before being granted an approved vendor status.

protect (v)~ To configure settings to restrict access to or permissions for a file or specific elements within a file.

protect (v)~ To safeguard a resource from attack or loss.

protected administrator (n)~ An account in the Administrators group of Windows- Vista. Users with this account type must consent to perform administrative activities.

protected computer (n)~ A computer that contains data sources that are protection group members.

protected content (n)~ Digital media content that is protected by a license agreement.

protected distribution point (n)~ A distribution point that has boundaries set to prevent clients outside of the boundaries from retrieving packages.

Protected Interoperable File Format (PN)~ A standard multimedia file format for delivery and playback of multimedia content.

protected member (n)~ A data source within a protection group.

protected mode (n)~ A highly privileged mode of operation where program code has direct access to all memory, including the address spaces of all user-mode processes and applications, and to hardware.

protected partition (n)~ A partition on a shared computer whose state is made static by Windows Disk Protection.

protected server (n)~ A server that contains data sources that are protection group members.

Protected View (PN)~ A feature that offers improved security by loading a document in a read-only view, rather than in the full editor, for scenarios that pose a greater potential security risk.

protection (n)~ The process of protecting data from loss or corruption by centrally creating and maintaining replicas and shadow copies of the data. DPM is designed to provide short-term disk-based backup, to support rapid and reliable recovery of data.

Protection (PN)~ A tab within the Exchange Administration Center (EAC) that contains anti-virus/anti spam, and data loss protection.

protection agent (n)~ Software, installed on a server, that tracks changes to protected data and transfers the changes to the DPM server. The protection agent also identifies data on a server that can be protected and is involved in the recovery process.

protection configuration (n)~ The collection of settings that are common to a protection group; specifically, the protection group name, disk allocations, replica creation method, network bandwidth throttling, and on-the-wire compression.

protection group (n)~ A collection of data sources that share the same protection configuration and schedule.

protection group member (n)~ A data source within a protection group.

protection level (n)~ The Microsoft implementation of an integrity level. In particular, a protection level, refers to an integrity label that contains only level information, without the additonal information traditionally contained within integrity level.

protection plan (n)~ The collection of recurring job definitions and schedules associated with a protection group.

protection point (n)~ A record of the computer's system settings and files at a specific moment in time.

protection policy (n)~ The collection of recurring job definitions and schedules associated with a protection group.

protection schedule (n)~ A schedule that specifies whether the replica is synchronized with live data on the on an hourly or daily basis as well as the time when shadow copies of the replica are created.

protection warning (n)~ A status that indicates an Endpoint Protection issue that has occurred on a computer that is managed by Windows Intune.

protested bill of exchange (n)~ A drawn bill of exchange that a customer has refused to pay.

protocol (n)~ A standard set of formats and procedures that enable computers to exchange information.

Protocol ~ Any 'language' used by computers to communicate with each other for particular tasks.

Protocol ~ On the Internet 'protocol' usually refers to a set of rules that define an exact format for communication between systems.

protocol handler (n)~ A handler that gives the Windows Search indexer access to data stores, enabling the indexer to crawl the nodes of a data store and extract relevant information to index.

protocol rollover (n)~ A procedure that enables switching from one protocol to another when a Windows Media server fails to make a connection using a particular protocol.

protocol setting (n)~ A setting that defines how business transactions are to be supported for a specific business-to-business protocol. Each business profile defines the various settings for processing messages (encoding) or transmitting messages (transport) for each of the business-to-business protocols over which the partner can communicate. A protocol setting can be for encoding protocols or for a transport protocol.

prototype (n)~ A preliminary type, form, or instance of a product or product component that serves as a model for later stages or for the final, complete version of the product.

provider (n)~ In a Web Parts connection, a server control that sends data to a consumer control. A provider can be a WebPart control or any type of server control, but must be designed to function as a provider. A provider must have a special callback method marked with a ConnectionProviderAttribute attribute in the source code. This method provides data to consumer controls in the form of an interface instance.

provider (n)~ An entity which provides some services.

provider (n)~ An in-process dynamic link library (DLL) that provides access to a database.

provider (n)~ A software component that allows a replica to synchronize its data with other replicas.

provider (n)~ A company that provides services or content for its customers.

provider API (n)~ A set of COM interfaces that are implemented by UI Automation providers.

provider endpoint (n)~ An endpoint through which an application system exposes or provides a service of some kind.

provider interface (n)~ A set of COM interfaces that are implemented by UI Automation providers.

provider object (n)~ An object that's part of a data provider such as Oracle Provider for SQL Server.

provision (v)~ To configure a user account and enable the account with access to some form of service.

provisional code (n)~ A code in a report definition that determines whether posted, unposted, or both posted and unposted financial data transactions are included in the report.

provisioned credit card processing account (n)~ An account that has been set up and activated for processing credit card payments and which was set up by using Dynamics Live.

Provisioned IO - Page Blob/Disk (GB) (PN)~ The resource for the provisioned input/output processes performed by the locally redundant storage type of Storage service for page blobs and measured in unit seconds.

Provisioned IO - Transaction Units (Page Blob) (PN)~ The resource for the provisioned input/output processes performed by the Storage service for page blobs and measured in unit seconds.

provisioning (n)~ A process in which organizations and public IM service providers use a Microsoft-hosted website to exchange information necessary to establish an IM connection.

provisioning (n)~ The assignment of access privileges and system resources to users, including employees, contingent staff and business partners; frequently automated as part of Identity and Access Management solutions in order to reduce ongoing support costs and enable corporations to demonstrate their compliance with documented security policies.

provisioning (n)~ The act of supplying and configuring computing resources.

provisioning domain (n)~ The domain name of the Outlook Live domain that you are configuring with Outlook Live Directory Sync (OLSync)(previously known as GALSync 2010). When you deploy OLSync, you manually enter at least one provisioning domain, for example, student.contoso.edu, during the ILM 2007 configuration process. The provisioning domain must be an accepted domain in your Outlook Live deployment.

provisioning packet (n)~ An XML packet that is downloaded by the computer enabled by FlexGo technology from the Provisioning Server over the Internet. Provisioning packets contain configuration information such as an end date or number of hours of computer usage time.

provisioning request (n)~ A request, through Microsoft, from an organization deploying Office Communications Server, or Live Communications Server 2005 SP1, to exchange connectivity information with one or more public IM service providers.

Provisioning Server (n)~ The server that creates packets to manage computers enabled by FlexGo technology.

Provisioning Service (n)~ Part of the Provisioning Server that implements the Provisioning Server's business logic.

provisioning site (n)~ A Microsoft-hosted site for provisioning connectivity with public IM service providers.

proximity (n)~ A Windows feature that enables users to connect computers with a simple tap gesture or by browsing for computers within wireless range. If two computers come within 3-4 centimeters of each other, or are tapped together, the operating system of each computer becomes aware of the other computer. Also, a user can browse for computers within wireless range that are advertising for a peer connection. The user can then connect the two computers to share content such as photos or links, or create a multi-player experience. If the connection is made using a tap gesture, the user can also publish and subscribe to messages transmitted during the tap.

Proximity API (PN)~ An API that enables awareness of device proximity within an app. The simple physical gesture of tapping devices together can be used to login to Windows, launch applications, connect with other devices, and share content between devices — all without the user needing to initiate any other action.

proximity search (n)~ Full-text query searching for those occurrences where the specified words are close to one another.

proximity sensor (n)~ A type of sensor that can determine without physical contact if an object/person is nearby, or can be used to measure the distance between the object/person and the sensor device.

proxy (n)~ A computer (or the software that runs on it) that acts as a barrier between a network and the Internet by presenting only a single network address to external sites.

proxy (n)~ A service, process, or file that allows the computer to serve as an interface device between a remote system and the Internet. Common uses of a proxy are to send unsolicited (spam) email.

Proxy (n)~ An Office Communications Server role deployed to forward SIP traffic, host applications, or provide connectivity to users in branch offices.

proxy (n)~ A software component that intermediates requests from client software components and responses from service or server software components that respond to those requests.

Proxy ~ A Proxy Server sits in between a- Client- and the 'real'- Server- that a Client is trying to use. Client's are sometimes configured to use a Proxy Server, usually an- HTTP- server.

proxy account (n)~ An account that is used to provide additional permissions for certain actions to users which do not have these permissions but have to execute these actions.

proxy address (n)~ The address by which a Exchange Server recipient object is recognized in a foreign messaging system. In Outlook Live, proxy addresses let people receive e-mail that is sent to different e-mail addresses.

proxy authentication (n)~ An authentication method that uses a proxy server.

proxy auto-config file (n)~ A configuration file that defines how web browsers and other user agents can automatically choose the appropriate proxy server (access method) for fetching a given URL.

proxy code (n)~ Code generated by .NET that creates the infrastructure a client can use to call a Web service.

proxy endpoint (n)~ An endpoint that represents a connection point for an application

system. Proxy endpoints provide access to or from members of the system from outside the system. A proxy endpoint delegates its behavior to an endpoint on a member of the system.

proxy management point (n)~ A secondary SMS/Configuration Manager site management point that services the Advanced Clients that are within its boundaries. Advanced Clients can use the proxy management point to request policy, upload inventory data, request package source location, and upload status messages.

proxy server (n)~ A server located on a network between client software, such as a Web browser, and another server. It intercepts all requests to the server to determine whether it can fulfill them itself. If not, it forwards the request to another server.

Proxy server ~ A computer used to store copies of popular webpages at an- ISPand provide them on request, to save having to fetch them from the website again.

PROXYAUTH (n)~ An attribute that requires a proxy server to authenticate users, which controls connections to selected destinations.

PRP (PN)~ A set of access control lists (ACLs) that determine what credentials can or cannot be replicated on a read-only domain controller (RODC). Each RODC has a unique Password Replication Policy (PRP) that is enforced by the writable domain controller that is its replication partner.

pruning (n)~ A process that removes unavailable printers from Active Directory. A program running on the domain controller periodically checks for orphaned printers (printers that are offline or powered down) and deletes the printer objects of the printers it cannot find.

PS/2 ~ The type of connector used to plug in mouse and keyboard on most modern PCs, now gradually being superseded by- USB. PS/2 was originally the name of a PC from IBM with a number of innovative but non-standard features, including special connectors for mouse and keyboard. The PC didn't catch on particularly well, mainly because its unusual architecture meant that it could not accept standard expansion cards, but its mouse and keyboard connectors proved popular and were widely adopted.

PS/2 ~ PS2 (without the /) is often used to refer to Sony's PlayStation 2, a popular games console.

PSC (PN)~ An object class in the Active Directory Domain Services (AD DS) schema that is created by default under the System container in the domain. The Password Settings Container stores Password Settings objects (PSOs) for that domain.

pseudo index (n)~ A dynamic cross-reference of one or more table data fields (columns) that permits an ODBC table (server table) without a unique index to be edited.

pseudo-class (n)~ A class used by CSS selectors to allow information that is external to the HTML source, such as whether a link has been visited, to classify elements.

pseudo-element (n)~ An element used by CSS selectors to style typographical rather than structural elements.

pseudo-random function (n)~ A function that takes a key, label, and seed as input, then produces an output of arbitrary length.

PSO (PN)~ An Active Directory object that is stored in the Password Settings Container. The Password Settings object holds the attributes of a certain fine-grained password policy.

PSOM (n)~ A custom protocol for transporting Web conferencing content.

PST import (n)~ A feature that enables IT administrators to move Personal Folders files (.pst) to a mailbox in Office 365. A .pst file is a data file that stores your messages and other items on your computer.

PSTN (n)~ Public switched telephone network (PSTN) is used by standard analog telephone lines, available worldwide.

PSTN connectivity (n)~ Connectivity with the public switched telephone network (PSTN) through integration with an audio conferencing provider.

PSTN usage records (n)~ Public switched telephone network (PSTN) usage records specify a class of call (such as internal, local, or long distance) that can be made by various users or groups of users in an organization.

Psychedelic (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 67.

Psychedelic Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 93.

PTT (n)~ A functionality that allows a user to push a button on a cell phone and begin voice input.

Public (adj)~ A privacy relationship setting that allows a small amount of information to be viewed, typically for nonfederated contacts.

public chat (n)~ A conversation that is open for all Skype users to join.

public cloud (n)~ A cloud infrastructure typically owned and managed by an organization that sells cloud services. The resources are shared by the general public or a group of customers in order to optimize utilization rates.

public cloud (oth)~ A cloud provided to the general public.

public cloud (n)~ The cloud infrastructure that is provisioned for open use by the general public. It may be owned, managed, and operated by a business, academic, or government organization, or some combination of them. It exists on the premises of the cloud provider.

public computer (n)~ A computer in a public environment that is accessed by several different users on a daily basis.

Public Conversations (PN)~ A wall in Dynamics CRM for conversations that are marked as being able to be seen by the entire organization.

Public Domain ~ Of all the kinds of software or information you can download, public domain has the fewest strings attached. With public domain downloads, there are no copyright restrictions.

public folder (n)~ A folder on a public server that people can use to share information, such as work information, discussions, contacts, tasks, and classified ads. Access permissions determine who can view and alter the folder and to what extent.

Public folder (n)~ The folder in Windows where you store files that you want to share with other people on the same computer or network. The Public folder is located in the Users folder of your root directory (for example, C:\Users\Public).

public FQDN (n)~ The FQDN of the public edge of an edge server.

public group (n)~ An item in the global address list that provides an easy way to send

messages to a group of people. A public group can include any item from a global address list, including other public groups.

public group (n)~ A group in Yammer that anyone can join even without an invitation.

public IM (n)~ A conversation that is open for all Skype users to join.

public IM connectivity (n)~ The ability to connect to public IM service providers.

Public IM Connectivity (n)~ A Microsoft license offered on a per-user, per-month subscription price which provides organizations with the capability to connect their existing base of Live Communications Server-enabled users to the top public IM service providers (MSN, AOL, and Yahoo!).

public IM connectivity contact (n)~ A contact who uses an instant messenger client from AOL, Yahoo!, MSN, or the Windows Live network of Internet services.

public IM contact (n)~ A contact who uses an instant messenger client from AOL, Yahoo!, MSN, or the Windows Live network of Internet services.

public IM service provider (n)~ An organization providing IM (instant messaging) services to the public.

public instant messenger contact (n)~ A contact who uses an instant messenger client from AOL, Yahoo!, MSN, or the Windows Live network of Internet services.

Public IP Addresses (PN)~ The service type of the Networking service that enables users to obtain and assign public IP addresses to virtual machines so that they become directly addressable.

public key (n)~ The nonsecret half of a cryptographic key pair that is used with a public key algorithm. Public keys are typically used when encrypting a session key, verifying a digital signature, or encrypting data that can be decrypted with the corresponding private key.

public key algorithm (n)~ An asymmetric cipher that uses two keys, one for encryption, the public key, and the other for decryption, the private key. As implied by the key names, the public key used to encode plaintext can be made available to anyone. However, the private key must remain secret. Only the private key can decrypt the ciphertext. The public key algorithm used in this process is slow (on the order of 1,000 times slower than symmetric algorithms), and is typically used to encrypt session keys or digitally sign a message.

Public Key Cryptography Standards (n)~ A family of standards for public key cryptography that includes RSA encryption, Diffie-Hellman key agreement, password-based encryption, extended-syntax, cryptographic message syntax, private key information syntax, and certificate request syntax, as well as selected attributes. Developed, owned, and maintained by RSA Data Security, Inc.

public key encryption (n)~ A method of encryption that uses a pair of mathematically related keys: a public key and a corresponding private key. Either key can be used to encrypt data, but the corresponding key must be used to decrypt it.

public key infrastructure (n)~ The laws, policies, standards, and software that regulate or manipulate certificates and public and private keys. In practice, it is a system of digital certificates, certification authorities, and other registration authorities that verify and authenticate the validity of each party involved in an electronic transaction. Standards for PKI are still evolving, even though they are being widely implemented as a necessary

element of electronic commerce.

Public Key Infrastructure certificate (n)~ A system of digital certificates, certification authorities, and other registration authorities that verify and authenticate the validity of each party involved in an electronic transaction.

public key infrastructure hierarchy (n)~ A hierarchy in which the roles of the certification authority are separated into one root CA and one or more subordinate CAs.

public link (n)~ A web address (URL) of a folder or photo album on OneDrive that allows access to anyone who visits the webpage. Visitors don't need to have explicit sharing permissions to the folder or album, sign in to Windows Live, or even have a Windows Live ID.

public name suffix (n)~ A suffix appended to the name of a published site. It is used in multiple web site publishing.

public network (n)~ A cluster network that supports client-to-cluster communication (either with or without supporting node-to-node communication).

public queue (n)~ For Message Queuing, a queue that is published in Active Directory and replicated throughout a Windows enterprise. Public queues can, therefore, be located by any computer running Message Queuing within the enterprise.

public switched telephone network (n)~ Public switched telephone network (PSTN) is used by standard analog telephone lines, available worldwide.

public variable (n)~ A variable you declare with the Public keyword in the Declarations section of a module. A public variable can be shared by all the procedures in every module in a database.

Public Virtual Worlds ~ an online networked virtual environment in which participants are immersed in a 3D representation of a virtual space and interact with other participants and the environment through an avatar

publication (n)~ A collection of one or more articles from one database.

publication (n)~ The output created in desktop publishing applications.

publication access list (n)~ The primary mechanism for securing the Publisher. It contains a list of logins, accounts, and groups that are granted access to the publication.

publication database (n)~ A database on the Publisher from which data and database objects are marked for replication and propagated to Subscribers.

publication retention period (n)~ In merge replication, the amount of time a subscription can remain unsynchronized.

public-facing URL (n)~ A URL that is directly accessible over the Internet and that does not require special credentials or network access to connect to it.

publish (v)~ To make a form, view, device or other resource available over a network.

publish (v)~ To make data ready and available for subsequent distribution and deployment in a server environment.

publish (v)~ To copy something from a computer to a location online, such as a photo album or a blog post.

publish (v)~ To save a copy of a file in Hypertext Markup Language (HTML) format to a Web server.

publish (v)~ To upload and deploy a website or cloud service to Microsoft Azure. Users can publish to the staging or production environment.

publish assignments (v)~ To notify resources of new and changed assignments to tasks.

publish profile (n)~ A collection of deployment-related settings that is stored in a file (e.g. .pubxml,.publishsettings).

Publish Recording (v)~ A UI element that allows a user to save a meeting to the conference center.

Publish this phone number (PN)~ An option in the Options dialog box, on the Personal tab. When the check box for this option is selected, Communicator displays this phone number along with other contact information for the user.

Published (adj)~ A status that indicates an article has been written and approved, and is available for viewing.

Published (adj)~ A Knowledgebase Article Status. Articles in this Status can be viewed on the Support Portal by Customers with the specified SLAs. Published is the only Status that makes Articles publicly visible.

published data (n)~ Data at the Publisher that has been replicated.

Published Data (n)~ The data that is published to the databus from each activity in a runbook.

Publisher (n)~ A server that makes data available for replication to other servers. A Publisher also detects changed data and maintains information about all publications at the site.

publisher (n)~ The entity that offers a remote workspace, typically the IT department of the user's employer, a business partner or vendor, or less commonly, a commercial application service provider. The publisher may use a digital certificate to represent its identity and use it to sign the remote resource files (e.g. RDP files) and the workspace description (e.g. Web Service feed).

publisher (n)~ A person or business that makes data or applications available to customers through an online market.

Publisher 2016 (PN)~ The year 2016 edition of Microsoft Publisher.

publisher database (n)~ A server that makes data available for replication to other servers. A Publisher also detects changed data and maintains information about all publications at the site.

publishing (n)~ Method of advertising a feature or application. Publishing does not populate the UI. However, if another application attempts to open a published application, there is enough information present for the installer to assign the published application.

publishing (n)~ The administrative task of making remote resources available to its users, setting policies that control how users will connect, how they will find the remote resources, and what settings users will connect with.

publishing action (n)~ The functionality to start a conversation on a social network, for example, to reply to, mark as favorite, or comment on a post.

publishing layout view (n)~ A specialized view tailored for textbox-based freeform document creation.

publishing page (n)~ A document that binds to a page layout to generate an HTML page for display to a reader. Publishing pages have specific fields that contain the content that is displayed in an HTML page.

publishing point (n)~ An organized memory location that translates a client request for

content into the physical path on the server hosting the content. A publishing point essentially acts as a redirector.

publishing point (n)~ The control point for a single Live Smooth Streaming event.

publishing profile (n)~ A downloadable package from the Microsoft Azure Management Portal that provides the secure connectivity required to publish (upload and deploy) websites and cloud services from a local development environment.

Publishing Resources (n)~ A web site collection feature that creates all artifacts that must be present for the web-level publishing feature to function. These include item profiles, web parts, workflow definitions, workflow bindings, site templates, events, actions, etc.

publishing server (n)~ A server running an instance of Analysis Services that stores the source cube for one or more linked cubes.

publishing table (n)~ The table at the Publisher in which data has been marked for replication and is part of a publication.

puff and sip device (n)~ An assistive computer technology for people with mobility impairments. A puff and sip device is a head-mounted alternative to using the mouse. The device allows a user to move the mouse pointer without using his or her hands by puffing air into a tube.

puffiness (n)~ A problem with the Surface screen when one area of the diffuser is not flat like the rest of the diffuser. For example, a giant bubble appears in the diffuser.

PUID (PN)~ A unique identifier used to represent a Passport account.

PUK (n)~ An 8-digit code used to unlock the SIM card. A Personal Unlocking Key is a type of personal identification number (PIN).

pull (v)~ The process of retrieving data from a network server.

pull ~ The transmission of information in response to a specific request for that information. Opening a webpage in a browser is an example of pull technology.

pull quote (n)~ An excerpt from the body of a story that is used as a graphic element in order to call attention to an important aspect of the topic under discussion.

pull replication (n)~ Replication that is invoked at the target.

pull request (n)~ A method of submitting contributions to an open development project through a distributed version control system such as Git occurring when asking for changes committed to an external repository to be considered for inclusion in a project's main repository.

pull subscription (n)~ A subscription created and administered at the Subscriber. The Distribution Agent or Merge Agent for the subscription runs at the Subscriber.

Pull-down menu ~ A menu which appears from nowhere when you click on or put your cursor over a link.

Punk (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 43.

Punk rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 121.

Purble Master (n)~ Skill level in the Purble Place game. Once a Purble Place game is completed, a player gets a skill level rank assigned automatically by the game (based on

number of guesses and hints during the game).

Purble Pairs (n)~ A part of the Purble Place game where the player has to flip a tile over to reveal a picture, and then try to find its match somewhere else.

Purble Place (n)~ Educational game for children that is part of the Windows Vista operating system.

Purble Shop (n)~ A game that is part of the Purble Place game that allows the player to build a face.

purchase after trial (n)~ To purchase an app after downloading, installing and trying it out.

purchase agreement (n)~ A source document that documents an agreement between two or more parties based on an understanding that a buying party will commit to purchasing a specific quantity or value of product over a period of time in exchange for favorable prices and discounts.

purchase agreement policy (n)~ A policy that authorizes parties to modify purchase agreement terms.

purchase amount approval limit (n)~ The maximum amount on a purchase document that an approver is allowed to approve.

purchase at download (n)~ To purchase an app just before downloading and installing it.

purchase ceiling (n)~ An upper limit on the amount a person or business entity is permitted to purchase during a specified period of time.

purchase invoice (n)~ The bill that an organization receives when a purchase is made.

purchase item (n)~ An itemized product that participates in a procurement process.

purchase miscellaneous charge (n)~ A charge on an item that is calculated independent of the quantity on the purchase line. An example of this type of charge is an item-specific service charge.

purchase order (n)~ A source document that documents the offer to buy products or the acceptance of an offer to sell products in exchange for payment.

purchase order discount (n)~ An amount deducted from the total net amount calculation on a purchase order.

purchase order line net amount (n)~ The expected currency amount for a purchase order line, calculated as follows: Purchase order quantity * (Unit price/Price unit) - Trade agreement discount + Purchase miscellaneous charge

purchase order net unit price (n)~ The expected currency amount per unit that is represented by the purchase order, calculated as follows: Purchase order line net amount / Quantity on the purchase order

purchase order overdelivery percentage (n)~ The percentage by which product receipt quantities are allowed to exceed the purchase order quantity.

purchase order policy (n)~ A policy that authorizes parties to modify purchase order terms and to control order processing.

purchase order underdelivery percentage (n)~ The percentage by which product receipt quantities are allowed to be less than the purchase order quantity.

purchase price (n)~ The price of product acquisition calculated as the extended price minus trade discounts.

purchase process (n)~ The method, or way, that the contact will purchase a selected

product, for example, by credit card or check.

purchase quotation (n)~ A source document that documents an offer to purchase a quantity of product for a specified price and by a specified date in response to a request for quotation in a procurement process.

purchase request (n)~ An economic event that generates requirements for products.

purchase requisition (n)~ A paper or electronic request made to the purchasing department to acquire a specified amount of goods or services from external suppliers and vendors.

purchase requisition (n)~ A source document that documents product requests so that they can be submitted for review and be used to authorize purchasing by a purchasing organization.

purchase unit (n)~ A unit of measure for expressing quantities of purchased product.

purchase unit price (n)~ The price of a purchase unit.

purchase VAT (n)~ The tax on an organization's purchases or input supplies, which is levied on the purchase price.

purchaseid (n)~ A unique code used to identify a purchase for transaction tracking and billing purposes.

purchaser (n)~ Someone on the Business Store with permissions to acquire apps from the Business Store on behalf of their company, but does not have Account settings or Distribute apps permissions.

Purchasing Account (PN)~ The Customer, Affiliate, department, division or other internal organization of Customer that is designated on a Purchasing Account registration.

pure code (n)~ Code that can contain both native and managed data types, but only managed functions.

pure log backup (n)~ A backup containing only the transaction log covering an interval without any bulk changes.

pure text (n)~ Simply formatted text without borders, graphics, or cells. Important for Web publishing.

purge (v)~ To eliminate old or unneeded information systematically; to clean up, as files.

pursuit team (n)~ People who are members of the group that is assigned to follow up on a particular lead.

push (v)~ To deliver data to a client without a client request for the data.

push (v)~ The process of sending data to a network server.

push (v)~ To add a new element to a stack, a data structure generally used to temporarily hold pieces of data being transferred or the partial result of an arithmetic operation.

push ~ A generic term applied to the methods, products or services used to deliver information to an internet user, without the user specifically requesting that item of information.

push button (n)~ A standard system control that initiates a command.

push notification (n)~ A transient message from the application to the user that contains relevant, time-sensitive information and provides quick access to the subject of that content.

push notifications (n)~ The sound alerts, alerts on screen (text), and badges that are pushed by applications to a device. For the Windows Phone, push notifications are

available through the Lync Server Push Notification Service. For the iPhone, iPad, and iPod touch devices, notifications are available through the Apple Push Notification Service.

push replication (n)~ Replication that is invoked at the source.

push subscription (n)~ A subscription created and administered at the Publisher.

push-button configuration (n)~ In some Wi-Fi Protected Setup networks, a method that enables users to push a physical or software-based button to automatically configure network names, connect devices to the network, and enable data encryption and authentication.

push-button reset (n)~ The ability to easily return a PC to a prior state, either by reinstalling Windows and keeping their files or by resetting the PC to the original factory state.

pushpin map (n)~ A map that visualizes posts by their post location in the form of pushpins.

push-to-talk (v)~ A functionality that allows a user to push a button on a cell phone and begin voice input.

Puzzle & trivia (PN)~ A game category that primarily features puzzle or trivia challenges.

puzzle + trivia (PN)~ A game category that primarily features puzzle or trivia challenges.

PV (n)~ The difference between the cost price and the actual production price. The production variance is determined when the production order is calculated.

PVA (n)~ A service that implements control of in-conference services for one PSTN user. It listens for request key commands from the user's PSTN device and executes them to control the phone functionality. For example, PVA implements #6 (mute) from the PSTN user.

PVR ~ (Personal Video Recorder)- A TV video recorder which records to a- hard disk. Typically a standalone unit, but you can also get software which allows you to use your PC's hard disk for this purpose.

PXE (n)~ A remote boot technology based on Dynamic Host Configuration Protocol (DHCP) that is used to start or install an operating system on a client computer from a remote server. A WDS Server is an example of a PXE Server.

PXE protocol (n)~ An extension to the DHCP protocol that enables information to be sent to network-bootable systems and enables these systems to find RIS servers.

Pyramid (PN)~ A SmartArt graphic layout type that includes layouts designed to show proportional relationships with the largest component on the top or bottom.

pyramid chart (n)~ A variation on a column chart that uses pyramid shapes instead of rectangular columns.

pyramid diagram (n)~ A diagram that is used to show foundation-based relationships.

Pyramid List (PN)~ A SmartArt graphic layout used to show proportional, interconnected, or hierarchical relationships. Text appears in the rectangular shapes on top of the pyramid background

Python ~ a programming language invented by Guido van Rossum for quick, easy construction of relatively small programs, especially those that involve character string operations.www.python.org

Q & A (n)~ A feature that enables attendees to ask questions of presenters a meeting.

Q ~

Q&A (PN)~ The natural language query engine part of Power BI for Office 365 on SharePoint Online BI sites which IT can customize to help employees search for specific datasets.

QA (n)~ A planned and systematic means for assuring that defined standards, practices, procedures, and methods are applied to the project and its results.

QA gate (n)~ A workflow activity in an authentication phase, in which the requesting user must supply answers to one or more predetermined questions. This activity is typically used in password reset, to challenge the user to prove their identity by providing the user with a selection of pre-determined questions for which only that user would know.

Q-Band ~ also known as V-Band, is a radio bandwidth range between 40 GHz t0 50 GHz.

QBE (n)~ A simple-to-use query language implemented on several relational database management systems. Using query by example, the user specifies fields to be displayed, intertable linkages, and retrieval criteria directly onto forms displayed on the screen. These forms are a direct pictorial representation of the table and row structures that make up the database. Thus, the construction of a query becomes a simple checkoff' procedure from the viewpoint of the user. '

QCIF (n)~ A video format that has 176 pixels by 144 lines and 30 fps.

QEC (n)~ A component in a Network Access Protection (NAP) Client Architecture defined for a specific type of network access (for example DHCP configuration or VPN connections) and matched to a specific type of NAP server.

QIC (n)~ A storage technology used with tape backup drives and cartridges. A means of backing up data on computer systems, QIC represents a set of standards devised to enable tapes to be used with drives from different manufacturers. The QIC standards specify the length of tape, the number of recording tracks, and the magnetic strength of the tape coating, all of which determine the amount of information that can be written to the tape. Older QIC-80 drives can hold up to 340 MB of compressed data. Newer versions can hold more than 1 GB of information.

QoE (n)~ A measurement of a user's perception of the quality of an audio communication session. For example, in a voice communication, QoE monitors echoes and background noises such as hissing in the line.

QoE Monitoring Server (n)~ A server role that provides near real-time monitoring and service assessment of media in order to better understand the media quality that users are experiencing.

QoS (n)~ A set of quality assurance standards and mechanisms for data transmission.

QPC (n)~ An API for the High Precision Event Timer (HPET).

QQ ~ Tencent QQ, generally referred to as QQ, is the most popular free instant messaging computer program in mainland China.- http://www.qq.com/

QR code (n)~ A specific two-dimensional bar code.

QST (n)~ A provincial sales tax collected in the province of QuÃ©bec in Canada.

quad (n)~ A unique identifier made from four otherwise separate pieces of information. For example, a color can be specified by a black, yellow, magenta and cyan quad.

quad ~ A cable containing two twisted pairs of conductors.

quad core ~ processor contains four cores

Quad-core ~ PC- processors which have four complete processors on the same chip, allowing computers to handle multiple tasks faster. See alsodual-core.

quadratic attenuation (n)~ The intensity of a beam of light that diminishes quickly at first then more slowly as it gets further from the light source.

quadratic Bezier curve (n)~ A curve described by two endpoints and one control point.

quadratic formula (n)~ A formula giving the roots of a quadratic equation.

qualifier (n)~ A modifier containing information that describes a class, instance, property, method, or parameter. Qualifiers are defined by the Common Information Model (CIM), by the CIM Object Manager, and by developers.

qualifier flavor (n)~ A flag that provides additional information about a qualifier, such as whether a derived class or instance can override the qualifier's original value.

qualify (v)~ To verify that a record fits specific criteria and should be converted to an opportunity, account, or contact, or be added to a marketing list.

Qualify Lead (oth)~ To render or declare something, such as a lead, qualified or fit.

qualifying (adj)~ Eligible for something by meeting a specific requirement or condition.

qualifying license (n)~ During software upgrades, the license for the product that is already installed on the machine, i.e. the version being upgraded.

qualifying product (n)~ During software upgrades, the product that is already installed on the machine, i.e. the version to be upgraded.

qualitative assessment (n)~ A process that prioritizes risks' effects on project objectives for risk response planning.

quality (n)~ The degree of excellence, or the desired standards, in a product, process, or project.

quality assurance (n)~ A planned and systematic means for assuring that defined standards, practices, procedures, and methods are applied to the project and its results.

quality dissatisfaction (n)~ The dissatisfaction that occurs when the quality of a release is poor.

quality level (n)~ A part of the Windows Media conformance test acceptance criteria. A device profile may contain one or more quality levels used to evaluate a WMA or WMV codec.

Quality of Experience (n)~ A measurement of a user's perception of the quality of an audio communication session. For example, in a voice communication, QoE monitors echoes and background noises such as hissing in the line.

Quality of Experience Monitoring Server (n)~ A server role that provides near real-time monitoring and service assessment of media in order to better understand the media quality that users are experiencing.

Quality of Service (n)~ A set of quality assurance standards and mechanisms for data transmission.

quality of service requirement (n)~ A type of work item that records a constraint on the system such as performance, load, stress, security mechanism, or platform. These requirements do not describe functionality but rather constraints on that functionality.

quality order (n)~ Defines a set of one or more tests that must be performed for an item

and a test quantity of its related order (such as a purchase, sales, or production order) or a test quantity of its inventory.

quality-of-service indicator (n)~ A statistic that indicates the degree to which a computer, server farm, or server cluster meets usage demands for that configuration.

quantitative assessment (n)~ A process that measures the probability and consequences of risks and estimates their implications for project objectives.

quantity (n)~ An exact measure of some countable operational or financial characteristic represented by a number.

quantity match variance (n)~ A matching discrepancy between the quantity on a vendor invoice and the matched quantities on the related packing slips.

quantity selling option (n)~ An option in the product catalog that determines whether a product is sold whole, in fractions, or in whole and fractions, or if a user has no control over the quantity.

quantity variance (n)~ The difference between an ordered product quantity and a received product quantity when no more receipts are expected.

quantity variance (n)~ The difference between an ordered product quantity and a delivered product quantity when no more deliveries are expected.

quantum (n)~ A brief period of time when a given thread executes in a multitasking operating system. It performs the multitasking before it is rescheduled against other threads with the same priority. Previously known as a time slice."

Quantum computing / theory ~ Data is represented as linked qubits (quantum bits), which have the ability to represent all possible states simultaneously. This gives quantum computers the ability to operate exponentially faster than conventional computers as the word length is increased.

quarantine (n)~ The practice of holding items from use until it has been determined that they conform to quality or other standards.

quarantine ~ A term used to isolate spam e-mail messages, it is often seen in anti-spam software. Once you quarantine the suspect messages, you must then delete them.

Quarantine Agent (n)~ A client component responsible for the collection and management of health information for a machine as well as facilitating the isolation of that machine from others on the network; it coordinates information between the various System Health Agents (SHAs) and Quarantine Enforcement Clients (QECs).

quarantine database (n)~ A database into which infected messages and attachments are placed in order to isolate them.

Quarantine Enforcement Client (n)~ A component in a Network Access Protection (NAP) Client Architecture defined for a specific type of network access (for example DHCP configuration or VPN connections) and matched to a specific type of NAP server.

Quarantine Enforcement Server (n)~ A logical component in a Network Access Protection (NAP) deployment responsible for restricting a clients network access based on the health evidence it presents and for the negotiation for access with health aware resources.

quarantine management (n)~ The process and procedures for handling items that move to and from quarantine.

quarantine order (n)~ A request to move items to or from quarantine.

Quarantine Server (n)~ The server component in a Network Access Protection (NAP) deployment that that coordinates the output from all the System Health Validators and decides whether a Quarantine Enforcement Server should quarantine a client or not (IAS is a Quarantine Server).

quarantine warehouse (n)~ The place where items are stored while in quarantine.

Quarter Common Intermediate Format (n)~ A video format that has 176 pixels by 144 lines and 30 fps.

quarter inch cartridge (n)~ A storage technology used with tape backup drives and cartridges. A means of backing up data on computer systems, QIC represents a set of standards devised to enable tapes to be used with drives from different manufacturers. The QIC standards specify the length of tape, the number of recording tracks, and the magnetic strength of the tape coating, all of which determine the amount of information that can be written to the tape. Older QIC-80 drives can hold up to 340 MB of compressed data. Newer versions can hold more than 1 GB of information.

Quarter Video Graphics Array (n)~ A video format that has 320 x 240 pixels, and a 1.33:1 aspect ratio.

query (v)~ To extract data from a database and present it for use.

query (n)~ A formalized instruction to a database to either return a set of records or perform a specified action on a set of records as specified in the query.

query (n)~ A formalized instruction to a data source to either extract data or perform a specified action. The query can be in the form of a query expression, or a method-based query (or a combination of the two). The data source can be in different forms, e.g. relational databases, XML documents, or in-memory objects.

query (n)~ A named set of criteria that Visual Studio Team Foundation uses to display work items.

query (n)~ An expression in the form of a query expression or a Standard Query Operator method call (or a combination of the two) that extracts information from a data source.

query (n)~ An instance of a query template that runs continuously in the StreamInsight server processing events received from instances of input adapters to which the query is bound and sending processed events to instances of output adapters to which it is bound.

Query ~ In computers, what a user of a search engine or database enters is sometimes called the query. To query (verb) means to submit a query (noun).

query binder (n)~ An object that binds an existing StreamInsight query template to specific input and output adapters.

query binding (n)~ The process of binding instances of input adapters and instances of output adapters to an instance of a query template.

Query Box (PN)~ A text box in which a user types words to begin a search-as-you-type' experience. A Query Box displays context-sensitive query completion suggestions

Query Builder (n)~ The user interface for defining work item queries.

query by example (n)~ A simple-to-use query language implemented on several relational database management systems. Using query by example, the user specifies fields to be displayed, intertable linkages, and retrieval criteria directly onto forms displayed on the screen. These forms are a direct pictorial representation of the table and row structures that make up the database. Thus, the construction of a query becomes a

simple checkoff' procedure from the viewpoint of the user. '

query clause (n)~ The combination of an expression (or query subclause) and its adjacent logical operator. It is modeled on the WHERE clause of a SQL statement and contains Field Name, operator, and value.

query clause (n)~ A single clause of a query expression. There are several different query clauses, each identified by its initiating query keyword. For instance, the from/From clause' refers to clauses like 'From c In customers' in Visual Basic

query criteria (n)~ The set of criteria used to search for objects.

query design (n)~ All elements included in the Query window, such as tables, criteria, the order in which fields are arranged, and so on. The design also specifies whether Auto Query is turned on, and whether you can edit the source data.

query expression (n)~ An expression that uses a language-integrated syntax for queries.

query field (n)~ A field that can contain a value that is used in a query.

query governor (n)~ A configuration option that can be used to prevent system resources from being consumed by long-running queries.

query hint (n)~ A hint that specifies that the indicated hints should be used throughout the query. Query hints affect all operators in the statement.

query keyword (n)~ A contextual keyword in C# and Visual Basic that designates the query clause of a query expression. For example, from, join, and select are query keywords in C#, and From, Join, and Select are query keywords in Visual basic.

query optimization (n)~ The process that determines the best execution strategy for a given query.

query optimizer (n)~ A database engine component responsible for generating efficient execution plans for statements.

query path (n)~ A string representation of a path that specifies which related objects to return when a typed object query is executed.

query pattern (n)~ The set of standard query operators that is available in all LINQ queries, and the rules that define the structure of a LINQ query.

query plan (n)~ An internal strategy by which a database server tries to create result sets quickly.

Query Remote Desktop Server Utility (PN)~ A utility that identifies remote desktop servers on the network.

query role (n)~ The role name of a server that services queries in the farm topology.

query rule (n)~ A rule that an administrator can configure and apply to query processing to help optimize results and create an enhanced user experience.

query server (n)~ A server that is running the search service and servicing queries.

Query Service (n)~ The web service exposed by the web front-end that allows a client program to execute queries.

query template (n)~ The fundamental unit of query composition. A query template defines the business logic required to continuously analyze and process events submitted to and emitted by the StreamInsight server.

query variable (n)~ A variable that stores a query, as opposed to the results of a query.

Query View (n)~ The Visual Studio document window that contains both the query builder and the results list. Query View is designed to help you quickly define and run

your own queries.

Query Web Service (n)~ A Provisioning Server Web service that responds to customer service related queries from solution providers.

Query window (n)~ A window in which you work with queries in Design view, Datasheet view, SQL view, or Print Preview.

query window (n)~ A reserved time for performing large, resource-intensive queries for a computer, server farm, or server cluster.

queryable managed property (n)~ A managed property that can be queried against. The query must contain the managed property field name, either in the query itself or programmatically.

queryable type (n)~ The type of the query variable in a LINQ query. The type of the variable that represents the data source is also a queryable type. A queryable type can be implicitly or explicitly typed, but in either case it must be a generic IEnumerable or IQueryable type.

query-based report (n)~ A type of report generated from an Application Object Tree (AOT) query.

query-based test suite (n)~ The set of test cases that are returned when a specific query is run. If new test cases that meet the criteria in this query are added to the test suite, the new test cases will automatically appear in the query-based test suite.

QueryPerformanceCounter (n)~ An API for the High Precision Event Timer (HPET).

query-size threshold (n)~ An administrative setting that limits the number of query results for SharePoint lists, sites, and site collections that contain a large number of items.

quest (n)~ A request to try a feature on- Insider Preview builds. The requests can be found within the Insider Hub app for those in the- Windows Insider- Program.

Question (n)~ An option available in the Case Type drop-down list. A customer service representative (CSR) can select this option for a customer who is asking a question and requires only an answer.

question (n)~ A question, usually from a drop-down list, that users can use to confirm their identity and reset their password in case they have forgotten it.

Question and Answer log (n)~ A record of the question and answer activity during a meeting.

Question Manager (n)~ A presenter tool that is used to manage and respond to questions from meeting participants.

question mark (n)~ The ? character, used as a punctuation mark or wildcard character.

question template (n)~ A structure that describes a set of questions that can be asked using a particular relationship or set of relationships.

question-mark pointer (n)~ Use the question-mark pointer to get context-sensitive Help on toolbar buttons, dialog box options, tools in the toolbox, and other parts of the window.

Questions and Answers (n)~ A feature that enables attendees to ask questions of presenters a meeting.

Questions and Answers pane (n)~ A client element that is used for attendees to ask questions of presenters.

queue (n)~ A list of programs or tasks waiting for execution.

queue (n)~ A holding container for work items. Members of a queue must be of the same

work item class (for example, only incidents).

queue (n)~ A holding area where callers are held until an agent becomes available. Each queue is associated with 0, 1, or more addresses (phone number or SIP URI), which may or may not be public For example, an overflow queue may not have an address, whereas other queues may have multiple addresses for different geographic zones.

queue (n)~ A specific instance of the Queue service that represents messages that may be retrieved by a client application or service.

Queue (n)~ A customized list of Tickets that categorizes them by specific criteria.

Queue ~ A queue is a list of jobs that are awaiting to be processed. When when a job is sent to a queue, it is simply added to the list of jobs.

Queue ~ A temporary delay in providing service caused by the inability of the particular system to handle the number of messages or calls attempted

Queue Reader Agent (PN)~ The executable that reads the changes from subscribers in the queue and delivers the changes to the publisher.

Queue service (PN)~ The data management service in Microsoft Azure Storage for storing large numbers of messages that can be accessed via HTTP or HTTPS.

queue time (n)~ The number of hours spent waiting for an operation to begin.

queue time after (n)~ The part of queue time spent waiting for the next operation.

queue time before (n)~ The part of queue time spent waiting for the current operation to begin.

queue up (v)~ To add a song or other digital media item to a list of items to be played, burned, or synchronized to a device.

queue workflow work item (n)~ A workflow work item that is assigned to a work item queue.

queuing (n)~ A performance optimization in which communication across networks and systems is maintained regardless of the current state of the communicating applications and systems. Applications send and receive messages through message queues maintained even when the application or the server isn't running.

Quick access (PN)~ The new top level view in File Explorer that shows the user's most frequently used and most recently used files and folders or folders pinned by the user for quick access.

Quick Access Toolbar (n)~ A customizable toolbar that provides one-click access to commands.

quick action (n)~ A subset of settings and features that can be assigned to one of four slots in action center for quick, one-tap access. In addition, they can provide useful, actionable, or critical info regarding the setting or feature.

quick action command (PN)~ A command in the message list that enables a user to perform a quick action.

Quick add (PN)~ The Web page object that assists users in finding both public (Web and Windows Live) and private (my Windows Live content) content for insertion into their authored content.

Quick Analysis (PN)~ A feature that enables single-click access to top data analysis features such as formulas, conditional formatting, sparklines, charts and PivotTable reports.

quick campaign (n)~ A communication method that creates a single activity for distribution to a group of marketing lists, accounts, contacts, or leads. Contrast with a campaign, which supports an end-to-end marketing program that has multiple activities.

Quick Click category (n)~ A default color category that is assigned to an item when you click the Categories column for the item in your Inbox or other table view. You set this color category from the Categorize menu.

Quick Click flag (n)~ A default flag that is assigned to an item when you click the Flag Status column in your Inbox or other table view. You set the default time, date, or other criteria for the flag from the Follow Up menu.

Quick Compose (PN)~ A feature that enables users to compose or reply to a message without leaving the context of the conversation.

Quick Contacts (PN)~ A feature that displays a list of frequently used contacts and allows the user to initiate communication directly from that list.

Quick Create (n)~ An option on the lower left corner of the Web application that enables a user to select a new record to create from the list, without having to navigate to the part of the UI that applies to the item the user wants to create.

quick deploy (n)~ A designation that the user can apply to a content deployment job to denote that it will be deployed frequently and quickly.

Quick Edit (PN)~ A feature that enables users to edit SharePoint list content directly without opening an edit window.

Quick Explore (PN)~ A feature that enables single-click access to trend and contribution patterns within a PivotTable or PivotChart report.

Quick Form (n)~ A feature that displays a short form that you can use to quickly enter data and create records.

quick form (n)~ A view or display of a shorter version of a form that allows you to enter and save data quickly and easily.

Quick Info tooltip (PN)~ The pop-up window that displays the complete declaration for an identifier when the pointer rests on the identifier in a code editor window.

Quick Launch (n)~ A customizable area of the taskbar, which by default is displayed to the right of the Start button. It contains icons you can click to open programs, such as Windows Explorer or Outlook Express, or to show the desktop. You can add or remove icons to it and move it to a different area of the taskbar.

Quick Launch (n)~ The name of the bar on the Home page of the Works Task Launcher. The Quick Launch bar allows users to quickly start any program included in Works and Works Suite.

Quick Launch toolbar (n)~ A customizable area of the taskbar, which by default is displayed to the right of the Start button. It contains icons you can click to open programs, such as Windows Explorer or Outlook Express, or to show the desktop. You can add or remove icons to it and move it to a different area of the taskbar.

quick link (n)~ A customizable link on the Home page (on a menu and a corresponding Web part).

Quick Lync (PN)~ A menu bar that appears beside the picture area of a contact in the Lync Contacts list that shows the available communication modes: IM, Call, Video, and View card.

Quick Notes (PN)~ A section in the default OneNote notebook where certain notes are stored by default.

Quick Parts (PN)~ A feature that contains galleries where the user can create, store, and find reusable pieces of content, including AutoText, document properties, fields and building blocks.

Quick Parts gallery (PN)~ A gallery to which users can add reusable content to be displayed in Quick Parts and the Building Blocks Organizer.

Quick Path (PN)~ A control that provides the essential user interface needed for a task, making the interaction straightforward. This feature shows only the most most relevant and most often used information options in a simple format.

quick play (n)~ An area in the Music app where recently played songs/albums and service-generated mixes are aggregated.

Quick Preview (PN)~ A feature that displays a preview of item content when a user hovers over a search result in SharePoint. The preview is optimized for the content type.

Quick Publication (n)~ A pre-formatted publication that can be quickly filled and finalized.

quick reports (n)~ In the Application Compatibility Manager, the set of easily accessible reports based upon your compatibility evaluation data.

Quick Rules (PN)~ A feature that allows form designers to select from a gallery of pre-built rules to make their forms dynamic.

Quick Search (n)~ A search feature associated with folders and programs that begins to display results as soon as a keyword is entered. When you enter text, files in the current view are automatically filtered to show only those that match what you typed.

Quick Shape (PN)~ A shape that has been added to a special area of a stencil to make it more easily accessible.

Quick Shapes area (PN)~ An area at the top of every stencil to which you can add the shapes you use most often, so that they will be more easily accessible.

Quick Shapes stencil (PN)~ A stencil in the Shapes window that shows all the Quick Shapes from the Quick Shapes area of each open stencil.

Quick Share Account (PN)~ A feature to define the quick upload of images using a user-defined storing location (such as OneDrive or Facebook) to be listed in the context menu.

Quick Start (n)~ A stand-alone, single document that users can use to get started on a subject or technology quickly.

Quick start (PN)~ A format for user assistance content that presents simple steps on a given topic that enable a user to begin using a feature quickly.

Quick Start (n)~ A virtual machine deployment that installs Remote Desktop Services on one server, creates a collection and publishes select RemoteApp programs.

Quick Start (n)~ A user experience by which a user is presumably able to easily configure an object of interest.

Quick Start Guide (PN)~ The initial user reference guide or piece of documentation for using a device or feature.

Quick Steps (PN)~ A feature that provides access to gallery of frequently-used actions with the touch of a button. Users can customize the gallery to execute a combination of operations in one click.

Quick Style set (n)~ A collection of formatting options (Quick Styles) that are designed to be used together.

Quick Styles (n)~ A feature that allows the user to select from a gallery of pre-defined formatting styles and apply them quickly to tables, text, charts, drawing objects and SmartArt graphics.

Quick Tabs (n)~ A user interface element that provides users with a quick and easy way to navigate across a large group of opened Web pages by providing the user with a visual representation of all of the opened thumbnails. Through this visualization, the user can easily spot and select a desired thumbnail.

Quick Tag Editor (n)~ A tool for quickly selecting and inserting HTML.

Quick Tag Tree (n)~ The hierarchical HTML tag structure of an opened HTML document that appears in a window docked beneath the quick tag selector.

Quick Text (PN)~ A keyboard functionality that enables the user to insert pre-written sentences, phrases, words, or characters instantly into a text box via a list option in the software input panel (SIP).

Quick Tour (n)~ An overview presentation of features that can be launched from within the program.

quick view (n)~ A view that provides one-click access to a subset of e-mail messages based on specific criteria, which include: flagged (messages that the customer has designated as requiring follow-up), photos (messages that contain photos), and social updates (messages that originate from a social networking service such as Facebook).

quick view form (n)~ A mini form that shows up within the main form, so that users can create a new record for an entity without leaving the context of the current process.

Quick views (PN)~ The group label for the links that provide one-click access to a subset of e-mail messages based on specific criteria, such as flagged, containing photos, and from social networking services.

QuickTime (PN)~ Software components developed by Apple for creating, editing, publishing, and viewing multimedia content. QuickTime, which supports video, animation, graphics, 3-D, VR (virtual reality), MIDI, music, sound, and text, has been part of the Mac OS since version 7 of the operating system and is used in many Macintosh applications. Windows applications can also run QuickTime files but require the installation of special player software. QuickTime is often used on the Web to provide Web pages with video and animation. Most Web browsers support plug-ins for running these types of files. QuickTime is also part of the new MPEG-4 specification.

Quicktime ~ A video compression standard created by Apple, and the program which displays such movies. Usually Quicktime files have the extension .MOV.

quiesce (v)~ To bring a form, service, server farm, or form template offline gradually by not accepting new user sessions and allowing existing sessions to finish.

quiet answer (n)~ A telephone-answering protocol in which incoming calls are answered with silence instead of a tone signal. Some telephone-switching systems use quiet answering. These switching systems expect the caller to provide another phone number, code, or extension after the quiet answer.

quiet hours (n)~ The timeframe a user specifies to suppress notifications from Windows.

quiet hours (PN)~ A feature in Cortana's Notebook that enables the user to turn off call,

text, and other notifications with options to let the inner circle get through.

quiet mode (n)~ The mode of a command-line application where it does not display confirmation messages or any other user interface items that normally appear on screen. The switch for quiet mode is typically '/q'.

quiet time (n)~ A timeframe someone specifies to suppress notifications from Windows Live Alerts.

quit (n)~ A command in many applications for exiting the program.

quiz (n)~ A test of knowledge that consists of a series of short questions, often in a multiple-choice format.

quorum (n)~ In a database mirroring session with a witness server, a relationship in which the servers that can currently communicate with each other arbitrate who owns the role of principal server.

quorum (n)~ For a failover cluster, the number of elements that must be online for a given cluster to continue running. The elements relevant in this context are nodes or, in some cases, a witness disk or witness file share.

quorum configuration (n)~ Settings in a failover cluster that determine the point at which too many failures will stop the cluster from running.

quorum disk (n)~ The cluster disk on which configuration data is maintained in the quorum log, cluster database checkpoint, and resource checkpoints. The quorum disk is managed by the quorum resource, which is usually a special kind of physical disk resource.

quorum log (n)~ The log where the quorum resource stores data. This data is maintained by the clustering software.

quorum mode (n)~ The WSFC quorum configuration in a failover cluster that determines the number of node failures that the cluster can sustain.

quorum resource (n)~ For a server cluster, the quorum-capable resource selected to maintain the configuration data necessary for recovery of the cluster. This data contains details of all of the changes that have been applied to the cluster database. The quorum resource is generally accessible to other cluster resources so that any cluster node has access to the most recent database changes. By default there is only one quorum resource per server cluster.

quota (n)~ A per-process limit on the use of system resources. For each process, the system sets limits on certain system resources that the process's threads can use, for example, the memory manager.

quota (n)~ A revenue objective specified as a monetary amount that has been assigned to a salesperson for a specified fiscal period.

quota (n)~ A per-user limit on cloud capacity usage.- A quota can consist of several dimensions such as CPUs, memory, storage, virtual machines, and so on.

quota limit (n)~ The amount of disk space available to a user.

quota message (n)~ An e-mail message that is automatically sent by Microsoft Exchange to the owners of a mailbox or a public folder when a size limit, which is called a storage quota, for the mailbox or public folder has been exceeded or is at risk of being exceeded.

quota point (n)~ The unit by which the virtual machine quota for a self-service user or group is calculated. Each new virtual machine can add zero or more quota points toward

virtual machine quotas. The virtual machine template that is used to create the virtual machine determines how many quota points the virtual machine adds. Quota points only apply to the quota while a virtual machine is deployed.

quota template (n)~ A template that defines a space limit on the physical drive, the type of quota (hard or soft), and a set of notifications to be generated when the quota limit is being approached.

Quota Usage (n)~ A storage report that lists the quotas that exceed a certain disk space usage level. Use this report to quickly identify quotas that may soon be exceeded so that you can take the appropriate action.

quotation (n)~ A formal offer for products or services, proposed at specific prices and related payment terms.

quotation (n)~ An abstract representation of an F# expression that is created by bracketing an F# expression with the special symbols <@ and @> or <@@ and @@>, for example: <@ 1 + 1 @>.

quotation (n)~ A source document that documents an offer to supply a quantity of product for a specified price and by a specified date.

quotation currency unit (n)~ The currency unit in an exchange rate calculation.

quotation management (n)~ The process of creating, adjusting, issuing, processing, and tracking a quotation from beginning, when customer information is collected, to ending, when the quotation is lost, canceled, or accepted.

quote (n)~ A formal offer for products or services, proposed at specific prices and related payment terms.

quoted identifier (n)~ An object in a database that requires the use of special characters (delimiters) because the object name does not comply with the formatting rules of regular identifiers.

QVGA (n)~ A video format that has 320 x 240 pixels, and a 1.33:1 aspect ratio.

QWERTY ~ This term is used to describe a standard (Latin alphabet-based) keyboard. Why? Because the first six keys in the upper-left part of the keyboard spell out Q-W-E-R-T-Y. I suppose you could call it a QWERTYUIOP keyboard, but QWERTY is a lot easier to say.

qword (n)~ A data type consisting of a 64-bit unsigned integer.

R ~

R&B (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 14.

R18+ (oth)~ A game rating symbol developed by the British Board of Film Classification (BBFC).

R1C1 notation (n)~ A convention for referencing the location of cells in a worksheet in which both the rows and the columns on the worksheet are numbered. The location of a cell is indicated with an R' followed by a row number and a 'C' followed by a column number.'

RA (n)~ An entity that identifies and authenticates certificate subjects on behalf of a certification authority, but does not issue or sign certificates.

RA (n)~ The Windows Fabric system service responsible for implementing the reconfiguration of replica-sets.

race condition (n)~ A condition in which a feedback circuit interacts with internal circuit processes in a way that produces chaotic output behavior.

race condition (n)~ A condition in which two or more threads can reach and execute a block of code, and the program outcome changes radically depending on which thread reaches the code first. A race condition is benign if all outcomes are valid. However, race conditions can be associated with synchronization errors that can result in one process interfering with another process and possibly introduce a vulnerability. Frequently, a potential outcome of a race condition leaves the program in an unstable or invalid state.

Racing & flying (PN)~ A game category that emphasizes racing elements or vehicle simulation.

racing + flying (PN)~ A game category that emphasizes racing elements or vehicle simulation.

rack (n)~ A storage system with multiple tiers that can accommodate pallets or other standardized containers. Typically, a rack holds pallets in vertical sections, but some can also be more than one pallet deep.

rack ~ A framework or structure that holds computer servers or networking equipment, usually by means of shelves or mounting plates. The height of computer equipment is expressed in- U, which equal the distance between shelf increments in a standard rack

rack-mounted (adj)~ Built for installation in a metal frame or cabinet of standard width (typically 19 inches or 23 inches) and mounting arrangements.

rack-mounted chassis (n)~ A chassis type that can be reported by the Win32_SystemEnclosure class in Windows Management Instrumentation (WMI) and that refers to a chassis that is designed to be rack-mountable.

RAD (n)~ A method of building computer systems in which the system is programmed and implemented in segments, rather than waiting until the entire project is completed for implementation. Developed by programmer James Martin, RAD uses such tools as CASE and visual programming.

RAD Web Access Configuration (PN)~ An option on the Remote Desktop Services

menu on the Administrative Tools menu that opens the RAD Web Access Web site for administrative purposes.

radar chart (n)~ A type of chart that compares the aggregate values of a number of data series.

Radeon ~ Radeon is a brand of GPU and RAM produced by AMD

radial (adj)~ A type of transition that uses an effect involving a circle or a circular motion.

Radial Cycle (PN)~ A SmartArt graphic layout used to show the relationship to a central idea. Emphasizes both information in the center circle and how information in the outer ring of circles contributes to the central idea. The first Level 1 line of text corresponds to the central circle, and its Level 2 text corresponds to the outer ring of circles. Unused text does not appear, but remains available if you switch layouts.

radial diagram (n)~ A diagram that is used to show relationships of elements to a core element.

radial gradient (n)~ A brush where one color gradually transitions into another in a radial fashion.

Radial List (PN)~ A SmartArt graphic layout used to show relationships to a central idea in a cycle. The center shape can contain a picture. Level 1 text appears in the smaller circles and any related Level 2 text appears to the side of the smaller circles.

radial menu (n)~ A touch-friendly, contextual control that presents commands in a circular arrangement.

Radial Venn (PN)~ A SmartArt graphic layout used to show both overlapping relationships and the relationship to a central idea in a cycle. The first line of Level 1 text corresponds to the central shape and the lines of Level 2 text correspond to the surrounding circular shapes. Unused text does not appear, but remains available if you switch layouts.

radian (n)~ The angle between two radii of a circle such that the length of the arc between them is equal to the radius. The circumference of a circle is equal to 2p times the radius, so one radian contains 360/(2p) = 180/p = approximately 57.2958 degrees. Conversely, multiplying the number of degrees by p/180 gives the number of radians; 360 degrees equals 2p radians.

radio (n)~ Electromagnetic waves longer than about 0.3 mm (frequencies lower than about 1 THz). Radio is used to transmit a wide variety of signals, using various frequency ranges and types of modulation, such as AM and FM broadcasts, microwave relays, and television broadcasts.

radio (n)~ A part of a device that converts sound waves or mechanical movements into corresponding electric waves or impulses.

Radio (PN)~ A feature that provides unending stream of music based not on the user's library, but on an artist or song selected by the user.

radio button (n)~ A standard control that allows a user to select from a fixed set of mutually exclusive choices.

radio frequency identification (n)~ A technology that uses radio frequencies to identify products. An RFID-capable product has an RFID tag that can transmit information, such as serial number, to an RF reader, which converts the information into digital data that can be sent to a computer.

radio frequency identification sensor (n)~ A type of sensor (such as a proximity sensor) that uses radio frequency identification (RFID) for a numerous purposes, such as identification of physical items, automatic log on, location of people, etc.

RADIUS (n)~ A proposed Internet protocol in which an authentication server provides authorization and authentication information to a network server to which a user is attempting to link.

RADIUS One-Time Password (n)~ An authentication method that supports the authentication to RADIUS server using passwords that change, based on time or on an authentication request counter.

RADIUS OTP (n)~ An authentication method that supports the authentication to RADIUS server using passwords that change, based on time or on an authentication request counter.

radix (n)~ The base of a number system-for example, 2 in the binary system, 10 in the decimal system, 8 in the octal system, and 16 in the hexadecimal system.

raft (v)~ To manipulate an interface element, such as a toolbar, to share horizontal space with when it is docked top or bottom, or vertical space when docked left or right.

ragged hierarchy (n)~ A hierarchy in which one or more levels do not contain members in one or more branches of the hierarchy.

ragged left (adj)~ Of, relating to, or being lines of text whose left ends are not vertically aligned but form an irregular edge. Text may be right-justified and have a ragged left margin. Ragged-left text is used infrequently-typically, for visual effect in advertisements.

ragged right (adj)~ Of, relating to, or being lines of text whose right ends are not vertically aligned but form an irregular edge. Letters and other word-processed documents are commonly left-justified, with ragged-right margins.

RA-GRS (PN)~ The Microsoft Azure service that gives users read access to their secondary storage replica in the event of a failure in their primary storage location.

RAID (n)~ A mechanism for storing identical data on multiple disks for redundancy, improved performance, and increased mean time between failures (MTBF). RAID provides fault tolerance and appears to the operating system as a single logical drive.

RAID ~ (Redundant Array of Inexpensive Disks; pr. 'raid') A way of connecting multiple hard disks together so that a computer sees them as one very large, very fast disk instead of many smaller ones, or to add redundancy so that if any disk in the array is physically damaged, the others have a copy of all the data and nothing is lost. Often called a 'RAID array', even though the acronym already contains the word array. Mostly used on network servers.

RAID-5 volume (n)~ A fault-tolerant volume with data and parity striped intermittently across three or more physical disks. Parity is a calculated value that is used to reconstruct data after a failure. If a portion of a physical disk fails, Windows recreates the data that was on the failed portion from the remaining data and parity. You can create RAID-5 volumes only on dynamic disks on computers running the Windows 2000 Server or Windows Server 2003 families of operating systems. You cannot mirror or extend RAID-5 volumes. In Windows NT 4.0, a RAID-5 volume was known as a striped set with parity.

rail (n)~ In a slider control, the element to the right of the thumb element.

raise an event (v)~ Perform an action, such as clicking a control in a graphical user

interface, leading to the execution of a piece of code.

RAISERROR statement (n)~ A Transact-SQL (T-SQL) statement that displays an error message and sets the @@ERROR automatic variable without changing the flow of the procedure.

RAM (n)~ The temporary storage area the computer uses to run programs and store data. Information stored in RAM is temporary and is designed to be erased when the computer is turned off.

RAM ~ (Random Access Memory; pr. 'ram') The computer's mainmemory, which it uses to hold whatever you are currently working on. The contents of RAM are lost when the computer is switched off. Adding more RAM is often the most cost-effective upgrade for an ageing computer.

RAM cache (n)~ Cache memory that is used by the system to store and retrieve data from the RAM. Frequently accessed segments of data may be stored in the cache for quicker access compared with secondary storage devices such as disks.

RAM chip (n)~ A semiconductor storage device. RAM chips can be either dynamic or static memory.

RAM resident (adj)~ Permanently located in a computer's memory, rather than swapped in and out of memory as needed.

random (adj)~ Specifically, a reference to an arbitrary or unpredictable situation or event. The term is also given an extended, pejorative or semi-pejorative meaning, however, in which it is used in the sense of nonspecific, incoherent, poorly organized, loser, and so on.

random access memory (n)~ The temporary storage area the computer uses to run programs and store data. Information stored in RAM is temporary and is designed to be erased when the computer is turned off.

random access memory cache (n)~ Cache memory that is used by the system to store and retrieve data from the RAM. Frequently accessed segments of data may be stored in the cache for quicker access compared with secondary storage devices such as disks.

random password setting (n)~ A setting that determines the number of characters required to set a password in the connected directory.

range (n)~ A sequence of values.

range (n)~ The range of a light. Objects that are within the range will be lit by the light. Objects beyond the range of the light will not be lit by the light. Range properties only apply to the Spot Light and Point Light.

range (n)~ A set of continuous item identifiers to which the same clock vector applies. A range is represented by a starting point, an ending point, and a clock vector that applies to all IDs that are in between.

range (n)~ The area or distance that a Bluetooth device is able to cover to be successfully paired with another Bluetooth device or computer.

range chart (n)~ A type of chart that displays a set of data points that are each defined by multiple values for the same category. Values are represented by the height of the marker as measured by the value axis. Category labels are displayed on the category axis. The plain range chart fills in the area between the top and bottom value for each data point.

range name (n)~ A name assigned to a cell or group of cells.

range partition (n)~ A table partition that is defined by specific and customizable ranges

of data.

range partitioning (n)~ A way of partitioning a table or index by specifying partitions to hold rows with ranges of values from a single partitioning column.

range query (n)~ A query that specifies a range of values as part of the search criteria, such as all rows from 10 through 100.

range selection (n)~ A selection that consists of a set of objects that are logically sequential or adjacent to each other.

range utilization (n)~ A measure that shows how much of a pay range a given employee has utilized and which is used to determine the potential for additional increases within the range. Range utilization is calculated as follows: (Fixed Pay Rate -€" Range Minimum) / (Range Maximum -€" Range Minimum). If fixed pay rate equals the range maximum, then the range utilization equals 100%, pay at midpoint equals 50%, and pay at minimum equals 0%.

range variable (n)~ A variable that provides access to each element in a sequence in a LINQ query.

rank (v)~ To give a unique cardinal position to each entry, as in stack rank.

ranking (n)~ The process used by Windows XP to rank drivers to determine which is the best for a device. The lower the rank, the better the match of the driver to the device.

ranking function (n)~ Function that returns ranking information about each row in the window (partition) of a result set depending on the row's position within the window.

ranking model (n)~ An XML document that describes how to rank items in search results.

Ransomware ~ a form of malware in which rogue software code effectively holds a user's computer hostage until a 'ransom' fee is paid. Ransomware often infiltrates a PC as a computer worm or Trojan horse that takes advantage of open security vulnerabilities.

Rap (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 15.

RAP (n)~ A Microsoft Services Premier Support offering that helps prevent serious issues from occurring by analyzing the health and risks present in an environment.

rapid application development (n)~ A method of building computer systems in which the system is programmed and implemented in segments, rather than waiting until the entire project is completed for implementation. Developed by programmer James Martin, RAD uses such tools as CASE and visual programming.

RAS account (n)~ A network account that enables a mobile device to remotely access a network.

Raspberry Filling Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a raspberry filling for their cake.

raster (n)~ A rectangular pattern of lines; on a video display, the horizontal scan lines from which the term raster scan is derived.

raster graphic (n)~ An image created as a collection of small, independent dots, called pixels, which are arranged in rows and columns.

raster image (n)~ A display image formed by patterns of light and dark or differently colored pixels in a rectangular array.

rasterization (n)~ The conversion of vector graphics (images described in terms of mathematical elements, such as points and lines) to equivalent images composed of pixel patterns that can be stored and manipulated as sets of bits.

rate and review (PN)~ An option to rate the content and add a review of an app.

rate card (n)~ A sheet of paper that contains the standard rate for the media you buy and sell.

rate engine (n)~ An engine that creates a rating structure and sets up an interface between rating services and carrier companies.

rate of change (n)~ The rate of price change compared with historical data. The rate of change is calculated against a period of days prior to the current price. The output is a percentage.

rate shopping (n)~ The process of locating and displaying all shipping rates that are available for a particular load.

rating (n)~ An evaluation of the relationship between a business and an account or a business contact (for example, good, great, average). Part of the account financial information.

rating (n)~ An assessment of music or video content on a scale that corresponds to the user's opinion of the content.

rating (n)~ An assessment of a Store item on a scale that corresponds to the user's opinion of the content.

rating control (n)~ A control that developers use to create a rating feedback UI element.

rating model (n)~ A model of defined values used to rate an employee's performance, including level of skills.

rating shortcut (n)~ A keyboard shortcut or a remote control that you can use to rate media files such as TV shows or songs.

Ratings and reviews (PN)~ The section in Windows Store containing the user ratings and reviews for a given app.

Rave (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 68.

raw camera image (n)~ A bitmap that the camera obtains and that the developers use to determine additional types of input, such as the size and shape of an object that is placed on the Surface screen.

raw data (n)~ Unprocessed, typically unformatted, data, such as a stream of bits that has not been filtered for commands or special characters.

raw file (n)~ A native format for fast reading and writing of data.

Raw File destination (n)~ An SSIS destination that writes raw data to a file.

Raw File source (n)~ An SSIS source that reads raw data from a file.

raw input (n)~ The input that the digitizer provides. It is the exact coordinates that the hardware provides into the input stack.

raw notification (n)~ A type of notification sent via the Microsoft Push Notification Service to an app running on Windows Phone. The format and meaning of the data is determined by the app.

raw socket (n)~ A socket that provides direct access to lower-level network protocols.

Razor (PN)~ A built-in view engine for ASP.NET MVC that uses the Razor syntax.

Razor (PN)~ An ASP.NET syntax that lets developers combine programming code (in C# or Visual Basic) with HTML markup in Web pages.

Razor syntax (n)~ An ASP.NET syntax that lets developers combine programming code (in C# or Visual Basic) with HTML markup in Web pages.

RBAC role (n)~ The user role that is assigned to a user account, which determines the options that are visible to that user and the tasks that the user can perform in the management interface for Exchange Labs.

RBC (oth)~ The largest bank in Canada as measured by assets and market capitalization.

RBL (n)~ A dynamic list that is maintained inside an organization or by a remote third-party organization that contains a list of known unsolicited e-mail sources. The receiving mail server may refuse connections from addresses that are on a RBL.

RBL service (PN)~ The business that compiles and distributes lists of IP addresses from which spam has originated in the past.

RBS (n)~ The structure that describes an organization's hierarchy. The RBS code defines the hierarchical position that a resource holds in the organization.

RCA connector (n)~ A connector used for attaching audio and video devices, such as stereo equipment or a composite video monitor, to a computer's video adapter.

RCW (n)~ A .NET Framework object that acts as a proxy for a reference-counted COM object.

RD CAP (n)~ A policy that allows the administrator to specify who can connect to an RD Gateway server. Administrators can also specify requirements that users must meet to connect to an RD Gateway server. Administrators can configure RD CAPs by using the Add Roles Wizard during installation of the RD Gateway role service, or by using RD Gateway Manager after installation.

RD Connection Broker (PN)~ A Remote Desktop Services role service that enables a user to load balance sessions in a remote desktop server farm. Additionally, RD Connection Broker enables a user to reconnect to an existing session in a load-balanced remote desktop server farm.

RD Gateway (PN)~ A role service that enables authorized remote users to connect to resources on an internal corporate or private network, from any Internet-connected device. RD Gateway uses Remote Desktop Protocol (RDP) over HTTPS to help form a secure, encrypted connection between remote users on the Internet and the remote computers on which their productivity applications run.

RD Gateway Manager (PN)~ A Microsoft Management Console (MMC) console on an RD Gateway server that administrators can use to configure Remote Desktop connection authorization policies (RD CAPs), Remote Desktop resource authorization policies (RD RAPs), and computer groups associated with RD RAPs. RD Gateway Manager also provides tools to help monitor RD Gateway connection status, health, and events.

RD Gateway server (n)~ A server on which the Remote Desktop Gateway role service is installed. Users connect to network resources on an internal corporate or private network through an RD Gateway server.

RD Gateway server farm (n)~ A group of RD Gateway servers that have been configured to function correctly using a load balancing solution that is in place.

RD Gateway-managed computer group (n)~ A list of network resources (computers) on an internal corporate or private network that users can access through an RD Gateway server. You can configure RD Gateway-managed computer groups by using RD Gateway Manager after installation of the RD Gateway role service.

RD Licensing (PN)~ A Remote Desktop Services role service that manages the Remote Desktop Services client access licenses (RDS CALs). RD Licensing installs, issues, and monitors the availability of RDS CALs on a Remote Desktop license server by using RD Licensing Manager.

RD Licensing Diagnoser (PN)~ A management tool that provides information to help identify possible licensing problems for the Remote Desktop Session Host server.

RD Licensing grace period (n)~ The grace period during which you must purchase and install the appropriate number of RDS CALs for each device or user that needs to connect to a remote desktop server.

RD Licensing Manager (PN)~ A Remote Desktop Services management tool for installing, issuing, and monitoring Remote Desktop Services client access licenses (RDS CALs) on a Remote Desktop license server.

RD Management Console (PN)~ A Server Manager component for Remote Desktop Services used to deploy, configure and manage RDS deployments.

RD RAP (n)~ A policy that allows an administrator to specify the network resources that users can connect to through an RD Gateway server. Administrators can configure RD RAPs by using the Add Roles Wizard during installation of the RD Gateway role service, or by using RD Gateway Manager after installation.

RD Session Host (PN)~ A Remote Desktop Services role service that enables a computer that is running Windows Server to host Windows-based programs or the full Windows desktop.

RD Session Host server (n)~ A server running the RD Session Host role service that hosts Windows-based programs or the full Windows desktop for Remote Desktop Services clients.

RD Session Host server running in redirection mode (n)~ An RD Session Host server running in redirection mode.

RD Virtualization Host (PN)~ A Remote Desktop Services role service that hosts the virtual machines that are made available to users by using RemoteApp and Desktop Connection.

RDA (n)~ A service that provides a simple way for a smart device application to access (pull) and send (push) data to and from a remote SQL Server database table and a local SQL Server Mobile Edition database table. RDA can also be used to issue SQL commands on a server running SQL Server.

RDBMS (n)~ A database system that organizes data into related rows and columns as specified by a relational model.

RDC (PN)~ The client software that enables users to connect to a remote computer that has the Remote Desktop feature enabled or to a remote desktop server.

RDF (n)~ A specification developed by the World Wide Web Consortium (W3C) to define a flexible infrastructure for organizing and managing metadata (data about data) across the Web and the Internet. The Resource Description Framework is intended to provide a

framework based on XML (eXtensible Markup Language) that can standardize the way applications exchange metadata (or metacontent). Possible uses include search engines, content rating systems, and other areas in which exchange of information about data is valuable.

RDF Site Summary (n)~ An XML-based syndication technology that enables websites to distribute content, such as news headlines and blog posts, effeciently to readers.

RDFE (PN)~ The publicly exposed API, which is the front end to the Management Portal and the Service Management API, acting as kind of router for request and traffic to and from the load balancers and fabric controller.

RDFI (n)~ The bank or financial institution that represents the customer or vendor who receives the payment.

RDL (n)~ A set of instructions that describe layout and query information for a report. RDL is composed of XML elements that conform to an XML grammar created for Reporting Services.

RDL Sandboxing (PN)~ A feature that makes it possible to detect and restrict specific types of resource usage by individual tenants in a scenario where multiple tenants share a single Web farm of report servers.

RDMA (n)~ A networking feature that lets one computer directly place information into the memory of another computer.

RDO (n)~ An object-oriented data access tool featured in Visual Basic 4 and later. Remote Data Objects have no native file format of their own; they can be used only with databases complying with the most recent ODBC standards. This feature is popular for its speed and minimal coding requirements.

RDP (n)~ A proprietary protocol to provide remote display and input capabilities over network connections for Windows-®-based applications between two computers.

RDS (PN)~ A server role that provides multi-user access to applications and desktops for non-admin purposes; provides technologies that enable users to access Windows-based programs that are installed on a remote desktop server, or to access the Windows desktop itself, from almost any computing device.

RDS CAL (n)~ A license that is required for a user or a device to connect to a remote desktop server.

RDS Per Device CAL (n)~ One of the two types of Remote Desktop Services client access licenses (RDS CALs) that permits one device (used by any user) to connect to a remote desktop server.

RDS Per User CAL (n)~ One of the two types of Remote Desktop Services client access licenses (RDS CALs) that permits one user to access remote desktop servers from an unlimited number of client computers or devices.

RDVH (PN)~ A Windows server that is running Microsoft Hyper-V Server.

RDWC (n)~ A feature of Windows that when deployed on a Web server, allows a user to connect to remote desktop servers and other computers through a Web browser, even if the full Remote Desktop Connection client is not installed on the user's computer.

reach (n)~ The number of unique users who perform a specific action, such as clicking on a specific ad.

reach (n)~ The potential size of the network and size of the audience of an author.

reach of clicks (n)~ The number of unique users who perform a specific action, such as clicking on a specific ad.

reactivate (v)~ To activate an account after it has been deactivated.

read (n)~ The action of transferring data from an input source into a computer's memory or from memory into the CPU (central processing unit).

read access (n)~ A privilege on a computer system that allows a user to read stored data.

Read mode (PN)~ A mode that is optimized for reading or viewing content and does not support edit functionality.

Read permission (n)~ Authorization for a user or role to read data in a form or report, but not to enter data, make edits, or modify the properties of the form or report.

read/write memory (n)~ Memory that can be both read from and written to (modified). Semiconductor RAM and core memory are typical read/write memory systems. Compare ROM (definition 2).

Read+Write permission (n)~ A designation that indicates that certain users or roles have both Read and Write permissions to an object or data set.

readability statistics (n)~ Information about the reading level of a document in Word.

Read-Access Geo Redundant (PN)~ The Microsoft Azure service that gives users read access to their secondary storage replica in the event of a failure in their primary storage location.

reader (n)~ A person who is allowed to view and read content.

Reader (PN)~ An app that facilitates the reading of PDF and XPS files.

Reader (PN)~ A user role in the Engagement functionality of Social Listening. A person with the Reader role can read posts from streams that are made available to them.

reading indicator (n)~ A visual effect in the navigation pane that shows users where they are in a document.

reading layout view (n)~ A view that is designed for reading documents on a computer screen. The document is resized to fit the screen and most toolbars are removed, but commands are available for navigating, commenting, and looking up words.

Reading List (PN)~ The Windows app where users can save links to content (such as articles or videos) and then quickly return to them later.

reading list (n)~ A feature that allows you to bookmark webpages and articles to read later.

reading order (n)~ The visual order in which characters, words, and groups of words are displayed. English and most other European languages are displayed in left-to-right order and Hebrew, Arabic, Persian, and Urdu are displayed in right-to-left order.

reading pane (n)~ A window in an e-mail program where you can preview an item without opening it.

reading position indicator (n)~ A visual effect in the navigation pane that shows users where they are in a document.

Reading View (n)~ A command on the View menu that gives you the best zoom level for reading notes in Windows Journal.

Reading View (PN)~ A slide show mode that displays content in a manageable window that can be resized and features navigation buttons. This mode is optimized for reviewing presentations, allowing users to get the full experience, complete with animations and

media, while performing other tasks, such as taking notes.

Reading View (PN)~ A view that allows users to read a document, but not to edit it.

reading view (n)~ A view that displays web articles in a distraction-free layout that is optimized for their screen size.

README (n)~ A file containing information that the user either requires or will find informative and that might not have been included in the documentation. Readme files are placed on disk in plain-text form (without extraneous or program-specific characters) so that they can be read easily be a variety of word processing programs.

Readme ~ An electronic document, usually distributed with software, containing additional information- that didn't make it into the printed guides, often giving tips about troubleshooting installation problems, and last minute changes to the software. It is usually entitled 'readme.txt'.

readme file (n)~ A file containing information that the user either requires or will find informative and that might not have been included in the documentation. Readme files are placed on disk in plain-text form (without extraneous or program-specific characters) so that they can be read easily be a variety of word processing programs.

read-only (Adverb) ~ Capable of being retrieved (read), printed or copied but not changed (written) or saved.

Read-only ~ A read-only file has been set so that it cannot be altered or deleted. Also called- write-protected. You can make a file read-only in Windows by right-clicking on it and checking the 'read-only' box under attributes.

Read-Only Administrator user role (n)~ A role that is used to limit users to only viewing status, job status, and properties of objects within their assigned host groups, private clouds, and library servers. A Read-Only Administrator cannot create new objects.

Read-only Analyst (n)~ A security role that grants permissions to administrative users so that they can view all objects in Configuration Manager.

read-only attribute (n)~ A file attribute, stored with a file's directory entry, indicating whether or not a file may be changed or erased. When the read-only attribute is off, the file can be modified or deleted; when it is on, the file can only be displayed.

read-only domain controller (n)~ A domain controller that has read-only copies of directory partitions.

read-only library share (n)~ A library share that is assigned to a private cloud and that is used to share resources to self-service users that deploy services to that private cloud.

read-only memory (n)~ A semiconductor circuit that contains information that cannot be modified.

read-only replicated folder (n)~ A replicated folder on a specific member in which users cannot add or change files.

read-optimized (adj)~ Type of form that is not editable, so viewers can quickly see data, but not modify it.

read-through provider (n)~ An assembly that is associated with an AppFabric cache that is called when a client makes a read' request for a key that does not currently exist. The provider retrieves this from a custom backend store and returns this seamlessly to the client.'

real (n)~ An approximate numeric data type with seven-digit precision. It can hold

positive values from approximately 1.18E - 38 through 3.40E + 38, negative values from approximately -1.18E - 38 through -3.40E + 38, or zero.

real account (n)~ An account balance that is carried forward into a subsequent fiscal period.

real address (n)~ An absolute (machine) address specifying a physical location in memory.

Real Audio, Real Media, Real Video ~ An audio and video compression system from RealMedia Inc which produces files small enough to play back in real time over an ordinary modem, at the cost of a lot of sound/vision quality.

Real Gambling (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

real mode (n)~ An operating mode in the Intel 80x86 family of microprocessors. In real mode, the processor can execute only one program at a time. It can access no more than about 1 MB of memory, but it can freely access system memory and input/output devices. Real mode is the only mode possible in the 8086 processor and is the only operating mode supported by MS-DOS. In contrast, the protected mode offered in the 80286 and higher microprocessors provides the memory management and memory protection needed for multitasking environments such as Windows.

real number (n)~ A data type, in a programming language such as Pascal, that is used for storing, to some limit of precision, values that include both integer and fractional parts.

real storage (n)~ The amount of RAM memory in a system, as distinguished from virtual memory.

real time (n)~ The actual time in which events occur.

RealAudio ~ a communication protocol developed by Real Networks (www.realaudio.com) that allows audio signals to be broadcast over the Internet.

realization (n)~ The number of hours that the contact worked during a time period that are billable, that is, the sum of all hours on all time slips during the period that were billable.

realized gain (n)~ The increase in the value of an asset calculated as the difference in the value of the asset when two economic events occur and when the difference is recognized on the occurrence of the second event as an increase in wealth.

realized gain (n)~ A gain realized due to the difference in exchange rates between the transaction exchange rate and the payment exchange rate for a multicurrency transaction during revaluation.

realized loss (n)~ The decrease in the value of an asset calculated as the difference in the value of the asset when two economic events occur and when the difference is recognized on the occurrence of the second event as a reduction in wealth.

Really Simple Syndication (n)~ An XML-based syndication technology that enables websites to distribute content, such as news headlines and blog posts, effeciently to readers.

realm (n)~ A set of security principles, in a non-Windows networked environment, that are subject to Kerberos authentication.

realm (n)~ A domain or resource established for security reasons.

realm name (n)~ An identifying prefix or suffix appended to a user name to enable

appropriate routing and authentication during a remote logon process.

RealPlayer ~ a widely used program for playing RealAudio files, distributed by Real Networks

real-time (n)~ Of or relating to a time frame imposed by external constraints. Real-time operations are those in which the computer's activities match the human perception of time or those in which computer operations proceed at the same rate as a physical or external process. Real-time operations are characteristic of aircraft guidance systems, transaction-processing systems, scientific applications, and other areas in which a computer must respond to situations as they occur (for example, animating a graphic in a flight simulator or making corrections based on measurements).

real-time animation (n)~ Computer animation in which images are computed and updated on the screen at the same rate at which the objects simulated might move in the real world. Real-time animation allows dynamic involvement by the user because the computer can accept and incorporate keystrokes or controller movements as it is drawing the next image in the animation sequence. Arcade-style animation (such as in a flight simulator program) makes use of real-time animation in translating game plays into on-screen actions. In contrast, in animation done in virtual time, image frames are first calculated and stored and later replayed at a higher rate to achieve smoother movement.

real-time block list (n)~ A dynamic list that is maintained inside an organization or by a remote third-party organization that contains a list of known unsolicited e-mail sources. The receiving mail server may refuse connections from addresses that are on a RBL.

real-time block list service (PN)~ The business that compiles and distributes lists of IP addresses from which spam has originated in the past.

real-time clock (n)~ In PCs, circuits or other hardware elements that provide the system with real-world time.

Real-time Co-authoring (n)~ The ability of multiple authors, who are editing a shared document, to simultaneously see text and formatting changes made by co-authors as they add them.

Real-Time Control Protocol (n)~ A scalable transport control protocol that works with the Real-Time Protocol (RTP) to monitor real-time transmissions to multiple participants over a network-for example, during videoconferencing. The Real-Time Control Protocol, or RTCP, transmits packets of control information at regular intervals and is used to determine how well information is being delivered to recipients.

Real-Time Object-Oriented Modeling diagram (n)~ A graphical model of a system's components and their relationships (the structure), and of the system's response to events (its behavior).

Real-time protection (n)~ An option in Windows AntiSpyware that, when selected, provides spyware protection in real time.

Real-Time Streaming Protocol (n)~ A network protocol, defined in RFC 2326, for controlling one or more digital media streams or a presentation (the aggregate of related media streams).

re-application (n)~ The removal of an item application between two item ledger entries (specifically, between an inventory increase and an inventory decrease) and the creation of a new application for those item ledger entries to other entries.

rearm (v)~ To restore the Windows operating system to the original licensing state. All licensing and registry data related to activation are either removed or reset. Any grace period timers are reset as well.

reason code (n)~ The code that represents the cause for a certain action.

reason ID (n)~ The error (identification) number of the reason for a failure of a bulk import.

rebalance (v)~ To redistribute data or resources more evenly in order to change the processing capacity.

rebar (n)~ A container for child windows with one or more bands. Each band can contain one child window, which can be a toolbar or any other control.

rebar control (n)~ A container for child windows with one or more bands. Each band can contain one child window, which can be a toolbar or any other control.

rebase (v)~ To take all the changes that were committed on one branch and replay them on another one.

rebate (n)~ A refund of an amount after the full amount has been paid.

rebinding state (n)~ A state used by DHCP clients to extend and renew their address lease when the current lease is close to expiring. In this state, the client broadcasts to the network to locate any DHCP server that can either renew or replace its currently leased configuration. The rebinding state begins when 87.5 percent of the client`s lease time has elapsed.

Reboot ~ Restart the computer, either by shutting it down properly and restarting it (a soft reboot), or just switching it off and on again (a hard reboot - should only be used as a last resort).

rebuild (v)~ To recompile the source versions in order to produce a named set of deliverables (software components).

recalculation animation (n)~ An animation effect that plays when the value of a cell is recalculated. The old value slides out of the bottom as the new value slides in from the top.

receipt (n)~ The acceptance of items into inventory.

receipt advice (n)~ A business document that documents a summary of the products a buyer receives from a vendor.

receipt date (n)~ The date transferred goods are received in a warehouse. Receipt date applies to transfer orders.

receipt item (n)~ An itemized product that is received in an operations process.

receipt margin (n)~ A number of days added to receipts to inventory, such as purchases, to protect against unplanned delays.

Receivable Management Services (PN)~ A company that provides accounts receivable and debt collection services.

receive adapter (n)~ An adapter that listens to a protocol-specific address for an incoming message. When the message is received, the receive adapter sends the message through the receive pipeline to eventually be persisted to the MessageBox database. A send adapter accepts a message from a send pipeline and sends it to the send port.

receive file (oth)~ To get a document, video, photo, or other file from another user via Skype.

receive port (n)~ A logical grouping of similar receive locations.

Received Files (n)~ An item on the View menu that displays the list of files that the user has received via instant message conversations.

receiving depository financial institution (n)~ The bank or financial institution that represents the customer or vendor who receives the payment.

recent (n)~ The UI label in Messenger for the aspect of the social view that displays unprioritized recent social activity of friends.

recent searches (n)~ Previous searches that are recommended to users based on what they are typing.

Recently-found songs (PN)~ The collection title for music songs recently found on customer drives or storage, regardless of when they were first ripped or downloaded.

recipient (n)~ The individual or account to whom an item is sent.

Recipient Block list (n)~ An administrator-defined list of recipients for which mail coming in from the Internet should never be accepted.

recipient list (n)~ A file that contains the unique information for each data-merged document.

Recipient Management (PN)~ The role group that gives users the permissions to create and manage mailboxes, public groups, and external contacts. Members can also import new users, track messages sent and received by users, and manage Exchange ActiveSync settings for the organization.

recipient object (n)~ An object that represents a user or resource in Outlook, generally a mail message addressee.

recipient scope (n)~ The specified portion of the Active Directory directory service hierarchy that the Exchange Management Console and the Exchange Management Shell will use for recipient management. When you set the recipient scope to a specific location within Active Directory, you can view and manage all recipients stored in that location and all the containers under it.

Recipient Update Service (n)~ A service that updates the recipient objects within a domain with specific types of information.

Reclaimed (PN)~ Status shown for a task that is assigned in Outlook and tracked in CRM, where the task assignment is declined, and the assigner of the task reassigns the task back to himself or herself.

recognition (n)~ The interpretation of strokes or gestures as characters or operations.

recognition accounting rule (n)~ An accounting rule that prescribes the recognition of revenue and expenditure in accounts and on financial statements.

recognition award (n)~ A one-time award that can be paid out immediately in recognition of special effort, usually in the form of cash, stock, or a gift certificate. Recognition award plans usually involve a nomination and approval process and reward an accomplishment that represents a behavior or value promoted by the company.

recognition error (n)~ A mistake that occurs when the speech recognizer or handwriting recognizer does not interpret your speech or handwriting as you intended.

recognition profile (n)~ The results from your speech training and the recognition settings that you chose.

recognized text (n)~ Text that appears under your handwriting on the writing pad or in

place of the handwritten letter in the character pad.

recognizer (n)~ A software module that recognizes and processes components of one language or group of related languages, or a class of related objects such as musical notes, system gestures, and geometric shapes.

recognizer language (n)~ A language that user can set in handwriting recognizer on Tablet PC.

Recommendation Service (PN)~ A feature in the PowerPivot add-in for Excel that identifies the categories of data in your Excel workbook (such as cities, sports teams, or animals), sends those data categories online to Microsoft, and recommends other sets of similar data that might interest you.

recommendation work stream (n)~ A set of activities that are created for a fixed or variable compensation plan. These activities include calculating a guideline increase or award based on the algorithm associated with a specific compensation action, entering a recommended increase or award, presenting the recommendation for approval (if required), and loading the recommendation to the employee.

recommendations (n)~ A set of features that identify and surface content, people, apps or other items that a user may be interested in.

Recommended (PN)~ The collection title for recommendation items that can be either based on personalization algorithm or not covered by any personalization data.

Recommended artists (PN)~ The collection title for musical artists based on personalization algorithm.

Recommended Charts (PN)~ A feature that presents the user with recommended charts that can be used to display the data provided.

Recommended for you (PN)~ The collection title for items based on personalization algorithm.

Recommended movies (PN)~ The collection title for movies based on personalization algorithm.

Recommended music (PN)~ The collection title for music albums based on personalization algorithm.

Recommended PivotTables (PN)~ A feature that presents the user with recommended PivotTables that can be used as a starting point to analyze the data provided.

recommended point of interest (n)~ A point of interest that you want to highlight to users. You can add extra information and images about recommended points of interest.

Recommended TV (PN)~ The collection title for TV shows based on personalization algorithm.

recompile (v)~ To compile a program again, usually because of changes that needed to be made in the source code in response to error messages generated by the compiler.

reconcile (v)~ To compare and adjust two or more accounts or statements so that the figures agree.

reconciliation (n)~ An adjustment made to two versions of the same fixed or calculated number when they are not the same.

reconciliation (n)~ A practice of adjusting two or more accounts or statements so that the figures agree.

reconfiguration (n)~ The process of changing roles of replicas in the replica-set due to

failures or load balancing.

Reconfiguration Agent (n)~ The Windows Fabric system service responsible for implementing the reconfiguration of replica-sets.

record (n)~ A group of related fields (columns) of information treated as a unit and arranged in a horizontal line in a table or spreadsheet.

record (n)~ The form used to store business information (e.g. open activities, activity history, linked records).

record (v)~ To account for the financial and operational consequences of an economic, resource flow, or accounting event.

record (n)~ An account of an economic transaction.

record (n)~ The data that defines and describes the parties, products, locations, and activities that compose the economic transaction.

Record a closed campaign response (v)~ Check box that indicates if the user wants to create a campaign response based on the information that is included in the opportunity.

Record Keyframe (v)~ To set a property change to occur at a certain time in an animation storyboard.

record layout (n)~ The organization of data fields within a record.

record length (n)~ The amount of storage space required to contain a record, typically given in bytes.

Record Link (n)~ A feature that allows you to associate one or more links (URLs) with a specific record in Dynamics NAV.

record locking (n)~ A technique employed in distributed processing and other multiuser situations to prevent more than one user at a time from writing data to a record.

record selector (n)~ A small box or bar to the left of a record that you can click to select the entire record in Datasheet view and Form view.

record set (n)~ A data structure made up of a group of database records. It can originate from a base table or from a query to the table.

Record Slide Show (PN)~ A feature that enables presenters to capture all the elements of a live presentation, including narration, slides, mouse clicks, A/V playback, and laser pointer highlights. The user can select which presentation aspects to record.

Record Sound troubleshooter (n)~ A troubleshooter that helps find and fix problems that prevent your computer or devices from recording sound.

record source (n)~ The underlying source of data for a form, report, or data access page.

record status (n)~ The condition, at a particular time, of a record.

record structure (n)~ An ordered list of the fields that compose a record, together with a definition of the domain (acceptable values) of each field.

record type (n)~ The representation of all the instances of a particular record. When changes are made to a record type, those changes will affect all individual records of that type.

Record Wall (PN)~ A part of the Activity Feeds solution, where the posts about records are displayed.

Recorded TV Library (PN)~ A Windows library that allows users to store, manage and share all their recorded TV items.

recording (n)~ A feature that allows presenters to capture and publish the audio and visual

components of a meeting for later viewing.

recording (n)~ A stored record of the audio and video components of a meeting.

Records Management (PN)~ The role group that gives users permissions to create and manage organization-wide rules, also known as transport rules. Members of the role group can also track messages sent and received by users.

recordset (n)~ The ActiveX Database Objects (ADO) object used to contain a result set. It also exhibits cursor behavior depending on the recordset properties set by an application. ADO recordsets are mapped to OLE DB rowsets.

recover (v)~ To put back into a stable condition. A computer user may be able to recover lost or damaged data by using a program to search for and salvage whatever information remains in storage. A database may be recovered by restoring its integrity after some problem has damaged it, such as abnormal termination of the database management program.

recover (v)~ To return to a stable condition after some error has occurred. A program recovers from an error by stabilizing itself and resuming execution of instructions without user intervention.

Recover Licenses Wizard (PN)~ A wizard that enables users to either import licenses from one license server on to another or re-install licenses previously installed in their server by re-building the license server database.

recoverable sales tax (n)~ A sales tax levied on purchased products that is deducted from the sales tax levied on the sale of the purchased products when both sales taxes are paid by the same party.

recovery (n)~ A phase of database startup that brings the database into a transaction-consistent state. Recovery can include rolling forward all the transactions in the log records (the redo phase) and rolling back uncommitted transactions (the undo phase), depending on how the database was shut down.

recovery (n)~ After a system failure, the restoration of lost data or the reconciliation of conflicting or erroneous data.

recovery agent (n)~ A person who is issued a public key certificate for the purpose of recovering user data that is encrypted with Encrypting File System (EFS).

recovery branch (n)~ A range of LSNs that share the same recovery branch GUID. A new recovery branch originates when a database is created or when RESTORE WITH RECOVERY generates a recovery fork. A multiple-branch recovery path is possible that includes ranges of LSNs that cover two or more recovery fork points.

recovery collection (n)~ The aggregate of all recovery jobs associated with a single recovery operation.

Recovery Console (n)~ A command-line interface that provides a limited set of administrative commands that are useful for repairing a computer.

Recovery Expert- - - (PN)~ An SMS backup and recovery tool. The Recovery Expert collects information about a site failure scenario by presenting questions. It then evaluates the answers and presents a list of tasks that must be performed to recover the site.

recovery fork point (n)~ The point (LSN,GUID) at which a new recovery branch is started, every time a RESTORE WITH RECOVERY is performed. Each recovery fork determines a parent-child relationship between the recovery branches. If you recover a

database to an earlier point in time and begin using the database from that point, the recovery fork point starts a new recovery path.

recovery goal (n)~ One of the goals that need to be met during recovery. The following three are possible: recovery range, data loss tolerance, and frequency of recovery points for protected data.

recovery image (n)~ A disk image provided for use in repairing or reinstalling an installation of Windows.

recovery interval (n)~ The maximum amount of time that the Database Engine should require to recover a database.

recovery key (n)~ A key that is used for recovering data that is encrypted on a BitLocker volume. This key is cryptographically equivalent to a startup key. If available, the recovery key decrypts the volume master key, which in turn decrypts the full volume encryption key. The recovery key is stored on a USB flash drive. To use the recovery key, a user inserts the USB flash drive and then restarts the computer.

recovery key (n)~ A code used to remove Reset protection without having the Microsoft account credentials that were used to turn it on.

recovery log (n)~ The log where the quorum resource stores data. This data is maintained by the clustering software.

Recovery Manager (PN)~ The Azure service that lets you coordinate the replication and recovery of System Center 2012 private clouds at a secondary location.

recovery media (n)~ Media provided by the OEM to the customer that enables the customer to repair or reinstall their installation of Windows.

recovery mode (n)~ A mode in which BitLocker Drive Encryption prevents access to the encrypted drive, either because the system components have changed or because it needs an authentication key. In this circumstance, the user investigates why BitLocker triggered recovery mode and can either repair the system or enter the recovery password to exit recovery mode.

recovery model (n)~ A database property that controls the basic behavior of backup and restore operations for a database. For instance, the recovery model controls how transactions are logged, whether the transaction log requires backing up, and what kinds of restore operations are available.

recovery option (n)~ Any input provided by the administrator during the recovery process, such as the recovery destination, schedule for recovery, and overwrite options.

recovery password (n)~ For BitLocker Drive Encryption, a numerical password that consists of 48 digits divided into 8 groups. Each group of 6 digits is reduced to modulo 11 (a numerical calculation) before being compressed into corresponding 16 bits of passphrase data. A copy of the passphrase data is stored on disk encrypted by the volume master key and thus an administrator can retrieve the recovery password after Windows has loaded. The recovery password must be entered by using the function keys on the keyboard.

recovery password file (n)~ A BitLocker Drive Encryption file that uses the naming convention: <GUID>.bek (including the BitLocker .fve file extension), which contains the recovery key that is required to unseal the volume during recovery.

recovery path (n)~ The sequence of data and log backups that have brought a database to

a particular point in time (known as a recovery point). A recovery path is a specific set of transformations that have evolved the database over time, yet have maintained the consistency of the database. A recovery path describes a range of LSNs from a start point (LSN,GUID) to an end point (LSN,GUID). The range of LSNs in a recovery path can traverse one or more recovery branches from start to end.

recovery period (n)~ The time period used for depreciating business assets.

recovery point (n)~ The point in the log chain at which rolling forward stops during a recovery.

recovery point (n)~ The date and time of a previous version of a data source that is available for recovery from media that is managed by DPM.

recovery point volume (n)~ A volume on the DPM server that contains the shadow copies and recovery points for a protected data source.

recovery policy (n)~ A type of public key Group Policy object () used by Encrypting File System () that provides for one or more user accounts to be designated as recovery agents.

recovery search (n)~ The administrator action of looking for recoverable items by specifying a set of search parameters. The results of the search can be selected for recovery.

Recovery Services (PN)~ The Microsoft Azure service that facilitates backup and recovery of data.

Recreational Software Advisory Council (n)~ An independent, nonprofit organization established in the fall of 1994 by a group of six trade organizations, led by the Software Publishers Association. The Council's goal was to create a new, objective content-labeling rating system for recreational software and other media such as the Internet.

recruitment project (n)~ A project to coordinate and track a program of recruiting activities and documentation.

rectangle (n)~ A report item that can be used as a container for multiple report items or as a graphical element on a report.

rectangle (n)~ A drawing object made up of four straight lines, connected using right angles (unless the object is skewed).

Rectangle Pan Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a rectangular pan to bake their cake in.

rectangular pixel (n)~ A pixel that generally has an aspect ratio of 3:4, 32:27, or 8:9, meaning that it is slightly less tall than it is wide, or vice versa. Nonsquare pixels are standard in digital video.

rectifier (n)~ A circuit component that passes current flowing in one direction but stops current flowing in the other direction. Rectifiers are used to convert alternating current to direct current.

Recurrence (n)~ An option that allows the user to specify the intervals at which an appointment or task will be repeated.

recurrence (n)~ The regular pattern according to which a scheduled appointment or task is repeated.

recurrence pattern (n)~ The regular pattern according to which a scheduled appointment or task is repeated.

recurring (adj)~ Pertaining to items that occur repeatedly. For example, an appointment

or task that occurs on a regular basis, such as a weekly status meeting or a monthly haircut, can be designated as recurring.

recurring notification (n)~ A repeating type of notification that is based on a specified time interval.

recurring task (n)~ A task that occurs repeatedly during the course of a project. For example, you might define the weekly status meeting as a recurring task.

recursion (n)~ The ability of a routine to call itself.

recursive discovery (n)~ A feature that defines the logic for locating network devices that you want Operations Manager to monitor. Additionally, this feature defines logic that inspects information on a network device so that Operations Manager can attempt to locate other devices using that information.

recursive hierarchy (n)~ A hierarchy of data in which all parent-child relationships are represented in the data.

recursive partitioning (n)~ The iterative process, used by data mining algorithm providers, of dividing data into groups until no more useful groups can be found.

recursive query (n)~ A query made to a DNS server in which the requester asks the server to assume the full workload and responsibility for providing a complete answer to the query. The DNS server will then use separate iterative queries to other DNS servers on behalf of the requester to assist in completing an answer for the recursive query.

recursive section (n)~ A control that contains other controls, can be inserted within itself, and is bound to nested reference fields.

recycle (v)~ To stop and restart the selected application pool. Restarting an application pool causes the application pool to be temporarily unavailable until the restart is complete.

Recycle Bin (PN)~ A temporary storage place for deleted files. The user can use it to retrieve files deleted in error. These deleted files are not actually removed from the hard disk until the recycle bin is emptied.

red book ~ Another name for the CD-DA audio CD format introduced by Sony and Philips, the Red Book standards defines the number of tracks on the disc that contain digital audio data and the error correction routines that save sound from minor data loss.

red book ~

Red Book audio (n)~ A standard compact disc format developed by Philips and Sony.

Red Book audio format (n)~ A standard compact disc format developed by Philips and Sony.

red eye (n)~ A photographic condition where the eyes of the subject appear red, due to the reflection of the camera flash from their eyes.

Red filter (n)~ A filter that is used in B&W photography. Increases contrast more than any other filter.

red gain (n)~ The factor by which the red pixel value has to be multiplied to achieve R=G=B values.

Red Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of red colors.

red, green, blue, alpha (n)~ A model that augments the red, green, blue (RGB) method of combining colors in light-based media, with a fourth color component, alpha, which is used to control color blending. In Open GL, an alpha value of 1.0 corresponds to complete

opacity and a value of 0.0 corresponds to complete transparency.

RedDog Front End (PN)~ The publicly exposed API, which is the front end to the Management Portal and the Service Management API, acting as kind of router for request and traffic to and from the load balancers and fabric controller.

redelegation (n)~ The process of telling your current domain name registrar to point your domain name to a new Web site. You do this by changing the name server information at your domain name registrar. When you redelegate a domain, your domain name registration remains with your current registrar and you will continue to be responsible for domain name fees and renewal with that organization.

red-green-blue (n)~ A color model that describes color information in terms of the red (R), green (G), and blue (B) intensities that make up the color.

redial (v)~ To call the last person called from a phone or device.

redial (n)~ A feature that stores the latest number dialed so that it can be dialed again automatically by pressing a single button.

redirect (v)~ To take action to deflect a phone call after the phone rings but before the call is answered.

Redirect URL (n)~ An option in the General Link Translation options area that specifies the URL used to redirect links that navigate to unpublished sites.

redirected access (n)~ Functionality that redirects all I/O operations over the network to another node that has access to the required drive.

redirection (n)~ The process of writing to or reading from a file or device different from the one that would normally be the target or the source. For example, the MS-DOS or OS/2 command dir >prn redirects a directory listing from the screen to the printer.

redirection (n)~ A process by which Outlook Web Access users who access an Internet-facing Client Access server that is in a different Active Directory site than the site that contains their mailbox can be redirected to the Client Access server that is in the same site as their Mailbox server if that Client Access server is Internet-facing.

redirection (n)~ The process of telling your current domain name registrar to point your domain name to a new Web site. You do this by changing the name server information at your domain name registrar. When you redelegate a domain, your domain name registration remains with your current registrar and you will continue to be responsible for domain name fees and renewal with that organization.

redirection mode (n)~ A mode that is configured on the remote desktop server by using the Remote Desktop Server Configuration tool. A remote desktop server in redirection mode is required to provide clients access to virtual machines in virtual desktop pools or to personal virtual desktops by using RemoteApp and Desktop Connection.

redirector (n)~ Software on a client computer that intercepts requests for information and, when appropriate, directs them to the network. Redirectors can either be built into the client operating system or be part of an added networking package.

redistributable component (n)~ A component that may be redistributed by a third party as part of its own software.

redistribute (v)~ To distribute anew.

redlining (n)~ The process of reviewing and marking up or adding comments to a drawing, document or other file.

redo (n)~ To do over again.

redo (n)~ The phase during recovery that applies (rolls forward) logged changes to a database to bring the data forward in time.

redo phase (n)~ The phase during recovery that applies (rolls forward) logged changes to a database to bring the data forward in time.

redo set (n)~ The set of all files and pages being restored.

redrawn document (n)~ A document that is recreated to resolve a problem or reflect a change, such as a protested bill of exchange or an honored promissory note.

reduce (v)~ In a graphical user interface, to decrease the size of a window. A user can reduce a window either by clicking the appropriate button in the title bar or by clicking the mouse on the border of the window and dragging the border toward the middle of the window.

reduce operation (n)~ An F# operation that performs a computation on successive collection elements and yields a single result of the same type as the elements.

Reduced Functionality Mode (PN)~ A mode which prevents users from logging on to the computer until Windows is activated.

reducing balance depreciation (n)~ A method of calculating the depreciation of a fixed asset as a fixed percentage of its net book value at the start of each depreciation period.

reduction key (n)~ A method that is used to increase or decrease forecast requirements in master planning, based on user defined percentages that are applied during specific periods.

reduction principle (n)~ A method for specifying the consumption of sales forecast requirements and purchase forecast requirements that are used in master scheduling.

reductive stemming (n)~ The process of reducing inflected words to their stem or root form For example, the word swimming' is reduced to the stem 'swim.' Because the word 'swam' can also be reduced to 'swim

Redundant Array of Independent Disks (n)~ A mechanism for storing identical data on multiple disks for redundancy, improved performance, and increased mean time between failures (MTBF). RAID provides fault tolerance and appears to the operating system as a single logical drive.

redundant code (n)~ Code that duplicates a function performed elsewhere-for example, code to sort a list that has already been sorted.

reentrant (adj)~ A routine that can be interrupted during execution and called again before its previous invocation's complete execution.

reentrant code (n)~ Code written so that it can be shared by several programs at the same time. When a program is executing reentrant code, another program can interrupt the execution and can then start or continue execution of that same code. Many operating-system routines are written to be reentrant so that only one copy needs to reside in memory to serve all executing applications. See also relocatable code.

Reestablish Instant Message Connection (v)~ An item on the right-click menu for a participant in a conversation that reconnects the IM client and IM server after disconnection.

Reestablish Instant Message Conversation-€¦ (v)~ The item on the right-click menu for a participant in a conversation that reconnects the selected participant to the current

conversation after disconnection.

refactor (v)~ To restructure code to make it easier to understand and to maintain, while preserving its functionality.

refactoring (n)~ An optimization process in object-oriented programming intended to improve the design or structure of a program without changing its functionality.

refactoring operation (n)~ A command such as Refactor.Rename, which is part of the process of improving your code by changing the internal structure of the code without changing its external behavior.

reference (v)~ To access a variable, such as an element in an array or a field in a record.

reference (n)~ A link in your project to another project, a .NET Framework assembly, or a compatible COM library. Adding a reference to your project allows you to use the referenced item in your project, but does not copy the referenced item to your project folder.

reference (v)~ To relate to another entity.

reference (n)~ A source of related information.

reference (n)~ A statement of the qualifications of an applicant made by a person who knows the applicant.

reference (n)~ The state of being related or referred.

Reference (PN)~ The Books & reference subcategory that contains apps for reference material, such as a dictionary or encyclopedia.

Reference & training (PN)~ The Developer tools subcategory containing apps to help developers with creating reference materials and training for the app they are building.

reference attribute type (n)~ An attribute type in which the values of the attribute are the ObjectIDs (globally unique identifiers) of other resources in ILM 2'.'

Reference Builder (n)~ A feature that enables the user to create, manage and apply standardized citations and references in a document.

reference computer (n)~ In a Microsoft deployment scenario, the computer that contains the master image.

reference data (n)~ A member in a dimension in the context of a dimension table in a relational database.

reference data (n)~ Data characterized by shared read operations and- infrequent changes. Examples of reference data include flight schedules and product catalogs. Windows Server AppFabric offers the local cache feature for storing this type of data.

reference data (n)~ Named entities that have no describing properties or numeric values.

reference data cache (n)~ A Microsoft SQL Server database created on the client computer for maintaining SAP data required by end-user applications during offline and online use.

reference dimension (n)~ A relationship between a dimension and a measure group in which the dimension is coupled to the measure group through another dimension.

reference field (n)~ A field that is associated with another field so that their properties always match. If the properties in one field are changed, the properties in the other field are updated automatically.

reference group (n)~ A group that is associated with another group so that their properties and the properties of the groups and fields they contain always match. If the properties of

one group are changed, the other group is updated automatically.

reference Help (n)~ A form of online Help that contains conceptual and explanatory information.

reference image (n)~ A configured Windows image that includes additional software applications and updated drivers. A single reference installation image can be deployed onto many destination computers.

reference mode (n)~ A word, number, or abbreviation used to identify a unique instance of an entity object type.

reference parameter (n)~ A parameter in which the address of a variable, rather than the explicit value, is passed to the called routine.

reference port (n)~ A port that defines the internal and external ports of an actor reference. Reference ports can be placed only on the outer border of an actor reference shape. They can be used as anchors for bindings.

reference rasterizer (n)~ A software device that interprets and implements the entire Direct3D feature set and is typically used for feature testing or demonstration purposes. Because the Direct3D features are implemented for accuracy, rather than speed, and are implemented in software, the results are not very fast.

reference relationship (n)~ In a model, a reference relationship indicates that participating objects work with one another with none of the dependencies or restrictions that exist in the hosting or containment relationships. For example, a network router and an Exchange Mailbox server may work together in providing e-mail services. In addition to working with the Exchange Server, the network router works with any other server or device that it routes network traffic for. Also, the Exchange Mailbox server works with all the other Exchange Servers and certain global catalog servers in the organization to provide e-mail services.

reference site (n)~ A designated child primary site that is used to regain control of SMS software distribution objects during a recovery operation.

reference table (n)~ The source table to use in fuzzy lookups.

Reference Tools (PN)~ A free floating utility in Microsoft Word for Mac that provides an -€œelectronic bookshelf-€? of key reference tools from directly within the application.

reference type (n)~ A data type that is represented by a reference (similar to a pointer) to the type's actual value. If a reference type is assigned to a variable, that variable references (or points to') the original value. No copy is made. Reference types comprise classes

referenced database (n)~ The database to which the user has established a reference from the current database. The user can create a reference to a database and then call procedures within standard modules in that database.

referenced key (n)~ A primary key or unique key referenced by a foreign key.

referential constraint (n)~ An element of an SSDL schema that specifies the direction of an association with FromRole and ToRole attributes. A referential constraint corresponds to a CSDL navigation property.

referential integrity (n)~ Rules that you follow to preserve the defined relationships between tables when you enter or delete records.

referential integrity (n)~ A constraint in ILM 2' in which a reference attribute cannot have as a value an object ID of a resource which has been deleted.'

referral (n)~ A recommendation from a third party about a person or company with which to do business.

referring domain (n)~ On the Internet and intranets, the address of a network location from which site visitors follow a hyperlink to your Web site.

referring physician (n)~ A physician who directs a patient for treatment to another doctor for specialty care or services.

referring source (n)~ A Web site or page containing a link to your site that a visitor used to reach your site.

refinable managed property (n)~ A managed property that can be used as the basis for a refiner for search results.

refinement dependency (n)~ A kind of dependency that indicates a historical or derivation relationship between two elements with a mapping between them. A description of the mapping may be attached to the dependency in a note.

refiner (n)~ A configuration that is used for query refinement and is associated with one managed property.

Reflect (v)~ A gradient brush option that makes the gradient repeat in alternating reflections.

reflect (v)~ To copy driver binaries, install services, and add registry keys for one or more drivers from a driver package onto a system, without the context of a specific device. A system can be booted from reflected drivers, however full device installation may still be required in order to enable full driver functionality.

reflecting software (n)~ A program that sends messages to a number of users upon receipt of a signal from a single user. A common type of reflector is an e-mail reflector, which forwards any e-mail sent to it to the multiple recipients currently on its list.

reflection (n)~ The process of obtaining information about assemblies and the types defined within them, and creating, invoking, and accessing type instances at run time.

reflection context (n)~ In the .NET Framework, a context that can provide reflection objects to automate certain features and customize them.

reflection image (n)~ The secondary image in the Water attract application that reflects' the ceiling on the water surface instead of showing the rocks underneath the water.'

reflector (n)~ A program that sends messages to a number of users upon receipt of a signal from a single user. A common type of reflector is an e-mail reflector, which forwards any e-mail sent to it to the multiple recipients currently on its list.

reflector (n)~ A filter driver at the top of the kernel-mode device stack that facilitates communication between the kernel-mode device stack and all the user-mode driver framework drivers on the system.

reflexive relationship (n)~ A relationship from a column or combination of columns in a table to other columns in that same table.

reflow (n)~ The process by which content lays itself out dynamically based on the available window or device size.

reflow (v)~ To adjust content layout dynamically based on the available window or device size.

reformat (v)~ In applications, to change the look of a document by altering stylistic details, such as font, layout, indention, and alignment.

refresh (v)~ To update displayed information with current data.

Refresh button (PN)~ The button pressed to update displayed information with current data.

refresh interval (n)~ An interval of time used by of a zone to determine how often to check if their zone data needs to be refreshed. When the refresh interval expires, the secondary master checks with its source for the zone to see if its zone data is still current or if it needs to be updated using a zone transfer. This interval is set in the SOA (start-of-authority) resource record for each zone.

refresh rate (n)~ In computer graphics, the frequency at which the screen is redrawn to prevent the image from flickering. The entire image area of most monitors is refreshed approximately 60 times per second.

refresh Windows (v)~ To reset the Windows operating system using a method that restores PC settings to defaults but retains a user's files and personalization touches.

refresh your PC (v)~ To reset a system using a method that restores PC settings to defaults but retains a user's files and personalization touches.

refreshable (adj)~ In programming, referring to a program module capable of being replaced in memory without affecting processing of the program or the information being used by the program.

ReFS (PN)~ A file system, introduced with Windows Server 8, that provides resiliency to both software and hardware errors. ReFS allows customers to maximize server uptime and prioritize volume availability without the use of expensive storage hardware.

refund (n)~ The return of an amount paid.

refund (v)~ Transfer an amount from the merchant's account back to the customer's account. The amount can be full or partial.

refurbish (v)~ To repair and/or restore programs and settings on a used computer in order to meet certain functional requirements and to allow it to be resold or repurposed.

refurbished PC (n)~ A used computer that has been repaired and/or tested in order to ensure conformance with certain functional requirements and to allow it to be resold or repurposed.

regenerate (v)~ To write again, especially in situations where information is not permanently recorded, such as RAM or a video display.

regex (n)~ A concise and flexible notation for finding and replacing patterns of text. The notation comprises two basic character types: literal (normal) text characters, which indicate text that must exist in the target string, and metacharacters, which indicate the text that can vary in the target string. You can use regular expressions to quickly parse large amounts of text to find specific character patterns; extract, edit, replace, or delete text substrings; or to add the extracted strings to a collection in order to generate a report.

Reggae (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 16.

region (n)~ Contiguous areas of storage on a disk.

region (n)~ A collection of 128 leaf level pages in logical order in a single file. Used to identify areas of a file that are fragmented.

region (n)~ A container of data, within a cache, that co-locates all cached objects on a

single cache host. Cache Regions enable the ability to search all cached objects in the region by using descriptive strings, called tags.

region (n)~ An area within a geo Azure region taxonomy. Does not imply any hierarchy or nesting within a geo. Regions can be assigned to other geos in the future if needed.

region selection (n)~ A selection technique that involves dragging out a bounding outline (also referred to as a marquee) to define the selected objects.

regional format (n)~ The options for setting the phone's default language and the specific country or region where it is spoken.

register (v)~ To provide your name and contact information to an organization so that you can receive product information, updates, and special offers.

register (v)~ To automatically update the progression or output of work done outside of the application.

register (n)~ A record that is used to record the operational, legal, and financial consequences of resource flow events in an accounting system.

registered domain (n)~ The domain that an administrator has registered with a domain registrar.

registered file type (n)~ File types that are tracked by the system registry and are recognized by the programs you have installed on your computer.

Registered Jack-45 connector (n)~ An eight-wire connector used to attach devices to cables. The eight wires are encased in a plastic sheath and color-coded to match corresponding slots in jacks and are used to connect computers to LANs (local area networks) and to link ISDN (Integrated Services Digital Network) devices to NT-1 (Network Terminator 1) devices.

registered parameter number (n)~ An identification number for a registered parameter that has been assigned a function by the MIDI Manufacturers Association and can be accessed through controllers.

REGISTERED SIGN (n)~ The symbol or character used to indicate that a word, phrase, symbol, or design is a registered trademark.

registered trademark symbol (n)~ The symbol or character used to indicate that a word, phrase, symbol, or design is a registered trademark.

registered user (n)~ Someone who visits a Web site and purposefully supplies personal information, such as name, address, and phone number.

registrant (n)~ A person who signs up for an event or a meeting within an event, but has not yet been approved as an attendee.

Registrar (n)~ A service that provides authentication, registration, and routing services.

Registrar ~ An organisation which retains a register of internet- domainnames, who owns them, and where they can be found. Domains under the most popular- TLDs such as .com, .net and .org can be registered with a number of different competing registrars, but you only need to register with one of them. National domains such as .uk usually have only one registrar.

registration (n)~ The process in which a consumer enters information, such as an e-mail address, to acquire a license.

registration (n)~ A procedure to configure self-service password reset for a user.

registration authority (n)~ An entity that identifies and authenticates certificate subjects

on behalf of a certification authority, but does not issue or sign certificates.

registration marks (n)~ Marks placed on a page so that in printing, the elements or layers in a document can be arranged correctly with respect to each other. Each element to be assembled contains its own registration marks; when the marks are precisely superimposed, the elements are in the correct position.

registry (n)~ A database repository for information about a computer's configuration. The registry contains information that Windows continually references during operation, such as: profiles for each user; the programs installed on the computer and the types of documents that each can create; property settings for folders and program icons; what hardware exists on the system; which ports are being used. The registry is organized hierarchically as a tree, and it is made up of keys and their subkeys, hives, and entries.

Registry ~ A file on Windows PCs which contains all the settings for the PC and its software. Can be edited by the user, but this should only be done as absolutely a last resort, as it is possible to trash the operating system if you don't know what you are doing.

registry boot (n)~ The default boot option used by most Windows DNS servers. When registry boot is used, DNS is started and initialized using DNS parameters and their values as they are stored in the Windows registry. You can use a Berkeley Internet Name Domain (BIND) boot file as an alternative to this method of boot configuration for DNS.

registry key (n)~ An identifier for a record or group of records in the registry.

regression (n)~ The reappearance of a previously fixed problem.

regression (n)~ The statistical process of predicting one or more continuous variables, such as profit or loss, based on other attributes in the dataset.

Regression analysis tool (n)~ A tool that performs linear regression analysis by using the least squares' method to fit a line through a set of observations. A user can analyze how a single dependent variable is affected by the values of one or more independent variables.'

regression line (n)~ A straight line that represents the relationship between matched pairs of data from two collections of data. The equation of the line is derived using the least-squares method of linear regression.

regression test (n)~ A test that is run after the daily build to verify that compilation of source code has been built successfully.

regression tree (n)~ A diagram that depicts a decision tree mining model that has been created to analyze continuous numeric data.

regressor (n)~ An input variable that has a linear relationship with the output variable.

regular (adj)~ Having a font weight that corresponds to a weight class value of 400 according to the OpenType specification.

regular expression (n)~ A concise and flexible notation for finding and replacing patterns of text. The notation comprises two basic character types: literal (normal) text characters, which indicate text that must exist in the target string, and metacharacters, which indicate the text that can vary in the target string. You can use regular expressions to quickly parse large amounts of text to find specific character patterns; extract, edit, replace, or delete text substrings; or to add the extracted strings to a collection in order to generate a report.

Regular SKU (n)~ An SKU that may not be back-ordered or pre-ordered.

regulated product (n)~ A product that is regulated by a government authority that requires compliance and audit reporting.

rehydrate (v)~ To activate an idle orchestration in memory from persistent storage as a result of some event taking place, such as a message being received.

reimage (v)~ To reset the virtual machine to its initial state. The initial state is defined by the settings configured on the VHD image file.

re-image (v)~ To uninstall all software on a computer and reinstall a new Windows image.

reinstallation (n)~ A process of repeated installation of a product, feature, tool, kit, pack, etc.

reinstate (v)~ To bring an application out of retirement and back into service.

reinstate charge (v)~ To reintroduce interest or fees that were originally waived for a party.

reject (v)~ To refuse to accept a file or message.

Reject option (n)~ The option of the Directory Services page that rejects all e-mail addresses (spam and legitimate mail) that are not included on the list of e-mail addresses associated with the specified domain. These addresses are rejected at the network perimeter.

relate (v)~ To collect objects in a set.

related events (oth)~ Other events that might be related to the selected event based on time. Time-based correlation helps establish causality by grouping Operational, Performance, System, and Application events that occur over a defined period.

Related Items (PN)~ A feature that enables users to link an item in a SharePoint task list to other items in the site that are related to it.

related link (n)~ A Team Foundation link between two work items.

related sell (n)~ Selling products or services to customers with similar interests on the basis of their established buying patterns or preferences. Additionally, several noncompeting advertisers may join together to develop a single targeted campaign.

relation (n)~ A structure composed of attributes (individual characteristics, such as name or address, corresponding to the columns in a table) and tuples (sets of attribute values describing particular entities, such as customers, corresponding to the rows in a table). Within a relation, tuples cannot be repeated; each must be unique. Further, tuples are unordered within a relation; interchanging two tuples does not change the relation. Finally, if relational theory is to be applicable, the domain of each attribute must be atomic- that is, a simple value, rather than a structure such as an array or a record. A relation in which the domains of all attributes are atomic is said to be normalized or in first normal form.

relation (n)~ A set of objects.

relational database (n)~ A database or database management system that stores information in tables.

relational database management system (n)~ A database system that organizes data into related rows and columns as specified by a relational model.

relational expression (n)~ An expression that uses a relational operator such as < or > to compare two or more expressions. A relational expression resolves to a Boolean (true/false) value. See also Boolean, relational operator.

relational model (n)~ The logical model used to define the tables, columns, and constraints in a relational database.

relational OLAP (n)~ A storage mode that uses tables in a relational database to store multidimensional structures.

relational operator (n)~ An operator that allows the programmer to compare two (or more) values or expressions. Typical relational operators are greater than (>), equal to (=), less than (<), not equal to (<>), greater than or equal to (>=), and less than or equal to (<=).

relational structure (n)~ The record organization used in the implementation of a relational model.

relationship (n)~ An association established between common fields (columns) in two tables. A relationship can be one-to-one, many-to-many, or one-to-many.

relationship (n)~ A logical connection between entities.

Relationship (PN)~ A SmartArt graphic layout type that includes layouts designed to illustrate connections.

relationship (n)~ A connection between objects.

relationship creation (n)~ Configuration flag of a synchronization rule. It determines whether objects should be created automatically in ILM 2'.'

relationship criterion (n)~ A filter to match objects during synchronization.

Relationship Explorer (PN)~ A UI section in the Form Editor that shows existing relationships for a form and will allow you to add to or modify them.

relationship inverse (n)~ The opposite end of a relationship, for example, product.Category and category.Product. In the Entity Framework, Code First detects that the objects are related as inverses.

relationship object (n)~ An object representing a pair of objects that assume a role in relation to each other.

relationship record (PN)~ An instance of a relationship in the Operations Manager database. Relationships are defined between classes to indicate an association between a particular instance of one class and a particular instance of another class

relationship role (n)~ A set of text labels describing the role accounts and contacts play with opportunities as well as other accounts and contacts.

relationship termination (n)~ Configuration flag of a synchronization rule. It indicate whether objects in other connected systems should be disconnected (and perhaps deleted) when the synchronization rule does not apply anymore.

Relationship Type (n)~ A field in the contact form that specifies the relationship of the account to the organization that uses Microsoft CRM.

Relationships (PN)~ The Lifestyle subcategory containing apps to help you with your personal relationships.

Relationships window (n)~ An object tab in which you view, create, and modify relationships between tables and queries.

relative address (n)~ A location, as in a computer's memory, that is specified in terms of its distance (displacement or offset) from a starting point (base address).

relative cell reference (n)~ In a formula, the address of a cell based on the relative position of the cell that contains the formula and the cell referred to. If you copy the formula, the reference automatically adjusts.

relative date (n)~ A range of dates that is specified by using comparison operators and

return data for a range of dates.

relative file location (n)~ An address that is relative to the active document or a hyperlink base.

relative ID (n)~ The portion of a security identifier (SID) that identifies a user or group in relation to the authority that issued the SID. The authority is usually either the local computer or a domain.

relative ID master (n)~ A domain controller that holds the RID operations master role in Active Directory. The RID master is assigned to allocate unique sequences of relative IDs to each domain controller in its domain. As the domain controllers use the IDs allocated, they contact the RID master and are allocated additional sequences as needed. At any time, the RID master role can be assigned to only one domain controller in each domain.

relative identifier (n)~ The portion of a security identifier (SID) that identifies a user or group in relation to the authority that issued the SID. The authority is usually either the local computer or a domain.

relative link (n)~ When a hyperlink uses a path based on a relative link, you can move the file that contains the hyperlink and the hyperlink destination without breaking the hyperlink. Move the file that contains the hyperlink and its destination together.

relative name (n)~ The partial DNS domain name configured in individual resource records to locate and qualify the record within a zone. The relative name is joined to the front of the parent domain (domain of origin) for each resource record to form a fully qualified domain name (FQDN) within the zone. In DNS Manager, the relative name will correspond to fields that use record-specific name properties, such as the Host computer name field used in an address (A) resource record.

relative path (n)~ A path that is implied by the current working directory. When a user enters a command that refers to a file, if the full pathname is not entered, the current working directory becomes the relative path of the file referred to.

relative PIDL (n)~ A PIDL that is relative to a root object in the shell namespace other than the desktop folder. This is commonly the parent folder of the item.

relative positioning (n)~ Placement of an element in the natural HTML flow of a document, but such that its position is offset from the preceding content.

relative reference (n)~ In a formula, the address of a cell based on the relative position of the cell that contains the formula and the cell referred to. If you copy the formula, the reference automatically adjusts.

relative transform (n)~ A type of transformation this is applied to an object repeatedly, relative to the current state of the object. Useful when animating an object that needs to be transformed the same amount each keyframe.

relative URL (n)~ A form of URL in which the domain and some or all directory names are omitted, leaving only the document name and extension (and perhaps a partial list of directory names). The indicated file is found in a location relative to the pathname of the current document.

relative virtual address (n)~ An offset from the address of a module that is loaded in memory.

relay host (n)~ A designated server through which Exchange routes all outgoing messages. The smart host then makes the remote connection. If a smart host is designated,

the Exchange server only needs to transmit to the smart host, instead of repeatedly contacting the domain until a connection is made.

relay hour (n)~ A unit of measure for relays between web services on premises and public endpoints.

relay port (n)~ A type of class port that defines the internal and external ports of an actor class. Can appear only on the border of an actor class. Relay ports relay incoming messages to a contained actor or outgoing messages from a contained actor.

relay server (n)~ A server that manages the exchange of messages or information among different users.

relayed messaging (n)~ A type of messaging service that supports traditional one-way messaging, request/response messaging, and peer-to-peer messaging, using a relayed messaging pattern. With a relayed pattern, an on-premise service connects to the relay service through an outbound port and creates a bi-directional socket for communication tied to a particular rendezvous address. The client can then communicate with the on-premises service by sending messages to the relay service targeting the rendezvous address. The relay service will then -€œrelay-€? messages to the on-premises service through the bi-directional socket already in place. Relayed messaging provides requires the server and client to both be online at the same time.

release (v)~ To relinquish control of a block of memory, a device, or another system resource to the operating system.

release (n)~ A build promoted for use or deployment. A release can be internal and used for further testing or external and released or deployed.

release (n)~ To send a production order from the estimation and scheduling stage to the shop floor so that production can begin.

release activity (n)~ A type of activity that is part of a release record, including dependent, manual, parallel, review, and sequential activities.

release candidate (n)~ A version of a build that has been tested and is ready for release.

Release Clipping Path (v)~ A tool that is used to relinquish the connection between a clipping path and the object that it clips.

Release Compound Path (v)~ A tool that is used to release all of the paths that went into making the compound path.

Release date (n)~ Date on which a film was released.

Release Decade (n)~ Decade in which a film was released.

release hold (v)~ To remove the hold from an item on SPS that exempts it from being subject to the policy set on the site.

release management (n)~ The process of managing software releases from development stage to software release, which includes submitting requests for changes or new features, planning and designing a new release, testing it and assuring quality and finally reviewing and building the new release and accepting it as a release candidate. The next step is deployment of the release in a real environment. Once deployed, the release enters a support phase, where errors, bugs and other issues are reported, collected and resolved.

Release Management (PN)~ The name of the Microsoft application designed for managing software releases from development stage to software release, which allows you more easily and more confidently configure and automate complex deployments to a

variety of target environments, model release processes, track approvals and sign-offs, and display release status graphically.

Release Management Client (PN)~ Component of Release Management for Visual Studio 2013. There are two Client components. The Windows client is a Windows Presentation Foundation (WPF) application that serves as the main interface point to manage release information. This is the component with which most users interact. The Web client is used to act on Approval Requests. This is the interface to which users are directed when following links in e-mail notifications.

Release Management Client for Visual Studio 2013 (PN)~ Component of Release Management for Visual Studio 2013. There are two Client components. The Windows client is a Windows Presentation Foundation (WPF) application that serves as the main interface point to manage release information. This is the component with which most users interact. The Web client is used to act on Approval Requests. This is the interface to which users are directed when following links in e-mail notifications.

Release Management for Microsoft Visual Studio 2013 with Update 2 (n)~ Additional release and deployment tools for Visual Studio 2013 to increase the capabilities in Team Foundation Server 2013 for configuring and automating complex deployments of applications across the desktop, the server, and the cloud, modeling release processes, tracking approvals and sign-offs, and displaying release status graphically.

Release Management for Visual Studio 2013 (PN)~ The name of the client due to which your development and operations teams can enable additional capabilities in Team Foundation Server 2013 so that they can more easily and more confidently configure and automate complex deployments to a variety of target environments. You can also model release processes, track approvals and sign-offs, and display release status graphically.

Release Management Server for Team Foundation Server 2013 (PN)~ The Server component of Release Management for Visual Studio 2013, the heart of release management components. It is a combination of Web and Windows Services that expose contracts used by all other components. This server component also contains a SQL Server database.

release notes (n)~ A document that contains general release information and late changes. It is one of the deliverables leading to the release readiness approved milestone.

Release status (n)~ Information about film's release, including date.

Release to Manufacturing (PN)~ The version of software that's distributed to manufacturers to build into hardware they will make available when the final software is made generally available.

released order (n)~ An order that has been authorized for production.

released work (n)~ Work that is authorized for released orders.

relevance (n)~ A measure of how closely results match a customer's search keywords.

relevance rank (n)~ The position of an item in an ordered list of search results that reflects its relatedness to the search query.

relevance ranking (n)~ The process of ordering search results to reflect their degree of relatedness to the search query.

Relevance view (PN)~ A view in BizTalk Mapper whereby non-relevant siblings of a schema element collapse to provide a more compact view of the schema. This reduces the

need for scrolling, and brings the focus to the useful parts of the schema and map.

relevancy ranking (n)~ The process of ordering search results to reflect their degree of relatedness to the search query.

reliability (n)~ The likelihood of a computer system or device continuing to function over a given period of time and under specified conditions.

reload (v)~ To load a program into memory from a storage device again in order to run it, because the system has crashed or the program's operation was otherwise interrupted.

relocatable address (n)~ In programming, an address that is to be adjusted to reflect the actual place in memory into which a program is loaded for execution. In Get the byte located 12 bytes from this instruction

relocate (v)~ To move programs and blocks of memory about within available space so as to use memory resources flexibly and efficiently. A relocatable program can be loaded by the operating system into any part of available memory rather than into only one specific area. A relocatable block of memory is a portion of memory that can be moved around by the operating system as required; for example, the system might collect several available, relocatable blocks of memory to form one larger block of the size requested for use by a program.

relying party (n)~ An entity that receives and processes identity credentials issued by an identity provider to conduct a business transaction with users of a client application.

relying party application (n)~ A Microsoft ASP .NET application that performs authorization based on the claims that are present in an Active Directory Federation Services (ADFS) security token.

REM statement (n)~ A statement in the Basic programming language and the MSDOS and OS/2 batch file languages that is used to add comments to a program or batch file. Any statement beginning with the word REM is ignored by the interpreter or compiler or the command processor.

remaining availability (n)~ A resource's residual hours on hand minus hours assigned to work on other projects.

remaining cost (n)~ The estimated cost that is yet to be incurred for a task, resource, or assignment.

remaining duration (n)~ The amount of time left to work on a task before the task is completed. This is calculated as follows: Remaining Duration = Duration - Actual Duration.

remaining work (n)~ The amount of work, in terms of a time unit such as hours or days, that is left to be completed on a task. This is calculated as follows: Remaining Work = Work - Actual Work.

remap (v)~ To map a share to a different directory path. E.g. \server\share is originally mapped to d:\oldfiles and later remapped to e:\newfiles.

Remaps (PN)~ The unit of measure for the number of times one IP address is remapped to a different IP address as part of the Reserved IP service.

remark (n)~ A statement in the Basic programming language and the MSDOS and OS/2 batch file languages that is used to add comments to a program or batch file. Any statement beginning with the word REM is ignored by the interpreter or compiler or the command processor.

remark statement (n)~ A statement in the Basic programming language and the MSDOS and OS/2 batch file languages that is used to add comments to a program or batch file. Any statement beginning with the word REM is ignored by the interpreter or compiler or the command processor.

remediation (n)~ The act of bringing a system or piece of software into compliance with a policy or configuration intent.

Remediation Server (n)~ A server used to update the computer state by providing software updates, new anti-virus (AV) signatures, additional intrusion detection signatures, and so on.

remediation server (n)~ A server that is used to update the computer state by providing software updates, new antivirus signatures, additional intrusion detection signatures, and so on.

remind me (PN)~ A feature in Cortana's Notebook where the user can add or manage his reminders.

reminder (n)~ A message that appears at a specified interval before an appointment, meeting, or task that announces when the activity is set to occur.

reminder (n)~ A notification on the app bar that appears at a specified interval before an appointment, meeting, or task announcing when the activity is set to occur.

remittance format (n)~ The file format for remittances to a specific bank.

remote (adj)~ Not in the immediate vicinity, as a computer or other device located in another place (room, building, or city) and accessible through some type of cable or communications link.

remote access (n)~ Part of the integrated Routing and Remote Access service that provides remote networking for telecommuters, mobile workers, and system administrators who monitor and manage servers at multiple branch offices. Users can use Network Connections to dial in to remotely access their networks for services such as file and printer sharing, electronic mail, scheduling, and SQL database access.

Remote Access Service (n)~ Windows software that allows a user to gain remote access to the network server via a modem.

remote Active Directory authentication (PN)~ A feature that enables IT professionals to activate Windows-based computers based on user identities in the Active Directory, without requiring additional infrastructure.

Remote Authentication Dial-In User Service (n)~ A proposed Internet protocol in which an authentication server provides authorization and authentication information to a network server to which a user is attempting to link.

remote business data removal (n)~ A feature that lets enterprises securely remove only enterprise data from personal devices, without affecting any personal data.

remote call control (n)~ The ability to send and receive calls on a desktop phone by using a computer-supported telecommunications application, such as Lync or Communicator.

remote call control URI (n)~ An identifier for a telephone, typically a telephone number or a SIP (Session Initiation Protocol) address.

remote computer (n)~ A computer that you can access only by using a communications line or a communications device, such as a network card or a modem, and a remote access software (such as Remote Desktop Connection).

remote connection (n)~ A feature that lets you work on your computer from a different computer.

Remote connections (PN)~ The list item for reporting that the remote connections feature is problematic. The list is displayed in the problem reporting utility built in to beta versions of Windows Live Sync.

remote control (n)~ The process of viewing and interacting with an existing Remote Desktop Protocol session initiated by another user.

Remote Control Activity (PN)~ The details of system activity of computers that are controlled remotely by a user; the Remote Control Activity is reported on the Remote Control report of Configuration Manager.

remote control software (n)~ Software designed to provide access to a computer from a remote location. These programs are often installed by the computer owner or administrator, and are only a risk if unexpected.

remote data (n)~ Data stored in an OLE DB data source that is separate from the current instance of SQL Server.

remote data access (n)~ A service that provides a simple way for a smart device application to access (pull) and send (push) data to and from a remote SQL Server database table and a local SQL Server Mobile Edition database table. RDA can also be used to issue SQL commands on a server running SQL Server.

Remote Data Objects (n)~ An object-oriented data access tool featured in Visual Basic 4 and later. Remote Data Objects have no native file format of their own; they can be used only with databases complying with the most recent ODBC standards. This feature is popular for its speed and minimal coding requirements.

remote database (n)~ A database which is stored on another computer and is shared out to other users. These users create their own local copy, which is periodically synchronized with the shared database.

remote debugger (n)~ A debugger in a remote debug situation.

remote debugging (n)~ The use of Visual Studio on one computer (the host computer) to debug an application that is running on another computer (the target or remote computer).

Remote Debugging Monitor (n)~ A small application that Visual Studio connects to for remote debugging.

Remote Debugging Tools (PN)~ The tools which let developers conduct a remote debugging from one computer to another device.

Remote Desktop (PN)~ A Windows feature that allows users to connect remotely to a computer and access programs, files, and network resources as though they were sitting at the computer.

Remote Desktop (PN)~ The app that allows users to connect remotely to a computer and access programs, files, and network resources as though they were sitting at the computer.

Remote desktop (PN)~ The Business subcategory containing apps to help people to access one computer from another via the Internet.

Remote Desktop ~ a feature of some versions of Microsoft Windows that allows one computer to serve as the screen, keyboard, and mouse of another; thus, any computer can be operated remotely.

Remote Desktop Connection (PN)~ The client software that enables users to connect to a

remote computer that has the Remote Desktop feature enabled or to a remote desktop server.

Remote Desktop connection authorization policy (n)~ A policy that allows the administrator to specify who can connect to an RD Gateway server. Administrators can also specify requirements that users must meet to connect to an RD Gateway server. Administrators can configure RD CAPs by using the Add Roles Wizard during installation of the RD Gateway role service, or by using RD Gateway Manager after installation.

Remote Desktop Connection Broker (PN)~ A Remote Desktop Services role service that enables a user to load balance sessions in a remote desktop server farm. Additionally, RD Connection Broker enables a user to reconnect to an existing session in a load-balanced remote desktop server farm.

Remote Desktop Easy Print (PN)~ A printer driver in Remote Desktop Services that simplifies the administration overhead to enable printing to supported clients. It enables users to reliably print from a RemoteApp program or from a remote desktop server desktop session to the correct printer on their client computer. It also enables users to have a much more consistent printing experience between local and remote sessions.

Remote Desktop Gateway (PN)~ A role service that enables authorized remote users to connect to resources on an internal corporate or private network, from any Internet-connected device. RD Gateway uses Remote Desktop Protocol (RDP) over HTTPS to help form a secure, encrypted connection between remote users on the Internet and the remote computers on which their productivity applications run.

Remote Desktop Gateway Manager (PN)~ A Microsoft Management Console (MMC) console on an RD Gateway server that administrators can use to configure Remote Desktop connection authorization policies (RD CAPs), Remote Desktop resource authorization policies (RD RAPs), and computer groups associated with RD RAPs. RD Gateway Manager also provides tools to help monitor RD Gateway connection status, health, and events.

Remote Desktop Gateway server (n)~ A server on which the Remote Desktop Gateway role service is installed. Users connect to network resources on an internal corporate or private network through an RD Gateway server.

Remote Desktop Gateway server farm (n)~ A group of RD Gateway servers that have been configured to function correctly using a load balancing solution that is in place.

Remote Desktop IP Virtualization (PN)~ A feature of Remote Desktop Services that enables administrators to assign virtual IP addresses to specific programs running on the remote desktop server or to client sessions running on the remote desktop server.

Remote Desktop license server (n)~ A computer on which the RD Licensing role service is installed. A license server issues RDS CALs to users or devices that connect to a remote desktop server.

Remote Desktop Licensing (PN)~ A Remote Desktop Services role service that manages the Remote Desktop Services client access licenses (RDS CALs). RD Licensing installs, issues, and monitors the availability of RDS CALs on a Remote Desktop license server by using RD Licensing Manager.

Remote Desktop Licensing Diagnoser (PN)~ A management tool that provides information to help identify possible licensing problems for the Remote Desktop Session

Host server.

Remote Desktop Licensing Manager (PN)~ A Remote Desktop Services management tool for installing, issuing, and monitoring Remote Desktop Services client access licenses (RDS CALs) on a Remote Desktop license server.

Remote Desktop licensing mode (n)~ A mode that determines the type of Remote Desktop Services client access licenses (RDS CALs) that a remote desktop server will request from a license server on behalf of a client that is connecting to the remote desktop server.

Remote Desktop profile (n)~ A user profile that is specifically created for remote desktop server sessions.

Remote Desktop Protocol (n)~ A proprietary protocol to provide remote display and input capabilities over network connections for Windows-®-based applications between two computers.

Remote Desktop resource authorization policy (n)~ A policy that allows an administrator to specify the network resources that users can connect to through an RD Gateway server. Administrators can configure RD RAPs by using the Add Roles Wizard during installation of the RD Gateway role service, or by using RD Gateway Manager after installation.

Remote Desktop Server Configuration (PN)~ A Remote Desktop Services management snap-in that you can use to configure settings for new connections, modify the settings of existing connections, and delete connections. You can configure settings on a per-connection basis or for the server as a whole.

Remote Desktop Server Extension (PN)~ A Windows Server feature that adds Remote Desktop Services-specific tabs to the Properties sheet of a user account.

remote desktop server farm (n)~ A group of servers that are in one location and that are networked together for the purpose of sharing workload.

remote desktop server group (n)~ A group of two or more remote desktop servers that you can manage via Remote Desktop Server Manager.

Remote Desktop Services (PN)~ A server role that provides multi-user access to applications and desktops for non-admin purposes; provides technologies that enable users to access Windows-based programs that are installed on a remote desktop server, or to access the Windows desktop itself, from almost any computing device.

Remote Desktop Services client access license (n)~ A license that is required for a user or a device to connect to a remote desktop server.

Remote Desktop Services Licensing Web site (n)~ A secure Microsoft Web site that is designed to help you manage your Windows 2000 or later license server and for you to obtain Remote Desktop Services client access license tokens. All information collected at this site is used to help you manage your Remote Desktop Services resources.

Remote Desktop Services Network Fair Share (PN)~ A feature that dynamically distributes available bandwidth across sessions based on the number of active sessions to enable equal bandwidth utilization.

Remote Desktop Services Per Device client access license (n)~ One of the two types of Remote Desktop Services client access licenses (RDS CALs) that permits one device (used by any user) to connect to a remote desktop server.

Remote Desktop Services Per User client access license (n)~ One of the two types of Remote Desktop Services client access licenses (RDS CALs) that permits one user to access remote desktop servers from an unlimited number of client computers or devices.

Remote Desktop Services session-based desktop deployment (n)~ A session-based deployment that allows users to connect to collections that include published RemoteApp programs and session-based desktops.

Remote Desktop Session Host (PN)~ A Remote Desktop Services role service that enables a computer that is running Windows Server to host Windows-based programs or the full Windows desktop.

Remote Desktop Session Host Configuration (PN)~ An MMC management snap-in for Remote Desktop Services. You can use Remote Desktop Session Host Configuration to configure settings for new connections, modify the settings of existing connections, and delete connections. You can configure settings on a per connection basis, or for the server as a whole.

Remote Desktop Session Host server (n)~ A server running the RD Session Host role service that hosts Windows-based programs or the full Windows desktop for Remote Desktop Services clients.

Remote Desktop Virtualization Host (PN)~ A Windows server that is running Microsoft Hyper-V Server.

Remote Desktop Virtualization Host Agent (PN)~ A service that is running on any machine that has the RD Virtualization role service installed.

Remote Desktop Web Access Configuration (PN)~ In Remote Desktop Services, the site where you can configure the RD Web Access Web Part.

Remote Desktop Web Connection (n)~ A feature of Windows that when deployed on a Web server, allows a user to connect to remote desktop servers and other computers through a Web browser, even if the full Remote Desktop Connection client is not installed on the user's computer.

Remote Desktops (PN)~ A snap-in that allows users to manage Remote Desktop connections to remote desktop servers and computers that are running Windows Server.

remote device wipe (n)~ A technology that enables the Exchange server to set a mobile device to erase all data the next time the device connects to the Exchange server.

Remote Diagnostics (n)~ Remote diagnostics is the ability to evaluate the current status of electronic equipment from a remote location.

Remote Direct Memory Access (n)~ A networking feature that lets one computer directly place information into the memory of another computer.

remote Distributor (n)~ A server configured as a Distributor that is separate from the server configured as the Publisher.

remote domain (n)~ A specially-configured domain that defines settings for mail flow based on the destination domain of each e-mail message. Administrators can configure specific settings for a specific destination domain, or configure default settings for all destination domains. In this way, they can control the types of messages that are sent to adomain. They can also apply message format policies and acceptable character sets for messages that are sent from users in their organization to the remote domain.

Remote Function Call (n)~ A SAP protocol that enables external systems to call SAP

ABAP function modules. RFCs enable remote calls between two SAP systems or between a SAP system and a non-SAP system.

Remote Health Check (n)~ A feature that remotely provides information about how well the system is functioning, how customers use it and about some of the problems they encounter.

remote host (n)~ A Web server on a separate server computer. A remote host is connected to other servers by a network connection.

Remote Installation Server (n)~ An optional component that remotely installs Windows XP Professional. RIS installs the operating system on remote boot-enabled client computers by connecting the computer to the network, starting the client computer, logging on with a valid user account, and copying an operating system image to the client computer.

Remote Installation Services (n)~ Software services that allow an administrator to set up new client computers remotely, without having to visit each client. The target clients must support remote booting.

remote login (n)~ The action of logging in to a computer at a distant location by means of a data communications connection with the computer that one is presently using. After remote login, the user's own computer behaves like a terminal connected to the remote system. On the Internet, remote login is done primarily by rlogin and telnet.

remote login identification (n)~ The login identification assigned to a user for accessing remote procedures on a remote server.

remote management (n)~ For an administrator, the process of managing Windows SteadyState Windows Disk Protection from a remote computer through Active Directory Group Policy.

remote media connection (n)~ A Windows Media Player (WMP) specific feature that allows you to use the Internet to access music, pictures and videos available on your home network. The feature must be activated on at least two computers in order to work.

remote networking (n)~ A communications program located on the mobile device that is used to create, store, and establish modem connections to remote computers and networks.

remote partition (n)~ A partition whose data is stored on a server running an instance of Analysis Services, other than the one used to store the metadata of the partition.

remote procedure call (n)~ A communication mechanism that allows computers to communicate with one another over a network. An RPC consists of a procedure identifier, parameters passed to the procedure, and a value returned to the caller (client computer) after the procedure has executed on the remote system (server computer).

remote resource (n)~ A computing resource or application that is offered in a remote workspace. Remote Desktop Server provides applications and desktops as remote resources. Other types of remote resources can be defined through extensibility.

remote roaming boundary (n)~ A roaming boundary in which the SMS site distribution points are remote (not well-connected) to the Advanced Client and software packages are not available locally to that client. Remote roaming boundaries are typically configured for wireless networks, VPNs, dial-up connections, and, sometimes, branch offices.

remote sensor (n)~ The device that receives infrared (IR) signals from other devices, like a remote control. Remote sensors could be peripheral devices, or could also be built into

either computers or monitors.

Remote Server Administration Tools (PN)~ A feature in Windows Server that enables remote management of Windows Server operating systems by allowing users to open and run management tools on a remote computer.

remote service binding (n)~ A Service Broker object that specifies the local security credentials for a remote service.

remote session (n)~ A connection to another computer on a network.

remote site (n)~ An SMS/Configuration Manager site to which a client is assigned and has a network connection, but the client is not currently located.

remote stored procedure (n)~ A stored procedure located on one instance of SQL Server that is executed by a statement on another instance of SQL Server.

remote table (n)~ A table stored in an OLE DB data source that is separate from the current instance of SQL Server.

remote terminal (n)~ A terminal that is located at a site removed from the computer to which it is attached. Remote terminals rely on modems and telephone lines to communicate with the host computer.

Remote Tools (PN)~ An SMS/Configuration Manager feature that an SMS/Configuration Manager administrator uses to directly control, monitor, or analyze client computers.

Remote Tools Client Agent (n)~ A component of the SMS/Configuration Manager Remote Tools feature. It is a program running on an SMS/Configuration Manager client that enables an SMS/Configuration Manager administrator to use remote troubleshooting tools to diagnose client problems or remotely control a client.

Remote Tools for Microsoft Visual Studio 2013 Update 2 (n)~ A set of tools enabling remote debugging, remote testing, and unit testing on computers that don't have Visual Studio installed.

Remote Tools for Visual Studio (PN)~ Remote Tools for Visual Studio enables remote debugging, remote testing, and unit testing on computers that don't have Visual Studio installed.

Remote Tools for Visual Studio 2013 (PN)~ Remote Tools for Visual Studio enables remote debugging, remote testing, and unit testing on computers that don't have Visual Studio installed.

Remote Tools for Visual Studio 2013 Language Pack (n)~ Language Pack is a free add-on that you can use to switch the language that's displayed in the Performance Tools for Remote Tools for Visual Studio 2013 user interface.

Remote Tools Operator (n)~ A security role that grants permissions to administrative users so that they can run and audit remote administration tools.

remote user (n)~ An external user with a persistent Active Directory identity within the organization.

Remote Video (n)~ A button in a Video conversation window that displays the video feed from the other person in the current video conversation.

remote viewer (n)~ An audience member who is not physically located in the same room as the presenter.

remote workspace (n)~ A workspace offered by a publisher, consisting of applications, shared desktops, and personal desktops (at least some of which are accessed remotely).

Each user gets a personally filtered view of the items in the remote workspace.

RemoteApp (PN)~ A feature of Remote Desktop Services that enables the user to access a program remotely through Remote Desktop Services but have it appear as if it is running on the user's local computer. Users can run RemoteApp programs side by side with their local programs.

RemoteApp (PN)~ The service type which provides remote desktop application as-a-service.

RemoteApp and Desktop Connection (PN)~ A customized view of RemoteApp programs and virtual desktops that the administrator makes available to users that are using Windows 7 or RAD Web Access.

RemoteApp and Desktop Connection Management (PN)~ A Windows Server role service for Remote Desktop Services (i.e. a RD subrole) that houses the assignment, connection handling, and execution designation policy, thus defining the contents and availability of a remote workspace.

RemoteApp and Desktop Connection Web service (n)~ A Web service that is installed as a part of RAD Web Access to help client computers keep in sync with workspaces.

RemoteApp and Desktop Web Access Configuration (PN)~ An option on the Remote Desktop Services menu on the Administrative Tools menu that opens the RAD Web Access Web site for administrative purposes.

RemoteApp Manager (PN)~ A Remote Desktop Services management snap-in for managing RemoteApp programs.

RemoteApp Users (PN)~ The resource for the RemoteApp service type of the App Services service.

RemoteFX (PN)~ A technology that delivers a rich user experience by rendering content on the server by using graphics processing units (GPUs) or hardware.

RemoteFX 3D video adapter (n)~ The synthetic video driver that is installed on the virtual desktop. RemoteFX uses GPU Virtualization, a technology that exposes a virtual graphics device to a virtual machine, to expose a WDDM driver with the virtual desktop, and allows multiple virtual desktops to share a single GPU on a Hyper-V server. The virtual GPU is used to perform host side rendering of 3D and other content. This enables support for all graphics types by sending highly compressed bitmap images to the endpoint device in an adaptive manner.

RemoteFX Adaptive Graphics (PN)~ A feature that enables a seamless delivery of virtual desktop and RemoteApp programs by using the Windows Aero and 3-D experience across a variety of networks, including networks where bandwidth is limited and latency is high.

RemoteFX decoder (n)~ A hardware decoder that can be installed on a client device and that decodes bitmaps that have transferred from the virtual desktop to the client computer.

RemoteFX decoding (n)~ The decoding process used with the Microsoft RemoteFX technology, including six functional stages which are in reverse order to the operations of the encoding process.

RemoteFX encoder (n)~ An optional hardware encoder that can be installed for additional scalability on the RemoteFX server. The RemoteFX encoder allows encoding on the processor, on the GPU, or on dedicated hardware. This flexible encoding process

provides high fidelity and scalability. In computers where the processors are consistently busy, the dedicated hardware ensures that the user experience is not affected.

RemoteFX encoding (n)~ The encoding process used with the Microsoft RemoteFX technology, including seven functional stages in the encoding path.

RemoteFX for RD Session Host (PN)~ RemoteFX running on an RD Session Host server.

RemoteFX for RD Virtualization Host (PN)~ RemoteFX running on an RD Virtualization Host server.

RemoteFX Media Streaming (PN)~ A feature that enables communication of media objects through a streaming process using RemoteFX.

RemoteFX server (n)~ A server running RemoteFX.

RemoteFX-enabled virtual desktop (n)~ A virtual desktop on which RemoteFX can be run.

remotely administered server (n)~ A server that you can administer by using a different computer. You typically access this type of server by using a network connection. A remotely administered server can have a local keyboard, mouse, or video card and monitor.

remoting (n)~ The process of communication between different operating system processes, regardless of whether they are on the same computer.

removable (oth)~ Capable of being taken out from a list, database, or other item, or to be uninstalled.

removable drive (n)~ A removable storage device, such as an external hard disk or USB flash drive, used for increasing storage space on a computer or for transferring information between computers.

removable media (n)~ Anything used for information storage that is designed to be easily inserted into and removed from a computer or portable device. Common removable media include CD and DVD discs, as well as removable memory cards.

Removable Storage (n)~ A service used for managing removable media (such as tapes and discs) and storage devices (libraries). Removable Storage allows applications to access and share the same media resources.

removal tool (n)~ Software code used by antivirus or anti-spyware programs to remove malicious software or potentially unwanted software from a computer.

remove (v)~ To take out objects from a list, database, or other item, or to uninstall a program.

Remove association (v)~ An option that allows the user to remove the link between an item and a To Do.

Remove Background (PN)~ An option that isolates the foreground portion of an image and make the background transparent.

remove call (PN)~ A button on the call progress screen for Voice over LTE (VoLTE). This button is used when a user is in a conference call and needs to drop one of the participants without ending the conference call.

Remove From Conference (oth)~ An item on the right-click menu for a conference participant that removes the selected participant from the current conference.

Remove from Contact List (PN)~ An item on a contact's context menu to remove a

contact from the contact list.

Remove from Group (PN)~ An item that deletes a selected contact from a contact group, when the contact is right-clicked.

Remove from This Conversation (oth)~ An item on the right-click menu for a contact that disconnects the selected participant from the current conversation.

Rename (v)~ An item on the right-click menu for a conference participant that renames the selected conference participant.

Rename Group (PN)~ An item that lets a user rename a group, when the group name in the Contacts list is right-clicked.

Rename this To Do (v)~ An option that allows the user to change the name of a To Do item in the list of tasks.

render (v)~ To display a graphic image from a data file on an output device such as a video display or printer.

render transform (n)~ A type of transformation that modifies the appearance of the element but is applied after the layout pass is complete. By using the RenderTransform property instead of the LayoutTransform property, you can obtain performance benefits.

rendered output (n)~ The output from a rendering extension.

rendered report (n)~ A fully processed report that contains both data and layout information, in a format suitable for viewing (such as HTML).

rendering (n)~ The creation of an image containing geometric models, using color and shading to give the image a realistic look. Usually part of a geometric modeling package such as a CAD program, rendering uses mathematics to describe the location of a light source in relation to the object and to calculate the way in which the light would create highlights, shading, and variations in color. The degree of realism can range from opaque, shaded polygons to images approximating photographs in their complexity.

rendering (n)~ The process of applying effects to or resizing an image according to adjustments or settings specified by the user.

rendering extension (n)~ A plug-in that renders reports to a specific format (for example, an Excel rendering extension)

rendering intent (n)~ In color management, the approach used to map the colors specified in an image file to the color gamut of your monitor or printer. The color gamut is the range of color that a device can produce.

rendering object model (n)~ Report object model used by rendering extensions.

renewal only mode (n)~ A configuration mode for the Certificate Enrollment Web Service in which it will only process renewal requests.

reorder margin (n)~ A number of days added to normal procurement time for items to protect against unplanned delays.

reorder point (n)~ The point at which an item should be reordered based on current inventory and customer buying patterns.

repackage (v)~ To take encoded data in one digital container file format and place it in another without transcoding. For example, from MP4 to ISMV.

repaginate (v)~ To recalculate the page breaks in a document.

repaint (v)~ To redraw the screen. The Repaint method completes any pending screen updates for a specified form.

reparenting (n)~ The process of dynamically rearranging a hierarchy of SharePoint sites, typically used during a migration.

re-parenting (n)~ The process of dynamically rearranging a hierarchy of SharePoint sites, typically used during a migration.

repeat (v)~ A command in Microsoft Word that causes all information contained in either the last command dialog box or the last uninterrupted editing session to be repeated.

repeat (v)~ To replay a portion or the entirety of a digital media file.

Repeat (v)~ A gradient brush option that makes the gradient repeat.

Repeat (v)~ An option that allows the user to specify the intervals at which an appointment or task will be repeated.

repeat count (n)~ The number of times to repeat a portion of an animation storyboard.

repeat delay (n)~ A delay of the amount of time that elapses before a character begins repeating when you hold down a key.

repeat rate (n)~ The rate at which characters repeat when a user holds down a key.

repeater control (n)~ A control that developers use to iterate over a small set of data, bind that data to an HTML template, and display it in any repeated UI.

Repeating Bending Process (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow. Maximizes both horizontal and vertical display space for shapes. Does not emphasize directionality.

repeating field (n)~ A field in the data source that can occur more than once. Controls such as bulleted, numbered, and plain lists; repeating sections; and repeating tables can be bound to repeating fields.

repeating group (n)~ A group in the data source that can occur more than once. Controls such as repeating sections and repeating tables are bound to repeating groups.

repeating section (n)~ A control on a form that contains other controls and that repeats as needed. Users can insert multiple sections when filling out the form.

repeating section content control (n)~ ?A content control that enables a user the repeat its contents as many times as the user wants to repeat it.

repeating table (n)~ A control on a form that contains other controls in a table format and that repeats as needed. Users can insert multiple rows when filling out the form.

repetition (n)~ An instance of a cycle in a multiple cycle series.

replace (v)~ To put new data in the place of other data, usually after conducting a search for the data to be replaced. Text-based applications such as word processors typically include Find and Replace commands.

Replace with (v)~ A UI element below which are listed items. A user can select an item from the list and it will be put in the place of another item.

replacement cost (n)~ The current cost of replacing an existing asset with a similar asset with equivalent operational capability.

replacement software (n)~ A software package that takes the place of the previously used software package.

replacer (n)~ A function used for replacing the value of text, digtal etc.

replenishment (n)~ An inventory management process in which a warehouse location is automatically or manually restocked based on predefined criteria to maintain the correct inventory levels at the location.

replica (n)~ In Active Directory replication, one instance of a logical Active Directory partition that is synchronized by means of replication between domain controllers that hold copies of the same directory partition. Replica can also refer to an instance of an object or attribute in a distributed directory.

replica (n)~ In the File Replication service (FRS), a computer that has been included in the configuration of a specific replica set.

replica (n)~ A complete copy of protected data residing on a single volume on the DPM server. A replica is created for each protected data source after it is added to its protection group. With co-location, multiple data sources can have their replicas residing on the same replica volume.

replica (n)~ A copy of a database that is a member of a replica set and can be synchronized with other replicas in the set.

replica (n)~ A particular repository of information to be synchronized.

replica creation (n)~ The process by which a full copy of data sources, selected for inclusion in a protection group, is transferred to the DPM storage pool. The replica can be created over the network from live data on the file server or from a tape backup system. Replica creation is an initialization process that is performed for each volume when the volume is added to a protection group.

replica ID (n)~ A value that uniquely identifies a replica.

replica key (n)~ A 4-byte value that maps to a replica ID in a replica key map.

Replica server (n)~ The server that hosts virtual machines that is maintained in reserve in the event that the primary server (and its primary virtual machines) must go offline. The Replica virtual machines are kept up to date with any changes that occur on the primary virtual machines by the process of replication.

replica set (n)~ One or more shared folders that participates in replication.

replica set (n)~ The complete list of replicas that backs a particular failover unit and their associated roles.

replica set topology (n)~ The order in which changes are propagated from replica to replica. Topology determines how quickly changes in another replica appear in your replica.

replica tick count (n)~ A monotonically increasing number that is used to uniquely identify a change to an item in a replica.

Replica virtual machine (n)~ A virtual machine running on the Replica server that receives changes that are detected on the corresponding primary virtual machine.

replica volume (n)~ A volume on the DPM server that contains the replica and shadow copies for a protected volume.

replication (n)~ The process of copying content and/or configuration settings from one location, generally a server node, to another. Replication is done to ensure synchronization or fault tolerance.

Replication ID (n)~ A 16-byte value generated from the unique identifier on a device, the current date and time, and a sequence number. It is used to identify a particular device, component, user, or session.

replication latency (n)~ In Active Directory replication, the delay between the time an update is applied to a given replica of a directory partition and the time it is applied to

some other replica of the same directory partition. A server receives changes no sooner than either it is notified of a change from its neighbor in the same site or its periodic replication timer expires.

Replication Link Analyzer (PN)~ A Configuration Manager tool that detects, analyzes, and remediates database replication issues in a hierarchy.

Replication Management Objects (PN)~ A managed code assembly that encapsulates replication functionalities for SQL Server.

replication policy (n)~ Rules that define how and when replication is performed.

replication topology (n)~ In the File Replication service (FRS), the interconnections between replica set members. These interconnections determine the path that data takes as it replicates to all replica set members.

replication topology (n)~ In Active Directory replication, the set of connections that domain controllers use to replicate information among themselves.

reply (v)~ To answer an instant message.

Reply All (PN)~ An option that initiates an e-mail response addressed to all of the recipients on the To or Cc lines of the original message.

reply comment (PN)~ A reply to a comment in a document.

Reply to All (PN)~ An option that initiates an e-mail response addressed to all of the recipients on the To or Cc lines of the original message.

report (n)~ The presentation of information about a given topic, typically in printed form. Reports prepared with computers and appropriate software can include text, graphics, and charts. Database programs can include special software for creating report forms and generating reports. Desktop publishing software and laser printers or typesetting equipment can be used to produce publication-quality output.

report (n)~ A database object that prints information formatted and organized according to your specifications.

report (n)~ Information produced from the metrics warehouse of Visual Studio Team Foundation.

report (n)~ A visual display of data in a dashboard that can be coordinated with other report views by using filters.

report (v)~ To update the progression or output of work done outside of the application. The reporting action is taken by a person.

report (n)~ A document that is generated by an application.

Report a service problem (PN)~ A link to enable users to notify Microsoft support in the event of an outage when one or more Office 365 services are down.

Report a violation (PN)~ The Sway link that opens an email that allows users to report a violation of Sway's terms of use.

Report Abuse (PN)~ The link to the form where a user can report violations of the terms of use. Contextually, it's understood that the abuse in question is poor conduct, such as obscene language or threats.

Report Builder (PN)~ A report authoring tool that features a Microsoft Office-like authoring environment and features such as new sparkline, data bar, and indicator data visualizations, the ability to save report items as report parts, a wizard for creating maps, aggregates of aggregates, and enhanced support for expressions.

Report Center (PN)~ A feature that leverages Excel Services and SharePoint Server to provide easy and powerful reporting capabilities.

Report Consolidator (PN)~ A Web Analytics component that is responsible for aggregating analytics data.

report data pane (n)~ A data pane that displays a hierarchical view of the items that represent data in the user's report. The top level nodes represent built-in fields, parameters, images, and data source references.

Report Data Provider-based report (n)~ A report where the data source is defined in a Report Data Provider (RDP) class.

Report database (n)~ The SQL Server database that stores DPM reporting information.

report definition (n)~ The blueprint for a report before the report is processed or rendered. A report definition contains information about the query and layout for the report.

report definition (n)~ A building block that uses a row definition, a column definition, and an optional reporting tree definition to build a report.

Report Definition Language (n)~ A set of instructions that describe layout and query information for a report. RDL is composed of XML elements that conform to an XML grammar created for Reporting Services.

Report Designer (n)~ A collection of design surfaces and graphical tools that are hosted within the Microsoft Visual Studio environment.

Report Designer (PN)~ An application that uses Microsoft Dynamics ERP data to create reports in Management Reporter.

report execution snapshot (n)~ A report snapshot that is cached. Report administrators create report execution snapshots if they want to run reports from static copies.

report footer (n)~ A report section used to place information that normally appears at the bottom of the page, such as page numbers, dates, and sums.

report generator (n)~ An application, commonly part of a database management program, that uses a report form created by the user to lay out and print the contents of a database. A report generator is used to select specific record fields or ranges of records, to make the output attractive by including such features as headings, running heads, page numbers, and fonts.

report group (n)~ A set of report definitions that can be used to generate more than one report simultaneously.

report header (n)~ A report section used to place information, such as a title, date, or report introduction, at the beginning of a report.

report history (n)~ A collection of previously run copies of a report.

report history snapshot (n)~ Report history that contains data captured at a specific point in time.

report intermediate format (n)~ Internal representation of a report.

report item (n)~ Entity on a report.

report layout template (n)~ A pre-designed table, matrix, or chart report template in Report Builder.

report library (n)~ A structured set of files (row worksheets, column worksheets and reporting trees) that are combined to create a financial report.

report link (n)~ URL to a report.

report link (n)~ The URL or network location where a generated report is stored.

report lost card (PN)~ A rich button in the Wallet feature that contains the contact phone number for the card issuer. Tapping the button calls the phone number.

Report Manager (n)~ A Web-based report management tool

report model (n)~ A metadata description of business data used for creating ad hoc reports.

Report Operator user role (n)~ In System Center Operations Manager 2007, the user role that grants members the rights to access and run reports. Because Virtual Machine Manager reports are created through Operations Manager, Virtual Machine Manager administrators must be a member of the Report Operator user role to view and run reports in the Virtual Machine Manager Administrator Console.

report part (n)~ A report item that has been published separately to a report server and that can be reused in other reports.

report period (n)~ The span of time during which you track and update a task that the workgroup manager has assigned to you. You can change the unit of time to days, weeks, or a single unit of time for the whole task.

Report Processor component (n)~ A component that retrieves the report definition from the report server database and combines it with data from the data source for the report.

Report Project (n)~ A template in the report authoring environment.

Report Project Wizard (n)~ A wizard in the report authoring environment used to create reports.

report queue (n)~ For Message Queuing, a queue on the source computer that contains report messages. Report queues can be used when sending test messages and tracking message routes.

report rendering (n)~ The action of combining the report layout with the data from the data source for the purpose of viewing the report.

report server (n)~ A location on the network where Report Builder is launched from and a report is saved, managed, and published.

Report Server (server/month) (PN)~ The unit of measure for a server on which a reporting service on Microsoft Azure SQL Reporting runs.

report server administrator (n)~ A user with elevated privileges who can access all settings and content of a report server. A report server administrator is a user who is assigned to the Content Manager role, the System Administrator role, or both. All local administrators are automatically report server administrators, but additional users can become report server administrators for all or part of the report server namespace.

report server database (n)~ A database that provides internal storage for a report server.

report server execution account (n)~ The account under which the Report Server Web service and Report Server Windows service run.

Report Server Web service (n)~ A Web service that hosts, processes, and delivers reports.

report signature (n)~ A string used to identify the version of a report.

report snapshot (n)~ A static report that contains data captured at a specific point in time.

report subscription (n)~ A registration to have a particular report delivered to specific

users who have an interest in it.

report task (n)~ A task that specifies which reports to generate and what parameters to use; which volumes and folders to report on; how often to generate the reports; and which file formats to save them in.

report template (n)~ An Excel template (.xlt file) that includes one or more queries or PivotTable reports that are based on external data. When you save a report template, Excel saves the query definition but doesn't store the queried data in the template.

Report toolbar (n)~ The toolbar at the top of the Report section, used to create and edit reports.

report type (n)~ A category of reports that all contain similar information.

report view group (n)~ A set of report views that are grouped together in a single dashboard zone. These report views can be conditionally shown, based on the selected KPI.

Report Viewer (n)~ A reporting tool, accessible through the Configuration Manager console, that uses your web browser as a report viewer.

Report Viewer (PN)~ A viewer that displays generated reports and lets users add comments to a report, create charts or graphs from report data, view various levels of a financial report, and export the report to other file types.

Report Web Part (PN)~ A feature that allows users to view and interact with reports that are created in PerformancePoint Dashboard Designer.

Report Wizard (PN)~ A wizard that guides users through creating and publishing a Reporting Services report.

report writer (n)~ An application, commonly part of a database management program, that uses a report form created by the user to lay out and print the contents of a database. A report generator is used to select specific record fields or ranges of records, to make the output attractive by including such features as headings, running heads, page numbers, and fonts.

reporting (n)~ The process of programmatically generating reports to present a customized view of stored data.

reporting agency (n)~ An organization that collects information from various sources for a variety of uses.

reporting component (n)~ A component that provides comprehensive reporting functionality for a variety of data sources.

reporting currency (n)~ The monetary unit of measure used to record the converted monetary value of economic transactions in ledger accounts for financial and management reporting purposes.

reporting currency unit (n)~ A currency unit that is used to record the financial consequences of accounting events and to prepare and report ancillary financial statements.

reporting data warehouse (PN)~ An Operations Manager feature that manages the OperationsManagerDW database and that can be independently installed.

reporting database (n)~ The SQL Server database that stores DPM reporting information.

reporting mode (n)~ The enforcement mode in which all non-compliance issues are

recorded for reporting purposes only. Client computers do not have their access restricted.

reporting point (n)~ An SMS/Configuration Manager site system that hosts the Report Viewer component for Web-based reporting functionality.

reporting service (n)~ A service provided by an application or underlying database subsystem, for example, SQL Server Reporting Services (SSRS), that enables rapid development of reports based on underlying data sources.

reporting services point (n)~ A site system role that integrates with SQL Server Reporting Services to create and manage reports for Configuration Manager.

Reporting Services report (PN)~ A report type that acts as a wrapper for a SQL Server Reporting Services report so that the Reporting Services report can be displayed in a PerformancePoint dashboard.

reporting tree (n)~ A visual representation of an organization's structure, showing levels in the corporate hierarchy such as companies, divisions, departments, projects and tasks. One of the three Management Reporter building blocks.

reporting tree definition (n)~ A building block that contains individual reporting units and is arranged like an organizational chart.

reporting unit (n)~ Any unit or box' within the reporting tree.'

Reporting view (n)~ The view in the Virtual Machine Manager Administrator Console in which the administrator runs reports.

Reports (n)~ A folder in the workspace browser where available report views are listed.

reports builder (n)~ A title for pages dealing with reports authoring.

Reports module (n)~ A Microsoft CRM module used to create, view, and print metrics and statistical reports.

Reports page (n)~ The page in the Administration Center that details Exchange Hosted Services statistics for the hosted organization.

ReportServer service (n)~ The local report service that manages, executes, renders, schedules, and delivers DPM reports.

report-specific schedule (n)~ Schedule defined inline with a report. Report-specific schedules are defined in the context of an individual report, subscription, or report execution operation to determine cache expiration or snapshot updates.

reposition (v)~ To change only the object's alignment, and margins (if the container is a Grid), or the top and left properties (if the container object is a Canvas).

repository (n)~ A database containing information models that, in conjunction with the executable software, manage the database.

repository (n)~ A central storage location, usually a server, that stores specific data such as files under source control.

repository engine (n)~ Object-oriented software that provides management support for and customer access to a repository database.

repository object (n)~ A COM object that represents a data construct stored in a repository type library.

Repository SQL schema (n)~ A set of standard tables used by the repository engine to manage all repository objects, relationships, and collections.

Repository Type Information Model (PN)~ A core object model that represents repository type definitions for Metadata Services.

representational state transfer (n)~ An architectural style that can be used to build software in which clients make requests of services. A resource is addressed via a unique URI, and a resource request is accomplished using the HTTP standard verbs, GET, POST, PUT, and DELETE. All the information necessary to process a resource request is contained inside the request itself.

republisher (n)~ A Subscriber that publishes data that it has received from a Publisher.

repudiation (n)~ The ability of a user to falsely deny having performed an action that other parties cannot prove otherwise. For example, a user who deleted a file can successfully deny doing so if no mechanism (such as audit files) can prove otherwise.

requery (v)~ To rerun a query underlying the active form or datasheet in order to reflect changes to the records, display newly added records, and eliminate deleted records.

request (n)~ A single action that the Provisioning Server is being asked to perform by the solution provider.

request amount approval limit (n)~ The maximum amount on a purchase request document that an approver is allowed to approve.

Request Filtering (n)~ An IIS 7.0 feature for HTTP and FTP that enables administrators to allow or deny Internet requests that are based on HTTP or FTP commands, URL sections, request limits, etc.

Request For Comments (n)~ A document in which a standard, a protocol, or other information pertaining to the operation of the Internet is published. The RFC is actually issued, under the control of the IAB, after discussion and serves as the standard. RFCs can be obtained from sources such as InterNIC.

request for quotation (n)~ A source document that documents an invitation to bid on supplying a quantity of product for a specified price and by a specified date.

request handler (n)~ A server component that enables the handling and routing of requests.

Request Handler (PN)~ A Duet server component that enables handling and routing of requests from the SAP system to Microsoft Office Outlook via Microsoft Exchange Server.

request header (n)~ An informational listing at the top of an HTTP request.

request management (n)~ The ability for a user to interact with and manage submitted requests and associated workflows.

Request Management (PN)~ A SharePoint feature that helps make smart routing decisions, based on routing rules that relate the nature of requests to the dynamic topology of its farm.

request method (n)~ A method that uses GET or POST.

request phase (n)~ A particular phase of the ILM -€œ2-€? request processing model. It represents one of three workflows: Authentication, Authorization or Action.

request throttling (n)~ A method of preventing a denial of service attack by limiting the number of requests that can be made to a system.

request tree (n)~ The tree of nodes that contains HTTP requests.

Request Web Service (n)~ A Web service that accepts requests from solution providers to manage computers with FlexGo technology.

requested (adj)~ An open service activity status that denotes that, although the resources

are not yet scheduled to perform work for this service activity, a potential time has been found.

requested execution level (oth)~ An attribute of an application that indicates which type of access token to use when the application is started. The requested execution level can be defined in an application manifest or an AppCompat database entry, or it may be derived automatically by the Windows operating system based on heuristics, if no application manifest is present.

requested permissions (n)~ Optionally specified permissions in an assembly that represent the minimum required, optionally desired, and always refused permissions for all code in the assembly. If there is no request, the code is granted the maximum that security policy allows.

requested receipt date (n)~ The date a customer or vendor requests that goods be received.

requested ship date (n)~ The date that the selling party should ship items to meet the customer's or vendor's requested receipt date.

requester (n)~ The person who requests the economic resources.

requestor (n)~ The identity of the user or service that has submitted a request to ILM 2'.'

requestor scope (n)~ A configured collection of users who can submit a request. It can be everyone'

request-response adapter (n)~ A receive adapter that receives a request message from the client, submits it to the server, waits for a response, and then sends the response back to the client.

requests (PN)~ Games hub screen that shows nudges (reminders) to make the next move and -€œyour turn-€? notifications in turn-based games, and invitations to play.

required component (n)~ A component that is required for the current component to properly work. For example, a workflow requires an entity to run.

required element (n)~ An element that is required to be present in order to satisfy a schema.

required field (n)~ A field that must contain a value if a record is updated or inserted into the database.

required parameter (n)~ A parameter that must be specified when the program is executed.

requirements analysis (n)~ The determination of the functional and performance characteristics of a solution based on analyses of customer needs, expectations, and constraints.

requisition (n)~ A request for a specified amount of an item to be pulled from inventory.

requisition (n)~ A paper or electronic request for goods or services.

re-registration (n)~ A procedure to update the registration for an authentication challenge in ILM 2'.'

Resample (v)~ Changing the pixel dimensions (and therefore the physical file size) of a picture or a graphic. Graphics can be resampled down (the number of pixels decreased) or resampled up (the number of pixels increased).

rescan (v)~ To search for new tape libraries and stand-alone tape drives attached to the DPM server, and for storage nodes managed by the DPM server.

reseal (v)~ To prepare the operating system for delivery to the customer by clearing the event log, resetting the time clock for Windows Product Activation, and configuring the first-run experience to run the next time Windows starts.

reservation (n)~ A specific IP address within a scope permanently reserved for leased use to a specific DHCP client. Client reservations are made in the DHCP database using DHCP Manager and based on a unique client device identifier for each reserved entry.

reservation (n)~ The designation of a quantity of inventory on a purchase order for a specific sales order or production schedule.

reserve capacity (n)~ Capacity that is kept in reserve so that it can be used when the need arises.

reserve time (n)~ A limited amount of usage time provided after all purchased time has expired or been expended. If the user does not add or download more usage time within this remaining amount of time, they will lose access to the computer.

reserved character (n)~ A keyboard character that has a special meaning to a program and, as a result, normally cannot be used in assigning names to files, documents, and other user-generated tools, such as macros. Characters commonly reserved for special uses include the asterisk (*), forward slash (/), backslash (\), question mark (?), and vertical bar (|).

reserved domain (n)~ A domain that cannot be associated with a Windows Live ID.

Reserved IP (PN)~ The service type that lets customers reserve IP addresses.

reserved unit (n)~ A resource unit that provides a dedicated set of resources for particular tasks.

reserved word (n)~ A word that has special meaning to a program or in a programming language and can be used only in certain predefined circumstances; it cannot be used in naming documents, files, labels, variables, or user-generated tools such as macros.

Reset (PN)~ An option in Call Timers that allows the user to clear the accumulated time displayed by the Recent Calls timer.

reset (v)~ To archive the transaction history of a computer running FlexGo technology in the Provisioning Server database, and then register the computer, starting a new transaction history.

reset (v)~ To set an entity, such as a feature, configuration, or object, back to its defaults.

reset (v)~ An action that restores the default factory settings of a device.

Reset protection (PN)~ A feature to prevent a device from being reset or reimaged without permission by requiring the owners to enter the Microsoft account information before the process can be started.

Reset Status (oth)~ An item on the user's My Status menu that resets the user's status to the previous setting after the user has manually selected a status setting.

reset Windows (v)~ To reset the Windows operating system so that all user customizations are removed.

reset your PC (v)~ To reset a system so that all user customizations are removed.

residential gateway (n)~ A device located in a residence that connects the home network to a local area network. The gateway provides features such as Internet Connection Sharing and firewall functionality.

residential server (n)~ The Exchange server that contains a user's mailbox.

resiliency (n)~ The ability of hardware, software or data to recover from a failure.

resiliency setting (n)~ A setting indicating the resiliency of data on a virtual disk or storage space.

resiliency type (n)~ A setting that allows the user to select the specific resiliency of data across multiple disks in a virtual disk or storage space.

Resilient File System (PN)~ A file system, introduced with Windows Server 8, that provides resiliency to both software and hardware errors. ReFS allows customers to maximize server uptime and prioritize volume availability without the use of expensive storage hardware.

resistance (n)~ The ability to impede (resist) the flow of electric current. With the exception of superconductors, all substances have a greater or lesser degree of resistance. Substances with very low resistance, such as metals, conduct electricity well and are called conductors. Substances with very high resistance, such as glass and rubber, conduct electricity poorly and are called nonconductors or insulators.

resistor (n)~ A circuit component designed to provide a specific amount of resistance to current flow.

resize (v)~ To change the size of an element on the screen.

Resize for mobile device (v)~ An option that allows a user to resize an image to fit on a mobile device, such as a cell phone or PDA.

resize handle (n)~ A handle that enables resizing of a row, column, window or other object.

resizing (n)~ The process of increasing or decreasing the dimensions of an object or space.

resolution (n)~ A measure of the fineness of detail in an image or text, usually as produced by a monitor or printer.

resolution (n)~ The process of translation between a domain name address and an IP address.

Resolution ~ Loosely speaking, the quality of an image. When printing or working with images, the resolution is usually measured in Dots Per Inch (dpi) - the more dots per inch, the higher the quality of the image but the larger the file needed to store it. In Windows, the screen resolution is how many- pixels- fit on the desktop, the most popular being 800 x 600 and 1024 x 768 - the former makes images, icons etc look bigger, but the latter means you can fit more of them on the screen.

resolution history (n)~ A feature that automatically tracks changes to alert fields.

resolution scope (n)~ In the enclosing context where values and expressions are associated, the precedence in which operators are evaluated, tasks are performed or rules are applied.

resolution state (n)~ The state of an alert in relation to its status in the resolution cycle. The default resolution states include New, Acknowledged, and Resolved.

resolution strategy (n)~ A set of criteria that the repository engine evaluates sequentially when selecting an object, where multiple versions exist and version information is unspecified in the calling program.

resolve (v)~ To match one piece of information to another in a database or lookup table.

resolve (v)~ To find a setting in which no hardware conflicts occur.

resolve (v)~ To convert a logical address to a physical address or vice versa.

resolve (v)~ To convert an Internet domain name to its corresponding IP address.

resolve (v)~ To record the outcome of a case and remove it from the queue of active cases.

resolved (v)~ To quarantine, remove, or clean an occurance of malware so that it no longer poses a threat.

resolver (n)~ DNS client programs used to look up DNS name information. Resolvers can be either a small stub (a limited set of programming routines that provide basic query functionality) or larger programs that provide additional lookup DNS client functions, such as caching.

resource (n)~ For Device Manager, any of four system components that control how the devices on a computer work. These four system resources are interrupt request (IRQ) lines, direct memory access (DMA) channels, input/output (I/O) ports, and memory addresses.

resource (n)~ For failover clusters or server clusters, a physical or logical entity that is capable of being managed by a cluster, brought online and taken offline, and moved between nodes. A resource can be owned only by a single node at any point in time.

resource (n)~ Generally, any part of a computer system or network, such as a disk drive, printer, or memory, that can be allotted to a running program or a process.

resource (n)~ Any item in a report server database that is not a report, folder, or shared data source item.

resource (n)~ A room, computer, or any equipment needed at a meeting.

resource (n)~ A user that performs a service, or the equipment or facility that is required for a service.

resource (n)~ A document, slide set, or other printable output that can be imported by the meeting client.

resource (n)~ A reusable named item in your project or document that can represent a color (brush), object, control, style, template, user control or value that you can apply or re-use' throughout your project to create consistency in color (theme) or to create multiple instances of a single control like a button where you want to maintain a unified look for each button.'

resource (n)~ An optional payload that can be associated with an action. By default, Human Workflow Services track resources that flow through an activity flow. It is important to note that Human Workflow Services does not manage the resource, it only tracks a reference to the resource.

resource (n)~ Any nonexecutable data that is logically deployed with an application. A resource might be displayed in an application as error messages or as part of the user interface. Resources can contain data in a number of forms, including strings, images, and persisted objects.

resource (n)~ A special variable that holds a reference to a database connection or statement.

resource (n)~ A stock of money, product, or people services used in the performance of an activity.

resource account (n)~ A single security principal-€"usually a user account-€"that is created in Active- Directory Domain Services (AD DS) and used to map to a single

federated user.

resource allocation (n)~ The process of distributing a computer system's facilities to different components of a job in order to perform the job.

resource allocation (n)~ The assignment of resources to tasks in a project.

Resource Booking Attendant (n)~ A calendaring feature that automatically manages resources. Resource requests are automatically accepted or denied depending on availability and policies.

Resource Breakdown Structure (n)~ The structure that describes an organization's hierarchy. The RBS code defines the hierarchical position that a resource holds in the organization.

resource budget (n)~ The amount of system resources that are allowed to be used by a block of code. Usage that exceeds this amount results in an error.

resource calendar (n)~ A calendar that specifies working and nonworking time for an individual resource. A resource calendar differs from a base calendar, which specifies working and nonworking time for more than one resource.

Resource Center (PN)~ A feature that contains articles to assist users in setting up their Web sites, Shared Sites, and using Office Live's Business Applications products.

resource current set (n)~ The collection of target resources at the time the request is received. Applies to 'read', 'delete' and 'modify' operation types.

resource data (n)~ The data structures, templates, definition procedures, management routines, icon maps, and so forth associated with a particular resource, such as a menu, window, or dialog box.

resource data (n)~ A type of data that is characterized by shared, concurrently read and written into operations, and accessed by many transactions. Examples of resource data include user accounts and auction items.

Resource Description Framework (n)~ A specification developed by the World Wide Web Consortium (W3C) to define a flexible infrastructure for organizing and managing metadata (data about data) across the Web and the Internet. The Resource Description Framework is intended to provide a framework based on XML (eXtensible Markup Language) that can standardize the way applications exchange metadata (or metacontent). Possible uses include search engines, content rating systems, and other areas in which exchange of information about data is valuable.

resource dictionary (n)~ A collection of resources into a single XAML document.

resource DLL (n)~ A dynamic-link library (DLL) that contains instructions for managing one or more types of cluster resources in a failover cluster or server cluster.

resource domain (n)~ A Windows NT 4.0 domain that is used for hosting file, print, and other application services.

Resource Engagements (PN)~ The negotiation between the project managers and their team leaders to commit resources to certain work.

resource exhaustion detector (n)~ A tool in Windows that detects when resources are low.

resource exhaustion resolver (n)~ A tool in Windows that resolves problems with low resources.

Resource Explorer (n)~ An SMS/Configuration Manager Administrator console feature

that displays the hardware and software inventory that has been collected from clients.

resource federation server (n)~ The federation server in the resource partner organization. The resource federation server typically issues security tokens to users based on a security token that is issued by an account federation server. The server receives the security token, verifies the signature, transforms the organizational claims based on its trust policy, generates a new security token based on information in the incoming security token, and signs the new token to return to the user and ultimately to the Web application.

resource federation server proxy (n)~ The federation server proxy that is located in the perimeter network of the resource partner organization. The resource federation server proxy performs account partner discovery for Internet clients, and it redirects incoming security tokens to the resource federation server.

resource file (n)~ A file that consists of resource data and the resource map that indexes it.

resource final set (n)~ The collection of target resources after the request has been processed. Applies to 'create' and 'modify' operation types only.

resource governor (n)~ A feature in SQL Server 2008 that enables the user to manage SQL Server workload and resources by specifying limits on resource consumption by incoming requests.

resource group (n)~ In AD FS, a single security group, which is created in Active- Directory, that incoming group claims (AD- FS group claims from the account partner) are mapped to.

resource group (n)~ Two or more resources (users, facilities, or equipment) that can be scheduled interchangeably.

Resource Hosting Subsystem (PN)~ A cluster software component that provides a communication, monitoring, and processing layer between the Cluster service and one or more clustered resources.

resource ID (n)~ A number that identifies a particular resource within a given resource type.

resource information (n)~ The categories of information shown in the Resource Sheet view that specify details about a resource, such as name, type, group, maximum units, and standard rate.

resource leak (n)~ A type of software bug that can occur in Windows-based applications developed in Visual C++ if the application is not programmed to release a system resource in the source code.

resource leveling (n)~ The process of adjusting over- or underallocation of a resource within a project.

resource link (n)~ A text link in the results pane that takes user to informational material such as Help, Web content, etc.

resource list (n)~ The resources that are available for assignments to tasks. The resource list may be stored in a single project file or shared with a resource pool.

resource mailbox (n)~ A mailbox that represents conference rooms and company equipment. Resource mailboxes can be included as resources in meeting requests, providing a simple and efficient way to utilize resources for an organization. The user account that is associated with a resource mailbox is disabled.

Resource Management System (n)~ A technology that enables developers to localize

their apps based on each user's preferred language and current resolution.

Resource Manager (PN)~ A system service that manages durable data. A server application uses a resource manager to maintain the durable state of the application, such as the record of inventory on hand, pending orders, and accounts receivable. The resource manager works in cooperation with the transaction manager to provide the application with a guarantee of atomicity and isolation, using the two-phase commit protocol.

resource map (n)~ A visualization of all the resources within a resource group or linked to it.

resource maximization (n)~ One of two placement goals during virtual machine placement. When resource maximization is the goal, the suitability of each virtual machine host is rated based on the purpose of consolidating multiple low-utilization workloads on a single host. Virtual machine placement in these cases involves determining the capacity limits for a particular host and placing virtual machines on that host until the limits are reached.

Resource Monitor (PN)~ A component of Windows Reliability and Performance Monitor that displays real-time CPU, memory, disk, and network performance information collected from the Windows Kernel Trace provider and performance counters.

resource package (n)~ A package that allows you to separate the core app package from additional resources (for example, French-specific assets like strings or images) and contain those resources in their own package. The resource package thus serves to tailor the app's overall experience without requiring download and installation of all resource packages to the PC.

resource partner (n)~ A federation partner that trusts the Federation Service to issue claims-based security tokens for Web-based applications (that is, applications in the resource partner organization) that users in the account partner can access.

Resource Plans (n)~ A feature that allows users to allocate resources or document resource requirements, in the absence of a detailed project plan containing resource assignments.

resource pool (n)~ A set of resources that is available for assignment to project tasks. A resource pool can be used exclusively by one project or can be shared by several projects.

resource record (n)~ A standard DNS database structure containing information used to process DNS queries. For example, an address (A) resource record contains an IP address corresponding to a host name. Most of the basic resource record types are defined in RFC 1035, but additional RR types have been defined in other RFCs and approved for use with DNS.

resource record set (n)~ A collection of more than one resource record returned in a query response by a DNS server. Resource record sets (RRsets) are used in responses where more than one record is part of the answer.

resource report (n)~ Printed information about a project's resources, which usually includes information about costs and the allocation of resources.

Resource Reservation Protocol (n)~ A signaling protocol that allows the sender and receiver in a communication to set up a reserved highway for data transmission with a specified quality of service.

resource sharing (n)~ The act of making files, printers, and other network resources

available for use by others.

resource type (n)~ A class of resources, such as print spooler, physical disk, or file share.

resource usage (n)~ An account of how many hours a resource is scheduled to work within a given time period, and thus an indicator of resources allocation within that time period.

resource utilization (n)~ Statistics from Application Diagnostics for users to see how their computers perform, for example, how many users are logged on to an application at a given time, how many errors they are encountering, and how quickly the application is performing for them.

resource view (n)~ A view that displays resource information. Resource views include the Resource Sheet, the Resource Graph, the Resource Usage, and the resource forms views.

Resource View (n)~ A window in the Visual Studio Resource Editor that displays the resource files included in your projects.

resource-intensive task (n)~ A process, thread, or set of related processes or threads that requires significant system resources or time, or requires exclusive access to large amounts of data.

Resources (n)~ The name of the control panel for Office (including the Tools Options dialog).

Resources & Training page (n)~ The page that contains classes and education resources for Exchange Hosted Services.

Resources toolbar (n)~ A toolbar that contains tools that meeting participants can use to manage resources during a meeting.

respiratory rate (n)~ The number of breaths per minute.

respond (v)~ To reply to an email, text message, or Calendar request by tapping the -€œrespond-€? button.

respond (v)~ To take action on an email message by either replying to the sender, to the sender and all recipients, or by forwarding the email to someone else.

respondent (n)~ A party that provides a response.

responder (n)~ A device that reacts or responds to requests or events.

Responder (PN)~ A user role in the engagement functionality in Microsoft Social Listening. A person with the Responder role can add, edit, and share social accounts they own, edit post metadata (sentiment, assignments), and publish posts via their social accounts.

response (n)~ In Windows remote access, strings expected from the device, which can contain macros.

Response Email Template (PN)~ A lookup field for the Convert Rule entity that contains the choices of which email template will be used for an automatic response to the customer.

response file (n)~ Text files that contain MSBuild.exe command line switches.

Response Group (PN)~ An application that lets you route and queue incoming calls to designated persons for a special purpose, such as customer service. The queue holds callers until an agent answers the call.

Response Group Configuration Tool (PN)~ A web-based Response Group Service tool where an administrator sets up a workflow including music on hold, welcome message,

and so on.

Response Group Service (PN)~ A Unified Communications Applications Server (UCAS) application that is used to create and configure Response Group Service groups.

Response Group tab (n)~ A custom tab, on an agent's Office Communicator client, that is used by the agent to sign in to his or her Response Group Service group. The agent must be signed in to the group in order to answer calls routed to the group.

response header (n)~ An informational listing at the top of an HTTP response.

Response Management through Partner (PN)~ A web-based tool that allows Certified and Gold Certified Partners to get support directly from Microsoft technical experts.

response queue (n)~ For Message Queuing, a queue that is created by the sending application and used by the receiving application to reply to messages. For example, an application might send a response message to a response queue every time the application receives a message.

response time (n)~ The amount of time required to do work from start to finish. In a client/server environment, this is typically measured on the client side.

Response Web Service (n)~ A Web service created by a solution provider to receive Provisioning Server responses.

responsibility (n)~ An obligation of a party to perform an assigned job and to be held accountable for the outcome of the results.

responsibility account code segment (n)~ A segment of a general ledger account code that corresponds to a category within the overall structure of the organization, such as location, division, department, area, task, project, or product.

responsibility matrix (n)~ A document that explicitly calls out the individual team members who are tasked with executing, reviewing, and approving work packages within a project.

responsibility segment (n)~ A segment of a general ledger account code that corresponds to a category within the overall structure of the organization, such as location, division, department, area, task, project, or product.

REST (n)~ An architectural style that can be used to build software in which clients make requests of services. A resource is addressed via a unique URI, and a resource request is accomplished using the HTTP standard verbs, GET, POST, PUT, and DELETE. All the information necessary to process a resource request is contained inside the request itself.

restart (v)~ To turn a computer off and back on again, either manually, or by clicking Restart.

restart (v)~ To reboot (reset) a computer or service that is currently running.

Restart this video feed (oth)~ The infotip that appears when the user pauses with the mouse over the Pause button in a Video conversation. The infotip for this button toggles between 'Pause' and 'Restart this video feed.'

resting heart rate (n)~ A person's heart rate when they are at rest.

restoration of service (n)~ The process of bringing service back online after data corruption, hardware or software failure, or disaster by either recovering data and settings or rebuilding a component in order to make its functionality available to users.

restore (n)~ A multi-phase process that copies all the data and log pages from a specified backup to a specified database (the data-copy phase) and rolls forward all the transactions

that are logged in the backup (the redo phase). At this point, by default, a restore rolls back any incomplete transactions (the undo phase), which completes the recovery of the database and makes it available to users.

restore (v)~ To copy files from a backup storage device to their normal location, especially if the files are being copied to replace files that were accidentally lost or deleted.

restore (v)~ To remove a record or item from the deleted folder and relink it to the record it was linked to before it was deleted.

restore (n)~ In DPM, the process by which an administrator retrieves a protected file or rebuilds a DPM server by using data that has been archived to tape. Restoring data requires use of tape backup software.

Restore Database (v)~ A button on a BCM wizard that enables the user to revert the database to a previous state.

restore point (n)~ A representation of a stored state of your computer's system files.

restore sequence (n)~ A sequence of one or more restore commands that, typically, initializes the contents of the database, files, and/or pages being restored (the data-copy phase), rolls forward logged transactions (the redo phase), and rolls back uncommitted transactions (the undo phase).

Restore this version (PN)~ The button in the History pane used to restore the current document to an earlier version

restrict (v)~ To block access to a program or operating system functionality.

restricted access token (n)~ An access token with restricted access to securable objects or performing privileged tasks.

restricted account (n)~ An account that has restricted functionality. In Windows Live, these accounts are designed for children under the age of 13 and provide a limited set of features. For example, restricted accounts don't have permission to synchronize libraries across computers.

Restricted Device Access Model (PN)~ The device access model for vertical solutions. Restricted Device Access does not allow other applications to access a specialized device.

restricted interface (n)~ A device interface that can only be accessed from a specific set of privileged apps which are declared in the Device Metadata for the device. That interface may be provided natively by Windows 8 or by custom driver access.- The interface is marked as restricted via a property on the instance.

restricted product (n)~ A product whose distribution is limited or constrained by a government authority.

restricted token (n)~ An access token with restricted access to securable objects or performing privileged tasks.

restricted user (n)~ A user who has limited access to certain features or limited ability to perform certain actions in an application or system.

restriction (n)~ A setting that blocks access to program or operating system functionality by Windows SteadyState.

restriction level (n)~ A pre-defined set of program restrictions that is automatically applied.

result set (n)~ The set of records that results from running a query or applying a filter.

result source (n)~ A source that returns a set of search results for a given search query. The source can be a search service in the local server farm or another server farm, or another search engine that is compliant with the OpenSearch protocol.

results (n)~ The set of records that results from running a query or applying a filter.

results file (n)~ In Windows Assessment Services and Windows Assessment Console, the XML file that is produced after a job completes, that is standardized and presented in the Windows Assessment Console to identify issues on the system. The results contain individual assessment output, information about the computer that the assessment was run on, the job manifest information, a copy of the assessment manifests from each assessment included in the job, and event trace log (ETL) files.

results library (n)~ A location on the local computer where Windows Assessment Console job results are stored.

results list (n)~ The table or grid in the UI that displays the list of results from a work item query.

results pane (n)~ A pane that displays details about an item selected in another portion of the user interface. For example, in Microsoft Management Console (MMC), the details pane is the right pane that displays details for the selected item in the console tree.

results store (n)~ A location on a Windows Assessment Services computer where job results files are stored. For the Windows Assessment Console, see results library.

Results view (n)~ The Visual Studio document window that contains both the results list and the work item form. Results view helps you quickly define and run your own queries.

resumable function (n)~ A function specialization for concurrency to create asynchronous code.

resume (n)~ A summary of one's academic and work history, usually submitted with a job application.

Resume (PN)~ An option that allows the user to resume the recording of a paused video clip.

resume (v)~ To continue a process or service that has been paused.

resume (v)~ To restart the processing of a workflow instance. Resuming a workflow puts it into a running state.

resume key (n)~ A key supplied by the SMB client that allows the system to reference the handle during a resume operation after a failover.

Resume Reading (PN)~ A feature that shows users their position in a document the last time they were reading, and lets them return there in a single action.

resynchronization (n)~ An SMS/Configuration Manager inventory process that is triggered automatically whenever an inventory file tries to update data that does not exist in the SMS/Configuration Manager site database. This can happen when the inventory data is corrupted.

Retail Headquarters (PN)~ A component of Microsoft Dynamics-® AX for Retail.

retail key (n)~ A type of product key required during the installation of Windows.

Retail POS (PN)~ A component of Microsoft Dynamics-® AX for Retail.

Retail POS Plug-ins (PN)~ A component of Microsoft Dynamics-® AX for Retail.

retail site (n)~ A Web site that provides retail shopping directly to the public.

Retail Store Connect (PN)~ A component of Microsoft Dynamics-® AX for Retail.

Retail Transaction Service (PN)~ A component of Microsoft Dynamics-® AX for Retail.

retain (v)~ When Windows Disk Protection is enabled, to keep (not erase) the cache file on the hard disk when a user logs off or the computer is restarted.

retained earnings (n)~ The accumulated earnings of a company or entity (minus distributed income, such as dividends) since its start date or inception.

retained profit (n)~ The accumulated earnings of a company or entity (minus distributed income, such as dividends) since its start date or inception.

retake (PN)~ A button that appears after the user takes a new Profile picture. Tap -€œretake-€? to delete the current picture and take another, or -€œaccept-€? to upload it.

retarget (v)~ To associate a snap-in with a different computer.

Retarget Windows Store projects to Windows 8.1 (n)~ You must retarget your projects and update your code, if you want to migrate your Windows Store app to Windows- 8.1.

retargetable assembly (n)~ An assembly that belongs to more than one implementation of the .NET Framework, or an assembly that has been built on more than one implementation of the .NET Framework with the same strong name and with appropriate attributes. Applications that use retargetable assemblies can run on any .NET Framework implementation where those assemblies have been built. For example, applications that are built to use the .NET Compact Framework can run on the desktop implementation of the .NET Framework.

retention hold (n)~ A feature which enables the user to suspend the processing of a retention policy or managed folder mailbox policy for that mailbox. Retention hold is designed for scenarios such as a user being on vacation or away temporarily.

retention policy (n)~ A policy that specifies the length of time during which data, documents, and other records must be available for recovery.

Retention Policy (PN)~ A feature that allows the application of tags to individual Outlook items to specify retention policy for that message, conversation or other item.

retention range (n)~ The duration of time for which the data should be available for recovery.

retention schedule (n)~ A schedule that specifies how long each record type in the file plan must be retained (its retention period) and the process for disposing of it when it reaches the end of this period (its disposition process).

retention stage (n)~ A stage in a retention policy, consisting of an event-action pair.

Retina display ~ screen technology introduced by Apple in the iPhone 4. It features a 960 x 640 resolution, an 800:1 contrast ratio and four times the number of pixels than earlier iPhone models.

retinal scanner (n)~ A biometric sensor that analyses your eye retina to recognize or authenticate identity.

retire (v)~ To remove managed hardware, software, or an IT service, from a production environment by using a controlled process.

retirement date (n)~ The date that an asset is sold or discarded.

Retirement Planner (PN)~ A feature tool that enables a user to calculate savings to hit retirement planning goals.

retract event (n)~ An internal event kind used to modify an existing insert event by modifying the end time of the event.

retrievable managed property (n)~ A managed property that can be displayed in search results.

retrieve (v)~ To obtain a specific requested item or set of data by locating it and returning it to a program or to the user. Computers can retrieve information from any source of storage-disks, tapes, or memory.

Retrieve (v)~ A button on in the Transfer Call dialog box that reconnects the user to the call that is currently on hold.

retrieve (v)~ To answer a call by dialing the associated number on the network where it has been parked.

Retrieve Call From Hold (oth)~ A button on in the Transfer Call dialog box that reconnects the user to the call that is currently on hold.

Retro (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 76.

retrospective (n)~ A meeting that occurs at the end of a sprint (iteration of development) in which the team evaluates the way they worked with the intent of making improvements in the upcoming sprint.

retry (n)~ A repeat connection attempt for a soft mount. The number of retries is specified as a command-line argument with a value from 1 to 10, inclusive. The default is 1.

retry (v)~ To perform an action that previously failed.

retry interval (n)~ The time, in seconds after the refresh interval expires, used by secondary masters of a zone to determine how often to try and retry contacting its source for zone data to see if its replicated zone data needs to be refreshed. This interval is set in the for each zone.

retry-after (n)~ A SIP (Session Initiation Protocol) header placed in the server response to a client's request, so that the client comes back after the specified period.

return address (n)~ The sender's address, to which a letter or parcel can be returned if undeliverable.

return code (n)~ In programming, a code that is used to report the outcome of a procedure or to influence subsequent events when a routine or process terminates (returns) and passes control of the system to another routine. Return codes can, for example, indicate whether an operation was successful or not and can thus be used to determine what is to be done next.

return materials authorization number (n)~ A reference number that is used to authorize and track goods returned for repair or refund. A return materials authorization is issued by a sales entity that authorizes a buying company to return goods.

return on equity (n)~ The ratio of profitability calculated by dividing net income by owners' equity.

Return on equity (n)~ Amount of net income returned as a percentage of shareholders equity. ROI measures a corporation's profitability by revealing how much profit a company generates with the money shareholders have invested.

return value (n)~ A single value that is the result of the execution of a statement, method, or function.

returned item (n)~ Goods or merchandise that a customer returns to the place of purchase

or that a borrower returns to a lender.

retweet (v)~ To repost a tweet from another Twitter user, sharing the tweet with one's own followers.

retweet (n)~ A short message on Twitter that you are resending to another audience.

reusable bookmark (n)~ A bookmark that can be consumed from a rowset for a given table and used on a different rowset of the same table to position on a corresponding row.

revaluation (n)~ An adjustment of the value of something.

revenue (n)~ An increase in an organization's assets or a decrease in an organization's liabilities during a reporting period.

revenue cycle (n)~ A recurring set of sales, fulfillment, payment, and transfer activities controlled by one or more parties that participate in exchange and nonexchange transactions.

revenue recognition (n)~ The process of transferring the revenue and costs currently recorded in the WIP balance sheet accounts to expense and revenue accounts in the Profit and Loss. The time and manner in which this can be performed is determined by Financial Standards.

revenue recognition accounting rule (n)~ A recognition accounting rule that prescribes the recognition of revenue in accounts and on financial statements.

reverse charge VAT (n)~ A value-added tax (VAT) on products that is owed by the customer that receives the product, not by the vendor that delivers the product.

reverse engineering (n)~ A method of analyzing a product in which the finished item is studied to determine its makeup or component parts-for example, studying a completed ROM chip to determine its programming or studying a new computer system to learn about its design. For computer software, reverse engineering typically involves decompilation of a substantial portion of the object code and studying the resulting decompiled code.

reverse lookup (n)~ A query for a pointer (PTR) that resolves an to its corresponding fully qualified domain name ().

Reverse Path (v)~ A tool to change the direction of a path from finish to start.

reverse proxy (n)~ A proxy server that forwards incoming requests to one or more servers.- To a client, the reverse proxy appears as the final destination regardless of whether the client's requests are forwarded to one or more servers.

reverse replication (n)~ The process where replication is established from a virtual machine that was formerly a Replica virtual machine, but is now a primary virtual machine as the result of a failover.

REVERSE SOLIDUS (n)~ A character used to separate directory names in MS-DOS and UNIX path specifications. When used as a leading character, it means that the path specification begins from the topmost level for that disk drive.

reversing entry (n)~ A transaction that reverses (and effectively cancels out) the debit and credit entries of a previous adjustment.

revert (v)~ To return to the last saved version of a document. Choosing this command tells the application to abandon all changes made in a document since the last time it was saved.

review (v)~ To view the contents of one resource while another resource is being

presented.

review (n)~ A critical evaluation of an item by the customers.

review activity (n)~ A step in a review process in which users approve or deny change requests.

Review tab (n)~ A tab on the Office ribbon that contains language and proofing tools, change tracking and markup options, and other features related to document review.

reviewer (n)~ In process scheduling, the person or role responsible for reviewing newly entered data.

reviewer (n)~ The user who completes an approval activity.

Revisable-Form-Text DCA (n)~ A standard within Document Content Architecture (DCA) for storing documents in such a way that the formatting can be changed by the receiver. A related standard is Final-Form-Text DCA.

revision gesture (n)~ A gesture (pen stroke) that is used to revise text when you're writing in Tablet PC Input Panel.

revision mark (n)~ A mark that shows where a deletion, insertion, or other editing change has been made in a document.

revision number (n)~ The number of times something has been revised.

Revival (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 87.

revocation (n)~ A process by which entities are listed as having invalid licenses.

revocation delay (n)~ The period of time between when the credential revocation request is placed and when the credentials are actually revoked.

revoked certificate (n)~ A certificate that has been cancelled by a certificate authority (CA) and is no longer valid.

rewind (v)~ To wind a magnetic tape spool or cassette to its beginning.

rewind (v)~ To reverse playback of a digital media file at a speed that is faster than normal.

rewrite (v)~ To write again, especially in situations where information is not permanently recorded, such as RAM or a video display.

Rewriteable ~ A special type of reuseable- CD- or- DVD- which you can write to, delete the contents, and write to again, theoretically forever. (A conventional CD or DVD's contents can't be changed once they have been written). However, rewriteable CDs are less reliable and more expensive than write-once CDs, and there are presently several different incompatible formats for rewriteable DVDs.

RFC (n)~ A document in which a standard, a protocol, or other information pertaining to the operation of the Internet is published. The RFC is actually issued, under the control of the IAB, after discussion and serves as the standard. RFCs can be obtained from sources such as InterNIC.

RFC (n)~ A SAP protocol that enables external systems to call SAP ABAP function modules. RFCs enable remote calls between two SAP systems or between a SAP system and a non-SAP system.

RFID (n)~ A technology that uses radio frequencies to identify products. An RFID-capable product has an RFID tag that can transmit information, such as serial number, to

an RF reader, which converts the information into digital data that can be sent to a computer.

RFID client console (n)~ The command-line utility that is used to configure BizTalk RFID.

RFID Manager (PN)~ The BizTalk RFID user interface (UI) that is used to administer the BizTalk RFID server. RFID Manager is a snap-in that is based on MMC 3.0.

RFID process (n)~ A high-level object that is used to put together custom sources.

RFID sensor (n)~ A type of sensor (such as a proximity sensor) that uses radio frequency identification (RFID) for a numerous purposes, such as identification of physical items, automatic log on, location of people, etc.

RFID Service account (n)~ The Windows account whose identity is used to run the BizTalk RFID service.

RFID solution (n)~ An RFID application that is designed for a specific business activity, such as tracking inventory in a warehouse.

RFID store (n)~ The database that stores settings related to BizTalk RFID, such as device information and processes.

RFID Worker Process account (n)~ The Windows account whose identity is used to run worker processes that in turn execute event handlers and providers. This is applicable for Windows Server 2003 only.

RFM (PN)~ A mode which prevents users from logging on to the computer until Windows is activated.

RFQ (n)~ A source document that documents an invitation to bid on supplying a quantity of product for a specified price and by a specified date.

RFQ journal (n)~ A journal that tracks the status of RFQs.

RFQ line (n)~ The part of the RFQ that specifies the detailed information about an item.

RFQ reply line (n)~ The part of the RFQ reply that specifies the detailed vendor information about an item.

RGB (n)~ A color model that describes color information in terms of the red (R), green (G), and blue (B) intensities that make up the color.

RGB ~ (Red, Green, Blue)- The three colours used by a computer screen - all the other colours can be made up by mixing red, blue and green. A few printers use this system as well, though most use the alternative- CMYK- system instead.

RGB color model (n)~ A color model that describes color information in terms of the red (R), green (G), and blue (B) intensities that make up the color.

RGB triplet (n)~ A triplet that identifies a color from its red, green and blue components.

RGB value (n)~ A value returned by the RGB function; specifies a color as a combination of red, green, and blue values as integers from 0 (zero) through 255.

RGBA (n)~ A model that augments the red, green, blue (RGB) method of combining colors in light-based media, with a fourth color component, alpha, which is used to control color blending. In Open GL, an alpha value of 1.0 corresponds to complete opacity and a value of 0.0 corresponds to complete transparency.

RHS (PN)~ A cluster software component that provides a communication, monitoring, and processing layer between the Cluster service and one or more clustered resources.

Rhythmic soul (n)~ One of the music genres that appears under Genre classification in

Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 118.

RIA (n)~ A web application that provides a user interface which is more similar to a desktop application than typical web pages. It is able to process user actions without posting the whole web page to a web server.

RIA Services link (n)~ A project-to-project link reference that facilitates generating presentation tier code from middle tier code.

RIB (PN)~ Information that identifies banks and bank account holders in France that includes bank codes, branch codes, account number, and name of the account holder.

Ribbon (PN)~ The part of the Microsoft Office user interface above the main work area that presents commands and options to the user. The Ribbon replaced menus and toolbars starting in the 2007 Microsoft Office system.

ribbon (n)~ An area in a window in which commands and other controls are displayed in functionally related groups. A ribbon can be divided into multiple views, known as tabs, and every tab can contain multiple groups of controls. Typically, a ribbon appears at the top of a window.

ribbon group (n)~ A labeled collection of commands and controls that are grouped together on a ribbon tab.

ribbon launch button (n)~ The button at the bottom right corner of a ribbon group. Typically, a click of the button opens a dialog box or other element that is related to the group.

ribbon pane default button (n)~ The button that appears when a ribbon is reduced to its minimum size. A click of the button displays the ribbon commands on a menu.

ribbon tab (n)~ When a ribbon is divided into multiple views, any one of the views. Every tab contains functionally related commands and other controls that are organized in groups. Typically, ribbon tabs are labeled.

rich black (n)~ A more saturated black color created by using 100% process black and some percentage of one or more of cyan, magenta, or yellow.

rich capture (PN)~ A feature in which the camera captures multiple shots at different settings, so that the user can shoot first and edit and select the perfect shot later. The resulting photo is produced by merging multiple images to produce different lighting, exposure time, or amount of details.

rich clients ~ Two-tier fat clients. There are two types of rich clients:

rich clients ~ Stand-alone rich clients are the more flexible of the two rich client types in that they can support both disconnected and connected operations, allowing a single client architecture to execute in both online and offline modes.

rich clients ~ Browser-based rich clients don-´t work well in a disconnected mode, but they do enjoy the luxury of having a predefined operating environment installed on just about every PC they might need to run on.

rich HTML (n)~ HTML that includes markup for formatting such as backgrounds, borders, text fonts, styles and colors.

rich Internet application (n)~ A web application that provides a user interface which is more similar to a desktop application than typical web pages. It is able to process user actions without posting the whole web page to a web server.

rich site (n)~ A Web site that has a lot of content and is visually attractive.

Rich Site Summary (n)~ An XML-based syndication technology that enables websites to distribute content, such as news headlines and blog posts, effeciently to readers.

rich text field (n)~ A field that can show formatting and graphics, such as an embedded object, and not just text.

rich text XML mapping (n)~ A type of XML mapping that links WordprocessingML content directly to the backing data in the custom XML part.

rich-text box (n)~ A standard Windows control that is similar to a standard text box, except that it also supports individual character and paragraph properties.

rich-text editor (n)~ A text-editing program that lets users create instant messages or blog posts that contain rich text elements, such as text formatting and embedded images.

RID (n)~ The portion of a security identifier (SID) that identifies a user or group in relation to the authority that issued the SID. The authority is usually either the local computer or a domain.

RID master (n)~ A domain controller that holds the RID operations master role in Active Directory. The RID master is assigned to allocate unique sequences of relative IDs to each domain controller in its domain. As the domain controllers use the IDs allocated, they contact the RID master and are allocated additional sequences as needed. At any time, the RID master role can be assigned to only one domain controller in each domain.

RIFF (n)~ A broad-based specification designed to be used in defining standard formats for different types of multimedia files. A tagged-file specification, RIFF relies on headers that tag individual data elements in a file, identifying them by type and length. Because tags identify data elements, the RIFF specification can be extended to cover new types of elements while continuing to support older applications, which can simply ignore new, unrecognized elements they encounter in a file.

right (n)~ An entitlement granted by contract or law.

right align (v)~ To align text along the right margin.

right angle bracket (n)~ The > character.

right arrow (n)~ The key on the keyboard that is labeled with a right arrow.

right brace (n)~ The } character.

right click (v)~ To position the mouse over an object, and then press and release the secondary (right) mouse button. Right-clicking opens a shortcut menu that contains useful commands, which change depending on where you click.

Right Double Quotation Mark (n)~ The -€? character.

right end (n)~ The short side of a Surface unit where the On/Standby power button is located and that provides access to the I/O connections of the Surface unit.

right mouse button (n)~ The button on your pointing device that you use to display shortcut menus or other program-specific features.

right outer join (n)~ An outer join in which all the records from the right side of the RIGHT JOIN operation in the query's SQL statement are added to the query's results, even if there are no matching values in the joined field from the table on the left.

RIGHT SINGLE QUOTATION MARK (n)~ The ' character (publishing character).

right-aligned (adj)~ Pertaining to text that is aligned along the right margin.

right-click (v)~ To position the mouse over an object, and then press and release the

secondary (right) mouse button. Right-clicking opens a shortcut menu that contains useful commands, which change depending on where you click.

rights (n)~ Tasks that a user is permitted to perform on a computer system or domain.

rights management (n)~ A technology that provides persistent protection to digital data using encryption, certificates, and authentication. Authorized recipients or users must acquire a license in order to consume the protected files, according to the rights, or business rules, set by the content owner.

Rights Management (PN)~ A capability of Microsoft Azure Active Directory that extends an existing on-premises AD to Microsoft Azure.

Rights Management Services SDK (n)~ The SDK which, as part of the Microsoft Rights Management services, connects a variety of runtime applications with the Microsoft Azure RMS.

rights template (n)~ The saved settings for file usage rights for the RM Services server in a specified domain. The administrator sets these in the Administration Console, and saves them for use by the client applications.

rights-managed (Adverb) ~ Stored on a server or client computer that is configured to control access to content by using information rights management (IRM) technology.

right-to-left (adj)~ Pertaining to keyboard settings, document views, user interface objects, languages, etc. for which text is displayed in a right-to-left direction.

Right-to-Left Reading Order (oth)~ The item on the right-click menu in a conversation that changes the Communicator user interface so it supports a right-to-left language.

ring (v)~ To create a sound, vibration, visual cue, or any other indication that the user has an incoming call.

ring (n)~ A sound, vibration, visual clue, or any other indication that a call is coming in.

Ring 0 (n)~ A highly privileged mode of operation where program code has direct access to all memory, including the address spaces of all user-mode processes and applications, and to hardware.

ring duration (n)~ A call-forwarding option that allows the user to set the number of seconds that the phone will ring before a call is redirected.

ring tone (n)~ The sound made by a mobile device or other phone to indicate an incoming call or message, for example, a series of beeps or an audio recording.

Ring type (PN)~ An option that allows the user to specify the type of alert the device will produce in response to an incoming call.

ringback (n)~ A feature that transfers a call back to the person who parked it, after a specified amount of time, so a caller doesn't remain on hold indefinitely.

ringer (n)~ The mechanical part that makes the phone ring to indicate an incoming call.

ringer volume (n)~ The loudness of a phone's ringer.

ringtone (n)~ The sound made by a mobile device or other phone to indicate an incoming call or message, for example, a series of beeps or an audio recording.

Ringtone Editor (PN)~ An editor that enables users to create ringtones from sound files on their PC or create custom recordings. It also enables them to preview and save them directly to their phone as the primary ringtone, or assign them to one or more contacts.

Ringtones & sounds (PN)~ The Personalization subcategory containing apps with special ringtones and sounds for your PC and phone.

RIP (n)~ An industry standard, distance vector routing protocol used in small- to medium-sized Internet Protocol (IP) and Internetwork Packet Exchange (IPX) internetworks.

rip (v)~ To copy digital media content from an audio CD. Content may be converted to a different format during the ripping process.

Rip ~ To transfer data to a hard disk from something else.

RIPL (n)~ The ability to start a computer from elsewhere on a network.

Ripper ~ Program which copies ('rips') tracks from music CDs onto a computer, often as an- MP3. Technically this is illegal in many jurisdictions, but in practice extremely widespread, and is usually tolerated as long as the ripped tracks are for personal use only.

RIS (n)~ Software services that allow an administrator to set up new client computers remotely, without having to visit each client. The target clients must support remote booting.

risk (n)~ A type of work item, recording a possible event with an undesirable outcome. Risks must be identified, assigned, and if the impact is probably and really undesirable, mitigated.

risk analysis (n)~ The evaluation, classification, and prioritization of risks.

Risk and Health Assessment Program (n)~ A Microsoft Services Premier Support offering that helps prevent serious issues from occurring by analyzing the health and risks present in an environment.

risk management (n)~ A proactive, formalized process for decision-making and taking action to continuously assess what can go wrong, assess and quantify the identified risks, determine what risks are important to address, implement strategies to deal with those risks, and monitor the status of risks and mitigation activities.

risk management plan (n)~ A document defining how risk will be managed throughout the project. It can include identified risks, probabilities, contingency plans and methods for implementing them, and a strategy for allocating resources if a risk event occurs.

risk mitigation (n)~ The act of reducing the probability and/or impact of a risk to an acceptable level.

risk statement (n)~ A condition-consequence statement that helps to clearly articulate risk by expressing a causal relationship between a real, existing project state of affairs or attribute, and a potential, unrealized other project state of affairs or attribute.

risk symptom (n)~ An indication that a risk has occurred or is about to occur.

risk trigger (n)~ An indication that a risk has occurred or is about to occur. They sometimes are called risk symptoms or warning signs. Triggers may be discovered in the risk identification process and watched in the risk monitoring and control process.

risk-driven scheduling (n)~ A principle of good scheduling that prioritizes tasks based on the level of risk involved and prioritizes features based on their importance to key stakeholders.

Rivest-Shamir-Adleman encryption (n)~ The patented public key encryption method, introduced by Ronald Rivest, Adi Shamir, and Leonard Adleman in 1978, on which the PGP (Pretty Good Privacy) encryption program is based.

RJ-45 (n)~ An eight-wire connector used to attach devices to cables. The eight wires are encased in a plastic sheath and color-coded to match corresponding slots in jacks and are used to connect computers to LANs (local area networks) and to link ISDN (Integrated

Services Digital Network) devices to NT-1 (Network Terminator 1) devices.

RJ-45 connector (n)~ An eight-wire connector used to attach devices to cables. The eight wires are encased in a plastic sheath and color-coded to match corresponding slots in jacks and are used to connect computers to LANs (local area networks) and to link ISDN (Integrated Services Digital Network) devices to NT-1 (Network Terminator 1) devices.

RM activation service (n)~ The Microsoft service responsible for placing a secure repository on an end user's computer.

RM Lockbox (n)~ The software module responsible for authenticating the valid use of protected content and protecting trusted software processing from modification and observation.

RMA number (n)~ A reference number that is used to authorize and track goods returned for repair or refund. A return materials authorization is issued by a sales entity that authorizes a buying company to return goods.

RMB (n)~ An official currency of the People's Republic of China.

RMO (PN)~ A managed code assembly that encapsulates replication functionalities for SQL Server.

RMS connector (n)~ A service which acts as a server and relays requests coming from on-premise Exchange or SharePoint to the Microsoft Azure RMS.

RMS connector administration tool (n)~ A tool that enables IT administrators to configure the RMS connector to support their on-premises servers.

RMS SDK (PN)~ The SDK which, as part of the Microsoft Rights Management services, connects a variety of runtime applications with the Microsoft Azure RMS.

RMS sharing (PN)~ The application that permits consumption and creation of RMS-protected content on PCs or mobile devices.

RMtP (PN)~ A web-based tool that allows Certified and Gold Certified Partners to get support directly from Microsoft technical experts.

road view (n)~ A view on a Virtual Earth map in Concierge that displays illustrated images of streets and cities.

roam (v)~ To move between different environments and have the same user experience in both environments.

roam (v)~ To use a phone outside the usual service area.

roaming (n)~ The process by which an SMS/Configuration Manager client changes its IP address such that it ends up in a site to which it is not assigned. Roaming exists to facilitate SMS/Configuration Manager clients in getting software distribution most efficiently.

roaming (n)~ The process of maintaining connectivity outside of one's usual service or coverage area.

roaming aggressiveness (n)~ The degree to which (or speed at which) a device or a computer seeks to achieve or improve a connection.

roaming boundary (n)~ For Advanced Clients, which can move from site to site, the list of IP subnets, IP address ranges, and Active Directory sites that determine which clients are able to access a site distribution point.

Roaming calls (PN)~ The name of a section in Call Timers that displays the cumulative duration of all calls made outside the usual service area (as defined by a service provider).

roaming profile (n)~ A server-based user profile that is downloaded to the local computer when a user logs on and that is updated both locally and on the server when the user logs off.

roaming service (n)~ A service for making calls outside the home' service area defined by a service provider.'

roaming user profile (n)~ A server-based user profile that is downloaded to the local computer when a user logs on and that is updated both locally and on the server when the user logs off.

robot (n)~ A program that performs a task on a network, especially a task that is repetitive or time-consuming.

Robots Exclusion (PN)~ A feature to manage the content of the Robots.txt file for your Web site.

Robots.txt file (n)~ A file that informs search engines about the pages in a Web site that the owner wants to exclude from, or allow for, indexing. The file contains allow' rules and 'disallow' rules to indicate which portions of a Web site should

robust (adj)~ Able to function or to continue functioning well in unexpected situations.

Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 17.

Rock & Roll (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 78.

RODC (n)~ A domain controller that has read-only copies of directory partitions.

RODC filtered attribute set (n)~ A dynamically configured set of attributes that are not replicated to a read-only domain controller (RODC). This prevents those attribute values from being revealed if an RODC is compromised.

ROFL (or ROTFL) ~ (Rolling On the Floor Laughing)- Internet slang indicating laughter.

rogue server (n)~ A server which is using non-standard processes and at odds with company policy. It may be set up to spread a virus, collect names for spammers or for some other illicit purpose.

role (n)~ A group of activities normally (but not always) performed by one person and often implemented with a security group. Often, one person may play multiple roles.

role (n)~ A symbolic name that defines a class of users for a set of components. Each role defines which users are allowed to invoke interfaces on a component.

role (n)~ A defined set of application access privileges. The security role assigned to a user determines which tasks the user can perform and which parts of the user interface the user can view. All users must be assigned at least one security role in order to access the system.

role (n)~ An administrative classification that is associated with a defined set of user rights.

role (n)~ A set of software programs that, when installed and properly configured, allows a computer running a Windows Server operating system to perform a specific function for multiple users or other computers within a network.

role (n)~ The name given to each End of an association to clarify the semantics of the relationship.

role (n)~ A specific part or function in an application or architecture. For example, a Web server, a database server, or a client.

role (n)~ The user role that is assigned to a user account, which determines the options that are visible to that user and the tasks that the user can perform in the management interface for Exchange Labs.

role (n)~ A behavior pattern of a participant in a relationship.

role (n)~ In the security model, a behavior pattern of a person playing an organization role, a functional role, and an application role.

role (n)~ The type of operating environment for applications that runs within a Microsoft Azure cloud service.

role assignment (n)~ The assignment of a specific role that determines whether a user or group can access a specific item and perform an operation on it.

role assignment policy (n)~ A collection of one or more end-user management roles that enable users to manage the settings of their Outlook Live account and public groups.

Role Center (n)~ A page that provides quick access to information that is regularly viewed, such as a list of activities and links to forms and reports that are used frequently.

role definition (n)~ The collection of task permissions associated with a role.

role entry (n)~ The individual entry on a management role. Role entries provide access to cmdlets, scripts, and other special permissions that let users perform a specific task. A role entry is often a single cmdlet and the parameters that members of a role group can run when the role is assigned to the role group.

role group (n)~ A universal security group with administrative rights assigned to it. These administrative rights are specified by built-in management roles, which are part of the role-based access control (RBAC) permissions model in Exchange Server 2010.

role group member (n)~ A member of an administrator role group, which is a universal security group with administrative rights assigned to it. The roles assigned to the role group are applied to each member who is added to the role group. This grants each user all the permissions allowed by the roles assigned to the role group.

role instance (n)~ The operating environment defined by a role running as a virtual machine within the context of a deployed Microsoft Azure cloud service. The service model may define multiple role instances for a cloud service.

role name (n)~ A name that appears as a text string near the end of a binary association. It indicates the role played by the class attached to the association end, so each end can have its own end name.

role owner (n)~ A user, who can define the assigned users for a privileged role and gates for activation.

role playing (PN)~ A game category that emphasizes character growth or storytelling elements.

role scope (n)~ The scope of influence or impact of a role assignment. The scope defines what objects a role group member can manage. In Outlook Live, there is the recipient scope and the configuration scope.

role service (n)~ A software program or logical collection of software programs that

provide the functionality of a role.

role switching (n)~ In a database mirroring session, the taking over of the principal role by the mirror.

Role Sync (PN)~ A feature that synchronizes SAP roles and SharePoint user profiles, which enables administrators to secure SharePoint objects such as sites, lists and items using SAP roles.

role-based access control role (n)~ The user role that is assigned to a user account, which determines the options that are visible to that user and the tasks that the user can perform in the management interface for Exchange Labs.

role-based administration (n)~ The method in which System Center 2012 Configuration Manager secures objects.

Role-Based Interface (n)~ A feature that customizes the contents of the user interface depending on the security permissions of the user. For example, if the user does not have permission to edit an item, the edit button will not be displayed.

role-based security (n)~ A method of limiting access to the Service Manager console.

role-playing dimension (n)~ A single database dimension joined to the fact table on a different foreign keys to produce multiple cube dimensions.

RoleTailored (adj)~ Pertaining to a Microsoft Dynamics software design that focuses on the users' role rather than the structure of the database.

role-type (n)~ A predefined role definition.

roll back (v)~ To reverse changes.

roll forward (v)~ To apply logged changes to the data in a roll forward set to bring the data forward in time.

roll forward set (n)~ The set of all data restored by a restore sequence. A roll forward set is defined by restoring a series of one or more data backups.

roll up (v)~ On the Gantt Chart, to display symbols on a summary task bar that represent subtask dates. You can roll up dates from subtasks to make important dates easily visible on a summary task bar.

roll up (v)~ To collect subsets of data from multiple locations in one location.

rollback (n)~ A return to a previous stable condition, as when the contents of a hard disk are restored from a backup after a destructive hard disk error.

rolling shutter (n)~ A method of image acquisition in which each frame is recorded by vertically or horizontally scanning the frame.

rolling upgrade (n)~ In a cluster, the process of systematically upgrading cluster nodes one node at a time while the other nodes continue to provide service.

rollout plan (n)~ The plan for delivering an external release. This plan includes all of the elements that must be put in place for acceptance in the marketplace, operations, or to a customer.

rollover (n)~ An effect that changes the appearance of the selected object when you hover over or click it.

rollover (n)~ In a log definition, a value that specifies how often a new log file is created. The default value is Daily'.'

rollover file (n)~ A file created when the file rollover option causes SQL Server to close the current file and create a new file when the maximum file size is reached.

rollup (n)~ The value of an item that is based on a weighted average of the values of itself and its child entries.

rollup field (n)~ A field that displays a value based on a calculation of the values of itself and its child fields.

ROM (n)~ A semiconductor circuit that contains information that cannot be modified.

ROM ~ (Read Only Memory; pr. 'rom') Memory whose contents are preset and cannot (usually) be changed by the user. See also- CD-ROM.

ROM Basic (n)~ A Basic interpreter stored in ROM (read-only memory) so that the user can start programming after simply turning on the machine, without having to load Basic from a disk or tape. ROM Basic was a feature of many early home computers.

roman (adj)~ Having upright rather than slanted characters in a typeface.

Romantic/Adult Situations (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

room (n)~ A shared space where smaller groups of attendees can meet separately.

room (n)~ A place on the phone where families (or other close-knit groups) can stay in touch. Rooms take the form of a panorama that lives in the People Hub. The panorama includes a family chat card, a shared calendar, a shared photo album, and a shared notebook. Users ask others to join their Room via an SMS invite.

room mailbox (n)~ A type of resource mailbox that is assigned to a meeting location such as a conference room, auditorium, or training room. Room mailboxes can be included as resources in meeting requests, providing a simple and efficient way of organizing meetings for an organization.

ROOM structure diagram (n)~ A graphical model of a system's components and their relationships (the structure), and of the system's response to events (its behavior).

rooms+groups (PN)~ A panel label in the People hub for the section of the hub where people can go to see the a list of the Rooms and/or Groups that they have created. In this context, this is where the user can go to be together with' the specific people or groups of people that are important to them.'

root (n)~ The highest or uppermost level in a hierarchically organized set of information. The root is the point from which further subsets are branched in a logical sequence that moves from a broad or general focus to narrower perspectives.

root account (n)~ On UNIX systems, the account having control over the operation of a computer. The system administrator uses this account for system maintenance.

root application system (n)~ The top-level application system for which you are defining and evaluating deployment. The System View window displays all applications in the system, including the full expansion of all systems in the root system.

root authority (n)~ The most trusted certification authority (CA), which is at the top of a certification hierarchy. The root CA has a self-signed certificate.

root CA (n)~ The most trusted certification authority (CA), which is at the top of a certification hierarchy. The root CA has a self-signed certificate.

root certificate (n)~ A self-signed certification authority certificate.

root certification authority (n)~ The most trusted certification authority (CA), which is at the top of a certification hierarchy. The root CA has a self-signed certificate.

Root certification authority certificate (n)~ A certificate signed by the certification

authority that is used to verify the authenticity of a server certificate created by the certification authority.

root directory (n)~ The uppermost directory on a computer, partition or volume.

root domain (n)~ The beginning of the Domain Name System (DNS) namespace. In Active Directory, the initial domain in an Active Directory tree.

root element (n)~ The element in an XML document that contains all other elements. It is the top-level element of an XML document and must be the first element in the document.

root folder (n)~ The uppermost directory on a computer, partition or volume.

Root Health Service (n)~ A Root Management Server component that performs state correlation based on state change data coming from other management servers.

root hints (n)~ DNS data stored on a DNS server that identifies the authoritative DNS servers for the root zone of the DNS namespace. The root hints are stored in the file Cache.dns, located in the systemroot\System32\Dns folder.

root host group (n)~ The default host group, Managed Computers, which contains all host groups in Virtual Machine Manager. The name of the root host group can be assigned during Setup. The default name is All Hosts.

root license (n)~ The element of a license chain that is bound to a computer and is required to decrypt the content key in the leaf license.

root management server (n)~ The first management server installed for a management group that performs unique functions in the management group. Specifically, it hosts the SDK and Config services and is the target server that all consoles attach to.

root model site (n)~ The primordial model site for an application. Each application must contain one root model site.

root name server (n)~ A computer with the ability to locate DNS servers containing information about top-level Internet domains, such as com, org, uk, it, jp, and other country/region domains, in the Internet's Domain Name System (DNS) hierarchy.

Root node (n)~ The location where the exception was raised, which provides information about entry points (external call) for an application: ASP page, web service method, Remoting methods, and so on.

root pool (n)~ For hardware resource pools, the original pool that exists for each type of hardware resource pool, such as networking or storage. Users can add, modify, or remove resource pools, which are descendants of the root pool. However, they cannot add, modify, or delete a root pool.

root product (n)~ A product that is contained in a catalog, but is not associated with any category.

root server (n)~ A computer with the ability to locate DNS servers containing information about top-level Internet domains, such as com, org, uk, it, jp, and other country/region domains, in the Internet's Domain Name System (DNS) hierarchy.

root user (n)~ A person with unlimited access privileges who can perform any and all operations on the computer.

rooted path (n)~ A sequence of folders (directories) that begins with a drive letter and colon (for example, C:) or a directory separator character (\) and leads to a specific file or folder.

rootkit (n)~ Software that conceals itself as well as other resources (such as files, folders,

processes, or registry entries) in order to prevent detection while it maintains access to the host computer.

Roslyn (PN)~ The codename of open-source compilers and code analysis APIs for C# and Visual Basic.NET languages.

rotary dialing (n)~ A form of dialing that enters a phone number by means of pulse frequencies. The user typically hears a series of clicking sounds when dialing.

rotate (v)~ To move bits in a register to the left or to the right. The bit that moves out of the end position rotates to the newly vacated position at the opposite end of the register.

rotate (v)~ To place at least two fingers on an object and rotate your fingers in a clockwise or counterclockwise direction.

rotate (v)~ A gesture represented by placing at least two fingers on an object and rotating your fingers in a clockwise or counterclockwise direction.

rotate (v)~ To automatically switch the display on a mobile device between portrait and landscape orientation.

Rotate 180 (v)~ A filter effect in Windows Movie Maker.

Rotate 270 (v)~ A filter effect in Windows Movie Maker.

Rotate 90 (v)~ A filter effect in Windows Movie Maker.

rotate gesture (n)~ A gesture represented by placing at least two fingers on an object and rotating your fingers in a clockwise or counterclockwise direction.

rotate mode (n)~ A mode in which the user can manipulate a 3D object by rotating it.

rotation (n)~ A multi-touch gesture that consists of two fingers moving around a center point or one finger moving around a finger that is not moving.

rotation handle (n)~ The round handle that appears at the top of a selected shape that you can use to rotate the shape.

rotation lock (n)~ A software setting that disables display rotation.

rotation lock button (n)~ The button or slider on tablets and convertible tablets that rotates the display.

rough order-of-magnitude estimate (n)~ An estimate done without detailed costing, or based on initial or incomplete data. It estimates the general size and scope of a project.

round (v)~ To shorten the fractional part of a number, increasing the last remaining (rightmost) digit or not, according to whether the deleted portion was over or under five.

round cap (n)~ For paths that contain unconnected ends, the end of the stroke that is extended to be rounded off.

round join (n)~ The join style where two lines join at an angle creating a rounded edge, cutting off the corner.

round robin (n)~ A simple mechanism used by DNS servers to share and distribute loads for network resources. Round robin is used to rotate the order of resource records (RRs) returned in a response to a query when multiple RRs of the same type exist for a queried DNS domain name.

round trip (n)~ The process of sending, processing and returning a signal, packet, message, etc.

rounding (n)~ The process of approximating a number by representing it with a fewer number of digits.

rounding adjustment (n)~ An adjustment to an amount made to enable balancing of a

balance sheet despite rounding differences.

rounding amount (n)~ An amount expressed as its nearest round number.

rounding difference (n)~ The deviation from an exact value resulting from the use of rounding.

rounding error (n)~ The deviation from an exact value resulting from the use of rounding.

rounding policy (n)~ A drop-down list on the price list item form from which a user can select how to round the price (up, down, or not at all).

rounding precision (n)~ The degree of precision with which values will be rounded.

routable connector (n)~ A one-dimensional (1-D) connector shape that changes its path to avoid crossing through two-dimensional (2-D) placeable shapes that lie between the two shapes the connector connects.

routable protocol (n)~ A communications protocol that is used to route data from one network to another by means of a network address and a device address. TCP/IP is an example of a routable protocol.

route (n)~ A Service Broker object that specifies the network address for a remote service.

route (n)~ A detailed set of instructions that describes how to create a particular item.

route (v)~ To direct a call.

route card (n)~ A production journal that is used to give feedback on actual time consumption for a route.

route distinguisher (n)~ An address qualifer used only within a single Internet service provider's multi-protocol label switching (MPLS) network. It is used to distinguish the distinct virtual private network (VPN) routes of separate customers who connect to the provider.

route group (n)~ A classification of routes that share certain production characteristics, such as queue time, setup time, and run time.

route job (n)~ A detailed list of all the jobs for each operation, including setup, process, queue and transportation times.

route operation (n)~ A step in the process of manufacturing an item.

routed event (n)~ An event instance that propagates through a tree of related elements rather than just targeting to a single element.

router (n)~ A device that sends, or routes, information between two networks (for example, between a home network and the Internet).

Router (PN)~ A software component that provides an interface between the Microsoft CRM system and Exchange 2000 or Exchange 2003.

Router ~ A device used to connect networks together, for example so that several PCs can share one internet connection. A relative of thehub, but more powerful.

Router ~ A special-purpose computer that handles the connection between 2 or more Packet-Switchednetworks. Routers spend all their time looking at the source and destination addresses of thepackets- passing through them and deciding which route to send them on.

router guard (n)~ A feature that drops router advertisement and redirection messages from unauthorized virtual machines pretending to be routers.

routine (n)~ Any section of code that can be invoked (executed) within a program. A

routine usually has a name (identifier) associated with it and is executed by referencing that name.

routing (n)~ The process of forwarding a packet through an internetwork from a source host to a destination host.

routing (n)~ The selection of carrier routes for transporting freight from origin points to destination points.

routing client (n)~ A type of cache client that includes a routing table that is maintained by lead hosts in the cluster and enables the client to obtain cached data directly from the cache host on which the data resides.

routing domain (n)~ A collection of contiguous network segments connected by routers that share the routing information for the routes within the domain.

routing group (n)~ A logical grouping of well-connected Exchange servers between which no connector is required for message transfer.

routing group connector (n)~ An SMTP connector that is required for mail to flow between Exchange routing groups. When Exchange Server 2007 is installed in an existing Exchange Server 2003 and Exchange 2000 Server organization, the required routing group connector is created during setup.

Routing Information Protocol (n)~ An industry standard, distance vector routing protocol used in small- to medium-sized Internet Protocol (IP) and Internetwork Packet Exchange (IPX) internetworks.

routing number (n)~ A unique bank registration number that a bank uses to identify itself.

routing number (n)~ A record that specifies the sequence of production operations.

routing rule (n)~ A set of criteria that you set up to determined how a record, for example, a case, will be handled.

routing table ~ In internet working, the process of moving a packet of data from source to destination.

row (n)~ The horizontal arrangement of cells in a table or spreadsheet.

row (n)~ A group of related fields (columns) of information treated as a unit and arranged in a horizontal line in a table or spreadsheet.

row aggregate function (n)~ A function that generates summary values, which appear as additional rows in the query results.

row area (n)~ The part of PivotTable view that contains row fields.

row building block (n)~ A worksheet template that contains links to the general ledger and/or external worksheets and other row worksheets. It also contains report row descriptions and calculations and defines the structure of each row in a Management Reporter report. One of the three Management Reporter building blocks.

row code (n)~ The code in a row definition that identifies the type of data in each line of the row definition.

row definition (n)~ A worksheet template that contains links to the general ledger and/or external worksheets and other row worksheets. It also contains report row descriptions and calculations and defines the structure of each row in a Management Reporter report. One of the three Management Reporter building blocks.

row field (n)~ A field that's assigned a row orientation in a PivotTable report. Items

associated with a row field are displayed as row labels.

row guide (n)~ A horizontal layout guide that is used to divide a page into two or more sections to help structure the layout of the page.

row heading (n)~ The numbered gray area to the left of each row.

Row Labels (PN)~ An area in the layout section of a PivotTable field list to which fields can be added in order to display them as rows on the side of the report.

row lock (n)~ A lock on a single row in a table.

row modifier (n)~ A cell in a report definition in which the content overrides the fiscal years, periods, and other information that is specified in the column definition for that row.

row selector (n)~ A small box or bar that, when clicked, selects an entire row in table or macro Design view, or when you sort and group records in report Design view.

row stack (n)~ The position of cards whereby cards are placed in descending order, alternating between red cards and black cards. For example, you can play the two of hearts on the three of clubs.

row versioning (n)~ In 0nline index operations, a feature that isolates the index operation from the effects of modifications that are made by other transactions.

row worksheet (n)~ A worksheet template that contains links to the general ledger and/or external worksheets and other row worksheets. It also contains report row descriptions and calculations and defines the structure of each row in a Management Reporter report. One of the three Management Reporter building blocks.

row-overflow data (n)~ varchar, nvarchar, varbinary, or sql_variant data stored off the main data page of a table or index as a result of the combined widths of these columns exceeding the 8,060-byte row limit in a table.

Rows (PN)~ An area in the layout section of a PivotTable field list to which fields can be added in order to display them as rows on the side of the report.

rowset (n)~ A set of rows in which each row has one or more columns of data.

Royal Bank of Canada (n)~ The largest bank in Canada as measured by assets and market capitalization.

royalty free (adj)~ Pertaining to the absence of a requirement to pay the original owner of music, images, software, or other content for the right to use, edit, or distribute their content.

RP (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

RPC (n)~ A communication mechanism that allows computers to communicate with one another over a network. An RPC consists of a procedure identifier, parameters passed to the procedure, and a value returned to the caller (client computer) after the procedure has executed on the remote system (server computer).

RPC transport (n)~ The underlying network services used by the remote procedure call (RPC) runtime for communications between network nodes.

RPG ~ (Role Playing Game)- A computer game in which you control a character and interact with other characters, explore virtual worlds, undertake quests etc, often involving swords and sorcery. See- MMORPG.

RR (n)~ A standard DNS database structure containing information used to process DNS queries. For example, an address (A) resource record contains an IP address corresponding

to a host name. Most of the basic resource record types are defined in RFC 1035, but additional RR types have been defined in other RFCs and approved for use with DNS.

RRset (n)~ A collection of more than one resource record returned in a query response by a DNS server. Resource record sets (RRsets) are used in responses where more than one record is part of the answer.

rs utility (n)~ Report scripting tool.

rs.exe (n)~ Report scripting tool.

RS-232-C standard (n)~ An accepted industry standard for serial communication connections. Adopted by the Electric Industries Association, this Recommended Standard (RS) defines the specific lines and signal characteristics used by serial communications controllers to standardize the transmission of serial data between devices. The letter C signifies the third in a series.

RS-422/423/449 (n)~ Standards for serial communications with transmission distances over 50 feet. RS-449 incorporates RS-422 and RS-423. Macintosh serial ports are RS-422 ports.

RSA (n)~ A public-key encryption standard for Internet security. It is the default cryptographic service provider (CSP) for Microsoft Windows. It was patented by RSA Data Security, Inc. in 1977. This acronym derives from the last names of the inventors of the technology: Rivest, Shamir, and Adleman.

RSA ACE/Server (n)~ An authentication server made by the RSA Security company.

RSA encryption (n)~ The patented public key encryption method, introduced by Ronald Rivest, Adi Shamir, and Leonard Adleman in 1978, on which the PGP (Pretty Good Privacy) encryption program is based.

RSAC (n)~ An independent, nonprofit organization established in the fall of 1994 by a group of six trade organizations, led by the Software Publishers Association. The Council's goal was to create a new, objective content-labeling rating system for recreational software and other media such as the Internet.

RSAT (PN)~ A feature in Windows Server that enables remote management of Windows Server operating systems by allowing users to open and run management tools on a remote computer.

rsconfig utility (n)~ Server connection management tool.

rsconfig.exe (n)~ Server connection management tool.

RsFx driver (n)~ A file-system filter driver to aid access to the data through the NTFS Streaming APIs for the filestream data type.

R-squared value (n)~ A number from 0 to 1 that reveals how closely the estimated values for the trendline correspond to your actual data. A trendline is most reliable when its R-squared value is at or near 1.

RSS (n)~ An XML-based syndication technology that enables websites to distribute content, such as news headlines and blog posts, effeciently to readers.

RSS ~ (Really Simple Syndication)- An automated system for gathering information, usually news, from multiple sources and bringing it together in one place, usually a website. If any of the information is changed at the source, it is automatically updated at the target.

RSS feed (n)~ A distribution mechanism for frequently-updated content that is aggregated

by an RSS reader and delivered or published in a standard XML format. The content is often summarized, with links to a more complete version.

RSS Platform Sync Engine (n)~ A synchronization engine which will automatically download data and enclosures for use by any application. The engine is designed for efficiency, using idle network bandwidth whenever possible to limit the effect on the users Internet experience. Developers can use the platform to get RSS data without having to manage details such as synchronization schedules or subscriptions.

RSS Reader (n)~ A program that retrieves updates and displays RSS formatted webpages and messages known as news feeds or web feeds. RSS readers can often aggregate and display news feeds from multiple sources.

RSS Subscriptions (n)~ A feature that enables a user to capture all of the RSS feeds they subscribe to in a folder that automatically updates at specified intervals.

RSVP (n)~ A signaling protocol that allows the sender and receiver in a communication to set up a reserved highway for data transmission with a specified quality of service.

RTAudio (PN)~ An advanced speech codec that is designed for real-time two-way Voice over IP (VoIP) applications such as gaming, audio conferencing, and wireless applications over IP. RTAudio is the preferred Microsoft audio codec and is the default codec for Microsoft Unified Communications platforms.

RTC (n)~ In PCs, circuits or other hardware elements that provide the system with real-world time.

RTCP (n)~ A scalable transport control protocol that works with the Real-Time Protocol (RTP) to monitor real-time transmissions to multiple participants over a network-for example, during videoconferencing. The Real-Time Control Protocol, or RTCP, transmits packets of control information at regular intervals and is used to determine how well information is being delivered to recipients.

RTFM ~ (Read The Flipping Manual)- Internet slang, usually fired at people asking basic questions to which they would know the answers if they had looked at the manual. There are several different translations of the letter F… :-)

RTGS (n)~ A funds transfer system where irrevocable transfers of money or securities take place directly from one bank to another without waiting periods.

RTL (adj)~ Pertaining to keyboard settings, document views, user interface objects, languages, etc. for which text is displayed in a right-to-left direction.

RTM (PN)~ The version of software that's distributed to manufacturers to build into hardware they will make available when the final software is made generally available.

RTS ~ (Real Time Strategy)- A computer game where you command armies (usually) of animated figures, direct their development, fight their battles and so on. 'Real Time' because the game runs continuously rather than waiting for your orders, though in practise you can usually pause the game as much as you like unless you are playing against a human opponent.

RTSP (n)~ A network protocol, defined in RFC 2326, for controlling one or more digital media streams or a presentation (the aggregate of related media streams).

RUB (n)~ The official currency of the Russian Federation.

rubber-banding (n)~ In computer graphics, changing the shape of an object made up of connected lines by grabbing' a point on an anchored line and 'pulling' it to the new

location.'

rubles (n)~ The official currency of the Russian Federation.

Ruby (PN)~ A run of text that is associated with another run of text, referred to as the base text.

Ruby ~ a scripting language for object-oriented programming similar in intent to PERL and PYTHON. Ruby was developed by Yukihiro Matsumoto in 1995. See- www.ruby-lang.org

rule (n)~ A set of conditions and associated actions that may be applied to certain tasks. For example, an email rule might stipulate that all messages from a particular sender be placed into a specific folder.

rule (n)~ In Operations Manager, an element in a management pack that defines the events and performance data to collect from computers, and what to do with the information after it is collected. A rule cannot set a health state.

rule (n)~ A condition-action pair that prescribes the action taken when the condition is met.

rule (n)~ In Best Practices Analyzer, a recommended configuration, performance, security, or operations standard by which a role is evaluated during a BPA scan. BPA works by measuring a role's compliance with best practice rules in eight different categories of a role's effectiveness, trustworthiness, and reliability.

rule collection (n)~ An ordered set of rules for the purpose of implementing a messaging policy. The number of rule collections is set at design time.

rule firing (n)~ The process of running one of the application rules (event chronicle rules, subscription event rules, and subscription scheduled rules) defined in the application definition file.

rule group code (n)~ A code that represents a common group of employees whose pay is processed using the same calculations.

rule line (n)~ A line printed above, below, or to the side of some element, either to set that item off from the remainder of the page or to improve the look of the page. Footnotes, for example, often appear below a short rule that sets them off from the main text on the page. The thickness of a rule is typically measured in points. (A point is approximately 1/72 inch.)

Rule Management area (n)~ The area of the Policy Filter page where administrators add and manage rules (such as Reject, Redirect, Deliver with Bcc) that define actions to take when conducting spam and virus filtering.

rule processor (n)~ The set of logic rules used by the Application Performance Monitoring (APM) service. This set of rules determines how to handle the processing of data that is collected from an application.

rule set (n)~ A container for grouping logically-related rules.

Rule-based configuration (n)~ A configuration technology that uses rules to develop product masters and to configure distinct products.

ruler (n)~ An on-screen scale marked off in inches or other units of measure and used to show line widths, tab settings, paragraph indents, and so on.

ruler guide (n)~ A horizontal or vertical layout guide that can be aligned to any point on a ruler.

ruler guide marker (n)~ A marker in the ruler that aligns with the current guide position and enables users to add, edit, or delete a guide from within the ruler.

ruler mark (n)~ A mark on the vertical or horizontal ruler that shows a unit or subunit of the measurement unit that is used for the publication.

ruler origin (n)~ The beginning or zero point of a horizontal or vertical ruler.

ruler subdivision (n)~ The division between grid lines and between intervals of the ruler.

Rules Engine Framework (n)~ The .NET component library, APIs, and services used by application developers to write rule-based applications.

Rules Engine Update service (n)~ A service that performs dynamic policy updates.

Rules Inspector (PN)~ A dialog that allows the user to view all the rules (logic) in a form pivoted in different ways. Because the information is summarized in a centralized view, the user doesn't have to click through multiple dialogs.

Rules Manager (PN)~ A task pane that helps form designers to build and manage custom business rules for use in their forms.

run (v)~ To execute queries and macros.

Run As account (n)~ A Windows account that can be associated with a Run As profile, and that can use the Windows Authentication, NTLM, Basic, or Digest methods of authentication.

Run As profile (n)~ A profile that associates an identity with a module so that it can run as that identity.

run configuration (n)~ Settings that are stored in a run configuration file and that impact the runtime environment of a test run.

Run Elevated (v)~ Option on a right-click menu of a program icon that, when selected, allows the program to run with full administrator privileges.

run history (n)~ A set of statistics that shows the results of a single run of a management agent.

run level (n)~ An attribute of an application that indicates which type of access token to use when the application is started. The requested execution level can be defined in an application manifest or an AppCompat database entry, or it may be derived automatically by the Windows operating system based on heuristics, if no application manifest is present.

Run Query (v)~ A command to run a work item query.

run settings (n)~ A set of properties that influence the way a load test runs. For example, test duration and description could be specified in the run settings.

run time (PN)~ The time during which an application is running. During run time, you can interact with an application.

run time (n)~ The time it takes for a physical manufacturing operation, excluding setup time, queue time, and move time.

Run Tracker (PN)~ A feature that allows the users to track running fitness.

runaway query (n)~ A query with an excessive running time, that can lead to a blocking problem. Runaway queries usually do not use use a query or lock time out.

RunBase framework (n)~ A framework that allows the user to implement business operations for which there is no existing support in Microsoft Dynamics AX.

runbook (PN)~ The sequence of activities that orchestrate actions on computers and

networks.

Runbook Designer (PN)~ The tool that is used by designers to create, modify, and deploy runbooks.

runbook server (n)~ The server that runs the service that manages runbooks and communicates with the orchestration database.

Runbook Tester (PN)~ The tool that is used to test and validate runbooks.

running foot (n)~ One or more lines of text in the bottom margin area of a page. A footer may contain elements such as the page number, the name of the file, or the date.

running head (n)~ One or more identifying lines printed at the top of a page. A header may contain a page number, a date, the author's name, and the document title, the name of chapter.

running state (n)~ The state of a workflow instance that is currently processing. A user can suspend, terminate, or cancel a running instance.

RunOnce application (n)~ An application that is configured to run the next time the computer is restarted. The application does not run after any subsequent reboots of the system.

runspace (n)~ In Windows PowerShell, the operating environment in which each command in a pipeline is executed.

runtime (n)~ The engine at the core of managed code execution. The runtime supplies managed code with services such as cross-language integration, code access security, object lifetime management, and debugging and profiling support.

run-time (adj)~ Occurring after a program has begun to be executed, such as evaluation of variable expressions and dynamic allocation of memory.

runtime callable wrapper (n)~ A .NET Framework object that acts as a proxy for a reference-counted COM object.

run-time error (n)~ A software error that occurs while a program is being executed, as detected by a compiler or other supervisory program.

runtime host (n)~ The environment, such as ASP.NET, Internet Explorer, or the Windows shell, in which the common language runtime is typically started and managed. Runtime hosts create application domains in which to run managed code on behalf of the user. See also application domaincpgloA, common language runtimecpgloC, managed codecpgloM.

run-time library (n)~ A file that contains one or more prewritten routines to perform specific, commonly used functions. Programmers use an RTL primarily in high-level languages such as C to avoid rewriting these routines.

Runtime object model (n)~ An object model designed for use by BDC clients and applications that provides an intuitive, object-oriented interface that abstracts the underlying data sources.

RVA (oth)~ An offset from the address of a module that is loaded in memory.

S corporation (n)~ An United States tax law designation given to any corporation that elects to pass corporate income, losses, deductions, and credit through to shareholders for federal tax purposes.

S/B Compatible ~ (SoundBlaster- compatible)- A common- Soundcard- format, now obsolete.

S/MIME (n)~ An Internet e-mail security-oriented protocol that adds public key encryption and support for digital signatures to the widely used MIME e-mail protocol.

S/MIME receipt (n)~ An e-mail security feature used to request confirmation that a message was received unaltered and information about who opened the message and when it was opened. This verification information is returned as a message to your Inbox.

S/PDIF (n)~ A standard for digital transfer of audio.

S2S protocol (n)~ An authentication protocol between two servers or services.

SA (n)~ A combination of identifiers, which together define Internet Protocol security (IPsec), that protects communication between sender and receiver.

SA (PN)~ A program offering available to Microsoft volume licensing customers that combines the right to use the latest versions of software with a range of other benefits, including productivity benefits, phone support, tools, partner services, training and IT tools that help customers deploy, manage, and migrate software.

SaaS (n)~ The capability provided to the consumer for using the provider's applications running on a cloud infrastructure. The applications are accessible from various client devices through either a thin client interface, such as a web browser (e.g., web-based email), or a program interface. The consumer does not manage or control the underlying cloud infrastructure, including network, servers, operating systems, storage, or even individual application capabilities, with the possible exception of limited user-specific application configuration settings.

SACL (n)~ An ACL that controls the generation of audit messages for attempts to access a securable object. The ability to get or set an object's SACL is controlled by a privilege typically held only by system administrators.

saddle stitch (n)~ A book binding method whereby pages are stapled along the spine and then folded to form a booklet.

safe array (n)~ A self-describing data type for declaring arrays used in creating COM components. Along with the data, a safe array contains information about the number and bounds of its dimensions.

Safe attachment (PN)~ The spam filter feature that checks an email attachment to see whether or not it is safe.

safe code (n)~ Code that is executed by the common language runtime environment rather than directly by the operating system. Managed code applications gain common language runtime services such as automatic garbage collection, runtime type checking and security support, and so on. These services help provide uniform platform- and language-independent behavior of managed-code applications.

safe list collection (n)~ The combined data from an Office Outlook user's Safe Senders

List, Safe Recipients List, Blocked Senders List, and external contacts, that is stored in Outlook and in the Exchange mailbox.

safe mode (n)~ A method of starting Windows using only basic files and drivers. Safe mode is available by pressing the F8 key during startup. This allows you to start the computer when a problem prevents it from starting correctly.

safe mode (n)~ A specific version policy that requests a given assembly be run with the exact version of its dependencies that it was compiled against.

Safe Mode ~ A cut-down version of- Windows- which you can launch instead of the full version for troubleshooting purposes.

Safe Recipients List (n)~ A list that includes the e-mail addresses of mailing lists for which you want to be a recipient. Messages sent to such a mailing list and received by you will not be treated as junk e-mail.

safe sender (n)~ A domain or a person that a user wants to always receive e-mail messages from. Users add recipients and domains to the Safe Senders list.

Safe Senders List (n)~ A list of domain names and e-mail addresses that you want to receive messages from. E-mail addresses in Contacts and in the Global Address Book are included in this list by default. People you sent messages to will be added to the list.

safelist (n)~ The collection of IP addresses that are in a gateway servers list or internal mail servers list of IP addresses that should not be treated as spam.

SafeSearch (PN)~ The feature of Bing that enables customers to block sites containing adult (sexually explicit) content. Customers can choose from three levels of filtering: strict (hides adult text and image results); moderate (hides adult images only); and off (doesn't hide any search results).

Safety (PN)~ The Windows Live webpage that displays security and safety-related activities.

safety margin (n)~ A time buffer, specified in days, that is added to order due dates to protect against unplanned delays in the item lead time.

safety scanner (n)~ The free online on-demand tool that conducts three types of scans: the protection scan checks for and removes things like viruses and malware; the clean-up scan checks the hard disk for unnecessary files and helps users decide which ones they can safely remove, and also clears the computer's registry of orphaned data; the tune-up scan helps improve the computer's performance by defragmenting the hard disk.

safety stock (n)~ The planned minimum inventory level.

salary survey reference job (n)~ A benchmark job description provided by the administrator of a salary survey (usually a third party) that allows different companies to compare their internal jobs to a standard description found in the marketplace.

sale (n)~ The exchange of products or services for money.

sales (n)~ The exchange of products and services with a customer for money.

Sales (PN)~ The area of the application targeted at helping salespeople identify, track, and forecast selling opportunities (be they with existing or new customers) and help bring them to successful closure (sales) more effectively and efficiently.

Sales & marketing (PN)~ The Business subcategory containing apps to help businesses plan and track sales and marketing tasks.

sales agreement (n)~ A source document that documents an agreement between two or

more parties based on an understanding that a selling party will commit to selling a specific quantity or value of product over a period of time in exchange for favorable prices and discounts.

sales agreement policy (n)~ A policy that authorizes parties to modify sales agreement terms.

sales amount approval limit (n)~ The maximum amount on a sales document that an approver is allowed to approve.

sales and operations planning (n)~ The development of tactical plans that provide management with the ability to strategically direct its businesses to achieve competitive advantage on a continuous basis by integrating customer-focused marketing plans for new and existing product with the management of the supply chain.

sales conversion point (n)~ The conversion point page where a visitor has completed a purchase. This is usually the confirmation page after the sale.

Sales Force Automation (n)~ The management of all aspects of the sales cycle and standardization of key sales functions by automating activities such as account and opportunity management, quote and proposal generation, scheduling, forecasting, and reporting.

sales forecast (n)~ An estimate of sales revenue that typically spans a specific period such as a month, quarter of a year, one half of a year, or a full year.

sales invoice (n)~ The bill that an organization gives a customer in connection with a sale.

sales item (n)~ An itemized product that participates in a sales process.

sales lead (n)~ A potential customer who must be contacted by a salesperson and either qualified or disqualified as a sales opportunity. Leads will be converted into accounts, contacts, or opportunities if they are qualified. Otherwise they are deleted or archived.

sales literature (n)~ The documents that are created with specific information about products and/or services and given to customers to help increase sales.

Sales module (n)~ The Microsoft CRM module used to access business records pertaining to sales, such as accounts, contacts, quotes, orders, and sales literature. In this module, users can create leads, convert them to opportunities, accounts, and contacts, and view and track information about competitors. Users can also create quotes and orders, and generate invoices.

sales order (n)~ An agreement between two parties for the sale of goods or services.

sales order (n)~ A source document that documents the offer to sell products or the acceptance of an offer to buy products in exchange for payment.

sales order discount (n)~ An amount deducted from the total net amount calculation on a sales order.

sales order line (n)~ The part of a sales order that specifies the detailed information about a requested item.

sales order policy (n)~ A policy that authorizes parties to modify sales order terms and to control order processing and payment processes.

sales pipeline (n)~ A potential sales transaction in process.

sales price model (n)~ A model that defines whether the calculation of sales price is based on quantity or on a markup amount or percentage of the cost price.

Sales Process Manager (n)~ A section of the Settings area where users can customize

sales processes for their team to improve sales performance.

sales quotation (n)~ A source document that documents an offer to supply a quantity of product for a specified price and by a specified date in response to a request for quotation in a sales process.

sales quotation template (n)~ A model for creating sales quotations. The template includes common information so that it does not need to be entered each time a quotation is created.

sales report (n)~ A report specific to the Sales areas of the product.

sales stage (n)~ The part of the sales process where an opportunity currently is; for example, prospecting, needs analysis, closed or won, closed or lost, and so on.

sales stage (n)~ In CRM, the period or step in the sales process that the prospect is in.

sales tax (n)~ A tax levied on the sale of products.

sales tax book (n)~ A record of sales and purchase transactions for sales tax reporting in Italy.

sales tax code (n)~ A user-defined code that uniquely identifies a specific sales tax and defines its characteristics, such as the percentage or amount, tax authority, terms of payment, and ledger accounts used for posting.

sales tax exempt (n)~ Pertaining to a sale or purchase transaction for which no sales tax is calculated.

sales tax group (n)~ A group of one or more sales tax codes that define sales tax (including duty) for customers, vendors, projects, and ledger accounts.

sales tax hierarchy (n)~ A hierarchy that organizes multiple levels of sales tax reporting codes, such as tax types, tax components, excise record types, and service accounting codes.

sales tax hierarchy node (n)~ A node in a sales tax hierarchy that represents sales tax information, such as the tax component or the excise record type.

sales tax hierarchy structure (n)~ A structure that contains multiple levels of sales tax reporting nodes and that does not contain data. This structure is used as a template to create a sales tax hierarchy.

sales tax jurisdiction (n)~ A government unit or subdivision that imposes taxes within a state. A geographical area within a state can be taxed by several jurisdictions: town, county, and state.

sales tax settlement period (n)~ A division of the year when the business reports and pays collected sales tax to the tax authorities.

sales territory (n)~ A segment of an organization's market. Sales territories are often defined by geographical location, such as Northwest territory and Southeast territory.

sales unit (n)~ A team of salespersons responsible for a common sales target.

sales unit (n)~ A unit of measure for expressing quantities of sales product.

sales unit price (n)~ The price of a sales unit.

sales VAT (n)~ The tax on an organization's sales, which is levied on the sales price.

salesperson (n)~ A security role assigned to users. A salesperson finds and qualifies leads, and works with opportunities, accounts, and contacts to complete sales activities.

Salsa (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp

genre ID # 143.

salt ~ In password protection, salt is a random string of data used to modify a password hash. Salt can be added to the hash to prevent a collision by uniquely identifying a user's password, even if another user in the system has selected the same password.

salvage account (n)~ An account used to track the salvage value of assets.

salvage value (n)~ The expected cash value of the asset at the end of its useful life.

SAM (n)~ A best practice incorporating a set of proven processes and procedures for managing and optimizing the purchase, deployment, maintenance, utilization, and disposal of software applications within an organization. SAM practice helps to manage risk from counterfeit as well as improperly licensed software.

Samba (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 114.

SAMI (n)~ An Extensible Markup Language (XML)-based language used to specify closed captions in multiple languages and styles.

sample (n)~ A subset of a population to represent the characteristics of the entire population being studied.

sample (n)~ An indivisible element of an image that is stored in computer memory. The terms pixel and sample are often used interchangeably.

sample application (n)~ End-to-end, compilable application that uses many technologies and is designed as teaching sample or commercial utility for which the code is made available for learning and re-use.

sample code (n)~ A set of program instructions that are provided as an example, typically for learning and re-use.

sample color (n)~ A single color that is based on the dominant color of an entire image.

sample data wizard (n)~ A wizard that installs sample data on the server.

sample diagrams (n)~ A set of diagrams, provided as examples, which you can use to learn about Visio and its features.

sample document (n)~ A type of template that contains instructions on how to create your own document.

sample item (n)~ An itemized product that is selected for inspection.

sample rate (n)~ The rate at which a digital recording device analyzes an analog signal in order to create a digital duplicate. Sample rate is measured in cycles (kHz) per second. The higher the sample rate, the better the quality of the digital reproduction of the analog signal.

sample runmap (n)~ An array of sample runs that make up an entire image.

sampling (n)~ The process of measuring the amplitude of an analog signal at regular intervals for the purpose of converting the signal into a digital format.

sampling (n)~ A profiling technique that involves taking snapshots of program execution at intervals.

sampling (n)~ A statistical process that yields some inferential knowledge about a population or data set of interest as a whole by observing or analyzing a portion of the population or data set.

sampling interval (n)~ The period of time during which a monitoring tool collects data.

sampling rate (n)~ The rate at which a digital recording device analyzes an analog signal in order to create a digital duplicate. Sample rate is measured in cycles (kHz) per second. The higher the sample rate, the better the quality of the digital reproduction of the analog signal.

SAN (n)~ A set of interconnected devices (such as disks and tapes) and servers that are connected to a common communication and data transfer infrastructure such as Fibre Channel.

SAN (n)~ An extension (defined in RFC 4985) used to store extra identifiers for a subject including the User Principal Name (UPN) of the user that is used by Windows for smart card logon and the user e-mail address (RFC 822 name).

sandbox ~ A trial environment online where you can test something out without breaking anything.

sandbox instance (n)~ A non-production, test instance that provides an isolated environment of Dynamics CRM to allow for testing of custom code, such as plug-ins.

sandboxed application (n)~ In Silverlight, an in-browser application or an out-of-browser application that has not been granted elevated trust.

Sandboxed Code Service (PN)~ The name of a service in Microsoft Sharepoint Foundation that needs to be started to allow for a sandboxed solution to be deployed.

sandboxed solution (n)~ A custom solution that can be deployed to a site by a site collection administrator, without approval from the farm administrator. Without that approval, the solution has full access to the immediate site and restricted access to system resources and other sites.

SANergy ~ A product of IBM Tivoli that delivers shared data access at the speed of a SAN, using fibre channel, the SCSI, or the iSCSI.

SAP (n)~ A NetWare protocol used to identify the services and addresses of servers attached to the network. When a server starts, it uses the protocol to advertise its service. When the same server goes offline, it uses the protocol to announce that it is no longer available.

SAPI (n)~ A feature in some versions of Windows that allows applications to include speech recognition or convert text to speech.

Sarbanes-Oxley Act of 2002 (PN)~ A U.S. federal law that requires the preservation of records by certain exchange members, brokers, and dealers.

SAS (n)~ A URL that grants access rights to containers, blobs, queues, and tables.

SASL (n)~ An open framework, described in Request for Comments (RFC) 2222, for adding authentication support to connection-based protocols.

SATA ~ (Serial Advanced Technology Attachment)- A high speed standard for connecting hard disks to your computer, replacing- EIDE- on most new computers.

satellite assembly (n)~ A .NET Framework assembly containing resources specific to a given language. Using satellite assemblies, you can place the resources for difference languages in different assemblies, and the correct assembly is loaded into memory only if the user elects to view that application in that language.

satellite phone ~ They operate both on either GSM/AMPs networks, and via satellite, in areas where there is no coverage.

Satire (n)~ One of the music genres that appears under Genre classification in Windows

Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 110.

saturation (n)~ In color management, the purity of a color's hue, moving from gray to the pure color.

save (v)~ To write data (typically a file) to a storage medium.

Save (v)~ An item on the File menu that writes data (typically a file) to a storage medium.

Save ~ Copy whatever you are working on from- memory, which is lost when you switch off the computer, to permanent- storage, usually the hard disk. It is a good idea- to save frequently when you are working on something important, in case there is a sudden power cut or you make some awful mistake that trashes your document.

Save As (v)~ An item on the File menu and a button on the Instant Message toolbar that saves the text of the current conversation as a file on the user's computer.

Save As E-mail (v)~ The item on the File menu that sends the text of the current conversation as an e-mail message to the user.

Save as type (PN)~ An option in the Save As dialog that enables a user to save a file in different formats or versions.

save picker (n)~ A UI element that enables users to chose a file name, extension, and storage location when saving a file.

save process (n)~ The process of writing data to disk.

Saved networks (n)~ A Control Panel item that allows the user to view saved networks and reconnect to them.

Saved Projects (n)~ A holding place where Works Projects created or customized by the user are displayed.

saved requisition (n)~ A requisition that has been saved but not submitted; business processes are not initiated for saved requisitions.

saved search (n)~ A list of files that match specific search or filter information. You can save a search created in the Search folder. Whenever you open a saved search, it will search your computer again to find all files that match what you're looking for.

saved state (n)~ A manner of storing a virtual machine so that it can be quickly resumed, similar to a hibernated laptop. When you place a running virtual machine in a saved state, Virtual Server and Hyper-V stop the virtual machine, write the data that exists in memory to temporary files, and stop the consumption of system resources. Restoring a virtual machine from a saved state returns it to the same condition it was in when its state was saved.

savepoint (n)~ A location to which a transaction can return if part of the transaction is conditionally canceled or encounters an error, hence offering a mechanism to roll back portions of transactions.

Savings Calculator (PN)~ A tool for calculating earnings on saving deposits.

SBA Sharing site (n)~ A shared site where a business owner can grant permissions to an accountant where they upload files and share information.

SBCS (n)~ A character encoding in which each character is represented by 1 byte. Single byte character sets are mathematically limited to 256 characters.

SBM (n)~ An Internet Engineering Task Force (IETF) standard that enables administrative control at the subnet level.

SBSI (n)~ Interactive training published by Microsoft Press that is integrated into Windows XP Help and Support Center.

scaffolding (n)~ The process of generating Web-page templates based on database schemas. In ASP.NET, Dynamica Data uses scaffolding to facilitate the generation of Web-based UI that lets a user view and update a database.

scalability (n)~ The capability to increase resources to yield a linear (ideally) increase in service capacity.

scalable (adj)~ Of or relating to the characteristic of a piece of hardware or software or a network that makes it possible for it to expand or shrink to meet future needs and circumstances. For example, a scalable network allows the network administrator to add many additional nodes without the need to redesign the basic system.

Scalable Video Coding (PN)~ A video compression standard that encodes high-quality video bitstreams. Support for the capability enables the conferencing server to determine how bitstreams should flow among receiving clients, based on the capabilities and bandwidth of the receiving endpoint.

scalar (n)~ A factor, coefficient, or variable consisting of a single value (as opposed to a record, an array, or some other complex data structure).

scalar data type (n)~ A data type defined as having a predictable and enumerable sequence of values that can be compared for greater-than/less-than relationships. Scalar data types include integers, characters, user-defined enumerated data types, and (in most implementations) Boolean values.

scalar property (n)~ A property of an entity that maps to a single field in the storage schema.

scalar-valued function (n)~ A function that returns a single value, such as a string, integer, or bit value.

scale (n)~ A horizontal or vertical line on a graph that shows minimum, maximum, and interval values for the data plotted.

scale (v)~ To enlarge or reduce the display of an item, such as a drawing or a proportional character font, by adjusting its size proportionally.

scale (v)~ In programming, to determine the number of digits occupied by fixed-point or floating-point numbers.

scale (n)~ The capacity and performance of a given streaming media deployment. Web server networks are considered to be of a much larger scale compared to Windows Media server networks for delivering media streams, because of the ubiquity of HTTP.

scale (n)~ A value referring to the number of units of service that a customer is entitled to within a particular tier of service offering: Basic, Standard and Premium.

scale break line (n)~ A line drawn across a chart area to indicate a significant gap between a high and low range of values on the chart.

scale factor (n)~ A number determining the degree to which a shape or image will be inflated or deflated.

scale factor (n)~ A ratio to convert from one number precision to another.

scale mode (n)~ A mode in which the user can manipulate a 3D object by increasing or decreasing its scale.

scale out (v)~ To include additional hardware resources, such as CPU, memory, and hard

disk space, to increase the capacity and performance of a given deployment.

scale out (a service) (v)~ To add additional virtual machines to a tier of a deployed service.

scale override management pack (n)~ A set of files for use with System Center Operations Manager to store overrides and change the degree to which inflating or deflating the number of resources and the performance of a given deployment.

scale unit (n)~ In Microsoft Azure, a base configuration of web and worker role instances and related services. A scale unit supports a defined degree of load in an application that can be easily duplicated and deployed to support additional load. A scale unit might consist of, for example, three web roles, two worker roles, one queue, and two SQL Database instances.

scaling (n)~ In computer graphics, the process of enlarging or reducing a graphical image—scaling a font to a desired size or scaling a model created with a CAD program, for example.

scaling (n)~ The process of expanding the capacity of a Web server or server cluster to accommodate increased site traffic and improve site performance.

scaling plateau (n)~ A preset scaling factor.

scam (n)~ A fraudulent business scheme; a swindle.

scam ~ A fraudulent scheme that is used to attempt to obtain money from a person via the Internet.

scan (v)~ In facsimile and other optical technologies, to move a light-sensitive device across an image-bearing surface such as a page of text, converting the light and dark areas on the surface to binary digits that can be interpreted by a computer.

scan (n)~ An image-bearing surface such as a single page or multi-page of text or picture that is passed through a scanner and has become a computer file.

scan (v)~ To systematically examine files or other data to identify content or patterns that meet specific criteria.

scan (n)~ A systematic examination of files or other data to identify content or patterns that meet specific criteria.

Scan (PN)~ The app that enables users to scan photos or documents using a connected scanner and save the images to a folder.

scan (v)~ The resulting 3D mesh containing color information.

scan code (n)~ A code generated by the keyboard software to identify the key pressed in a unique manner.

scan engine (n)~ Software used to inspect messages to detect viruses or to identify spam.

scan head (n)~ An optical device found in scanners and fax machines that moves across the subject being scanned, converts light and dark areas to electrical signals, and sends those signals to the scanning system for processing.

scan interval (n)~ For Process Control, the time between successive checks for new processes started on the server. You can configure this in the Process Control snap-in.

scan job (n)~ A scan that has a unique ID associated with it for reporting and tracking purposes.

Scan Management (PN)~ A MMC snap-in tool under Print and Document Services that is used for managing network scanners, and configuring your Distributed Scan Server and

how scans should be processed.

scan profile (n)~ A collection of saved settings for scanning documents or pictures. In Windows Fax and Scan, you can adjust scan settings and then save them as a scan profile.

scanner (n)~ An optical input device that uses light-sensing equipment to capture an image on paper or some other object. Captured image data is converted into binary files that can be stored and manipulated by computer programs.

Scanner ~ A device which makes high-resolution copies of printed images and text to use on a computer.

scatter chart (n)~ A chart that plots numerical data along two value axes (x,y).

scatter/gather direct memory access (n)~ A form of direct memory access (DMA) in which data is transferred to and from noncontiguous ranges of physical memory.

scatter/gather DMA (n)~ A form of direct memory access (DMA) in which data is transferred to and from noncontiguous ranges of physical memory.

scatter/gather list (n)~ A list of one or more paired base addresses and lengths that describe the physical locations from which to transfer data in scatter/gather direct memory access.

scavenging (adj)~ The process of cleaning and removing extinct or outdated names data from the WINS database.

SCC (n)~ A clustered Exchange deployment that uses shared storage and can have multiple active and passive servers (referred to as nodes) dedicated to a clustered mailbox server.

SCCM (PN)~ A systems management software product for managing large groups of PCs and servers, keeping software up-to-date, setting configuration and security policies, and monitoring system status while giving users access to preferred applications from the devices they choose.

SCE (PN)~ A management solution specifically designed for IT professionals working in midsize businesses who often face IT challenges similar to those of larger enterprises-troubleshooting user problems, automating management tasks, managing multiple systems, and diagnosing and resolving IT problems.

SCE Console (n)~ The user interface that provides access to System Center Essential features.

scenario (n)~ A type of work item that records a single path of user interaction through the system. As the persona attempts to reach a goal, the scenario records the specific steps that they take in attempting to reach that goal.

Scenario (n)~ A predefined dimension that is used to differentiate between different modeling scenarios. For example, you can use this dimension to track values for budget, actual, and forecasted scenarios for any given period of time. It is automatically included with every model.

Scenario Power Manager (PN)~ The entity in the operating system that decides on and manages performance and power settings for certain user scenarios.

scene (n)~ The image that is depicted in a photograph.

scene (n)~ A series of images and other controls combined together in a single component that can be dynamically instantiated in other components.

scene (n)~ An image and color combination designed to personalize a display window that

is viewable to other people. For example, in Windows Live Messenger, someone can choose from a set of available scenes, or upload their own background image. They can also use a default color suggestion, or specify their own color. Someone's personalization is displayed in the main Messenger window (visible to themselves) and also in the main conversation window (visible to others).

scene-coherent 3-D (n)~ The camera angles and light settings that you can use to control the orientation, shadow, and perspective for grouped shapes.

SCEP (PN)~ A Public Key Infrastructure (PKI) communication protocol that defines the communication between network devices and a Registration Authority (RA) for certificate enrollment.

Schannel (n)~ A Security Support Provider (SSP) that implements the Secure Sockets Layer (SSL) and Transport Layer Security (TLS) Internet standard authentication protocols.

schedule (v)~ To program a computer to perform a specified action at a specified time and date.

schedule (n)~ The timing and sequence of tasks within a project.

Schedule (PN)~ A button that launches the Service Scheduling form.

schedule (n)~ A timetable of planned activities and economic resource allocations.

schedule (n)~ The global settings that you can use to define a set of date and time criteria for a runbook.

Schedule a Conference… (oth)~ An item on the Actions menu that opens a new Outlook meeting invitation using the user's conferencing information.

Schedule a Meeting (PN)~ A menu item that opens an Outlook meeting invitation prepopulated with the selected contact(s).

schedule group (n)~ In the Concurrency Runtime, a container for related tasks that are queued to a Task Scheduler.

Schedule Important Software Updates (PN)~ A tool on the main Windows SteadyState interface used to set schedules for software and operating system updates.

schedule performance index (SPI) (n)~ The ratio of the earned value (EV), which is sometimes referred to as the budgeted cost of work performed (BCWP), to the planned value (PV), which is sometimes referred to as the budgeted cost of work scheduled (BCWS). SPI is often used to estimate the project completion date. The SPI value is calculated as follows: SPI = EV/PV. If the resulting SPI value is less than 1.0, that indicates that less work was completed on the project than was planned. If the SPI value is 1.0 or greater, that indicates that more work was completed than was planned.

schedule variance (n)~ The difference between the budgeted cost of work performed [BCWP] and the budgeted cost of work scheduled [BCWS]. This is calculated as follows: SV = Budgeted Cost of Work Performed - Budgeted Cost of Work Scheduled.

Schedule View (PN)~ An Outlook Calendar view in which each calendar is listed vertically (not side-by-side). This view is optimized for viewing a schedule for a group and scheduling a meeting for a group.

scheduled conference (n)~ A conference scheduled using Microsoft Outlook with the Outlook Add-in.

Scheduler (PN)~ A feature in campaign automation that lets you to add a wait step. The

wait step is a type of workflow step that pauses a workflow process for a specific amount of time or until a subsequent action occurs.

Scheduler (PN)~ The Microsoft Azure service that allows users to invoke actions, such as calling HTTP/S endpoints or posting a message to a storage queue, on any schedule.

scheduler instance (n)~ In the Concurrency Runtime, an instance of a Task Scheduler. Every scheduler instance has an associated policy that governs how various kinds of workloads are run.

Scheduling and Delivery Processor (n)~ A component of the report server engine that handles scheduling and delivery. Works with SQL Agent.

Scheduling Assistant (n)~ An Outlook and Outlook Web Access feature that automatically suggests the best meeting times for a given a group of attendees, allowing users to schedule people and resources quickly and efficiently.

schema (n)~ The set of definitions for the universe of objects that can be stored in a directory. For each object class, the schema defines which attributes an instance of the class must have, which additional attributes it can have, and which other object classes can be its parent object class.

schema (n)~ An object or collection of database objects that contain structural information, or metadata, about a database.

schema (n)~ An XML text file that describes entity and relationship types. The schema also defines a container within which instances of these types are logically organized.

schema (n)~ The metadata used to describe the content and structure of a document.

schema cache (n)~ A copy of the schema in memory to improve performance on schema operations. This cached version is automatically updated, in small time intervals, each time the schema is updated.

schema mapping (n)~ A special kind of transformation whereby an XML document is converted from one XML schema to another.

schema master (n)~ A domain controller that holds the schema operations master role in Active Directory. The schema master performs write operations to the directory schema and replicates updates to all other domain controllers in the forest. At any time, the schema master role can be assigned to only one domain controller in the forest.

schema rowset (n)~ A specially defined rowset that returns metadata about objects or functionality on an instance of SQL Server or Analysis Services. For example, the OLE DB schema rowset DBSCHEMA_COLUMNS describes columns in a table, while the Analysis Services schema rowset MDSCHEMA_MEASURES describes the measures in a cube.

schema snapshot (n)~ A snapshot that includes schema for published tables and objects required by replication (triggers, metadata tables, and so on), but not user data.

schema validation (n)~ The verification that the XML of a procedure conforms to the provisioning schema of Microsoft Provisioning Framework (MPF). This schema contains the generic XML elements and attributes available to invoke specific provisioning functionality.

schema-aware (adj)~ Pertaining to a processing method based on a schema that defines elements, attributes and types that will be used to validate the input and output documents.

schema-scoped object (n)~ An object that belongs to a schema.

Schematron (n)~ A part of an ISO standard (DSDL: Document Schema Description Languages) designed to allow multiple, well-focused XML validation languages to work together.

scheme (n)~ A predefined set of harmonized colors that you can apply to text and objects. Text and objects with an applied scheme color will change automatically when you switch to a new color scheme or modify the current color scheme.

scheme color (n)~ One of the colors defined in a set of chosen colors. If you fill an object with a scheme color, the object's color changes whenever you choose another color scheme for that publication.

Scissors (PN)~ A tool that lets you split a Bezier or B-Spline path at a particular location.

SCL (n)~ The normalized value that is assigned to an e-mail message. This value indicates, based on the characteristics of the message, such as the content, message header, and so forth, the likelihood that the message is spam. This value is persisted with the message when the message is sent to other Exchange servers.

SCM (n)~ A server capable of manipulating (i.e. starting and stopping) services remotely on other machines.

SCM (n)~ The power supply that controls powering up the computer motherboard and all other devices that require power in the system. The SCM operates at all times when the system is plugged into an electrical outlet.

SCM status indicator lights (n)~ A set of three lights that gives a detailed status of a Surface unit. These lights are part of the system control module (SCM) in the I/O connections area. On venue units, you must remove the appropriate end panel to view these lights. On developer units, the end panel is removed and you can always view these lights.

SCODE (n)~ A data-type which specifies a particular warning or error code.

scope (n)~ The extent to which an identifier, such as an object or property, can be referenced within a program. Scope can be global to the application or local to the active document.

scope (n)~ In a multicast transmission, the reach of a stream. The scope of a multicast transmission can be set to reach either an immediate subnetwork only or the entire Internet.

scope (n)~ The parts of the vision for the solution that can be accomplished within the constraints of a given version. Negotiating the scope of a project balances customer needs and desires against technological and business constraints.

scope (n)~ The range and depth of a search on a portal site, desktop or other.

scope (n)~ The set of data that is being synchronized.

scope (v)~ To define the extent of a view of the UI Automation tree, starting from a base element.

scope (n)~ The set of public and private clouds to which a user role has access.

Scope (n)~ In the Business Rules editor, the UI string that refers to whether the business rule applies to all forms or is specific to one form.

SCOPE expression (n)~ An expression that specifies a member set that includes, explicitly or implicitly, a member from every dimension in the model.

scope identifier (n)~ A GUID that uniquely identifies a scope within a site collection.

scope of organization control (n)~ The direct or indirect amount of control that an operating unit has over the output of a process.

SCOPE statement (n)~ A program element that evaluates a SCOPE expression.

scorecard (n)~ A report type that depicts organizational performance by displaying a collection of key performance indicators (KPIs) together with performance targets for those KPIs. A scorecard can be organized hierarchically.

scorecard element (n)~ Any one of the individual components of a scorecard, such as key performance indicators (KPIs), members, properties, actuals, targets, or MDX expressions.

scorecard indicator (n)~ A set of graphics, text, and colors for defining different levels of performance when comparing an actual value and a target value within a KPI.

scorecard view (n)~ A hierarchical arrangement of the KPIs and objectives that are contained in a scorecard. A scorecard view also can be configured to include additional data from scorecard data sources.

Scorecard View (n)~ A feature that allows users to view and interact with scorecard views that are created in Business Scorecard Builder.

Scorecard Viewer for Reporting Services (PN)~ An interface that is used for deploying dashboards to SQL Server 2005 Reporting Services. With this interface, you can view dashboard scorecards in Report Definition Language (RDL) format.

Scorecard Web Part (PN)~ A feature that allows users to view and interact with scorecards that are created in PerformancePoint Dashboard Designer.

scoring experiment (n)~ The first outcome of a machine learning process after training a predictive analytics model to have a web service users can send data to and receive predictions.

scout (n)~ A feature accessed from Search or Maps that displays things to see and do, shopping, and restaurants in a user's current location and the surrounding area.

SCP (PN)~ A lightweight protocol that enables small devices to communicate with each other over low-speed networks.

SCR (n)~ A replication that uses the same log shipping and replay technology used by local continuous replication (LCR) and cluster continuous replication (CCR) to provide added deployment options and configurations.

scrap (n)~ An application or system file maintained for storing data that has been marked for movement, copying, or deletion.

scrap (n)~ Waste that occurs during the manufacturing process.

scrap value (n)~ The expected cash value of the asset at the end of its useful life.

Scrapbook (PN)~ A feature designed to help users manage random clippings and tidbits of info.

scratch area (n)~ The gray or light-blue area that surrounds a page. You can use it to temporarily hold objects that are not currently on the page.

scratch directory (n)~ A temporary directory used by the operating system or some other program to temporarily store data until the current session is terminated.

scratch partition (n)~ A temporary partition used by the operating system or some other program to temporarily store data.

scratch-out gesture (n)~ A gesture that erases ink. You perform the gesture by moving the tablet pen from side to side several times, covering the ink that you want to erase,

without lifting the pen. When you lift the pen, the ink disappears.

screen (n)~ The graphic portion of a visual output device or Surface unit.

screen (n)~ A window that covers the full area of a display screen.

screen clipping (n)~ An image that shows all or part of a computer screen or other display.

screen font (n)~ A typeface designed for display on a computer monitor screen. A screen font often has an accompanying PostScript font for printing to PostScript-compatible printers.

screen language (n)~ UI text language for a specific user.

Screen magnifier (PN)~ An accessibility feature that allows users to magnify specified areas of the screen to improve readability.

screen reader (n)~ An app that reads what is displayed on a screen and converts the input for presentation by means of non-visual output devices.

Screen Recording (PN)~ A feature that enables the user to record on-screen activity, and embeds the video automatically in PowerPoint.

screen resolution (n)~ The setting that determines how much information is displayed on the computer screen, measured horizontally and vertically in pixels. At lower screen resolutions, such as 640 x 480, fewer items fit on the screen, but they are larger and easier to see. At higher resolutions, such as 1600 x 1200, more items fit on the screen and they appear smaller.

screen review utility (n)~ An accessibility aid for people who are blind or have learning disabilities, such as dyslexia. These aids make on-screen information available as synthesized speech or a refreshable Braille display.

screen rotation (PN)~ A setting that determines if the screen will rotate automatically when the phone is rotated.

screen saver (n)~ A utility that causes a monitor to blank out or display a certain image after a specified amount of time passes without the keyboard being touched or the mouse being moved. Touching a key or moving the mouse deactivates the screen saver.

screen sharing (n)~ A feature that enables users to share their desktops with contacts.

screen time-out (n)~ A setting that specifies an amount of time before the screen turns off and the phone locks itself.

screened subnet (n)~ One or more computers that have a connection to the Internet through an external screening router and a connection to the internal network through an interior screening router. Computers that are linked to the perimeter network have limited access to both the Internet and the internal network. This architecture is convenient if multiple hosts require direct Internet access.

screening type (n)~ The method of screening that is applied before files are saved. Examples are active screening and passive screening.

Screensaver ~ A program that blanks the computer screen or displays images if you don't do anything for a few minutes, in Windows for example. Early screens could have images literally burned permanently onto the tube if left displaying the same thing all day. Much less of a problem with modern screens, and these days screensavers are mostly used for security (with a password to return to normal mode), or just for fun.

ScreenTip (n)~ A small pop-up window that provides a brief note or label pertaining to

the item or control being pointed to.

ScreenTip (n)~ A new type of ScreenTip that is larger and can contain more detailed information, including graphics.

scRGB (n)~ A standard color space that enables various devices including cameras, scanners, displays, and printers to produce reasonably identical colors. scRGB is optimized for greater than 8 bits per channel with a gamma of 1.0, and white point and primaries identical to sRGB. The scRGB color space is based on sRGB but offers a larger color gamut and precision by encoding values over 1.0 (white) and under 0.0 (black) with more bits per channel.

Scribble (n)~ A tool that lets you draw freeform drawings using the mouse, as if they were drawn with a pen.

script (n)~ A type of program consisting of a set of instructions to an application or tool program. A script usually expresses instructions by using the application`s or tool`s rules and syntax, combined with simple control structures such as loops and if/then expressions.

script ~ A series of statements, written in a scripting language such as AppleScript or Perl, that instruct an application or the operating system to perform various operations. Interpreter programs translate scripts.

script anchor (n)~ The visual representation of a script on a Web page that you open in a Microsoft Office program.

script command (n)~ A command associated with a designated time in Windows Media-based content. The data can be used by players to perform a specific action such as displaying a Web page.

script engine (n)~ A program that interprets and executes a script.

script file (n)~ A collection of scripting commands, parameters and expressions that enables you to automate tasks or perform bulk operations repeatedly.

script file (n)~ A file that contains scripting commands, parameters, and expressions that provide information to, and retrieve it from, the remote computer you are connecting to. This information includes your user name and password, port information, carriage returns, line feeds, and pauses.

script injection attack (n)~ An attack that attempts to send executable scripts to your application with the intent of having other users run it. A typical script injection attack sends script to a page that stores the script in a database, so that another user who views the data inadvertently runs the code.

script pane (n)~ The text editor portion of the Table Designer.

Scripted Host Package (n)~ The host package initiated by a script.

scripting engine (n)~ A program that interprets and executes a script.

scripting interface (n)~ The interface through which scripting languages access and manipulate application-specific objects.

scriptlet (n)~ A Web page based on Dynamic HTML (DHTML) that you can use as a control in any application that supports controls. The scriptlet is a complete Web-ready .htm file, but it includes information that allows you to work with it as a control-€"you can get and set its properties, call its methods, and so on.

scroll (v)~ To move a document or other data in a window in order to view a particular portion of the document. Scrolling may be controlled by the mouse, arrow keys, or other

keys on the keyboard, eventually with one or more fingers.

scroll arrow (n)~ A component of a scroll bar that allows the information to be scrolled by defined increments when the user clicks it. The direction of the arrow indicates the direction in which the information scrolls.

scroll arrow button (n)~ A component of a scroll bar that allows the information to be scrolled by defined increments when the user clicks it. The direction of the arrow indicates the direction in which the information scrolls.

scroll bar (n)~ A standard Windows control that supports scrolling.

scroll bar shaft (n)~ The component of a scroll bar that provides the visual context for the scroll box. Clicking in the scroll bar shaft scrolls the information by a screenful.

scroll boundaries (n)~ The minimum and maximum scroll positions that a user can pan or scroll between.- Scroll boundaries allow virtualized controls to -€œreserve-€? additional space at the beginning or end of the panning region to place new content.

scroll box (n)~ A component of a scroll bar that indicates the relative position (and optionally the proportion) of the visible information relative to the entire amount of information. The user can drag the scroll box to view areas of information not currently visible.

SCROLL LOCK key (n)~ On the IBM PC/XT and AT and compatible keyboards, a key on the top row of the numeric keypad that controls the effect of the cursor control keys and sometimes prevents the screen from scrolling. On the enhanced and Macintosh keyboards, this key is to the right of the function keys on the top row. Many modern applications ignore the Scroll Lock setting.

Scroll tab (n)~ A tab that supports scrolling.

scroll wheel (n)~ A hard plastic disc on a mouse that is perpendicular to the mouse surface. It is normally located between the left and right mouse buttons and is used for scrolling.

Scroll, Banner (n)~ A title animation in Windows Movie Maker.

Scroll, Inverted (n)~ A title animation in Windows Movie Maker.

Scroll, Perspective (v)~ A title animation in Windows Movie Maker.

Scroll, scroll-bar ~ To scroll something is to move it up or down the screen, so you can see what is above or below the current position, for example at a website. A scroll-bar is a bar on the right-hand side (usually) of a window which allows you to move the- text etc up and down the screen with a mouse. If the window is too wide to fit the screen there will be a scroll-bar at the bottom, so you can scroll the text left and right too.

Scroll, Up Side-by-Side (n)~ A credit animation in Windows Movie Maker.

Scroll, Up Stacked (n)~ A credit animation in Windows Movie Maker.

scroller (n)~ A grid view that allows you to horizontally and/or vertically scroll content such as audio, videos, photos or text that cannot fit within the space provided or the screen.

scroll-fed (adj)~ Of, pertaining to, or descriptive of an optical output device (such as a scanner, copier or printer) whose sheets of paper to process are loaded one-by-one using a roller pickup.

scrolling combo box (n)~ A standard Windows control that combines the characteristics of a text box with a scrolling list box.

scrolling region (n)~ A control that contains other controls and that can display vertical or horizontal scroll bars. Scrolling regions are used for layout purposes only and are not bound to fields or groups in the data source.

scrolling speed (n)~ The velocity at which the Portable Media Center user interface scrolls through lists and screen views.

scrolling text control (n)~ A control or component on a page that displays moving text.

scrub (v)~ To move the timeline playhead manually in order to preview an animation storyboard.

scrubber (n)~ A data integrity scanner which periodically scans the volume, attempting to identify latent corruption, and then proactively triggering a repair of that corrupt data.

SCSI (n)~ A standard high-speed parallel interface defined by the American National Standards Institute (ANSI). A SCSI interface is used for connecting microcomputers to peripheral devices, such as hard disks and printers, and to other computers and local area networks (LANs).

SCSI ~ (Small Computer Systems Interface; pr. 'scuzzy') A system for controlling hard disks, tape drives, and various other add-ons. Sometimes used for a PC's main hard disk, but more often the main hard disk is controlled by an- EIDE- controller built into the motherboard. A SCSI controller would usually be installed as an expansion board. SCSI is a bit faster than EIDE, but more expensive.

SCSI initiator (n)~ The device in a SCSI connection that issues commands. The device that receives the commands is the target.

SCSI reserve (n)~ The process that occurs when the cluster node that owned the quorum resource fails or is unavailable, and the remaining nodes determine which node will take ownership.

SCW (n)~ A tool that automates security best practices to reduce the attack surface for a server. The SCW was introduced with Windows Server 2003 Service Pack 1.

SD (PN)~ A video format with the same resolution as traditional television.

SD card (n)~ A memory card about the size of a postage stamp that is supported by many types of devices.

SDI (n)~ A feature in Windows which facilitates the preparation and maintenance of run-time images.

SDI (n)~ A specification according to which each open document occupies its own window in the UI, though only a single instance of the program application is running.

SDK (n)~ A set of routines (usually in one or more libraries) designed to allow developers to more easily write programs for a given computer, operating system, or user interface.

SDL (PN)~ A software development process based on the classical spiral model to reduce the number of security-related design and coding defects and the severity of any defects that are left, thus reducing software maintenance costs while increasing reliability of software concerning software security-related bugs.

SDLC (n)~ A type of link service used for managing synchronous data transfer over standard telephone lines (switched lines) or leased lines. The data transmission protocol most widely used by networks conforming to IBM's Systems Network Architecture (SNA). SDLC is similar to the HDLC (High-level Data Link Control) protocol developed by the International Organization for Standardization (ISO).

SDMI (n)~ An organization that sets standards for secure digital music. One of the main goals of Secure Digital Music Initiative (SDMI) is to create a framework for the secure playing, storing, and distribution of digital music.

SDV (n)~ Digital video or service that is not made available on the network or system until requested by a customer.

SE team (n)~ A team within Microsoft that produces hotfixes.

seal (v)~ To store data in such a way that it can be retrieved later by the same security support component, and only by that security support component.

seal (n)~ The process that BitLocker Drive Encryption uses to encrypt the volume master key and create a binary large object (BLOB).

sealed case PC (n)~ A chassis type that can be reported by the Win32_SystemEnclosure class in Windows Management Instrumentation (WMI) and that refers to a computer whose case is not meant to be opened by anyone but the original equipment manufacturer.

sealing signature (n)~ A signature that is applied to an already signed file to ensure that any previously unsigned portion of the file is signed.

seamless ~ In software, it means that what takes place between the user and the application or applications accessed by the user is perfectly smooth to the user and the software being used by the user will work easily with other software the user is using.

seamless application (n)~ A software program published over Remote Desktop Protocol that allows users to connect directly to the program rather than the entire desktop and use the program exactly the same way as locally installed software.

seamlessly (Adverb) ~ Without any problems, without dificulty, perfectly, impeccably. Does not need to be corrected later.

search (n)~ The process of seeking a particular file or specific data. A search is carried out by a program through comparison or calculation to determine whether a match to some pattern exists or whether some other criteria have been met.

search (v)~ To try to locate an object (a file, a folder, a computer, a text).

Search (v)~ The UI element that initiates the process of seeking a particular file or specific data. A search is carried out by a program through comparison or calculation to determine whether a match to some pattern exists or whether some other criteria have been met.

Search (n)~ A search feature associated with folders and programs that begins to display results as soon as a keyword is entered. When you enter text, files in the current view are automatically filtered to show only those that match what you typed.

Search (PN)~ The area in Settings where you can set your preferences for the instance's search configuration.

Search (PN)~ The service that allows developers to incorporate search capabilities into their applications without having to worry about the complexities of full-text search and without having to deploy, maintain or manage any infrastructure.

Search (PN)~ The menu option in the Office 365 Compliance Center that allows users to search mail, files, and sites, specifying criteria on groups, people, or locations, and then take compliance actions on the results.

Search Administration Web Service (PN)~ A service over which the administration (that is all the methods necessary to control the Search service, such as starting content source

index crawls, updating scopes, etc.) of the Microsoft Office SharePoint Search service takes place.

Search Alerts (n)~ A feature that monitors a user's saved searches and sends regular E-mail summaries with new and updated matching results. The user can provide feedback on the results to tune the saved search query for better results.

search and pin calendars (n)~ A feature that enables a user to search for another user's or group's calendar and pin it to their calendar list.

search box (n)~ A text box in which someone types words to begin a search.

Search Builder (PN)~ A Windows feature that helps users to build better queries by enabling them to click on suggested filters, based on what the user is typing, to add them to a search.

Search button (n)~ The button next to a search box that someone clicks to search for something.

Search by (Adverb) ~ Pertaining to a search process enabled by a particular technology.

Search charm (n)~ A user interface element that provides access to search in apps or on the PC.

search condition (n)~ In a WHERE or HAVING clause, predicates that specify the conditions that the source rows must meet to be included in the SQL statement.

search connector (n)~ A search location exposed via .osdx templates and made possible via the OpenSearch technology. It connects the local search indexer to a remote index and provides the end user with the ability to search for files on a Web site or on an intranet site from within Windows.

search connector (n)~ An XML file that specifies how to connect to, send queries to, and receive results from a location.

Search contract (n)~ The contract that delivers a system-wide entry point to the Windows search experience.

search engine (n)~ A program that searches for key words in documents, databases, Internet content or other files.

Search engine ~ A website directory which indexes as many websites as it can and allows you to search its database for sites on particular subjects. Because of the immense size and rate of growth of the world wide web, no-one has a complete directory of all sites which exist. The most popular is- Google, so popular that it's name has become a verb.

search engine optimization (n)~ The act of modifying the pages of a Web site so that its content is more easily discoverable by Internet search engines.

search filter (n)~ A term that can be added to a search to filter the results by a specific property (for example, by author). Relevant search filters appear under the search box in any open folder.

search folder (n)~ A virtual folder that displays items based on specified search criteria.

search folder (n)~ The search folder that is created by the ILM Add-in for Outlook 2007 and that provides the user with a way to see pending and completed approvals, and approval request updates.

Search Folders (n)~ Virtual folders that contain views of all e-mail items matching specific search criteria. The items remain stored in one or more Outlook folders.

Search History (n)~ A feature in Bing that shows the words you searched for and the sites

you've visited, along with the date and time of your search.

Search icon (n)~ An icon visible in some screens of the phone, tapped to activate the Search function. Context-sensitive.

search key (n)~ The value that is to be searched for in a document or any collection of data.

Search on Web (PN)~ ?A feature that enables the user to start a web search from text that is selected within a document.

search page (n)~ A page from which you can find and go to other Internet sites or to documents on an intranet. Many search pages provide various ways to search, such as by topic, by keyword, or by matches to user queries.

search phrase (n)~ Term or sentence that is used in a search rule to formulate a query.

Search Prediction (PN)~ A feature that automatically corrects searches for misspellings, alternative spellings or other input that would otherwise reduce the number or quality of the results.

search preview (n)~ A feature that displays a thumbnail preview next to each search result. Pointing to the preview enlarges it.

search provider (n)~ A component or application that provides data to Windows Search.

search query (n)~ A set of keywords or terms that form a search topic by defining languages, sources, search terms, inclusions, and exclusions.

search refiner (n)~ An advanced feature that enables a user to apply filters on properties such as people, folder, and attachments.

Search refiner (PN)~ The UI element in Outlook that shows options that allows users to broaden or narrow email searches.

search results (n)~ The list of answers to a search request that match the search criteria specified by the user.

search schema (n)~ A data structure that describes crawled properties, managed properties, and the mapping between them.

search scope (n)~ The range and depth of a search on a portal site, desktop or other.

search scope (n)~ A collection of data stores (identifiable by URL) that represents content that the indexer crawls and indexes.

Search service application (n)~ A SharePoint service application that is deployed and managed on premises and that enables enterprise search functionality.

search settings database (n)~ The database that stores search feature settings which include but are not limited to query rules and the search schema.

Search setup (PN)~ The procedure to create search rules in search topics, which defines the data to acquire.

Search Suggestions (n)~ Search suggestions appear when a user types in the search box. Do not use autosuggest"

search tag (n)~ A button that contains a suggested search term based on what content the user has in his/her sway.

Search tasks and templates (v)~ The name of a search box where the user can enter keywords and look for tasks and templates that match the query.

search term (n)~ Phrase, sentence, or a single word that is used in a search rule to formulate a query.

search topic (n)~ Someone or something that people talk or write about.

Search Topic Category (PN)~ A group of related search topics.

search vertical (n)~ A targeted search experience that displays results that are custom filtered and formatted for a specific content type or class, such as people or videos.

Search Virtual Folder (n)~ A feature that allows the user to group search files by any criteria and display them in one place.

searchable managed property (n)~ A managed property whose value can be returned by a query.

Search-Driven Navigation (PN)~ A set of controls that helps users navigate directly to where they want to go in SharePoint, without having to navigate the hierarchy or edit the URL.

search-first migration (n)~ A process in which only the search settings from a SharePoint Server 2007 farm are migrated to a new SharePoint Server 2010 farm. This makes it possible to take advantage of the end-user enterprise search capabilities of SharePoint Server 2010 in the event that it is not possible to perform a complete upgrade from SharePoint Server 2007.

SeaShell (PN)~ A property of the Brushes class in .NET Framework 4.5 that gets the solid fill color that has a hexadecimal value of #FFFFF5EE.

season (n)~ A connected set of episodes or events that run under the same title, usually within the course of one year.

seat (n)~ An individual device subscription license that is required for each computer that accesses the service

Seating Chart (n)~ A color-coded representation of the participants at a meeting and their statuses.

Seating Chart panel (n)~ The Live Meeting console element that displays the Seating Chart for a Live Meeting session.

seats (n)~ Actual number of users, not the number of e-mail addresses or domains in an organization.

second element cost (n)~ The capital expenditure on an asset that is incurred after an organization starts to hold it, such as cost of improving the assets in the pool.

Second screen (PN)~ The UI label that indicates- a screen or monitor that is attached to a PC and that content can be projected on to.

secondary calendar (n)~ The alternate calendar that is selected from within Outlook. The secondary calendar appears when dual calendar support is enabled.

secondary client computer (n)~ A client computer on which synchronization does not take place.

secondary customer (n)~ A customer that is linked to the primary customer in a customer relationship.

secondary data source (n)~ An XML data file, database, or Web service that is used by a form for the entries in a list box or for script actions.

secondary database (n)~ A read-only copy of a primary database.

secondary DPM server (n)~ A DPM server that protects one or more primary DPM servers in addition to file and application data.

secondary feature block (n)~ The remainder of the application package that is not

contained in the primary feature block. This content is streamed to the client on demand as application features are used.

secondary protection (n)~ A type of protection in which data on the protected server is protected by a primary DPM server and the replica on the primary DPM server is protected by a secondary DPM server.

secondary quotation (n)~ A quotation that competes with other quotations for the same good or service and is linked to a primary quotation.

secondary region (n)~ The Azure region where an active secondary database resides.

secondary replica (n)~ An availability replica that maintains a secondary copy of each availability database, and serves as a potential failover target for the availability group.

secondary server (n)~ In a log shipping configuration, the server instance where the secondary database resides. At regular intervals, the secondary server copies the latest log backup from the primary database and restores the log to the secondary database. The secondary server is a warm standby server.

secondary site (n)~ An SMS/Configuration Manager site that does not have access to a SQL Server database, is always a child of a primary site, and is administered solely through its parent or through another primary site above it in the SMS/Configuration Manager site hierarchy.

secondary storage (n)~ Any data storage medium other than a computer's random access memory (RAM), typically tape or disk.

secondary tile (n)~ A shortcut to places within an app or to other content.

secondary window (n)~ A window that provides information or supplemental interaction related to objects in a primary window.

secondary zone (n)~ A read-only copy of a DNS zone that is transferred from an authoritative DNS server to another DNS server to provide redundancy.

second-level domain (n)~ A domain name that is rooted hierarchically at the second tier of the domain namespace directly beneath the top-level domain name such as .com and .org. When DNS is used on the Internet, second-level domains are names such as microsoft.com that are registered and delegated to individual organizations and businesses according to their top-level classification. The organization then assumes further responsibility for parenting management and growth of its name into additional subdomains.

secret answer (n)~ An answer that only the user knows for a specific question. The answer is used to confirm someone's identity if they forget their password.

secret chat room (n)~ In the Lync persistent chat feature, a room that has been set up with the most restricted level of privacy. Only members of a secret chat room can find it, see who is participating in it, follow it, or read and post in it.

secret key (n)~ A symmetric encryption key shared by two entities, such as between a user and the domain controller (DC), with a long lifetime. A password is a common example of a secret key. When used in a context that implies Kerberos only, a principal's secret key.

secret key encryption (n)~ An encryption algorithm that requires the same secret key to be used for both encryption and decryption. Because of its speed, symmetric encryption is typically used when a message sender needs to encrypt large amounts of data.

SECT (n)~ The location of a sector within a virtual stream.

section (n)~ A portion of a document in which you set certain page formatting options. You create a new section when you want to change such properties as line numbering, number of columns, or headers and footers.

section (n)~ A control that contains other controls.

section (n)~ A part of a form, report, or data access page such as a header, footer, or detail section.

section (n)~ A labeled group of consecutive slides that helps the user navigate and organize presentations.

section 179 (n)~ A section of the U.S. Internal Revenue Service tax code that permits some property (fixed assets) to be expensed in the year it is purchased rather than depreciated over a number of years.

Section 179 (n)~ A section of the U.S. Internal Revenue Service tax code that permits some property (fixed assets) to be expensed in the year it is purchased rather than depreciated over a number of years.

section break (n)~ A nonprinting mark you insert to show the end of a section.

section header (n)~ The horizontal bar above a form or report section in Design view that displays the type and name of the section.

section layout (n)~ A pre-defined layout that users can select for their InfoPath form sections. Options include single column, two-column, three-column, and four-column layouts.

section mark (n)~ The -§ character.

SECTION SIGN (n)~ The -§ character.

sector-based imaging (n)~ When creating a Windows image, the process of capturing every non-blank sector into a physical file. This is not the process used by ImageX.

securable (n)~ Entities that can be secured with permissions. The most prominent securables are servers and databases, but discrete permissions can be set at a much finer level.

securable object (n)~ Anything in the SharePoint environment on which permissions or permission levels can be set.

secure bit (n)~ The bit in a key message used to notify the supplicant and authenticator when a key exchange is complete and a link is considered secure. The bit is set to 0 (not secure) or 1 (secure).

secure channel (n)~ A Security Support Provider (SSP) that implements the Secure Sockets Layer (SSL) and Transport Layer Security (TLS) Internet standard authentication protocols.

secure desktop (n)~ A desktop that is isolated from other processes running on the system. The secure desktop increases the security of the elevation prompt.

secure digital card (n)~ A memory card about the size of a postage stamp that is supported by many types of devices.

Secure Digital Music Initiative (n)~ An organization that sets standards for secure digital music. One of the main goals of Secure Digital Music Initiative (SDMI) is to create a framework for the secure playing, storing, and distribution of digital music.

secure element (n)~ A chip capable of supporting smartcard applications with a high level

of security (i.e. for payments or transactions).

Secure FTP (PN)~ A protocol that is used to upload configuration files over any reliable data stream; for example, to upload Directory Services user entries to the Administration Center.

Secure FTP mode (n)~ A mode for uploading an address list file to Directory Services via Secure FTP (SFTP). This is one of the three upload modes in EHS. This mode permits specifying multiple domains per file.

Secure Hash Algorithm 1 (PN)~ An algorithm that generates a 160-bit hash value from an arbitrary amount of input data. SHA-1 is used with the Digital Signature Algorithm (DSA) in the Digital Signature Standard (DSS), among other places.

Secure Hypertext Transfer Protocol (n)~ A protocol that provides a secure Hypertext Transfer Protocol (HTTP) connection.

secure note (n)~ Any information (e.g. account numbers, sensitive data, etc.) with a title and some free-form text that can be stored in a secure manner in a personal vault.

secure password authentication (n)~ A feature that allows a server to confirm the identity of the person logging on.

secure receipt (n)~ A secure e-mail feature used to check that your digital signature is being validated by the recipients security software. If your digital signature is validated, a notification appears in your Inbox.

secure repository (n)~ The software module responsible for authenticating the valid use of protected content and protecting trusted software processing from modification and observation.

Secure Sockets Layer (PN)~ The protocol that improves the security of data communication by using a combination of data encryption, digital certificates, and public key cryptography. SSL enables authentication and increases data integrity and privacy over networks. SSL does not provide authorization or nonrepudiation.

secure store database (n)~ The database used by the Secure Store Service to store credentials.

Secure Store Service (PN)~ The shared service that securely stores credential sets for external data sources and associates those credential sets to identities of individuals or to group identities. This service can be used to support a variety of solutions. For example, the stored credentials can be leveraged by certain applications to enable single sign-on.

secure transaction technology (n)~ The use of the SSL (Secure Sockets Layer), S-HTTP (Secure HTTP), or both in online transactions, such as form transmission or credit card purchases.

secure zone (n)~ A DNS zone that is stored in Active Directory and to which access control list (ACL) security features are applied.

Secure/Multipurpose Internet Mail Extensions (n)~ An Internet e-mail security-oriented protocol that adds public key encryption and support for digital signatures to the widely used MIME e-mail protocol.

secured connection (n)~ A connection established over a secure HTTPS channel.

Secured Execution Environment (n)~ A secured (or isolated) container within the firmware or microcode of a hardware component that is capable of hosting the Lower Provisioning Module (LPM) code and providing it with an execution environment.

security (n)~ Protection of a computer system and its data from harm or loss.

Security (PN)~ An app category that helps protect a computer and its data from harm or loss.

Security Administrator (n)~ A security role that grants permissions to administrative users so that they can add, remove, and modify administrative users and their administrative assignments.

security administrator (n)~ An administrative user who has been granted the permissions to add, remove, and modify administrative users and their administrative assignments.

security administrator (n)~ A user, who administers all of the privileged access management systems and is able to define PIM roles, and candidates.

security advisory (n)~ A notification addressing a security change that may affect the security of customers' computers.

Security and maintenance (PN)~ A feature in Control Panel where users can take actions, such as changing settings, on features related to security and general PC software maintenance.

Security API (PN)~ An API for asset protection, usage control, privacy, and policy application.

security association (n)~ A combination of identifiers, which together define Internet Protocol security (IPsec), that protects communication between sender and receiver.

security audit (n)~ The process that tracks the activities of users and records selected types of events in the security log.

security blanket (n)~ A group of values that describe the security settings that apply to all proxies in a process or to just a particular interface proxy.

security breach (n)~ An event that compromises the security of a computer, application, network or other resource.

Security Center (PN)~ Windows launch point to manage security settings for automatic updates, internet options, or Windows Firewall.

security certificate (n)~ A digital document that is commonly used for authentication and to help secure information on a network. A certificate binds a public key to an entity that holds the corresponding private key. Certificates are digitally signed by the certification authority that issues them, and they can be issued for a user, a computer, or a service.

Security Configuration Wizard (n)~ A tool that automates security best practices to reduce the attack surface for a server. The SCW was introduced with Windows Server 2003 Service Pack 1.

security context (n)~ The security attributes or rules that are currently in effect. For example, the rules that govern what a user can do to a protected object are determined by security information in the user's access token and in the object's security descriptor. Together, the access token and the security descriptor form a security context for the user's actions on the object.

security descriptor (n)~ A data structure that contains security information associated with a protected object. Security descriptors include information about who owns the object, who can access it and in what way, and what types of access are audited.

security extension (n)~ A component in Reporting Services that authenticates a user or group to a report server.

security file (n)~ A file that contains a digital code that makes it possible to seal messages or to add a digital signature to messages. This file can be stored on a 3.5-inch disk or on your computer's hard disk.

security filtering (n)~ A method of applying the settings of a Group Policy object (GPO) based on security principals.

security group (n)~ A group that can be listed in discretionary access control lists (DACLs) used to define permissions on resources and objects. A security group can also be used as an e-mail entity. Sending an e-mail message to the group sends the message to all the members of the group.

security hole (n)~ An unintentionally unprotected entry point into an otherwise secure computer, component, application, or other online resource.

security host (n)~ An authentication device, supplemental to standard Windows and remote access server security, that verifies whether a caller from a remote client is authorized to connect to the remote access server.

security ID (n)~ In Windows-based systems, a unique value that identifies a user, group, or computer account within an enterprise. Every account is issued a SID when it is created.

security identifier (n)~ In Windows-based systems, a unique value that identifies a user, group, or computer account within an enterprise. Every account is issued a SID when it is created.

security key (n)~ An identifier used by two APPC logical units (LUs) to validate security when a session is activated. The security key performs a function similar to that of a password, but at the LU-LU session level rather than at the TP-conversation level.

security label (n)~ A secure e-mail feature that lets you add sensitivity labels, such as Internal Use Only, to the message header. Security labels in your organization are controlled by security policies set up by your e-mail administrator.

security log (n)~ An event log containing information on security events that are specified in the audit policy.

security model (n)~ A model that defines how access to data is controlled.

security model (n)~ A structure that organizes application access control permissions by using privilege, duty, and business process classifiers and that grants permissions that are aggregated into duties to user role assignments.

security pack (n)~ A kind of management pack that contains the logic to monitor the security events for a specified application.

security package (n)~ The software implementation of a security protocol. Security packages are contained in security support provider dynamic-link libraries (DLLs) or in security support provider/authentication package DLLs.

security policy (n)~ The active policy established by the administrator that programmatically generates granted permissions for all managed code based on the code's requested permissions. Code that requires more permissions than policy will grant is not allowed to run.

security policy (n)~ A condition or parameter used for configuring security settings in order to control the level of security on the device.

security principal (n)~ In Windows-based computers, an account (such as a user, security

group, device, or computer) that can be granted or denied access to resources.

security principal name (n)~ A name that uniquely identifies a user, group, or computer within a single domain. This name is not guaranteed to be unique across domains.

security protocol (n)~ A specification that defines security-related data objects and rules about how the objects are used to maintain security on a computer system.

security question (n)~ A question, usually from a drop-down list, that users can use to confirm their identity and reset their password in case they have forgotten it.

security role (n)~ A defined set of application access privileges. The security role assigned to a user determines which tasks the user can perform and which parts of the user interface the user can view. All users must be assigned at least one security role in order to access the system.

security scope (n)~ A method that, when used in conjunction with security roles, limits which objects an administrative user can use and see.

Security Server (PN)~ Centro server that hosts primary security roles and workloads.

security settings (n)~ Settings used to specify privacy, security, and logon configurations for Windows.

Security Suite ~ A set of programs designed to protect a computer from- malwareand similar threats. Usually consists of a- firewall,- antivirusprogram, anti-spyware- program, and often an anti-phishingprogram

security support provider (n)~ A dynamic-link library (DLL) that implements the Security Support Provider Interface (SSPI) by making one or more security packages available to applications. Each security package provides mappings between an application' SSPI function calls and an actual security model' functions. Security packages support security protocols such as Kerberos and NTLM.

Security Support Provider Interface (n)~ A common interface between transport-level applications, such as Microsoft Remote Procedure Call (RPC), and security support providers (SSPs), such as Windows Distributed Security. SSPI allows a transport application to call one of the SSPs to obtain an authenticated connection. These calls do not require extensive knowledge of the security protocol's details.

Security tab (PN)~ A tab in a file or folder Properties dialog box that allows the user to set, view, change, or remove file and folder permissions.

security test (n)~ A test that looks for attack paths that might be used to gain access to assets.

security token (n)~ A cryptographically signed data unit that transfers authentication and authorization information, based on a credential.

security token service (n)~ A Web service that issues security tokens. A security token service makes assertions based on evidence that it trusts to whoever trusts it. To communicate trust, this service requires proof, such as a security token or set of security tokens, and it issues a security token with its own trust statement. (Note that for some security token formats, this can simply be a reissuance or cosignature.) In Active Directory Federation Services (ADFS), the Federation Service is a security token service.

Security Token Service Descriptor (n)~ A message that specifies a service to be activated.

security trimmer (n)~ A component that limits search results at query time based on the

identity of the user who submitted the query.

security trimming (n)~ The process of limiting search results based on the identity of the user who submitted the query.

security update (n)~ A broadly released fix for a product-specific security-related vulnerability. Security vulnerabilities are rated based on their severity which is indicated in the Microsoft's security bulletin as critical

security update package (n)~ A broadly released fix for a product-specific security-related vulnerability. Security vulnerabilities are rated based on their severity which is indicated in the Microsoft's security bulletin as critical

security vulnerability (n)~ A vulnerability in a product that is addressed by a Microsoft security update and security bulletin or a service pack.

security-critical (n)~ Pertaining to a type or member that accesses secure resources and can only be used by fully trusted code in the .NET Framework.

security-edge gateway (n)~ A security solution that segregates one portion of a network from another portion, allowing only authorized network traffic to pass through according to traffic filtering rules.

security-enabled workgroup (n)~ An Access workgroup in which users log on with a user name and password and in which access to database objects is restricted according to permissions granted to specific user accounts and groups.

security-safe-critical (adj)~ Pertaining to a type or member that accesses secure resources and can be safely used by partially trusted code in the .NET Framework.

security-transparent (adj)~ Pertaining to a type or member that is partially trusted and that cannot expose access to any protected resources or functionality.

SEE (n)~ A secured (or isolated) container within the firmware or microcode of a hardware component that is capable of hosting the Lower Provisioning Module (LPM) code and providing it with an execution environment.

see+do (n)~ A list of attactions (places and events) in a specific neighborhood.

seed (v)~ To add a database, either a blank database or a copy of the production database, to the storage group copy. This becomes the baseline database for the passive copy of the storage group.

seed (n)~ An initial value used to generate pseudorandom numbers.

seeding (n)~ The process of including initial data in a form or report.

seeding (n)~ A process that ensures that index replicas on the same index partition remain syncronized during regular operation and during recovery.

seek error (n)~ An error that occurs when the read-write head of the hard disk drive cannot be positioned over the designated area of the disk.

segment (n)~ In EDI, a logical combination of elements. For example, name and address details are combined in one segment.

segment (n)~ A section of an account code that represents a type of entity for which you are accounting.

segment (n)~ A customer base that groups individuals by age, gender, geographic location, and interests, for marketing purposes.

segment (n)~ A concrete sequence of media samples of a track that correspond to a particular interval in an Apple HTTP Live Streaming presentation.

Segment Builder (PN)~ A tool that enables advertisers to create and manage custom segments, so that they can target ads to specific subsets of their site visitors.

Segment Catalog (PN)~ An online tool for researching the behavioral targeting segments that are available on the Microsoft Media Network, including detailed demographic and historical search data.

segment tag (n)~ In EDI, a unique identifier for a segment. Within EDIFACT, for example, segment tags are three-letter uppercase codes that prefix the elements within a document. In ANSI X.12, the segment tags are two or three-letter uppercase codes. A segment tag is similar to a record type identifier.

segmentation (n)~ A data mining technique that analyzes data to discover mutually exclusive collections of records that share similar attributes sets.

segmentation (n)~ The process of defining and subdividing a list of contacts into clearly identifiable parts or segments' that may have similar needs

segmented address space (n)~ An address space that is logically divided into chunks called segments. To address a given location, a program must specify both a segment and an offset within that segment. (The offset is a value that references a specific point within the segment, based on the beginning of the segment.) Because segments may overlap, addresses are not unique; there are many logical ways to access a given physical location. The Intel 80x86 real-mode architecture is segmented; most other microprocessor architectures are flat.

Segmented Cycle (PN)~ A SmartArt graphic layout used to show a progression or a sequence of stages, tasks, or events in a circular flow. Emphasizes the interconnected pieces. Each of the first seven lines of Level 1 text corresponds to a wedge or pie shape. Unused text does not appear, but remains available if you switch layouts.

Segmented Process (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow. Emphasizes Level 2 text, since each line appears in a separate shape.

Segmented Pyramid (PN)~ A SmartArt graphic layout used to show containment, proportional, or interconnected relationships. The first nine lines of Level 1 text appear in the triangular shapes. Unused text does not appear, but remains available if you switch layouts. Works best with Level 1 text only.

Segoe UI (n)~ A member of the Segoe family of fonts used in Microsoft products for user interface text, as well as for some online user assistance material, intended to improve the consistency in how users see all text across all languages.

segregation of duties (n)~ A design principle used to reduce the risk of fraud, irregularities, and errors that separates the recording, verification, authorization, custody of assets, and periodic review duties of people who participate in, document, or record the financial consequences of economic transactions.

SEK (n)~ The official currency of Sweden.

select (v)~ To mark text, cells, and similar items that will be subject to a user action, such as copying text.

select (v)~ To add a check to a check box to specify a desired feature or option.

SELECT (PN)~ A WMI Query Language statement that is used to retrieve information. SQL supports queries across multiple tables, but WQL supports only single class queries.

Select All (PN)~ Selects all the content in the current file or page.

Select Annotations tool (v)~ An annotation tool used to select annotations on a slide so they can be moved, edited or deleted.

Select picture (v)~ A button in Works that opens the Insert Picture dialog, where the user can browse to an image to be inserted as a watermark.

select query (n)~ A query that asks a question about the data stored in your tables and returns a result set in the form of a datasheet, without changing the data.

Select without sub-labels (v)~ An option that selects a parent label without selecting its children.

selected object (n)~ The object to which any current modifications, such as property changes, will apply.

selection (n)~ The portion of an on-screen file that has been marked as subject to user action.

selection anchor (n)~ The point at which a selection operation was initiated. This point might be at the visual beginning or end of the selection, depending on how the user made the selection. For example, if the user makes a text selection by moving the mouse pointer from the end of a sentence to its beginning, the selection anchor will be at the end of that sentence.

selection appearance (n)~ The visual display of an object when it has been selected.

selection end (n)~ The point at which a selection operation ends. This point might be at the visual beginning or end of the selection, depending on how the user made the selection. For example, if the user makes a text selection by moving the mouse pointer from the end of a sentence to its beginning, the selection end will be at the beginning of that sentence.

selection handle (n)~ A graphical control point of an object that provides direct manipulation support for operations of that object, such as moving, sizing, or scaling.

selection handle (n)~ A handle that appears on objects or text insertion points when a user taps on them making selection easier.

selection net (n)~ A means of selecting more than one shape at a time by dragging the Pointer tool to define an area that encloses all the shapes to be selected.

Selection Net tool (n)~ A tool that defines a rectangular area that encloses all the shapes to be selected.

selection rectangle (n)~ A rectangle with sizing handles that surrounds a selected object or objects.

Selection tool (PN)~ A tool to select an entire path, shape, block of text, or group of objects.

selective blend (n)~ A high-quality, efficient de-interlacing method that combines two different de-interlacing techniques in order to retain as much detail in the image as possible without introducing artifacts.

selector (n)~ In a cascading style sheet style definition (or style rule), the HTML element linked to a particular set of style properties and values.

self service (n)~ A service that an employee can complete independently, such as completing an online address change form.

self-extracting file (n)~ An executable program file that contains one or more compressed

text or data files. When a user runs the program, it uncompresses the compressed files and stores them on the user's hard drive.

self-healing technology (n)~ The relative capacity of a system to dynamically reallocate available resources in order to be unaffected, or to undergo graceful degradation, when subjected to unfavorable environmental factors

selfie (n)~ A photo that one has taken of oneself, normally using a smartphone or a digital camera, that is planned to be uploaded to a social media website.

self-join (n)~ A join in which records from a table are combined with other records from the same table when there are matching values in the joined fields. A self-join can be an inner join or an outer join. In database diagrams, a self-join is called a reflexive relationship.

self-maintenance (n)~ The process in Application Diagnostics by which the database automatically manages data growth and automatically purges old data by using rules.

self-monitoring analysis and reporting technology system (n)~ A system by which technology is used to monitor and predict device performance and reliability. A SMART system employs various diagnostic tests to detect problems with devices, with the object of increasing productivity and protecting data.

self-monitoring, analysis, and reporting technology (n)~ An industry-standard, reliability-prediction indicator for both IDE/ATA and SCSI hard disk drives. SMART provides early warning for some hard disk drive failures so that critical data can be protected.

self-service BI (n)~ Analytic tools and processes that enable users in an organization to access data to create, use, and share reports without relying on IT for report creation.

self-service business intelligence (n)~ Analytic tools and processes that enable users in an organization to access data to create, use, and share reports without relying on IT for report creation.

self-service policy (n)~ A collection of configuration settings that determine the conditions under which a user or group can manage their own virtual machines through virtual machine self-service. The self-service policy assigns virtual machine permissions and templates. Self-service policies are configured for a host group.

Self-Service Portal (n)~ A Web interface that is configured by an administrator so that end users can search knowledge, create requests, and read IT announcements.

self-service registration model (n)~ A Certificate Lifecycle Manager (CLM) registration model in which a certificate subscriber performs or requests certificate management activities directly using a Web-based interface.

self-service restore (n)~ A service that provides a basic disaster recovery capability by automatically creating and maintaining backups for up to 30 days when creating a database with any service tier to back-out unintentional changes or recover an accidentally deleted database.

self-service sign up (n)~ The method by which a user signs up for a cloud service and has an identity automatically created for them in Azure Active Directory based on their email domain.

Self-Service Site Creation (PN)~ A feature that allows members of the Administrator site group to create subsites off of their Web sites.

self-service user (n)~ A user who creates and manages his own virtual machine(s) within a controlled environment by using the Virtual Machine Manager Self-Service Portal.

Self-Service User Content (n)~ A node in the Library workspace that displays the resources (for example, .vhd files and scripts) that self-service users have uploaded for authoring templates and for sharing with other self-service users.

Self-Service user role (PN)~ A user role allowing users to create, deploy, and manage their own virtual machines and services.

self-signed certificate (n)~ In the absence of a certification authority (CA) that is capable of issuing file encryption certificates, a certificate that is generated and digitally signed with its own key.

self-test (n)~ A set of one or more diagnostic tests that a computer or peripheral device (such as a printer) performs on itself.

self-tracking entity (n)~ An entity built from a Text Template Transformation Toolkit (T4) template that has the ability to record changes to scalar, complex, and navigation properties.

Seller Dashboard (n)~ A service for software developers to submit and distribute software apps that support or enhance Microsoft technologies, such as Microsoft SharePoint, Microsoft Office, and Microsoft Azure.

Seller Dashboard Agreement (PN)~ An application provider agreement customers are encouraged and reminded to read so they're aware of any restrictions or limitations regarding the use of the Seller Dashboard service.

seller portal (n)~ A view into Dynamics Marketing by a salesperson so the salesperson can see what marketing campaigns have been sent to potential customers.

selling period (n)~ The period of time between an item or right receipt date and its expiration date.

semantic error (n)~ An error in meaning; a statement in a program that is syntactically correct (legal) but functionally incorrect.

semantic layout (n)~ Markup that is based on meaning or intention, as opposed to direct specification of style.

Semantic Model Definition Language (PN)~ A set of instructions that describe layout and query information for reports created in Report Builder.

semantic object (n)~ An object that can be represented by a database object or other real-world object.

semantic validation (n)~ The process of confirming that the elements of an XML file are logically valid.

semantic zoom (n)~ Zooming behavior that is specified by the developer. Zooming in on a UI or a collection of things and providing greater, meaningful context. You might zoom in on a collection of photos and suddenly titles or dates appear. The photos may go from file names to thumbnails or from small thumbnails to large ones, or from thumbnails to full photo files.

semantics (n)~ In programming, the relationship between words or symbols and their intended meanings.

semantics (n)~ The study of meaning in language.

semaphore (n)~ In programming, a signal—a flag variable—used to govern access to

shared system resources. A semaphore indicates to other potential users that a file or other resource is in use and prevents access by more than one user.

Semblio Authoring (PN)~ An authoring tool in Semblio product for creating educational content.

Semblio Authoring redistributable merge module (n)~ A merge module that combines multiple content files created in Semblio Authoring into one redistributable package.

Semblio player (n)~ A player in Microsoft Semblio that students and educators can use to view and interact with presentations.

semiadditive measure (n)~ A measure that can be summed along one or more, but not all, dimensions in a cube.

semi-bold (adj)~ Having a font weight that corresponds to a weight class value of 600 according to the OpenType specification.

semiconductor (n)~ A substance, commonly silicon or germanium, whose ability to conduct electricity falls between that of a conductor and that of a nonconductor (insulator). The term is used loosely to refer to electronic components made from semiconductor materials.

semi-light (adj)~ Having a font weight that corresponds to a weight class value of 350 according to the OpenType specification.

semisynchronous call (n)~ A method call that returns immediately and allows the application or script to enumerate the returned objects as a collection. A semisynchronous method call does not require setting up an object sink, but an asynchronous method call does require setting up an object sink.

semisynchronous method call (n)~ A method call that returns immediately and allows the application or script to enumerate the returned objects as a collection. A semisynchronous method call does not require setting up an object sink, but an asynchronous method call does require setting up an object sink.

send (v)~ To transmit a message or file through a communications channel.

send (v)~ To transfer data or files to a device or an app.

Send {first name} a quick message (PN)~ The message text box that is displayed on a contact's summary page.

Send a link (PN)~ The UI link text for sending a link to a page.

Send an Instant Message… (oth)~ The item on the Actions menu that sends an instant message to the person the user selects from the corporate address book.

send contact (oth)~ To share a contact with other users.

Send contract (n)~ A contract that enables developers to leverage the SendTo button on the Connect Charm to send content from their application to connected devices.

Send E-Mail… (oth)~ An item on the Actions menu that sends e-mail to the person the user selects from the corporate address book.

send file (oth)~ To transfer a document, video, photo, or other file to other users via Skype.

send pipeline (n)~ A pipeline that is executed on messages before they are sent out of the BizTalk server.

send port (n)~ The location to which messages are sent or from which messages are received, and the technology that is used to implement the communication action. The

location is uniquely identified by the name of the port.

send port group (n)~ A logical grouping of send ports. When a message is sent to a send port group, it is routed to all of the associated send ports.

Send recurring (PN)~ A setting on the email maintain page that indicates that this email can be sent to any newly registered contacts that click on the offer confirmation link in the offer email.

send request file (n)~ A file with instructions that a sender uses to connect to and transfer data to a destination.

send SMS (oth)~ To send a text message to a mobile phone from the Skype client.

send text (oth)~ To send a text message to a mobile phone from the Skype client.

send text message (oth)~ To send a text message to a mobile phone from the Skype client.

Send/Receive (PN)~ The button that enables someone to simultaneously send the messages they have composed and retrieve the new messages they've received.

Send/Receive group (n)~ E-mail accounts and folders that you can group and set common options for, such as whether to download headers or messages, size limits on downloaded messages, behavior online vs. offline, and time interval for connecting to the server.

sender (n)~ The one who sends an electronic message.

Sender Address (PN)~ A plug-in that enables users to quickly insert an HTML tag into the body of an email message that displays the mailing address of the sender.

sender password (n)~ A password given by the service provider to the user.

sender policy framework (n)~ An extension of the SMTP protocol that prevents spammers from forging the From: fields in e-mail messages by verifying that the IP address in the SMTP Received: header is authorized to send e-mail for the sender's domain.

sender reputation (n)~ Anti-spam functionality that is enabled on computers that have the Edge Transport server role installed to block messages according to characteristics of the sender. The Sender Reputation agent continuously monitors senders and their past Simple Mail Transfer Protocol (SMTP) interactions, such as the amount of spam and messages that are not spam that a sender has sent, and relies on persisted data about the sender to determine what action, if any, to take on an inbound message.

Sending MOS (n)~ A prediction of the wideband listening quality MOS (MOS-LQ) of the audio stream that is being sent from the user. This value takes into account the speech and noise levels of the user along with any distortions.

send-to program (n)~ The program that a specific XML style sheet is used to export data to. You use the XML data export feature to send data from Microsoft Dynamics NAV to a send-to program. A style sheet applies to one send-to program.

Senior Detective (n)~ Skill level in the Purble Place game. Once a Purble Place game is completed, a player gets a skill level rank assigned automatically by the game (based on number of guesses and hints during the game).

SENS (n)~ An event publisher for various system events.

Sensing Method (n)~ The sensing component in the camera that was used to capture the image.

sensitive cursor (n)~ A cursor that can reflect data modifications made to underlying data

by other users while the cursor is open.

sensitive data (n)~ Personally identifiable information (PII) that is protected in special ways by law or policy.

sensitivity (n)~ The degree of confidentiality of an e-mail message or calendar item, ranging from normal to confidential.

Sensitivity (PN)~ The significance level that must be reached before a notification is sent.

sensitivity level (n)~ The degree of confidentiality of an e-mail message or calendar item, ranging from normal to confidential.

sensitivity slider (n)~ A control in the UI that is used to indicate the sensitivity of a notification.

sensitivity threshold (n)~ A threshold that applies to resource calls and are less than or equal to the alerting threshold, generally being set to approximately 100 milliseconds. The sensitivity threshold defines what is determined to be a 'fast-function', and those functions will not be included in the event call stacks to reduce the amount of data sent to the management server.

sensor (n)~ A device used in digital cameras to capture visual information.

sensor (n)~ Any hardware or software that can detect events or environmental changes, such as your current location or the amount of light around your computer. For example, a notebook with a location sensor, such as a Global Positioning System (GPS) receiver, can determine your exact location. An ambient light sensor can detect when there is a change in lighting, and then a program can use that information to adjust the brightness of your screen.

sensor adapter (n)~ An adapter that acts as a wrapper around the physical sensor, and provides a standard interface for configuring the sensor, capturing samples, and controlling the flow of biometric data from the sensor into the processing engine.

sensor monitoring service (n)~ A Windows service that supports screen rotation, screen brightness, and the inbox location provider. Windows 8 starts this service whenever it detects one of the corresponding sensors or when a user launches a location-aware app.

Sent from my Windows device (PN)~ A tagline or signature added to all email that's sent from a Windows Phone.

sentiment (n)~ The determined emotional attitude of a speaker or a writer in relation a post found by a search topic.

sentiment change (n)~ The delta in sentiment value from one time frame to another.

sentiment index (n)~ Statistically calculated value that expresses the overall sentiment in relation to a specific item.

Sentiment Target (PN)~ The focus item that the sentiment indicator and value are calculated for.

sentiment value (n)~ The annotated sentiment of a post, either positive, negative, or neutral.

sentiment widget (n)~ A chart that aggregates sentiment values and visualizes the overall sentiment.

SEO (n)~ The act of modifying the pages of a Web site so that its content is more easily discoverable by Internet search engines.

SEPA (PN)~ A European banking industry initiative that enables secure electronic

payment transfers between bank accounts within and across euro areas.

separate worksheet link (n)~ A worksheet link that accesses multiple rows and columns of data in an external worksheet file into a report, or that associates one or more external worksheet files with one or more reporting units in the reporting tree of a report.

separator (n)~ A line that separates groups of controls (on a surface) or commands (on a menu).

separator bar (n)~ A line that separates groups of controls (on a surface) or commands (on a menu).

separator bar (n)~ A special type of menu item that appears as a dividing bar between two active menu items.

separator character (n)~ A character you choose to indicate where you want text to separate when you convert a table to text, or where you want new rows or columns to begin when you convert text to a table.

Sepia (n)~ A photographic style that renders a photo in brown tones, mimicking the old-fashioned look of photos taken in the early part of the 20th century.

Sepia Tone (n)~ A filter effect in Windows Movie Maker.

sequence (n)~ An ordered arrangement, as in a set of numbers, such as the Fibonacci sequence.

sequence (n)~ An instance of a queryable type.

sequence check (n)~ A process that verifies that data or records conform to a particular order.

sequence diagram (n)~ An interaction diagram that shows the objects participating in a particular interaction and the messages they exchange arranged in a time sequence.

sequence group (n)~ A grouping that contains the sequence of operations that are assigned to the resource or resource groups.

sequence number (n)~ A number that's assigned by the Provisioning Server to a transaction processed for a specified computer.

sequenced application (n)~ An application that has been monitored by the Sequencer, broken up into primary and secondary feature blocks, can be streamed to a computer running the Microsoft Application Virtualization Terminal Services Client or the Microsoft Application Virtualization Desktop Client, and can run inside of its own virtual environment.

sequenced application package (n)~ The files that comprise a virtual application and allow a virtual application to run. These files are created after sequencing and specifically include .osd, .sft, .sprj, and .ico files.

sequenced collection (n)~ A collection of destination objects of a sequenced relationship object.

Sequenced Packet Exchange (n)~ The transport level (ISO/OSI level 4) protocol used by Novell NetWare. SPX uses IPX to transfer the packets, but SPX ensures that messages are complete.

sequenced relationship (n)~ A relationship in a repository that specifies explicit positions for each destination object within the collection of destination objects.

Sequencer (PN)~ An application that monitors and records the installation and setup process for applications so that an application can be sequenced and run in the virtual

environment.

Sequencer Project file (n)~ An XML-based file in which the Sequencer stores its Exclusion Items and Parse Items information. The SPRJ file is used heavily in the creation of application records as well as during an upgrade to a package.

sequencing (n)~ The process of creating an application package by using the Application Virtualization Sequencer. In this process, an application is monitored, its shortcuts are configured, and a sequenced application package is created containing the .osd, .sft, .sprj, and .ico files.

sequencing (n)~ The order in which jobs are processed or operations are performed at a manufacturing facility to achieve objectives.

sequencing computer (n)~ The computer used to perform sequencing and create a sequenced application package.

Sequencing Wizard (n)~ A step-by-step wizard that walks the user through sequencing an application, including package configuration, installing the application or applications to be sequenced, and sequencing the application package for streaming.

sequential file (n)~ A file whose records are arranged in the order they are placed in the file.

sequential layout (n)~ The arrangement of the metadata order in a specified direction.

sequential liability (n)~ A rule that states that a company only has to pay money it owes after it has received payment from its customers.

sequential search (n)~ A simple, though inefficient, search algorithm that operates by sequentially examining each element in a list until the target element is found or the last item has been completely processed. Linear searches are primarily used for very short lists.

Serial ATA ~ See- SATA.

Serial Keys (PN)~ A feature of Windows operating systems that, in conjunction with a communications aid interface device, allows keystrokes and mouse controls to be accepted through a computer's serial port. It also allows the user to control the computer using alternative input devices as if they were using a standard keyboard and mouse.

Serial Line Internet Protocol (n)~ A data link protocol that allows transmission of TCP/IP data packets over dial-up telephone connections, thus enabling a computer or a LAN (local area network) to be connected to the Internet or some other network.

serial number (n)~ A number assigned to a specific inventory item to identify it and differentiate it from similar items with the same item number.

serial number (control unit) (n)~ A 17-character alphanumeric identifier for a control unit and its manufacturer. The first five characters denote the manufacturer and the remaining 12 characters denote the control unit.

serial port (n)~ A serial communications port used to connect a device, such as a modem, printer, or mobile device, to a computer.

Serial Port ~ A socket for plugging devices into the computer, now replaced byUSB.

serial routing (n)~ A routing method in which calls are always offered to available agents in the hunt group in the same order, as determined by the administrator.

serial shipping container code (n)~ A standardized 18-digit label that uniquely identifies each unit to be transported or stored.

serialization (n)~ The process of converting an object's state information into a form that can be stored or transported. During serialization, an object writes its current state to temporary or persistent storage. Later, the object can be recreated by reading, or deserializing, the object's state from storage.

serialization class (n)~ A class designed to serialize and deserialize objects.

SerialKey device (n)~ Enables you to attach an alternate input device (also called an augmentative communication device) to your computer's serial port. This feature is designed for people who are unable to use the computer's standard keyboard and mouse.

SerialKeys (PN)~ A feature of Windows operating systems that, in conjunction with a communications aid interface device, allows keystrokes and mouse controls to be accepted through a computer's serial port. It also allows the user to control the computer using alternative input devices as if they were using a standard keyboard and mouse.

series axis (n)~ The third axis in a three-dimensional coordinate system, used in computer graphics to represent depth.

series field (n)~ A field that is displayed in the series area of a chart and that contains series items. A series is a group of related data points.

series line (n)~ In 2-D stacked bar and column charts, a line that connects the data markers in a data series and is used to emphasize the difference in measurement between each series.

series point (n)~ An individual value plotted in a chart and represented together with other data points by bars, columns, lines, pie or doughnut slices, dots, and various other shapes called data markers. Data markers of the same color constitute a data series.

server (n)~ On the Internet or other network, a computer or program that hosts web pages and responds to commands from a client.

server (n)~ A computer that provides shared resources, such as files or printers, to network users.

Server ~ A computer at the centre of most- networks- which provides- filesand other services to other computers. Also known as a file server.

Server ~ A computer, or a software package, that provides a specific kind of service to- clientsoftware running on other computers. The term can refer to a particular piece of software, such as a- WWW- server, or to the machine on which the software is running

server address (n)~ The name of a server that identifies the owner of that name in a hierarchical format.

server administrator (n)~ A member of the Administrators group on the local server computer.

server application (n)~ Application software running on a cluster node, regardless of whether it does service registration.

server authentication certificate (n)~ In AD FS, a certificate that AD- FS-enabled Web servers, federation servers, and federation server proxies use to secure Web services traffic for communication among themselves as well as with Web clients.

server certificate (n)~ A unique digital identification that forms the basis of the Secure Sockets Layer (SSL) security features on a Web site. Server certificates are obtained from a trusted, third-party organization called a certification authority, and they provide a way for users to authenticate the identity of a Web site.

server cluster (n)~ A group of servers that are in one location and that are networked together for the purpose of sharing workload.

server collation (n)~ The collation for an instance of SQL Server.

Server Configuration node (n)~ In Exchange Server 2007, a node in the Console pane of the Exchange Management Console that enables administrators to view a list of all the servers in their Exchange organization and perform server role-specific tasks. The Server Configuration node contains the following sub-nodes: Mailbox, Client Access, Hub Transport, and Unified Messaging.

server copy (n)~ A copy of a file that has been saved to a server.

server cursor (n)~ A cursor implemented on the server.

server definition (n)~ The definition of a logical application server.

server error (n)~ A failure to complete a request for information through HTTP that results from an error at the server rather than an error by the client or the user. Server errors are indicated by HTTP status codes beginning with 5.

Server Explorer (n)~ The section of the Visual Studio integrated development environment (IDE) that contains solutions, projects, and files.

server farm (n)~ A group of servers that are in one location and that are networked together for the purpose of sharing workload.

server farm ~ Secure facility that hosts a large number of Web servers.

Server Filter By Form (n)~ A technique that uses a version of the current form or datasheet with empty fields in which you can type values you want the filtered records to contain. The data is filtered by the server before it's retrieved from the database.

Server for NIS (PN)~ A feature of Windows that enables a Windows based Active Directory domain controller to administer Network Information Service (NIS) networks.

Server Gated Cryptography (n)~ An extension of the Secure Sockets Layer (SSL) that allows financial institutions with export versions of Microsoft Windows 2000 Server to use 128-bit encryption. Although SGC capabilities are built into Windows 2000 Server, a special SGC certificate is required to use SGC.

Server Graphical Shell (PN)~ The graphical user interface which installs on Windows Server by default and which includes the new Windows user interface Start screen, Internet Explorer, Windows Explorer, and the desktop.

server licensor certificate (n)~ The certificate that establishes the credentials of the RMS server, making it a valid certification and licensing service, and enabling it to run.

server locator point (n)~ An SMS/Configuration Manager site system that locates client access points and management points for SMS/Configuration Manager clients.

server locator point (n)~ A Configuration Manager site system that completes site assignment and can locate management points for Configuration Manager clients when clients cannot retrieve that information from Active Directory Domain Services or other mechanisms.

Server Manager (PN)~ A component of Microsoft CRM Deployment Manager that you can use to view your Microsoft CRM servers, server connection information, and enable or disable them as necessary. In Server Manager, you can also specify a Microsoft SQL Server Reporting Services server.

Server Manager (PN)~ An expanded Microsoft Management Console (MMC)

component available in Windows Server that provides a single source for securely deploying and managing roles, role services, and features on a server; managing a server's identity and system information, including local user accounts; starting and stopping available services; and displaying server status, critical events, and issues with role configuration.

Server Manager command line tool (n)~ A command line tool that automates the deployment of roles and features on computers running Windows Server.

Server manifest (n)~ A file with an .ism file name extension that describes the presentation attributes configured on the Web server. It uses XML-formatting.

Server Message Block (n)~ A file-sharing protocol designed to allow networked computers to transparently access files that reside on remote systems over a variety of networks. The SMB protocol defines a series of commands that pass information between computers. SMB uses four message types: session control, file, printer, and message.

server name (n)~ A name that uniquely identifies a server computer on a network.

Server Name Indication (PN)~ The IIS feature that supports the SSL/TSL protocol extension and allows a virtual domain name, or a hostname, to be used to identify the network endpoint.

server node (n)~ An individual computer in a server cluster.

Server Operators group (n)~ A group whose members can manage all domain controllers in a single domain. This group does not exist on workstations, stand-alone servers, or member servers. Administrative tasks that can be performed by members of this group include logging on locally, creating and deleting network shared resources, starting and stopping services, backing up and restoring files, formatting the hard disk of the computer, and shutting down the computer.

server pool (n)~ A group of servers that are in one location and that are networked together for the purpose of sharing workload.

server process (n)~ A process that hosts Component Object Model (COM) components. A COM component can be loaded into a surrogate server process, either on the client computer (local) or on another computer (remote). It can also be loaded into a client application process (in process).

server product (n)~ A software product that acts as a server for one or more services. Typically, a server product would be installed on a server machine (hardware), and provide services to users over the network.

server role (n)~ The primary function of the server, as enabled by the grouping of features and services that the server administrator specifies.

server script (n)~ A script consisting of statements embedded in an .asp file (Active Server Page). The script is executed by the Microsoft Internet Information Server (IIS) server when the page is requested by the browser but before the content is sent to the browser.

Server Side Incremental (adj)~ A feature that must be enabled in Active Directory to run incremental import of profiles.

server software (n)~ A software product that acts as a server for one or more services. Typically, a server product would be installed on a server machine (hardware), and provide services to users over the network.

server subscription (n)~ A subscription to a merge publication with an assigned priority value used for conflict detection and resolution.

server topology (n)~ A graphical depiction of the configuration or arrangement of (usually conceptual) servers, including connecting lines.

Server Virtualization Validation Program (PN)~ A certification program for Microsoft vendors that enables them to validate various virtualization configurations so that Microsoft customers can receive technical support for Windows Server in virtualized environments.

server-based SharePoint integration (n)~ A feature in document management where you can store your documents in SharePoint and access them from Microsoft Dynamics CRM.

server-based web site (n)~ A web site hosted by a Web server, such as Microsoft Internet Information Server (MIIS).

server-level principal (n)~ An account that is similar to the sa login in SQL Server. During the provisioning process, SQL Azure creates a login for you that is the server-level principal of your SQL Azure server. The SQL Azure server-level principal account has permission to manage all server-level and database-level security.

Servers (PN)~ The Developer tools subcategory containing apps to help developers with the server aspects of building an app.

server-side image map (n)~ An image map that passes the coordinates of the mouse pointer to a CGI handler routine on the server. Server-side image maps require the Web server to compute the target URL of the hyperlink based on the mouse pointer coordinates.

server-side include (n)~ A mechanism for including dynamic text in World Wide Web documents. Server-side includes are special command codes that are recognized and interpreted by the server; their output is placed in the document body before the document is sent to the browser. Server-side includes can be used, for example, to include the Date and Time stamp in the text of the file.

server-side session (n)~ The runspace on the datacenter (host) server, which contains the commands used by the remote user in a client-side session.

server-side synchronization (n)~ To perform synchronization between records in CRM and in email systems on the CRM server side (in the cloud, without dependency on the client being up and connected.

server-to-server protocol (n)~ An authentication protocol between two servers or services.

service (n)~ An activity, such as consulting or design, performed for sale or purchase by one or more resources.

service (n)~ A program, routine, or process that performs a specific system function to support other programs.

service (n)~ A set of related components provided in support of one or more business processes. The distributed application will comprise a range of configuration item types but will be perceived by customers and users as a self-contained, single, coherent entity.

service (n)~ A website or service that a customer can connect in order to share what they've been doing on other websites, see their friends and their updates from other services in Windows Live, or share their Windows Live activity on other websites.

service (n)~ A change in the state of a consuming party or a change in the state of an item

belonging to a consuming party that is produced by an activity performed by a providing party.

service (n)~ A set of virtual machines that are configured and deployed together and are managed as a single entity. For example, a deployment of a multi-tier line-of-business application.

service access point (n)~ A logical address that allows a system to route data between a remote device and the appropriate communications support.

service account (n)~ An account that is intended to be used to run a service. A service account has privileges beyond those provided when a service is run as part of the system, such as the ability to connect over the network to another computer.

service activity (n)~ A schedulable appointment to provide a service to a customer. A service activity uses one or more resources to perform a service at a specific time and place.

service administrator (n)~ The person responsible for setting up and managing a service.

Service Advertising Protocol (n)~ A NetWare protocol used to identify the services and addresses of servers attached to the network. When a server starts, it uses the protocol to advertise its service. When the same server goes offline, it uses the protocol to announce that it is no longer available.

service agreement (n)~ An agreement between a service provider and a customer that specifies the amount and type of service the provider will deliver.

service agreement line (n)~ An itemization of tasks that are covered by a service agreement.

service application (n)~ A background application that runs without any user interface components (such as windows) and that supports another application that is displaying on the screen.

Service Broker (PN)~ A technology that helps developers build scalable, secure database applications.

Service Broker External Activator (PN)~ An extension of the internal activation feature that allows users to move the logic for receiving and processing Service Broker messages from the database engine service to an application executable outside the database engine service.

service bureau (n)~ A company that provides various services related to publishing, such as prepress production, desktop publishing, typesetting, imagesetting, and optical scanning of graphics.

Service Bus (PN)~ The hosted service from Microsoft that provides developer-oriented services and a secure messaging infrastructure for widespread communication, large-scale event distribution, naming, and service publishing.

Service Bus Connections (cxns/month) (n)~ The unit of measure for the Service Bus connections, which can be provisioned individually on a pay-as-you-go basis or in a pack of 5, 25, 100, or 500 connections. If the connection usage in a given day exceeds the provisioned pack size, the user will be charged a prorated amount based on the maximum simultaneous connections used for each day.

Service Bus Relay (PN)~ The Service Bus service for secure messaging and connectivity to enable hybrid applications that run across Microsoft Azure and on-premises

environments.

service calendar (n)~ A scheduling component that is used to view and manage appointments and service activities.

service catalog (n)~ The list of published service offerings.

service certificate (n)~ A certificate issued by a signing authority verifying a cloud service's authenticity and security.

service component (n)~ The set of configuration items that are used to deliver a business service, such as computers, Web sites, databases, and other application components.

service configuration file (n)~ The file that sets values for the hosted service that can be configured while the service is running in the Microsoft Azure fabric. Values in the service configuration file include the number of instances required for each role, the values for the configuration parameters established in the service definition file, and the thumbprints for any SSL certificates associated with the service.

service configuration file (n)~ The file that sets values for a service.- The values that you can specify include the number of instances to deploy for each role, the values for the configuration parameters that you established in the service definition file, and the thumbprints for any SSL certificates associated with the service.

service configuration setting (n)~ A configuration option that can be changed in a running service without requiring the service to be redeployed.

service connection point (n)~ An Active Directory node on which system administrators can define Certificate Lifecycle Manager (CLM) management permissions for users and groups.

Service connector (PN)~ A hidden utility or app that works in the background to connect Windows features to a 3rd party service.

Service Control Manager (n)~ A server capable of manipulating (i.e. starting and stopping) services remotely on other machines.

service coverage (n)~ The specific hours and days of the week for which service support will be provided.

service definition file (n)~ The file that defines the service model for the application, which includes the roles that comprise a hosted service, the service endpoints, configuration settings, and certificates for SSL endpoints. The service model cannot be changed once the service is deployed and running.

service definition file (n)~ The file that determines- the service model, such as the roles that comprise a service, optional local storage resources, configuration settings, and certificates for SSL endpoints.

service deliverable (n)~ Any computer code or materials, other than Products or Fixes, or Sample Code that Microsoft leaves with Customer at the conclusion of Microsoft's performance of Professional Services.

service dependent (adj)~ The person or service in an enterprise that relies on a business service. These people and services are affected by the output and downtime of the business service.

Service Deployment Configurations (n)~ A node in the Library workspace where you can view instances of services that have been saved (during the process of configuring specific deployment settings for the service instance) but have not been deployed.

Service Desk (PN)~ The web-based interface that CSRs use to manage configurations, handle Tickets, Chat Requests, Knowledgebase Articles, and other tasks.

service endpoint (n)~ An endpoint through which an application system exposes or provides a service of some kind.

service endpoint (n)~ An endpoint that exposes a Web service.

Service Fabric (PN)~ A high control platform that enables developers and independent software vendors (ISV) to build cloud services with a high degree of scalability and customization.

service factory (n)~ Used by the Windows Fabric runtime to create stateful service replicas of a specific service type.

service group (n)~ A logical combination of services that are maintained as one.

service hardening (n)~ The process of making services less susceptible to attack from malicious software by running least privilege, minimizing resource access, locking down ports and protocols, and generally reduce the damage potential and number of critical vulnerabilities in services.

service hooks (n)~ An extension to integration environments to push data into other services in real time and send notifications or triggering actions after a build.

service host (n)~ The run-time environment for hosting a service within a process.

service instance (n)~ An instance of an orchestration that BizTalk Server is either processing or has serialized into the MessageBox for further processing or tracking. Within BizTalk Server, this is usually a serialized representation of the state of the orchestration and references to any messages in use within the orchestration.

service instance (n)~ A deployed service in Microsoft Azure or VMM.

service instance (n)~ An instance of an Office 365 cloud product.

service item (n)~ An itemized service that participates in an operations process.

service item (n)~ An item that is subject to maintenance work managed in a service order.

service level (n)~ The level of support that customer service is required to provide for a case. The service contract a customer purchases determines the service level for its associated cases.

service level agreement (n)~ An agreement between two or more parties describing the deliverables, support, and communication that each party will provide to the other.

Service Level Agreement (PN)~ An agreement that specifies the minimum service level for the Online Services.

Service Level Agreement (SLA) (n)~ A provision that designates what actions a Customer can perform during support interactions, as well as what content they may view on your Support Portal.

service level agreement metric (n)~ A calculated time interval that Service Manager determines between the date and time fields in incidents and service requests. For example, the SLA metric -€œresolution time-€? is defined as the difference between the Incident Created Date and the Incident Resolved Date.

service level agreement target (n)~ The specified duration of time in which the IT organization must respond to or resolve an incident or service request.

service level agreement time (n)~ The amount of time an alert can remain in an alert resolution state before it becomes a service level exception.

service level exception (n)~ An alert that has remained longer than specified in a resolution state. For example, the default service expectation time for an alert to remain in the New resolution state is 10 minutes. If an alert's resolution state is New for longer than 10 minutes, it is considered a service level exception.

service life (n)~ The time that an asset will provide a benefit to the business.

Service Manager console (n)~ The console that is used by help desk analysts and administrators for help desk functions such as change, incident, problem, and configuration management.

Service Manager data warehouse management server (n)~ The Service Manager management server that performs the management functions for the data warehouse.

Service Manager database (n)~ A database that includes all the work items, configuration items, and administrative settings for the product.

Service Manager IT portal (n)~ A Web interface designed for information technology (IT) managers and IT professionals so that they can view and manage incidents, changes, and assets. It can also be used to examine metrics and reports.

Service Manager management server (n)~ The server that hosts the System Center Data Access Service service and Microsoft Office SharePoint sites.

Service Manager reporting server (n)~ The server that hosts Microsoft SQL Server Reporting Services (SSRS).

service manifest (n)~ A strictly-versioned schematized xml document authored by the service developer to describe the provisioning and deployment package of a set of service types. It specifies independently upgradable code, configuration, and data packages that together implement a specified set of service types.

service map (n)~ A representation of a service from the perspective of the business and user that shows critical dependencies, settings, and areas of responsibility.

service mapper (n)~ A component that helps map logical services to their physical locations, facilitating the deployment of Duet end-user applications.

service mark (n)~ A mark used in the sale or advertising of services to identify and distinguish them from services provided by another company.

service message (n)~ A message that contains service-related content.

Service module (n)~ The Microsoft CRM module used to access business records pertaining to customer service, such as cases, accounts, contacts, contracts, and the Knowledge Base Manager (KB Manager). In this module, users can open and resolve cases, create and view service contracts, and create and manage information in the Knowledge Base.

service object (n)~ The component or product that is covered by a service agreement.

service offering (n)~ The item or work effort that is available to customers through the Self-Service Portal in the service catalog.

service order (n)~ A request for a single service visit by one or more service technicians.

service order (n)~ A response to a customer request for service or an order that is automatically generated at set intervals specified by the terms of a service contract.

service order line (n)~ The part of a service order that specifies detailed information about the requested service.

Service Oriented Architecture (n)~ A software architecture that uses policies, practices,

and frameworks to enable application functionality to be provided and consumed as sets of services. These services are published at a level of granularity relevant to service consumers.

service pack (n)~ A tested, cumulative set of all hotfixes, security updates, critical updates and updates, as well as additional fixes for problems found internally since the release of the product. Service packs may also contain a limited number of customer requested design changes or features, and contain all fixes since the previous service pack or RTM.

service package (n)~ A package, also known as a service template, is a file that contains the role binaries and the service definition file to be published to the Microsoft Azure fabric.

service plan (n)~ A collection of Exchange features, organization-wide resource limits, and permissions that are automatically configured or applied when a new hosted organization is provisioned in the service.

service plan template (n)~ An XML file used to define the elements of a service plan or a mailbox plan.

service principal (n)~ A globally-unique name associated with a service entity at an endpoint node within a Kerberos peer-to-peer communication.

service principal (PN)~ An automated process, application or service that needs to access other resources.

service principal name (n)~ The name by which a client uniquely identifies an instance of a service. It is usually built from the DNS name of the host. The SPN is used in the process of mutual authentication between the client and the server hosting a particular service.

Service Profile Identifier (n)~ An 8-digit to 14-digit number that identifies the services that you order for each B-channel. For example, when you order Primary Rate ISDN, you obtain two phone numbers and two SPIDs from your Integrated Services Digital Network (ISDN) provider. Typical ISDN adapters cannot operate without configuring SPIDs.

service program (n)~ A program that uses Service Broker functionality. A service program may be a Transact-SQL stored procedure, a SQLCLR stored procedure, or an external program.

service provider (n)~ A business that supplies Internet connectivity services to individuals, businesses, and other organizations. An ISP provides a telephone number, a user name, a password, and other connection information so that users can access the Internet through the ISP's computers.

service provider (n)~ An entity which provides some services.

service provider (n)~ A Web service that facilitates publishing of metadata into the metadata database and updating of the same later on.

Service Provider Interface (n)~ Calling conventions that back-end services use to make themselves accessible to front-end applications.

Service Quality Metrics (n)~ Technology a user can enable that allows data relating to application use/performance/errors to be collected and sent to Microsoft, thus allowing Microsoft to continue to improve the product based on actual user data.

service quality metrics (n)~ A collection of statistics that indicates the degree to which a service meets performance, usage, and other demands for the service.

service record (n)~ A category of data in the Internet Domain Name System that specifies information on available services. The SRV record is used to locate domain controllers for Active Directory.

service report (n)~ A report generated with customer service data, including case, knowledge base, and contract data.

service request (n)~ A request from a customer for a service.

service request fulfillment (n)~ The process for managing service requests.

service requirement (n)~ A design option that, if it is changed, requires the service to be redeployed.

service resource record (n)~ A resource record used in a zone to register and locate well-known TCP/IP services. The SRV resource record is specified in RFC 2782, and it is used to locate domain controllers for Active Directory.

Service Set Identifier (n)~ A unique set of letters or numbers that identifies a wireless network. For a computer or device to connect to a wireless network, it must supply that network's SSID. An SSID can be up to 32 characters.

Service status (PN)~ A UI element that links to a Web page that displays the condition and quality of the service.

service task (n)~ An action to be taken by a service technician as part of a service order.

service template (n)~ A Virtual Machine Manager library resource that contains the configuration settings used to deploy each tier of a service.

Service Template Designer (n)~ A graphical tool in the VMM console that is used to create and modify service templates.

service ticket (n)~ A ticket issued by the Kerberos V5 ticket-granting service (TGS) that allows a user to authenticate to a specific service in the domain.

Service Tier Advisor (PN)~ A database engine that analyzes the performance and feature requirements for individual databases to provide insights that help choose the right Basic, Standard, or Premium tier and the performance level for a database.

service topology (n)~ The number of instances of a role to run for a Microsoft Azure hosted service, as defined by the service configuration file.

service window (n)~ A reserved time for performing administrative tasks on a computer, server farm, or server cluster.

services layer (n)~ The layer that functions as a gateway between the client layer and the platform layer, where the data resides. The services layer provides three functions: provisioning, billing and metering, and connection routing.

servicing window (n)~ A user-defined time period that can be assigned to a virtual machine, host, or service to indicate when that object is available to be taken offline (for example, to perform maintenance).

session (n)~ A period of time when a connection is active and communication can take place. For the purpose of data communication between functional units, session also refers to all the activities that take place during the establishment, maintenance, and release of the connection.

session (n)~ A collaborative meeting or formal presentation in which a participant has chosen to share an application or desktop.

session (n)~ A logical connection created between two hosts to exchange data.

session (n)~ An instance that begins when someone signs into a web service or program.

Session 0 (PN)~ The session that is used for all of the system services.

session concentration (n)~ For Message Queuing, a feature that typically reduces network bandwidth within a site and the number of sessions between sites. Specially configured Message Queuing servers with routing services provide session concentration.

session cookie (n)~ A cookie that is deleted at the end of the browser session.

Session Countdown (n)~ A feature on the General tab of the User Settings tool that allows the administrator to display the session countdown interface to alert users of how much time is left before the end of their sessions.

Session Description Protocol (n)~ A protocol that Telephony API (TAPI) uses to advertise Internet Protocol (IP) multicast conferences. This protocol describes multimedia sessions for the purposes of session announcement, session invitation, and other forms of session initiation. SDP descriptors are stored in Active Directory.

session host (n)~ The server to which participants in the session (e.g. game session) have to connect.

session hour (n)~ A unit of measure of time for a session.

session identifier (n)~ A handle that uniquely identifies a specific activity that occurs over a period of time devoted to that activity. The session identifier must be provided as an argument in actions regarding the session. Session identifiers are used by Internet and device-specific transmission protocols, communications protocols, security protocols, and directory protocols and by mail, editing, and user interface tools.

Session Initiation Protocol (n)~ A standard signaling protocol for establishing multi-media communications sessions between two or more users over an IP network.

Session Initiation Protocol trunking (n)~ A mechanism for connecting the voice network of an enterprise to a service provider that offers public switched telephone network (PSTN) origination, termination, and emergency services without deploying PSTN gateways.

session key (n)~ The key used for encrypting data during a communication session.

session layer (n)~ Layer five of the OSI model. A network layer that allows two applications on different computers to establish, use, and end a session. This layer establishes dialog control between the two computers in a session, regulating which side transmits, as well as when and how long it transmits.

session state (n)~ In ASP.NET, a variable store created on the server for the current user; each user maintains a separate Session state on the server. Session state is typically used to store user-specific information between postbacks.

Session Timers (n)~ A feature on the General tab of the User Settings tool that allows the administrator to set session limits and display attributes.

session-based desktop deployment (n)~ A session-based deployment that allows users to connect to collections that include published RemoteApp programs and session-based desktops.

set (n)~ In printing and display, a group of related characters, such as a character set.

set (n)~ A named collection of objects. Typically sets are used to organize resources based on rules.

set (n)~ A grouping of dimension members or items from a data source that are named and

treated as a single unit and can be referenced or reused multiple times.

set difference (n)~ The collection of elements in one set that do not appear in the other set.

Set due date (v)~ An option that allows the user to set the date by which a To Do needs to be completed.

set intersection (n)~ The collection of elements in a first set that also appear in a second set.

Set Note… (oth)~ The item on the user's My Status menu that enables the user to type a note that will appear as part of his status.

set operation (n)~ A query operation that produces a result set that is based on the presence or absence of equivalent elements within the same or separate collections (or sets).

set union (n)~ In set theory, the smallest combination of two sets that contains all elements of both sets.

set-by-caller callback (n)~ In Network Connections, a form of callback in which the user supplies the telephone number that the remote access server uses for callback. This setting spares the user any long-distance telephone charges.

setter (n)~ Code in a XAML document that represents a property being set to a value.

setter (n)~ An accessor method in an object-oriented class definition.

setting (n)~ A configuration parameter or element that controls the behavior of a service, application, feature, function, or a run-time environment.

Settings (PN)~ The area of the product in which you can work with business units, users, security roles, templates, subjects, services, and so on.

settings (n)~ Personal configuration options that allow users to customize their applications or operating system.

settings (n)~ Options that allow users to change their voicemail number, turn on caller ID, international assist, and long tones.

settings (n)~ An icon that displays options related to user and site settings. The settings icon is visually represented by the shape of a gear.

Settings (PN)~ ?The app where people can find Windows and device settings.

Settings and Constraints Editor (n)~ The inspector window used with all diagrams through which settings, constraints and resource definitions can be viewed and edited.

Settings charm (n)~ A user interface element that provides access to PC and app settings.

Settings contract (n)~ A contract for surfacing an app user preferences in a way that is consistent with Windows' settings model.

Settings flyout (PN)~ The flyout that is displayed on the right side of the screen and allows users to access app and system settings.

Settings Manager (n)~ An administrative tool that is used to configure settings for the Duet client component and to administer the local metadata cache. This tool includes two components: Configuration Manager and Metadata Cache Manager.

settings modifier (n)~ Software that changes settings without adequate consent.

Settings pane (PN)~ The pane held in the flex pane that contains the top Office 365 settings as well as contextual settings based on what Microsoft service you are currently using.

settings+pin (PN)~ An appbar menu item in the Wallet panorama that, when tapped, takes users to the Wallet Settings, where the user can set a Wallet PIN.

settlement (n)~ The balancing of two transactions, such as a payment and an invoice. The purpose of a settlement is to reduce the outstanding balance between the transactions to zero.

set-top box (n)~ A device that converts a cable TV signal to an input signal to the TV set. Set-top boxes can be used to access the World Wide Web and are a type of information appliance.

setup (n)~ A computer along with all its devices.

setup (n)~ The procedures involved in preparing a software program or application to operate within a computer or mobile device.

Setup Analysis Tool (PN)~ A tool that automates the running of application installations while monitoring the actions taken by each application's installer.

setup initialization file (n)~ A text file, using the Windows .ini file format, that stores configuration information allowing SQL Server to be installed without a user having to be present to respond to prompts from the Setup program.

setup program (n)~ A program whose function is to install another program, either on a storage medium or in memory. An installation program, also called a setup program, might be used to guide a user through the often complex process of setting up an application for a particular combination of machine, printer, and monitor.

setup technician (n)~ A technican who goes to the customer location and sets up a computer enabled by FlexGo technology after purchase, helps the customer connect to the Internet, and assists the user with adding time.

setup time (n)~ The number of hours needed to prepare the work area prior to an operation.

severity (n)~ The property of an alert indicating its seriousness. Examples include Service Unavailable, Security Issue, Critical Error, Error, Warning, Information, and Success.

severity (n)~ In ACT, the importance your organization attaches to a particular update.

severity (n)~ In Server Manager and Event Viewer, the urgency of an event or error condition, system fault, failure, or action by either the system or the user. Severity can be any of four industry-standard values: Information, Warning, Error, or Critical. These values are defined in the Event Viewer Help.

Severity icon (n)~ The icon for indicating the severity level of an event: Information (for Performance Events), Critical Error for Critical Exception Events, or Noncritical Error for Handled or Noncritical Exception Events from the APM service.

Sex (n)~ A content descriptor developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

Sex (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

Sex education (n)~ A content descriptor developed by Microsoft.

sexual situations (n)~ A label in a voluntary content-based rating system used by TV networks in the United States to indicate to viewers if a particular show has higher levels of sex, violence or adult language.

Sexual Themes (n)~ A content descriptor developed by the Entertainment Software

Rating Board (ESRB).

Sexual Violence (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

SFT file (n)~ A file that contains one or more applications that the Sequencer has repackaged -€"without altering source code-€"into a series of blocks of code that can be streamed. These blocks will have been optimized for rapid launch of the application on a SoftGrid Client.

SFTMIME (PN)~ A command-line interface for setting up and managing applications, file type associations, and desktop configuration servers managed by Application Virtualization Desktop and Terminal Services Clients.

SFTP (PN)~ A protocol that is used to upload configuration files over any reliable data stream; for example, to upload Directory Services user entries to the Administration Center.

SGC (n)~ An extension of the Secure Sockets Layer (SSL) that allows financial institutions with export versions of Microsoft Windows 2000 Server to use 128-bit encryption. Although SGC capabilities are built into Windows 2000 Server, a special SGC certificate is required to use SGC.

SGML (n)~ The international standard for organizing and tagging elements and data in a document. SGML itself does not specify any particular formatting; rather, it specifies the rules for tagging elements. Tags can then be interpreted to format elements in different ways.

SHA (n)~ A client software component that declares a client's health state (by providing a statement of health) to a NAP agent.

SHA1 (PN)~ A cryptographic hash function designed by the United States National Security Agency and a U.S. Federal Information Processing Standard published by the United States NIST.

SHA-1 (n)~ An algorithm that generates a 160-bit hash value from an arbitrary amount of input data. SHA-1 is used with the Digital Signature Algorithm (DSA) in the Digital Signature Standard (DSS), among other places.

SHA-1 (PN)~ A cryptographic hash function designed by the United States National Security Agency and a U.S. Federal Information Processing Standard published by the United States NIST.

shade (n)~ A color that is mixed with black. A 10-percent shade is one part of the original color and nine parts black.

shader (n)~ A graphics function which calculates computer image effects pixel by pixel allowing control of the lighting, shading and color of each individual pixel.

shader (n)~ An abstract computational unit on a GPU that processes complex floating-point calculations as a stream, in parallel with other abstract computational units.

shader program (n)~ A linear program written in a low-level shader language, such as High-Level Shading Language (HLSL), for compilation and execution on a GPU.

Shadow (n)~ A report that lists the usage of volume resources for shadow copies. Use this report to identify inconsistencies in diff area configuration that may allow reclaiming large portions of disk space.

shadow (n)~ A shaded outline that appears behind an object or text and creates the illusion

of depth.

shadow (v)~ In programming, to hide, or disable access to, a programming element that has the same name. In such a situation, the shadowed element is not available for reference; instead, when code uses the shared name, the shadowed element is resolved to the shadowing element.

Shadow Copies for Shared Folders (n)~ A Windows feature that provides access to point-in-time copies of files that are located on shared resources, such as a file server.

shadow copy (n)~ A static image of a set of data, such as the records displayed as the result of a query.

shadow copy client software (n)~ Client software that enables an end user to independently recover data by retrieving a shadow copy.

Shadow Copy report (n)~ A DPS report that provides information on how well data is being protected by the shadow copies.

shadow folder (n)~ An optional file system folder that contains current copies of all files in a project. The shadow folder provides a location from which to view the files without accessing the Visual SourceSafe database and serves as a convenient place to build or compile the project.

shadow password ~ A password that's stored in a secure file on the server and can be authenticated using a variety of conventional authentication methods

shadowing (n)~ The process of viewing and interacting with an existing Remote Desktop Protocol session initiated by another user.

shadowing effect (n)~ A diagramming capability that creates shadows behind a chart for better visual effect.

shallow copy (n)~ A copy of the contents of a data structure that does not include all its substructures.

Shamrock Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a shamrock decoration for their cake.

shape (n)~ An object created using drawing tools or commands.

shape (n)~ A graphical representation of an action or grouping of actions in an orchestration.

shape connector line (n)~ A line used to link shapes and to determine their relative order in an orchestration.

shape data (n)~ The collection of custom properties for a shape.

Shape tool (PN)~ A tool that allows you to draw a shape such as a rectangle, ellipse (circle), line, etc.

shapefile (n)~ A public domain format for the interchange of spatial data in geographic information systems. Shapefiles have the file name extension .shp'.'

shape-level validation (n)~ The act of checking a visual workflow to ensure that the shapes and connections are valid.

ShapeSheet (n)~ A spreadsheet that contains information about a shape; for example, its dimensions, angle, and center of rotation and the styles that determine the shape's appearance.

ShapeStudio (n)~ A shape-development tool included in the Microsoft Office Visio 2003 SDK, providing a development and test environment that integrates with Visio.

shape-to-shape connection (n)~ A method of connecting shapes. The actual point of connection might change when you move the connected shapes. You make shape-to-shape connections by dragging a connector from the center of one shape to the center of another shape.

shard (n)~ A database partition generated as a product of splitting a large database into chunks in a distributed scalable database system.

shard (v)~ To break an application's logical database into smaller chunks of data and distributing the chunks of data across multiple physical databases to achieve application scalability.

sharding (n)~ A technique for partitioning large data sets, which improves performance and scalability, and enables distributed querying of data across multiple tenants.

share (v)~ To make resources, such as folders and printers, available to others.

share (n)~ A directory or folder made available to users over the network.

share (n)~ One unit of ownership interest in a company.

Share (PN)~ The Sway feature that allows users to: share a URL to a Sway via Facebook, Twitter, or a link; generate HTML embed code of a Sway in another website; and change previously shared URLs to a Sway.

Share a quick message (PN)~ The link that prompts someone to enter a personal message to share, if the personal message field is currently empty. The personal message appears on someone's Profile page, and in Messenger.

Share charm (PN)~ A user interface element that provides access to sharing files and info with other apps.

Share contract (n)~ A contract that lets a Windows Store app receive content, such as photos , links, and text, that the user shares from other apps. An app that supports this contract can be included in the list of apps that appears when the user taps the Share charm. Windows limits the list to include only the apps that support the type of data being shared. Examples of apps that might want to use this contract include social networking, email, and note-taking apps.

Share Database (v)~ An option, found on the Business Contact Manager menu, in the Database Tools selection, that enables the user to share all information in a database.

share name (n)~ A name that refers to a shared resource on a server. Each shared folder on a server has a share name used by personal computer users to refer to the folder. Users of Macintosh computers use the name of the Macintosh-accessible volume that corresponds to a folder, which may be the same as the share name.

Share of Voice (PN)~ The relative distribution of posts, sources, languages, and sentiments, taking the user's filters into account.

share path (n)~ The full name of a resource on a network in the format \servername\sharename, which can include a directory path under the share name.

Share pictures and videos (v)~ An option that allows the user to share the metadata - caption, label, flag, etc. when sharing a picture or video.

Share Source contract (n)~ A contract that lets a Windows Store app receive content, such as photos , links, and text, that the user shares from other apps. An app that supports this contract can be included in the list of apps that appears when the user taps the Share charm. Windows limits the list to include only the apps that support the type of data being

shared. Examples of apps that might want to use this contract include social networking, email, and note-taking apps.

Share Target contract (n)~ A contract that lets a Windows Store app receive content, such as photos , links, and text, that the user shares from other apps. An app that supports this contract can be included in the list of apps that appears when the user taps the Share charm. Windows limits the list to include only the apps that support the type of data being shared. Examples of apps that might want to use this contract include social networking, email, and note-taking apps.

Share target description (n)~ The area in the Share UI where developers can add text to describe Share targets.

Shared (adj)~ An Azure Web site hosting tier, used for pricing calculation.

shared access computer (n)~ A computer in a public environment that is accessed by several different users on a daily basis.

Shared Access Signature (n)~ A URL that grants access rights to containers, blobs, queues, and tables.

shared address book (n)~ An Address Book that contains entries for every group, user, and contact within an organization's implementation of Exchange Server.

Shared Address Information (n)~ An IP address of the OneNote session that is being shared with other users.

shared address space (n)~ A Simple Mail Transfer Protocol (SMTP) address space or domain suffix that is shared by two different messaging systems. For example, you may have to share the SMTP address space between Microsoft Exchange and a third-party e-mail system, or between Exchange environments that are configured in different Active Directory forests. In these scenarios, users in each e-mail system have the same domain suffix as part of their e-mail addresses.

Shared App Service Hours (n)~ A new name for Shared Websites Hours, a resource of the Azure App Service service.

shared assembly (n)~ An assembly that can be referenced by more than one application. An assembly must be explicitly built to be shared by giving it a cryptographically strong name.

shared asset (n)~ An asset that is used by more than one cash-generating unit (CGU). An example is a distribution center that is used to store items before they are transported to different markets that share that same distribution center.

shared borders (n)~ Page regions reserved for content that you want to appear consistently on all your web pages. Shared borders usually contain link bars - hyperlinks to the other pages in the current web site.

Shared Caching (PN)~ The initial managed, multi-tenant cache service offering in Microsoft Azure, introduced in April 2011.

Shared Caching Service (PN)~ The initial managed, multi-tenant cache service offering in Microsoft Azure, introduced in April 2011.

shared code (n)~ Code that is specifically designated to exist without modification in the server project and the client project.

shared computer activation (n)~ A licensing mode that enables Office 365 subscribers to activate Office on-premises in a shared computer environment (Remote Desktop Services)

or a roaming scenario where the underlying hardware changes frequently (such as Windows To Go).

shared control (n)~ A Web Parts control that can appear on a Web page and be personalized when the page is in either shared or user-level personalization scope. Note that a shared control can have properties that are both user-scope and shared-scope for personalization purposes.

shared data source item (n)~ Data source connection information that is encapsulated in an item. Can be managed as an item in the report server folder namespace.

shared database (n)~ A database that is shared out to other users. These users create their own local copies, which are periodically synchronized with the shared database.

shared dimension (n)~ A dimension created within a database that can be used by any cube in the database.

shared distribution point (n)~ A distribution point in a Configuration Manager 2007 hierarchy that clients can use to download the content and packages that have been migrated to System Center 2012 Configuration Manager.

shared favorite (n)~ A webpage link saved as a .url file in someone's Shared favorites' folder. For example

shared folder (n)~ A folder on another computer that has been made available for other people to use on the network.

shared folder permissions (n)~ Permissions that dictate which users can access a shared folder on a network.

shared library (n)~ A container for assumptions and metadata (dimensions, hierarchies, forms and reports, inter-model mappings, DTS packages that are used by PerformancePoint Server, and PerformancePoint Server data sources) that are global to any child model site of the root model site, or of a model site with which the library is associated. The assumptions and metadata of a shared library are for the exclusive consumption of these child models and are not available outside their immediate model family.

shared line appearance (n)~ A telephony feature that makes two or more phones behave as if they are linked; that is, that a call to one number causes all phones to ring.

shared lock (n)~ A lock created by nonupdate (read) operations.

shared name (n)~ A name that consists of an assembly's identity-its simple text name, version number, and culture information (if provided)-strengthened by a public key and a digital signature generated over the assembly. Because the assembly manifest contains file hashes for all the files that constitute the assembly implementation, it is sufficient to generate the digital signature over just the one file in the assembly that contains the assembly manifest. Assemblies with the same strong name are expected to be identical.

Shared notes (PN)~ The OneNote pages that are shared with everyone in a Room. Once created, they appear in the -€œlists-€? panel in the Room UI panorama.

shared ownership (n)~ In virtual machine self-service, the ownership model for virtual machines under which all members of a group can manage all virtual machines owned by any member of the group and the virtual machine quota, if one has been specified, applies to all virtual machines created by all group members.

Shared photos (PN)~ The link to photos that only you and people that you select can

view (versus public photos that anyone can view).

shared printer (n)~ A printer that receives input from more than one computer.

shared resource (n)~ Any information, file, folder, program, device, etc., that is available to multiple users on a network.

Shared Resource Provider (n)~ A logical unit consisting of shared servies and shared resources. A farm could have multiple SRPs.

shared schedule (n)~ Schedule information that can be referenced by multiple items.

Shared Services Provider (n)~ A logical grouping of shared services and their supporting resources.

Shared Sites (n)~ A feature of Microsoft Office Live that allows businesses to maintain and share business information on password-protected Web sites for collaborating with internal employees and external customers, suppliers, and vendors.

shared steps (n)~ A group of test steps that can be reused between test cases.

shared user account (n)~ A single user account that is logged on to by multiple users.

shared user profile (n)~ A file that contains configuration information for a specific user including settings and restrictions applied by Windows SteadyState.

shared view (n)~ A view of a list or Web Part Page that every user who has the appropriate permissions can see.

shared Web Part (n)~ A Web Part added to a Web Part Page by a user who is working on the page in shared view.

Shared with Me (PN)~ A view that displays a list of documents and folders that are shared with the user.

shared workbook (n)~ A workbook that is configured to allow multiple users on a network to view and make changes at the same time. Each user who saves the workbook sees the changes that are made by other users.

SharePoint admin center (PN)~ A web-based management portal from which a company's service administrator can manage their SharePoint Online service, including creating and deleting site collections, managing user accounts and storage quota, and specifying service settings.

SharePoint Developer Center (PN)~ A website that provides content and resources to help developers create custom solutions for SharePoint Foundation, SharePoint Server and SharePoint Designer.

SharePoint Enabled BCS Solution (PN)~ A package containing a set of external lists for offlining, along with associated business data actions and task panes.

SharePoint Extensions for Team Foundation Server (PN)~ Required software for Visual Studio Team Foundation Server with one or more SharePoint Web applications. The Team Foundation Server Extensions for SharePoint Products include site templates to which the process templates for Team Foundation Server refer when team projects are created.

SharePoint Extensions for Team Foundation Server 2013 (PN)~ Required software for Visual Studio Team Foundation Server with one or more SharePoint Web applications. The Team Foundation Server Extensions for SharePoint Products include site templates to which the process templates for Team Foundation Server refer when team projects are created.

SharePoint group (n)~ A group of users that can be created on a SharePoint site to manage permissions to the site and to provide an e-mail distribution list for site users. A group can be used by many sites in one site collection.

SharePoint integrated permission model (n)~ A security model in which Project Server permissions are derived from SharePoint.

SharePoint library (n)~ A collection of files on SharePoint Server that is shared with other site users.

SharePoint list indicator (n)~ The title of a dialog page that enables the user to set up a SharePoint list indicator by setting name, description, list URL, indicator value, indicator appearance, etc. The indicator value can be specified based on number or percentage of certain column values, or certain aggregate data.

SharePoint Maintenance Manager (PN)~ An administrative tool that examines a computer, server farm, or server cluster against an optimal set of procedures and functional principles for that configuration, and reports possible issues.

SharePoint Object Model Adapter (PN)~ A component assembly that translates calls between 32-bit SharePoint project code and 64-bit SharePoint Object Model code, and helps maintain isolation between the two sides and facilitate versioning.

SharePoint Online (Plan 1) (Government Pricing) (PN)~ The SharePoint Online (Plan 1) offer for government organizations that is hosted in the commercial cloud environment.

SharePoint Online (Plan 1) for Government (PN)~ The SharePoint Online (Plan 1) offer for government organizations that is hosted in the government cloud environment.

SharePoint Online (Plan 2) (Government Pricing) (PN)~ The SharePoint Online (Plan 2) offer for government organizations that is hosted in the commercial cloud environment.

SharePoint Online (Plan 2) for Government (PN)~ The SharePoint Online (Plan 2) offer for government organizations that is hosted in the government cloud environment.

SharePoint Online Administration Center (PN)~ A web-based management portal from which a company's service administrator can manage their SharePoint Online service, including creating and deleting site collections, managing user accounts and storage quota, and specifying service settings.

SharePoint Online Storage (PN)~ The storage space to create site collections. The storage size may differ due to different online services purchased.

SharePoint Online Storage for Nonprofits (PN)~ An offer from Microsoft Office 365 for nonprofit organizations that offers additional storage options for SharePoint Online, priced per gigabyte, to support an organization's SharePoint Online growth.

SharePoint Portal Server (PN)~ A Microsoft server product that creates a portal Web site that allows users to share documents and search for information across the organization and enterprise within one extensible portal interface.

SharePoint Products and Technologies (n)~ A set of products and technologies that allow users in an organization to create, manage, and build their own collaborative Web sites and make them available throughout their organizations.

SharePoint Publishing Wizard (n)~ The wizard used to publish sharepoint sites and servers.

Sharepoint ServerRole (PN)~ A role assigned to the SharePoint server, like Web Server Role, which means that the server is used to host a web content.

SharePoint Services (n)~ A family of Microsoft Web-based team collaboration environments that provide the ability to create and access virtual workspaces for managing documents, discussions, lists, surveys and other important contextual information such as team member status and presence.

SharePoint Tools (n)~ The tools that are designed for using in SharePoint.

SharePoint Tracing Service (PN)~ A service responsible for writing diagnostic logging and usage logging information from SharePoint applications to log files on disk.

SharePoint Translation Services (PN)~ A collection of extensible features that allows customers to use machine translation or external translation vendors to translate their website content.

sharer file (n)~ A file using resources from another file, which can be another project file or a file containing only resource information, called a resource pool.

Sharing frame (n)~ In desktop sharing, a box that the presenter can draw around a portion of the desktop to share only the portion of the desktop within the box.

sharing invitation (n)~ A notification for sharing items, such as calendars, documents or folders, with others.

sharing mode (n)~ The client view that the presenter sees when he or she is presenting a Sharing slide.

sharing session (n)~ A collaborative meeting or formal presentation in which a participant has chosen to share an application or desktop.

Sharing sidebar (n)~ An element that appears on the right side of all list, library, and calendar pages that are contained within Business Applications, and on the right side of pages contained in Contact Manager. The Sharing sidebar is a convenient way to manage permission levels and add new user accounts, and is also a quick way to publish a list or add a form to your public Web site.

Sharing slide (n)~ A slide on which a presenter can show a shared application or desktop to other meeting participants.

sharpen (v)~ To enhance the edges of subjects in an image.

Sharpen and Soften (PN)~ A feature that allows the user to digitally alter a picture to increase or decrease the sharpness of focus.

sharpness (n)~ The degree of detail in the edges of subjects in an image.

shear (v)~ To distort an object along its horizontal, vertical, or both axes.

shear (n)~ A transformation that distorts a shape by a specified angle from an axis. The result is that a square is formed into a parallelogram. The skew or shear can be applied in more than one direction at a time.

shear handle (n)~ The handle on an object's selection rectangle that you drag to shear the object.

sheet (n)~ A primary document used in Excel to store and work with data. A worksheet consists of cells that are organized into columns and rows; a worksheet is always stored in a workbook.

shelf life (n)~ The period of time between an item's manufacture date and its expiration date.

shell (n)~ The command interpreter that is used to pass commands to the operating system.

Shell (PN)~ The operating system that is located on the Windows operating system in the Surface unit. The Shell includes access points, Launcher, time-outs, out-of-order screen, and user mode.

shell extension (n)~ A software that extends the functionality of the Windows Explorer desktop shell.

Shell item (n)~ Any single piece of content, such as a file, folder, email, or contact.

shelve (v)~ To group a set of changes into a shelveset.

shelved file (n)~ A file temporarily storing work in progress.

shelveset (n)~ A set of changes, not yet committed, that are now located in the server. The entire contents of the pending changes, including the changes to the modified files themselves, are included.

shelving (n)~ The process of temporarily storing work in progress in a repository without checking them in and submitting a changelist.

shift (v)~ In programming, to move the bit values one position to the left or right in a register or memory location.

shift code (n)~ A code that represents the timeframe that an employee will be associated to when working on a particular day. The shift code determines the starting time, the hours, the length, and the earning code to be paid.

SHIFT key (n)~ A keyboard key that, when pressed in combination with another key, gives that key an alternative meaning, for example, producing an uppercase character when a letter key is pressed. The SHIFT key is also used in various key combinations to create nonstandard characters or to perform special operations.

shift register (n)~ A circuit in which all bits are shifted one position at each clock cycle. It can be either linear (a bit is inserted at one end and lost' at the other during each cycle) or it can be cyclic or looped (the 'lost' bit is inserted back at the beginning).'

shim (n)~ A traditional way of analyzing the data from two hooks to the .dll to determine things like timing and called APIs. The tool inserts the shim into the code path between the calling function and the intended target function.

shiny media (n)~ A CD or DVD disc onto which files can be copied. Common writeable disc types include CD-R, CD-RW, DVD-R, and DVD-RW.

ship date (n)~ The date that items are shipped from a shipping location.

Ship method (n)~ A label for a field that contains the value for shipping method' on the Create New Address screen in the Account form.'

shipment (n)~ A quantity of freight that is created against a source document such as a sales order, purchase order, or transfer order, and that is transported from an origin point to a destination point. You can consolidate inbound or outbound shipments that are going to the same destination point into a single load.

shipping address (n)~ The location to which products that have been ordered should be sent.

shipping and handling (n)~ The process of packing and distributing merchandise for a charge.

shipping calendar (n)~ The days that the selling company can ship goods.

shipping label (n)~ A label that is printed with a recipient's address and is used to mail or ship an item.

shipping method (n)~ A method of transportation for goods or services, such as Air, Truck or UPS.

Shipping updates (PN)~ A quick view that displays only the e-mail messages that contain shipment information, such as a tracking number and web link.

ship-to address (n)~ The location to which products are to be sent.

Shiva Password Authentication Protocol (n)~ A two-way, reversible encryption mechanism for authenticating PPP connections employed by Shiva remote access servers.

Shockwave ~ A software technology from Macromedia Inc for making animations, games, sound and all kinds of special effects on a webpage.

shoot-'em-up ~ A computer game in which you control a character, vehicle etc and shoot lots of onscreen enemies. Also called an- FPS- (First Person Shooter).

shooter (PN)~ A game category that emphasizes shooting action or marksmanship.

shop floor control (n)~ A system that uses information from the manufacturing area and elsewhere to communicate status about production orders and work centers for planning and management purposes. Shop floor control encompasses a variety of functions for managing personnel, materials, and processes, and supports planning, scheduling, and costing systems.

Shopping (PN)~ An app category that facilitates shopping in online stores.

shopping basket analysis (PN)~ A standard data mining algorithm that analyzes a list of transactions to make predictions about which items are most frequently purchased together.

shopping cart (PN)~ A list of items that a customer has selected to purchase from a commerce Web site. It is usually compiled into a file and sometimes visually represented by a shopping basket, shopping cart, or other container used when shopping.

shopping cart (n)~ A virtual container that stores products that have been selected for purchase from a- procurement catalog or a vendor catalog.

short date (n)~ The standard short formats to display a date. For example: MM/dd/yy; dd/MM/yy

short grain (adj)~ Of, pertaining to, or characteristic of a type of paper which grain direction runs parallel to the short edge of the sheet.

Short Message Service (PN)~ A service for wireless products that allows users to send and receive brief messages consisting of text and numbers to and from mobile phones and devices.

short name (n)~ A valid MS-DOS or OS/2 8.3 file name (with up to 8 characters followed by a period and an extension of up to 3 characters) that a computer running any member of the Windows Server2003 family, or any similar operating system, creates for every Macintosh folder name or file name on the server. Personal computer users refer to files on the server by their short names; Macintosh users refer to them by their long names.

Short tones (PN)~ A setting for the phone keyboard that causes a key to produce a short duration tone regardless of how long the key is pressed.

shortcut (n)~ A link to any item accessible on your computer or on a network, such as a program or application, file, folder, disk drive, printer, or another computer. You can put shortcuts in various areas, such as on the desktop, on the Start menu, or in specific folders.

Shortcut ~ In- Windows- (from 95 on), a type of- icon- which lets you launch a program

quickly, without having to search for it. Often placed on the Windows- desktop- for convenience. Usually has a small arrow in the bottom lefthand corner, to show it is a shortcut rather than the program itself.

shortcut group (n)~ One of the groups of shortcuts to folders that can be displayed in the Shortcuts pane.

shortcut key (n)~ Any combination of keys that must be pressed simultaneously.

shortcut menu (n)~ A menu that is related to the active window or item, accessible by right-clicking the mouse.

shortcut menu item (n)~ A command displayed in the shortcut (context) menu. Examples include open and print.

shortcut trust (n)~ A trust that is manually created between two domains in the same forest. The purpose of a shortcut trust is to optimize the interdomain authentication process by shortening the trust path. Shortcut trusts are transitive and can be one-way or two-way.

Shortcuts pane (n)~ The area in the Navigation Pane that contains shortcuts and shortcut groups. It can be accessed by using the Shortcuts button at the bottom of the Navigation Pane. Click a group in the Shortcuts pane to show the shortcuts in the group.

shorthand property (n)~ A type of property that allows authors to specify the values of several properties with a single property. For instance, the 'font' property is a shorthand property for setting 'font-style', 'font-variant', 'font-weight', 'font-size', 'line-height', and 'font-family' all at once.

short-term debt (n)~ A current obligation that is payable within one year.

Show Extended View (v)~ The item on the View menu that displays additional information and actions for each contact in the user's contact list.

Show Friendly Name (PN)~ A selection that displays the first and last name, instead of the e-mail address or sign-in name, for each contact in the user's Contacts list.

Show Full Screen Video (oth)~ The button in a Video conversation window that displays the current video conversation in full-screen mode.

Show Lights (oth)~ A menu command that displays the transformation handles for all lights that are present in the document.

Show me as away when my computer is idle for this time period: (oth)~ The option in the Options dialog box, on the Rules tab, that changes the user's status to Away after the computer has been idle for the selected time period.

Show Tabs (v)~ The item on the View menu that displays tabs at the bottom of the Communicator window, if additional tabs are installed.

Show Time As (PN)~ The field name for the confirmation status used to categorize how firmly a service activity has been scheduled. The options include Requested, Tending, Pending, Reserved, In Progress, and Arrived.

show/hide (v)~ To reveal or conceal information on a screen, such as webpage modules or details about a person.

showcase (v)~ To present prominently or highlight a project, product, scenario, etc.

showcase (n)~ A tool in a class of Partner Portal tools, which presents prominently or highlights. For example, the Solution Showcase tool is meant to highlight partner business solutions.

Showcase (PN)~ The option button that modifies a card by allowing users to make selected content feel more or less prominent by applying Structure-specific treatments, based on the selected level.

showplan (n)~ A report showing the execution plan for an SQL statement.

ShowSounds (n)~ A feature that instructs programs that usually convey information only by sound to also provide all information visually, such as by displaying text captions or informative icons.

Showtunes (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 69.

shrink (v)~ To remove unused space from data tables.

S-HTTP (n)~ A protocol that provides a secure Hypertext Transfer Protocol (HTTP) connection.

shuffle (n)~ A menu item that allows the play back all of the items in a playlist once, in random order. Playback ends when all of the items in the list have been played one time.

shuffle (v)~ To present items within a set in no established order, as opposed to ordering items by name, by date taken, by size, etc., and typically used with audio and visual media, such as album song order or photo slide shows.

shuffle all (PN)~ A menu item that allows the play back all of the items in a playlist once, in random order. Playback ends when all of the items in the list have been played one time.

shuffle mask (n)~ A form of data obfuscation to protect data that is classified as personal identifiable data, personal sensitive data or commercially sensitive data where data is randomly shuffled within the same column.

shut down (v)~ To close the operating system in an orderly fashion.

Shut Down (v)~ A menu item that provides options for restarting or turning off your computer or device, or for activating Stand By or Hibernate modes.

shutdown (n)~ The process of quitting all programs before closing the operating system.

shut-down (adj)~ Having characteristics of the process of quitting all programs before turning off the computer.

Shutter Bar (n)~ The bar that replaces the Navigation Pane in Access when it is minimized.

shutter speed (n)~ The amount of time a shutter is open during exposure to allow the light to reach the film or, in digital cameras, the image sensor.

SHV (n)~ A server software counterpart to a system health agent (SHA). A system health validator verifies the statement of health (SoH) made by its respective SHA.

SI (PN)~ The international metric system of units of measurement.

sibling (n)~ A process or node in a data tree that is descended from the same immediate ancestor(s) as other processes or nodes.

sibling site (n)~ A site on the same hierarchy tier that has the same parent site as another site.

sibling window (n)~ A child window that has the same parent window as one or more other child windows.

SIC code (n)~ A four-digit number assigned by the U.S. government to designate the

economic activity of businesses.

SID (n)~ In Windows-based systems, a unique value that identifies a user, group, or computer account within an enterprise. Every account is issued a SID when it is created.

Side by Side (adj)~ Pertaining to a type of layout that displays the contents of windows one next to another on the screen.

side effect (n)~ Any change of state caused by a subroutine, such as a routine that reads a value from a file and advances the current file position.

side gesture (n)~ A gesture where the user interacts with the side of the phone to use an experience.

side pane (n)~ A pane displayed on the left side of the Project and Project Web Access interfaces. In Project, the side pane contains Project Guide information; in Project Web Access, the side pane contains links.

side panel (n)~ The panel that covers a long side of a central processing unit or Surface unit.

sidebar (n)~ A graphical user interface element that displays information to the side of an application.

side-by-side execution (n)~ The ability to install and use multiple versions of an assembly in isolation at the same time. Side-by-side execution can apply to applications and components as well as to the .NET Framework. Allowing assemblies to coexist and to execute simultaneously on the same computer is essential to support robust versioning in the common language runtime.

side-by-side hosting (n)~ The loading and activation of multiple versions of the common language runtime within the same process.

Side-fold card (n)~ One of the page size options available in Publisher for printing a folded card. This option prints four pages per sheet of paper, with fold on left.

sideload (v)~ To load apps that were not distributed via the Windows Store, usually for testing an app before it is ready for sale.

sideloading (n)~ The process of loading apps that were not distributed via the Windows Store, usually for testing an app before it is ready for sale.

SideShow (PN)~ A feature in Windows that uses add-in programs, or gadgets, to extend information from your computer onto secondary displays.

Siena (PN)~ A Windows Store app with which a user can create apps, such as for a business or an enterprise, without having to learn a programming language, such as Visual Basic or Visual C#.

SIF (n)~ A video format that is a version of CIF and is specific to NTSC or PAL television standards. SIF has 352 x 240 non-square pixels for NTSC

sign (v)~ To bind an identity, such as a network login, hardware ID, or certificate, to a message, file, or other piece of digitally encoded information.

sign bit (n)~ The most significant, or leftmost, bit of a number field, usually set to 1 if the number is negative.

sign in (v)~ To create a user session for an Internet account. For example, you sign in to a Microsoft account, an Internet service provider account, or Skype.

Sign In (v)~ A UI element that creates a user session or establishes user access to a service.

Sign in as (PN)~ The label for the list that enables a user to select a status before signing in. Possible status options are Available, Busy, Do Not Disturb, and so on.

Sign in with your work or school account (oth)~ A sign-in phrase to a work or school account.

sign out (v)~ To end a user session for an Internet account. For example, you sign out of a Microsoft account, an Internet service provider account, or Skype.

Sign Out (v)~ A UI element that ends a user session or exits a service.

sign up (v)~ To enroll in a service, often resulting in setting up a new account.

signal (n)~ A beep or tone from a computer's speaker or a prompt displayed on screen that tells a user that the computer is ready to receive input.

signal (n)~ A notification of an event that triggers an activity.

Signal API (PN)~ An API that is used to send signals to the Office Graph.

signal event (n)~ In a statechart or activity diagram, an indication that one object has received a signal from another. A signal can be declared by using the keyword signal on a class in a class diagram.

signature (n)~ An image of a legally-binding signature that is stored and printed on checks as appropriate.

signature (n)~ Data that binds a sender's identity to the information being sent. A digital signature may be bundled with any message, file, or other digitally encoded information, or transmitted separately. Digital signatures are used in public key environments and provide authentication and integrity services.

signature (n)~ A unique algorithm or static hash value used to identify a specific instance of malicious code or potentially unwanted software.

signature (PN)~ The list of types involved in the definition of a method, field, property, or local variable. For a method, the signature includes its name, number of parameters and their types, the type it returns (if any), and its calling convention (default or vararg). The signature for a property is similar to that of a method. The signature for fields and local variables is simply their type (for example, array [0..5] of int).

signature (n)~ Text that is automatically added to outgoing e-mail messages, typically used to identify the sender.

signature certificate (n)~ A certificate that identifies the certification authority (CA) that issues server and client authentication certificates to the servers and clients that request these certificates.

signature line (n)~ A control that allows users to digitally sign a form or document.

signature request (n)~ A request to sign an XPS document.

Signature Setup (n)~ The title for a dialog that specifies how a signature line should be signed, including instructions for signers.

signature update (n)~ A collection of signatures that adds to the detection capability of the scanner.

signature word (n)~ A two-byte data structure written at the end of the boot sector after the bootstrap code. Used by the bootstrap loader to determine that the end of boot sector has been reached.

Signed - unverified (n)~ Content has been hashed but could not be verified as valid against the signature.

Signed - verified (n)~ Content has been hashed and verified as valid against the signature. The certificate used to verify the signature is -€œvalid-€? in the sense that it has a relationship to a trusted certificate authority (and isn't expired, etc.)

signed driver (n)~ A driver that meets the criteria of the Windows Logo Program. For performance and stability, Microsoft strongly recommends that you use only signed drivers for new or updated drivers.

signed in (adj)~ Pertaining to an agent who is both subscribed to a group and actively taking calls for that group. While groups can be defined to automatically sign in agents, others allow the agent to specify whether he/she is signed in.

signed integer (n)~ An integer that has a positive or negative sign.

significance (n)~ One of the arguments of the FLOOR function.

significant other (PN)~ Usually the spouse or domestic partner of a contact. Detail that can be added to a contact's profile, listed under other."

sign-in (n)~ The credentials (user name and password) that a person uses to gain access to a service, network server, etc.

sign-in allowed users (n)~ A set of users of Office 365 who have their sign-in privileges allowed. It is also the name of a view in the users and groups section of Office 365.

sign-in blocked users (n)~ A set of users of Office 365 who have their sign-in priveleges blocked. It is also the name of a view in the users and groups section of Office 365.

sign-in info (n)~ Information that includes identification and proof of identification that is used to gain access to local and network resources. Examples of credentials are user names and passwords, smart cards, and certificates.

sign-in information (n)~ Information that includes identification and proof of identification that is used to gain access to local and network resources. Examples of credentials are user names and passwords, smart cards, and certificates.

sign-in name (n)~ The ID that the user enters to sign in to Lync or Communicator.

Signing Services for Office (n)~ The digital signature functionality including Digital Signatures, electronic signatures, Mark As Final and Electronic Postmarks.

signoff queue (n)~ A queue type that is used for reports that the user has not seen before. It is utilized when a user is not to be notified when the event occurs, but is to be notified prior to reporting the event.

sign-up address (n)~ An e-mail address that a user can create to use when they buy products online or register for updates from a Web site and don't want to use their main e-mail address.

silent (PN)~ A status displayed when the phone sound volume is set to 0 and vibration is off.

silent activation (n)~ A type of activation that is performed without any user interaction.

silent installation (n)~ An installation that runs unattended and does not require any user input after it has been started.

silent process exit (n)~ Silent and unexpected process termination by the process itself or by another application.

silent RIP (n)~ The capability of a computer to listen for and process Routing Information Protocol (RIP) announcements but without announcing its own routes.

silent setup (n)~ An installation that runs unattended and does not require any user input

after it has been started.

Silicon Valley ~ A nickname for the region south of San Francisco that contains an unusually high concentration of computer companies. Silicon is the most common semiconductor material used to produce chips.

silver competency (n)~ A qualification that distinguishes a Microsoft partner company that has demonstrated a very high level of expertise within a specific skill set. A silver competency indicates that a company is within the top 5 percent of Microsoft partners worldwide.

Silverlight business application (n)~ A template that provides many common features for building a business application with a Silverlight client. It utilizes WCF RIA Services for authentication and registration services.

Silverlight Development Kit (n)~ The package which contains documentation, online samples, quick starts and tools for developing Silverlight applications.

Silverlight plug-in (n)~ A plug-in that users download to run a Silverlight-based application in their browser. This term also refers to the component embedded in a Web page that renders Silverlight content.

Silverlight XAP file (n)~ The Silverlight application that is downloaded to the client browser and enables Smooth Streaming. XAP files are essentially .zip files that contain an assembly manifest file and one or more assemblies.

SIM (n)~ A smart card that stores a subscriber's personal identifier, billing information, and data.

SIM card (n)~ A smart card that stores a subscriber's personal identifier, billing information, and data.

SIM PIN (n)~ A type of personal identification number (PIN) for the SIM card, consisting of 4 digits, that is used to gain access to your mobile phone.

SIM security (PN)~ A toggle switch that you tap to enter a SIM PIN.

SIM slot (n)~ The hardware slot (or tray) in which a SIM card is placed. Some phones have more than one SIM slot.

Sim, sim-free ~ (Subscriber Identity Module)- A chip smaller than a man's thumbnail, which contains the number and network subscription of a mobile phone, and sometimes other data. Move the chip to another phone, and the phone number moves with it. A sim-free phone is one bought without a number and not tied to any particular network. There are currently three types of different sizes. The standard SIM is the largest, used in older phones, the smaller micro- and nano-SIMs are used in the latest smartphones.

similar events (n)~ Events that resemble one another and where criteria similarity depends on the type of event.

similarity matrix (n)~ A matrix of scores that represents the similarity between a number of data points.

SIMM (n)~ A small circuit board, designed to accommodate surface-mount memory chips, with a 32-bit data path and connectors that are on the same circuit and that respond to the same signal.

SIMM ~ (Single In-line Memory Module; pr.'sim') A largely obsolete type of- RAM- for older PCs. Replaced by- DIMM.

simple (adj)~ Pertaining to the resiliency type for a volume that stripes data across

physical disks with no resiliency in a Microsoft Storage Spaces storage pool.

Simple Authentication and Security Layer (PN)~ An open framework, described in Request for Comments (RFC) 2222, for adding authentication support to connection-based protocols.

Simple Certificate Enrollment Protocol (PN)~ A Public Key Infrastructure (PKI) communication protocol that defines the communication between network devices and a Registration Authority (RA) for certificate enrollment.

simple client (n)~ A type of cache client that does not have a routing table and thus does not need network connectivity to all cache hosts in the cache cluster. Because data traveling to simple clients from the cluster may need to travel across multiple cache hosts, simple clients may not perform as fast as a routing clients.

Simple Control Protocol (PN)~ A lightweight protocol that enables small devices to communicate with each other over low-speed networks.

simple feature (n)~ A feature with all geometric attributes described piecewise by straight-line or planar interpolation between sets of points as defined by the Open Geospatial Consortium.

Simple Filter tab (n)~ A tab, found on the Action menu, in the Filter Report selection, that enables the user to select or filter records with the wanted values.

simple indicator (n)~ The title of a dialog that enables users to set up a simple indicator by setting the name, description, value, goal, status icon, etc.

simple keyframe (n)~ In an animation timeline, a type of keyframe that indicates a single property change at a point in time.

Simple Mail Transfer Protocol (n)~ A member of the TCP/IP suite of protocols that governs the exchange of electronic mail between message transfer agents.

simple mapping (n)~ The mapping that is automatically established when User Name Mapping maps Windows domain users to UNIX users with the same names.

Simple Markup view (PN)~ A view for tracked changes that clearly identifies where changes and comments are in a document, and gives you easy access to them, without detracting from the readability.

simple network (n)~ A type of operations network in which one operation is started and completed before the next operation begins.

Simple Network Management Protocol (n)~ A network protocol used to manage TCP/IP networks. In Windows, the Simple Network Management Protocol (SNMP) service is used to provide status information about a host on a TCP/IP network.

Simple Network Management Protocol trap (n)~ An unsolicited Simple Network Management Protocol (SNMP) packet sent from one SNMP entity to another usually in response to a stimulus or an event on the sending entity.

Simple Object Access Protocol (n)~ A simple, XML-based protocol for exchanging structured data and type information on the World Wide Web. The protocol is currently the de facto standard for XML messaging.

simple PIDL (n)~ A PIDL that is parsed without disk verification.

simple recovery model (n)~ A database recovery mode that minimally logs all transactions sufficiently to ensure database consistency after a system crash or after restoring a data backup. The database is recoverable only up to the time of its most recent

data backup, and restoring individual pages is unsupported.

simple shape (n)~ A shape in an orchestration that cannot be collapsed and cannot contain other shapes.

simple style (n)~ A style that is used for Expression Blend controls that contain simplified templates based upon the set of Windows Presentation Foundation system controls.

Simple TCP/IP Services (n)~ Four TCP/IP services: Character Generator, Daytime Discard, Echo, and Quote of the Day.

simple type (n)~ Primitive type that is used for defining properties in the conceptual schema.

simple type (n)~ An element that can only contain text and appears as <simpleType> in an XML document, or any attribute of an element. Attributes are considered simple types because they contain only text.

simple volume (n)~ A dynamic volume made up of disk space from a single dynamic disk. A simple volume can consist of a single region on a disk or multiple regions of the same disk that are linked together.

simplified sharing (n)~ A streamlined process for sharing Office documents with others.

simulated deployment (n)~ A configuration option that lets you assess how accurate your application rules are before you deploy an application.

Simulated Gambling (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Simulation (PN)~ The Games subcategory containing games that simulate an experience, for example, Microsoft Flight Simulator.

simultaneous operations (n)~ A type of operations network in which multiple operations take place at the same time and must be completed before moving on to the next operation.

single click (n)~ One mouse click (usually with the left mouse button).

Single Connect (PN)~ A collection of features designed to improve Groove's communications infrastructure and routing model in order to increase efficiency and performance.

single copy cluster (n)~ A clustered Exchange deployment that uses shared storage and can have multiple active and passive servers (referred to as nodes) dedicated to a clustered mailbox server.

Single data type (n)~ A data type that stores single-precision floating-point variables as 32-bit (4-byte) floating-point numbers ranging in value from -3.402823E38 to -1.401298E-45 for negative values and 1.401298E-45 to 3.402823E38 for positive values.

Single Database (PN)~ Fully isolated database optimized for workloads when performance demands are predictable.

Single Euro Payments Area (PN)~ A European banking industry initiative that enables secure electronic payment transfers between bank accounts within and across euro areas.

Single Instance Store (n)~ A component that saves disk space on the server by maintaining a single physical copy of all identical files found. If SIS finds a duplicate file on the server, it copies the original file into the SIS store and leaves a link where the original resided. This technology is used only with Remote Installation Services.

single instancing (n)~ A technique used within the file-based imaging process that allows

you to store two or more copies of a file for the space cost of one copy.

single language pack (n)~ A set of language resources that supports the deployment of a software program in a particular language.

single node server cluster (n)~ A cluster configuration that has one node and that can be configured with or without external cluster storage devices. For a single node cluster without an external cluster storage device, the local disk is configured as the cluster storage device. There are advantages and limitations for each cluster configuration (single node server cluster, single quorum device server cluster, and majority node set server cluster).

Single Payment Classification Code (PN)~ A Standard Entry Class ACH code that describes a type of financial transaction.

single photo (n)~ A camera option to capture just one image when the user presses the camera button.

single post pane (n)~ The part of the product that displays a single post with all its content. The single post pane also renders available threads to the post.

single quorum device server cluster (n)~ A cluster configuration that has two or more nodes and that is configured so that every node is attached to one or more cluster storage device. The cluster configuration data is stored on a single cluster storage device. There are advantages and limitations for each cluster configuration (single node server cluster, single quorum device server cluster, and majority node set server cluster).

single session-only disc (n)~ A recordable media (such as CD-RW) to which you can only write once without reformatting.

single sign-on (n)~ An authentication process that permits a user to log on to a system once with a single set of credentials to access multiple applications or services.

single sign-on daemon (n)~ A daemon on a Windows-based computer that receives an encrypted password and decrypts it before requesting a password change on the UNIX host.

Single Sign-On server (n)~ The server on which the Enterprise Single Sign-On (SSO) service is installed.

Single Sign-On services (n)~ Services that enable single sign-on for adapters by accessing credentials in the SSO Credential database. These services are used to manage and administer the Credential database. As a configuration store, these services are used to access configuration data for adapters.

single stepping (n)~ A debugging technique that enables you to run a macro one action at a time or run Visual Basic code one line at a time.

single switch device (n)~ An assistive computer technology for people with mobility impairments. A single switch device allows users to interact with a computer by using slight body movements.

single use kanban (n)~ A type of kanban that is used with a fixed quantity kanban rule to meet exceptionally high demand. A single use kanban does not trigger a new kanban when it is discarded.

single-byte character set (n)~ A character encoding in which each character is represented by 1 byte. Single byte character sets are mathematically limited to 256 characters.

single-document interface (n)~ A specification according to which each open document occupies its own window in the UI, though only a single instance of the program application is running.

single-hop connection (n)~ A connection that goes from one computer to another computer.

single-label domain (n)~ A domain, website, or other directory whose name consists of a single chunk, such as contoso

single-mapped cell (n)~ A cell that has been linked to a non-repeating element in an XML map.

single-pane view (n)~ A window in which only one view appears, such as the Task Sheet, Network Diagram view, Resource Graph view, or Calendar view.

single-photon emission computed tomography (n)~ A type of computed tomography (CT) scan in which a small amount of a radioactive drug is injected into a vein.

single-precision (adj)~ Of or pertaining to a floating-point number having the least precision among two or more options commonly offered by a programming language, such as single-precision versus double-precision.

single-root I/O virtualization (n)~ Functionality that enables SR-IOV-€"capable devices, e.g. network adapters, to be assigned directly to virtual machines.

single-selection list box (n)~ A list box that supports only selection of a single item in the list.

SingleSKU (PN)~ A Windows delivery technology that provides an edition upgrade -€œpath-€? where customers and OEMs can move from a lower to a higher edition within an edition family on an active installed OS. An example would be a Retail edition family that includes Home Basic, Home Premium, Professional, and Ultimate, and which allows for easier moves between editions.

single-threaded apartment (n)~ An apartment that consists of exactly one thread.

single-use code (n)~ A code, which can be used only once, that can be used in place of a password to sign in.

single-user mode (n)~ A state in which only one user can access a resource.

sink (n)~ A device or part of a device that receives something from another device.

SIP (n)~ A standard signaling protocol for establishing multi-media communications sessions between two or more users over an IP network.

SIP (n)~ A software accessory that enables you to use a variety of direct input methods (such as handwriting, speech, touch, stylus, gestures, and so on) to interact with Windows-based programs. An input panel can include a writing pad and a character pad to convert handwriting into typed text or mathematical equations, and an on-screen keyboard to enter individual characters.

SIP domain (n)~ A domain that is configured to accept SIP traffic.

SIP phone (n)~ A desktop telephone that, in addition to providing standard telephony features, connects to the Internet through SIP.

SIP trunking (n)~ A mechanism for connecting the voice network of an enterprise to a service provider that offers public switched telephone network (PSTN) origination, termination, and emergency services without deploying PSTN gateways.

SIP/PSTN gateway (n)~ A device that translates signaling and media in different formats

between the Enterprise Voice infrastructure and a public switched telephone network (PSTN) or private branch exchange (PBX).

SIR ~ (Serial InfraRed). A wireless communication system for PCs and peripherals, especially laptops. Only works when the devices are in line-of-sight of each other.

Siri ~ A voice-controlled AI on Apple smartphones and tablets which can be used to control some features of the device.

SIS (n)~ A component that saves disk space on the server by maintaining a single physical copy of all identical files found. If SIS finds a duplicate file on the server, it copies the original file into the SIS store and leaves a link where the original resided. This technology is used only with Remote Installation Services.

site (n)~ One or more well-connected (highly reliable and fast) TCP/IP subnets. A site allows administrators to configure Active Directory access and replication topology to take advantage of the physical network.

site (n)~ A group of related web pages that is hosted by an HTTP server on the World Wide Web or an intranet. The pages in a website typically cover one or more topics and are interconnected through hyperlinks.

site (n)~ A business location to which resources are assigned. A site is used to ensure that all resources required for a service are in the same physical location.

site (n)~ A collection of files and metadata that comprises a complete website when published to an HTTP server on the World Wide Web.

site analysis (n)~ The process of visiting all the pages of a Web site to gather information about the structure of the site. The IIS SEO Site Analysis feature performs a site analysis to discover violations of best practices for search engine optimization.

site assignment (n)~ The process of including selected resources in an SMS/Configuration Manager site.

site assignment rules (n)~ A group of boundaries that an SMS/Configuration Manager administrator defines for an SMS/Configuration Manager site. SMS/Configuration Manager uses these rules to determine which resources and clients are assigned to the site.

site boundary (n)~ A site property, specified using IP subnets and Active Directory sites, that defines the resources that the site manages.

site certificate (n)~ A unique digital identification that forms the basis of the Secure Sockets Layer (SSL) security features on a Web site. Server certificates are obtained from a trusted, third-party organization called a certification authority, and they provide a way for users to authenticate the identity of a Web site.

site certificate (n)~ A certificate that identifies the certification authority (CA) that issues server and client authentication certificates to the servers and clients that request these certificates.

Site Client (PN)~ A type of Groove workspace that is an offline, personal copy of a SharePoint site and is kept in sync with the corresponding SharePoint site providing a convenient way of working with SharePoint content, even when the SharePoint site is not available.

site code (n)~ A three-character code that SMS/Configuration Manager uses to uniquely identify an SMS/Configuration Manager site. The site code is specified during the site installation and cannot be changed after installation. The valid characters for site codes are

A through Z and 0 through 9.

site collection (n)~ A set of Web sites that have the same owner and share administration settings. Each site collection contains a top-level site, can contain one or more subsites, and may have a shared navigation structure.

site collection administrator (n)~ A user who has administrative permissions for a site collection.

site collection flag (n)~ A 4-byte unsigned integer bit mask that specifies the properties that are global to a site collection. One or more values can be set for this bit mask.

site collection identifier (n)~ A GUID that identifies a site collection. In stored procedures, the identifier is typically @SiteId or @WebSiteId. In databases, the identifier is typically SiteId/tp_SiteId.

Site Collection Images (n)~ A system library used to store images that are used throughout the site collection. Provides versioning, check-in/check-out, search and visual browse capabilities.

site collection quota (n)~ An option for a site collection that allows administrators to set levels for maximum storage allowed, maximum number of users allowed, and warnings that are associated with the maximum levels.

site collection solution gallery (n)~ A capability that enables site collection administrators to manage and add new solutions to their site collections.

Site Component Manager (PN)~ A service that provides change and configuration services for sites, including installations.

site content type (n)~ A named and uniquely identifiable collection of settings and fields that store metadata for lists within individual sites.

site control file (n)~ An ASCII text file (such as Sitectrl.ct0) that contains the settings of an SMS/Configuration Manager site.

site database server (n)~ An Configuration Manager site system role assigned to the computer that hosts the Configuration Manager site database (a SQL Server database). The computer might or might not be the site server.

Site Designer (n)~ A tool that is used to create and personalize subscriber Web sites.

Site Directory (PN)~ The name of the central location from which to view and access all Web sites associated with a specific portal site.

Site Folders (PN)~ A consolidated view of all sites that a user has followed.

site gate (n)~ A Message Queuing server that is configured to route messages between sites on behalf of other clients using Message Queuing servers.

site hop (n)~ The act of following a link from one Web site to a site or page on another server when crawling for content.

site license (n)~ A purchase agreement for using multiple copies of the same software at a business or an institution, usually at a volume discount.

site license ~ A license that gives a customer permission to use a software package on more than one system. Site licenses provide a bulk rate to companies and schools that want to use software on many computers.

site link (n)~ An Active Directory object that represents a set of sites that can communicate at uniform cost through some intersite transport. For Internet Protocol (IP) transport, a typical site link connects just two sites and corresponds to an actual wide area

network (WAN) link. An IP site link connecting more than two sites might correspond to an asynchronous transfer mode (ATM) backbone connecting more than two clusters of buildings on a large campus or several offices in a large metropolitan area connected via leased lines and IP routers.

Site Link Account (n)~ The account that is used to make a connection to another site in the same hierarchy.

site mailbox (n)~ An Exchange mailbox that is associated with a SharePoint site, enabling users to access documents and email related to group projects through either Outlook or SharePoint.

Site Manager (PN)~ The Azure service that lets you coordinate the replication and recovery of System Center 2012 private clouds at a secondary location.

site map (n)~ A file or other store that describes the logical layout of a Web site (as distinct from the physical layout of pages). Site maps are used by site navigation controls to display navigation using a menu, tree view, or SiteMapPath (breadcrumb) control.

site map (n)~ A Web site file that lists the URLs in the Web site that are available for search engines to index.

site map file (n)~ A Web site file that lists the URLs in the Web site that are available for search engines to index.

site map index (n)~ A Web site file that lists the locations of site map files on a Web site.

site navigation (n)~ In ASP.NET Web sites, the process of displaying controls such as menus, a tree view, or SiteMapPath (breadcrumb) controls that assist users in finding pages of interest. Site navigation is typically driven from a sitemap.

site path rule (n)~ A rule for a specific part of a site that includes or excludes content from the content index.

site plan (n)~ A drawing used for residential and commercial landscape design, parks planning, yard layouts, plat maps, outdoor recreational facilities, and irrigation systems. Uses a scale of 1:200. A type of building plan.

site recovery (n)~ The Microsoft Azure service that allows users to automate protection and replication and orchestrate recovery for virtual machines and applications that run on Hyper-V hosts located in System Center Virtual Machine Manager (VMM) clouds and also in Microsoft Azure for simplified disaster recovery.

Site Reports (n)~ A feature that provides detailed Web site statistics and reports related to the subscriber's Web site.

site resource (n)~ A resource that is available for use by a specific Web site.

site restriction (n)~ The main rule for a site that includes or excludes content from the content index.

site selectable (adj)~ Pertaining to an element that can be selected as a whole element in the editor. Any element with a height or width attribute, either implicitly or explicitly defined, is site selectable.

site server (n)~ An Configuration Manager site sytem role assigned to the server on which SMS/Configuration Manager Setup has been run successfully. When Configuration Manager is installed on a computer, that computer is automatically assigned the site server role. Every SMS/Configuration Manager site has one site server.

site system (n)~ A server or share that provides SMS/Configuration Manager functionality

to an SMS/Configuration Manager site. The functionality provided by a site system depends on the assigned role. A site system can perform one or more roles.

site system role (n)~ A role that a site system can perform in an SMS/Configuration Manager site. There are several possible site system roles. All of the roles can be assigned to the primary site server or spread out over several different site systems. Some of the site system roles are assigned during installation and others are assigned through the SMS/Configuration Manager Administrator console.

site usage (n)~ Information about the number of visits to a Web site, the number of page views during a specific time, and the number of conversions.

Sites app (n)~ An app for the Windows Store designed for small groups of SharePoint users to enable them to perform basic tasks, such as provide access to team document libraries, site feeds, and project tasks.

site-to-site VPN (n)~ A network comprised of Virtual Private Networks.

Six Sigma ~ Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects in any process and is broadly applied, from manufacturing to transactional processes within product to service sectors.

Six Sigma DMAIC Cycle (n)~ A template that outlines the phases, key activities and deliverables of the standard Six Sigma life cycle.

size (v)~ To change the dimensions of a shape by dragging one of its handles after it has been selected with the pointer tool.

size grip (n)~ A special control that appears at the junction of a horizontal and vertical scroll bar or the right end of a status bar and provides an area that a user can drag to size the lower right corner of a window.

sizing handle (n)~ A handle that supports sizing an object.

Ska (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 21.

sketch style (n)~ A Skin for objects and controls that have a hand-sketched look.

SketchFlow (PN)~ A feature set within Expression Blend 3 for creating fully functional WPF- or Silverlight-based prototypes.

SketchFlow Animation (PN)~ A feature that enables on-the-fly animations in prototypes to represent the behavior of the application when in use.

SketchFlow Map panel (n)~ A panel that displays the application flow of a prototype project.

SketchFlow Player (PN)~ A stand-alone player that displays a SketchFlow prototype, enabling a reviewer to click through the prototype.

SketchFlow prototype (n)~ A prototype created by using the SketchFlow features available in Expression Blend 3.

skeuomorph (n)~ A design that is derived from another object and that retains ornamental design cues that relate back to the original object.

skew (n)~ A transformation that distorts a shape by a specified angle from an axis. The result is that a square is formed into a parallelogram. The skew or shear can be applied in more than one direction at a time.

skew (v)~ To distort an object along its horizontal, vertical, or both axes.

skewed fraction (n)~ A fraction that is written on a downward angle: the diagonal fraction bar is placed down and to the right of the numerator, and the denominator is slightly down and to the right of the fraction bar.

SKI (n)~ A certificate extension that contains a hash of the certification authority's certificate public key. This hash is placed in the Authority Key Identifier (AKI) extension of all issued certificates to facilitate chain building.

skill (n)~ The ability to proficiently perform certain tasks or duties.

skill code (n)~ A type of enterprise outline code that allows you to specify the skills that a resource has.

skill gap analysis (n)~ A method of comparing the actual skill level of an employee with a target level defined for a current job, a career path, or any other job in a company. This analysis helps to identify strengths and weaknesses in an employee's competence profile in relation to a job, and can be used to determine the appropriate competence development activities.

skill gap wheel (n)~ A graphical tool that enables fast recognition of entire skill profiles and skill gaps.

skill profile wheel (n)~ A control that visually represents the complete list of competencies that an employee, a unit, or a team can demonstrate. A skill profile wheel is often used in connection with skill gap analyses, for example to display the difference between an employee's current profile and that of a career path.

skill set (n)~ A group of related skills.

skin (n)~ A customized user interface that overlays an existing user interface. A skin customizes the look of the program but does not affect its functionality. Programs that allow the use of skins usually make standards available for the creation and distribution of new skins.

skin (v)~ To apply a skin to an existing user interface.

skin definition file (n)~ An XML document that specifies the elements in a skin, along with their relationships and functionality. A skin definition file has a .wms file name extension.

skin file (n)~ A file containing one or more control properties that define how the controls should look. Skin files are part of ASP.NET themes.

skin mode (n)~ An operational state of Windows Media Player in which its user interface is displayed as a skin.

skip (v)~ When performing an operation over a group of items, to leave intact an item because it cannot be operated due to some or other reason. E.g. when copying a group of files, the files currently opened for writing will not be copied.

Skip button (PN)~ The button that takes the user to bypass the current item or page and move to the next item or page.

skiplisting (n)~ The process of bypassing the connecting IP address in the mail header for the purposes of assessing the likelihood that the message is spam and instead inspecting the previous IP address listed in the header.

SKU (n)~ A unique identifier, usually alphanumeric, for a product. The SKU allows a product to be tracked for inventory purposes. An SKU can be associated with any item that can be purchased. For example, a shirt in style number 3726, size 8 might have a SKU

of 3726-8.

SKU (n)~ An inventory dimension.

SKU (n)~ An item and its assigned inventory dimensions.

Skype account (n)~ A feature that enables the user to see Skype activity, change settings, and purchase Skype Credit.

Skype call (n)~ A call made with the Skype client, either between Skype clients or to a mobile phone or landline.

Skype Click to Call (PN)~ A downloadable plugin for calling phone numbers directly from websites in a browser.

Skype Connect (PN)~ A feature that enables making and receiving Skype calls via a PBX system.

Skype Credit (PN)~ A Skype product; one of the possible ways to pay for using Skype products.

Skype for Amazon Fire Phone (PN)~ The Skype software application for Amazon Fire Phone.

Skype for Android (PN)~ The Skype application that runs on the Android operating system.

Skype for BlackBerry (PN)~ The Skype software application for BlackBerry devices.

Skype for Business (PN)~ The Microsoft communications service that provides communications capabilities across presence, instant messaging, audio/video calling, and an online meeting experience that includes audio, video, and web conferencing.

Skype for Business basic (PN)~ An application that enables instant messaging (IM), audio and video calls, meetings, availability (presence) information, and sharing capabilities all from one, easy-to-use program. It's a slimmer version of the full Skype for Business client that provides all of the same core functionality.

Skype for Business for iPhone (PN)~ The version of Skype for Business 2015 that runs on iPhone.

Skype for Business Online (PN)~ A cloud communications service that connects people. Skype for Business Online provides intuitive communications capabilities across presence, instant messaging, audio/video calling, and an online meeting experience that includes audio, video, and web conferencing.

Skype for Business Server (PN)~ A real-time communications server software which provides the infrastructure for enterprise instant messaging, presence, VoIP, ad hoc and structured conferences (audio, video and web conferencing).

Skype for Business Web App (PN)~ a browser-based meeting client that you use to join Skype for Business Meetings

Skype for Business Web App Plug-in (PN)~ A plug-in required for audio, video, and screen sharing during a Skype for Business Meeting

Skype for iPad (PN)~ The Skype software application for iPads.

Skype for iPhone (PN)~ The Skype software application for iPhone.

Skype for iPod touch (PN)~ The Skype software application for iPod touch.

Skype for Kindle Fire HD (PN)~ The Skype software application for Kindle Fire HD.

Skype for Linux (PN)~ The Skype software application for Linux.

Skype for Mac (PN)~ The Skype software application for Mac.

Skype for modern Windows (PN)~ The Skype software application that uses the non-desktop user interface introduced with Windows 8.

Skype for Nokia X (PN)~ The Skype software application for Nokia X devices.

Skype for Outlook.com (PN)~ The Skype add-on for Outlook.com web-based email service.

Skype for PlayStation-®Vita (PN)~ The Skype software application for PlayStation-®Vita.

Skype for TV (PN)~ The Skype software application for smart TVs.

Skype for Web (PN)~ The Skype web application for Skype instant messaging, Skype audio calls and Skype video calls.

Skype for Windows desktop (PN)~ The Skype software application for Windows desktop.

Skype for Windows Phone (PN)~ The Skype software application for Windows Phone.

Skype for Xbox One (PN)~ The Skype software application for Xbox One.

Skype Home (PN)~ A tab in the Skype desktop client for displaying a user's Facebook newsfeed and Skype mood messages.

Skype Manager (PN)~ A web tool that businesses can use to allocate Skype Credit, features, and products to employees.

Skype Meeting Broadcast (PN)~ A Web conferencing solution that enables the broadcasting of a Skype for Business meeting on the Internet, with a dedicated producer. It supports large group meetings with as many as 10 000 people, who can attend in a browser on nearly any device.

Skype messages (PN)~ A wrapper of Skype features offering instant, voice, video, and SMS messaging.

Skype Name (n)~ A unique user name for logging into the Skype client, a user's account, and so on.

Skype Number (n)~ A Skype product that allows a user to call directly to Skype from landlines and mobile phones.

Skype partner (n)~ An organization that cooperates with Skype; the cooperation ranges from developing mutual software to selling products specially tailored for the organization.

Skype Premium (PN)~ A subscription that grants users a Premium account, that includes access to enhanced Skype features such as group video calling, group screen sharing, and live chat customer support.

Skype Room Systems (PN)~ A comprehensive Partner offering that bundles the Skype Room System software and the required hardware (consisting of a large screen or projector, a camera and an audio device) that can be controlled by a client app on a mobile phone. It facilitates meeting participation without a laptop or desktop from within the meeting room enabling a meeting experience in a conference room setting.

Skype To Go number (n)~ A product that enables a user to call mobile phones and landlines from a mobile phone or landline via Skype.

Skype Translator (PN)~ The Skype software that translates audio and instat messaging conversations.

Skype video calling (PN)~ An app that lets you make video calls.

Skype voucher (n)~ An electronic coupon that can be bought from selected retail outlets to top up Skype Credit.

Skype WiFi (PN)~ A feature that enables the user to connect to public WiFi hotspots, paying per minute with Skype Credit.

Skype world minute (n)~ A calling minute available through a Skype paid feature that lets users call phones in over 40 countries/regions worldwide.

Skype-® for Business (PN)~ The Microsoft communications service that provides communications capabilities across presence, instant messaging, audio/video calling, and an online meeting experience that includes audio, video, and web conferencing.

Skype-® for Business 2015 (PN)~ The Microsoft communications service that provides communications capabilities across presence, instant messaging, audio/video calling, and an online meeting experience that includes audio, video, and web conferencing.

Skype-® for Business basic 2015 (PN)~ An application that enables instant messaging (IM), audio and video calls, meetings, availability (presence) information, and sharing capabilities all from one, easy-to-use program. It's a slimmer version of the full Skype for Business client that provides all of the same core functionality.

Skype-® for Business basic client (PN)~ An application that enables instant messaging (IM), audio and video calls, meetings, availability (presence) information, and sharing capabilities all from one, easy-to-use program. It's a slimmer version of the full Skype for Business client that provides all of the same core functionality.

Skype-® for Business for iPhone (PN)~ The version of Skype for Business 2015 that runs on iPhone.

Skype-® for Business Online (PN)~ A cloud communications service that connects people. Skype for Business Online provides intuitive communications capabilities across presence, instant messaging, audio/video calling, and an online meeting experience that includes audio, video, and web conferencing.

Skype-® for Business Server (PN)~ A real-time communications server software which provides the infrastructure for enterprise instant messaging, presence, VoIP, ad hoc and structured conferences (audio, video and web conferencing).

Skype-® for Business Server 2015 (PN)~ A real-time communications server software which provides the infrastructure for enterprise instant messaging, presence, VoIP, ad hoc and structured conferences (audio, video and web conferencing).

SkypeKit (PN)~ A collection of Skype software and APIs that allows internet-connected devices or applications to offer voice and video calls.

Skype-to-Skype call (n)~ A free internet call between two or more Skype users.

SLA (n)~ An agreement between two or more parties describing the deliverables, support, and communication that each party will provide to the other.

SLA (PN)~ An agreement that specifies the minimum service level for the Online Services.

SLA metric (n)~ A calculated time interval that Service Manager determines between the date and time fields in incidents and service requests. For example, the SLA metric -€œresolution time-€? is defined as the difference between the Incident Created Date and the Incident Resolved Date.

SLA override management pack (n)~ A set of files for use with System Center

Operations Manager to store overrides and change the minimum service level to be provided and the actions a customer can perform.

SLA target (n)~ The specified duration of time in which the IT organization must respond to or resolve an incident or service request.

slab (n)~ A contiguous piece of memory.

slab consolidation (n)~ The process of reducing the number of slabs allocated in thinly provisioned arrays and thinly provisioned virtual disks by rearranging data from sparsely populated slabs to densely populated slabs.

slack space (n)~ The unused area outside of the boot sector in sector 0 of a partitioned data storage device.

slamming ~ Changing an end user's primary local exchange carrier or Interexchange Carrier without the end user's authorization.

slash (n)~ The / character.

slate (n)~ A tablet-style portable computer that's designed for touch input and that lacks an integrated physical keyboard.

slate (n)~ A still image to use to cover up the input live feed in certain cases (for example during a commercial break).

slave ~ This usually refers to an- IDE- setting on a hard drive or other IDE device. When two devices are used on a single IDE channel, one is set to master and the other to slave.

SLCC (n)~ A service or feature of Windows that enables licensing at the feature level; thereby broadening the distribution and licensing options for retailers, ISVs, and OEMs. New business models may include: trials, subscriptions, gifting, transfers, or pay-for-use.

SLD (n)~ A domain name that is rooted hierarchically at the second tier of the domain namespace directly beneath the top-level domain name such as .com and .org. When DNS is used on the Internet, second-level domains are names such as microsoft.com that are registered and delegated to individual organizations and businesses according to their top-level classification. The organization then assumes further responsibility for parenting management and growth of its name into additional subdomains.

sleep (n)~ A power-saving state that allows the computer or device to quickly resume full-power operation (typically within several seconds) when you want to start working again. All open documents and programs are saved to memory before the computer or device enters the low-power state.

sleep mode (n)~ A power-saving state that allows the computer or device to quickly resume full-power operation (typically within several seconds) when you want to start working again. All open documents and programs are saved to memory before the computer or device enters the low-power state.

SLES (PN)~ A server product for enterprise computing by SUSE.

slice (n)~ A subset of the data in a cube, specified by limiting one or more dimensions by members of the dimension.

slice (n)~ A rectangular selection including active layers and effects on the workspace that can be exported.

slicer (n)~ An interactive and flexible data filter that always conveys the current filtering state.

Slicers (PN)~ A feature that provides one-click filtering controls that make it easy to

narrow down the portion of a data set that's being looked at.

slide (n)~ A frame that contains text, shapes, pictures, or other content. A slide is a digital equivalent to a traditional film slide.

slide (v)~ To place a finger on the screen, move the finger in one or more directions, and then take the finger off of the screen.

slide (n)~ A gesture represented by placing a finger on the screen, moving the finger in one or more directions, and then taking the finger off the screen.

slide down (v)~ To place a finger on the screen, move the finger down, and then take the finger off of the screen to power off the phone.

slide gesture (n)~ A gesture represented by placing a finger on the screen, moving the finger in one or more directions, and then taking the finger off the screen.

Slide Library (n)~ A folder where a collection of PowerPoint slides is shared.

slide master (n)~ The slide that stores information about the design template applied, including font styles, placeholder sizes and positions, background design, and color schemes.

Slide Navigator (PN)~ A feature that enables the user to visually browse for and navigate to other slides without leaving Slide Show view.

slide show (n)~ An animated presentation of images that appears when a PC is locked.

Slide Show (PN)~ A view for delivering a presentation that displays it as the audience will see it.

slide two fingers (v)~ To slide two fingers on a touchpad or similar device at the same time and with a relatively short distance between each other.

slide up (PN)~ The text displayed at the bottom of a locked phone screen during an incoming call.

Slidecast (PN)~ A tool that enables the user to record a narration over their presentation, export the presentation to a video, then upload that video to a video or information sharing website.

slider (n)~ A common Windows control that displays and sets a value from a continuous range of possible values, such as brightness or volume.

slider handle (n)~ The user interface control that facilitates modification of the appearance, position, or behavior of another control that displays and sets a value from a continuous range of possible values.

Slideshow (PN)~ A mode of Windows Photo Viewer which displays full-screen slide shows for photos.

Slideshow (PN)~ The Sway card that shows individual pieces of content sequentially, allowing forward and backward navigation one piece of content at a time.

slideshow (n)~ A view of a set of photos that displays them one at a time, sequentially.

Slideshow Web Part (n)~ A customizable component of a Microsoft Office Live Web site that allows users to create an album of rotating images on their Web pages.

slide-title master pair (n)~ The slide master and title master for a given design template that you have applied to a presentation.

sliding window (n)~ A window of fixed length L that moves along a timeline according to the stream's events. With every event on the timeline, a new window is created, starting at the event's start time.

slippage (n)~ The amount of time that a task has been delayed from its original baseline plan. The slippage is the difference between the scheduled start or finish date for a task and the baseline start or finish date.

slipstream (v)~ To integrate updates, patches or service packs into the base installation files of the original software, so that the resulting files will allow a single step installation of the updated software.

slot (n)~ The location in a library or media changer which is assigned to a certain media (tape or disc).

slot ~ a slot, or expansion slot, is an engineered technique for adding capability to a computer in the form of connection pinhole type contact points

Slow Down, Half (v)~ A filter effect in Windows Movie Maker.

Slow Jam (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 111.

slow page (n)~ A page that takes a long time (30 seconds or more) to download in a Web browser.

Slow Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 95.

slower connection (n)~ A network connection that is not cable or DSL.

SlowKeys (n)~ An accessibility feature built into Macintosh computers and available for DOS and Windows that allows the user to add a delay to the keyboard so that a key must be held down for a certain amount of time before it is accepted.

SLP (n)~ A set of language resources that supports the deployment of a software program in a particular language.

SLS (n)~ A service which provides an infrastructure that enforces a software license policy based on trusted platform module; thus, enabling secure licensing to, and only to, the license holder.

small caps (n)~ A font effect in which lowercase text appears as capital letters in a reduced font size.

small computer system interface (n)~ A standard high-speed parallel interface defined by the American National Standards Institute (ANSI). A SCSI interface is used for connecting microcomputers to peripheral devices, such as hard disks and printers, and to other computers and local area networks (LANs).

small organization (n)~ An organization with between 1-49 employees and 24 or less personal computers.

small outline dual inline memory module (n)~ A smaller version of a DIMM used in laptops.

small tile (n)~ A square tile of 70 x 70 pixels on the Start screen.

smalldatetime (n)~ A date and time data type that is less precise than the datetime data type. Data values range from January 1, 1900, through June 6, 2079, to an accuracy of one minute.

Smaller (adj)~ An item on the Text Size menu, which is opened from the Edit menu. Smaller is one of the text size choices for the user's instant messages

Smallest (oth)~ An item on the Text Size menu, which is opened from the Edit menu. Smallest is one of the text size choices for the user's instant messages

smallint (n)~ A data type of 2 bytes (16 bits) that stores whole numbers in the range of -2^15 (-32,768) through 2^15 - 1 (32,767).

smart blocking (n)~ A feature in the Messaging app that detects whether an SMS message is spam, based on its content.

smart card (n)~ A plastic (credit card-€"sized or smaller) device with an embedded microprocessor and a small amount of storage that is used, with an access code, to enable certificate-based authentication. Smart cards securely store certificates, public and private keys, passwords, and other types of personal information.

Smart card ~ A tamper-resistant hardware device the size of a credit card, that can be used for the storage of secure information such as personal information, electronic cash and private encryption keys.

Smart Card Personalization Control (PN)~ An ActiveX control that performs all Certificate Lifecycle Manager (CLM) smart card application management activities on a client computer.

smart card profile (n)~ A Certificate Lifecycle Manager (CLM) profile created when a request is performed using a profile template that only includes smart card-based certificate templates.

smart card reader (n)~ A device that is installed in computers to enable the use of smart cards for enhanced security features.

Smart Card Self Service Control (PN)~ Software installed on a client computer that enables end users and administrators to manage smart cards by providing a connection from the client computer to the smart card.

smart card unblocking (n)~ The action of binding a smart card with administrative credentials to reset the the personal identification number (PIN) attempt counter.

smart device (n)~ A hardware device based on the Windows Embedded CE operating system or a derivative such as Windows Mobile or Windows Automotive.

Smart Device Connectivity API (PN)~ An application programming interface that enables developers to establish a connection between a desktop computer and a device. This API enables developers to focus on creating remote tools, while it handles the details of device interconnectivity and transport mechanisms.

SMART error (n)~ An error returned by the SMART test.

smart file (n)~ A file that is only available when a device is connected to the Internet so that the file's data uses little space in the device's storage.

smart folder (n)~ In the Macintosh environment, a virtual folder that displays items based on specified search criteria.

smart host (n)~ A designated server through which Exchange routes all outgoing messages. The smart host then makes the remote connection. If a smart host is designated, the Exchange server only needs to transmit to the smart host, instead of repeatedly contacting the domain until a connection is made.

smart indent (n)~ An indent that is applied based on smart indenting rules for the language in which you are programming.

smart link (n)~ The connection between two activities in a runbook.

Smart Menus (PN)~ A feature of Windows Live Toolbar that provides additional information for particular kinds of text someone selects.

Smart Paging (PN)~ Functionality within the Dynamic Memory feature of Hyper-V that uses disk resources as additional, temporary memory when more memory is required to restart a virtual machine than what is physically available on the host.

smart phone (n)~ A wireless, mobile device that combines platform software, a browser, a modern chipset, and a telephone handset.

smart rounding (n)~ A marketing practice to use odd numbers that are marginally less than their nearest round number to set prices.

SMART system (n)~ A system by which technology is used to monitor and predict device performance and reliability. A SMART system employs various diagnostic tests to detect problems with devices, with the object of increasing productivity and protecting data.

Smart Task (PN)~ A small panel that is attached to the upper right-hand corner of a .NET control. When the panel is opened, it contains checkboxes and combo boxes that enables developers to select connectivity and other options for the control.

SmartArt (n)~ An Office feature that allows users to create professional looking information graphics quickly and easily.

SmartArt graphic (n)~ A graphic element from the SmartArt feature.

SmartArt graphic Picture Layout (PN)~ A feature that automates the task of positioning images and combining them with text in documents. It produces attractive, editable designs that highlight photos and accompanying text and make it easy for novices to produce compelling, high quality photo layouts.

SmartArt graphics (n)~ An Office feature that allows users to create professional looking information graphics quickly and easily.

SmartArt Picture Layout (PN)~ A feature that automates the task of positioning images and combining them with text in documents. It produces attractive, editable designs that highlight photos and accompanying text and make it easy for novices to produce compelling, high quality photo layouts.

smartdial (n)~ A feature that allows end users to quickly search for contacts, previous calls, Speed Dials, or SIM contacts by using the phone keypad. As they type, an accumulator application will track their inputs and the corresponding matches, and allow them to select from a list of likely matches. A single key generally maps to multiple characters, and then combinations of key presses are used to generate a list of matching words or names relevant to the current application.

smartphone (n)~ A wireless, mobile device that combines platform software, a browser, a modern chipset, and a telephone handset.

Smartphone ~ A computer in a cellphone. As well as a phone, typically it will include both stills and movie cameras, music player, enough computing power to run sophisticated programs such as office sofware and games, satellite navigation, and gigabytes of storage. The most famous is Apple's- iPhone, but all the major manufacturers make them and they are where the IT industry is mostly focussed at the moment. Some think that they will completely replace most personal computers.

SmartScreen Application Reputation (PN)~ A rating of how safe an app is determined to be by SmartScreen, according to age, presence of digital certificate, and other criteria.

SmartScreen Filter (PN)~ A feature in Internet Explorer that helps detect phishing websites and can help protect you from installing malicious software or malware.

Smartsearch (PN)~ A feature that allows you to search your device content for contact names or contact-related content. E.g. search for Eric' will render all e-mail

SmartShapes (n)~ A technology that lets you develop shapes that behave like the objects they represent in the real world. You do this by defining formulas that represent shape attributes, such as width and height, and shape behavior, such as what the shape does when a user right-clicks it.

SMB (n)~ A file-sharing protocol designed to allow networked computers to transparently access files that reside on remote systems over a variety of networks. The SMB protocol defines a series of commands that pass information between computers. SMB uses four message types: session control, file, printer, and message.

SMB Direct (PN)~ An SMB feature that supports the use of network adapters that have RDMA capability and can function at full speed with low latency, while using little CPU.

SMB Multichannel (PN)~ An SMB feature that allows file servers to use multiple network connections simultaneously and includes fault tolerance and increased throughput.

SMBIOS (n)~ A BIOS developed to enable system-related information, such as information about hardware, to be gathered from computers on a network.

SMDS (n)~ A very high-speed, connectionless, packet-switched data transport service that connects LANs (local area networks) and WANs (wide area networks).

SMI (n)~ An interrupt generated by the host-controller-emulation hardware when a universal serial bus (USB) keyboard or mouse data is received and steered by the host controller hardware to a System Management Interrupt (SMI) or the standard host controller interrupt.

smiley (n)~ A string of text characters that, when viewed sideways, form a face expressing a particular emotion.

Smiley ~ :-)- or- :) A group of symbols used to indicate a smile or laughter in an email or newsgroup message (look at it sideways). There are all sorts of variants including :-(for sadness, ;-) for a smile with a wink, :-D for a big smile or a laugh. and :-o for astonishment. Collectively they are often called- emoticons.

Smiley Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a smiley face decoration for their cake.

SMM (n)~ A mode used by some systems, typically portable computers, to perform specialized keystroke or other processing in BIOS firmware. While in SMM, the processor does not field interrupts that add to interrupt service routine (ISR) latencies.

SMO (PN)~ An application programming interface that supports the incorporation of SQL Server administration into any COM or OLE Automation application.

smoke test (n)~ A group of tests used to determine the health of a build at a high level. Typically, these tests exercise the core functionality to help team members determine whether further testing is worthwhile. They are run after the daily build to verify that compilation of source code has been built successfully and is ready for further testing.

smooth stream (n)~ Digital media that is delivered in a continuous flow across a network by one of the IIS Smooth Streaming extensions for IIS 7 (IIS Smooth Streaming or IIS

Live Smooth Streaming).

Smooth Streaming (PN)~ A feature that clients use to request fragments from a Smooth Streaming presentation to maintain an evenly distributed flow of content as client bandwidth and CPU resources change.

smooth streaming (n)~ A form of adaptive streaming used by the IIS Smooth Streaming extensions for IIS 7.

Smooth Streaming heuristics (n)~ Stream-switching logic algorithms hosted by Smooth Streaming-compatible clients (primarily Microsoft Silverlight) that determine the optimal bit rate in a Smooth Streaming presentation to render at any given instant. The two main criteria used to determine which bit rate is best to stream at any given instant are available bandwidth and client video-processing capability.

Smooth Streaming presentation (n)~ The collection of files that enable smooth streaming.

Smooth Streaming presentation content (n)~ Video files (with .ismv file name extensions) and audio files (with .isma file name extensions). Each file is output from an encoder (Expression Encoder 2 SP1 in this case) at different bit rates and synchronized such that clients can seamlessly request contiguous fragments from different files as network and CPU conditions change. The content files are a media container that stores the contiguous MP4 fragments.

Smooth Streaming presentation manifest (n)~ A file that stores information about the Smooth Streaming presentation.

SMORG (n)~ An organization with between 1-49 employees and 24 or less personal computers.

SMP (n)~ A multiprocessing operation in which multiple processors share the same memory, which contains one copy of the operating system, one copy of any applications that are in use, and one copy of the data. Because the operating system divides the workload into tasks and assigns those tasks to whatever processors are available, SMP reduces transaction time.

SMS (n)~ A short alphanumeric message that is sent between mobile phones or devices using the SMS protocol.

SMS (PN)~ A service for wireless products that allows users to send and receive brief messages consisting of text and numbers to and from mobile phones and devices.

SMS Administrator console (n)~ The primary interface that you use to administer SMS. The SMS Administrator console allows you to configure, run, and access SMS features and tools.

SMS API (PN)~ An API that is part of the Windows 8 extensible platform for sending and receiving SMS text messages through a mobile broadband adapter or a cellphone connected to a PC.

SMS center number (n)~ The number used to send and receive messages.

SMS client (n)~ A computer running SMS client components. A client can be further categorized as either a Legacy Client or an Advanced Client.

SMS Client policy (n)~ Configuration details for the SMS Client that are provided after client installation.

SMS collection (n)~ A set of resources in the Configuration Manager hierarchy.

SMS delivery confirmation (PN)~ A toggle switch to request delivery notification via SMS.

SMS Executive (n)~ The primary Configuration Manager service that accesses and updates the database and manages many different process threads.

SMS hardware inventory (n)~ An SMS feature that automatically gathers information about hardware on Legacy Client computers in an SMS site.

SMS Installer (n)~ An SMS tool that enables you to create customized, self-extracting, software installation files.

SMS inventory (n)~ An SMS feature that automatically gathers information about hardware and software on Advanced Client computers in an SMS site.

SMS message (n)~ A short alphanumeric message that is sent between mobile phones or devices using the SMS protocol.

SMS object (n)~ A component used in SMS software distribution and software updates — for example, collections, advertisements, programs, packages, deployments, and so on.

SMS Provider (n)~ A WMI provider that allows both read and write access to the Configuration Manager site database.

SMS resource (n)~ An object (such as a computer, a router, or a user group) that can be discovered and potentially become an SMS client and be managed by SMS. Resources and clients can be organized into collections.

SMS site (n)~ A collection of clients and SMS site systems that are bounded by a group of subnets, such as IP subnets or an Active Directory site, and which are specified by an SMS administrator as a site.

SMS site database (n)~ A Microsoft SQL Server database that stores SMS site data, such as discovery data, configuration data, and status messages and inventory data. Every primary site has an SMS site database. The server supporting the SMS site database is automatically assigned the site database server role.

SMS software distribution (n)~ An SMS feature that automatically distributes software programs to client computers in an SMS hierarchy.

SMS software inventory (n)~ An SMS feature that automatically gathers information about software on Legacy Client computers in an SMS site.

SMS text message (n)~ A short alphanumeric message that is sent between mobile phones or devices using the SMS protocol.

SMT (n)~ Microprocessor technology that enables the concurrent execution of multiple separate threads on a single physical processor.

SMTP (n)~ A member of the TCP/IP suite of protocols that governs the exchange of electronic mail between message transfer agents.

SMTP ~ (Simple Mail Transfer Protocol). The original method of transmitting and receiving email on the internet. Still sometimes used for transmitting, but has been widely replaced by- POP3- andIMAP.

SMTP adapter (n)~ An adapter that implements the SMTP protocol (that is, sends e-mail messages) to interact with line-of-business applications. This adapter includes only the send handler.

SMTP address (n)~ An e-mail address that uses the Simple Mail Transfer Protocol (SMTP).

SMTP connector (n)~ A software component that represents a logical path between a source and a destination for the purpose of transmitting Simple Mail Transfer Protocol (SMTP) messages. A SMTP connector can be configured as a Send connector or as a Receive connector.

SMTP mail server (n)~ An e-mail server that uses the Simple Mail Transfer Protocol (SMTP).

SNA (n)~ A network model devised by IBM to enable IBM products, including mainframes, terminals, and peripherals, to communicate and exchange data.

snap (v)~ To automatically align drawing objects to gridlines, guides, columns, other objects, etc.

Snap (PN)~ A feature that enables customers to easily display two documents side by side, maximize a single document, and expand a window vertically by simply dragging window borders to the edge of the screen.

snap (v)~ To move an object, such as a window or an app, into a locked position on the screen.

Snap (PN)~ A feature that enables users to easily display two apps side by side or maximize a single app.

Snap Assist (PN)~ A feature that suggests apps for a customer to snap after they already snapped one app.

Snap Fill (PN)~ A feature that automatically sizes app windows so they maximize the screen real estate.

snap point (n)~ A location (both interval and non-interval) where the position of the content comes to rest after the user has completed their interaction.

snap resolution (n)~ In animation, specifies the regular intervals on the timeline at which you can set a keyframe. This interval rate is called snap resolution' because it refers to where on the timeline the playhead and keyframes can be 'snapped'.'

snap-in (n)~ A type of tool that you can add to a console supported by Microsoft Management Console (MMC). A stand-alone snap-in can be added by itself; an extension snap-in can be added only to extend the function of another snap-in.

snap-in console start page (n)~ The start page that appears in the results pane when the snap-in console root node is selected in the tree.

snap-in start page (n)~ The start page that appears in the results pane when a given snap-in is selected in the tree.

snapline (n)~ A user interface guide thats is used to align objects.

snapped app (n)~ The narrower of the two apps that can appear on the screen simultaneously after a second app is snapped to the screen.

snapshot (n)~ A static image of a set of data, such as the records displayed as the result of a query.

snapshot (n)~ A static report that contains data captured at a specific point in time.

snapshot (n)~ A picture taken with the webcam (during the call or any time).

snapshot ~ A copy of the data in a database at any given point in time.

snapshot ~ A copy of changed data in the active files and directories of a file system with the exception of the inode number

snapshot definition (n)~ A collection of settings required to produce a snapshot,

including user credentials, filter criteria, parameters, and schedule information.

Snapshot frame (n)~ A box the presenter can draw around a portion of the desktop to capture a static image of the enclosed portion of the desktop at that moment.

snapshot isolation level (n)~ A transaction isolation level in which each read operation performed by a transaction returns all data as it existed at the start of the transaction. Because a snapshot transaction does not use locks to protect read operations, it will not block other transactions from modifying any data read by the snapshot transaction.

snapshot replication (n)~ A replication in which data is distributed exactly as it appears at a specific moment in time and does not monitor for updates to the data.

Snapshot Share (n)~ A share available for the storage of snapshot files. Snapshot files contain the schema and data for published tables.

Snapshot slide (n)~ A slide that displays a static image of a presenter's desktop or the portion of the desktop captured in a Snapshot frame.

Snapshot Viewer (n)~ A program you use to view, print, and electronically mail a snapshot, such as a report snapshot.

snapshot window (n)~ A window that is defined according to the start and end times of the event in the stream, instead of a fixed grid along the timeline.

SNI (PN)~ The IIS feature that supports the SSL/TSL protocol extension and allows a virtual domain name, or a hostname, to be used to identify the network endpoint.

SNI based SSL (oth)~ An extension to SSL and TLS protocols that allows multiple domains to share the same IP address, with separate security certificates for each domain.

SNI SSL (oth)~ An extension to SSL and TLS protocols that allows multiple domains to share the same IP address, with separate security certificates for each domain.

sniff / sniffer ~ The process of listening to network traffic that you are not authorized to receive.

sniff / sniffer ~ Sniffer: network management tool that monitors data packets on a network to help administrators ensure message integrity and service quality.

sniffer (n)~ An application or device that can read, monitor, and capture network data exchanges and read network packets. If the packets are not encrypted, a sniffer provides a full view of the data inside the packet.

snip (n)~ Text, graphics, and any associated annotations captured by using Snipping Tool.

Snippet Gallery (PN)~ A gallery of HTML code snippets for common components that can be customized and added to SharePoint designs.

Snipping Tool (PN)~ A Windows tool used to capture a screen shot, or snip, of any object on the screen, and then annotate, save, or share the image.

SNMP (n)~ A network protocol used to manage TCP/IP networks. In Windows, the Simple Network Management Protocol (SNMP) service is used to provide status information about a host on a TCP/IP network.

SNMP Response Editor (n)~ A feature that allows the user to specify where the Simple Network Management Protocol (SNMP) trap generates when it matches the properties that are set as alert criteria.

SNMP trap (n)~ An unsolicited Simple Network Management Protocol (SNMP) packet sent from one SNMP entity to another usually in response to a stimulus or an event on the sending entity.

snooze (v)~ To delay a reminder or alarm by a specified time.

snowflake schema (n)~ An extension of a star schema such that one or more dimensions are defined by multiple tables. In a snowflake schema, only primary dimension tables are joined to the fact table. Additional dimension tables are joined to primary dimension tables.

SOA (n)~ A software architecture that uses policies, practices, and frameworks to enable application functionality to be provided and consumed as sets of services. These services are published at a level of granularity relevant to service consumers.

SOA resource record (n)~ A record that indicates the starting point or original point of authority for information stored in a zone. The SOA resource record (RR) is the first RR created when adding a new zone. It also contains several parameters used by other computers that use DNS to determine how long they will use information for the zone and how often updates are required.

SOAP (n)~ A simple, XML-based protocol for exchanging structured data and type information on the World Wide Web. The protocol is currently the de facto standard for XML messaging.

SOAP action (n)~ A parameter that can be used to specify a URI that identifies the intent of a SOAP message.

SOAP adapter (n)~ An adapter that implements the SOAP protocol to interact with line-of-business applications, publishes orchestrations as Web services, and consumes external Web services.

SOAP body (n)~ A collection of zero or more elements in a SOAP message.

SOAP extension (n)~ An extensibility class in .NET that allows the SOAP message to be intercepted before and after deserialization on incoming and outgoing messages. The SOAP extension may be used on both .NET clients and .NET services.

SOAP fault (n)~ A collection of elements in a SOAP message that identify the code and cause of an error.

SOAP header (n)~ The extensibility elements of a SOAP message. The SOAP header allows additional information to be sent with a SOAP request.

SOAP message (n)~ The data encapsulated in a SOAP envelope that flows back and forth between a client and a Web service.

SOC (n)~ A chip that integrates most of all of the basic components of a computer, including microprocessors and necessary support components. SOC technology is used in firewalls, gateways, specialized servers, and interactive devices.

social (PN)~ The webpage subheading for the view in Messenger that displays the social activity of friends.

social (adj)~ Of or related to social networking.

social (PN)~ An app category that facilitates communication or social networking.

Social (PN)~ An app category that facilitates communication or social networking.

Social Analytics ~ describes the process of measuring, analyzing and interpreting the results of interactions and associations among people, topics and ideas.

social authentication (n)~ A way to authenticate users by linking them to their social identity.

Social Center (PN)~ Area within Microsoft Social Engagement that provides a set of

user-based streams (of posts) that allow users to keep track of underlying data sets.

social channel (n)~ An account on a social networking site such as Facebook or Twitter that you connect to from Microsoft Dynamics CRM.

social computing (n)~ An area of computer science concerned with creating or recreating social conventions and social contexts online through the use of software and technology.

social data (n)~ A collection of features that can be used to store and share comments, shortcuts, descriptions, and other information about Web pages and items on a SharePoint site or the Internet.

social database (n)~ A database that is used to store social tagging information for a user, i.e. Social Comment or Social Tag or Social Rating.

social distance (n)~ The relationship between the user who typed the query and the people who are listed in the search results as defined by their positions in the organization.

social engineering (n)~ The practice of penetrating system security by tricking individuals into divulging passwords and information about network vulnerabilities. Often done by calling the individual on phone and pretending to be another employee of company with a computer-related question.

social feedback (n)~ Feedback about any content, page, or site that is provided using social bookmarks, tags or comments.

social network (n)~ A network made of people or organizations linked by some type of social relationship.

social networking (n)~ The use of Web sites and services that provide enhanced information and interaction capabilities with regard to people and resources.

social networking site (n)~ A site that provides social networking capabilities.

social profile (n)~ A profile on a social network that is owned and maintained by one or more individuals within Microsoft Social Engagement.

Social Rating Synchronization Job (PN)~ A timer job that synchronizes rating values between the social database and content database.

social sales (n)~ The part of the sales cycle that is conducted through social media platforms.

social security number (n)~ In the United States, a Taxpayer Identification Number assigned to citizens and some noncitizens. The number is required for anyone to obtain work or to receive governmental benefits, such as social security payments after retirement.

social slice (n)~ In a pie chart that represents records, for example, cases broken out by source, the part of the pie' (the slice) that represents social sources such as Facebook

social tag (n)~ A custom keyword or description and shortcut to a Web page or item on a SharePoint site or the Internet. All of these tags can be viewed, managed, and shared by using My Site.

social update (n)~ An action taken on Windows Live or on partner websites such as Facebook that is considered to have social relevance and that might appear in an activity feed. For example, photo activity and status updates are considered to be socially relevant. Within Windows Live, friends see one another's relevant actions in feeds within Messenger, on Windows Live Home, and other places. Depending on the partner and their settings, actions that a customer takes on Windows Live may be visible on partner sites,

actions they take on partner sites may be visible on Windows Live, or both.

Social updates (PN)~ The UI label for the Hotmail quick view that displays only the e-mail messages that originate from a social networking service such as Facebook.

socket (n)~ An identifier for a particular service on a particular node on a network. The socket consists of a node address and a port number, which identifies the service.

socket (n)~ An opening in the housing of a computer, portable device, peripheral, or other intelligent electronic device designed to hold a PC Card or smart card.

socket ~ a receptacle that provides a means of communication between two processes.

socket ~ An identifier that an application uses to uniquely identify an end point of communication.

socket ~ A means for directing data to an application in a- TCP/IP- network using a unique identifier that is a combination of an IP address and a port number.

SO-DIMM (n)~ A smaller version of a DIMM used in laptops.

soft booking (n)~ A project booking that tentatively assigns a resource to a project or activity without committing it to the schedule.

soft break (n)~ A break which is simulated by the debugger. It is used if a native program cannot be stopped for some reason (for example, the program is executing in kernel mode). The debugger freezes all threads and simulates a break.

soft delete (n)~ The process of moving an item to the Deleted Items folder.

soft edges (n)~ A picture, shape, or video effect that uses gradation as opposed to a hard outline. The edges of the object disappear or fade into the background.

soft font (n)~ A set of characters that are copied from a computers disk to a printers memory when requested for printing a document. Downloadable fonts are most commonly used with laser printers, although dot matrix printers can accept some of them.

soft hyphen (n)~ A hyphen that is used to control where a word or phrase breaks if it falls at the end of a line. For example, you can specify that the word nonprinting' breaks as 'non-printing' rather than 'nonprint-ing."

soft key (n)~ One of the two unlabeled keys located just below the display area on a mobile phone. These keys are called soft' because their functions change to fit the context. Labels in the lower part of the mobile screen tell users what the soft keys do.'

soft keyboard (n)~ A keyboard representation on the screen that allows users to type using touch, a stylus, or other input device.

soft page (n)~ A rendered page that can be slightly larger than the size specified using the InteractiveHeight and InteractiveWidth properties of a report (HTML and WinForm control).

soft page-break renderer (n)~ A rendering extension that maintains the report layout and formatting so that the resulting file is optimized for screen-based viewing and delivery, such as on a Web page or in the ReportViewer controls.

soft quota (n)~ A quota that does not enforce the quota limit, but generates all configured notifications.

soft reboot (n)~ The restarting of a running computer without first turning off the power.

soft recovery (n)~ Soft' recovery is what happens when the system is shut down improperly

soft restart (n)~ The restarting of a running computer without first turning off the power.

soft shadowing (n)~ A shadowing effect that uses gradation as opposed to a hard outline.

soft start (n)~ In a preset recording interval, a starting point which includes extra buffer time allocated to a planned scheduled recording in case the program starts a little early.

soft stop (n)~ In a preset recording interval, an end point which includes extra buffer time allocated to a planned scheduled recording in case the program ends a little late.

softkey (n)~ An item on mobile devices (e.g. mobile phones) that consists of a key plus a software label describing the current function of the key.

softkey (n)~ One of the two unlabeled keys located just below the display area on a mobile phone. These keys are called soft' because their functions change to fit the context. Labels in the lower part of the mobile screen tell users what the soft keys do.'

softphone (n)~ A software program integrated within your computer to serve as a telephone.

software (n)~ Licensed copies of Microsoft software identified on the Product List. Software does not include Online Services or Services Deliverables, but Software may be part of an Online Service.

Software ~ The programs that run on a computer. Without software, a computer can't do anything.

Software + Services (PN)~ A business model which blends locally installed, full-package software with Internet-delivered or hosted applications.

software as a service (n)~ The capability provided to the consumer for using the provider's applications running on a cloud infrastructure. The applications are accessible from various client devices through either a thin client interface, such as a web browser (e.g., web-based email), or a program interface. The consumer does not manage or control the underlying cloud infrastructure, including network, servers, operating systems, storage, or even individual application capabilities, with the possible exception of limited user-specific application configuration settings.

software asset management (n)~ A best practice incorporating a set of proven processes and procedures for managing and optimizing the purchase, deployment, maintenance, utilization, and disposal of software applications within an organization. SAM practice helps to manage risk from counterfeit as well as improperly licensed software.

Software Asset Management (n)~ A best practice incorporating a set of proven processes and procedures for managing and optimizing the purchase, deployment, maintenance, utilization, and disposal of software applications within an organization. SAM practice helps to manage risk from counterfeit as well as improperly licensed software.

software bundler (n)~ A program that installs other potentially unwanted software, such as adware or spyware. The license agreement of the bundling program may require these other components in order to function.

software decoder (n)~ A type of digital video disc () decoder that allows a DVD drive to display movies on your computer screen. A software decoder uses only software to display movies.

software deployment (n)~ The process of distributing and installing a software program throughout an entire organization.

software development kit (n)~ A set of routines (usually in one or more libraries) designed to allow developers to more easily write programs for a given computer,

operating system, or user interface.

software factory (n)~ A structured collection of tools, templates, libraries, documents, and other assets. The factory extends an integrated development environment with a custom process used to build a specific type of software system, application, or component.

software factory asset (n)~ A resource or set of resources provided by a software factory and used in a development environment to build a software application. Assets can include documents, models, configuration files, build scripts, source code files, prescriptive guidance, localization files, deployment manifests, test case definitions, and so forth.

software factory documentation (n)~ The help and other narrative that describes the other assets and activities contained in the software factory.

software factory product (n)~ The instance of a specific type of software system, application, or component built by the software factory.

software factory schema (n)~ The model that defines the structure of a factory. The schema organizes the assets and the custom process around a set of architectural views. The schema also describes the outputs of the factory.

software input panel (n)~ A software accessory that enables you to use a variety of direct input methods (such as handwriting, speech, touch, stylus, gestures, and so on) to interact with Windows-based programs. An input panel can include a writing pad and a character pad to convert handwriting into typed text or mathematical equations, and an on-screen keyboard to enter individual characters.

software key (n)~ A system-generated, device-specific, registry subkey that contains information about the driver software associated with a device.

software keyboard (n)~ A keyboard representation on the screen that allows users to type using touch, a stylus, or other input device.

Software Licensing Commerce Client (n)~ A service or feature of Windows that enables licensing at the feature level; thereby broadening the distribution and licensing options for retailers, ISVs, and OEMs. New business models may include: trials, subscriptions, gifting, transfers, or pay-for-use.

Software Licensing Service (n)~ A service which provides an infrastructure that enforces a software license policy based on trusted platform module; thus, enabling secure licensing to, and only to, the license holder.

software metering (n)~ A feature that monitors program usage on client computers.

software package (n)~ The combination of files, settings, and related general information that is required to install software on managed computers. The general information includes items such as the command line that needs to run on computers to install the software, hardware requirements that must be met before the software can be successfully installed, and a schedule for the installation.

software piracy (n)~ Any unauthorized copying, distribution, and use of computer software, or software theft.

Software Plus Services (PN)~ A business model which blends locally installed, full-package software with Internet-delivered or hosted applications.

software profile (n)~ A Certificate Lifecycle Manager (CLM) profile created when a request is performed using a profile template that only includes software-based certificate

templates.

software protection (n)~ The process of protecting data from loss or corruption by preventing installation of driver software from untrusted sources.

software provisioning (n)~ The act of configuring software packages in the Service Manager console and supplying the requested software packages to computers, as requested by Self-Service Portal users.

Software Publishing Certificate (n)~ A PKCS #7 signed-data object containing X.509 certificates. The certificate contains the verifiable public key of a trusted software publisher.

Software Publishing Certificate (n)~ An option button label in the Certificate type group box in the Certificate Settings Properties box in Mobile Deployment Manager.

software router (n)~ A router that is not dedicated to performing routing, but performs routing as one of multiple processes running on the router computer.

software telephone (n)~ A software program integrated within your computer to serve as a telephone.

software transformer (n)~ A software module or routine that modifies the events (data) into a format expected by the output device, and emits the data to that device.

software update (n)~ Any update, update rollup, service pack, feature pack, critical update, security update, or hotfix used to improve or fix a software product released by Microsoft Corporation.

Software Update Manager (n)~ A security role that grants permissions to administrative users so that they can define and deploy software updates.

software update point (n)~ A Configuration Manager site role that is configured on a computer running WSUS.

software upgrade (n)~ A software package that replaces an existing version of a product with a newer and/or more powerful or sophisticated version of the same product. The upgrade process typically leaves existing customer data and preferences intact while replacing the existing software with the newer version.

SoH (n)~ A declaration from a client computer that asserts the computer's health status. System health agents (SHAs) create SoHs and send them to a corresponding system health validator (SHV).

solicit-response adapter (n)~ A two-way send adapter. A solicit-response send adapter sends a request message from BizTalk Server to a destination, waits for a response message, and then submits the response message back to BizTalk Server.

solid color brush (n)~ A brush composed of a single color

solid-state drive (n)~ A primary storage device based on solid-state memory, such as flash memory, that provides nonvolatile storage with benefits of performance, reliability and power saving.

SOLIDUS (n)~ The / character.

solution (n)~ The coordinated delivery of the elements (including technologies, documentation, training and support) needed to successfully respond to a unique customer's business problem or opportunity.

solution (n)~ A set of components, for example, entities, attributes, relationships, workflows, and reports, that provide a specific set of functionality on top of the core CRM

platform.

solution (n)~ An instance of an application, such as NetBreeze or Microsoft Dynamics Marketing.

Solution Accelerator (n)~ An integrated set of Microsoft components, templates, and guidance designed to solve specific customer business problems.

solution architecture (n)~ The architecture of the software including its structure, entry points, trust areas, and class and component relationships.

solution component (n)~ A part of a solution that someone extending CRM can use to achieve specific functionality.

solution concept (n)~ A high-level description of how the solution will meet goals and requirements.

solution explorer (n)~ A component of Microsoft SQL Server Management Studio that allows you to view and manage items and perform item management tasks in a solution or a project.

Solution Explorer (PN)~ The window that displays solutions, projects, and files, as well as access to the commands that pertain to them.

solution package (n)~ A compressed file that can be deployed to a server farm or a site. It can contain assemblies, resource files, site and feature definitions, templates, code access security policies, and Web Parts.

solution provider (n)~ The company that defines the offering program for computers running FlexGo technology, including hardware, software, and services; support; financing.

solution publisher (n)~ A partner, such as an ISV, who develops solutions on top of a software platform.

solution repository (n)~ A deployment-wide container of solutions that can be deployed in multiple organizations.

Solutions to Problems (n)~ An item on the Control Panel.

solve order (n)~ The order of evaluation (from highest to lowest solve order) and calculation (from lowest to highest solve order) for calculated members, custom members, custom rollup formulas, and calculated cells in a single calculation pass of a multidimensional cube.

solvency ratio (n)~ An indicator of a company's ability to meet its long-term financial obligations, calculated by dividing net worth by total assets.

Some Adult Assistance May Be Needed (oth)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Some friends (PN)~ The UI label for a permissions setting that indicates an item is being shared with (made available to) only friends who don't have limited access.

Someone (PN)~ The display name UI label used when there isn't a display name value available, as when data can't be retrieved or someone hasn't completely filled out their profile.

Someone on Windows Live (PN)~ The display name UI label used when there isn't a display name value available, as when data can't be retrieved or someone hasn't completely filled out their profile.

someone@example.com (n)~ A sample email address used in Microsoft software and

Help files for demonstration purposes.

Sonata (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 105.

song (n)~ A brief musical composition.

song credit (n)~ Credits used to download songs with a Xbox Music Pass subscription.

Sony/Philips Digital Interface (n)~ A standard for digital transfer of audio.

sort (v)~ To organize information, such as a list of files, in a particular order. For example, a list of files can be sorted alphabetically by name in ascending or descending order.

sort code (n)~ A 6-digit code used by the British and Irish banking industries to identify banks and route money transfers between banks.

sort order (n)~ A way to arrange data based on value or data type. You can sort data alphabetically, numerically, or by date. Sort orders use an ascending (1 to 9, A to Z) or descending (9 to 1, Z to A) order.

sortable managed property (n)~ A managed property whose result set can be sorted based on the property before the result set is returned.

sorting (n)~ A method of arranging data based on the order of specified information. For example, records sorted by class would list all records within a class before moving to records in the next class.

sorting code (n)~ A code that defines how data is sorted in a report.

sorting ID (n)~ A code which dictates the correct order for sorting the characters of a language. The sorting ID is used in conjunction with a locale ID to distinguish between default sorts and alternate sorts for locales which have more than one sorting order.

sorting order (n)~ A way to arrange data based on value or data type. You can sort data alphabetically, numerically, or by date. Sort orders use an ascending (1 to 9, A to Z) or descending (9 to 1, Z to A) order.

Soul (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 42.

Sound (PN)~ The label of the picker box showing a list of Alarms and Alerts.

sound board (n)~ A type of expansion board on PC-compatible computers that allows the playback and recording of sound, such as from a WAV or MIDI file or a music CD-ROM. Most PCs sold at retail include a sound card.

sound card (n)~ A type of expansion board on PC-compatible computers that allows the playback and recording of sound, such as from a WAV or MIDI file or a music CD-ROM. Most PCs sold at retail include a sound card.

Sound Clip (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 37.

sound file (n)~ A file that contains the information a computer uses to play sounds on your computer. Sound files usually have the file extension .wav.

Soundcard ~ Originally an- expansion card- to enable the PC to make sounds more sophisticated than a simple 'beep!'. Now usually built into the motherboard.

SoundSentry (n)~ A Windows feature that produces a visual cue, such as a screen flash or

a blinking title bar, whenever the computer plays a system sound.

Soundtrack (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 24.

source (n)~ A disk, file, document, or other collection of information from which data is taken or moved.

source (n)~ Audio and video content that can be captured and encoded from devices installed on your computer or from a file.

source (n)~ The database in a particular operation that the operation does not modify.

source (n)~ The SSIS data flow component that makes data from different external data sources available to the other components in the data flow.

source (n)~ A synchronization provider that enumerates any changes and sends them to the destination provider.

source (n)~ The web application from which Operations Manager- received the event.

source (n)~ The media that the information is coming from, such as Facebook or Twitter.

source adapter (n)~ A data flow component that extracts data from a data store.

source area (n)~ A cell range that you consolidate in the destination area you specify.

source code (n)~ Human-readable program statements written by a programmer or developer in a high-level or assembly language that are not directly readable by a computer. Source code needs to be compiled into object code before it can be executed by a computer.

source code ~ Computer programs or operating systems are originally written by a human being in a programming language. This is called the source code of the software.

source code configuration file (n)~ A file that Build.exe uses to generate source code. A source code configuration file can be a dirs file, a sources file, or a makefile file.

source code control (n)~ A set of features that include a mechanism for checking source code in and out of a central repository. It also implies a version control system that can manage files through the development lifecycle, keeping track of which changes were made, who made them, when they were made, and why.

source company account (n)~ The legal entity that is the origin of a liability in an intercompany economic transaction.

source control (n)~ A set of features that include a mechanism for checking source code in and out of a central repository. It also implies a version control system that can manage files through the development lifecycle, keeping track of which changes were made, who made them, when they were made, and why.

Source Control Explorer (n)~ A window that is used to view and manage Team Foundation source control items which can include team projects folders and files.

source cube (n)~ The cube on which a linked cube is based.

source data (n)~ The original data on which a computer application is based.

source data (n)~ The list or table that's used to create a PivotTable or PivotChart report. Source data can be taken from an Excel list or range, an external database or cube, or another PivotTable report.

source data integration (n)~ The process of cleansing source data, such as transactional and operational data, and moving it to a data warehouse or a data mart.

source database (n)~ A database on the Publisher from which data and database objects are marked for replication as part of a publication that is propagated to Subscribers. For a database view, the database on which the view is created.

source depot (n)~ An internal version control system that enables people to work on one project from separate workstations and still maintain an up-to-date version of each file.

source details (n)~ Name of the view that has details about the selected source.

source directory (n)~ The folder that contains the file or files to be copied or moved.

source document (n)~ The document where a linked or embedded object was originally created.

source document (n)~ An original record that evidences the occurrence of one or more economic, resource flow, and accounting events. A source document is entered into a system that records, classifies, tracks, and reports on the economic resources exchanged or committed at the time of the event.

source document (n)~ The business documents that trigger a warehouse activity, such as a sales order that triggers an activity to pick an item from inventory.

source document amount (n)~ A monetary amount measurement that is documented on a source document.

source file (n)~ A file that contains the data that a program will process and store in a destination file.

source inventory location (n)~ The inventory location where materials required by a kanban production activity or transfer activity are picked.

source language (n)~ The programming language in which the source code for a program is written.

Source Manager (n)~ A dialog box that allows users to add/remove/organize the list of bibliographic information for the document

source model (n)~ The model from which data will be moved.

source object (n)~ The single object to which all objects in a particular collection are connected by way of relationships that are all of the same relationship type.

source of authority (n)~ The location where Active Directory directory service objects, such as users and groups, are mastered (an original source that defines copies of an object) in a cross-premises deployment.

source of lead (n)~ The source of an account, business contact, or opportunity; for example, an advertisement or personal reference.

source partition (n)~ An Analysis Services partition that is merged into another and is deleted automatically at the end of the merger process.

source program (n)~ The program used to create a linked object or embedded object. To edit the object, you must have the source program installed on your computer.

source provider (n)~ A synchronization provider that enumerates any changes and sends them to the destination provider.

source requirement (n)~ The product quantity documented on a source document line that creates a pegging requirement.

source subscription (n)~ A subscription that is canceled to create a new subscription as a result of a conversion or merge.

source system (n)~ The system in which application and metadata reside before they are

migrated to a different one.

source term (n)~ The term in the source language that is associated with a concept.

Sourced From (n)~ The source where the user was created. It can be an Azure AD, synced from a local directory, or a Microsoft account.

South African National Clearing Code (PN)~ A series of numbers used to identify banks and transaction routing information for South African financial institutes.

Southbridge ~ the chip that controls all of the computers I/O functions, such as USB, audio, serial, the system BIOS, the ISA bus, the interrupt controller and the IDE channels. In other words, all of the functions of a processor except memory, PCI and AGP.

Southern Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 56.

South-North (adj)~ A node placement style that specifies that the nodes are placed south-north in relation to the MOM Management Server.

SOW (n)~ A detailed description of the work that needs to be completed within the scope of a contract.

SOX (PN)~ A U.S. federal law that requires the preservation of records by certain exchange members, brokers, and dealers.

SOX Compliance and Technology Options (n)~ A template that addresses the general activities involved in efforts to achieve more efficient SOX compliance.- This project assumes that the organization is already SOX compliant.

SP (n)~ A tested, cumulative set of all hotfixes, security updates, critical updates and updates, as well as additional fixes for problems found internally since the release of the product. Service packs may also contain a limited number of customer requested design changes or features, and contain all fixes since the previous service pack or RTM.

SP2, SP3 ~ (Service Pack 2, 3 etc)- Microsoft occasionally release a large package of updates for a Windows version, rolling up previous small updates into one package, and patching vulnerabilities which have come to light since the original release. These major packages tend to be called Service Pack and a number.

space (n)~ The approximate location of one or more resources, such as a person, computer, printer, or asset, in a space plan.

Space (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 44.

space (n)~ A personal web presence provided by the Windows Live Spaces service.

space character (n)~ A character that is entered by pressing the SPACEBAR on the keyboard and that typically appears on the screen as a blank space.

Space Explorer (n)~ A window that displays a list of all the spaces in the drawing and all the resources associated with each space.

space gesture (n)~ In Tablet PC Input Panel, an action gesture that performs the same action as pressing the SPACE key on the keyboard.

space plan (n)~ A drawing that uses Space shapes and resource shapes to track the approximate location of resources in a building. A type of building plan.

space saving (adj)~ A chassis type that can be reported by the Win32_SystemEnclosure

class in Windows Management Instrumentation (WMI) and that refers to a chassis that is specifically designed to be compact to save physical space.

SPACEBAR (n)~ A long key occupying much of the bottom row of most keyboards that sends a space character to the computer.

Spaces (PN)~ The link to the user's personal online space, with blog functionality, photo albums, and lists, on Windows Live Spaces.

spacing character (n)~ A character with a non-zero width.

spam (n)~ An unsolicited and typically unwelcome message, often commercial or political in nature, transmitted via the Internet as a mass mailing (sometimes as if from a fictitious user or domain) to a large number of recipients.

Spam ~ Unsolicited bulk advertising, usually via email. Originally a name for mass postings to Usenet- newsgroups- advertising products or services, regardless of their relevance to the newsgroup. (The name comes from a famous Monty Python sketch in which every conversation is interrupted every few- seconds by people shouting 'spam spam spam' at the top of their voices). Sending spam is illegal in most jurisdictions. A spam filter is a program designed to automatically remove spam from your email before you see it and is standard in any corporate email system.

spam ~ An inappropriate attempt to use a- mailing list, or- USENET- or other networked communications facility as if it was a broadcast medium (which it is not) by sending the same message to a large number of people who didn't ask for it.

spam confidence level (n)~ The normalized value that is assigned to an e-mail message. This value indicates, based on the characteristics of the message, such as the content, message header, and so forth, the likelihood that the message is spam. This value is persisted with the message when the message is sent to other Exchange servers.

spam confidence level threshold (n)~ The level at which the content filter feature in Exchange Server takes a specific action on a specific message, such as rejecting a message or deleting a message.

Spam Fighters program (PN)~ The spam-fighting program that Hotmail runs where actual customers classify e-mail messages as junk' or 'not junk.' Because the program is by invitation only

Spam Filter page (n)~ The page that enables users to manage all aspects of their spam filtering and storage.

spam on IM (n)~ Unsolicited commercial instant messages or presence subscription requests sent to multiple users.

Spam Options area (n)~ The area of the Spam Filter page that allows users to select spam storage options.

Spam Quarantine storage option (n)~ The option on the Spam Filter page that redirects mail identified as spam to individual Web-based mailboxes hosted by Exchange Hosted Services servers. Spam is stored for 15 days, and then automatically purged.

Spam Redirection storage option (n)~ The option on the Spam Filter page that redirects mail identified as spam to a single SMTP address within the domain that is set by the administrator.

spam submission (n)~ The submission by users of unfiltered messages to the spam evaluation team at Exchange Hosted Services. Users submit the unfiltered spam messages

with the full Internet headers intact to the organization's abuse alias.

spammer (n)~ A person who sends spam.

spanned volume (n)~ A dynamic volume consisting of disk space on more than one physical disk. You can increase the size of a spanned volume by extending it onto additional dynamic disks. You can create spanned volumes only on dynamic disks. Spanned volumes are not fault tolerant and cannot be mirrored.

SPAP (n)~ A two-way, reversible encryption mechanism for authenticating PPP connections employed by Shiva remote access servers.

Spark (PN)~ An open source project for a fast and general engine for large-scale data processing using an advanced DAG execution engine that supports cyclic data flow and in-memory computing and combines SQL, streaming, and complex analytics for machine learning.

Spark application (n)~ A- driver program- that runs the user'smain- function and executes various- parallel operations- on a cluster.

spark-defaults.conf (n)~ The configuration file where Spark's configurable properties are stored, where each line consists of a key and a value separated by whitespace.

sparkline (n)~ A miniature chart that can be inserted into text or embedded within a cell on a worksheet to illustrate highs, lows, and trends in your data.

sparse array (n)~ An array (arrangement of items) in which many of the entries are identical, commonly zero. It is not possible to define precisely when an array is sparse, but it is clear that at some point, usually when about one-third of the array consists of identical entries, it becomes worthwhile to redefine the array.

sparse column (n)~ A column that reduces the storage requirement for null values at the cost of more overhead to retrieve nonnull values.

sparse file (n)~ A file that is handled in a way that requires much less disk space than would otherwise be needed. Sparse support allows an application to create very large files without committing disk space for those regions of the file that contain only zeros. For example, you can use sparse support to work with a 42-GB file in which you need to write data only to the first 64 KB (the rest of the file is zeroed).

sparsity (n)~ The relative percentage of a multidimensional structure's cells that do not contain data.

spatial (adj)~ Pertaining to the relative position of things in an area.

spatial column (n)~ A table column that contains data of a spatial data type, such as geometry or geography.

spatial data (n)~ Data that is represented by 2D or 3D images. Spatial data can be further subdivided into geometric data (data that can use calculations involving Euclidian geometry) and geographic data (data that identifies geographic locations and boundaries on the earth).

spatial index (n)~ An extended index which provides the ability to index a spatial column.

spatiotemporal (adj)~ Pertaining to something that exists both in space and time.

SPC (n)~ A PKCS #7 signed-data object containing X.509 certificates. The certificate contains the verifiable public key of a trusted software publisher.

SPDIF (n)~ A standard for digital transfer of audio.

speaker (n)~ The microphone and speaker on a calling device/phone that allows you to converse with someone without using the handset or headset.

Speaker Calibration wizard (n)~ A wizard that helps the user to adjust their speakers for the best sound by running automatic calibration tests for levels, delay, and frequency response.

speaker fill (n)~ A System Audio Effects (SYSFX) component used to provide a more immersive audio experience in the Windows Media Player and thus an improved listening experience by utilizing the available speakers that a user has attached to his/her PC by sending audio to all of the speakers, regardless of the number of channels the content contains. This will provide a better sounding experience for stereo and quadraphonic content being rendered on multi-channel playback systems.

speaker phantoming (n)~ An audio effect that can split sounds designed for multiple speakers into fewer speakers.

speaker volume (n)~ An indicator showing the level of sound registered during a conversation.

Speakerphone (adj)~ The name of a device profile that is activated when the device is used as a speaker phone.

speakerphone (n)~ The microphone and speaker on a calling device/phone that allows you to converse with someone without using the handset or headset.

special character (n)~ A character that is not found on your keyboard and must be inserted from within the software or by pressing a combination of keys on your keyboard.

special depreciation allowance (n)~ A deduction from the depreciable basis of qualifying fixed assets taken in the first year of service.

special depreciation ratio (n)~ The depreciation ratio that is used in the calculation of special depreciation for assets.

Special interest (PN)~ The Lifestyle subcategory containing apps for people with interests not found in other categories.

special paper (n)~ Paper that has colored, preprinted patterns or borders on it. You can use these papers to create a colorful and stylish look without a color printer or copier.

special permissions (n)~ On NTFS volumes, a custom set of permissions. You can customize permissions on files and directories by selecting the individual components of the standard sets of permissions.

special skill (n)~ Capability, knowledge, and aptitude that are relatively rare.

specialization (n)~ A specific focus areas which is a subset of the Microsoft Partner Program Competencies.

specialized device (n)~ A new type of device that we don't have built-in support for in Windows.

Specialized Device Access Model (PN)~ The model that describes the two ways that a Windows Store app can access a specialized device: Open Access Model and Restricted Device Access Model.

specification (n)~ In information processing, a description of the data records, programs, and procedures involved in a particular task.

specifier (n)~ The name given to a programming entity, such as a class or a variable.

SPECT (n)~ A type of computed tomography (CT) scan in which a small amount of a

radioactive drug is injected into a vein.

spectrum ~ A continuous range of frequencies, usually wide in extent, within which waves have some specific common characteristics.

specular material (n)~ A type of material that controls the color of the specular highlight on a 3D object.

Speech (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 101.

Speech (PN)~ A phone feature that enables speech recognition, pressing and holding the Start button.

Speech API (n)~ A feature in some versions of Windows that allows applications to include speech recognition or convert text to speech.

speech input (n)~ Text that is entered by dictating into a microphone.

speech recognition (n)~ The ability to interpret vocal commands or convert spoken words into computer-readable text. Speech recognition programs enable you to control an application or enter text by speaking into a microphone, rather than by using a keyboard.

speech recognition engine (n)~ The component of Speech Engine Services (SES) that converts spoken input to text and delivers the text to an application. SES is a component of Speech Server.

speech recognition profile (n)~ The results from your speech training and the recognition settings that you chose.

speech synthesis (n)~ A feature that developers use to create spoken words from text in an app.

Speech-to-Speech Translation ~ involves translating one spoken language into another. It combines- speech recognition, machine translation and text-to-speech technology.

speed bump (n)~ A control that slows down the speed of panning from a user interaction.

speed dial (n)~ A single- or double-digit number associated with telephone numbers, or e-mail or Web addresses, that enables users to quickly access the numbers or addresses.

Speed Dial (n)~ A menu item that enables the user to quickly access telephone numbers or e-mail or Web-addresses through an associated list of single or double-digit numbers.

speed dial (n)~ A feature where users can add contacts that they call frequently so that they can get to their numbers quickly rather than going through the Contact list in People.

speed dial key (n)~ A single- or double-digit number associated with telephone numbers, or e-mail or Web addresses, that enables users to quickly access the numbers or addresses.

speed dial list (n)~ A list of single or double-digit numbers associated with telephone numbers, or e-mail or Web-addresses, that enables users to quickly access the numbers or addresses.

speed dial number (n)~ A single- or double-digit number associated with telephone numbers, or e-mail or Web addresses, that enables users to quickly access the numbers or addresses.

speed dialing (n)~ A process by which a user presses and holds a key on their mobile phone keypad to dial a specific phone number.

Speed Up, Double (v)~ A filter effect in Windows Movie Maker.

spell tuning processor (n)~ A processor used to fine-tune a spelling checker dictionary.

spelling checker (n)~ A feature or tool that helps users check for and correct misspellings in a document.

Spelling pane (PN)~ A pane that provides functionality to correct spelling errors in your document.

Spelling Service (PN)~ A Web service that provides spelling checker functionality.

spend (n)~ An expenditure in the procurement domain.

spending limit (n)~ A feature in Microsoft Azure that protects users from accidentally incurring charges for usage beyond the included offer monthly amount by disabling the service for the remainder of that billing month.

SPF (n)~ An extension of the SMTP protocol that prevents spammers from forging the From: fields in e-mail messages by verifying that the IP address in the SMTP Received: header is authorized to send e-mail for the sender's domain.

spherical projection (n)~ The result of projecting an image onto a sphere.

SPID (n)~ An 8-digit to 14-digit number that identifies the services that you order for each B-channel. For example, when you order Primary Rate ISDN, you obtain two phone numbers and two SPIDs from your Integrated Services Digital Network (ISDN) provider. Typical ISDN adapters cannot operate without configuring SPIDs.

Spike (n)~ A special AutoText entry that stores multiple deletions. Microsoft Office Word appends one item to another until you paste the contents as a group in a new location in your document. You can also use the Microsoft Office Clipboard to get the same result.

Spim (n)~ Unsolicited commercial instant messages or presence subscription requests sent to multiple users.

spin box (n)~ A control (composed of a text box and spin button control) that allows a user to adjust a value from a limited range of possible values.

Spin, In (v)~ A title animation in Windows Movie Maker.

Spin, out (v)~ A title animation in Windows Movie Maker.

spindle (n)~ Any drive included within the chassis of a laptop or other portable computer. A laptop including a floppy disk drive and a hard drive would be considered a two-spindle machine.

spinlock (n)~ A locking mechanism associated with a global data structure. This mechanism ensures that only one thread can get access to the data structure at any given time.

splash screen (n)~ An initial screen displayed by interactive software, usually containing a logo, version information, author credits, or a copyright notice.

splatted variable (n)~ A variable passed as a command argument where the variable sigil -€˜$' has been replaced with -€˜@'. The contents of a variable passed this way will be -€œsplatted-€? by the runtime rather than being passed as a single argument.

spline (n)~ A curved line, made up of segments and defined by control points.

splined interpolation (n)~ One of three methods used to describe how an animation transitions between values over its duration. This method uses a Bezier curve to describe how the animation transitions between key frames. The Bezier curve starts at zero, which corresponds to the current key frame value, and ends at one (the next key frame's value). By altering the curve's two control points, you alter the animation's progress curve.

split (v)~ To divide an audio or video clip into two clips.

split (n)~ The total amount of time up to a given point that the user marks while using the stopwatch. After marking a split, the stopwatch continues running in the background.

split access token (n)~ A combination of full access token and filtered access token linked together by the local security authority (LSA) component of the operating system.

split bar (n)~ A division between window panes in a split window; the split bar visually separates window panes.

split box (n)~ A special control added to a window, typically adjacent to the scroll bar, that allows a user to split a window or adjust a window split.

split brain syndrome (n)~ A state in which one or more of the nodes in a cluster cannot communicate with the other cluster nodes. In this case, the cluster may be split into two or more partitions that cannot communicate with each other.

split button (n)~ A drop-down button that performs a default action and can also expand to a list of other possible actions.

split domain (n)~ A Simple Mail Transfer Protocol (SMTP) address space or domain suffix that is shared by two different messaging systems. For example, you may have to share the SMTP address space between Microsoft Exchange and a third-party e-mail system, or between Exchange environments that are configured in different Active Directory forests. In these scenarios, users in each e-mail system have the same domain suffix as part of their e-mail addresses.

split form (n)~ A form in which two views are displayed at the same time. These are synched so that as your focus moves in one view it is changed automatically in the other view.

split gesture (n)~ A revision gesture that is used to add space within a word (split words).

split keyboard mode (n)~ A keyboard layout in which the onscreen keyboard can be split into two halves, resulting into two halves of the keyboard towards the edge of the screen.

split source document (n)~ A source document that documents partial product quantities and monetary amounts from one referenced document of the same class.

split stack layout (n)~ A layout style in which each end of the ToolStrip is the base of a stack, with some items stacked at the head and other items stacked at the tail. Items are stacked from the ends in.

split task (n)~ A task that is scheduled for non-contiguous periods of time. For example, a two-day task that does not require contiguous work might be split so that the first day of work is scheduled for Monday, and the second day is scheduled for Thursday.

split testing (n)~ A method of marketing testing by which a baseline control sample is compared to a variety of single-variable test samples to improve response rates.

split time (n)~ The time recorded for an interval or a segment of a race.

split view (n)~ A view that allows the user to see both a form and a datasheet at the same time.

Split view (n)~ A view that allows the user to see both Code view and Design view at the same time.

splitter ~ A simple device that takes one input and sends it to several identical ports without amplification.

splitter function (n)~ A function used to split the specified columns into a set of additional columns using the specified splitter.

splitting (n)~ The process of separating the copy of the file inside Briefcase from the copy outside Briefcase.

SPM (PN)~ The entity in the operating system that decides on and manages performance and power settings for certain user scenarios.

SPN (n)~ The name by which a client uniquely identifies an instance of a service. It is usually built from the DNS name of the host. The SPN is used in the process of mutual authentication between the client and the server hosting a particular service.

spoken word (n)~ Human voice.

sponsor (n)~ An individual who initiates and approves a project and its results.

sponsored site (n)~ Another site promoted by the host site.

sponsorship (n)~ An advertiser's association with a Web site that can involve financial or material support in return for increased visibility perceived advantage over run-of-site advertising and a targeted audience.

Sponsorship Wizard (PN)~ A wizard that enables users to set up multiple records for sponsorship items, such as booths, signs, or banners, for an event quickly and easily.

spoof (v)~ To make a transmission appear to come from a user other than the user who performed the action.

spoofed mail (n)~ An e-mail message whose sending address has been modified to appear as though it originates from a sender other than the actual sender of the message.

spoofing ~ A process whereby a router responds to keep alive messages from a host rather than passing them on the remote client, thus saving call charges. Used mainly in- ISDN

spoofing ~ Of an e-mail message or network packet, falsely claiming to be from an address different from that from which it actually originated.

spool / spooler ~ Temporary storage of batch data until it is ready to be handled (for example, by a processor or printer).

spool / spooler ~ Spooler: A program that handles print jobs and places them in a queue for distribution and printing on one or more printers.

spooler (n)~ Hardware or software that stores data temporarily for later processing.

spooling (n)~ A process on a server in which print documents are stored on a disk until a printer is ready to process them. A spooler accepts each document from each client, stores it, then sends it to a printer when the printer is ready.

Sports (PN)~ An application that allow the user to follow sports headlines, teams, scores, schedules and standings.

sports (PN)~ An app category that provides news or other information about organized sports.

Sports (PN)~ An app category that provides news or other information about organized sports.

Sports (PN)~ A game category that simulates a sport or recreational activity.

Sports & activities (PN)~ The Kids & family app subcategory containing apps for people who enjoy sports and recreational activities.

sports + recreation (PN)~ A game category that simulates a sport or recreational activity.

Sports Scoreboard (n)~ A title animation in Windows Movie Maker that makes the title slide in from the top and then quickly disappear.

spot (n)~ A short presentation or commercial on television or radio between major

programs.

spot color (n)~ A premixed color matched to a standard color guide, such as PANTONE.

Spot Corruption Handling (PN)~ An error-handling function of NTFS that is targeted only to corrupted areas to avoid lengthy checkdisk operations.

Spot Fixer (PN)~ A process that repairs any errors that the online scan detects.

spot light (n)~ A type of light that is cast like a real spot light. The light starts from the position of the light and spreads out in the shape of a cone. Parts of a 3D object outside the cone of light cast will not be affected by the spot light.

spot metering (n)~ In photography, a method of calculating exposure whereby only a tiny point of the scene is taken into account.

Spot Verifier (PN)~ A process that verifies and eliminates lengthy chkdsk due to any transient errors that NTFS detects.

spot-check report (n)~ A report generated for a published app after a spot check has been done.

Spotlight (n)~ A home page pane with links to online services, program-specific features, help topics, or other information.

spotlight (PN)~ A screen in the store that highlights new and updated games, apps, and music.

spotlight (n)~ A category of products given special prominence in the Store via editorial programming.

Spotlight (PN)~ The filter that shows videos or channels that are curated by the Office 365 Video administrator or channel administrator and highlighted in the portal or channel home so that all users can see them.

Spotlight Site (n)~ A listing or document selected as the best recommendation in the Site Directory.

SPP Notification Service (PN)~ A Windows service that provides software licensing activation and notification.

spread (n)~ A small overlap that extends the shape of the upper of two differently colored, abutting objects. A spread extends beyond the area that it knocks out.

spread by ratio (v)~ To spread a non-leaf-level value to all leaf-level members while maintaining the ratio between the non-leaf-level and leaf-level members.

spread evenly (v)~ To enter a non-leaf-level value and spread it evenly over all leaf-level cells.

spreading (n)~ The process of entering data at a non-leaf level and distributing the data automatically to the leaf level while maintaining data consistency within the model.

spreadsheet (n)~ An application commonly used for budgets, forecasting, and other finance-related tasks that organizes data values using cells, where the relationships between cells are defined by formulas. A change to one cell produces changes to related cells. Spreadsheet programs usually provide graphing capabilities for output and a variety of formatting options for text, numeric values, and graph features.

Spreadsheet ~ A- program- used for doing calculations and setting up financial balance sheets, indispensable for accountants and managers. The best known is Microsoft Excel.

Spreadsheet Compare (PN)~ A Microsoft Office product that detects and categorizes changes between two spreadsheets to facilitate review and approval processes.

Spreadsheet Component (n)~ A Microsoft Office Web Component that provides the interactive functionality of a spreadsheet on a Web page. You can enter data, add formulas and functions, apply filters, change formatting, and recalculate.

Spreadsheet Inquire (PN)~ A Microsoft Office product that provides interactive diagnostics to identify errors, deviations from spreadsheet best practices and insights into data flow in and out of the spreadsheet.

Spreadsheet Management (PN)~ A set of features in the Office 365 Compliance center that provides customers with the ability to understand and control the use of their spreadsheets.

spreadsheet program (n)~ An application commonly used for budgets, forecasting, and other finance-related tasks that organizes data values using cells, where the relationships between cells are defined by formulas. A change to one cell produces changes to related cells. Spreadsheet programs usually provide graphing capabilities for output and a variety of formatting options for text, numeric values, and graph features.

spreadsheet report view (n)~ A report view that provides interactive functionality for a spreadsheet on a Web page.

sprint (n)~ In the Scrum method of agile software development, work is confined to a regular, repeatable work cycle, known as a sprint or iteration. In by-the-book Scrum, a sprint is 30 days long, but many teams prefer shorter sprints, such as one-week, two-week, or three-week sprints. But how long each sprint lasts is something for the team to decide, who must weigh the advantages or disadvantages of a longer or shorter sprint for their specific development environment. The important thing is that a sprint is a consistent duration.

SPRJ file (n)~ An XML-based file in which the Sequencer stores its Exclusion Items and Parse Items information. The SPRJ file is used heavily in the creation of application records as well as during an upgrade to a package.

SPX (n)~ The transport level (ISO/OSI level 4) protocol used by Novell NetWare. SPX uses IPX to transfer the packets, but SPX ensures that messages are complete.

SpyNet (n)~ A voluntary worldwide community of Windows AntiSpyware users that plays a key role in determining which suspicious programs are classified as spyware by reporting potential spyware to Microsoft. Any user can choose to join SpyNet. Signatures are created for programs that are identified as spyware and made available to all users.

SpyNet Community Rating (n)~ Information provided by the SpyNet community which shows the percentage of users who allowed or blocked a particular program. This information is available even before they confirm whether or not a program is spyware.

spyware (n)~ A program that collects information, such as the web sites a user visits, without adequate consent. Installation may be without prominent notice or without the user's knowledge.

Spyware ~ Programs, typically installed by stealth, which record what you do on your PC and send reports to criminals, allowing them to steal your bank details, passwords and so on. See also- Malware.

SQL (n)~ A database query and programming language widely used for accessing, querying, updating, and managing data in relational database systems.

SQL adapter (n)~ An adapter that exchanges information between BizTalk Server and a

SQL Server database.
SQL Agent service (n)~ The SQL Server agent (SQLAgent$MICROSOFT$DPM$) that manages the DPM jobs schedule.
SQL Azure fabric (n)~ A distributed computing system composed of tightly integrated networks, servers, and storage. The SQL Azure fabric enables automatic failover, load balancing, and automatic replication between physical servers.
SQL Azure Reader (PN)~ The Azure ML module to import data from Azure SQL into an experiment from data management services outside Azure Machine Learning Studio.
SQL Data Sync (PN)~ The capability or feature of SQL Database that shares data across multiple SQL Database instances and SQL Server databases.
SQL Data Sync Preview (PN)~ An initial version of SQL Data Sync.
SQL Data Warehouse (PN)~ A service type of the Data Services service.
SQL database (n)~ A database based on Structured Query Language (SQL).
SQL Database (PN)~ The Microsoft-hosted database and web services that enable relational queries, search, and data synchronization with mobile users, remote offices, and business partners, which can store and retrieve structured, semi-structured, and unstructured data.
SQL Database instance (n)~ An individual database instance of the SQL Database service in Microsoft Azure.
SQL Database Premium (PN)~ The edition of Microsoft Azure SQL Database that offers access to built-in business-class functionality and reserved capacity.
SQL Database Web Edition (PN)~ The edition of Microsoft Azure SQL Database that offers relational databases run (up to 5 GB) on shared resources, with built-in replicas within a datacenter, and dynamic scale-out of thousands of distributed databases.
SQL dependency (n)~ The dependency that makes one object reliant on another object.
SQL expression (n)~ Any combination of operators, constants, literal values, functions, and names of tables and fields that evaluates to a single value.
SQL injection attack (n)~ An attack that attempts to compromise your database (and potentially the computer on which the database is running) by creating SQL commands that are executed instead of, or in addition to, the commands that you have built into your application.
SQL Native Client (n)~ A stand-alone data access API that is used for both OLE DB and ODBC.
SQL persistence provider (n)~ A persistence provider that is included in the .NET Framework that saves and restores workflow instances to and from a SQL Server database.
sql query (n)~ An SQL statement, such as SELECT, INSERT, UPDATE, DELETE, or CREATE TABLE.
SQL Reporting (PN)~ The cloud-based reporting service for the Microsoft Azure Platform built on SQL Server Reporting Services technologies.
SQL Reporting hour (n)~ A unit of measure of time for Microsoft Azure SQL Reporting.
SQL Server (n)~ A family of Microsoft relational database management and analysis systems for e-commerce, line-of-business, and data warehousing solutions.
SQL Server 2005 Express Edition (n)~ An edition of a Microsoft relational database

design and management system for e-commerce, line-of-business, and data warehousing solutions.

SQL Server 2005 Mobile Edition (n)~ SQL Server product name (edition)

SQL Server Agent (PN)~ A Microsoft Windows service that executes scheduled administrative tasks, which are called jobs, and stores the information in SQL Server.

SQL Server Analysis Services (n)~ A feature of Microsoft SQL Server that supports online analytical processing (OLAP) and data mining for business intelligence applications. Analysis Services organizes data from a data warehouse into cubes with precalculated aggregation data to provide rapid answers to complex analytical queries.

SQL Server Analysis Services cube (n)~ (Analysis Services cube for short.) A conceptual view, consisting of descriptive categories (dimensions) and quantitative values (measures). The generic industry term is OLAP data cube."

SQL Server Browser (PN)~ The Windows service that listens for incoming requests for Microsoft SQL Server resources and provides information about SQL Server instances installed on the computer.

SQL Server Client Tools (PN)~ SQL Server client tools are used to establish connection directly to SQL Server databases.

SQL Server Compact (PN)~ A Microsoft relational database management and analysis system for e-commerce, line-of-business, and data warehousing solutions.

SQL Server component (n)~ A SQL Server program module developed to perform a specific set of tasks - e.g., data transformation, data analysis, reporting.

SQL Server computer (n)~ A computer running Microsoft SQL Server with a configured database.

SQL Server Configuration Manager (PN)~ A tool to manage the services associated with SQL Server, to configure the network protocols used by SQL Server, and to manage the network connectivity configuration from SQL Server client computers.

SQL Server Connection Director (PN)~ A connectivity technology where applications based on different data access technologies (.NET or native Win32) can share the same connection information. Connection information can be centrally managed for such client applications.

SQL Server Data Mining Content Viewer (PN)~ A viewer that displays the content that is contained in the content schema rowset of the mining model.

SQL Server Data Mining Content Viewer Controls (PN)~ A set of server-side controls that allow a user to browse complex mining models from any computer that has Microsoft Internet Explorer installed.

SQL Server Data Quality Services (PN)~ A knowledge-based data-quality system that enables users to perform knowledge discovery and management, data cleansing, data matching, integration with reference data services, and integrated profiling.

SQL Server Data Tools (PN)~ A set of tools that provide functionalities for both data-tier and app-tier developers to perform all their development work against any SQL Server platform within Visual Studio.

SQL Server data-tier application project (n)~ A Visual Studio project used by database developers to create and develop a DAC. DAC projects get full support from Visual Studio and VSTS source code control, versioning, and development project management.

SQL Server Enterprise (PN)~ The SQL Server edition for mission critical applications, enterprise business intelligence and data warehousing.

SQL Server Express 2012 SP1 (PN)~ SQL Server 2012 Express with SP1 is a free, feature-rich edition of SQL Server that is ideal for learning, developing, powering desktop, web & small server applications, and for redistribution by ISVs. SQL Server 2012 SP1 Express release includes the full version of SQL Server 2012 Management Studio with SP1 instead of SQL Server 2012 Management Studio Express.

SQL Server instance auto-protection (n)~ A type of protection that enables DPM to automatically identify and protect databases that are added to instances of SQL Server that are configured for auto-protection.

SQL Server Integration Services (PN)~ A feature of Microsoft SQL Server used to import, export, and transform data from different data sources.

SQL Server login (n)~ An account stored in SQL Server that allows users to connect to SQL Server.

SQL Server Management Objects (PN)~ An application programming interface that supports the incorporation of SQL Server administration into any COM or OLE Automation application.

SQL Server Management Studio (PN)~ A suite of management tools included with Microsoft SQL Server for configuring, managing, and administering all components within Microsoft SQL Server.

SQL Server Master Data Services (PN)~ A master data management application to consistently define and manage the critical data entities of an organization.

SQL Server Native Client (PN)~ A stand-alone data access API that is used for both OLE DB and ODBC.

SQL Server object (n)~ An entity within SQL Server.

SQL Server Object Explorer (PN)~ The section of the Visual Studio integrated development environment (IDE) that contains nodes that represent database objects.

SQL Server PDW (n)~ A scalable data warehouse appliance that delivers performance and scalability through massively parallel processing (up to hundreds of terabytes), using SQL Server databases for distributed processing and data storage.

SQL Server PowerPivot for Excel (PN)~ A SQL Server add-in for Excel.

SQL Server profile (n)~ A Virtual Machine Manager library resource that contains instructions for customizing an instance of Microsoft SQL Server for a SQL Server data-tier application (DAC) when you deploy a virtual machine as part of a service.

SQL Server Profiler (n)~ A graphical user interface for monitoring an instance of the SQL Server database engine or an instance of Analysis Services.

SQL Server report view (n)~ A report view in the form of a SQL Server report, which uses the analysis features of SQL Server 2000 Reporting Services.

SQL Server Reporting Services (PN)~ A server-based report generation environment for enterprise, Web-enabled reporting functionality so you can create reports that draw content from a variety of data sources, publish reports in various formats, and centrally manage security and subscriptions.

SQL Server service (n)~ The SQL Server service that manages the DPM database.

SQL Server Service Broker (PN)~ A technology that helps developers build scalable,

secure database applications.

SQL Server Standard (PN)~ The SQL Server edition for basic database, reporting and analytics capabilities.

SQL Server Store for Office Applications (PN)~ A SQL Server feature that enables storage of data from an Office application on a SQL server.

SQL Server Trace (n)~ A set Transact-SQL system stored procedures to create traces on an instance of the SQL Server Database Engine.

SQL Server Utility (PN)~ A way to organize and monitor SQL Server resource health. It enables administrators to have a holistic view of their environment.

SQL Server Utility dashboard (n)~ A dashboard that provides an at-a-glance summary of resource health for managed SQL Server instances and data-tier applications. Can also be referred to as the SQL Server Utility detail view or the list view with details.

SQL Server Utility Explorer (n)~ A hierarchical tree displaying the objects in the SQL Server Utility.

SQL Server Utility viewpoints (n)~ A feature of SQL Server Utility that provides administrators a holistic view of resource health through an instance of SQL Server that serves as a utility control point (UCP).

SQL Server Web (PN)~ The edition of Microsoft Azure SQL Database that offers relational databases run (up to 5 GB) on shared resources, with built-in replicas within a datacenter, and dynamic scale-out of thousands of distributed databases.

SQL statement (n)~ An SQL or Transact-SQL command, such as SELECT or DELETE, that performs some action on data.

SQL Trace (n)~ A set Transact-SQL system stored procedures to create traces on an instance of the SQL Server Database Engine.

SQL view (n)~ A window that displays the SQL statement for the current query or that is used to create an SQL-specific query (union, pass-through, or data definition). When you create a query in Design view, Access constructs the SQL equivalent in SQL view.

SQL writer (n)~ A VSS compliant writer provided by the SQL Server that handles the VSS interaction with SQL Server.

SQL Writer Service (PN)~ A service that permits Windows backup programs to copy SQL Server data files through the Volume Shadow Copy Service framework, while SQL Server is running.

sql_variant (n)~ A data type that stores values of several data types, except for text, ntext, image, timestamp, and sql_variant types. It is used in a column, parameter, variable, or return value of a user-defined function.

SQL-92 (PN)~ The version of the SQL standard published in 1992.

SQL-specific query (n)~ A query that consists of an SQL statement. Subqueries and pass-through, union, and data-definition queries are SQL-specific queries.

SQM (n)~ Technology a user can enable that allows data relating to application use/performance/errors to be collected and sent to Microsoft, thus allowing Microsoft to continue to improve the product based on actual user data.

SQM Data Collection (PN)~ A system job that collects quality and performance information and sends it to Microsoft for analysis.

square cap (n)~ For paths that contain unconnected ends, the end of the stroke that is

extended to be squared off.

square tile (n)~ A square tile of 150 x 150 pixels on the Start screen.

SR (n)~ A request from a customer for a service.

SR number (n)~ A numeric identifier for a service request.

SRAM (n)~ A form of semiconductor memory (RAM) based on the logic circuit known as a flip-flop, which retains information as long as there is enough power to run the device. Static RAM is usually reserved for use in caches.

sRGB (n)~ A standard color space that enables various devices including cameras, scanners, displays, and printers to produce reasonably identical colors. scRGB is optimized for greater than 8 bits per channel with a gamma of 1.0, and white point and primaries identical to sRGB. The scRGB color space is based on sRGB but offers a larger color gamut and precision by encoding values over 1.0 (white) and under 0.0 (black) with more bits per channel.

SR-IOV (n)~ Functionality that enables SR-IOV-€"capable devices, e.g. network adapters, to be assigned directly to virtual machines.

SRP (n)~ A logical unit consisting of shared servies and shared resources. A farm could have multiple SRPs.

SRV record (n)~ A category of data in the Internet Domain Name System that specifies information on available services. The SRV record is used to locate domain controllers for Active Directory.

SRV resource record (n)~ A resource record used in a zone to register and locate well-known TCP/IP services. The SRV resource record is specified in RFC 2782, and it is used to locate domain controllers for Active Directory.

SSAS (oth)~ A feature of Microsoft SQL Server that supports online analytical processing (OLAP) and data mining for business intelligence applications. Analysis Services organizes data from a data warehouse into cubes with precalculated aggregation data to provide rapid answers to complex analytical queries.

SSCC (n)~ A standardized 18-digit label that uniquely identifies each unit to be transported or stored.

SSD (n)~ A primary storage device based on solid-state memory, such as flash memory, that provides nonvolatile storage with benefits of performance, reliability and power saving.

SSD ~ (Solid State Drive)- A technology that replaces the conventional hard disk, particularly in laptops, with a device that behaves exactly like a hard disk but uses memory instead of magnetic storage. It is very much faster than even the fastest hard disks and is now standard on high-end laptops and notebooks, and often retrofitted into PCs as well.

SSD Based Instance (n)~ One or more volumes providing temporary block-level storage using solid-state memory storage devices.

SSDL (n)~ An XML-based language that is used to define the entity types, associations, entity containers, entity sets, and association sets of a storage model, often corresponding to a database schema.

SSDT (PN)~ A set of tools that provide functionalities for both data-tier and app-tier developers to perform all their development work against any SQL Server platform within

Visual Studio.

SSI (n)~ A mechanism for including dynamic text in World Wide Web documents. Server-side includes are special command codes that are recognized and interpreted by the server; their output is placed in the document body before the document is sent to the browser. Server-side includes can be used, for example, to include the Date and Time stamp in the text of the file.

SSID (n)~ A unique set of letters or numbers that identifies a wireless network. For a computer or device to connect to a wireless network, it must supply that network's SSID. An SSID can be up to 32 characters.

SSIS (PN)~ A feature of Microsoft SQL Server used to import, export, and transform data from different data sources.

SSL (PN)~ The protocol that improves the security of data communication by using a combination of data encryption, digital certificates, and public key cryptography. SSL enables authentication and increases data integrity and privacy over networks. SSL does not provide authorization or nonrepudiation.

SSL 128 (n)~ An encryption level used for SSL. The number refers to the length of the key, so the higher the number, the more difficult the encryption is to break.

SSL certificate (n)~ A certificate used to provide SSL. It encrypts traffic and verifies the identity of the server.

SSL client certificate (n)~ A certificate that contains information that identifies the user, as well as information about the organization that issued the certificate.

SSL client certificate mapping authentication (n)~ A method of authentication where certificates are used on the client and a mapping is made on the server (or possibly on the Active directory domain controller) to determine which client certificates should be allowed access to the site.

SSL connection (n)~ A connection established over a secure HTTPS channel.

SSN (n)~ In the United States, a Taxpayer Identification Number assigned to citizens and some noncitizens. The number is required for anyone to obtain work or to receive governmental benefits, such as social security payments after retirement.

SSO (n)~ An authentication process that permits a user to log on to a system once with a single set of credentials to access multiple applications or services.

SSOD (n)~ A daemon on a Windows-based computer that receives an encrypted password and decrypts it before requesting a password change on the UNIX host.

SSP (n)~ A dynamic-link library (DLL) that implements the Security Support Provider Interface (SSPI) by making one or more security packages available to applications. Each security package provides mappings between an application' SSPI function calls and an actual security model' functions. Security packages support security protocols such as Kerberos and NTLM.

SSP (n)~ A logical grouping of shared services and their supporting resources.

SSPI (n)~ A common interface between transport-level applications, such as Microsoft Remote Procedure Call (RPC), and security support providers (SSPs), such as Windows Distributed Security. SSPI allows a transport application to call one of the SSPs to obtain an authenticated connection. These calls do not require extensive knowledge of the security protocol's details.

STA (n)~ An apartment that consists of exactly one thread.

stabilization (n)~ A technique that increases sharpness and fidelity by compensating for some effects that camera movement has on images in videos.

stack (n)~ A region of reserved memory, organized as a stack, in which programs temporarily store status data such as procedure and function call return addresses, passed parameters, and local variables.

stack (n)~ A collection of related files depicted visually as a pile. Stacks are organized by common file properties such as author or keyword.

stack (v)~ To position two or more objects so that they have a specific amount of space between, either vertically or horizontally.

stack (n)~ A feature that lets you position two or more objects so that there is a specific amount of space between them vertically or horizontally.

stack (v)~ To group very similar photos together in the Photos app,- and show only- one (the best shot) in the list view of your photos.

stack (n)~ A group of very similar photos that have been grouped together by the Photos app. The app- shows only the best- photo of the stack- in the list view.

Stack (PN)~ The Sway group card that shows individual pieces of content sequentially, as a skeuomorphic stack.

stack frame (n)~ The activation record for an assembly language routine, established by its prolog.

stack layout (n)~ A layout style in which adjacent items align against each other as though they were stacked, always taking up the free space in between the items.

stack order (n)~ The order in which objects are placed in a layer. An object higher in the stack will cover up (appear on top of) one lower in the stack.

stack panel (n)~ A layout container that arranges its child elements in a single vertical or horizontal row.

stack rank (n)~ An ordering of items for prioritization.

stack segment (n)~ A portion of a reserved memory area, or stack.

Stack Selector Web Part (PN)~ A feature that enables users to show more than one view in a single location on a dashboard, and provides a control to switch between them.

stack trace (n)~ A report that lists the sequence or heirarchy of nested procedure calls made by a program up to the current procedure call.

stacked (adj)~ Pertaining to a type of layout consisting of a collection of -€œRow-Wise Groupings-€?. A stacked layout most resembles a form with name/value pairs (label, textbox).

stacked bar chart (n)~ A bar chart subtype that shows the relationship of individual items to the whole.

stacked column chart (n)~ A column chart subtype that shows the relationship of individual items to the whole, comparing the contribution of each value to a total across categories.

stacked fraction (n)~ A fraction that is written vertically with the numerator on the top and the denominator below, with a horizontal fraction bar between them.

Stacked List (PN)~ A SmartArt graphic layout used to show groups of information or steps in a task, process, or workflow. Circular shapes contain Level 1 text, and the

corresponding rectangles contain Level 2 text. Works well for numerous details and minimal Level 1 text.

Stacked Venn (PN)~ A SmartArt graphic layout used to show overlapping relationships. A good choice for emphasizing growth or gradation. Works best with Level 1 text only. The first seven lines of Level 1 text correspond to a circular shape. Unused text does not appear, but remains available if you switch layouts.

stacking order (n)~ The order in which shapes overlap other shapes on the page and the order in which shapes are selected.

Staff picks (PN)~ The collection title for items recommended by a specific real-life staff member who is identified on the site.

stage (n)~ An element of workflow logic that groups steps. Adding stages to a workflow does not affect how the steps function. Stages are purely for conceptual grouping of steps within complex workflows.

stage bin (n)~ The location where items are placed for internal operations.

stage view (n)~ A high-level view in Visual Designer that shows the stages of a SharePoint workflow, rather than individual actions or conditions.

staged data (n)~ Data imported into staging tables during the staging process in SQL Server Master Data Services.

staged deletion (n)~ A type of deletion that occurs after processing the relevant rule of a deletion policy to automatically delete items in a site collection within a specified time period.

staged edition (n)~ An edition that is present on the system, but not installed. All the files/components that are a part of the edition are present, but cannot be used yet. The edition can later be installed, essentially upgrading from something like Home Premium to Ultimate. Staged editions are used as part of the Windows Anytime Upgrade feature and AllBits feature.

staged migration (n)~ A type of e-mail migration that migrates a subset of on-premises mailboxes to the cloud. This type of migration allows the admin to maintain coexistence between their on-premises and cloud-based e-mail organizations.

staged read-only domain controller installation (n)~ A process in which a read-only domain controller (RODC) is installed in two stages. In the first stage, a highly privileged user, such as a member of the Domain Admins group, creates an account for the RODC. In the second stage, a delegated user attaches the server that will be the RODC to the account that was created for it.

staged RODC installation (n)~ A process in which a read-only domain controller (RODC) is installed in two stages. In the first stage, a highly privileged user, such as a member of the Domain Admins group, creates an account for the RODC. In the second stage, a delegated user attaches the server that will be the RODC to the account that was created for it.

Staggered Process (PN)~ A SmartArt graphic layout used to show a downward progression through stages. Each of the first five lines of Level 1 text corresponds with a rectangle. Unused text does not appear, but remains available if you switch layouts.

staging (n)~ The process of running a management agent that imports data from a connected data source into the connector space, and then immediately stopping the run.

staging (n)~ The process used in SQL Server Master Data Services to import data into staging tables and then process the staged data as a batch prior to importing it into the master database.-

staging database (n)~ A database that is used to transition data into the PerformancePoint Server system from an external data source, or to transition data from the PerformancePoint Server system to an external database.

staging environment (n)~ A deployment area in a Microsoft Azure cloud service that mirrors the production environment and allows the service to be tested before deploying it to production.

staging folder (n)~ A private folder that acts as a cache for new and changed files that are ready to be replicated from sending members to receiving members. These files are stored under the local path of the replicated folder in the DfsrPrivate\Staging folder.

staging process (n)~ The process used in SQL Server Master Data Services to import data into staging tables and then process the staged data as a batch prior to importing it into the master database.-

staging queue (n)~ The batch table in SQL Server Master Data Services where staged records are queued as batches to be processed into the Master Data Services database.

staging table (n)~ A table in SQL Server Master Data Services that is populated with business data during the staging process.

staging Web site (n)~ A Web site that is maintained on a private file or Web server.

stakeholder (n)~ An individual or organization that is actively involved in a project, or whose interests may be positively or negatively affected as a result of project execution or project completion.

stalemate (n)~ In chess, a position in which the king is the only piece that can move and the only possible move is into check.

Stamp tool (n)~ An annotation tool used to add an arrow, check mark, or X to a slide.

Stamp tool (n)~ A tool that allows the user to add multiple copies of a shape to a drawing.

standalone (adj)~ Of, pertaining to, or being a device that does not require support from another device or system, for example, a computer that is not connected to a network.

Standalone ~ A computer not connected to any kind of network.

stand-alone (adj)~ Of, pertaining to, or being a device that does not require support from another device or system, for example, a computer that is not connected to a network.

stand-alone CA (n)~ A certification authority (CA) that is not integrated with Active Directory.

stand-alone certification authority (n)~ A certification authority (CA) that is not integrated with Active Directory.

stand-alone DFS namespace (n)~ A type of Distributed File System (DFS) namespace where the namespace information is stored locally on the server or failover cluster.

stand-alone drive library (n)~ A single-drive, non-automated unit, such as a tape drive or CD-ROM drive, that holds a single tape or disc. With this type of library, the user manually inserts a tape or disc into the drives.

stand-alone namespace (n)~ A type of Distributed File System (DFS) namespace where the namespace information is stored locally on the server or failover cluster.

stand-alone root (n)~ A DFS namespace, the configuration information for which is

stored locally on the host server. The path to access the root or a link starts with the host server name. A stand-alone root has only one root target. There is no root-level fault tolerance. Therefore, when the root target is unavailable, the entire DFS namespace is inaccessible.

standalone server (n)~ A computer that runs Windows Server but does not participate in a domain. A standalone server has only its own database of end users, and it processes logon requests by itself. It does not share account information with any other computer and cannot provide access to domain accounts.

stand-alone site (n)~ A Configuration Manager primary site with no parent sites and no child sites.

standalone snap-in (n)~ A snap-in that can by itself comprise a snap-in console.

Standalone System Sweeper (PN)~ An offline system cleaner tool designed to run in a restricted operating system environment to detect malicious or unwanted software.

stand-alone tape drive (n)~ A single-drive, non-automated tape drive that holds a single tape.

standard (n)~ A de jure technical guideline advocated by a recognized noncommercial or government organization that is used to establish uniformity in an area of hardware or software development. The standard is the result of a formal process, based on specifications drafted by a cooperative group or committee after an intensive study of existing methods, approaches, and technological trends and developments. The proposed standard is later ratified or approved by a recognized organization and adopted over time by consensus as products based on the standard become increasingly prevalent in the market.

standard (n)~ A de facto technical guideline for hardware or software development that occurs when a product or philosophy is developed by a single company and, through success and imitation, becomes so widely used that deviation from the norm causes compatibility problems or limits marketability.

Standard (adj)~ An Azure Web site hosting tier, used for pricing calculation.

Standard (1 GB) (PN)~ The unit of measure for one GB of cache consumed during use of the Standard edition of Microsoft Azure Cache.

standard account (n)~ A type of user account that allows users to install software and change system settings that do not affect other users or the security of the computer. This account type is recommended for daily use.

standard activity (n)~ The set of activities that is included with the standard installation of Orchestrator.

standard application (n)~ An application on a Surface unit that appears in Launcher. Standard applications contrast to attract applications (although an application can be both an attract application and a standard application). Microsoft produces several standard applications for Surface, including Concierge, Music, and Photos.

Standard Apps (n)~ A resource of the 'Application Insights' service type of the 'Visual Studio' service to implement basic or typical apps like Office 365, Exchange, Lync, Sharepoint, Dynamics AX, etc. run and managed in cloud.

Standard Batch (n)~ The Standard tier for the Microsoft Azure service that enables large amounts of discrete, compute-intensive batches of tasks to be easily executed in Azure.

Typical workloads include media transcoding, rendering, test suite execution, simulations, image analysis, and file processing.

Standard BizTalk unit (n)~ A unit of measure for the compute capacity and memory used by the Standard tier of Microsoft Azure BizTalk Services.

Standard CDN Data Transfer (GB) (n)~ A unit of measure which refers to data moving in and out of Windows Azure data centers other than those explicitly covered by the Content Delivery Network pricing.

standard consumer (n)~ One of several preinstalled permanent consumers that perform an action, such as sending an e-mail or writing to a log when configured by a managed object format (MOF) file or a script.

standard cost price (n)~ The normal or ideal cost that is used as a comparison to the actual cost. For manufactured items, standard cost price includes labor, materials, and overhead. For purchased items, standard cost price includes purchase price plus transportation and other fees.

standard deployment (n)~ A deployment type that allows users to configure a Remote Desktop Services deployment across multiple servers or on one server.

standard deviation (n)~ A statistical measure of the amount by which a set of values differs from the arithmetical mean, equal to the square root of the mean of the differences' squares.

Standard DTU Pack (n)~ A resource of the 'SQL Database' service type of the 'Data Services' service for 'Pay-As-You-Go' billing based on the rating of CPU, memory, reads, and writes consumed.

Standard Edition configuration (n)~ An Office Communication Server configuration consisting of a single Standard Edition Server.

Standard Elastic Database Existence (n)~ A resource of the 'SQL Database' service type of the 'Data Services' service that refers to the existence of a database.

Standard Elastic DTU Pack (n)~ A resource of the 'SQL Database' service type of the 'Data Services' service for 'Pay-As-You-Go' billing based on the rating of CPU, memory, reads, and writes consumed.

standard environment (n)~ A collection of computers on which you can run and manage tests as a single entity.

standard error (n)~ An output stream typically used by programs to output error messages or diagnostics.

Standard Event Hubs (n)~ The Standard tier of the feature that in Service Bus that provides large-scale ingestion, persistence and processing of data events from high-throughput data sources and/or millions of devices. The ingested events are stored durably until the required retention period expires.

Standard Existence (n)~ A resource of the 'SQL Database' service type of the 'Data Services' service that refers to the existence of a database.

standard font (n)~ The default text font for worksheets. The standard font determines the default font for the Normal cell style.

Standard Generalized Markup Language (n)~ The international standard for organizing and tagging elements and data in a document. SGML itself does not specify any particular formatting; rather, it specifies the rules for tagging elements. Tags can then be interpreted

to format elements in different ways.

Standard Image Format (n)~ A video format that is a version of CIF and is specific to NTSC or PAL television standards. SIF has 352 x 240 non-square pixels for NTSC

Standard Industrial Classification code (n)~ A four-digit number assigned by the U.S. government to designate the economic activity of businesses.

standard input (n)~ A stream that is defined to receive data input. By default, standard input is read from the keyboard.

Standard IO - Block Blob (GB) (PN)~ The resource for the standard input/output processes performed by the Storage service for block blobs.

Standard IO - File (GB) (PN)~ The resource for the standard input/output processes performed by the Storage service for the storage type called File."

Standard IO - Page Blob/Disk (GB) (PN)~ The resource for the standard input/output processes performed by the Storage service for page blobs.

Standard IO - Table/ Queue (GB) (PN)~ The resource for the standard input/output processes performed by the Storage service for the storage type called Table/Queue."

standard keyboard (n)~ An input device consisting of a set of individual keys similar to those on a typewriter. It is used to convey information from a user to a computer or data communications circuit.

Standard Large App Service Hours (PN)~ A new name for Large Standard Websites Hours, a billing meter for the Microsoft Azure Web Sites service based on long usage time.

Standard Medium App Service Hours (PN)~ A new name for Medium Standard Websites Hours, a billing meter for the Microsoft Azure Web Sites service based on mid-sized usage time.

Standard Mobile Services unit (n)~ A unit of measure for the Standard tier of the Microsoft Azure Mobile Services service.

standard mode (n)~ The standard statement completion mode that is provided by IntelliSense. Standard mode is used when classes and members are used after having been defined.

standard module (n)~ A module in which you can place Sub and Function procedures that you want to be available to other procedures throughout your database.

Standard MS1 Database (Hours) (n)~ A resource of the 'MySQL Database on Azure' service type of the 'Data Services' service for 'Pay-As-You-Go' billing based on the number of database instances and hours consumed.

standard NIS map (n)~ In Network Information Service (NIS), a map that consists of aliases, bootparams, ethers, hosts, group, netgroup, netid, netmasks, networks, passwd, protocols, rpc, services, pservers, and shadow; all other maps are nonstandard.

Standard Notification Hub unit (n)~ A unit of measure for the Standard tier of the Microsoft Azure Notification Hubs service.

Standard Notification Hubs (n)~ The Standard tier of the highly scalable, cross-platform push notification infrastructure that enables users to either broadcast push notifications to millions of users at once or tailor notifications to individual users.

Standard Origin-Streamed Hours (PN)~ The standard resource for the Media Services service type of the Media service measured per hour streamed from the origin, per bitrate.

Standard Overage Data Points (1M) (PN)~ A standard unit of measure for 'Pay-As-You-Go' billing for the SQL Data Warehouse service type based on bandwith usage using 1M as baseline.

Standard Overage Events (1M) (n)~ A resource of the 'Application Insights' service type of the 'Visual Studio' service for 'Pay-As-You-Go' billing for an amount of events exceeding a 1M baseline.

standard query operator (n)~ A method that constitutes a query pattern and that is implemented by a LINQ provider for a specific domain. Standard query operators are defined in the System.Linq.Enumerable class.

standard rate (n)~ A base rate that you assign to resources [such as people, equipment, or material] and that Project uses to calculate resource cost totals.

Standard Report (n)~ A basic collection and representation of data that helps CSRs keep track of Key Performance Indicators (KPIs), such as the number of Tickets solved or the view count of a Knowledgebase Article.

Standard Sender (n)~ A Configuration Manager communication mechanism that enables you to create and send package information to another Configuration Manager site over standard network channels.

Standard Small App Service Hours (PN)~ A new name for Small Standard Websites Hours, a billing meter for the Microsoft Azure Web Sites service based on short usage time.

Standard Support (PN)~ The Microsoft Azure support plan that includes basic support plus support for billing and subscription management-related issues as well as break-fix issues; response time is under 2 hours.

Standard toolbar (n)~ A toolbar that contains buttons you can use to perform some of the most common tasks in a Microsoft Office program, such as opening, saving, and printing files.

standard user (n)~ A user account in the Users group that has a full privilege access token. The standard user is not an administrator and is not a member of any local groups that are filtered.

Standard User Analyzer (n)~ An add-in for AppVerifier that predicts whether an application will perform correctly when run as a standard user or as an administrator with a filtered access token.

Standard VM Support hour (n)~ A unit of measure of time for the Standard level of support for a virtual machine.

Standards and formats (oth)~ A Regional and Language Options setting that determines the formats used to display dates, times, currency, numbers, and the sorting order of text.

standby (n)~ A state in which your computer consumes less power when it is idle, but remains available for immediate use. While your computer is on standby, information in computer memory is not saved on your hard disk. If there is an interruption in power, the information in memory is lost.

standby continuous replication (n)~ A replication that uses the same log shipping and replay technology used by local continuous replication (LCR) and cluster continuous replication (CCR) to provide added deployment options and configurations.

standby file (n)~ In a restore operation, a file used during the undo phase to hold a copy-

on-write' pre-image of pages that are to be modified. The standby file allows reverting the undo pass to bring back the uncommitted transactions.'

standby server (n)~ A server instance containing a copy of a database that can be brought online if the source copy of the database becomes unavailable. Log shipping can be used to maintain a warm' standby server

standing query (n)~ An instantiation of a query template that runs within the StreamInsight server performing continuous computation over the incoming events.

Standings (PN)~ A list of teams or contestants arranged according to their past records.

star (n)~ A rating unit, e.g. assigning a one-star rating' to an image.'

star (n)~ A unit of measure used to allot a column or row a weighted proportion of available screen space.

star join (n)~ A join between a fact table (typically a large fact table) and at least two dimension tables.

star out (n)~ A function that is available to callers when they are dialed into Unified Messaging Auto Attendant but they want to be able to get to Outlook Voice Access to access their e-mail and voice mail. The caller presses the star (*) key per the voice prompt, which takes them to Outlook Voice Access.

star query (n)~ A query that joins a fact table and a number of dimension tables.

star rating (n)~ A shape that consists of a number of stars (e.g. ???). Used for data graphics solution to visualize the data.

star schema (n)~ A relational database structure in which data is maintained in a single fact table at the center of the schema with additional dimension data stored in dimension tables. Each dimension table is directly related to and usually joined to the fact table by a key column.

star sizing (n)~ In a Grid layout container, a type of sizing that makes the width of columns and the height of rows resize proportionally when the parent grid is resized.

star-sized (Adverb) ~ Produced with the use of the star sizing.

start (v)~ To start or reset a computer by turning the power on, by pressing a reset button on the computer case, or by issuing a software command to restart.

Start (PN)~ The Home screen of an unlocked Windows Phone.

Start (PN)~ A screen that gives users quick access to recent documents and recommended templates when an Office application starts.

Start (PN)~ The button that invokes the Start menu (desktop) and the Start screen (mobile or desktop).

Start (PN)~ The- full-screen view of Start that includes the- list of items, such as apps, websites, and other info that a person can specify and customize. It is what is displayed when the Start button is used.

Start (PN)~ The resizable view of Start. It can be resized to show the list of items, such as apps, websites, and other info that a person can specify and customize.

Start a New Conference… (oth)~ An item on the More/Actions menu that starts a conference with the person the user selects from the corporate address book. Also an item on the right-click menu for a person that starts a conference with the person.

Start a Video Conversation… (oth)~ The item on the Actions menu that starts a video conversation with the person the user selects from the corporate address book.

Start an Audio Conversation… (oth)~ The item on the Actions menu that starts an audio conversation with the person the user selects from the corporate address book.

start angle (n)~ The angle of rotation, between 0 and 360, at which the scale will begin. The zero (0) position is located at the bottom of the gauge, and the start angle rotates clockwise. For example, a start angle of 90 degrees starts the scale at the 9 o'clock position.

Start Application Sharing or Whiteboard (oth)~ The button on the toolbar in a conversation window that starts a sharing session with the participants of the current conversation.

Start background (n)~ A photo you can choose to use as the background for some Live Tiles on the Start screen.

Start Board (PN)~ The Win 8 style home page with customizable live tiles of the Azure portal.

Start Burn (v)~ An option that starts the CD burning process.

START button (n)~ A hardware button on Portable Media Center.

Start button (PN)~ The round button in the lower left-hand corner of the Windows screen that allows the user to click and display the Start menu.

Start button (PN)~ The hardware button on the phone, pressed to pressed to go to the Start screen.

Start Button ~ A button on the lefthand end (usually) of the- Taskbar- in most versions of- Windows, which you click on to display the- Start Menu.

start cap (n)~ The start of a line.

Start charm (PN)~ The charm that takes users to the Start screen.

start date (n)~ The date when a project or task is scheduled to begin.

Start Here (n)~ A phrase that clearly indicates to the customer to begin reading instructions at this point.

Start menu (PN)~ The resizable view of Start. It can be resized to show the list of items, such as apps, websites, and other info that a person can specify and customize.

Start Menu ~ A set of menus which appear when you click on the- Start Buttonin Windows, which you can customise to suit your own preferences. Most programs will automatically add themselves to the Start Menu when you install them.

Start Menu restrictions (n)~ Settings that allow the administrator to restrict Start Menu attributes.

Start Microsoft Office Live Meeting (oth)~ The button on the main Communicator window that starts the Microsoft Office Live Meeting program.

Start Microsoft Office Live Meeting… (oth)~ The item on the Actions menu that starts a Live Meeting session with the person the user selects from the corporate address book.

Start Microsoft Office OneNote (oth)~ The button on the main Communicator window that starts the Microsoft Office OneNote program.

Start new experience screen (n)~ The screen that appears when a Surface unit times out (that is, when a Surface unit doesn't receive any contact for a while). The Start new experience screen enables users to return to the previously running application or to start a new experience.

start point (n)~ The beginning of a path.

Start screen (PN)~ The Home screen of an unlocked Windows Phone.

Start screen (PN)~ A screen that gives users quick access to recent documents and recommended templates when an Office application starts.

Start screen (PN)~ The- full-screen view of Start that includes the- list of items, such as apps, websites, and other info that a person can specify and customize. It is what is displayed when the Start button is used.

Start Sharing… (oth)~ An item on the Actions menu that starts a sharing session with the person the user selects from the corporate address book.

start tag (n)~ A type of markup in markup languages. A start tag is the starting element of a tag pair which contains metainformation about some part of the text.

start voice nav (PN)~ A way of providing driving or walking directions to the user where the app provides both spoken and visual instructions at the right time for the user to act on those instructions.

start+theme (PN)~ The title of Settings screen in which the user can control settings for the Start screen in addition to theme color and background color settings.

Startboard (PN)~ The customizable area in the welcome page of the Microsoft Azure preview portal on which you can pin blades and other resources.

starter code (n)~ Some basic statements that are automatically generated when creating a new project from a standard template to help the developer write programs right away.

Starter Diagram (PN)~ A partially completed diagram that includes shapes and tips to help the user get started in Visio. A user can select from three diagrams at startup.

starter kit (n)~ A template or model program that helps you start writing programs right away.

Starter Site (n)~ A set of Commerce Server features that are pre-configured and bundled into a package file. The package file is designed to be unpacked and then customized to meet the needs of your organization

start-of-authority resource record (n)~ A record that indicates the starting point or original point of authority for information stored in a zone. The SOA resource record (RR) is the first RR created when adding a new zone. It also contains several parameters used by other computers that use DNS to determine how long they will use information for the zone and how often updates are required.

startup (n)~ The process of starting or resetting a computer or a device. When first turned on (cold boot) or reset (warm boot), the computer runs the software that loads and starts the computer's operating system, which prepares it for use.

startup document (n)~ The document that appears first when you run your application.

startup environment (n)~ In dual-boot or multiple-boot systems, the configuration settings that specify which system to start and how each system should be started.

StartUp Folder ~ An area under Programs in the Windows- Start Menu. Any programs placed in this folder will launch themselves automatically whenever you start up Windows.

startup key (n)~ A key that is stored on a USB flash drive that must be inserted each time the computer starts.

startup latency (n)~ The time it takes for the encoder, SDK reader, or other devices to start before encoding begins. Startup latency prevents the cutting of frames at the mark-in

point.

startup object (n)~ A project property that defines the entry point to be called when the application loads.

startup screen (n)~ A text or graphics display that appears on the screen when a program is started (run). Startup screens usually contain information about the software's version and often contain a product or corporate logo.

stash (v)~ In the Git context, to take the dirty state of a working directory -€" that is, modified tracked files and staged changes -€" and save it on a stack of unfinished changes that the user can reapply at any time.

stash file (n)~ A local file that holds the master key for the Kerberos database.

stash file (n)~ An internal structure that is used to stage a disc before recording it to media.

state (n)~ The condition at a particular time of any of numerous elements of computing—a device, a communications channel, a network station, a program, a bit, or other element—used to report on or to control computer operations.

state (n)~ The activity level of an account or a business contact; possible values are 'active' or 'inactive'.

state (n)~ The overall nature and appearance of an object captured within a moment in time.

state (n)~ The period of time during which an actor exhibits a particular behavior.

state (n)~ In a statechart or activity diagram, a condition during which an object satisfies a condition, performs an action, or waits for an event.

state (n)~ The condition of a system, process, or party.

State (n)~ On the Business Rules editor dialog box, the column that lists whether a business rule is activated or deactivated.

state block (n)~ A collection of one or more device states that can be applied to a device with a single API call.

state context (n)~ A nested series of states, which represents the current state of a system.

state indicator (n)~ An Operator Console command bar that shows the state of computers in a specified computer group.

state machine (n)~ A graph of states and transitions that describes the response of an object of a given class to the receipt of outside stimuli. A state machine is attached to a class or method. A statechart diagram represents a state machine.

state machine workflow (n)~ A workflow that is modeled in an event-driven manner as a state machine.

state management point (n)~ A Systems Management Server site system role that stores user state data while a computer is being migrated to a new operating system.

state message (n)~ A message type that is used to identify at what stage a Configuration Manager client process has succeeded, failed, or stopped.

state migration point (n)~ A Configuration Manager site system role that stores user state data while a computer is being migrated to a new operating system.

state object (n)~ A collection of state variables for a particular protocol layer.

state performance counter (oth)~ A counter that monitors the immediate health state of an application by collecting a snapshot of configured performance counters at 5 minute

intervals. This data is available for viewing trends in Application Diagnostics.

state provider (n)~ Interacts with Windows Fabric to make service state highly available and reliable. It replicates, applies, and rebuilds the state of the service.

State/Province (PN)~ A UI element where the state or province of the location of a record, such as an account or contact, is indicated.

State/Region (n)~ A label for a geographic selection.

statechart diagram (n)~ A representation of a state machine, attached to a class or method, that describes the response of the class to outside stimuli.

stateful (adj)~ In the streaming context, pertaining to, or characteristic of, streaming protocols used by Windows Media Services that require an interactive connection between the server and client during the streaming session. Streaming data in a stateful connection cannot be cached for reuse by other clients (that is, the data is not cacheable).

stateful object (n)~ An object that holds private state accumulated from the execution of one or more client calls.

stateful partitioned service (n)~ A stateful service that partitions its state (and access patterns to that state) into subsets for load-balanced execution.

stateful service (n)~ A service that has state and achieves reliability through replication between multiple replicas on other nodes in the cluster. If a node on which a replica of this service is active goes down, another replica is started on another node.

stateless (adj)~ Of or pertaining to a system or process that participates in an activity without monitoring all details of its state. For example, stateless handling of messages might take account of only their sources and destinations but not their content.

stateless object (n)~ An object that does not hold private state accumulated from the execution of one or more client calls.

stateless partitioned service (n)~ A stateless service that partition its execution into subsets for load-balanced execution.

stateless service (n)~ A service that does not use Windows Fabric to make state highly reliable, or state is persisted to external storage, which needs to be made reliable by using Windows Fabric. If a node on which an instance of this service is active goes down, another instance is started on another node.

statement (n)~ The smallest executable entity within a programming language.

statement (n)~ A report that summarizes the status of an account, including current balance and recent activities.

statement (n)~ A compiled T-SQL query.

statement company (n)~ The company from which a centralized statement is printed.

statement completion (n)~ The process by which the language service helps users finish a language keyword or element that they have started typing in the core editor.

statement of earnings (n)~ A report that summarizes a company's costs, expenses, and revenues for a specific accounting period.

statement of health (n)~ A declaration from a client computer that asserts the computer's health status. System health agents (SHAs) create SoHs and send them to a corresponding system health validator (SHV).

statement of health response (n)~ The validation of a statement of health (SoH) that a system health validator (SHV) produces and sends to the NAP administration server. The

SoHR can contain remediation instructions.

statement of income (n)~ A report that summarizes a company's costs, expenses, and revenues for a specific accounting period.

Statement of Services (PN)~ Any work order or other description of services (including in a Supplemental Agreement) that incorporates an agreement.

statement of work (n)~ A detailed description of the work that needs to be completed within the scope of a contract.

static (n)~ In information processing, fixed or predetermined. For example, a static memory buffer remains invariant in size throughout program execution.

static adapter (n)~ An adapter that uses the user interface provided by the adapter framework.

static allocation (n)~ Apportionment of memory that occurs once, usually when the program starts. The memory remains allocated during the program's execution and is not deallocated until the program is finished.

static analysis (n)~ The analysis of the source or object code of a program without executing the code. Typically the analysis is designed to detect errors.

static binding (n)~ Binding (converting symbolic addresses in the program to storage-related addresses) that occurs during program compilation or linkage.

static buffer (n)~ A secondary sound buffer that contains an entire sound. Typically it is filled with data only once.

static control (n)~ A Web Parts control that is part of the declarative page persistence' markup in an .aspx page; it exists only as part of the .aspx page

static cursor (n)~ A cursor that shows the result set exactly as it was at the time the cursor was opened.

static dialog box (n)~ A scripted dialog box between the client computer and an intermediary device. This kind of dialog box requires no response from the user.

static field (n)~ A member that represents a variable associated with an object or class and identifies exactly one storage location. It is not attached to an instance, does not depend on an instance expression and requires one fewer level of indirection on each load and store.

Static IP ~ an IP address that is assigned permanently to a computer. A static IP address is needed for any kind of server that people access through the Internet

static IP address (n)~ The permanent address of a computer on the Internet, assigned by an ISP. However, because of a shortage of IP address numbers, ISPs sometimes favor assigning dynamic IP addresses instead.

static IP address pool (n)~ A set of static IP addresses that VMM can automatically assign as needed.

static load balancing (n)~ The process of manually moving a group between nodes to balance the load across the nodes.

static membership (n)~ A group in which the membership is determined by an attribute of the group resource that lists all the group's members.

static method (n)~ A method that is not invoked on an instance of an object.

static page (n)~ A Hypertext Markup Language (HTML) page that is prepared in advance of a request for it and that is sent to the client upon request. This page takes no special action when it is requested.

static picture (n)~ A snapshot of information, often from another document or program, that is not linked to the document or program in which the information was created.

static property (n)~ A property that is common to all instances of an object.

static RAM (n)~ A form of semiconductor memory (RAM) based on the logic circuit known as a flip-flop, which retains information as long as there is enough power to run the device. Static RAM is usually reserved for use in caches.

static report (n)~ An Excel workbook that contains no matrices. Essentially a snapshot of data at the point in time of creation.

static resource (n)~ A device resource that cannot be configured or relocated. The resource can include interrupt request (IRQ) signals, direct memory access (DMA) channels, input/output (I/O) port addresses, and memory addresses.

static router (n)~ A router with manually configured routing tables. A network administrator, with knowledge of the internetwork topology, manually builds and updates the routing table, programming all routes in the routing table. Static routers can work well for small internetworks but do not scale well to large or dynamically changing internetworks due to their manual administration.

static routing (n)~ Routing limited to fixed routing tables, as opposed to dynamically updated routing tables.

static row filter (n)~ A filter available for all types of replication that allows you to restrict the data replicated to a Subscriber based on a WHERE clause.

static sound buffer (n)~ A section of memory that contains a complete sound. These buffers are convenient because the entire sound can be written once to the buffer.

static structure diagram (n)~ A diagram that shows the static structure of a model; that is, the elements that exist (such as classes and types), the internal structure of the elements, and their relationships to one another.

static text field (n)~ A standard Windows control used for instructions, control labels, and all text that the user doesn't need to horizontally scroll, edit, or select. Compare text box.

static verb (n)~ A verb that applies to a Shell item without needing to inspect the current state of an item or system. A static verb is based on a static registration of the associated elements of an item, and does not change.

static virtual device driver (n)~ A virtual device driver (VxD) that is statically loaded during system startup. A static VxD can be loaded in a number of different ways, including device enumeration by the Plug and Play (PnP)static device enumerator.

static VxD (n)~ A virtual device driver (VxD) that is statically loaded during system startup. A static VxD can be loaded in a number of different ways, including device enumeration by the Plug and Play (PnP)static device enumerator.

static Web Part (n)~ A Web Part that is added to a Web page (.aspx file) and that is not in a Web Part zone.

statistical account (n)~ A classifier of economic resource quantity used to classify debit or credit entries in an accounting system.

statistical baseline forecast (n)~ An estimate of future demand that is created by applying a forecasting algorithm to historical transaction data.

status (n)~ The condition at a particular time of any of numerous elements of computing —a device, a communications channel, a network station, a program, a bit, or other

element—used to report on or to control computer operations.

status (n)~ The condition of the payment schedule of an account or a business contact; possible values are 'current' or 'overdue'.

status (n)~ The condition of a user that can be displayed to the user's contacts to communicate whether the user is currently online and available, offline and unavailable, and so on.

status (n)~ The approval status for an entry.

status (n)~ The condition of an object in a system or process.

Status (n)~ The current state of a Ticket based on the Actions performed on it by either a CSR or a Customer.

status alert (n)~ A notification that is sent when one of the user's tagged contacts changes status to Available or Offline.

status area (n)~ The area on the right side of the Windows taskbar. It contains shortcuts to programs and important status information.

status bar (n)~ A horizontal window at the bottom of a parent window in which an application can display various kinds of status information. The status bar can be divided into parts to display more than one type of information.

status bar control (n)~ A standard Windows control that provides the functionality of a status bar.

status date (n)~ A date that you set [rather than the current date] for reporting the time, cost, or performance condition of a project.

status filter rule (n)~ A filtering rule that controls how status messages are reported and viewed.

status light (n)~ A light that appears around a Surface screen to indicate the overall status of the unit. The status light displays the following colors: -€¢ A rhodamine (pink) color appears temporarily when the unit is turned on. -€¢ A blue color appears temporarily when the unit is turned off. -€¢ A red color appears when there is a problem with the unit. The SCM status indicator lights provide more details information about the status of a Surface unit.

status manager (n)~ A manager responsible for tracking the task updates and assignments within a project. Separate from the project manager. Each task in a project can have a different status manager.

status message (n)~ A message for the SMS/Configuration Manager Administrator console generated by an SMS/Configuration Manager component. Status messages differ from operating system events in that they represent the flow of activity within an SMS/Configuration Manager site.

status message (n)~ A customized message that someone sets in Windows Live Messenger, on Windows Live Home, or on their profile page. The status message is part of the share anything' control. The information is distributed to any connected service.'

status message ID (n)~ A unique status message identifier. However, each instance of the same status message does not have a different ID. For example, if a certain message's ID is 62, it is 62 every time the message is generated. A status message has the same ID regardless of locale. Status Message Viewer maps each ID to locale-specific message text.

status message property (n)~ An optional attribute of a status message that lets you

differentiate among groups of messages when you are querying, finding, and filtering. A status message property can be Advertisement ID, Collection ID, Package ID, or User Name.

status message property value (n)~ An optional attribute of a status message property that is applied by the SMS component that generates the message. Status message properties let you differentiate messages associated with particular advertisements, collections, packages, and users when you are querying, finding, and filtering.

status message severity (n)~ An indication of the significance of a status, such as error, warning, or informational.

status message threshold (n)~ The limit that defines when the summary status for a component or site system should indicate OK, Warning, or Critical status.

status message type (n)~ The nature of the status message, such as audit, detail, or milestone.

Status Message Viewer (n)~ A tool in the SMS/Configuration Manager Administrator console that is used to browse the status messages in the SMS/Configuration Manager site database.

status reason (n)~ The description of the status of a record or activity. The options available are based on what record type is open and in which module.

status report (n)~ A description of the status of a member's project work and related work.

status reporting level (n)~ The level at which client and server components report status messages to Status Manager and the Windows NT event log.

status summarizer (n)~ A component that consolidates the data generated by Configuration Manager status messages into a succinct view of the status of a component, a server, a package, or an advertisement.

status summary (n)~ A data set that is generated by a status summarizer. Status summarizers use both the status messages that are collected by Status Manager and other data in the SMS/Configuration Manager site database to generate status summaries.

status system (n)~ The overall system that generates, collects, processes, replicates, and presents status messages and other data to the SMS/Configuration Manager Administrator console.

Status Unavailable Contacts (n)~ The default contact group name that Communicator uses for all contacts for whom no status information is available.

STDERR (n)~ An output stream typically used by programs to output error messages or diagnostics.

STDIN (n)~ A stream that is defined to receive data input. By default, standard input is read from the keyboard.

StdOut (n)~ A property or pointer that exposes the write-only output stream for the current process.

stealth (adj)~ Exhibiting characteristics that allow malicious software to evade detection by ordinary means.

stealth notifier (n)~ A type of trojan malware that connects to a remote server through a stealth connection and that notifies the server that the malware has been installed.

stemmer (n)~ In Full-Text Search, for a given language, a stemmer generates inflectional

forms of a particular word based on the rules of that language. Stemmers are language specific.

stemming (n)~ The process of capturing relationships between words by reducing inflected words to their stem or root form (reductive stemming), or expanding stems to their inflected forms (expansive stemming). For example, the word swimming' is reduced to the stem 'swim.' Because the word 'swam' can also be reduced to 'swim

stencil (n)~ A collection of masters associated with a particular Visio drawing type, or template. By default, stencils that open with a template are docked on the left side of the drawing window.

stencil ref (n)~ An OpenGL class specyfing the reference value for the stencil test.

step (n)~ A component of a job.

step (v)~ To execute a program one step at a time, usually within the context of a debugger.

step (n)~ An operation in a task that progresses an activity towards completion.

step clause (n)~ A clause that specifies the amount by which the loop counter is incremented each time a For…Next loop is traversed. In the following example, Step 2' is the step clause: For loopCounter = 1 to 100 Step 2'

step compensation (n)~ A compensation level structure that defines discrete amounts of pay per level. Pay is described as a specific amount, and frequency is usually expressed as hourly. For example, one step may have ten increasing, specific rates of hourly pay. Pay increases move an employee from one rate to another within a step for a specific reason, such as the length of tenure or improved skills.

step into (v)~ To execute the current statement and enter Break mode, stepping into the next procedure whenever a call for another procedure is reached.

step up (v)~ To upgrade from an existing service to a higher edition.

step variable cost (n)~ A variable cost that can change dramatically because it involves large purchases or expenditures that cannot be spread out over time.

step-by-step directions (n)~ Instructions for how to get from one location to another, describing each step precisely and in order.

Step-by-Step Interactive (n)~ Interactive training published by Microsoft Press that is integrated into Windows XP Help and Support Center.

Steps (PN)~ Movement of putting one leg in front of the other in walking or running.

step-up (n)~ An upgrade from an existing service to a higher edition.

Stereoscopic 3D (PN)~ A Windows 8 feature that enables content to look 3-dimensional by slightly offsetting two images so that the eye sees them as 3D.

stereotype (n)~ A representation of a usage distinction. A stereotype is a subclass of an existing element with the same attributes and relationships as that element but with a different intent and possibly additional constraints.

stewardship portal (n)~ A feature of MDS that provides centralized control over master data, including members and hierarchies and enables data model administrators to ensure data quality by developing, reviewing, and managing data models and enforcing them consistently across domains.

sticky button (n)~ A button control within a graphical user interface that when clicked remains down' (appearing to be pressed) until it is clicked again. It can display either text

or a picture

stitch (v)~ To combine a series of elements into an individual, larger one, such as a series of photos into one panoramic photo.

stochastic (adj)~ Based on random occurrences. For example, a stochastic model describes a system by taking into account chance events as well as planned events.

stock (n)~ An accumulation of items that are owned and controlled by organizations.

stock flow event (n)~ The occurrence of an action that registers the input and output of stock in stores, buffers, queues, and accounts.

stock grant (n)~ Variable compensation in the form of company stock that is granted outright. Stock grants are almost always restricted in some manner, and vest over time. For example, a grant of 900 shares may be made available to an employee over three years, with 300 shares transferring to employee ownership at the end of each year. Dividends for the stock, however, are often paid to the employee each year based on the number of shares of the grant retained by the company.

stock item (n)~ An itemized product item that participates in a stock tracking process.

stock keeping unit (n)~ A unique identifier, usually alphanumeric, for a product. The SKU allows a product to be tracked for inventory purposes. An SKU can be associated with any item that can be purchased. For example, a shirt in style number 3726, size 8 might have a SKU of 3726-8.

stock keeping unit (n)~ An item and its assigned inventory dimensions.

stock option (n)~ Variable compensation that provides the right to purchase company stock at a set price for a set number of years (typically ten). The purchase price (or strike price) is set on the date of the award.

stocked (adj)~ A policy that controls whether products are tracked in stock.

stockkeeping unit (n)~ An inventory dimension.

stockout (n)~ Insufficient goods or materials to meet current needs.

stock-out (adj)~ Describes an item that is not in inventory.

Stock-Out Threshold (n)~ A value that the SKU quantity must be above or equal to for the SKU item to be considered in-stock.

stolen page (n)~ A page in Buffer Cache taken for other server requests

stop (v)~ To halt a process or action, typically without restoring the prior state.

Stop (v)~ The user interface item that halts a process or action, typically without restoring the prior state.

stop bit (n)~ In asynchronous transmission, a bit that signals the end of a character. In early electromechanical teleprinters, the stop bit provided time for the receiving mechanism to coast back to the idle position and, depending on the mechanism, had a duration of 1, 1.5, or 2 data bits.

Stop message (n)~ A character-based, full-screen error message displayed on a blue background. A Stop message indicates that the Windows kernel detected a condition from which it cannot recover. Each message is uniquely identified by a Stop error code (a hexadecimal number) and a string indicating the errors symbolic name. Stop messages are usually followed by up to four additional hexadecimal numbers, enclosed in parentheses, which identify developer-defined error parameters. A driver or device may be identified as the cause of the error. A series of troubleshooting tips are also displayed, along with an

indication that, if the system was configured to do so, a memory dump file was saved for later use by a kernel debugger.

stop responding (v)~ To be unresponsive.

stoplist (n)~ A specific collection of so-called stopwords, which tend to appear frequently in documents, but are believed to carry no usable information.

stopword (n)~ A word that tends to appear frequently in documents and carries no usable information.

storage (n)~ In computing, any device in or on which information can be kept. Microcomputers have two main types of storage: random access memory (RAM) and disk drives and other external storage media. Other types of storage include read-only memory (ROM) and buffers.

Storage (PN)~ The Microsoft Azure service that lets you store binary data and text data in blobs, unstructured non-relational data in tables, and messages for workflow and communication in queues.

Storage (PN)~ The memory available for storage of apps, games, media, settings, and more. It is an interface for users to see what is consuming the storage space on their phone, and functionality to move content from phone to SD card.

Storage ~ The generic term for any method of storing information which is not lost when the computer is switched off; the most common types are- hard disks,- CDs, and- DVDs.

storage access key (n)~ A value that is unique to a storage account and that can be used to connect to the storage account from code running in a Microsoft Azure cloud service, locally on a developer's machine, or anywhere else that has Internet connectivity.

storage account (n)~ An account that provides access to Microsoft Azure storage services to obtain persistent, redundant storage in the cloud. The storage services include these fundamental services: a) Blob service b) Queue service c) Table service.

storage account owner (n)~ The Microsoft Azure user account used to create the storage account. By default, only the storage account owner has access to containers within the storage account.

storage adapter (n)~ An adapter that provides an interface for managing biometric template databases. This includes operations such as adding and deleting templates, as well as looking up templates either by user identity or by biometric content.

storage allocation (n)~ In operating systems, the process of reserving memory for use by a program.

storage area network (n)~ A set of interconnected devices (such as disks and tapes) and servers that are connected to a common communication and data transfer infrastructure such as Fibre Channel.

storage card (n)~ In a server cluster, a resource that can act as the cluster's quorum resource. To be quorum-capable, a resource must provide shared storage and a means of persistent arbitration. The cluster service defines only physical disk resources as quorum-capable.

storage card (n)~ A card, inserted into a portable device, used to store files.

storage classification (n)~ A user-defined name assigned to a storage pool that is used to describe the particular capabilities of the storage pool.

storage device (n)~ A device that you can connect to a computer to copy and store files.

Common storage devices include external hard disk drives and flash memory cards.

storage dimension (n)~ The dimension of an item that controls how items are stored and taken from inventory, giving retailers the ability to manage inventory on a very detailed level.

storage dimension (n)~ The site, warehouse, and inventory location attributes that are used to locate an item in storage.

storage emulator (n)~ The utility that provides the Blob, Table, and Queue services on the developer's local machine for application testing and debugging before deploying to a Microsoft Azure cloud service.

storage engine (n)~ A component of SQL Server that is responsible for managing the raw physical data in your database. For example, reading and writing the data to disk is a task handled by the storage engine.

storage group (n)~ A collection of mailbox stores and public folder stores that share a set of transaction log files. Exchange manages each storage group with a separate server process.

storage key (n)~ A Base64 encoded identification string required to access storage accounts in Azure that is created automatically when creating a storage account.

storage layout (n)~ The layout and general resiliency of data across multiple disks in a virtual disk or storage space.

storage limit (n)~ The maximum storage space users are allowed to use in a cloud service, as determined by a storage plan.

storage location (n)~ The position at which a particular item can be found: either an addressed location or a uniquely identified location on a disk, tape, or similar medium.

storage memory (n)~ Memory that is similar to a RAM disk on a desktop computer. It is used to store data and nonsystem applications.

storage object (n)~ A logical grouping of data or objects within a compound file that can contain streams or other subordinate storages. The relationship between storages and streams in a compound file is similar to that of folders and files.

storage plan (n)~ A subscription that provides a certain amount of online storage space.

storage pool (n)~ In DPM, a set of disks that store replicas, shadow copies, and transfer logs for protected data.

storage pool (n)~ A group of physical disks that can be managed together.

storage provider (n)~ A service that enables administration of storage subsystems through a common management API.

storage quota (n)~ The total amount of storage space assigned to a company when it subscribes to a service.

storage report (n)~ A reporting tool that alerts administrators to current disk use trends, as well as to attempts by certain users or groups to save unauthorized files.

storage space (n)~ A virtual disk created on a Storage Spaces storage subsystem.

storage space (n)~ A capacity used to store files and data on a local drive or cloud service.

Storage Spaces (PN)~ A storage subsystem that lets you group disks (drives) into one or more storage pools. You can then create storage spaces from available capacity (free space) in the pool.

storage subsystem (n)~ A stand-alone hardware appliance that hosts one or more storage

devices (such as disk drives, tape drives, optical drives), and is peripheral to the server or servers that control access to it. Storage subsystems are used to create centralized data repositories, while freeing computing and storage resources on servers.

storage tier (n)~ An optional layer of a storage space that writes data to physical disks of a particular speed.

storage transaction (n)~ A read or write operation to Microsoft Azure Storage.

Storage Usage report (n)~ A Web analytics report that provides information about storage usage trends.

Store (PN)~ The online store where users can learn about and download apps, games, music, and more for their Windows device.

Store (PN)~ The online store where users can learn about and download apps, games, music, videos, and podcasts for their Windows Phone. Users can use the Store on their phones or on the web at windowsphone.com.

store area (n)~ A section of a warehouse used for inventory items with similar characteristics, such as an input area for items when they are received in inventory.

store driver (n)~ A software component of the Hub Transport Server that delivers inbound messages to Exchange stores, the databases that contain public folder and mailbox stores. The store driver is also responsible for retrieving messages from a user's outbox and submitting it for delivery.

Store Manager (PN)~ A feature that provides an e-commerce solution that enables you to set up and customize your own online storefront for selling products online.

store schema definition language (n)~ An XML-based language that is used to define the entity types, associations, entity containers, entity sets, and association sets of a storage model, often corresponding to a database schema.

store zone (n)~ A classification of store areas. Store zones provide a way to order and prioritize store areas for items as they arrive in inventory.

store-and-forward (adj)~ A method of delivering transmissions in which messages are held temporarily by an intermediary before being sent on to their destination. Store and forward is used by some switches in delivering packets to their destinations.

store-and-forward replication (n)~ A replication model, used by Active Directory, in which changes are not sent directly from one domain controller to all other domain controllers. Instead, a system of replication partners is created automatically by the system, taking advantage of the existing connections. Replication through neighboring systems is also called transitive replication.

stored procedure (n)~ A precompiled collection of SQL statements and optional control-of-flow statements stored under a name and processed as a unit. They are stored in an SQL database and can be run with one call from an application.

stored procedure resolver (n)~ A program that is invoked to handle row change-based conflicts that are encountered in an article to which the resolver was registered.-

stored virtual machine (n)~ An inactive virtual machine that has been saved to the Virtual Machine Manager library. The virtual machine's virtual hard disks (.vhd files) and virtual machine configuration file (.vmc file) are stored on a library share.

storefront (n)~ A business that displays its merchandise on the Internet and has provisions for contact or online sales.

stories (n)~ In the Agile context, work is expressed in the backlog as user stories. A user story is a short, simple description of a feature told from the perspective of the user who desires a new capability. A User Story should focus on the who, what and why of a feature, not how. The user story will typically follow a simple template: As a <type of user>, I want <some goal> so that <some reason>.

Storno accounting (n)~ The practice of using negative numbers to reverse original journal account entries.

story (n)~ A document area that contains a range of text distinct from other areas of text in a document. For example, if a document includes body text, footnotes, and headers, it contains a main text story, footnotes story, and headers story.

storyboard (n)~ A view of the workspace that displays the sequence of your clips.

storyboard (n)~ A collection of transitions applied to one or more animation variables over time.

storyboard (n)~ A conceptualization of the user interface and user interactions for a software compontent.

storyboard link (n)~ A type of work item link that is used to link work items to storyboard files.

storyboard shape (n)~ A shape or graphical object that has been added to a storyboard or to a storyboard shapes file.

Storyline (PN)~ The Sway feature that allows users to edit, add, reorder, delete, and structure their Sway content.

storyline (n)~ A concise synopsis of the main plot of a film or TV show.

storytelling (n)~ A feature that enables users to share stories with others using their digital photos and photo management software.

straight line depreciation (n)~ A method of depreciation that calculates the depreciation of a fixed asset as a fixed amount in each depreciation period.

straight quotation mark (n)~ The character.'

straighten a photo (v)~ To adjust the axis of a photo so that objects in the photo appear level, typically with use of an image editing tool.

Straighten photo (PN)~ The panel item the image-leveling feature in Windows Live Photo Gallery. When the item is clicked, the feature automatically adjusts the photo according to its best interpretation of the horizontal axis. It also displays a slider, which allows someone to make further adjustments. The photo is automatically cropped as needed.

straight-line service life depreciation method (n)~ A method of depreciation that calculates the depreciation of a fixed asset as a fixed amount in each depreciation period.

straight-line service life remaining depreciation method (n)~ A method of depreciation that calculates the depreciation of a fixed asset as a fixed amount in each depreciation period. There will be a difference in the depreciation amount calculated between straight-line service life remaining and straight-line service life when there is an adjustment posted to the asset.

Strategic Merger or Acquisition Evaluation (n)~ A template that addresses, from a Strategic Business Development perspective, the general activities that a company goes through to determine their business growth strategy.- The roadmap includes understanding

market position, evaluating trade-offs between mergers/acquisitions and internal development, evaluating M&A candidates and placing valuation on target companies.

Strategy (PN)~ The Games subcategory containing games that require strategy to win, often political/military in nature.

strategy + simulation (PN)~ A game category that emphasizes strategic decision making or simulation of real-life activities.

strategy map (n)~ A performance management tool for visually presenting an organization's or organizational unit's objectives and goals, their groupings of objectives and goals, and their mappings of objectives and goals to themes, initiatives, KPIs, targets, business processes, and action plans. Each item in the visualization contains a set of metadata, which itself is customizable.

Strawberry Batter Button (n)~ A button on the Comfy Cakes game interface that allows the player to select strawberry batter for their cake.

Strawberry Icing Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a strawberry icing for their cake.

stream (v)~ To transfer digital data in a continuous flow across a network.

stream (n)~ Digital media that is delivered in a continuous flow across a network.

stream (n)~ Packets delivered by a Windows Media server that are consumed by clients without caching. For a Web server with Smooth Streaming installed, the experience is similar, except that the data can be cached by clients, though this can be prevented by applying Cache Control header directives in the Smooth Streaming feature.

stream (n)~ The flow of data from a source to a single receiver that flows through a channel, as opposed to packets, which may be addressed and routed independently, possibly to multiple recipients.

stream (n)~ An abstraction of a sequence of bytes, such as a file, an I/O device, an inter-process communication pipe, a TCP/IP socket, or a spooled print job. The relationship between streams and storages in a compound file is similar to that of files and folders.

stream (n)~ Chronological list of posts to monitor that match user-defined criteria.

Stream Analytics (n)~ A highly scalable event-processing engine that helps uncover real-time insights from devices, sensors, infrastructure, applications and data.

stream consumer (n)~ The structure or device that consumes the output of a query. Examples are an output adapter or another running query.-

stream format (n)~ Information about the properties of a stream, such as the codecs used, frame rate, and frame size. A player uses stream format information to decode a stream.

stream format file (n)~ A file used by a player to decode a multicast stream.

Stream, streaming ~ Video or audio that plays while still downloading, rather than you having to wait till the download has finished.

stream-based conversion (n)~ ?A mode of Word Automation Services in which the input and output of the conversion are streams, rather than files on the site.

streaming (n)~ A method of delivering digital media across a network in a continuous flow. The digital media is played by client software as it is received. Typically, streaming makes it unnecessary for users to download a file before playing it.

Streaming ~ Streaming is the transfer of data in a continuous stream over the Web (usually audio or video) that allows the user to play it as it arrives. However, to receive

this content you must have the right plug-in for the application such as RealPlayer?, QuickTime? viewer, etc.

streaming buffer (n)~ A secondary sound buffer that contains only part of a sound. Its data must be refreshed as it is playing.

streaming reserved unit (n)~ A resource unit reserved for on-demand streaming.

Streaming SIMD Extensions (n)~ A single instruction, multiple data instruction set extension to the x86 architecture, containing instructions working mostly on single precision floating point data to greatly increase performance when exactly the same operations are to be performed on multiple data objects. Typical applications are digital signal processing and graphics processing.

StreamInsight (PN)~ The platform, consisting of the StreamInsight server, Event Flow Debugging tool, Visual Studio IDE, and other components, for the development of complex event processing applications.

StreamInsight Event Flow Debugger (PN)~ A stand-alone tool in the Microsoft StreamInsight platform that provides event-flow debugging and analysis.

StreamInsight platform (n)~ The platform, consisting of the StreamInsight server, Event Flow Debugging tool, Visual Studio IDE, and other components, for the development of complex event processing applications.

StreamInsight server (n)~ The core engine and adapter framework components of Microsoft StreamInsight. The StreamInsight server can be used to process and analyze the event streams associated with a complex event processing application.

streamline (v)~ To make easier; to eliminate unnecessary steps.

stream-thinning (n)~ The process of lowering the frame rate of source video to reduce the bandwidth required for streaming to be lower than or equal to the available client bandwidth. If necessary, the video portion of the stream may stop streaming and only the audio portion streamed.

Streetside (PN)~ Street level imagery that enables users to experience Bing Maps from the street level. Streetside supplements maps, directions and local search.

strengths, weaknesses, opportunities, and threats analysis (n)~ An analysis of the internal and external environmental factors performed as part of developing the organizational strategy.

stress test (n)~ A test designed to determine the response of a system under load.

stress test (n)~ A test that determines an application's breaking points and pushes the application past its upper limits as resources are saturated.

stretch (v)~ To adjust the size of an item to fit its container.

Stretch (v)~ A title animation in Windows Movie Maker.

stretch (v)~ A zoom-in gesture represented by two fingers with at least one of them moving away from each other at any angle, within an acceptable tolerance.

stretch (v)~ To touch an item with two or more fingers and then spread the fingers apart.

stretch gesture (n)~ A zoom-in gesture represented by two fingers with at least one of them moving away from each other at any angle, within an acceptable tolerance.

strict mode (n)~ A state that applies a set of restrictions to JavaScript code.

STRIDE (n)~ A method of categorizing threat types. These threat types include: spoofing identity, tampering with data, repudiation, information disclosure, denial of service, and

elevation of privilege.

strikethrough (adj)~ Pertaining to a formatting style in which characters are crossed out by horizontal line.

strikethrough gesture (n)~ A movement of your tablet pen that that creates a formatting style to ink in which characters are crossed out by a horizontal line.

string (n)~ A group of characters or character bytes handled as a single entity. Computer programs use strings to store and transmit data and commands. Most programming languages consider strings (such as 2674:gstmn) as distinct from numeric values (such as 470924).

string collection editor (n)~ An editor that enables users to view and change the list of strings for controls such as list boxes and combo boxes.

string comparison (n)~ The use of an operator to determine whether one string is greater than or equal to another string. Use the Option Compare statement to specify binary (case sensitive) or text (non-case sensitive) comparison.

String data type (n)~ A fundamental data type that holds characters, one character per 2 bytes. A fixed-length string can contain 1 to 64K characters; a variable-length string can contain 1 to 2 billion.

string delimiter (n)~ A text character that sets apart a string embedded within a string.

string expression (n)~ An expression that evaluates to a sequence of contiguous characters. Elements of the expression can be: functions that return a string or a string Variant (VarType 8); a string literal, constant, variable, or Variant.

strip line (n)~ Horizontal or vertical ranges that set the background pattern of the chart in regular or custom intervals. You can use strip lines to improve readability for looking up individual values on the chart, highlight dates that occur at regular intervals, or highlight a specific key range.

stripe (n)~ Horizontal or vertical ranges that set the background pattern of the chart in regular or custom intervals. You can use strip lines to improve readability for looking up individual values on the chart, highlight dates that occur at regular intervals, or highlight a specific key range.

striped media set (n)~ A media set that uses multiple devices, among which each backup is distributed.

striped volume (n)~ A dynamic volume that stores data that is allocated alternately and evenly (in stripes) across two or more physical disks.

stroke (n)~ A line style resembling natural media paint strokes or photorealistic images that you can apply to an object.

stroke (n)~ The set of data that is captured in a single pen down, up, or move sequence.

strong consistency (n)~ A scenario where high availability is enabled and there is more than one copy of a cached object in the cache cluster. All copies of that object remain identical.

strong encryption (n)~ Encryption using a longer key (e.g. 128 bit).

Strong Language (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Strong Lyrics (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

strong name (n)~ A name that consists of an assembly's identity-its simple text name, version number, and culture information (if provided)-strengthened by a public key and a digital signature generated over the assembly. Because the assembly manifest contains file hashes for all the files that constitute the assembly implementation, it is sufficient to generate the digital signature over just the one file in the assembly that contains the assembly manifest. Assemblies with the same strong name are expected to be identical.

strong password (n)~ A password that cannot be easily guessed or cracked. A strong password is at least eight characters long, does not contain all or part of the user's account name, and contains at least three of the four following categories of characters: uppercase characters, lowercase characters, numbers, and symbols found on the keyboard (such as !, @, #).

Strong Sexual Content (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

strongly-typed (adj)~ Pertaining to a collection element whose type matches the actual type of the elements stored in the same collection, rather than the type of a base class.

struct (n)~ A compound data type that is typically used to contain a few variables that have some logical relationship. Structs can also contain methods and events. Structs do not support inheritance but they do support interfaces. A struct is a value type, while a class is a reference type.

structural editing (n)~ Editing that occurs within a structured document such as a well-formed XML document.

structure (n)~ The design and composition of a program, including program flow, hierarchy, and modularity.

structure (n)~ A user-defined value type that, similar to a class, can contain constructors, constants, fields, methods, properties, indexers, operators, and nested types. Unlike classes, however, structures do not support inheritance.

Structure (PN)~ The Sway Design feature that allows users to change the navigation and layout model of a particular Sway document.

structured parallelism (n)~ In the Concurrency Runtime, parallel code that is scheduled and finished in the lexical scope from which it starts. Under the structured parallelism model, a task does not finish until its child tasks finish.

structured programming (n)~ Programming that produces programs with clean flow, clear design, and a degree of modularity or hierarchical structure.

Structured Query Language (n)~ A database query and programming language widely used for accessing, querying, updating, and managing data in relational database systems.

structured reference (n)~ A reference to a table or subset of a table by the table name and column specifier instead of cell coordinates.

Structured References (n)~ A formula syntax that allows the user to refer to list and pivot data in a friendlier way.

STS (n)~ A Web service that issues security tokens. A security token service makes assertions based on evidence that it trusts to whoever trusts it. To communicate trust, this service requires proof, such as a security token or set of security tokens, and it issues a security token with its own trust statement. (Note that for some security token formats, this can simply be a reissuance or cosignature.) In Active Directory Federation Services

(ADFS), the Federation Service is a security token service.

STT (n)~ The use of the SSL (Secure Sockets Layer), S-HTTP (Secure HTTP), or both in online transactions, such as form transmission or credit card purchases.

stub (n)~ A routine that contains no executable code and that generally consists of comments describing what will eventually be there; it is used as a placeholder for a routine to be written later.

stub zone (n)~ A copy of a zone that contains only the resource records required to identify the authoritative DNS servers for that zone. A DNS server that hosts a parent zone and a stub zone for one of the parent zone`s delegated child zones can receive updates from the authoritative DNS servers for the child zone.

student (n)~ A person who is enrolled in a class.

Studio Experiment Hours (PN)~ The resource of the Machine Learning service type of the Data Services service for hours spent in Microsoft Azure Machine Learning Studio.

Study aids (PN)~ The Education subcategory containing apps to help you study for exams.

study group (n)~ A student collaboration group where studying can be organized and managed online.

stuttering (n)~ As the client renders the stream, the disruption of flow by either repetitions and/or prolongations of video, or by short pauses.

style (n)~ A set of formatting characteristics that you can apply to text, tables, and lists in your document to quickly change their appearance.

style (n)~ A reusable set of properties, resources, and event handlers that can be shared between instances of the same object type.

Style (PN)~ The Sway feature that allows users to choose a color and font for their sway.

Style & fashion (PN)~ The Lifestyle subcategory containing apps for people with interest in fashion and style.

style area (n)~ A vertical area along the left edge of the document window that displays the name of the paragraph style that is applied to each paragraph.

Style gallery (PN)~ The gallery that holds all the Style options that can be applied to a sway.

style inspector (n)~ A floating task pane that allows users to view and customize specific paragraph and text style properties.

style picker (n)~ An interface in which the user can select and set styles for certain elements on the page.

style sheet (n)~ A text file containing code to apply semantics such as page layout specifications to published content.

style trigger (n)~ A mechanism to apply property values based on specified conditions to create visually compelling effects and a consistent appearance.

Styles Guides (PN)~ A feature which, when activated, indicates visually where automatic styles have been applied in a document.

stylistic set (n)~ A stylistic variation on a font that provides an alternative to its default appearance.

stylus (n)~ A pointed input device that comes with a mobile device or tablet PC, and is used to navigate through applications and to input information.

sub chassis (n)~ A chassis type that can be reported by the Win32_SystemEnclosure class in Windows Management Instrumentation (WMI) and that refers to an enclosure that facilitates mechanical and electrical attachment to a main chassis for a set of computer components that are removable, indepdent of any components attached to the main chassis.

sub notebook (n)~ A chassis type that can be reported by the Win32_SystemEnclosure class in Windows Management Instrumentation (WMI) and that refers to a class of small and light notebooks with screens typically measuring less than 14 inches diagonally.

Sub procedure (n)~ A Visual Basic for Applications (VBA) procedure that carries out an operation, but unlike a Function procedure, does not return a value.

Sub Segment (PN)~ A field on the Account Details part of the Details tab that allows the user to specify the segment more closely. It indicates the size and/or strategic importance of the end customer and defines selling and marketing model/business process used to engage with the end customer.

sub-account (n)~ An account, and its information, that is included within another account.

sub-bill of material (n)~ A bill of material that makes up a component of another bill of material.

sub-BOM (n)~ A bill of material that makes up a component of another bill of material.

subcampaign (n)~ A subdivision of a larger campaign.

subcategory (n)~ A new category that is based on an existing category. For example, instead of tracking computers along with your other equipment, you might want to create a Computer subcategory from the Equipment category to track them as a separate group. Similarly, you can further organize a Restaurants category to include American and Chinese subcategories.

subcollection (n)~ A collection that is associated with another collection for the purpose of software distribution.

subcommand (n)~ A command in a submenu (a menu that appears when a user selects an option in a higher-level menu).

subcontact (n)~ A secondary contact for an Account (that is, not the primary contact).

sub-contact (n)~ A secondary contact for an Account (that is, not the primary contact).

subcontracting (n)~ The practice of outsourcing service activities to vendors.

subcontractor (n)~ An individual or organization that fulfills all or part of a contract from another contractor or subcontractor.

subdatasheet (n)~ A datasheet that is nested within another datasheet and that contains data related or joined to the first datasheet.

subdirectory (n)~ A directory contained within another directory in a file system hierarchy.

subdomain (n)~ A DNS domain located directly beneath another domain name (the parent domain) in the namespace tree. For example, example.microsoft.com' would be a subdomain of the domain 'microsoft.com'.'

subdomain ~ Subdomain is a way to divide your site into sections with short and easy to remember names. Other use of subdomains might be to let somebody else use your account.

subentry (n)~ An index entry that falls under a more general heading. For example, the

index entry planets' could have the subentries 'Mars' and 'Venus."

subexpression (n)~ In regular expressions, a concatenation or an alternation, depending on the regular expression grammar being used.

subform (n)~ A form contained within another form or a report.

subform control (n)~ A control that displays a subform in a form or a subform or a subreport in a report.

sub-grid (n)~ A grid added to a form by a customizer that provides users with access to a group of records, which are usually contextually related.

subgroup (n)~ A group of contacts that is also part of another group, displayed as nested groups in the contact list.

subheading (n)~ A subordinate heading in an outline (in a document, worksheet or other).

subject (n)~ In public key cryptography, an entity that requests or holds a certificate. A subject can be a user, a computer, or any other device capable of requesting or using a certificate.

subject (n)~ A category used to organize objects in the Knowledge Base.

subject alternative name (n)~ An extension (defined in RFC 4985) used to store extra identifiers for a subject including the User Principal Name (UPN) of the user that is used by Windows for smart card logon and the user e-mail address (RFC 822 name).

subject key identifier (n)~ A certificate extension that contains a hash of the certification authority's certificate public key. This hash is placed in the Authority Key Identifier (AKI) extension of all issued certificates to facilitate chain building.

subject line (n)~ The part of a message header that is used by the sender to indicate the object of the message.

Subject Manager (n)~ A sub-area of the Settings module where the subject tree is managed.

subject tree (n)~ The hierarchical list of categories used to correlate and organize information.

subkey (n)~ An element of the registry that contains entries or other subkeys. A tier of the registry that is immediately below a key or a subtree (if the subtree has no keys).

subledger journal account entry (n)~ An account entry in a subledger journal account.

subledger journal entry (n)~ A journal entry in a subledger journal.

submarine cable ~ A cable designed to be laid underwater.

submenu (n)~ A type of drop-down menu that appears when a user points to a command on a higher-level menu.

Submission queue (n)~ A persistent queue that is used to hold messages that are submitted to the Exchange Server organization through SMTP-receive, the Pickup directory, or the store driver.

submit (v)~ To propose or send in something for consideration, approval, or judgment.

submodel (n)~ A forecasting model that can be used as a component of another model.

subnet (n)~ A subdivision of an Internet Protocol (IP) network. Each subnet has its own unique subnetted network ID.

subnet bandwidth management (n)~ An Internet Engineering Task Force (IETF) standard that enables administrative control at the subnet level.

subnet mask (n)~ A 32-bit value that enables the recipient of Internet Protocol version 4

(IPv4) packets to distinguish the network ID and host ID portions of the IPv4 address. Typically, subnet masks use the format 255.x.x.x. IPv6 uses network prefix notations rather than subnet masks.

subnet mask ~ A bit mask used to select bits from an Internet address for subnet addressing.

subnetwork (n)~ An identifiable and separate part of an organization's network identified through IP addressing.

subnotebook (n)~ A notebook that is smaller in size and lighter in weight than a full-sized notebook, while retaining the same functionality.

subordinate CA (n)~ In a public key infrastructure (PKI) hierarchy, any certification authority that is not the root CA.

subordinate certification authority (n)~ In a public key infrastructure (PKI) hierarchy, any certification authority that is not the root CA.

subordinate control (n)~ A type of interoperating control whose availability is determined by the state of another control (the superior control).

subordinate record (n)~ A record, such as a contact, that you designate as subordinate to a master record.

subordinate server (n)~ A server that does not attempt to resolve queries on its own. Instead, it sends all queries to forwarders.

subordinate shape (n)~ In an organization chart, a shape that is placed below and connected to a superior (or manager) shape.

subpath (n)~ A group of paths that comprise a compound path.

subphase (n)~ A summary task that is nested within another summary task. With the Project outlining features, you can designate subphases.

sub-pixel positioning (n)~ A font rendering technique that takes advantage of partial pixels to make text appear sharper on the screen.

subproject (n)~ A project that is a component of another project.

subquery (n)~ A SELECT statement that contains one or more subqueries.

subreport (n)~ A report contained within another report.

sub-report (n)~ A report that is displayed in a second window when a user clicks an item in a report.

subreport control (n)~ A control that displays a subform in a form or a subform or a subreport in a report.

subroute (n)~ A route that makes up a component of another route.

subroutine (n)~ A common term for routine, likely to be used in reference to shorter, general, frequently called routines.

subscribe (v)~ To start using the services of a service provider, e.g. an Internet access provider. The subscriber may or may not be charged for the used services.

subscribe (v)~ To request data from a Publisher.

subscribe (v)~ To arrange to receive a product or use a service regularly.

subscribe (v)~ To select the views to be loaded onto a mobile device.

subscribe (v)~ To request data from the data bus.

subscribed (adj)~ Pertaining to an agent who is listed as an agent in the group definition.

subscriber (n)~ In Notification Services, the person or process to which notifications are

delivered.

subscriber (n)~ In replication, a database instance that receives replicated data.

subscriber (n)~ A person who has indicated his or her desire to be on a mailing list.

subscriber (n)~ A mobile user who has selected specific subscriptions for his/her mobile device.

subscriber access number (n)~ A number that is configured in a Private Branch eXchange (PBX) that allows a subscriber to access their Microsoft Exchange mailbox over the telephone.

subscriber database (n)~ In replication, a database instance that receives replicated data.

subscribing server (n)~ A server running an instance of Analysis Services that stores a linked cube.

subscription (n)~ Part of the application metadata that specifies the data source, the refresh interval, and, optionally, subscription expiration.

subscription (n)~ An agreement in which a customer prepays for periodic or regular services.

subscription (n)~ A view that a mobile device user has selected to be available on his or her mobile device.

subscription (n)~ A request for a copy of a publication to be delivered to a subscriber.

subscription (n)~ A collection of Microsoft Azure offerings tied to a single Live ID.

Subscription (n)~ An automated notification that alerts Customers via email when a specified Knowledgebase Article is updated.

subscription advisor (n)~ A Microsoft partner who is authorized to sell subscriptions for Microsoft Online Services. The subscription advisor may have additional authorization to offer technical support. Internally, a subscription advisor may be referred to as a reseller

Subscription Center (PN)~ An email marketing plug-in that is required to be added to all commercial emails.

subscription computer (n)~ The computer offered to a customer by a solution provider where the customer chooses from a range of packaged services, including a computer, genuine Windows software, and broadband Internet services, which are included in one bill. Computer time is purchased for a specified, regular time period (for example, on a monthly or quarterly basis).

subscription computing (n)~ An approach in which telephone and internet service providers offer PCs to their customers, who then have the ability to pay for them over time through their monthly bill.

subscription database (n)~ A database at the Subscriber that receives data and database objects published by a Publisher.

subscription database (n)~ A database at the Subscriber that receives data and database objects published by a Publisher.

subscription event rule (n)~ A rule that processes information for event-driven subscriptions.

subscription file (n)~ An audio or video file that you rent from an online store, typically for a monthly fee.

subscription group (n)~ A classification of subscriptions used for pricing, posting, and otherwise managing subscriptions.

subscription plan (n)~ The type of Microsoft Azure subscription that describes the billing rate and other charges.

subscription scheduled rule (n)~ One or more Transact-SQL statements that process information for scheduled subscriptions.

subscription transaction (n)~ A transaction that modifies a subscription. There are four types of subscription transactions: regular subscription, non-regular subscription, price change, and reduction days.

subselect (v)~ To select individual shapes within a group.

subset (n)~ A selection of tables and the relationship lines between them that is part of a larger database diagram.

subshell (n)~ A new Monad session launched as a child of another Monad session.

subsidiary (n)~ A company controlled by another company or corporation.

subsidy lock (n)~ A type of phone lock that original equipment manufacturers embed into their mobile phones at the request of mobile phone operators to prevent their use on a cellular network other than the one for which the phone was originally intended.

subsidy PIN (n)~ A type of personal identification number (PIN), consisting of 8 digits, that is used to unlock a phone's subsidy lock.

subsite (n)~ A complete Web site stored in a named subdirectory of the top-level Web site.

substance flow (n)~ The flow of substances between a source process and a destination process.

substitute (n)~ A delegate who stands in for the approval of a document when the original approver is out of office.

substitute (n)~ An item that can take the place of another item.

substitute product (n)~ An item that can take the place of another item.

subsystem (n)~ A system that is part of another system.

Subsystem for UNIX-Based Applications (n)~ A Windows component that provides platform services for UNIX system-based applications.

subtask (n)~ A task that is part of a summary task. The subtask information is consolidated into the summary task. You can designate subtasks by using the Project outlining feature.

sub-territory (n)~ A territory, and its information, that is included within another territory.

Subtitle (n)~ A title animation in Windows Movie Maker.

subtotal (n)~ The adjusted price value multiplied by the quantity of products ordered, providing an overall sale value.

subtotal (n)~ An intermediate partial sum, quantity, or amount.

subtract (n)~ To perform the basic mathematical operation of deducting something from something else.

subtract (v)~ To combine two or more shapes or paths to result in a single path that represents the only portion of the last-selected object that was not overlapped by another object.

subtree (n)~ Any node within a tree, along with any selection of connected descendant nodes. In the registry structure, subtrees are the primary nodes that contain keys, subkeys, and value entries.

success code (n)~ An exit code value returned by an executable program that indicates that an operation completed successfully.

success story (n)~ An account of an individual or organization's business achievements.

successor (n)~ An activity that occurs after another activity in a series. A successor can have, but does not always have, a prerequisite.

suffix pattern (n)~ The end bytes in a given stream of bytes.

Suggested (PN)~ The Sway menu option that automatically suggests content related to a user's current sway and allows him/her to add it.

Suggested color (PN)~ The Sway feature that uses an intelligence platform to suggest color options based on the content in a user's sway.

Suggested Contacts (PN)~ A feature that makes Outlook auto-complete lists available through the default Exchange mailbox.

Suggested Content (PN)~ The menu option in Sway under the -€œAdd Content-€? button that analyzes the user's Sway to suggest useful content that can be browsed or added as desired.

Suggested searches (n)~ Keywords, phrases, or contacts that are suggested as users type.

Suggested Sites (PN)~ A search feature that allows Internet Explorer to use your browsing history to return results that suggest other sites that you may like or find useful.

Suggested Tasks (n)~ A list of Works tasks returned in response to keywords entered by the user in the To Do box. When the user types in words, the app uses these words to search the Answer Wizard to find suitable tasks or templates.

Suggestions for you (PN)~ The suggested content that is displayed on different surface areas in the operating system. Content can range from tips and tricks, a link to other content, an app, etc.

Suggestive Themes (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

suite (n)~ A set of application programs sold as a package, usually at a lower price than that of the individual applications sold separately. A suite for office work, for example, might contain a word processing program, a spreadsheet, a database management program, and a communications program.

Suite ~ A group of programs which carry out different tasks but are intended to work together, such as Microsoft Office.

Suite B (n)~ A set of cryptographic algorithms specified by the US National Security Agency to provide an interoperable standard for government and industry.

Suite B algorithm (n)~ One of a set of cryptographic algorithms specified by the US National Security Agency to provide an interoperable standard for government and industry.

summary (n)~ A brief content of a larger document.

summary (n)~ A shortened version of information that contains only the main points.

summary data (n)~ For automatic subtotals and worksheet outlines, all rows or columns that summarize detail data. Summary data usually is adjacent to and below the detail data.

summary function (n)~ A type of calculation that combines source data in a PivotTable report or a consolidation table, or when you are inserting automatic subtotals in a list or database.

summary project (n)~ A parent project that is used only for structuring information and against which no transactions are registered.

summary query (n)~ The part of a fan-out query that carries out post processing to allow condensing the results from the member query to desired final result-set.

summary task (n)~ A task that is made up of subtasks and summarizes those subtasks. Use outlining to create summary tasks. Project automatically determines summary task information [such as duration and cost] by using information from the subtasks.

Summary toolbar (n)~ A list view toolbar type in the toolbar picker, that shows an abbreviated version of a full toolbar.

summary unit (n)~ A reporting unit that summarizes data from lower-level units. The lower-level units can be either detail units or other summary units.

Super VGA (n)~ A video standard established by BESA to provide high-resolution color display on IBM-compatible computers. The most commonly implemented SVGA standard is 1024- x- 768 pixels color resolution.

Super Video CD (n)~ An optical disc format used to store video on standard compact discs developed by China Recording Standards Committee in competition to the DVD format.

super video graphics adapter (n)~ A video standard established by BESA to provide high-resolution color display on IBM-compatible computers. The most commonly implemented SVGA standard is 1024- x- 768 pixels color resolution.

superclass (n)~ A class in object-oriented programming from which another class - a subclass - is derived. The subclass inherits its attributes and methods from the superclass.

superior control (n)~ A type of interoperating control that determines the availability of another control (the subordinate control).

superior shape (n)~ In an organization chart, a shape that is placed above and connected to any other shape, such as an employee (subordinate or coworker shape) or assistant shape.

supermarket (n)~ A just-in-time inventory location that has finite capacity- and is used to batch material near a point of consumption.

supernode (n)~ A relay point for peer-to-peer traffic whereby users volunteer to allow their computer to be used by other users to establish direct voice chats, share files and pictures by handling data flow and connections for other users.

superscope (n)~ An administrative grouping feature that supports a DHCP server's ability to use more than scope for each physical interface and subnet. Superscopes are useful under the following conditions: If more DHCP clients must be added to a network than were originally planned, if an Internet Protocol (IP) network is renumbered, or if two or more DHCP servers are configured to provide scope redundancy and fault-tolerant design DHCP service for a single subnet. Each superscope can contain one or more member scopes (also known as child scopes').'

supersedence (n)~ A deployment behavior that specifies how new software replaces existing software.

super-user credentials (n)~ Elevated credentials that have rights to access objects that ordinary users without elevated credentials can't access.

supervision list (n)~ The list of e-mail addresses or users that are subject to or excepted

from the actions of the closed campus supervision policy or anti-bullying supervision policy.

supervision list entry (n)~ An individual item on the list of e-mail addresses or users that are subject to or excepted from the actions of the closed campus supervision policy or anti-bullying supervision policy. For example, a bully's e-mail address would be an entry on the supervision list of a victim'

supervision policy (n)~ A set of e-mail policy settings that can help primary and secondary school administrators comply with some requirements of the Children's Internet Protection Act (CIPA). Using these policy settings, administrators can control who can send e-mail to and receive e-mail from the users in their organization, and filter and reject e-mail that contains objectionable words.

supervisor mode (n)~ A highly privileged mode of operation where program code has direct access to all memory, including the address spaces of all user-mode processes and applications, and to hardware.

Supplemental Agreement (PN)~ Any agreement that incorporates this agreement, such as a Statement of Services.

supplementary item (n)~ An extra item that is added to the sales or purchase order lines when a certain quantity of an item is sold or purchased.

supplementary item group (n)~ A user-defined classification of supplementary items that have similar characterisitcs.

supplicant (n)~ An entity at one end of a point-to-point LAN/WLAN segment that is requesting authenticated access to the network.

supplied inventory location (n)~ The inventory location where an item is consumed and where the replenishment of the item is planned.

supplied service (n)~ A service that an employee receives without taking action or requesting assistance, such as automatic payroll deposit.

supplier site (n)~ A Web site designed for the creation and transmission of purchase orders between businesses that have an established relationship.

supply chain management (n)~ The management of a network of interconnected businesses involved in the ultimate provision of product and service packages required by end customers.

supply forecast (n)~ An estimate of future product supply.

supply planner (n)~ The employee who is responsible for creating a supply plan.

support (n)~ The activities and actions performed by customer service representatives to assist customers.

support (n)~ A business department that deals with routine inquiries and complaints from customers.

support agent (n)~ A user who works for a company that is a valid partner tenant who has been assigned either limited or full administration agent role.

Support Center (n)~ A unified place where a user can access all Help and Support content and services from Microsoft, the OEM, and the corporation.

Support Count (n)~ A dynamic option that displays the number of rows in which the determinant column value determines the dependent column.

Support Percentage (n)~ A dynamic option that displays the percentage of rows in which

the determinant column determines the dependent column.

Support Portal (PN)~ The website that serves as a dashboard for Customers to submit Tickets, initiate Chat Requests, and leave feedback.

support professional (n)~ An engineer who specializes in product support. Support professionals talk with customers, investigate their issues, and provide solutions.

support session (n)~ An interactive session between a support professional and a customer.

support team (n)~ An organization or group that is responsible for providing technical support.

surf (v)~ To browse among collections of information on the Internet, in newsgroups, in Gopherspace, and especially on the World Wide Web. As in channel surfing while watching television, users ride the wave of what interests them, jumping from topic to topic or from one Internet site to another.

surface (n)~ A shape representing a continuous area in a coordinate system.

surface area (n)~ The number of ways in which a piece of software can be attacked.

surface chart (n)~ A chart that shows a three dimensional surface that connects a set of data points. As in a topographic map, colors and patterns indicate areas that are in the same range of values.

Surface Hub (PN)~ A large, interactive whiteboard device for collaboration and videoconferencing, designed to advance the way people work together naturally.

Surface Input (PN)~ An administration application that captures touch input and sends it to a Surface application. Surface Input has status indicators in the notification area of the Windows desktop in administration mode.

Surface Pen (PN)~ A digital pen designed to work with Surface Pro 3 and Surface 3, enabling effortless writing and drawing in any app that supports inking.

surface picking (n)~ The process of choosing which input surface contributes most to the output surface at a certain position on the output. Surface picking is often used with mouse operations to choose different actions in code that depend on which image you select. In cases where several images are alpha blended on the output point, the transform can use the alpha channel of each input sample to choose the input surface.

Surface Shell (PN)~ An administration application that replicates user mode without leaving administrator mode so you can test and debug applications with Launcher. Surface Shell starts the Shell so that the Surface unit displays the default attract application and Launcher.

Surface Simulator (PN)~ A software application that developers can use to simulate Surface input from contacts, such as fingers and tagged objects, on a separate computer. Surface Simulator enables you to design and develop Surface applications without a Surface unit.

Surface unit (n)~ The set of hardware components that, together with the Microsoft Surface software, make up the Microsoft Surface product. At a high level, a Surface unit consists of a computer module and the Surface Vision System enclosed in a frame and covered by the Surface tabletop.

Surfing ~ In a computer context, wandering around the- World Wide Web(which really annoys the guys with the boards and the big waves). Also called- websurfing.

surge suppressor (n)~ An appliance that protects computers from power surges and brownouts by providing a buffer between a power source and the computer.

surrogate key (n)~ A single attribute candidate key whose values are system-generated and that does not represent properties that identify objects in the real world.

surrogate timesheet (n)~ A timesheet that you create in Project Web Access and submit on behalf of someone who works for you.

survey (n)~ A Web site component that presents users with a set of questions specified by the creator of the survey and collects user responses. Results are tallied in a graphical summary. Requires a Web server that is running Windows SharePoint Services.

Survivable Branch Appliance (n)~ A telephony device that keeps the phones working if the connection to the central site is lost.

Survivable Branch Server (PN)~ A server running Windows Server that meets specified hardware requirements, and that has Lync Server Registrar and Mediation Server software installed on it. Like Survivable Branch Appliances, this device can provide voice mail survivability for branch users during a WAN outage.

SUSE Linux Enterprise Server (PN)~ A server product for enterprise computing by SUSE.

suspect tape (n)~ A tape that has conflicting identification information, such as the barcode or the on-media identifier.

suspend (v)~ To halt a process temporarily.

suspended app (n)~ An application that has been deactivated or removed from a marketplace, due to issues with the application.

suspended state (n)~ The state of a workflow instance that has stopped processing temporarily because of user intervention or a workflow policy. A user can resume, cancel, or terminate a suspended instance.

SUT (n)~ A system that is being tested for correct operation.

SV (n)~ The difference between the budgeted cost of work performed [BCWP] and the budgeted cost of work scheduled [BCWS]. This is calculated as follows: SV = Budgeted Cost of Work Performed - Budgeted Cost of Work Scheduled.

SVC (n)~ A logical connection between two nodes on a packet-switching network that is established only when data is to be transmitted.

SVCD (n)~ An optical disc format used to store video on standard compact discs developed by China Recording Standards Committee in competition to the DVD format.

SVF (n)~ A function that returns a single value, such as a string, integer, or bit value.

SVG (n)~ An XML-based language for device-independent description of two-dimensional graphics. SVG images maintain their appearance when printed or when viewed with different screen sizes and resolutions. SVG is a recommendation of the World Wide Web Consortium (W3C).

SVGA (n)~ A video standard established by BESA to provide high-resolution color display on IBM-compatible computers. The most commonly implemented SVGA standard is 1024- x- 768 pixels color resolution.

SVVP (PN)~ A certification program for Microsoft vendors that enables them to validate various virtualization configurations so that Microsoft customers can receive technical support for Windows Server in virtualized environments.

swap (v)~ To switch between active calls.

swap chain (n)~ A collection of buffers used for displaying frames to the user.

Swap Displays (PN)~ A feature in Presenter View that enables the user to switch which monitor is showing Presenter View and which monitor is showing Slide Show.

swap file (n)~ A hidden file on the hard disk that Windows uses to hold parts of programs and data files that do not fit in memory. The paging file and physical memory, or random access memory (RAM), comprise virtual memory. Windows moves data from the paging file to memory as needed and moves data from memory to the paging file to make room for new data.

swap VIP (v)~ To swap the staging environment with the production environment of a cloud service.

swap virtual IP (v)~ To swap the staging environment with the production environment of a cloud service.

swash (n)~ A decorative glyph that uses elaborate ornamentation often associated with calligraphy.

swatch (n)~ A collection of preset colors. Typically it appears in toolbar dropdown as small squares filled with the colors.

swatch (n)~ A solid color, gradient, or image sample that is saved in order to be easily recalled to apply as a fill or stroke.

Sway (PN)~ The web app that allows users to put together different types of content, such as text, images and videos, using an interactive online canvas that can be shared and embedded on other sites.

Sweep (PN)~ The menu in Hotmail that includes actions a customer may take on the contents of the folder that is currently displayed. Some actions draw context from a selected message. For example, if someone selects a message, they can move all or delete all messages from that sender. If no message is selected, the actions occur at a folder level, such as marking all messages in the folder as read, or deleting all messages in the folder.

sweep (v)~ To undertake e-mail cleanup actions in Hotmail via the Sweep menu.

sweep angle (n)~ The number of degrees, between 0 and 360 that the scale will sweep in a circle. A sweep angle of 360 degrees produces a scale that is a complete circle.

SWIFT code (n)~ An international identification code used to identify financial institutions for international money transfers.

swimlane (n)~ In an activity diagram, a way of assigning responsibility to action states. Swimlanes are columns with solid vertical lines on each side. Each swimlane represents the responsible class, person, or organizational unit.

Swing (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 83.

swipe (v)~ To move your finger in one quick sweep across a fingerprint reader for authentication with a device or computer.

swipe (n)~ To slide a machine-readable card through a magnetic stripe reader.

swipe (v)~ To quickly slide a finger for a short distance.

swipe (n)~ A gesture represented by a quick slide of a finger over a short distance.

swipe gesture (n)~ A gesture represented by a quick slide of a finger over a short distance.

switch (n)~ A device used to connect computers on a network that forwards packets to specific ports rather than broadcasting every packet to every port.

switch (n)~ A circuit element that has two states, on and off.

switch (v)~ To change the modality of a conversation from, say, voice call to video, starting from a pop-up notification.

switch ~ A device, such as a PBX, that responds to originator signals and connects the caller to the desired communications destination.

switch in table (n)~ The staging table the user wants to use to switch in their data. The staging table needs to be created before switching partitions with the Manage PartitionsWizard.-

switch out table (n)~ The staging table the user wants to use for the partition to switch out of the current source table.-

switch parameter (n)~ A parameter that does not take an argument.

Switch Series/Category (PN)~ A control that allows users to plot their chart such that the x-axis data appears on the y-axis and vice versa.

Switch User (v)~ A UI command used to switch between accounts on a device.

Switch Video (oth)~ The button in a Video conversation window that switches between the local and remote video feeds in the current video conversation.

switched digital video (n)~ Digital video or service that is not made available on the network or system until requested by a customer.

switched network (n)~ A communications network that uses switching to establish a connection between parties, such as the dial-up telephone system.

switched virtual circuit (n)~ A logical connection between two nodes on a packet-switching network that is established only when data is to be transmitted.

switching hub (n)~ A central network device (multiport hub) that forwards packets to specific ports rather than, as in conventional hubs, broadcasting every packet to every port. In this way, the connections between ports deliver the full bandwidth available.

switchover (n)~ An administrator-initiated action in which one or more passive copies of the mailbox database are being activated and designated as the active copy. An administrator can perform a database switchover, which is the activation of a single mailbox database copy, or an administrator can perform a server switchover, which is the activation of multiple mailbox database copies.

swizzle (v)~ To reorder data within a surface so as to increase the efficiency of accessing the data within the surface.

SWOT analysis (n)~ An analysis of the internal and external environmental factors performed as part of developing the organizational strategy.

SYLK file (n)~ A file constructed with a proprietary Microsoft format, used primarily for exchanging spreadsheet data in such a way that formatting information and intercellular data value relationships are preserved.

syllabus (n)~ ?A summary of class information, such as the course name and description, a schedule of lessons and assignments, and evaluation criteria.

Symbian ~ A joint venture launched in 1998 by Psion, Ericsson, Nokia and Motorola to develop Psion's EPOC 32 operating system into a real-time operating system for handheld phones and PDAs. Matsushita, NTT DoCoMo, Siemens and Sun Microsystems have since

joined.

symbol (n)~ An identifier in human readable language that refers to a location in compiled code, such as a function or variable. Symbols are used in debugging.

symbol (n)~ A general term that encompasses many types of identifiers in programming languages, including namespaces, classes, functions, and variables.

symbol store (n)~ A collection of indexed symbol files, which are debug (.dbg) or program database (.pdb) files that contain debugging information for Windows-based applications. This store is used by debuggers to retrieve debugging information associated with product releases. All symbols can be stored on the same symbol server and retrieved without having to know the associated product names, releases, or build numbers.

symbolic link (n)~ A disk directory entry that takes the place of a directory entry for a file but is actually a reference to a file in a different directory.

symmetric encryption (n)~ An encryption algorithm that requires the same secret key to be used for both encryption and decryption. Because of its speed, symmetric encryption is typically used when a message sender needs to encrypt large amounts of data.

symmetric key (n)~ The cryptographic key used to both encrypt and decrypt protected content during publishing and consumption.

symmetric multiprocessing (n)~ A multiprocessing operation in which multiple processors share the same memory, which contains one copy of the operating system, one copy of any applications that are in use, and one copy of the data. Because the operating system divides the workload into tasks and assigns those tasks to whatever processors are available, SMP reduces transaction time.

symmetrical number pattern (n)~ A Sudoku pattern where the game-generated numbers are symmetrically placed on the board.

symmetric-key cryptography (n)~ A type of cryptography that uses symmetric keys to provide confidentiality.

Symphonic Rock (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 94.

Symphony (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 106.

Symptom Checker (PN)~ A feature that allows a user to check medical symptoms to diagnose illness.

sync (v)~ To reconcile the differences between files, e-mail, appointments, and other items stored on one computer, device or in the cloud with versions of the same files on another computer, device or in the cloud. Once the differences are determined, both sets of items are updated.

sync (n)~ The process of reconciling the differences between data stored in one location and a copy of the same data stored in another location.

Sync (PN)~ A menu item that initiates the process of synchronization.

Sync Center (PN)~ An item on the Control Panel that provides user a comprehensive view over all roamed content, as well as ability to check on the synchronization progress of individual items.

sync conflict (n)~ A conflict that occurs when data differences between data stored in one location and a version of the same data in another location cannot be reconciled.

sync error (n)~ A problem that prevents sync from completing. Sync errors are typically caused by problems with the device, network folder, or other computer you are trying to sync with.

sync group (n)~ A collection of databases that are configured for mutual synchronization by the synchronization service.

sync job (n)~ A scheduled synchronization task.

sync loop (n)~ A series of synchronizations that is repeated until a terminating condition is reached.

Sync Manager (n)~ A tool used to ensure that a file or directory on a client computer contains the same data as a matching file or directory on a server.

sync my settings (PN)~ A feature that allows you to sync some of the settings on your phone across all of your Windows 8 devices.

Sync Pane (n)~ A panel in Sync Wizard that shows the devices and the content to be synchronized.

sync partnership (n)~ A profile in Sync Manager that specifies how and when files are synchronized between two locations (such as between a desktop computer and a laptop).

sync schedule (n)~ The times that will trigger automatic synchronization between a device and Exchange Server every time an item arrives or is modified in Exchange Server.

Sync Slider (PN)~ A feature that allows an Outlook user to limit the amount of email data that is synchronized locally in their offline Outlook Data File (.ost), based on the age of the items. This approach helps maximize Outlook performance on devices that have a very limited amount of local storage.

Sync Wizard (n)~ A one-time Device Setup wizard that comes up the first time you attach a particular portable music device to the player.

Synced folder (PN)~ The tooltip displayed when pointing to a personal folder icon on the Manage folders page on the Windows Live Devices website.

Synced folders (PN)~ The webpage subheading for the list of synced folders.

synced user (n)~ A user account in a cloud service or other separate system that is synchronized with the local Active Directory directory service.

SyncEngine (n)~

synchronization (n)~ The matching of timing between computers on a network, or between components of a computer, so that all are coordinated.

synchronization (n)~ The process by which DPM transfers changes from the protected server to the DPM server, and applies the changes to the replica of the protected volume.

synchronization (n)~ The process of reconciling the differences between data stored in one location and a copy of the same data stored in another location.

synchronization application (n)~ A software component, such as a personal information manager or music database, that hosts a synchronization session and invokes synchronization providers to synchronize disparate data stores.

synchronization conflict (n)~ A conflict that occurs when data differences between data stored in one location and a version of the same data in another location cannot be reconciled.

synchronization engine (n)~

synchronization entity (n)~ A Navision or Outlook object containing data to be synchronized. Navision objects are tables and fields; Outlook objects are items, collections, and properties.

synchronization exception (n)~ A setting in the Navision Synchronization add-in that defines which categories of Outlook items should not be synchronized.

synchronization filter (n)~ A filter to prevent objects in the metaverse from being transferred to the ILM 2' database.'

synchronization job (n)~ A scheduled synchronization task.

synchronization level (n)~ A hierarchical structure consisting of Navision entities and specific Outlook items that they should be mapped to.

synchronization log (n)~ A hidden file, stored on a protected volume, in which the DPM File Agent records changes to data since the last synchronization job.

synchronization loop (n)~ A series of synchronizations that is repeated until a terminating condition is reached.

synchronization manager (n)~ A tool used to ensure that a file or directory on a client computer contains the same data as a matching file or directory on a server.

Synchronization Manager (n)~ A tool used to ensure that a file or directory on a client computer contains the same data as a matching file or directory on a server.

synchronization provider (n)~ A software component that allows a replica to synchronize its data with other replicas.

Synchronization report (n)~ A DPM report that provides statistics on the success or failure of synchronization jobs, and illustrates patterns of failure.

synchronization session (n)~ A unidirectional synchronization in which the source provider enumerates its changes and sends them to the destination provider, which applies them to its store.

synchronization with consistency check (n)~ A feature that enables the user to check for and correct inconsistencies between a protected volume and its replica.

synchronize (v)~ To reconcile the differences between files, e-mail, appointments, and other items stored on one computer, device or in the cloud with versions of the same files on another computer, device or in the cloud. Once the differences are determined, both sets of items are updated.

Synchronized Accessible Media Interchange (n)~ An Extensible Markup Language (XML)-based language used to specify closed captions in multiple languages and styles.

synchronized copy (n)~ A copy of a department that you create on a new page of a large organization chart, so that you can determine how your chart breaks across pages. When you create a synchronized copy, any changes you make appear in both.

synchronous (adj)~ Pertaining to applications or commands run in the order listed and that must finish before the next application or command is run.

synchronous conversion (n)~ ?A mode of Word Automation Services in which requests are processed synchronously, rather than in batches.

synchronous data exchange (n)~ A style of processing where an application requests that an event occurs and waits for the event to complete, so that the application is certain of the result of its request before it proceeds.

synchronous data link control (n)~ A type of link service used for managing synchronous data transfer over standard telephone lines (switched lines) or leased lines. The data transmission protocol most widely used by networks conforming to IBM's Systems Network Architecture (SNA). SDLC is similar to the HDLC (High-level Data Link Control) protocol developed by the International Organization for Standardization (ISO).

synchronous event (n)~ An event whose handler runs in the same processing thread as the action that raised the event. The action cannot continue until processing is complete for the event handler.

synchronous-commit failover set (n)~ Within a given availability group, a set of two or three availability replicas (including the current primary replica) that are configured for synchronous-commit mode, if any.

Syncing folders and program settings (PN)~ The list item for reporting that the syncing folders and program settings feature is problematic. The list is displayed in the problem reporting utility built in to beta versions of Windows Live Sync.

syndicated content (n)~ A distribution mechanism for frequently-updated content that is aggregated by an RSS reader and delivered or published in a standard XML format. The content is often summarized, with links to a more complete version.

syndication format (n)~ A format used for publishing data on blogs and web sites.

synonym (n)~ A word with the same meaning as another in the same language but often with different implications and associations.

syntactic validation (n)~ The process of confirming that an XML file conforms to its schema.

syntax (n)~ The rules governing the formation of a command-line statement, including the order in which a command must be typed, and the elements that follow the command.

syntax (n)~ The grammatical pattern of words in a language.

syntax checker (n)~ A program for identifying errors in syntax for a programming language.

syntax error (n)~ An error in the grammatical structure of the code or expression.

synthetic transaction (n)~ A feature that can be used to test the availability or performance of a given service or application from the perspective of an end user, or to confirm the functionality of a low level service.

Synthpop (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 147.

Sys Rq key (n)~ A key on some IBM and compatible keyboards that is intended to provide the same function as the Sys Req key on an IBM mainframe computer terminal: to reset the keyboard or to change from one session to another.

sysadmin (n)~ The person responsible for setting up and managing local computers, stand-alone servers, member servers, or domain controllers. An administrator performs such duties as assigning user accounts and passwords, establishing security access levels, watching for unauthorized access, allocating storage space, and helping users with networking problems.

SYSKEY (n)~ A tool used to configure the startup key, a random, 128-bit, symmetric

cryptographic key created at system startup and used to encrypt all of the user`s symmetric cryptographic keys.

Syspart (n)~ A process that executes through an optional parameter of Winnt32.exe. Used for clean installations to computers that have dissimilar hardware. This automated installation method reduces deployment time by eliminating the file-copy phase of Setup.

Sysprep (PN)~ A tool that prepares the hard disk on a source computer for duplication to destination computers.

system (n)~ A set of items or devices working together to accomplish a task.

system (n)~ Any application or process that you want to model. Examples of systems include a computer game, a process for assembling microchips, and a library information system.

System (PN)~ An API for accessing and managing system resources.

system access control list (n)~ An ACL that controls the generation of audit messages for attempts to access a securable object. The ability to get or set an object's SACL is controlled by a privilege typically held only by system administrators.

system administration (n)~ The range of activities of a system administrator.

system administrator (n)~ The person responsible for setting up and managing local computers, stand-alone servers, member servers, or domain controllers. An administrator performs such duties as assigning user accounts and passwords, establishing security access levels, watching for unauthorized access, allocating storage space, and helping users with networking problems.

System Agent (n)~ An agent that monitors checkpoints for potential threats making unauthorized or hazardous changes to your computer, such as altering your security permissions or system settings.

system API call (n)~ A transition from user to kernel mode.

System Applications (PN)~ A tab in the Windows Server Centro' Administration Console that provides access to plug-ins for managing third-party applications.'

system board (n)~ The primary circuit board in a computer that contains most of the basic components of the system.

system boundary (n)~ In a use case diagram, a boundary surrounding the use cases that indicates the system. You can resize the system boundary by dragging a selection handle on the System Boundary shape.

system builder (n)~ Anyone who assembles systems, and then provides them to a solution provider or OEMs who brands and sells the systems.

system caret (n)~ The location where text or graphics will be inserted. Also used for text box controls to indicate input focus.

System Center Audit Forwarding service (PN)~ The service that is used by an Operations Manager agent to be an Audit Collection Services (ACS) forwarder, which sends information about security events to the management server that is acting as the ACS collector when Audit Collection is enabled.

System Center Configuration Manager (PN)~ A systems management software product for managing large groups of PCs and servers, keeping software up-to-date, setting configuration and security policies, and monitoring system status while giving users access to preferred applications from the devices they choose.

System Center Data Access service (PN)~ A Windows service that runs on the management servers in each management group, and that allows client applications to access Operations Manager data and functionality.

System Center Essentials (PN)~ A management solution specifically designed for IT professionals working in midsize businesses who often face IT challenges similar to those of larger enterprises-troubleshooting user problems, automating management tasks, managing multiple systems, and diagnosing and resolving IT problems.

System Center Essentials Console (n)~ The user interface that provides access to System Center Essential features.

System Center Essentials Setup Wizard (n)~ A wizard that guides the user through the intial configuration of System Center Essentials, after it has been installed.

System Center Global Service Monitor (PN)~ A cloud-based service that monitors the availability of external web-based applications from multiple locations around the world.

System Center Management APM service (n)~ A service that processes events collected from the monitored systems.

System Center Management Health service (n)~ The Windows-based service responsible for executing management packs as part of the Operations Manager agent and server components.

System Center Virtual Machine Manager (PN)~ A member of the Microsoft System Center suite of management products, Microsoft System Center Virtual Machine Manager 2007 (SCVMM) enables enterprise-wide management of virtual machines.

System Center Virtual Machine Manager server (PN)~ The server which is used to run System Center Virtual Machine Manager.

system class (n)~ A class that the CIM Object Manager defines to support core features such as event notification, security, and localization. A system class is automatically defined in each namespace.

system clock (n)~ The electronic circuit in a computer that generates a steady stream of timing pulses—the digital signals that synchronize every operation. The system clock signal is precisely set by a quartz crystal, typically at a specific frequency between 1 and 50 megahertz. The clock rate of a computer is one of the prime determinants of its overall processing speed, and it can go as high as the other components of the computer allow.

system color (n)~ A color that is defined by the operating system for a specific type of monitor and video adapter and that is associated with a specific part of the user interface, such as a window title or a menu.

system configuration (n)~ In reference to a single microcomputer, the sum of a system's internal and external components, including memory, disk drives, keyboard, video, and generally less critical add-on hardware, such as a mouse, modem, or printer. Software (the operating system and various device drivers), the user's choices established through configuration files such as the AUTOEXEC.BAT and CONFIG.SYS files on IBM PCs and compatibles, and sometimes hardware (switches and jumpers) are needed to configure the configuration' to work correctly. Although system configuration can be changed

System Configuration Checker (n)~ A system preparation tool that helps to avoid setup failures by validating the target machine before a software application is installed.

system context (n)~ The state of Windows after it first starts when some system services

are loaded but no user is logged in and per-user settings are not available.

system control area (n)~ An area in the taskbar that shows icons for network connectivity, volume control, clock, and on laptops and Tablet computers, the battery.

system control module (n)~ The power supply that controls powering up the computer motherboard and all other devices that require power in the system. The SCM operates at all times when the system is plugged into an electrical outlet.

system currency unit (n)~ A currency unit that is used as the default currency unit if no currency unit is specified when entering monetary amounts.

System Data Source Name (n)~ A data source name that can be used by any process on the computer.

system databases (n)~ A set of five databases present in all instances of SQL Server that are used to store system information.

system definition (n)~ The definition of a system.

System Designer (n)~ The designer used to create and edit system diagrams.

system device (n)~ A device on a system board, such as an interrupt controller, keyboard controller, real-time clock, DMA page register, DMA controller, memory controller, FDC, IDE port, serial and parallel port, PCI bridge, and so on. In today's PCs, these devices are typically integrated in the supporting chip set.

system diagram (n)~ The diagram used to design an application system composed from applications or other systems. The system diagram (.sd) file contains information based on the System Definition Model (SDM).

system disk (n)~ A disk that contains an operating system and can be used to boot a computer.

system drive (n)~ The drive letter of the mass-storage device (usually a hard disk) where Windows is installed.

System DSN (n)~ A data source name that can be used by any process on the computer.

system engineer (n)~ A Microsoft employee who assists one or more specific royalty OEMs as they prepare to manufacture computers that will use the version of Windows that is currently under development.

system error (n)~ A software condition that renders the operating system incapable of continuing to function normally. This type of error usually requires rebooting the system.

system event (n)~ An event triggered by Windows system components that is recorded in the system log, such as the failure of a driver or other system component to load during startup.

system functions (n)~ A set of built-in functions that perform operations on and return the information about values, objects, and settings in SQL Server.

system gesture (n)~ A gesture that emulates a mouse message, such as left-click, double-click, right-click, left-drag, right-drag, and hover.

system health (n)~ A model used in Windows Server Centro' to describe the proper function and performance of key servers

system health agent (n)~ A client software component that declares a client's health state (by providing a statement of health) to a NAP agent.

system health validator (n)~ A server software counterpart to a system health agent (SHA). A system health validator verifies the statement of health (SoH) made by its

respective SHA.

System Health Validator point (n)~ The tool in the Configuration Manager console that is used to browse the status messages in the Configuration Manager site database.

system info (n)~ The information about a computer that's derived fromm the System Information program.

System Information (PN)~ A program that shows details about a computer's hardware configuration, computer components, and software, including drivers.

system job (n)~ A process whose execution can proceed independently or in the background. Other processes may be started before the asynchronous process has finished.

system language (n)~ The default language that is used by the application text localization system.

system log (n)~ A record of events that are generated by the operating system components.

system management BIOS (n)~ A BIOS developed to enable system-related information, such as information about hardware, to be gathered from computers on a network.

system management interrupt (n)~ An interrupt generated by the host-controller-emulation hardware when a universal serial bus (USB) keyboard or mouse data is received and steered by the host controller hardware to a System Management Interrupt (SMI) or the standard host controller interrupt.

System Management Mode (n)~ A mode used by some systems, typically portable computers, to perform specialized keystroke or other processing in BIOS firmware. While in SMM, the processor does not field interrupts that add to interrupt service routine (ISR) latencies.

system media pool (n)~ In Removable Storage, one of two classes of media pools: system and application. The system media pool holds cartridges that are not in use and includes free media pools, unrecognized media pools, and import media pools.

system menu (n)~ A menu that contains commands you can use to manipulate a window or close a program. You click the program icon at the left of the title bar to open this menu. The context menu of a window replaces this menu.

system migration (n)~ The movement of an existing system from a development or staging environment into a production or live environment.

system of units (n)~ A set of units used for measurement or exchange.

system on a chip (n)~ A chip that integrates most of all of the basic components of a computer, including microprocessors and necessary support components. SOC technology is used in firewalls, gateways, specialized servers, and interactive devices.

system partition (n)~ The partition that contains the hardware-specific files needed to load Windows (for example, Ntldr, Osloader, Boot.ini, Ntdetect.com). The system partition can be, but does not have to be, the same as the boot partition.

System Preparation Tool (PN)~ A tool that prepares the hard disk on a source computer for duplication to destination computers.

system profile (n)~ The default, predefined templates that contain the necessary technical details for encoding a particular piece of content.

system prompt (n)~ A short audio recording, installed on the Exchange Unified Messaging server, that is played to callers by the server. System prompts may be used to

welcome callers, to inform them of their options when they use the system, and to make them aware of important information and of events and errors that have occurred.

system property (n)~ A property that the CIM Object Manager defines to provide information that applies to each class (for example, name, derivation, and namespace).

System Protection (n)~ A Windows technology that protects OS resources (files, folders registry keys) and prevents applications and administrators from making changes to a computer's resources in an arbitrary way.

system rating (n)~ A number that gives a general indication of the performance capability of your computer's hardware.

System Recovery (PN)~ A Windows feature that enables users to easily roll back their PC to an earlier good state while keeping their data safe.

system requirements (n)~ A minimum hardware configuration of a computer (typically relates to CPU speed and type, size of RAM, free space on hard disk, and presence of other devices such as sound card, CD-ROM, etc.) needed to run a software program on it.

System Restore (n)~ A tool that lets you restore your computer to a previous state, if a problem occurs, without losing your personal data files (such as Microsoft Word documents, browsing history, drawings, favorites, or e-mail).

system role assignment (n)~ Role assignment that applies to the site as a whole.

system role definition (n)~ Role definition that conveys site-wide authority.

system services (n)~ A group of integrated services that enables you to access information from and interact with your Microsoft Dynamics AX installation.

system statistics (n)~ Information about the technology, such as type of browser, that a Web site visitor uses to access the site.

system stored procedures (n)~ A set of SQL Server-supplied stored procedures that can be used for actions such as retrieving information from the system catalog or performing administration tasks.

system table (n)~ A table that stores the data defining the configuration of a server and all its tables.

system tables (n)~ Built-in tables that form the system catalog for SQL Server.

system time (n)~ The system clock time.

System Tray ~ An area on the righthand end of the Windows- Taskbar- which displays icons representing- TSRs presently running, usually at least a loudspeaker which represents the volume control for thesoundcard, and a clock. Programs in the Sytem Tray are often but not always launched from the- StartUp folder.

System unit (or box) ~ The unit with the disk drives which the keyboard, monitor etc are plugged into on a desktop computer. In other words, the actual computer.

system upgrade (n)~ An upgrade of a system from an existing or older version to a newer or more recent version.

system variable (n)~ A variable provided by DTS.

system view (n)~ A view that is defined for all entities and cannot be deleted or shared.

System View window (PN)~ A simple browser providing an outline view of available applications and systems used as a drag source to create references to Application Systems on the Application Connection Designer, System Designer and the System Deployment Designer.

system volume (n)~ The first volume that is accessed when a computer starts up. This volume contains the hardware-specific files that are required to load Windows and includes the computer's boot manager (for loading multiple operating systems). Generally, the system volume can be, but is not required to be, the same volume as the operating system volume.

system-defined financial dimension type (n)~ A financial dimension mapped to a table or view in the database that represents an entity type and whose values are in the domain of one attribute of that entity type.

system-€"DPI aware (adj)~ Pertaining to an application that always renders at the system DPI setting, which is calculated by Windows based on the primary display at first logon.

systemroot (n)~ The path and folder name where the Windows system files are located. Typically, this is C:\Windows, although you can designate a different drive or folder when you install Windows. You can use the value %systemroot% to replace the actual location of the folder that contains the Windows system files. To identify your systemroot folder, click Start, click Run, type %systemroot%, and then click OK.

Systems Application Architecture (n)~ An IBM-developed standard for the appearance and operation of application software that will give programs written for all IBM computers—mainframe computers, minicomputers, and personal computers—a similar look and feel. SAA defines how an application interfaces with both the user and the supporting operating system. True SAA-compliant applications are compatible at the source level (before being compiled) with any SAA-compliant operating system—provided the system is capable of furnishing all the services required by the application.

systems integrator (n)~ A person or organization that develops enterprise applications by integrating hardware or software provided by independent vendors.

Systems Network Architecture (n)~ A network model devised by IBM to enable IBM products, including mainframes, terminals, and peripherals, to communicate and exchange data.

system-under-test (n)~ A system that is being tested for correct operation.

SYSVOL (n)~ A shared directory that stores the server copy of the domain`s public files, which are replicated among all domain controllers in the domain.

T ~

T1 (n)~ A U.S. telephone standard for a transmission facility at digital signal level 1 (DS1) with 1.544 megabits per second in North America and 2.048 megabits per second in Europe. The bit rate is the equivalent bandwidth of approximately twenty-four 56-kilobits-per-second lines. A T1 circuit is capable of serving a minimum of 48 modems at 28.8 kilobits per second or 96 modems at 14.4 kilobits per second. T1 circuits are also used for voice telephone connections. A single T1 line carries 24 telephone connections with 24 telephone numbers. When it is used for voice transmission, a T1 connection must be split into 24 separate circuits.

T3 (n)~ A U.S. telephone standard for a transmission facility at digital signal level 3 (DS3). T3 is equivalent in bandwidth to 28 T1s, and the bit rate is 44.736 megabits per second. T3 is sometimes called a 45-meg circuit.

TA (n)~ A two-way device provided by a cable provider that enables some one-way digital CableCARD-based consumer electronic devices such as high-definition DVRs and Media Center PCs to access digital cable channels delivered using switched digital video.

tab (n)~ A clickable UI element designed to look like a tab on a file folder. Tabs are usually arranged horizontally and allow users to switch between related pages or webpages.

Tab (PN)~ The on-screen keyboard key that traditionally (as in word processing) is used to insert tab characters into a document.

tab character (n)~ A character used to align lines and columns on screen and in print. Although a tab is visually indistinguishable from a series of blank spaces in most programs, the tab character and the space character are different to a computer. A tab is a single character and therefore can be added, deleted, or overtyped with a single keystroke.

tab control (n)~ A standard control that resembles a notebook and lets the user navigate different sections of information without leaving the current element on the screen.

tab delimited (adj)~ Having values separated from each other by tabs.

tab gesture (n)~ In Tablet PC Input Panel, an action gesture that performs the same action as pressing the TAB key on the keyboard.

TAB key (n)~ A keyboard key, often labeled with both a left-pointing and a right-pointing arrow, that traditionally (as in word processing) is used to insert tab characters into a document. In other applications, such as menu-driven programs, the TAB key is often used to move the on-screen highlight from place to place.

tab order (n)~ The order in which the TAB key moves the input focus from one control to the next within a dialog box. Usually, the tab order proceeds from left to right in a dialog box, and from top to bottom in a radio group.

tab page (n)~ A part of a tab control that consists of the tab UI element and the display area, which acts as a container for data or other controls, such as text boxes, combo boxes, and command buttons.

Tab Peek (PN)~ A feature in the browser that allows the user to hover over open browser tabs and see thumbnails of the underlying webpage.

Tab Selector (PN)~ The UI control containing tabs that do not appear directly in the

ribbon because of limited screen space.

tab set (n)~ In Internet Explorer, a set of tabs you can store in your Favorites or as Home Page to reopen all tabs in the set in one go.

tabbed browsing (n)~ A function of some Web browsers that allows users to surf and view multiple pages by loading Web sites into sections (or tabs) of one page, rather than multiple pages.

tabbed conversation (n)~ A conversation that is displayed with other conversations in one window. The conversations are loaded into sections or tabs of the window, rather than in multiple windows.

tabbed conversations (n)~ A presentation method in Messenger that allows someone to maintain multiple conversations in a tabbed view.

tabbed docking bar (n)~ The host control for a group of dockable windows. Once docked, each window changes form, becoming a tab.

tabbed group (n)~ In a multiple document interface (MDI) application, a set of child windows that have tab borders and are docked together in the client area of the application. To undock a child window from the group, drag it by its tab.

tabify (v)~ To convert to tabs according to tab settings.

table (n)~ One or more rows of cells commonly used to display numbers and other items for quick reference and analysis. Items in a table are organized into rows and columns.

table (n)~ A database object that stores data in records (rows) and fields (columns). The data is usually about a particular category of things, such as employees or orders.

table (n)~ A specific instance in the Table service that represents a collection of entities. Entities are similar to rows. An entity has a partition, a primary key and a set of properties.

table data region (n)~ A report item on a report layout that displays data in a columnar format.

Table Designer (PN)~ A visual design surface that is used to create and edit TSQL tables and table related objects.

Table Hierarchy (PN)~ A SmartArt graphic layout used to show groups of information built from top to bottom, and the hierarchies within each group. This layout does not contain connecting lines.

table layout (n)~ The layout of a form in which all elements are positioned in cells within a table.

Table List (PN)~ A SmartArt graphic layout used to show grouped or related information of equal value. The first Level 1 line of text corresponds to the top shape and its Level 2 text is used for the subsequent lists.

table lock (n)~ A lock on a table including all data and indexes.

table lookup (n)~ The process of using a known value to search for data in a previously constructed table of values: for example, using a purchase price to search a tax table for the appropriate sales tax.

table name (n)~ A name for an Excel table, which is a collection of data about a particular subject that is stored in records (rows) and fields (columns).

table of authorities (n)~ A list of the references in a legal document, such as references to cases, statutes, and rules, along with the numbers of the pages the references appear on.

table of contents (n)~ The listing of contents at the beginning of a document or file.

table of figures (n)~ A list of the captions for pictures, charts, graphs, slides, or other illustrations in a document, along with the numbers of the pages the captions appear on.

table pane (n)~ The area of the Query window that displays the tables in a query. Each table displays the fields from which you can retrieve data.

table reference (n)~ A name, expression or string that resolves to a table.

table scan (n)~ A data retrieval operation where the database engine must read all the pages in a table to find the rows that qualify for a query.

Table service (PN)~ The data management service in Microsoft Azure Storage that stores large amounts of structured, non-relational data. The Table service is a NoSQL datastore that accesses authenticated calls from inside and outside Microsoft Azure.

table style (n)~ A combination of table formatting options identified by a style name.

table-per hierarchy (n)~ A method of modeling a type hierarchy in a database that includes the attributes of all the types in the hierarchy in one table.

table-per-concrete type (n)~ A method of mapping the inheritance where each non-abstract type in the hierarchy is mapped to separate table in the database. Often used when there are unrelated tables that store the same kinds of data in the database. For example, the Product and DiscontinuedProduct tables.

table-per-type (n)~ A method of modeling a type hierarchy in a database that uses multiple tables with one-to-one relationships to model the various types.

tablet (n)~ A portable computer that allows you to write on or interact with the screen.

Tablet ~ A portable computer which consists only of a screen, usually with no keyboard. It is controlled using a touchscreen. The most popular is Apple's- iPad, but all the major manufacturers are producing them and they are replacing latops in a lot of situations because they are so much lighter.

tablet button (oth)~ A hardware button on a Tablet PC.

tablet mode (n)~ A mode that optimizes Windows for touch when a keyboard is not attached to a 2-in-1 device.

tablet PC (n)~ A portable computer that allows you to write on or interact with the screen.

Tablet PC Input Panel (oth)~ A Tablet PC accessory that enables you to use handwriting, speech, or an on-screen keyboard to enter text, symbols, numbers, or keyboard shortcuts. You can use it to interact with any Windows-based program.

Tablet PC Input Panel icon (oth)~ The icon that you tap to open Tablet PC Input Panel. The icon appears in the taskbar. It also appears next to a text entry area when Input Panel is undocked.

Tablet PCs ~ Tablet PCs were brought to market to address the low use of laptop computers in meetings and the slowing of laptop adoption in the enterprise. They are designed to be closer to the pad and pencil that are the standard for note taking.

tablet pen (n)~ A pointed input device that comes with a mobile device or tablet PC, and is used to navigate through applications and to input information.

Tablet Settings (n)~ A Control Panel icon in Tablet PCs.

tabletop (n)~ The entire top of a Surface unit. The tabletop includes the screen (where users interact with objects and where images render) and the diffuser.

table-valued function (n)~ A user-defined function that returns a table.

Tablix (PN)~ A data region that can render data in table, matrix, and list format. It is

intended to convey the unique functionality of the data region object and the users' ability to combine data formats.

Tablix data region (PN)~ A data region that can render data in table, matrix, and list format. It is intended to convey the unique functionality of the data region object and the users' ability to combine data formats.

tabular data (n)~ Data displayed in cells in a table.

tabular data stream (n)~ The SQL Server internal client/server data transfer protocol. TDS allows client and server products to communicate regardless of operating-system platform, server release, or network transport.

tabular query (n)~ A standard operation such as search, sort, filter or transform on data in a table.

tag (n)~ To request an alert for a specific contact when that contact's presence status changes.

tag (n)~ One or more characters containing information about a file, record type, or other structure.

tag (n)~ A marker used to identify a physical object. An RFID tag is an electronic marker that stores identification data.

tag (v)~ To apply an identification marker to an item, case, or pallet.

tag (n)~ A marker that can be applied to content or items (like photos or text) to identify certain types of information. This allows the user to find, view and sort tagged items with ease.

tag (n)~ In markup languages such as SGML and HTML, a code that identifies an element in a document, such as a heading or a paragraph, for the purposes of formatting, indexing, and linking information in the document.

tag (v)~ To apply a marker to content or items (like photos or text) to identify certain types of information.

tag (n)~ A geometrical arrangement of shapes that define a value that the Surface Vision System can recognize. These geometrical arrangements are added to physical objects (then called tagged objects) to work with Surface applications (for example, a glass tile that acts as a puzzle piece in a puzzle application).

tag (n)~ A pair that consists of an integer identifier and a COM object.

tag (v)~ Mentioning of one or more users in posts to link information related to those users.

tag ~ In Web pages, tags indicate what should be displayed on the screen when the page loads.

tag cloud (n)~ A visual depiction of a weighted list. The cloud contains keywords or tags associated with a text or Web site, and formatting (e.g. color and/or size) is used to indicate the relative importance of each item, or frequency with which it occurs.

Tag Contact (n)~ An item on the right-click menu for a contact that marks the selected contact so the user will receive alerts when this contact changes status.

Tag for Presence Alerts (PN)~ A menu item that marks the selected contact so the user will receive presence alerts when this contact's presence changes from anything to Available or from anything to Unavailable.

Tag for Status Change Alerts (PN)~ A menu item that marks the selected contact so the

user will receive presence alerts when this contact's presence changes from anything to Available or from anything to Unavailable.

Tag Inspector Tree (n)~ An item on the View menu that refers to the hierarchical HTML tag structure of an opened HTML document.

tag line (n)~ A brief, memorable statement that summarizes the purpose of an organization or emphasizes an important aspect of a product or service.

tag tree (n)~ The hierarchical HTML tag structure of an opened HTML document that appears in a task pane window.

tagged ~ Tagged is a social networking site based in San Francisco, California, United States, founded in 2004.- http://www.tagged.com/

tagged contact (n)~ A contact whose presence status is displayed in an alert whenever it changes.

tagged contacts only (oth)~ An option in the Options dialog box, on the Alerts tab, that displays alerts only for the contacts that the user has tagged in his contact list.

Tagged Image File Format (n)~ A high resolution, tag-based image format used for scanning, storing, and combining graphic images.

Tagged Items (PN)~ A Web Part that displays all items that belong to a given tag.

tagged note (n)~ A OneNote item that has been marked with a note tag.

tagged object (n)~ A physical object that is optically or digitally tagged to be used interactively with Surface applications. The Surface Vision System currently recognizes byte tags and identity tags.

tagged value (n)~ A keyword-value pair that can be attached to any model element. The keyword is called a tag, and it represents a property applicable to one or many elements. Both the keyword and the value are strings.

Tags (PN)~ A feature that allows the user to apply custom or default markers to items (e.g. Outlook messages or OneNote content) in order to categorize information for easy retrieval and sorting.

tail-log backup (n)~ A log backup taken from a possibly damaged database to capture the log that has not yet been backed up. A tail-log backup is taken after a failure in order to prevent work loss.

take advantage (v)~ To use for your benefit.

Taken (n)~ A button that specifies the date the picture was taken.

takt time (n)~ The time that it takes to produce one unit of a product.

Talk (PN)~ A button that initiates the process of dialing a phone number.

talkgroup (n)~ A contact list, similar to an alias, that allows the talk to reach a list of users at once by the push-to-talk functionality.

TAM (n)~ A Microsoft employee who provides technical assistance to one or more specific royalty OEMs as they manufacture computers installed with a released version of Windows.

Tandems ~ Switches that consolidate traffic, reduce trunk group requirements, and switch interoffice traffic.

tangent (n)~ The gradient of a curve at a point. You can modify a curve that is part of a path object by using the control handles that represent the tangent of the curve.

tangent handle (n)~ A handle that specifies unique behavior for certain shapes.

Tangible User Interfaces ~ the user controls digital information and processes by manipulating physical, real-world objects that are meaningful in the context of the interaction.-

Tango (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 113.

tap (v)~ To touch an item once with the tablet pen and then lift the pen quickly.

TAP (n)~ A collection of boundary scan control signals that define a serial protocol for scan-based devices. There are five pins, TCK/clock, TMS/mode select, TDI/data in, TDO/data out, and TRST/reset.

tap (v)~ To briefly press a UI element with your fingertip or stylus to perform an activity (such as choosing an action from a menu or opening an item).

tap (n)~ A gesture represented by placing a finger or stylus on the screen and then lifting it up.

tap (v)~ To touch an NFC-capable device to a tag, an NFC reader, or another device to wirelessly transfer content or information.

Tap and Do (PN)~ A gesture that enables proximity-based authentication between two devices.

tap and hold (v)~ To tap a device screen and hold one's finger or stylus in place.

Tap and Hold (PN)~ A feature that provides a progressive disclosure method that remains active only as long as the user holds (presses down) their finger on the touch surface.

Tap and Send (PN)~ The feature that allows you to tap' a PC or phone against another device (or put it close to another device)

tap gesture (n)~ A gesture represented by placing a finger or stylus on the screen and then lifting it up.

tap to expand (PN)~ A text string displayed in the status bar for Call Progress, alternating with the callee's name, to prompt the user that he/she can tap the bar to return to the call.

tap to merge (PN)~ A text string displayed in the status bar during a held call, alternating with the held callee's name, to prompt the user that they can tap the bar to merge the calls.

tap to open (PN)~ A text string that the user can tap to open a file downloaded from Internet Explorer.

tap to pair (PN)~ A text string that the user can tap to connect an accessory over Bluetooth.

Tap to share (PN)~ The feature that allows you to tap' a PC or phone against another device (or put it close to another device)

tap to swap (PN)~ A text strings that appears in the status bar when the user can switch between the active call and the call on hold.

tap two fingers (v)~ To tap with two fingers on a touchpad or similar device at the same time and with a relatively short distance between each other.

tape (n)~ A thin strip of polyester film coated with magnetic material that permits the recording of data.

tape backup (n)~ A SQL Server backup operation that writes to any tape device supported by the operating system.

tape catalog (n)~ A catalog that maps data to the tape on which the data is stored.

tape drive (n)~ A device that can read or write data to tape. A library contains one or more tape drives.

tape label (n)~ A unique identifier for tape. For non-writable tapes, this may be a serial number.

tape library (n)~ A data-storage system that consists of removable tape and a hardware device that can read from or write to the tape.

tape set (n)~ An ordered collection of backup tapes written to by one or more backup operations using a constant number of backup devices.

TAPI (n)~ An application programming interface (API) used by communications programs to work with telephony and network services.

tare weight (n)~ The weight of an empty container and packing material, which is deducted from gross weight to determine the weight of the goods.

Targa (PN)~ A photorealistic graphics file format designed for systems with a TARGA Truevision display adapter.

target (n)~ One or more expressions that identify where, when, and to whom content should be displayed. You can target demographics, sections of a Web site, or both.

target (n)~ A Universal Naming Convention (UNC) path that corresponds to a namespace root or folder.

target (n)~ A computer or computer group to which override criteria is applied.

target (n)~ As one aspect of a KPI, the desired level of performance with respect to a specific business goal or strategy. Actual values are evaluated against the target to determine KPI score and status.

target (n)~ The database on which an operation acts.

target action (n)~ An option that specifies that a piece of content is to be shown when the target is met more often than when the target is not met.

Target Application (PN)~ An item stored in the Secure Store Service that maps users or groups to credentials needed to access external data or other resources.

target award (n)~ The amount of a variable compensation award that is calculated by the plan before company or individual performance is taken into account. The target award is what an employee will receive if all targets are reached.

target computer (n)~ The computer that will be distributed to customers on which you install Windows. You can either run Windows Setup on the destination computer or copy a master installation onto a destination computer.

target device (n)~ A device that receives an action specified by the OneCare administrator. For example, an external hard drive that is the designated the place for file backup would be considered to be the target device' of the backup function. '

target diagram (n)~ A diagram that is used to show steps toward a goal.

target directory (n)~ The destination folder into which a file or files are to be copied or moved.

target frame (n)~ The name of a frame in which the target page of a hyperlink is displayed. Typically, a hyperlink from one frame of a frames page (or frameset) will supply as its target frame another frame of the frames page.

target framework (n)~ The version of the .NET Framework or of Silverlight for which a particular application has been created.

target identifier (n)~ One of up to eight target controllers on a SCSI-II bus through which peripheral devices are addressable, either as numbered TIDs or as logical units (LUs) subordinate to a particular TID.

target incentive amount (n)~ A target award that is defined as a flat award of cash or stock according to compensation level.

target incentive percent (n)~ A target award that is defined as a percent of a basis and provided in cash or stock according to compensation level. The basis is usually the annualized fixed pay rate, but can also be a midpoint, control point, or other compensation range reference point.

target increase (n)~ The increase of a variable compensation award that is calculated by the plan before company or individual performance is taken into account. The target increase represents the award that an employee will receive if all targets are reached.

Target List (PN)~ A SmartArt graphic layout used to show interrelated or overlapping information. Each of the first seven lines of Level 1 text appears in the rectangular shape. Unused text does not appear, but remains available if you switch layouts. Works well with both Level 1 and Level 2 text.

target logical datacenter (n)~ The logical datacenter definition to which the system is being deployed.

target model (n)~ The model to which data will be moved.

target partition (n)~ An Analysis Services partition into which another is merged, and which contains the data of both partitions after the merger.

target PC (n)~ A computer that receives an action specified by the OneCare administrator. For example, a computer that is the designated the place for file backup would be considered to be the target PC' of the backup function. '

Target Quantity (n)~ The amount of inventory you want to keep based on buying patterns. Also the quantity at which the system would order inventory when it reaches the reorder point.

target queue (n)~ In Service Broker, the queue associated with the service to which messages are sent.

target server (n)~ A server that receives jobs from a master server.

target term (n)~ The equivalent of a source term in a target language.

target type (n)~ The type of target, which has certain characteristics and behavior.

target value (n)~ As one aspect of a KPI, the desired level of performance with respect to a specific business goal or strategy. Actual values are evaluated against the target to determine KPI score and status.

targeting (n)~ The process of delivering specific content to specific users.

targets file (n)~ In the context of MSBuild, an XML file that contains MSBuild target elements that can be used by one or more build projects. A target element contains one or more tasks to be performed in a build.

tarpitting (n)~ The practice of artificially delaying server responses for specific SMTP communication patterns that indicate high volumes of spam or other unwelcome e-mail messages. The intent is to slow down the communication process for such e-mail traffic so that the cost of sending spam increases for the person or organization who is sending the e-mail.

tarpitting interval (n)~ The interval that is used to delay a response in a tarpitting scenario.

task (n)~ An action that diagnoses or repairs a problem. A task can also automate a management process.

task (n)~ A personal or work-related project, assignment, or errand to be tracked through to completion.

task (n)~ A type of work item that records a development task or test task.

task (n)~ An action that a user accomplishes by using the Actions pane and the context-sensitive menu that affects non-Service Manager objects.

task (n)~ In Operations Manager, an element in a management pack that is manually initiated by an operator to run a predefined command or script against a monitored object.

task (n)~ An atomic activity assigned to one or more persons or pieces of equipment responsible for meeting the requirements of the activity.

task (n)~ A single unit of work within a prescribed sequence of actions, taken to complete a job or function.

task (n)~ An individual step defined in a job template.

Task (n)~ A milestone for CSRs that serves as a reminder to perform certain Actions, review Tickets, or other similar functions.

task area (n)~ A grouping of related tasks in DPM Administrator Console. The console has five task areas: Monitoring, Protection, Recovery, Reporting, and Management.

task board (n)~ In its most basic form, a task board can be drawn on a whiteboard or even a section of wall. Using electrical tape or a dry erase pen, the board is divided into three columns labeled To Do'

task calendar (n)~ The base calendar that you can apply to individual tasks to control their scheduling, usually independent of the project calendar or any assigned resources' calendars. By default, all tasks use the project calendar.

task chain (n)~ A sequence of tasks that are defined in a job template so that tasks act on the output of preceding tasks in a workflow.

task delegation (n)~ The process of one team member assigning a task to another team member in Project Server. When a task is delegated to another team member, that team member actually does the work on the task.

task dependency (n)~ A relationship between two linked tasks; linked by a dependency between their finish and start dates. There are four kinds of task dependencies: Finish-to-start [FS], Start-to-start [SS], Finish-to-finish [FF], and Start-to-finish [SF].

task form (n)~ A narrow and long form that appears in the task pane, which is used to view and edit related data for lookups.

task group (n)~ In the Concurrency Runtime, a construct that enables related, fine-grained tasks to be queued to a Task Scheduler. A task group can be used to schedule tasks, wait for tasks to finish, and cancel tasks that have not started.

task ID (n)~ A number that Project automatically assigns to a task as you add it to the project. The task ID indicates the position of the task with respect to the other tasks.

task information (n)~ Information provided about a specific task.

task input panel (n)~ A small space on the To-Do Bar where the user can input tasks directly. The default label reads Type a new task'.'

Task Launcher (n)~ The starting point for all Works programs, contacts, appointments, templates and projects in one easy to use location.

task list (n)~ A list of tasks that appears in the Tasks folder and in the TaskPad in Calendar.

Task List (n)~ A list of tasks that appears in the Tasks folder and in the TaskPad in Calendar.

Task Manager (n)~ A tool that provides information about programs and processes running on the computer. Using Task Manager, you can end or run programs, end processes, and display a dynamic overview of your computer's performance.

task manager (n)~ A generic service used to schedule and run caller-defined tasks. A task manager automatically breaks a transform task into threads and manages their completion, which improves the efficiency of the transform

task object (n)~ A Data Transformation Services (DTS) object that defines pieces of work to be performed as part of the data transformation process. For example, a task can execute an SQL statement or move and transform heterogeneous data from an OLE DB source to an OLE DB destination using the DTS Data Pump.

task page (n)~ A window that opens on top of a navigation place where the user completes a specific task. Task pages can open in New, Edit, View or Selection mode. A task page can contain any entities or lists of entities that the user will need to perform a task, for example, a list of entities, a document, a card, a journal or a worksheet.

task pane (n)~ The area of an application window that enables the users to perform additional tasks.

Task Pane (PN)~ One of the major controls of the Windows Server Centro' Administration Console

task pane app (n)~ An app for Office that resides within a task pane in a client application.

task pane app for Office (n)~ An app for Office that resides within a task pane in a client application.

Task Parallel Library (n)~ A set of public types and APIs in the System.Threading and System.Threading.Tasks namespaces in the .NET Framework version 4 and above. The purpose of the TPL is to make developers more productive by simplifying the process of adding parallelism and concurrency to applications.

task path (n)~ A series of tasks that includes the predecessors and successors to the task that is selected.

task report (n)~ Printed information about a project's tasks or activities. Task reports usually include information about start dates, work completed, and expected durations.

task request (n)~ A request sent in an e-mail message asking the recipient to complete a task. If the recipient accepts the task, it is added to the recipient's task list, and the recipient becomes the new owner of the task.

Task Scheduler (n)~ A tool which enables users to automatically perform routine tasks on a chosen computer by monitoring whatever criteria the users choose to initiate the tasks (referred to as triggers) and then executing the tasks when the criteria is met.

Task Scheduler (PN)~ In the Concurrency Runtime, a component that schedules and coordinates tasks at run time. Sometimes referred to as a scheduler.

task sequence (n)~ The mechanism in Configuration Manager for performing multiple steps or tasks on a client computer at the command-line level without requiring user intervention.

task sequence execution engine (n)~ An engine that manages the sequence of task execution.

task template (n)~ An XML file that describes a task's configurable properties.

task type (n)~ A characterization of a task based on which aspect of the task is fixed and which aspects are variable. There are three task types: Fixed Units, Fixed Work, and Fixed Duration. The default task type in Project is Fixed Units.

task view (n)~ A view that displays task information. Task views include three task forms; examples include Calendar, Detail Gantt, Gantt Chart, Milestone Rollup, PA_PERT Entry Sheet, Task Entry, Relationship Diagram, Task Sheet, and Task Usage.

Task view (PN)~ A feature that helps customers quickly switch between all the open apps and programs, and any desktops they create.

Task Well (n)~ An area in the Outlook Calendar module where users can display the tasks and other items assigned to that day (or week).

task workspace (n)~ A workspace used to store tasks and also to provide end-user collaboration for them. A Task Workspace Locator List is required to locate the appropriate workspace for a particular task type.

Task Workspace Locator List (PN)~ A list that is used to look up the location of a task workspace, given the details of the task type.

taskband (n)~ A special instance of a deskband on the taskbar that cannot be turned off by the user and offers the primary means to view and switch between the running tasks in the Windows system.

taskbar (n)~ The bar that contains the 'Start' button and appears by default at the bottom of the desktop. You can click the taskbar buttons to switch between programs. You can also hide the taskbar, move it to the sides or top of the desktop, and customize it in other ways.

Taskbar ~ In Windows, a bar across the bottom of the screen (usually - you can move it to the top or side if you want to) which contains theStart Button, the- System Tray,
and- icons- which represent all the applications currently running. You can switch between applications by calling up the taskbar and clicking on the relevant icon. The taskbar can be set to remain visible all the time (the default), or only to appear when you press
the- Windows key.

taskbar button (n)~ A button that represents an item or program that is open and running on your computer. For example, if you open Microsoft Word, and then minimize it, it will be displayed as a taskbar button, which you can then click when you want to maximize it.

TaskBoard (PN)~ An app that enables a user to interact with tasks in a SharePoint list. A user can quickly move tasks between status categories to keep the list up to date.

task-oriented Help (n)~ A type of Help that present the steps involved in carrying out a particular task.

TaskPad (n)~ The list of tasks in Calendar.

Tasks pane (n)~ A pane in the Service Manager console that contains tasks that a user can perform.

Tasks peek (n)~ A contextual summary of the user's task list, which is displayed in a callout without switching to the Tasks module.

tax (n)~ A charge levied by a government on products, activities and employee or corporate income to finance government expenditure.

tax (n)~ A charge levied by a governing authority.

tax authority (n)~ The governmental agency that taxes are paid to.

tax branch (n)~ A branch office that is used to record value-added tax (VAT) and inventory movement. All the branch offices of a VAT-registered legal entity are referred to as tax branches. Each tax branch uses the same tax registration number as the head office of the legal entity.

tax correction (n)~ A form that is used to file corrections to an original tax return.

tax credit (n)~ A monetary amount that may be set against an entity or individual's tax liability.

tax exempt number (n)~ An identification number that is issued by a tax authority to indicate that a company is not required to pay sales tax.

tax liability (n)~ A government authority's legal claim to the assets of a legal entity.

tax recovery (n)~ Expenses that are eligible to be fully or partially recovered.

tax variance (n)~ The difference between an expected tax and an actual tax.

taxable amount (n)~ An amount that is subject to tax.

taxable product (n)~ A product that is subject to taxation.

taxonomy (n)~ A classification of words, labels, tags, etc. into groups based on similiarities.

taxpayer identification number (n)~ A 9-digit number used to identify an entity (company or person) for tax reporting purposes in the U.S. There are several different types of tax identification numbers, such as employer identification number (EIN), Social Security number (SSN), individual taxpayer identification number (ITIN), and adopted taxpayer identification number (ATIN).

TB (n)~ A measurement used for high-capacity data storage. One terabyte equals 240, or 1,099,511,627,776, bytes, although it is commonly interpreted as simply one trillion bytes.

TBH ~ (To Be Honest)- Internet slang.

TCG (n)~ The organization that sets standards for Trusted Platform Module (TPM) use and interface.

TCO (n)~ Specifically, the cost of owning, operating, and maintaining a single PC; more generally, the cost to businesses and organizations of setting up and maintaining complex and far-reaching networked computer systems. Total cost of ownership includes the up-front costs of hardware and software added to later costs of installation, personnel training, technical support, upgrades, and repairs. Industry initiatives designed to lower the total cost of ownership include centralized network management and administration, as well as hardware solutions in the form of network-based computers with or without local storage and expansion capability.

TCP (n)~ The protocol within TCP/IP that governs the breakup of data messages into packets to be sent via IP, and the reassembly and verification of the complete messages from packets received by IP.

TCP connect request (n)~ The first of three packets used to establish a TCP connection

between two computers.

TCP port (n)~ The port assigned to handle Transmission Control Protocol (TCP) data. TCP is the transport layer protocol in theTCP/IP protocol suite.

TCP/IP (n)~ A set of networking protocols widely used on the Internet that provides communications across interconnected networks of computers with diverse hardware architectures and various operating systems. TCP/IP includes standards for how computers communicate and conventions for connecting networks and routing traffic.

TCP/IP ~ (Transfer Control Protocol/Internet Protocol)- A commonprotocol- (language) which a computer can use to communicate with other computers, particularly on the internet.

TCPI (n)~ The ratio of the work remaining to be done to funds remaining to be spent, as of the status date [BAC - BCWP]/[BAC - ACWP]. A TCPI value greater than one indicates a need for increased performance; less than one indicates performance can decrease.

Td (n)~ A vaccine for immunization against tetanus-diphtheria.

Tdap (n)~ A vaccine for immunization against tetanus-diphtheria-pertussis. The term acellular means that the pertussis component is cell-free, which improves safety by reducing the incidence of side effects.

TDD (n)~ A device that enables the transmission of typed messages over phone lines. These devices typically include keyboards for typing messages to send and display and/or printers to receive messages from one device to another.

TDE (PN)~ A technology for real-time I/O encryption and decryption of SQL Server and Azure SQL Database data and log file with a symmetric key without increasing the size of the encrypted database. The database encryption key (DEK) is stored in the database boot record for availability during recovery and is protected with a certificate. TDE is performed at the page level and does not provide encryption across communication channels.

TDI (n)~ A common set of routines for network layer components that communicate with the session layer of the Open Systems Interconnection (OSI) model. These routines allow software components above and below the transport layer to be mixed and matched without reprogramming.

TDS (n)~ The SQL Server internal client/server data transfer protocol. TDS allows client and server products to communicate regardless of operating-system platform, server release, or network transport.

Teaching callout (n)~ A callout in a UI that contains help information for a new feature, is context-sensitive, and contains information in the form of text, graphics, or animations.

team (n)~ A group of users who share and collaborate on business records in the system. A team can consist of members who report to a single business unit (such as all sales or all customer service) or members who report to different business units (salespeople, customer service representatives, and accounting representatives).

Team (n)~ A privacy relationship setting that allows a large amount of information to be viewed, usually assigned to people on your team.

team (n)~ An organization whose members share a common responsibility, interest, or objective.

Team Call (PN)~ The feature that forwards a call from a team leader to an entire team according to a hunt group algorithm.

Team Dev (PN)~ The part of Visual Studio Team System that specifically targets team members who are in the developer role.

Team Edition for Software Developers (PN)~ The part of Visual Studio Team System that specifically targets team members who are in the developer role.

Team Edition for Software Testers (PN)~ The part of Visual Studio Team System that specifically targets team members who are in the test role.

Team Explorer (n)~ A client application for accessing Team Foundation Server functionality that integrates into Visual Studio 2005 when it is installed on the same computer as Visual Studio 2005. Team Explorer enables you to access the team projects you are working on and provides access to the process guidance documentation that explains the organization and workflow of each team project.

Team Explorer 2013 Additional Components (PN)~ Additional elements for Team Explorer, which is the client software that you use to access Visual Studio Team Foundation Server 2013 functionality from Visual Studio.

Team Explorer 2013 Language Pack (PN)~ A language pack for Microsoft Visual Studio 2013 Team Explorer, which enables the display of the user interface in different languages. After you install the language pack, you can switch among the languages.

Team Explorer for Microsoft Visual Studio 2013 (PN)~ Team Explorer is the client software that you use to access Visual Studio Team Foundation Server 2013 functionality from Visual Studio.

Team Explorer for Visual Studio 2013 (PN)~ Team Explorer is the client software that you use to access Visual Studio Team Foundation Server 2013 functionality from Visual Studio.

Team Foundation Application (PN)~ An application existing within a Team Foundation.

Team Foundation Server (n)~ A set of tools and technologies that enable a team to collaborate and coordinate their efforts on building a product or completing a project. The tools include source control, work item tracking, building, team project portal, reporting, and project management.

Team Foundation Server Administration Console (PN)~ A console which provides a central location for managing most aspects of Team Foundation Server.

Team Foundation Server Extensions (PN)~ You can integrate Visual Studio Team Foundation Server with one or more SharePoint Web applications. If you perform this integration, project managers can create a SharePoint site (referred to as a team project portal) for a team project or a site collection for a team project collection. In addition, project managers can also create libraries that contain process guidance and the documents for each team project. If you want to integrate one or more SharePoint Web applications with Team Foundation Server, you must first install and configure the Team Foundation Server Extensions for SharePoint Products on the server that is running the Web application. You can then configure mappings from Team Foundation Server to the SharePoint Web applications that you have configured with extensions.

Team Foundation Server SharePoint Extensions (PN)~ Required software for Visual Studio Team Foundation Server with one or more SharePoint Web applications. The Team

Foundation Server Extensions for SharePoint Products include site templates to which the process templates for Team Foundation Server refer when team projects are created.

Team Foundation Service (PN)~ Team Foundation Service is a subset of a larger suite, which is called Visual Studio Online.

Team Management (n)~ The Duet end-user application that enables users to view up-to-date information about other users, open positions across divisions, and organizational structures in Microsoft Office Outlook. Users can view these in Outlook in the form of Outlook Contact items or Office documents that are integrated with and retrieved from SAP systems.

team of peers (n)~ An organizational work model that emphasizes the use of small, cohesive teams of role specialists who communicate on an equal basis in the accomplishment of their individual and group tasks. This work model contrasts to that of the traditional top-down, linear-structure work model, and has been functionally proven in a variety of different organizations, cultures, and project sizes.

Team Planner (PN)~ A view that shows all of the resources on a project and their work over time. This makes it easy to rearrange work, schedule new work, and manage a team's load.

team project (n)~ The named collection of work items, code tests, work products, metrics, and so forth used by a defined team to track a common set of related work.

team project collection (n)~ A group of team projects with similar requirements or objectives hosted on the same Team Foundation Server (TFS) that are assigned the same resources and can then be managed as an autonomous resource with its own user groups, server resources, and maintenance schedule.

team project collection host group (n)~ A Virtual Machine Manager host group that has been bound to a team project collection.

team project collection library share (n)~ A Virtual Machine Manager library share that has been bound to a team project collection.

team project host group (n)~ A project collection host group that has been further bound to a TFS team project for the purpose of deploying virtual environments.

Team Project Host Group Name (PN)~ The name of the host group in the team project collection.

team project library share (n)~ A project collection library share that has been further bound to a TFS team project for storage of virtual environment templates and virtual machine templates.

team project portal (n)~ The Windows SharePoint Services (WSS) site for each team project. A team project portal allows team members to store and share documents, reports, and information related to a specific team project.

Team Resources (n)~ A feature that allows task work to be assigned to a group at the resource level to rather than to an individual. The total work load of the team resource includes both each individual's and the team's. These are not project teams.

Team Room (n)~ A new feature that keeps a record of things that happen in a team -€" checkins, work item updates, build failures, code reviews, etc. - and allow developers to have conversations about the activity.

team site (n)~ A SharePoint site created to facilitate team collaboration on projects and

other efforts.

Team Test (PN)~ The part of Visual Studio Team System that specifically targets team members who are in the test role.

Team Web Access (PN)~ A developer's tool to connect to Visual Studio Team Foundation Server (TFS) through a web browser and coordinate a development team.

team Web site (n)~ A customizable Web site with features that help a team work together. The default site has pages for document libraries, announcements, and team events. Only members, specified by the site creator, can use the site.

Team Work Center (PN)~ ?A Web Part that combines a search list of projects in a site collection along with a timeline that shows how those projects relate to one another.

Team Workspace (PN)~ A business application that lets teams quickly organize, author, and share information with the people in their company. It provides lists for managing announcements, calendar items, tasks, discussions, favorite links, and includes a document library.

team-call group (n)~ A group of people who can answer calls on behalf of someone else.

tearsheet (n)~ A page torn from the magazine or newspaper showing the ad that ran, as proof of performance.

technical account manager (n)~ A Microsoft employee who provides technical assistance to one or more specific royalty OEMs as they manufacture computers installed with a released version of Windows.

technical support (n)~ An organization or group that is responsible for providing technical support.

Techno (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 18.

Techno-Industrial (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 51.

Technology Guarantee (PN)~ The promotional program that encourages OEM Direct and System Builder Channel (SBC) to upgrade to Office 2007 and retail customers to upgrade to Office 2007 and/or Windows Vista.

technosphere (n)~ The entities that are outside the organization's operational boundary. Materials that come from the technosphere are bought or sold, rather than acquired from the environment.

Teen (n)~ A game rating symbol developed by the Entertainment Software Rating Board (ESRB).

telecine (n)~ The film-to-video conversion system that adds frames to video to compensate for the differences in frame rates between film and video.

telecoil (n)~ A component of a hearing aid that is activated for use with a hearing aid compatible telephone.

Telematics ~ Blend of telecommunications and informatics (another term for IT). This area of research studies the interrelationships between different communications engineering fields

telemetry (n)~ The automatic measurement and transmission of data from remote sources

by wired or wireless communication means. Telemetry technology is used in a wide variety of applications.

telemetry (n)~ Data that shows how partner products are used including where, how often, with which other software and hardware. This helps them identify user needs and experiences as well as potential marketing and product improvement opportunities over time. Partners and Microsoft can better understand what happens between planning, lab testing, sales data, and real world scenarios over time.

telemetry data (n)~ Data that shows how partner products are used including where, how often, with which other software and hardware. This helps them identify user needs and experiences as well as potential marketing and product improvement opportunities over time. Partners and Microsoft can better understand what happens between planning, lab testing, sales data, and real world scenarios over time.

telephone device for the deaf (n)~ A device that enables the transmission of typed messages over phone lines. These devices typically include keyboards for typing messages to send and display and/or printers to receive messages from one device to another.

telephone typewriter device (n)~ A device that enables the transmission of typed messages over phone lines. These devices typically include keyboards for typing messages to send and display and/or printers to receive messages from one device to another.

Telephone User Interface (n)~ An interface that is used to navigate the menus of a Unified Messaging (UM) system using DTMF or touchtone inputs.

telephony (n)~ A telephone technology; voice, fax, or modem transmissions based on either the conversion of sound into electrical signals or wireless communication by means of radio waves.

Telephony API (n)~ An application programming interface (API) used by communications programs to work with telephony and network services.

Telephony Conferencing Server (n)~ A service that runs on an Office Communications Server Front End Server and that enables multiparty conferencing with PSTN callers connecting through an audio conferencing provider.

television (n)~ An electronic system of transmitting transient images of fixed or moving objects together with sound through space by an apparatus that converts light and sound into electrical waves and reconverts them into visible light rays and audible sound.

Tell a friend (PN)~ The standard display text for mailto: link for sending a link to a page, typically used when asking someone to view but not participate in something.

Tell Me (PN)~ A feature that enables users to search for user interface controls.

telnet (n)~ A client or server program that implements the Telnet protocol.

Telnet (n)~ A protocol that enables an Internet user to log on to and enter commands on a remote computer linked to the Internet, as if the user were using a text-based terminal directly attached to that computer. Telnet is part of the TCP/IP suite of protocols.

tempdb (n)~ A system database that is re-created every time the server is started.

template (n)~ A file that contains some pre-defined formatting, layout, and/or text and graphics and that serves as the basis for new documents with a similar look or purpose.

template (n)~ A library resource consisting of a guest operating system profile, a hardware profile, and one or more virtual hard disks (.vhd files), which can be used to create a new virtual machine. Computer identify information must have been removed

from the .vhd file that contains the operating system files by using the System Preparation tool (Sysprep). Self-service users must use designated templates to create their virtual machines.

template (n)~ A reusable set of properties defining the look of a control. A template can be shared between instances of the same object type.

template (n)~ In ASP.NET: A declarative page fragment that is used to provide a visual interface for a templated ASP.NET server control. A template contains presentation elements that include literal text, HTML, and data-binding expressions, as well as declarative syntax elements that represent ASP.NET server controls.

template (n)~ A method that is used to populate initial values in a class, such as a change request or incident.

template binding (n)~ A binding between a property on an element in a control template and a property on the control instance to which the template is applied. For example, a Button's Background property changes and, because a Rectangle in its template is template bound to that property, the Rectangle changes color.

Template Manager (n)~ A sub-area of the Settings module where the user manages e-mail, contract, and article templates.

template node (n)~ The design-time access point to the Items Collection Editor for a ToolStrip, MenuStrip, ContextMenuStrip, or StatusStrip control.

Template Part (n)~ A customized set of controls that can be saved for reuse in multiple form templates. Template parts are saved as custom controls in the Controls task pane.

template part (n)~ One of the available constructs that make up a UI template for a portal extension.

template set (n)~ In ASP.NET mobile controls: A collection of templates associated with a templated control.

templated control (n)~ An ASP.NET server control that does not itself provide a visual interface but allows its users (page developers) to supply templates that provide a visual interface. When the ASP.NET page parser encounters a templated control, it parses the control's template and dynamically creates child controls that supply the visual interface. The Repeater and DataList ASP.NET server controls are templated controls. The DataGrid control is not strictly a templated control, but uses templates to customize its user interface.

Templates (n)~ A button that redirects the user to the Templates section in the Works Task Launcher.

temporary consumer (n)~ An event consumer that receives event notifications only while the consumer is active.

temporary node (n)~ A node that is created as a result of an administrator action and that displays in the navigation pane for the current console session only.

temporary procedure (n)~ A procedure placed in the temporary database, tempdb, and erased at the end of the session.

temporary smart card (n)~ A non-permanent smart card issued to a user for replacement of a lost smart card or to a user that requires access for a limited time.

temporary stored procedure (n)~ A procedure placed in the temporary database, tempdb, and erased at the end of the session.

temporary table (n)~ A table placed in the temporary database, tempdb, and erased at the end of the session.

tenant (n)~ A client organization that is served from a single instance of an application by a web service. A company can install one instance of software on a set of servers and offer Software as a Service to multiple tenants.

tenant administrator (n)~ A user account that has been assigned as an administrator for the tenant.

Tenant Administrator (PN)~ An administrator with a Tenant Administrator user role.

Tenant Administrator user role (PN)~ A user role that allows the user to create and manage self-service users and VM networks, specify which tasks the self-service users can perform on their virtual machines and services, and place quotas on computing resources and virtual machines.

tenant-level external data log (n)~ An error log that contains errors and exceptions that occur when SharePoint tries to connect to external systems through Business Connectivity Services. It can be retrieved by tenant administrators.

tender (n)~ Something used as a medium of payment.

tender declaration (n)~ A count of the coins and bills at the POS; for example, as part of the end of day or end of shift procedure.

Tent card (n)~ One of the page size options available in Publisher for printing a folded card. This option prints two pages per sheet of paper.

tentative (adj)~ An open service activity status that denotes that the resources are not scheduled to perform work for this service activity.

tentative (adj)~ Pertaining to time on a schedule when a person may participate in a scheduled task.

tent-fold card (n)~ A top-fold card with four pages. Page one becomes the front cover, pages two and three are the inside pages, and page four is the back of the card.

terabyte (n)~ A measurement used for high-capacity data storage. One terabyte equals 240, or 1,099,511,627,776, bytes, although it is commonly interpreted as simply one trillion bytes.

Terabyte ~ Unit of measurement for pieces of information : approximately 1 trillion bytes, 1 billion kilobytes, 1 million megabytes or 1000 gigabytes. That's a- lot- of data.

Teredo bubble packet (n)~ A data packet that is typically sent to create or maintain a NAT mapping and consists of an IPv6 header with no IPv6 payload.

Teredo relay (n)~ An IPv6/IPv4 router that can forward packets between Teredo clients on the IPv4 Internet (using a Teredo tunneling interface) and IPv6-only hosts.

term (n)~ A word or phrase that stands for a concept used in a particular subject area.

term end date (n)~ The date at the end of a subscription. For example, in Microsoft Online Services, there are a variety of services that a customer may subscribe to, and each subscription has its own term length (e.g., 6 months, 12 months) and term end date.

term extraction (n)~ The procedure of reviewing completed files/documents for the purpose of automatically identifying words and phrases with specialized technical meaning.

term harvesting (n)~ The procedure of reviewing completed files/documents for the purpose of identifying words and phrases with specialized technical meaning and

collecting them in a separate document.

term license ~ A type of software agreement wherein the customer pays maintenance fees for use of the software over a specified term and, unless the license is renewed, has no right to use the software after the term expires.

term mining (n)~ The procedure of reviewing completed files/documents for the purpose of automatically identifying words and phrases with specialized technical meaning.

term set (n)~ A collection of related terms.

term store (n)~ A database that stores managed metadata, including term sets, terms, and managed keywords.

Term Studio (PN)~ A terminology management database that allows product contributors across Microsoft to document, standardize and share important information about concepts, their synonyms and equivalents.

terminal ~ Simple device at which data can be entered or retrieved from a network. Generally, terminals have a monitor and a keyboard, but no processor or local disk drive.

Terminal Adaptor ~ A piece of hardware similar to a modem, required to operate anISDN- internet connection.

Terminal Services session (n)~ A Terminal Services session.

terminate (v)~ With reference to software, to end a process or program.

terminate-and-stay-resident (n)~ A program that remains loaded in memory even when it is not running, so that it can be quickly invoked for a specific task performed while another program is operating.

termination (n)~ The ending of a thread, process, or program.

terminologist (n)~ A person who studies, documents, and recommends the standard usage of terms and their associated concepts within a given subject area.

terminology (n)~ The study of terms and their associated concepts.

terminology (n)~ A set of terms used in a particular subject field.

terminology database (n)~ A database containing terminological data.

terminology management (n)~ The investigation, documentation, and consistent reuse of terms and their associated concepts.

Terms (PN)~ The link to the Microsoft service agreement.

terms (n)~ The contractual provisions and major terms agreed to by the parties to an agreement.

terms and conditions (n)~ The contractual provisions and major terms agreed to by the parties to an agreement.

Terms of use (PN)~ The link to the Microsoft service agreement.

Terms of Use (PN)~ A document that covers how users may use Skype software, Skype products, and the Skype website.

terms of use (n)~ A legal notice that establishes the terms under which service is provided.

territory (n)~ The area in the country/region where an account is located.

Terror (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 130.

tertiary domain (n)~ A DNS domain located directly beneath another domain name (the

parent domain) in the namespace tree. For example, example.microsoft.com' would be a subdomain of the domain 'microsoft.com'.'

test (v)~ To check program correctness by trying out various sequences and input values.

test (n)~ A program, a script (manual or automated), a specific set of steps, or general instructions that can be run repeatedly against software, and that will yield a result such as pass, fail, or other results that resolve to pass or fail, such as inconclusive.

Test Access Port (n)~ A collection of boundary scan control signals that define a serial protocol for scan-based devices. There are five pins, TCK/clock, TMS/mode select, TDI/data in, TDO/data out, and TRST/reset.

test adapter (n)~ The code assembly that is responsible for loading a particular type of test.

test agent (n)~ A background process that receives, runs, and reports on tests and collects data on a single computer. The test agent communicates with test agent controller, usually located on another computer.

test agent controller (n)~ A background process that manages a set of machines with the test agent software installed.

Test Agent Installer service (PN)~ The service of installing a test agent.

test approach (n)~ The test goals, coverage, techniques, and data for the project and each of the iterations.

test case (n)~ A specification that describes the goals of a test, the results that the test might produce, the circumstances in which it will be run, and how it should be implemented.

test class (n)~ Any class that is marked with the TestClass attribute.

test condition (n)~ In a database unit test, a set of frequently used validation functions that test whether a unit test returns the expected results.

test configuration (n)~ A set of configuration variables that specify the correct setup required for testing an application.

Test connection (n)~ The act of testing connectivity with a directory or application

Test Controller 2013 (PN)~ An application designed for Visual Studio 2013, which executes test cases on your PC or in a test lab. You can execute the test cases on your local PC, or schedule a test run.

Test Controller 2013 Language Pack (PN)~ A language pack for Microsoft Test Controller for Visual Studio 2013, which enables the display of the user interface in different languages. After you install the language pack, you can switch among the languages.

test deployment (n)~ The deployment of tests and all dependent files noted by the user or the system from their default location (for example, bin/debug) to the execution directory.

test developer (n)~ A tester typically assigned to authoring coded tests.

Test Drive (n)~ A scaled-down version of a product where a user can try out different features before buying it.

Test Effectiveness (PN)~ A report that communicates the amount of code covered or exercised for a particular test run.

test environment (n)~ An environment that corresponds as closely as possible to the production environment and within which system and user acceptance tests can be carried

out.

test fake (n)~ A mechanism that allows you to isolate part of an application so that it can be tested separately from another part on which it would be dependent in typical operation. During testing, a test fake executes instead of the methods and properties of the other part. The actions and return values of the test fake are under the control of the test. Within Visual Studio, a test fake takes the form of either a test stub or a test shim.

test file (n)~ A file used as part of a testing process to check the validity or correctness of a program or procedure.

test harness (n)~ An application that loads test adapters and owns the process that executes tests.

test list (n)~ A list of tests that can be selected and managed from Test Manager.

Test List Editor (PN)~ The window in Visual Studio Team System that is used to manage, execute, and control large numbers of tests and test lists.

test method (n)~ Any method that is marked with the TestMethod attribute. You cannot run a unit test if its test method is not in a test class.

test metric (n)~ A unit of measure for testing.

test metric threshold (n)~ A goal for the project, measured using a test metric.

test mix (n)~ A formula that defines the probability of a virtual user running a given test in a load test scenario.

Test mode (n)~ A Directory Services option on the Accounts page. When a customer is running in Test mode, all e-mail for recipients who are not on the user list is redirected to a separate e-mail address after filtering (thus this mail is not rejected).

Test Mode/Live Mode (n)~ The modes on the Accounts page for a custom spam filter policy rule to run in. A rule can be run in test mode to monitor what would happen if rule were deployed, or in live mode, where the rule is actually deployed.

test plan (n)~ A set of test cases and their associated test configuration information and the iteration when it is planned to run these tests. The test cases can be organized into a test suite hierarchy.

test point (n)~ A pairing of a test case and a test configuration.

Test Professional 2013 (PN)~ Version of Visual Studio 2013 integrates testers and other stakeholders into the development workflow to enable in-context collaboration with developers.

Test Professional 2013 Language Pack - ENU (PN)~ Language Pack is a free add-on that you can use to switch the language that's displayed in the Microsoft Visual Studio Test Professional 2013 user interface.

test project (n)~ A project created specifically to hold test types.

test result (n)~ The verdict from executing a test: pass, fail, or inconclusive.

Test Results (oth)~ A window which displays the current status of every test in the test run.

Test Results window (n)~ A window which displays the current status of every test in the test run.

test run (n)~ A set of pairings of test cases and test configurations to be run. The results of this set of pairings can be viewed together. Test runs are either automated or manual.

test script (n)~ A defined requirement that is checked against a product and yields either a

pass or a fail result. Pass indicates meeting the requirement and fail indicates not meeting the requirement.

test settings (n)~ A set of variables that define how tests are going to be run and any data to be collected or system actions taken while tests are run. For example, collect code coverage data or emulate a specific network.

test shim (n)~ A type of test fake that works by introducing a detour to the entry point of methods or properties that are called by a unit under test. The shim is executed instead of the existing code, and is under the control of the tests. A shim can be applied to any code, even if it was not designed to be isolated during testing.

test step (n)~ An action to be taken when the test is run, and possibly the expected result from that action.

test stub (n)~ A type of test fake that is an alternative implementation of an interface or class that is called by a unit under test. The test stub is under the control of the unit tests. Designing a system so that its parts can be replaced by test stubs results in more flexible code.

test suite (n)~ A set of selected test cases. A test suite can contain other test suites, but each test suite can be contained in only one other test suite.

test suite type id (n)~ A unique identifier that is assigned to a type of selected test cases.

test task (n)~ An assignment to create test cases and test a specific area of the product, usually in the context of a scenario or quality of service requirement.

test type (n)~ A set of functionality and/or a template to help expose parts of the underlying test framework.

Test View (PN)~ A window that allows you to navigate to your tests for editing (authoring).

Test View window (n)~ A window that allows you to navigate to your tests for editing (authoring).

TestClass attribute (n)~ The attribute put on a class element to indicate it contains coded tests.

TestMethod attribute (n)~ The attribute added to a method element to indicate it is a coded test.

tetanus and diphtheria vaccine (n)~ A vaccine for immunization against tetanus-diphtheria.

tetanus, diphtheria and acellular pertussis vaccine (n)~ A vaccine for immunization against tetanus-diphtheria-pertussis. The term acellular means that the pertussis component is cell-free, which improves safety by reducing the incidence of side effects.

tethering ~ enables your cellular telephone or similar Internet-enabled mobile device to connect other devices such as netbooks, laptops or PDAs to the Internet. Mobile phones that offer tethering typically connect to other devices via Bluetooth or a USB cable in order to provide them with Internet access.

TETRAGRAM FOR DEFECTIVENESS OR DISTORTION (n)~ The Unicode character U+1D30F, which represents a Tai Xuan Jing symbol.

text (n)~ In word processing and desktop publishing, the main portion of a document, as opposed to headlines, tables, figures, footnotes, and other elements.

Text (n)~ A field data type that can contain up to 255 characters or the number of

characters specified by the Fieldsize property, whichever is less.

Text (PN)~ A tool that lets you create blocks of text characters. Each character in a text block can have its own stroke and fill.

text (v)~ To send text messages from a mobile phone or device.

text (n)~ A short alphanumeric message that is sent between mobile phones or devices using the SMS protocol.

text attributes (n)~ Any characteristic of text, such as font, size, style, color, or effect such as subscript or superscript.

text block (n)~ The text area associated with a shape that appears when you click the shape with the text tool or select it with the pointer tool.

text box (n)~ A rectangular control in an application that allows the user to enter or edit text.

Text Cycle (PN)~ A SmartArt graphic layout used to represent a continuing sequence of stages, tasks, or events in a circular flow. Emphasizes the arrows or flow rather than the stages or steps. Works best with Level 1 text only.

text direction (n)~ The direction text is written in a document, for instance left to right, right to left, horizontal or vertical.

Text Display Size (n)~ An item on the Edit menu that displays a list of relative text sizes for instant message text.

text document (n)~ A document that contains alphanumeric information, not just 0s and 1s.

text editor (n)~ A program that creates files or makes changes to existing files.

text effect (n)~ A visual effect that colors, tweaks, or otherwise graphically alters fonts.

text field (n)~ A standard Windows control that displays static or dynamic text.

text file (n)~ A file composed of text characters. A text file can be a word-processing file or a plain' ASCII file encoded in a format practically all computers can use.'

text flow (n)~ The way text is displayed in a document, how it behaves and breaks according to settings.

text formatting (n)~ Formatting that controls the appearance of a text. Examples include text alignment, intercharacter spacing, text justification, and text and background colors.

text frame (n)~ An area within a shape that can contain text.

text harvesting (n)~ A process of extending a handwriting recognizer's lexicon by gathering and storing the user's vocabulary.

text label (n)~ Descriptive text that you can add to a form, worksheet, chart, or other document.

text message (n)~ A short alphanumeric message that is sent between mobile phones or devices using the SMS protocol.

text messaging (n)~ The process of creating and sending text messages between or to mobile phones and devices using the SMS protocol.

text mode (n)~ A display mode in which the monitor can display letters, numbers, and other text characters but no graphical images or WYSIWYG (what-you-see-is-what-you-get') character formatting (italics

text notification (n)~ A type of text e-mail reminder that includes a URL and brief instructions for the user about how to log on and view the spam that was sent to that user's

address. This text is customizable on the Spam Filter page.

text object (n)~ An entity containing text in a document, for instance a text box or table cell.

text placeholder (n)~ A symbolic value used instead of a real value which in this case is text.

text prediction (n)~ A recognition feature that helps increase input speed and reduce effort by providing users with word completion and next word prediction alternates as the user is writing/typing.

text query (n)~ One or more phrases that can contain operators, quotation marks, wildcards such as * or ?, and parentheses.

text reply (n)~ A predetermined text reply that can be automatically sent in response to incoming calls, text messages, or both when Driving Mode is turned on. The text reply is sent with no action on the part of the user.

text reply (n)~ A response to an incoming call using a text message when the caller is a contact calling from a mobile phone.

text segment (n)~ A unit of text, for example a word, a phrase, a sentence, a paragraph, a document.

text service (n)~ A program that enables a user to enter or edit text. Text services include keyboard layouts, handwriting and speech recognition programs, and Input Method Editors (IMEs). IMEs are used to enter East Asian language characters with a keyboard.

Text Services Framework (PN)~ A device-independent, language-neutral, and extensible system that enables natural language services and advanced text input on the desktop and within applications.

Text slide (n)~ A blank collaborative slide on which participants can type notes or comments.

text stream (n)~ A type of encoded output that can be included in a Smooth Streaming presentation, such as captions.

text string (n)~ A group of characters or character bytes representing text handled as a single entity.

text suggestion (n)~ A word that's suggested as users type, which they can select to quickly insert.

text telephone (n)~ A device that enables the transmission of typed messages over phone lines. These devices typically include keyboards for typing messages to send and display and/or printers to receive messages from one device to another.

text telephony (n)~ A feature that enables those who are deaf or speech impaired to use the telephone with a teletypewriter.

text tone (n)~ The sound the phone makes when the user receives a text message.

text window (n)~ A window containing a text document.

text wrap (n)~ The ability of a word-processing program or a text-editing program to break lines of text automatically to stay within the page margins or window boundaries of a document without the user having to do so with carriage returns, as is typically necessary on a typewriter.

text wrapping (n)~ A feature that consists of advanced text wrap functionality, allowing the user to select from various styles to specify how text flows around objects or graphics

in a document.

text writer (n)~ In ASP.NET mobile controls: A mechanism that allows device adapters to write their output through an object. A text writer object is created from the TextWriter base class.

Text-Based Designer (PN)~ A text-based workflow editor that enables users to create and edit workflows by using declarative statements.

text-mode Setup (n)~ The second of the three stages of Setup, where the basic hardware of the computer (CPU, motherboard, hard disk controllers, file systems, and memory) is determined, the base operating system necessary to continue is installed, and specified folders are created.

text-only file (n)~ A document file in ASCII format, containing characters, spaces, punctuation, carriage returns, and sometimes tabs and an end-of-file marker, but no formatting information.

text-to-speech (n)~ Pertaining to technologies for converting textual (ASCII) information into synthetic speech output. Used in voice-processing applications requiring production of broad, unrelated, and unpredictable vocabularies, such as products in a catalog or names and addresses. This technology is appropriate when system design constraints prevent the more efficient use of speech concatenation alone.

text-to-speech engine (n)~ The component of Speech Engine Services that processes text input and produces speech output by synthesizing words and phrases.

texture (n)~ A rectangular array of pixels applied to a visual object.

TFS (n)~ A set of tools and technologies that enable a team to collaborate and coordinate their efforts on building a product or completing a project. The tools include source control, work item tracking, building, team project portal, reporting, and project management.

TFS service (n)~ The service that Team Foundation Server (TFS) uses. Team Foundation Server includes many services that run on the application tier. Your actual services will vary based on which features of Team Foundation you have installed.

TFT ~ (Thin Film Transistor)- A technology used originally in- laptopscreens for giving a sharp and vibrant colour display. Much less bulky than the- CRT- system used in most desktop monitors, which it is now widely replacing.

TFTP (n)~ A formal set of format, timing, sequencing, and error control rules for transferring files to and from a remote computer system running the Trivial File Transfer Protocol (TFTP) service.

TG (n)~ A contact list, similar to an alias, that allows the talk to reach a list of users at once by the push-to-talk functionality.

TGA (n)~ A photorealistic graphics file format designed for systems with a TARGA Truevision display adapter.

thank you note (n)~ A note or email message sent to a person to thank them for something received, or for a meeting.

thaw (v)~ In I/O operations, to allow execution of a thread.

theater mode (n)~ A feature in Internet Explorer whereby the object's main window fills the entire screen and displays a toolbar with a minimal set of navigational buttons. A status bar is also provided in the upper right-hand corner of the screen.

theater view (n)~ A view where the preview is centered in a PowerPivot Gallery SharePoint document library and lets you rotate through the available worksheets. Smaller thumbnails of each worksheet appear lower on the page, on either side.

theme (n)~ A set of coordinated graphic elements applied to a document or Web page, or across all pages in a Web site. Themes can consist of designs and color schemes for fonts, link bars, and other page elements.

theme (n)~ In ASP.NET, a collection of control properties, stylesheets, and images that can be applied as a unit to a page or Web site to define an overall appearance.

theme (n)~ A collection of visual elements and sounds for your computer desktop or device User Interface. A theme determines the look of the various visual elements of your User Interface, such as windows, icons, fonts, and colors, and it can include sounds.

theme (n)~ A set of colors and background images that lets users change the appearance of Windows Live pages. The theme is common to all pages, except for group, event, and space pages, which may each have their own theme.

theme color (n)~ One of a set of colors that is used in a file. Theme colors, theme fonts, and theme effects compose a theme.

theme effect (n)~ One of a set of visual attributes that is applied to elements in a file. Theme effects, theme colors, and theme fonts compose a theme.

theme engine (n)~ The program module that applies a predefined graphic theme to the user interface.

theme family (n)~ A set of variants on a single theme.

theme font (n)~ One of a set of major and minor fonts that is applied to a file. Theme fonts, theme colors, and theme effects compose a theme.

theme pack (n)~ A renamed .cab file which contains a .theme file, and optionally one or more desktop backgrounds, icons, mouse pointer files, and sound files. It does not contain executables or screen savers.

theme resource (n)~ A file of supported type used in a theme.

theme variant (n)~ One of the variations of a theme that make up a theme family.

Themes (PN)~ The Personalization subcategory containing apps with special themes for your PC and phone.

thesaurus (n)~ An integrated proofing tool used to search on common words and display synonyms.

Thesaurus pane (PN)~ A pane that provides synonym lookup and display functionality.

theta join (n)~ A join based on a comparison of scalar values.

Thick (or fat) client ~ Thick clients, also called heavy clients, are full-featured computers that are connected to a network.

thin (adj)~ Having a font weight that corresponds to a weight class value of 100 according to the OpenType specification.

Thin Client ~ A type of client/server computing where applications are run, and data is stored, on the server rather than on the client. Because the applications are executed on the server, they do not require client-resident installation, although the- GUI- and some application logic may be rendered to the client.

thin provisioning (n)~ A mechanism that allows administrators to set policies on storage utilization such that storage can be dynamically allocated from or returned to a larger

aggregated pool of storage, depending on client usage.

thin rendering (n)~ The process of rendering server-based spreadsheets, diagrams, or other documents in a browser using an application server.

Things to try (PN)~ A topic title used to introduce more information on what a user may want to try to make better use of a particular tool, feature, etc.

think profile (n)~ A property that indicates whether think times are used or ignored in load tests. The think profile applies to an entire scenario in a load test. Its state are: On, Off, Normal Distribution.

think time (n)~ The elapsed time between the receipt of a reply to one request and the submission of the next request. For example, if it takes about 60 seconds for a user to enter all the information required for a Web-based time-entry form, 60 seconds is the think time for this scenario.

thin-provisioned (adj)~ Of, pertaining to, storage that allows thin provisioning.

third party (n)~ A company that manufactures and sells accessories or peripherals for use with a major manufacturer's computer or peripheral, usually without any involvement from the major manufacturer.

third-level domain (n)~ A DNS domain located directly beneath another domain name (the parent domain) in the namespace tree. For example, example.microsoft.com' would be a subdomain of the domain 'microsoft.com'.'

third-party installer (n)~ A software installation development solution offered by a company other than Microsoft.

third-party installer (n)~ A program that installs software, offered by a company other than Microsoft.

third-party logistics (n)~ A party that provides logistics services to customers.

third-party update (n)~ An update published by a company other than Microsoft.

Thrash metal (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. Winamp genre ID # 144.

thread (n)~ A type of object within a process that runs program instructions. Using multiple threads allows concurrent operations within a process and enables one process to run different parts of its program on different processors simultaneously. A thread has its own set of registers, its own kernel stack, a thread environment block, and a user stack in the address space of its process.

thread (n)~ All published reactions (such as comments, likes, and retweets) to a single post.

thread (n)~ An instant message or text message conversation between two or more participants.

thread ~ In Mach, the unit of CPU utilization. A thread consists of a program counter, a set of registers, and a stack pointer.

thread component (n)~ An SMS/Configuration Manager program that runs as a thread of the SMS Executive service component. A thread component can be started and stopped through the SMS/Configuration Manager Service Manager.

Thread Count (n)~ In Task Manager, the number of threads running in a process.

thread local (n)~ A mechanism that uses static or global memory local to a thread by

which variables are allocated such that there is one instance of the variable per extant thread.

thread safety (n)~ The ability for multiple threads to access and share data in a correct way.

threading model (n)~ The model that determines how the methods of an application's component are assigned to threads in order to be executed.

thread-safe (adj)~ Pertaining to multithreaded applications and how threads share and access data.

threat (n)~ A possible entry point to an asset that could be used by an adversary to adversely affect that asset.

threat model (n)~ A systematic analysis of identifying assets, and assessing and documenting the security risks associated with those assets exposed via software. The threat modeling process involves an understanding of the goals of an adversary in attacking a system based on the systems assets of interest. The scope of the threat model is defined by the scope of functionality of software being modeled.

threat type (n)~ A category of entry points to an asset that could be used by an adversary to adversely affect that asset. Threat types include: Spoofing identity, Tampering with data, Repudiation, Information disclosure, Denial of Service, and Elevation of Privilege.

three-dimensional (adj)~ Of, pertaining to, or being an object or image having or appearing to have all three spatial dimensions (length, width, and depth).

three-factor authentication (n)~ An authentication method that requires three authentication methods, which may include something the user provides, such as certificates; something the user knows, such as user names, passwords, or pass phrases; physical attributes, such as a thumbprint; and personal attributes, such as a personal signature.

three-way handshake (n)~ The method for initializing a Transmission Control Protocol (TCP) session between two hosts on an Internet Protocol (IP) network. The three-way handshake synchronizes the sequence number and acknowledgment numbers of the two hosts establishing a connection, exchanges TCP window sizes, and exchanges other TCP options, such as the maximum segment size.

three-way matching policy (n)~ A matching policy that requires one or more vendor invoice prices to match with one or more purchase order prices and that requires one or more vendor invoice quantities to match with one or more product receipt quantities.

threshold (n)~ A limit against which other values can be compared. When a value crosses this limit, it can trigger an alert or other action.

Threshold (n)~ A filter effect in Windows Movie Maker.

threshold filtering (n)~ The process of reducing a full-color image to an eight-color image. This is done by setting a value for a threshold, which is the cutoff value for each color component of a sample.

threshold rule (n)~ A rule that is set on an individual performance counter to monitor system resource usage during a load test.

threshold value (n)~ A limit against which other values can be compared. When a value crosses this limit, it can trigger an alert or other action.

Thrift (PN)~ A software framework for scalable cross-language service development.

Thrift server (n)~ A Remote Procedure Call (RPC) framework that can be used to develop scalable cross-language services.

throttle (n)~ A process that restricts the flow of data.

throttling (n)~ The process of setting the maximum portion of total network capacity that a service is allowed to use. An administrator can deliberately limit a servers Internet workload by not allowing it to receive requests at full capacity, thus saving resources for other programs, such as e-mail.

throttling (n)~ The restriction in the flow of data when the total throughput across Event Hubs in exceeds the aggregate throughput unit allowances .

throughput (n)~ The data transfer rate of a network, measured as the number of bits per second transmitted.

throughput (n)~ The total amount of output produced by a resource.

Throughput ~ The volume of work or information flowing through a system.

Throughput ~ In data communications, the total traffic between stations over a period of time.

Throughput ~ A measure of the amount of information transmitted over a network in a given period of time.

Throughput Unit Hours (n)~ The unit of measure to compute the total amount of a Data Lake workload.

thumb (n)~ The part of a slider control that can be moved to set the slider position.

thumb control (n)~ The part of a slider control that can be moved to set the slider position.

Thumb drive ~ A computer storage device about the size of a man's thumb, often carried on a keyring, which plugs into a PC- USB- port and is seen by the PC as an extra drive - a very convenient way to carry large amounts of data around.

thumb keyboard (n)~ A split on-screen keyboard that is optimized for thumb typing.

thumbnail (n)~ A miniature version of an image that is often used for quick browsing through multiple images.

thumbnail image (n)~ A miniature version of an image that is often used for quick browsing through multiple images.

thumbnail pane (n)~ A type of pane that presents the current scanned document as one or more small images.

thumbnail picture (n)~ A miniature version of an image that is often used for quick browsing through multiple images.

thumbnail toolbar (n)~ A toolbar control that is embedded in a window's thumbnail preview. Thumbnail toolbars are a feature of pinned sites in Internet Explorer 9.

thumbprint (n)~ A hexadecimal string that contains the SHA-1 hash of the certificate.

thunk (n)~ A small section of code that performs a translation or conversion during a call or indirection. For example, a thunk is used to change the size or type of function parameters when calling between 16-bit and 32-bit code.

thunk (v)~ To call 32-bit code from 16-bit code, or vice versa. Thunking involves, in large part, the translation to and from 16-bit segment offset memory addressing and 32-bit flat, or linear, memory addressing.

tick (n)~ A regular, rapidly recurring signal emitted by a clocking circuit.

tick count (n)~ A monotonically increasing number that is used to uniquely identify a change to an item in a replica.

tick mark (n)~ A small line of measurement, similar to a division on a ruler, that intersects an axis.

tick mark label (n)~ A label that identifies the categories, values, or series in a chart.

ticker (PN)~ A feature that displays the prices of securities; name is derived from a telegraphic receiving instrument that automatically printed stock quotations on ticker tape.

ticker symbol (n)~ An identification code used to identify a publicly traded corporation on a particular stock market.

Ticker Tape (n)~ A title animation in Windows Movie Maker.

Ticket (n)~ A record within Parature of a case, issue, or question that is submitted by a Customer or by a CSR on behalf of a Customer.

tick-mark label (n)~ A label that identifies the categories, values, or series in a chart.

TID (n)~ A 9-digit number used to identify an entity (company or person) for tax reporting purposes in the U.S. There are several different types of tax identification numbers, such as employer identification number (EIN), Social Security number (SSN), individual taxpayer identification number (ITIN), and adopted taxpayer identification number (ATIN).

tidal volume (n)~ The volume of air inspired or expired at each breath.

TIE (PN)~ The engine that detects and decides what a gesture (tap, pinch, zoom) means.

tier (n)~ An element of a service template that contains the configuration settings necessary to deploy a particular portion of a service.

tiered storage (n)~ Storage that supports multiple storage tiers within a pool and ways to maintain data in each storage tier.

tiering engine (n)~ A service that tracks regions of storage and may move data between them based on an input/output policy or other administrator-specified rules.

tiering policy engine (n)~ A service that tracks regions of storage and may move data between them based on an input/output policy or other administrator-specified rules.

TIFF (n)~ A high resolution, tag-based image format used for scanning, storing, and combining graphic images.

TIFF, Tif ~ (Tagged Image File Format)- A type of graphics (picture) file, often used for photographs. The files are usually huge, as the data is not compressed. Files in this format usually have names ending .tif .

tilde (n)~ The ~ character.

TILDE (n)~ The ~ character.

tile (v)~ In computer-graphics programming, to fill adjacent blocks of pixels on the screen with a design or pattern without allowing any blocks to overlap.

tile (v)~ To fill the space on a monitor or within a smaller area with multiple copies of the same graphic image.

tile (v)~ To print a document in overlapping pieces.

tile (n)~ An image that uses approved product signature lockups, key brand and product identity elements and colors, and the Microsoft logo.

tile (n)~ A moveable object on the Start screen that opens apps or other customized content, like pinned websites.

tile (n)~ A UI element consisting of a rectangle that contains a set of data. Tiles can often be rearranged or hidden.

tile (n)~ An element in a control template that has special, possibly mandatory, significance and semantics in the functioning of the control. For example, a template for a ScrollBar control should supply a Thumb part for the ScrollBar to function correctly, but it need not provide a small decrease or a small increase button.

tile brush (n)~ A brush used to fill the interiors of graphical shapes such as rectangles, ellipses, pies, polygons, and paths with a tile pattern.

tile horizontally (v)~ To rearrange and resize open files or windows into horizontal tiles that display above and below one another without overlapping.

Tile image (n)~ A UI element that enables a user to repeat an image so that it fills the page.

tile server (n)~ A map image caching engine that caches and serves pregenerated, fixed-size map image tiles.

tile vertically (v)~ To rearrange and resize open files or windows into vertical tiles that display next to one another without overlapping.

tiled resourcing (n)~ A graphics feature that allows large logical resources to occupy only a small amount of physical memory, which can be dynamically remapped as the relevant application needs it.

till (n)~ The removable tray in a cash register drawer.

time (n)~ The time the preventive maintenance routine was completed.

time (n)~ A SQL Server system data type that stores a time value from 0:00 through 23:59:59.999999.

Time & expenses (PN)~ The Business subcategory containing apps to help businesses keep track of how much time and money are spent on various projects or accounts.

time allowance (n)~ The number of hours or minutes per day that a child is allowed to use the computer.

time and material project (n)~ An external project that is invoiced as work progresses based on the consumption of hours, expenses, items, fees, and on-account transactions.

time and materials (n)~ A type of contract in which the final price paid is based on the amount of time it took to complete the project and the cost of the materials used.

time and materials project (n)~ A project where the vendor invoices the customer based on work completed on the job. There is a direct relationship between the invoice lines and the usage already performed on the job.

Time Attack Mode (n)~ A menu item on the Purble Place menu that allows the user to select a timed mode for their game.

Time Broker (n)~ A feature that provides time events that can be used to initiate background work in suspended apps.

time code (n)~ A digital signal applied to a stream. The signal assigns a number to every frame of video, representing hours, minutes, seconds, and frames.

time dimension (n)~ A dimension that breaks time down into levels such as Year, Quarter, Month, and Day.

time event (n)~ An event that occurs after a designated period of time or on the occurrence of a given date or time. A time event is indicated by the keyword after,

followed by an expression that evaluates to an amount of time.

Time Event Broker (n)~ A feature that provides time events that can be used to initiate background work in suspended apps.

time fence (n)~ A time interval, specified in days, that defines and limits which data are included in a master scheduling calculation.

time formula (n)~ An expression that is created following the Simple Time Period Syntax. It takes the form of a time unit plus or minus a whole number, such as Year-1 or Month-6. It is the formula that is applied when you are using time intelligence on a dashboard.

time frame (n)~ A period of time during which something takes place or is planned to take place.

time grain (n)~ The aggregation interval of a metric for Virtual Machines metrics.

time horizon (n)~ The maximum length of time for which future operations are planned.

time intelligence (n)~ Functionality that is used to show dynamic time periods relative to the current date.

time intelligence filter (n)~ A dynamic dashboard filter that can be linked to scorecards and reports so that they will update automatically relative to the current time.

time interval (n)~ A period of time in which a given event is valid. The valid time interval includes the valid start time, and all moments of time up to, but not including the valid end time.

Time Management (n)~ The Duet end-user application that enables users to view, create, and maintain their data for time recording activities in Microsoft Office Outlook. Users can add time-reporting data in Outlook in the form of Calendar items, which are integrated with time-reporting-compliance guidelines defined in SAP systems.

Time Off (PN)~ A menu item on the Set Up menu that opens the Time Off dialog, which defines how much of the user's schedule is affected by a schedule change.

time out (v)~ To reach the end of a pre-determined period of inactivity or absence of expected event or action, after which a device, program, or process is typically deactivated or interrupted.

time picker control (n)~ A control that developers use to allow a user to select a time.

time project (n)~ An internal project for which only hour transactions are registered.

time range (n)~ A period of time during which a setting or other functionality is in effect.

time reminder (n)~ A reminder set by the user to go off at a particular time.

Time Sensitive Alert (TSA) (oth)~ An alert that fires based on custom criteria after Tickets have been idle for a specified period of time.

time server (n)~ A computer that periodically synchronizes the time on all computers within a network. This ensures that the time used by network services and local functions remains accurate.

time slip (n)~ An area in the product that keeps track of how much time a project takes and allows you to analyze all the time that is spent working on a task or a project.

time stamp (n)~ A certification specifying that a particular message existed at a specific time and date. In a digital context, trusted third parties generate a trusted time stamp for a particular message by having a time stamping service append a time value to a message and then digitally signing the result.

time stamp (n)~ A record of the time that a document was created and modified.

time stamp authority (n)~ A service acknowledging that the data existed before a particular time. The service is typically a trusted third party.

Time Synchronization Packet (n)~ A packet that instructs the Lower Provisioning Module (LPM) what time it is (in UTC format).

Time to Live (n)~ A timer value included in packets sent over TCP/IP-based networks that tells the recipients how long to hold or use the packet or any of its included data before expiring and discarding the packet or data.

time travel (v)~ The process of moving between time frames.

time value (n)~ The number of minutes, hours, days, etc.

time zone (n)~ A geographical area that observes the same local time. The local time has a positive, zero, or negative offset from Coordinated Universal Time (UTC). The offset can be different during standard time and daylight saving time.

time zone ID (n)~ A string that represents a time zone on a computer.

Time-Based Assistant (PN)~ A component in Exchange 2013 that performs background tasks, such as mailbox database maintenance, mailbox processing, inference training, calendar repair, offline address book generation, and more.

Time-Based Assistant (PN)~ A component in Exchange 2013 that performs background tasks, such as mailbox database maintenance, mailbox processing, inference training, calendar repair, offline address book generation, and more.

Time-Based In-Place Hold (n)~ A feature that provides the ability to keep SharePoint items on In-Place Hold for a specific time period.

timeline (n)~ A view on a calendar that displays items such as meetings and events from left to right on a time scale and that can incorporate items from multiple calendars.

timeline (n)~ A linear representation of activities shown in chronological order, such as the activities that lead up to a sale.

timeline (n)~ A representation of a segment of time during which changes occur on a property at intervals called keyframes. You can specify the length of the time segment, when it should start, how many times it will repeat, and more.

timeline (n)~ A high-level linear representation of a project schedule that can be easily formatted, annotated, and copied and pasted from Project into other Office applications.

Timeline (PN)~ ?A graphic control that allows users to select time periods for data filtering, using a familiar linear time representation.

timeline editor (n)~ The area in the Interaction panel where a user can edit individual timelines.

timeline snapping (n)~ Snapping the movement of the playhead during frame-by-frame playback, and snapping keyframes, to specific intervals on the timeline.

timeline zoom (n)~ A zoom that displays a smaller or larger range of time on the timeline.

Time-only entry point (oth)~ An entry point where only the processing time will be captured, without any runtime variables.

timeout (n)~ Settings in Web playlists that specify how long a playlist is available to clients. When the time-out value is reached, clients are disconnected.

timeout ~ Event that occurs when one network device expects to hear from another network device within a specified period of time, but does not. The resulting timeout

usually results in a retransmission of information or the dissolving of the session between the two devices.

time-out (n)~ An event that occurs when a predetermined amount of time has elapsed without some other expected event or activity taking place.

time-out error (n)~ A condition where an expected character is not received in time. When this condition occurs, the software assumes that the data has been lost and requests that it be resent.

timephased (adj)~ Pertaining to a task, resource, or assignment information that is distributed over time.

timer (n)~ An internal routine that causes the system to send a message whenever a specified interval elapses.

timer (n)~ A mechanism that measures the duration of events, like calls, Internet time, etc.

timer (n)~ A mechanism that measures the remaining time from a preset amount of time and sounds an alarm when this time has elapsed.

timer account (n)~ A dedicated, administrator-level user account that performs scheduled administrative tasks.

Timer Coalescence API (PN)~ A native API that allows apps that aren't Windows Store apps and that use timers to coalesce timer messages such that when the screen is off, timers continue to fire but the app wakes less often, thus saving battery life.

timer control (n)~ A control that can be put on a case form that displays a timer indicating how much time has elapsed, or how much time is left, for a service call.

timer job (n)~ A trigger to start to run a specific Windows service for one of the Microsoft SharePoint Products and Technologies. It contains a definition of the service to run and specifies how frequently the service should be started.

timescale (n)~ The time period indicator at the top of the Gantt views, the Resource Graph view, the Task Usage view, and the Resource Usage view. You can customize it to show up to three tiers that can display various time units: top, middle, and bottom.

timesheet (n)~ A record of an employee's work hours for one week.

timesheet manager (n)~ The person to whom your timesheet is submitted. If the user and the timesheet manager are the same person, an automatic approval will be performed upon submittal.

timestamp (n)~ A data type that is automatically updated every time a row is inserted or updated.

timestep mode (n)~ A way to change the unit of time.

Time-Zone Independent (PN)~ The behavior property of a Date and Time attribute where field values are displayed with no time zone conversion.

TIN (n)~ A 9-digit number used to identify an entity (company or person) for tax reporting purposes in the U.S. There are several different types of tax identification numbers, such as employer identification number (EIN), Social Security number (SSN), individual taxpayer identification number (ITIN), and adopted taxpayer identification number (ATIN).

tint (n)~ A color mixed with white. A 10-percent tint is one part of the original color and nine parts white.

TINY (n)~ A UNICODE character; mathematical symbol; plus sign.

tinyint (n)~ A data type of 1 byte (8 bits) that stores whole numbers in the range of 0 through 255.

tip (n)~ A type of note that helps users apply the techniques and procedures described in the text to their specific needs. A tip suggests alternative methods that may not be obvious and helps users understand the benefits and capabilities of the product. A tip is not essential to the basic understanding of the text.

tip (n)~ The text displayed in Cortana screen to educate the user about what Cortana can do as well as to help the user learn what he can say to continue with the task.

Tip of the Day (n)~ A tip that provides useful information about product features for the user. A new tip is displayed each day.

title (n)~ On a DVD, typically, the largest unit of content, such as a movie or TV program, is called a title. There is not a consistent standard across all DVDs and because of this, a DVD can contain one or more titles.

Title area (n)~ The area at the top of a Windows Journal note where you can write a title. The title appears as the suggested file name when you save the note.

title bar (n)~ The horizontal bar at the top of a window that displays the name of the window. Title bars can contain different buttons, such the Minimize, Maximize, and Close buttons, so that you can control how you want to view the window.

title case (n)~ A case distinction in which every word's first chararacter is uppercase and the remaining letters are lower case.

title master (n)~ The slide that stores information from the design template pertaining to styles on title slides, including placeholder sizes and positions, background design, and color schemes.

Titled Matrix (PN)~ A SmartArt graphic layout used to show the relationships of four quadrants to a whole. The first line of Level 1 text corresponds to the central shape, and the first four lines of Level 2 text appear in the quadrants. Unused text does not appear, but remains available if you switch layouts.

TLB (n)~ A table used in a virtual memory system that lists the physical address page number associated with each virtual address page number. A TLB is used in conjunction with a cache whose tags are based on virtual addresses. The virtual address is presented simultaneously to the TLB and to the cache so that cache access and virtual-to-physical address translation can occur simultaneously.

TLD (n)~ In the Internet and other networks, the highest subdivision of a domain name in a network address, which identifies the type of entity owning the address (for example, .com for commercial users or .edu for educational institutions) or the geographical location of the address (for example, .fr for France or .sg for Singapore). The domain is the last part of the address (for example, www.acm.org).

TLD ~ (Top Level Domain). The part of an internet address between the last . and the end of the address, excluding the path/address of a specific page if present. TLDs include .com, .org, .net, and all the national domains such as .uk for the UK and .fr for France. See also- domain,- registrar,- How web addresses work.

TLS (n)~ A protocol that provides communications privacy and security between two applications communicating over a network. TLS encrypts communications and enables clients to authenticate servers and, optionally, servers to authenticate clients. TLS is a

more secure version of the Secure Sockets Layer (SSL) protocol.

TLS authentication (n)~ Authentication by using the Transport Layer Security (TLS) protocol.

TLS encryption (n)~ A generic security protocol similar to Secure Sockets Layer (SSL), used with Simple Mail Transfer Protocol (SMTP).

TLV (n)~ A method of organizing data that involves a Type code (16 bit), a specified length of a Value field (16 bit), and the data in the Value field (variable).

TM (n)~ A storage area that shows the association between text segments in a source language and their translations into one or more target languages.

To box (n)~ A text box where someone enters the e-mail addresses of the primary recipients of an e-mail message.

to complete performance index (n)~ The ratio of the work remaining to be done to funds remaining to be spent, as of the status date [BAC - BCWP]/[BAC - ACWP]. A TCPI value greater than one indicates a need for increased performance; less than one indicates performance can decrease.

To Do (n)~ A task on a To Do list in a Works project.

To Do List (n)~ A list of To Do items associated with a particular project.

To line (n)~ The part of a message header that contains the e-mail addresses of the primary recipients of an e-mail message.

toast (n)~ A transient message that contains relevant, time-sensitive information and that provides quick access to the subject of that content in an app.

toast notification (n)~ A transient message that contains relevant, time-sensitive information and that provides quick access to the subject of that content in an app.

Tobacco (n)~ A content descriptor developed by Microsoft.

Tobacco Reference (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

TOC (n)~ The listing of contents at the beginning of a document or file.

Today (PN)~ The title of the window in which the Windows Live Messenger Today page is displayed.

Today page (n)~ A customizable page that launches with Windows Live Messenger and features a summary of news and weather, allows a customer to preview their Windows Live Mail inbox and search the Internet.

to-do (adj)~ Pertaining to tasks that need to be done.

to-do (n)~ A pending task.

To-Do Bar (n)~ An area within the Outlook application window that can be enabled to show an overview of the user's schedule, tasks and frequent contacts.

to-do list (n)~ A list of tasks that are not associated with a project schedule.

toggle (adj)~ Pertaining to an electronic device with two states or a program option that can be turned on or off using the same action, such as a mouse click.

toggle button (n)~ A button control within a graphical user interface that when clicked remains down' (appearing to be pressed) until it is clicked again. It can display either text or a picture

toggle flag (PN)~ A menu option to change the flag status of an email.

toggle key (n)~ A keyboard key that alternates between turning a particular operation,

function, or mode on or off.

Toggle Keys (PN)~ A feature that sets your keyboard to beep when one of the locking keys (CAPS LOCK, NUM LOCK, or SCROLL LOCK) is turned on or off.

toggle screen (v)~ In Windows Media Player Mobile, an optional setting that enables the user to toggle the device's display on and off. This is useful, for example, when the user is playing music using Windows Media Player on a mobile device and wants to conserve battery life. When the display is toggled off, pressing any key will turn the display back on.

token (n)~ Any nonreducible textual element in data that is being parsed. For example, the use in a program of a variable name, a reserved word, or an operator. Storing tokens as short codes shortens program files and speeds execution.

token (n)~ For networking, a unique structure or message that circulates continuously among the nodes of a token ring and describes the current state of the network. Before any node can send a message on the network, it must first wait to control the token.

token (n)~ The unique, 25-character code on a prepaid card that adds computer use time to your prepaid computer or that pays for your subscription.

token ~ Frame that contains control information. Possession of the token allows a network device to transmit data onto the network.

token ~ The basic syntactic unit of a computing language.

token ~ The basic textual units that are indexed by enterprise search.

token decrypting certificate (n)~ A standard X509 certificate that is used to decrypt any incoming token.

token signing certificate (n)~ An X509 certificate whose associated public/private key pair is used by federation servers to digitally sign all security tokens that they produce.

token subscription (n)~ A subscription that can only be paid with a prepaid card.

token-based activation (n)~ A specialized activation option available for approved Microsoft Volume Licensing customers that enables customers to use public key infrastructure (PKI) and digital certificates (or -€œtokens,-€? typically stored on smart cards) to activate Windows Vista Enterprise and Windows Server 2008 SP2 locally without contacting either customer-hosted KMS or the Microsoft-hosted activation service using MAK.

tokencode (n)~ The code used to activate a token.

tokenization (n)~ In text mining or Full-Text Search, the process of identifying meaningful units within strings, either at word boundaries, morphemes, or stems, so that related tokens can be grouped. For example, although San Francisco' is two words

token-signing certificate (n)~ An X509 certificate whose associated public/private key pair is used by federation servers to digitally sign all security tokens that they produce.

toll (n)~ The toll phone number for the conferencing service. In the Options dialog box, on the Account tab, this is one of the conferencing information settings needed for a user to join a conference.

toll-free (n)~ The toll-free phone number for the conferencing service. In the Options dialog box, on the Account tab, this is one of the conferencing information settings needed for a user to join a conference.

tombstone (n)~ When an app on Windows Phone is deactivated, a record that is kept by

the operating system about which screen the user was on.

toning (n)~ The process of applying a certain color overlay to an image. For example, a sepia-toned picture.

Toning Hue (n)~ A control that lets a user adjust the color of the tone they wish to apply to their B&W image.

Toning Intensity (n)~ A control that lets a user adjust the intensity of the color overlay that is applied to their B&W image, thereby giving it a tone.

tool (n)~ A utility or feature that aids in accomplishing a task or set of tasks.

tool pane (n)~ A task pane on a Web Part Page used to browse, search for, and import Web Parts from Web Part galleries, and to modify custom and common Web Part properties.

tool part (n)~ A control in the tool pane that allows users to set properties, execute commands, invoke wizards, and manipulate Web Parts on a Web Part Page.

tool window (oth)~ A child window of the Visual Studio Integrated Development Environment (IDE) used to display information.

toolbar (n)~ A row, column, or block of buttons or icons, usually displayed across the top of the screen, that represent tasks or commands within the program. The toolbar buttons provide shortcuts to common tasks frequently accessed from the menus.

toolbar (n)~ A horizontal grouping of actions that apply to the container (or containers) with which the toolbar is associated. For example, a container in which mail is viewed might have an action toolbar with options that include Reply, Delete, and Move to.

Toolbar ~ An extra set of controls that can be added to many programs or the operating system, to provide extra functionality not present in the standard version. A toolbar often comes free with downloaded software and is intended to tie you to one company's products, especially internet search.

toolbar button (n)~ A command button used in a toolbar (or status bar).

toolbar control (n)~ A standard Windows control designed with the same characteristics as the toolbar.

toolbar edit box button (n)~ The commands for the ribbon appear as a drop down menu that appears when the user clicks the default button.

toolbox (n)~ A bundle of software, services, marketing materials, etc., bundled together and meant to be used together.

Toolbox (PN)~ A feature that provides a home for the Office Scrapbook, Compatibility Report, Project Palette and Reference Pane and is shown as a floating palette.

toolbox (n)~ A set of controls, drawing tools, and manipulation tools that can be used to add and modify visual elements in your document.

toolchain (n)~ A collection of programming tools used in a serial manner used for developing applications and operating systems.

toolkit (n)~ A bundle of software, services, marketing materials, etc., bundled together and meant to be used together.

Tools (PN)~ An app category that offers useful tools to extend the capabilities of Windows.

tools + productivity (PN)~ An app category that augments or enhances the standard phone experience.

Tools for Maintaining Store apps (n)~ The tools which enable you to service your Store applications.

Tools for Maintaining Store apps for Windows 8 (n)~ The tools which enable you to service the Windows 8 version of Store applications.

tooltip (n)~ A small pop-up window that provides a brief note or label pertaining to the item or control being pointed to.

tooltip (n)~ Text displayed in BizTalk Mapper for those schema nodes that are hidden partially or completely from the current alignment in the grid view.

Top albums (PN)~ The collection title for music albums that are in the top N% of sales/plays.

top app bar (n)~ An app bar that appears along the top edge of the screen and may include app commands or navigation.

Top artists (PN)~ The collection title for musical artists that are in the top N% of sales/plays.

Top charts (PN)~ The section of the Store that includes the top apps, games, movies, and TV charts (Free, Paid, New and rising, Grossing, and Best rated).

Top free (PN)~ The category of the top items (apps or games) that are free at any point in time.

Top Free Apps (PN)~ The category of the top items (apps or games) that are free at any point in time.

Top free apps (PN)~ The category of the top items (apps or games) that are free at any point in time.

Top Free Games (PN)~ The category of the top items (apps or games) that are free at any point in time.

Top free games (PN)~ The category of the top items (apps or games) that are free at any point in time.

Top grossing (PN)~ The category of paid items (apps or games) that are in the top of gross sales over their lifetime.

Top grossing apps (PN)~ The category of paid items (apps or games) that are in the top of gross sales over their lifetime.

Top grossing games (PN)~ The category of paid items (apps or games) that are in the top of gross sales over their lifetime.

Top movie rentals (PN)~ The collection title for movies that are in the top N% of rentals.

Top music (PN)~ The collection title for music items that are in the top N% of sales/plays.

Top paid (PN)~ The category of the top items (apps or games) that are not free at any point in time.

Top Paid Apps (PN)~ The category of the top items (apps or games) that are not free at any point in time.

Top paid apps (PN)~ The category of the top items (apps or games) that are not free at any point in time.

Top Paid Games (PN)~ The category of the top items (apps or games) that are not free at any point in time.

Top paid games (PN)~ The category of the top items (apps or games) that are not free at any point in time.

top playlists (n)~ The most played music playlists.

Top rated (PN)~ The collection title for items that are in the top N% of ratings.

top rating (n)~ In most cases, the highest rating that you can assign to a file, e.g. a five-star rating'.'

Top rentals (PN)~ The collection title for movies or TV episodes that are in the top N% of rentals.

top result (n)~ The search result that is most relevant to a user.

top results (n)~ An arrangement of search results ordered by relevance using a special search algorithm.

Top selling (PN)~ The collection title for items that are in the top N% of sales.

top songs (n)~ The most played songs in Xbox Music Store.

Top songs (PN)~ The collection title for music songs that are in the top N% of sales/plays.

Top TV (PN)~ The category that includes the most popular TV shows in the Video Store.

Top-fold card (n)~ One of the page size options available in Publisher for printing a folded card. This option prints four pages per sheet of paper, with fold on top.

topic (n)~ The subject of a dynamic data exchange (DDE) conversation between two applications.

topic (n)~ Someone or something that people talk or write about.

topic (n)~ An Azure Service Bus messaging entity that provides a one-to-many form of communication in a publish pattern. Messages are published to a topic and are then made available to recipients that have subscribed to that topic.

Topic Assistant (n)~ A tool used to categorize content into areas automatically.

topic branch (n)~ In the Git context, a diversion from the main line of development to work without messing with that main line.

topic category (n)~ A group of related search topics.

topic feeds (n)~ Feeds that provide information and notifications based on the persistent chat room that you are following.

top-level domain (n)~ In the Internet and other networks, the highest subdivision of a domain name in a network address, which identifies the type of entity owning the address (for example, .com for commercial users or .edu for educational institutions) or the geographical location of the address (for example, .fr for France or .sg for Singapore). The domain is the last part of the address (for example, www.acm.org).

top-level folder (n)~ The uppermost directory on a computer, partition or volume.

top-level property grid (n)~ A property grid that only displays the properties that appear in the sentence-level view of an action.

top-level site (n)~ A Web site at the top of the hierarchy in a site collection, from which you can manage site collection features.

top-level Web site (n)~ The default, top-level site provided by a Web server or virtual server. To gain access to the top-level Web site, you supply the URL of the server without specifying a page name or subsite.

top-level window (n)~ A window that has no parent, or whose parent is the desktop. Top-level windows are typically used as the primary window in an application.

topology (n)~ In Active Directory replication, the set of connections that domain controllers use to replicate information among themselves.

topology (n)~ The physical layout of computers, cables, switches, routers, and other components of a network.

topology (n)~ The order in which changes are propagated from replica to replica. Topology determines how quickly changes in another replica appear in your replica.

Topology Builder (PN)~ An installation component of Lync Server used to display, adjust, and validate a planned topology.

Top-rated movies (PN)~ The collection title for movies that are in the top N% of ratings.

to-production bin (n)~ The stage bin where picked components are placed before consumption.

Top-selling movies (PN)~ The collection title for movies that are in the top N% of sales.

Torrent ~ A method of making data available for download over the internet, where the recipient of data is expected to make the data available to others for download from their PC, rather than all users downloading from a central server. Typically much of the data is bootleg software, audio and video. Because the data is distributed from multiple computers all over the place rather than a central point, it is difficult to police.

Torrent ~ A method of making data available for download over the internet, where the recipient of data is expected to make the data available to others for download from their PC, rather than all users downloading from a central server.

total (n)~ The whole sum, quantity, amount, or aggregate.

total cost of ownership (n)~ Specifically, the cost of owning, operating, and maintaining a single PC; more generally, the cost to businesses and organizations of setting up and maintaining complex and far-reaching networked computer systems. Total cost of ownership includes the up-front costs of hardware and software added to later costs of installation, personnel training, technical support, upgrades, and repairs. Industry initiatives designed to lower the total cost of ownership include centralized network management and administration, as well as hardware solutions in the form of network-based computers with or without local storage and expansion capability.

total field (n)~ A field that summarizes data from the underlying record source. A total field might use a summary function, such as Sum or Count, or use an expression to calculate summary values.

total price variance (n)~ The sum of line price variance amounts for a vendor invoice when compared with related purchase order lines.

Total Quality Management diagram (n)~ A flowchart used to compare current and ideal processes, and to understand how the steps in a process work together.

total row (n)~ A special row in a list or table that provides a selection of aggregate functions useful for working with numerical data.

total slack (n)~ The amount of time that a task can slip before it delays the project.

total time (oth)~ The time that is elapsed between the time a function starts execution until the time it terminates execution. This is the sum of this function's internal processing time and all its callees total time.

totals query (n)~ A query that displays a summary calculation, such as an average or sum, for values in various fields from a table or tables. A totals query is not a separate kind of query; rather, it extends the flexibility of select queries.

totals row (n)~ A special row in a list or table that provides a selection of aggregate

functions useful for working with numerical data.

touch (n)~ A feature that enables users to provide input through the screen by using a finger or a pen.

touch and hold (v)~ To tap a device screen and hold one's finger or stylus in place.

Touch Design (n)~ A feature that creates new and improved mobile browser views. Documents are displayed as big touchable tiles on the screen. Users can view their own documents, shared documents, or ones they follow. They can open documents or share the URL of a document with other users. Additionally, users can navigate to Mail, Calendar, People, and Sites to view sites that they follow and those promoted by their site administrator.

touch DOM event (n)~ A touch event for the Web and Windows Web applications. Web developers use touch DOM events to enable touch.

touch flick (n)~ A gesture you can make with a flick of your finger to quickly navigate and perform shortcuts.

Touch Improvements (n)~ A utility that allows the user to modify aspects of the UI to facilitate use of a touch-screen Tablet PC. All settings controlled by the utility are either changed as a group to improve the touch-screen Tablet PC experience or they are returned to their default states.

Touch Injection API (PN)~ A native API for touch that allows a desktop app to send touch input to the screen (it already exists for mouse and keyboard). It simulates touch by sending messages that look like touch messages. It can be used to automate testing of a Windows Store app (larger company), and is used to support a class of devices.

Touch Interaction Engine (PN)~ The engine that detects and decides what a gesture (tap, pinch, zoom) means.

touch keyboard (n)~ A soft keyboard that is displayed with a different set of settings by default (larger buttons, bigger size, etc.) when you launch the Tablet PC Input Panel with touch. This is to facilitate touch input.

touch keyboard (n)~ A contiguous on-screen keyboard.

touch pad (n)~ A variety of graphics tablet that uses pressure sensors, rather than the electromagnetics used in more expensive high-resolution tablets, to track the position of a device on its surface.

touch pointer (n)~ A tool for accessing right-click menus and targeting small pieces of the interface using touch input.

touch prediction (n)~ A Windows 8 feature that compensates for hardware that doesn't perform to expectations. It anticipates a user's intent for panning and predicts the path.

touch screen (n)~ A touch-sensitive screen on your device that can recognize the location of a touch (of a fingertip or stylus, for example) on its surface and translate that touch into a desired action (such as opening an item or moving the cursor).

touch selection (n)~ Selecting images and/or text by tapping.

touch selection handle (n)~ A handle that enables touch selection scenarios that are not possible or are difficult to accomplish with standard touch gestures alone.

touch targeting (n)~ Using the touch of your finger to guess your intended target instead of the actual target.

touch training (n)~ A feature that helps improve the recognition of a user's touch flicks

by a process in which the user's touch flicks are analyzed.

touchpad (n)~ A variety of graphics tablet that uses pressure sensors, rather than the electromagnetics used in more expensive high-resolution tablets, to track the position of a device on its surface.

Touchpad ~ A pressure-sensitive pad which replaces the- mouse- on mostlaptop- and- netbook- computers.

touchscreen (n)~ A touch-sensitive screen on your device that can recognize the location of a touch (of a fingertip or stylus, for example) on its surface and translate that touch into a desired action (such as opening an item or moving the cursor).

Touchscreen ~ A computer screen which is touch-sensitive, used to controltablet- computers and most- smartphones. They are also widely used for specialised applications such as supermarket self checkouts and public information devices.

touchtone (n)~ A form of dialing that uses multiple-tone signaling. The user hears a series of tones (beeps) when dialing.

touchtone command (n)~ A command transmitted by touching buttons on a digital keyboard which transmits tones for each key press.

touchtone dialing (n)~ A form of dialing that uses multiple-tone signaling. The user hears a series of tones (beeps) when dialing.

touchtone interface (n)~ An interface that is used to navigate the menus of a Unified Messaging (UM) system using DTMF or touchtone inputs.

TP (oth)~ A processing method in which transactions are executed immediately after they are received by the system.

TPD (PN)~ A policy that allows for one AD RMS cluster to issue use licenses against publishing licenses that were issued by a different AD RMS cluster.

TPH (n)~ A method of modeling a type hierarchy in a database that includes the attributes of all the types in the hierarchy in one table.

TPL (n)~ A set of public types and APIs in the System.Threading and System.Threading.Tasks namespaces in the .NET Framework version 4 and above. The purpose of the TPL is to make developers more productive by simplifying the process of adding parallelism and concurrency to applications.

TPM (n)~ Microchip designed to provide certain basic security-related functions to the software that utilizes TPM.

TPM (n)~ Security hardware that provides a hardware-based root of trust and can be leveraged to provide a variety of cryptographic services, such as early-boot component checking.

TPM Initialization Wizard (n)~ A wizard that initializes a trusted platform module (TPM) hardware.

TPT (n)~ A method of modeling a type hierarchy in a database that uses multiple tables with one-to-one relationships to model the various types.

TQM diagram (n)~ A flowchart used to compare current and ideal processes, and to understand how the steps in a process work together.

trace (v)~ To execute a program in such a way that the sequence of statements being executed can be observed.

trace (v)~ To track an inventory dimension to show its related receipts and issues.

trace (n)~ A collection of events and data returned by the Database Engine.

trace consumer (n)~ An application that formats and displays trace messages.

trace controller (n)~ An application that enables tracing and connects the trace provider with the trace consumer.

trace definition (n)~ A statement that defines a trace.

trace dependency (n)~ A kind of dependency that indicates a historical relationship between two elements that represent the same concept at different semantic levels or from different points of view.

trace file (n)~ A file containing records of activities of a specified object, such as an application, operating system, or network. A trace file can include calls made to APIs, the activities of APIs, the activities of communication links and internal flows, and other information.

trace log (n)~ The file that contains the information gathered during trace logging.

trace logging (n)~ A means of capturing highly detailed information about the PerformancePoint Server system when problems occur.

trace message (n)~ A message that includes the current status of various COM+ activities, such as startup and shutdown.

tracepoint (n)~ A breakpoint with a custom action associated with it. When a tracepoint is hit, the debugger performs the specified tracepoint action instead of, or in addition to, breaking program execution.

tracer arrow (n)~ An arrow that shows the relationship between the active cell and its related cells. Tracer arrows are blue when pointing from a cell that provides data to another cell, and red if a cell contains an error value, such as #DIV/0!.

tracer token (n)~ A performance monitoring tool available for transactional replication. A token (a small amount of data) is sent through the replication system to measure the amount of time it takes for transactions to reach the Distributor and Subscribers.

traceroute ~ Program available on many systems that traces the path a packet takes to a desti-

traceroute ~ nation. It is used mostly to debug routing problems between hosts. A traceroute protocol is also defined in RFC 1393.

tracing (n)~ The process of capturing and displaying debugging information about a Web page as the page is running. Tracing information includes HTTP headers and control state. You can display trace output in the page or in a separate trace viewer.

tracing ID (n)~ A unique ID that identifies the session instance in which the specified error occurred. IDs are stored in trace logs.

tracing image (n)~ A prototype image used as a mockup for a Web page design.

Tracing Service (PN)~ A service responsible for writing diagnostic logging and usage logging information from SharePoint applications to log files on disk.

track (n)~ An individual song or other discrete piece of audio content.

track (v)~ To follow the flow of information; to monitor progress.

track (n)~ In a Smooth Streaming presentation, a contiguous set of chunks encoded at a specific bit rate and stored in a media container format (also called a wire format'). For Smooth Streams encoded for Silverlight-based clients

trackback (n)~ A notification sent from one blog to another. It is a way for bloggers to let

each other know when one of them has made a reference to another's blog entry.

tracking (n)~ The process of viewing and updating the actual progress of tasks so that you can see progress across time, evaluate slippage of tasks, compare scheduled or baseline data to actual data, and check the completion percentage of tasks and your project.

tracking code (n)~ A piece of HTML code in a Web site that places a cookie on visitors' systems to keep track of their actions and movements within a site.

Tracking Columns (n)~ An option under the Columns heading on the Report window. When expanded, this option enables the user to select columns that contain tracking information such as Created By' and 'Modified On'.'

tracking dimension (n)~ The batch number and serial number attributes that are used to track an item.

tracking participant (n)~ A software component that consumes tracking records emitted by the Windows Workflow Foundation (WF) runtime. Tracking participant implementations can send records to a storage location such as a log file or a database.

tracking profile (n)~ A set of characteristics that define a business-related process and contains the mapping between a specific orchestration and activity definition. A tracking profile is a file with a .btt extension.

tracking profile (n)~ Configuration data that is used to subscribe to specific tracking records that can be emitted by the Windows Workflow Foundation (WF) runtime.

Tracking Protection (PN)~ The feature that blocks third-party web content that could potentially track someone's web activity.

tracking record (n)~ Data emitted by the Windows Workflow Foundation (WF) runtime when certain milestones are reached within a workflow instance, for example, when an instance or activity is completed.

trade discount (n)~ A discount that does not depend on prompt payment.

TRADE MARK SIGN (n)~ The symbol or character used to indicate that a word, phrase, symbol, or design is a trademark, but not a registered trademark.

trademark symbol (n)~ The symbol or character used to indicate that a word, phrase, symbol, or design is a trademark, but not a registered trademark.

trade-off matrix (n)~ A tool for managing project trade-offs by portraying them in a matrix that reflects the three project variables (presented on the y axis) in the context of three decisions (presented on the x axis). The project variables are resources (people and money), schedule (time), and features (the product and its quality). These variables are sometimes presented as the trade-off triangle. The three decisions are whether to optimize, constrain, or accept a given variable. A change to one of the project variables requires that the team make a correction on one of the three sides to maintain project balance, including potentially the same side on which the change first occurred. For example, a decision to add a feature to a product may require that other features be removed if sufficient time and resources are unavailable to support their development.

Tradeshow Planning, Execution and Wrap-Up (n)~ A template used to help in planning for tradeshows.

trading partner (n)~ An external or internal organization with which your oganization exchanges electronic data. For example, a trading partner could be a supplier, a customer, or an internal department.

trading partner agreement (n)~ A definitive and binding agreement between two trading partners for transacting messages over a specific business-to-business protocol. A trading partner agreement brings together common bi-directional message processing properties from specific business profiles of both partners. It is a comprehensive collection of all aspects governing the business transaction between the two trading partners. The trading partner agreement is typically derived from the profiles of each partner, with the ability to customize and override the required settings.

trading party (n)~ An entity that is at the root level of a trading partner management (TPM) solution. Each participating organization in an ongoing business relationship, and any single business entity that is running BizTalk Server and sending or receiving messages to or from any other party, is a trading party.

trading relationship (n)~ A relationship that is formed when a buying party and a selling party enter into an agreement.

traffic (n)~ The number of visits to a website, or the amount of user activity on a website or on a network.

traffic ~ The messages or calls that flow through the circuits or equipment on a communications network. The four Switched Access capacity traffic types are originating, terminating, voice data and SwitchNet 56.

Traffic Manager (PN)~ The networking service in Microsoft Azure that load-balances incoming traffic across multiple Microsoft Azure cloud services.

trail (n)~ A line drawn by a user with his free hand.

trail byte (n)~ The byte value that is the second half of a double-byte character.

Trailer (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 70.

trailer (n)~ A video that plays after the main video ends.

trailer clip (n)~ A video that plays after the main video ends.

trailer video (n)~ A video that plays after the main video ends.

trailers (n)~ An advertisement or a commercial for a feature film that will be exhibited in the future at a cinema.

trailing (adj)~ Pertaining to an item that follows or comes after another.

trailing clip (n)~ A video that plays after the main video ends.

trailing video (n)~ A video that plays after the main video ends.

train (v)~ To populate a model with data to derive patterns that can be used in prediction or knowledge discovery.

training (n)~ The process of teaching the speech recognition engine to recognize your voice and manner of speaking. The speech engine looks for patterns in the way you speak, enabling it to provide better accuracy when you dictate text. You train the engine by reading text in the training wizard, and continue to train the engine as you dictate text while working.

training data set (n)~ A set of known and predictable data used to train a data mining model.

training experiment (n)~ The components to create and test a predictive analytics model based on historical data.

trait (n)~ An attribute that describes an entity.

Trance (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 31.

transacted pipeline (n)~ A pipeline that supports COM+ transactions. MtsTxPipeline and PooledTxPipeline are the only objects that support transactions. If any component in a transacted pipeline fails, the work of the preceding components in the pipeline is undone and the object ends the transaction.

transaction (n)~ The pairing of two or more actions that are performed together as a single action; the action succeeds or fails as a whole.

transaction (n)~ An event or condition that is recorded in asset, liability, expense, revenue, and/or equity accounts. Sales to customers or purchases from vendors are examples of transactions.

transaction (n)~ A social economic exchange action.

transaction (n)~ A physical economic exchange action.

transaction (n)~ A data manipulation action processed by a database.

transaction (n)~ The posting or registration of a change on a document or a journal line.

transaction currency unit (n)~ A currency unit that a party accepts for payment.

transaction data (n)~ Entities that document economic, resource flow, and accounting events and record their financial, legal, and operational consequences.

transaction history (n)~ A record of data transfers between the user's computer and the server.

transaction isolation level (n)~ The property of a transaction that controls the degree to which data is isolated for use by one process, and is guarded against interference from other processes.

transaction log (n)~ A file that records transactional changes occurring in a database, providing a basis for updating a master file and establishing an audit trail.

transaction log file (n)~ A file that contains a record of the changes that were made to an Exchange database. All changes to the database are recorded in the transaction log files before they are written into the database files. If a database shuts down unexpectedly, unfinished transactions can be restored by replaying the transaction log files into the database.

transaction manager (n)~ A service that coordinates transactions.

transaction number (n)~ The 32-character number assigned to each new computer use time transfer between the prepaid card and the server.

transaction processing (n)~ A processing method in which transactions are executed immediately after they are received by the system.

transaction retention period (n)~ In transactional replication, the amount of time transactions are stored in the distribution database.

transaction rollback (n)~ Rollback of a user-specified transaction to the last savepoint inside a transaction or to the beginning of a transaction.

transaction service (n)~ A program that enables real-time, synchronous communication between the POS, the store database, and the head office database.

transaction text (n)~ A description for a journal line. Transaction text stays with the

journal line until an event causes new transaction text to be added, such as when the transaction is settled.

transaction threshold (n)~ The maximum limit of a transaction value, up to which a tax on the transaction value is not calculated.

transaction value (n)~ The value assigned to a financial exchange, such as the cost of an expense or an amount of income.

transactional (adj)~ Pertaining to a type of license or seat that is purchased at a slight discount as part of a volume license agreement but is limited to a period of time that is less than the term of that agreement, usually to support short term temporary, contingency, or seasonal workers.

transactional dead-letter queue (n)~ For Message Queuing, a queue that stores transactional messages that cannot reach their destination queue. Transactional dead-letter queues store failed messages on the computer on which the message expired. Messages in these queues are written to disk and are therefore recoverable.

transactional message (n)~ For Message Queuing, a message that can be sent and received only from within a transaction. This type of message returns to its prior state when a transaction is terminated abruptly. A transactional message is removed from a queue only when the transaction is committed; otherwise, it remains in the queue and can be subsequently read during another transaction.

transactional messaging (n)~ A stream of messages sent in order exactly once, achieved by synchronizing and coordinating multiple BizTalk message queuing adapter instances in a group.

transactional replication (n)~ A type of replication that typically starts with a snapshot of the publication database objects and data.

Transact-SQL (PN)~ The language containing the commands used to administer instances of SQL Server, create and manage all objects in an instance of SQL Server, and to insert, retrieve, modify and delete all data in SQL Server tables. Transact-SQL is an extension of the language defined in the SQL standards published by the International Standards Organization (ISO) and the American National Standards Institute (ANSI).

Transact-SQL Compiler Service (PN)~ A component based on the Microsoft SQL Server Database Engine that can validate the syntax and semantics of DDL statements with the same fidelity as a Microsoft SQL Server Database engine.

transcode (v)~ To convert a media file from one format to another, generally by decoding and then re-encoding the file.

transcoding (n)~ The process of converting a media file or format from one digital format to another.

Transcriber (PN)~ A full-screen handwriting recognition method that allows writing words and sentences by hand'. The text can also be converted to typed text.'

transcript (n)~ The collection of entries from a chat session.

transfer (v)~ To move data from one location to another.

transfer (n)~ The movement of information from one location to another, either within a computer (as from a disk drive to memory), between a computer and an external device (as between a file server and a computer on a network), or between separate computers.

transfer (n)~ The act of sending the current phone call to a third person.

Transfer (PN)~ A menu item that transfers the current phone call without the user remaining on the line to announce the call.

transfer appearance (n)~ The visual feedback displayed during a transfer operation.

transfer batch (n)~ The quantity of one or more items that is transferred or that can be transferred.

transfer call (oth)~ To pass an incoming call to another Skype contact or any phone.

transfer log (n)~ A log, located on the DPM server, that stores pending changes to a replica.

Transfer Now (oth)~ The button on Phone Controls that transfers the current phone call.

transfer order (n)~ A request to move items between warehouses. A transfer order keeps track of the items shipped out of one warehouse and received into another warehouse.

transfer order line (n)~ The part of a transfer order that specifies detailed information about a request to transfer a specific item to a different warehouse.

transfer price (n)~ The price charged for goods or services provided by one unit of a company to another unit in the same company.

transfer rate (n)~ The rate at which a circuit or a communications channel transfers information from source to destination, as over a network or to and from a disk drive. Transfer rate is measured in units of information per unit of time — for example, bits per second or characters per second — and can be measured either as a raw rate, which is the maximum transfer speed, or as an average rate, which includes gaps between blocks of data as part of the transmission time.

Transfer Settings area (n)~ The area on the Organizations page that can replicate and apply the settings and rules to other domains, after one domain is created, for faster and easier setup of domains.

transform (n)~ A template of the differences between two installer databases that can be applied to produce similar changes in other databases.

transform (v)~ To change the appearance or format of data without altering its content; that is, to encode information according to predefined rules.

transform (v)~ In mathematics and computer graphics, to alter the position, size, or nature of an object by moving it to another location (translation), making it larger or smaller (scaling), turning it (rotation), changing its description from one type of coordinate system to another, and so on.

transform file (n)~ A template of the differences between two installer databases that can be applied to produce similar changes in other databases.

Transform Parse (PN)~ A system job that parses a transformation used in data migration.

transformation (n)~ The process of converting an XML document that conforms to one schema into an XML document that conforms to another schema, often changing the document structure in the process.

transformation (n)~ The process of transforming objects in a 2-D plane. Transformations include rotation, scale, skew or shear, flip, and translation.

transformation (n)~ The SSIS data flow component that modifies, summarizes, and cleans data.

transformation input (n)~ Data that is contained in a column, which is used duing a join or lookup process, to modify or aggregate data in the table to which it is joined.

transformation output (n)~ Data that is returned as a result of a transformation procedure.

transit (n)~ Local public transportation; the vehicles used for such transport.

transit engine (n)~ An engine that calculates the number of days that it will take for shipped freight to get from its origin point to its destination point.

transit warehouse (n)~ An intermediate location between a from' warehouse and a 'to' warehouse for warehouse transfers. Items in a transit warehouse are in the process of being transferred to a different warehouse (transfer order) and therefore cannot be picked for other orders during transportation.'

transition (n)~ An animation effect that specifies how the display changes as a user moves from one item (such as a slide or Web page) to another.

transition (n)~ An allowed path from one state to another.

transition (n)~ In a statechart or activity diagram, a relationship between two states or action states or between a state and itself.

transition (n)~ A move from one license, product, or license model to another. Some examples of transitions are: a step-up to a higher edition; a move from on-premises to the cloud, or cloud to on-premises; or a move to or from a license model that is a hybrid of an online service and an on-premises product.

transition effect (n)~ An animation effect that specifies how the display changes as a user moves from one item (such as a slide or Web page) to another.

transition event (n)~ A change in the location of processor event execution between ring 3 (user mode) and ring 0 (kernel mode). Transition events represent time spent outside the direct execution of the application code. Transition events can be time spent in threads that are not part of the profiled item, or time spent executing calls from the profiled item to the operating system.

transition point (n)~ The start or endpoint of a transition segment.

transition style (n)~ An abstract grouping of similar transition effects.

transition to history (n)~ An incoming transition segment that ends on an outer state context and does not have a continuing transition segment within the context.

transitive trust (n)~ The standard type of trust relationship between Windows domains in a domain tree or forest. When a domain joins an existing forest or domain tree, a transitive trust is automatically established. Transitive trusts are always two-way relationships. This series of trusts, between parent and child domains in a domain tree and between root domains of domain trees in a forest, allows all domains in a forest to trust each other for the purposes of authentication. For example, if domain A trusts domain B and domain B trusts domain C, then domain A trusts domain C.

translate (v)~ To move an object in the 2D x-y coordinate system.

translation (n)~ The transfer of concepts from a source language text into a target language.

translation (n)~ The process of moving an object in the 2D x-y coordinate system.

translation lookaside buffer (n)~ A table used in a virtual memory system that lists the physical address page number associated with each virtual address page number. A TLB is used in conjunction with a cache whose tags are based on virtual addresses. The virtual address is presented simultaneously to the TLB and to the cache so that cache access and

virtual-to-physical address translation can occur simultaneously.

translation matrix (n)~ A matrix that transforms the current graphics path to the desired flattened path.

translation memory (n)~ A storage area that shows the association between text segments in a source language and their translations into one or more target languages.

Translator (PN)~ An app that allows you to use text entry, your voice, or your camera to translate text into different languages using the Microsoft statistical machine translation system.

transliteration (n)~ The process of transcribing letters or words from one alphabet or script to another one (for example, Russian alphabet into Latin alphabet) to facilitate comprehension and pronunciation for non-native speakers.

transmission (n)~ The sending of information over a communications line or a circuit.

Transmission Control Protocol (n)~ The protocol within TCP/IP that governs the breakup of data messages into packets to be sent via IP, and the reassembly and verification of the complete messages from packets received by IP.

Transmission Control Protocol/Internet Protocol (n)~ A set of networking protocols widely used on the Internet that provides communications across interconnected networks of computers with diverse hardware architectures and various operating systems. TCP/IP includes standards for how computers communicate and conventions for connecting networks and routing traffic.

Transmission Level 1 (n)~ A U.S. telephone standard for a transmission facility at digital signal level 1 (DS1) with 1.544 megabits per second in North America and 2.048 megabits per second in Europe. The bit rate is the equivalent bandwidth of approximately twenty-four 56-kilobits-per-second lines. A T1 circuit is capable of serving a minimum of 48 modems at 28.8 kilobits per second or 96 modems at 14.4 kilobits per second. T1 circuits are also used for voice telephone connections. A single T1 line carries 24 telephone connections with 24 telephone numbers. When it is used for voice transmission, a T1 connection must be split into 24 separate circuits.

Transmission Level 3 (n)~ A U.S. telephone standard for a transmission facility at digital signal level 3 (DS3). T3 is equivalent in bandwidth to 28 T1s, and the bit rate is 44.736 megabits per second. T3 is sometimes called a 45-meg circuit.

transmitting station ID string (n)~ A string that specifies the transmitter subscriber ID sent by the fax machine when sending a fax to a receiving machine. This string is usually a combination of the fax or telephone number and the name of the business. It is often the same as the called subscriber ID.

transmogrify (v)~ To move from a lower to a higher edition within an edition family without running through a full upgrade. The transmogrify (aka transmog) process leverages SingleSKU to work.

transparency (n)~ A standard that requires that the structure for processing personal information be in a fashion that is open and understandable to the individual whose data is being processed. It is a goal of the Fair Information Practices, which requires a company to inform users what personal information the company collects and how the data is used.

transparency (n)~ The quality that defines how much light passes through an object's pixels.

transparency (n)~ A security model that helps developers write and deploy secure libraries and applications by isolating code depending on privilege. Level 1 transparency was introduced in the .NET Framework version 2.0. It enables developers to annotate code to declare which types and members can perform security elevations and other trusted actions (security-critical) and which cannot (security-transparent). Level 2 transparency, which was introduced in the .NET Framework 4, refines this model. It adds a third group of code, security-safe-critical code, which are types or members that access secure resources and can be safely used by partially-trusted code in the .NET Framework.

transparent (adj)~ In computer use, of, pertaining to, or characteristic of a device, function, or part of a program that works so smoothly and easily that it is invisible to the user. For example, the ability of one application to use files created by another is transparent if the user encounters no difficulty in opening, reading, or using the second program's files or does not even know the use is occurring.

transparent (adj)~ In computer graphics, of, pertaining to, or characteristic of the lack of color in a particular region of an image so that the background color of the display shows through.

transparent (adj)~ In communications, of, pertaining to, or characteristic of a mode of transmission in which data can include any characters, including device-control characters, without the possibility of misinterpretation by the receiving station. For example, the receiving station will not end a transparent transmission until it receives a character in the data that indicates end of transmission. Thus, there is no danger of the receiving station ending communications prematurely.

transparent caching (n)~ A caching technique that optimizes bandwidth consumption on wide area network (WAN) links and provides near-local read response times for mobile users and branch office workers who are accessing network files and folders that are not explicitly made available offline.

Transparent Data Encryption (PN)~ A technology for real-time I/O encryption and decryption of SQL Server and Azure SQL Database data and log file with a symmetric key without increasing the size of the encrypted database. The database encryption key (DEK) is stored in the database boot record for availability during recovery and is protected with a certificate. TDE is performed at the page level and does not provide encryption across communication channels.

transport (n)~ A mechanism for moving data from one point to another.

transport adapter (n)~ A software component that enables message exchange through a specific transport.

transport address (n)~ The transport-specific identification for the location to which messages are sent or from which messages are received.

transport agreement (n)~ An agreement between the business profiles of two trading partners to use a specific transport protocol (AS2) while exchanging messages.

transport calendar (n)~ The days the carrier can pick up and transport goods.

transport days (n)~ The number of days required by the carrier to pick up and deliver goods.

Transport Driver Interface (PN)~ A common set of routines for network layer components that communicate with the session layer of the Open Systems Interconnection

(OSI) model. These routines allow software components above and below the transport layer to be mixed and matched without reprogramming.

transport event (n)~ An occurrence of a particular message transport activity or phase through the SMTP and NNTP services.

transport layer (n)~ Layer four of the OSI model. The network layer that handles error recognition and recovery. When necessary, it repackages long messages into small packets for transmission and, at the receiving end, rebuilds packets into the original message. The receiving transport layer also sends receipt acknowledgments.

Transport Layer Security (n)~ A protocol that provides communications privacy and security between two applications communicating over a network. TLS encrypts communications and enables clients to authenticate servers and, optionally, servers to authenticate clients. TLS is a more secure version of the Secure Sockets Layer (SSL) protocol.

Transport Layer Security encryption (n)~ A generic security protocol similar to Secure Sockets Layer (SSL), used with Simple Mail Transfer Protocol (SMTP).

transport protocol (n)~ A protocol that governs the transport channel used for sending messages back and forth between two partners. With respect to trading partner management (TPM), only the AS2 protocol is supported.

transport provider (n)~ The driver and support files that provide transport services in a networking environment.

transport rule (n)~ A concept that implements a single function point of a transport messaging policy. A transport rule contains conditions as to when to trigger this rule and an ordered set of actions as to what to do if the rule is triggered. Additionally, each transport rule can have exceptions that specify what to exclude from the condition. Exceptions typically identify a subset of criteria identified in the condition.

transport time (n)~ The amount of time it takes to transfer items between two warehouses.

transportation demand (n)~ A sales order, purchase order, or transfer order that is ready for transportation planning.

transportation party (n)~ An individual or organization involved in the transportation process.

Transporter Command Shell (PN)~ The command line interface packaged with the Microsoft Transporter Suite For Lotus Domino, a bundle of utilities to help migrate from Domino to Exchange 2007.

Transporter Management Console (PN)~ The snap-in for Microsoft Management Console that installs with the Microsoft Transporter Suite.

transpose (v)~ To reverse, as the order of the letters h and t in hte, in correcting the spelling of the; or reversing two wires in a circuit.

transpose (v)~ In mathematics and spreadsheets, to rotate a matrix (a rectangular array of numbers) about a diagonal axis.

trap (v)~ To intercept an action or event before it occurs, usually in order to do something else. Trapping is commonly used by debuggers to allow interruption of program execution at a given spot.

trap (n)~ In Simple Network Management Protocol (SNMP), a message sent by an agent

to a management system indicating that an event has occurred on the host running the agent.

trap (v)~ To create small overlaps where two differently colored objects abut on a printed page.

trap handler (n)~ A body of code in the kernel to which the processor transfers control when an interrupt or exception occurs. The trap handler determines the type of condition that caused the interrupt or exception, and transfers control to an interrupt service routine (ISR) or exception handler.

Trapezoid List (PN)~ A SmartArt graphic layout used to show grouped or related information of equal value. Works well with large amounts of text.

trapping (n)~ In printing, the process of eliminating white lines between colours by printing small areas of overlapping colour where colours touch.

Travel (PN)~ An application for travel planning, including destination photos and panoramas, travel guides, booking tools, currency conversions, and weather forecasts.

Travel (PN)~ An app category that facilitates travel planning or navigation.

travel + navigation (PN)~ An app category that facilitates travel planning or navigation.

TRC (n)~ An algorithm for colour reproduction that maps a set of in-put tones to a set of output tones and is used to control how a device reacts to different light intensities in the visible colour spectrum.

tree (n)~ A data structure containing zero or more nodes that are linked together in a hierarchy. If any nodes are present, one node is the root; each node except the root is the child of one and only one other node, and each node has zero or more nodes as children.

tree ~ A hierarchical collection of nodes that can have an arbitrary number of references to other nodes.

tree ~ A data structure whose elements are linked in a hierarchical fashion.

tree diagram (n)~ A type of block diagram with tree shapes to represent hierarchies, such as family trees or tournament plans.

tree structure (n)~ Any structure that has the essential organizational properties of a tree.

tree view (n)~ A hierarchical representation of the folders, files, disk drives, and other resources connected to a computer or network.

tree view control (n)~ A standard Windows control that allows a set of hierarchically-related objects to be displayed as an expandable outline.

Trello (PN)~ A free web-based project management application.

Trend (PN)~ A general tendency or inclination, typically determined by the examination of a particular attribute over time.

trend alert (n)~ Feature to receive notification if a defined value changes significantly.

trend analysis chart (n)~ A chart that shows the projected trend for a KPI based on analysis of previous data.

trend chart (n)~ A chart that shows the change in data over time.

Trending (PN)~ The category of items (apps or games) that are suggested to users due to their recent popularity.

trendline (n)~ A graphic representation of trends in data series, such as a line sloping upward to represent increased sales over a period of months.

trendline label (n)~ Optional text for a trendline, including either the regression equation

or the R-squared value, or both. A trendline label can be formatted and moved; it cannot be sized.

triage (n)~ The process of prioritizing projects or elements of a project (such as bug fixes) to ensure that available resources are assigned in the most effective, time-efficient, and cost-efficient manner.

triage team (n)~ The team that performs the process of reviewing newly reported or reopened bugs and assign a priority and iteration for working on them.

trial (n)~ A version of a product that can be used at no cost for a limited period of time for purposes of evaluation.

trial balance (n)~ A report that lists the balances of ledger accounts for a specified time period.

trial edition (n)~ A version of a product that can be used (typically at no cost) for a limited period of time for purposes of evaluation.

trial version (n)~ A version of a product that can be used (typically at no cost) for a limited period of time for purposes of evaluation.

triangle cap (n)~ For paths that contain unconnected ends, the end of the stroke that is extended to taper to a point.

triangle strip (n)~ A sequence of triangles in which adjacent triangles share an edge. The first three vertices define the first triangle, and each subsequent vertex defines a new triangle using that point along with two vertices from the previous triangle in the sequence.

triangulation (n)~ The conversion method that converts from one denomination currency to another using the euro (or other triangulation currency) as an intermediate conversion step.

triangulation currency (n)~ A currency that can be used to convert between two other currencies for which there is no direct exchange rate table available. The triangulation currency must have available exchange rates with both of the currencies to be converted. The first currency can be converted into the common (triangulation) currency, and then the common currency can be converted into the second currency.

Tribal (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 72.

trigger (v)~ To activate a function or program, such as the release of a virus payload, in response to a specific event, date, or time.

trigger (n)~ In a database, an action that causes a procedure to be carried out automatically when a user attempts to modify data. A trigger can instruct the database system to take a specific action, depending on the particular change attempted. Incorrect, unwanted, or unauthorized changes can thereby be prevented, helping to maintain the integrity of the database.

trigger (n)~ The mechanism by which a system or application event triggers either an instant or an animated change in one or more properties.

trigger (n)~ An object responsible for firing an action when a condition is met.

Trigger (PN)~ A feature in campaign automation where you can schedule a task or operation based on a response to a previous action.

trigger distance (n)~ For Latin-based languages only, the distance you need to move the stylus to the right of the right edge of the ink for the ink to be immediately converted to text. The trigger distance is used by the handwriting recognition feature to detect that a user has started writing the next word.

trigger event (n)~ The parameters of a Microsoft Dynamics CRM workflow that define the circumstances in which the workflow performs its actions.

triggered update (n)~ A type of Routing Information Protocol (RIP) announcement that occurs when network topology changes. With triggered updates, the update announcing network topology changes is sent almost immediately rather than waiting for the next periodic announcement.

Triggers panel (n)~ A user interface that provides a way to configure the behavior of an object by configuring property changes to occur or animation timelines to run when an event is raised by the object, for example, the Click event for a button.

trim (v)~ To hide parts of a file or clip without deleting them from the original source. Files and clips can be trimmed by adjusting the start or end trim point.

trim (v)~ To preempt a storyboard's control of an animation variable with a higher-priority storyboard. If trimming a storyboard on one or more variables causes the storyboard to end prematurely, it is considered truncated.

trim (n)~ A Direct3D API call that releases temporary memory buffers allocated by the graphics driver on behalf of an app, reducing the app's memory footprint while it is suspended.

trim points (n)~ The points where playback of a file or clip begins and ends. There are two trim points: start trim point and end trim point.

Triple Data Encryption Standard (n)~ An encryption algorithm based on the Data Encryption Standard (DES).

Triple DES (n)~ An encryption algorithm based on the Data Encryption Standard (DES).

Triple Play ~ The combined offering of voice, video, and data over one line.

triplet (n)~ A unique identifier made from three otherwise separate pieces of information. For example, a color can be specified by a red, blue, green triplet. Triplets are the second most common type of ID after single, or unique, IDs.

Trivial File Transfer Protocol (n)~ A formal set of format, timing, sequencing, and error control rules for transferring files to and from a remote computer system running the Trivial File Transfer Protocol (TFTP) service.

Trivial FTP (n)~ A formal set of format, timing, sequencing, and error control rules for transferring files to and from a remote computer system running the Trivial File Transfer Protocol (TFTP) service.

Trojan ~ A program similar to a- virus- which is disguised as something harmless like a game, but when launched actually sabotages the computer on which it is running.

Trojan Horse ~ A computer program is either hidden inside another program or that masquerades as something it is not in order to trick potential users into running it. The term 'Trojan Horse' comes from a possibly mythical ruse of war used by the Greeks sometime between 1500 and 1200 B.C.

Trojan telnet (n)~ A type of trojan malware that installs a telnet server on a user's computer without the user's knowledge.

troubleshooter (n)~ An automated tool that helps find and fix specific problems on your computer.

troubleshooting (n)~ The process of diagnosing and solving problems or difficulties.

troubleshooting performance counter (oth)~ A counter that collects continuously within a 15-minute window. When a .NET exception or performance event occurs, all performance counter data from the 15-minute window leading up to the event are captured and stored.

true sound (PN)~ A feature that increases or decreases the volume of the speaker in a group call to match the position of the speaker (i.e right or left).

TrueType ~ A technology for outline fonts that is built into all Windows and Macintosh operating systems. Outline fonts are scalable enabling a display device to generate a character at any size based on a geometrical description.

TrueType font (n)~ A type of computer font that can be scaled to any size. TrueType fonts are clear and readable in all sizes and can be sent to any printer or other output device that is supported by Windows.

truncate (v)~ To cut off the beginning or end of a series of characters or numbers; specifically, to eliminate one or more of the least significant (typically rightmost) digits. In truncation, numbers are simply eliminated, unlike rounding, in which the rightmost digit might be incremented to preserve accuracy.

truncate (v)~ To preempt a storyboard's control of an animation variable with a higher-priority storyboard. If trimming a storyboard on one or more variables causes the storyboard to end prematurely, it is considered truncated.

trunk ~ A line which runs between two switches or swiching systems which are generally found in Central Offices and/or PBXs.

trunk ~ Individual channels or circuits that can be grouped. This is the smallest denominator for a network facility.

trust (v)~ To have confidence in the reliability of an entity or service and the information that it provides.

trust (n)~ Confidence in the reliability of an entity or service and the information that it provides.

trust anchor (n)~ The public key of the public/private key pair that is used to sign a DNS zone.

Trust Bar (n)~ A notification bar warning the user about data that is blocked in the loaded file. Trust Bars can be for information only (non-actionable) or actionable.

Trust Center (n)~ Part of the Office Center feature that allows users to set various security and privacy options, and to see currently enforced security and privacy rules.

Trust Center (n)~ A website that describes the compliance, security, and privacy features of Microsoft Office 365.

trust chain (n)~ A sequence of certificates, where each certificate in the sequence is signed by the subsequent certificate. The last certificate in the chain is normally a self-signed certificate.

trust level (n)~ A characterization of an external entity based on how it is authenticated and what privileges it has. Trust levels can be associated with entry points, personas, assets, or other protected resources.

trust license (n)~ The file used in ClickOnce applications to grant an elevated level of trust to a managed application. Trust licenses must be signed by trust license issuers, which must be installed on a client computer prior to deploying the ClickOnce application.

trust list (n)~ A signed list of root certification authority certificates that an administrator considers reputable for designated purposes, such as client authentication or secure e-mail.

trust object (n)~ An object representing a trust relationship.

trust relationship (n)~ A logical relationship established between domains to allow pass-through authentication, in which a trusting domain honors the logon authentications of a trusted domain.

TRUSTe (n)~ An independent, non-profit initiative whose mission is to build the trust and confidence of users on the Internet by promoting the TRUSTe principles of fair information practices. Microsoft is a premier sponsor of TRUSTe and a member of the TRUSTe privacy program.

trusted application (n)~ In Silverlight, an out-of-browser application to which a user grants elevated trust upon installation, providing greater access to the local system.

Trusted Boot (PN)~ A customized process that identifies and fixes potential problems during PC startup.

Trusted Computing Group (PN)~ The organization that sets standards for Trusted Platform Module (TPM) use and interface.

trusted connection (n)~ A Windows network connection that can be opened only by users who have been authenticated by the network.

Trusted Documents (PN)~ A feature that allows the user to indicate that a document is trusted, and therefore can be opened without security notifications, so long as the filepath and creation time of the document remain unchanged.

trusted domain (n)~ A domain that is trusted by other domains.

trusted domain (n)~ A domain that is engaged in a trust relationship with another domain, which is also called a federation. This relationship is between two federation servers, and allows a system to provide controlled access to its resources or services to a user that belongs to another security realm without requiring the user to authenticate directly to the system and without the two systems sharing a database of user identities or passwords.

trusted forest (n)~ A forest that is trusted to make authentication statements for security principals in that forest. Assuming forest A trusts forest B, all domains belonging to forest A will trust all domains in forest B, subject to policy configuration.

trusted location (n)~ A folder or file path on your computer or a location on your intranet from which it is safe to run code. Default trusted locations include the Templates, Addins, and Startup folders, and you can specify your own trusted locations.

trusted PC (n)~ A computer that a customer adds to their Windows Live account security information from which they can reset a forgotten password without providing further information.

trusted platform module (n)~ Microchip designed to provide certain basic security-related functions to the software that utilizes TPM.

Trusted Platform Module (PN)~ Security hardware that provides a hardware-based root of trust and can be leveraged to provide a variety of cryptographic services, such as early-

boot component checking.

trusted publisher (n)~ The developer of a macro that is trusted by you on your computer. The trusted publisher is identified by the certificate that they used to digitally sign the macro.

trusted publisher store (n)~ A list of software publisher certificates used to digitally sign code, such as macros. Because you explicitly trust the software publishers, their code is allowed to run on your computer without needing to prompt for permission.

Trusted Publishing Domain (PN)~ A policy that allows for one AD RMS cluster to issue use licenses against publishing licenses that were issued by a different AD RMS cluster.

trusted root CA (n)~ A root certification authority that appears in the Trusted Root Certification Authorities console of the Windows operating systems and is trusted by the operating system.

Trusted Root Certification Authorities (n)~ Implicitly trusted certification authorities. Includes all of the certificates in the Third-Party Root Certification Authorities store plus root certificates from the user organization and Microsoft.

trusted root certification authority (n)~ A root certification authority that appears in the Trusted Root Certification Authorities console of the Windows operating systems and is trusted by the operating system.

trusted root key (n)~ An encryption key used in Configuration Manager to help clients identify valid management points.

trusted source (n)~ The developer of a macro that is trusted by you on your computer. The trusted publisher is identified by the certificate that they used to digitally sign the macro.

trusted zone (n)~ A set of Web sites that are completely trustworthy.

trustworthy website (n)~ A website that is not fraudulent or deceptive.

TRY (n)~ The official currency of Turkey.

Try It (PN)~ The button in Yammer that triggers the OAuth flow.

TS (n)~ A program that enables real-time, synchronous communication between the POS, the store database, and the head office database.

TS session (n)~ A Terminal Services session.

TSF (PN)~ A device-independent, language-neutral, and extensible system that enables natural language services and advanced text input on the desktop and within applications.

TSID string (n)~ A string that specifies the transmitter subscriber ID sent by the fax machine when sending a fax to a receiving machine. This string is usually a combination of the fax or telephone number and the name of the business. It is often the same as the called subscriber ID.

T-SQL (PN)~ The language containing the commands used to administer instances of SQL Server, create and manage all objects in an instance of SQL Server, and to insert, retrieve, modify and delete all data in SQL Server tables. Transact-SQL is an extension of the language defined in the SQL standards published by the International Standards Organization (ISO) and the American National Standards Institute (ANSI).

T-SQL Compiler Service (PN)~ A component based on the Microsoft SQL Server Database Engine that can validate the syntax and semantics of DDL statements with the same fidelity as a Microsoft SQL Server Database engine.

TSQL pane (n)~ One of the tabs that hosts the editor control to allow TSQL code editing.

TSR ~ (Terminate and Stay Resident)- A program, usually loaded automatically on startup, which remains in memory to provide particular functions such as connection to a network or protection against viruses. In Windows TSRs are usually represented by icons in the- System tray, such as the small loudspeaker which represents the volume control for the soundcard. A few TSRs are essential, but many are installed automatically by a particular application just to improve its own performance, with no thought for anything else you may be doing, and may have a negative impact on everything else. Sometimes launched from the- StartUp folder- in the Windows- Start Menu, but often elsewhere as it is too easy to delete them from there.

TTFB (oth)~ Time To First Byte

TTL (n)~ A timer value included in packets sent over TCP/IP-based networks that tells the recipients how long to hold or use the packet or any of its included data before expiring and discarding the packet or data.

TTLB (oth)~ Time To Last Byte

TTS (n)~ Pertaining to technologies for converting textual (ASCII) information into synthetic speech output. Used in voice-processing applications requiring production of broad, unrelated, and unpredictable vocabularies, such as products in a catalog or names and addresses. This technology is appropriate when system design constraints prevent the more efficient use of speech concatenation alone.

TTS engine (n)~ The component of Speech Engine Services that processes text input and produces speech output by synthesizing words and phrases.

TTY (n)~ A feature that enables those who are deaf or speech impaired to use the telephone with a teletypewriter.

TTY (n)~ A device that enables the transmission of typed messages over phone lines. These devices typically include keyboards for typing messages to send and display and/or printers to receive messages from one device to another.

TTY/TDD (n)~ A device that enables the transmission of typed messages over phone lines. These devices typically include keyboards for typing messages to send and display and/or printers to receive messages from one device to another.

TUI (n)~ An interface that is used to navigate the menus of a Unified Messaging (UM) system using DTMF or touchtone inputs.

tumbling window (n)~ A hopping window whose hop size is equal to the window size.

tune up scan (n)~ An online scan that examines a hard disk's level of fragmentation.

tune-up (n)~ An adjustment made to improve working order or efficiency.

tune-up scan (n)~ An online scan that examines a hard disk's level of fragmentation.

tuning adapter (n)~ A two-way device provided by a cable provider that enables some one-way digital CableCARD-based consumer electronic devices such as high-definition DVRs and Media Center PCs to access digital cable channels delivered using switched digital video.

tunnel (n)~ A logical connection over which data is encapsulated. Typically, both encapsulation and encryption are performed, and the tunnel is a private, secure link between a remote user or host and a private network.

tunnel / tunneling ~ A communication channel created in a computer network by

encapsulating a communication protocol's data packets in (on top of) a second protocol that normally would be carried above, or at the same layer as, the first one.

Tunnel Broker ~ In computer networking terminology, a tunnel broker is the phrase used to describe a service that provides a network tunnel.

tunnel server (n)~ A server or router that terminates tunnels and forwards traffic to the hosts on the target network.

tunneling (n)~ In Windows Presentation Foundation, an event routing strategy where the event instance moves down the element tree (starting at the root of the visual tree and ending with the source). The names of events that use this routing strategy are prefixed with the word Preview'. These events have the same signature as their counterparts that use the bubbling event routing strategy.'

tuple (n)~ An ordered collection of members that uniquely identifies a cell, based on a combination of attribute members from every attribute hierarchy in the cube.

Tuple Mover (n)~ A background task that periodically compresses data stored in delta stores in the traditional row-mode into the more efficient columnar format.

turbulence force (n)~ A parameter in the Perlin Noise function which is used to scale the amount of force from the vector field that is applied to the images.

turbulence speed (n)~ A parameter in the Perlin Noise function which controls how fast the vector field is changing.

turn off (v)~ To make a device, component, or feature nonfunctional. For example, if you disable a device in a hardware configuration, you cannot use the device when your computer uses that hardware configuration. Disabling a device frees the resources that were allocated to the device.

turn on (v)~ To activate or turn on.

turn-by-turn (adj)~ A way of providing driving or walking directions to the user where the app provides both spoken and visual instructions at the right time for the user to act on those instructions.

turnkey communications line (n)~ A private network provider that is hired by a company to facilitate electronic data interchange (EDI) or provide other network services.

turnover (n)~ A company's annual sales volume.

turnover threshold (n)~ The maximum limit of a cumulative transaction value, up to which a tax on the transaction value is calculated by using concessional rates instead of standard rates.

turtle contour (n)~ A contour that is tapered slightly at the beginning and end of the curve, resembling the shape of a turtle shell.

tutorial (n)~ A teaching aid designed to help people learn to use a product or procedure. In computer applications, a tutorial might be presented in either a book or a manual or as an interactive disk-based series of lessons provided with the program package.

TV (n)~ An electronic system of transmitting transient images of fixed or moving objects together with sound through space by an apparatus that converts light and sound into electrical waves and reconverts them into visible light rays and audible sound.

TV (PN)~ AN MSN site that allows the user to access the latest TV reviews, photos, trailers, clips, news, local showtimes, DVD info, synopsis, cast and crew, awards, and TV series info.

TV cam (n)~ A camera that can be used with a television set to make video calls.

TV genres (PN)~ The genres channel title for TV shows.

TV movies (PN)~ The movie genre for movies originally made for TV.

TV networks (PN)~ The networks channel title for TV shows.

TV tuner card (n)~ A video card that can receive television signals, usually through an antenna or cable connection.

TWAIN (n)~ A cross-platform interface for acquiring electronic images that have been captured by scanners, digital cameras, and still-frame video capture boards.

TWAIN ~ (Technology Without An Interesting Name, according to legend) A standard 'language' or- protocol- which computers use to communicate with- scanners.

tweak (v)~ To make final small changes to improve hardware or software performance; to fine-tune a nearly complete product.

Tweak ~ When you modify a certain piece of hardware for better performance, it is often referred to as 'tweaking' it.

Tweet (PN)~ A text-based post on Twitter.

tweet (n)~ A text-based post on Twitter.

twirl angle (n)~ The angle that determines the curve from the inner points and the outer points.

Twisted Pair ~ Two copper wires twisted to cancel their own radio frequency interference to reduce noise on the circuit.

twisted-pair cable (n)~ Two paired wires, with each wire twisted two or more times per inch to help cancel out noise.

two-dimensional (adj)~ Existing in reference to two measures, such as height and width —for example, a two-dimensional model drawn with reference to an x-axis and a y-axis, or a two-dimensional array of numbers placed in rows and columns.

two-factor authentication (n)~ An authentication method that requires two authentication methods, which may include something the user provides, such as certificates; something the user knows, such as user names, passwords, or pass phrases; physical attributes, such as a thumbprint; and personal attributes, such as a personal signature.

two-finger right-click (n)~ A multi-touch gesture that consists of either a left-down movement, or right-down, right-up or left-down, right-down, left-up, right-up (roll).

two-finger tap (n)~ A multi-touch gesture that consists of two fingers tapping at the same time and with a relative short distance between each other.

two-level interactive template (n)~ A workflow template which allows the administrator to define two question with up to four answers. The answers determine which queue the call is routed to.

two-pass encoding (n)~ An encoding method in which content is analyzed in one pass through the encoder, after which compression is applied in the second pass.

two-phase commit (n)~ A protocol that ensures that transactions that apply to more than one server are completed on all servers or none at all. Two-phase commit is coordinated by the transaction manager and supported by resource managers.

two-step verification (n)~ An optional Microsoft account sign-in method with which users can only sign in by entering both a password and a security code sent to them by the Microsoft account team.

two-way binding (n)~ A type of data binding where changes made to the target automatically update the source, and changes to the source automatically update the target. Data binding is always set on the target object.

two-way matching policy (n)~ A matching policy that requires one or more vendor invoice prices to match with one or more purchase order prices.

two-way trust (n)~ A trust relationship between two domains in which both domains trust each other. For example, domain A trusts domain B, and domain B trusts domain A. All parent-child trusts are two-way.

two-way trust relationship (n)~ A trust relationship between two domains in which both domains trust each other. For example, domain A trusts domain B, and domain B trusts domain A. All parent-child trusts are two-way.

type (n)~ In programming, the nature of a variable. For example, integer, real number, text character, or floating point number. Data types in programs are declared by the programmer and determine the range of values a variable can take as well as the operations that can be performed on it.

type (v)~ To enter information by means of the keyboard.

type (n)~ In printing, the characters that make up printed text, the design of a set of characters (typeface), or, more loosely, the complete set of characters in a given size and style (font).

type (n)~ A form or structure that distinguishes a particular class of objects.

Type (n)~ On the Business Rules editor form, the column that displays whether the business rule is the primary rule, or a participating one.

Type (n)~ In the Azure REST API, the variant of a computing service created by the customer, e.g. cloud service, database, storage account, web app, mobile service.

Type 1 fonts (n)~ Scalable fonts designed to work with PostScript devices.

type checking (n)~ The process performed by a compiler or interpreter to make sure that when a variable is used, it is treated as having the same data type as it was declared to have.

type declaration (n)~ A declaration in a program that specifies the characteristics of a new data type, usually by combining more primitive existing data types.

type descriptor (n)~ An object that defines the data type of an input, output or return parameter of a method instance object.

type discovery (n)~ The process of identifying the types that should be part of an Entity Framework model.

type inference (n)~ A process in which the compiler determines the data type of a local variable that has been declared without an explicit data type declaration. The type is inferred from the initial value provided for the variable.

type library (n)~ A file (or component within another file) that contains Automation standard descriptions of exposed objects, properties, and methods.

type manager (n)~ A software program that helps you increase or decrease the sets of available fonts.

type mismatch (n)~ A general error that happens when assigning a value to a variable of another type or when comparing values of incompatible data types.

type promotion (n)~ The promotion of an element's scope to the namespace containing

the module.

type safety (n)~ The ability for languages and classes to exchange information through commonly agreed upon definitions and usage patterns for types.

Type, Length, Value (n)~ A method of organizing data that involves a Type code (16 bit), a specified length of a Value field (16 bit), and the data in the Value field (variable).

typed adapter (n)~ An adapter that emits only a single event type.

typed event (n)~ An event for which the structure of the event payload provided by the source or consumed by the sink is known, and the input or output adapter is designed around this specific event structure.-

typed text (n)~ Text that you enter by using a keyboard or that your Tablet PC converts from handwriting or speech.

type-declaration character (n)~ A character appended to a variable name indicating the variable's data type.

typeface (n)~ A set of characters that share common characteristics, such as stroke width and the presence or absence of serifs (short lines at the upper and lower edges of characters).

Type-Length-Value (n)~ A method of organizing data that involves a Type code (16 bit), a specified length of a Value field (16 bit), and the data in the Value field (variable).

type-safe (oth)~ Pertaining to programming languages that can exchange information through commonly agreed upon definitions and usage patterns for types.

Typewriter (n)~ A title animation in Windows Movie Maker.

typography (n)~ The conversion of unformatted text into camera-ready type, suitable for printing.

U (n)~ A content descriptor developed by the British Board of Film Classification (BBFC).

U ~ U is the standard unit of measurement for rack-mounted equipment. Racks can be used to house servers, hard drives, switches, routers, and other computer hardware. They are also used for mounting audio and video equipment. 1U is equal to 1.75 inches.

U.S. Customary System (n)~ The system of weights and measurements maintained by the National Bureau of Standards in the United States.

U.S. unit (n)~ A unit used in the United States' measurement system, such as inches, feet, yards, and miles.

UA (n)~ A program that helps a client connect with a server.

UAC (n)~ A security feature that helps prevent unauthorized changes to a computer, by asking user for permission or administrator credentials before performing actions that could potentially affect the computer's operation or that change settings that affect multiple users.

UAC access token (n)~ An access token with the least administrative privileges required for the session. It is a restricted access token where all elevated privileges have been filtered out. A filtered access token is created by default for all interactive users that are not standard users, except the built-in administrator.

UAC user (n)~ A user account in the Users group that has a full privilege access token. The standard user is not an administrator and is not a member of any local groups that are filtered.

UACCE (PN)~ A compatibility evaluator used to identify potential compatibility issues due to permission restrictions enforced by User Account Control (UAC), formerly known as Limited User Account (LUA).

UBE, UCE ~ (Unsolicited Bulk Email, Unsolicited Commercial Email)- Email sent out in bulk to addresses harvested from web pages, newsgroups etc, advertising products or services - mostly scams or pornography. Also known as- spam. Sending UCE is a violation of most- ISP's Acceptable Use Policies, and will often get your account terminated immediately.

UBL (n)~ A language for defining XML business documents that is maintained by the Organization for the Advancement of Structured Information Standards (OASIS).

UC (n)~ A system that integrates platforms for communications including e-mail, voice mail, telephony, instant messaging, and voice and video conferencing.

UC SIP phone (n)~ A SIP phone that integrates with the Communicator client.

UCE (n)~ An unsolicited and typically unwelcome message, often commercial or political in nature, transmitted via the Internet as a mass mailing (sometimes as if from a fictitious user or domain) to a large number of recipients.

UCE (PN)~ A Windows serviceability tool used to help prioritize the testing of applications when evaluating a new Windows update.

UCP (n)~ A network node that provides the central reasoning point for the SQL Server Utility. It uses Utility Explorer in SQL Server Management Studio (SSMS) to organize and monitor SQL Server resource health.

UCS (n)~ An international standard character set reference that is part of the Unicode standard. The most widely held existing version of the UCS standard is UCS-2, which specifies 16-bit character values currently accepted and recognized for use to encode most of the world's languages.

UCS Transformation Format 8 (n)~ A character set for protocols evolving beyond the use of ASCII. The UTF-8 protocol provides for support of extended ASCII characters and translation of UCS-2, an international 16-bit Unicode character set. UTF-8 enables a far greater range of names than can be achieved using ASCII or extended ASCII encoding for character data.

UDDI (n)~ A specification for publishing and locating information about Web services. It defines a standards-based way to store and retrieve information about services, service providers, binding information, and technical interface definitions, all classified using a set of standard or custom classification schemes.

UDF (n)~ A file system defined by the Optical Storage Technology Association (OSTA) that is the successor to the CD-ROM file system (CDFS). UDF is used for removable disk media like DVD, CD, and magneto-optic (MO) disks.

UDP (n)~ A connectionless transport protocol in the TCP/IP protocol stack that is used in cases where some packet loss is acceptable, for example, with digital media streams.

UDP resend (n)~ An error correction method that allows the client to request that the server retransmit lost data packets.

UDP socket (n)~ A socket that transmits datagrams over the User Datagram Protocol (UDP).

UDT (n)~ A user-written extension to the scalar type system in SQL Server.

UDT (n)~ In OLE, a set of interfaces that allow data to be sent and received in a standard fashion, regardless of the actual method chosen to transfer the data.

UEFI (PN)~ A standard programming interface for setting up and booting a computer, based on the Extensible Firmware Interface (EFI) developed by Intel. It provides runtime services, which are used to access the drivers that were loaded in the pre-boot environment. For example, when booting from a network, the operating system can continue to use the same network protocols used to download it in the first place.

UI (n)~ The portion of a program with which a user interacts.

UI Automation (PN)~ The accessibility model for Microsoft Windows that programmatically gathers information about an application's User Interface (UI) elements and exposes it to assistive technology products and automated test scripts.

UI Automation client (n)~ An assistive technology application, such as a screen reader, that uses UI Automation to obtain programmatic access to the UI elements in an application's user interface. The client presents information about UI elements to the end user. Automated test scripts are also considered to be UI Automation clients.

UI Automation core (n)~ The run-time library that handles communication between providers and clients in the UI Automation framework.

UI Automation element (n)~ An element that represents a UI item that implements a UI automation provider interface and that exposes the IUIAutomationElement interface to UI Automation clients.

UI Automation framework (PN)~ The accessibility model for Microsoft Windows that programmatically gathers information about an application's User Interface (UI) elements and exposes it to assistive technology products and automated test scripts.

UI Automation provider (n)~ An implementation of UI Automation interfaces that exposes programmatic information about a UI element. The provider supplies this

information to the UI Automation framework in response to UI Automation client requests.

UI Automation tree (n)~ A hierarchical representation of all UI Automation elements on the Windows desktop.

UI Control Locator (n)~ A tool that identifies controls to use in a coded UI test.

UI culture (n)~ The language that is used to display strings and other graphical elements in a user interface.

UI framework (n)~ A component that manages child controls, hit testing, and rendering in an area of the screen.

UI part (n)~ A container in the content area of a pages and places that can contain graphs, lists or links to data. Most of the links are internal, but the content area can also contain UI parts that display data from other applications, for example, Microsoft Outlook.

UI Privilege Isolation (PN)~ A window manager subsystem that blocks applications at a lower UI privilege level from sending messages to or hooking threads belonging to processes with a higher UI privilege level.

UI privilege level (n)~ The integrity level that is stored in the access token of a process and that is used by the UI Privilege Isolation (UIPI) feature to determine if an application or process is permitted to send Windows messages to another application or process.

UI surface (n)~ The area in the new Windows UI where developers can place controls. The UI surface includes the app canvas, the app bar, a context menu, a flyout, and so on.

UI template file (n)~ A file that contains pre-defined formatting, layout, text, and graphics that guides user interface creation for a portal extension.

UIA (n)~ The accessibility model for Microsoft Windows that programmatically gathers information about an application's User Interface (UI) elements and exposes it to assistive technology products and automated test scripts.

UIAutomation (n)~ The accessibility model for Microsoft Windows that programmatically gathers information about an application's User Interface (UI) elements and exposes it to assistive technology products and automated test scripts.

UID (n)~ An alphanumeric identification used to identify a particular user.

UID cache (n)~ A file for storing Unique Identifier alphanumeric values for e-mail users.

UID list (n)~ A list of Unique Identifier alphanumeric values.

UIDL command (n)~ A PowerShell command that calls a Unique Identifier List.

UII (PN)~ The base components that are included in the CRM SDK that you can use to build applications for customer care.

UIM (PN)~ A card developed for cdmaOne/CDMA2000 (CDMA') handsets that extends the GSM SIM card to CDMA phones and networks.'

UIM card (PN)~ A card developed for cdmaOne/CDMA2000 (CDMA') handsets that extends the GSM SIM card to CDMA phones and networks.'

UIPI (PN)~ A window manager subsystem that blocks applications at a lower UI privilege level from sending messages to or hooking threads belonging to processes with a higher UI privilege level.

ULS (PN)~ An instrumentation and logging platform that provides monitoring, reporting and log viewing capabilities for Office servers and services.

Ultra DMA, UDMA ~ (Direct Memory Access)- A standard for- EIDE- disk

controllersrelating to how fast they can transfer data. Often followed by a number representing the transfer rate in- Mbps, eg UDMA100 operates at up to 100 Mbps.

ultra wide-band (n)~ A wireless technology similar to radar that is centered on the 200MZ to 4GHz band.

ultra-bold (adj)~ Having a font weight that corresponds to a weight class value of 800 according to the OpenType specification.

ultra-light (adj)~ Having a font weight that corresponds to a weight class value of 200 according to the OpenType specification.

ultra-mobile PC (n)~ A class of mobile PCs that has a touch screen no larger than 7 inches and a tablet pen.

ultra-wideband (n)~ A wireless technology similar to radar that is centered on the 200MZ to 4GHz band.

UM (PN)~ An application that consolidates a user's voice mail, fax, and e-mail into one mailbox, so that the user only needs to check a single location for messages, regardless of type. The e-mail server is used as the platform for all types of messages, making it unnecessary to maintain separate voice mail and e-mail infrastructures.

UM access telephone number (n)~ A telephone number that points to a hunt group and is the access number for calls that are routed to Unified Messaging servers.

UM Management (PN)~ The role group that gives users the permissions to manage Unified Messaging (UM) server configurations, UM properties on mailboxes, UM prompts, and UM auto attendant configuration.

UML (n)~ A language developed by Grady Booch, Ivar Jacobson, and Jim Rumbaugh of Rational Software that can be used for specifying, building, and documenting software and non-software systems, such as business models.

unallocated disk space (n)~ Any unpartitioned and unformatted space on a hard disk.

unallocated space (n)~ Available disk space that is not allocated to any volume. The type of volume that you can create on unallocated space depends on the disk type. On basic disks, you can use unallocated space to create primary or extended partitions. On dynamic disks, you can use unallocated space to create dynamic volumes.

Unannounced Transfer (n)~ A button on Phone Controls that transfers the current phone call without the user remaining on the line to announce the call.

unapproved (adj)~ The status that indicates an article has been written and is ready for review.

unary operator (n)~ An operator that takes only one operand, for example, the increment (++) operator.

unattend.xml (n)~ A file that automates Windows Setup. This file enables the configuration of Windows settings, the addition and removal of components, and many Windows Setup tasks, such as disk configuration.

unattended installation (n)~ An installation that runs unattended and does not require any user input after it has been started.

unattended service account (n)~ The security account that is used when a data source is configured to connect as a single shared identity for all users.

unattended setup (n)~ An installation that runs unattended and does not require any user input after it has been started.

unauthorized DHCP server (n)~ A DHCP server that is not an authorized server, as specified in [RFC2131], section 7.

unauthorized server (n)~ A server which is using non-standard processes and at odds with company policy. It may be set up to spread a virus, collect names for spammers or for some other illicit purpose.

unavailable (adj)~ Pertaining to the state of a control in which normal functionality is not available to a user.

Unavailable (PN)~ An option that allows the user to forward incoming calls when the user is not available to answer them.

unavailable appearance (n)~ The visual display for a control when it is unavailable.

unbalanced hierarchy (n)~ A hierarchy in which one or more levels do not contain members in one or more branches of the hierarchy.

unblock code (n)~ An operator-provided code to unblock a SIM card.

unbound application (n)~ An application in the system that is not yet bound to a logical server on the deployment diagram.

unbound control (n)~ A control that is not connected to a field in an underlying table, query, or SQL statement. An unbound control is often used to display informational text or decorative pictures.

unbound form (n)~ A form that isn't connected to a record source such as a table, query, or SQL statement.

unbound object (n)~ An object, such as a picture, whose value isn't derived from data stored in a table.

unbound object frame (n)~ A control you place on a form or report to contain an unbound object.

unbound report (n)~ A report that isn't connected to a record source such as a table, query, or SQL statement.

unbound stream (n)~ An event stream that contains the definition of the event model or payload type, but does not define the data source.

unbound type (n)~ A type that is referenced in a project and that IntelliSense and the C# compiler cannot match to a declaration.

unboxing (n)~ The conversion of an object instance to a value type.

UNC (n)~ A convention for naming files and other resources beginning with two backslashes (\), indicating that the resource exists on a network computer.

UNC path (n)~ The standard path to access network shares.

uncloak (v)~ Remove the cloaked attribute from a project.

uncomment (v)~ To convert text that has been commented out back into source code so that it will no longer be ignored by the compiler or interpreter.

uncommittable (adj)~ Pertaining to a transaction that remains open and cannot be completed. Uncommitable transactions could be considered a subclass of partially failed transactions, where the transaction has encountered an error that prevents its completion, but it is still holding its locks and has to be rolled back by the user.

Unconditional (adj)~ An option that forwards all incoming calls unconditionally.

undead ~ An undead object is an object that cannot be proven to be dead by the garbage collector, but whose liveness is dubious.

undecorated name (n)~ In C++, the form that an identifier has in the source code (as a string of human-readable characters) as opposed to its decorated name, which consists of symbols that are meaningful only to the compiler and the linker.

undeliverable (adj)~ Not able to be delivered to an intended recipient. If an e-mail message is undeliverable, it is returned to the sender with information added by the mail server explaining the problem; for example, the e-mail address may be incorrect, or the recipient's mailbox may be full.

underallocation (n)~ The result of assigning a resource to work fewer hours than the resource has available.

under-construction (n)~ A status for a tangible asset that indicates that the asset is not productive. For example, the asset is being transported or installed. In impairment accounting, the impairment cost is distributed when the construction of an asset is complete.

underdelivery (n)~ A limit, specified as a percentage of quantity ordered, for how much the purchaser will accept under the amount ordered. Underdelivery typically applies to bulk items.

underline (v)~ To format a selection of text so that the text is printed with a line slightly below it.

underlying table (n)~ A table referenced by a view, cursor, or stored procedure.

underscore (n)~ The _ character.

Undirected (adj)~ A node placement style that specifies that the nodes do not have a particular direction in relation to the MOM Management Server.

undo (v)~ To go back to a previous state by reversing the effects of one or more commands.

undo (n)~ The phase during database recovery that reverses (rolls back) changes made by any transactions that were uncommitted when the redo phase of recovery completed.

undo disk (n)~ A virtual hard disk that stores the changes made to a virtual machine's guest operating system and data after the Undo Disks feature has been enabled for the virtual machine. Changes accumulate in the undo disk (.vud) file until you commit or discard the changes. Each time you shut down or turn off a virtual machine, you decide whether to keep, commit, or discard the changes.

undo file (n)~ A file that saves the content of the pages in a database after they've been modified by uncommitted, rolled back transactions and before recovery restores them to their previous state. The undo file prevents the changes performed by uncommitted transactions from being lost.

undo phase (n)~ The phase during database recovery that reverses (rolls back) changes made by any transactions that were uncommitted when the redo phase of recovery completed.

undock (v)~ To detach a laptop or other portable computer from a docking station.

unelevate (v)~ To remove the ability of a network object, such as a user account or a network-joined computer to access the resources that the server provides. Deactivating a network object does not delete the object from the active directory, nor does it delete any data that is associated with the object.

unenforced relationship (n)~ A link between tables that references the primary key in

one table to a foreign key in another table, and which does not check the referential integrity during INSERT and UPDATE transactions.

unenlist (v)~ To eliminate all subscriptions and instances (running or suspended) for that service.

unfavorite (v)~ To remove something from one's Favorites.

unfold button (n)~ A command button used to expand a secondary window to a larger size to reveal additional controls or information.

unfollow (v)~ Action taken by a Microsoft Dynamics CRM user on a CRM record (such as an Account -€" Contoso) that stops posts about that CRM record from showing up on the user's personal Wall.

Unfollow (PN)~ The button in Yammer that appears in a tooltip when the curser hovers over someone that a user is following that allows them to choose to no longer receive updates on what the other person is posting on the feed.

unfollow (v)~ The act of stopping tracking a person, group, or organization on a social media website or application by unsubscribing from their account.

unfreeze (v)~ To release nonscrolling panes within a worksheet.

unfriend (v)~ To remove someone from your Messenger friends list. The opposite of sending someone a friend (buddy) invitation.

ungroup (v)~ To release objects that have been combined together as a single object.

unhandled exception (n)~ An exception that was identified with a try catch or finally block' structure or that occurred outside this structure but was not caught by any structured error handler. 'Dr. Watson' errors are examples.'

Unhold (n)~ A feature that allows the user to resume a temporarily suspended phone call.

unicast (n)~ In data communications networks, to transmit data from one terminal to another, such as from client to server, or from server to server.

unicast address (n)~ An address used for one-to-one communication between IPv6 hosts, which have multiple unicast addresses.

Unicode (n)~ A character-encoding standard developed by the Unicode Consortium that represents almost all of the written languages of the world. The Unicode character repertoire has multiple representation forms, including UTF-8, UTF-16, and UTF-32. Most Windows interfaces use the UTF-16 form.

Unicode collation (n)~ A set of rules that acts as a sort order for Unicode data.

unicode escape sequence (n)~ In regular expressions, a backslash followed by the letter 'u' followed by four hexadecimal digits. It matches a character in the target sequence that has the value that is specified by the four digits.

unidentified caller (n)~ A caller whose caller ID information is not available.

unified communications (n)~ A system that integrates platforms for communications including e-mail, voice mail, telephony, instant messaging, and voice and video conferencing.

Unified Communications SIP phone (n)~ A SIP phone that integrates with the Communicator client.

Unified Connection Manager (PN)~ A Windows service that is designed to aggregate network information (connection availability/status, profiles lists, radio state/strength, etc.) from infrastructure networks so that it can be presented to the user in a meaningful way.

The main function of the UCM service includes making connection decisions (connect/disconnect) based on policy across multiple media types. The UCM service also allows for third-party media types to be seamlessly integrated into the system making the UCM expandable with future media types.

Unified Extensible Firmware Interface (PN)~ A standard programming interface for setting up and booting a computer, based on the Extensible Firmware Interface (EFI) developed by Intel. It provides runtime services, which are used to access the drivers that were loaded in the pre-boot environment. For example, when booting from a network, the operating system can continue to use the same network protocols used to download it in the first place.

Unified Logging Service (PN)~ An instrumentation and logging platform that provides monitoring, reporting and log viewing capabilities for Office servers and services.

Unified Messaging (n)~ An application that consolidates a user's voice mail, fax, and e-mail into one mailbox, so that the user only needs to check a single location for messages, regardless of type. The e-mail server is used as the platform for all types of messages, making it unnecessary to maintain separate voice mail and e-mail infrastructures.

Unified Messaging language (n)~ One of the languages in which Microsoft Exchange Server 2007 Unified Messaging (UM) functionality is supported by the availability of UM language packs.

Unified Messaging server role (n)~ A set of components and services that enable voice, fax, and e-mail messages to be stored in a user's single mailbox. Users can also access their Microsoft Exchange Server 2007 mailbox from a telephone or a computer.

Unified Modeling Language (n)~ A language developed by Grady Booch, Ivar Jacobson, and Jim Rumbaugh of Rational Software that can be used for specifying, building, and documenting software and non-software systems, such as business models.

Unified Service Desk for Microsoft Dynamics CRM (PN)~ An out of the box (OOB) solution where admins can set up and configure the applications that a customer service agent needs easily and quickly.

Unified Tracing Model (n)~ The name given to the processes that define how to receive tracing information from both the IIS request-processing pipeline and related technologies like ASP.NET through a single tracing infrastructure.

unified work list (n)~ A list of all tasks, approvals, and alerts assigned to the current user.

Uniform Data Transfer (n)~ In OLE, a set of interfaces that allow data to be sent and received in a standard fashion, regardless of the actual method chosen to transfer the data.

Uniform Resource Identifier (n)~ A character string used to identify a resource (such as a file) from anywhere on the Internet by type and location. The set of Uniform Resource Identifiers includes both Uniform Resource Names (URNs) and Uniform Resource Locators (URLs).

Uniform Resource Locator (n)~ An address that uniquely identifies a location on the Internet. A URL is usually preceded by http://, as in http://www.microsoft.com. A URL can contain more detail, such as the name of a page of hypertext, often with the file name extension .html or .htm.

Uniform Resource Name (n)~ A scheme for uniquely identifying resources that may be available on the Internet by name, without regard to where they are located.

uninitialize (v)~ To change the state of an enumerator or data source object so that it cannot be used to access data.

uninstall (v)~ When referring to a device, to remove the corresponding device drivers from the hard disk and physically remove the device from the computer.

uninstall (v)~ When referring to software, to remove program files and folders from the hard disk and remove related data from the registry so the software or solution is no longer available.

Uninstall ~ Remove a program from your system. You can't just delete its folder, because almost all programs make changes to various parts of Windows.- Many programs come with a special uninstaller, which you should use if it exists. Otherwise, you can uninstall programs (in Windows) from the Control Panel.

uninterpreted configuration item. (n)~ An imported configuration item that cannot be interpreted by the Configuration Manager console and whose properties cannot be viewed or edited in the console.

uninterruptible power supply (n)~ A device, connected between a computer (or other electronic equipment) and a power source (usually an outlet receptacle), that ensures that electrical flow to the computer is not interrupted because of a blackout and, in most cases, protects the computer against potentially damaging events, such as power surges and brownouts.

union (n)~ In database management, a relational operator. Given two relations (tables), A and B, that are union-compatible (contain the same number of fields, with corresponding fields containing the same types of values), A UNION B builds a new relation containing those tuples (records) that appear either in A or in B or in both. Compare difference, intersect

union query (n)~ A query that uses the UNION operator to combine the results of two or more select queries.

UnionPay Online Payment (PN)~ An online payment method using UnionPay bank cards or services from China.

uni-processor (n)~ A computer with a single processor.

uni-processor (adj)~ In reference to a computer with a single processor.

unique column constraint (n)~ A property of a field that requires all of the values in that field to be unique.

unique customer (n)~ A customer who may visit a Web site several times within a certain timeframe, but is counted only once.

unique ID (n)~ A number used as a unique identifier for each Windows Live ID holder. This number is disclosed to residents of the European Union to comply with EU privacy regulations.

unique identifier (n)~ A 16-byte value generated from the unique identifier on a device, the current date and time, and a sequence number. It is used to identify a particular device, component, user, or session.

unique index (n)~ An index in which no two rows are permitted to have the same index value, thus prohibiting duplicate index or key values.

unique permission (n)~ A permission setting for using a list, library, or site that is different from the permission settings of its parent site.

Unique Program Identifier (n)~ A 21-character identifier used to identify computers enabled by FlexGo technology product models and locales for a specific solution provider.

unique volume name (n)~ A name containing a globally unique identifier (GUID) that is assigned to a volume. The name is guaranteed to be unique. Using unique volume names, you can avoid the ambiguity of drive letters in the Microsoft MS-DOS operating system.

uniqueidentifier data type (n)~ A data type containing a unique identification number stored as a 16-byte binary string used for storing a globally unique identifier (GUID).

uniqueifier (n)~ A 4-byte column that the SQL Server Database Engine automatically adds to a row to make each index key unique.

uniqueness constraint (n)~ A constraint that prohibits repetition of individual data or combinations of data.

unit (n)~ A measurement that specifies in what quantity a product or service is sold.

unit availability (n)~ Amount of time, expressed as a percentage or a decimal number, that a resource can be scheduled for assigned work. It refers to the availability of a resource; for example, a resource may be available 50%, 100%, or 300% of full time.

unit class (n)~ A classification of units of measurement.

unit contribution margin (n)~ The unit sales price minus the unit variable cost.

unit conversion factor (n)~ The factor used to convert from one unit of measure to another unit of measure, such as from centimeters to meters.

unit group (n)~ A compilation of the different measurements that a product is available in. A unit group contains the base unit in which a product is available, for example, a two-liter. It then lists all the different increments that this base unit is packaged in for sale, such as an individual two-liter bottle or a case of 6 two-liter bottles, and also indicates which measurement is the primary unit.

Unit Hours (PN)~ The unit of measure for BizTalk Server used on Azure.

unit of measure (n)~ A division of quantity established in calibrated or normative systems of measurement.

unit of measure (n)~ The type of measurement system used in a drawing. In formulas, used after a number to specify the unit of measure that the number represents.

unit of measurement (n)~ A division of quantity established in calibrated or normative systems of measurement.

unit of work (n)~ An object that uses referential integrity constraints to sequence database reading and writing operations in one atomic work process.

unit price (n)~ The amount per unit an item is sold for.

unit test (n)~ A test that confirms the functionality and peformance of specific modules and behaviors of code. Often a subset of unit tests are also used as check-in test to discover bugs before a build.

unit variance amount (n)~ The amount of variance between the invoice net unit price and the purchase order net unit price when invoice lines and purchase order lines are compared.

unite (v)~ To combine two or more shapes or paths to result in a single compound path that represents all of the area that was covered by the individual shapes and paths. If the resulting path is not a solid shape (for example, if there are holes), you can release the compound path, which results in a path object being created for each contiguous edge.

United Nations Trade Data Elements Dictionary (n)~ The dictionary of all elements used within the EDIFACT standard.

United Parcel Service zone (n)~ A geographical division used by the U.S.-based carrier, UPS, to determine shipping time and costs.

United States (PN)~ The US-American geo within the Azure region taxonomy.

units (n)~ The quantity of a resource assigned to a task. The maximum units is the maximum number of units available for the resource. For example, if you have three plumbers, the maximum units is 300 percent or three plumbers working full-time.

Universal (BBFC) (n)~ A content descriptor developed by the British Board of Film Classification (BBFC).

universal app (n)~ ?An app that is built using the Windows universal app platform.- Developers can create a Windows universal app that runs on all Windows-based device types, or they can choose to limit an app to specific devices.

universal app platform (n)~ ?The portion of the Windows universal platform that app developers use to build apps that can target all Windows-based device families.

Universal Business Language (n)~ A language for defining XML business documents that is maintained by the Organization for the Advancement of Structured Information Standards (OASIS).

Universal Character Set (n)~ An international standard character set reference that is part of the Unicode standard. The most widely held existing version of the UCS standard is UCS-2, which specifies 16-bit character values currently accepted and recognized for use to encode most of the world's languages.

Universal Description, Discovery, and Integration (n)~ A specification for publishing and locating information about Web services. It defines a standards-based way to store and retrieve information about services, service providers, binding information, and technical interface definitions, all classified using a set of standard or custom classification schemes.

Universal Disk Format (n)~ A file system defined by the Optical Storage Technology Association (OSTA) that is the successor to the CD-ROM file system (CDFS). UDF is used for removable disk media like DVD, CD, and magneto-optic (MO) disks.

universal driver (n)~ ?A driver that is available on more than one Windows-based device family.

universal driver platform (n)~ ?The portion of the Windows universal platform that driver developers use to build drivers that can work across all Windows-based device families.

universal group (n)~ A security or distribution group that can contain users, groups, and computers from any domain in its forest as members.

Universal Naming Convention (n)~ A convention for naming files and other resources beginning with two backslashes (\), indicating that the resource exists on a network computer.

Universal Naming Convention name (n)~ The full name of a resource on a network. It conforms to the \servername\sharename syntax, where servername is the name of the server and sharename is the name of the shared resource. UNC names of directories or files can also include the directory path under the share name with the following syntax:

\servername\sharename\directory\filename.

Universal Naming Convention path (n)~ The standard path to access network shares.

Universal Object Control (n)~ A data driven UI that takes two inputs: the OVC describing how to render the UI for the object to be edited/created, and the resource object which is being edited/created.

universal provider (n)~ A data provider that supports session, membership, roles, and/or profile properties and is part of the ASP.NET Universal Providers package.

Universal Providers (PN)~ A package of unified data-provider classes that support session, membership, roles, and profile properties in all versions of SQL Server 2005 and later, including SQL Server Compact Edition and SQL Azure.

Universal Receiver Transmitter (n)~ A circuit which is used for synchronous, asynchronous, or combined synchronous/asynchronous communications, and which contains a serial-to-parallel converter for data transmitted out of the computer and a parallel-to-serial converter for data coming in.

universal serial bus (n)~ An external bus that supports Plug and Play installation, which enables you to connect and disconnect devices without shutting down or restarting your computer.

Universal Windows app (n)~ An app that is built using the Universal- Windows Platform (UWP), which was first introduced in Windows 8 as the Windows Runtime.

Universal Windows Platform (PN)~ The converged Windows platform that enables the creation of Windows apps, games, and drivers that can target every Windows 10 device.

Universal Windows Platform Bridge (PN)~ A toolkit of tools and run-time technologies that enable a developer to bring existing code from another code base into the Universal Windows Platform. Each toolkit will vary in terms of the tooling and run-time technologies that it provides, but all of them make it easier to quickly bring code from its code base- to the Windows Store.

universally unique identifier (n)~ A 16-byte value generated from the unique identifier on a device, the current date and time, and a sequence number. It is used to identify a particular device, component, user, or session.

Universe (n)~ A directory that holds the data for all Parature Departments belonging to one Parature Client.

UNIX (PN)~ A powerful, multiuser, multitasking operating system initially developed at AT&T Bell Laboratories in 1969 for use on minicomputers. UNIX is considered more portable, that is, less computer-specific, than other operating systems because it is written in C language. Newer versions of UNIX have been developed at the University of California at Berkeley and by AT&T.

Unix ~ A computer operating system (the basic software running on a computer, underneath things like word processors and spreadsheets). Unix is designed to be used by many people at the same time (it is multi-user) and has- TCP/IP- built-in.

UNIX file permissions (n)~ A set of permissions that describes the access rights to a UNIX file or directory for the file owner, the group owner, and other users. Every UNIX file and directory possesses a set of permissions, and each user can have any combination of read, write, or execute access.

UNIX-to-UNIX CoPy (n)~ A set of software programs that facilitates transmission of

information between UNIX systems using serial data connections, primarily the public switched telephone network.

Unknown (PN)~ A status message for an incoming call that indicates that the caller cannot be identified (e.g. Internet call).

unknown (adj)~ Used to describe a value, parameter, or variable that is not known.

unknown member (n)~ A member of a dimension for which no key is found during processing of a cube that contains the dimension.

unknown tape (n)~ Tape that has not been identified by the DPM server.

unlike (v)~ Action taken by a Microsoft Dynamics CRM user on a post to undo their Like on that post.

unlike (PN)~ A Facebook term for removing the -€œlike-€? a friend's post or disconnecting from a Page by clicking the unlike' button.'

Unlike (PN)~ The button in Yammer that allows users to undo the application of the Like' button for a post.'

Unlimited (adj)~ Characteristic of a subscription which gives you, for a per-month fee, unlimited calls to a selected country/region; e.g. Unlimited Portugal.

unlimited calls (n)~ A part of a Skype subscription offer that allows a user to call to selected destination(s) within limits defined by the Fair Usage Policy.

unlimited material (n)~ A method for scheduling resources that assumes that all the component materials needed for production are available at the time they are needed.

unlimited music (n)~ Users who subscribe to Xbox Music Pass can download and listen to as many songs as they want as long as the subscription remains active.

unlimited purchase approval (n)~ An approval for which no maximum amount has been specified on purchase documents.

unlimited request approval (n)~ An approval for which no maximum amount has been specified on purchase request documents.

unlimited sales approval (n)~ An approval for which no maximum amount has been specified on sales documents.

unlink (v)~ To disconnect an item from a record, or a record from another record.

unlink (v)~ To separate linked inboxes.

unlink (v)~ To remove the mapping from a folder to OneDrive.

unload (v)~ To remove software from system memory.

Unlock (PN)~ An option that unlocks the keypad after it was locked.

unlock (v)~ To enable an object to be modified.

unlock (v)~ To gain access to all phone functionality by entering the correct password when the phone has locked itself due to delayed use or when the user has manually locked it.

Unlock (PN)~ A UI button that gives a user access to all phone functionality when the phone has locked itself due to delayed use or when the user has manually locked it.

unlock (v)~ To free a GSM cell phone from the restriction to use a particular cellular carrier. A phone that is SIM locked may be unlocked by entering a code.

unlock code (n)~ A code needed to use a phone with a SIM card on another cellular network.

Unlock Session (oth)~ The button in Conference Controls that unlocks the current

conference so that additional participants can now join.

unlocked group (n)~ A group whose membership can be changed by users other than the owner of the group.

unlocked user profile (n)~ A user account whose settings that are changed in a user session are retained every time the user logs on to the account.

unmanaged (adj)~ Pertaining to a computer or device that is not managed by MOM.

unmanaged Azure tenant (n)~ A directory that has no global administrator.

unmanaged client (n)~ A client that is not communicating with its assigned site in the Configuration Manager hierarchy and therefore cannot receive policy or upload inventory data.

unmanaged code (n)~ Code that is executed directly by the operating system, outside the .NET Framework common language runtime. Unmanaged code must provide its own memory management, type checking, and security support, unlike managed code, which receives these services from the common language runtime.

unmanaged function (PN)~ A function that is compiled to machine code (such as x86 or x64) as opposed to intermediate language (IL).

unmanaged instance (n)~ An instance of SQL Server not monitored by a utility control point.

unmarshal (v)~ To deserialize one or more data structures from an octet stream using a specific transfer syntax (for example, unmarshaling a 32-bit integer).

unmarshaling (n)~ In OLE, the process of unpacking parameters that have been sent across process boundaries.

Unmute (PN)~ A button on Audio Controls that turns off mute on the user's phone.

Unmute (PN)~ An option that allows the user to reactivate the device's microphone during a call so that sound is transmitted to other call participants.

unmute (v)~ To enable on-screen and sound notification.

Unmute Microphone (PN)~ A button on Audio Controls that turns off mute on the user's microphone.

Unmute Speakers (PN)~ A button on Audio Controls that turns off mute on the user's speakers.

UNN (PN)~ An identifying number required to perform payment transactions from Belarus individuals or companies.

unpair (v)~ To remove a Bluetooth link or connection between two Bluetooth-€"enabled devices.

unpark (v)~ To reopen a core processor that had been parked for power saving purpose.

unpin (v)~ To remove an item, such as a tile, library, movie, game, or app, from a given area of the UI, to make it inaccessible in that area (e.g. to make a library non-visible in the navigation pane).

unpivot (v)~ To expand values from multiple columns in a single record into multiple records with the same values in a single column.

unplumb (v)~ To destroy any streams linked with a physical or logical interface and close the related device.

unposted transaction (n)~ A transaction that has been entered into the financial data, but that has not yet been posted.

unprotect (v)~ To remove access restrictions or permissions for a file or specific elements within a file.

unprotected solution (n)~ A solution that is open' and that can be modified by anybody with the required privileges. '

unpublish (v)~ To remove an item from public view.

unpublished work (n)~ Beta software or other materials that are not released to the general public.

unrated (adj)~ A record that has not received a rating.

Unread Changes (PN)~ A feature that highlights new or changed content in a shared notebook that the user has not yet read.

unrealized gain (n)~ The anticipated increase in the value of an asset calculated as the difference in the value of the asset when two economic events occur and when the difference is recognized on the occurrence of the second event as an anticipated increase in wealth.

unrealized loss (n)~ The anticipated decrease in the value of an asset calculated as the difference in the value of the asset when two economic events occur and when the difference is recognized on the occurrence of the second event as an anticipated reduction in wealth.

unrealized sales VAT (n)~ The calculated value-added tax (VAT) amount that is not due until the invoice is paid. This amount is posted to an unrealized sales VAT account and can be claimed only after a receipt or tax invoice is printed.

unrealized VAT (n)~ The calculated value-added tax (VAT) amount that is not due until the invoice is paid. This amount is posted to an unrealized purchase VAT account and can be claimed only after the receipt of a receipt/tax invoice or a tax invoice.

unrecognized media pool (n)~ A repository of blank media and media that are not recognized by Removable Storage.

unrecognized tape (n)~ A tape that contains content that was not created by DPM.

unrestricted mode (n)~ A state that does not apply a specific set of restrictions to JavaScript code.

unsafe character (n)~ A character in a URL that may be altered during transport across the Internet.

unsafe code (n)~ Code that is executed directly by the operating system, outside the .NET Framework common language runtime. Unmanaged code must provide its own memory management, type checking, and security support, unlike managed code, which receives these services from the common language runtime.

unscheduled conference (n)~ A conference that is created on the fly by inviting multiple users to a new or ongoing IM session.

unseal (n)~ For BitLocker Drive Encryption, the process that a Trusted Platform Module (TPM) uses to decrypt data in a sealed binary large object (BLOB) to reveal the original secret.

unsearchable item (n)~ An item that can't be indexed for a mailbox search using Multi-Mailbox Search. This includes unrecognized message types and messages that contain attachments that are encrypted or have an unrecognized format.

Unselect without sub-labels (v)~ An option that deselects a parent label with deselected

children.

unshare (v)~ To make resources, such as folders, printers, records, etc., unavailable to others.

unshelve (v)~ To restore individual file revisions from a shelveset to your workspace.

un-sign (v)~ To remove the digital signature added to the document.

unsigned driver (n)~ A driver that is not supported and that is not certified to work with a particular version of Windows.

unsigned integer (n)~ A data type that can only hold a whole number with a value greater than, or equal to, zero. In this implementation, the maximum value that an unsigned integer can hold is 0xFFFFFFFF (4,294,967,295).

unsolicited commercial e-mail (n)~ An unsolicited and typically unwelcome message, often commercial or political in nature, transmitted via the Internet as a mass mailing (sometimes as if from a fictitious user or domain) to a large number of recipients.

unsolicited vendor (n)~ A vendor that applies to supply products to one or more legal entities without responding to a formal or informal request.

unstack (v)~ To remove the stacked view of windows.

unstack (v)~ To remove the stack' association from a group of similar photos that have been stacked together in the Photos app.'

unstructured parallelism (n)~ In the Concurrency Runtime, parallel code that can start in one context and finish in a different context. For example, a set of tasks in a task group can start in one context, and then finish in a different context.

unsubscribe (v)~ In a newsreader client program, to remove a newsgroup from the list of newsgroups to which upload one subscribes.

unsupported feature (n)~ A feature that is inactive in Office Web Apps, but that is present when the content is opened in the rich client.

unswizzle (v)~ To reconstruct a surface to give an application access to the content of the surface.

UNTDED (n)~ The dictionary of all elements used within the EDIFACT standard.

Unterhaltungssoftware Selbstkontrolle (n)~ An independent self-regulatory agency which applies and enforces interactive game ratings in Germany.

untyped adapter (n)~ An adapter that accepts or emits multiple event types in which the payload structure or the type of fields in the payload are not known in advance. Examples are events from a CSV or text file, a SQL table, or a socket.

unwanted software (n)~ A software that was installed on the system without user's consent.

UOC (n)~ A data driven UI that takes two inputs: the OVC describing how to render the UI for the object to be edited/created, and the resource object which is being edited/created.

up vector (n)~ A vector that identifies which direction is -€œup-€? for a camera.

upcast (n)~ An expression that modifies an object type into the type of a base class.

update (n)~ A broadly released fix for a specific problem addressing a noncritical, non-security-related bug.

update (v)~ To change a system or a data file to make it more current.

update (v)~ To change an existing row of data in the data store or to transmit pending

changes to the data store.

update (n)~ The process of scanning content to compile and maintain an index.

update (v)~ To deploy a new version of a hosted service to replace an existing deployed version. There are two options for update: update in-place or swap virtual IP. Both of these update the service while it is running and without requiring the deployment to be deleted and redeployed.

Update Advisor (PN)~ A mobile app that- helps customers resolve space issues on their phones when installing a new update, by- moving apps and files to an SD card or OneDrive,- or deleting them.

update bar (n)~ A control that appears in the Page Inspector integrated browser when changes have been made to a file in a web application. It prompts the user to update the view of the web application in the Page Inspector browser by either pressing CTRL+ALT+ENTER, or by clicking the update bar with the mouse.

Update central (PN)~ The primary landing page for information about installing operating system updates on a Windows Phone.

Update Compatibility Evaluator (PN)~ A Windows serviceability tool used to help prioritize the testing of applications when evaluating a new Windows update.

update compliance (n)~ A type of interactive reporting that informs if a software and hardware inventory is in adherence with update requirements.

update domain (n)~ A grouping of role instances in a cloud service that allows in-place updates to occur without impacting service availability. When you update a cloud service, Microsoft Azure updates it one update domain at a time, stopping the instances running within one of the update domains, updating the instances, starting them back up, and then moving on to the next update domain. In this way, at least one update domain stays running while another one gets updated.

update group (n)~ A collection of managed properties that are updated together in the search index.

update list (n)~ A list that includes the name of the person who originally sent a task request plus the names of everyone who received the task request, reassigned the task to someone else, or chose to keep an updated copy of the task in their task list.

update lock (n)~ A lock placed on resources (such as row, page, table) that can be updated.

update management (n)~ A feature that enables administrators to view, download, and deploy software updates required by operating systems and other software on managed computers.

Update Management Configuration Wizard (PN)~ A wizard that guides the user through configuring the update management feature and then downloading information about current updates from Microsoft Update so the user can start deploying updates to managed computers.

update package (n)~ A broadly released fix for a specific problem addressing a noncritical, non-security-related bug.

update profile (n)~ Information, including changes to the system state, that describes a software update.

update query (n)~ An action query that changes a set of records according to criteria you

specify. An update query does not return any records.

update request (n)~ A request to change the attributes of an object.

update rollup (n)~ A tested, cumulative set of hotfixes, security updates, critical updates, and updates packaged together for easy deployment. A rollup generally targets a specific area, such as security, or component of a product, such as Microsoft Internet Information Services (IIS).

update sequence number (n)~ In Active Directory replication, a 64-bit counter that is maintained by each Active Directory domain controller. At the start of each update transaction (originating or replicated) on a domain controller, the domain controller increments its current USN and associates this new value with the update request.

update statistics (n)~ A process that recalculates information about the distribution of key values in specified indexes.

updated (PN)~ The heading for information about the time at which something was added, changed, or re-posted.

Updates workspace (n)~ A workspace in Windows Intune that allows you to manage software updates.

Updating Run (PN)~ The end-to-end process feature by which Cluster-Aware Updating takes each node of a failover cluster offline, applies a set of software updates, performs a restart if necessary, brings the node back online, and moves on to the next node, until all nodes have been updated.

updating run (n)~ A process that is executed by the Updating Run feature.

up-down bars (n)~ In line charts with multiple data series, bars that indicate the difference between data points in the first and last series.

upgrade domain (n)~ A group in which Virtual Machine Manager automatically places instances of a tier of a service so that when the service is updated, those instances will be updated at the same time.

Upgrade Pre-Scan tool (PN)~ A pre-upgrade scan tool that scans the user's sites and reports issues, allowing the user to fix any errors before performing an upgrade to Office SharePoint Server 2007 or Windows SharePoint Services 3.0.

upgrade with maintenance (n)~ The type of volume license agreement that grants the new version rights to the licensed product family throughout the term of the customer's volume license agreement.

UPHClean (PN)~ A service that helps to ensure user sessions are completely terminated when a user logs off.

UPID (n)~ A 21-character identifier used to identify computers enabled by FlexGo technology product models and locales for a specific solution provider.

uplink (n)~ The transmission link from a computer to a networked device, such as a Windows Media Center Extender or Xbox.

up-link / uplink ~ A term used in satellite communications to describe the earth station and the transmit ted signal to a communications satellite .

uplink license (n)~ One of several elements in a license chain which contains content keys that are used to encrypt and decrypt content that is transmitted from a computer to a networked device.

upload (v)~ To transfer a copy of a file from a local computer to a remote computer by

means of a modem or network.

upload (n)~ In communications, the process of transferring a copy of a file from a local computer to a remote computer by means of a modem or network.

Upload ~ To transfer information (files) from a user PC to a network or the Internet. See also- download.

Upload Center (PN)~ A central hub for viewing pending uploads to http servers (mainly SharePoint) and correcting upload errors.

Upload Content (PN)~ The menu option in Sway under the -€œAdd Content-€? button that allows users to upload images, Word documents, or PowerPoint presentations from their computer or mobile device into their Sway.

Upload Videos (PN)~ The button that allows a user to upload a video to a specific channel within the Office 365 Video.

UPM (n)~ A component of the Local Provisioning System (LPS) that manages the provisioning of the computer from within the operating system or software.

UPN (n)~ A user account name (sometimes referred to as the user logon name) and a domain name identifying the domain in which the user account is located. This is the standard usage for logging on to a Windows domain. The format is: user@domain.com (as for an e-mail address).

UPnP technology (n)~ A technology that allows devices such as personal computers, peripherals, intelligent appliances, and wireless devices to connect to a network and to communicate with each other.

Upper Provisioning Module (n)~ A component of the Local Provisioning System (LPS) that manages the provisioning of the computer from within the operating system or software.

uppercase (adj)~ Of, pertaining to, or characterized by capital letters.

uppercase letter (n)~ In some languages, a distinct, and usually larger, form of a letter. May be used in word-initial position in certain cases, or for emphasis.

upper-left (adj)~ Pertaining to the location of something that is higher in place and on the left side relative to something else.

upper-right (adj)~ Pertaining to the location of something that is higher in place and on the right side relative to something else.

UPS (n)~ A device, connected between a computer (or other electronic equipment) and a power source (usually an outlet receptacle), that ensures that electrical flow to the computer is not interrupted because of a blackout and, in most cases, protects the computer against potentially damaging events, such as power surges and brownouts.

UPS service (n)~ A service that manages an uninterruptible power supply (UPS) connected to a computer.

UPS zone (n)~ A geographical division used by the U.S.-based carrier, UPS, to determine shipping time and costs.

upsert (oth)~ A term adopted by some database implementations that applies to a database statement, or combination of statements, that inserts a record to a table in a database if the record doesn't exist or, if the record already exists, updates the existing record.

upstream (Adverb) ~ Pertaining to the direction in which the signal flow is sent from the subscriber (or front-end), towards the head-end station (or central office) on a network.

upvote (n)~ An action to express that you agree with similar feedback sent by someone else. Rather than resubmit the same feedback, you can tap Upvote

upvote (v)~ To agree with similar feedback sent by someone else. Rather than resubmit the same feedback, you can tap Upvote

Upward Arrow (PN)~ A SmartArt graphic layout used to show a progression or steps that trend upward in a task, process, or workflow. Each of the first five lines of Level 1 text corresponds to a point on the arrow. Works best with minimal text. Unused text does not appear, but remains available if you switch layouts.

UPWARDS ANCORA (n)~ A UNICODE character; supplemental punctutation.

Urgent interruptions only (PN)~ Pertaining to a user who sets their status to Do Not Disturb. For the user's contacts who have a Workgroup privacy relationship, the user is displayed with the Busy icon and Urgent interruptions only text.

URI (n)~ A character string used to identify a resource (such as a file) from anywhere on the Internet by type and location. The set of Uniform Resource Identifiers includes both Uniform Resource Names (URNs) and Uniform Resource Locators (URLs).

URL (n)~ An address that uniquely identifies a location on the Internet. A URL is usually preceded by http://, as in http://www.microsoft.com. A URL can contain more detail, such as the name of a page of hypertext, often with the file name extension .html or .htm.

URL ~ (Universal Resource Locator)- An address used to locate something on the internet, most often a web page. All web addresses are URLs.

URL mapping (n)~ The process of associating a Uniform Resource Locator (URL) with a physical directory.

URL Pattern (PN)~ A field in which the user can enter intranet URLs to create Work URL exceptions.

URL Rewrite Module for IIS 7 (PN)~ A module that dynamically alters Internet client requests that are based on rules that specify how a URL should be modified before it is processed. For example, Internet clients will see requests that look like http://www.example.com/catalog/product/123/, which are dynamically rewritten to the actual address of http://www.example.com/catalog.aspx?product=123.

URL smashing (n)~ The process of matching a search string (with spaces removed) against URL addresses to return the most relevant result.

URL template (n)~ A URL-based connection string that is used to query a web server for search results.

URLScan 3.1 (PN)~ A security tool that restricts the types of HTTP requests that Internet Information Services (IIS) 6.0 will process. UrlScan screens all incoming requests to the server by filtering the requests based on rules that are set by the administrator.

URN (n)~ A scheme for uniquely identifying resources that may be available on the Internet by name, without regard to where they are located.

URT (n)~ A circuit which is used for synchronous, asynchronous, or combined synchronous/asynchronous communications, and which contains a serial-to-parallel converter for data transmitted out of the computer and a parallel-to-serial converter for data coming in.

US Central (PN)~ The Central US region within the Azure region taxonomy.

US East (PN)~ The Eastern US region within the Azure region taxonomy.

US East 2 (PN)~ The second Eastern US region within the Azure region taxonomy.

US Government Azure Sponsorship (n)~ A sponsored offer (a type of subscription purchased by customers) targeted to US Government customers interested in trying out Azure services.

US Government Pro-Direct Support (PN)~ A support offer (a type of subscription purchased by customers) targeted to US Government customers.

US Government Standard Support (PN)~ A support offer (a type of subscription purchased by customers) targeted to US Government customers.

US North Central (PN)~ The North Central US region within the Azure region taxonomy.

US South Central (PN)~ The North Central US region within the Azure region taxonomy.

US unit (n)~ A unit used in the United States' measurement system, such as inches, feet, yards, and miles.

US West (PN)~ The Western US region within the Azure region taxonomy.

usage (n)~ The number of units or dollars of an inventory item consumed over a period of time.

usage analysis (n)~ A feature that enables data collection to evaluate how Web sites on your server are being used.

Usage and Health Data Collection (PN)~ A feature that collects and logs SharePoint health indicators and usage metrics for analysis and reporting purposes.

usage data (n)~ Information that an administrator can use to learn how other people access and use a site. By analyzing this data, an administrator can identify a site's most popular (or unpopular) areas and clarify the most common navigational paths through the site.

usage dependency (n)~ A kind of dependency that indicates that one element requires the presence of another element for its correct implementation or functioning.

usage event (n)~ A user action that is counted and analyzed by the recommendations algorithm in the Analytics Service.

usage expiration date (n)~ The date and time at which a purchased block of unlimited computer usage time terminates.

usage keyword (n)~ A keyword that is used to determine which search scopes are shown for a specific page in the portal UI. Each list view page in the UI specifies zero or more usage keywords, and the UI for that page will include all search scopes that contain matching keywords.

usage scenario (n)~ A description of the tasks that users perform to accomplish their work.

usage time (n)~ An amount of time that is used toward computer or software access.

usage type (n)~ In Exchange Server 2007, the type of connector that is determined by the intended use of the connector. The usage type determines the default settings for the connector. This includes the SIDs that are authenticated, the permissions that are assigned to those SIDs, and the authentication mechanism.

USB (n)~ An external bus that supports Plug and Play installation, which enables you to connect and disconnect devices without shutting down or restarting your computer.

USB ~ (Universal Serial Bus)- A standard type of connection port, used to attach extra devices such as a scanner to a computer. Standard on new PCs from around 1998. USB 2.0 and 3.0 are faster versions of the same thing. Many PCs now use USB to connect the mouse and keyboard.

USB drive (n)~ A small device used to store information. USB flash drives plug into computer USB ports so you can copy information to or from them, making it easy to share and transport information.

USB port (n)~ A narrow, rectangular connection point on a computer or other device (such as a keyboard) where you can connect a universal serial bus (USB) device.

USBlyzer ~ A software USB Protocol Analyzer for Windows that displays USB Descriptors and captures and analyzes the activity of USB devices in real time.

USD (PN)~ The official currency of the United States.

USD (PN)~ An out of the box (OOB) solution where admins can set up and configure the applications that a customer service agent needs easily and quickly.

use case (n)~ A collection of scenarios which make up a behaviorally related sequence of interactions that a user performs in a dialog with a system.

use case (n)~ In a use case diagram, a representation of a set of events that occurs when an actor uses a system to complete a process. Normally, a use case is a relatively large process, not an individual step or transaction.

use case diagram (n)~ A diagram that shows the external actors who will interact with your system and how they will use it. The diagram consists of a system boundary, actors, use cases, and use case relationships (communicates, uses, and extends).

use license (n)~ The license that enables end users to consume protected content.

Use of Alcohol (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Use of Drugs (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Use of Tobacco (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Use Rights (PN)~ A document that specifies the terms and conditions applicable to the use of products licensed under Microsoft Volume Licensing Programs.

use strict directive (n)~ A JavaScript syntactic unit that specifies that the code in the block to which it applies must obey certain restrictions.

use tax (n)~ An excise tax levied on products in the United States where a sales tax is not levied.

Usenet (n)~ A worldwide network of UNIX systems that has a decentralized administration and is used as a bulletin board system by special-interest discussion groups. Usenet, which is considered part of the Internet (although Usenet predates it), is comprised of thousands of newsgroups, each devoted to a particular topic. Users can post messages and read messages from others in these newsgroups in a manner similar to users on dial-in BBSs. Usenet was originally implemented using UUCP (UNIX-to-UNIX Copy) software and telephone connections; that method remains important, although more modern methods, such as NNTP and network connections, are more commonly used.

Usenet ~ An enormous collection of public- newsgroups- on the- Internet, well over

25,000 at last count, which allow users to post messages discussing particular issues. Now largely replaced by internet forums, whcih are easier to police against massive spamming.

user (n)~ A person who uses a computer or device.

User Access Logging (PN)~ A logging feature that gathers unique client records and events for later retrieval by an administrator using WMI or PowerShell.

user account (n)~ In Active Directory, an object that consists of all the information that defines a domain user, which includes user name, password, and groups in which the user account has membership. User accounts can be stored in either Active Directory or on your local computer.

User Account Control (n)~ A security feature that helps prevent unauthorized changes to a computer, by asking user for permission or administrator credentials before performing actions that could potentially affect the computer's operation or that change settings that affect multiple users.

User Account Control Compatibility Evaluator (PN)~ A compatibility evaluator used to identify potential compatibility issues due to permission restrictions enforced by User Account Control (UAC), formerly known as Limited User Account (LUA).

user administrator role (n)~ An administrative role for PerformancePoint Server that allows members to assign users to and remove users from any administrative PerformancePoint Server role within their scope (application or model site), with the exception of the global administrator role, add users to or remove users from user-created business roles within their scope (application or model-site), add users to or remove users from the PerformancePoint Server system. User Administrator members cannot create or delete business roles.

user agent (n)~ A program that helps a client connect with a server.

user agent string (n)~ A string that identifies a user's web browser and provides details about the user's computer system to web servers hosting the websites that the user visits.

User Behavior Analyzer (PN)~ Part of the Web Analytics Shared Service that analyzes user behavior data logged by the server when a user visits a Web site.

User Breakdown Structure (n)~ The structure that describes an organization's hierarchy. The RBS code defines the hierarchical position that a resource holds in the organization.

user control (n)~ A base control that provides a way to create a reusable custom control without having to create a new control class.

user credentials (n)~ Information, such as user name and password, for a particular user or account for gaining access to a resource.

user database (n)~ A database created by a SQL Server user and used to store application data.

User Datagram Protocol (n)~ A connectionless transport protocol in the TCP/IP protocol stack that is used in cases where some packet loss is acceptable, for example, with digital media streams.

user device affinity (n)~ The ability to define a relationship between a user to a device to simplify deployment.

user dictionary (n)~ A customizable dictionary for each user that is empty by default. Users can add typed or handwritten words to and remove them from the user dictionary.

User dimension (n)~ A predefined dimension that maintains user-related information such

as process scheduling reviewer and approver hierarchies, and security roles.

user exception (n)~ An exception that occurs while executing a normal application (in Word, Excel, etc)

user experience (n)~ User's perception about the utility usability and desirability of a product as they integrate it into their lives and their family system. The user experience will be the differentiator that drives adoption and use of hardware software and services.

user feed (n)~ The data flow published by a user or by others on this person's udate area and that this user might see.

user form template (n)~ A browser-enabled form template that has been published from InfoPath, and that does not need to be uploaded by an administrator to a server running InfoPath Forms Services.

user function (n)~ A grouping of the tasks a certain employee needs to perform when participating in a specific business process.

user group (n)~ A collection of users that have been assigned identical access permissions.

user icon (n)~ The icon or picture associated with a particular user account in Windows.

user ID (n)~ An alphanumeric identification used to identify a particular user.

user identifier (n)~ An alphanumeric identification used to identify a particular user.

user identity (n)~ Identity assigned to a user during authentication. For example, the user identity of anonymous users would be the default iusr' account. '

User Import (n)~ Provisioning of users from a human resource management system into a directory

user instance (n)~ An instance of SQL Server Express that is generated by the parent instance on behalf of a user.

user interface (n)~ The portion of a program with which a user interacts.

User Interface (PN)~ An API for user interface.

User interface ~ A program's controls, with which the user 'interfaces' with the program.

User Interface Integration (PN)~ The base components that are included in the CRM SDK that you can use to build applications for customer care.

user interface language (n)~ The language in which all software (including the operating system) displays its menus, help files, error messages, and dialog boxes.

User Interface Privilege Isolation (PN)~ A window manager subsystem that blocks applications at a lower UI privilege level from sending messages to or hooking threads belonging to processes with a higher UI privilege level.

user interface privilege level (n)~ The integrity level that is stored in the access token of a process and that is used by the UI Privilege Isolation (UIPI) feature to determine if an application or process is permitted to send Windows messages to another application or process.

user interface virtualization (n)~ In Windows Presentation Foundation and Silverlight, a technique by which a subset of UI elements are generated from a larger number of data items based on which items are visible on the screen. Virtualization is a performance enhancement, because it is intensive, both in terms of memory and processor, to generate a large number of UI elements when only a few may be on the screen at a given time.

user isolation (n)~ A method, using user names, for separating and isolating content areas

within an FTP site. This is to ensure that users don't access FTP directories of one another.

User Local (PN)~ The behavior property of a Date and Time attribute where field values are displayed in the user's local time.

user locale (n)~ The user preferences for the formatting of dates, currencies, numbers, and so on. The user locale is a per-user setting, and does not require the user to restart or to log on or log off the computer.

user management administrator (n)~ A Microsoft Online Services administrator who manages user accounts, groups, and password resets, manages support tickets, and monitors services health.

User Manager (PN)~ A part of Microsoft CRM Deployment Manager. Its primary function is to create multiple Microsoft CRM user accounts in specific groups, such as salespeople in specific departments or regional divisions.

user migration (n)~ The process of moving user details, mail folders, and Active Directory data to a hosted Microsoft Exchange Server environment.

user mode (n)~ The nonprivileged processor mode in which application code, including protected subsystem code, executes. User-mode applications cannot gain access to system data except by calling subsystem-supplied functions, which, in turn, call system services.

user mode (n)~ The mode of the Surface unit when the Surface Shell and applications can run. In this mode, the Windows user interface and functionality are suppressed.

user mode account (n)~ The user account that the software uses to log on user mode.

user mode exception (n)~ An exception that occurs while executing a normal application (in Word, Excel, etc)

user name (n)~ A unique name that identifies a user account to operating system. An account's user name must be unique among the other group names and user names within its own domain or workgroup.

user name (n)~ A unique identifying string for a specific database user.

User Name Mapping (n)~ A service that maps UNIX user and group accounts to their Windows equivalents and thath the NFS services can use for file system access control list (ACL) mapping.

User Network (n)~ A worldwide network of UNIX systems that has a decentralized administration and is used as a bulletin board system by special-interest discussion groups. Usenet, which is considered part of the Internet (although Usenet predates it), is comprised of thousands of newsgroups, each devoted to a particular topic. Users can post messages and read messages from others in these newsgroups in a manner similar to users on dial-in BBSs. Usenet was originally implemented using UUCP (UNIX-to-UNIX Copy) software and telephone connections; that method remains important, although more modern methods, such as NNTP and network connections, are more commonly used.

user notification (n)~ A notification that an application sends to inform users about important information while the application is running.

user object (n)~ An object from Window Manager, which includes windows, menus, cursors, icons, hooks, accelerators, monitors, keyboard layouts, and other internal objects. Users can configure Task Manager to display the number of USER objects currently being used by a process.

user object (n)~ An object in Active Directory that contains information about the user,

including user logon name, first name, last name, display name, and telephone number.

user password (oth)~ The password stored in each user's account. Each user generally has a unique user password and must type that password when logging on or accessing a server.

user principal name (n)~ A user account name (sometimes referred to as the user logon name) and a domain name identifying the domain in which the user account is located. This is the standard usage for logging on to a Windows domain. The format is: user@domain.com (as for an e-mail address).

user principal name suffix (n)~ The part of the user principal name (UPN) to the right of the @ character. The default UPN suffix for a user account is the DNS domain name of the domain that contains the user account. Alternative UPN suffixes may be added to simplify administration and user logon processes by providing a single UPN suffix for all users. The UPN suffix is only used within the Active Directory forest, and it is not required to be a valid DNS domain name.

user profile (n)~ A file that contains configuration information for a specific user, such as desktop settings, persistent network connections, and application settings.

user profile (n)~ A description of the eventual users of the solution in terms of geography, organizational and communication structures, user functions, resource availability, and other relevant information.

User profile (n)~ A form that holds predefined roles. Each user profile consists of predefined Quick Links, Alert rules, Favorites, and Metrics. Users must be assigned to a profile in order to access a respective role center.

user profile (n)~ A profile that defines the set of available actions, scope choices, and quota options available to a user role. Examples of profiles are App Controller Administrator, Cloud Manager, and Self-Service User.

User Profile Hive Cleanup Service (PN)~ A service that helps to ensure user sessions are completely terminated when a user logs off.

User Profile service (n)~ A shared service in Microsoft SharePoint Server that enables the creation and management of user profiles that can be accessed from multiple sites and farms.

User Provisioning (n)~ The assignment of access privileges and system resources to users, frequently automated to reduce ongoing support costs and force compliance with security policies.

user rights (n)~ Tasks that a user is permitted to perform on a computer system or domain.

user role (n)~ A combination of a profile and a scope. A profile defines actions that a user is allowed to perform. A scope defines the objects on which the actions can be performed.

user role (n)~ A set of permissions to objects in the database. Users who have been assigned the role can access these objects with the permissions specified in the role. The permissions determine what the user can do with the object -€" read, insert, modify, delete or execute.

user role (n)~ A method of granting permissions to specific users for groups of data. These permissions are based on a user role profile.

user role (n)~ A unique combination of members, scope, and quota.- A user role is based

on one and only one profile.

user role profile (n)~ A set of permitted operations and classes of data that users need access to so they can perform specific job duties.

User Self Trust Certificate (n)~ In the absence of a certification authority (CA) that is capable of issuing file encryption certificates, a certificate that is generated and digitally signed by applications on behalf of the user.

User Services (PN)~ Configuration settings that are used to help maintain presence information and manage conferencing.

User Services pool (PN)~ Provides presence information and helps to manage preferences.

User Services service (n)~ A Lync Server service that is used to help maintain presence information for users and to manage meetings and conferences.

User Settings (PN)~ A Windows SteadyState tool used for configuring shared user profiles.

User Solution Packaging (PN)~ An approach that packages together all content deployable to SharePoint — list templates, list instance, site template, files and declarative workflows.

user state capture (n)~ Capability to use default settings and algorithms of Windows Easy Transfer to capture user files and settings. This capability includes logic to determine additional file types that may have been created or modified by users. Without default logic, capture is based on defined manifest of where to look for and what file formats to look for.

User State Migration Tool (PN)~ The tool designed to help IT professionals migrate files and settings to the next version of the Windows-® operating system.

user story (n)~ A high-level description of a user goal that helps you estimate the work needed to achieve this goal. User stories are the fundamental element of planning agile projects.

user type (n)~ A DWORD that specifies how data is used. A user type is assigned to an identifier in the metabase.

user-based policies (n)~ Policies that are detailed enough to be applied to distribution groups, security groups, and individual users.

user-controlled scheduling (n)~ A feature that allows the user to specify manual or automatic scheduling on a per-task basis.

user-defined aggregate function (n)~ An aggregate function created against a SQL Server assembly whose implementation is defined in an assembly created in the .NET Frameworks common language runtime.

user-defined dimension (n)~ A user-created and user-modifiable dimension that is not assigned a dimension type that is recognized by PerformancePoint Planning Business Modeler. No built-in behavior is associated with it.

user-defined field (n)~ A field that you can define to track information specific to your business.

user-defined financial dimension type (n)~ A financial dimension mapped to a user-defined list of values.

user-defined message (n)~ Any message that is not a standard Windows message.

user-defined object (n)~ A custom object defined by the user.

user-defined style (n)~ A new style or a modification to a built-in style. User-defined styles always contain cascading style sheet formatting attributes.

user-defined type (n)~ A user-written extension to the scalar type system in SQL Server.

user-defined type (n)~ A base data type that is explicitly defined by using the pre-compiler typedef directive.

user-friendly (adj)~ Easy to learn and easy to use.

user-interface object (n)~ An object that provides functionality to the user-interface. For example, menu items, toolbar buttons, and accelerator keys are all user-interface objects.

user-interface thread (n)~ A thread that handles user input and responds to user events independently of threads executing other portions of the application.

user-level security (n)~ When using user-level security in an Access database, a database administrator or an object's owner can grant individual users or groups of users specific permissions to tables, queries, forms, reports, and macros.

username (n)~ The name by which a user is identified to a computer system or network. During the logon process, the user must enter the username and the correct password. If the system or network is connected to the Internet, the username generally corresponds to the leftmost part of the user's e-mail address (the portion preceding the @ sign, as in username@company.com).

user-preferred interface language (n)~ A language selected by the user for viewing menus, dialog boxes, messages, and Help files. If none is selected, the system-preferred language is displayed.

Users (PN)~ The unit of measure representing the number of users.

Users group (n)~ The group account that contains all user accounts. Access automatically adds user accounts to the Users group when you create them.

User's Guide (n)~ A comprehensive, printable reference for using the device.

USMT (PN)~ The tool designed to help IT professionals migrate files and settings to the next version of the Windows-® operating system.

USN (n)~ In Active Directory replication, a 64-bit counter that is maintained by each Active Directory domain controller. At the start of each update transaction (originating or replicated) on a domain controller, the domain controller increments its current USN and associates this new value with the update request.

UTC (oth)~ The standard time common to every place in the world, coordinated by the International Bureau of Weights and Measures. Coordinated Universal Time is used for the synchronization of computers on the Internet.

UTF-8 (n)~ A character set for protocols evolving beyond the use of ASCII. The UTF-8 protocol provides for support of extended ASCII characters and translation of UCS-2, an international 16-bit Unicode character set. UTF-8 enables a far greater range of names than can be achieved using ASCII or extended ASCII encoding for character data.

Utilities (PN)~ The Developer tools subcategory containing apps to help developers create apps.

Utilities & tools (PN)~ An app category to help your PC or mobile device work better.

utility (n)~ A computer program that performs a specific support function required by the operating system, by other programs, or by system users.

utility cmdlet (n)~ A cmdlet that acts against any object rather than one that retrieves data from the system.

utility control point (n)~ A network node that provides the central reasoning point for the SQL Server Utility. It uses Utility Explorer in SQL Server Management Studio (SSMS) to organize and monitor SQL Server resource health.

utility program (n)~ A computer program that performs a specific support function required by the operating system, by other programs, or by system users.

Utility Reader (PN)~ A privilege that allows the user account to connect to the SQL Server Utility, see all viewpoints in the Utility Explorer in SSMS and see settings on the Utility Administration node in Utility Explorer in SSMS.

utilization (n)~ The number of hours that a contact worked during a time period, that is, the sum of all hours on all time slips during the period.

utilization hour (n)~ An hour that is included in a calculation as billable or efficient.

UUENCODE (n)~ An encoding mechanism that converts binary data into printable ASCII characters so that the data can be included in the message body without violating SMTP conventions.

UUID (n)~ A 16-byte value generated from the unique identifier on a device, the current date and time, and a sequence number. It is used to identify a particular device, component, user, or session.

UWB (n)~ A wireless technology similar to radar that is centered on the 200MZ to 4GHz band.

UWP (PN)~ The converged Windows platform that enables the creation of Windows apps, games, and drivers that can target every Windows 10 device.

UWP app (n)~ A Windows app that targets the Windows 10 Universal Windows Platform (UWP).

UWP Bridge (PN)~ A toolkit of tools and run-time technologies that enable a developer to bring existing code from another code base into the Universal Windows Platform. Each toolkit will vary in terms of the tooling and run-time technologies that it provides, but all of them make it easier to quickly bring code from its code base- to the Windows Store.

V.34 (n)~ A data transmission standard that provides for up to 33,600 bits per second (bps) communications over telephone lines. It defines a full-duplex (two-way) modulation technique and includes error-correcting and negotiation.

V.90 (n)~ A data transmission standard that provides for up to 56,000 bits per second (bps) communications over telephone lines. The transmission speed from the client-side modem is 33,600 bps, the same as for V.34. The transmission speed from the host-side modem, such as an Internet service provider (ISP) or corporate network, is up to 56,000 bps, with an average speed of 40,000 to 50,000 bps. When the host-side modem does not support this standard, the alternative is V.34.

V2V conversion (n)~ The process by which a functioning virtual machine created in VMware is converted' to an identical

VA (n)~ The activation of large numbers of software licenses.

VAC (n)~ The earned value field that shows the difference between the budget at completion [BAC] and the estimate at completion [EAC]. In Project, the EAC is the Total Cost field, and the BAC is the Baseline Cost field.

vacuumer (n)~ A tool for data removal.

valid (adj)~ Pertaining to syntax, a file (or other syntactical entity) which satisfies syntax rules.

Valid for Advanced Find (adj)~ A Boolean field that is used to indicate if an attribute can be used in Advanced Find.

valid time state table (n)~ A table that tracks the state of an entity over time using a valid-from and a valid-to column.

valid XML (n)~ A well-formed XML document that conforms to a specific set of constraints, usually defined in an XML schema.

validate (v)~ To compare files on local volumes with their associated data in secondary storage by Remote Storage. Validating files ensures that all the files on the managed volumes point to valid and correct data in remote storage. It also recalculates volume statistics.

validate (v)~ To ensure that all data sources that are used by a KPI or scorecard are available.

validate (v)~ To use an online process to confirm whether installed software was properly activated.

validation (n)~ The process of comparing files on local volumes with their associated data in secondary storage by Remote Storage. Volumes that are validated ensure that the correct data is recalled from remote storage when a user attempts to open the file from a local volume.

validation (n)~ The process of confirming that data passing into the system is correct and complies with predefined rules, definitions, or parameters.

validation (n)~ The process in which Microsoft tests an app to make sure it meets app requirements.

validation chain (n)~ A sequence of certificates, where each certificate in the sequence is

signed by the subsequent certificate. The last certificate in the chain is normally a self-signed certificate.

validation formula (n)~ Checks the data in a field as it is entered. It sets limits or conditions on what can be entered.

validation function (n)~ A function that determines whether or not a string meets certain requirements.

validation rule (n)~ A property that defines valid input values for a field or record in a table, or a control on a form.

validation server control (n)~ A server control, included with ASP.NET, that verifies user input. The input is checked as it comes from HTML server controls and Web server controls (for example, a Web page form) against programmer-defined requirements. Validation controls perform input checking in server code. If the user is working with a browser that supports DHTML, the validation controls can also perform validation using client script.

validation test (n)~ A test that ensures that the functionality called for in a scenario or quality of service requirement is working.

validator (n)~ A server control, included with ASP.NET, that verifies user input. The input is checked as it comes from HTML server controls and Web server controls (for example, a Web page form) against programmer-defined requirements. Validation controls perform input checking in server code. If the user is working with a browser that supports DHTML, the validation controls can also perform validation using client script.

validity check (n)~ The process of analyzing data to determine whether it conforms to predetermined completeness and consistency parameters.

validity period (n)~ The amount of time a defined credential is deemed to be trusted.

valuation allowance (n)~ An account that is used to reduce the gross cost of an asset to then arrive at the net cost.

value (n)~ A quantity assigned to an element such as a variable, symbol, or label.

value axis (n)~ A chart axis that displays scaled numerical values.

value converter (n)~ A class that is used to convert values from one type to another. Useful when data binding when the source and target properties have mismatching types.

value expression (n)~ An expression in Multidimensional Expressions (MDX) that returns a value. Value expressions can operate on sets, tuples, members, levels, numbers, or strings.

value list (n)~ A list of values used by some application, such as a database, as a search string or as values for a filtered query.

value mapping (n)~ The translation of field data values based on business rules.

value model (n)~ A method of changing the monetary value of a fixed asset over time for different purposes, such as accounting depreciation, tax depreciation, revaluation, and disposal.

value stream (n)~ An operating unit that controls one or more production flows.

value substitution (n)~ A string substitution performed on XML elements as a document passes through the pipeline.

value type (n)~ A data type that is represented by the type's actual value. If a value type is assigned to a variable, that variable is given a fresh copy of the value. (This is in contrast

to a reference type, where assignment does not create a copy.) Value types are usually created on a method's stack frame, rather than in the garbage-collected heap. A value type can be boxed, which is a process that creates a corresponding reference type.

value-added network (n)~ A private network provider that is hired by a company to facilitate electronic data interchange (EDI) or provide other network services.

value-added reseller (n)~ A company that adds features or customizations to an existing product and then re-sells that product to a customer.

value-added tax (n)~ A tax on products at each stage of their production based on the value added during that stage.

value-added tax (n)~ A tax on goods or services that is applied to each sale of the good or service. Each company is liable for apying to the tax authorities the VAT for goods or services that they have sold, but to subtract from that amount the tax for goods or services that they have purchased.

VAMT (PN)~ An MMC snap-in that enables IT professionals to automate and centrally manage the Windows and Microsoft Office volume and retail activation process. VAMT can manage volume activation by using Multiple Activation Keys (MAKs) or the Windows Key Management Service (KMS).

VAN (oth)~ A private network provider that is hired by a company to facilitate electronic data interchange (EDI) or provide other network services.

vanishing point (n)~ A point that represents where the perspective recedes in your drawing. You can move the vanishing point to any location on the drawing page. When you drag a raised block shape onto this drawing page, the shape orients so that its perspective lines point to the vanishing point.

vanity URL (n)~ An alternate URL that is typically shorter and/or easier to remember and communicate than the original address, or that incorporates a creative name that associates it with a particular product or subject matter.

Vaporware ~ Derogatory term for- software- which is announced but fails to materialise.

VAR (n)~ A company that adds features or customizations to an existing product and then re-sells that product to a customer.

varbinary (n)~ A variable-length data type with a maximum of 8,000 bytes of binary data.

varchar (PN)~ The variable-length data type with a maximum of 8,000 ANSI characters.

variable (n)~ A named storage location capable of containing data that can be modified during program execution.

variable (n)~ A global value that is used to define a frequently used setting, such as a directory path to common files or server names.

variable award (n)~ An individual provision of some form of variable compensation.

variable bit rate (n)~ A characteristic of a data stream in which the bit rate fluctuates, depending upon the complexity of the data.

variable compensation (n)~ Compensation, contingent on discretion, performance, or results, that is awarded to an employee by an organization.

variable consumption (n)~ Specification that the volume or quantity of a component used in a finished item is proportional to the number of items produced or reported as finished.

variable cost (n)~ A cost that varies based on production or sales volume.

variable expression (n)~ An expression that depends on the value of at least one variable and, hence, must be evaluated during program execution.

variable grid (n)~ Grid lines that change as you change the magnification of a drawing. When you zoom in, grid lines are closer together. When you zoom out, grid lines are farther apart.

variable initializer (n)~ An assignment statement that is executed when the variable's class is initialized.

variable material consumption (n)~ The time-based quantity of material resource to be used in an assignment. A variable consumption indicates that the amount of material that is used changes if the task duration or assignment length changes.

variance (n)~ The difference between two values, such as the difference between estimated and actual expenses.

variance (n)~ The difference between an expected and an actual economic resource.

variance at completion (n)~ The earned value field that shows the difference between the budget at completion [BAC] and the estimate at completion [EAC]. In Project, the EAC is the Total Cost field, and the BAC is the Baseline Cost field.

variant (n)~ A single combination of the attributes that are available for a product. For a given type of shirt for example, each combination of color and size is a variant.

variant configuration technology (n)~ A method of modeling product masters and searching for product variant configurations.

Variant data type (n)~ The default data type for variables that don't have type-declaration characters when a Deftype statement isn't in effect. A Variant can store numeric, string, date/time, Null, or Empty data.

variant expression (n)~ Any expression that can evaluate to numeric, string, or date data, as well as the special values Empty and Null.

Variation Labels (n)~ Sets of language collections with user-defined, language-specific formats and behaviors that can be applied to page layout. CMS supports up to 50 different labels.

VAT (n)~ A tax on products at each stage of their production based on the value added during that stage.

VAT ID (n)~ A unique number governments issue to companies and citizens in order to track taxes paid on goods and services. VAT IDs in the European Union contain a country prefix followed by up to 12 digits or characters.

vault (n)~ A set of credentials that users can create, store and manage in Credential Manager.

VB (n)~ A trademarked name owned by Microsoft Corporation for a high-level, visual-programming version of Basic. Visual Basic was designed for building Windows-based applications.

VBA (n)~ A macro-language version of Visual Basic that is used to program many Windows applications and is included with several Microsoft applications.

VBA Converter (PN)~ A tool that converts Visual Basic for Applications macros that are opened or saved in a previous format.

VBA project (n)~ A collection of the modules, class modules, and user forms that are

needed to create an application. Modules, class modules, and user forms can be imported into and exported from a project.

VBR (n)~ A characteristic of a data stream in which the bit rate fluctuates, depending upon the complexity of the data.

VBScript (PN)~ A scripting language that is used to create interactive or animated content for the Internet, such as games or advanced financial applications. VBScript is based on Microsoft Visual Basic syntax.

VBX (PN)~ A software module that, when called by a Visual Basic application, produces a control that adds some desired feature to the application. A VBX is a separate executable file, usually written in C, that is dynamically linked to the application at run time and can be used by other applications, including some applications not developed in Visual Basic. Although VBX technology was developed by Microsoft, most VBXs have been written by third-party developers. VBXs are still in use, but the technology has been superseded by OCXs and ActiveX controls.

VC-1 (n)~ A high-quality, industry-standard codec based on Windows Media Video Version 9. VC-1 is optimized for encoding video intended for professional broadcast and video streaming and offers compression quality greater than MPEG-2.

vCalendar (n)~ The file name extension of a file containing calendar information that can be shared among different calendar programs.

vCard (n)~ A commonly used file format for storing contact information. Contacts that use the vCard format are stored as .vcf files.

VCC (n)~ An end-to-end connection consisting of concatenations of two or more virtual channels between two end points.

VCD (PN)~ A recording format that can store about 70 minutes of video on a CD. Video CDs play on most Windows computers and DVD players. VCD image quality is about the same as that of a VHS cassette.

VCI (n)~ A section of the asynchronous transfer mode (ATM) cell header that contains the virtual channel address over which the cell is to be routed.

VCR (n)~ An analog magnetic recording and playback machine used to record and view full-motion video.

VDS (n)~ A set of application programming interfaces (APIs) that provides a single interface for managing disks. VDS uses two sets of providers to manage storage devices. The built-in VDS software providers enable the management of disks and volumes at the operating system level. The VDS hardware providers enable the management of disk storage subsystems and are supplied by the hardware vendor.

vector (n)~ In computer graphics, a line drawn in a certain direction from a starting point to an endpoint, both of whose locations are identified by the computer using x-y-coordinates on a grid. Vectors are used in the output of some graphics programs instead of groups of dots (on paper) or pixels (on screen).

vector artwork (n)~ An image generated from a mathematical description that determines the position, length, and direction in which lines are drawn. A vector graphic is created as a collection of lines rather than as a pattern of individual dots or pixels.

vector font (n)~ A font rendered from a mathematical model, in which each character is defined as a set of lines drawn between points. Vector fonts can be cleanly scaled to any

size or aspect ratio.

vector graphic (n)~ An image generated from a mathematical description that determines the position, length, and direction in which lines are drawn. A vector graphic is created as a collection of lines rather than as a pattern of individual dots or pixels.

Vector Markup Language (n)~ An XML-based specification for the exchange, editing, and delivery of 2-D vector graphics on the Web. An application of XML (Extensible Markup Language), VML uses XML tags and Cascading Style Sheets to create and place vector graphics, such as circles and squares, in an XML or HTML document, such as a Web page. These graphics, which are rendered in the native operating system, can include color and are editable in a variety of graphics programs.

vector path (n)~ A vector-based shape that is made up of one or more line segments connected by two or more anchor points. Paths can be made from a combination of straight lines and curves, each of which may be made up of many connecting points. All paths can be stroked or filled.

vectorization (n)~ The process of converting raster graphics into vector graphics.

VEIL (oth)~ A technology for encoding low-bandwidth digital data bitstream in video signal, which enables broadcasters to encode information into TV commercials that can be detected by special machines but that cannot be seen by the human eye.

velocity (n)~ A measure of the work accomplished per unit of time.

velocity (n)~ In Scrum, velocity is how much product backlog effort a team can handle in one sprint. This can be estimated by viewing previous sprints, assuming the team composition and sprint duration are kept constant. It can also be established on a sprint-by-sprint basis, using commitment-based planning. Once established, velocity can be used to plan projects and forecast release and product completion dates

velocity report (n)~ A report that provides a measure of the rate of work accomplished per iteration unit of time.

vendor (n)~ A party that supplies products to one or more legal entities in exchange for payment.

vendor analysis report (n)~ A document that displays vendor invoice amounts summarized by one or more dimensions. A vendor analysis report is used to monitor and control expenditures assigned to parties, products, locations, activities, or one or more of their classifiers.

vendor catalog (n)~ A listing of product offerings that are available for purchase from a vendor.

Vendor Evaluation and Consolidation (oth)~ A template that addresses the general activities that make up the vendor evaluation and consolidation process.

vendor invoice (n)~ A source document that documents a vendor payment request. A vendor invoice can refer to one or more purchase orders. When the vendor invoice is authorized, a payment can be made to the vendor.

vendor prepayment (n)~ A payment made to a vendor before any items are received or services are performed.

vendor price tolerance group (n)~ A group that can be assigned to vendors and that controls the allowable price variance percentage for invoice matching.

vendor request (n)~ Requests by vendors and employees to add and modify the vendors

approved to do business for an organization.

vendor user (n)~ An external user who has access to either the Microsoft Dynamics AX client or an Enterprise Portal web portal.

vendor-neutral ~ A state in which no one vendor can control the definition, revision or distribution of a specification.

Venn diagram (n)~ A diagram that is used to show areas of overlap between and among elements.

vennootschapsbelasting (n)~ A corporation tax in the Netherlands.

verb (n)~ A user interface element in a Web Parts application that an end user can click to perform actions such as closing, minimizing, restoring, editing, or deleting a Web Parts control. Developers can also add custom verbs to controls. Web Parts verbs are based on the System.Web.UI.WebControls.WebParts.WebPartVerb class.

verb (n)~ A command displayed in the shortcut (context) menu. Examples include open and print.

verb control block (n)~ A structure made up of variables which identifies the verb to be executed, supplies information to be used by the verb, and contains information returned by the verb when execution is complete.

verbose mode (n)~ A mode that presents the user with additional or more detailed information.

verbosity level (n)~ The amount of information to display in the build log.

verbs menu (n)~ A menu in the title bar of a part control that contains various verbs (UI actions that apply to an individual control) such as Close, Minimize, Restore, Delete, Export, Edit, Help, and others, as well as custom verbs implemented by developers.

verification (n)~ A part of the compilation process in which code is checked for conformance to a specific set of rules defined to allow proof of certain security requirements. The common language runtime can verify Common Intermediate Language (CIL).

verification (n)~ The process in which a developer tests an app to make sure it meets app requirements.

verification certificate (n)~ A certificate that represents the public-key portion of a token-signing certificate. A verification certificate is stored in the trust policy and used by the federation server in one organization to verify that incoming security tokens have been issued by valid federation servers in the organization's farm and in other organizations.

verifier provider (n)~ A utility that analyzes data from the verifier.dll to determine things like timing and called APIs.

verifier stop (n)~ A message that is displayed when a violation has been found in an application being tested.

version (n)~ A numeric or other designation appended to a product name to identify a particular release.

version (n)~ Metadata that identifies a change made to an item in a replica. It consists of the replica key and the replica tick count for the item.

version (n)~ The status of an item in source control that reflects one or more changes from a previous form. The greater the version number, the more recent the version.

version (n)~ A property that is used to differentiate objects stored in the cache using the

same key. Windows Server AppFabric stores the version information using the DataCacheItemVersion class. Every time an object is added or updated in the cache, the version value changes. Versioning is used to maintain data consistency. Optimistic concurrency is achieved by using versioning as opposed to locks.

version (n)~ The status of an entity participating in a release process.

version control (n)~ The process of maintaining a database of all the source code and related files in a software development project to keep track of changes made during the project.

version control label (n)~ A word, symbol, or other group of characters used to identify a snapshot of a set of files at a specific point in time. It is often applied by an automated build process. It can be used to view, build, or even roll back a large set of files to the state they were in when the label was applied.

version history (n)~ A feature that tracks and stores a record of a shared document when it is first created, and each time it is edited.

version limit (n)~ The number of previous major versions of a document to retain in the repository when the document is approved.

version number (n)~ A number assigned by a software developer to identify a particular program at a particular stage, before and after public release. Successive public releases of a program are assigned increasingly higher numbers. Version numbers usually include decimal fractions. Major changes are usually marked by a change in the whole number, whereas for minor changes only the number after the decimal point increases.

version policy (n)~ The rules that specify which version of dependent assemblies to bind to. Version polices are expressed using configuration files.

version stamp (n)~ A monotonically increasing integer that serves as the version of a configuration object.

versioning (n)~ A feature that enables you to store, track, and restore items in a list and files in a library as they are changed.

vertex (n)~ A handle at intersections between segments, lines or curves that comprise a shape.

vertex (n)~ The highest point of a curve, the point where a curve ends, or the point where two line segments meet in a polygon or freeform path.

vertex (n)~ A data structure that describes the attributes of a graphical object, among which, the position of a point in 2D or 3D space.

vertex buffer (n)~ Memory buffer that contains vertex data.

vertex data (n)~ Data about a graphical object including position coordinates, color data, texture coordinate data, normal data, and so on.

vertical (n)~ A segment of the marketplace, not all of it at once.

Vertical (PN)~ The Structure that places content on a vertical axis and allows users to navigate through it from top to bottom.

vertical alignment (n)~ The consistent vertical positioning of text, graphics, and other objects.

Vertical Arrow List (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow that move toward a common goal. Works well for bulleted lists of information.

vertical axis (n)~ The vertical reference line on a grid, chart, or graph that has horizontal and vertical dimensions.

vertical bar (n)~ The | character.

Vertical Bending Process (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow. Maximizes both horizontal and vertical display space for shapes. Places more emphasis on the interrelationships among the shapes than on direction or movement.

Vertical Block List (PN)~ A SmartArt graphic layout used to show groups of information or steps in a task, process, or workflow. Works well with large amounts of Level 2 text. A good choice for text with a main point and multiple sub-points.

Vertical Box List (PN)~ A SmartArt graphic layout used to show several groups of information, especially groups with large amounts of Level 2 text. A good choice for bulleted lists of information.

Vertical Bullet List (PN)~ A SmartArt graphic layout used to show non-sequential or grouped blocks of information. Works well for lists with long headings or top-level information.

Vertical Chevron List (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow, or to emphasize movement or direction. Emphasizes Level 2 text over Level 1 text, and is a good choice for large amounts of Level 2 text.

Vertical Equation (PN)~ A SmartArt graphic layout used to show sequential steps or tasks that depict a plan or result. The last Level 1 line of text appears after the arrow. Works best with Level 1 text only.

vertical filtering (n)~ Filtering columns from a table. When used as part of replication, the table article created contains only selected columns from the publishing table.

VERTICAL LINE (n)~ The | character.

vertical offset (n)~ The distance, in device independent pixels, that the viewport has been scrolled from its top side.

vertical partitioning (n)~ The process of splitting a single table into multiple tables based on selected columns. Each of the multiple tables has the same number of rows but fewer columns.

Vertical Picture Accent List (PN)~ A SmartArt graphic layout used to show non-sequential or grouped blocks of information. The small circles are designed to contain pictures.

Vertical Picture List (PN)~ A SmartArt graphic layout used to show non-sequential or grouped blocks of information. The small shapes on the left are designed to contain pictures.

Vertical Process (PN)~ A SmartArt graphic layout used to show a progression or sequential steps in a task, process, or workflow from top to bottom. Works best with Level 1 text, since the vertical space is limited.

vertical ruler (n)~ A bar displayed along the left side of a document window. You can use the vertical ruler to adjust the top and bottom page margins and the row height in tables.

vertical search (n)~ A type of search which is restricted to a specific domain, such as news search, image search, local search.

vertical solution (n)~ An add-on software solution that complements the functionality of a product and that focuses on industry-specific needs.

vertical split (n)~ A vertical orientation of the CIDER shell.

Vertipaq (PN)~ A high performance analytics engine that uses compressed in-memory column-oriented storage to manage large volumes of data and deliver fast response to user queries.

very important person (n)~ A person with a high rank or special status, who usually receives special treatment.

very large database (n)~ A database that has become large enough to be a management challenge, requiring extra attention to people, processes, and processes.

vesting schedule (n)~ The manner in which-long term variable compensation is distributed to an employee. Long-term incentives are awarded at one time but distributed at a later time.

VFAT (n)~ The file system driver software used under the Windows 9x Installable File System Manager (IFS) for accessing disks. VFAT is compatible with MS-DOS disks but runs more efficiently. VFAT uses 32-bit code, runs in protected mode, uses VCACHE for disk caching, and supports long filenames.

VGA ~ (Video Graphics Array)- An early colour graphics standard for PCs, now used as a sort of lowest common denominator which all monitors and graphics cards understand.

VGS (PN)~ The set of software drivers and services -€" such as Integration Services (for Hyper-V) or Virtual Machine Additions (for Virtual Server) -€" installed on a virtual machine that help maximize performance and enhance the user interface experience for a virtual machine.

via (n)~ A copper-plated hole that goes all the way through a PCB and allows a connection between wires on different layers of the PCB.

Vibrate (PN)~ An option that causes the device to vibrate instead of playing an audible notification or alert tone.

Vibrate (PN)~ A profile that causes the device to vibrate as opposed to ring.

Video (PN)~ The brand name of the video offering from Xbox Live.

video (n)~ An audiovisual recording.

video (n)~ Any phone call that includes a video component, where you can see the person that you're talking to (and they can see you).

Video (PN)~ An MSN site that allows the user to access the latest news, sport, entertainment, lifestyle and cars videos.

video accelerator (n)~ A video card that contains a graphics coprocessor. A graphics accelerator can update the video display much more quickly than the CPU can, and it frees the CPU for other tasks. A graphics accelerator is a necessity for modern software such as graphical user interfaces and multimedia applications.

video call (n)~ In Windows Live Messenger and Windows Live Mail desktop, a video exchange through instant messages between two or more people.

video call (n)~ A call that connects Lync users with peer-to-peer capabilities. Users can start a video call by pointing to a contact in the Contacts view and then clicking the video call icon.

video call (n)~ Any phone call that includes a video component, where you can see the

person that you're talking to (and they can see you).

video call (n)~ A free internet call between two Skype users seeing each other via webcam.

Video Capable (n)~ A status on a Lync contact card that indicates a camera is enabled.

video card (n)~ The electronic components that generate the video signal sent through a cable to a video display. The video adapter is usually located on the computer's main system board or on an expansion board, but it is sometimes built into the terminal.

video carousel (n)~ A slide show of MSN videos that displays in the advertising space of the main Main messenger window.

video cassette recorder (n)~ An analog magnetic recording and playback machine used to record and view full-motion video.

Video CD (n)~ A recording format that can store about 70 minutes of video on a CD. Video CDs play on most Windows computers and DVD players. VCD image quality is about the same as that of a VHS cassette.

video chat (n)~ A free internet call between two Skype users seeing each other via webcam.

video clip (n)~ A file that contains a short video item, usually an excerpt from a longer recording.

Video Conversation (n)~ A button in the conversation window that starts a video conversation with the participants of the current conversation.

video conversation (n)~ An instant message conversation in which one or both participants is broadcasting a video feed by using a camera.

video digitizer (n)~ A device used in computer graphics that uses a video camera, rather than a scan head, to capture a video image and then stores it in memory with the aid of a special-purpose circuit board.

video encoded invisible light (oth)~ A technology for encoding low-bandwidth digital data bitstream in video signal, which enables broadcasters to encode information into TV commercials that can be detected by special machines but that cannot be seen by the human eye.

video frame (n)~ One of many sequential images that make up video.

video game (n)~ A class of computer program in which one or more users interact with the computer as a form of entertainment. Computer games run the gamut from simple alphabet games for toddlers to chess, treasure hunts, war games, and simulations of world events. The games are controlled from a keyboard or with a joystick or other device and are supplied on disks, on CD-ROMs, as game cartridges, on the Internet, or as arcade devices.

Video Left (n)~ A credit animation in Windows Movie Maker.

video light (n)~ The phone's LED light used during video capture to help exposure in dark conditions.

video look-up table (n)~ When a graphic is created or edited, the user may specify a CLUT that corresponds with the needs of print, Web, or other destination media. In Web design, a specific CLUT of browser-safe colors is used to be certain graphics and designs will display consistently across different platforms and with different browsers.

video mail (n)~ A short video sent as an email message to someone in the contact list.

video memory (n)~ A type of memory used by video cards to store information that will be displayed on a monitor. The amount of video memory dictates the maximum resolution and color depth available for the display.

video message (n)~ A short video sent as an email message to someone in the contact list.

video message (n)~ A short video clip that can be recorded by a user and left for an offline contact.

Video Messages (PN)~ The feature that gives users a rich way to send video messages asynchronously to another user.

video messages (PN)~ The feature that gives users a rich way to send video messages asynchronously to another user.

video negotiation (n)~ A process in which a sending endpoint can determine the video capabilities of a receiving endpoint before it sends a video stream.

video on demand (n)~ A technology that includes systems, services, and standards for the interactive delivery of streaming video to multimedia clients such as digital set-top boxes.

video panorama (n)~ A secondary video window that automatically appears if someone clicks Video on the command bar and there is a RoundTable device present.

video phone (n)~ A device equipped with camera and screen, as well as a microphone and speaker, capable of transmitting and receiving video signals as well as voice over a telephone line. Using conventional telephone lines, a videophone can transmit only freeze-frame video.

video port (n)~ A connection that sends video information from one device to another. For example, a computer's video port sends video signals to a monitor.

video quality notifications (n)~ Alerts to Lync users about the quality of the network, computer, camera, and lighting conditions.

Video Search ~ The ability to search within a collection of videos, whether inside the enterprise or outside, whether under enterprise control or in another company's domain, is attracting interest in areas of content management as expectations sparked by- YouTube,- Hulu,Netflix,- Vimeo- and- Blinkx- enter the enterprise environment.

video snapshot (n)~ A picture taken with the webcam (during the call or any time).

Video Spotlight (PN)~ A mode that enables presenters to select one person's video feed so that every participant in the meeting sees that participant only.

video storage (n)~ A feature that enables the user to store video clips.

Video Store (PN)~ The section of the Store where you can purchase or rent movies and TV shows.

Video Styles (PN)~ A gallery of effects that users can apply to videos to create a customized, artistic look.

Video telepresence ~ a form of immersive video communication that creates the impression of being in the same room as other conference participants. Most telepresence suites run high-definition (HD) video resolution at 720p or 1,080p lines.

Video Top (n)~ A credit animation in Windows Movie Maker.

video transition (n)~ In video editing, the method of changing from one scene or clip to another. A cross-fade and a wipe are examples of transitions.

video upgrade (n)~ A Windows Phone feature to upgrade a phone call into a Skype video call.

videophone (n)~ A device equipped with camera and screen, as well as a microphone and speaker, capable of transmitting and receiving video signals as well as voice over a telephone line. Using conventional telephone lines, a videophone can transmit only freeze-frame video.

VidPN (n)~ A model that relates the video present sources on a display adapter to the video present targets on the adapter and specifies how those sources and targets are configured. It is an abstraction of the display adapter's presentational subsystem.

view (v)~ To cause an application to display information on a computer or device screen.

view (n)~ In relational database management systems, a logical table created through the specification of one or more relational operations on one or more tables. A view is equivalent to a divided relation in the relational model.

view (n)~ The display of data or an image from a given perspective or location.

View (n)~ A common menu item that enables the user to select how the contents of the current program are displayed.

view (n)~ In the Operations console, a display of a filtered set of data from the OperationsManagerDB database.

View (n)~ A filter for Ticket lists that displays Tickets based on specific criteria.

View all (PN)~ The link that appears above an incomplete content set and leads to the full list of items. For example, when a content module displays items 1-€"6, a View all' link in line with the module label leads to a webpage that lists all items. The items that are available in preview are redundantly available in the list of all items

View Bar (n)~ A screen element along the left edge of the Project window that provides buttons for the most commonly used views. The View Bar provides a convenient means of changing views by just clicking the icons that appear on the View Bar.

view box (n)~ A control that scales all of its child elements similar to a zoom control.

view generation (n)~ A repository engine feature that is used to create relational views based on classes, interfaces, and relationships in an information model.

view identifier (n)~ A value that identifies a view that is available for a UI Automation element that implements a control pattern.

View Lists right (n)~ A right that allows a user to view items in a list, document library, discussion board, or survey. Does not allow the user to add, modify, or remove the items.

view state (n)~ A mode of session state in which the entire session state is serialized and stored as a BLOB on the client then deserialized during every post-back. This has a tremendous hit in bytes over the wire (BoW), but is highly scalable in that it doesn't require storing information in the database.

view state (n)~ A state in which an app can be viewed. Full screen is the view state in which the app takes up the full screen. Snapped is the view state in which the app takes up the smaller portion of the screen (it becomes a snapped app). Fill is the view state in which the app takes up the larger and remaining portion of the screen when another app is snapped.- When an app is the main app, is in the fill view state.

view type (n)~ The basic structure of a view. When you create a view, you must first select one of five view types (table, timeline, day/week/month, card, or icon) to determine how information will be arranged and formatted in your new view.

viewed hyperlink (n)~ A hyperlink on a Web page that a site visitor has activated by

using a mouse device, keyboard, or other type of pointing device.

viewer (n)~ An application that displays or otherwise outputs a file in the same way as the application that created the file. An example of a viewer is a program to display the images stored in GIF or JPEG files.

View-Only Organization Management (PN)~ The administrator role group that gives users permissions to view, but not modify, all mailboxes, public groups, and external contacts in the organization. Members can also view settings for role assignment policies, transport rules, and supervision policies.

viewplane (n)~ The 2D coordinate system that defines the projected (camera) view of a 3D scene.

viewport (n)~ A virtual window, used for controls that display content, through which all or part of the content is visible. A viewport is typically used to display a particular portion of content when all of the content will not fit in the available display space. Compare to the extent size, which is the total width and height of the content.

viewport (n)~ The portion of a DataRepeater control on which repeated items will be displayed at run time.

viewport 3D (n)~ A control where you can author 3D content at design time on the artboard and then render it correctly at run time.

viewport extent (n)~ The width or height of the viewport.

viewport origin (n)~ The corner of the viewport from which the height and width of the viewport are measured.

vignette (n)~ An effect that adds gradual dark shading- at the edges of a photo.

Violence (n)~ A content descriptor developed by the Entertainment Software Rating Board (ESRB).

Violence (n)~ A content descriptor developed by the Pan European Gaming Information (PEGI) and the British Board of Film Classification (BBFC).

Violence (n)~ A content descriptor developed by the Computer Entertainment Rating Organization (CERO).

Violet Hues (PN)~ One of the background colors on the Screen Saver Settings dialog box that consists of a range of violet colors.

VIP (n)~ A person with a high rank or special status, who usually receives special treatment.

VIP (n)~ An IP address that is not connected to a specific computer or network interface card. Service deployments are assigned a VIP for receiving network traffic which is redirected to a physical device in the Microsoft Azure fabric.

viral provisioning (n)~ The automated creation of undifferentiated user profiles following invites that trigger the unattended execution of a script.

viral tenant (n)~ The instance of Azure Active Directory that is automatically created when provisioning multiple accounts at the same time from unattended scripting.

viral user (n)~ The user or customer that is brought over by another one.

virtual (adj)~ Of or pertaining to a device or service that appears to the user as something it actually is not or that does not physically exist.

virtual account (n)~ A Local Service account that does not require password management. A virtual account is separate from the Local Service, Local System, and

Network Service accounts. It uses the computer's account and credentials when it needs network access in a domain environment.

virtual address (n)~ In a virtual memory system, the address the application uses to reference memory. The kernel and the memory management unit (MMU) translate this address into a physical address before the memory is actually read or written.

virtual application (n)~ An application packaged by the Sequencer to run in a self-contained, virtual environment. The virtual environment contains the information necessary to run the application on the client without installing the application locally.

virtual channel (n)~ In Asynchronous Transfer Mode (ATM), the path taken by data sent from one sender to one receiver.

Virtual Channel Connection (n)~ An end-to-end connection consisting of concatenations of two or more virtual channels between two end points.

virtual channel identifier (n)~ A section of the asynchronous transfer mode (ATM) cell header that contains the virtual channel address over which the cell is to be routed.

virtual classroom (n)~ An online meeting for teaching and collaboration pertaining to a particular lesson.

virtual cluster (n)~ A Network Load Balancing cluster that you create by assigning specific port rules to specific virtual IP addresses. With virtual clusters, you can use different port rules for different Web sites or applications hosted on the cluster, provided each Web site or application has a different virtual IP address.

virtual COM (n)~ The subsystem that manages COM objects created by application processes running in a virtual environment and prevents conflict with the same objects created outside the virtual environment.

virtual community (n)~ The collective of people who interact through or use online resources.

virtual container (n)~ A container that allows any LDAP-compliant directory to be accessed through Active Directory.

virtual core (n)~ A core provided to the guest OS by the hypervisor.

virtual desktop (n)~ A desktop enhancement tool that provides access to the desktop when it is covered by open windows or that expands the size of the working desktop.

virtual desktop (n)~ A client operating system that is deployed by using a virtual machine to provide a self-contained operating environment that behaves as if it were a separate computer.

virtual desktop (n)~ The work area on a computer screen that contains different groups- of apps or content open and available for different tasks or aspects of your life. Each group of items is called a desktop or virtual desktop.

virtual desktop pool (n)~ A group of one or more identically configured virtual machines. Users can connect to any virtual machine in the pool by using RemoteApp and Desktop Connection. Because the virtual machines are identically configured, users will receive the same virtual desktop regardless of which virtual machine they connect to. Only one user can use a given virtual machine at a time, but the user is not assigned to a particular virtual machine.

virtual desktop template (n)~ A virtual machine that is configured as a template in a virtual desktop collection and is used to create new virtual desktops in that collection.

virtual DHCP server (n)~ An emulation of a Dynamic Host Configuration Protocol (DHCP) server. A virtual network can be configured to provide a virtual DHCP server, which offers dynamic configuration of IP addresses and related information to DHCP-enabled virtual machines.

virtual directory (n)~ A name used to access the contents of any Exchange store using a Web browser. The virtual directory name is used to open a mailbox as well as browse the folders of a public store. This name is also used in URLs using the Microsoft Internet Publishing Provider (MSDAIPP), which includes both hyperlinks in Web pages as well as Microsoft ActiveX Data Objects client-side code.

virtual directory (n)~ A directory name, used in an address, that corresponds to a physical directory on the server.

virtual directory (n)~ An opaque directory where only files and subdirectories defined in the application package or created through interaction with an application in a virtual environment are visible. Any files in an identically named local directory are not visible to the application.

virtual disk (n)~ A collection of one or more physical disks from a previously created storage pool.

Virtual Disk Service (n)~ A set of application programming interfaces (APIs) that provides a single interface for managing disks. VDS uses two sets of providers to manage storage devices. The built-in VDS software providers enable the management of disks and volumes at the operating system level. The VDS hardware providers enable the management of disk storage subsystems and are supplied by the hardware vendor.

virtual dispatch slot (n)~ An entry in an internally maintained table of functions that is used at runtime to look up virtual function calls in an object-oriented type.

virtual drive (n)~ A non-physical disk exposed to the user as if it were a real disk. The disk may be backed by either a file or memory.

virtual environment (n)~ A runtime container that defines the resources available to application processes launched from an application package. Resources include files, directories, registry keys and values, fonts, COM objects, and services. These resources originate from the application package but may be changed by the application. Changes to resources made by the application are isolated from other applications launched from different packages or by different users. Changes made by the application take precedence over package-defined resources and persist from one launch of the application to the next.

virtual environment (n)~ An environment composed of virtual machines.

Virtual Fibre Channel (PN)~ A Hyper-V technology that provides the guest operating system of a virtual machine with direct access to Fibre Channel-based storage by exposing Fibre Channel ports to the guest through a virtual Fibre Channel adapter.

virtual file (n)~ A file name within the virtual environment that is mapped to an alternate target location. A virtual file appears alongside other files in the containing directory, regardless of whether that directory is virtual or local.

virtual file system (n)~ The subsystem that intercepts and redirects file system requests from application processes running in a virtual environment. These requests are processed based on the virtual files and directories defined in the application package and created or modified through interaction with a virtual application.

virtual floppy disk (n)~ A file-based version of a physical floppy disk. A virtual floppy disk is stored as a file with a .vfd file name extension.

virtual folder (n)~ A list of files that match specific search or filter information. You create a virtual folder by specifying the types of files you want to find and saving that search information. Whenever you open a virtual folder it will search your computer again to find all files that match what you're looking for.

Virtual Guest Services (PN)~ The set of software drivers and services -€" such as Integration Services (for Hyper-V) or Virtual Machine Additions (for Virtual Server) -€" installed on a virtual machine that help maximize performance and enhance the user interface experience for a virtual machine.

virtual hard disk (n)~ The storage medium for a virtual machine. It can reside on any storage topology that the host operating system can access, including external devices, storage area networks, and network-attached storage. The file format is .vhd.

virtual IP (n)~ An IP address that is not connected to a specific computer or network interface card. Service deployments are assigned a VIP for receiving network traffic which is redirected to a physical device in the Microsoft Azure fabric.

virtual IP address (n)~ An IP address that is shared among the hosts of a Network Load Balancing cluster. A Network Load Balancing cluster might also use multiple virtual IP addresses, for example, in a cluster of multihomed Web servers.

virtual IP template (n)~ A template that contains configuration settings for how a load balancer should handle a specific type of network traffic.

virtual key code (n)~ A symbolic constant name, hexadecimal value, or mouse or keyboard equivalent that provides a hardware and language-independent method of identifying keyboard keys. Each virtual key code represents a unique keyboard key and also identifies the purpose of that key. The keyboard driver must provide one or more keyboard layouts that maps keyboard scan codes to the appropriate virtual key codes.

virtual LAN (n)~ A logical grouping of hosts on one or more local area networks (LANs) that allows communication to occur between hosts as if they were on the same physical LAN.

virtual link (n)~ A logical link between a backbone area border router and an area border router that is not connected to the backbone.

virtual local area network (n)~ A logical grouping of hosts on one or more local area networks (LANs) that allows communication to occur between hosts as if they were on the same physical LAN.

virtual log file (n)~ Non-physical files that are derived from one physical log file by the SQL Server Database Engine.

virtual machine (n)~ A software implementation of a computer that emulates a complete hardware system, from processor to network card, in a self-contained, isolated software environment, enabling the simultaneous operation of otherwise incompatible operating systems.

Virtual Machine Additions (n)~ A collection of software drivers that maximize performance and provide a better user interface (UI) experience within a virtual machine. Virtual Machine Additions are only available for supported guest operating systems.

virtual machine bus (n)~ A communications line used in Hyper-V by virtual machines

and certain types of virtual devices. The virtual devices that use virtual machine bus have been optimized for use in virtual machines.

virtual machine configuration (n)~ The configuration of the resources assigned to a virtual machine. Examples include devices such as disks and network adapters, as well as memory and processors.

virtual machine configuration file (n)~ An XML-based file that stores the configuration of the virtual machine.

Virtual Machine Connection (PN)~ A feature of Hyper-V that allows a running virtual machine to be managed remotely through an interactive session.

virtual machine deployment (n)~ The process of moving the configuration files for a virtual machine from the Virtual Machine Manager library to a virtual machine host.

virtual machine expiration (n)~ A feature of Virtual Machine Manager that enables an administrator to set the number of days after the created date when a virtual machine is retired from use by self-service users. Expired virtual machines no longer appear in the Virtual Machine Manager Self-Service Portal. However, the Virtual Machine Manager administrator still can manage the expired virtual machines. Expiration settings are applied transparently through the virtual machine templates with which self-service users create their virtual machines.

virtual machine host (n)~ A physical computer that is running virtualization software, such as Hyper-V, on which virtual machines can be deployed.

virtual machine identity (n)~ The virtual machine name in combination with the computer name of the virtual machine's host, which uniquely identify a virtual machine in Virtual Machine Manager. The virtual machine name is a different property- from the computer name of the guest operating system running inside the virtual machine.

Virtual Machine Management service (n)~ The Hyper-V service that provides management access to virtual machines.

Virtual Machine Manager (PN)~ A member of the Microsoft System Center suite of management products, Microsoft System Center Virtual Machine Manager 2007 (SCVMM) enables enterprise-wide management of virtual machines.

Virtual Machine Manager Administrator Console (PN)~ The console that provides access to the administrative functions of Virtual Machine Manager.

Virtual Machine Manager agent (n)~ Software that is installed on either a virtual machine host or a library server, which enables Virtual Machine Manager to monitor and manage hosts, virtual machines, and library resources. An agent is also installed on the source machine during a physical-to-virtual machine conversion.-

Virtual Machine Manager database (n)~ The SQL Server database that holds all Virtual Machine Manager configuration information.

Virtual Machine Manager library (n)~ The catalog of resources that can be used to create virtual machines in Virtual Machine Manager.

Virtual Machine Manager Self-Service Portal (PN)~ The Web site that users with the needed permissions and settings can use to manage their own virtual machines within a controlled environment. The Virtual Machine Manager administrator configures self-service policies to determine which users can use the self-service portal and what they can do.

Virtual Machine Manager server (n)~ A physical computer running Virtual Machine Manager.

Virtual Machine Manager service (n)~ The software component that runs Virtual Machine Manager.

Virtual Machine Manager toolbar (n)~ A toolbar in the main Virtual Machine Manager Administrator Console that includes commands for hiding or displaying the Actions pane, customizing columns in the current view, opening the Job Tracking Status Window to monitor the status your own jobs, and opening Virtual Machine Manager Help.

virtual machine migration (n)~ The process of moving a deployed virtual machine from its current virtual machine host to another host.

virtual machine name (n)~ The name that, in combination with the computer name of the virtual machine's host, uniquely identifies a virtual machine in Virtual Machine Manager. The virtual machine name is a different property from the computer name of the guest operating system.

virtual machine ownership (n)~ The ownership under which an owner can operate and manage a designated virtual machine through the Virtual Machine Manager Self-Service Portal. If a self-service policy is created for a group, the group can have either per user ownership of virtual machines or shared ownership of virtual machines.

virtual machine permissions (n)~ Permissions that determine which actions self-service users can perform on their own virtual machines. The permissions allow users to create, delete, start, stop, pause, and resume their own virtual machines, serve as a local administrator on their virtual machines, and access their virtual machines remotely by using Virtual Machine Remote Control (VMRC).

virtual machine placement (n)~ The process of selecting the most suitable host to deploy a virtual machine on.

virtual machine preservation (n)~ The process of updating a host operating system, maximizing uptime of the virtual machine(s) that it hosts.

Virtual Machine Queue (PN)~ A feature that uses hardware packet filtering to deliver packet data from an external virtual machine network directly to virtual machines, which reduces the overhead of routing packets and copying them from the management operating system to the virtual machine.

virtual machine quota (n)~ A limit that is placed on the number of deployed virtual machines for a user or group in virtual machine self-service. Each virtual machine can add zero or more quota points toward a virtual machine quota that is set for a self-service policy. If the self-service policy is associated with a group, the quota either can be shared by all group members (under shared ownership) or can apply to each group member individually (under per user ownership). The quota does not apply to stored virtual machines.

Virtual Machine Remote Control (n)~ A feature of Virtual Server that allows a running virtual machine to be managed remotely.

virtual machine role (n)~ A cloud service role that provides a customer-customizable virtual machine image.

virtual machine self-service (n)~ The Virtual Machine Manager feature that enables users to manage their own virtual machines within a controlled environment.

virtual machine snapshot (n)~ A file-based snapshot of the state, disk data, and configuration of a virtual machine at a specific point in time.

virtual machine template (n)~ A library resource consisting of a guest operating system profile, a hardware profile, and one or more virtual hard disks (.vhd files), which can be used to create a new virtual machine. Computer identify information must have been removed from the .vhd file that contains the operating system files by using the System Preparation tool (Sysprep). Self-service users must use designated templates to create their virtual machines.

virtual machine-based desktop deployment (n)~ A deployment that allows users to run multiple client operating systems on a single server hosted on Hyper-V.

Virtual Machines (PN)~ The Infrastructure-as-a-Service (IaaS) offer in Microsoft Azure that allows customers to deploy persistent virtual machines with nearly any server workload they want.

Virtual Machines view (n)~ The view in the Virtual Machine Manager Administrator Console in which the administrator monitors, operates, migrates, clones, and creates checkpoints for virtual machines that are deployed on a virtual machine host.

virtual memory (n)~ Temporary storage used by a computer to run programs that need more memory than is physically installed on the computer.

Virtual Memory Size (n)~ In Task Manager, the amount of virtual memory, or address space, committed to a process.

virtual name space (n)~ The set of all hierarchical sequences of names that can be used by an application to locate objects. One such sequence of names defines a path through the virtual name space, regardless of whether the hierarchy of names reflects the actual arrangement of objects around the system. For example, the virtual name space of a Web server consists of all possible URLs on the network on which it runs.

virtual namespace (n)~ The set of all hierarchical sequences of names that can be used by an application to locate objects. One such sequence of names defines a path through the virtual name space, regardless of whether the hierarchy of names reflects the actual arrangement of objects around the system. For example, the virtual name space of a Web server consists of all possible URLs on the network on which it runs.

virtual network (n)~ A virtual version of a physical network switch. A virtual network can be configured to provide access to local or external network resources for one or more virtual machines.

Virtual Network (PN)~ The networking service in Microsoft Azure that lets customers create and manage virtual private networks in Microsoft Azure and securely link them to other virtual networks or their own on-premises networking infrastructure.

virtual network adapter (n)~ The logical or software instance of a physical network adapter that allows a physical computer or a virtual machine to connect to a network or the Internet.

virtual network number (n)~ A 4-byte hexadecimal number used for addressing and routing purposes. The internal network number identifies a virtual network inside a computer. The internal network number must be unique to the IPX internetwork.

virtual object (n)~ Any content or control in an application that a user can interact with, i.e. a menu, a button, the background, etc.

virtual path (n)~ A sequence of names that is used to locate a file and that has the same form as a pathname in the file system but is not necessarily the actual sequence of directory names under which the file is located. The part of a URL that follows the server name is a virtual path. For example, if the directory c:\bar\sinister\forces\distance on the server miles is shared on the local area network at foo.com under the name \miles\baz and contains the file elena.html, that file may be returned by a Web request for http://miles.foo.com/baz/elena.html.

virtual path (n)~ In Asynchronous Transfer Mode (ATM), a set of virtual channels that are switched together as a unit through the network.

Virtual PC (n)~ The Microsoft virtual machine solution for client operating systems. Virtual PC enables multiple client operating systems to run simultaneously on a single physical computer, each in its own isolated software partition.

virtual printer memory (n)~ In a PostScript printer, a part of memory that stores font information. The memory in PostScript printers is divided into two areas: banded memory and virtual memory. The banded memory contains graphics and page-layout information needed to print your documents. The virtual memory contains any font information that is sent to your printer either when you print a document or when you download fonts.

virtual private network (n)~ The extension of a private network that encompasses encapsulated, encrypted, and authenticated links across shared or public networks. VPN connections typically provide remote access and router-to-router connections to private networks over the Internet.

virtual processor (n)~ In the Concurrency Runtime, in the Task Scheduler, an abstraction of a physical processing resource. Just one context executes at any given time on a virtual processor. Every scheduler instance contains a collection of virtual processors, and every virtual processor maps to a virtual processor root in the Resource Manager.

virtual processor root (n)~ In the Concurrency Runtime, in the Resource Manager, an abstraction of a physical processing resource. To enable oversubscription of hardware threads, multiple virtual processor roots can map to one physical processing resource.

virtual registry (n)~ The subsystem that intercepts and redirects registry requests for keys and values from application processes running in a virtual environment. The redirection is based on the registry information defined in the application package and created or modified through interaction with a virtual application.

virtual root (n)~ The root directory that a user sees when connected to an Internet server, such as an HTTP or FTP server. The virtual root is actually a pointer to the physical root directory, which may be in a different location, such as on another server. The advantages of using a virtual root include being able to create a simple URL for the Internet site and to move the root directory without affecting the URL.

virtual server (n)~ In a server cluster, a collection of services that appear to clients as a physical Windows-based server but are not associated with a specific server. A virtual server is typically a resource group that contains all of the resources needed to run a particular application and that can be failed over like any other resource group. All virtual servers must include a Network Name resource and an IP Address resource.

virtual server (n)~ A virtual computer that resides on a Hypertext Transfer Protocol (HTTP) server but appears to the user as a separate HTTP server. Several virtual servers

can reside on one computer, each capable of running its own programs and each with individualized access to input and peripheral devices. Each virtual server has its own domain name and IP address, and each appears to the user as an individual Web site or File Transfer Protocol (FTP) site. Some Internet service providers (ISPs) use virtual servers for those clients who want to use their own domain names.

virtual services (n)~ The subsystem that acts as the Service Control Manager (SCM) for services running in a virtual environment.

virtual shared folder (n)~ A mailbox folder structure on some IMAP servers in which mail folders are accessed with the administrator username and password, and shell login access to the mail server is not allowed. Access to specific mailboxes is managed by access control lists. This means that users are assigned the permissions to only access their mailbox folder, while an administrator has access to all mailboxes. This allows organizations to use administrative credentials to migrate e-mail from an IMAP server to Outlook Live.

Virtual Smart Card (PN)~ The ability for some devices to act like physical smart cards even if they aren't.

virtual smart card (n)~ The ability to emulate the functionality of traditional smart cards, but instead of requiring the purchase of additional hardware, it uses technology that users already own and are more likely to have with them at all times.

Virtual Space mode (n)~ A view mode in which the editor acts as if the space past the end of each line is filled with an infinite number of spaces, allowing code lines to continue off the side of the visible screen area.

virtual store (n)~ A certificate store that consists of a collection of other certificate stores.

virtual switch (n)~ A virtual version of a physical network switch. A virtual network can be configured to provide access to local or external network resources for one or more virtual machines.

virtual switch extension (n)~ A plug-in that enables the capabilities and functionalities of a virtual switch to be extended.

virtual team (n)~ A group of individuals who work across organizational boundaries. This includes groups of geographically, organizationally and/or time dispersed workers brought together by information and telecommunication technologies to accomplish one or more organizational tasks.

virtual user minute (n)~ A unit of measure for the number of users times the number of minutes of service used.

Virtual, virtual reality ~ A simulated environment on the internet or a computer.

virtualization (n)~ A feature that allows standard users to run applications that normally write to per-computer files and registry keys. If these write operations fail, they are automatically redirected to equivalent per-user locations.

virtualization (n)~ A means by which a service is run on a virtual platform with virtual storage.

virtualization (n)~ In Windows Presentation Foundation and Silverlight, a technique by which a subset of UI elements are generated from a larger number of data items based on which items are visible on the screen. Virtualization is a performance enhancement, because it is intensive, both in terms of memory and processor, to generate a large number

of UI elements when only a few may be on the screen at a given time.

virtualization management (n)~ The software and processes that you use to manage virtual machines and virtual machine hosts.

Virtualization Mode (n)~ An audio effect setting that allows users with stereo headphones to experience stereo and multi-channel content without the need to set up an extensive multi-channel speaker system.

virtual-key code (n)~ A symbolic constant name, hexadecimal value, or mouse or keyboard equivalent that provides a hardware and language-independent method of identifying keyboard keys. Each virtual key code represents a unique keyboard key and also identifies the purpose of that key. The keyboard driver must provide one or more keyboard layouts that maps keyboard scan codes to the appropriate virtual key codes.

virtual-mode data binding (n)~ A type of data binding in which a data-bound control retrieves only as many rows from the database as the user will be able to see on the screen.

virtual-to-virtual machine conversion (n)~ The process by which a functioning virtual machine created in VMware is converted' to an identical

virus (n)~ Malware that replicates, commonly by infecting other files in the system, thus allowing the execution of the malware code and its propagation when those files are activated.

Virus ~ A program that has been deliberately created to cause computer problems, usually minor ones as a prank, but occasionally very nasty ones indeed, such as erasing your entire hard disk. Viruses were originally designed to attach themselves to programs on a disk, and then 'hide' in the computer's memory once the host program is executed, and 'infect' every disk they come across. Some types of virus (such as the famous 'I love you')- propagate by email, disguised as an- attachment, which is why you should never open an attachment you are unsure of.

Virus ~ A chunk of computer programming code that makes copies of itself without any concious human intervention.

virus detection (n)~ The process of finding malicious software on a computer.

Virus Filter page (n)~ The page where administrators set up and enable virus filtering (for customers who subscribe to this service).

virus filtering (n)~ One of the contracted services offered by Exchange Hosted Services that scans and blocks email containing suspicious or malicious code.

virus protection (n)~ A series of measures to protect a machine from being infected by a virus.

Virus protector ~ A program which guards against computer- viruses, either by lurking in memory as a- TSR- and checking everything you run for viruses as you go along, or by scanning some or all of the files on either hard or floppy disk at a time you specify. Virus protectors need to be updated frequently to guard against new types of virus.

virus scanner (n)~ Software used to scan for and eradicate computer viruses, worms, and trojan horses.

Virus Scanning API (n)~ A virus-scanning API that is used by third-party antivirus service providers to protect computers that have the Exchange Server 2007 Mailbox server role installed.

virus signature (n)~ A portion of unique computer code contained in a virus. Antivirus

programs search for known virus signatures to identify infected programs and files.

virus signature file (n)~ A file that updates an antivirus program so that the program recognizes signatures of new viruses and removes the viruses from the user's computer.

visibility (n)~ A property of a replica that indicates which members of the replica set it can synchronize with and which conflict resolution rules apply. Replicas fall into three visibility types: global, local, and anonymous.

visibility (n)~ The ability of one element to see or refer to another. For one element to send a message to another element, the latter must be visible to the former.

visibility (n)~ The ability of a Bluetooth device to let any other Bluetooth device discover and connect with it.

visibility mode (n)~ A mode in which SharePoint Server is the primary source for all the project details. Project Server scheduling, time and status, and advanced functionality are disabled.

visible border (n)~ A faint dotted line that appears around elements with hidden borders.

visible page (n)~ In computer graphics, the image that is being displayed on the screen. Screen images are written into display memory in sections called pages, each of which contains one screen display.

Visio Graphics Service (PN)~ A Microsoft SharePoint Server 2010 service application that allows users to share and view Visio web drawings using Visio Services. The service application also enables data-connected Microsoft Visio 2010 web drawings to be refreshed and updated from a variety of data sources.

Visio Pro for Office 365 (PN)~ The subscription offering of the Visio business diagramming and drawing software with professional features for use on multiple devices and with ongoing access to upgrades.

Visio Pro for Office 365 (Government Pricing) (PN)~ The Visio Pro for Office 365 offer for government organizations that is hosted in the commercial cloud environment.

Visio Pro for Office 365 (Month to Month) (Government Pricing) (PN)~ The Visio Pro for Office 365 offer for the month-to-month subscription for government organizations.

Visio Pro for Office 365 for Government (PN)~ The Visio Pro for Office 365 offer for government organizations that is hosted in the government cloud environment.

Visio Professional 2016 (PN)~ The year 2016 edition of Microsoft Visio Professional.

Visio Standard 2016 (PN)~ The year 2016 edition of Microsoft Visio Standard.

Visio Web Access (PN)~ A Web Part that enables users to view (in full fidelity) and share Visio files in SharePoint Server without having the Visio client installed.

Visio Web Access Web Part (PN)~ A Web Part that enables users to view (in full fidelity) and share Visio files in SharePoint Server without having the Visio client installed.

Visio Workflow Interchange (PN)~ A file format that allows a file created in Visio to be loaded and displayed in SharePoint Designer.

vision (n)~ A feature that lets a user search by pointing their phone at barcodes, text, QR codes, Microsoft Tags, CDs, DVDs, or books.

vision statement (n)~ A one- or two-sentence summary of the principle objectives of the project which can be used by any team member to help prioritize work and make project decisions.

Vision System (PN)~ The camera, light, and projector systems that are used to identify

the size and location of touch input and gestures on the Surface unit.

visited hyperlink (n)~ A hyperlink on a Web page that a site visitor has activated by using a mouse device, keyboard, or other type of pointing device.

Vista ~ See- Windows Vista.

Vista ~ formerly code named Longhorn, is the name of the next Microsoft Windows desktop operating system release to follow Windows XP.

visual (n)~ A low-level graphical object that serves as the ancestor of many useful graphical components.

visual aid (n)~ A guide, such as a solid or a dotted line, that helps you see empty or invisible elements and elements with hidden borders.

Visual Basic (PN)~ A trademarked name owned by Microsoft Corporation for a high-level, visual-programming version of Basic. Visual Basic was designed for building Windows-based applications.

Visual Basic 2013 (PN)~ A family of products, tools, and technologies that you can use to build powerful, high-performance apps.

Visual Basic Editor (PN)~ An environment in which you write new and edit existing Visual Basic for Applications code and procedures. The Visual Basic Editor contains a complete debugging toolset for finding syntax, run-time, and logic problems in your code.

Visual Basic eXtension (PN)~ A software module that, when called by a Visual Basic application, produces a control that adds some desired feature to the application. A VBX is a separate executable file, usually written in C, that is dynamically linked to the application at run time and can be used by other applications, including some applications not developed in Visual Basic. Although VBX technology was developed by Microsoft, most VBXs have been written by third-party developers. VBXs are still in use, but the technology has been superseded by OCXs and ActiveX controls.

Visual Basic for Applications (n)~ A macro-language version of Visual Basic that is used to program many Windows applications and is included with several Microsoft applications.

Visual Basic PowerPacks 12.0 (PN)~ Visual Basic PowerPacks contains controls and libraries, which are primarily designed to help Visual Basic developers build great VB applications much easier. You can use these controls by opening Toolbox and finding the controls under Visual Basic PowerPacks category.

Visual Basic Scripting Edition (n)~ A scripting language that is used to create interactive or animated content for the Internet, such as games or advanced financial applications. VBScript is based on Microsoft Visual Basic syntax.

Visual Best Bet (PN)~ A Best Bet that can contain rich visual data, such as a video, image, or piece of HTML code, in addition to text or links.

visual brush (n)~ A tile brush created from a visual object.

Visual C# 2013 (PN)~ Visual C# 2013 is modern, high-level, multi-paradigm, general-purpose programming language for building apps using Visual Studio and the .NET Framework. C# is designed to be simple, powerful, type-safe, and object-oriented. The many innovations in C# enable rapid application development while retaining the expressiveness and elegance of C-style languages.

Visual C# Compiler (PN)~ Command-line compiler (csc.exe) that allows users to build

Visual C# apps. It produces executable (.exe) files, dynamic-link libraries (.dll), or code modules (.netmodule).

Visual C# Compiler for Microsoft .NET Framework 4.5 (PN)~ Command-line compiler (csc.exe) that allows users to build Visual C# for projects that target the Microsoft .NET Framework 4.5 platform.

Visual C++ 2013 (PN)~ A powerful and flexible Visual C++ language in Visual Studio, which enables the development of native Windows Store apps, native desktop apps, and managed apps that run on the .NET Framework.

Visual C++ Redistributable for Visual Studio (PN)~ The Visual C++ Redistributable Packages install runtime components of Visual C++ libraries that are required to run applications developed using Visual Studio on a computer that does not have Visual Studio installed. These packages install run-time components of these libraries: C Runtime (CRT), Standard C++, ATL, MFC, C++ AMP, and OpenMP.

visual challenge (n)~ A HIP challenge that requires a user to view an image and then type a set of characters contained in that image.

visual cue (n)~ A popup window or text displayed on screen when the computer beeps or makes other sounds. This is an accessibility option for people with hearing disabilities.

Visual Designer (PN)~ A Visio-based design surface that enables users to create and edit workflows visually by manipulating shapes that represent actions and conditions.

visual editing (n)~ The ability to activate or edit and embedded object from within an OLE control.

Visual F# 2013 (PN)~ F# is a programming language that provides support for functional programming in addition to traditional object-oriented and imperative (procedural) programming. The Visual F# product provides support for developing F# applications and extending other .NET Framework applications by using F# code. F# is a first-class member of the .NET Framework languages and retains a strong resemblance to the ML family of functional languages.

visual filtering (n)~ The process of applying filters on-the-fly by clicking on elements within widgets in the Analytics area.

visual interface (n)~ A display format, like that of Windows, that represents a program's functions with graphic images such as buttons and icons. GUIs enable a user to perform operations and make choices by pointing and clicking with a mouse.

visual manager (n)~ A class that provides support for changing the appearance of an application at a global level.

visual object (n)~ A low-level graphical object that serves as the ancestor of many useful graphical components.

Visual Reports (n)~ A menu item that displays output forms (in Excel and Visio) that consume Project data stored in local OLAP cubes. The reports are visual' in the sense that they can contain graphics

visual search (n)~ A type of search that returns richer results such as graphics and images, helping you find exactly what you're looking for, quickly and easily.

Visual SourceSafe (PN)~ A professional document source-control system developed by Microsoft.

Visual SourceSafe to Team Foundation Server Upgrade Wizard (n)~ A wizard which

is used to upgrade Visual SourceSafe to Team Foundation Server. Upgrading your code projects, files, version history, labels, and user information from Visual SourceSafe to Team Foundation Server (TFS) or Visual Studio Online version control has many benefits for your team. TFS version control is a modern version control system that is fully integrated with the suite of ALM tools in Visual Studio 2012 and Team Foundation Server.

Visual SourceSafe Upgrade for Microsoft Visual Studio 2013 (n)~ An upgrade of Visual SourceSafe system for Visual Studio 2013.

Visual Studio .NET (n)~ An integrated development environment for helping developers to build scalable applications and Web services.

Visual Studio 2010 Team Foundation Build Agents (n)~ Build agents are used to perform the processor-intensive work of a build in order to use Team Foundation Build. The build agent executes the steps of the build process. Typically, these steps include getting files from version control, provisioning the workspace, compiling the code, running tests, and merging files back into version control.

Visual Studio 2012 Visual C++ toolset (v110) (n)~ A set of tools designed for Visual Studio 2012 Visual C++.

Visual Studio 2012 with Update 2 (n)~ Visual Studio with an update that introduces- new technology improvements- in agile planning, quality enablement, Windows and Web developments, line-of-business development and development experience.

Visual Studio 2013 (PN)~ Visual Studio 2013 is a family of products, tools, and technologies that you can use to build powerful, high-performance apps. You can create Windows Store apps, in addition to desktop, web, phone, and game-console apps, in this release of Visual Studio.

Visual Studio 2013 ARM Cross Tools Command Prompt (n)~ A command prompt that is run in the Visual Studio 2013 ARM Cross Tools program.

Visual Studio 2013 ARM Cross Tools Command Prompt for Windows Phone (n)~ A command prompt that is run in the Visual Studio 2013 ARM Cross Tools program for the Windows Phone.

Visual Studio 2013 ARM Phone Tools Command Prompt (n)~ A command prompt that is run in the Visual Studio 2013 ARM Phone Tools program.

Visual Studio 2013 Command Prompt (n)~ A command prompt that is run in the Visual Studio 2013 program.

Visual Studio 2013 Express for Windows (PN)~ Visual Studio Express 2013 for Windows provides the core tools that are required to build compelling, innovative Windows Store apps.

Visual Studio 2013 Itanium Cross Tools Command Prompt (n)~ A command prompt that is run in the Visual Studio 2013 Itanium Cross Tools program.

Visual Studio 2013 Itanium Win64 Command Prompt (n)~ A command prompt that is run in the Visual Studio 2013 Itanium Win64 program.

Visual Studio 2013 Preview (PN)~ The pre-release product name version of Visual Studio 2013.

Visual Studio 2013 Remote Debugger Discovery (n)~ The process of discovering Visual Studio 2013 Remote Debugger.

Visual Studio 2013 Shell (Isolated) application (n)~ The Visual Studio isolated shell allows you to create stand-alone applications that can run side-by-side with other versions of Visual Studio. It is used primarily to host specialized tools that can use Visual Studio services but also have a customized appearance and branding.

Visual Studio 2013 Shell (Isolated) solution (n)~ The solution of Visual Studio 2013 Shell (Isolated) that allows to create stand-alone applications that can run side-by-side with other versions of Visual Studio.

Visual Studio 2013 Tools Command Prompt (n)~ A command prompt designed for using in the Visual Studio 2013 Tools program.

Visual Studio 2013 Update 4 (PN)~ The latest in a cumulative series of feature enhancements and additions and bug fixes for Visual Studio released on November 12, 2014.

Visual Studio 2013 x86 Tools Command Prompt for Windows Phone (n)~ A command prompt that is run in the Visual Studio 2013 x86 Tools program for the Windows Phone.

Visual Studio Code (PN)~ A free code editor and cross-platform development tool in the Visual Studio family supporting OSX, Linux, and Windows, redefined and optimized for building and debugging modern web and cloud applications.

Visual Studio Development Server (PN)~ The web server that ships with Visual Studio.

Visual Studio Enterprise (PN)~ The edition of Visual Studio 2015 including all of the features available with the development tools to build mission-critical enterprise solutions.

Visual Studio Enterprise with MSDN (PN)~ A type of subscription purchased by the customer targeted to MSDN subscribers with Visual Studio Ultimate.

Visual Studio Enterprise with MSDN (MPN) (PN)~ A type of subscription purchased by the customer targeted to MSDN subscribers who are MPN members with Visual Studio Ultimate.

Visual Studio Express 2013 for Windows Desktop (PN)~ Visual Studio Express 2013 for Windows Desktop enables the creation of desktop apps in C#, Visual Basic, and C++, and supports Windows Presentation Foundation (WPF), Windows Forms, and Win32.

Visual Studio Graphics Analyzer (PN)~ A customized VS environment in the Visual Studio Graphics Diagnostics (VSGD) toolset in Visual Studio 2013 Update 3 containing the necessary components for analyzing graphics frames and helping diagnose graphics rendering and performance issues in DirectX apps.

Visual Studio Graphics Debugger (PN)~ The tool in Microsoft Visual Studio for debugging shader programs.

Visual Studio Industry Partner Program (PN)~ A program that assists partners in building, integrating, and selling applications, tools, components, and even entire programming languages with Visual Studio 2005 and Visual Studio 2005 Team System. The VSIP program offers unique benefits to all its members-€"developers, tools ISVs, and line of business and infrastructure ISVs.

Visual Studio Online (PN)~ The Microsoft Azure service which provides an end-to-end, cloud-based application lifecycle management solution.

Visual Studio Online Application Insights (n)~ A Visual Studio Add-in and a Microsoft Azure service of telemetry collection for monitoring the availability, performance, and usage of deployed live applications, not necessarily Microsoft Azure applications, and

diagnosing issues or exceptions in web services through log traces, without code redeploying.

Visual Studio Plug-in (n)~ A plug-in on a developer system, with which you can access the actual line of defective source code via Microsoft Visual Studio .NET.

Visual Studio Premium (PN)~ Visual Studio Premium is an integrated development environment that includes advanced tools that development teams can use to plan, develop, test, and operate applications.

Visual Studio Premium 2013 (PN)~ An environment consisting of powerful tools for teams collaborating in developing apps for PCs, mobile, and the cloud.

Visual Studio Premium with MSDN (PN)~ The MSDN subscription with Visual Studio Premium and Microsoft Azure credits among other benefits.

Visual Studio Professional 2013 (PN)~ Visual Studio Professional 2013 can help you create applications that have innovative user experiences that delight your customers. The integrated environment makes complex tasks easier so that you can focus on achieving your goals. By using Visual Studio Professional 2013, you can deliver quality applications on Windows, Office, Windows Phone, the web, or the cloud. When you combine it with Windows 8.1, you'll be able to build Windows Store apps.

Visual Studio Professional with MSDN (PN)~ The MSDN subscription with Visual Studio Professional and Microsoft Azure credits among other benefits.

Visual Studio Remote Debugging Configuration Wizard (n)~ A wizard enabling you to configure the process of a remote debugging in Visual Studio.

Visual Studio Team Explorer (PN)~ Team Explorer is the client software that you use to access Visual Studio Team Foundation Server 2013 functionality from Visual Studio.

Visual Studio Team Foundation Background Job Agent service (PN)~ The Visual Studio Team Foundation Background Job Agent service provides a general scheduling mechanism for Web services and jobs for Team Foundation. This Windows service is also used to run the tasks spawned by various wizards, such as the New Team Project wizard and Create a Team Project Collection wizard. The service uses the service account for Team Foundation Server (TFS), referred to as TFSService. The service runs on any server that is running a Web service or Web application in the logical application tier for Team Foundation. To operate correctly, the service account for the Team Foundation Background Job Agent service must have the permissions required for the tasks that it performs.

Visual Studio Team Foundation Server Express (PN)~ Visual Studio Team Foundation Server Express is a source-code-control, project-management, and team-collaboration platform at the core of the Microsoft suite of Application Lifecycle Management (ALM) tools, which help individuals and small teams be more agile, collaborate more effectively, and deliver quality software more consistently.

Visual Studio Test Agent Installer service (PN)~ The service which enables you to perform an installation of a test agent. You install a test agent on each of the computers that are running components of the system under test.

Visual Studio Test Pro with MSDN (PN)~ The Microsoft Azure offer for Visual Studio Test Professional with an MSDN subscription.

Visual Studio Test Professional 2013 (PN)~ Version of Visual Studio 2013 integrates

testers and other stakeholders into the development workflow to enable in-context collaboration with developers.

Visual Studio Test Professional 2013 DVD (PN)~ A DVD disk on which the program of Visual Studio Test Professional 2013 is saved and stored.

Visual Studio Tools (PN)~ The tools of Visual Studio designed for developers for inspecting the code, creating applications etc.

Visual Studio Tools for Applications (n)~ A family of Microsoft Visual Studio add-in software that allows developers to use Visual Basic and Visual C# to develop and customize applications built on the Microsoft .NET Framework.

Visual Studio Tools for Microsoft Office (PN)~ A family of Microsoft Visual Studio add-in software that allows developers to use Visual Basic and Visual C# to write code behind Word- and Excel-based applications.

Visual Studio Tools for Office (n)~ A set of development tools available in the form of a Visual Studio add-in (project templates) and a runtime that allows Microsoft Office 2003 and later versions of Office applications to host the .NET Framework Common Language Runtime (CLR) to expose their functionality via .NET.

Visual Studio Ultimate (PN)~ Visual Studio Ultimate is the state-of-the-art development solution that empowers teams of all sizes to design and create compelling apps to delight users.

Visual Studio Ultimate 2013 (PN)~ Visual Studio Ultimate 2013 is the state-of-the-art development solution that empowers teams of all sizes to design and create compelling apps to delight users.

Visual Studio Ultimate with MSDN (PN)~ The MSDN subscription with Visual Studio Ultimate and Microsoft Azure credits among other benefits.

Visual Studio UserControl Test Container (PN)~ Container provided by Visual Studio that allows to test run-time behavior of UserControl classes in a fast and easy way. This test container starts directly from the user's Windows control library project.

Visual Styles (n)~ The visual guides that appear in a document to show the user where style formats have been applied.

visual total (n)~ A displayed, aggregated cell value for a dimension member that is consistent with the displayed cell values for its displayed children.

visual tree (n)~ In Windows Presentation Foundation, the element tree containing all visual elements (elements that derive from the type System.Windows.Media.Visual) used for a piece of the user interface. This tree is the accumulation of all visual elements created directly by the application (whether in code or in markup) and all visual elements created by the template expansion of elements such as controls and data objects.

visual upgrade (n)~ A feature that enables low-impact upgrades by allowing users or administrators to have more control over when the UI transitions from one version to the next.

visual voicemail (n)~ A feature that allows a user to see and play their voicemail messages from a list, instead of calling voicemail to get their messages.

visualization (n)~ In Windows Media Player, a graphical display that changes in response to the audio signal.

visualization (n)~ A feature of an application that displays data in the form of an image,

diagram, or animation. For example, some databases can interpret and show data in the form of a two- or three-dimensional model.

visualizer (n)~ A component of the Visual Studio debugger user interface that creates a dialog box or other interface to displays a variable or object in a meaningful way that is appropriate to its data type. For example, an HTML visualizer interprets an HTML string and displays the result as it would appear in a browser window, a bitmap visualizer interprets a bitmap structure and displays the graphic it represents, and so on. Some visualizers allow you to edit as well as view the data.

visualizer (n)~ A way to visually represent data in debug mode.

VLAN (n)~ A logical grouping of hosts on one or more local area networks (LANs) that allows communication to occur between hosts as if they were on the same physical LAN.

VLAN Trunk mode (n)~ Trunk mode provides network services or network appliances on a VM with the ability to see traffic from multiple VLANs; a switch port receives traffic from all VLANs that you configure in an allowed VLAN list or through a VM connection.

VLDB (n)~ A database that has become large enough to be a management challenge, requiring extra attention to people, processes, and processes.

VM (n)~ A software implementation of a computer that emulates a complete hardware system, from processor to network card, in a self-contained, isolated software environment, enabling the simultaneous operation of otherwise incompatible operating systems.

VM role (n)~ A cloud service role that provides a customer-customizable virtual machine image.

VMBus (n)~ A communications line used in Hyper-V by virtual machines and certain types of virtual devices. The virtual devices that use virtual machine bus have been optimized for use in virtual machines.

VML (n)~ An XML-based specification for the exchange, editing, and delivery of 2-D vector graphics on the Web. An application of XML (Extensible Markup Language), VML uses XML tags and Cascading Style Sheets to create and place vector graphics, such as circles and squares, in an XML or HTML document, such as a Web page. These graphics, which are rendered in the native operating system, can include color and are editable in a variety of graphics programs.

VMM service template (n)~ A template, also called a virtual machine template, that represents a set of virtual machines that are working together to provide a tool for the customer.

VMQ (PN)~ A feature that uses hardware packet filtering to deliver packet data from an external virtual machine network directly to virtual machines, which reduces the overhead of routing packets and copying them from the management operating system to the virtual machine.

VMRC (n)~ A feature of Virtual Server that allows a running virtual machine to be managed remotely.

vocabulary (n)~ A collection of definitions consisting of friendly names for the facts used in rule conditions and actions. Vocabulary definitions make the rules easier to read, understand, and share by people in a particular business domain.

vocabulary (n)~ A set of related terms used to express concepts in a technical application.

Vocal (n)~ One of the music genres that appears under Genre classification in Windows Media Player library. Based on ID3 standard tagging format for MP3 audio files. ID3v1 genre ID # 28.

VOD (n)~ A technology that includes systems, services, and standards for the interactive delivery of streaming video to multimedia clients such as digital set-top boxes.

voice call (n)~ A telephone call where the human voice, rather than data or video, is transmitted (that is, an ordinary telephone call).

voice call (n)~ A Skype call where only audio is used (without video).

voice client (n)~ A client that supports VoIP.

voice clip (n)~ A file, similar to a video clip, that contains a short audio segment that a user records to send to a contact. The clip appears in the contact's conversation window and plays automatically.

voice command (n)~ A spoken command that controls a program or computer operation through speech recognition technology.

voice command mode (n)~ A speech mode that you can use to give commands to a program.

voice comment (n)~ A recording that is attached to your document.

voice connection (n)~ The connection on your phone that allows you to make phone calls.

voice grade ~ The term applied to channels used primarily for speech transmission, generally with a frequency range of about 300 to 3,000 cycles per second (hertz.) Voice Grade channels may be used to send analog or digital data or facsimile.

voice input (n)~ Spoken instructions that a computer translates into executable commands using speech recognition technology or that are embedded into documents with the aid of a microphone.

voice mail (n)~ A system that records and stores telephone messages in a user mailbox.

voice mail system (n)~ A system that records and stores telephone messages in a user mailbox.

voice message (n)~ An electronic message with a primary content of digitized audio.

voice message (n)~ A message recorded for a contact who didn't answer a call.

voice message originator (n)~ An e-mail address that is used on call answering messages. The voice message originator is used as the From' field for Unified Messaging messages and is the address to which non-delivery reports (NDRs) are sent.'

voice messaging (n)~ A system that sends and receives messages in the form of sound recordings.

voice navigation (n)~ A feature that provides turn-by-turn audio directions read out loud to users to go to a given destination.

voice note (n)~ A note that contains recorded information.

Voice over Internet Protocol (n)~ The use of the Internet Protocol (IP) for transmitting voice communications. VoIP delivers digitized audio in packet form and can be used to transmit over intranets, extranets, and the Internet. It is essentially an inexpensive alternative to traditional telephone communication over the circuit-switched Public Switched Telephone Network (PSTN). VoIP covers computer-to-computer, computer-to-telephone, and telephone-based communications. For the sake of compatibility and interoperability, a group called the VoIP Forum promotes product development based on

the ITU-T H.323 standard to transmit multimedia over the Internet.

Voice over IP (n)~ The use of the Internet Protocol (IP) for transmitting voice communications. VoIP delivers digitized audio in packet form and can be used to transmit over intranets, extranets, and the Internet. It is essentially an inexpensive alternative to traditional telephone communication over the circuit-switched Public Switched Telephone Network (PSTN). VoIP covers computer-to-computer, computer-to-telephone, and telephone-based communications. For the sake of compatibility and interoperability, a group called the VoIP Forum promotes product development based on the ITU-T H.323 standard to transmit multimedia over the Internet.

voice policies (n)~ Define the following for each user, site, or organization that is assigned the policy: A set of calling features that can be enabled or disabled to determine the Enterprise Voice functionality that is available to users. Also, a set of PSTN usage records that define what types of calls are authorized.

voice profile (n)~ Information about your specific speaking style and environment that helps Speech Recognition to better understand the commands you say.

voice recognition (n)~ The ability to interpret vocal commands or convert spoken words into computer-readable text. Speech recognition programs enable you to control an application or enter text by speaking into a microphone, rather than by using a keyboard.

Voice Recorder (PN)~ An app- used to record sounds with the device's microphone and to record phone calls.

voice roaming (n)~ A phone call made in a roaming area. Generally making phone calls or using your data connection when the phone is roaming is more expensive, and the user will be charged additional fees for voice roaming calls.

voice route (n)~ A route that contains instructions that tell Lync Server how to route calls from Enterprise Voice users to phone numbers on the public switched telephone network (PSTN), or a private branch exchange (PBX).

voice shortcut (n)~ A voice command that can be executed by the user at any time and performs an action that typically saves a lot of clicks.

voice tag (n)~ A sound the user records to associate with a telephone number.

Voice User Interface (n)~ An interface that is used to navigate the menus of a Unified Messaging (UM) system using speech inputs.

voiceband ~ A voice grade bandwidth typically spanning between 300 and 3300 Hz.

voicemail (n)~ A system that records and stores telephone messages in a user mailbox.

voicemail (n)~ A telephone message delivered to a voicemail system.

Voicemail ~ A voice message recorded on a computer and sent to a specific person by the computer or telephone system. In effect a more sophisticated telephone answering machine.

voiceprint (n)~ Used in biometric authentication to map the characteristics of an individual's voice, such as pitch and rhythm, and use it to verify their identity.

void (v)~ To prohibit the use of a document as a contract.

VoIP (n)~ The use of the Internet Protocol (IP) for transmitting voice communications. VoIP delivers digitized audio in packet form and can be used to transmit over intranets, extranets, and the Internet. It is essentially an inexpensive alternative to traditional telephone communication over the circuit-switched Public Switched Telephone Network

(PSTN). VoIP covers computer-to-computer, computer-to-telephone, and telephone-based communications. For the sake of compatibility and interoperability, a group called the VoIP Forum promotes product development based on the ITU-T H.323 standard to transmit multimedia over the Internet.

VOIP ~ (Voice Over Internet Protocol)- A system for making cheap phonecalls over the internet instead of via the telephone system.

VoIP gateway (n)~ A computer device that converts between circuit switch telephony protocols and VoIP protocols.

VOIP-enabled Live Meeting trial conference center session (n)~ A Live Meeting session conducted using VoIP to transmit data and conducted on a Live Meeting conference center accessed with a trial account.

volatile memory (n)~ Memory used by a program that can change independently of the program, such as memory shared by another program or by an interrupt service routine.

volatile memory (n)~ Memory, such as RAM, that loses its data when the power is shut off.

volume (n)~ The loudness of an audio signal.

volume (n)~ An area of storage on a hard disk. A volume is formatted by using a file system, such as NTFS, and has a drive letter assigned to it. A single hard disk can have multiple volumes. Some volumes can span multiple hard disks.

volume activation (n)~ The activation of large numbers of software licenses.

Volume Activation Management Tool (PN)~ An MMC snap-in that enables IT professionals to automate and centrally manage the Windows and Microsoft Office volume and retail activation process. VAMT can manage volume activation by using Multiple Activation Keys (MAKs) or the Windows Key Management Service (KMS).

Volume Activation Services (PN)~ A server role in Windows Server that enables users to automate and simplify the issuance and management of Microsoft software volume licenses for a variety of scenarios and environments. With Volume Activation Services, you can install and configure the Key Management Service (KMS) and enable Active Directory-based Activation.

volume bitmap (n)~ A stored reference (which may exist both on hierarchical directory volumes and in memory) to every piece of data that is in the allocation blocks and indicates whether the block is allocated or free for use.

volume control block (n)~ An opaque structure in which a file system maintains state information about a mounted volume.

volume control button (n)~ A hardware button that increases and decreases the sound volume.

volume discount (n)~ The amount subtracted from the unit of a product or service based on the volume purchased.

volume image (n)~ A single Windows image in a Windows image (.wim) file.

volume leveling (n)~ The process of automatically increasing or decreasing the volume during playback to make all audio content sound similar with respect to volume levels. Volume leveling may change the original dynamic range of the content.

volume license (n)~ A license form that allows multiple installations of a particular product.

volume license key (n)~ A product key that is provided to Microsoft customers who choose a Microsoft Volume Licensing program for their organizations and that allows multiple installations of a particular product. The key is assigned to a company or institution intended for their sole use and only for distribution to employees or third parties who are authorized to install and distribute licenses pursuant to the terms of their license agreement.

volume license product key (n)~ A product key that is provided to Microsoft customers who choose a Microsoft Volume Licensing program for their organizations and that allows multiple installations of a particular product. The key is assigned to a company or institution intended for their sole use and only for distribution to employees or third parties who are authorized to install and distribute licenses pursuant to the terms of their license agreement.

volume map control block (n)~ An opaque structure that stores virtual block number (VBN) to logical block number (LBN) mappings for an a volume file of a file system.

volume master key (n)~ An advanced encryption standard (AES) 256-bit key that is used by BitLocker Drive Encryption to encrypt the full volume encryption key. There is only one volume master key per volume.

volume mount point (n)~ A point of access to a volume (or multiple volumes) that users and applications can use to unify disparate file systems into one logical system.

volume serial number (n)~ The optional identifying volume number of a disk or tape. MS-DOS systems use the term volume serial number. Apple Macintosh systems use the term volume reference number. A volume serial number is not the same as a volume label or volume name. Compare volume label.

volume set (n)~ A volume that consists of disk space on one or more physical disks. A volume set is created by using basic disks and is supported only in WindowsNT4.0 or earlier. Volume sets were replaced by spanned volumes, which use dynamic disks.

Volume Shadow Copy Service (n)~ A Windows Server 2003 technology that supports creation of single point-in-time shadow copies - also known as snapshots - of single or multiple volumes without impacting file server performance. Volume Shadow Copy Service also supports backups of open files.

volume snapshot (n)~ A snapshot of a volume that is made at a specific point in time.

volume snapshot device (n)~ A virtual device created by System Restore that is needed to set a system restore point.

volume-leveling value (n)~ A value that is included with Windows Media Format (WMF) or MP3 format files that allows volume leveling to work.

voucher (n)~ A record of a vendor transaction, including the vendor's name and address, description of goods or services received, document number, terms of payment, due date and amount due.

voucher number (n)~ A unique identifier for a transaction or group of transactions.

VpB (oth)~ A corporation tax in the Netherlands.

VPN (n)~ The extension of a private network that encompasses encapsulated, encrypted, and authenticated links across shared or public networks. VPN connections typically provide remote access and router-to-router connections to private networks over the Internet.

VPN client (n)~ A computer that initiates a VPN connection to a VPN server. A VPN client can be an individual computer that obtains a remote access VPN connection or a router that obtains a router-to-router VPN connection.

VPN device (n)~ A device that is configured for a virtual private network.

VPN Gateway (PN)~ A service that allow on-premises networks to be securely connected through site-to-site VPNs to Azure using industry standard protocols IPsec and IKE.

VPN quarantine (n)~ A network where clients that do not conform to specific criteria are placed.

VPN Reconnect (PN)~ A Windows feature that enables your PC to maintain a persistent VPN connection across network changes.

VPN server (n)~ A computer that accepts virtual private network (VPN) connections from VPN clients. A VPN server can provide a remote access VPN connection or a router-to-router VPN connection.

v-root (n)~ The root directory that a user sees when connected to an Internet server, such as an HTTP or FTP server. The virtual root is actually a pointer to the physical root directory, which may be in a different location, such as on another server. The advantages of using a virtual root include being able to create a simple URL for the Internet site and to move the root directory without affecting the URL.

VS 2013 Shell (PN)~ A solution which allows you to create your own Visual Studio-based application in either integrated or isolated mode. In integrated mode, many Visual Studio features are available in addition to your application. In the isolated mode, you choose a subset of Visual Studio features that you wish to distribute along with your own extension.

VS Enterprise (PN)~ The edition of Visual Studio 2015 including all of the features available with the development tools to build mission-critical enterprise solutions.

VS Enterprise 2015 (PN)~ The edition of Visual Studio 2015 including all of the features available with the development tools to build mission-critical enterprise solutions.

VS Express 2013 for Web (PN)~ Visual Studio Express 2013 for Web provides the core tools for creating compelling, innovative web applications and services.

VS Express 2013 for Windows (PN)~ Visual Studio Express 2013 for Windows provides the core tools that are required to build compelling, innovative Windows Store apps.

VS Express 2013 for Windows Desktop (PN)~ Visual Studio Express 2013 for Windows Desktop enables the creation of desktop apps in C#, Visual Basic, and C++, and supports Windows Presentation Foundation (WPF), Windows Forms, and Win32.

VS Express for Desktop (PN)~ Visual Studio Express 2013 for Windows Desktop enables the creation of desktop apps in C#, Visual Basic, and C++, and supports Windows Presentation Foundation (WPF), Windows Forms, and Win32.

VS Express for Web (PN)~ Visual Studio Express for Web provides the core tools for creating compelling, innovative web applications and services.

VS Express for Windows (PN)~ Visual Studio Express 2013 for Windows provides the core tools that are required to build compelling, innovative Windows Store apps.

VS Express for Windows Phone (PN)~ Visual Studio Express Edition that works as an add-in to Visual Studio Professional, Premium or Ultimate editions. The Windows Phone SDK provides also a stand-alone Visual Studio Express for Windows Phone. It consists of a designer, phone emulator, and the assets to build apps and games for Windows Phone.

VS Premium 2013 (PN)~ An environment consisting of powerful tools for teams collaborating in developing apps for PCs, mobile, and the cloud.

VS Professional 2013 (PN)~ Visual Studio Professional 2013 can help you create applications that have innovative user experiences that delight your customers. The integrated environment makes complex tasks easier so that you can focus on achieving your goals. By using Visual Studio Professional 2013, you can deliver quality applications on Windows, Office, Windows Phone, the web, or the cloud. When you combine it with Windows 8.1, you'll be able to build Windows Store apps.

VS Ultimate 2013 (PN)~ Visual Studio Ultimate 2013 is the state-of-the-art development solution that empowers teams of all sizes to design and create compelling apps to delight users.

VS2013 ARM Cross Tools Command Prompt (PN)~ A command prompt that is run in the Visual Studio 2013 ARM Cross Tools program.

VS2013 Cross Tools Command Prompt (n)~ A command prompt that is run in the VS2013 Cross Tools program.

VS2013 Native Tools Command Prompt (n)~ A command prompt that is run in the VS2013 Native Tools program.

VSAPI (n)~ A virus-scanning API that is used by third-party antivirus service providers to protect computers that have the Exchange Server 2007 Mailbox server role installed.

VSCode (PN)~ A free code editor and cross-platform development tool in the Visual Studio family supporting OSX, Linux, and Windows, redefined and optimized for building and debugging modern web and cloud applications.

VSGA (PN)~ A customized VS environment in the Visual Studio Graphics Diagnostics (VSGD) toolset in Visual Studio 2013 Update 3 containing the necessary components for analyzing graphics frames and helping diagnose graphics rendering and performance issues in DirectX apps.

VSIP Program (PN)~ A program that assists partners in building, integrating, and selling applications, tools, components, and even entire programming languages with Visual Studio 2005 and Visual Studio 2005 Team System. The VSIP program offers unique benefits to all its members-€"developers, tools ISVs, and line of business and infrastructure ISVs.

VSS (n)~ A Windows Server 2003 technology that supports creation of single point-in-time shadow copies - also known as snapshots - of single or multiple volumes without impacting file server performance. Volume Shadow Copy Service also supports backups of open files.

VSS express writer (n)~ A scheme for applications to only identify their components requiring to be backed up without the necessity of creating a full VSS writer.

VSS Upgrade Wizard (n)~ A wizard which is used to upgrade Visual SourceSafe to Team Foundation Server. Upgrading your code projects, files, version history, labels, and user information from Visual SourceSafe to Team Foundation Server (TFS) or Visual Studio Online version control has many benefits for your team. TFS version control is a modern version control system that is fully integrated with the suite of ALM tools in Visual Studio 2012 and Team Foundation Server.

VSS writer (n)~ A component within an application that interfaces with the VSS platform

infrastructure during backups to ensure that application data is ready for shadow copy creation.

VSTA (n)~ A family of Microsoft Visual Studio add-in software that allows developers to use Visual Basic and Visual C# to develop and customize applications built on the Microsoft .NET Framework.

VSTO (PN)~ A set of development tools available in the form of a Visual Studio add-in (project templates) and a runtime that allows Microsoft Office 2003 and later versions of Office applications to host the .NET Framework Common Language Runtime (CLR) to expose their functionality via .NET.

VTBL (oth)~ A table of function pointers, such as an implementation of a class. The pointers in the VTBL point to the members of the interfaces that an object supports.

Vtunnel ~ Web proxy supporting SSL via the HTTPS encryption protocol. ,a href='http://www.vtunnel.com/'>http://www.vtunnel.com/

VUI (n)~ An interface that is used to navigate the menus of a Unified Messaging (UM) system using speech inputs.

vulnerability (n)~ Any weakness, administrative process or act, or physical exposure that makes a computer susceptible to exploit by a threat.

W3 (n)~ A set of interlinked documents in a hypertext system. The user enters the web through a home page.

W3C (n)~ A consortium of commercial and educational institutions that oversees research and promotes standards in all areas related to the World Wide Web.

W3C ~ (World Wide Web Consortium)- An influential group of interested parties who agree what is and isn't official- HTML. Originally WWWC, but W3C is a lot easier to say.

W9 (n)~ An official form issued by the US Internal Revenue Service that is used to provide a payee's taxation identification number to a payer.

WAF (n)~ An appliance, server plugin, or filter that applies a set of rules to an HTTP conversation to identify and block common attacks to web applications.

wait condition (n)~ A workflow condition that enables a workflow to block its own execution.

waiting call (n)~ A new call (i.e., a call that has not yet been accepted) or a call returned from a prior transfer. After a timeout, unsuccessfully connected transferred calls are listed again as waiting calls.

Waiting for Call (n)~ A telephony signal that Network Connections has put the modem in Listen mode and is waiting for incoming calls.

waiting thread (n)~ A thread whose execution is blocked while waiting for a wait function to return.

waive charge (v)~ To withdraw the interest or fees originally owed by a party.

Wake On LAN (PN)~ The technology that allows a remote network device (either on a wired or wireless network) to remotely cause a host PC to wake from a sleep state so that it can provide some service to that remote device.

wake-up packet (n)~ A packet that is sent by a Configuration Manager primary site server to bring computers out of a sleep state so that they can perform a management function, such as installing a mandatory software update.

wall (n)~ An area in Microsoft Dynamics CRM where information is displayed about the user and the records that the user follows.

wall reference line (n)~ The line that extends from the wall begin point to the wall endpoint. Although the wall reference line is typically centered on the wall or aligned with one edge of the wall, you can locate it any distance you want from the wall.

Wallet (PN)~ The feature on Windows Phone where a person can add credit cards that can be used to purchase things through the Store or for in-app purchases. Depending on the phone, locale, and OEM, if users add credit cards to Wallet, they will also be able to pay for things with their phones using NFC. The Wallet can also be used to save coupons' that the user may receive from businesses.'

wallet card (n)~ The wallet card works by providing your most important medical information if you are in need of critical care inside or outside a medical facility.

wallpaper (n)~ In a graphical user interface such as Windows, a pattern or picture in the screen background that can be chosen by the user.

wallpaper (n)~ In a graphical user interface such as Windows, a pattern or picture in the

screen background that can be chosen by the user.

Wallpaper ~ A picture or motif on your Windows desktop. To change the Windows wallpaper right-click anywhere on the desktop, select Properties from the pop-up menu, choose the Desktop tab and select a new entry from the list under Background. To add pictures of your own to the list, save them as .bmp(bitmap) files and put them in your Windows folder.

Wallpaper & lock screens (PN)~ The Personalization subcategory containing apps with special wallpaper and lock screens for your PC and phone.

wall-time (n)~ The total time taken by a computer to complete a task which is the sum of CPU time, I/O time, and the communication channel delay.

WAMS (PN)~ The Microsoft Azure service that allows you to create workflows for the creation, management, and distribution of digital media.

WAN (n)~ A communications network connecting geographically separated computers, printers, and other devices. A WAN enables any connected device to interact with any other on the network.

WAN ~ (Wide Area Network)- A sort of group of networks, or more properly- LANs, connected together.

WAP (n)~ A standard protocol for providing Internet communications and advanced telephony services on phones, pagers, PDAs, and other wireless terminals.

WAP ~ (Wireless Application Protocol; pr. 'wapp' or 'wopp') A system to enable early mobile phones to browse the World Wide Web. In practise the site has to be specially designed and text only, and only a very few sites have bothered. Now largely obsolete, as smartphones can display the original sites pretty well.

WAP Connection (PN)~ An option that allows the user to specify how the Wireless Application Protocol connection will be handled by the device.

WAP gateway (n)~ A software usually on a mobile operator's network that converts desktop webpages to a mobile format. Helpful for older phone models that can't render the full desktop page.

warehouse (n)~ A building or structure where materials or goods are stored on an interim basis until they are transferred to their destination.

warez ~ General term used to describe cracks, patches, keys, key generators or other methods that allow software applications to be used without paying a license fee, i.e. illegal pirate software.

warm (n)~ Pertaining to the intermediate rating of perceived interest that an account, opportunity, or lead has about a product or service.

warm boot (n)~ The restarting of a running computer without first turning off the power.

Warm Boot ~ Rebooting the system by using a software command rather than turning the power off, then on. The system is reset but power is never interrupted

warm latency (n)~ The time to create a new workflow instance when the workflow type has already been compiled.

warm standby (adj)~ A method of redundancy in which the secondary (i.e., backup) system runs in the background of the primary system. Data is mirrored to the secondary server at regular intervals, which means that there are times when both servers do not contain the exact same data.

warm standby server (n)~ A standby server that contains a copy of a database that is asynchronously updated, and that can be brought online fairly quickly.

warm start (n)~ The restarting of a running computer without first turning off the power.

warning (n)~ A message that notifies you of a build issue.

warning alert (n)~ An alert that helps users diagnose potential problems with their data protection schema.

warning beep (n)~ A sound that alerts the user to an issue.

Warning Computers (n)~ The label in the row of the Results pane that displays the number of instances where a computer has unresolved alerts with a severity level of Warning.

warning icon (n)~ An icon that indicates a security risk.

warning level (n)~ The point at which users are nearing their quota limit.

warning message (n)~ A message that appears on the screen to alert the user to something that must not be addressed.

warp (v)~ To distort the appearance of an object by squeezing some parts together and stretching other parts farther apart.

warping (n)~ The process of distorting a picture unevenly by squeezing some parts together and stretching other parts farther apart.

WAS (n)~ A service that provides process activation, resource management, and health management services for message-activated applications.

WAS (PN)~ An end-to-end test lab solution that enables the automation of computer and image inventory, test execution, and local results generation in a pre-manufacturing lab environment.

watch (n)~ An expression or a variable that appears in the Watch window.

watch (v)~ To monitor an e-mail conversation or newsgroup thread. The headers for messages in a watched conversation appear in a different color, which makes them easier to find in a message list.

watch folder (n)~ A computer folder to which a job template is bound and which detects when specified media file types arrive in it.

watch list (n)~ A list of connection attempts by federated partners that may require the administrator to take action to effectively monitor and control domain usage. Such attempts can include potentially suspicious activity or a higher volume of usage than the current trust relationship supports.

Watch window (PN)~ A Visual Studio debugging window that is available in break mode and that provides the value of a variable or an expression.

watchdog (n)~ A hardware device that monitors system health and functionality by communicating with the system software. The communication is through a dedicated device driver or device timer.

watchdog driver (n)~ A hardware device that monitors system health and functionality by communicating with the system software. The communication is through a dedicated device driver or device timer.

watchdog timer (n)~ A hardware device that monitors system health and functionality by communicating with the system software. The communication is through a dedicated device driver or device timer.

watcher node (n)~ A specific agent-managed computer that is designated to monitor a feature on another computer such as a database or a web application.

Water (PN)~ The Microsoft-supplied default attract application for Surface units. Customers can customize the background and reflection images in this application, but the water effects stay the same.

Water Configuration tool (n)~ The tool that you use to customize Water.

Watercolor (n)~ A filter effect in Windows Movie Maker.

watermark (n)~ An image that appears as the background to a document. Generally faded and transparent, so that text can be clearly read over it.

watermark (n)~ A threshold used to manage the memory consumption on each cache host. The high watermark and low watermark specify when objects are evicted out of memory.

WAU (n)~ An upgrade option that allows users to upgrade from one edition of Windows to another by purchasing the upgrade online. It is enabled by Software Licensing Services (SLS) technology which allows a digital lincense to determine what features are enabled or disabled allowing Microsoft to sell either additional licenses or product upgrades through digital licenses (PUP-DL). Customers may either buy full packaged product (FPP) or upgrade quickly and conveniently electronically.

WAV (n)~ A file format in which Windows stores sounds as waveforms. Such files have the extension .wav. Depending on the sampling frequency, on whether the sound is monaural or stereo, and on whether 8 or 16 bits are used for each sample, one minute of sound can occupy as little as 644 kilobytes or as much as 27 megabytes of storage.

WAV file, Wave ~ A computer sound recording. WAV files tend to be very large, so sound recordings are often compressed into- MP3s- on the internet, giving a slightly lower quality but- much- smaller files.

WAVE (n)~ A file format in which Windows stores sounds as waveforms. Such files have the extension .wav. Depending on the sampling frequency, on whether the sound is monaural or stereo, and on whether 8 or 16 bits are used for each sample, one minute of sound can occupy as little as 644 kilobytes or as much as 27 megabytes of storage.

wave (n)~ A logical grouping of warehouse work items that is created by means of a wave template configuration, processed either automatically or manually, and then released to pick the items for production or shipping.

wave device (n)~ A hardware device capable of reproducing sound.

wavelength ~ The distance between the crests of a wave in a radio signal, measured as the speed of light divided by the frequency in- Hz.

wavelet (n)~ A mathematical function that varies over a limited extent of time. Wavelets are coming into increasing use for analyzing signals (such as sound). They have limited duration and sudden changes in frequency and amplitude rather than the infinite duration and constant amplitude and frequency, of the sine and cosine functions.

wax paper (n)~ In the Comfy Cakes game, a piece of parchment paper on the conveyor belt for a new cake that the player will try to bake'. Each paper represents an order for a new cake

WBEM (n)~ An initiative undertaken by the Distributed Management Task Force (DMTF) to provide enterprise system managers with a standard solution for management.

WBF (PN)~ The collection of technologies and infrastructure required to support biometrics in Windows.

WBS (n)~ A deliverable-oriented grouping of project elements that organizes and defines the total work scope of the project. Each descending level represents an increasingly detailed definition of the project work.

w-buffer (n)~ A buffer that stores a depth value for each pixel in a scene. Pixels with a small z-value overwrite pixels with a large z-value.

WCE (PN)~ A command-line program launched by ACT-DC and configured by the user through the data collection package (DCP) settings. It may run immediately and exit or it may continue to monitor system activity throughout the duration of time configured by the user.

WCF (PN)~ A managed technology that is used to build and manage service-oriented Windows systems.

WCF Data Services (PN)~ A component of the .NET Framework that enables the user to create services that use the Open Data Protocol (OData) to expose and consume data over the Web or intranet by using the semantics of representational state transfer (REST).

WCF service (n)~ An application service such as authentication, profile properties, or roles, that can be accessed by any non-ASP.NET application that can read and send messages in SOAP format. WCF services enable different types of applications to share common data, such as user credentials for logging in.

WCF Service Connector (PN)~ An out-of-the-box BDC connector that ships with WSS. It provides connectivity between BCS and a WCF service endpoint.

WDF (n)~ A framework that provides prewritten support for the requirements of Windows driver model (WDM), giving Microsoft Windows device-driver developers the ability to better focus on their device models. The driver framework reduces the amount of new code required to provide a full-featured WDM device driver.

WDI (n)~ A framework that enables root cause detection of failures for Windows components through dynamic tracing.

WDK (PN)~ The SDK that contains all the tools and downloads needed to build a driver for Windows.

WDL (n)~ A collection of hardware device drivers for a Microsoft Windows operating system that were not included in the original Windows package.

WDM (n)~ A driver model based on the Windows NT driver model that is designed to provide a common architecture of I/O services for Windows operating systems for specific classes of drivers. These driver classes include USB and IEEE 1394 buses, audio, still-image capture, video capture, and HID-compliant devices such as USB mice, keyboards, and joysticks. Provides a model for writing kernel-mode drivers and minidrivers, and provides extensions for Plug and Play and power management.

weak PIN (n)~ Any PIN that could be easily guessed by a hacker.

Wealth Estimator (PN)~ A tool that enables a user to compute the future value of money.

Weapons (n)~ A content descriptor developed by Microsoft.

Weather (PN)~ An application that provides current weather forecasts with customized locations and interactive weather maps.

Weather (PN)~ The News & weather subcategory containing apps with information about

weather, including current forecasts or historical data.

Weather Bar (n)~ A feature in the Outlook calendar that can be enabled to display the weather forecast for a selected location.

weather station (n)~ A device that contains many sensors (thermometer, rain gauge, barometer, etc.) to measure atmospheric data such as temperature, air pressure or humidity.

web (n)~ A set of interlinked documents in a hypertext system. The user enters the web through a home page.

WEB (n)~ A content rating system for Web sites developed by Microsoft.

Web (PN)~ An API for AtomPub and syndication.

Web 2.0 ~ A set of technologies and applications that enable efficient interaction among people, content, and data in support of collectively fostering new businesses, technology offerings, and social structures.

Web address (n)~ An address that uniquely identifies a location on the Internet. A URL is usually preceded by http://, as in http://www.microsoft.com. A URL can contain more detail, such as the name of a page of hypertext, often with the file name extension .html or .htm.

Web Analytics (PN)~ A set of features that provides data analysis and reporting on Web traffic, search, and SharePoint assets. This information can be used to tailor systems to meet users' needs, optimize how they use and discover information, and to create targeted content.

Web analytics ~ The use of a range of quantitative analyses to understand Web site performance and visitor experience. These analyses include usage levels and patterns on an individual and aggregate level.

Web Analytics service application (PN)~ A SharePoint service application that collects, reports, and analyzes the usage and effectiveness of SharePoint Server sites.

Web Analytics Web Part (PN)~ A Web Part available to end users that displays the most frequently viewed content and search queries.

Web Analytics Web Service (PN)~ A service that processes analytics logging data about a SharePoint Server site and returns aggregated data.

web app (n)~ A client-server program accessed over a network that uses a web browser as the interface for the end user.

Web app Open Platform Interface (PN)~ An interface that enables a web application server (for example, Office Web Apps Server) to access and change files that are stored by a host server (such as SharePoint Server).

Web application (n)~ A software program that uses Hypertext Transfer Protocol (HTTP) for its core communication protocol and that delivers Web-based information to the user in the Hypertext Markup Language (HTML) language.

web application (n)~ A client-server program accessed over a network that uses a web browser as the interface for the end user.

Web Application Firewall (n)~ An appliance, server plugin, or filter that applies a set of rules to an HTTP conversation to identify and block common attacks to web applications.

Web Application Firewall (Units) (n)~ A resource of the 'CDN' service for 'Pay-As-You-Go' billing based on the number of firewall instances deployed.

web application hybrid (n)~ A web application that combines functionality or data from multiple sources into a single, integrated service, application, or medium.

Web Application Proxy (PN)~ The Remote Access role service in Windows Server 2012 R2 that allows administrators to publish applications for external access.

Web Apps (n)~ A feature of App Service that allows developers to create and deploy business-scalable mission-critical web apps.

Web archive (n)~ A presentation saved in MHTML format that integrates all supporting information, including graphics and other files, into a single file.

Web beacon (n)~ An external reference, such as a graphic image, linked to an external Web server that is placed in an HTML-formatted message. It can be used to verify that your e-mail address is valid when the message is opened and images downloaded.

Web browser (n)~ A software program used to display webpages and to navigate the Internet.

Web browsing (PN)~ The Utilities & tools subcategory containing apps to help you when browsing the Internet.

Web chat (n)~ A content descriptor developed by Microsoft.

Web client (n)~ A computer that uses a Web server.

Web component (n)~ A software component that requires IIS. Web components include IIS Virtual Directory setup to support Address Book Server, the Web Conferencing Server (downloading of meeting content), and the IM Conferencing group expansion Web service.

Web conference (n)~ An online gathering of people facilitated by software that allows participants to view, and optionally control, shared content and communicate with each other using various means, such as a telephone conference call.

web conferencing (n)~ Functionality supplied by the Web Conferencing service such as data sharing, and uploading documents and PowerPoint presentations, by using whiteboards and desktop sharing.

Web Conferencing Edge Server (n)~ An Office Communications Server that resides in the perimeter network and enables data collaboration with external users.

Web Conferencing Server (n)~ An Office Communications Server that manages data collaboration (e.g., application sharing, polling) for online conferences.

web connection (n)~ A connection between the user's device and a server that provides access to the Internet, typically through an Internet service provider.

web console (n)~ The browser-based interface that allows you to access the monitoring and reporting workspaces according to your user role.

Web Content Filter (n)~ An Internet service that determines the type of content on a particular Web site allowing the user or an administrator to block inappropriate content.

web context (n)~ A security context in Windows that controls capabilities. Windows Store apps written in HTML/JavaScript can contain content stored in a local or web context. Script files acquired from the Windows Store (and originally packaged with the application) can access WinRT APIs, but content dynamically downloaded from the web runs with restricted capabilities, much like those afforded to browser-based script today.

web crawler (n)~ An automated program that searches the Internet for new Web documents and places their addresses and content-related information in a database, which

can be accessed with a search engine. Generally considered to be a type of bot, or Internet robot.

Web Deploy (PN)~ A framework for automating the deployment of Web sites.

Web Deployment Agent Service (PN)~ A Windows service that enables you to perform MS Deploy operations such as dump and sync over a network. By default, the remote service runs by using the Network Service account.

Web Deployment Framework (PN)~ The managed code framework that includes public APIs and the underlying deployment tool engine. This is the top-level node and cannot be removed.

Web deployment package (n)~ A compressed (.zip) file or a folder that contains web site files, that is used to deploy a web site in IIS.

Web Deployment Tool (PN)~ A framework for automating the deployment of Web sites.

Web discussion (n)~ Comments that users attach to Web pages and documents.

Web Distributed Authoring and Versioning (n)~ A set of extensions to the Hypertext Transfer Protocol (HTTP) that facilitates collaborative editing and file management between users located remotely from each other on the Internet.

Web Edit (PN)~ A feature that simplifies the task of creating new SharePoint data. It makes it easier for users to enter free-form information or add photos, Web Parts or files to a SharePoint page.

Web Edition (PN)~ The edition of Microsoft Azure SQL Database that offers relational databases run (up to 5 GB) on shared resources, with built-in replicas within a datacenter, and dynamic scale-out of thousands of distributed databases.

Web e-mail (n)~ A content descriptor developed by Microsoft.

web farm (n)~ A network load balancing cluster of servers that support client Web site requests.

web filtering (n)~ A method of blocking access to websites based on their content. For example, In Windows Live Family Safety, parents can specify a filtering level, such as Strict or Basic, for their child.

Web folder (n)~ A folder on a Web server.

Web Folders (n)~ A shortcut you use to save, open, copy, or delete files on a Web or FTP server. Some Web folders, such as document libraries, have functionality not available with local folders. You'll find Web folders in My Network Places or Web Folders.

Web Forms (n)~ The ASP.NET page framework, which consists of programmable Web pages (called Web Forms pages) that contain reusable server controls.

Web Forms Server Control (PN)~ Web form server controls are used for designing the user interface of the application and posting data on the server. Although similar to HTML controls in appearance and operations, server controls run on the server. It is easier to program with these controls because the methods, properties, and events epxosed by these controls are consistent and utilize the .NET Framework class library.

web front-end component (n)~ A component that interacts with the users and other external systems in various ways.

Web hosting (PN)~ The Developer tools subcategory containing apps to help developers with the web hosting aspects of building an app.

Web hosting service (n)~ A wide variety of activities that provide computer and

communication facilities to businesses or individuals, especially for use in creating Web and electronic commerce sites. A Web host provides such services as news, mail, or data to computers that connect to it. A Web host can provide high-speed access to the Internet, redundant power and data storage, and 24-hour maintenance at a lower cost than implementing the same services independently.

web layout view (n)~ A view of a document as it will appear in a Web browser. For example, the document appears as one long page (without page breaks) and text and tables wrap to fit in the window.

web log (n)~ A frequently updated online journal or column.

Web Management Service (n)~ A service that enables remote and delegated management of a Web server and its Web sites and applications.

Web master (n)~ A person responsible for creating and maintaining a World Wide Web site. A webmaster is often responsible for responding to e-mail, ensuring the site is operating properly, creating and updating Web pages, and maintaining the overall structure and design of the site.

Web Meeting Place (n)~ A Live Meeting session type designed for smaller, more collaborative meetings.

Web method (n)~ A procedure that is exposed to Web service clients as an operation that can be called on the Web service.

Web Note (n)~ A feature in the Spartan browser that allows customers to write or type on webpages from within the browser, using digital ink.

web package (n)~ A collection of files, settings, databases, and auxiliary information that is packaged as a file structure or as a compressed file for deployment.

web page (n)~ A document on the World Wide Web. A Web page consists of an HTML file, with associated files for graphics and scripts, in a particular directory on a particular machine (and thus identifiable by an URL). Usually a Web page contains links to other Web pages.

Web Page Preview (n)~ An option that displays the Web page in a Web browser.

Web page report view (n)~ A report type that contains a Web page.

Web Part (n)~ A reusable component that wraps Web-based content (such as XML, HTML, and scripting) with a standard property schema and displays that in a cohesive unit on a page.

Web Part description file (n)~ An .xml file that defines the default property settings for a Web Part, including references to other files that are required to run and display the part.

Web Part zone (n)~ A container with a set of properties that can be configured to control the organization and format of Web Parts on a Web Part Page.

Web Parts (n)~ An integrated set of controls for creating Web sites that enable end users to modify the content, appearance, and behavior of Web pages directly from a browser.

Web Parts connection (n)~ An association between two server controls residing in a WebPartZoneBase zone that enables them to share data, with one control acting as the provider of data and the other control acting as the consumer. A connection is encapsulated within a System.Web.UI.WebControls.WebParts.WebPartConnection object.

Web Parts control (n)~ A control that is part of the Web Parts control set.

Web Parts control set (n)~ The integrated set of ASP.NET software components that

provide personalization, structural components such as zones and the WebPartManager control, Web Parts UI controls, and other components for building Web Parts controls and applications.

Web Parts page (n)~ An ASP.NET Web page that includes Web Parts controls that let users personalize the page, such as selecting the information to display.

Web performance test (n)~ A test type that targets the validation of Web pages and HTTP requests.

Web Performance Test Editor (PN)~ The Visual Studio editor in which a Web test is edited. It displays a tree structure of request nodes.

Web Performance Test Result Viewer (PN)~ A Visual Studio window where Web tests are run and results are displayed.

Web PI (n)~ A wizard that automates the installation of several commonly used Web technologies from a single installation point. These technologies include all the IIS features like ASP and ASP.NET, as well as Application Request Routing (ARR), Visual Web Developer Express, SQL Server Express, etc.

Web Platform Installer (n)~ A wizard that automates the installation of several commonly used Web technologies from a single installation point. These technologies include all the IIS features like ASP and ASP.NET, as well as Application Request Routing (ARR), Visual Web Developer Express, SQL Server Express, etc.

Web playlist (n)~ A playlist file (with an .isx file name extension) that is stored on the Web server and used by the Web Playlists feature. The file is an XML-formatted file.

Web Playlists (PN)~ The name of an extension that lets the user create server-controlled sequences of digital media content and to prevent caching of content on end-user computers.

Web pool (n)~ A grouping of one or more URLs served by a worker process.

Web Pool Agent (n)~ An isolated process under which the Certificate Lifecyle Manager (CLM) web portal runs.

web portal (n)~ A user interface implemented by a software application via a component of a web server, such as IIS.

web presence provider (n)~ A Web hosting and Internet service provider who manages the Web server hardware and software required to make a Web site available on the Internet.

Web project (n)~ A collection of files that specifies elements of a Web application.

web proxy (n)~ A method exposed in a client object model to issue requests from SharePoint to a remote service that developers can use in apps for SharePoint.

Web Proxy AutoDiscovery (n)~ A standard networking protocol used to help Internet client software automatically locate and interface with cache services within a network.

Web publishing (n)~ The process of publishing content to an intranet or Internet site.

Web query (n)~ A query that retrieves data stored on your intranet or the Internet.

Web reference (n)~ A reference that provides access to an available resource by using an Internet protocol such as SOAP or HTTP.

Web Request Throttling (n)~ A feature that offers improved reliability by throttling client requests and notifying SharePoint administrators when performance is in jeopardy. It monitors parameters such as available memory, number of requests in the queue, and

wait times, and rejects incoming requests if performance values cross predefined thresholds.

Web resource (n)~ Web content that can be stored on the server and executed in the browser.

Web restrictions (n)~ A feature of Parental Controls that allows users to block Web sites that they don't want to view.

web role (n)~ A cloud service role that provides an operating environment for running web sites or applications as supported by Internet Information Services (IIS) 7.0.

Web root (n)~ The root directory for a Web site, where the content files are stored. In (IIS), the home directory and all its subdirectories are available to users by default. Also, the root directory for an IIS service. Typically, the home directory for a site contains the home page.

Web server (n)~ A server computer that hosts Web pages and responds to requests from browsers.

Web server control (n)~ An ASP.NET server control that belongs to the System.Web.UI.WebControls namespace. Web server controls are richer and more abstract than HTML server controls. A Web server control has an asp tag prefix on an ASP.NET page, such as <asp:Button runat=server' />.'

Web Server Management Enumerator module (PN)~ A probe action module type that performs a WS-Management Enumerate operation.

Web Service Connector (PN)~ An out-of-the-box BDC connector that ships with WSS. It provides connectivity between BCS and a Web service endpoint.

Web Service Description Language Schema (n)~ An interface implemented in the XML message format for describing the network services offered by the server.

Web Service Details window (n)~ The window that displays the behavior specification for a Web service endpoint. For example, it displays the operations for a Web service endpoint.

Web service endpoint (n)~ An endpoint that exposes a Web service.

Web service extension (n)~ An ISAPI or CGI that extends IIS functionality beyond serving static pages.

Web services (n)~ Protocols that enable computers to work together by exchanging messages. Web services are based on the standard protocols of XML, SOAP and WSDL, which allow them to interoperate across platforms and programming languages, including the ability to manage federated identities and security.

Web Services Description Language (n)~ An XML format for describing Web services. WSDL allows Web service providers and users of such services to work together easily by enabling the separation of the description of the abstract functionality offered by a service from concrete details of a service description such as how' and 'where' that functionality is offered.'

Web Services Federation (PN)~ A specification that defines a model and a set of messages for brokering trust and the federation of identity and authentication information across different trust realms. The WS-Federation specification identifies two sources of identity and authentication requests across trust realms: active requestors, such as Simple Object Access Protocol (SOAP)-enabled applications, and passive requestors, which are

defined as Hypertext Transfer Protocol (HTTP) browsers that can support broadly supported versions of HTTP, for example, HTTP- 1.1.

Web Services Security (PN)~ A series of specifications that describe how to attach signature and encryption headers to Simple Object Access Protocol (SOAP) messages. In addition, WS-Security describes how to attach security tokens, including binary security tokens such as X.509 certificates and Kerberos tickets, to messages. In Active Directory Federation Services (ADFS), WS-Security is used when Kerberos signs security tokens.

Web Site Administration tool (n)~ A set of prewritten ASP.NET pages that can be used by individuals with no programming skills to configure a Web application.

Web Site Certificate Wizard (n)~ A wizard that enables the user to add or configure certificates to web sites.

Web Slice (PN)~ A piece or slice of a Web page that users can directly subscribe to from the browser. The browser checks if the piece of the web has updates, and indicates to the user when there are new updates available. Users can preview the piece of the Web before navigating to the full Web page.

Web slide (n)~ A slide that provides each meeting participant with an independent connection to a Web page that is specified by the presenter.

Web synchronization (n)~ In merge replication, a feature that lets you replicate data by using the HTTPS protocol.

Web Test Editor (n)~ The Visual Studio editor in which a Web test is edited. It displays a tree structure of requests nodes.

Web Test Recorder (PN)~ A feature in Visual Studio Team Edition that records the actions you perform while you browse a Web site. As you move through the site, recorded requests are added to the Web test.

Web Viewer (PN)~ A web-based viewer that displays generated reports in a web browser.

web worker API (n)~ The API that defines a way to run scripts in the background. Web Workers are specified in the World Wide Web Consortium (W3C)'s Web Workers specification.

Web-based application (n)~ A software program that uses Hypertext Transfer Protocol (HTTP) for its core communication protocol and that delivers Web-based information to the user in the Hypertext Markup Language (HTML) language.

web-based application (n)~ A software program that uses Hypertext Transfer Protocol (HTTP) for its core communication protocol and that delivers Web-based information to the user in the Hypertext Markup Language (HTML) language.

Web-based Distributed Authoring and Versioning (PN)~ A set of extensions to the Hypertext Transfer Protocol (HTTP) that facilitates collaborative editing and file management between users located remotely from each other on the Internet.

Web-based e-mail (n)~ Electronic mail that can be accessed through a Web site.

web-based e-mail (n)~ Electronic mail that can be accessed through a Web site.

Web-Based Enterprise Management (n)~ An initiative undertaken by the Distributed Management Task Force (DMTF) to provide enterprise system managers with a standard solution for management.

web-based seminar (n)~ A seminar conducted through the Internet.

web-based tool (n)~ A web-based application utility or feature that aids in accomplishing

a task or set of tasks.

webcam (n)~ A camera for use with a computer to transmit a video picture.

Webcam ~ (WEB CAMera)- a kind of cheap TV camera which you can use for videoconferencing over the internet, or just showing off. They are very popular for making video calls over the internet.

webcast (n)~ A series of digital media files (audio or video) delivered to users over the Web.

WebDAV (n)~ A set of extensions to the Hypertext Transfer Protocol (HTTP) that facilitates collaborative editing and file management between users located remotely from each other on the Internet.

WebDAV 7.5 for IIS 7 (PN)~ An extension for the HTTP/1.1 protocol to allow clients to publish, lock, and manage resources on the Web.

WebDAV injector (n)~ Code that loads WebDAV objects at runtime.

WebDAV provider (n)~ An application that presents WebDAV services to users, for example Microsoft SharePoint.

web-enabled (adj)~ Pertaining to an application or other software that is able to connect to the World Wide Web and get or post data provided the appropriate network infrastructure is available.

web-enabled application (n)~ A software program that uses Hypertext Transfer Protocol (HTTP) for its core communication protocol and that delivers Web-based information to the user in the Hypertext Markup Language (HTML) language.

Web-enabled InfoPath form for mobile devices (n)~ A form that can be opened and filled in on a mobile device, like a PDA or smartphone.

web-enabled mobile phone (n)~ A mobile phone that can view web content by connecting directly to the Internet.

Webhook (n)~ In web development, a method of augmenting or altering the behavior of a web page, or web application, with custom callbacks, which may be maintained, modified, and managed by third-party users and developers who may not necessarily be affiliated with the originating website or application.

Webhost ~ A company which makes webpages available on the World Wide Web, usually as a commercial venture.

webinar (n)~ A seminar conducted through the Internet.

WebInbox (n)~ A message center in Project where a workgroup manager can view Web-based messages from workgroup members who are using Microsoft Project Central. The manager can update the project schedule based on the responses of workgroup members.

weblet (n)~ A class that generates content in HTML code sothat Web applications can display active, current content and data.

weblog (n)~ A frequently updated online journal or column.

Weblog ~ A website documenting someone's thoughts or experiences, also known as a- blog.

Webmail ~ Email controlled from a website such as Hotmail or Yahoo instead of with a dedicated mail program like Outlook Express or Eudora. Many ISPs allow you to access your email both with a mail program and via the Web, so that you can access your email while travelling.

webmaster (n)~ A person responsible for creating and maintaining a World Wide Web site. A webmaster is often responsible for responding to e-mail, ensuring the site is operating properly, creating and updating Web pages, and maintaining the overall structure and design of the site.

Webmaster ~ The person prinicipally responsible for maintaining a website.

webmaster ~ the person who has principal responsibility for maintaining a site on the WORLD WIDE WEB and updating some or all of the WEB PAGEs

webmaster tools (n)~ A set of tools that is used to troubleshoot the crawling and indexing of Web sites.

WebOS ~ a mobile operating system developed by Palm for its Pre range of smartphones. With Palm's acquisition by HP in 2010, WebOS is now being expanded to address other devices, notably tablets, but also printers.

webpage (n)~ A document on the World Wide Web. A Web page consists of an HTML file, with associated files for graphics and scripts, in a particular directory on a particular machine (and thus identifiable by an URL). Usually a Web page contains links to other Web pages.

Webquest ~ A webquest is an inquiry-based learning instructional strategy utilizing information on the internet to guide learners. For webquests and sample webquests, see- http://webquest.org/information on developing-

WebReady Document Viewing (n)~ A technology that allows documents to be converted to HTML and displayed in a Web browser when a viewing application is not available.

Webserver ~ A computer which fetches or stores- World Wide Web- pages and provides them over the internet on request.

website (n)~ A group of related web pages that is hosted by an HTTP server on the World Wide Web or an intranet. The pages in a website typically cover one or more topics and are interconnected through hyperlinks.

Website ~ A page or group of pages on the- World Wide Web.

website host (n)~ A company that provides servers, Internet connectivity, and other associated facilities needed to publish websites.

Website requests (PN)~ The tab on the Family Safety website that displays requests a child has made via e-mail to view a blocked website.

Websites (PN)~ The Microsoft Azure hosting offer that is streamlined for fast and easy website deployments either running custom application code or popular open source web apps.

Websites Basic (PN)~ An Azure Web site hosting tier, used for pricing calculation.

Websites hour (n)~ A unit of measure for the time used of the Microsoft Azure Web Sites service.

Websites Shared (PN)~ An Azure Web site hosting tier, used for pricing calculation.

Websites Standard (PN)~ An Azure Web site hosting tier, used for pricing calculation.

WebSocket protocol (n)~ A feature of Internet Information Services (IIS) that lets the server establish a long-running, full-duplex, bidirectional TCP connection to the client and that lets the server push data to the client.

Webspace ~ The storage on an internet server where websites are kept. Webspace can be hired from a commercial provider, or is sometimes provided free with an internet account.

Websurfing ~ Looking at pages on the- World Wide Web. Often just calledsurfing.

week number (n)~ The weeks of the year are assigned a number from 1 to 52, called week numbers. When you turn on week numbers, they appear on the left side of the Date Navigator in Calendar.

Week view (n)~ A calendar view that displays information for a one-week period.

weekday (n)~ One of the seven days of a week, the first day being a Sunday for U.S. English.

weekday (n)~ Any day of the week except Saturday and Sunday.

Weekend Rule (PN)~ A policy in Microsoft Office Outlook that moves reccurring meetings forward one day if they land on a weekend or on a public holiday.

weekly digest (n)~ A weekly email that is a summary of threads in public groups that a user belongs to, including the All Company group.

weight (n)~ The value of a scorecard element in relation to the values of other elements of the same type.

weight engine (n)~ An engine that is called automatically when the volume of a package is not proportional to its weight.

weighted close formula (n)~ A formula that calculates the average of the high, low, and close prices, while giving extra weight to the close price.

weighted duration (n)~ Weighted average of the expected, pessimistic, and optimistic dates and durations. By default, PERT analysis calculation gives heaviest weight to the expected duration, and lightest weight to the pessimistic and optimistic durations.

Welcome Center (n)~ A feature that serves as a launching point for several optional Windows tasks and OEM-defined tasks.

well-formed (adj)~ Pertaining to an Extensible Markup Language (XML) document that is syntactically correct.

well-formed XML (n)~ An XML file in which there is only one root element and all the elements, delimited by start- and end-tags, nest properly within each other.

WEP (n)~ An encryption algorithm system included as part of the 802.11 standard, developed by the Institute of Electrical and Electronics Engineers as a security measure to protect wireless LANs from casual eavesdropping. WEP uses a shared secret key to encrypt packets before transmission between wireless LAN devices and monitors packets in transit to detect attempts at modification. WEP offers both 40-bit and 128-bit hardware-based encryption options.

WER (PN)~ The Windows technology that collects data on system crashes or hangs and sends it to Microsoft.

West-East (adj)~ A node placement style that specifies that the nodes are west-east in relation to the MOM Management Server.

wetting (n)~ A problem with the Surface display when extremely black areas appear on the Surface screen. Wetting occurs when diffuser layers accidentally contact each other. Wetting resembles areas of moisture under the Surface screen.

WFP (n)~ A feature that runs in the background and protects your system files from being overwritten. When a file in a protected folder is modified, WFP determines whether the new file is the correct Microsoft version or whether the file is digitally signed. If not, the modified file is replaced with a valid version.

WFP (n)~ An architecture in Microsoft Windows that allows unprecedented access to the TCP/IP packet processing path, wherein outgoing and incoming packets can be examined or changed before allowing them to be processed further.

WGA (PN)~ A program for licensed Windows software that provides access to updates, value-added downloads, free software trials, and special promotions.

WGA Notifications (PN)~ Notifications that indicate a new installation of Windows did not pass validation.

What can I say? (PN)~ Part of the text that explains how the Speech feature can be activated.

What You See Is What You Get (n)~ Pertaining to a program or interface that allows creation and editing of web pages, text, or graphical user interfaces such that users can see what the end results will look like while the documents are being created.

what-if analysis (n)~ The process of changing the values in cells to see how those changes affect the outcome of formulas on a worksheet. For example, varying the interest rate that is used in an amortization table to determine the amount of the payments.

what's new (oth)~ A list that displays someone's recent activity on Windows Live.

WHERE clause (n)~ The part of an SQL statement that specifies which records to retrieve.

Whipped Cream Filling Button (n)~ A button on the Comfy Cakes game interface that allows the player to select a whipped cream filling for their cake.

white balance (n)~ A setting that compensates for the color of light in which a picture was taken. A correct white balance setting makes colors look natural, while an incorrect white balance can result in pictures that have exaggerated colors.

white box view (n)~ A unit test is typically written by a developer to verify the behavior of a specific method or set of methods. They can also be used for white-box testing or in conjunction with load or stress testing.

white label ~ product or service is a product or service produced by one company (the producer) that other companies (the marketers) rebrand to make it appear as if they made it. Common in Telco wholesale.

white list ~ List of approved or trusted people or vendors or items etc.

white point (n)~ The lightest color that can be reproduced by a display device. Black point and white point are set to achieve optimal highlights and shadows in an image.

white reference image (n)~ A snapshot of the Surface screen when it is covered by the white side of the calibration board. (This situation represents the absence of light in your environment.) This snapshot is taken during calibration.

white space (n)~ Any characters that can be found between words - this includes space (')

White thumbpads (n)~ A DialKeys style that shows white keys appearing in two semicircles in the corners of the screen.

whiteboard (n)~ Software that allows multiple users across a network to work together on a document that is simultaneously displayed on all the users' screens as though they are gathered around a physical whiteboard.

whiteboard (n)~ A feature in OneNote on Microsoft Surface Hub where you can draw with the Surface Hub pens or with touch.

Whiteboard slide (n)~ A blank collaborative slide on which participants can add content by using the annotation tools.

whitelist (n)~ A list or register of entities that are being provided a particular privilege, service, mobility, access or recognition.

white-space character (n)~ Any characters that can be found between words - this includes space (')

WHOIS ~ This is an Internet service that finds information about a domain name or IP address.- HTTP://WWW.WHOIS.NET

WHQL (n)~ A Microsoft hardware-testing organization that produces and supports the Microsoft Hardware Compatibility Test kit for current Microsoft operating systems. Both hardware and software are tested before rights to use the logo are granted.

WIC (PN)~ An extensible platform component for decoding/encoding digital images and performing common transforms.

WID (PN)~ A relational data store that's included in Windows and is used by several Windows Services.

wide area network (n)~ A communications network connecting geographically separated computers, printers, and other devices. A WAN enables any connected device to interact with any other on the network.

wide character (n)~ A 2-byte multilingual character code.

wide tile (n)~ A rectangular tile of 310 x 150 pixels on the Start screen.

wideband audio (n)~ Audio transmission that uses more bandwidth than conventional telephony in order to enhance voice quality.

wideband audio codec (n)~ An audio codec that provides high-quality voice by using a sampling rate of 16 kHz.

wideband codec (n)~ An audio codec that provides high-quality voice by using a sampling rate of 16 kHz.

widget (n)~ A unit of execution within the Microsoft support diagnostic tool (MSDT) XML.

widget (n)~ Part of a graphical user interface (GUI) that allows a user to control and change the appearance of elements for operating an application.

widget (n)~ A feature of OneNote for Android that allows you to create notes, audio notes, and picture notes right from your phone's home screen.

Widget (n)~ An area of the Service Desk that can be customized to include information and interfaces for custom integrations with third party tools or systems.

widget ~ An HTML-based program that runs in the Dashboard layer of the system.

widget pack (n)~ A kind of management pack that allows new dashboard widget libraries to be installed and used in Operations Manager to display monitoring data on a dashboard.

widow (n)~ The last line of a paragraph printed by itself at the top of a page.

WiFi (PN)~ The 802.11b standard for wireless networking. A standard for delivering digital information over high-frequency, wireless local area networks.

Wi-Fi (PN)~ The 802.11b standard for wireless networking. A standard for delivering digital information over high-frequency, wireless local area networks.

Wi-Fi hotspot (n)~ A public place (such as a coffee shop, airport, or hotel) with a wireless network that you can use to connect to the Internet.

Wi-Fi networking (PN)~ A toggle switch that allows phone to access available Wi-Fi networks.

Wi-Fi Protected Access (n)~ A security method used by wireless networks. WPA encrypts the information that is sent between computers on a wireless network and authenticates users to help ensure that only authorized people can access the network.

Wi-Fi Protected Access 2 (PN)~ A wireless implementation and the second generation of WPA security that is based on the final IEEE 802.11i amendment to the 802.11 standard.

Wi-Fi Sense (PN)~ A feature that automatically attaches users to Wi-Fi hotspots.

Wi-Fi, WiFi ~ (WIreless FIdelity)- A method of connecting computers to a network without cables, using small radio transmitter/receivers built in to most portable devices and broadband modems. Many hotels and other public locations now offer free WiFi if you have a suitable device, such as a laptop, tablet or smartphone.

wiki (n)~ A Web site that provides an infrastructure for users to easily create, edit, and delete content, hyperlinks, and Web pages for the site using a Web browser and simple text syntax.

Wiki ~ A website where the users create and edit the content collaboratively, the best known being- Wikipedia, a huge online encyclopedia. Entries on controversial subjects should be viewed with caution, as they may have been edited by persons with strong but not necessarily accurate views. Anyone can create a Wiki using free- open source- software.

Wikipedia ~ The world's largest online encyclopedia, which can be edited by anyone at all.www.wikipedia.org

wikis ~ A wiki is a simple collaborative system for creating and maintaining hyperlinked collections of Web pages. A wiki usually enables users to add or change pages 'in context' without having to worry about where and how the content is physically stored.

wildcard (n)~ A keyboard character that can be used to represent one or many characters when conducting a query.

wildcard character (n)~ A keyboard character that can be used to represent one or many characters when conducting a query.

wildcard search (n)~ A search for data in a table or field using placeholders (such as * or ?).

wildcarding (n)~ In DNS, the supported use of wildcard characters such as the asterisk (*) in domain names for DNS queries that resolve to multiple names. When wildcarding is used, DNS servers must support resolving name queries that use wildcard characters, and resolvers must be able to parse multiple records from any resource record sets (RRsets) issued in wildcard query responses.

WildList ~ The WildList has been used as a 'reference standard' by many antivirus testing organizations that require 100% detection of acknowledged 'in the wild' viruses for tested products to attain various, 'desirable' certification levels.

will call (n)~ A shipping method that indicates an order will be picked up instead of being shipped.

WIMBoot (n)~ A boot process that enables Windows to start and run directly from a compressed .wim file.

Win32 API (n)~ A 32-bit application programming interface for Windows operating

systems that includes sophisticated operating system capabilities, security, and API routines for Windows-based applications.

Win95 ~ Windows 95. See- Windows.

Win98 ~ Windows 98. See- Windows.

Win9x ~ Compatible with or pertaining to both Windows 95 and Windows 98.

window (n)~ A rectangular area on a computer screen in which programs and content appear.

window (n)~ A subset of events within a stream that fall within some period of time; that is, a window contains event data along a timeline.

window class (n)~ A set of attributes that the system uses as a template to create a window.

window frame (n)~ The framework that is hosting the window.

Window Gallery (n)~ A gallery containing thumbnail views of open application windows.

window ghosting (n)~ A Desktop Window Manager feature that lets the user minimize, move, or close the primary window of an application that is not responding.

window glass (n)~ A visual effect that imparts a quality of translucency to windows.

window handle (n)~ A handle that uniquely identifies a window.

window interval (n)~ The length of time during which a pre-configured number of similar events are written to Planning Server log files, when filtering is enabled.

window pane (n)~ A portion of a software window bounded by and separated from other portions by vertical or horizontal bars and having a separate function.

window procedure (n)~ A function, called by the operating system, that controls the appearance and behavior of its associated windows. The procedure receives and processes all messages to these windows.

windowed mode (n)~ A visual setting that enables app screen content to display in a window.

Windows ~ A family of- operating systems from the Microsoft Corporation, standard on most PCs.

Windows 10 (PN)~ The version 10 of the Windows operating system that runs on PCs and tablets.

Windows 10 Education (PN)~ An edition of Windows 10 available through volume licensing, that is designed for education institutions, and includes all of the features of Windows 10 Pro, plus some other features like virtualization, management, DirectAccess, and BranchCache.

Windows 10 Education N (PN)~ Regulatory Edition of Education Edition to comply with the mandatory requirements for EU market and Korean government

Windows 10 Enterprise (PN)~ An edition of Windows 10 that is available only through volume licensing, is designed for businesses, and includes all of the features of Windows 10 Pro, plus some other features like virtualization, management, DirectAccess, and BranchCache.

Windows 10 Enterprise 2015 LTSB (PN)~ Long term and less frequent servicing updates for Windows 10 Enterprise 2015 edition.

Windows 10 Enterprise 2015 LTSB Evaluation (PN)~ Long term and less frequent

servicing updates for Windows 10 Enterprise 2015 Evaluation edition.

Windows 10 Enterprise 2015 LTSB N (PN)~ Regulatory Edition of LTSB - V2015 Edition to comply with the mandatory requirements for EU market and Korean government

Windows 10 Enterprise 2015 LTSB N Evaluation (PN)~ Regulatory Edition of LTSB - V2015 Evaluation Edition to comply with the mandatory requirements for EU market and Korean government

Windows 10 Enterprise Evaluation (PN)~ The evaluation edition of Windows 10 Enterprise.

Windows 10 Enterprise Insider Preview (PN)~ ?A prerelease build of Windows 10 for enterprises available to customers in April 2015 or later.

Windows 10 Enterprise N (PN)~ Regulatory Edition of Enterprise Edition to comply with the mandatory requirements for EU market and Korean government

Windows 10 Enterprise N Evaluation (PN)~ Regulatory Edition of Enterprise Evaluation Edition to comply with the mandatory requirements for EU market and Korean government

Windows 10 Enterprise Technical Preview (PN)~ ?A prerelease build of Windows 10 for enterprises available to customers in October 2014 and January 2015.

Windows 10 Holographic (PN)~ An edition of Windows 10 designed for HoloLens.

Windows 10 Home (PN)~ ?An edition of Windows 10 designed for home users.

Windows 10 Home Insider Preview (PN)~ ?A prerelease build of Windows 10 made available to customers in- April 2015 or later. This is the most basic edition of Windows 10 Insider Preview.

Windows 10 Home Insider Preview Single Language (PN)~ The single-language edition of Windows 10 Insider Preview.

Windows 10 Home N (PN)~ Regulatory Edition of Home Edition to comply with the mandatory requirements for EU market and Korean government

Windows 10 Home Single Language (PN)~ The single-language edition of Windows 10 Home.

Windows 10 IoT Core (PN)~ An edition of Windows 10 optimized for fixed function IoT devices.

Windows 10 IoT Core Device Center (PN)~ A win32 desktop application that downloads and flashes the operating system (Windows 10 IoT Core) onto an SD card, and- allows users to view data about all active devices on a network.

Windows 10 IoT Enterprise (PN)~ An edition of Windows 10 for a range of powerful IoT devices that provides granular lockdown capabilities, Win32 and modern app support.

Windows 10 IoT Mobile (PN)~ An edition of Windows 10 for mobile IoT devices that need a rich user experience and granular lockdown capabilities.

Windows 10 Mobile (PN)~ An edition of Windows 10 designed to run on mobile devices.

Windows 10 Mobile Enterprise (PN)~ Enterprise edition of Windows 10 for mobile phones.

Windows 10 Mobile Insider Preview (PN)~ ?A prerelease build of Windows 10 for phones that was made available to Insiders.

Windows 10 Mobile Technical Preview (PN)~ A prerelease build of Windows 10 for

phones that was made available to Insiders.

Windows 10 Pro (PN)~ An edition of Windows 10 designed for enthusiasts and businesses that includes the features of Home edition while also allowing an organization to manage the device, set policies, control encryption, control updates, and login remotely.

Windows 10 Pro Insider Preview (PN)~ ?The professional edition of Windows 10 Insider Preview released in April 2015 or later.

Windows 10 Pro N (PN)~ Regulatory Edition of Pro Edition to comply with the mandatory requirements for EU market and Korean government

Windows 10 Pro Pack (PN)~ A downloadable pack that adds features to Windows 8 or Windows 8.1 Single Language editions to move them to a Windows 10 Pro edition.

Windows 10 Pro Technical Preview (PN)~ The professional edition of the Windows Technical Preview build that is released in January 2015.

Windows 10 Team (PN)~ An appliance-like edition of the OS focused on large screen computing for teams (or groups).

Windows 10 Technical Preview (PN)~ A prerelease build of Windows 10 that was made available to customers in October 2014 and in January 2015. This is the most basic edition of Windows 10 Technical Preview build.

Windows 10 Technical Preview for phones (PN)~ A prerelease build of Windows 10 for phones that was made available to Insiders.

Windows 10 Technical Preview SL (PN)~ The single-language edition of Windows 10 Technical Preview.

Windows 2000 ~ A version of- Windows- intended for business users, the successor to- Windows NT. Now obsolete.

Windows 3, 3.1, 3.11 ~ A very early version of Windows, a sort of forerunner of the operating system that ran on top of the original PC operating system, DOS. Long obsolete.

Windows 7 Enterprise (PN)~ An edition of Microsoft Windows 7 operating system that is designed to significantly lower IT costs and risks, and to meet the needs of large, global organizations with complex IT infrastructures.

Windows 7 hardware logo (n)~ Logo assigned to the hardware products that have passed Microsoft designed tests for compatibility and reliability on Windows 7.

Windows 7 Home Basic (PN)~ An edition of Microsoft Windows 7 operating system that is designed for users who have basic computing needs, such as e-mail, browsing the Internet, and viewing photos.

Windows 7 Home Premium (PN)~ An edition of Microsoft Windows 7 operating system that is designed for users who want to go beyond e-mail and Web surfing to improve personal productivity and enjoy digital entertainment.

Windows 7 logo (n)~ Logo assigned to the products that have passed Microsoft-designed tests for compatibility and reliability on Windows 7.

Windows 7 Logo Program (PN)~ A program designed to identify compatible and reliable systems, software, and hardware products that have passed Microsoft-designed tests for compatibility and reliability on Windows 7.

Windows 7 Professional (PN)~ An edition of Microsoft Windows 7 operating system that is designed for users who own or run a small business.

Windows 7 software logo (n)~ Logo assigned to the software products that have passed

Microsoft designed tests for compatibility and reliability on Windows 7.

Windows 7 Starter (PN)~ An edition of Microsoft Windows 7 operating system that is available in emerging markets, and is designed for a beginning PC user with additional tools and tutorials to make it easier to use.

Windows 7 Ultimate (PN)~ The most complete edition of Microsoft Windows 7 operating system that is designed for users who use the same computer at home and for their daily work.

Windows 7, 8 etc ~ See- Windows

Windows 8 (PN)~ The operating system for PCs and tablets powered by x86 (32-bit) and AMD (64-bit) processors that includes an updated Windows Explorer, Task Manager, better multi-monitor support, and fast language switching.

Windows 8 app (PN)~ An app that targets Windows 8. It could be a Windows Store app or a desktop app.

Windows 8 Consumer Preview (PN)~ The beta release of the Windows 8 operating system.

Windows 8 Enterprise (PN)~ An edition of Windows 8 that is available only through volume licensing.

Windows 8 Media Center Pack (PN)~ A media pack add-on to Windows 8 Pro that upgrades the edition to include Windows Media Center.

Windows 8 Pro (PN)~ The operating system designed for enthusiasts and business/technical pros that includes all of the features in Windows 8, plus features for encryption, virtualization, PC management, and domain connectivity.

Windows 8 Pro Pack (PN)~ A downloadable pack that adds features to Windows 8 or Windows 8 Single Language editions to move them to a Windows 8 Pro edition with Windows Media Center installed.

Windows 8 Pro with Media Center (PN)~ An edition of Windows 8 Pro that contains Windows Media Center.

Windows 8 Release Preview (PN)~ The release candidate release of the Windows 8 operating system.

Windows 8 Single Language (PN)~ An edition of Windows 8 designed to make Windows affordable to mainstream consumers in emerging markets.

Windows 8 Upgrade Assistant (PN)~ "A downloadable app that helps users choose which edition of Windows 8 is right for them, determine if their hardware can support it, determine the compatibility of apps and devices and assist with any changes that are needed, and then purchase and install it from within the app. "

Windows 8.1 (PN)~ An updated version of Windows 8, which lets you watch movies or play games with Xbox, Skype with friends, access files anywhere with OneDrive, or find your next favorite app in the Windows Store.

Windows 8.1 Enterprise (PN)~ The edition of Windows 8.1 that is available only through volume licensing.

Windows 8.1 Enterprise Update (PN)~ The software update to Windows 8.1 Enterprise that gives users a more familiar and convenient experience across touch, keyboard and mouse inputs and enables more affordable Windows device choices.

Windows 8.1 Preview (PN)~ Windows 8.1 in a preview form to get as many Windows

8.0 users as possible to try it out.

Windows 8.1 Pro (PN)~ The edition of Windows 8.1 designed for enthusiasts and business/technical pros that includes all of the features in Windows 8.1, plus features for encryption, virtualization, PC management, and domain connectivity.

Windows 8.1 Pro for Education (PN)~ The edition of Windows 8.1 Pro that is optimized for students and educational institutions.

Windows 8.1 Pro Update (PN)~ The software update to Windows 8.1 Pro that gives users a more familiar and convenient experience across touch, keyboard and mouse inputs and enables more affordable Windows device choices.

Windows 8.1 Pro with Media Center (PN)~ The edition of Windows 8.1 Pro that contains Windows Media Center.

Windows 8.1 Pro with Media Center Update (PN)~ The software update to Windows 8.1 Pro with Media Center that gives users a more familiar and convenient experience across touch, keyboard and mouse inputs and enables more affordable Windows device choices.

Windows 8.1 Single Language (PN)~ The edition of Windows 8.1 designed to make Windows affordable to mainstream consumers in emerging markets.

Windows 8.1 Single Language Update (PN)~ The software update to Windows 8.1 Single Language that gives users a more familiar and convenient experience across touch, keyboard and mouse inputs and enables more affordable Windows device choices.

Windows 8.1 Update (PN)~ The software update to Windows 8.1 that gives users a more familiar and convenient experience across touch, keyboard and mouse inputs and enables more affordable Windows device choices.

Windows 8.1 with Bing (PN)~ The edition of Windows 8.1 that has the search engine in Internet Explorer defaulted to Bing.

Windows 98SE ~ (Second Edition)- An upgrade to Microsoft's Windows 98. Generally agreed to be the best of the Win9x bunch.

Windows AC (PN)~ A tool in the Windows ADK that uses assessments to create jobs that evaluate quality and view the results after a job runs. The Windows AC can also package a job and other necessary files, save the files in a folder that contains an executable file, move the job to another computer, and then run the job on the new computer.

Windows accounting (n)~ The accounting process carried out by Windows as accounting provider.

Windows activation (n)~ The process of activating Windows.

Windows Activation Client (n)~ The application that helps the user to activate a Windows product with Microsoft.

Windows Activation Technologies (PN)~ A set of antipiracy features for activation and validation in Windows Vista and Windows 7.

Windows ADK (PN)~ A suite of tools designed to help original equipment manufacturers, system builders, corporate IT professionals, and enthusiasts customize, automate, assess, and deploy the Windows operating system onto new hardware.

Windows Alarms & Clock (PN)~ An app that enables user to use clock, check world clocks, set alarms, set timers and run a stopwatch.

Windows All-User Install Agent (PN)~ An agent that installs Windows Store apps for all

users on a machine.

Windows API (n)~ The functions, messages, data structures, data types, and statements you can use in creating applications that run under Microsoft Windows 95 or later, including procedure declarations, user-defined type definitions, and constant declarations.

Windows app (n)~ An application experience that is- installed on a Windows-based device. This type of app does not include Classic Windows applications.

Windows app (n)~ An app that is built using the Universal- Windows Platform (UWP), which was first introduced in Windows 8 as the Windows Runtime.

Windows App Certification Kit (PN)~ A part of the Windows SDK that validates both Windows Store apps for the Windows Store and Windows desktop applications.

Windows application (n)~ A software application designed for use with the Microsoft Windows environment.

Windows AS (PN)~ An end-to-end test lab solution that enables the automation of computer and image inventory, test execution, and local results generation in a pre-manufacturing lab environment.

Windows ASC (PN)~ The graphical user interface that is used to manage Windows Assessment Services settings and assets, such as which lab computers to test, which images should be applied to those computers, and which assessments should be used to test the computers.

Windows Assessment and Deployment Kit (PN)~ A suite of tools designed to help original equipment manufacturers, system builders, corporate IT professionals, and enthusiasts customize, automate, assess, and deploy the Windows operating system onto new hardware.

Windows Assessment Console (PN)~ A tool in the Windows ADK that uses assessments to create jobs that evaluate quality and view the results after a job runs. The Windows AC can also package a job and other necessary files, save the files in a folder that contains an executable file, move the job to another computer, and then run the job on the new computer.

Windows Assessment Services (PN)~ An end-to-end test lab solution that enables the automation of computer and image inventory, test execution, and local results generation in a pre-manufacturing lab environment.

Windows Assessment Services -€" Client (PN)~ The graphical user interface that is used to manage Windows Assessment Services settings and assets, such as which lab computers to test, which images should be applied to those computers, and which assessments should be used to test the computers.

Windows Assessment Toolkit (PN)~ A toolkit that helps you determine the quality of a running operating system or a set of components with regard to performance, reliability and functionality. The toolkit includes several assessments and provides the tools needed to run assessments on a local computer or on multiple computers, and review the results of the assessments to diagnose problems and determine how to make improvements.

Windows Assistance Online (n)~ A World Wide Web version of Windows Client Help.

Windows Automated Installation Kit (n)~ A Microsoft suite of tools designed to help original equipment manufacturers, system builders, and corporate IT professionals customize, automate, and deploy Windows Vista operating system onto new hardware.

Windows Automatic Feedback (PN)~ A generic dialog for enabling both CEIP and WER on multiple machines simultaneously using Server Manager.

Windows Azure Online Backup Preview (n)~ The non-final release of the Azure-based backup solution enabling server data to be backed up and recovered from the cloud in order to help protect against loss and corruption.

Windows Backup (n)~ A file backup feature of Windows Vista that performs scheduled incremental backups of data to the target media. It also allows the user to restore an individual file or a group of files.

Windows Basics (n)~ A tutorial outlining basic Windows features, workflow and information.

Windows Biometric Credential Manager (PN)~ The Windows component that stores and manages biometric credentials such as fingerprints.

Windows Biometric Framework (PN)~ The collection of technologies and infrastructure required to support biometrics in Windows.

Windows Biometric Service (PN)~ A privileged Windows service that interfaces with biometric hardware through the Windows Biometric Driver Interface, and manages the capture, matching and storage of biometric data, and exposes this capability to applications through the Windows Biometric API.

Windows Bluetooth stack (n)~ A Bluetooth stack that is built in the Windows operating system. It also supports third-party driver development.

Windows Boot Manager (n)~ A Boot Configuration Data (BCD) application object.

Windows BranchCache (PN)~ A Windows component that helps speed data transfer within remote (branch) offices by caching the data on a local server or individual PCs.

Windows button (PN)~ A tablet hardware button with the Windows logo on it that's similar to the Windows key on a keyboard. Pressing the Power and Windows buttons simultaneously is the equivalent of pressing Ctrl+Alt+Del.

Windows Calculator (PN)~ The app that calculates (standard and scientific) and converts.

Windows Calendar (PN)~ The Microsoft app to facilitate the management of events.

Windows Call (PN)~ An app for making video calls.

Windows Camera (PN)~ An app to facilitate the capture of photos and videos by using the PC.

Windows Camera for Lumia (PN)~ The Camera app- that- comes pre-installed- on high-end Lumia devices.

Windows CE (PN)~ An operating system specially designed for mobile devices.

Windows Certification Program (PN)~ A certification program to ensure that devices, systems, and apps are compatible, reliable, and can perform to meet Windows standards.

Windows Certification Program for Hardware (PN)~ A certification program to ensure that systems and hardware are compatible and reliable and can perform to meet Windows standards.

Windows Client Protection (n)~ A strategy including components and features of Windows Vista that allows system administrators to manage the system from one place by combining antivirus and anti-spyware software.

Windows Communication Foundation (PN)~ A managed technology that is used to

build and manage service-oriented Windows systems.

Windows Communication Foundation application service (n)~ An application service such as authentication, profile properties, or roles, that can be accessed by any non-ASP.NET application that can read and send messages in SOAP format. WCF services enable different types of applications to share common data, such as user credentials for logging in.

Windows Communications Apps (PN)~ The download package that includes People, Messaging, Mail, and Calendar.

Windows Compatibility Evaluator (PN)~ A command-line program launched by ACT-DC and configured by the user through the data collection package (DCP) settings. It may run immediately and exit or it may continue to monitor system activity throughout the duration of time configured by the user.

Windows component library (n)~ A library of components that have a version that can be independent from the major Windows version. The Windows Store manages the process of ensuring that the correct version of the Windows component library is present when the app is installed on a Windows 8 PC. These libraries, which include Windows Library for JavaScript, C Runtime Libraries (CRT), and PlayReady DRM, are essential to the creation of Windows Store apps.

Windows Connect Now (n)~ A technology that allows for ease of creating a new or expanding an existing wireless network. This setup can be done automatically using a USB flash driver or manually through a Wireless Network Setup wizard.

Windows Contacts (n)~ A directory that you can use to store names, e-mail addresses, fax numbers, and distribution lists.

Windows DAC (n)~ A suite of data access APIs that ship with the Windows operating system. Data Access Components includes three major API surfaces-€"ADO, OLE DB, and ODBC-€"each of which is optimized for a different set of applications. All three major components of Data Access Components employ the provider model, which allows access to a variety of data sources using a virtually identical set of programmatic calls.

Windows Defender (PN)~ Antispyware software included in Windows that can prevent other software from displaying advertisements (such as pop-up ads), collect information about you, or change settings on your computer, generally without appropriately obtaining your consent.

Windows Defender alert level (n)~ A classification of software that help you quickly understand if the item is harmful and whether you need to take action immediately or if you should review more details.

Windows Deployment Services (PN)~ Software services that allow an administrator to set up new client computers remotely, without having to visit each client. The target clients must support remote booting.

Windows desktop application (n)~ ?An application that is built using the traditional Win32 app model, typically makes use of the COM or .NET runtime, and runs only on the desktop of Windows.

Windows Desktop Apps Certification Kit (PN)~ Tools and documentation to certify apps for Windows.

Windows Dev Center (PN)~ The online center that quickly gets you the info and tools

you need for Windows development.

Windows Dev Center desktop dashboard (n)~ The entry point to the desktop section of the Windows Dev Center where users can certify desktop apps for Windows, exchange information with Microsoft, and obtain services.

Windows Dev Center hardware and desktop dashboard (n)~ The entry point to the hardware and desktop development sections of the Windows Dev Center where users can certify hardware and desktop apps for Windows, distribute drivers, exchange information with Microsoft, and obtain services.

Windows Dev Center hardware dashboard (n)~ The entry point to the hardware section of the Windows Dev Center where users can certify hardware for Windows, distribute drivers by using Windows Update, exchange information with Microsoft, and obtain services.

Windows Developer Preview (PN)~ A nonfinal release of Windows that's made available to developers.

Windows device (n)~ ?A device (e.g. phone, tablet, or PC) that runs Windows.

Windows Diagnosis and Recovery (n)~ A feature in Windows that allows users to run system diagnostics and troubleshooting.

Windows Diagnostic Infrastructure (n)~ A framework that enables root cause detection of failures for Windows components through dynamic tracing.

Windows Diagnostics (n)~ A feature of Windows that checks for problems associated with network connections.

Windows Disk Diagnostic (n)~ Feature of Windows that proactively detects impending disk failures and can alert the support center to replace the failing hard disk before total failure occurs. For administrators, this feature will guide them through the process of backing up their data so the hard disk can be replaced without data loss.

Windows Disk Protection (PN)~ A feature that helps protect the Windows partition that contains the Windows operating system and other programs from being permanently modified from user session to user session.

Windows distribution (n)~ The collection of files released with Windows. This collection includes the langpacks directory, the sources directory, and other directories and files required for Windows Setup. In some scenarios, language packs must be copied to the langpacks directory and not installed directly into the .wim file.

Windows driver foundation (n)~ A framework that provides prewritten support for the requirements of Windows driver model (WDM), giving Microsoft Windows device-driver developers the ability to better focus on their device models. The driver framework reduces the amount of new code required to provide a full-featured WDM device driver.

Windows Driver Kit (PN)~ The SDK that contains all the tools and downloads needed to build a driver for Windows.

Windows Driver Library (n)~ A collection of hardware device drivers for a Microsoft Windows operating system that were not included in the original Windows package.

Windows Driver Model (PN)~ A driver model based on the Windows NT driver model that is designed to provide a common architecture of I/O services for Windows operating systems for specific classes of drivers. These driver classes include USB and IEEE 1394 buses, audio, still-image capture, video capture, and HID-compliant devices such as USB

mice, keyboards, and joysticks. Provides a model for writing kernel-mode drivers and minidrivers, and provides extensions for Plug and Play and power management.

Windows DS (PN)~ Software services that allow an administrator to set up new client computers remotely, without having to visit each client. The target clients must support remote booting.

Windows DVD Maker (n)~ A feature of Windows Vista that allows users to make DVDs from movies created using the Windows Movie Maker software.

Windows DVD Player (PN)~ First-party Windows app for playing commercial and homemade DVD-Video discs.

Windows Easy Transfer (PN)~ A Windows tool that assists consumers in moving their data (documents and settings) to the new environment.

Windows Embedded 8 Handheld (PN)~ A Microsoft operating system built on Windows Phone 8 designed for handheld portable devices.

Windows Embedded Handheld (PN)~ A Microsoft operating system designed for handheld portable devices.

Windows Error Reporting (PN)~ The Windows technology that collects data on system crashes or hangs and sends it to Microsoft.

Windows Essential Business Server Messaging Server (PN)~ The server that provides messaging capabilities and manages network services for Windows Essential Business Server.

Windows Essentials (PN)~ The set of Microsoft software for email, instant messaging, photos, and personal movies available to customers in a single download and installation.

Windows Essentials 2012 (PN)~ A set of apps that includes Messenger, Photo Gallery, Movie Maker, OneDrive, Mail, Writer, and Family Safety. (Family Safety is only included in Windows 7 downloads; it's built in to Windows 8.)

Windows Experience Index (n)~ A measure of the capability of your computer's hardware and software configuration, expressed in numbers called base score and subscore.

Windows Explorer (PN)~ A utility that enables the user to locate and open files and folders.

Windows extensibility points (n)~ A mechanism that an app can use to interact with the system or with other apps. You must declare extensibility points in the package manifest.

Windows Fabric (n)~ A distributed systems platform that makes it easy to build scalable, reliable, low-latency, and easily managed services and applications for the cloud.

Windows Fax and Scan (n)~ A feature in Windows Vista that allows the user to manage faxing and scanning functions.

Windows Feedback (PN)~ The app used to provide product feedback that results from the Windows Insider Program.

Windows Feedback Forwarder (PN)~ A forwarding service that enables you to automatically and securely send feedback to Microsoft after setting up a Group Policy domain or organizational unit. After configuring Group Policy and joining the Customer Experience Improvement Program (CEIP), Windows periodically collects and uploads statistical information.

Windows Feedback Platform (n)~ A DLL containing the list of problems on a particular

computer that require additional data collection for diagnosis.

Windows File Protection (n)~ A feature that runs in the background and protects your system files from being overwritten. When a file in a protected folder is modified, WFP determines whether the new file is the correct Microsoft version or whether the file is digitally signed. If not, the modified file is replaced with a valid version.

Windows Filtering Platform (n)~ An architecture in Microsoft Windows that allows unprecedented access to the TCP/IP packet processing path, wherein outgoing and incoming packets can be examined or changed before allowing them to be processed further.

Windows Fingerprint Credential Provider (PN)~ The Windows component that provides fingerprint information that is used to gain access to local and network resources.

Windows Firewall (n)~ A Control Panel feature that is used to set restrictions on what traffic is allowed to enter your network from the Internet.

Windows Firewall Configuration Provider (PN)~ A provider that lets administrators manage Windows Intune policy settings for Windows Firewall to control incoming and outgoing traffic on client computers that are managed by Windows Intune.

Windows Firewall shielded mode (n)~ A features of Windows Firewall that blocks everything.

Windows Firewall with Advanced Security (n)~ A snap-in which allows users to configure policies that provide enhanced network security for Windows computers.

Windows Flip (n)~ A feature that allows users to flip through open windows (by using Alt+Tab), providing a live thumbnail of each window, rather than just a generic icon and file name.

Windows Flip 3D (n)~ A feature that allows users to use the scroll wheel on their mouse to flip through open windows in a stack, and quickly locate and select the one they want to work with.

Windows Font Cache Service (PN)~ A Win32 service process that optimizes performance of applications by caching commonly used font data. Applications will start this service if it is not already running. It can be disabled, though doing so will degrade application performance.

Windows Forms (PN)~ A Microsoft .NET Framework programming model for developing graphical user interfaces.

Windows Forms Designer (PN)~ A tool that enables the rapid development of Windows-based applications. It allows you to add controls to a form, arrange them, and write code for their events.

Windows Gadget Platform (PN)~ A Windows removable component that enables applications to programmatically add gadgets to the Windows Desktop during application setup or first run. It also offers users the ability to install and run gadgets on their desktops for personalization and functional needs.

Windows Genuine Advantage (PN)~ A program for licensed Windows software that provides access to updates, value-added downloads, free software trials, and special promotions.

Windows Get Started (PN)~ ?The built-in app that teaches customers the basic tasks of getting started with Windows 10 and what's new in each update.

Windows grace (n)~ A state between licensed and non-licensed for the user to activate/reactivate the Windows license. Typical retail Windows will be unlicensed after it is first installed before activation. Enterprise Windows (volume license clients) may find they are in this state if the computer has not been connected to the enterprise key management service for more than 180 days. Finally a customer who has initially used an invalid product key that Microsoft later identifies may be placed in this state and asked to get a valid product key.

Windows Hardware Certification (PN)~ A certification program to ensure that systems and hardware are compatible and reliable and can perform to meet Windows standards.

Windows Hardware Certification Kit (PN)~ The test automation framework used to certify devices or systems for Windows.

Windows hardware development (n)~ The section of the Windows Dev Center that provides the information customers need to develop hardware for Windows.

Windows Hardware Quality Labs (n)~ A Microsoft hardware-testing organization that produces and supports the Microsoft Hardware Compatibility Test kit for current Microsoft operating systems. Both hardware and software are tested before rights to use the logo are granted.

Windows HCK (PN)~ The test automation framework used to certify devices or systems for Windows.

Windows Hello (PN)~ The ability to unlock your device by detecting your face, iris, or fingerprint.

Windows HomeGroup (PN)~ A Windows feature that enables users to share pictures, music, videos, documents, and printers with other people on a home network.

Windows HPC Server (PN)~ A high-performance computing solution built on Windows Server technology.

Windows ICD (PN)~ A tool that allows the creation of a provisioning package that can be used to customize Windows devices without re-imaging, or build a customized Windows image for individual markets, regions, and mobile networks.

Windows image (n)~ A single compressed file containing a collection of files and folders that duplicate a Windows installation on a disk volume.

Windows Image Acquisition (PN)~ A device-driver interface that supports still digital cameras and low- and high-end scanners, and allows retrieving of still images from IEEE 1394-based DV camcorders and USB-based Web cams.

Windows image file boot (n)~ A boot process that enables Windows to start and run directly from a compressed .wim file.

Windows Imaging and Configuration Designer (PN)~ A tool that allows the creation of a provisioning package that can be used to customize Windows devices without re-imaging, or build a customized Windows image for individual markets, regions, and mobile networks.

Windows Imaging Component (PN)~ An extensible platform component for decoding/encoding digital images and performing common transforms.

Windows Insider (PN)~ A participant in the Windows Insider Program.

Windows Insider Community Forum (PN)~ ?A community forum for Windows Insiders.

Windows Insider Hub (PN)~ The app in the operating system where the user can manage the builds in the Windows Insider- Program.

Windows Insider Preview (PN)~ Any prerelease build of the next version of Windows,- made available to customers in Spring 2015 or later.

Windows Insider Program (PN)~ ?An external program that enables participants (called Insiders') to provide feedback on Windows new features.'

Windows Installation Compatibility Advisor (PN)~ A downloadable Web application that helps Windows users identify which edition of Windows meets their needs, whether their PCs are ready for an upgrade to the next Windows version, and which features of the suggested Windows version will be able to run on their PCs.

Windows Installer (n)~ A feature of Windows that defines and manages a standard format for application setup and installation, and tracks components such as groups of files, registry entries, and shortcuts.

Windows Installer patch (n)~ A self-contained package (.msp file) that contains the updates to the application and describes which versions of the application can receive the patch. Patches contain at a minimum, two database transforms and can contain patch files that are stored in the cabinet file stream of the patch package.

Windows Installer service (PN)~ A Microsoft Windows service that defines and manages a standard format for installing applications.

Windows Internal Database (PN)~ A relational data store that's included in Windows and is used by several Windows Services.

Windows Internet game (n)~ A desktop application that connects to a public game service on the Internet. The game service is hosted by the MSN Gaming Zone.

Windows Internet Name Service (n)~ A Windows name resolution service for network basic input/output system (NetBIOS) names. WINS is used by hosts running NetBIOS over TCP/IP (NetBT) to register NetBIOS names and to resolve NetBIOS names to Internet Protocol (IP) addresses.

Windows Internet Naming Service (n)~ A Windows name resolution service for network basic input/output system (NetBIOS) names. WINS is used by hosts running NetBIOS over TCP/IP (NetBT) to register NetBIOS names and to resolve NetBIOS names to Internet Protocol (IP) addresses.

Windows Intune (n)~ A Windows Intune web-based portal for information workers that allows information workers to download approved or recommended software and mobile device apps.

Windows Intune administrator console (n)~ The user interface for administrators of Windows Intune.

Windows Intune agent (n)~ The first agent that is installed on a client computer after the Windows Intune client software is installed on a client and the client is enrolled in the Windows Intune service. This agent is associated with two installed programs that help monitor the health of the client computer and raise alerts to report current and potential problems.

Windows Intune Center (PN)~ A program that is installed on a managed computer that lets users request remote assistance from administrators, manage how some updates are deployed to the computer, and start scans for malicious software, also known as malware.

Windows Intune Endpoint Protection (PN)~ A security solution that helps enhance the security of client computers by providing real-time protection against potential threats; keeping malicious software, or malware, definitions up-to-date; and automatically running scans.

Windows Intune Endpoint Protection agent (PN)~ A daemon that is installed on client computers and communicates client status to the Windows Intune service and installs new virus and spyware definitions on the client.

Windows Intune Exchange Connector (PN)~ A downloadable software feature of Windows Intune that transfers data between your on-premises instance of Exchange Server and Windows Intune and that allows Windows Intune administrators to manage any mobile device that connects to Exchange Server.

Windows Intune Exchange Connector Configuration Tool (n)~ The tool used to configure settings in the Windows Intune Exchange Connector.

Windows Intune Monitoring Agent (PN)~ An agent that monitors the health of client computers that are managed by Windows Intune.

Windows Intune Tools (n)~ A set of utilities to integrate the user interface for end-users of Windows Intune.

Windows IoT Core Watcher (PN)~ ?A utility that IoT developers can use to find available Windows 10 IoT Core devices to which they can deploy apps.

Windows Journal (n)~ The Tablet PC accessory that you use to create notes in your own handwriting.

Windows key (n)~ A modifier key with the Windows logo on it. This key is used for a number of Windows shortcuts, and is reserved for Windows use. For example, pressing the Windows logo key displays or hides the Windows Start menu.

Windows Key ~ An extra key on keyboards made after 1995, located between Ctrl and Alt and bearing the Microsoft Windows logo. Pressing this key in any Win95/98 application should immediately call up the Taskbar with the Start Menu open. (If your keyboard doesn't have a Windows key you can perform the same task by pressing Ctrl-Esc).

Windows Keyring (n)~ A Windows feature that creates an authentication key that contains user name and password to the Windows user account.

Windows library (n)~ A collection of items, such as files and folders, assembled from various locations. The locations might be on your computer, an external hard drive, removable media, or someone else's computer.

Windows Library for JavaScript (PN)~ A set of APIs that developers use to create UI for Windows by using JavaScript.

Windows Live account (n)~ Private information that a customer provides to establish their Windows Live ID. This information is separate from the customer's (outward-facing) profile and is never shared without explicit consent.

Windows Live Admin Center (PN)~ A service that enables customers to implement Windows Live communication services within their own personal domains.

Windows Live Agents (PN)~ The developer platform for building agents (helper bots) for Windows Live Messenger.

Windows Live Alerts (PN)~ The Windows Live service that notifies someone of an event

or information based on their subscription preferences. The alerts can be sent to Messenger, Mail, Hotmail, or a mobile device.

Windows Live button (n)~ A graphical navigational element that links to the user's Windows Live home page.

Windows Live Calendar (PN)~ The Windows Live service that lets people and groups add, manage, and share event information.

Windows Live Call (PN)~ The Windows Live service that allows users to make computer-to-computer or computer-to-phone calls. Users must be signed in to Windows Live Messenger to use it.

Windows Live Contacts (PN)~ The Windows Live universal roaming contact list that allows users to share their contact information and subscribe to others' to automatically receive updates across Windows Live Messenger and Windows Live Spaces.

Windows Live Contacts API (PN)~ The API that defines a set of web services which can programmatically access the Windows Live Contacts Address Book database.

Windows Live Devices (PN)~ The website where customers add computers (both PCs and Macs), mobile phones, and digital photo frames so they can access their synced folders and connect remotely to their devices.

Windows Live Essentials (PN)~ The set of Microsoft software for email, instant messaging, photos, and personal movies available to customers in a single download and installation.

Windows Live Events (PN)~ The Windows Live service for event planning and invitations.

Windows Live Family Safety (PN)~ Software that enables parents and guardians to customize children's web experiences in order to help protect their safety and privacy online.

Windows Live for mobile (PN)~ The set of Windows Live services available for use on mobile devices.

Windows Live for Windows Mobile (PN)~ The set of Windows Live services optimized for use on mobile devices running Windows Mobile.

Windows Live FrameIt (PN)~ The Windows Live service that lets someone set up dynamic photo collections or other media sources to stream into a digital photo frame, or any RSS-enabled device.

Windows Live Gallery (PN)~ The website where developers and hobbyists can upload their custom creations designed to work with Windows Live or Windows Vista. Visitors to the gallery can download the software, write reviews, and post messages to online forums.

Windows Live Groups (PN)~ The web service where users can share their thoughts, photographs, and interests with all members of a group. Members all contribute to a group profile, and can post blog entries, photos, and other items, just as they can to an individual profile.

Windows Live Home (PN)~ The main landing or start page on Windows Live.

Windows Live Hotmail (PN)~ The web email service for domains supported by Microsoft account, including @hotmail.com and @live.com.

Windows Live Hotmail Plus (PN)~ A premium subscription service that provides additional online storage for Hotmail messages, and the suppression of graphical ads

within Hotmail.

Windows Live installer (n)~ The software that installs the Windows Live software someone selects on the installation webpage.

Windows Live Mail (PN)~ The desktop e-mail program that lets users manage multiple e-mail accounts, newsgroups, and feeds in one place.

Windows Live Mesh (PN)~ A -€œsoftware-plus-services-€? platform and experience that enables PCs and other devices to -€œcome alive-€? by making them aware of each other through the Internet, enabling individuals and organizations to manage, access, and share their files and applications seamlessly on the Web and across their world of devices.

Windows Live Messenger (PN)~ An instant messaging and video chat service designed for a consumer audience (not for the enterprise). Messenger is available via a desktop app, on the web (no installation needed), and on mobile devices.

Windows Live Messenger Companion (PN)~ An add-on for Internet Explorer that lets someone share the webpage they're viewing with their Messenger friends, see webpages their friends have shared, and comment on shared webpages.

Windows Live Movie Maker (PN)~ Software for capturing, editing, and arranging audio and video source material to create movies.

Windows Live OneCare (PN)~ The subscription-based safety and security software that includes virus scanning, firewall, backup, and maintenance features.

Windows Live OneCare for Server (PN)~ The OneCare software designed to run on supported servers.

Windows Live OneCare safety scanner (n)~ The free online on-demand tool that conducts three types of scans: the protection scan checks for and removes things like viruses and malware; the clean-up scan checks the hard disk for unnecessary files and helps users decide which ones they can safely remove, and also clears the computer's registry of orphaned data; the tune-up scan helps improve the computer's performance by defragmenting the hard disk.

Windows Live Photo Gallery (PN)~ A desktop app that enables users to view, manage, edit, and share photos and videos.

Windows Live Photos (PN)~ The Windows Live service that provides free online storage for photos, which customers can organize into photo albums.

Windows Live Profile (PN)~ The descriptive information about a user that is shown to other users. This editable information is separate from the registration information they provide to establish their Windows Live account. This separation allows users to disclose or conceal personal information as they choose.

Windows Live Sign-in Assistant (PN)~ The helper program that can store sign-in information for multiple Windows Live IDs.

Windows Live SMS services (n)~ An SMS-based service that lets users complete various Windows Live tasks by sending, receiving, and replying to SMS messages.

Windows Live Spaces (PN)~ The Windows Live service that enables a user to create a personal website where they can create and update a blog, and share their photos, music playlists and more, to connect with friends, family, or the online world.

Windows Live Sync (PN)~ Software and the supporting service that enable the synchronization of files between computers and with online storage, of program settings

between PCs, and the remote connection to a PC.

Windows Live Toolbar (PN)~ The web browser toolbar that provides quick access to Windows Live services, plus optional features to customize the browsing experience.

Windows Live Troubleshooting Data (PN)~ The visible name of the information sent to Microsoft via Windows Error Reporting if the Windows Live Essential Installer crashes.

Windows Live Writer (PN)~ A desktop app that enables WYSIWYG editing, offline editing, and preview functionality.

Windows Location Provider (PN)~ A feature in Windows that communicates with a Microsoft online service to determine a PC's approximate location based on wireless network or IP address info.

Windows logo key (n)~ A modifier key with the Windows logo on it. This key is used for a number of Windows shortcuts, and is reserved for Windows use. For example, pressing the Windows logo key displays or hides the Windows Start menu.

Windows Mail (PN)~ A feature of Windows Vista that provides e-mail client software with the increased functionality of Instant Search, and junk mail and phishing filters.

Windows Mail (PN)~ The Microsoft app for sending and receiving email.

Windows Management Framework (PN)~ A software package that makes updated management functionality available for installation in Windows and Windows Server. Windows Management Framework includes updated features and functionalities in components such as Windows PowerShell, Windows Remote Management (WinRM), and Windows Management Instrumentation (WMI).

Windows Management Instrumentation (PN)~ The Microsoft extension to the Distributed Management Task Force (DMTF) Web-based Enterprise Management (WBEM) initiative.

Windows Management Instrumentation filter (n)~ A query that is based on Windows Management Instrumentation (WMI) and used to filter the effect of a Group Policy object (GPO). WMI filters are written in WMI Query Language (WQL) and are evaluated on the target computer or user. If the filter evaluates to true, then the GPO is applied. Otherwise, the GPO is not applied. WMI filters are useful for exception management.

Windows Maps (PN)~ A universal app for Windows and Windows Phone, used for maps and directions.

Windows ME ~ (Millenium Edition)- The successor to- Windows 98, but not widely taken up,- and soon replaced by Windows XP. Now obsolete.

Windows Media Audio (PN)~ An audio file or stream in Windows Media Format. The audio content of the file or stream is encoded with one of the Windows Media Audio codecs.

Windows Media Audio 9 Professional (n)~ A high-performance codec that delivers better-than-CD resolutions and is designed for audiences that use high-fidelity hardware and 5.1 channel surround sound-equipped computers. It captures full-resolution 24-bit/96 kHz audio in stereo, 5.1 channel, or even 7.1 channel surround sound for streaming, progressive download, or download-and-play delivery at 128 to 768 Kbps.

Windows Media Audio codec (n)~ A codec used to compress and decompress audio streams.

Windows Media audio encoder library (n)~ A static library of APIs that is used to

convert audio data into a specified digital format for convenient storage, retrieval, and delivery over a network.

Windows Media Author (PN)~ A graphical interface tool for creating and testing illustrated audio. The tool is designed to combine and synchronize audio and image files. Using it, the author can manage objects-sounds, images, and URLs-so that they appear at the correct time during playback. This tool uses technology from Digital Renaissance, Inc.

Windows Media client (PN)~ The ActiveX control called Windows Media Player that receives and renders content from Windows Media server components. The client can be on either the same computer as the server, or another computer.

Windows Media Connect (n)~ A feature of Windows that provides software for streaming music video and picture files on a computer to one or more digital media receivers (DMRs) connected to a home network.

Windows Media Device Manager (n)~ An element in Microsoft Windows Media that acts as a broker between an application, the Microsoft Digital Rights Management (DRM) system, and the service provider. All communication requests between the application and the portable audio player must go through Microsoft Windows Media Device Manager.

Windows Media Digital Rights Management (n)~ Windows Media digital rights management platform and associated technologies.

Windows Media DRM (n)~ Windows Media digital rights management platform and associated technologies.

Windows Media Encoder Software Development Kit (n)~ An SDK for creating encoding applications based on Windows Media technologies.

Windows Media Encoding Script (n)~ A command-line tool in Windows Media Encoder 9 Series that is used to encode and broadcast digital media content.

Windows Media Encoding Utility (n)~ A command-line utility for earlier versions of Windows Media Encoder, which encodes and broadcasts digital media content.

Windows Media file (n)~ A file that contains audio, video, or other data. The content of the file is encoded with one of the Windows Media codecs. -

Windows Media Format Software Development Kit (n)~ An SDK for creating applications that play, write, edit, encrypt, and deliver Advanced Systems Format (ASF) files and network streams.

Windows Media License Service (n)~ The Windows Media Rights Manager Software Development Kit (SDK) component on a licensing server that issues licenses.

Windows Media Player (n)~ The Windows Media technology that plays digital media files or streams.

Windows Media Player Network Sharing Service (PN)~ A method for exposing a media library hosted in Windows Media Player to various media renderer devices on the local network.

Windows Media Screen codec (n)~ A codec used to compress and decompress sequences of screen images.

Windows Media Sharing Center (PN)~ The primary interface used to enable sharing media to other computers and devices, and to access media sharing settings and devices that interact with the media sharing feature. If you enable sharing you can play your favorite music, videos, and pictures on any computer or device in any room in your home.

Windows Media Speech codec (n)~ A codec used to compress and decompress audio streams with an emphasis on speech.

Windows Media streaming library (n)~ A library providing a set of APIs that are used to convert audio data into a specified digital format for convenient storage and retrieval using computer technology, usually involving compression and encryption technology.

Windows Media Video (PN)~ A video file or stream in Windows Media Format. The video content of the file or stream is encoded with one of the Windows Media Video codecs.

Windows Media Video codec (n)~ A codec used to compress and decompress video streams.

Windows Meeting Space (n)~ A feature that enables quick, face-to-face collaboration for two to ten people with computers running Windows Vista. You can share documents, your desktop, or a program, and you can co-edit handouts.

Windows Memory Diagnostics Tool (n)~ A feature of Windows Vista that can automatically detect and resolve problems caused by defective physical memory. If the diagnostics module identifies a memory problem, Windows Vista can avoid using the affected portion of physical memory, enabling the operating system to start successfully and avoid application crashes.

Windows Memory Tester (n)~ A Boot Configuration Data (BCD) application object.

Windows Messaging (PN)~ An app that facilitates SMS and instant messaging.

Windows Metafile Format (n)~ A 16-bit vector graphics format for Windows-compatible computers used mostly as a clip art format in word-processing documents.

Windows Mobile Device Center (n)~ An application designed for managing Microsoft Windows Mobile-® devices via a Windows Vista client computer. When the mobile device is connected to the computer by cable, cradle, infrared, or wireless LAN, the mobile user uses Windows Mobile Device Center to create a partnership between the desktop computer and the mobile device to configure the device, manage settings, add & remove applications, and synchronize data. After the partnership is created, the mobile user can manage the device using any of the connection mechanisms. While connected, the mobile user can also use the Windows Vista client computer without a partnership to do such things as browse the device and configure settings for the device.

Windows Mobile Membership (PN)~ Membership to a program managed by Microsoft that gives members access to many Windows Mobile benefits including downloads, applications, services, product updates, and events.

Windows Mobility Center (PN)~ A single location in Windows where you can adjust mobile PC settings.

Windows MultiPoint Server Repair Service (PN)~ The service that is installed as part of the MultiPoint role on server and ensures that some MultiPoint configuration settings remain set to keep Windows MultiPoint Server running smoothly.

Windows NT ~ An early version of- Windows- intended for business use, more stable for networking but less game-friendly than its- Win9xcousins. First released in 1993, superseded first by Windows 2000 and then Windows XP. Now obsolete.

Windows NT Integrated Security (PN)~ A security mode that leverages the Windows NT authentication process.

Windows NT token-based application (n)~ A Windows application that relies on a Windows- NT token to perform authorization of users.

Windows OneCore (PN)~ The unified, component-based software architecture model that provides a large and highly consistent set of APIs across multiple Windows 10-based device families.

Windows Online Troubleshooting Service (PN)~ An online service that is used by Microsoft and OEMs to post Windows Troubleshooting Packs for their customers to quickly resolve issues after Windows has shipped.

Windows Open Services Architecture (n)~ A common set of interfaces that connect front-end applications with back-end services.

Windows operating system (n)~ A proprietary software operating system with a graphical user interface (GUI).

Windows OS Loader (n)~ A Boot Configuration Data (BCD) application object.

Windows password (n)~ A password you use to log on to Windows. You can also change your settings so that you can log on to Windows without a password.

Windows PC (n)~ A- PC that runs Windows.

Windows PC Accelerator (n)~ A performance-enhancing technology in Windows Vista.

Windows PE (PN)~ A minimal Win32 operating system with limited services that's used to prepare a computer for Windows installation, to copy disk images from a network file server, and to initiate Windows Setup.

Windows People (PN)~ An app that facilitates contact list and social update management.

Windows Performance Analyzer (PN)~ A set of performance monitoring tools used to produce in-depth performance profiles of both systems and applications.

Windows Performance Diagnostic Console (n)~ A tool used in computer management to monitor the devices or processes on user's system.

Windows Performance Recorder (PN)~ A tool that provides OEMs and IT Professionals with detailed recordings of system and application behavior and resource usage.

Windows Performance Toolkit (PN)~ A kit that consists of two tools: Windows Performance Recorder and Windows Performance Analyzer. These tools are used to provides detailed recordings of system and application behavior and resource usage, and then analyze the results.

Windows Phone (PN)~ A device that runs Windows Phone Operating System.

Windows phone (n)~ A phone that runs Windows 10 Mobile.

Windows Phone 8 devices and Windows Phone 8 or higher emulators (PN)~ The devices equipped with Windows Phone 8 as well as emulators of Windows Phone 8 or higher versions. Windows Phone Emulator is a desktop application that emulates a Windows Phone device. It provides a virtualized environment in which you can debug and test Windows Phone apps without a physical device. It also provides an isolated environment for your application prototypes.

Windows Phone 8.1 Update (PN)~ The software update to Windows Phone 8.1.

Windows Phone app (n)~ An app that runs on Windows Phone (Windows Runtime app, Silverlight, and DirectX).

Windows Phone Live App (PN)~ Any app from the app list with Start screen tile notifications.

Windows Phone Reading List (PN)~ The Windows Phone app where users can save links to content (such as articles or videos) and then quickly return to them later.

Windows Phone Software Development Kit (SDK) (PN)~ The Windows Phone Software Development Kit (SDK) provides you with the tools that you need to develop apps and games for Windows Phone 8 and Windows Phone 7.5.

Windows Phone Store (PN)~ The online store where users can learn about and download apps, games, music, videos, and podcasts for their Windows Phone. Users can use the Store on their phones or on the web at windowsphone.com.

Windows Photo Gallery (n)~ A photo organizer used to view, manage, and edit digital pictures.

Windows Photo Gallery (PN)~ A desktop app that enables users to view, manage, edit, and share photos and videos.

Windows Photo Viewer (PN)~ A stripped down version of Vista's Windows Photo Gallery, which supports only two modes: Photo Viewer and Slideshow.

Windows Photos (PN)~ An app that enables the users to view, organize, edit and share all of their photos from multiple sources.

Windows Platform Update (n)~ End-user operating system updates that support the use of selected current release technologies on previous versions of the Windows operating system.

Windows Portable Device API (PN)~ An API that provides access to digital still cameras, media players, and multi-function cellular phones that implement Media Transfer Protocol (MTP).

Windows PowerShell (PN)~ A command-line shell and task-based scripting technology that provides IT administrators comprehensive control and automation of system administration tasks.

Windows PowerShell - Virtual Machine Manager command shell (n)~ The command shell, based on Windows PowerShell (Powershell.exe), that makes available the cmdlets that perform all functions in Virtual Machine Manager.

Windows PowerShell Integrated Scripting Environment (PN)~ A Windows PowerShell host application that enables you to run commands and to write, test, and debug scripts in a friendly, syntax-colored, Unicode-compliant environment.

Windows PowerShell ISE (PN)~ A Windows PowerShell host application that enables you to run commands and to write, test, and debug scripts in a friendly, syntax-colored, Unicode-compliant environment.

Windows PowerShell Web Access (PN)~ A feature that lets a server act as a web gateway through which an organization's users can manage remote computers by running Windows PowerShell sessions in a web browser.

Windows Preinstallation Environment (PN)~ A minimal Win32 operating system with limited services that's used to prepare a computer for Windows installation, to copy disk images from a network file server, and to initiate Windows Setup.

Windows preprocessor (n)~ A mechanism for user-mode applications and kernel-mode drivers to log real-time binary messages. The logged messages can subsequently be converted to a human-readable trace of the driver's operation.

Windows Presentation Foundation (n)~ A new strategic graphics subsystem in Windows

Vista that provides a unified approach to user interface, 2D and 3D graphics, documents and media. Built on the .NET Framework foundation and utilizing Direct3D for vector-based rendering, it provides a powerful solution for building immersive applications of all kinds.

Windows Problem Reporting (n)~ The Windows technology that manages information to help Microsoft create solutions to non-critical problems (problems that do not cause programs, services, or components to stop working).

Windows Process Activation service (n)~ A service that provides process activation, resource management, and health management services for message-activated applications.

Windows Property Store (PN)~ A Windows feature that facilitates a convenient way to get and set properties. It provides access to properties by using friendly canonical names in a type safe manner without dealing with PROPVARIANT. Developers can easily store basic data in a property store.

Windows Property System (PN)~ An extensible read/write system of data definitions that provides a uniform way of expressing metadata about Shell items.

Windows Push Notification Service (PN)~ The feature of Windows for sending tile updates and notifications to users.

Windows Push Notifications Keep Alive Detector (PN)~ Windows Push Notifications (WNS) component that analyses network conditions and determines an optimal ping interval to keep the connection alive.

Windows RE (PN)~ A special version of Windows Preinstallation Environment (Windows PE) that includes diagnostic, troubleshooting, and maintenance tools.

Windows Reader (PN)~ An app that facilitates the reading of PDF and XPS files.

Windows Reading List (PN)~ The Windows app where users can save links to content (such as articles or videos) and then quickly return to them later.

Windows ReadyBoost (n)~ A feature that makes PCs running genuine Windows Vista more responsive by using flash memory on a USB drive, SD Card, Compact Flash, or other memory form factor to boost system performance.

Windows ReadyDrive (n)~ A feature that enables Windows Vista PCs equipped with a hybrid hard disk drive to boot up faster, resume from hibernate in less time, and preserve battery power.

Windows Recovery Environment (n)~ A special version of Windows Preinstallation Environment (Windows PE) that includes diagnostic, troubleshooting, and maintenance tools.

Windows Remote Assistance (PN)~ A feature in Windows that allows a person to connect remotely to someone else's computer to help fix a problem.

Windows Resource Leak Diagnostic (n)~ A tool in Windows that detects and diagnoses resource leaks.

Windows Resource Protection (n)~ A feature in Windows that attempts to block the replacement of necessary system files to improve reliability and security.

Windows Restrictions (PN)~ A tool that restricts user access to programs, settings, Start menu items, and locks shared local user profiles against permanent changes.

Windows Resume Loader (n)~ A utility that loads the executable code of a program into

memory for execution after hibernation.

Windows RT (PN)~ The operating system only available pre-installed on PCs and tablets powered by ARM processors that helps enable new thin and lightweight form factors with impressive battery life. Windows RT includes touch-optimized versions of Microsoft Word, Excel, PowerPoint, and OneNote.

Windows RT 8.1 Update (PN)~ The software update to Windows RT 8.1 that gives users a more familiar and convenient experience across touch, keyboard and mouse inputs and enables more affordable Windows device choices.

Windows Runtime (PN)~ An environment in which COM objects are activated using a fully qualified namespace and a class name within the namespace. Also refers to the set of APIs that is provided by the Windows Runtime.

Windows Runtime C++ Template Library (PN)~ A library that provides infrastructure for the Windows Runtime; it can also be used to create a language projection to build Windows Runtime components in C++ and for app building.

Windows Runtime component (n)~ A reusable software component that can be used in multiple applications, regardless of the programming languages in which the applications are written.

Windows Scan (PN)~ The app that enables users to scan photos or documents using a connected scanner and save the images to a folder.

Windows Scenic (PN)~ A collection of user interface (UI) APIs, released in Windows 7, that delivers a host of new capabilities to Windows developers and the Windows platform. The Scenic APIs are exposed through two functional platforms: Scenic Animation, which supports the animation of UI elements, and Scenic Ribbon (Ribbon), a new application command system.

Windows Script Component file (n)~ XML files that are much like HTML files, but contain special elements that define the script component and its behavior.

Windows Script Components (PN)~ A new technology that allows the creation of powerful, reusable COM components with easy-to-use scripting languages such as Microsoft Visual Basic Scripting Edition (VBScript) and Microsoft JScript.

Windows Script Host (n)~ A language-independent scripting host for ActiveX scripting engines on 32-bit Windows platforms. WSH can be used to automate administrative tasks on a server, using any scripting language.

Windows SDK (PN)~ The SDK for developing on Windows. Developers can confidently select and install this SDK for all Windows apps (both Window Store apps and desktop apps). The SDK is integrated with Visual Studio and also available as a separate download.

Windows Search (PN)~ A PC (desktop and beyond) search platform that allows search of the local hard drive plus network locations like SharePoint sites and the Internet.

Windows Search service (PN)~ The Windows service that analyzes a set of documents, extracts useful information, and then organizes the extracted information so that properties of those documents can be efficiently returned in response to queries.

Windows Sensor and Location platform (n)~ A Windows platform that provides a standard way for device manufacturers to expose sensor devices to software developers and consumers, while providing developers with a standardized application programming

interface (API) for working with sensors and sensor data. Examples of sensors include ambient light sensors, location sensors, motion detection sensors, etc.

Windows Server 2012 (PN)~ The 2012 release of the Windows Server operating system.

Windows Server 2012 Datacenter (PN)~ A Windows Server 2012 edition.

Windows Server 2012 Essentials (PN)~ A Windows Server 2012 edition.

Windows Server 2012 Foundation (PN)~ A Windows Server 2012 edition.

Windows Server 2012 Standard (PN)~ A Windows Server 2012 edition.

Windows Server 8 Beta (PN)~ The Beta release of the Windows Server operating system.

Windows Server Backup (PN)~ A feature of the Windows Server-® 2008 operating system that provides a basic backup and recovery solution for the server that it is installed on.

Windows Server CEIP (n)~ The Microsoft Customer Experience Improvement Program that is deployed with Windows Server.

Windows Server Customer Experience Improvement Program (n)~ The Microsoft Customer Experience Improvement Program that is deployed with Windows Server.

Windows Server Migration Tools (PN)~ A feature that includes five Windows PowerShell cmdlets for migrating some roles and features from servers that are running Windows Server 2003 or 2008 to servers that are running either Windows Server 2008 R2 or Windows Server 8.

Windows service (n)~ A service designed for consumers that runs on Windows or in a web browser.

Windows Service Hardening (n)~ A feature of Windows Vista that limits the damage that can be done to the system by an attacker by preventing the compromised service from changing important configuration settings in the file system or registry or from infecting other computers on the network. For example, the Remote Procedure Call (RPC) service can be kept from replacing system files or modifying the registry.

Windows Servicing (n)~ A feature of Windows that provides servicing for Windows for the installation of update packages and other maintenance packages.

Windows Setup (n)~ The program that installs or upgrades the Windows operating system.

Windows SharePoint Services (oth)~ A family of Microsoft Web-based team collaboration environments that provide the ability to create and access virtual workspaces for managing documents, discussions, lists, surveys and other important contextual information such as team member status and presence.

Windows Sidebar (n)~ An organizational feature of Windows that displays a panel on the side of the desktop with shortcuts to mini-applications, also known as gadgets. The examples of such gadgets are local weather, a photo slideshow, a dictionary, news headlines, and a Windows Media Player control.

Windows SideShow (PN)~ A feature in Windows that uses add-in programs, or gadgets, to extend information from your computer onto secondary displays.

Windows SIM (PN)~ A utility for creating and modifying answer files and configuration sets.

Windows SmartScreen (PN)~ A filtering feature that monitors downloaded apps for

malware or unknown reputation.

Windows Software Development Kit (PN)~ The SDK for developing on Windows. Developers can confidently select and install this SDK for all Windows apps (both Window Store apps and desktop apps). The SDK is integrated with Visual Studio and also available as a separate download.

Windows Software Development Kit for Windows Store Apps (PN)~ An SDK that contains everything for a developer to create an app for the Windows Store. It is a subset of the complete Windows SDK. This allows developers to stick with APIs that are safe for applications that would appear in the Store and are focused towards core app scenarios.

Windows Software Protection Platform (n)~ A technology that reduces software piracy by requiring that each installation of a Windows product be activated with Microsoft, either through the Internet or by telephone. A unique product key is required for each installation of Windows, but Microsoft does not request or collect any information other than the Product Key during the installation. The end user may reinstall Windows using the same Product Key on the same computer as many times as necessary, but it cannot be used to install Windows on another computer. The end user can make incremental hardware upgrades to the computer. However, if the hardware is significantly altered, the end user will be required to reactivate the installation of Windows.

Windows Speech Recognition (PN)~ A feature that uses speech recognition to enable you to interact with your computer or other devices by voice. You can dictate documents and e-mails in mainstream applications, and use voice commands to start and switch between applications, control the operating system and even fill out forms on the web.

Windows spotlight (PN)~ A variable default lock screen image that shows beautiful images on lock combined with hotspots containing fun facts, Windows tips/trick, and more (similar to Bing IoTD). Users can switch from this default lock screen to a personal picture.

Windows SteadyState (PN)~ A software application that is used by administrators of one or more public computers to help maintain computer reliability and stability from one user session to the next.

Windows Storage Server 2012 Standard (PN)~ A Windows Server 2012 product.

Windows Storage Server 2012 Workgroup (PN)~ A Windows Server 2012 product.

Windows Store (PN)~ The online store where users can learn about and download apps, games, music, and more for their Windows device.

Windows Store app (PN)~ An app that runs in a non-desktop app model, and runs on Windows, but is not necessarily sold or deployed via the Store.

Windows Store app built for Windows using C++ or C# (PN)~ A Windows Store- app written in C++ or C# that uses standard Windows UI controls, has access to the Windows Runtime APIs, and can participate in the extensibility offered to- Windows Store apps.

Windows Store app built for Windows using JavaScript (PN)~ A Windows Store app that uses HTML, CSS, and JavaScript, can use the standard Windows UI controls, has access to the Windows Runtime APIs, and can leverage the extensibility offered to Windows Store apps. These apps use CSS for their visual styling with Windows UI controls to create a native look and feel.

Windows Store app development (PN)~ The process of developing Windows Store apps.

Windows Store App development on Windows 8.1 (PN)~ The process of developing Windows Store apps on Windows 8.1.

Windows Store app reference (n)~ The section, or Table of Contents node, of Windows Developer docs that contains all of the reference docs for Windows Store app development.

Windows Store Apps (n)~ The apps you can download and buy online in the Windows Store.

Windows Store dashboard (n)~ The service run by the Windows Store team that supports the end-to-end process for registering Windows Store developers and onboarding apps into the Windows Store catalog.

Windows Store developer account (n)~ An account that is required to submit an app in the Windows Store.

Windows Store device app (PN)~ An app that's downloaded from the Windows Store and installed automatically to the PC when a user attaches a certified device to the PC, provided that the device manufacturer has submitted the app to the Windows Store.

Windows SuperFetch (n)~ A memory management innovation in Windows Vista that helps make your PC consistently responsive by tracking what applications are used most on a given machine and intelligently preloading these applications into memory.

Windows System Assessment Tool (n)~ A tool that provides performance metrics and other information necessary for Windows and applications to make scaling decisions. It measures the performance attributes of: system memory, the storage sub-system, the CPU (or CPUs), and the graphics sub-system.

Windows System Image Backup (n)~ The technology in Windows that lets customers create a system image for backing up their hard drive and related system settings, programs, and files.

Windows System Image Manager (PN)~ A utility for creating and modifying answer files and configuration sets.

Windows System Resource Manager (n)~ A feature of Microsoft-® Windows-® Server 2003, Enterprise Edition and Windows Server 2003, Datacenter Edition. With Windows System Resource Manager, administrators can control and account for the how CPU and memory resources allocated to applications, services, and processes.

Windows tablet (n)~ A tablet device that runs Windows.

Windows Tablet and Touch Technology (n)~ Human interface technology that enables alternate ways to browse documents and programs using a digital pen or your fingertip in addition to the possibility of using a keyboard or other interface devices.

Windows Troubleshooting (PN)~ The overall set of troubleshooting technologies that includes a troubleshooting platform (Windows Troubleshooting Platform), a set of Web services, a toolkit (Windows Troubleshooting Toolkit), and an SDK to encourage third parties and OEMs to develop troubleshooting capabilities.

Windows Troubleshooting Pack (PN)~ A type of pack that is developed for the Windows Solution Center (using the Windows Troubleshooting Pack Designer) to perform data collection and analysis to provide users and IT professionals with only those solutions that apply to their PC at the time of viewing.

Windows Troubleshooting Platform (PN)~ The engine that executes the Windows

Troubleshooting Packs across the operating system.

Windows UI control (PN)~ A UI control available through WinUI that allow an app take on the look and feel of Windows. Regardless of the developer's choice to use HTML/JS or C++/C#, the developer can create an application that carries the new Windows experience. This includes controls enabling the display, entry and manipulation of data and content including View Controls, Text Controls, Pattern Controls, Overlay Controls, Media (Video & Audio) Controls, Content Controls, Collection Controls, and Basic Controls. These controls are available for Windows Store apps.

Windows Ultimate Extras (n)~ Programs, services, and tips and tricks for using Windows Vista Ultimate Edition. Users can select the programs and services that they want from a menu.

Windows universal app (n)~ ?An app that is built using the Windows universal app platform.- Developers can create a Windows universal app that runs on all Windows-based device types, or they can choose to limit an app to specific devices.

Windows universal app platform (PN)~ ?The portion of the Windows universal platform that app developers use to build apps that can target all Windows-based device families.

Windows universal driver (n)~ ?A driver that is available on more than one Windows-based device family.

Windows universal driver platform (PN)~ ?The portion of the Windows universal platform that driver developers use to build drivers that can work across all Windows-based device families.

Windows universal platform (PN)~ ?The converged app model that enables the creation of Windows apps and drivers that can target all Windows-based device families.

Windows Update (PN)~ A Microsoft Web site maintained by the Windows product group for the purpose of providing updates for core Windows components.

Windows Update (PN)~ The API platform, user interface, and Web service for delivering Windows updates and applications. Users can check for and install updates, view the update history for the computer, and turn on or change automatic updating settings. Windows Update can be used by consumers through the Windows Update Web service or by corporate customers who use Windows Server Update Services to control distribution within their organization.

Windows Update for Windows Mobile (n)~ An application that performs the functions of Windows Update for Windows Mobile devices. WMDU enables the user to help keep their device protected and up to date by receiving important firmware updates automatically. The user can also check for important and optional updates manually. WMDU has 2 components: an on-device client and an OMA proxy server that mediates between Microsoft Update service and a Windows Mobile device.

Windows Update website (n)~ A Microsoft Web site maintained by the Windows product group for the purpose of providing updates for core Windows components.

Windows user account (n)~ All the information that defines a user to the operating system, including the user name and any required password, membership in groups, and the rights and permissions that are associated with the user.

Windows user name (n)~ A unique name that identifies a user account to operating

system. An account's user name must be unique among the other group names and user names within its own domain or workgroup.

Windows User State Migration Tool (PN)~ The tool designed to help IT professionals migrate files and settings to the next version of the Windows-® operating system.

Windows vault (n)~ A type of vault that contains credentials for servers, Web sites, and programs that Windows can try to log you on to automatically.

Windows Vista ~ Microsoft's first attempt to replace Windows XP, first released in 2007. It had a prettier interface and a few nice ideas, but it was bloated and slow and was soon replaced by Windows 7, which looks very like Vista but is quicker and more stable.

Windows Vista Upgrade Advisor (n)~ A downloadable Web application that helps Windows users identify which edition of Windows meets their needs, whether their PCs are ready for an upgrade to the next Windows version, and which features of the suggested Windows version will be able to run on their PCs.

Windows Voice Recorder (PN)~ An app- used to record sounds with the device's microphone and to record phone calls.

Windows Web Services API (PN)~ A native-code implementation of SOAP that provides a foundation for building Web services for internal Microsoft customers such as components of Windows and parts of Office.

Windows Workflow Foundation (n)~ An extensible programming model and runtime components for building solutions on the Windows platform.

Windows Workflow Foundation activity (n)~ A unit of program behavior in Windows Workflow Foundation. Single activities can be composed together into more complex activities.

Windows XP ~ One of Microsoft's more stable and popular releases, once they had patched it several times to remove the worst mistakes and security holes, first released in 2001. There are still a great many computers running it in preference to more recent releases, even though Microsoft no longer support it.

Windows XP Validation Advisor (PN)~ A program that determines whether the Windows product key installed on a computer matches the original Windows product key that was purchased and provides customized recommendations for resolution when an installation of Windows has failed validation.

Windows.UI.Xaml (PN)~ The APIs that developers can use to create the UI for their Windows app if they use a language other than JavaScript and/or if they have experience with XAML.

Windows-based (adj)~ Pertaining to or being a computer or an application that runs on a Windows operating system.

Windows-based application (n)~ An application that runs on a Windows operating system.

WinInet (n)~ A Windows application programming interface (API) that enables applications to interact with Gopher, FTP, and HTTP protocols to access Internet resources.

WinJS (PN)~ The namespace name for Windows Library for JavaScript. Developers will type it in their code.

wink (n)~ An animated greeting a customer can send to a contact.

Winnt.exe (PN)~ A command-line utility used to start an unattended setup from computers running MS-DOS, Windows 3.1, or Windows for Workgroups.

Winnt32.exe (PN)~ A command-line utility used to start an unattended setup from computers running Windows95, Windows98, WindowsNT, Windows2000, or WindowsXP.

WinRT (adj)~ Pertaining to the Windows Runtime.

WINS (n)~ A Windows name resolution service for network basic input/output system (NetBIOS) names. WINS is used by hosts running NetBIOS over TCP/IP (NetBT) to register NetBIOS names and to resolve NetBIOS names to Internet Protocol (IP) addresses.

WINS proxy (n)~ A computer that listens to name query broadcasts, and responds for those names not on the local subnet. The proxy communicates with the name server to resolve names, and then caches them for a specific time period.

WINS resource (n)~ A resource type that provides WINS from a cluster.

WinSAT (n)~ A tool that provides performance metrics and other information necessary for Windows and applications to make scaling decisions. It measures the performance attributes of: system memory, the storage sub-system, the CPU (or CPUs), and the graphics sub-system.

Winsock (n)~ An application programming interface (API) standard for software that provides a TCP/IP interface under Windows.

WinSock direct (n)~ A common programming interface to the lower-level system area network (SAN) implementations, developed by Microsoft. WSD sits underneath the standard WinSock application programming interface (API), but bypasses the kernel networking layers to talk directly to the SAN hardware. Because WSD sits underneath the existing WinSock API, IT departments can deploy applications in a SAN environment without modifying the applications.

Winsock proxy client (n)~ Software that allows Windows-based programs to use networking protocols such as TCP/IP.

Winzip ~ The most popular program for compressing files, either for storage or transmission via the internet, widely available as a free download. The compressed files it creates have the extension .zip. See also- zip.

WIP (n)~ Material that is in some stage of the manufacturing process, from raw material issued to a production order to a manufactured product ready for acceptance into inventory.

WIP (n)~ An item under current assets in the balance sheet that represents work in progress in some stage of the manufacturing process.

WIP calculation (n)~ The value (hours) posted to the balance sheet as a project progresses. The WIP calculation applies to fixed-price projects, time and material projets and investment projects.

WIP statement (n)~ A report of the value of work in process.

wipe (v)~ To remove all data from a mobile device that has been lost, stolen, or compromised.

WIQL (n)~ A loose variant of SQL that describes a query in the Work Item Tracking subsystem of Team Foundation Server using a syntax that contains SELECT, WHERE,

COLUMN and SORT clauses. Query View is the user interface for defining work item queries.

wired (adj)~ Of, pertaining to, or characteristic of an electronic circuit or hardware grouping in which the configuration is determined by the physical interconnection of the components (as opposed to being programmable in software or alterable by a switch).

Wired AutoConfig Service (n)~ A system service that provisions local area network (LAN) Ethernet adapters with the security and connectivity settings that are required for Institute of Electrical and Electronics Engineers (IEEE) 802.1X authenticated IEEE 802.3 wired access.

Wired Equivalent Privacy (n)~ An encryption algorithm system included as part of the 802.11 standard, developed by the Institute of Electrical and Electronics Engineers as a security measure to protect wireless LANs from casual eavesdropping. WEP uses a shared secret key to encrypt packets before transmission between wireless LAN devices and monitors packets in transit to detect attempts at modification. WEP offers both 40-bit and 128-bit hardware-based encryption options.

Wired Group Policy Client (n)~ A Group Policy Client in a wired environment.

wired profile (n)~ A collection of security and connectivity settings that are used for 802.1X authenticated wired access.

wireframe contour chart (n)~ A contour chart displayed without color.

wireless (adj)~ Of, pertaining to, or characteristic of communications that take place without the use of interconnecting wires or cables, such as by radio, microwave, or infrared.

Wireless Application Protocol (n)~ A standard protocol for providing Internet communications and advanced telephony services on phones, pagers, PDAs, and other wireless terminals.

wireless communication (n)~ Communication between a computer and another computer or device without wires. The form of wireless communication provided as part of the Windows operating system uses infrared (IR) light to transmit files. Radio frequencies, as used by cellular and cordless telephones, are another form of wireless communication.

wireless display (n)~ A display that is connected through wireless communication.

wireless Ethernet (n)~ The Ethernet standard for networking that allows short-range wireless communication within a home or office.

wireless fidelity (n)~ The 802.11b standard for wireless networking. A standard for delivering digital information over high-frequency, wireless local area networks.

Wireless Group Policy Client (n)~ A Group Policy Client in a wireless environment.

wireless LAN (n)~ A local area network (LAN) that sends and receives data via radio, infrared optical signaling, or some other technology that does not require a physical connection between individual nodes and the hub. Wireless LANs are often used in office or factory settings where a user must carry a portable computer from place to place.

Wireless Manager (PN)~ A feature that allows the user to enable or disable any wireless connection, such as Bluetooth, Wi-Fi, or cellular phone.

Wireless Markup Language (n)~ An XML-based markup language used to specify content and the user interface for narrowband devices, including cellular phones and pagers. WML is part of WAP.

wireless network (n)~ A network that uses radio frequencies (instead of wires or cables) to transmit data between devices.

Wireless network ~ A computer network which uses radio transmitters (usually) to move information between computers without the need for physical cables. See- Wi-Fi.

wireless network name (n)~ The name used to identify a wireless network.

wireless network profile (n)~ Information about a wireless network, such as the wireless network name, service set identifier (SSID), network adapter used to connect to the network, default icon, and default printer.

wireless power (supply) ~ facilitates the charging or direct powering of electrical and electronic equipment using inductive or radio frequency (RF) energy transfer.

wireless profile (n)~ A collection of security and connectivity settings that are used for wireless access.

wireless radio (n)~ The hardware part of the device that enables phone functionality.

wireless stereo (adj)~ Of, pertaining to, or characteristic of Bluetooth headphones or other external accessories that enable users to hear stereo music without the use of interconnecting wires or cables, such as by radio, Bluetooth or infrared.

wireless transceiver (n)~ A device that sends and receives wireless signals.

wireless wide area network (n)~ A wireless network that connects geographically separated locations by using telecommunications services, such as satellite, radio, and mobile phone technologies.

witadmin (PN)~ A command-line tool to create, delete, import, and export objects such as categories, global lists, global workflow, types of links, and types of work items.

With Activities (adj)~ A view that lists all the active accounts, contacts, or opportunities that belong to the mobile user and that contain related activities.

with one click (Adverb) ~ Done by positioning the pointer over an item and pressing the left mouse button once.

With Opportunities (adj)~ A view that lists all the active accounts or contacts that belong to the mobile user and that contain related opportunities.

withholding tax (n)~ A tax levied by a government authority that is deducted from compensation.

witness directory (n)~ A directory that is created and shared on a witness server for use by a database availability group that has an even number of members.

witness disk (n)~ For a failover cluster, a disk in the cluster storage that is designated to hold a copy of the cluster configuration database. A failover cluster has a witness disk only if this is specified as part of the quorum configuration.

witness file share (n)~ For a failover cluster, a file share in the cluster storage that is designated to hold information about the cluster configuration database. A failover cluster has a witness file share only if this is specified as part of the quorum configuration.

witness server (n)~ In database mirroring, the server instance that monitors the status of the principal and mirror servers and that, by default, can initiate automatic failover if the principal server fails. A database mirroring session can have only one witness server (or witness')

wizard (n)~ An interactive utility that guides users through a multi-step, infrequently performed task. Effective wizards reduce the knowledge required to perform the task

compared to alternative UIs.

Wizard ~ A- Windows- feature which presents a user with simple menus or options for what would otherwise be a complex task, and carries them out automatically. Almost all Windows programs areinstalled- via Wizards, and they are also widely used inside Windows programs.

WLAN (n)~ A local area network (LAN) to which mobile users (clients) can connect and communicate by means of high-frequency radio waves rather than wires. WLANs are specified in the IEEE 802.11 standard

WLL (n)~ A stand-alone, dynamic-link library that, when loaded, can add custom commands that extend the functionality of Microsoft Word. Commands and functions in a loaded WLL are also available to Microsoft Visual Basic projects.

WMA (PN)~ An audio file or stream in Windows Media Format. The audio content of the file or stream is encoded with one of the Windows Media Audio codecs.

WMA codec (n)~ A codec used to compress and decompress audio streams.

WMA Pro (n)~ A high-performance codec that delivers better-than-CD resolutions and is designed for audiences that use high-fidelity hardware and 5.1 channel surround sound-equipped computers. It captures full-resolution 24-bit/96 kHz audio in stereo, 5.1 channel, or even 7.1 channel surround sound for streaming, progressive download, or download-and-play delivery at 128 to 768 Kbps.

WMF (n)~ A 16-bit vector graphics format for Windows-compatible computers used mostly as a clip art format in word-processing documents.

WMI (n)~ The Microsoft extension to the Distributed Management Task Force (DMTF) Web-based Enterprise Management (WBEM) initiative.

WMI class (n)~ A template for a type of managed object. WMI classes define the basic units of management. For example, the Win32_LogicalDisk class is a template for all logical disks that occur in the Windows environment. In this case, WMI uses the class template to generate an instance of Win32_LogicalDisk for each disk installed on a computer.

WMI filter (n)~ A query that is based on Windows Management Instrumentation (WMI) and used to filter the effect of a Group Policy object (GPO). WMI filters are written in WMI Query Language (WQL) and are evaluated on the target computer or user. If the filter evaluates to true, then the GPO is applied. Otherwise, the GPO is not applied. WMI filters are useful for exception management.

WMI provider (n)~ In Windows Management Instrumentation (WMI), a set of interfaces that provide programmatic access to management information in a system. IIS 7.0 implements a WMI provider in the namespace called WebAdministration to provide programmatic access to configuration and system settings.

WMI Query Language (PN)~ A subset of ANSI SQL with semantic changes adapted to Windows Management Instrumentation (WMI).

WML (n)~ An XML-based markup language used to specify content and the user interface for narrowband devices, including cellular phones and pagers. WML is part of WAP.

WMS (n)~ A Windows service that manages the execution of instance control commands, the recovery of workflow service hosts, and the resumption of instances in the event of

expired timers.

WMSvc (PN)~ A service that enables remote and delegated management of a Web server and its Web sites and applications.

WMV (PN)~ A video file or stream in Windows Media Format. The video content of the file or stream is encoded with one of the Windows Media Video codecs.

WNS (PN)~ The feature of Windows for sending tile updates and notifications to users.

WOA (n)~ A World Wide Web version of Windows Client Help.

wobble correction (n)~ An image stabilization technique used to remove wobbled distortions from a video captured with a rolling shutter camera that's exposed to large accelerations or jitter.

WOEID (n)~ A unique 32-bit reference identifier, now assigned by Yahoo!, that identifies any feature on Earth.

wolfpack ~ The codename for Microsoft's clustering solution. Wolfpack was released in September, 1997 as part of Windows NT 4.0, enterprise Edition. Its official name is MSCS.

WOPI (PN)~ An interface that enables a web application server (for example, Office Web Apps Server) to access and change files that are stored by a host server (such as SharePoint Server).

WOPI application (n)~ A web application server, such as Office Web Apps Server, that uses WOPI and WOPI conventions to integrate with a host server, and is designed to view and edit files stored by the host.

WOPI host (n)~ A host server, such as SharePoint Server, that uses WOPI to support file operations and provides a wrapper for the WOPI application UI.

word (n)~ The native unit of storage on a particular machine. A word is the largest amount of data that can be handled by the microprocessor in one operation and also, as a rule, is the width of the main data bus. Word sizes of 16 bits and 32 bits are the most common.

Word (PN)~ The Games subcategory containing games that involve wordplay, like scrabble or crosswords.

Word 2016 (PN)~ The year 2016 edition of Microsoft Word.

Word Add-in Library (n)~ A stand-alone, dynamic-link library that, when loaded, can add custom commands that extend the functionality of Microsoft Word. Commands and functions in a loaded WLL are also available to Microsoft Visual Basic projects.

Word Automation Services (PN)~ A service application in SharePoint Server that provides unattended, server-side conversion of documents into formats that are supported by the Microsoft Word client application.

word boundary (n)~ In regular expressions, a boundary that occurs when the current character is at the beginning of the target string and is one of the word characters A-Za-z0-9_, or when the current character position is past the end of the target string and the last character in the string is one of the word characters, or when the current character is one of the word characters and the preceding character is not, or when the current character is not one of the word characters and the preceding character is.

word boundary assert (n)~ In regular expressions, a statement that matches when the current position in the target string is immediately after a word boundary.

Word Count (n)~ A feature that calculates and displays the number of words, characters, lines, pages and paragraphs in a document.

word extraction dictionary (n)~ A custom extraction dictionary that lists words or phrases that are matched to exact words in the content in a case-insensitive way. For example, the entry anchor' will match 'anchor' and 'Anchor

Word Flow (PN)~ A keyboard feature that suggests words and corrects misspellings.

Word Flow with shape writing (n)~ A keyboard feature that enables user to slide the finger from letter key to the next letter key in the word.

Word for Android (PN)~ The version of Microsoft Word that runs on the Android operating system.

Word for iPad (PN)~ The version of Microsoft Word that runs on iPad.

Word for iPad, iPhone and iPod touch (PN)~ The version of Microsoft Word that runs on iPad, iPhone and iPod touch.

Word for Mac (PN)~ The version of Microsoft Word that runs on the Mac operating system.

Word for Mac for Office 365 (PN)~ The version of Word from Office 365 that runs on the Mac operating system.

Word for Mac Preview (PN)~ The public preview of Word for Mac.

Word Home and Student 2010 (PN)~ The year 2010 edition of the Microsoft word processing software program for creating Web, e-mail, and print documents, designed for home and students.

word list (n)~ A file that contains a collection of words that make up an application dictionary.

Word Mobile 2010 (PN)~ The year 2010 edition of the Microsoft word processing software for creating Web, e-mail, and print documents, designed for use with handheld computing devices.

Word Mobile Viewer (PN)~ A viewer that allows users to display Word documents on a phone's browser. A file is rendered as an HTML page with sufficient fidelity to convey text and images on a small screen.

Word Online Viewer (PN)~ A Word Web App technology that enables users to view in full fidelity a Word document that is stored online.

word part extraction dictionary (n)~ A custom extraction dictionary that lists words or phrases that are matched anywhere in the content in a case-insensitive way. For example, the entry anchor' will match 'anchor

word processing (n)~ The act of entering and editing text with a word processor.

word processor (n)~ An application for creating and manipulating text-based documents.

Word Processor ~ A- program- used for creating documents, letters etc. The best known is Microsoft Word.

Word publication (n)~ A Microsoft Office Word document that contains hyperlinks to another location. You can use hyperlinks to go to another location in the same document or to another file on your hard disk, your network, an intranet, or the Internet.

word stemming (n)~ The process of capturing relationships between words by reducing inflected words to their stem or root form (reductive stemming), or expanding stems to their inflected forms (expansive stemming). For example, the word swimming' is reduced

to the stem 'swim.' Because the word 'swam' can also be reduced to 'swim

word wrap (n)~ The ability of a word-processing program or a text-editing program to break lines of text automatically to stay within the page margins or window boundaries of a document without the user having to do so with carriage returns, as is typically necessary on a typewriter.

Word XML Format (n)~ The formal name for Word 12 file format. This format has an open, royalty-free specification, and is the technology licensed to external parties. This license is the subject in the messaging points where -€œOpen, royalty-free license-€? is discussed.

WordArt (n)~ Text objects you create with ready-made effects to which you can apply additional formatting options.

WordArt Gallery (n)~ A dialog box in which the user can choose a WordArt style.

WordML (n)~ A Microsoft XML format for Word documents.

wordwrap (n)~ The ability of a word-processing program or a text-editing program to break lines of text automatically to stay within the page margins or window boundaries of a document without the user having to do so with carriage returns, as is typically necessary on a typewriter.

Work (n)~ An item that appears on the Call Forwarding On menu, which appears on the My Status menu. When the user selects Work, Communicator automatically forwards incoming calls to the number the user has published for his work phone.

Work (PN)~ A field for a contact's workplace telephone number, typically retrieved automatically from the corporate address book.

work (n)~ The entire range of inventory-related tasks that are performed by a company's warehouse employees. The creation of warehouse work is triggered either automatically by user-defined settings or manually by a worker. Each work item is performed on a mobile device by a warehouse worker.

work account (n)~ A user account and associated credentials that is used to access Microsoft's and 3rd parties' business services, such as Office 365. Work or school accounts are usually assigned to end users by their organization (work, school, non-profit) and managed by the admin. However, some business services like Yammer support work or school accounts that were created by end users, without IT involvement. We sometimes refer to these accounts as -€œviral-€? AAD accounts but we don't use this term externally. Work or school accounts are stored in Azure Active Directory (AAD) and managed by Microsoft on behalf of the organization. One of the key difference with a Microsoft account is that users don't own the account and will typically loose access to it if they leave the organization. Other aspects like password policies are imposed by admins.

work breakdown structure (n)~ A deliverable-oriented grouping of project elements that organizes and defines the total work scope of the project. Each descending level represents an increasingly detailed definition of the project work.

work cell (n)~ A resource group that participates in a production flow activity.

work center (n)~ A self-contained unit of the manufacturing process, or an entire plant.

work fax (n)~ An Outlook contact's professional fax number.

Work Folders (PN)~ The enterprise-oriented feature which enables organizations to provide their users with access to data and documents stored on their corporate computers

from anywhere.

work in process (n)~ Material that is in some stage of the manufacturing process, from raw material issued to a production order to a manufactured product ready for acceptance into inventory.

work in process (n)~ An item under current assets in the balance sheet that represents work in progress in some stage of the manufacturing process.

work in process calculation (n)~ The value (hours) posted to the balance sheet as a project progresses. The WIP calculation applies to fixed-price projects, time and material projets and investment projects.

work in progress (n)~ Material that is in some stage of the manufacturing process, from raw material issued to a production order to a manufactured product ready for acceptance into inventory.

work in progress (n)~ An item under current assets in the balance sheet that represents work in progress in some stage of the manufacturing process.

work item (n)~ A record of work on a project that must be fulfilled or evaluated. It is assigned to an individual. The current state and progress is tracked on the work item record.

work item (n)~ A user-defined object with unique fields, forms, and rules. Work items can be queried across the database.

Work Item Form view (n)~ The Visual Studio document window that shows the full form of a work item instance. You can open many work item forms as documents in Visual Studio.

work item ID (n)~ The unique identifier of a work item in the database.

work item log (n)~ A log that lists the current notes you are typing and the uneditable historical conversation that has already been saved.

work item query (n)~ A specialized SELECT statement containing a WHERE clause, and COLUMN and SORT BY elements. Work Item Query is modeled after SQL queries.

Work Item Query Language (n)~ A loose variant of SQL that describes a query in the Work Item Tracking subsystem of Team Foundation Server using a syntax that contains SELECT, WHERE, COLUMN and SORT clauses. Query View is the user interface for defining work item queries.

work item queue (n)~ A list that contains workflow work items that are assigned to users.

work item queue assignment expression (n)~ A statement that conditionally assigns work items to specific work item queues.

work item type (n)~ A named definition associated with a project in a Team Foundation Server. Types are composed of fields, a form and work flow. They are defined using XML. Definitions are portable between Team Foundation Servers.

Work Management Service (PN)~ A SharePoint shared service that aggregates tasks that systems such as SharePoint, Project Server, and Exchange assign to users.

Work Management Task Sync (PN)~ A component of the Work Management Service that synchronizes tasks with systems outside of SharePoint, such as an Exchange mailbox, to enable task management in Outlook.

Work on the go (v)~ Refers to being able to do your work from anywhere with your mobile device, whether you are in your office, at home, or traveling (on the go').'

work or school account (n)~ A user account and associated credentials that is used to access Microsoft's and 3rd parties' business services, such as Office 365. Work or school accounts are usually assigned to end users by their organization (work, school, non-profit) and managed by the admin. However, some business services like Yammer support work or school accounts that were created by end users, without IT involvement. We sometimes refer to these accounts as -€œviral-€? AAD accounts but we don't use this term externally. Work or school accounts are stored in Azure Active Directory (AAD) and managed by Microsoft on behalf of the organization. One of the key difference with a Microsoft account is that users don't own the account and will typically loose access to it if they leave the organization. Other aspects like password policies are imposed by admins.

work pane (n)~ In Exchange 2007, the bottom middle pane of the Exchange Management Console. The work pane provides detailed information about the specified Exchange server.

Work Phone (PN)~ A button in the Options dialog box, on the Phones tab, that users click to enter their work phone number. The Work Phone button is disabled if the work phone number has been supplied through the corporate directory.

work phone (PN)~ An Outlook contact's professional telephone number. Not a company's main phone number.

work product (n)~ A discrete deliverable or artifact, such as a document, spreadsheet, changeset, and so forth.

workbook (n)~ In a spreadsheet program, a file containing a number of related worksheets.

workbook (n)~ One matrix, or a collection of matrixes, that use a single model site as a data source.

workbook window (n)~ The window that contains the user's workbook of tabbed sheets.

workday (n)~ A span of time that constitutes one shift. The workday includes hours worked, as well as interruptions in work, such as meals or break time.

worker (n)~ A person who assumes the role of an employee or a contractor and is paid in exchange for services.

worker (n)~ A cloud service role that provides a general-purpose environment for running application workloads. Typically, background processing for web applications running on web roles can be offloaded to instances of the worker role.

worker process (n)~ The implementation of the core Web server in IIS. Worker processes run in W3wp.exe.

worker process isolation mode (n)~ The Web process model for IIS 6.0.

worker role (PN)~ A cloud service role that provides a general-purpose environment for running application workloads. Typically, background processing for web applications running on web roles can be offloaded to instances of the worker role.

worker thread (n)~ A thread commonly used to handle background tasks that the user should not have to wait for to continue using your application. Tasks such as recalculation and background printing are typically executed on worker threads.

workflow (n)~ A sequence of activities, actions, or tasks through which documents or items are passed as part of an automated business process.

workflow (n)~ A set of instructions that route and queue incoming calls and generate

reports to an agent or a set of agents according to adjustable business logic. It defines the user experience of a user who calls a response group.

workflow (n)~ A workflow process that is executing.

workflow (n)~ A set of logical rules that define the steps necessary to automate specific business processes, tasks, or sets of actions to be performed on Microsoft Dynamics CRM records.

Workflow (n)~ A list of Statuses for objects in Parature (such as Tickets, Chat Sessions, and Knowledgebase Articles) and the transition of those objects through Statuses via Actions performed manually and/or automatically.

workflow action (n)~ An element of workflow logic that specifies the event or task that should be performed by the workflow jobs started by the workflow.

workflow activation (n)~ The process that occurs when a workflow host calls the WorkflowRuntime.CreateWorkflow method.

workflow activity (n)~ An elemental unit of a workflow that represents actions and provides functionality for control flow, conditions, event handling, state management, and communication with applications and services.

workflow activity (n)~ A unit of program behavior in Windows Workflow Foundation. Single activities can be composed together into more complex activities.

workflow application (n)~ A set of programs that aids in the tracking and management of all the activities in a project from start to finish.

workflow compression (n)~ A feature that helps users compress (or expand) the duration of a job without having to update the start and due dates of every task in the workflow.

workflow condition (n)~ A logical 'if-then' statement in a workflow that defines a specific situation and any actions that should be taken when that situation occurs.

workflow decision element (n)~ A guard condition that controls the logical branching of task sequences within a workflow process. A workflow decision can be made by a user or by an automation rule.

workflow definition (n)~ An XML or XOML file that contains the information that other programs require to instantiate and run the workflow. Optionally, any custom metadata the workflow requires to run.

Workflow Designer (PN)~ A graphical tool used to create a workflow visually by representing actions and constraints as shapes that can be connected to form a complete schedule.

workflow document (n)~ A view of data that is submitted to workflow for processing.

workflow element (n)~ A modeling element used to define workflow processes.

workflow escalation action (n)~ An automatic workflow action taken when a workflow work item is not completed by the current assignee.

workflow execution account (n)~ A user account that is granted the rights for executing workflows.

workflow foundation (n)~ An extensible programming model and components that can be used to design and implement custom applications for common business processes, such as document approval. Components include version control, tracking, and reporting.

workflow history (n)~ A view of the workflow tracking data generated by the workflow runtime.

workflow host (n)~ The server component that deals with the execution of workflows.

workflow host (n)~ An environment in which the workflow runtime is started so that it can be accessed as a service.

workflow instance (n)~ A running instance of a workflow definition, when a request is made.

workflow instance (n)~ A workflow activated by and executing in the workflow host.

Workflow Instance Recovery (n)~ A feature of the Workflow Management service (WMS) that monitors persistence stores for workflow service instances that should be running and restarts them.

workflow job (n)~ A job performed on entities or records, based on rules defined in a workflow.

workflow list form (n)~ A form that- displays a list of workflows for a particular module, along with the versions of the workflow.

workflow management (n)~ A feature area of ILM 2 that deals with designing workflows, executing them and managing them. Workflow management consists of the Workflow Designer, request management and the workflow host.

Workflow Management service (n)~ A Windows service that manages the execution of instance control commands, the recovery of workflow service hosts, and the resumption of instances in the event of expired timers.

Workflow Manager (n)~ A tool used to create, customize, and edit workflow rules and rule templates, and sales process rules and rule templates.

workflow manager (n)~ A user of the Response Group service who has the necessary user rights to create a workflow or to manage certain properties of a workflow.

Workflow Monitor (n)~ A tool used to view the status of workflow and sales processes in the organization.

workflow option (n)~ A parameter for a workflow that includes settings that determine which records it acts on and how it is triggered.

workflow participant (n)~ A person who assumes the role of user in a workflow process.

workflow phase (n)~ A set of workflow stages that have been grouped together.

workflow policy (n)~ A group of rules for a workflow.

workflow presence watcher (n)~ A user account that the Response Group service creates in order to subscribe to the presence status of agents.

workflow process (n)~ A series of interrelated action steps and the workflow rules that drive the transition between these steps. A workflow process defines the actions the workflow should take at each step, and the workflow rules the workflow should use to evaluate when to proceed to the next step.

workflow registration (n)~ A registration process that occurs when you add a workflow definition to the Microsoft Dynamics CRM database.

workflow rule (n)~ A set of action steps in a business process or sales process. A workflow rule specifies the required activities for a workflow and the order in which those activities must be performed.

workflow runtime (n)~ A software component that activates and executes workflow instances using Microsoft Windows Workflow Foundation.

workflow scope (n)~ The extent of activity controlled by a workflow process.

workflow service (n)~ A WCF service that is implemented as a workflow. The workflow contains messaging activities that send and receive WCF messages.

workflow service host (n)~ A component that is responsible for running all workflows, orchestrating, and dispatching them.

workflow stage (n)~ An element of workflow logic that groups steps. Adding stages to a workflow does not affect how the steps function. Stages are purely for conceptual grouping of steps within complex workflows.

workflow stage (n)~ A defined point in a workflow that is entered when specified conditions are met.

workflow state (n)~ The status of an item in its progress through a workflow.

workflow status (n)~ The condition, at a particular time, of a workflow.

workflow step (n)~ An individual stage defined in a workflow.

workflow task (n)~ An action or task in a sequence that is related to a built-in or user-defined business process.

workflow task list (n)~ A list that stores the sequence of actions or tasks for a business process.

workflow template (n)~ A template that serves exclusively as the basis for creating other workflows. Workflow templates cannot start workflow jobs.

workflow template (n)~ A specification that can be instantiated and given state to produce a workflow.

workflow tracking data (n)~ The data that is logged during the execution of a workflow instance.

workflow type (n)~ A set of metadata and event handlers in the Application Object Tree (AOT) that defines a workflow design template.

workflow-enabled (adj)~ Automated in such a way that business documents and assignments are routed from one user to another for specific action.

workgroup (n)~ A group of computers that are connected on a network and share resources, such as printers and files.

Workgroup (PN)~ A privacy relationship setting that allows a large amount of information to be viewed, usually assigned to people on your team.

workgroup ID (n)~ A case-sensitive alphanumeric string that is 4 to 20 characters long and that you enter when creating a new workgroup information file by using the Workgroup Administrator. This uniquely identifies the Admin group for this workgroup file.

workgroup information file (n)~ A file that Access reads at startup that contains information about the users in a workgroup. This information includes users' account names, their passwords, and the groups of which they are members.

workgroup manager (n)~ The person who creates and maintains the project schedule and uses workgroup messages to assign tasks to the workgroup members; also uses the workgroup features to update tasks in the project as members reply.

Workgroup Template (n)~ A template stored on a network location where it can be accessed and shared by multiple users.

working copy (n)~ The copy of a file that is currently being modified.

working directory (n)~ The directory in which Web server software is installed.

working folder (n)~ The folder in which your documents appear when you open or save them. If you select another folder when opening or saving, that folder becomes the working folder. You can set the startup location of this folder in most applications.

working folder (n)~ A folder on a user's local computer that is used to store files when they are checked out of a Visual SourceSafe database. A user makes changes to the files in the working folder and then checks the modified files back into the Visual SourceSafe database for version tracking.

working hours (n)~ A user's work day hours as specified in Microsoft Office Outlook by the day of the week and the start and end times.

working set (n)~ The set of pages in the virtual address space of the process that are currently resident in physical memory.

Working Time (n)~ The time that a resource is in the office, and that is not dedicated to project tasks or effort. Represents a resource's true availability.

working time calendar (n)~ A calendar that defines the capacity and work time in a production system, for use in managing work centers or work center groups.

workload (n)~ Composition of often related [server] roles that run together on a single server or set of related servers. Each workload corresponds to an overall business/product area. Network is an example of a workload. While small or medium businesses might run an entire workload on a single machine, this would be unusual for a large enterprise. Workloads are often managed by the same group within IT, and a large business might have a separate operations team and purchasing decision maker for each workload.

workload (n)~ A set of automated tasks that exercise the computer in a predefined, repeatable manner.

workload (n)~ A compute instance of a cloud service on Azure consisting of an application hosted and run on web-based virtual machines and worker roles.

workload group (n)~ In Resource Governor, a container for session requests that are similar according to the classification rules that are applied to each request. A workload group allows the aggregate monitoring of resource consumption and a uniform policy that is applied to all the requests in a group.

workload/product navigation (n)~ A control on the user interface used on many mobile and online applications to indicate navigation within the application.

workpane (n)~ The area of the workspace that contains the options you select for a given task. Workpanes appear at certain times, such as when a document is opened, or when you click certain items on menus and toolbars.

Workplace (n)~ The page where users find cases and activities that are assigned to them. Users can accept, assign, and delete assignments from here. They can also check the public lists of activities and cases and accept those as well.

workplace (PN)~ A feature on the phone to enroll in and manage a workplace account.

workplace account (n)~ An account provided by a company that allows users to install apps or hubs provided by that company, and that governs the company policies applied to the phone.

Workplace module (n)~ The Microsoft CRM module that contains the work a user has been assigned, is currently working on, and is available in queues to which the user has access. Users can accept, assign, and delete assignments from here. Users can also access

their calendars and the Knowledge Base.

WorkQueue (PN)~ A folder that contains subfolders that asset and job manifest files traverse as they are processed in a job.

Works with ads (n)~ A version of Works, aka Works SE, that includes advertising.

Works without ads (n)~ A version of Works that does not include advertising. Users can elect to pay for this version, aka Works Standard, instead of using the free, ad funded Works, aka Works SE.

worksheet (n)~ A primary document used in Excel to store and work with data. A worksheet consists of cells that are organized into columns and rows; a worksheet is always stored in a workbook.

workspace (n)~ A user interface area in which users perform most tasks.

workspace (n)~ A file where a user can create or modify information without affecting data that is located on the server. A client-side copy of the files in the repository that you want to work in.

workspace (n)~ A type of business application that provides private, customizable Web sites, which you can use to collaborate on projects and documents with coworkers, clients, business partners, or anyone to whom you grant permission. You can have as many workspaces as you want; each workspace has separate permissions, which means that people can access only the workspaces you want them to access. Workspaces may include documents, lists, pictures, surveys, discussion boards, and Web pages.

workspace (n)~ A collection of computing resources such as programs and virtual desktops that enable a user to accomplish a set of related tasks.

workspace browser (n)~ A component of the shell of Dashboard Designer. It holds available KPIs, data sources, indicators, report views, scorecards, and dashboards for use in the workspace.

workspace explorer (n)~ The main window where users do most Groove activities, such as collaborating in workspaces.

workspace file (n)~ A file that saves display information about open workbooks, so that you can later resume work with the same window sizes, print areas, screen magnification, and display settings.

workspace manager (n)~ A window that lists all your workspaces along with status information.

workspace shortcuts pane (n)~ An area on the leftmost side of the Windows Intune console containing the icons with shortcuts to open the corresponding navigation pane and overview pane, to view status summaries and perform management tasks that are relevant to that workspace.

workspace site (n)~ A subsite based on the Document Workspace or Meeting Workspace site templates.

workstation (n)~ A microcomputer or terminal connected to a network.

workstream (n)~ An activity that is composed of other activities. Workstreams are the simple building blocks of the process. They may be assigned to single or multiple roles.

World Clock (n)~ A gadget that shows current local time in your own time zone or any city in the world.

world coordinate (n)~ A coordinate used to model a particular graphic world.

world geometry (n)~ The mathematical representation of a 3D space or object.

world transformation (n)~ The transformation that converts world coordinates to page coordinates.

World Wide Name (n)~ A unique identifier used in storage technologies for physical (e.g. ports) and logical objects (e.g. RAID array LUN) and created and managed by IEEE. It is composed in a variety of formats and often contains an organizationally unique identifier.

World Wide Web (n)~ A set of interlinked documents in a hypertext system. The user enters the web through a home page.

World Wide Web (WWW or just 'the Web') ~ The easiest part of the- Internet- to understand and use, the World Wide Web consists of many millions of pages of text and images published by anyone and everyone, from governments and large corporations down to the humblest home user, in a standardised hypertext- format. A particular person or company's area is called a website. Viewed with a program called a- browser. Wandering around the World Wide Web is often called- Websurfing- or justsurfing.

World Wide Web Consortium (n)~ A consortium of commercial and educational institutions that oversees research and promotes standards in all areas related to the World Wide Web.

World Wide Web Distributed Authoring and Versioning (n)~ A set of extensions to the Hypertext Transfer Protocol (HTTP) that facilitates collaborative editing and file management between users located remotely from each other on the Internet.

World Wide Web Publishing Service (n)~ The service that manages the IIS core components that process HTTP requests and configure and manage Web applications. Formerly known as W3SVC.

worm (n)~ Self-propagating malicious code that can automatically distribute itself from one computer to another through network connections. A worm can take harmful action, such as consuming network or local system resources, possibly causing a denial of service attack.

WORM (n)~ An optical disc that can be read and reread but cannot be altered after it has been recorded. WORMs are high-capacity storage devices. Because they cannot be erased and rerecorded, they are suited to storing archives and other large bodies of unchanging information.

Worm ~ A malicious program introduced into computers by stealth, similar to a- virus.

WOSA (n)~ A common set of interfaces that connect front-end applications with back-end services.

Wow! (adj)~ A title animation in Windows Movie Maker.

WPA (n)~ A security method used by wireless networks. WPA encrypts the information that is sent between computers on a wireless network and authenticates users to help ensure that only authorized people can access the network.

WPA (PN)~ A set of performance monitoring tools used to produce in-depth performance profiles of both systems and applications.

WPA2 (n)~ A wireless implementation and the second generation of WPA security that is based on the final IEEE 802.11i amendment to the 802.11 standard.

WPAD (n)~ A standard networking protocol used to help Internet client software automatically locate and interface with cache services within a network.

WPF (PN)~ A new strategic graphics subsystem in Windows Vista that provides a unified approach to user interface, 2D and 3D graphics, documents and media. Built on the .NET Framework foundation and utilizing Direct3D for vector-based rendering, it provides a powerful solution for building immersive applications of all kinds.

WPF layer (n)~ A layer in the Surface SDK that exposes functionality for developers to use to create Surface applications.

WPI (PN)~ A wizard that automates the installation of several commonly used Web technologies from a single installation point. These technologies include all the IIS features like ASP and ASP.NET, as well as Application Request Routing (ARR), Visual Web Developer Express, SQL Server Express, etc.

WPN Keep Alive Detector (PN)~ Windows Push Notifications (WNS) component that analyses network conditions and determines an optimal ping interval to keep the connection alive.

WPP (n)~ A mechanism for user-mode applications and kernel-mode drivers to log real-time binary messages. The logged messages can subsequently be converted to a human-readable trace of the driver's operation.

WPR (PN)~ A tool that provides OEMs and IT Professionals with detailed recordings of system and application behavior and resource usage.

WQL (PN)~ A subset of ANSI SQL with semantic changes adapted to Windows Management Instrumentation (WMI).

wrap (n)~ The circumstance in which one piece of software (the wrapper') contains

wrap (v)~ To encapsulate another piece of software (usually a legacy program or test) so that the contained software can function in the environment of the wrapper.

wrap panel (n)~ A layout container that arranges its child elements in a single vertical or horizontal row, creating a new row if needed to display the overflow from the previous row.

Wrapped PST store (n)~ A message store that is read from and written to by a Wrapped PST provider.

wrapper class (n)~ A class that takes an existing class, and provides it with a new interface.

wrapper playlist (n)~ A Windows Media metafile that places additional content at the beginning or end of a stream. Examples of this content include welcome messages, goodbye messages, advertisements, and station branding.

wraps ~ An online distribution platform for financial advisors.

writable (adj)~ Capable of recording data that has been edited or entered.

write (n)~ A transfer of information to a storage device, such as a disk, or to an output device, such as the monitor or printer. For example, a disk write means that information is transferred from memory to storage on disk.

write (v)~ To transfer information either to a storage device, such as a disk, or to an output device, such as the monitor or a printer. Writing is the means by which a computer provides the results of processing. A computer can also be said to write to the screen when it displays information on the monitor.

write access (n)~ A privilege on a computer system that allows a user to save, change, or delete stored data. Write access is usually set by the system administrator for a networked

or server system and by the owner of the computer for a stand-alone machine.

write back (v)~ To update a cube cell value, member, or member property value.

write conflict (n)~ A situation that occurs when a user is trying to make simultaneous changes to the same object or simultaneous changes to other objects that have attributes referencing this object.

write enable (v)~ To change a cube or dimension so that users in cube roles with read/write access to the cube or dimension can change its data.

write lock ~ The process of controlling a field so that the ability to change information held within it is maintained. In almost all computer languages, a type of table is used.

write mode (n)~ In computer operation, the state in which a program can write (record) information in a file. In write mode, the program is permitted to make changes to existing information.

write off (v)~ To remove a debt that will not be paid by a party.

write on wall (oth)~ To post a message on a friend's Facebook wall.

write once, read many (n)~ An optical disc that can be read and reread but cannot be altered after it has been recorded. WORMs are high-capacity storage devices. Because they cannot be erased and rerecorded, they are suited to storing archives and other large bodies of unchanging information.

Write permission (n)~ A designation that indicates that certain users or roles may enter data, make edits, or modify the properties of a form or report.

write property (n)~ A permission level that grants a process the ability to change properties on another process.

write scope (n)~ The administrative boundary in which members of an Exchange 2010 role group can make changes. For the Outlook Live hosted service, the write scope is the entire Outlook Live organization. For on-premises implementations of Microsoft Exchange Server 2010, write scopes may be smaller in breadth, such as those defined by a specific organizational unit or a database.

writeable disc (n)~ A CD or DVD disc onto which files can be copied. Common writeable disc types include CD-R, CD-RW, DVD-R, and DVD-RW.

writeable section (n)~ A data section in a module, such as a data section containing a module's global variables, that can be written to at run time.

write-ahead log (n)~ A transaction logging method in which the log is always written prior to the data.

writeback (n)~ The result of an operation that occurs when data is entered into a writable cell in a PerformancePoint Add-in for Excel matrix. The data is submitted to PerformancePoint Planning Server, saved to a relational fact table, and then the source data cube is updated.

write-behind provider (n)~ An assembly that is associated with an AppFabric cache that is called to asynchronously write cache updates to a custom backend store.

write-down adjustment (n)~ An adjustment to decrease the value of a fixed asset for accounting purposes.

write-in product (n)~ A product that is manually added to quotes, orders, and invoices rather than selected from the Microsoft Dynamics CRM product catalog.

write-only (adj)~ Capable of being changed (written) but not seen (read).

write-protect *(v)*~ To prevent the writing (recording) of information, usually on a disk.

write-protected (adj)~ Pertaining to a disk to which content cannot be recorded.

Write-protected ~ A write-protected file has been set so that it cannot be altered or deleted without first removing the write protection. Also calledread-only. You can write-protect a file in windows by right-clicking on it and checking the 'read-only' box under attributes.

Write-protected ~ A write-protected file has been set so that it cannot be altered or deleted without first removing the write protection. Also called read-only.

writer (n)~ A piece of software handling application-related data consistency during backup and restore operations.

Writer (PN)~ A desktop app that enables WYSIWYG editing, offline editing, and preview functionality.

write-up adjustment (n)~ An adjustment to increase the value of a fixed asset for accounting purposes.

writing area (n)~ Any area where you can enter handwriting to be converted to typed text and inserted in a program.

writing pad (n)~ The pad in Tablet PC Input Panel that you use to write text to be converted to typed text and inserted in a program.

WRL (PN)~ A library that provides infrastructure for the Windows Runtime; it can also be used to create a language projection to build Windows Runtime components in C++ and for app building.

WRM header (n)~ A rights management header that is used by a client to locate or acquire a license for the piece of content in which it is stored.

WRP (n)~ A feature in Windows that attempts to block the replacement of necessary system files to improve reliability and security.

WSD (n)~ A common programming interface to the lower-level system area network (SAN) implementations, developed by Microsoft. WSD sits underneath the standard WinSock application programming interface (API), but bypasses the kernel networking layers to talk directly to the SAN hardware. Because WSD sits underneath the existing WinSock API, IT departments can deploy applications in a SAN environment without modifying the applications.

WSDL (n)~ An XML format for describing Web services. WSDL allows Web service providers and users of such services to work together easily by enabling the separation of the description of the abstract functionality offered by a service from concrete details of a service description such as how' and 'where' that functionality is offered.'

WSDL file (n)~ The file in which the contract that must be adhered to by a Web service and all its callers is defined. It is written in Web Services Description Language (WSDL).

WSDL message (n)~ An abstract, typed definition of the data that is communicated during a WSDL operation.

WSDL Schema (n)~ An interface implemented in the XML message format for describing the network services offered by the server.

WS-F PRP (PN)~ An implementation of the WS-Federation specification that proposes a standard protocol for how passive clients (such as Web browsers) apply the federation framework. Within this protocol, Web service requestors are expected to understand the

new security mechanisms and be capable of interacting with Web service providers.

WS-Federation (PN)~ A specification that defines a model and a set of messages for brokering trust and the federation of identity and authentication information across different trust realms. The WS-Federation specification identifies two sources of identity and authentication requests across trust realms: active requestors, such as Simple Object Access Protocol (SOAP)-enabled applications, and passive requestors, which are defined as Hypertext Transfer Protocol (HTTP) browsers that can support broadly supported versions of HTTP, for example, HTTP- 1.1.

WS-Federation Passive Requestor Profile (PN)~ An implementation of the WS-Federation specification that proposes a standard protocol for how passive clients (such as Web browsers) apply the federation framework. Within this protocol, Web service requestors are expected to understand the new security mechanisms and be capable of interacting with Web service providers.

WSH (n)~ A language-independent scripting host for ActiveX scripting engines on 32-bit Windows platforms. WSH can be used to automate administrative tasks on a server, using any scripting language.

WSIM (PN)~ A utility for creating and modifying answer files and configuration sets.

WSRM (n)~ A feature of Microsoft-® Windows-® Server 2003, Enterprise Edition and Windows Server 2003, Datacenter Edition. With Windows System Resource Manager, administrators can control and account for the how CPU and memory resources allocated to applications, services, and processes.

WSS (oth)~ A family of Microsoft Web-based team collaboration environments that provide the ability to create and access virtual workspaces for managing documents, discussions, lists, surveys and other important contextual information such as team member status and presence.

WSS (PN)~ The Windows service that analyzes a set of documents, extracts useful information, and then organizes the extracted information so that properties of those documents can be efficiently returned in response to queries.

WS-Security (PN)~ A series of specifications that describe how to attach signature and encryption headers to Simple Object Access Protocol (SOAP) messages. In addition, WS-Security describes how to attach security tokens, including binary security tokens such as X.509 certificates and Kerberos tickets, to messages. In Active Directory Federation Services (ADFS), WS-Security is used when Kerberos signs security tokens.

WTF ~ (What The F***)- Internet slang, not suitable for polite company.

WWAN (n)~ A wireless network that connects geographically separated locations by using telecommunications services, such as satellite, radio, and mobile phone technologies.

WWN (n)~ A unique identifier used in storage technologies for physical (e.g. ports) and logical objects (e.g. RAID array LUN) and created and managed by IEEE. It is composed in a variety of formats and often contains an organizationally unique identifier.

WWW (n)~ A set of interlinked documents in a hypertext system. The user enters the web through a home page.

WWW ~ See- World Wide Web.

WWW service (n)~ The service that manages the IIS core components that process HTTP

requests and configure and manage Web applications. Formerly known as W3SVC.

WWW Service Administration and Monitoring component (n)~ A component of the World Wide Web Publishing Service (WWW service) in IIS that is responsible for configuration, by means of the metabase, and for worker process management.

WYSBYGI (n)~ Providing a preview of the effects of the changes the user has selected before finally applying them. For example, a dialog box in a word processing program might display a sample font a user has chosen before the font is actually changed in the document. The user can cancel any changes after previewing them, and the document will be unaffected.

WYSIWYG (n)~ Pertaining to a program or interface that allows creation and editing of web pages, text, or graphical user interfaces such that users can see what the end results will look like while the documents are being created.

WYSIWYG ~ (What You See Is What You Get; pr. 'whizzy-wig')- A computer interface, usually for creating documents, that reproduces the end-product as accurately as possible on screen. Standard on all modern software, so you don't often hear it mentioned these days.

X ~

X Internet ~ A set of technologies that connect firms' information systems to physical assets, products, and devices.

X.25 ~ A type of packet switched network used extensively by PNOs for public services and popular for transaction based private networks.

X.400 (n)~ An international messaging standard that can be used by a variety of messaging systems. X.400 uses a strict addressing method that reflects a hierarchical environment. The use of X.400 has been largely supplanted by the combination of SMTP and MIME.

X.509 certificate (n)~ A certificate that adheres to the X.509 public key infrastructure (PKI) standard, which identifies the requirements for robust public key certificates.

X.509 v3 certificate (n)~ A certificate that adheres to the syntax and format described in version 3 of the International Telecommunication Union - Telecommunication [Standardization Sector] (ITU-T) recommendation X.509. This is the standard certificate format used by Windows certificate-based processes. An X.509 certificate includes the public key and information about the person or entity to whom the certificate is issued, information about the certificate, plus optional information about the certification authority (CA) issuing the certificate.

X++ (PN)~ The object-oriented programming language used to develop software for the Microsoft Dynamics AX application.

x64 (n)~ Pertaining to the x64 64-bit architecture. The x64 platform enables 64-bit memory addressing, and can run on processors such as AMD Athlon 64, AMD Opteron, Intel Xeon with EM64T, and Intel Pentium 4 with EM64T.

x64 ~ A processor architecture based on the 32-bit IA-32 (x86) architecture, with extensions for the execution of 64-bit software. AMD produced the first instances of x64-based processors, the AMD64 processors-€"also referred to with the term- x86-64.

x64-based (oth)~ Pertaining to the combination of a 64-bit Windows operating system and microprocessors that natively support the x86 for extended systems (x64) 64-bit instruction set. Examples include AMD Opteron and Intel Xeon with 64-bit extension technology processors.

x86 (n)~ Refers to microprocessors that have or emulate the 32-bit Intel processor architecture.

x86-based (oth)~ Pertaining to the combination of a 32-bit Windows operating system and a microprocessor that natively supports the 32-bit x86 instruction set. Examples include Intel Pentium 4, AMD Athlon and VIA C7 processors.

XAML (PN)~ An XML-based language used to represent a tree of objects. Events generated by these objects can be handled using any .NET programming language.

XAML activation (n)~ The process of activating a workflow instance directly from the XAMLX file that contains the workflow definition rather than from a DLL or by using a configuration file.

XAML Binary File (n)~ A file containing a pre-parsed binary representation of a XAML file produced by the XamlBinaryWriter class intended to be write-once to improve loading

and parsing performance.

x-axis (n)~ The horizontal reference line on a grid, chart, or graph that has horizontal and vertical dimensions.

X-band ~ bandwith between 7 GHz to 8 GHz, which usually is used by military satellites.

XBF (n)~ A file containing a pre-parsed binary representation of a XAML file produced by the XamlBinaryWriter class intended to be write-once to improve loading and parsing performance.

Xbox Music Store (PN)~ The area of Xbox Live where music is sold.

Xbox Video (PN)~ The brand name of the video offering from Xbox Live.

XBRL (oth)~ An XML language for the electronic communication of business and financial data.

XBRL instance document (n)~ An XML file that contains the financial data and XBRL taxonomy information of a report.

XBRL-€"Financial reporting (oth)~ XBRL messages that contain financial data in summary form, such as balances per period and which provide a standard understanding of what profit is or what depreciation is on a financial report.

XBRL-€"FR (oth)~ XBRL messages that contain financial data in summary form, such as balances per period and which provide a standard understanding of what profit is or what depreciation is on a financial report.

XBRL-€"General Ledger (oth)~ XBRL messages that contain financial transactions and which provide a standard understanding of what a journal ledger posting is or what a depreciation posting is.

XBRL-€"GL (oth)~ XBRL messages that contain financial transactions and which provide a standard understanding of what a journal ledger posting is or what a depreciation posting is.

XBRL-€"Global Ledger (oth)~ XBRL messages that contain financial transactions and which provide a standard understanding of what a journal ledger posting is or what a depreciation posting is.

XBT (n)~ A digital currency that uses Bitcoin.

x-coordinate (n)~ The position of a point with reference to the x-axis, defined in conjunction with the y- and z-coordinates.

xcopy ~ a command in Windows and other operating systems for copying groups of files. It works just like copy except that as many files as possible are read into memory before any are written to disk. This is usually faster than using copy.

XDE (PN)~ An extended development environment integrating Microsoft Visual Studio .NET and Rational Application Developer.

Xen ~ A virtualization platform which began as a research project at the University of Cambridge and was released as open source software in 2003. Xen utilizes paravirtualization to hook calls to the hardware node's resources

Xeon ~ a high-speed Pentium-class microprocessor introduced by Intel in 2002 as a successor to the Pentium 4. It features a pipelined architecture with clock speeds of 1.8 GHz and higher.

X-header (n)~ An e-mail message header that begins with X-'.'

X-Header storage option (n)~ The option that adds an X-Header to the Internet header of

spam messages. Information contained in this X-Header is specified by administrators in the Administration Center.

XHTML (n)~ A markup language that extends HTML and reformulates it as XML.

XID (n)~ An identifier exchanged between nodes on an SNA network. The XID enables the nodes to recognize each other and to establish link and node characteristics for communicating. Host Integration Server supports two types of XIDs: Format 0 XIDs and Format 3 XIDs.

XImage (PN)~ A command-line tool that captures, modifies, and applies installation images for deployment in a manufacturing or corporate environment.

XING ~ XING (named openBC/Open Business Club until 17 November 2006) is a social software platform for enabling a small-world network for professionals.http://www.xing.com/

XML (n)~ A markup language for describing and exchanging structured data in a format that is independent of operating systems and applications. XML is a World Wide Web Consortium (W3C) specification and is a subset of Standard Generalized Markup Language (SGML).

XML attribute (n)~ A name-value pair, separated by an equal sign and included in a tagged element, that modifies features of an element. All XML attribute values are strings enclosed in quotation marks.

XML element (n)~ An XML structure that consists of a start tag, an end tag, and the information between the tags. Elements can have attributes and can contain other elements.

XML entity (n)~ The combination of characters and symbols that replace other characters when an XML document is parsed, usually those that have other meanings in XML. For example, < represents the < symbol, which is also the opening bracket for a tag. A General Entity is an entity that is used within the XML document itself, as opposed to a parameter entity, which is only referenced in the DTD.

XML expansion pack (n)~ A collection of files, managed by a manifest.xml file, that add functionality to a Microsoft Office Word or Microsoft Office Excel document by specifying custom display or actions.

XML feed (n)~ A distribution mechanism for frequently-updated content that is aggregated by an RSS reader and delivered or published in a standard XML format. The content is often summarized, with links to a more complete version.

XML for Analysis (PN)~ A specification that describes an open standard that supports data access to data sources that reside on the World Wide Web.

XML fragment (n)~ Lines of text that adhere to XML tag rules, but do not have a Document Type Definition (DTD) or schema, processing instructions, or any other header information.

XML literal (n)~ A Visual Basic coding construct that enables direct incorporation of XML into code, instead of requiring that it be stored in a string.

XML namespace (n)~ A collection of names, identified by a URI reference, that are used in XML documents as element types and attribute names.

XML namespace prefix (n)~ An abbreviated form of an XML namespace.

XML Paper Specification (PN)~ A specification that describes a file format that is used

to store documents, to process them for printing, and to print them. This means that a document does not change during the printing process. The XPS format conforms to the Open Packaging Conventions (OpenXML, ECMA-376 1st edition Part 2).

XML Paper Specification Viewer (n)~ A viewer that allows users to visualize, navigate, and customize the view of files with an XPS Document format.

XML Path Language (n)~ A language used to address parts of an XML document. XPath also provides basic facilities for manipulation of strings, numbers, and Boolean values.

XML Query (n)~ Functional query language that is broadly applicable to a variety of XML data types derived from Quilt, XPath, and XQL. Both Ipedo and Software AG implement their own versions of the W3C's proposed specification for the XQuery language. Also called: XML Query, XQL.

XML schema (n)~ The World Wide Web Consortium (W3C) standard language used for creating XML schema documents. The XML schema contains two parts: a set of predefined types (for example, string, dateTime, decimal), and an XML language for defining new types (for example, complexType, minOccurs, element).

XML schema definition language (n)~ The World Wide Web Consortium (W3C) standard language used for creating XML schema documents. The XML schema contains two parts: a set of predefined types (for example, string, dateTime, decimal), and an XML language for defining new types (for example, complexType, minOccurs, element).

XML Schema Document (n)~ A specification that describes the complex types used in a Web method and thereby enables interoperability between clients and Web services built on different platforms by adhering to a common type system, as defined by the W3C.

XML Signature (n)~ An XML-based digital signature that can be used to secure the data contained in XML documents. XML Signatures are a standard governed by the World Wide Web Consortium (W3C).

XML standalone (n)~ An enumerated constant that indicates how an IXmlWriter produces the standalone attribute of the XML declaration. The following are the possible values: omit, yes, no.

XML template file (n)~ An XML file that contains the sample data that is displayed in the fields of a form before a user fills it out.

XML tree (n)~ A hierarchical structure of XML elements.

XML Web service (n)~ A unit of application logic providing data and services to other applications that can invoke Web protocols.

XMLA (PN)~ A specification that describes an open standard that supports data access to data sources that reside on the World Wide Web.

XMP (n)~ An extensible markup language that records metadata in a syntax that is a subset of XML. It is used in PDF, photography and photo editing applications and was first introduced by Adobe Systems in April 2001.

XMS (n)~ A specification developed by Lotus, Intel, Microsoft, and AST Research that defines a software interface allowing real-mode applications to use extended memory and areas of memory not managed by MS-DOS. Memory is managed by an installable device driver, the Expanded Memory Manager (EMM). The application must use the driver to access the additional memory.

XOR (n)~ A Boolean operation that yields true' if and only if one of its operands is true

and the other is false. '

XP ~ Windows XP. Refers to the Windows XP operating system from Microsoft.www.microsoft.com (obsolete)

XPath (PN)~ A language used to address parts of an XML document. XPath also provides basic facilities for manipulation of strings, numbers, and Boolean values.

Xperia ~ Sony Xperia is a family of Sony smartphones and tablets. The line of phones has been manufactured since 2008, while the first tablet released under the brand was launched in 2012. The name Xperia is derived from the word 'experience', and was first used in the Xperia X1 tagline, 'I (Sony Ericsson) Xperia the best'.

XPress compression (n)~ A Microsoft proprietary compression algorithm highly tuned for speed. It achieves ZIP-level compression ratios and is currently the server-side compression implementation of choice within Microsoft.

XPS (PN)~ A specification that describes a file format that is used to store documents, to process them for printing, and to print them. This means that a document does not change during the printing process. The XPS format conforms to the Open Packaging Conventions (OpenXML, ECMA-376 1st edition Part 2).

XPS document (n)~ An Open Packaging Conventions package that conforms to the XML Paper Specification. An XPS document can be stored as a file or a memory stream.

XPS Document file format (n)~ An open, cross-platform document format that allows customers to effortlessly create, share, print, and archive paginated documents.

XPS Document format (n)~ An open, cross-platform document format that allows customers to effortlessly create, share, print, and archive paginated documents.

XPS Essentials Pack (n)~ A package that includes all the essentials one needs to have a full experience with XPS documents, without the need of .NET Framework components. It includes the XPS Viewer EP, filters, renderers, and resource files.

XPS package (n)~ An XPS document that is saved to a file as an Open Packaging Conventions package that complies with the XML Paper Specification.

XPS printer driver (n)~ A GDI-based Version 3 printer driver or printer driver component that supports the XPS print path that was introduced in Windows Vista.

XPS Viewer (n)~ A viewer that allows users to visualize, navigate, and customize the view of files with an XPS Document format.

XPS Viewer EP (n)~ An XPS viewer included in XPS Essentials Pack that allows users to visualize, navigate, and customize the view of files with an XPS Document format.

XPSDrv (n)~ A GDI-based Version 3 printer driver or printer driver component that supports the XPS print path that was introduced in Windows Vista.

xRank (PN)~ A service that tracks the popularity of notable people and topics based on Bing search data.

x-report (n)~ A type of report that is generated to record current sales totals for a specific cash register.

xRM (PN)~ The Microsoft Dynamics CRM's business application framework that surfaces the Microsoft Application Platform to accelerate the development of enterprise-class relational business applications.

XrML (n)~ A proposed standard digital rights management (DRM) markup language which enables users to specify rights and conditions associated with resources, such as

digital content or Web services.

XSD (n)~ The World Wide Web Consortium (W3C) standard language used for creating XML schema documents. The XML schema contains two parts: a set of predefined types (for example, string, dateTime, decimal), and an XML language for defining new types (for example, complexType, minOccurs, element).

XSD Browser (PN)~ In Visual Studio, an object browser that displays the structure of XML schema definitions (XSD).

XSDL (n)~ The World Wide Web Consortium (W3C) standard language used for creating XML schema documents. The XML schema contains two parts: a set of predefined types (for example, string, dateTime, decimal), and an XML language for defining new types (for example, complexType, minOccurs, element).

XSL (n)~ An XML vocabulary that is used to transform XML data to another form, such as HTML, by means of a style sheet that defines presentation rules.

XSL Transformation (n)~ A declarative, XML-based language that is used to present or transform XML data.

XSLT (n)~ A declarative, XML-based language that is used to present or transform XML data.

x-ua-compatible header (n)~ An HTML header in which the HTTP-EQUIV property has a value of x-ua-compatible, which allows content to specify the document compatibility modes supported by the webpage.

X-Windows ~ The software system written for managing windows under Unix. A graphics architecture, application programming interface and prototype implementation developed at the Massachusetts Institute of Technology, X-Windows defines a client/server relationship between the application program and the workstation. It is not, however, a complete graphical user interface, but rather the basis on which one can be built.

xy chart (n)~ A chart that plots numerical data along two value axes (x,y).

x-y-z coordinate system (n)~ A three-dimensional system of Cartesian coordinates that includes a third (z) axis running perpendicular to the horizontal (x) and vertical (y) axes. The x-y-z coordinate system is used in computer graphics for creating models with length, breadth, and depth.

Y ~

Yammer (PN)~ An enterprise-level social network used for private communication within organizations or between organizational members and pre-designated groups.

Yammer Configuration (PN)~ The options a person sets in the CRM UI to connect CRM to the enterprise Yammer network.

Yammer Enterprise (Government Pricing) (PN)~ The Yammer Enterprise offer for government organization collaboration, knowledge exchange, and team efficiency that is hosted in the commercial cloud environment.

Yammer Now (PN)~ A messaging app that allows Yammer users to quickly chat with their coworkers wherever they are.

yaw (n)~ A rotation in 3D space about the y-axis.

year-end closing (n)~ An accounting process that occurs at the end of the fiscal year and is used to transfer the balances of the temporary owners' equity accounts to the permanent owners' equity account, to carry forward closing account balances from one accounting period to opening account balances in the subsequent accounting period, and to generate financial statements.

Yellow Book ~ Published by Philips and Sony, the 'Yellow Book' used the Red Book as its basis for the physical specifications of sectors in a- CD-ROM—designed for computer data.

Yellow filter (n)~ One of the most common filters used in B&W photography. Increases contrast slightly.

Yes/No data type (n)~ A field data type you use for fields that will contain only one of two values, such as Yes or No and True or False. Null values are not allowed.

Yes/No field (n)~ A type of field with content set to either Yes or No. For example, the Recurring field indicates whether the task is a recurring task.

Yield (n)~ The income return on an investment. This refers to the interest or dividends received from a security and is usually expressed annually as a percentage based on the investment's cost, its current market value or its face value.

YMMV ~ (Your Mileage May Vary)An Internet slang, meaning 'your experience may be different'. Derives from a disclaimer in US car ads.

yomi (PN)~ The Japanese kana characters that indicate the correct pronunciation, sorting, and grouping behavior of a word written in kanji. The name of a field that stores such characters and can impact the sorting/grouping behavior of a corresponding field that can contain a word written in kanji. Typically used to modify the kanji field's name (e.g. -€œYomi Last Name-€? specifies how to correctly pronounce/sort/group -€œLast Name-€?). The main distinction compared to -€œphonetic-€? is that sorting/grouping behavior is expected to be impacted for -€œyomi-€?, but not for -€œphonetic-€?.

You are here location (n)~ The location on the map screen that indicates where the Surface location (and the user) are currently located.

youngest version ~ the historical version of a data set that is chronologically closest to the base version in a generation group.

Your movies (PN)~ The user's video library title, displayed in the Quick links' section

Your movies & TV (PN)~ The user's video library title, displayed in the Quick links' section

YouTube (PN)~ A website for uploading and viewing videos for free.

youtuber ~ a person who produces video content for the video sharing site- Youtube.

Yukon ~ Yukon is the code name used for the beta version of Microsoft's SQL Server 2005. SQL Server 2005 is said to provide enhanced flexibility, scalability, reliability, and security to database applications, and to make them easier to create and deploy, thus reducing the complexity and tedium involved in database management.

YUV color space (n)~ A color model that describes color information in terms of its brightness (luminance, or Y), and color (chrominance, or U and V).

Z (n)~ A game rating symbol developed by the Computer Entertainment Rating Organization (CERO).

Z ~

zapping ~ Considered to be the lowest form of software programming known to mankind, it involves altering the assembly code in hex format after it has been output from a complier or assembler. Typically done when there is a compiler bug, the proper data is not being generated, or the original source code was lost.

ZAR (n)~ The official currency of South Africa.

z-axis (n)~ The third axis in a three-dimensional coordinate system, used in computer graphics to represent depth.

z-buffer (n)~ A buffer that stores a depth value for each pixel in a scene. Pixels with a small z-value overwrite pixels with a large z-value.

Zeppelin (PN)~ A web-based notebook that enables interactive data analytics.

zero (v)~ To fill or replace with zeros (for example, to zero a specified portion of memory, a field, or some other limited structure).

zero bug bounce (n)~ The first point in time after a milestone (typically code complete) that there are no active bugs accepted by the triage meetings that are older a specified amount of time (typically between 3 hours and 3 days). It is referred to as bounce because bugs checked in can cause regressions and these regressions can cause the number of bugs to bounce' back up from zero.'

zero bug release (n)~ The first release to testing after all active bugs have been resolved.

zero day ~ a software vulnerability that has been exploited by malicious hackers on or before the day the software creators become aware of the problem

zero defect state (n)~ A point in the product cycle when the code does not generate errors that break a build.

Zero Download Messenger (PN)~ A Web-based tool that enables mail recipients to decrypt and reply to encrypted e-mail messages that are sent from the Hosted Encryption service.

zero insertion force socket (n)~ A type of socket design that does not require the CPU chip to be forcefully pushed into the socket.

zero out (v)~ To set a variable value or a series of bits to zero.

zero padding (n)~ Appending zeros to the beginning of a number, or a series of numbers.

zero power ODD (n)~ Pertaining to the ability to reduce the power consumption of optical disk drives in the operating system to zero to save energy when the drives are not in use.

zero power optical disk drive (n)~ Pertaining to the ability to reduce the power consumption of optical disk drives in the operating system to zero to save energy when the drives are not in use.

zero suppression (n)~ The elimination of leading (nonsignificant) zeros in a number. For example, zero suppression would truncate 000123.456 to 123.456.

zero value (n)~ A value equal to 0 (zero).

Zero Wait State ~ Refers to a system that allows the processor to work at full clock speed regardless of the clock speed of- RAM.

zero-length string (n)~ A string that contains no characters.

zero-rated (adj)~ Denotes products for which the buyer pays no value-added tax (VAT) and for which the seller can recover the cost of the input tax levied on the sale.

ZIF socket (n)~ A type of socket design that does not require the CPU chip to be forcefully pushed into the socket.

ZigBee (alliance / modules) ~ A vendor initiative started by Philips Semiconductor, Honeywell and Invensys Metering .

-zilla ~ an English slang suffix, a back-formation derived from the English name of the Japanese movie monster Godzilla. It is popular for the names of software and websites. This trend has been observed since the popularization of the- Mozilla- Project

zindex (n)~ The numerical index of an object in the stacking order. An object with a higher index value will appear on top of objects with lower index values.

z-index (n)~ The numerical index of an object in the stacking order. An object with a higher index value will appear on top of objects with lower index values.

zine ~ Small, often free magazine, usually produced by hobbyists and amateur journalists.

zip (v)~ To make a single file out of a set of files using a program such as compress, gzip, or PKZIP.

Zip ~ A popular standard for file- compression- developed by the PKWare corporation. Files thus compressed usually have the extension .zip. See- Winzip.

zip (file) ~ An open standard for compression and decompression used widely for PC download archives.

zip (file) ~ Windows users will see this term a lot when looking for files on the Internet. A zip file (.zip) is a 'zipped' or compressed file. 'Zipping' a file involves compressing one or more items into a smaller archive.- www.winzip.com

ZIP code (n)~ In the United States, the postal code assigned to all addresses.

Zip drive (n)~ A disk drive developed by Iomega that uses 3.5-inch removable disks (Zip disks) capable of storing 100 megabytes of data.

zip drive ~ a large capacity floppy disc drive developed by IOMEGA Corporation. Used for backing up important data. Now obsolete.

Zip/Postal Code (n)~ The label for the text box where the user types the postal code for outgoing correspondence.

zombie ~ a computer that a remote attacker has accessed and set up to forward transmissions (including spam and viruses) to other computers on the Internet. also known as a zombie army

zombie ~ an abandoned, unkept or sadly out-of-date Web site.

zombie ~ A user that surfs the web hours on end and never seems to sleep or tire.

zone (n)~ In a DNS database, a manageable unit of the DNS database that is administered by a DNS server. A zone stores the domain names and data of the domain with a corresponding name, except for domain names stored in delegated subdomains.

zone (n)~ A physical or logical division within a warehouse, defined for efficient resource utilization. A zone might be identified by type of materials stored, by type of equipment used, or by assigned picker.

zone (n)~ A logical partition or communication boundary within a datacenter on a logical datacenter diagram. However, a zone can represent any type of boundary, for example, trust boundaries.

zone (n)~ A region that contains Web Parts controls on a page, and provides layout management and a consistent UI for the contained controls. A zone in the Web Parts control set is a composite control that contains other controls and is rendered as an HTML table. All Web Parts zones inherit from System.Web.UI.WebControls.WebParts.WebZone.

zone ~ A logical group of network devices.

Zone 1 (PN)~ The geo within the Azure region taxonomy that covers the geographic locations North America and Europe with the respective regions.

Zone 2 (PN)~ The geo within the Azure region taxonomy that covers the geographic locations Asia Pacific, Japan, Latin America and Middle East / Africa with the respective regions.

Zone 3 (PN)~ The geo within the Azure region taxonomy that covers the geographic location of Brazil.

zone elevation (n)~ A situation that occurs when a Web page loaded in one URL security zone loads a page from a less restrictive zone in a frame or a new window. For example, if a page from the Internet zone loads a page from the Local Machine zone, a zone elevation has occurred.

zone endpoint (oth)~ An endpoint that represents a connection and communication endpoint for a zone and is inbound outbound or bidirectional type. A zone endpoint delegates communication to endpoints on logical servers within the zone.

zone signing key (n)~ A public key corresponding to a private key that is used to sign one or more DNS record sets within a zone, below the zone apex.

zone transfer (n)~ The process whereby a secondary DNS server obtains information about a zone or domain from the primary server.

zone walking (n)~ The process of repeating NSEC queries in order to retrieve all the names in a DNS zone.

zone-redundant storage (n)~ Storage of three copies of a customer's data across multiple facilities located in one or two regions.

Zones (PN)~ A resource of the DNS Service Type of the Networking Service to manage a special database for storing IP addressess and web site names to resolve web site names

zone-signing key (n)~ A public key corresponding to a private key that is used to sign one or more DNS record sets within a zone, below the zone apex.

zoom (v)~ To enlarge a selected portion of a graphical image or document to fill a window or the screen.

Zoom (PN)~ A tool that lets you change the current view magnification of your document.

zoom (n)~ A multi-touch gesture that consists of two fingers moving in opposite directions (-> <- or <- ->).

zoom in (n)~ To enlarge a selected portion of a graphical image or document to fill a window or the screen.

zoom out (n)~ To adjust the perspective of an image or document in order to view a larger area on the screen at one time, as if viewed from farther away.

Zoom, In (n)~ A credit or title animation in Windows Movie Maker.

Zoom, Out (n)~ A title animation in Windows Movie Maker.

Zoom, Up and In (n)~ A title animation in Windows Movie Maker.

z-order (n)~ The order in which objects are placed in a layer. An object higher in the stack

will cover up (appear on top of) one lower in the stack.

ZPODD (n)~ Pertaining to the ability to reduce the power consumption of optical disk drives in the operating system to zero to save energy when the drives are not in use.

z-report (n)~ A type of report that is generated to record current sales totals for a specific cash register and to close the current work shift.

ZRS (n)~ Storage of three copies of a customer's data across multiple facilities located in one or two regions.

zSeries ~ IBM's 64-bit mainframe product line, which includes its z800, z900 and z990 mainframe servers. The zSeries products are a re-branding of, and major upgrade to, IBM's S/390-class mainframe computers.

ZSK (n)~ A public key corresponding to a private key that is used to sign one or more DNS record sets within a zone, below the zone apex.

Zune (PN)~ A Microsoft sub-brand grouping digital-media products, including devices that play media, a software media player, and online media services.

zune ~ The Zune is a portable digital media player from Microsoft . The first version, released in November of 2006, is about the size of a deck of playing cards and weighs 5.6 ounces.

Zune software (n)~ The computer-based program through which customers shop and download from the online Marketplace, play and manage music and video collections, and sync games, apps, and other media to their phones.
