Map 52 Byzantium

Compiled by C. Foss, 1997

Introduction

Map 52 Byzantium

Map 53 Bosphorus

Map 52 encompasses two very different regions, Thrace and Bithynia, together with the northern coast of Mysia. Thrace, now European Turkey, is open, rolling country with few prominent features. In classical times, its population was mainly tribal, and it never had any great density of settlement. It has also attracted relatively little research and remains largely unknown, not least because considerable areas have been military zones. The coast of the Propontis, however, was the home of Greek colonies whose names are already attested in the Athenian tribute lists of the fifth century B.C. It also became the site of the greatest city of the East, Constantinople, which dwarfed all the others in Late Antiquity (see below).

Bithynia is entirely different. Its coastal regions, with the lakes behind them, are part of the Mediterranean zone. Throughout antiquity, the rich vegetation here supported dense settlement and continuous occupation. Behind, there is broken country with mountains that culminate in the Mysian Olympus; the eastern part is watered by the mighty R. Sangarius. Interior Bithynia was settled only in the Hellenistic period; it flourished in Roman times, when Nicomedia and Nicaea were rival metropolitan centers. The regions of these two cities have been illuminated by the explorations and publications of Dörner and Şahin, and a broad district around Cyzicus by Hasluck. Much of the rest awaits systematic survey.

Map 53 focuses on the area of transition between the extremities of these two regions, centered on the long narrow channel of the Thracian Bosphorus. This passage of 17 miles, varying from one-third to two miles in width, separates Europe and Asia, and connects the Black Sea with the Propontis. Since archaic times, its primary role has been one of transit—between two continents as well as between two bodies of water.

The Bosphorus is lined with wooded hills, some of which drop precipitously into the channel. Its shoreline is highly indented, with frequent bays, harbors, and the mouths of several small rivers which rise not far away. Because of its strategic location, the agricultural wealth of its hinterland, and the easy availability of fish, the area has always supported a large number of settlements, which increased constantly in the period covered here, in particular after the transformation of Byzantium into Constantinople in the fourth century A.D.

The topography of the Bosphorus is extraordinarily well known, thanks to one of the most remarkable and detailed of ancient geographic texts. The *Anaplous tou Bosporou*, written by Dionysius of Byzantium in the second century A.D., records a great number of ports and landmarks along the entire coastline. Except on the Golden Horn, many of these can be located. Unfortunately, the text has a large lacuna, which can be at least approximately filled by the Latin translation (or paraphrase) of Peter Gyllius, made in the sixteenth century. The Latin text only was published by Carl Müller in GGM II with introduction and full commentary. The best critical edition of the Greek and Latin text, however, is now that of Güngerich (1927). The topography is most conveniently analyzed by E. Oberhümmer in RE Bosporos 1 and RE Keras. Most of his identifications are adopted on the map.

Attention should be drawn to one passage of Dionysius which is more than usually confusing. After describing the entire right bank of the Golden Horn, he reaches Semystira at the junction of the two rivers Kydaros and Barbyzes. He then continues (Güngerich, p. 13): “A tergo Semystirae, paulo supra fluminis ostia initium circumflexus in alterum latus sinus Ceratini efficit promontorium Drepanum inflexum ... loca nuncupata Mandrae et Drys; ille quidem a loco quieto et tecto, mari enim tranquillo alluitur ... post promontorium est longus sinus Auleon appellatus.” Commentators, misled by the Latin translation, have taken this passage to refer to places on the R. Barbyzes (“a tergo” from Semystira). The Greek text, however, which merely states that they are *κατόπιν*, “after” Semystira, shows that the left bank of the Horn is being described, from the junction of the rivers, around the large

bend of Sütllüce, where the stream changes direction, and then continuing south-east. On this reading, the text suits the topography better, as well as accommodating the “mari tranquillo,” which could hardly refer to the course of the river. Otherwise, Dionysius seems to be wandering up-river, but then returns suddenly to a point on the Horn far below Semystira. Drepanon Pr. may therefore be identified with Sütllüce, Boukolos Collis is its highest point, and Auleon Sinus is the small gulf at Hasköy. The intervening places remain unidentifiable.

For Constantinople and its environs (including the Bosphorus), the most significant modern studies are Janin (1964) and Eyice (1976); the latter devotes greater attention to physical remains. The most recent, and often novel, views are those of Mango (1985).

Map 54 Epirus-Acarnania

Compiled by W.M. Murray, 1994

Introduction

The first systematic investigations of north-west Greece were carried out during the nineteenth century by Leake (1835), Heuzey (1860), Lolling (1889, for work done in 1876-77), Oberhummer (1887), Partsch (1887; 1889; 1890), and Woodhouse (1897). Progressing slowly over the mountainous terrain on foot, these men recorded in detail many observations that still remain our best evidence for numerous sites throughout the region. In recent years, still more has been learned from the work of Hammond (1967), Dakaris (1971; 1972), Cabanes (1976; 1985; 1986; 1987), TIB Nikopolis, Murray (1982), Bommeljé (1987), Pritchett (1994; SAGT 7-8) and others, who often retraced the steps of the early travelers in their search for additional details. Through the combined results of these investigations, a reasonably clear picture has emerged which forms the basis of the map.

Generally speaking, the region covered includes many small settlements (both fortified and unfortified) whose ancient names will never be known. My goal has been to include as many of these sites as possible in order to reflect more accurately the distribution of population, and to reduce the apparent significance of those small settlements whose names do happen to be preserved. In order to avoid overcrowding the map (and thus rendering it unintelligible), I have selected those sites that possess one or more of the following characteristics: a fortification wall sufficient to enclose at least 0.1 hectare; building foundations appropriate for a small settlement; and tombs in sufficient numbers to represent the cemetery of a settlement rather than, say, one family's grave enclosure.

The region also includes a great many fortresses and towers (cf. Plutarch, *Aratus* 50.7). As many as possible of these are marked, although a number of small signal towers and small open sites are omitted for the sake of clarity in a few areas of dense habitation. Likewise omitted for the same reason are several small bridges recorded by Dakaris (1972, 186-87) in Thesprotia.

Throughout, the goal has been to reflect the sites reported in the fundamental accounts by Hammond (1967), Dakaris (1971; 1972) and TIB Nikopolis for Epirus; by Oberhummer (1887), Murray (1982) and Pritchett (1994; SAGT 7-8) for Acarnania; and by Woodhouse (1897) and Bommeljé (1987) for Aetolia. Because no comparable account yet exists for the islands, it has not proved possible to be quite so rigorous there. Homeric toponyms are omitted unless they are attested as actual place names by later ancient writers. Thus Nerikos and Same are marked, but not Scherie, which is never referred to as an historical place.

It has sometimes been difficult to locate sites mentioned by early travelers, either because the remains have since disappeared, or because the nineteenth century names have changed—even more than once. In the northern regions of the map, the sites are less well documented, detailed maps are less easy to obtain, and much of the scholarship appears only in inaccessible Albanian journals. It is common to have two or more sites associated with an ancient name, because in most areas the number of sites greatly exceeds the number of preserved names. Question marks reflect such uncertainties.

Although the strings of settlements reaching inland from the coast reveal that the region was originally criss-crossed by a net of foot- and bridle-paths, these are omitted. An attempt has been made, however, to indicate certain significant routes that passed through the region. Since the evidence seldom reveals their exact course over a long distance, many stretches are marked as approximate only. For details, consult the journeys of the early travelers mentioned above, Cabanes (1976) Map 2, and the discussions of Hammond (1967, 690-700), Axiote (1980) and Pritchett (1994, 179-241).

Representation of the changing positions of coastlines and coastal lakes calls for an equally conservative approach. Good evidence exists to show that some regions have experienced a relative rise in sea level of almost 11 ft since antiquity (Murray 1982, 460-62; 1988). This encroachment by the sea (partly due to land subsidence) is not uniform across the entire region. In addition, near the rivers it has been offset to an unknown degree by the

deposition of alluvial sediments. Although a clear picture of the ancient coastline, based on geological evidence, has yet to be published, I have attempted to follow such evidence as exists (such as for the Achelous delta). Where it does not, certain changes attested by ancient authors are at least reflected. Where it is impossible to establish the exact degree of change, the modern coastline is left unaltered, but the main areas likely to have been affected are rendered as swamp, following the example of Dakaris in his studies of Thesprotia and Kassopia.

My earlier determination of the broad outlines of the coastline's progression past Oiniadai toward the Oxeiai islands (Murray 1985) now calls for modification in the light of Freitag (1994), which convincingly exploits the literary testimonia to demonstrate a more complex situation. As a result, I have now drawn the mouth of the R. Achelous with the help of J.C. Kraft, who relies on a study of sediment cores made by Villas (1984). Moreover, in recognition of the doubts raised by Freitag, the coastal lake Melite appears only as an Unlocated Toponym.

Map 55 Thessalia-Boeotia
Compiled by J. Fossey and J. Morin, 1995
with the assistance of G. Reger (islands)

Introduction

Most of the mainland surface area represented on the map has been the subject of detailed topographic publications over the past forty years. The last fifteen years have been especially productive; in fact, only one part of Thessalia is not covered at all by recent investigation, the area of Achaea Phthiotis north of Mt. Othrys. Such copious publication has proved a challenge, insofar as no map at this scale could hope to reflect fully the entire settlement pattern revealed by the latest surveys and remain comprehensible. Nor could it show most of the fortifications which dot the landscape around every ancient Greek community, large or small. Filling in 'empty' areas (the mountainous hinterland of Aetolia and the Pindus range, for example) with modern toponyms has also been deliberately avoided in order to maintain the map's consistency. What appears here, therefore, is limited chiefly to those sites mentioned in ancient sources, whose locations are known; to these have been added a limited number of sites to which only a modern name can be attached.

The coastline shown corresponds for the most part to the modern one. Lack of information from specific studies makes it impossible to mark many acknowledged changes (at the mouth of the R. Peneios, for example). This caution does not apply, however, to the coastal area of Thermopylae now located far inland because of the massive accumulation of alluvium from the R. Spercheios; here the ancient coastline has been the subject of a recent, detailed investigation (Kase 1991). The mouth of the R. Euenos (in Aetolia) poses a particular problem. The coastline shown there is very hypothetical because no accurate information is available; the absence of sites in this delta is a reasonable reflection of the situation in antiquity, but no coastline can be drawn with any confidence.

Since the end of the nineteenth century, central Greece has seen drainage operations on several bodies of water (the Copais, Xynias and Boibe lakes, as well as a few smaller ones) and areas subject to flooding, especially in Thessalia. In general, the shorelines shown are those of the lakes in the nineteenth century, except where recent data are available, as in the cases of Lake Copais (Knauss 1990) for example, and the plain of Thisbe (Knauss 1992). The eastern shoreline of Lake Copais can be determined with a fair degree of certainty because of the encircling hills; but the more level nature of the ground along its western side, combined with the considerable regular variation of the lake's level (both seasonal and annual fluctuation), precludes such confidence there and calls for approximate linework only. In the case of the marshy plain of Thisbe, the map represents the situation as Pausanias (9.32.2) describes it, with one half of the surface area covered by water, the other half drained. There is some degree of uncertainty about the northern extremity of Lake Boibe, which was marshy in antiquity and no doubt also subject to wide-ranging variations. Mycenaean drainage works have been omitted throughout, since they lie outside the chronological limits of the map.

Roads are omitted deliberately. Information on them is either too scrappy or too general in nature to warrant marking road courses. In fact "roads" in Greece were typically pathways following the lie of the land, not constructed features at all (except in those rare instances where they were, say, cut into a rock face). The paucity of remains makes marking them with any confidence virtually impossible.

Islands

The choice of sites marked is consciously limited to the more significant; in particular, some towers reported for certain islands are omitted. Those on Peparethus are included in view of the argument that they form a system for defensive or refuge purposes (Fredrich 1906). Clearly, further work on many islands (Euboea in particular) would improve our knowledge as well as reveal more sites; Bruneau's (1987) survey is instructive in this regard.

Map 56 Pergamum

Compiled by C. Foss, S. Mitchell (north) and G. Reger (islands), 1994

Introduction

The western seaboard of Asia Minor **north** of Ionia comprises Aeolis, the Gulf of Adramyttium and the Troad. Greek settlements were established at coastal sites here between about 1000 and 500 B.C., but none developed into a center on the scale of the leading Ionian cities. There were four major coastal plains, around Elaea at the mouth of the R. Caicus, in the broad delta of the R. Grylios, on either side of the R. Euenos north of Adramyttium, and in the lower basin of the R. Scamander around Ilium/Troia. It is clear that there have been changes to the water courses and to the position of the ancient coastline in these alluvial areas. In general, however, it appears that since classical times the increase in alluvial deposits at the river deltas has been matched by a rise in the sea level, with little resultant change to the position of the ancient shoreline. There has been considerable discussion concerning the original course of the Caicus between Pergamum and the sea. Dörpfeld (1911) argued that in antiquity the river ran north of Mt. Kane through the gap between Kane and Atarneus, and this course is thus marked with approximate linework. Dörpfeld's view, however, was contested by Philippson (1911). No detailed geomorphological investigation of the area has been carried out, and the dispute remains unresolved.

The river valleys of north-west Asia Minor extend eastwards into the thinly inhabited interior of the Troad and of Mysia, which is dominated by the forested mountain ranges of Ida, Pindasos, Temnon and Aspendos. The mountains of the Troad were noted for timber as well as for mineral deposits, especially iron, lead and silver (Pernicka 1984).

The evidence for the ancient topography of the region is hard to interpret. Only four of the ancient settlements in the entire area between Pergamum and Ilium and across inland Mysia are identified by epigraphic evidence (Alexandria Troas, Assos, Aureliane, Pericharaxis). The best information for the overall pattern of settlement has come from detailed archaeological exploration, notably of the Troad by Cook (1973), of the Gulf of Adramyttium by Stauber (IK 50), and of the territory of Pergamum by Schuchhardt (1912). Assigning names from the ancient sources to these sites is usually a matter of informed guesswork, however, and modern reconstruction depends heavily on the interpretation of the literary evidence. Much of this, including the work of Strabo, reflects the attempts of ancient commentators to make sense of Homeric geography (Leaf 1923).

The **southern** part of the map comprises Lydia and northern Ionia. The latter is a region of typical Mediterranean climate and vegetation, with a long indented coastline and two major rivers, the Hermus and Cayster. It contains one large mountain, Mimas on the peninsula of Erythrai; otherwise it is broken country of small, but highly fertile, coastal and interior plains interrupted by craggy limestone hills. Communication was consequently easiest by sea. Because of its agricultural wealth, favorable maritime communications, and presence of numerous suitable harbors with adjacent hills for defense, this was the earliest area of the Greek colonization that produced a network of towns and cities.

The interior is Lydia, a land characterized by the massive range of the Tmolus, the broad and extremely fertile plains of the Hermus and Cayster, and a rough, rather arid hilly country in the north-east. This country has enormous agricultural and mineral resources, as well as good communications with both coast and interior. Its most important roads follow the Hermus and radiate from Sardis. Already under the Lydian kingdom, the plains and valleys supported numerous settlements. In many cases, their presence is indicated by the tumuli which adorned important graves, a practice continuing into the Hellenistic period. Under the Romans, Lydia was densely occupied. The largest settlements were always in the Hermus valley, but the Cayster had many villages and towns, as did the hills. Mt. Tmolus, which contains numerous alpine valleys perpendicular to the main range, supported settlements too, although it was perhaps of greatest value for transhumance and for its mineral resources, of which the most famous was the gold of the R. Pactolus.

Lydia has been well explored over the past century, notably by Buresch, Keil and von Premerstein, Louis Robert, and Herrmann. Their researches have produced an unusual quantity of inscriptions, which provide many of the toponyms marked. This epigraphic material is now being published, with the full context of historical geography, in TAM. Inscriptions of the Cayster valley appear in IK 17.

Islands

The three large islands of Lemnos, Lesbos and Chios dominate the western side of the map. Study of their topography has been uneven, and the map reflects these differences. For Lesbos, Koldewey's survey (1890), conducted in the 1880s, remains the primary basis for the identification of many sites; its beautiful, large-scale maps and plans by Kiepert are as pleasurable as profitable to study. Some additional information appears in Kontes (1978), but many of his identifications must be treated with caution. Excavations have been conducted at some sites, and recent work has done much to increase our knowledge of Mytilene (Williams 1991). Most recently, however, three new studies deal with Lesbos in a comprehensive way: Axiotes' (1992) extremely full descriptions of sites with sketch maps and illustrations; Spencer's (1995) gazetteer of sites, which now replaces Kontes; and TIB Aigaion Pelagos (1998), which also covers Lemnos. These volumes represent a considerable advance on earlier work. Spencer, in particular, has collected and published an immense amount of data, including material in Axiotes; only the more significant sites newly brought to light by these two scholars can be marked at this scale.

On Chios, many sites have been excavated, including notably Emporio (Boardman 1967). Ongoing work in the town of Chios has permitted a very useful summary by Tsarabopoulos (1986). The island as a whole was the subject of an intensive survey by Yalouris (1986), which is the basis for many of the identifications on the map.

Since exploration early in the twentieth century by Fredrich (1906) and Sealy (1918), Lemnos has unfortunately remained neglected for the most part. There have been excavations, however, at the Kabeirion (Levi 1966).

Two groups of sites largely are omitted. First, ancient farms, many of which are known for the island of Chios (Boardman 1958; Lambrinoudakis 1986); Dotion, however, is marked because its ancient name is known. Second, the many toponyms appearing in the Diocletianic (or later) land surveys (IG XII 2.76-80, IG XII Suppl.; Charitonides 1968, 70; LaBarre 1996, 223-37 for a recent study and bibliography). This second group poses a particular problem for Lesbos, since a remarkable number of toponyms there can reasonably be claimed to preserve names from those lists (Mantzuranis 1951; Kontes 1978). Kontes especially has been very quick to equate modern sites bearing these toponyms with the ancient ones. But in many cases, the modern sites have revealed no evidence of ancient occupation. Since toponyms can wander, the mere existence of a modern one resembling a known ancient one seems insufficient for the identification of a site without supporting archaeological remains. Kydonia provides a good example; a recent suggestion makes it the name of a region, not an island (Pliny, *NH* 2.232, 5.140; Koldewey 1890, 42; Mason 1993, 244-45). In general, I have been conservative in this matter, even rejecting some identifications (Mesos Agros, for example) that most scholars have accepted.

Another problem arises from the large quantity of toponyms attested from antiquity whose identification is disputed or entirely uncertain. Lesbos has attracted numerous names of cities, indeed probably more than were ever established there. On Chios, some Hellenistic inscriptions published (in a bad state) by Zolotas (1908) offer a plethora of names. Only such toponyms as seem securely enough identified are marked; the rest remain Unlocated Toponyms. In addition, some famous sites, notably Leukonion (Thuc. 8.24.3) and the Lesbian site of the action in *Daphnis and Chloe* (Mason 1979; Green 1982), remain unlocated.

Considerable shoreline change has occurred in the Aegean since antiquity, including the silting-up of harbors or bays, and loss of land to the sea. Most of these changes are too minor to show at this scale—for example, the shoreline at Eresos on Lesbos (Schaus 1994, 421-24). An exception is the strait between island and shore (*euripos*) at Mytilene, now silted up. Otherwise, the landscape of these islands has remained relatively unchanged.

Map 58 Peloponnesus

Compiled by J. McK. Camp II and G. Reger (islands), 1994

Introduction

The Peloponnese has been the focus of considerable topographical research for a long time. Virtually every early European traveler to mainland Greece spent time visiting the sites there, and in the twentieth century it has been the subject of numerous excavations and survey projects. Laconia, Messenia, western Achaea, the area around Megalopolis, the southern Argolid, and the Nemea/Phleious valleys have all received notable attention in recent years. Other areas have been studied largely by individuals—among them, Phaklares, Pikoulas, Pritchett, Wiseman—rather than large teams. The resulting picture of occupation, and of numbers of ancient sites known from the various areas, is inevitably uneven. In addition, surface survey all too often cannot distinguish a site's extent or nature. No sites known solely from survey are marked here, and likewise very few known only from excavation (their ancient names unattested in each instance).

Rather, the map's primary goal is to mark the location of the mass of places and features mentioned in the literary sources and inscriptions. Given the scale, this alone constitutes a major challenge. The thirteen most significant authors for the purpose (Diodorus Siculus, Herodotus, Livy, Pausanias, Pliny, Plutarch, Polybius, Ptolemy, Scylax, Stephanus, Strabo, Thucydides, Xenophon), together with relevant inscriptions, between them preserve over 1,000 Peloponnesian toponyms; about 450 of these are marked. Among the authors, Pausanias dominates; seven of his ten books are devoted to the Peloponnese, and he preserves some 650 toponyms. The commentary on Pausanias by Papachatzes (1974-81) is a vital starting-point for further information, though more recent work by Phaklares, Pikoulas and the British Laconia survey team (Cavanagh 1996) should also be consulted.

For making the compilation, the excellent maps at 1:50,000 scale issued by the Greek army have proved invaluable. Modern toponyms are a problem. In the 1920s, and again occasionally since then, efforts have been made to rename modern settlements, rivers and other features with Turkish, Slavic or Albanian toponyms, replacing these with more Hellenic names (note, for example, *AJA* 87 (1983) 54; *AJA* 95 (1991) 196 (n. 10)). Consequently, the date of a modern map or bibliographic reference may have considerable bearing on which of two, or even three, modern names is used. In addition, an ancient toponym was often chosen as the new name, but not always appropriately applied. Thus an ancient name on a modern map may, or may not, be in its correct ancient location.

There are several areas where geomorphologic changes have, or may have, occurred. One of these is the lagoon around Pylos and its vicinity; another is the marshy area near Teichos Dymaion. In addition, Stymphalos and several of the upland plains of Arcadia (Orchomenos, Phleious, and near Nestane) may have had more standing water at those times when there was no active human intervention.

The explanation given in the Introduction to Map 55 for the deliberate omission of roads applies to this map likewise.

Islands

The map includes the westernmost islands of the so-called "western string" of the Cyclades (Keos, Kythnos, Seriphos, Melos) and several other minor islands. As usual, between them they have attracted very different levels of scholarly attention. Melos was the subject of a pioneering surface survey (Renfrew 1982), and Keos has been investigated intensively by several teams of scholars over the past two decades (Cherry 1991; Georgiou 1993; Mendone 1993). The results of these efforts can only be reflected very selectively at this scale. In contrast, Seriphos and Kythnos have hardly been touched; future work will undoubtedly improve our knowledge here.

For the principles adopted for the marking of farms and towers, see the Introduction to Map 61 (islands).

Directory

All place names are in Greece

Map 59 Attica

Compiled by J.S. Traill, 1995

Introduction

A primary concern of the map is to present the ancient demes. Of the 143 Athenian constitutional demes (140 original, 3 later), 122 are marked; the remaining 21 appear in the Directory as Unlocated Toponyms. Split or divided demes normally have the designators 'Kathyperthen' (Upper) and 'Hypenrthen' (Lower); also, in the case of Lamptraia Hypenrthen, 'Paralioi' (Coastal). The largest Attic deme, Acharnai, which in all likelihood comprised two sections (its name is plural), has been placed at two locations, Menidi and south-west of Menidi. In every instance I have attempted to indicate as precisely as possible the deme center. Deme (or trittys or phyle) boundaries, however, are not outlined, even though in my view many of the rupestrial boundary markers (*horoi*), now being recovered in increasing numbers by M.K. Langdon and associates, define these territorial limits.

In the Directory, the phyle or tribe appears as the first item in the brackets under **Modern Name/Location**, using Roman numerals from I to X for the original ten phylai. Demes reassigned to Antigonis and Demetrias in 307/306 B.C. have an additional numeral in parentheses (XI or XII). The three demes formed along with, or shortly following, the creation of Ptolemais, Attalis and Hadrianis, bear the numerals XIII, XIV and XV respectively. The second item in the brackets gives the trittys assignment of each deme, namely city (Asty), inland (Mesogaia) or coast (Paralia). Note that an asterisk (*) here, as in Traill (1986, 123-40), indicates a geographically isolated segment of the trittys. The bouleutic quota (that is, the representation of the deme in the Council of 500), appears as the last item in the brackets. It is the best indication of the relative sizes of demes, and has been utilized in determining which of five type-sizes to choose when marking each deme name on the map. Quotas—which increased in the Macedonian period, when the Council was enlarged from 500 to 600 members—are shown in parentheses.

Although both archaeological and literary evidence for the existence of many Attic demes remains sporadic in several periods of antiquity, Athenians' continuing systematic use of the demotic implies that a political and constitutional apparatus (at the least, maintenance of a local record office) survived far into the Roman period. Thus in the Directory all the original demes are dated CHR (see Map Key). Typically, no more than two references are given for a deme, the first to a standard work such as RE or KvA text, the second to the summary of data in Traill (1986).

For the compilation of the map, challenges have arisen from the sheer abundance of evidence on the one hand, and from the unevenness, both geographical and chronological, of its distribution on the other. For example, there are literally hundreds of mines, mining works and quarries attested in Attica, and at this scale it would be impractical, if not impossible, to do more than mark the most significant. The same applies to all the rich remains associated with many settlements in the Asty and Paralia regions. By contrast, some of the large and important demes, particularly in the Mesogaia, have left very few traces for any period.

There is simply not enough consistent, reliable evidence to show the routes connecting the many demes and major sites. It is generally agreed, however, that modern roads tend to follow the course of their ancient predecessors; note Bradford (1957, plates 7, 9a, b) for comparison of the ancient and modern roads between Euonymon and Aixone. The only routes marked, therefore, are those well documented archaeologically (note especially Vanderpool 1979 for north-west Attica), and those with a well attested ancient name linked to remains on the ground either sporadically (Steiriakē Hodos), or extensively (Hiera Hodos).

There are similar problems with marking ancient terrace walls; they abound in modern Attica, and many were recorded by KvA in the late nineteenth century. Note Bradford (1957, plates 8, 9c) for the example of ancient terracing at Euonymon.

The military camps, towers and fortifications shown are drawn primarily from McCredie (1966), Munn (1993) and Ober (1985). The many smaller rubble emplacements, some of which have been studied and published by

Langdon (1995), are omitted. Marking of the numerous aqueducts and walls of ancient Attica is likewise selective; none is shown within the city, and only a few close to it.

Directory

Introduction

Homer, in the *Iliad* (2.649), refers to Crete as *Κρήτην ἑκατόμπολιν*, while at *Odyssey* 19.174 there are *ἑννῆκοντα πόλεις* on the island. Clearly, in early Greek tradition Crete was the island of 100 or 90 cities, and later authors—like Xenion (FGH 460 F2), it would seem—felt obliged to come up with 100 names when discussing Crete's geography. While it is unlikely that it ever contained that many *πόλεις* (independent “city-states”), the number of city names attested is certainly large—in Stephanus, for example, nearly eighty. The map seeks to establish the location of all the major cities, that is, those whose independence is indicated by their participation in a treaty or by the minting of coins. Similarly, it seeks to mark other names (both cultural and physical features) attested in literary or epigraphical sources. Even so, some fairly well attested names must remain as Unlocated Toponyms; there are some False Toponyms, too, of places which in all likelihood never existed. In addition to the cultural and physical features to which an ancient name can be attached (many of which have been investigated archaeologically), the map also aims to mark those larger sites attested by archaeology, to which no ancient name can be reliably attributed. As a general rule, very small settlements (especially individual farmsteads) are omitted in order not to overcrowd the map.

Two further aspects essential to any study of the island's topography and settlement are also passed over, because they seem inappropriate to a map at this scale. First, there is no systematic attempt to locate all toponyms attested in boundary treaties, in particular the fifty attested in a late second century B.C. boundary treaty between Olous and Lato (Faure 1967; van Effenterre 1969). Apart from the uncertainty of attribution to specific modern topographic features, the relatively small area covered would lead to serious overcrowding. Nonetheless a small number of securely locatable toponyms from such documents are marked. Second, sites attested by systematic archaeological surface survey are omitted, although it would be possible to increase the number of known sites of the classical period considerably by adding them. The chief reason has again been to avoid overcrowding, but there is also the question of representativeness; an area covered by intensive survey will seem much more densely populated than others, even though this may well not have been the case in antiquity.

To pursue settlement patterns in more detail, note the surveys conducted in the following areas of the island (from west to east). Some of the publications are preliminary, and fuller details may follow: Khania (Moody 1987, where the emphasis is prehistoric, but historical periods are mentioned); Sphakia region (Nixon 1988; 1989; 1990; Moody 1998); Rethymnon and its region to the east (Schiering 1982); Amari valley (Rocchetti 1994); western Mesara plain (Watrous 1993) and Kommos area (Hope Simpson 1995); Agiopharango valley and the nearby south coast (Blackman 1975; 1977); Knosos vicinity (Hood 1981); Mallia region (Müller 1990); Lasithi plateau (Watrous 1982); Vrokastro region (Hayden 1992; 1995); Kavousi region (Haggis 1992; 1996); Ag. Photia (Tsipopoulou 1989); south-east Crete (Schlager 1991); and the Lamnoni and Katelionas basins near Ziros (Branigan 1998).

It is well known that the west coast of the island experienced a severe tectonic uplift, probably in A.D. 438 (Thommeret 1981). Around the ancient harbors at Phalasarna and Kisamos, the uplift was in the order of 20 ft, while in the south-west corner of the island (ancient Kriou Metopon, Biennos and Kalamyde) it was close to 27 ft. In addition, since antiquity there has been a general rise in sea level around Crete of about six ft, while localized tectonic disturbances have affected a number of other places on the island. Despite the dramatic nature of the west Cretan uplift, the lateral retreat of the sea is in fact minimal at the scale of the map, given the fairly extreme vertical topography of much of the coastline in the area; it has not, therefore, been possible to indicate this retreat precisely. The major visible effect is that the modern Tigani promontory probably formed an island in antiquity (Gondicas 1988, 146), equated with ancient Iousagoura; the site of modern and medieval Palaiochora (equated by some scholars with ancient Kalamyde) was also an off-shore island, lending greater plausibility to the location of ancient Kalamyde to the east of the modern town, near the mouth of the Vlythias river (Gondicas 1988, 17). For a

summary of archaeological data relevant to sea level changes, see Leatham (1958) and Sanders (1982, 181-82); for landscape change in all periods, Rackham (1996).

Myers (1992) has great value for its up-to-date, stunningly illustrated collection of information on sites of all periods with bibliographic references; for predominantly Roman period sites, Sanders (1982) with its gazetteer is more accessible than Harrison (1993). Guarducci's discussion of topography in *IC* I-IV is often valuable for its topographic references. For controversial sites beginning with the letters A and B, note the well documented discussions by Kitchell (1977), supplemented in two instances by Kitchell (1979; 1983). For other sites, note especially Faure (1960; 1963; 1988; 1993) and—for west Crete—Gondicas (1988). Chaniotis (1996) is generally useful on many aspects of topography.

Insets

Here, as on other Aegean islands, the density of names and symbols marked often reflects the focus of modern research more than the realities of ancient habitation and land use. The towers of Siphnos, for example, famous for their numbers, caught the attention of Ashton (1991), who produced a splendid and complete catalog; his detailed findings, however, cannot be fully reflected at this scale. Several other islands have fared less well. Perhaps the greatest disappointments are Andros, which until recently has failed to attract much attention (except for Zagora), and Tenos, where work has focused almost exclusively on the temple of Poseidon and Amphitrite and a few other cult sites. For Tenos, we know many toponyms which may be villages (so RE) or demes, whether attached to a homonymous village or not (Etienne 1990, 24-30); these are omitted from the Unlocated Toponyms.

Map 61 Ephesus

Compiled by C. Foss and G. Reger (islands), 1994

Introduction

The continental part of the map comprises three distinct geographic regions: the coasts of Ionia and Caria, the Maeander valley, and the mountainous hinterland of Caria. The coastal region, settled by Greeks in their first great expansion in the Iron Age, became the site of major cities and many smaller settlements along its deeply indented coastline. The excavators of Ephesus and Miletus have long surveyed the regions of those cities, and other classical scholars have investigated the rest of Ionia. The Ionian coast has seen great physical changes since antiquity. The vast quantities of alluvium deposited by the R. Maeander have made the ancient port of Ephesus an inland town, and turned the former Gulf of Latmos near Miletus into a lake (inset and E2). The Carian coast, with its numerous small ports, is well known thanks to the researches of Bean and Fraser.

The broad Maeander valley, which divides Ionia from Caria, always played a major role in the economy of the region with its fertility and the communication it provided between coast and interior. It has not been systematically surveyed. The river's tributaries offered an outlet for the scattered settlements in the basins and plateaus of the heavily forested interior of Caria. Much of this region, as well as many parts of neighboring ones, was carefully explored by Louis Robert.

The map omits Carian sites for which no Greek name is attested; for these, see Radt (1970). For unnamed village sites also not marked, see Marchese (1989, 147-54).

Islands

The Aegean islands here pose difficult problems. The number of *poleis* (city-states) and other sites is considerable. Ancient sources such as Pliny the Elder and some of the later geographers offer a welter of names. These are often corrupt, and in some instances they can be associated with a specific island only with the greatest hesitation.

Research and archaeological exploration have treated the different islands very unevenly. For example, it is still unclear where the main *polis* site was on Kalymna, whereas the territory of Ialysos on Rhodes (Map 60 G3) has been so thoroughly documented by Papachristodoulou (1989) that only a selection of the sites identified there can be marked at this scale. Future work is sure to improve our knowledge of the topography of many islands.

Individual farms (*choria*) attested by the Diocletianic inventories are omitted both from the map and from the Unlocated Toponyms; most of their locations are in any case not known. Tholaria are also omitted; again, the locations of many remain uncertain. Single graves and small groups of graves are omitted likewise; it is a matter of judgment when "graves" become a "cemetery," but in general only those that their discoverers or excavators term a necropolis are marked.

Sherd scatters discovered in surveys are generally not indicated unless other, more substantial evidence (for example, walls) suggests a settlement. In the same connection note that the rich results of several surveys cannot be reflected at this scale because the areas covered were too small (for example, Erard-Cerceau 1993; Brunet 1988). Towers—such a common feature on the islands—are marked as forts; choice of this symbol, however, is not meant to prejudice views on the purposes of these structures, which continue to be debated. In general, only the relatively well-preserved towers are marked.

Map 62 Phrygia

Compiled by T. Drew-Bear, 1996

Introduction

So far as is known, the area covered by the map does not pose significant problems of changes in physical geography. Deforestation has wreaked havoc in recent times (note Drew-Bear 1990, 1924-26), but no attempt is made to indicate the extent of forests in antiquity, since this is usually indeterminable—although it may be assumed that mountains were normally heavily forested, whereas plains were certainly treeless already in the classical period. Epigraphy is our primary source for the toponyms that appear on the map. Relating inscriptions to the landscape is the result of generations of work by scholars who have traveled in this region, found inscriptions and coins, and described geographical features that may be related. Very few inscriptions earlier than the Roman period are known from Phrygia. Hence there survive here very few attestations of toponyms from times earlier than the Roman empire. Nonetheless the great majority of toponyms known from inscriptions of the imperial period are indigenous and not Greek, which proves that these communities must have existed already for centuries before the arrival of Greeks in Asia Minor. The sites even of cities founded in Hellenistic times are normally known in Phrygia only if they survived as important communities into the Roman period. The picture that results from the available epigraphic evidence is therefore distorted: the second and third centuries A.D. are strongly over-represented, after which comes the great amount of Christian archaeological material preserved here.

Notable among the many voyagers who have explored this area are W.M. Hamilton, “the prince of travellers in Asia Minor” (Ramsay 1895), who laid the foundations for our understanding of the geography of the region; W.M. Ramsay, who has contributed the most to our knowledge of its historical geography; and among his successors, above all W.M. Calder, who published many inscriptions. The western part of the area covered by the map has been studied with excellent results by Buresch, Keil and von Premerstein, as well as by Herrmann. The latter, however, followed the geographical conclusions adopted by his teacher Keil on the basis of Byzantine administrative arrangements. Inscriptions published subsequently (some by Herrmann himself), which Keil could not know, now confirm the statements of classical authors neglected by Keil. These demonstrate that, during the period which produced Greek and Latin documents in the region covered by Herrmann’s partial corpus of “North-East Lydia” (TAM V.1), this area did not in fact form part of Lydia, but constituted the southern part of Mysia Abbaeitis and was culturally linked to Phrygia, not to the Lydian plain. The region comprising the north of the map, along the Sangarius and Rhyndakos rivers, has been less thoroughly explored, most recently by Şahin and Schwertheim. My own extensive field-work in most of the regions of the map has resulted in the discovery of numerous inscriptions and sites; many entries in the relevant portions of TIB Phrygien are based on this unpublished material.

Normally, size of lettering for the name distinguishes between communities which possessed the status of city (in Hellenistic or Roman times) or bishopric on the one hand, and those which were no more than villages on the other. Such indication of administrative rank implies nothing about size of population. Some “cities” in this region, as elsewhere, were surely smaller at one time or other than some “villages,” but the available evidence typically provides information only about civic status, not about size of population. Hierocles, *Synekdemos*, and the first of the *Notitiae episcopatum* are the latest literary sources used.

Descriptions, plans and photographs of rock reliefs, tombs and fortifications in the “Highlands” (most of them antedating the arrival of the Greeks in this part of Asia Minor) may be found in Haspels (1971), despite the limitations of its topographical indications. Only some of the most important of these numerous rock monuments are marked, in particular those that influence the funerary sculpture of the area in the Roman period. It is a pleasure to thank C. Thomas for her aid in placing these, and other, sites on the map.

Normally omitted are sites (most often of the Roman period, with no known ancient name) located on the basis either of epigraphical or architectural finds by myself or others, or of rock-cut tombs (numerous in the areas covered

by the map), or sherds. Beside sherds, usually the only proof of the existence of a Christian village—its houses built of mud-brick or field-stones—are the marble architectural remains of its church, particularly abundant in Phrygia. Such churches (even if their remains place them before the Byzantine period) are omitted here, as are the rock-cut churches (often difficult to date) found in suitable areas. For the great number of Christian sites, see TIB Galatien and TIB Phrygien.

Except for stretches occasionally noticed in travelers' publications, the roads shown are based mainly upon the maps of TIB and unpublished field-work by D.H. French, who assisted in marking them here.

The list of Unlocated Toponyms includes in principle all cities thought to have been situated within the area of the map, but only those villages for which at least an approximate location may be suggested. In view of the extensive area covered, the list cannot be complete. It did not seem useful to include the numerous villages attested in the donors' lists of the "Xenoi Tekmoreioi" (whose sanctuary was located in the territory of Antiochia), for which no evidence exists outside those lists themselves; it is not even certain that they belong to the area of the map. References to these village-names may readily be found in RE Phrygia (where Ruge places them merely in the "phrygisch-pisidisches Grenzgebiet").

Map 63 Ancyra

Compiled by S. Mitchell, 1997

Introduction

The map covers the southern and eastern parts of Galatia, the treeless central Anatolian plateau (known as the Axylon), northern Lycaonia and the western part of Cappadocia. It includes three major cities: Pteria in the north-east; Ancyra in the north-west; and Caesarea in the south-east. Pteria, an enormous though short-lived Median city, founded by Alyattes c. 585 B.C. but destroyed by Croesus virtually within a generation, has now been convincingly identified with the vast Iron Age site on Kerkenes Dağ. Ancyra and Caesarea, by contrast, developed and flourished in Roman times and have remained major centers up to the present.

The western part of the map covers the central Anatolian basin from eastern Phrygia to the Salt Lake (Tatta Lacus). This region of villages and large estates (Mitchell 1993 I, 149-58 with map) was explored above all by W.M. Ramsay, W.M. Calder and their associates (MAMA 1 and 7; Mitchell 1982); the inscriptions which they discovered contribute a substantial proportion of the toponyms located here. The ecology and geography of the region are the subject of H. Wenzel's brilliant monograph, *Die Steppe als Lebensraum* (1937). The drainage systems in the south-east are internal, leading to the Salt Lake. The extent of this shallow lake is immensely variable, depending on the season and current rainfall levels. The eastern part of the map belongs to the basin of the R. Halys.

Cappadocia, noted for its churches and cave refuges, came into its own in Late Antiquity and the Byzantine period. Most of its famous Byzantine sites are first attested by sources of the middle and later Byzantine periods, but three major centers of that date (Malakopea, Korama, Salanda) are marked because they have yielded some evidence for occupation in Late Antiquity. Much of the region west of Caesarea was occupied by a Greek-speaking population up to the beginning of the twentieth century, and the ancient toponymy has survived in modern place names.

Apart from inscriptions and modern survivals of ancient toponymy, the principal information about the region's topography comes from Strabo, Pliny, Ptolemy and the itineraries. Strabo and Pliny, drawing on Hellenistic or early imperial sources, provide (inadequate) evidence for the settlements and regional divisions of central Anatolia before the construction of a road network during the Roman Empire. An understanding of the Roman and Late Roman topography depends on a grasp of how the Roman road system functioned. Major contributions to this understanding have been made by Calder in MAMA 7, Ballance (1958), French (1974; 1981) and Hild (1977), but numerous uncertainties remain to be clarified. Many places listed in Ptolemy, some of them repeated in the confused itineraries of TabPeut, have yet to be located. The routes followed by the ancient roads can often be fixed with more confidence than the location of the road stations along them. My policy has been to indicate the approximate locations of these road stations, even when a site has yet to be firmly identified.

Two systematic attempts to reconstruct the ancient topography of central Anatolia have been published, by W. Ruge in his entries for RE, and by TIB. When Ruge wrote his articles, most of the locations were unknown. His discussions have therefore now usually been superseded by the corresponding entries in TIB Kappadokien (1981), Galatien (1984), Paphlagonien (1996) and Phrygien (1990), all of which incorporate the results of much recent field work. They are accordingly preferred as standard references in the Directory.

Map 64 Caesarea-Melitene

Compiled by T.B. Mitford, 1996

Introduction

The map covers a region dominated by mountains, the watershed of four great rivers flowing into different seas, and the transition between the endless plains of the Anatolian plateau and the highlands of eastern Turkey. Enclosed to the south by the broken ridges of the Taurus, the region is cut transversely by a more rounded massif, the rising north-easterly sweep of the Antitaurus. To the north and west, the mountains drain into the Kızılırmak (ancient Halys) as it flows towards the Black Sea; to the south, into the Seyhan (Saros) and Ceyhan (Pyramos), before they cut through the Taurus to reach the Mediterranean. To the east, large tributaries flow into the Euphrates, the natural frontier between the classical world and Armenia.

Much of the central area lies above the tree line, and is snowbound from November to April. Settlement has concentrated on the river plains: along the Halys between Sivas (Sebasteia) and Kayseri (Caesarea), and to the south and east around Elbistan (Ablastha) and Malatya (Melitene). These formed the main axes of communications in antiquity as today, skirting the high Antitaurus and linking Sivas, Kayseri and Malatya. The geography has changed little since ancient times, except in the east where the Keban and Karakaya dams have transformed the Cappadocian section of the Euphrates into two elongated lakes.

Most of the area covered by the map fell under Persian rule, and later comprised the eastern half of the Roman and Byzantine province of Cappadocia. But it also includes parts of Pontus, Armenia Minor and Armenia proper. In the fifth century B.C. it was probably traversed by the Persian Royal Road (described by Herodotus 5.52), the great trade route linking the Aegean with northern Mesopotamia and Susa. In Roman times there were military roads of the highest importance in Cappadocia, leading eastwards from Ancyra through Sebasteia towards Satala and northern Armenia, and through Caesarea to the Euphrates at Melitene. Moreover the eastern *limes* ran up the Euphrates valley, to continue over the Pontic mountains to the Black Sea.

Strabo is an excellent source for the region, and draws on firsthand knowledge; he visited Comana, and wrote in Amaseia, the Pontic metropolis (Map 87 A4), under Augustus and Tiberius. He is thus able to describe the physical, historical and political geography of Cappadocia in careful, if not always reliable, detail. There is copious further documentary evidence for the ancient topography. In the mid-second century Ptolemy compiled the coordinates of the mountains, rivers and cities of Cappadocia and Armenia Minor. The main routes diverging from Caesarea and Sebasteia, and their intermediate stations, are known from ItAnt and TabPeut. Segments of the latter reappear in GeogRav, evidently drawing on a common source. The lists of bishoprics from Late Antiquity are no less essential.

Cappadocia did not share the civilized structure of the western and coastal provinces of Asia Minor. Isolated and undeveloped, it was a vast region sparsely covered by villages and divided into districts (*strategiai*) evidently tribal in origin, adapted by the Seleucid kings as a basis for centralized administration, and retained under the Roman Empire. Much of it was occupied by royal, later imperial, lands. About 150 place names are preserved. Most can be located in general terms, although barely half can be identified with any certainty. The fact is that war, invasion and destruction have been endemic in this region since the third century A.D. Almost all physical traces of antiquity—building materials, inscriptions, even road surfaces—have been pressed into reuse in the reconstruction of towns and villages, generally on sites already found convenient. A few ancient place names have survived in continuous use until modern times: Zara, for example, or Zimara on the Euphrates. Others have evolved in recognizable form: Sivas, Kayseri, Malatya.

No comprehensive survey work has been undertaken across eastern Cappadocia as a whole. Notable, but partial, journeys of exploration were undertaken a century ago: along the southern routes by Sterrett (1888), Ramsay (1890), Munro (1893) and Hogarth (1893); in Pontus by Anderson (1903) and Cumont (1906); and up the Euphrates

valley by Hogarth and Yorke (1896). Grégoire (1909) later traveled south-westwards from Nicopolis (Map 87 D4), and down the R. Halys. Then, in the final decades of Christianity there, many of the names and traces of antiquity were still preserved. So locations could readily be proposed for many ancient names, and lines for many roads. The early results were collated by Ramsay (1890), and mapped by Anderson (1903). They were supplemented some forty years later by von der Osten's (1929; 1930; 1933) automobile journeys in the north and east of Cappadocia. His map of ancient sites shows the distribution of settlements in Hittite and earlier times.

The detail and conjecture of these earlier travelers cannot always be corroborated, however. For they followed—or created—rudimentary maps, and it was only the publication in 1947 of the Turkish military series (1:200,000) that permitted accurate location of physical and cultural features, and of the roads and tracks linking them. These Turkish maps retain almost all the village-names known to earlier scholars, and form the indispensable foundation of the present compilation. They show that the lines proposed for several roads are unsustainable: Grégoire's roads leading north and west from Zara, for example, or Ramsay's road north-east from Arabissos. They permit precise tracking of milestones (collated by French 1985; 1988) along the strategic road from Caesarea to the Euphrates. And they show where settlement has been possible, and where it has not.

In collating evidence for the ancient place names, RE remains essential. More recent work is carefully summarized in TIB Kappadokien to provide a comprehensive study of the geography of Cappadocia in the Byzantine period. Sinclair (1989; 1989a) describes ancient sites and roads in a broader historical framework; Bryer and Winfield (1985) discuss the tortured geography of southern Armenia Minor, where the lines followed by ancient roads are not all firmly established. I have covered the eastern frontier on foot over many years. But across eastern Cappadocia as a whole, exploration has been patchy; of this, the omission from the map of a place as important as Divriği is an unwelcome reflection.

Map 65 Lycia-Pisidia

Compiled by C. Foss (west) and S. Mitchell, 1994

Introduction

The map covers a large segment of south-west Asia Minor, extending from the southern edge of Phrygia in the north to the Mediterranean coastline. The most striking feature is the western extremity of the Taurus mountain range, which dominates the entire landscape of Pisidia and Lycia. In the north-east are the internally drained lake basins of Trogitis (Lake Suğla), Karalis (Lake Beyşehir), Lake Eğirdir (E1-2, ancient name unknown), and Ascanius (Burdur Lake). The mountains to the south of these contain the sources of three major rivers, which flow down through Pisidia to the Pamphylian plain—the Melas, Eurymedon and Kestros. Both Pamphylia and Pisidia contained large populations in antiquity, occupying a dense network of city-states, up to ten in Pamphylia and over fifty in Pisidia. Pisidia was accessible by some of the most important routes of southern Asia Minor, in particular the road built by the first Roman proconsul of Asia, M'. Aquillius, between 129 and 126 B.C. from Pergamum (Map 56 E3) to Side (French 1991), and the Augustan *Via Sebaste*, which ran from Perge to Pisidian Antioch (Map 62 F5).

The historical geography of this region has been much advanced in many recent studies—by Bean, Mitchell and Nollé especially (note the overview in Mitchell 1998b)—and the pace of discovery shows no signs of slowing. Current research by Turkish scholars is beginning to throw important new light on the border zone between southern Pisidia and eastern Lycia to the west of Attalea. Above all, the sensational discovery at Patara of an inscription erected by the emperor Claudius in A.D. 45 will offer the foundation for a thorough re-appraisal of the historical geography of the entire region between Caunus in the west and Attalea in the east. This *stadiasmos*—about which only preliminary information has so far been released—contains details of all the routes of the newly annexed Roman province of Lycia, with distances between the cities measured in stades (Şahin 1994).

The western part of the map comprises Lycia, the Kibyratís, and an interior region of Caria. The latter two are high plateaus and basins interrupted by mountains and lakes, with a widely scattered population. Historically, the most important of these regions was Lycia, which comprises a coastal zone with many excellent harbors, the broad and fertile valley of the R. Xanthos, and small valleys and basins in the rising country to the north. The coastal zone in particular supported a remarkable number of cities and villages, well known from remains, inscriptions and extensive exploration since the mid-nineteenth century; see especially Foss (1993; 1994). The historical geography of the coast is known from the descriptions of Scylax (fourth century B.C.) and StadMM (third/fourth centuries A.D.). An inscription of Hadrian's time from Oenoanda (Wörle 1988) names many unidentified villages, as does the sixth-century life of St Nicholas of Holy Zion.

Remains of aqueducts have been identified at the following cities, but in the absence of detailed publication it is impossible to mark them on the map: Antiochia ad Maeandrum, Apamea (D1), Hierapolis, Laodicea ad Lycum, Trapezopolis (Weber 1904).

Map 66 Taurus

Compiled by S. Mitchell, 1995

Introduction

The map covers three distinctive geographical areas. In the north is the steppic basin of Lycaonia and south-west Cappadocia. The rivers here drain towards the interior of the country and end in the shallow lakes and salty marshes of central Anatolia. To the south comes the semicircular sweep of the Taurus mountains, the ancient territory of Isauria and Cilicia Tracheia ("rugged"). The mountains are divided up by the deeply cut river-systems of the Calycadnus in the west, and by the Cydnus and (P)Saros in the east. The third area is the western half of Cilicia Pedias ("plain"), as far as the outlet of the R. Pyramos. In modern times elaborate dam and canalization schemes have been developed for the irrigation of the Lycaonian steppe south of Iconium and of Cilicia Pedias between the (P)Saros and Pyramos. These may have had predecessors in antiquity, but there is no reliable archaeological documentation for such systems. Deposits at the river mouths in Cilicia Pedias have pushed the modern coastline forward by as much as four miles in some locations, and the outlets of both the (P)Saros and Pyramos have altered substantially since the Roman period (see Map 67 Introduction).

Relatively systematic information for the coastal topography of the region is available from the shipping manuals of coastal landmarks. These mainly comprise the work attributed to Scylax, which in its present form dates to the 330s B.C. (GGM I, xliii-xlv), an account in Strabo Book 14, and the StadMM compiled in the third or fourth century A.D., but drawing in part on the same sources as Strabo. Ptolemy covers Cilicia and Lycaonia. The stations on overland routes through the region are known from several itineraries, notably ItAnt and ItBurd, both of which provide accounts of the major road running south from Ancyra to Tyana, through the Cilician Gates to Tarsus, and thence east to Syria (French 1981, 13-14, 120-23). A fragmentary inscription from Rome preserves a segment of the route from Tarsus north to Andabalis (Map 63 F4), possibly followed by Hadrian in October 117 (CIL 6.5076; French 1981, 124; Halfmann 1986, 190). TabPeut illustrates several major roads and road stations in the region, but with some cartographic confusion owing to the mountainous terrain. The only comprehensive geographical survey is provided by Strabo, although the quality of his information is extremely variable (Syme 1995, especially 153-65). For Late Antiquity, the main sources are the lists of bishoprics, *Notitiae episcopatum* (Darrouzès 1981), and Hierocles' *Synekdemos*. Until recently, a large number of ancient place names were preserved by the toponymy of modern Turkish villages and towns (cf. Robert 1977). These name survivals have been noted as fully as possible in the Directory.

There are notable uncertainties in the historical geography of the steppe north of the Taurus. Four of the seven cities which belonged to the *koinon* of Lycaonia have yet to be located with certainty (Barata, Koropissos, Dalisandos, Hyde). Exploration of the mountain regions (see especially Bean 1970) has clarified many uncertainties and produced a much clearer picture of the topography of Isauria. Along the Cilician coast many of the identifications of smaller sites are necessarily approximate, although the general location of particular places is usually clear.

Two indispensable sources of reference deserve mention. First, the articles on individual place names written for RE by W. Ruge, even though these often have to be brought up to date to take account of more recent discoveries. Second, three volumes of the excellent TIB-Kappadokien (1981), Galatien (1984), Kilikien (1990). These contain systematic information not only for the Byzantine period but also earlier, and typically offer the best evaluation of sources and archaeological data.

Directory

All place names are in Turkey

Map 67 Antiochia

Compiled by P.-L. Gatier (Syria) and T. Sinclair, 1997
with the assistance of M. Ballance

Introduction

Turkey

Eastern Cilicia, known as Kilikia II in Late Roman times, is a mixture of rugged mountains and a very fertile coastal plain. A century ago, much of this plain was swampy, malarial and underpopulated. Since then, drainage and irrigation have brought prosperity. While bearing in mind the more limited resources available, it is probably fair to assume that for much of antiquity conditions resembled those of a century ago. In such flat country there must have been changes in the course of the rivers: the Pyramos, for instance, seems to have had two mouths, one in roughly the present position, and the other just west of Magarsa (Map 66 G3). The positions of the main ancient settlements in the plain are all reasonably certain, although several, including Epiphaneia, Phlaouiopolis and Neronias, have yet to be confirmed epigraphically.

In the mountainous areas of the Amanus and on the southern slopes of the Taurus, there may have been larger areas of forest than today; they are, after all, regions where goats and (in the more accessible parts) charcoal-burners have long been active. The fact that the map shows very few ancient settlements in these mountains is due partly to the lack of modern research; but there is no recorded ancient city that can possibly be located here, in sharp contrast to Cilicia Tracheia further west with its numerous small cities.

Apart from the rift valley on the east side of the mountain range itself, the entire area east of the Amanus is rolling countryside, much of it fertile, underlain by dry, chalky rock. Above ground, the physical fabric of the ancient sites has for the most part been erased by very active, populous medieval occupation. Few inscriptions have been found, and few more are likely to be found. For various reasons, there has been little survey or excavation of classical remains, except in the vicinity of Antioch and downstream thence along the R. Orontes. The district east of the R. Euphrates is the least explored; here some ancient sites are known only from pre-World War I travel literature, and have not been checked since. There is a striking number of Late Antique monasteries in the entire region which are named in texts, but whose sites have yet to be identified. The rescue excavations in the shadow of the Atatürk dam downstream, and upstream of Samsat (ancient Samosata), have not shed light on any sites known to ancient authors.

The map reflects a re-evaluation of previous scholarship on the alignment of roads and siting of way-stations and other settlements. Even so, rather than relying on traces followed over a continuous course, the basis for most identifications remains the ancient itineraries, a few observed sections of road, the known bridges, and modern toponymy. Within modern Turkey, those way-stations and settlements named only in the itineraries are all assigned to the Late Antique period; the possibility that some were established earlier remains open, however.

Syria

The map reflects important differences between the three regions of northern Syria today. These regions comprise the mountainous Kurd Dagħ, in the north-west of the country; the so-called Limestone Massif, directly south of Kurd Dagħ; and the eastern steppes. The Kurd Dagħ has been completely neglected by modern research. By contrast, the regions of Antiochia and Apamea (Map 68 B3) further south continue to be the subject of many studies, not least because of the threat from rising population. These regions include the semi-deserted Limestone Massif, where hundreds of villages still display important, well-preserved ruins from the Roman and Late Antique periods. Only the more significant can be marked on a map at this scale. The eastern steppes had been neglected by travelers and archaeologists. Recently, however, the building of dams on the Euphrates has generated new surveys and excavations along its banks and those of several other rivers in the eastern plains (Qoueiq, Sadjour, Balikh).

Most of this work has been carried out by orientalists and prehistorians. New information is therefore emerging; at the same time, many sites are being submerged or destroyed before a satisfactory record has been made of them.

Traces of Hellenistic land division appear around Beroia (Dodinet 1990). The evidence of one Roman centuriation-system is clear in many parts of the Limestone Massif; in some of its localities a different system has also been detected (Tate 1992, 235).

The main landscape changes are directly connected to water resources, and have occurred during the last thirty years. The great dam of the Euphrates at Tabqa, above Raqqa (ancient Nicephorium, Map 68 G2), has created a vast lake (Lake al-Assad), which covers a large part of the valley formerly occupied by the meanders of a sinuous river with several channels. Those channels were used for irrigation and water transport as early as the Bronze Age, and most seem to have been in use during classical antiquity.

As a further consequence of these modern developments, there has been a dramatic shrinkage of the large salt lakes and swamps of the sub-desert regions, the Jabboul Lake (F4) and el-Math (Map 68 D2), into which the rivers Nahr ed-Dahab (ancient Dardas) and Qoueiq (ancient Belus) empty respectively.

Map 68 Syria

Compiled by J.P. Brown (south) and P.-L. Gatier, 1997

Introduction

The map is divided into three geographic regions from west to east: the mountainous Jebel Ansariyeh between the coast and the R. Orontes valley; the so-called Limestone Massif of rocky hills and plateaus, ending to the south in the Jebel Zawiye; and the eastern steppe of basalt and limestone which turns to mountains, especially north of Palmyra.

The Jebel Ansariyeh remains little known archaeologically. It was probably more heavily forested in antiquity than today, although to what extent remains unclear (Rey-Coquais 1974, 69).

The Limestone Massif, divided between Antiochia (Map 67 C4) and Apamea, is crowded with many ruined villages, mostly built during Late Antiquity (fourth to sixth centuries). Here and in the adjoining parts of the steppe, extensive archaeological exploration started at the end of the nineteenth century (de Vogüé 1865; Butler 1903; 1907; Lassus 1935; Tchalenko 1953; Tate 1992). Except around Palmyra (Schlumberger 1951), less work was done in the more eastern parts of the steppe. New surveys have recently begun in this zone (Geyer 1998).

Poidebard (1934) and Mouterde (1945) did pioneering research in aerial archaeology, surveying the eastern steppe. Unfortunately their work was not followed up with adequate ground survey and excavation. Thus many of their conclusions have been questioned, especially their proposed dating of the structures they discovered, and the nature of the complex network of roads they identified. Some sites that they identified as Roman forts, for example, have subsequently been dated to the pre-classical or Islamic periods (Kennedy 1990). On the issue of roads, see Thomsen 1917; Bauzou 1989; 1993.

The main changes in natural features are water-related. Several dams have been built recently on the R. Euphrates (Tabqa), Orontes (Restan) and other smaller streams, creating reservoirs or lakes. Equally, modern drainage and irrigation have led to the disappearance of swamp areas (Orontes valley and coastal plains) and a reduction in the size of several lakes (Jabboul in E1, Lake of Homs in C4). See Calvet (1992) and Besançon (1995).

The ancient dam of the Lake of Homs is hard to date (Roman, according to Seyrig 1959; or earlier, Calvet 1992; Gatier 1996). The supposed long aqueduct from Salamias to Apamea seems very questionable (Geyer 1998). Numerous water channels and *qanats* were created for agricultural purposes around Salamias and in the region between Jabboul Lake and the Palmyrene mountains (Geyer 1998); most were either made, or restored, in Late Antiquity. Canals for irrigation or transport, or both, are attested in the Euphrates valley (Lauffray 1983).

Recent research has identified scattered traces of Hellenistic-Roman centuriation around (H)Emesa, Laodicea and Epiphaneia, as well as in the northern Jebel Zawiye, but many conclusions remain tentative (Dodinet 1990; 1994; Tate 1992, 235; 1994).

Much attention has focused on the monasteries known from lists in Syriac sources of the sixth century A.D. The majority are situated in the Limestone Massif (see among others, Caquot in Tchalenko 1953 III; Mundell Mango 1983).

South

A unique feature of the map (extending into the northern part of Map 69) is the sole epigraphic documentation of a forest from classical antiquity. At some date under the emperor Hadrian (A.D. 117-138), two of his procurators, C. Umbrinus and Q. Vettius Rufus, marked out the boundaries of the imperial forest in the Mount Lebanon range (no doubt including many stands of the cedar, *Cedrus Libani*) with the words IMP. HAD. AUG. DEFINITIO SILVARUM. Today their inscriptions stand in the living rock in the midst of barren, sun-baked shale. In 1969-70 Jean-François Breton, in dangerous political conditions, reviewed and republished them (Breton 1980); but he was

unable to visit the northern Lebanon. The lines marked on the map follow the placement of the inscriptions, and offer an approximate lower boundary for the forest as it then existed. Within it stand three of the many Roman temples of Lebanon and Antilebanon, described by Krencker (1938).

Along the Phoenician coast are the city of Byblos and the later one of Tripolis (although its Greek name predates Alexander). In the desert far to the east stands the caravan city of Palmyra, which for a brief period in the third century A.D. dared to rival Rome. To the south, it was linked to Damascus along a route marked by Roman forts and milestones, the Strata Diocletiana (Dunand 1931); to the northeast, a route attested by TabPeut continued to Soura. The map also marks a route northwest to Apamea (its course very doubtful, but attested by TabPeut), and another poorly attested one west to (H)Emesa. By its very nature the caravan route to the R. Euphrates is likely to have fluctuated considerably, and cannot be marked, despite the frequent mention of it in many Greco-Aramaic inscriptions from Palmyra.

The road from Heliopolis (modern Baalbek, Map 69 D1) north to (H)Emesa must surely have been connected to the coastal route in the valley of the R. Eleutheros (Nahr el-Kebir); but only a solitary milestone at modern Semaqiyat attests to it. The great Crusader fortress Krak des Chevaliers (modern Qal'at al-Husn) appears only as the conjectural site of the road-station 'Carion.'

Map 69 Damascus-Caesarea

Compiled by J.P. Brown and E.M. Meyers (Israel), 1994

Introduction

Jordan, Lebanon, Syria

This is an area of much diversity. Coastal Sidon was well known to Homer; inland Gabitha, by contrast, first appears as the site of a great Moslem victory in A.D. 636. The snows of Hermon Mons overlook the parched deserts of Syria. The rift valley of Lebanon between its twin mountain ranges sinks to the R. Jordan far below sea level. The limestone of Libanus Mons has fossil fish which Eusebius took to be records of Noah's flood; the great basalt tract of Trachon(itis) (modern Lejja) and its neighbors was deposited by lava flows from extinct volcanoes of Auranitis (modern Jebel Druze).

The map marks some changes from current topography. Tyrus was an island until Alexander's time; he joined it to the mainland by a mole, later silted up to form the modern peninsula. The southern valley (Koile Syria) of Lebanon was a swamp of uncertain extent (Kalamon Limne), where Theophrastus found aromatic rush and papyrus; its malarial waters were not drained until the fourteenth century A.D. The northwest of the map shows pockets of the Lebanese forest as delimited by Hadrian; see the text for Map 68.

Knowledge of Syria came gradually to the Greek and Roman world. Herodotus records admirals of the Phoenician cities. Theophrastus had perhaps visited Damascus. Alexander made the coast well known. The campaign of Antiochus III in 219 B.C., as narrated by Polybius, brings detailed information about the Valley of Lebanon and Peraea; that of Judas in 163 B.C. (1 Maccabees 5.24-44) attests numerous sites of Gala(a)ditis. Strabo (16.2.16), however, is grossly in error about the orientation of Libanus and Antilibanus. The episcopal lists of church councils in the fourth and fifth centuries A.D. attest to many sees in the Roman provinces of the region, partially identified by inscriptions of bishops on-site.

The ancient attestation for most sites appears in either Honigmann I-II or Thomsen 1907, supplemented by ABD and Abel (1933) for biblical sites. Dussaud (1927) remains the primary study of identifications. Thomsen's catalog of milestones (1917) is seriously outdated, but has found no successor. Though its coordinates are not always reliable, Kennedy (1990) is a precious atlas of aerial photographs of desert sites. Devreese (1945) is a near-exhaustive survey of church sites. Sites of the Hebrew Bible are marked when there is literary or archaeological evidence for their continued occupation in the Greek or Roman periods. Such are Canatha, Hammon and Yiron in southern Lebanon; Iabeis and Karnaia in Transjordan.

The indestructible basalt of the lava lands was used to build forts, temples and churches, as well as providing material for inscriptions. By contrast, the even more fertile territory of Damascus is almost a blank for us. Trachon(itis) and Auranitis were more densely populated than today; they became one of the strongest centers of Christianity before the coming of Islam, though there is little record of their evangelization. Inscriptions attest to aqueducts in Auranitis, but we cannot yet trace their courses even approximately.

The map shows several categories of sites known by modern names only. Besides the great Roman temples of Heliopolis, many handsome smaller ones (described by Krencker 1938) stood in Lebanon and Hermon, some on sites today wholly deserted. In a few cases the divinity honored is known; Balmarcodes, 'Lord of the Dance', in the mountain sanctuary above Berytus is elsewhere unattested. In the lava lands, Sartre (1985, 191) marks 179 cities and villages with Greek or Latin inscriptions; for most no ancient name is known, and only a selection appears here. The sites with the most substantial Christian remains also appear. Lines of Roman forts mark the frontier of the desert; some, but by no means all, can be identified with names preserved in NotDig. No ancient name can at present be attached to the enigmatic Jordanian city Umm el-Jimal, with a Roman fortress and fifteen churches.

The only modern corpora of inscriptions for the region cover Gerasa (Kraeling 1938) and Bostra (IGLSyr 13.1)—in neither case with surrounding villages—Ba'albek (Heliopolis) and the Beqa' (Massyas) (IGLSyr 6). The most useful volume (supplemented by IGRR) remains Waddington's collection of Syrian inscriptions published in 1870. For almost this entire part of the map, the materials are scattered and outdated; any future collection should throw much new light.

As a result of his extensive aerial survey of the Syrian desert in the 1920s, Poidebard (1934) proposed numerous ruined forts as Roman installations. Some are securely authenticated by soldiers' graffiti in Greek or Latin, like the remote site of Nemara. Others cannot be confirmed as Roman: such are Saba Biyar, Jebel Seis in its volcanic crater, and Qasr Burqu'.

The marking of Roman roads is conservative. Some are unquestionably located by TabPeut, Roman itineraries, paving, or (best of all) milestones. A full publication of the latter will remove many uncertainties. The roads south and southeast of Damascus are unclear, since Aenos on the route marked by TabPeut connecting Damascus-Aenos-Canatha remains unidentified (though the place is also attested as an episcopal see). Bauzou (1985) reliably reports links joining well-attested segments which would otherwise be isolated, and his results are here noted. Some isolated milestones simply call for arrows pointing to uncertain destinations. The map does not mark at all the vast network of roads which Poidebard conjectured east and northeast of Jebel Seis, by drawing lines between forts (themselves not certainly Roman) and desert wells. In all probability there are more Roman roads in this area than the map indicates; but they remain to be plotted by future surveys on the ground.

Israel

Citations for the Directory have been greatly simplified by the availability of TIR Iudaea. Its gazetteer reflects the enormous amount of archaeological activity in this region, recording 1,250 sites, of which 524 are known from literary sources. Approximately one quarter of the total for the north of Palestine are marked here, in every case the most important sites. The principal criteria for inclusion were literary attestation and excavation record. Sites documented in either of these ways were preferred to those known only through survey or modern name traditions. In only two cases are sites marked that were omitted from TIR Iudaea and included in the older but still useful study by Kochavi (1972).

TIR Iudaea cites virtually every primary source and secondary article for each name or feature. Not only references in Greek, Latin and Syriac are covered, but also Jewish sources in Hebrew and Aramaic. Unfortunately, however, forms of ancient names are not given in the original languages attesting them.

The key to understanding the Roman road system in Palestine is to recognize the unique topography of the land. Eventually there were over 1,000 miles of public roads here, normally designated as such by their milestones. Many if not most of the routes used in Palestine during the Roman period had also been used earlier in biblical times. The four north-south routes followed the Mediterranean coast on the west, and the Jordan Valley in the east. The east-west transversal roads followed routes that were imposed by the terrain: along the valley in Lower Galilee, along the riverbeds in Samaria, along the ridges in Iudaea (Map 70), and along the northern plains of the Negev (Map 70). Upper Galilee was enclosed by the Tyrus-Paneas transversal road. Caesarea on the coast was the main urban center in this system. Its linkage to the corresponding center in the east, Scythopolis, was through Legio, where the Legion VI Ferrata was stationed from around A.D. 120. The entire network of Roman roads was designed to link the whole Roman east from Syria to Egypt, as well as to serve local needs. The network was first established in conjunction with the Great Revolt (A.D. 66-70), developed by Hadrian, and reached its zenith during the Severan period early in the third century. The internal network of Syria-Palaestina intersected in Jerusalem, where the Legion X Fretensis was established after A.D. 70 (TIR Iudaea 21-22; Roll 1996).

Map 70 Pelusium-Ierusalem

Compiled by B. Isaac, 1994

Introduction

The western part of the map covers northern Sinai, the land-bridge between Africa and Asia, an area that is not well researched (Meshel 1980; NEAEHL; TIR Iudaea). A number of sites from the Hellenistic, Roman and Late Roman periods have been surveyed or excavated, but much is buried beneath sand. This includes most of the coast road, one of the most important routes in the Roman Empire. The eastern part of the map covers southern Palestine, which has been explored extensively for over a century, especially its northern sector, and is relatively well known through the literary sources (Josephus and Eusebius, *Onomasticon* in particular). The foundations for the historical geography of the region were laid in the nineteenth century by such scholars as Robinson (1856), Guérin (1868), and Clermont-Ganneau (1880; 1888; 1899). Their works are still valuable.

In many parts of Iudaea, almost every hilltop was occupied in the Late Roman period. A selection has therefore to be made for the map. The settlements marked have been chosen according to various criteria, and thus altogether they form—invariably—a rather random collection. The following were given preference: settlements which received city status at some stage; villages described as ‘very large’ by Eusebius; sites which played an important role in the description of historic events, even if they never contained a substantial population (for example, the villages of Bethoron); sites where important archaeological remains have been excavated; and unexcavated sites with remarkable remains (for example, many monasteries in the Judean desert; military sites in the Negev).

For the modern cartography of Israel, the *Atlas of Israel* (Tel Aviv, 1985) should be consulted. The best sets of maps currently available are those published by the Survey of Israel at a scale of 1:50,000. For synagogues, refer to Hüttenmeister (1977); for churches to Ovadiah (1970; 1984) and Tsafrir (1993). TIR Iudaea includes distribution maps of synagogues and churches. A major project is the *Archaeological Survey of Israel*, a series of maps with gazetteers made and published by the Israel Antiquities Authority (Jerusalem). This will eventually encompass a full archaeological survey of Israel and the occupied territories. So far, 26 maps have been published at a scale of 1:20,000 and one at a scale of 1:50,000, all with accompanying text and illustrations. For Sinai, there is a recent map at a scale of 1:250,000, published by the Centre for the Mapping of Israel (Hamerkaz le mipui Yisrael, 1994). The best maps, however, are those published by the Survey of Israel at a scale of 1:50,000, when Sinai was under Israeli occupation; these are no longer distributed. For the entire area in antiquity, note also various maps in TAVO.

For all sites in Iudaea/Palaestina, the relevant entry in TIR Iudaea must be consulted. In the Directory only more recent or additional essential references are given, such as NEAEHL. Very useful, too, for the identification of sites is Abel (1933), especially vol. 2. Other important works of reference are Schürer (1973), Möller (1976), and Avi-Yonah (1977).

For the road system, in the first instance see TIR Iudaea. For exploration of the system and the identification and description of the many associated sites, Conder (1880) with its accompanying maps remains essential. Further bibliography includes Isaac (1978); Roll (1983); ABD 5, 782-87. For historical discussion, see Isaac (1992). Avi-Yonah (1977) is outdated, but Thomsen (1917) remains valuable. The information available consists both of remains of ancient pavement and of numerous milestones (not marked on the map). Over 500 of the latter have been recorded in Palestine to date. While remains of pavement are most frequently encountered in the stony uplands, milestones are found in all areas of Palestine, although less frequently in the coastal plain, still less in the Negev, and not at all in Sinai. Reconstruction of the road system in the desert, particularly in Sinai, is thus problematic, milestones being rare and the remains of pavement covered beneath sand (note Graf 1998).

For aqueducts in general, see Amit (1989). There is no general work on bridges. In addition to the aqueducts marked, there were others which do not show at this scale at Cadesh Barnea (Amit 1989, 325-35), Chariton

(Amit 1989, 305-12), Douka (Amit 1989, 223-28), Masada (Amit 1989, 289-98), and Sartaba/Alexandreion (Amit 1989, 215-22).

There is insufficient information to justify marking centuriation on the map (or on map 69 either). At least two *cippi* (boundary markers), however, set up in this connection have been seen in the Lachish area. The grid would have belonged to the territory of Beth Govrin/Eleutheropolis (Applebaum 1981). One *cippus* has been found at Shavei Zion near Nahariya (Map 69 B3 Nea Come), which clearly belonged to the territory of Ake/Ptolemais, a Roman veteran colony (Map 69 B4).

Map 71 Petra

Compiled by S.T. Parker, 1994

Introduction

Reconstruction of the physical landscape in classical antiquity is complicated by several factors. The major issue is the level of the Dead Sea (Mortuum Mare/Asphaltitis Lacus). It seems clear that its water level has varied considerably, even within modern times. For example, in the early nineteenth century it was possible to ford the Dead Sea via the Lisan peninsula that extends from the eastern shore. By late in that century, however, the water level had risen sufficiently to make such a ford there impassable. In the late twentieth century, human activity has increasingly diverted the Dead Sea's traditional water sources, leading to a dramatic fall in its level. The map can reflect no more than a reasonable estimate of the Dead Sea's level in classical antiquity. The size of the lake in the oasis at Basienis (modern Azraq) in antiquity is also debatable. Extensive pumping of water in the last few decades has reduced its size.

Several criteria govern the choice of sites marked. The latter include sites of presumed importance, as well as sites known from documentary sources or physical remains (or both). Intensive archaeological surveys during the past two decades have added literally thousands of new sites to our knowledge, including hundreds of classical ones (Jacobs 1983; Hart 1986; Ibach 1987; Parker 1987; King 1987; 1989; MacDonald 1988; 1992; Miller 1991; Graf 1992; 'Amr 1996). The vast majority of these sites, however, remain unexcavated and little known beyond the fact that some kind of occupation, usually suggested by surface ceramic evidence, is attested during the Hellenistic, Roman or Late Antique periods. It would be impossible to include most of these new sites at this scale, although a few exceptional discoveries have been included.

In contrast to the region of sedentary habitation in the western part of the map, the eastern desert remains largely unexplored archaeologically. Even so, a few projects have sampled small sectors, revealing the presence of nomadic populations during classical antiquity (Parker 1987, 107-63; Rolston 1982).

Knowledge of the ancient road system is uneven. Some roads, particularly the Via Nova Traiana, are securely attested by numerous dated milestones and segments of well-preserved road surface (Thomsen 1917; Graf 1995). Other segments of what appear to be ancient roads have been reported by various scholars, but many remain difficult to date (Rasson-Seigne 1995). Even the exact course of the Via Nova Traiana itself remains unclear in a few places. Much fieldwork remains to be done in this connection.

Map 72 Cyprus

Compiled by D. Rupp, 1994

Introduction

Many factors, both ancient and not so ancient, have contributed to the cultural map that can be constructed of Cyprus between 1100 B.C. and A.D. 640. Before the beginning of the third century B.C. the island remained on the periphery of the Greek world. Only then did hellenization begin to permeate its entire society, not just the elite in the urban centers of some of the Iron Age kingdoms. Political and economic ties with the Levant, as well as cultural influences, had contributed significantly to shaping the Cypriote landscape in the Iron Age. Until hellenization irrevocably transformed Cypriote society and its use of the landscape in the Hellenistic period, the historical geography of the island must be understood in its own indigenous terms.

Aside from the principal urban centers of the Iron Age kingdoms, Greek and Roman sources do not provide a wealth of detailed information on the geography of Cyprus. Extant epigraphical sources are likewise relatively mute on this topic. It is thus archaeology that must be employed as the primary source for historical geography. In the later nineteenth century, the plundering of chamber tombs and of rural sanctuaries under the guise of research was the norm in Cypriote archaeology. Although subsequently this regrettable approach was abandoned and the scientific excavation of kingdom centers commenced, fascination with the material culture revealed by tombs and by sanctuaries continued unabated. As a result, while there now exists a wealth of evidence for their location, overall distribution patterns and periods of occupation, by contrast the location, size and nature of settlements is much less well understood.

Since the 1950s, archaeological surveys (conducted more or less systematically) have shed increasing light on the evolution of settlement patterns beyond the kingdom centers. Even so, the lack of adequate and uniform publication of these surveys still greatly diminishes our understanding. Before the Turkish invasion in 1974 most archaeological work was focused along the north coast, the central plain and the east coast. Since 1974 very little, if any, proper fieldwork and research have been done in these areas. Instead, almost all research is conducted in and along the north and east slopes of the Troodos Mountains, on the south coast and in the southwest region. Unprecedented agricultural, touristic and infrastructure development here have for the most part revealed more tombs and rural sanctuaries. The predilection for early Prehistoric and Bronze Age cultures among both Cypriote and foreign archaeologists has meant that the post-Bronze Age periods continue to receive only a modicum of attention. Thus our knowledge of the island's historical geography in antiquity remains very uneven and uncertain.

Ancient Cypriotes appear to have lived primarily in rural villages scattered across the landscape rather than in larger urban concentrations. The island was never really urbanized, except in a limited way from the Hellenistic period. Thus the environments in which the majority of the population lived have few, if any, of the cultural, architectural and epigraphic indicators normally used by classical archaeologists to locate and identify major settlements. The probable locations of these rural villages were discovered in most cases by archaeological survey. Since few of the artifact scatters assigned to postulated settlements have been tested by formal archaeological excavation, it is seldom certain whether they in fact represent the buried remains of an actual settlement at that location. The only such sites marked are those with evidence of prolonged occupation, or with extensive and substantial surface artifact scatters.

Aside from major sanctuaries in the kingdom centers and some of the extra-mural sanctuaries dating to the Roman period, Cypriotes did not construct "temples" as we know them from the Greek and Roman world. Most Cypriote sanctuaries arose in the later eighth through sixth centuries B.C. in the rural hinterlands of the Iron Age kingdoms. Besides helping to define kingdom boundaries, they probably represent attempts by the ruling elite of the nascent kingdoms to establish a sense of territorial identity and loyalty among the rural inhabitants. The architectural embellishments of these small *temenos* shrines were limited and simple in the extreme. Thus, while the term "temple" is used for them, few can in fact be considered to have had a Greek or Roman-style temple as their

architectural focus. Many probably had very limited architectural embellishment, or none at all. Often they are identified only from the discards of terracotta votive figurines found in dumps (*favissae*) in the area of the shrine.

Literally thousands of ancient chamber tombs have been excavated in one way or another. They occur in isolation or in cemeteries. Which settlement they were associated with is frequently unclear. The map would be overwhelmed with cemetery symbols if all the known examples were included. The small sample marked are the ones most noteworthy for the island's cultural and political development, and those most frequently cited because of unusual individual finds or the nature of the burial assemblage.

Copper ore mining and related metallurgical activities in the Lower Pillow Lava Formation that rings the Troodos Mountains were an important economic activity throughout antiquity. Modern mining activities, however, and a lack of systematic study of the post-Bronze Age mining and metallurgical industries, leave many uncertainties. The map reflects this unsatisfactory state of knowledge.

Map 73 Ammon

Compiled by D.J. Mattingly, 1996

Introduction

This map starkly reveals the long coastline and deep desert hinterland of Marmarica and Libya Inferior. In these respects, the region resembles Syrtica (Map 37). The harshness of the rock desert of the Qattara depression and the impermeability of the sand seas further south are self-evident obstacles to settlement and movement alike. Yet equally, another series of deep depressions in the desert plateau, where water is to be found close to the surface, has made a dynamic contribution to the character of desert living, allowing the creation of large oasis-dwelling communities and fostering the development of long-distance movement along desert tracks (Bates 1914; Rebuffat 1970; 1970a; see Giddy 1987 for a more detailed listing of the main routes of the western desert). The most important of these oases, called Ammon (modern Siwa) in honor of the desert god revered there, gives its name to the map. The oracle here was of significance for both the Saharan and Mediterranean worlds, a point confirmed (though not initiated) by Alexander's famous visit to the oasis (Fakhry 1944; 1950; 1973; Abboudy Ibrahim 1992). Early modern travelers' tales convey well the difficulty of desert travel (Sholz 1822; Pacho 1827; St John 1849).

Archaeological research in the region as a whole is very underdeveloped. The impression to be gained from the available evidence, however, is of a sharp division between sedentary settlements in the coastal zone and oases in the desert proper. Pastoral groups, notoriously elusive in the archaeological record, no doubt provided a partial link between the two. There was evidently some greater concentration of sites in western Marmarica. Papyrological evidence attests agricultural settlements (Romanelli 1940; 1943, 122-28; Catani 1985, 150-54), and Laronde (1987, 224) mentions numerous ancient sites in the coastal hinterland, but these have never been systematically recorded. Similarly, better conditions existed in Mareotis towards the eastern limit of the map. More archaeological work is urgently required to examine rural settlement, and to explore the first contacts between Libyans and other Mediterranean Bronze Age peoples and the earliest phases of settlement (Bates 1914; Carter 1963; White 1989; 1994). Archaeological survey work is likely to find important evidence for rural settlement, but probably not approaching the density and sophistication of that, for instance, on the Cyrenaican plateau (Map 38).

The region divides between modern Libya and Egypt just to the west of Catabathmus Maior (Sollum) and Ammon (Siwa). Throughout its history, the coastal zone stretching between Egypt and Libya has been a corridor for frequent military movement between power blocs at either end (and the scars of World War II are still all too evident here). Well before the archaic period, the Egyptians were attempting to exert military and political control over both Marmarica and the oases of the western desert. The process was continued under Greeks and Romans. But we should not conclude too readily that the Libyans of this region were forever the victims of invasion from outside. They were indeed capable of being the aggressors themselves, as both Cyrenaica and Egypt were to find on numerous occasions.

The information on this stretch of coast from maritime sources such as Scylax and StadMM (supplemented by Strabo, Ptolemy, and others) is impressive. Indeed comparison with Maps 35, 37 and 38 will indicate that this area has by far the most detailed listings of promontories, anchorages, reefs and islands. The reasons for this are several. In part it is a reflection of a greater volume of shipping along this littoral (many of the grain ships returning to Alexandria from Rome would cut across open sea until they sighted and followed this coastline), but it is in part also connected with the fact that this was a long coast with very few proper towns and permanent harbors. Thus we have descriptions of numerous summer anchorages, small islands (some little more than reefs), and minor harbors (with or without water) where shipping might take refuge when in difficulty. The numerous toponyms of the littoral thus reflect not a populous countryside, but rather the anxieties of ancient mariners navigating a thinly inhabited and poorly resourced coastline. It should perhaps come as no surprise that the best modern research on the Greek toponyms of the coast was accomplished by Fourtau (1914, 101), drawing on the navigational expertise and local knowledge of inshore waters of an illiterate ex-smuggler turned coast guard chief!

For sites in the coastal sector of modern Libya, once again Purcaro Pagano (1976; cf. also Fantoli 1933; Stucchi 1975, 358-59) provides a summary of the ancient sources and discusses some modern views on toponyms, though without establishing definitive identifications. For sites mentioned in the maritime itineraries, the views of Laronde (1987, 219-32) are generally to be preferred. The road itineraries between Paliouros (Map 38) and Catabathmus Maior are hopelessly corrupt (all fall short of the required mileage). With very few archaeological sites recorded in detail, along road lines that were never given a paved surface and from which no milestones have been recorded, the minor way-stations are for the most part untraceable. Most of these will have been wells on the pre-desert plateau that the routes have tended to cross in preference to following close to the shore. The location of Catabathmus Maior (literally the 'great descent') is self-evident to anyone who has traveled up or down the cliff-like escarpment that meets the coast just west of Sollum. Although less discernible on a map of this scale, the Catabathmus Minor is equally obvious in a similar feature about 63 miles west of el-Alamein.

Beyond Catabathmus Maior, there is again the same difficulty of locating road stations between there and Paraetionium (Marsa Matruh), with the mileage totals seemingly too low for the actual distances to be covered, and few sites locatable with any degree of confidence. In these circumstances we can do no better than Ball (1942, 138-54). Knowledge of the maritime itinerary is most conveniently taken from Ball too, drawing on Fourtau (1914), de Cosson (1935) and White (1996) for a number of controversial sites. The recent rescue excavations at the important site of el-Alamein Marina (almost certainly known as Leukaspis or Antiphræ in antiquity) have occasioned re-evaluation of the potential scale of some of these coastal settlements (Daszewski 1990; 1993; 1995). Leukaspis, however, was at the western edge of the Mareotic area, known in antiquity as today for its greater potential for supporting farming and population. West of el-Alamein, the pre-desert character of Libya becomes more fully established, with the harbor and town at Paraetionium the only major center before Catabathmus Maior (White 1994).

Knowledge of the archaeology of the desert oases rests very much with the remarkable work of Fakhry (1942; 1942a; 1944; 1950; 1973; 1974). It is clear that the largest of these comprised multiple and complex settlements, not single sites. Their occupation is confirmed as being of long duration, where this has been tested by excavation; many of the other known sites, too, may have been inhabited far longer than the dates supported by the presently limited evidence. The oasis known as Ammon in the ancient sources extended well beyond the impressive temples and ruins in the immediate vicinity of modern Siwa town at Aghurmi. There were at least seven separate villages or towns in the Siwa depression, and the numerous cemeteries in other parts suggest that seven is a considerable underestimate for the original number of villages. The same general conclusion emerges from research in Bahariya (Oasis Parva) and Gasr Farafra to its southwest (see inset), where there were a number of other major settlements apart from the capital under el-Bawiti/el-Qasr (Ball 1903; Beadnell 1901; Fakhry 1942; 1974; Gosline 1990). The announcement in 1999 of the discovery of a major Hellenistic/Roman burial ground at Bahariya, perhaps containing as many as 10,000 sarcophagi, shows the importance of these sites as centers of population and relative wealth. In the Libyan oasis group known as Giarabub, research is still in its infancy, but tombs in at least three widely separated locations suggest a similar pattern of settlement around each of the major springs there (Fadel Ali 1995, 152).

Map 74 Delta

Compiled by A. Bernand, 1994

Introduction

The Nile Delta—a triangle bounded by Alexandria, Pelusium and Memphis—is undoubtedly the region of Egypt that has been most transformed since antiquity, with the exception of Lower Nubia, inundated by the waters of Lake Nasser since 1972 (Map 81). The transformation of the Delta is due for the most part to the construction of successive dams that have considerably modified irrigation patterns and the configuration and exploitation of the region. Especially significant in this regard have been the Nile Dam to the north of Cairo (ancient Babylon), conceived by Napoleon and undertaken by Mehemet Ali in 1835; the Old Aswan Dam, erected first between 1898 and 1902, with later phases of construction from 1907 to 1912, and again from 1929 to 1934; and the new High Aswan Dam (Saad el-Ali) begun in 1964. Such works of engineering, undertaken for the sake of agricultural growth, were already recognized by Herodotus at a time when the waters of the Delta had been transformed into an inland sea.

Any map that seeks to return the modern landscape of the Delta back to its ancient appearance must recognize several forms of major change, the main ones being coastline change, the shifting of certain bends of the Nile, the successive and uneven drainage of the larger lakes, and the transformation of agricultural patterns.

Notable changes to the river banks are the result mainly of subsidence of the Delta socle, which has tipped to the northwest and caused submersion of sites in the vicinity of ancient Canopus (modern Abukir). This also explains the disappearance of sites located to the east of Cape Zephyrion, such as Menouthis, Herakleion and Thonis. These are now at the bottom of Abukir Bay, a short distance from the modern shore.

The two branches of the Nile that delimited the Delta in antiquity have long disappeared. The western, Kanobikos branch seems to have shrunk progressively and then disappeared in the fifth century A.D. The Pelousiakos branch to the east must have undergone a similar fate. For both, it is at least possible to reconstruct plausible courses following modern canals, alluvial deposits, and the location of settlements mentioned by Greek and Roman authors. The courses of the branches in outline need not be doubted, even if any attempt at precision must remain hypothetical.

The landscape has been profoundly modified by the draining of the large lakes in the north. These have been gradually reduced in size. Modern cultivation of rice and especially cotton have been the cause of extensive drainage projects and the regulation of irrigation. Thus in ancient times the levels of Lakes Mareotis, Kanopike, Paralios and Tanitike were all notably higher than today. The extensive swamps on their shores have little by little been encroached upon by human intervention. The ancient lake just south of Canopus has even disappeared today, and Lake Mareotis has been reduced by agricultural development. The changes in Lakes Paralios and Tanitike have been less marked because of the aridity of the surrounding soil. There has been a multiplication of irrigation channels in modern times too. There were some already in antiquity, such as the Boutikos that traversed a number of towns to link Pelusium with the Kanobikos branch. A canal also reached Sais off the Bolbitinos branch. To the southeast, the canal comprising the Ptolemaios and Traianos Potamos traversed the depression of Wadi Tumilat to join the Nile to the Red Sea at the modern Bay of Suez.

The High Dam has produced additional changes as a result of the reduction in the flow of fresh water, and particularly the disappearance of the annual flood with its sediment, now mainly deposited behind the dam. The results have included an increased salinity of the soil and a loss of fertility, especially near the coast.

Unlike the Nile Valley, the Delta has not yielded papyri in large numbers. Only where papyri have been carbonized or preserved at valley sites have they survived. As a result, relatively few toponyms are known from the documents, and even fewer can be located on a map. Inscriptions are somewhat more numerous (those of the western Delta are collected in Bernand 1970), but they too contribute relatively little to the map. Most of the place

names are known from geographical and literary works. Inevitably, the result is a sparser map than the others covering the Nile valley.

Map 75 Memphis-Oxyrhynchus

Compiled by R. Müller-Wollermann, 1995

Introduction

Both the ancient evidence for the region covered by the map, and modern exploration of it, are uneven, not least because of wide disparities in the archaeological and written materials available for different districts. The southern part as far as the approach to the Fayum (i.e., the northern section of the Hermopolite nome, together with the Oxyrhynchite, Kynopolite and Herakleopolite nomes) has been explored by surveys, so that considerable numbers of archaeological sites are known. Even so, there has been little actual excavation of post-Pharaonic sites here. The reverse is true for the Arsinoite nome, where only limited survey work has been done so far, but more excavations have been conducted. For the northernmost part of the Nile valley covered by the map (the area of the Aphroditopolite and Memphite nomes), there has been neither extensive survey nor (with the one exception of Memphis) significant excavation for the Greek and Roman periods.

On the philological side, the pattern is again varied. The Oxyrhynchite and Arsinoite nomes have yielded large numbers of Greek papyri and ostraca, and a fair quantity of inscriptions have come from the Arsinoite too. Papyrological finds from the other nomes covered here are less extensive, but still very considerable. There are many inscriptions from *Tenis he kai Hakoreos* in the northern Hermopolite nome, and some papyrus archives from the same region. The Herakleopolite nome has produced numerous papyri, although many were lost in 1899 when a ship carrying German excavation-finds caught fire. Documentation for the Memphite region in the Ptolemaic period is very strong.

In addition to the comprehensive collection of Egyptian toponyms by Calderini-Daris (C-D), more specific compilations of toponyms have been made for the Oxyrhynchite (Pruneti 1981) and Hermopolite nomes (Drew-Bear 1979). Falivene (1998) is a similar work for the Herakleopolite nome. No comprehensive work on the toponyms of the Arsinoite nome has been published since Wessely (1904) and the list at the back of Grenfell (1907). Most of the numerous named sites, mainly villages and hamlets, are still unlocatable, but the map shows the progress made to date. A particular problem arises from the existence of homonymous toponyms, as in the case of *Sobthis* and its derivatives, modern *Saft*; the various occurrences of such place names frequently defy assignment to specific locations with any certainty.

Considerable further work has been done on the relative location of villages known from the papyri, resulting in a sort of notional geography not yet fully linked to known modern places. Naturally, these villages cannot be shown on the map, but the reader wanting a fuller picture of what is known of the administrative geography of the region may consult Sheridan (1998) for the Hermopolite nome, Krüger (1990) and Rowlandson (1996) for the Oxyrhynchite, and Rathbone (1996) for the Arsinoite. Because the number of toponyms not yet identifiable with a modern location is so large, only the more important ones appear in the list of unlocated toponyms; the others can easily be found in the reference works cited.

The map retains the modern course of the Nile. In antiquity the river may have run somewhat to the west of its present course (Butzer 1976), though the shift would hardly be noticeable on a map at this scale. In fact, however, no systematic survey work has been done to establish the ancient course clearly, and even if it were known with greater precision for any one period, further shifting is still likely to have occurred during the timespan covered by the map.

There is a similar problem with the *Tomis fl.* (Bahr Yusuf) and the waterways in the Fayum, whose beds may also have shifted. In general, the map shows only those waterways which may with some confidence be considered ancient; it omits subsidiary canals likely to be of more modern construction.

The lakes in the Fayum have given rise to considerable controversy. The very identification of the ancient Lake Moeris with the modern Birket Qarun (Evans 1991), which is adopted here, has been thought inconsistent with some statements in the ancient sources. The strongest advocate of this doubt is Garbrecht (1990), who argues that

the ancient wall visible in the south-east of the Fayum was the dam of an artificial lake to be identified as Lake Moeris. To date, this view has not won wide acceptance.

The water-level of the Birket Qarun, once much higher than at present, was deliberately reduced in ancient times in order to extend the area of cultivated land in the Fayum. The principal means of reduction was control of the inflow to the Fayum from the Bahr Yusuf. There has been much debate about the precise history of this shrinkage of the lake, but recent work (Davoli 1998) has shown that the level in the Roman period was similar to the modern level, with subsequent periods of expansion and contraction. The lake is thus shown on the map at its modern extent.

Rathbone's survey in the Gharaq basin (1996) convincingly demonstrated that there were three lakes of notable size south of Lake Moeris, not just two. The third is the easternmost of those shown; remains of it can still be seen today.

Map 76 Sinai

Compiled by D.F. Graf, 1996

Introduction

For the most part, the map covers vast expanses of desert, especially in the Sinai peninsula of Egypt, and in southern Jordan/northwestern Saudi Arabia (the Hisma desert). Most of the settlements marked are clustered at the top right of the map, south of Petra (Map 71 A5), on the plateau of southern Jordan. They are known primarily from recent intense archaeological activity, and their ancient names remain unattested.

The impression given by the map that the empty expanses are devoid of settlements and population is misleading. There are in fact scattered signs of small settlements and an extensive desert population in antiquity, especially where the advanced hydrological technology employed by the Nabataeans and their successors made life possible in otherwise adverse conditions. Proof is offered by the remains of cisterns, reservoirs, aqueducts and other catchment devices in the region (Stone 1982, 25-62; Graf 1983), not all of them marked on the map. These traces of a substantial pastoral population are matched by the thousands of graffiti incised in the sandstone mountains and on boulders that litter the desert floor of the Hisma desert (Harding 1952; Graf 1980; Jobling 1982; Livingstone 1985; King 1990; al-Theeb 1993) and Sinai peninsula (Stone 1992). Most of these graffiti are in pre-Islamic Arabic script called "Thamudic" that emanates from the late Hellenistic to early Roman period; but others are in Nabataean Aramaic, and a few in Greek and Latin. The largest concentration of Nabataean texts is in southern Sinai, where almost half the entire corpus of more than 4,000 exists. The Greek and Latin texts are few, concentrated at Auara, Aramaia, and in southern Sinai. The presence of these rock inscriptions and graffiti amply illustrates the literary testimony of Agatharchides (90), who already in the Hellenistic period assigns a substantial pastoral community and many villages to the littoral of the Aelaniticus Sinus.

The Roman road system for the region has been largely clarified, especially the Via Nova Traiana between Petra (Map 71 A5) and Aila (Graf 1995), and the Wadi Arabah road between Aila and Ad Dianam (Avner 1996). Some problems remain, however. In particular, TabPeut indicates a route which connected Clysma at the head of the Suez Gulf (Heroopoliticus Sinus) across the Sinai peninsula to Aila. These two port cities were obviously important for the eastern trade, and the focus of multiple caravan routes inland. So a route connecting them is plausible, and the distance given (170 m.p., approximately 158 miles) seems about right. Even so, the attempt to identify the road stations mentioned by TabPeut at Medeia (Marah?) and Pharan with the small stations of Nakhl and el-Thamad of the later Hajj route (Sachsse 1928) is not convincing. Archaeological investigation of these stations indicates that they are purely medieval (and thus omitted from the map), constructed in the Ayyubid-Mamluk period for the pilgrim route between Cairo and Mecca (Rothenberg 1970, 13; Tamari 1982). In consequence, it is tempting to regard the route as a late addition to TabPeut, instead representing the Christian pilgrimage route to St. Catherine's monastery (Tou Batou), which passed through Pharan in southern Sinai (Mayerson 1981). There are still difficulties, however, with this view. In general, only a few of the many staging-posts mentioned in the travel accounts by Christian pilgrims have been identified; the rest remain a matter of conjecture.

The nature of the settlement and canal at Clysma are undetermined. The Roman settlement of Aila is now being uncovered by excavation. There is reason to think of "a southward advance in the shoreline over the millennia" here (Parker 1997, 41; cf. Schur 1986, 393). Other changes in the Red Sea coastline are more difficult to define, however (cf. Greenwood 1997, 19).

Map 77 Hermopolis Magna

Compiled by M. Drew-Bear, 1997

Introduction

The great majority of the ancient toponyms in this region are known from documentary papyri. For the Hellenistic period there are almost no literary sources. Later, we have essentially the lists of Ptolemy, ItAnt and NotDig. In the Christian period, saints' lives in Greek and Coptic often provide important topographical information; like the Coptic papyri, these sources often enable us to link ancient toponyms to modern sites. This region is particularly rich in churches and monasteries, which were more abundant here than in adjacent regions such as Oxyrhynchus to the north (Map 75). Only a selection among the most important of these Christian sites, which may be thought to have existed before the Arab conquest, could be marked on the map. Detailed information may be found in Timm 1-6 (with helpful bibliography), though this compilation is a difficult one for users unfamiliar with the Coptic forms of ancient toponyms.

Among the very numerous toponyms (cities, villages, *epoikia*, *kleroi*, *topoi*, etc.) attested in the papyri but impossible to mark on a map, the list of Unlocated Toponyms registers only villages for which an approximate location may be deduced, usually due to the mention of a toparchy, sometimes of a *pagus*. A list of all toponyms from the Hellenistic, Roman and Late Antique periods attested for the northern half of the map may be found in Drew-Bear (1979). To this list, complete at the date of publication, subsequent editions of papyri have added further attestations of already known toponyms, but few new villages and little information that would permit the location of those previously attested. The second C-D supplement provides references through 1993 for the full span of the map. Sheridan (1998) adds considerable information about the *pagus* numbers of Hermopolite villages, and offers a notional or relative sketch-map of that nome.

Over time, changes occurred in the names and areas of the administrative districts originally created in the Pharaonic period, and called *nomes* by the Greeks. Thus the territory of the town of Koussai, which corresponded to the fourteenth Pharaonic nome, doubtless lost its autonomy in the Ptolemaic period; but in Roman times it certainly formed part of the Hermopolite nome until Diocletian's reorganization (Skeat 1964, no. 2), when that nome was reconstituted with an area of approximately 170 square miles. This is a size similar to that of the Apollonopolite, Diospolite, Lykopolite and Tentyrite nomes, whose respective territories were centered on their capital cities. The more important Antaiopolite, Panopolite and Thinite nomes each spanned slightly over 312 square miles, whereas the largest of all, the Hermopolite (at certain times including the areas of the Antinoite and Koussite nomes), extended over 700 square miles. Its metropolis, the city of Hermopolis, took pride in being "very ancient," especially with regard to the neighboring city Antinoopolis of the "New Greeks," founded by Hadrian. Because of its extent and fertility, the Hermopolite nome included numerous villages, many of whose names are known from papyri. Some of these villages developed from sanctuaries where sacred animals were raised, especially the ibis sacred to Thoth, patron divinity of the Hermopolite nome, after whom more than a dozen villages are named. Other hamlets, which often grew to become villages, were named after their original proprietors, some of them cleruchs; the names of these places, such as Demetriou or Hoplonos, are therefore normally attested in the genitive case (sc. *epoikion* or *kome*).

It is certain that the course of the R. Nile, like that of the Tomis (Bahr-Youssef), diverges today from what it was in antiquity (Drew-Bear 1979, 311-12). There is no reason, however, to believe that these courses remained stable throughout the period covered by the map, nor is there any means of establishing what the changes were. In 1720, according to E. Jomard (Drew-Bear 1979, 35-36, 320), the Nile flowed beneath the walls of Mellawi (Manlau), though it no longer did so at the beginning of the nineteenth century when he wrote, while today the river is over a mile east of the town. Even if by chance the course of a canal or river can be established for a short stretch at a specific date, this still will not suffice to reconstruct it over any appreciable distance. Hence the modern courses of the Nile and Bahr-Youssef are shown here. In the Hermopolite nome, even the indication *hormos* ("port") is ambiguous, since this could have lain on the Nile or on the Tomis.

Middle Egypt, from north of Antinoopolis south to the village of Aphrodito, was always the site of monastic groups independent of those in other regions. Often the earliest communities settled in rock-cut tombs or quarries dating from Pharaonic times, which were transformed into churches and monasteries (for example, Erebe, Deir Abu Hennes, Deir el-Dik, Wadi Sarga). Certain groups installed themselves on the top of cliffs, above all in the region of Lykopolis (for example, Deir Magara) or of Antaiopolis/Tkoou, creating rock-cut churches which served as models as far away as Ethiopia (Doresse 1970, 27). Preserved monastic sites are more numerous on the east bank of the Nile, which is more mountainous and less inhabited, so that the remains stayed better preserved. In general, this region formed “le cœur de la Thébàide des monastères” (Gascou 1994, 86) until the Arab conquest, a seat of intense monastic activity. Papyri show that monastic settlements developed and prospered near the cities, because of the generosity of their inhabitants and competition among rich patrons. Within and around the single town of Aphrodito, Timm registers about thirty religious establishments, none of whose sites has been identified. This is hardly surprising in a cultivated and inhabited zone, unfavorable to the preservation of archaeological remains, in contrast to the rock-cut *laurai* near Antinoopolis or Lykopolis, for example. In the region of Diospolis Mikra, around A.D. 320, S. Pachomius founded the first Christian monastery (as distinguished from isolated hermits’ cells scattered in *laurai*) at Tabennisis near Pboou (Faw Qibli) not far from the Nile. The exact site of this establishment, however, which was to exert such immense influence in Egypt and beyond, has yet to be fixed with certainty.

The oldest sources, prior to the sixth century, designate not only the “mountains” (*laurai*, the more numerous groups of hermits’ cells, chapels and churches scattered over areas large and small), but also the monasteries by the names of their founders or heads (for example, Apollo the Great who founded Bawit in the fourth century; Bane; Ioannes of Lykopolis). Even in the sixth and seventh centuries, according to the papyri, a few of these establishments still bore the names of saints, and many more the names of “Fathers” (Apa, Abba), whose fame was more than merely local. However, after many sites were devastated by the terrible Persian invasion of 619, and the cities became poorer following the Arab conquest, the memory of the founders of the great *laurai* tended to fade. In the Arab period, such names were replaced by “the Martyr,” “the Archangels” or “the Virgin,” appellations which in certain instances have been preserved to the present (respectively Deir el-Shuhada, Deir el-Malek, Deir el-Adra). Hence it is often difficult to identify a religious foundation known only by the name of its founder in the oldest texts (pre-Arab conquest), and thus likely to have been renamed later. For the monasteries of the region of Koussai, for example, the legend of the passage of the Holy Family here replaced the memory of the monks who had founded them. The cult of the Virgin, venerated by Muslims as well as by Christians, thus gained in importance.

Map 78 Porphyrites et Claudianus Montes

Compiled by S.E. Sidebotham, 1997

Introduction

The area between the Nile and the Red Sea, commonly referred to as the Eastern Desert, is a desert of stone and dirt rather than of sand. Its two major roles in antiquity reached their culmination in the Roman period. The northern zone, which occupies most of the map, contained quarries and mines, including in particular gold mines and quarries for fine building stone. The southern zone is dominated by the routes linking the Nile valley with the Red Sea ports, from which merchant ships sailed to East Africa and India (see Map 80).

The area of the map has been explored by scholars since the nineteenth century, but much of what we know today has only been discovered in the last twenty years. In part, this knowledge comes from surveys of roads and sites. Most of the latter have not been excavated, and we often have only approximate dates for them from surface ceramic finds or the style of building. That said, the last two decades have also seen several important excavations in the region, notably at the two quarries that give the map its title, Mons Claudianus and Mons Porphyrites (Peacock 1997). There have been recent excavations, too, at several of the smaller road stations. At Mons Claudianus in particular, this activity has unearthed large numbers of ostraca with a wealth of information about the exploitation of the desert (Bingen 1992; 1997). Only a small fraction of them has been published to date, but they have already led to some significant gains to our knowledge of the geography of the region. Progress here in the near future is sure to be rapid as the new finds are published.

The ancient itineraries have long provided the backbone of our knowledge of the desert routes, and many of the identifications of the toponyms in these sources were made long ago. Others remained unknown or controversial until recent exploration. Aside from the routes, relatively few ancient names were known either; and it is still the case that only modern names are known for most of the sites identified by survey. Two additional problems are that many sites have several modern names, and that some seem to defy identification with any known ancient name. The placement of the majority of the sites marked, as well as some of the roads, derives from coordinates obtained using the Global Positioning System.

Because the map so extensively reflects recent survey work, it marks several sites not previously recorded by western scholars. These include the gabbro quarries at Maghrabiya. Although the stone from them had been recognized in Roman flooring elsewhere in the Mediterranean, and dated by the pavements in which it appeared, its source had never been located. There are also newly located tonalite gneiss quarries at Umm Huyut. Other sites marked for the first time include two on the Abu Sha'ar-Nile road, at Bir Salah and Atrash Northeast. Bir Salah takes its name, as Ma'aza Bedouin custom dictates, from the name of the guide who showed me the ancient site there; it had no known name prior to that visit.

Undoubtedly the greatest difference between this map and previous ones of the region is the proliferation of ancient roads and tracks. Many miles of previously unrecorded routes appear here for the first time. Very few are paved, and even those for extremely short distances; most are merely the natural desert surface cleared of stones and lined with cairns to show the route. No milestones mark their courses.

The map marks no roads (other than the Via Hadriana), and almost no sites, north or north-west of the Porphyrites Mons-Abu Sha'ar area. This signifies, not the absence of remains here, but instead an inadequate level of exploration to date.

Map 79 Oasis Magna

Compiled by G. Wagner, 1995

Introduction

The Great Oasis (Oasis Magna), referred to today as the New Valley (Wadi el-Gedid), consists of two depressions, Khargeh and Dakhleh. Khargeh is the more easterly. It is situated approximately 95 to 125 miles from the Nile Valley, and extends over 115 miles from north to south, although it is no more than 10 to 20 miles wide. It is fringed by parallel dunes to the west, and lies about 110 miles from Dakhleh. This second depression is oriented east-west and runs for over 60 miles, with a width of 10 to 15 miles. In Arabic, the names for both depressions maintain their designations by the Greeks as “exterior” (exotero) and “interior” (esotero), with “interior” meaning further away, as seen from the Nile.

In the absence of rainfall (a condition that must go back as far as the Predynastic period), life was centered around either springs or wherever aquifers broke through to the surface, and around artesian wells. Only recently has it come to light that the many types of hydraulic installations developed also included *qanawât*, subterranean drains laid on a gentle gradient and linked to cesspits. They occur in the Kysis region especially, where it is now certain that they date back to the first period of Persian rule (525-401 B.C.). Altogether, it is the distribution of water sources that accounts for the widespread dispersal of settlements in such a broken pattern, markedly different from that in the Nile Valley. The Great Oasis in effect comprises a collection of micro-oases, resembling “islands in the ocean,” as Strabo described them (17.1.5). Indeed the same pattern prevails to this day, despite modern methods for sinking wells and pumping water.

In general during ancient times, and in particular during the early Roman empire, water was plentiful in the Great Oasis, and it was tapped energetically. Over the course of the third and fourth centuries, however, a reduction, and then exhaustion, of the supply evidently occurred. Major ecological and geopolitical problems led to the abandonment of a large number of sites early in the fifth century, and to the desertification of the Great Oasis. It is clear that by the sixth century there was significant contraction of settlement and population: in the case of Khargeh, only Hibis, Um Dabadib and el-Deir are known to have still been inhabited.

The oldest known accounts by western travelers go back to the end of the seventeenth century and give a cursory description of Khargeh, which was crossed from north to south by pilgrims making their way to Sennar in Sudan. D’Anville’s map of 1765 reflects these contacts. At the beginning of the nineteenth century, Cailliaud de Nantes and Edmonston first discovered the temples of Deir el-Hagar (ancient *Sioua), el-Khargeh (ancient Hibis), Qasr el-Ghoueita (ancient [Per-ousekh]), Qasr el-Zaiyan (ancient Tchonemyris), and Douch (ancient Kysis). With the help of the Greek inscriptions, they identified Douch as Kysis, and Qasr el-Zaiyan as Tchonemyris. The draftsmen who accompanied them drew these monuments, which were among the best preserved. In the mid-nineteenth century, Letronne published some Greek inscriptions from the Great Oasis; at the beginning of the twentieth, the papyrologist Wilcken identified ancient Mothis, and the Egyptologist Lefébvre elucidated the toponym Tchonemyris as meaning “great well” or “great spring” in Egyptian.

As late as 1970, our knowledge of the region might be summarized as follows: the city of el-Khargeh was identified as Hibis, Qasr el-Zaiyan as Tchonemyris, Qasr el-Ghoueita as the Egyptian Per-ousekh, and Douch as Kysis. In Dakhleh, Mut (el-Kharab) was identified as Mothis, and the site of the temple of Deir el-Hagar as the Egyptian Set-ouah (*Sioua). The Hibite nome was considered to comprise both Khargeh and Dakhleh (recent evidence, however, has shown that at some point in the Roman period a Mothite nome was created, apparently covering the whole of the Dakhleh oasis).

In 1969-70, there occurred the celebrated finds at Balat/Ain Assil by the Egyptologist A. Fakhry, which revealed that already under the Old Kingdom (VIth Dynasty) Dakhleh was a governorate. During the 1970s, both the publication of papyrus texts and survey archaeology drew attention to the entire region. When Parsons published

his 1971 article, scholars were abruptly made aware of the existence of at least 86 *hydreumata* to the south-west and north-east of Hibis that are listed in a survey of the mid-third century A.D. The name most frequently attached to them is *Pmoun*, “the water,” or “well of ...,” or sometimes *Tchon*, “the spring of.” It is impossible to reconstruct what each of the *hydreumata* actually comprised: they could be hamlets, isolated farmsteads, even villages. There is also no way of knowing how extensive a radius this ancient survey covered: it could be anything from 1-2 miles to 20-25. It has proved impossible to identify any of the 86 *hydreumata*, and thus none can be marked on the map.

My own ongoing researches in the region date back to 1974, and were the basis of Wagner (1987). In 1976 the Institut Français d’Archéologie Orientale in Cairo (IFAO) began to conduct systematic excavations at the site of ancient Kysis. These still continue today, and have brought to light a considerable number of Greek ostraca. During the same period the Egyptian Antiquities Organization (EAO) carried out a short-term excavation at Ain Waqfa (ancient Pege Sykaminia?). In ODouch 1-3 and Hussein 1993, thirteen new toponyms make their appearance, but only two or three of them can be identified. It should be noted that all this documentation is very homogeneous and relates to the half-century A.D. 350-400 (within the Late Antique period). I am quite convinced, however, that the ancient sites thus revealed were settled during the Roman period too, if not earlier. Excavations conducted by IFAO at Manawir el-Biyut in the autumn of 1994 brought to light the amazing discovery that the temple of Manawir dates from the first period of Persian rule.

From time to time, excavations have been conducted by EAO at Bagawat (the necropolis of Hibis), at Beleida (an ancient village on the outskirts of Hibis), and at Ain Labakha, a village to the north and site of the principal temple of that area, dedicated to the god Piyris (*temenos Piyrios*).

For many years now, the Dakhleh Oasis Project has carried out a systematic survey of the entirety of this oasis, so far registering well over 200 Romano-Byzantine sites. Most recently, as part of this project, an Australian team has focused its attention on two sites whose ancient names it has proved possible to identify, Esment el-Kharab (ancient Kellis) and Ain Birbiyeh (Egyptian Jmr-t). The *Agricultural Account Book* (Bagnall 1997) and other Greek documents discovered at Esment (Worp 1995) have revealed nearly twenty ancient toponyms, of which fifteen or so are new. While none of these can be identified, they can be situated in the Trimithis-Mothis-Kellis region and are listed as Unlocated Toponyms. The mid-late fourth century date of this material places these sites in the Late Antique period, but here again I am convinced that their occupation goes back to the Roman period.

Since 1979 regular reports of the Dakhleh Oasis Project’s activities have appeared in the *Journal of the Society for the Study of Egyptian Antiquities* (Toronto), and since 1988 in its Australian counterpart (Sydney), as well as in the *Bulletin of the Australian Centre for Egyptology*. IFAO’s activities at Douch are published within the framework of the various series issued by it, especially BIFAO. Excavations conducted by EAO in the Great Oasis have been partially published in collaboration with IFAO, but most often remain unpublished.

Map 80 Coptos-Berenice

Compiled by J. Keenan, S.E. Sidebotham (eastern desert) and T. Wilfong, 1994

Introduction

In the absence of the necessary evidence, it is impossible to plot the course of the R. Nile or to map the coast of the Red Sea (with its ancient harbors) exactly as they were in antiquity. The map therefore retains the modern river course and coastline. Even so, it is as well to bear in mind the “net eastward movement of the Nile over the past two millennia” posited by Butzer (1976, 33-36), especially south of Luxor (ancient Diospolis Magna/Thebai). The shift is relatively unimportant for this map, however, because only “minor modifications are apparent in the constricted area farther south” (Butzer 1976, 35). The construction of the High Dam has not had a major impact on the course of the Nile north of Aswan (ancient Syene).

The part of the Nile Valley shown on this map is not as densely documented by the papyri as the regions in the two maps immediately to its north. There are, however, substantial bodies of documents for some parts of the region, particularly the Theban region in the Hellenistic period and Late Antiquity. These have not had the same degree of study as the topography of the Hermopolite, Oxyrhynchite or Arsinoite nomes, nor has there been extensive field survey in this area for the Hellenistic and Roman periods.

In recent years there has been a notable increase in archaeological fieldwork in the desert region. Surveys and excavations have shed fresh light on many aspects of the Ptolemaic and Roman occupation. Consequently, the map marks numerous mines, quarries, settlements, military posts, roads and road stations for the first time. Most of the sites and roads marked between the Nile and the Red Sea coast, as well as remains on the coast itself, have been plotted using the Global Positioning System. This technology has brought a degree of accuracy to locating sites that was not possible on previous maps of the region.

The conventional association of the names of the Ptolemaic and Roman Red Sea ports with specific ancient sites known along this coastline remains as controversial as ever, and in many cases speculative (EAAE, 684-86). Recent archaeological fieldwork, however, has shed some light on the issue. For example, the traditional identification of Myos Hormos with the site at Abu Sha'ar (Map 78) north of the modern city of Hurghada has now been proven incorrect. Excavations conducted between 1987 and 1993 demonstrated conclusively that the remains at Abu Sha'ar are of a Late Roman fort, which was subsequently converted into a Christian monastery and pilgrimage center (EAAE, 84-87). Some other site must be sought for the emporium of Myos Hormos.

Ostraca found in excavations along the route linking the region of Quseir and Quseir al-Qadim on the Red Sea coast with Coptos on the Nile have recently been used to revive the argument that the ruins at Quseir al-Qadim should be associated with Myos Hormos (Bülow-Jacobsen 1994; cf. Reddé 1986, 63 and Peacock 1993). The discovery, however, of ancient remains by Brocchi (1841, 124-25) and of Ptolemaic temple blocks by Weigall (1913, 60-61) at Quseir (about 8-9 miles south of the ruins of Quseir al-Qadim), indicates that there was another ancient port in the vicinity; it, rather than Quseir al-Qadim, might be Myos Hormos. It seems, then, that the association of Quseir al-Qadim with Myos Hormos—adopted with caution on the map—remains an open question (Whitcomb 1996; EAAE, 658-60).

The location of Nechesia has also been debated. RE, Murray (1925, 142-43) and Meredith (1953, 103), among others, speculated that the sites of Mersa Mubarak or Mersa Nakari were appropriate for this putative Ptolemaic foundation. Recent surveys and limited excavations at Mersa Nakari, begun in 1999, have revealed a site partially surrounded by a wall. So far, fieldwork in the vicinity indicates activity there in the early and late Roman periods. A road, dating from Ptolemaic through Late Roman times, links the ruins at Mersa Nakari to the Nile opposite Apollonopolis Magna (Bagnall 1996, 318-20; Sidebotham 1999, 364-68). Thus it is attractive to equate the remains at Mersa Nakari with Nechesia, but positive identification remains uncertain.

The Ptolemaic foundation of Philoteris provides a third example. Its location has never been proven, and several nineteenth and twentieth century travelers (note Murray 1925, 142) have placed it at various points on the Red Sea. Rapid modern development along the coast, however, will eventually destroy whatever extant ancient remains there are, and we may never know its location. More generally, current human and natural depredations make urgently needed future fieldwork in this entire region a race against time.

As on Maps 78 and 81, the spelling of modern Egyptian and Bedouin place names for ancient sites gives rise to much difficulty. The ancient names for most sites in the region are unknown, so they are identified by their modern ones. Due to spelling variations, however, which are the result of different dialects and pronunciations, several different written versions for a single location may be found. Frequently, too, a particular ancient site will have various quite different modern names, some recorded on maps, others given by the indigenous Bedouin.

Map 81 Triakontaschoinos

Compiled by S.M. Burstein, 1995

with the assistance of D. Borough

Introduction

The map covers Lower Nubia and the eastern deserts of southern Egypt and northern Sudan from the First almost up to the Third Cataract. One fundamental caution applies to all study of this region: Lower Nubia for a distance of about 300 miles between the First Cataract and the Dal Cataract (north of Firka) now no longer exists, having been submerged by Lake Nasser. Evidence for its ancient topography, therefore, rests on three sources: ancient texts, modern travelers' descriptions, and the archaeological excavations and surveys conducted in connection with the construction of the several Aswan Dams during the twentieth century.

Since no attempt was made to determine the ancient course of the Nile prior to the creation of Lake Nasser, its channel is shown here as on the first edition of ONC J-5 (1960). In fact, the close correspondence of ancient and modern settlement sites in the region makes it probable that the channel here has not shifted significantly since 1000 B.C.

The settlement history of the region is a complex one. Almost throughout antiquity, rule over Lower Nubia was divided between Egypt and various states in the central Sudan subsumed under the general designation "Kush." During most of the period spanned by the map, the boundary between Egyptian and Kushitic territory lay approximately 85 miles south of the First Cataract at Hierasykaminos. Consequently, the sources contain toponyms in four ancient languages: Greek, Latin, Egyptian and Meroitic. The identifications proposed are based on the work of Priese (1984). Many of his equations, however, particularly with regard to places south of Hierasykaminos, must be considered hypothetical. Egyptian and Meroitic toponyms are imperfectly represented in classical sources (Desanges 1993, 30-31). Moreover the archaeological record is defective, since it stems from an excavation strategy that focused more on cemeteries and prominent structures (forts, temples, churches) than on settlement sites. Thus the full extent of ancient settlement can no longer be determined. The many still unidentified toponyms, however, suggest that settlement in Lower Nubia during the first millennium B.C. and the first half of the first millennium A.D. may have been considerably denser than the map can suggest.

The situation with regard to the deserts east of the Nile is different. Exploration of these regions has hardly begun. Even so, the results already achieved by Alfredo and Angelo Castiglioni in the Wadi Allaqi (southeast of Pselchis), and by S.E. Sidebotham in the vicinity of Berenice, indicate that a notable increase in the number of known sites here can be expected.

Map 82 Meroe

Compiled by N.B. Millet, 1995

Introduction

Of all the areas covered by the *Barrington Atlas*, it may be said that the Sudan has a claim to be among the least explored in terms of its history and archaeology. The pioneering efforts of investigators such as Reisner and Garstang were limited to major monumental sites in the Nile river valley, mostly those of Pharaonic times. Only with the Egyptian decision to build the High Dam at Aswan, and the consequent launching of the UNESCO Salvage Campaign in the 1960s, did the Middle Nile become the subject of serious archaeological examination.

No previous map has made any useful attempt to match names preserved by Greek and Latin sources with places and features in what is now the Democratic Republic of the Sudan. The sources are mostly of Roman date, with very few toponyms being attested earlier. Many names mentioned by Strabo, Pliny and Ptolemy can be equated with modern places, but since relatively little excavation has been carried out, the inadequacy of the archaeological record normally makes it quite impossible to determine their size or importance in antiquity. Indeed, in many of the places, signs of ancient habitation have yet to be reported.

The ancient lists of place names have been carefully examined and sifted by Priebe (1984) and Török (1988). Their identifications are based on several factors, including Roman mileage estimates and similarity of names to those of modern settlements or regions. Contributions to the topographical study of the region are also made by Edwards (1989) and Welsby (1996).

There are several caravan trails across the Bayuda desert that might have been followed by the Neronian exploratory expedition into Meroitic territory. The site in this desert now known as el Fura may be Pliny's Boron.

The known monuments of the Napatan and Meroitic periods of Sudanese history (720 B.C. to A.D. 350)—temples and royal (pyramid) cemeteries most obviously, but some town sites as well—are for the most part located along the Nile. The pyramid fields of Nuri, el Kurru and Barkal (ancient Napata) were the burial places of the royalty of the Napatan period. The pyramids of the later kings and queens of the Meroitic period are at Meroe itself, at some distance from the city.

Once Rome no longer claimed control south of the First Cataract from about 297, it seems that Roman contact with the area covered by the map was largely broken off. The paucity of references to places in the Sudan in Late Antiquity may also be due to the preoccupation with difficulties further north.

The hafirs (waterholes) marked were essential to the ancient Sudanese pastoral economy. They should be regarded as Hellenistic in date; most are still in use today (Hinkel 1991).

Map 83 Nabataea Meridionalis

Compiled by D.F. Graf, 1996

Introduction

The Nabataean Arab kingdom centered at Petra (Map 71) stretched from Damascus (Map 69) to the region of Egra (modern Meda'in Salih) in the Hijaz of Saudi Arabia. This map covers the southern part of the kingdom (Arabia Eudaemon: see Map 76), the poorest known from an archaeological standpoint. The fundamental exploration of Jaussen and Savignac (Sartre 1996) has been followed by only sporadic expeditions of limited scope (Ingraham 1981; Graf 1988); many questions about the landscape remain unanswered (Bowersock 1983; 1988). There is no question that the region was an integral part of the Nabataean realm (Gatier 1988; cf. Bowersock 1988). Strabo (16.4.18) describes this part of Nabataea as having "a large population and abundant pasturage." The density of ancient settlements known here from classical geographers is far greater than in other parts of Arabia (MacAdam 1989, 311). The explanation for this disparity is clearly that better sources were available for this region.

Pliny's list of toponyms and ethnonyms for Arabia is probably derived from itineraries supplied to Aelius Gallus for his Arabian expedition in 25 B.C.; these in turn presumably reflect trade routes actively used in the decades just prior to the expedition (RE Suppl. 11, col. 1291). The sources for Ptolemy's extensive listings are far more complex; they probably constitute a conflation of various geographical writings from the early Hellenistic period to his own time (cf. Groom 1986, 71), from Ariston (Agatharchides 87a) to Marinus of Tyre (RE Suppl. 12, cols. 791-838), representing primarily itineraries by land and sea (Brice 1984, 177). More than 150 villages and towns are listed for Arabia Eudaemon, along with the related tribes of the region, physical features (mountains, bays, coastline), and islands. Ptolemy's latitudes for the northwest of the Arabian peninsula are fairly accurate (Groom 1986, 67), although the longitude when plotted for the inland towns consistently appears somewhat exaggerated in length (Groom 1981, 85; Brice 1984, 177). Nevertheless, as elsewhere in the eastern Mediterranean (Carmody 1976, 609), the general impression of Ptolemy's coordinates for the Red Sea Arabian littoral is that they are approximately correct and should be respected.

That said, the precise location of many of these sites remains a problem. The pioneering topographical work of Sprenger (1875) has largely been absorbed into RE, and although over a century old now it is still the basic guide for the identification of most of the sites. The other important early effort to identify the toponyms and tribes of the region is that of Musil (1926), which unfortunately was not systematic or complete. The more recent reassessment of the ancient toponyms by von Wissmann (RE Suppl. 12; 1976) is mainly adopted here, with some reservation. Both Sprenger and von Wissmann employed a similar toponymical methodology in identifying ancient settlements. Each assumes that the toponyms are essentially a product of itineraries of trans-Arabian trade routes. As a result, many of their identifications are based on purely linguistic homophonia, seeking for similar sounding modern toponyms in proximity to known routes, without any archaeological confirmation. The problems in this approach are substantial. The presumed pre-Islamic routes are at times purely hypothetical, derived mainly from itineraries of later Islamic geographers (Potts 1988, 133-34). Even more troublesome is the fact that a good critical edition of the relevant sections of Ptolemy (6.6-7) is still lacking (MacAdam 1989, 316-17).

Further archaeological exploration of the region is highly desirable. It may help to resolve such issues as the location of the Nabataean-Roman port of Leuke Kome (Young 1997). This has been located at various sites on the Arabian coast, including al-Haura' or Umm Lajj (Sprenger 1875, 28), Yanbu' al-Bar (RE Suppl. 12, cols. 540-42; von Wissmann 1976, 466; not marked), and Egra (modern al-Wajh; Gatier 1988, 186-87). The archaeological (Ingraham 1981, 71) and topographical (Kirwan 1984, 55) evidence, however, points to 'Aynuna further north. Only a few Hellenistic-Roman sherds were found at al-Haura' and Umm Lajj. None has been found at al-Wajh. Meantime, Yanbu' al-Bahr is still poorly investigated (Ingraham 1981, 78), whereas 'Aynuna has extensive Nabataean-Roman ruins. In sum, with the exception of a few settlements like Meda'in Salih (Egra), al-'Ula (Dedan),

and Tayma' (Thaima), the naming of the vast majority of the sites is still a matter of linguistic and geographical guesswork.

Some archaeological support for an extensive population existing in this region in the Hellenistic and Roman periods is reflected in the substantial epigraphic evidence from Arabia. The peninsula is covered with thousands of rock inscriptions in the Old Arabian script that was used from perhaps as early as the eighth century B.C. until the dawn of Islam. The earliest epigraphic evidence occurs in the regions of Tayma' and al-'Ula from the sixth century B.C., but the most substantial finds are in what has been classified as "Thamudic" script as a matter of convenience, after the legendary tribe of the region (Graf 1990, 133). The initial organization of the script into five types ("A" through "E"), was later revised as geographical categories (Taymanite and Dedanite = A, Najdi = B, Hijazi = C-D, and Tabuki = E), in full cognizance that further refinement was needed (Winnett 1970). For example, it is now evident that the "E" type emanating mainly from the Roman era extends well beyond Tabuk (ancient Baclanaza), with texts appearing as far north as the environs of 'Amman (ancient Philadelphiea, Map 71 B2); they thus largely coincide with the Nabataean realm, and in fact attest by their content that many of the individuals were constituents of the kingdom. The substantial corpus of Nabataean-Aramaic texts from Meda'in Salih (Jaussen 1909; Healey 1993), must now be expanded to include more recent Nabataean-Aramaic and Thamudic pre-Islamic Arabic epigraphic finds from the northwest of the peninsula (Livingstone 1985; al-Theeb 1993), particularly the monumental Greek-Aramaic bilingual text from the Thamudic temple at Ruwafah dated to the reign of M. Aurelius and L. Verus (Parr 1972, 54-58; Graf 1978, 9-12).

Although epigraphic evidence for Christianity in the region is minimal (Beaucamp 1981), the existence of monasteries in the region of Midian is known from Islamic sources (Shahid 1984, 326). By the time of the Islamic conquests, the Arab tribes of Judham, 'Amila and Bali had occupied the area north of Baclanaza (Tabuk) as *foederati* for the Byzantine empire (Shahid 1984, 383-84).

Map 84 Maeotis

Compiled by David Braund, 1996
with the assistance of Diane Braund

Introduction

The eastern Crimea and the Taman' peninsula opposite across the Straits of Kerch' are discussed and depicted in greater detail on Map 87, which represents the heartland of the Bosporan Kingdom. Its rulers claimed to include all but the eastern fringes of Map 84 in their orbit, within which the significance of the shallow Sea of Azov (ancient Maeotis) can hardly be exaggerated (Maslennikov 1995); the characteristics of that sea and the nearby waters of the Black Sea are also discussed in the introduction to Map 87.

The location of many features here presents particular problems. The scant information provided by ancient writers is often of uncertain quality, not least because it incorporates much that is guesswork or mythical (notably Amazons: see Mela 1.116; Ptol. 5.8.17). As such writers indicate (sometimes explicitly: Pliny, *NH* 6.20-22), there was substantial dispute in antiquity about this region, especially about the identities and locations of the many peoples of the hinterland to the east of the Sea of Azov. Peoples whose very existence was open to doubt in antiquity are omitted from the map, as are those whose location to the east of the Sea of Azov lacks all precision; the latter are listed as unlocated. Beyond the map, to the north, the distinction of the more southerly steppe and the more northerly wooded steppe is of the first importance: the physical conditions of the latter encouraged settlement, while the former, which reached down to the Sea of Azov, was better suited to pastoralism (note Moruzhenko 1989 on settlement of the wooded steppe between the R. Don and R. Dnieper north of the map; Smirnov 1991).

By definition, to locate pastoral and (as it seems) migratory peoples on a map is almost to miss the point; in this region it was their very mobility that constituted their greatest significance for the classical world. But since they can hardly be omitted, I have taken difficult—and doubtless somewhat controversial—decisions about where such peoples should be represented. The guiding principles have been, on the one hand, the duration of a people's presence in an area within the timespan of the map and, on the other, the area from which a people made most impact upon the classical world. Thus the Roxolani, who might have appeared in the north-west of this map, are to be found on Map 23, north of the R. Danube. The alternative to hard choices of this sort is chaos, even in the best of instances: see, for example, the careful map in Vinogradov (1994, 162), plotting the multiple movements of just two peoples in only twenty years or so of the first century A.D.

The identification of the rivers of the region also remains notably problematic, although an attempt can be made. For the east coast of the Sea of Azov, I have followed Gajdukevič (1971), but critically, and with amendments. In particular (following Anfimov 1986), the Rhombites Ellasson is identified here as the modern R. Kirpili, not the R. Beysug, as often (Kacharava 1991, 10). The significance of rivers for transport in the region is indicated, for example, by the findspots of Roman amphorae along the Hypanis and other water courses (Kropotkin 1988, 170).

Anfimov (1950, 85-86; cf. Melyukova 1989, 224-51) notes that the ancient sources are satisfied with locating the Maiotai on the eastern side of the Sea of Azov, without indicating how far inland they reach. He points to the relative unattractiveness of settlement in the coastal areas, since these are marshy (and were doubtless disease-ridden: note the place name Konopion, "Mosquito-Town," somewhere on the coast of Azov). Anfimov insists that Maiotai stretched inland, especially to the R. Hypanis, and even east of Ust'-Labinskaya. For the classical world, however, the Maiotai were very much the people of the Maeotis. Strabo (11.2.1) notes that they live on the coast, whereas archaeology shows them not on the coast itself, but just behind it (cf. Anfimov 1950, 95). Whether the term "Maiotai" is anything more than a classical construct remains uncertain (cf. Gardiner-Garden 1986), but in any case we are in no position to claim the hinterland for them. It is there that Strabo locates the Sirachoi, who are said to have embraced a variety of lifestyles and are no doubt a collection of distinct peoples, as were the Maiotai

themselves (cf. Strabo 11.2.1 and 11 for a broad distinction between those Maiotai who looked to the Bosp(h)orus, and those who had dealings with Tanais).

Immediately behind the coast of the Sea of Azov, Maiotian settlements conform to a general pattern; they center upon a relatively elevated piece of ground, with a further area of settlement nearby. The “acropolis” tends to have a river or lake on one side, and to be surrounded with a ditch on its other sides. A shallower ditch often surrounds the neighboring settlement-site. Limited archaeology suggests that these settlements may have been established around 100 B.C. and continued into the third century A.D., so that the bulk of finds are from the Roman period. However, there are occasional finds of pottery as early as the fifth and even sixth century B.C.; as a result, much earlier settlement has been suspected, especially around Novodzhereliyevskaya.

The lakes to the north of the lower reaches of the R. Rhombites Ellasson are natural salt lakes, which may have facilitated fish-pickling. Although no cisterns have been identified, both Strabo (11.2.4) and substantial finds of fish-remains on the sites of the lower Rhombites Ellasson confirm the importance of fishing in the local economy, as may also the name Rhombites itself, “Turbot-river” (Anfimov 1950, 95-96). Besides fish, grain is also attested in the settlements of the river estuary (*Panicum miliaceum*, *Triticum vulgare*, and rarely *Hordeum sativum*). The bones of cattle, sheep, pigs and horses have often been found. Archaeology here is still in its infancy, despite the pioneering work of Anfimov (cf. Melyukova 1989, 224-51). It seems, however, that there was less settlement on the waterways east of modern Rogovskaya, though there were burials (often kurgan-mounds) along the banks of all the rivers of the region, from the second millennium B.C. until Late Antiquity (Anfimov 1950, 94). The presence of burial-mounds and absence of settlement east of Rogovskaya, in the steppe zone of the lower river, would be consonant with the presence of pastoralists in the area. As Strabo (7.3.17) indicates, these came to Azov in winter, and pastured their herds on the steppe-lands of the interior in summer.

On the usual view, the burials of Maiotai were simple inhumations without the mounds of the richer “Scythian” and “Sarmatian” burials. Such ethnic attributions should now be re-thought (for some “Maiotian” burials were rich), with differentiation according to wealth and burial customs. At any rate, the co-existence of a “Scythian” mound and “Maiotian” inhumations at Kelermes around 600 B.C. has raised important issues about relations between the inhabitants of the region (Galanina 1985; 1997).

For peoples, the information provided by classical sources will not bear sustained critique, though it has conditioned the archaeology of the whole area. It is clear enough that classical writers employ terms like “Sarmatians” and “Scythians” without great care or precision (Braund 1994a; cf. Ochir-Goryayeva 1989). From Herodotus onwards, they took the R. Tanais (modern Don) to be the dividing-line between Scythia(ns) to its west and Sarmatia(ns) to its east, and it is shown thus on the map (cf. Scylax 69-70). Scholars tend to suppose a process of invasion by Sarmatians heading westwards during the Hellenistic and Roman periods, but there is much scope for doubt about the nature of any such movements. At the same time, since the peoples to the north of the Black Sea seem to have been prone to movement, their location on a map is particularly uncertain and may prove misleading. For example, Aorsia is mentioned in an important new inscription from the southern Crimea, but its location is a matter of keen dispute, highlighting the general difficulty of locating even major peoples. While one scholar can argue powerfully that Aorsia must mean the area behind Olbia (Vinogradov 1994; cf. Simonenko 1992), another can respond (more plausibly in my view) that it must be located near the R. Don, as shown here (Shchukin 1995). Minor peoples are still more problematic, even when they adjoin the classical world: for example, the Psessoï are certainly east of the Sea of Azov, but there would be a good case for placing them further south along its coast than shown here (after Gajdukevič 1971; but see GGM 1.59). The Thateis can be given a general location although, as with almost all the peoples of this region, it should not be pressed.

To the west of Bata (modern Novorossiysk) towards Gorgippia (modern Anapa), small agricultural settlements proliferated on terraces of river valleys and the heights above (Koshelenko 1984, 91-92; Kacharava 1991, 42; Alekseyeva 1997). Similarly, the valleys of small mountain streams northwest of Torikos (modern Gelendzhik) have significant traces of ancient remains (Koshelenko 1984, 93). Onayko, upon whose work (1982) we principally rely for archaeology at and around Bata and Torikos, argued that the well-defended sites which ran north-west from Bata towards Gorgippia from c. 100 B.C. until the Neronian period or so marked the eastern limits of the Bosporan Kingdom (cf. Dmitriyev 1979 for an important burial-ground at Dyurso c. A.D. 400).

It is important to understand that the archaeology on which the map is based is patchy; this may well account for some of the gaps in coverage. Much depends on the work of a very few individuals. Without the pioneering

efforts of Onayko around Bata and Torikos, or of N.V. Anfimov on the lower Hypanis, micro-regions which were densely settled in antiquity would be represented here as lacking settlements. Only in recent decades has it become clear that the *chora* of Gorgippia was densely settled, especially on the fertile plain around Krasnaya Skala (Hind 1983, 90; Alekseyeva 1991; 1997). Accordingly, arguments from archaeological silence cannot be made, though it does seem that the hinterland across the Caucasus from Tuapse (here tentatively identified as Palaia Achaia) was not settled, but inhabited by pastoralists, whose burials have often been excavated. At the same time, we cannot be sure about the dates of many small rural sites marked, since even at best these have not been excavated fully. In particular, it may be suspected that there was more settlement in the region from the fourth century A.D. than present knowledge indicates. Sustained excavation of more sites might establish continuity after the upheavals at that date, as it has at Gorgippia (Koshelenko 1984, 83) and at the Roman-period settlements around Tanais. Shelov (1972, 175) insists that the late material from these is medieval, but, as usual in Soviet publications, his “medieval” would embrace much of Late Antiquity (cf. Hind 1992, 105). Even so, it must be stressed that archaeology does demonstrate widespread destruction by the end of the third century A.D., which accords with our literary evidence.

The physical geography of the Don estuary in antiquity remains unclear in any detail, although it is established in broad terms (cf. Marchenko 1995, with full bibliography). Yelizavetovskoye Gorodishche may well have been an island, encouraging its possible identification with Strabo’s Alopekia (Brashinskiy 1984; Hind 1992, 104). Accordingly, the area of the Don estuary is marked on the map as approximate only. The numerous burial mounds of many periods which crowd it are omitted for reasons of space; even though they have not attracted much scholarly interest, their existence is to be noted (see Shelov 1970; cf. Mys'kov 1994 on “Sarmatian” burials of the lower Don c. A.D. 200). In particular, such mounds now ring Yelizavetovskoye Gorodishche on its east, south and west, with a marsh to its north; the latter has been seen as an ancient waterway, which gave access to Taganrog and the Sea of Azov (note Marchenko 1992, 174-75, with site-plan). Outstanding among the burial mounds of the Azov region was that above Berdyansk, which stood 27.5 ft high, with a diameter of 167.5 ft, and contained three burials dated to the early fourth century B.C. (Boltrik 1994).

Indeed, the region of the map is covered with burial-grounds, of which only the most significant have been marked. Many of the most striking mounds were raised well before the classical period, particularly along the R. Hypanis (Masson 1991). Like the estuary of the Tanais, the hinterland of Gorgippia too was covered with burial mounds, which cannot be shown here (Salov 1979; Alekseyeva 1997).

The south-east segment of the map presents the greatest difficulties. Extant descriptions of the coastline between Gorgippia and Palaia Achaia provide several names of towns, villages and physical features. However, even where such descriptions are broadly contemporaneous (notably those of Pliny, Arrian and Ptolemy), these names do not match, while those of physical features also resist plausible identification. What is at least clear (as I have confirmed by autopsy), is the dominance of three locations: modern Tuapse, Gelendzhik Bay and Novorossiysk Bay. Tuapse itself occupies a distinct (albeit brief) break in the rugged mountains which begin off the south-east corner of the map (see Map 87); there can be no doubt that this place figures significantly in ancient descriptions of the region, whether or not it is to be equated with Palaia Achaia. In antiquity, this coastline was best known for being dangerous and inhospitable, so that a lack of settlement is predictable (though archaeology here has been very limited). By contrast, Gelendzhik Bay offers a very welcome haven to those who have sailed from Tuapse, and Torikos may be located here with some confidence. The larger bay further north at Novorossiysk was evidently the location of many of the places mentioned in ancient descriptions of the region, but precise locations remain elusive. Accordingly, modern names (such as Myskhako, Shirokaya Balka) have been preferred here, while ancient names which seem to belong to the general area of Novorossiysk Bay appear only as Unlocated Toponyms. In this region, notably at Gorgippia and Bata, ancient sources sometimes seem to distinguish harbor and city (note Strabo, 11.2.14), but there is no indication of the nature of that distinction, nor of any physical separation of the harbors and cities in question. Gorgippia presents the further difficulty that it must surely be Sindikos Limen (so Hind 1992, 108), though Strabo in different passages uses both names without making the identification, perhaps indicating even his uncertainty in this area (11.2.12, 14).

Roads and routes are missing from the map, since there is no real evidence for them in this region. Even so, they have been hypothesized, both locally (as around Gorgippia: Alekseyeva 1991, 80) and over long distances, for example along the north coast of the Sea of Azov (Boltrik 1990).

Map 85 Oudon-Rha

Compiled by David Braund, 1996
with the assistance of Diane Braund

Introduction

The lower reaches of the R. Volga (ancient Rha), and in general the steppe to the north and north-west of the Caspian Sea, were of particular significance to the classical world as the homeland of the Sarmatians (traditionally, from the fourth century B.C. to the fourth century A.D.). The latter term is fraught with difficulties. The distinctions which archaeologists commonly draw between Sarmatians and Sauromatians are no more than modern constructions, whereas ancient writers tend to use the terms interchangeably (Smirnov 1980, 140). The Alanoi, who appear in classical sources from the first century A.D., are usually understood to be a Sarmatian grouping (see the general discussion in Kovalevskaya 1984; Yatsenko 1993), though our classical sources typically refer to them as Scythians (RE Alanoi). Further, the Alanoi are often harder to distinguish from the Albanoi (Map 88 D1) than modern discussions like to acknowledge. The similarity of their names and the textual uncertainties of our manuscripts combine with their close physical proximity to make such distinctions highly problematic, both in general and from case to case (Braund 1994, 225 n. 116). Moreover, the Caucasus mountains, by reference to which the northern limits of the Albanoi tend to be located (Akopyan 1987, 30-31), were regularly imagined in antiquity as stretching further north along the Caspian shore than they do in reality.

In any event, it is clear enough that the Sarmatians of this region, and doubtless also the Alanoi, were an amalgam of different political groupings under their own chieftains—termed by Tacitus “scepter-holders” (*sceptuchi*, *Ann.* 6.33)—who could as well act against each other as in concert. Rome and Parthia/Persia carried on a diplomatic struggle in this region for the support of such leaders. The Iberoi and Albanoi evidently played a large part in that diplomacy, for their relations with the Sarmatians entailed friendship as well as enmity (Braund 1994, 208-209).

The elite of the region are traditionally imagined to have originated in the east, and they had some access to goods from there, as well as from the classical world. Their burials amply illustrate this mixture of east and west. At Krivaya Luka on the lower Volga (but north of this map, as are the other burials mentioned; modern Astrakhan is marked for orientation only) a black-glaze cup and stamped amphora of Heraclea (Map 86 B2) were found in a rich female burial, deposited in the first half of the third century B.C. (Dvornichenko 1989, 5). Another burial at Krivaya Luka, however, contained bronze work similar to that of central Mongolia, of a type found nearby again in the important burial close to the village of Kosika, located 70 miles north of Astrakhan on the right bank of the Volga. Both burials are dated to a period from the end of the first century B.C. into the first century A.D. (Dvornichenko 1989). The latter one also contains outstanding gold and silver work, as well as a bronze Roman ladle which, for all its polychrome- and animal-style, includes such elements as a meander and is attributed to Greek craftsmen. The pottery here recalls finds in burials in the R. Hypanis area (Map 84 C3), a key link between the Black Sea region and the northern Caspian.

Mounds were usually raised over the burials of the elite, often augmented further by sites on elevated ground, as near Kosika. There is a distinct absence of such burials in the Volga delta south of the modern village of Nikol'skoye, though chance finds indicate that this area was not entirely uninhabited. Its population was evidently the same as that further north along the Volga (Dvornichenko 1989, 6). A thorough survey is needed to establish the extent to which the level of the Caspian Sea was higher at the mouth of the Volga in antiquity, but one may reasonably suppose that the delta was substantially wetter even than it is today (on Caspian levels, see further the introduction to Map 90).

The classical world had only an outline knowledge of the entire region. This was developed in the late Hellenistic and Roman periods, not least no doubt by the expeditions of Pompey, Corbulo and Arrian; but there was little firsthand knowledge before Late Antiquity. Of particular significance was Zemarchos' return through the region after his embassy to the Turks c. 568 (Menander the Guardsman, frag. 10.4). For most of antiquity, the

Caspian was regarded as an inlet of a great northern Ocean, with the Volga imagined as a connecting channel (Strabo 11.6.1; Pliny, *NH* 6.36-38; cf. Dion 1977, 216-19). Pliny imagines that channel as narrow enough to make for an easy passage between the nomads and Sauromatians to its west and the Abzoe to its east. Since all these peoples are in his view Scythians, he records the name Scythicus Sinus for the channel. Here he was evidently drawing upon the work of M. Varro, who seems to have visited the general area with Pompey in the mid-60s B.C., as part of an entourage which produced several accounts of the region (unless we take Mithridates VIII of Bosphorus to be his source). The extent to which Pompey's forces explored as far as the Volga is unknown, if they did so at all (Braund 1994, 152). At least the Abzoe are marked on the map.

The R. Volga has been identified with Herodotus' otherwise mysterious Oaros (4.124), which he thought emptied into the Sea of Azov, not the Caspian. From Hellenistic times, it seems, the Volga was known as the Rha; it enjoyed a certain fame as a source of the medicinal root of a plant of the rhubarb family (AmmMarc 22.8.28). Kiessling (RE Ra) notes that this plant was also thought to come from the region of the Crimean Bosphorus, a further indication of a link between the Volga and the Sea of Azov (Map 84 B2). Certainly, goods—especially light goods—could be conveyed from the Volga across to the upper reaches of the R. Tanais (Map 84 F1), and then down that river to Azov and the Black Sea. Attendant circumstances permitting, this was the easiest route between the northern Caspian and the Mediterranean world. Accordingly, if there was any substance to the emperor Claudius' report that Seleucus Nicator entertained the notion of cutting a channel from Caspian to Azov (Pliny, *NH* 6.31; cf. Strabo 11.1.5), the movement of such goods may have provided an impetus to the plan. Further, an underground link between Azov and Caspian was also imagined (Strabo 11.7.4).

In Late Antiquity, the Volga seems to have acquired its Turkish name, Atel (Theophanes, *Chronographia* 356). That is no doubt why it occurs in the tradition of Zemarchos' return from the Turks with the name Attila (Blockley 1985, 266). At the same time, the Armenian geographical tradition not only records the Turkish name, but also suggests that the Volga delta may have consisted of still more watercourses in antiquity than it does today. Accordingly, the Volga delta appears on the map only in approximate form.

The peoples of the region were still more problematic for classical writers (note Pliny, *NH* 6.19-22). Indicative of our sources' ignorance is the regular inclusion of the Amazons among the peoples of the lands of the northern Caspian (Strabo 11.5.1; Pliny, *NH* 6.35; Ptol. 5.8.13). Similarly, the Issedones/Essedones, although somehow imagined in the region of the northern Caspian by Herodotus and others, seem to have no basis in fact and are therefore omitted. More mundane is a disagreement among classical writers over the location of the Geli and the Legae (as well as the associated R. Mermadalís), who are variously placed to the north-west of the Caspian or to its south-west, and are here listed as unlocated. The ancient R. Soanas presents a similar problem. It is usually identified as the modern Sunzha, a tributary of the Terek just south of the map, though it is tempting to link it with the Souanoi further west. Since the Soanas has also been regarded as part of the lower Terek proper, it is listed here as unlocated.

Strabo (11.5.8) seems to have envisaged an Aorsian sphere of influence which reached from the west—perhaps even from as far as Olbia (Map 23 E2)—almost to the north and north-east Caspian (cf. Braund 1994a; Vinogradov 1994; Klochov 1996). In this respect, the Aorsoi seem to have been the forerunners of the Alanoi in the region.

Map 86 Paphlagonia

Compiled by C. Foss, 1995

Introduction

The map comprises ancient Paphlagonia, and extends into eastern Bithynia and the northernmost part of Galatia. Evidence for the ancient topography is most abundant on the coast, along the Roman roads, and in Galatia. Arrian's *Periplus Ponti Euxini* (written c. A.D. 132), together with an earlier text by Menippus (c. 20 B.C.) and a related Late Antique anonymous work, describe the coast in great detail. Most of the sites named in these works can be located at least approximately, although a few resist identification; Müller's commentary in GGM I remains valuable. For the Roman roads, ItMiller is uncritical; French (1981) is far more useful, but treats only one major road. The roads of Paphlagonia are presented in admirable detail by TIB Paphlagonien, those of northern Galatia likewise by TIB Galatien.

The interior of Paphlagonia is a remote, mountainous country, cut off from the regions to the south by long, parallel ranges. Communication east and west is relatively easy; north and south, it is much more difficult. The country contains a few long, wide plains and river valleys, some of considerable fertility. In antiquity, the mountains were heavily forested. For the most part, the region was never densely populated. For a general description, see Leonhard (1915); and for an excellent account of some areas (including eastern Bithynia), with discussion of specific problems, note Robert (1980). RE Paphlagonia gives a full list of all named sites (cols. 2537-50) and of physical remains (2498-2510, 2515). Some features listed there do not appear on the map because of limited significance or uncertainty of dating. TIB Paphlagonien documents many minor sites such as unidentified villages, unlocated villages mentioned in inscriptions, and places attested only by Stephanus of Byzantium.

Map 87 Pontus-Phasis

Compiled by David Braund and T. Sinclair (Turkey), 1997
with the assistance of Diane Braund

Introduction

Pontus

The land of Pontus has two main parts, both of which belonged to the Mithridatic kingdom of Pontus in the Hellenistic period. The first is the main ridge of the Pontic mountains and the steep descent to the shore. The lower slopes are thickly wooded, and the shore districts have a humid and rainy climate. In the main Pontic ridge a gap occurs in the hinterland of Amisus (modern Samsun), after which the mountain chain continues at a lower height and with less abrupt slopes (Strabo's term Paryadres seems to denote the higher part of the chain). As far east as Rhizaion (Rize) Greek settlements along the coast have existed since the sixth century B.C., and in the case of Sinope the seventh.

To the south, the Pontic chain is bordered by Armenia Minor, a part of Armenia itself (Late Antique *Sper*, probably the *Syspiritis* of the classical authors), and what was to become the Georgian mountainous district of Tao, drained by the R. Glaukos (Oltu Çay) and the Tortum Çay. The district of Chaldia, the Gümüşhane basin, is difficult to classify, particularly in classical times, as there is no evidence that it belonged either to Pontus (in a geographical or administrative sense), to Armenia Minor, or to Armenia itself. The Roman empire made no effort to control the interior of Chaldia until the reign of Justinian.

The second part of Pontus is the series of fertile inland plains, joined by relatively low chains of hills, in the river systems of the Iris (Kızıl Irmak) and the lower Halys (Yeşil Irmak). This district had little cultural contact with the Greek or Roman world until the campaigns of Lucullus and Pompey against Mithridates in the 70s and 60s B.C. Modern study of it dates from the work of Anderson (1903) and the Cumont brothers (1906), based on careful fieldwork aimed at resolving questions of historical geography rather than at a formal archaeological survey. Since then, further progress in the same direction has been made by Olshausen and Biller (1984), who built on Wilson's thesis (1960); it, too, is based on extensive traveling. Bryer and Winfield's work (1985) on the Pontus of the medieval Trapezuntine empire (broadly speaking, the main Pontic range and seaboard plus the district of Chaldia) in fact deals thoroughly with the antiquities and sources of classical times too, and has settled several questions of classical historical geography. Within the area of the Trapezuntine empire, few sites with relevant surface remains now remain unexamined. Bryer and Winfield's work also covers the classical road system of much of the Halys and Iris drainage area, and of the northern districts of Lesser Armenia. The roads in these latter districts, however, have not been systematically checked on the ground, and the exact location of several stations in the ancient itineraries has yet to be determined by inspection of sites and road traces.

If the testimony of different geographers is compared, the tribes of the Pontic seaboard seem to have moved, and to have merged or suffered other changes in identity. On the map no attempt is made to reflect these changes, but instead to present a consistent picture reflecting the locations for which the tribes in question are best known.

The Late Antique Anonymous *Periplus* is in part dependent on Arrian's *Periplus* of the early second century A.D. In cases where its information seems not to amount to an independent attestation, the sites and (in particular) rivers mentioned are marked as if attested for the Roman period only.

The date of any item of information in the itineraries is often impossible to determine. Settlements and road stations here known only from this type of source are marked as Late Antique, even though the possibility remains open that some may date back to the Roman period too. The roads themselves, however, are not reckoned to belong to any single period.

Phasis

The east coast of the Black Sea does not permit great confidence in mapping, for our sources are largely ill-informed and confused. We do, however, have Arrian's firsthand (though selective) account of his journey as far

as Dioscurias/Sebastopolis. This provides a firm enough basis for the interpretation of other classical texts treating that stretch of coast (Silberman 1995). Yet Arrian is noticeably less helpful on the portions of the coast and hinterland which he did not see at first hand. Moreover, while Strabo had family reasons to know the area, he supplies only occasional insights (note 11.2.17 on the settlement at Phasis). Later, Pliny seems very confused in several instances (as on the environs of Cygnus, *NH* 6.14-15). Procopius' information on Colchis/Lazike (see also Map 88 A2) is to be treated with particular caution, though Agathias seems rather sounder (Braund 1994, 268-314). Throughout, these and our other descriptions of the region are at their most rebarbative when naming and locating both rivers and peoples.

I often refer to my own book (Braund 1994) because it is more accessible than better, more detailed treatments in Georgian and Russian; references to the latter are to be found in the book. The only substantial discussions of the region to have appeared subsequently are by Lordkipanidze (1996, a collection of conference papers; 1996a). However, Lordkipanidze (1991a) is also still fresh and accessible on archaeological evidence, while Miron (1995) provides some fine illustrations. Silberman's (1995) commentary on Arrian's *Periplus* is often valuable, despite occasional problems of orthography, which are largely inevitable in this area.

There has been substantial archaeological work on the eastern coast of the Black Sea, sometimes usefully combined with close studies of the classical literary tradition. In particular, a justly renowned article by Lomouri (1957) has established a measure of agreement on the identification of some of the rivers from Phasis northwards (cf. *RE Suppl.* 9 Pontos Euxinos; Silberman 1995). Yet it is worth recalling how much such identifications were disputed previously; even the identification of the R. Phasis itself was seriously in doubt. Lomouri demonstrates that it is the modern Rioni (on its etymology, Braund 1994, 25 n. 102).

Other identifications remain disquieting, however, despite Lomouri's arguments. In particular, the ancient R. Chobos is now usually identified as the modern Enguri (or Inguri), despite the fact that the modern R. Chobi lies beside it, to the south. One might expect the modern Chobi to be the ancient Chobos. Meanwhile, the ancient Sigames runs north of the ancient Chobos, and its name bears a measure of similarity with the modern Enguri. Yet, despite such reservations, the map represents the orthodox view established by Lomouri. Indeed, the identification of rivers in this part of the map seems simplicity itself by comparison with those further north along the coast, where uncertainty and speculation are the rule. For example, there is a good case for taking Masaitike there to be not a settlement site (as it appears on the map, reflecting the usual view, Kacharava 1991, 154-55), but a river (as Silberman 1995, 16 understands it to be). While rivers abound, however, the lack of promontories north of Pityous suggests that we may do well to take Cape Adler as a key fixed point for any reconstruction of the area; this seems to be a promontory named Herakleion by Arrian (see Silberman 1995, 51 on the term, taking Arrian to indicate two capes of that name).

The peoples of the region were notable for their number and variety, as classical sources appreciated (Strabo 11.2.16; Pliny, *NH* 6.15). It is to be expected that they should differ on the locations for some. Although there was doubtless change over time, the modern tendency to suppose wholesale movements of peoples around the region seems best resisted, particularly in view of our sources' limited knowledge of the geography of the hinterland. No doubt, too, some of the classical names of peoples here were at best collective terms. Such seems to be the case with the Heniochoi, who occur in two parts of the map and might have been marked elsewhere too, for example at Phasis (Braund 1994, 75-76). Even well-attested peoples like the Abasgoi are said to have internal political divisions, entailing two kings in the sixth century A.D. (Braund 1994, 65); one wonders whether different groupings of this sort also had distinct identities beyond that of "Abasgoi." Political changes over time must also be a factor. The emergence of the Lazoi (see Map 88 A2 Lazike) through the Roman period in the place of the Kolchoi seems to be a matter of political domination more than any physical relocation (Braund 1994, 274-76), while the retention of the old term Kolchoi by Byzantine sources indicates further the impact of intellectual fashion upon the literary tradition. Archaeologically, we are very seldom able to make strong connections between the remains of material culture and the names of peoples favored by classical writers (but see Khrouchkova 1989 on Gantiadi/Tsandripsh and Abasgia).

As to the settlements of the region, a series of questions remain open. After many years of uncertainty and controversy, the site of the settlement at Phasis now seems to have been established, thanks to underwater archaeology under tough conditions (note Gamkrelidze 1992). Evidently the lake which Strabo noted as bounding one side of the site has now engulfed it, or part of it; the lower reaches of the Rioni are prone to changes of course across the wetland. The Roman fort continues to excite discussion, but can be located with some confidence at

Patara Poti, where it appears on the map (Braund 1994, 191-93), while the Phasian Theos (“Phasian goddess”) is firmly located by Arrian as lying on the north bank of the R. Phasis, evidently across that river from the city. Further south, Apsaros/Apsyrtos is certainly Gonio, but the town there remains to be located satisfactorily; it seems clear enough that Procopius’ grandiloquent historical account of it is at best a considerable overstatement (*Bell.* 8.2.14). The R. Apsaros appears to be a branch of the Tchorokhi, the ancient Akampsis. The latter might evidently be known as “River of Bandits” (Scylax, GGM I.62, *Ληστῶν ποταμός*), a name which would help to account further for the location of a fort close to the settlement.

Meanwhile, north from Phasis, it is Dioscurias/Sebastopolis and its environs that dominate the region. Amphora stamps indicate that Gvandra lay within the territory of the city (Braund 1994, 143), which must therefore at least have reached far along the coast to the west. The relationship between the city and the substantial fortified settlement at Esherskoye Gorodishche remains an open and pressing question (see Braund 1994, 142-43). Also problematic here is the identification of Tracheia/Anakopia, which has been imagined at Gagra, though Noviy Afon remains more plausible (Braund 1994, 301).

Behind and to the east of Dioscurias/Sebastopolis, the Kelasuri Wall (Kelasurskaya Stena, sometimes referred to as the Abkhazian Wall) remains an enigma. Suggested dates for it range across antiquity and far beyond to the seventeenth century (note Lomouri 1957, 106-107, surveying some options). Since more recent work has tended to favor a date in the sixth century A.D., albeit very provisionally, its inclusion on the map seems justifiable. Whether or not there was an extended wall in Late Antiquity, there is little doubt that fortifications were established to control the river valleys behind Dioscurias/Sebastopolis by the end of classical antiquity, at the latest. The same was done further east towards Souania too, where we know the Late Antique names of important strongpoints which cannot be located on the map (for example, Bouchlous, Tzacher/Sideroun). These valleys were important both as lines of communication and also in their own right, as excavation in the Tsebel'da valley has made very clear. There were principal north-south routes across the Caucasus; the Klukhor Pass is the best-known and is therefore included on the map, together with the associated Marukh Pass. But it should be stressed that the mountains could be crossed by a variety of routes, which increase in ease and number as the Caucasus range drops to the west (Braund 1994, 44).

Ancient Koraxikon Teichos and Karteron Teichos (two names for what might be a single location) may well have been fortifications to guard routes through the mountains, but they are still to be located. Any identification with the fortifications on the R. Kelasuri (ancient Chrysorrhoeas?) seems unlikely; whether actual walls or simply strongholds, they must lie to the west of Dioscurias/Sebastopolis. They seem best sought around Pityous or to its west, with the R. Korax and the Koraxoi. It is disturbing that we seem to have no classical name for the important R. Bzyb': this might be the R. Korax (Kacharava 1991, 141-42).

Even where locations are known, the problems of attaching firm dates to Late Antique buildings applies not only to military structures, but also to early churches in the region. For example, while Dranda and Gantiadi (Tsandripsh) are marked in view of their significance and the fact that they have been dated to the sixth century, there remains a real possibility that both may date beyond the timespan of the map. Lesser churches of uncertain date have been omitted, but may be found conveniently (with full bibliography and illustrations) in Khrouchkova (1989). They include churches incorporated in Archaïopolis, Gyenos, Onogouris, Petra, Pityous, Sebastopolis, Tzibile and Vashnari.

Map 87 inset Cimmerius Bosphorus

Compiled by David Braund, 1997

with the assistance of Diane Braund

Introduction

The inset is centered upon the Straits of Kerch', known in antiquity as the Cimmerius Bosp(h)orus, apparently named after the prehistoric and semi-mythical Kimmerioi who were said to have passed through this region. For most of antiquity this was the heartland of the Bosporan kingdom, which came to reach north, east and west beyond the area shown here (Gajdukevič 1971; Alekseyeva 1988; 1997). The principal river of the inset is the Kuban, whose estuary dominates its eastern parts. The Kuban was one of the rivers named Hypanis in antiquity; it was also known, at least in its lower reaches, as the Antikeites. It connects the region with the fertile interior of the north Caucasian foreland (Map 84). Its estuary dominates the Taman' peninsula (probably ancient Eone), which is the landmass facing across the straits to modern Kerch' and the eastern Crimea.

Together with the outflow from the Sea of Azov (ancient Maeotis), the alluvium of the Kuban seems to have been a prime cause of significant changes in the coastline of the Taman' peninsula, which was evidently a more fragmented landmass in antiquity. It is often held that two channels of the Kuban emptied into the Straits. The more southerly one may be located with confidence and identified as the Coracanda. The northern channel is more in doubt: a narrow isthmus has been retained here, located on a line between Tyrambe and Kepoi. There is good evidence of an ancient dyke in this area (shown on the inset). It is usually interpreted as a means of flood control (Gajdukevič 1971, 220), and thought to have connected the inlets beside which it runs (cf. Tsvetayeva 1979, 49); but the point remains to be established securely. Mela (1.112) describes the Kuban as rendering at least part of the western Taman' "almost an island," with its two mouths entering the sea (evidently the Black Sea) and a "lake," evidently the Korokondamitis Limne

Thus it seems that the south-west and north-west portions of the Taman' peninsula were, respectively, almost an island and a true island (almost two islands), as Strabo confirms (11.2.9-10). In consequence, the cities of Phanagor(e)ia and Hermonassa stood on "islands," which bore their names (AmmMarc 22.8.30, possibly indicating earthworks and canals; StByz *Ταυρικὴ*; note also Strabo 11.2.11 on Pharnaces' canal in the region). But it was the island of Phanagor(e)ia that was the true island, often mentioned as such in inscriptions as an administrative region of the Bosporan kingdom (note evidently CIRB 40), and described by Alexander Polyhistor (StByz *Ἰπτανίς*). The Coracanda also marked the boundary of Sindike (Strabo 11.2.10, retaining Antikeites). However, the courses and identification of much of the lower Kuban must remain provisional (a possible "Sindian gulf" in the area is probably a mistranslation, despite Blavatsky 1985, 55-66).

It is widely held that at least some of the lakes of the eastern Crimea were inlets or bays of the sea in antiquity. Yet uncertainty remains, both in particular cases and in general; accordingly, even where a change of this sort since antiquity seems established, the coast is marked here as an approximation. The profile of the south-west end of the Sea of Azov has also been the subject of debate (cf. Maslennikov 1995, 93), but Strabo (7.4.1) at least confirms the existence of the Sapra Limne there. Elsewhere in the region, the sea has engulfed much that was land in antiquity. Sectors of some ancient cities have been reliably located under water, notably at Kytai (Gajdukevič 1971, 192) and Akra (Hind 1992, 100) in the Crimea, and also on the Taman' peninsula where the lower portions of the towns of Phanagor(e)ia and Kepoi are now under water (Hind 1983, 89; Dolgorukov 1990). Underwater explorations have been attempted for decades, though much remains to be done before we can reasonably identify the extent and location of all that has been engulfed by the sea since antiquity. Local traditions in particular, although conceivably sound, are still best treated with caution at present (cf. Minns 1913, 23 with Gajdukevič 1971, 218-19 on columns claimed near the Chushka Spit).

In antiquity the sea-ice of the region attracted comment by Herodotus (4.28) and others. The waters of the Straits of Kerch' (with the Sea of Azov to their north) freeze in severe weather, especially in February, as a result of a

combination of low temperatures, high wind-speeds and the low salinity of the water (cf. Maxwell 1990, 20-24). Ice appears off Kerch' in the second half of December. The ice-cover is often broken up by winds and currents, but in severe winters when the wind is from the north-west, the ice-cover is firm and an obstruction to shipping, which is also endangered by fast icing. Ice normally clears by the second half of March (Maxwell 1990, 199-200).

The peninsulas are largely flat, particularly when set beside the substantial mountains of the south-western Crimea to the west and the main range of the Caucasus to the east (cf. CIRB 113). Accordingly, Hind must be right to reject the usual identification of the Kerch' peninsula with Herodotus' "rugged peninsula." Although it could be seen as a peninsula in antiquity (AmmMarc 22.8.32), Herodotus (4.99) must refer rather to the mountainous coast between Kerkinitis and Theodosia which stretches south to Ai-Todor (ancient Charax; see Map 23 H4). The Taman' peninsula could be called Eone, perhaps also Eudousia and Eulysia in Late Antiquity, though the extent of these territories remains rather unclear. The Eudousianoï are located on the Taman' peninsula in Late Antiquity (Kazanski 1991, 124-26, who sees them as Tetraxitai Goths; cf. Heather 1991, 14).

There are significant elevations on each side of the Straits which offer some contrast with the steppe-land that surrounds the Sea of Azov, particularly the so-called Mt. Mithridates whose summit bore the acropolis of Pantikapaion at Kerch' (Gajdukevič 1971, 170-71; Tolstikov 1992). These elevations offered opportunities for the siting of impressive monuments; such no doubt was the Satyrou Mnema ("Monument of Satyros") located on the Taman' peninsula (cf. Hind 1992, 105-106; Treister 1993, 562-63 on monumental sculpture of the peninsula; Gajdukevič 1971, 214 on the monument of Komosarue). The tumulus-burials of the region (kurgans), best known for their rich grave-goods, stood out against the flat landscape; they often gained height through their location on elevated ground.

Extensive ditches were formative man-made features of the landscape, particularly in the Crimea where they are still visible. Two long dykes ran north-south across the Kerch' peninsula (a third posited near Theodosia seems less certain: Gajdukevič 1971, 55; Maslennikov 1983; Vdovichenko 1986; cf. Maslennikov 1981, 23 for photos). The longer of these dykes is the more western ditch (variously known as the Ak-Kos Dyke, or Uzunlar Rampart), which seems to have been created (or perhaps better developed from forerunners) in the first century B.C. by King Asander (Strabo 7.4.6; cf. Treister 1993, 550). Localized survey and excavation suggest that it was a ditch-and-mound construction, reinforced by fortified strongpoints and further connecting ramparts. The shorter dyke is usually termed the "Tyritake Dyke," having the town of Tyritake at its southern end. The extended ditch mentioned in the region by Herodotus cannot be identified (4.3; Koltukhov 1991, 94). Ptolemy's Taphros ("Ditch") was doubtless located near such a feature (3.6.5; Zubarev 1987, 48; Kacharava 1991, 255-56). There can be no real doubt that both long dykes were strategic structures designed to control lateral movement across the eastern Crimea, not least by pastoralist Scythians (on whom see Hind 1992, 99-103; Treister 1993, 525). There seem to have been smaller dykes at other critical points, as evidently below Semenovka (Maslennikov 1981a, 78-79), while on the Taman' peninsula the purposes of flood control and defense may have coincided (on Sindoi, see Shelov 1978, 27-31).

The identification of settlements is rendered more difficult by the duplication and variation of place names. For example, Kimmeris of the north-west Taman' (unlocated: probably at Kuchugury or Il'ich) is readily confused with Kimmerikon of the south-eastern Crimea, as even in antiquity it seems. At least two places in the region seem to have borne the name Herakleion (Gajdukevič 1971, 203), while Apatouros/-on also occurs in different contexts. Similarly, the rivers Antikeites and Pantikapēs on this inset are not to be confused with namesakes elsewhere in the Ukraine proper.

The whole area has been subjected to very substantial archaeological survey and excavation, but a certain unevenness should be acknowledged. In particular, although the Taman' peninsula has long been a focus of archaeology, detailed examination of its more rural areas is largely the work of recent years and much remains to be done there (cf. Sokol'skiy 1976; Paromov 1990; Abramov 1993). More has been done on the Crimean side (Kruglikova 1975 is fundamental, as is now Maslennikov 1998), but the northern coast of the peninsula has only recently been given as much attention as it deserves (cf. Treister 1993, 549-50; Maslennikov 1995). Omissions from the inset must be recognized: above all, the multitude of tiny sites located or suspected here cannot be accommodated fully at this scale. Moreover, the assignment of dates of occupation to the majority of these sites cannot be made with any confidence (cf. Abramov 1993 for an attempt).

Despite sustained effort by Zubarev (1987), the locations of places mentioned by Ptolemy in the eastern Crimea remain too unsure to mark. Further, roads are often posited, but are insufficiently attested to be shown (on

land transport, see Peters 1990; Hind 1992, 104). “Industrial activities,” notably fish-pickling at Tyritake, Salachik and elsewhere (Curtis 1991, 120-26; Vinokurov 1994), and perhaps naphtha extraction on the Taman' peninsula in Late Antiquity, are not attested outside settlements, and are therefore not identified as such on the inset.

Late Antique (and possibly Roman) levels have been neglected by Soviet scholarship, not least because it held everything after c. A.D. 400 to be “early-feudal” or medieval, not the business of classical archaeologists. Recent work, however (as at Zenonos Chersonesos, Phanagor(e)ia, Hermonassa and Kuchugury), indicates more continuity than once imagined after Hunnic and other depredations in the area (cf. Nikolayeva 1983; Kazanski 1991a, 510-12; Hind 1992, 103; Treister 1993, 559-60). On the tribulations of the Bosporan kingdom in Late Antiquity, note Blavatsky (1985, 242-60). On Goths in the Bosphorus, see Kazanski (1991, 124-26); their movements cannot be represented here.

For important surveys of the intensive archaeological and historical investigation into the Bosporan kingdom, see Hind (1983, 85-90; 1992, 99-109), Koshelenko (1984; 1992), and Treister (1993; 1994; cf. Belin de Ballu 1965; Heinen 1980). The substantial monograph of Gajdukevič distills the work of a lifetime, first published in 1949 (in Russian), and updated in its German edition of 1971; cf. Leschhorn (1993, 44-64) on local chronology. Essential for the whole Black Sea region is the place-by-place summary of Kacharava (1991), incorporating both archaeological and literary evidence.

Map 88 Caucasias

Compiled by David Braund, 1997
with the assistance of Diane Braund

Introduction

For the most part, the area shown here was little known to the classical world before the Hellenistic period, when Seleucus I seems to have claimed it as part of his empire. Seleucus sent Patrocles to explore the Caspian; he may have reached as far north along this coast as Derbent (ancient Tzon), but we cannot be sure. According to Arrian, the exploration of the Caspian had been mooted by Alexander and was to be carried out by one Heracleides. Although Alexander never put the scheme into effect, his thinking may have encouraged Seleucus (EncIran Caspian). It surely encouraged Pompey to send Varro to taste the waters of the Caspian (it seems) during his Transcaucasian campaign of 66-65 B.C. Pompey's adventures in the region were almost as much about exploration as they were about conquest, and he prided himself on being the first Roman general to wage war here (Braund 1994, 12). Moreover his entourage included men who would write about his campaign, notably Varro and Theophanes of Mytilene; together they provided much of the information upon which Strabo and Pliny drew later. Pompey's campaign also established links which were to be renewed, both through the campaign of Antony's general Canidius Crassus in 37, and through the diplomatic and military contact that was to become increasingly significant under the emperors of the first century A.D. It culminated in the campaigns of Corbulo under Nero, and the grand reception and recognition in Rome of the Parthian Tiridates as king of Armenia in 66. Corbulo's campaigns, like Pompey's, brought back important information. Pliny (*NH* 6.23) made use of that source, together with other reports available to him.

Despite the temporary success of Nero's arrangements in Armenia, the region remained a regular focus of dispute and conflict between Rome and the Parthians, as well as their successors the Sasanians. During Domitian's reign (81-96), a Roman centurion cut his name and unit on the rocks at Gobustan, down the coast from the Apsheron peninsula (inset) where the modern city of Baku is situated (marked for orientation only). A fort has often been imagined here, but there is no more than a graffito, so that the map does not mark the spot. The author of the graffito was evidently encouraged by the many prehistoric drawings on the rocks there. His was the easternmost Latin inscription until the discovery of what may be Latin graffiti far to the east of the Caspian (Braund 1991).

Armenia and Albania, in particular, lay firmly to the east of Rome's well-established provinces. While Rome usually sought to exert influence over the region through friendly kings, the fact remains that from a Persian perspective the region was part of the Persian empire (Colchis apart, perhaps). Indeed, even in Achaemenid times the bulk of the region had shown its cultural affinities with the east (cf. Tiratsian 1979, 173). In Iberia, fifth-century pottery displays apparent Iranian influence (Narimanishvili 1992). Meanwhile, fine buildings at Gumbati (eastern Iberia), Sary-tepe and Beniamin (Armenia) have been reasonably identified as Achaemenid administrative centers. An isolated column-base reported out of context at Qaracarmirli Köyi may suggest another such building in Albania (Furtwängler 1996; Gagoshidze 1996). Indeed, the so-called Yaloylutepe culture, which was widespread in Albania in the later centuries B.C., seems to be an influence from Iran which spread strongly there and on into the easternmost parts of Iberia (Ismizade 1956; Pitskhelauri 1977, 224-25). Greek influence—and again, Achaemenid—is most striking in Colchis, on the eastern shore of the Black Sea, from about 550 B.C.; the Colchian hinterland appears on the western side of the map (for the coastal strip, see Map 87). Influences from the north, across the Caucasus, seem to have been less significant, but still show up in the material culture of the region (Braund 1994, 130-31; Pirtskhalava 1995).

Of course, external influences, whether from Iran, the Greek world or the north, interacted with established traditions within the region. In Armenia, for example, there was a substantial Urartian heritage, notably in construction and in burial-practice (Tiratsian 1985). However, while there was continuity of settlement at a small number of Urartian sites, in many cases such settlements were abandoned or became places for burial

(Tiratsian 1979). Even where there was continuity, place names might still change, so that Urartian Argishtikhinili became Armaouira (Armavir)(Sarkisian 1960, 32; Arakelian 1967, 39).

The fourth and third centuries B.C. saw a marked increase in urbanization in Colchis, Iberia and Armenia (Tiratsian 1979; Braund 1994, 122-70; Zardarian 1994). The increase may be observed even in Albania, which was never substantially urbanized in antiquity. We cannot identify most of the cities mentioned later by Ptolemy, but we can be sure enough from archaeology that the few settlements of Albania start to develop as towns from about 400 B.C. (Babayev 1990). By Pliny's time, Chabala seems to have stood out as the key settlement in the area (Khalilov 1974). In Armenia (though not elsewhere in the region, it seems) most cities declined or were destroyed in the fourth century A.D., a process usually attributed to Persian domination. The only city there to persist strongly was Doubios (Dvin), apparently the center of Persian administration (Sarkisian 1960, 19).

From the fifth century A.D., however, an internal literary tradition began within the region, both in Iberia and in Armenia. Accordingly, the earliest extant Georgian script has been found in Iberia from this period, inscribed on the church at Bolnisi. The Armenian tradition in particular provides substantial information (Hewsen 1992). Even so, its value for previous centuries remains a matter of substantial doubt (Sarkisian 1960, 18-19). In Armenia, and still more so in Iberia, this information seems better understood in the context of the early medieval period. Accordingly, the map is compiled on the basis of a combination of archaeological evidence with the literary testimony of the classical world, so as to focus upon the Greek and Roman perception of ancient Transcaucasia.

In Georgia there has been very substantial archaeological effort. Besides the numerous expeditions organized by the Centre for Archaeological Studies in Tbilisi under the direction of O. Lordkipanidze, there have been important initiatives by the Janashia Museum (often led by I. Gagoshidze), the Museum of Art and elsewhere. The long-standing excavations at Meschistha/Mtskheta led by A. Apakidze and V. Nikolaishvili deserve particular attention, for they have laid bare much of the enormous site of the ancient Iberian capital at the confluence of the Aragvi (ancient Aragos) and Mtkvari rivers (Russian Kura, ancient Kyros).

The various parts of Meschistha are easily confused, not least because the toponym itself may be used in rather different ways. In a restricted sense it may apply specifically to the settled area immediately west of the Aragvi's confluence with the Mtkvari, where the modern town now lies. However, it is also used to denote "Greater Meschistha," the whole area of settlement and fortification around that confluence, within which several other toponyms may be applied to particular locations (Armaziskhevi, Seusamora, for example).

Few churches have been marked, for they belong largely to a later period, despite frequent claims to antiquity. An exception, however, has been made for the important early church of Jvari, as also for the church at Bolnisi. Across the R. Aragos in Meschistha was built the first church in Iberia in the fourth century A.D., Svetitskhoveli.

Classical archaeology in Daghestan-Azerbaijan (Albania) and Armenia, by contrast, has been conducted by smaller groups of committed scholars. Recent work in Albania (pre-classical and classical) is summarized by Kasumova (1988) and especially Aliyev (1988), who indicates the polemics that may be involved (cf. Osmanov 1983; 1985; Nuriyev 1987). Tiratsian (1985) and Zardarian (1994) give valuable summaries for Armenia. Much of the most recent work across the region is outlined briefly in Lordkipanidze (1997).

There remains great scope for archaeology north from the marchlands of Azerbaijan and Daghestan. As it is, we already have strong indications of substantial Albanian cultural influence spreading northwards by the beginning of the first millennium B.C. (Khalilov 1965, 154; EncIran Darband, 14). Indeed, the extent of Albania northwards tends to be underestimated (EncIran Darband, 15), a fact which sharpens the problem of distinguishing between the Alanoi and Albanoi (see Introduction to Map 85). It may be that the pastoralism of the Albanoi enabled them to interact readily with the peoples of the northern steppe. Certainly, Strabo (note 11.4.3) treats Albanoi as quasi-Scythians, albeit less fierce; according to him, they need no sea, but live a Cyclopean lifestyle.

At Derbent (ancient Tzon), recent underwater research has shown some remains of harbor walls reaching under the present sea-level for at least 750 ft, with further remains apparently as far as 1,350 ft beyond the current shoreline. The Caspian Sea is well-known for its fluctuation in level over the centuries (EncIran Caspian; Introduction to Map 90). These walls seem as early as the Sasanian period. Along the coastline between the mountains and sea well south of Derbent, substantial walls are also known from the fifth century A.D. at least. Important questions about dating remain to be resolved, however; such resolution is made more difficult by the possibility of repeated reconstruction (EncIran Darband; Introduction to Maps 98-99). In any event, here lies the

easiest land-route from north to south through the main Caucasus, because it does not cross the mountains, but rather skirts around them along the narrow Caspian coastline. The greatest natural obstacle here was not the mountains but the sea, for strong southerly winds can whip it up to inundate much of the land. The phenomenon is well recorded in modern times (EncIran Caspian), and Romans were evidently aware of it too (Tac., *Ann.* 6.33; cf. Horace, *Odes* 2.9).

The area of Derbent is by far the most likely site for the “Caspian” or “Albanian Gates” (also in Middle Persian texts, Kasumova 1988, 88). In Late Antiquity, Derbent itself was called Tzon or Tzour. It was also one of the three locations given the name “Caspian Gates.” Although the route past Derbent gave the easiest terrain for north-south passage, it must be stressed that even the main Caucasus range was distinctly permeable (Braund 1994, 44-47). The map shows the principal passes.

The arrangement on the Darial Pass, the westernmost of the “Caspian Gates”, requires a word of explanation. The pass itself lies some 7 miles north of Qazbegi (C2). It is quite a level passage, with a bend at which the ancient fort was located on a craggy outcrop above the western bank of the river; substantial medieval remains are still visible (Tsitlanadze 1971). In Late Antiquity at least, this fort was known as Biraparach or Iouroeipaach; Pliny names it Cumania. Its location made it more part of the northern steppe than of Iberia proper, which may account for its non-Iberian garrison (Ioannes Lydus, *De Mag.* 3.52; Procop., *Bell.* 1.10.9-12). The natural obstacle to travel along this route lies to the south of Qazbegi, most familiar under its Russian name as Krestovyy Pass (numbered site 10). In their concern for the term “Caspian Gates,” the ancient sources can create the impression that it was the only important pass in the region. Some do show an awareness of other routes, however, including the unlocated Dareine. Moreover, those who have traveled these mountains cannot fail to observe the many available routes, both major and minor.

Of routes into Svaneti (ancient Souania) from the south and west, the impeccable Freshfield writes (1896, 1.185): “I have myself been in and out of Souanetia eight times, by seven different tracks. I have been twice through the Skenis Skali forests [sc. Tskhenis tsqali, ancient R. Hippos]. I have also penetrated the still wilder forests of the Kodori, and wandered among the scarcely less tangled woods that cover the northern slopes of the Laila.” From the north, there was a choice of routes into Svaneti from the R. Baksan. Then as now, however, probably the easiest route of all set off up the higher reaches of the R. Rioni (ancient Phasis/Rheon) from Kutaisi (ancient Kotais) (Freshfield 1896, 1.187; cf. Chartolani 1989; 1996). The importance of Souania, as became apparent in Late Antiquity, owed much to its location on passes north-south and east-west, among which the Mamison Pass (numbered site 7) is particularly important (Braund 1994, 311-14).

There were also important passes south of the Caucasus proper. In the south-west of the map, the Goderdzi Pass (numbered site 3) permitted easy passage from the Black Sea around Apsaros and Bathys Limen (Map 87 G3) up the valley of the R. Adcharistsqali into south-west Iberia. Rather to the east, the Zekari Pass (numbered site 4) offered a route into the hinterland of Colchis and western Iberia. Between Colchis and Iberia there was the key Surami Pass (numbered site 5), guarded by Sarapanis to its west. A little to the north, the situation was replicated by the Jvari Pass (numbered site 6) and the fort of Skandis to its west in turn. Routes between Iberia and Armenia only involved less significant passes, and some of these were in any case blocked by snow during winter (Strabo 11.5.6). Since no ancient roads are attested in the region, none are shown on the map. TabPeut’s route from Artaxata (Map 89 G1) to Sebastopolis (Map 87 G2) cannot be traced. As for the much-repeated notion of a trade route through here between the Black Sea and India, there is good cause for scepticism, despite ancient testimony (EncIran Caspian; Braund 1994, 40-42).

Another persistent notion is the availability of gold in the region, encouraged by the myth of the Golden Fleece and stories of gold on islands in the Caspian (Strabo 11.7.2). This notion too, however, has little to recommend it. The traveler Lamberti (1725, 178), who shows a sustained interest in economic matters, reports Strabo’s story of winning gold from mountain streams with fleeces, but only to dismiss it. He observes that: “...none of these supposed riches remains, nor even any memory in the land that any such riches ever existed.” It seems to have been the myth of gold-rich mountains that attracted Russian interest in the Ossetians in the eighteenth century; that interest evaporated when the emptiness of the story was realized (Klaproth 1827, 67-68). Far too much has been made of an isolated report by Botchorishvili in the 1940s of an encounter with some old men in Svaneti who claimed to recall the process of winning gold from streams through the use of fleeces (and to know of a lost city beneath the ice); she did not find the process being practiced, as has sometimes been imagined (Braund 1994, 21-25). All this is not to deny the existence of mines, as Pliny (*NH* 6.30) indicates among the Souanoi and little-known Valli of the mountains

(probably Ptolemy's Oualoi). According to travelers, there was lead and some silver (Klaproth 1827, 165), and even one or two gold-workings (Lamberti 1725, 195 on gold above Mingrelia).

More rewarding is Lamberti's evidence (*ibid.*) of the movement of Svans down into the lowlands beneath them twice a year—first to work on the harvest in return for salt, cloth and metal-goods and later, in winter, to barter their wood (cf. Klaproth 1827, 130). Blocks of salt were brought in from northern Armenia and used as currency in the mountains (*ibid.* 169). Transhumance was and still is a vital issue throughout the region, not least to the north. Strabo (11.3.3) reports the close links between the northernmost Iberians, dwelling in the mountains, and the peoples of the plains to their north, whom he terms “Scythians and Sarmatians.” It is important to remember that relations between the peoples of the region entailed friendship and accommodation, as well as intermittent hostilities. We happen to know that in the early nineteenth century the peoples of the mountains to their east in Daghestan were permitted to pasture their flocks on the plain to the north, as their lack of local pasturage required (Klaproth 1827, 60-62). Hostilities tend to be described and explained in our sources as border disputes. The border between the Iberians and Albanians seems to have been a particular source of difficulty, not least because it lies along a frontier between Iberian sedentarism and Albanian pastoralism (Aliyev 1974, 83-123; Braund 1994, 221-22). Rivers might constitute visible borders, as the Alazonios could do between the Iberians and Albanians (Pliny, *NH* 6.29; cf. 6.39 on the R. Kyros as boundary between Iberia and Armenia, conceivably Albania too; Ptol. 5.11.3). Rivers, however, were also precious resources in their own right, worth fighting for. Moreover, the inhabitants on both banks might have more in common than outsiders from further afield.

I have taken into account attempts made to identify sites which rely primarily upon the re-ordering of texts or similarities of place names from antiquity to the present day. Except, however, where the similarities are genuinely close, my preference has been to give such attempts short shrift. It should be recognized that some scholars have adopted a less conservative approach (notably Mouraviev 1985; 1988).

Directory

Map 89 Armenia

Compiled by S.E. Kroll (Iran), M. Roaf, St J. Simpson and T. Sinclair (Turkey), 1996

Introduction

Turkey

The Roman empire occupied parts of the area covered by the map, and from 591 nearly all of it. Moreover, irrespective of political hegemony, the Armenian and Syrian regions here were by virtue of culture and religion an extension of the Greek and Roman world.

Armenia in the Roman and Late Antique periods was bounded to the west by the R. Euphrates and to the south by the Taurus mountains, apart from the upper Tigris basin (districts of Ingilene, Sophanene and Arzanene). The area to the south of the Taurus was not considered part of Armenia nor settled by Armenians, but was inhabited by Syrians. The northern edge of the map more or less coincides with the boundary of Armenia in the Roman and Late Antique periods, except towards the east, where significant districts of Armenia—the plain east of the R. Araxes and the mountainous area around Lychnitis Limne—lie within Map 88.

The parts of Armenia on Map 89 consist mostly of plains separated by mountains and hills. Elevation rises from west to east, reaching about 5,000 ft in the Thospitis Limne basin. It drops, however, in the basin of Matiane Limne and the Araxes plain further north; these two areas were part of Atropatene during classical antiquity, but were counted within Armenia by the early seventh century A.D. (they are now in Iranian Azerbaijan). Despite its height and partly mountainous nature, the terrain of Armenia was capable of supporting a large and quite evenly dispersed population. Pottery surveys, together with such excavation as has taken place, show that Armenia was most densely populated during the Roman period, with the exception of the Thospitis Limne region, where the pre-Achaemenid Urartian occupation was the most active.

Archaeological excavation over the whole area, within classical Armenia or beyond, has been largely confined to rescue work behind the dams on the Euphrates and Tigris rivers, and to pre-Achaemenid sites elsewhere. Pottery surveys apart, surface-instrument survey of sites, as opposed to standing monuments, has been mostly limited to Urartian settlements. This said, Atropatene is an exception on both counts. More systematic excavation work could well lead to more complete and satisfactory identification of known toponyms, and would certainly permit a better-balanced picture of occupation with the inclusion of significant unnamed sites. Except in Atropatene, virtually none of the unnamed sites excavated counts as significant at this scale.

For the most part, the toponyms known from Greek and Latin sources occur in texts which—from a geographic perspective—are highly unsystematic. They are therefore supplemented selectively by Armenian and Syriac names.

Iraq and Syria

The difficulties of working with limited evidence (both written and material) in this general area, as outlined in the Introduction to Map 91, apply here likewise. The standard study of the region during classical antiquity is the important and useful work of Dillemann (1962). Unfortunately, however, many of his proposals cannot be confirmed, and his locations for ancient toponyms (except in a few cases) are disputed.

Although large numbers of churches and monasteries are recorded in texts (Fiey 1965), relatively few of them can be identified with existing ruins, and even fewer such sites can be shown to have existed before the Islamic period.

The road system is discussed by Dillemann (1962) and Oates (1968; 1990). Only small fragments of constructed roads have been discovered, and none of these is securely dated. Bridges have been identified as Roman, although they may date to a later period. Some milestones have been found, but perhaps not *in situ*. “Hollow ways” identified on the plains of northern Iraq and Syria (Wilkinson 1995) may indicate the positions of ancient routes.

There is no evidence for large-scale canal building except in the river valleys. A canal (not marked) investigated between Tell Sahlan and Tell Hammam al-Turkmen in the R. Balihu valley has been dated by excavation to the Hellenistic period (Gerritsen 1996). In all likelihood, during classical times, as today, canals were constructed to irrigate the river valleys.

Map 90 Media Atropatene

Compiled by S.E. Kroll, 1994

Introduction

The map approximates the region called by Greek authors Media Atropatene after Atropates, the satrap of Alexander who governed there and later became an independent ruler. The modern name Azerbaijan derives from Atropatene. Originally, Media Atropatene was the northern part of greater Media. To the north, it was separated from Armenia by the R. Araxes. To the east, it extended as far as the mountains along the Caspian Sea, and to the west as far as Lake Urmia (ancient Matiane Limne) and the mountains of present-day Kurdistan. The R. Amardos may have been the southern border.

Research in this region has always been hampered by national boundaries. Most of the area covered by the map belongs to Iran, but the northern parts belong to (former Soviet) Azerbaijan, to Armenia, and to the autonomous but disputed regions of Nakhichevan and Nagorno Karabakh. Apart from reports from travelers, no scientific research was undertaken in this part of Iran before 1945, nor has any comprehensive survey of ancient sites yet been carried out. As a result, many of the sites marked here have been discovered by chance, and not by intensive research. Because of the border situation, almost no topographic research has been possible in Armenia, northern Azerbaijan and the autonomous regions.

The state of historical and archaeological research, and the fundamental difficulties in identifying ancient settlements, are discussed most recently by Schottky (1989). It is still impossible to distinguish clearly between Achaemenid, Hellenistic, Parthian and Sasanian remains. As no coins were minted in Atropatene during Greek and Roman times (Schottky 1990), it is hardly surprising that coins are seldom found on sites there. Important contributions to the research on the region were written several decades ago, for example by Kiessling (RE Hyrkania) and Minorsky (1964 [1944]); these are still valuable for interpreting its ancient geography.

In antiquity, most of the region was lightly forested, but today hardly any forests can be found except near the Caspian. Deforestation began in the Bronze Age, and by medieval times the landscape must have been similar to that of the present. Most rivers, such as the Araxes, Kyros and Amardos, flow towards the Caspian Sea, though some drain towards Lake Urmia with its high degree of salination. The sparse scientific and historical evidence currently available suggests that the water-levels of both the Caspian Sea and Lake Urmia were higher in the past. The exact levels are not known, and changes occurred intermittently in any case. The shorelines shown are therefore approximate. The Caspian is shown with two. The lower corresponds to the approximate shoreline in c. 150 B.C., A.D. 200 and A.D. 600; the higher to the approximate shoreline in c. 400 B.C., A.D. 50 and A.D. 400 (see further EncIran 5, 488). Lake Urmia was possibly six feet higher in c. 300 B.C., and this level may have been maintained into the Islamic period.

Agriculture was possible where enough water was available, as around Lake Urmia and near the rivers. Even today, large-scale irrigation canals are unknown except in the lower Kyros and Araxes area, and there is no evidence that they already existed in antiquity. In the other parts of the region, pastoral herding was, and still is, the normal way of life. Roads and bridges were first built in medieval times. In winter and spring, rain and snow make even local travel here difficult. Thus in antiquity movement was largely confined to summer and fall.

Before Alexander, the area was virtually unknown to the Greek world, and so sites only occupied before the Achaemenid period are omitted. With the exception of some Greek (Parmenion possibly) and Roman military campaigns (in particular the famous siege of Phraaspa by Antony), few Greeks or Romans entered this area, and their geographers had no further knowledge of it. So it is hardly surprising that none of the few places, tribes or regions mentioned by Greek and Roman authors can be identified with certainty. Some major tribes have been marked, reflecting the situation as it may have been in Hellenistic times. Where tribes should be placed in other periods remains a matter for discussion (RE Hyrkania; Minorsky 1964; TAVO B V 1; Schottky 1989; 1991).

While the ancient city of Ganzak can be identified with the enormous ruins of Leilan with a high degree of probability (Minorsky 1964; Schwarz 1969, 1098-1100), the location of Phraaspa is more difficult and can only be guessed. I follow Minorsky, who separates Ganzak from Phraaspa (in line with Ptolemy, against Strabo). If Phraaspa is identified with the ruins at Zohak Qal'eh, the widely separated coordinates given by Ptolemy (Minorsky 1964, 104) can be accounted for. There is at least no dispute that the two archaeological sites with which Ganzak and Phraaspa are identified here stand out as the largest in the whole region, and that both were heavily fortified in antiquity. Another important site (but not as large as the places just noted) is the famous fire-temple Adur Gushnasp, situated high in the Kurdish mountains at the holy lake of Takht-i Suleiman, and never mentioned by any ancient western source. It is possible, however, that Heraclius during his campaign in A.D. 624 reached this temple and destroyed it (Minorsky 1964).

Map 91 Ctesiphon

Compiled by M. Roaf and St J. Simpson, 1994

Introduction

The region covered by the map lies on the frontier of the Greek and Roman world. It formed part of the early Seleucid kingdom, but subsequently the border between the classical world and its eastern neighbors ran through here. Since there was essentially no contact prior to c. 600 B.C., exclusively Late Assyrian and earlier sites are omitted. Islamic sites are likewise omitted unless they occur in classical sources or were occupied prior to c. A.D. 640. The long period of foreign domination (Achaemenid, Seleucid, Parthian, Roman, Sasanian, Byzantine) between the collapse of the “cuneiform” empires of Assyria and Babylonia and the rise of Islam is one that has yet to be treated with the same intensity as earlier or later ones. The variety and diversity of the sources give rise to notable difficulty, and no one scholar can control them all with equal confidence.

Settlements are restricted to regions where water was available. The area where cereal cultivation was feasible lies in the north-east segment of the map. To the south and west, either canal irrigation had to be used, or other subsistence strategies adopted (such as nomadic pastoralism, exploitation of trade or raw resources). Hence the distribution of settlements: these are found on the plains and in the mountain valleys to the north and east, as well as along the river valleys and the alluvial plains in the south-east, where irrigation was feasible. There are few settlements outside these regions (especially in the mountainous, inhospitable north-east), and very few of any significance. This said, the map may create a misleading impression in the area to the east of the R. Tigris, because very little survey work has been carried out here. Many sites in this area have had to be omitted because information about their dates of occupation is lacking. More generally, there are areas where the ancient landscape has been lost either through natural processes of erosion or alluviation, or through modern development and dam building; inevitably, our knowledge of such areas is likely to remain defective.

The sources underpinning the map are various. Of prime importance is archaeological fieldwork, but such investigations as have been made are very patchy. Some areas have been the subject of repeated investigation, while others are still *terra incognita*. Surveys have varied greatly in quality; moreover, many (including some of the most useful, because they cover the greatest area) have not been published in detail. Often the areas of sites and the periods of their occupation are not noted, and even when they are, evidence such as the types of potsherds discovered is not presented. Moreover since the pottery types are still not well known, and since more recent research has cast doubt on older period-attributions, the lack of detailed primary evidence prevents the reassessment of conclusions from it in the light of new information.

The ancient textual sources are very diverse, and provide uneven geographical and chronological coverage. The most important indigenous sources are Babylonian cuneiform tablets (mostly from the alluvium in the south-east, and restricted to the archaic, classical and Hellenistic periods); the Babylonian Talmud (its focus being on communities in the south-east with Jewish populations during the Roman and Late Antique periods); and Christian ecclesiastical literature (mostly concerned with northern regions during the Late Antique period).

For the involvement of Greeks and Romans in the area, the classical authors are fundamental. These texts are most useful for reconstruction of the historical geography when they offer itineraries or draw upon official documents. Most important are Herodotus, Xenophon, Alexander's historians, Isidore of Charax, Ammianus Marcellinus and Procopius. Less easy to use are such geographers and historians as Polybius, Diodorus, Strabo and Pliny, who preserved (with or without explicit acknowledgment) the works of earlier authors. The information in all the Greek and Roman texts, however, has to be treated with caution. Often it appears that the names used are not necessarily accurate. In rendering foreign names into Greek or Latin, variant spellings were typically used, and there is no easy way to decide whether one is more accurate than another. Equally, it is impossible to determine which of the many names mentioned only once or twice are genuine.

The identification of ancient places is often uncertain. The location of some ancient sites is not known precisely, and the association of a particular name with a site can be very problematic. Only very exceptionally do contemporary inscriptions confirm an identification (as is done by some dated Aramaic inscriptions, for example). More commonly, an earlier or later attestation of the name may suggest—but not necessarily prove—it. Another problem arises with names of places whose location is almost certain, but which cannot be identified with known archaeological remains. For example, Circesium may or may not be Tell Busaira, Nicephorium may be just to the east of Islamic Raqqa, ancient Idu may be under the modern town of Hit.

The date of a site's occupation can be equally problematic. Ancient names are often only recorded in later texts, such as accounts of Alexander's conquests written in the Roman period, or Islamic texts which mention many Sasanian towns. In these cases I assume from the context that the attestations are intended to refer to the earlier period. Where the name is not given a specific historical context, however, I take the attestation to belong to the period of the author.

The cuneiform sources are conveniently indexed by Zadok (1985), the Talmudic by Oppenheimer (1983), and the Christian sources rather less conveniently by Fiey (1973). Dillemann (1962) discusses the information from classical texts about northern Mesopotamia between the sixth century B.C. and sixth century A.D.; the late Sasanian and early Islamic geography of Iraq has been investigated by Morony (1982).

Although a wealth of information is recorded by nineteenth century travelers, their accounts have not proved very useful. Twentieth century investigators, such as Herzfeld, Musil, Poidebard and Stein, provide systematic coverage of large areas and provide useful reviews of the classical sources, but their descriptions and dating criteria are often not altogether reliable.

Excavation reports and recent archaeological surveys provide the most important sources for the locations of sites (although the smallest are mostly omitted here). Important archaeological surveys include Adams (1965; 1981), Geyer (1987), Ibrahim (1986), Kohlmeyer (1984), and Röllig (1977). The regions of Derband-i Khan, Dokkan, Hamrin, Haditha, Eski Mosul, and the Middle R. Habur, where dams were planned, have been the centers for intensive salvage excavations, but not all of these have been published in detail.

The secondary literature is of very uneven quality. The focus of the principal encyclopedias (RLAss, EncIs, RE) lies outside the region and period covered by the map. Relatively little systematic study of the historical geography has been made, except for discussion of the itineraries recorded in classical texts such as Xenophon, Alexander's historians, Isidore, Ammianus, and the problematic TabPeut. But even in these detailed accounts there are numerous uncertainties, and with a few honorable exceptions scholars have preferred to outline a single possible solution rather than stressing the inherent uncertainty in the evidence.

The major changes to the environment in the region during the last three millennia have been due to human interference with the water systems. In the twentieth century this has involved the construction of dams on all the major river systems and the consequent flooding of large areas. The modern lakes of Tharthar, Habbaniya, Razaza, Samarra, Dokkan, Derband-i Khan, Hamrin, and Haditha have all been removed from the map, and have been replaced either by the pre-existing course of the river or by a modified extent of the lake. It should be realized that the ancient lakes and rivers differed both from today's ones and from those recorded on earlier modern maps. In earlier periods, the construction and abandonment of canal systems have done more than dams to alter the landscape and the settlement patterns. These canals have not only altered the pre-existing drainage patterns, but have also affected the pattern of alluviation and erosion.

In the alluvial plain to the south-east there have been major changes in the courses of the rivers too. These likewise affect Map 93. There is not sufficient evidence to plot or date the successive courses of the Tigris and Euphrates. Such indications as exist are either textual or archaeological attestations of rivers running through or past particular cities such as Babylon, Seleucia and Ctesiphon. Various channels are shown for the Tigris and Euphrates once they emerge from their river valleys onto the alluvium below [Samarra] and Hit. Except where there is sound justification for drawing a particular course, rivers are marked as uncertain.

The course marked for the Tigris includes ancient channels observed from aerial photographs. Downstream from [Samarra] its course moved east in the thirteenth century A.D. to the present one; rather than the latter, the map shows only the ancient course going past [Ukbara]. Further south, however, the modern course is shown in addition to other possible channels. It is retained in part for reference, and in part because there is evidence that ancient

branches did indeed run approximately along the modern courses, since they went through Ctesiphon and Babylon. There is also evidence that at least one branch of the Tigris lay further north (in the vicinity of Opis), and was partly incorporated into the Nahrawan canal system.

Similar considerations govern the choice of courses shown for the Euphrates; essentially they follow those suggested by Adams in his surveys, and are intended to indicate some possibilities without necessarily ruling out others. The courses marked seem to be the most significant insofar as they mesh with the observed settlement patterns for the relevant periods. Although some texts appear to include clear enough descriptions of water courses, they lack sufficient detail, and there are too few definite reference points for channels to be plotted exclusively from them.

A further problem which has not been properly resolved is the distinction between canals and rivers. The ancient sources do not make a rigid distinction between them; river channels were sometimes turned into canals; and sometimes canals became major courses of rivers.

Although the rivers and canals shown give a reasonable impression of the major water courses, much of the alluvial plain—particularly those parts where ancient settlements have been identified—was covered with canals of various sorts, bringing water from the levees of the rivers and larger canals to the fields and orchards. There were also areas of lake and marsh; the excess water from the annual river-flooding was allowed to flow here, and the local topography, canal dikes and defensive walls (note the *Teichos Medias*) all prevented it from draining away. The locations of these canals, lakes and marshes for the most part remain uncertain, and would in any event have shifted during the timespan of the map. No doubt, however, at least some of the areas in the alluvial plain where ancient sites have not been recorded were marshes and subject to periodic flooding.

Another modern feature—removed from the map because of shifting locations—are fields of sand dunes, both in the alluvial plain, and in the steppe and desert to the south and west. The extent and position of these fields has varied in the past, tending to increase in periods when much of the agricultural land was abandoned, and to decrease during periods of intense agricultural exploitation. In the absence of firm evidence, none is shown here.

The possibility of shifting river courses—so obvious in the wide, flat alluvial plains—is also present in the valleys of such rivers as the Tigris, Euphrates, Aborras, 'Diabas', Radani, Zabas Megas and Zabas Mikros. Here river courses are rendered as certain, although clearly they have shifted over the centuries, as ox-bow lakes and traces of meanders show. Moreover canals probably ran along both sides of the rivers in the past, as they do today.

Only a few of the most important district or regional names can be marked. Sources have a tendency to confuse the capital of a province with the province itself (Morony 1982, 6), because regions were often named after their principal settlement; hence marking a district name does little more than indicate the location of the settlement after which it is named. Furthermore the same name may be applied to both larger and smaller administrative districts. There is no question that the extent and importance of districts varied over the centuries.

For similar reasons, tribal names are omitted: their territories were simply too extensive and variable.

Directory

All place names are in Iraq unless otherwise noted

Map 92 Ecbatana-Susa

Compiled by A. Hausleiter, E.J. Keall and M. Roaf, 1997

Introduction

The area covered by the map lies in Iran—except for the top left and bottom left corners, which are in Iraq. The main feature is the band of parallel mountain ridges running from north-west to south-east (part of the Zagrus chain: see further Map 3 D2). These make it difficult to cross the mountains from the Babylonian and Elamite plains in the south-west to the desert region south of the foothills of the Alburz mountains at the top right of the map. Though impossible to mark with precision, there was nonetheless a major route through these mountains. This is the Great Khorassan Road, part of the “Silk Road,” which from prehistoric times provided a link between the Mesopotamian plains and the resources of the Iranian highlands. As early as the Parthian period, traders and diplomats used it to travel between the Near East and China. In the first century A.D., the settlements and districts along it were recorded in Isidore of Charax’s *Parthian Stations*—Chala, Karina, Kambadene, Concobar, Ahmadan, Rhaga(i), and thence to central Asia and beyond. East of Concobar, there were alternative routes around the Alvand mountain. Further routes ran parallel to the Zagrus ridges, leading north-west to Media Atropatene (Map 90) and south-east to Susiana and Persis (Maps 93, 94); other, more difficult routes allowed contact between Susiana and the highland areas to the north and east.

The relative emptiness of most areas of the map reflects not so much absence of ancient settlement as the lack of detailed, published archaeological survey work. It is true that the highest parts of the mountains have only ever been used as summer pastures for transhumant tribes, while the inhospitable waterless desert of central Iran (the western edge of which appears here) has never sustained more than a minimal population. It may be confidently predicted, however, that future survey in the valleys and plains between, and to the east of, the steep ridges of the Zagrus chain will identify ancient settlements—some of them in all likelihood with substantial populations, because there is certainly sufficient rainfall here for the cultivation of cereal crops.

Changes in the physical landscape since classical times have yet to be studied in great detail. The courses of the rivers in the low-lying plains have always been subject to movement, and these are discussed in the Introduction to Map 93. The extent and character of the lakes and salt-marshes in the eastern part of the map vary from season to season and from year to year.

The major cities Susa, Ecbatana and Rhaga(i) remained important from the Achaemenid to the Sasanian periods. Also marked are a few other cities which can be identified either through archaeological discoveries or through texts; the latter include Arab geographers who include information about earlier periods. Otherwise textual information about this area is sparse. It is impossible to identify most of the places mentioned by Pliny, Ptolemy and other classical authors, and there are very few indigenous inscriptions of classical date that offer any useful geographical information. Many of the names that are recorded in Greek and Latin texts seem to be erroneous.

Despite difficulties of dating, the Chahar Taq (Four Arch) monuments found in the Zagrus mountains are marked (A2–B3; note also Map 94). These buildings, which include four arches supporting a dome, are thought to have been fire-temples built by the Zoroastrian population in the Sasanian and Islamic periods. All those known are marked, even though in fact some may have been built after the rise of Islam (EncIr 4, 634–38). A further problem with several of these monuments is their remote location, which has prompted contradictory reports by travelers and archaeologists; hence the use of a hollow symbol in these instances. A similar uncertainty about dating applies to the bridges marked; they are normally assigned to the Sasanian period, but may be later.

Today, tribal groups such as the Kurds, Lurs and Bakhtiari dominate the Zagrus mountains. To locate similar tribes mentioned in ancient texts is difficult. This is partly because the tribes were (and are) transhumant, spending the winters in the lower-lying plains and the summers in the mountain pastures; partly, too, because tribal groups have often moved from one region to another; and partly because different groups are given similar names, although

in Greek and Roman texts these may in fact be merely descriptive (thus Scenitae, “tent-dwellers”). For these reasons it has proved impossible to mark names of tribes on the map.

The location and extent of different regions or districts must be regarded as approximate for the most part; for the Sasanian period, they are based on Gyselen (1989).

Map 93 Mesene

Compiled by A. Hausleiter, M. Roaf, St J. Simpson and R. Wenke
with the assistance of P. Flensted-Jensen

Introduction

The area of the map includes the southern part of Babylonia, much of Susiana, part of the Arabian desert, and the head of the Persian Gulf. Outside the alluvial plains there was only sparse occupation. The lower Mesopotamian plain lies between the western desert plateau and the mountain ranges of the Zagrus. The plain can be divided into a sequence of different zones created on one side by the squeezing of its lower end by the cone of the Wadi Batin (running north-east through C5-C4), and on the other by the delta of the Karkheh and Karun rivers. These zones comprise an alluvial area to the north of Babylon (Map 91 F5), the delta region of the Tigris and Euphrates rivers, a region of shifting lakes and marshes, and an estuary region to the south of [Basra].

The same zones may have existed in classical antiquity, but there have been major changes in the geomorphology and vegetation since then. The Tigris and Euphrates rivers have flowed in a variety of channels and artificial canals. Their exact ancient courses are unknown; they can only be partially reconstructed from textual references to named watercourses passing through particular settlements, and from traces visible on aerial photographs. Even during the timespan of the map the courses moved many times, so that not all those shown were in use at any one point. Only very limited geomorphological research has been carried out, and little of it is relevant to classical antiquity. Undoubtedly, however, all significant settlements lay on a watercourse, and networks of canals were constructed across much of the alluvial plain. These are only hinted at on the map, but an idea of the possible pattern can be found in the pioneering work of Adams (1981). It is often hard, if not impossible, to distinguish artificial, man-made canals from natural river-courses, and the map makes no attempt to do so. Another omission is levees and dikes (the former almost certainly present along the different branches of the Euphrates).

It is no less challenging to indicate the areas in the alluvium which were covered by lakes and marshes. The extent of such features has varied from season to season and from year to year. There are signs, however, that even greater changes are involved. In the fifth, sixth and seventh centuries A.D. there was catastrophic flooding of the R. Tigris, which covered much of the southern part of the alluvial plain; the lakes and marshes formed then persisted until the twentieth century. The earlier pattern is not clear, although it is certain that some areas covered by water in the Islamic period were dry land before.

There have been changes to the coastline too. In the third millennium B.C. it lay much further inland. During the Seleucid and Parthian periods, when there was a fall in global sea level of about six ft, the coastline may have been further south than at present. In the late Sasanian and early Islamic period (c. A.D. 600), sea level was slightly higher than at present, and so the coastline may have been further inland. The apparent absence of settlement sites in the low-lying alluvium near the coast suggests that this region was either estuarine with extensive lagoons, or was subject to invasion by the waters of the Gulf. In addition to sea level changes, continuing alluviation, movements of the river-courses and local subsidence have all determined the extent of lagoons, marshes and lakes; but the precise limits or locations of these features cannot yet be determined. It is at least clear that the major Tigris floods of Late Antiquity substantially altered the topography of the plains watered by both it and the Euphrates. The rendering adopted here is based on Sanlaville (1989).

Since the locations of modern sand dunes are not related significantly to the distribution of ancient sites, these are omitted from the map. Even so, it is important to bear in mind that during antiquity, too, there were substantial belts of sand dunes in the region.

The cultural features marked derive from a wide range of textual and archaeological sources. Apart from the Greek and Latin works treating this region (notably, Pliny, Ptolemy, TabPeut), there are cuneiform tablets (both Akkadian and Elamite), the Babylonian Talmud, and various Syriac documents. Native Parthian or Pahlavi texts are

rare, but much of the Sasanian tradition was preserved in the works of Arab geographers. Unquestionably, the Greek and Latin texts are confused; the locations and name-forms given by them are to be considered very unreliable. Places recorded in cuneiform texts are more dependably identified, in some cases because inscribed bricks have been found on the sites. The identification of many important settlements mentioned in ancient texts remains uncertain. In some cases there may well have been more than one settlement with the same name (thus there is some evidence for their being at least two towns on the R. Tigris named Apamea).

Apart from excavation at certain sites, the archaeological evidence is that of surface survey. In a few areas systematic and more or less comprehensive surveys have been carried out (note especially Adams 1981), but all too often areas have not been surveyed at all, or the researchers have focused only on earlier, supposedly more appealing periods. The absence of sites in particular areas of the alluvium should certainly not be taken as proof that there was no settlement there. Future research and new discoveries are sure to alter the impression created by the map (note now Mehrkiyan 1997).

Most of the sites found by survey cannot be given their ancient names, even those which must have been substantial cities covering more than 50 hectares. The names of some may, of course, appear among the Unlocated Toponyms.

Only settlements thought to have been significant are marked; sites covering less than ten hectares are normally omitted.

Beyond the plains watered by the Tigris and Euphrates, very few sites are marked. A number of fortresses and road stations have been found; the evidence suggests that—at least in their present state—they belong to the Islamic period, although some were no doubt constructed earlier. There is no evidence on the ground for the construction of a ditch and line of fortifications from the region of Hit (Map 91 D4) to the Gulf in the Sasanian period; probably the later accounts recorded by Arab geographers were based on a misunderstanding.

The areas outside the irrigated plains were not completely deserted, however, as they were used by the powerful Arab tribes which at times exerted domination over the settled areas. The territories covered by these tribes were extensive and shifted frequently. The names given to the tribes in classical authors are often very general (thus Arabs) or descriptive (thus Scenitae, “tent-dwellers”), or taken from the places in which they were living (thus Orcheni in the region of Orchoe). The only tribal name marked is that of the Banu Lakhm, the group led by the Lakhmid dynasty based at their capital of [(al-)Hir(t)a], which ruled southern Babylonia as vassals of the Sasanians.

No constructed roads have been identified here, and much of the commercial traffic went by water. It is likely that camel caravans used the same routes in antiquity as have been used by pilgrims and merchants in more recent periods.

The identification and extent of different regions are the subject of much debate, and they also changed during the timespan of the map. Authors were not consistent in their usage either; the same name may be given to different regions, or there may have been a shift of name as the result of some political or administrative change. For example, there appear to have been at least two regions called Mesene, one (unlocated) along the Tigris in the area of Ctesiphon (Map 91 F4), the other on the lower reaches of the river, marked here and also known as Characene.

The names Mesopotamia and (As)Syria were sometimes used to include the alluvial plains of the Euphrates and Tigris, but not normally. It seems probable that in the sixth century B.C. the island of Icarus was part of the region of Dilmun, as also the island Tylos (modern Bahrain, Map 95 C3).

On the names of districts in the Sasanian period, see Morony (1982) and Gyselen (1989).

Map 94 Persis

Compiled by A. Hausleiter, M. Roaf and R. Wenke, 1997
with the assistance of P. Flensted-Jensen

Introduction

The map covers the ridges and valleys of the southern Zagrus mountains and the narrow coastal plain to the south-west, corresponding to the heart of the provinces of ancient Persis and modern Fars.

Since classical antiquity there have been changes to the coastline. During the Seleucid and Parthian periods, when there was a fall in global sea level of about six ft., the coastline may have been further south-west than at present. In the late Sasanian and early Islamic period (c. A.D. 600), sea level was slightly higher than at present (Sanlaville 1989). These changes are indicated by two approximate coastlines.

Permanent settlements today, as in the past, are largely confined to the valleys. The mountain slopes, however, are—and no doubt were—exploited by transhumant pastoralists. The north-east region of the map does not receive enough rainfall for growing cereal crops. *Qanats*, a typically Persian form of underground irrigation channel, were therefore constructed. Although they are omitted from the map, by the sixth century A.D. there were qanats in many of the upland valleys. A few dams and surface canals are shown; their dates, and in some cases their courses, are often uncertain.

The cultural features shown reflect not only the extent and character of ancient settlement, but also archaeological and historical research in the region. Virtually none of it has been systematically surveyed. Many sites and monuments have been noted by travelers, but often—unfortunately—without the provision of precise locations. Even when co-ordinates are recorded, they are liable to prove inaccurate. In cases where a precise location cannot be established therefore, a hollow symbol is used. Nevertheless the emptiness of the northern half of the map does fairly reflect the more hostile character of this area, very mountainous in the west and having little rainfall in the east.

The cultural features marked derive from a wide range of textual and archaeological sources. The Greek and Roman authors (in particular Pliny, Ptolemy and the historians of Alexander) are typically confused, and not to be relied upon for the locations and forms of names. By contrast, the cuneiform tablets from Persepolis written in Elamite (Sumner 1986; RGTC 11) record place names more reliably (allowing for the problem of transcribing Persian names in Elamite syllabic script). Native Parthian or Pahlavi texts are rare, although much of the Sasanian tradition was preserved in the works of Arab geographers. Even so, the identification of many important towns and cities mentioned in ancient texts remains uncertain. Metzler (1977) made suggestions for the identification of the places recorded by Ptolemy with those found in the Persepolis Fortification Tablets (Hallock 1969), and these have been reviewed by Vallat (RGTC 11) in his gazetteer of place names found in Elamite texts.

Apart from excavations of certain sites, the archaeological evidence is that of surface survey. Almost the only systematic and more or less comprehensive such work has been by Sumner (1979) in the Kur river valley, but even it is not published in detail. Most of the area has not been surveyed at all. Thus the absence of sites in particular locations should not be taken as evidence that there was no settlement there.

The single stone-paved road shown (probably of Achaemenid date) formed part of the route from Persepolis to Susa (Map 93 E1), continuing west past Tepe Suruvan and then turning north-west towards Susiana. A section of rock-cut road south of Pasargadae is too short to be marked (Stronach 1978, 166-67). Elsewhere, other constructed roads have been noted, but there is no evidence for dating them to the pre-Islamic period; in addition, their courses have not been recorded accurately, and so they are omitted. Lack of space at this scale makes it impossible to mark the canal that ran from east of (I)Stakhr past Naqsh-i Rajab to Persepolis (Kleiss 1994, 166).

A particular problem is presented by the Chahar Taq temples which are found throughout Fars (Vanden Berghe 1984). These Zoroastrian temples may date either to the Sasanian or to the Islamic period. Those for which an Islamic date has been suggested are omitted, as are some others whose location is known only vaguely from the sources. Some of those that are marked may well be Islamic in fact, and in a number of cases their locations must remain approximate. Chahar Taq temples within settlements—as at Ardashir-Khurra—are omitted.

The well-preserved remains at Sarvistan, once dated to the Sasanian period, are omitted out of respect for Bier's conclusion (1986) that they belong to the Islamic period. Likewise omitted are monuments dated to the Sasanian period on the basis of their similarity to Sarvistan.

The probable identification of pre-Islamic Shiraz with Qasr-i Abu Nasr, rather than the modern city of Shiraz, is a notable illustration both of the possibility that place names have moved, and of the danger of identifying ancient sites on the basis of similar modern and ancient place names.

Greek and Roman sources record numerous names for tribes in this region. Since there is no evidence for their precise locations (and indeed because of transhumance their territories may have been extensive), none is marked (see, however, the Directory for some names).

Very few district names are marked. For such names in the Sasanian period, see Gyselen (1989); often they are difficult to locate, or just derive from a major settlement such as Ardashir-Khurra.

Map 95 Tylos

Compiled by D.T. Potts, 1995

Introduction

The map can show few ancient toponyms, hydronyms and ethnonyms. Rather, it is dominated by the modern names of archaeological sites at which important finds of Greco-Roman origin, or of a Greco-Roman-related nature, have been made. The reason is quite simply that this area lay largely beyond the ken of ancient authors such as Strabo, Pliny and Ptolemy, whose works show little familiarity with the landscape. Theophrastus' works contain important detail on the natural history of ancient Bahrain, but no toponyms apart from Tylos. The city of Gerra (possibly modern Thaj) was reasonably familiar to a number of authors, but the precise locations of minor settlements and tribes were not. In many cases it is particularly difficult to be certain whether or not an east Arabian toponym or ethnonym falls within the limited scope of Map 95, and I have therefore listed most unlocated toponyms in the Directory for Map 4.

The most recent studies of the geomorphology of coastal Arabia reveal evidence of very minor fluctuations in sea level during the later Holocene era. Around Bahrain, for example, sea levels may have been slightly lower in the last centuries B.C. and first centuries A.D. than they are today, with the consequence that the shoreline near the great mound of Qalat al-Bahrain was further north than at present. Along the coast of Sharjah in the United Arab Emirates (Map 95, inset), sea level fluctuations during the Iron Age and Hellenistic periods are thought to have eroded the margins of a series of coastal lagoons, which resulted in "coastal" settlement being situated at points well inland from the modern shoreline (Sanlaville 1987, 216, 218). Along most of the lower Gulf coast, however, it would be impossible—in the absence of detailed, local studies—to represent graphically the shoreline of the Classical through Late Antique periods with any confidence. For this reason I have not attempted to modify the course of the Gulf coast, but have left it as it appears on modern maps.

Rather, the more pressing problem is to come to terms with the mass of toponyms and ethnonyms preserved in the ancient literary sources relating to this area, for which nothing but the most speculative identifications exist. Although scholars such as Forbiger (1844), Sprenger (1875), Schnetz (1920), von Wissmann (1967; RE articles), Groom (1994) and myself (1990) have proposed a number of identifications, none has been confirmed by epigraphic evidence, and in the absence of further evidence they can only be considered conjectural.

Map 96 Hyrcania

Compiled by E.J. Keall and M. Roaf, 1997

Introduction

Portions of four natural regions dominate the map: the Caspian Sea (for its level, see the Introduction to Map 90); the flat plains east of it; the Alburz mountains; and the central desert of Iran.

The region is not well-known archaeologically. The Gurgan plain has been surveyed by Kiani (1982), and the region round [Damghan] by Trinkhaus (1989); but very little research has been carried out elsewhere. Because the coastal plains south of the Caspian receive abundant rainfall, they are intensely farmed today, and were no doubt densely settled in antiquity too, as was the Gurgan plain. Otherwise, human settlement was only possible where water was available. Today, many settlements south of the Alburz mountains are dependent on the tapping of the groundwater by means of underground canals known as *qanats*. It is uncertain how early this technology was exploited in the region. The lower slopes of the Alburz support extensive forests and may well have contained permanent settlements, but the more elevated regions would only have been used by herders in the summer months. The lack of rainfall to the north of the Gurgan plain, as well as south of the Alburz, means that few permanent settlements existed there.

The “Alexander Wall” or “Red Snake,” running for approximately 95 miles, formed the border of Hyrcania, and served as a barrier against the tribes to the north (Kiani 1982). It was probably erected in the Parthian period, but remained in use in the Sasanian period (when some of the forts along it may have been built). The location of the pre-Islamic city of G(o)urgan is uncertain. It may have been in the neighborhood of the Islamic city of [Jurjan], but remains of earlier date have not been found. The possibility that the name might have moved is highlighted by the fact that the name Gurgan is now attached to the city known until the early twentieth century as Asterabad, and situated some 50 miles west-south-west of Jurjan.

The location of tribal groups is difficult to establish, so that the proposed locations for the few marked may well be inaccurate. Many tribes moved with the seasons to exploit the pastures available for their flocks. Tribes also moved into new areas, either voluntarily like the (A)Parni in the third century B.C., or under pressure from the ruling powers, like the Mardi (not marked) who were moved to guard the region round the Caspiae Portae (Map 92 H1), west of Cho(a)rene.

Map 97 Parthyene

Compiled by E.J. Keall and M. Roaf, 1997

Introduction

The map is dominated by the mountain ridges of the Koppet Dagħ, Allah Dagħ and Binalud in north-east Iran. To the north lies the Karakum desert in present-day Turkmenistan. Nisa(ia), the first capital of the Parthians, is situated near the southern edge of the desert; this region has been investigated by Soviet archaeologists, but very little systematic survey on the Iranian side of the border has been published. Hence the locations and identifications of ancient toponyms marked are for the most part uncertain.

In the Achaemenid period this region belonged to the province of Parthava (Parthia), which also included Hyrcania. In the third century B.C. the Parni tribe invaded and adopted the name of the province as their own. In the following two centuries they established Parthian rule over most of the Near East as far west as the R. Euphrates.

This region was almost unknown to Greeks and Romans, so that the names given by such authors as Strabo, Isidore of Charax, Pliny, Ptolemy and TabPeut may well be distorted; indeed, some are plainly so garbled as not even to merit inclusion as Unlocated Toponyms. There are few local texts which can illuminate the historical geography; more helpful are those early Islamic writers whose work contains information about earlier periods.

Map 98 Merv-Bactra

Compiled by F. Hiebert, P.L. Kohl and St J. Simpson (west), 1995

Introduction

Map 98 Merv-Bactra

Map 99 Bactria

West

Map 98 largely covers the regions known to classical authors as Margiana, Ar(e)ia and the western part of Bactria. This area corresponds in modern political terms to north-east Iran, north-west Afghanistan, southern Turkmenistan and southern Uzbekistan. Ancient and modern settlement patterns have been strongly dictated by the physical geography. It consists of a high Iranian plateau which is ringed by mountain chains that continue into Afghanistan, and drained by numerous streams as well as three major rivers, the Arius (known as the Har-i Rud in Afghanistan, or Tedjen in Turkmenistan), Margus (Murghab), and Oxus (Amu Dar'ya). Each of these rivers flows northwards to form large delta-fans capable of supporting substantial populations.

Classical authors offer vague descriptions of this region, as well as references to major urban centers or rivers. Arab conquest accounts, Syriac church synod lists, coin legends and Sasanian *bullae* provide some additional toponymic information (Le Strange 1905; Fiey 1973; Gyselen 1989). Archaeological discoveries, however, remain the primary source for reconstructing ancient settlement patterns. Even so, systematic archaeological investigation has been largely confined to the Margus oasis area and to southern Uzbekistan (north of the R. Oxus). Other areas of southern Turkmenistan, north-east Iran and north-west Afghanistan have attracted less archaeological attention. This is reflected by the distribution of places marked on the map, and their limited number.

Within southern Turkmenistan most of the archaeological work has been conducted by Soviet teams belonging to Yu.T.A.K.E. (Southern Turkmenistan Complex Archaeological Expedition), founded in 1946. Over the past decade a number of foreign expeditions have been working in the country. As yet, most of this research is only published as preliminary reports, and problems remain in the exact dating of surveyed sites. Nevertheless the state of research for the early periods has been ably synthesized by Kohl (1984), and more general summaries covering the classical and later periods have been published by Frumkin (1970), Harmatta (1994), and Litvinsky (1996).

The Merv oasis has been extensively surveyed, first by an American team in 1904, and most recently by a joint Turkmen-Russian-Italian expedition (Gubaev 1998). A number of palaeochannels and sites dating from the third millennium B.C. to the Islamic period have been mapped, although the classical and later periods are treated summarily. Evidently there was a gradual westward shift of the hydrography, combined with retraction of the irrigated settled area into the core of the oasis during the classical period. These developments appear to have resulted from an interplay of neotectonics, climatic change and human activity.

The drainage pattern was irrevocably changed in the twentieth century with the construction of the Karakum canal, which draws water from the Oxus through the Margus and Arius deltas. In addition, modern agricultural policies have led to the destruction of many small sites. The map marks the most significant surviving archaeological sites, major palaeochannels reconstructed from satellite images and aerial photographs, and major ancient canals. It must be stressed that the exact dates and courses of many of these water channels are hypothetical. Moreover, as in other intensively settled and irrigated alluvial regions, the pattern of canals must have changed over time. The heart of the Merv oasis is known to have been intensively cultivated in antiquity (cf. Strabo 11.10. 2), and archaeobotanical, charcoal and zooarchaeological analyses confirm the existence of a thriving agricultural economy there, at least during the Sasanian period.

Antiochia is the principal site within Margiana. Little is known about its Hellenistic or Parthian periods. These are now buried deep below later Sasanian and Early Islamic occupation-levels that, judging by aerial photographs,

appear to have preserved a street-plan based on rectangular *insulae*. Excavations conducted since 1992 as part of the Turkmen-British Merv Project have added important new information on the Hellenistic, Parthian and Sasanian fortifications, as well as other areas of Sasanian housing (Herrmann 1999). With the destruction of many rural sites in the hinterland of Antiochia, those sites that do survive tend to be larger settlements or substantial fortresses; a selection is marked. Historical accounts suggest that the Margiana region was not confined to the delta of the Margus, but extended southwards along the river valley a short distance above the suggested location for Iasonion. There has again, however, been little archaeological survey work along the middle course of the R. Margus.

A number of the places marked in the Ar(e)ia region of Afghanistan reflect chance finds and unexcavated sites rather than systematic investigation. The region around Alexandria Ariorum—presumed to lie beneath or close to the present city of Herat—has likewise received little archaeological attention. The lower course of the R. Arius has not been properly surveyed either, although a number of Partho-Sasanian and later sites exist in the Serakhs area and along the piedmont zone to the north-west.

Map 98 east, and Map 99

Eastwards, the classical world extended to central Asia (modern Turkmenistan, Uzbekistan and northern Afghanistan), where western colonists and artisans brought trade items and cultural features into an already well established local culture. In the oasis regions of northern and southern Bactria, late Iron Age and Achaemenid/early Parthian period settlement maintains the Bronze Age pattern of large-scale irrigation agriculture with sites interspersed along canals. In the foothill regions and along the banks of large rivers, land use changed from small-scale irrigation to more complex irrigation systems involving the use of *qanats* and water wheels, which allowed urban sites to develop here too.

The period from 330 to 150 B.C. sees post-Alexandrian Seleucid and Greco-Bactrian communities incorporated as satrapies. Subsequently, the period from 150 B.C. to A.D. 225 shows the further development of local settlements within the context of important Parthian, Roman and Kushan imperial policies. The establishment of many new settlements, particularly along the R. Oxus, reflects both a technological shift and the growth of foreign colonies, making the distinction of purely “classical” sites quite difficult. Maps 98 and 99 feature not only the larger sites known to Greek and Roman authors, but also the network of smaller oasis sites which made this area so important to the classical world. Following the establishment of Sasanian hegemony (A.D. 225-640), the region became a major breadbasket for the eastern empires, and was thus in turn an important target for early Islamic expansion.

The boundary of classical influence to the north and west is somewhat arbitrary, since the area is characterized by many contiguous local cultures within the larger context of imperial rule. Particularly intriguing is the establishment of a series of walls, traditionally dated to the Seleucid period (but inadequately investigated), that form several boundaries: between Bactria and Sogdiana; to the north and north-east of Bactria; in the Merv oasis; north of the Gurgan plain (Map 96); and further west, inland from the western shore of the Caspian Sea (Map 88).

Note that the famous Sar-i Sang lapis lazuli mines of Badakhshan fall immediately beyond the edge of Map 99 (east of E3).

South of the R. Oxus is the heartland of classical Bactria. Soviet-Afghan, French, Japanese, British and American archaeological teams have established broad parameters for settlements located here in deltaic oases and along river-beds, and for the coincidental modifications of the landscape. By far the most extensive survey work was conducted by Soviet-Afghan (Kruglikova 1976; 1986; Sarianidi 1989) and French teams (Bernard 1978; Gentelle 1989; Lyonnet 1997; Gardin 1998). Ball’s encyclopedic compilation of archaeological sites in Afghanistan (1982) was assembled shortly before the Soviet invasion, and remains the standard reference for this archaeologically rich region. The present map reflects not only the standard syntheses (note Tarn 1951) of the classical historians, particularly Herodotus, Strabo, Arrian and Ptolemy (Holt 1988), but also the extensive modern surveys and excavations of sites of the period.

While the Oxus has often been cited as the northern boundary for classical Bactria, P’iankov (1982) argues persuasively that ancient texts take the areas north of the river to be likewise part of the classical satrapy of Bactria. Intensive archaeological research conducted in Soviet Turkmenistan (Pilipko 1985), Uzbekistan (Rtveladze 1974; 1976) and Tajikistan (Stavisky 1986) has identified the settlement patterns north of the Oxus and its headstream from the east, the P’yandzh (Map 99 D2-E2). The establishment of cities such as Tarmita, Takht-i Sangin (the site of the

Oxus temple) and “Greek” cities along the banks of the Oxus, demonstrates a pattern similar to southern Bactria. Some areas may seem unoccupied (for example, along the north bank of the Oxus west of Tarmita) only because they have not yet been properly surveyed due to state security or political restrictions. Archaeological surveys suggest that the northern region was in fact as densely occupied as southern Bactria, with a strong shift in settlement location by the early Parthian period (c. 150 B.C.). During the Kushano-Sasanian periods, northern Bactria was clearly a melting-pot of cultures. Buddhism, Mithraism, Christianity and Zoroastrianism met here, and there were also links to China from the west.

Introduction

The linework for boundaries does not distinguish between sections that are known and those that can only remain approximate.

Map 101 owes much to Barnes (1982, 201-25; note the omission of Insulae from the diocese of Asiana on 206); likewise Map 102 owes much to Honigsmann's 1939 edition of Hierocles (HierSyn). For both maps, Jones (1964, Appendix III and accompanying maps) has also been valuable.

Achaia

Note NP Achaia.

Aegyptus, Libya (Bagnall)

For the boundary between Cyrene and Aegyptus, see Romanelli (1940). Pliny (*NH* 5.38-39) seems to include Darnis within the province of Cyrene, but Ptolemy (4.5.1; 4.7.1, reflected here) places it in Aegyptus. The date of any such change remains unknown.

For the boundary between Aegyptus Herculia and Thebais in the Verona List, see Lallemand (1964, 44-46). For boundaries between Aegyptus Iovia and Libya Inferior, and between Libya Inferior and Superior, see *ibid.*, pp. 47-49. For boundaries between Aegyptus Iovia and Herculia, note *P.Oxy* L.3574, LI.3619, LIV.3756. The Boubastites Nomos was probably part of Herculia, and the boundary shown reflects that likelihood; there is no other evidence for its course.

For the southern boundary of Aegyptus during the first three centuries A.D., see Burstein (1998).

Africa (Wells)

For Africa Proconsularis, note Lepelley (1981, 10). The boundary shown between it and Numidia retains Musti and Mactar within Proconsularis, swings west to pass closer to Thala than to Sufes, and thence passes closer to Theveste than to Cillium. The boundary shown between Numidia and Mauretania Caesariensis retains Milevis in the latter province. The boundary between Mauretania Tingitana and Mauretania Caesariensis is taken to be the R. Mulucha?; see further the Introductions to Maps 28 and 29, and Siraj (1995, 402-408).

Asia Minor (Mitchell)

Map 100: see Mitchell (1993, 151-57). For Trajan's provinces of Armenia and Mesopotamia, abandoned by Hadrian, see Lightfoot (1990). Late Antique sources mention the establishment of a third province (Assyria) by Trajan, but it remains otherwise unattested.

Map 101: see Mitchell (1988) 107.

Map 102: see Mitchell (1993) 158-63.

Britannia (Esmonde-Cleary)

The northern boundary of the single province at the death of Trajan is uncertain, but must have been somewhere in the area of where Hadrian's Wall would be built. There is no evidence for subdivision of the province before the early third century.

The Verona List names four provinces in the diocese of Britanniae. On the evidence of NotDig, which lists the governor of Maxima Caesariensis as a *consularis* and those of the other provinces as *praesides*, the argument has been made that Maxima Caesariensis was the "senior" province and took in the former provincial, now diocesan, capital, Londinium.

In addition, there is the evidence of the bishops from Britain subscribing to the *acta* of the Council of Arles in 314. Unfortunately the list is corrupt. Two sees, London and York, are tolerably certain. One may be Colchester or Lincoln (usually taken as Lincoln, because Colchester is close to London). The fourth is unknown.

An inscription (RIB 103) from Cirencester (Cironium) mentions a *primae provinciae rector*. This is taken to locate Britannia I in the south-west, perhaps with Cirencester as its capital. Thus, with an increasing degree of uncertainty, the four provincial capitals may have been London, York (Eburacum), Lincoln (Lindum), Cirencester. The locations of the provinces Flavia Caesariensis and Britannia II are guesswork, however, and absolutely nothing is known of any provincial boundaries. For further discussion of capitals, see Haensch (1997, 121-30).

Danube and Balkans (Wilkes)

Pannonia Superior and Inferior, Savia, Valeria: see RE Suppl. 9, cols. 584-89. The shift of boundary with Italy's Regio X that moved the Emona region into the latter occurred before the end of the first century (RE Suppl. 11, cols. 571-76). After 510 the province named Pannonia was the southern part of the former Pannonia II, comprising the regions of Sirmium and Bassiana; see Popović (1971, 50-51).

Dalmatia, Praevalitana: see Wilkes (1984, 78-80). The boundary with the Pannonias shown on Map 100 follows Dušanić (1977, 54). For the Verona List, see RE 22, cols. 1674-75 and Suppl. 8, cols. 22-23.

Moesia Superior and Inferior: for Map 100, see Mócsy (1970, 9-16). For Moesia I and II, Dardania, Dacia Ripensis and Mediterranea, and Scythia in the Verona List, see Velkov (1977, 61-63 and map).

Dacia: see TIR Aquincum and TIR Romula. The boundaries shown on Map 100, and the three sub-divisions of the province, in fact reflect changes made at the beginning of Hadrian's reign. At this time, the Banat plain to the west, as well as that of Wallachia east of the lower R. Olt (ancient Alutus), were evacuated.

Thracia, Haemimontus, Rhodope, Europa: see Velkov (1977, 61-63 and map); Gerov (1979).

Macedonia, Epirus Vetus and Nova, Thessalia: see Papazoglu (1979; 1988, 90-98).

Gaul (Drinkwater)

See Jones (1964); Moreau (1972); Heinen (1985); Duval (1989 vol. 2, map).

Two inscriptions (ILS 1368, 1417) indicate that at one indeterminable stage there was a province named Alpes Atractianae / Atractianae et Poeninae. Nothing more of it is known, not least its relationship to Alpes Graiae et Poeninae (Moreau 1972, 9-10). Altogether there remains considerable uncertainty about the boundaries and status of the Alpine provinces. For discussion, see Haensch (1997, 142-46); for Alpes Maritimae, note Rivet (1988, chap. 31).

Germania, Raetia, Noricum (Wells)

See Schönberger (1969, especially 164-71 and Map B); Alföldy (1974, 57-61, 199). At the death of Trajan, the eastern boundary of Germania Superior is taken to be the Neckar *limes*.

The boundary between Raetia and Noricum remains controversial, but is taken here to be the R. Inn (ancient Aenus). The southern boundary of both provinces was probably the watershed.

Hispania (Knapp)

The standard treatment of provincial boundaries here is still Albertini (1923). While there remains some controversy about the exchanges of territory between Tarraconensis and Baetica, and between Tarraconensis and Lusitania, these transfers certainly took place before the reign of Trajan and are thus reflected on Map 100.

Italia (Harris)

Almost everywhere the boundaries of the Augustan regions (I-XI) can be closely established, chiefly from Pliny (*NH* 3.46-74). The boundaries of the provinces in the Verona List, by contrast, sometimes depend on epigraphic evidence indicating which provinces individual cities belonged to, and are consequently less secure in some areas; the extent of Flaminia et Picenum causes particular difficulty. Its southern part later became the

province of Valeria, named after the Via Valeria and first attested in 399 (RE Valeria 4). In general, see Thomsen (1947) and Barnes (1982, 201-208).

Syria, Iudaea, Arabia (Parker)

The boundaries of the three Trajanic provinces, Syria, Iudaea and Arabia, are relatively well known. To the east, however, Syria and Arabia faced the desert, and thus had no formally demarcated boundary there. The principal controversy for this period is whether to include north-west Hejaz (the region east of the Gulf of Aqaba and the north-east coast of the Red Sea) within provincial Arabia. Unquestionably this region had formed part of the Nabataean kingdom annexed by Trajan as *provincia Arabia*. Even so, in some scholars' view the Roman province did not extend south-east of Aila/Aelana. Although there is epigraphic testimony to Roman military activity in the Hejaz as far south as Egra (Map 83 C5), this does not of itself prove that the region comprised part of provincial Arabia. More decisive are bilingual (Greek and Nabataean) inscriptions from Ruwwafah, deep within Hejaz (Map 83 B4), that explicitly mention two governors of Arabia around the years 165-69. As Bowersock (1983, 97) notes, "It would be inconceivable to find the names of Roman governors...if the site were not an integral part of the province they were administering." That said, extending the provincial boundary as far south as Egra remains conjectural (Sartre 1982, 29-35 with map on 227).

Diocletian transferred the southern portion of provincial Arabia—essentially Sinai, Negev, southern Transjordan—to Palaestina (as Iudaea was called by this date, having been renamed Syria Palaestina after the suppression of the Jewish revolt in 135). The north-west Hejaz seems to have been abandoned in the third century. Earlier (in the Severan period), Arabia had gained some additional territory on its northern frontier at the expense of Syria. The most significant changes, however, occurred in Syria. By the early fourth century the region had been subdivided into four provinces, the boundaries of which are reasonably well established. In addition, the Severan annexation of the client kingdom of Osroene created a new province between the Euphrates and Aborras rivers in north-west Mesopotamia.

The most vexing question of this period is the existence of a so-called province of Arabia Nova, attested in a papyrus dated to 315-16. This seems to explain the passage in the Verona List which mentions "Arabia item Arabia." Some suggest that Arabia Nova should be located in north-east Egypt, but others contend that it was carved out of Palaestina c. 314-15. If so, it apparently included the city of Eleutheropolis (Map 70 F2). But its borders are otherwise unknown, and there has been no attempt to take it into account on Map 101. Evidently its existence as a province was brief, because it appears neither in NotDig nor in any other source. For a useful summary of the issue, see Barnes (1996, 548).

With few exceptions, Diocletian's provincial boundaries in this part of the empire underwent little change through the sixth century. Most notably, by the beginning of the fifth century Palaestina had been partitioned into three provinces: Prima (basically Iudaea and Samaria), Secunda (lands around the Sea of Galilee), and Tertia (Sinai, Negev, southern Transjordan). The border between Palaestina Tertia and Arabia moved northwards, incorporating much of the region east of the Dead Sea into the former (TIR Iudaea 17). Honigmann (HierSyn, Map IV) errs in excluding Sinai from Palaestina Tertia.

GUIDELINES

The *Map-by-Map Directory* accompanies the *Barrington Atlas of the Greek and Roman World*, and aims to supplement its front matter, maps and Gazetteer. The *Directory* is not designed for use independently.

There is a separate Directory for each map. Normally, the principal components of each Directory are (in brief) three: an introductory text; a listing of names and features; and a bibliography. Exceptionally, however, there is no text for Maps 1 and 57, and the texts for Maps 2-6 mostly direct their attention to those areas which do not appear elsewhere at larger scales. In some instances, one text covers more than a single map; in others, there are separate texts for distinct sections of a single map. Even so, the listing of names and features is a single, comprehensive one for each map, irrespective of the number of compilers or the range of modern countries covered. The same applies to the bibliography for each map. The only exceptions are Maps 48, where Sardinia and Corsica are presented separately, and 87, where the main map (*Pontus-Phasis*) and the inset (*Cimmerius Bosphorus*) each have their own Directory.

The purpose of each *introductory text* is to draw attention to large, or general, characteristics of the map which call for special explanation. These may include, for example, formative features of the physical landscape, and problems encountered in seeking to restore it to its ancient aspect; the nature and development of modern understanding of the cultural landscape, including apparent variations in density arising from uneven exploration; criteria of significance adopted for determining which sites and features (roads/routes in particular) should be marked on the map, and which omitted. Conciseness was made a requirement for the text, although it was recognized that some maps call for more such introduction than others; this applies especially to regions very unfamiliar to most anglophone readers.

In the introductory texts, review of a region's history was normally ruled out. Likewise excluded for the most part was discussion of the placement or naming of individual sites and features. Compilers of course remain free to publish material of this type elsewhere (if they have not done so already, as several have). The Ancient World Mapping Center also plans to make such contributions by compilers available electronically—as well as to invite comments and updates from the scholarly community at large—via its web site at http://www.unc.edu/depts/cl_atlas.

The *listing of names and features* breaks down into sections as follows (not all of them necessarily required for each map):

1. Abbreviations for certain ancient texts or modern reference works that are cited in this particular listing (and in few other listings, if any). Generally omitted here, however, are the abbreviations for most of the standard, more commonly cited texts and reference works; these are listed only at the head of the entire Map-by-Map Directory.
2. Names of each site or feature named on the map, listed alphabetically. Each name is preceded by the grid-square letter/number in which it appears on the map. The name is followed by three further columns which state successively:
 - period(s) of occupation;
 - the current modern name or location of an ancient name (alternatively, additional information about the location, nature or previous name(s) of a site or feature marked with a modern name); and, as required, the modern country or countries where the name is (or was) located as of August 1, 1999;
 - one or more references (typically two at most) that are the recommended first recourse for readers seeking further information about an ancient name, or about the nature of a site or feature.
3. Unnamed symbols and features (mostly cultural). These are accompanied by the same data as names, and grouped by type, with the latter in alphabetical order (thus, for example, aqueducts, bridges, canals, centuriation, dams, mines, monasteries, numbered sites and features, roads, springs, walls, etc.).
4. Unlocated toponyms. By definition, these are ancient names only, no grid-square letter/number precedes them, and their location can at best be no more than probable. In all likelihood they were situated within the area of the map, although at present sufficient evidence to mark them there even approximately is lacking.

5. False toponyms. These are listed with one or two references, and sometimes a brief comment. They are ancient names which in the compiler's estimation represent a misreading or a mistaken claim on the part of modern scholarship.

The scope of the *bibliography* is limited to modern publications mentioned in the introductory text and in the listings of names and features. It omits ancient authors, as well as modern publications (reference works especially) whose titles are cited in abbreviated form.

There follow more details of how the listings of names and features and the bibliographies are presented.

Listing Column 1: Grid-square/letter

The grid square given for a name is the one within which the symbol or feature to which it relates can be found. If there is no such symbol or feature (as with the name of a people), the grid square given is the one where the name begins. Whenever the name of an extensive feature (Danuvius, for example) is repeated on a map, only its occurrence in the "highest numbered" grid square is given (reckoning A1 as highest). Where a name recurs in two or more distinct contexts (even on the same map), each occurrence is listed. In instances where a name recurs within a single grid square of a map, some means of distinguishing the occurrences is offered on the map or in the listing (different symbols or periods of occupation, for example; in the last resort, numbers are attached to the names). No more than "inset" is given for names appearing only in an inset, except in the case of Maps 60 and 87 where grid squares are given for such names.

Listing column 2: Names

All modern names appear here (but not elsewhere) in italic type.

Descriptors such as fl. (river), Ins. (island) or T. (temple) not attached to names on the map (because the landscape or a symbol make the nature of the feature named self-evident) are normally added in the Directory.

The alphabetic listing of names ignores initial definite articles (thus, *unlike* in the Gazetteer, *Los Barros* is listed under B), as well as the abbreviation N. (Nomos). Otherwise, however, the alphabetization does take into account initial abbreviations, and orders names as if these were spelled out. This applies in particular to Saint in various languages, abbreviated Ag., S., etc.

Where some instances of a feature (roads, for example) have an ancient name, and others do not, all the named instances are listed first.

Ancient names with variant spelling(s)–(E)Idomene, for example, or O(no)ba—are listed more than once. The fuller information about such a name is attached to its longer form, and the listing of the shorter form(s) is only a cross-reference. Even this is omitted wherever it would immediately precede or follow the first name.

Where a site or feature has variant names appearing on the map, its listing occurs under the name which stands first. The other variants are included in the entry, each separated by a slash (/). In addition a cross-reference is made under each other variant, referring back to the first name. Again, however, wherever such a cross-reference would immediately precede or follow the first name, it is omitted.

Under some names appearing on the map, variants are listed which do *not* appear on the map. These are typically less significant, and include those names of peoples omitted from the map because they match so closely the names of corresponding regions or settlements (thus Bastetania is marked on Map 27, but the Bastetani who occupied that region are not). Each such name is preceded by a *diamond* (§) to confirm that it is not to be found on the map; no cross-references are included for these names.

A site or feature dedicated to a known deity or individual, and equally one owned by or associated with an individual or family, appears both on the map and in the Directory with the ancient name of the figure(s) in the nominative. Use of a *modern* name in such instances signifies that the connection with the site/feature is insecure (for example, *Plinio* attached to a villa site on Map 39 E2).

For the marks attached to ancient names (asterisks, brackets, etc.), and the Greek and Latin terms and abbreviations used for principal features, see Map Key.

All names are written in the English alphabet. Where possible, accents, variant letters and other marks in non-English scripts are retained. Normally, however, the alphabetization of the listings takes no account of these, but assimilates letters affected to the nearest equivalent letter in English.

Latin names follow their attested forms, using *i* not *j*, and *u* not *v* when a vowel. Ancient Greek names are transcribed literally, though without marking accents or long vowels. *Th* is used for theta, *k* for kappa, *x* for xi, *ch* for chi, *ps* for psi. Combinations with gamma such as *gg* or *gk* become *ng* and *nk*, etc. Upsilon with another vowel remains *u* (thus *au* for alpha + upsilon); otherwise it normally becomes *y*. Rho's rough breathing is optional for initial rho (which can thus appear as either *Rh* or *R*), but elsewhere in the word it is omitted in the case of names attested only in Greek. Subscripts are ignored.

The transliteration of other ancient and modern scripts has been determined by vicars in accordance with the general principle that the system adopted should be as straightforward as possible, and readily comprehensible to anglophone readers with little or no knowledge of the language. To that end, accents and other marks are kept to a minimum. It is recognized that the conventions for transliterating Arabic in particular vary considerably from region to region. Some effort has been made to strive for reasonable consistency within a region or modern country, but seldom more widely than that. There has been equal caution about attaining complete consistency in the case of modern Greek, except that its *chi* is transliterated *kh*.

Fuller information about a name is only given once in the entire Directory, regardless of how many times a name appears on different maps. Where a name appears, say, twice on maps of different scales, normally the fuller information will be given in the Directory of the larger-scale map. There are various exceptions, however:

- Where the context of the smaller-scale map seems more appropriate, the fuller information may be given in its Directory (thus see Map 48's Directory for the names in Corsica appearing on Map 41);
- Similarly, where a smaller-scale map offers a clearer impression of an entire large physical feature (certain seas or mountain ranges, for example, but not rivers), the fuller information may be given in its Directory;
- The fuller information about a river is given in the Directory for the largest-scale map on which its mouth appears;
- Where a name appears on maps of the same scale, the fuller information may be given in the Directory of any of them.

In order to establish which Directory gives fuller information about a name appearing on more than one map, check the entry for the name in the Gazetteer. The map whose Directory gives fuller information is cited first there.

The other Directories for maps where a name appears do include a cross-reference.

Listing column 3: Period(s) of occupation

For periodization (Archaic, Classical, Hellenistic, Roman, Late Antique), see the Atlas, pp. xxv-xxvi and Map Key, where all dates given are to be taken as approximate only.

Periods may be assigned separately to variant names. Where these names appear on the map, slashes separate the period(s) assigned to each.

It must be recognized that in many instances periods can only be assigned with great caution. In the case of most physical features, the periods assigned (if any) reflect attestation of the name, not the existence of the feature.

Listing column 4: Modern Name/Location

So far as possible, the current, officially recognized form of a name is used. Where an anglophone form is also in common use, it may be noted in addition (thus Firenze / Florence). In some instances, where an earlier modern form of a name is well known or features prominently in relevant scholarship, it too is noted (thus Annaba, formerly Bône).

Where there is the need to give more than one modern name or location, each is separated by a slash.

Distances are expressed in feet and miles (1 mile = 5,280 ft); occasional reference is made to the Roman mile (m.p.) of 4,855 ft.

For Modern Country Abbreviations, see the Atlas endpaper, and the head of both the Gazetteer and Directory.

In the case of a map covering several modern countries, the one within which the site or feature is (or was) located as of August 1, 1999 is given here. Modern country names given for names of ancient peoples or regions must be regarded as only approximations in the many instances where the area they spanned remains ill-defined. Where this area, or any feature, extends over two modern countries, these are given in alphabetical order. If more than two modern countries are spanned, no attempt is made to give country names. Likewise no country name is given to any cultural linework feature (such as aqueduct, road, wall), stretch of sea, or Roman province name. In addition, for obvious reasons, country names are often not given for Unlocated Toponyms.

Where all, or much, of the map lies within a single modern country, this is indicated at the head of the Directory listing, and its abbreviated name is omitted from this column; only the abbreviated names of other countries are given, as required.

In certain instances where the form of a name in another ancient language (Sanskrit, for example) may shed light on the Greek or Latin form, this equivalent is included here.

Where the modern name or location given differs from one that has found widespread acceptance, attention may be drawn here to the difference of opinion by use of *contra* with a scholarly reference.

Brief additional precision on the nature or development of a site (especially one lacking an ancient name) may appear here: thus “sanctuary and settlement,” or “fort, subsequently church.”

Listing column 5: References

The preferred references are modern works that both offer insight into the site/feature and its ancient name(s) (if any), and indicate where fuller information may be found. Consequently, the reference here may not necessarily be the most recent contribution, but it is likely to serve as a useful starting-point for investigation. Where the preferred reference may be hard to obtain, or written in a language unfamiliar to most anglophone readers, a more accessible alternative may be cited in addition. In many cases, too, the principal (or sole) ancient source may be cited.

Successive references to a site/feature appear in chronological order (broadly speaking), separated by semi-colons. Some are one or more words or names, or an acronym. Except in the instances where these need no further elaboration (the journals *Gallia* or *Taras*, for example), they are explained either at the head of the listing in which they appear, or (for reference works of broader scope, as well as ancient texts) at the head of the entire Directory.

Other references comprise an author and date; publication details for these follow in the bibliography for the map. A work that appeared in more than one volume over two or more years is normally referenced only by the year in which the first volume appeared.

In general, a number preceded by a comma (and space) in this column should be taken to signify a *page* or sheet; a number preceded by a period/full stop (and no space) signifies a *numbered item* of some description (section of a work, say, or a document, or place). Note that in the case of a few works (CAG, for example), some references are to items, but others to pages.

Most references to encyclopedic works include the lemma for a name only when the former differs from the latter (thus for Tedanius fl., RE Telavius is cited, rather than simply RE, because of the difference). Likewise, in general, most such references add volume and page/column numbers only when the article will not be readily found by turning to its expected place in the sequence of the work. For convenience, references to certain encyclopedic works (BTCGI, EncBerb and Hakkert, *Lex.* among them) do include the relevant volume number.

A number after an RE reference specifies which article of more than one with the same lemma is meant. In the few instances where an RE volume number is required, this appears in Roman numerals. The Supplementbände, however, are cited in Arabic numerals, preceded by “Suppl.”.

A personal name here with initial(s) and no date acknowledges a scholar (in some instances the compiler of the map) who by some means or other has contributed unpublished information which is taken into account.

Bibliography

Where a publication has more than three authors, normally only the name of the first is given, followed by “et al.”.

The same principles for alphabetization and for transliteration of non-English scripts apply here as in Listing column 2 above. Exceptionally, however, the bibliography does retain modern Greek script for titles (but not authors) in that language.

For journals, the year of publication cited is that carried by the volume in the series, even when its appearance is known to have been delayed to a later date.

Only in a few special instances is notice taken of the reprinting of any work.

PART 1: EUROPA SEPTENTRIONALIS

PART 2: HISPANIA–LIBYA

Note: Information about the earliest period of Greek contact with Iberia may be contained in the fourth century A.D. poem by Rufus Festus Avienus, *Ora Maritima*. It takes the form of a *periplus*, or coasting narrative, around the peninsula from the northwest, south through the Straits of Gibraltar, and on east and north up the Mediterranean coast, naming places and peoples along the way. The archaic date of Avienus' information has been stoutly defended by many, but it remains more likely that he was engaging in antiquarian creative invention. Hence, names attested only in Avienus are not marked on the maps, and appear in a separate list in each Directory. There is no such special treatment, however, for names known from Avienus *and* from another source.

PART 3: ITALIA

PART 4: GRAECIA-ASIA MINOR

PART 5: SYRIA–MEROE

PART 6: PONTUS EUXINUS–PERSICUS SINUS–BACTRIA

OVERVIEW MAPS

PROVINCES OF THE ROMAN EMPIRE

Map 100 Provinces of the Roman Empire at the Death of Trajan (A.D. 117)

Compiled by R.S. Bagnall, J.F. Drinkwater, A.S. Esmonde-Cleary, W.V. Harris,
R.C. Knapp, S. Mitchell, S.T. Parker, C.M. Wells, J.J. Wilkes,
and the Project Office, 1999

Map 101 Dioceses and Provinces of the Roman Empire according to the Verona List (c. A.D. 303-324)

Compiled by R.S. Bagnall, J.F. Drinkwater, A.S. Esmonde-Cleary, W.V. Harris,
R.C. Knapp, S. Mitchell, S.T. Parker, C.M. Wells, J.J. Wilkes,
and the Project Office, 1999

Map 102 Dioceses and Provinces of the Roman Empire according to Hierocles (late 5th - early 6th centuries A.D.)

Compiled by R.S. Bagnall, S. Mitchell, S.T. Parker, J.J. Wilkes,
and the Project Office, 1999

Use and installation instructions for the CD-ROM version of the Map-By-Map Directory to the Barrington Atlas of the Greek and Roman World, Richard J.A. Talbert (ed.).

These documents are distributed in Adobe Portable Document Format (PDF), for use with Adobe Acrobat software.

Minimum software requirements:

Adobe *Acrobat Reader 4.0 With Search.* Earlier versions have not been tested with these documents. The base version of Adobe Acrobat Reader 4.0 (no search) will open and display the Map-By-Map Directory, but cross-file searching will not be possible.

To review hardware requirements for the Acrobat Reader Software, please consult Adobe's web site at <http://www.adobe.com>

Software included on this CD:
(all software is in the directory/folder named "ARS_INST")

- (1) Acrobat Reader with Search for Windows9x/NT: rs405eng.exe
- (2) Acrobat Reader with Search for Macintosh: "ARSMACIN"

Software for other platforms and operating systems, as well as non-English-language versions can be obtained for free from the Adobe web site:

<http://www.adobe.com/products/acrobat/readstep.html>

Using the Map-By-Map Directory:

1. Once you have installed and started the Acrobat Reader software, ensure that the CD is in the CD-ROM drive.
2. Choose "File -> Open" from the menu bar
3. Browse to your CD-ROM drive and open the directory/folder labelled "BATLDIRS".
4. Open the file named "B_ATLAS.PDF"
5. To browse the contents, use the mouse to select ("click") the appropriate text on the title page and table of contents. The contents of the relevant file will be displayed.
6. To "find" within the file that is currently displayed (i.e., directory information for a single map), choose "Edit -> Find" from the menu bar and then enter the appropriate "find" criteria.
7. To "search" for information in the entire Map-By-Map directory (i.e., irrespective of which file contains the information):
 - a. choose "Edit -> Search -> Select Index" from the menu bar.

b. in the "Index Selection" dialog box, choose "Map-By-Map Directory Index". If that index is not displayed, select the "Add" button and then open the file in the BATLDIRS directory/folder labelled "BATLINDX.PDX". Make sure that there is a check-mark in the box to the left of the words "Map-By-Map Directory Index" before selecting the "OK" button on the "Index Selection" dialog box. Note: the B_ATLAS.PDF file does not need to be open for Acrobat Reader to successfully attach and search the index. Once you have attached the index, it will remain attached each time you start Acrobat Reader. Thereafter, you need not repeat steps 7a and 7b.

c. Select "Edit -> Search -> Query" from the menu bar.

d. Enter the appropriate "Search" criteria

e. "Edit -> Search -> Word Assistant" can be used to find some possible alternative spellings. NB: please note that many limitations imposed by atlas transliteration and name selection policy are not eliminated by this feature. See the "GUIDELINES" file (via the Table of Contents) and the atlas front matter (print version of atlas) for more information. For example, if the atlas lists only "Zucchabar", then a search for "Zoucchabar", "Zukkhobar", "Succhabar", etc. will fail to locate the entry.

More information concerning the construction of "Find" and "Search" criteria can be obtained by selecting "Help -> Reader Guide" from the menu bar.
