BARRINGTON
ATLAS OF THE
GREEK AND
ROMAN
WORLD

EDITED BY
RICHARD J. A. TALBERT

PRINCETON UNIVERSITY PRESS

BARRINGTON ATLAS OF THE GREEK AND ROMAN WORLD

"Quite simply the most important and most complicated project to be undertaken in classical studies this generation."

—NEH reviewer

In 99 full-color maps spread over 175 pages, the *Barrington Atlas* recreates the entire world of the Greeks and Romans from the British Isles to the Indian subcontinent and deep into North Africa. It spans the territory of more than 75 modern countries. Its large format (13 x 19 ins or 33 x 48 cm) has been custom-designed by the leading cartographic supplier MapQuest.com, Inc., and is unrivalled for range, clarity and detail. Over 70 experts, aided by an equal number of consultants, have worked from satellite-generated aeronautical charts to return the modern landscape to its ancient appearance, and to mark ancient names and features in accordance with the most up-to-date historical scholarship and archaeological discoveries. Chronologically, the *Barrington Atlas* spans archaic Greece to the Late Roman Empire, and no more than two standard scales (1:500,000 and 1:1,000,000) are used to represent most regions.

Since the 1870s, all attempts to map the classical world comprehensively have failed. This new initiative has finally achieved that elusive and challenging goal. It began in 1988 at the University of North Carolina, Chapel Hill, under the direction of the distinguished ancient historian Richard Talbert, and has been developed with approximately \$4 million in funding support.

The resulting *Barrington Atlas* is a reference work of permanent value. It has an exceptionally broad appeal to everyone worldwide with an interest in ancient Greeks and Romans, the lands they penetrated, and the peoples and cultures they encountered in Europe, North Africa and Western Asia. Scholars and libraries should all find it essential, although it is not just for them. It is also for students, travelers and lovers of fine cartography, as well as for anyone eager to retrace Alexander's eastward marches, to cross the Alps with Hannibal, to traverse the Eastern Mediterranean with St. Paul, or to ponder the roads, aqueducts and defense works of the Roman Empire. For the new millennium the *Barrington Atlas* brings the ancient past back to life in an unforgettably vivid and inspiring way.

"This atlas provides us with a vital missing tool. It is a model of creative planning, and will be absolutely indispensable."

—C. Nicolet (Sorbonne, Paris)

Richard J. A. Talbert is William Rand Kenan Professor of History and Classics at the University of North Carolina, Chapel Hill, and current President of the Association of Ancient Historians. He taught previously in the United Kingdom and Canada, and is the author of *The Senate of Imperial Rome* (Princeton), which won the American Philological Association's Goodwin Award of Merit.

272 pages with front matter, maps and gazetteer. Publication date September 2000.

Regional Co-Ordinators:

R.S. Bagnall, Columbia University (Nile Valley) • J.McK. Camp II, American School of Classical Studies, Athens (Greece) • J.F. Drinkwater, University of Nottingham, U.K. (North-West Europe) • C. Foss, University of Massachusetts, Boston (Asia Minor) • W.V. Harris, Columbia University, New York (Italy) • R.C. Knapp, University of California, Berkeley (Iberian Peninsula) • S.T. Parker, North Carolina State University (Near East) • M. Roaf, Universität München, Germany (Mesopotamia and beyond) • C.M. Wells, Trinity University, San Antonio (Central Europe and North Africa) • J.J. Wilkes, University of London, U.K. (Balkans and Black Sea)

Map Compilers outside United States include:

A. Bursche, University of Warsaw, Poland • M.U. Erdosy, University of Toronto, Canada • E.W.B. Fentress, American Academy, Rome, Italy • P.-L. Gatier, Université Lumière Lyon 2, France / IFAPO, Beirut, Lebanon • B. Isaac, Tel Aviv University, Israel • P. Kos and M. Šašel Kos, Narodni Muzej, Ljubljana, Slovenia • R. Müller-Wollermann, Universität Tübingen, Germany • D.T. Potts, University of Sydney, Australia • L. Quilici and S. Quilici Gigli, Rome, Italy • R.J.A. Wilson, University of Nottingham, U.K.

Consultants include:

J. de Alarcão, Universidade de Coimbra, Portugal • V. Begley, Durham, NC • K. Belke and F. Hild, Akademie der Wissenschaften, Vienna, Austria • A.B. Bosworth, University of Western Australia, Perth • J. Bouzek, Charles University, Prague, Czech Republic • G.W. Bowersock, Institute for Advanced Study, Princeton • J. Desanges, Ecole Pratique des Hautes Etudes IV, Sorbonne, Paris, France • E. Miraj, Archaeological Museum, Durres, Albania • G. Nenci, Scuola Normale Superiore, Pisa, Italy • D. Paunier, Université de Lausanne, Switzerland • I. Rodà de Llanza, Universitat Autònoma de Barcelona, Spain • M.W. Stolper, Oriental Institute, University of Chicago • L. Török, University of Bergen, Norway

MAP-BY-MAP DIRECTORY

The *Barrington Atlas* includes a CD-ROM *Map-by-Map Directory*. A separate 1,500 page two-volume print edition of the *Directory* is also available at \$150 / £95. The *Directory* is designed to provide information about every place or feature in the *Barrington Atlas*. The section for each map comprises:

- a concise text drawing attention to special difficulties in mapping a region, such as extensive landscape change since antiquity, or uneven modern exploration.
- a listing of every name and feature on the map, with basic data about the period of occupation, the modern equivalents of ancient placenames, the modern country within which they are located, and brief references to relevant ancient testimony or modern studies.
- a bibliography of works cited.

The *Map-by-Map Directory* is an essential accompaniment to the *Barrington Atlas*. As a uniquely rich, comprehensive, up-to-date distillation of evidence and scholarship, it has no match elsewhere and opens the way to an immense variety of further research initiatives.

The CD-ROM will work on any MAC or PC that supports Adobe Acrobat Reader, version 4.0. The installation software for Acrobat Reader is included on the CD-ROM.

Map 2 Hibernia-Scadinavia

Compiled by A. Bursche (eastern Europe) and R. Warner (Ireland), 1996

Introduction

Eastern Europe

The knowledge shown by ancient geographers and historians (in particular, Pliny, Tacitus, Ptolemy, Cassius Dio) derives particularly from permanent trade contacts developed in the first two centuries A.D., linking the middle Danube and (later) the lower Rhine and northern Pontic areas with the south Baltic coast, the main source of amber (Kolendo 1981; 1983; 1985; 1990; 1993; Godłowski 1985; Nowakowski 1983; 1996; Wolters 1990). The region between the lower Vistula and Neman (ancient Roudon) rivers was probably the best known area in all of more remote “barbaricum” territory (Strzelczyk 1980; Kolendo 1981b; 1984; 1985; 1987a; 1992; Wołagiewicz 1986; Nowakowski 1990; 1992; 1996, 109-16; Bierbrauer 1994, 72-75). According to Pliny (*NH* 37.45), trading in amber should be located here, or more precisely on the coast (cf. Kolendo 1981). As a result, many names of peoples and geographical features in this area are known. Archaeology makes a significant contribution too. One of the largest concentrations of Roman artifacts has been found in enormous cemeteries in East Pomerania at the Vistula mouth (Eggers 1951; Wołagiewicz 1970; Kolendo 1981a; Godłowski 1985; Tempelmann-Mączynska 1985; Wielowiejski 1985).

Other useful sources of information for ancient authors were Germanic captives, hostages, official visitors or envoys on the one hand, and on the other Roman intelligence agents (*exploratores*), as well as ransomed or rescued Roman captives (Volkmann 1964; Amirante 1969; Kolendo 1978; 1987; 1989; 1996, 146; 1996a; Lee 1993; Scardigli 1994). The naval expedition of A.D. 5, undertaken during Roman occupation of territory between the Rhine and the Elbe (ancient Albis), must have been especially informative (Kolendo 1981b; Kehne 1995, 27-28). In the Late Roman period there was considerable diplomatic contact with the peoples of “barbaricum” (Werner 1973; Kolendo 1981a; 1993; 1995; Krüger 1983; Whittaker 1994, 132-91; Bursche 1996). In addition, during the third and fourth centuries A.D. the Danish islands of Fyn, Zealand and Bornholm played a major role in the Baltic Sea region as redistribution centers for Roman artifacts (Lund Hansen 1987; Hedeager 1992).

Some information about north-east Europe certainly reached fifth and sixth century authors (in particular, Cassiodorus, Iordanes, Procopius) by way of Germanic tribes settled in territory of the Western Empire who maintained contacts with their homeland; among these were Ostrogoths, Visigoths, Vandals and Heruls (cf. Werner 1949; Fagerlie 1967, 163-74; Wagner 1967, 193-99; Svennung 1972; Kolendo 1986; 1992, 187; 1993a; Heather 1991; Bursche 1996, 122).

Although many names of peoples and geographical features are known, plenty are attested only once, and in general precise locations are usually very doubtful or completely obscure (Schmidt 1934; Kolendo 1981b; 1987a); thus only the better attested names appear on the map. Large-scale tribal migrations are difficult to show here. Several of the Germanic tribes living in north-central Europe during the pre-Roman or Roman periods came to play a major role in incursions into the Roman world, and eventually contributed to the destruction of the western empire (Demougeot 1969; Thompson 1982; Demandt 1989; Wolfram 1990; Heather 1991; Kazansky 1991; Godłowski 1992; Mączynska 1993; Bierbrauer 1994, 134-71; Whittaker 1993; 1994, 192-278; Kolendo 1993; 1995). It should be noted, too, that from the end of the fifth century onwards the area between the middle Danube, Elbe and south Baltic coast was increasingly settled by the Slavs (Godłowski 1979; 1983; Parczewski 1993, 132-44).

Ptolemy's testimony is not specific enough to permit the placement of any of the toponyms he mentions north of the Carpathians, despite various attempts to do so (Svennung 1974; Kolendo 1981b). The same applies to most of the tribes in Scandinavia mentioned by Iordanes (*Getica* 21-24, cf. Svennung 1967; Alonso-Núñez 1988).

The fact that the eastern part of the map largely lies outside the Roman Empire has influenced the choice of sites marked. Preference has been given to native settlements and cemeteries where there is evidence of extensive

Roman contacts indicated by the presence of many Roman artifacts. Because of the scale, it has been necessary to select only the most significant and extensively excavated settlements, the larger cemeteries, and the most famous “chieftain graves.” In addition, some extraordinary hoards and votive-deposits (bog finds such as Ilkjær 1990) containing Roman goods have been marked.

Ireland

Irish contacts of a low order with the classical world can be demonstrated archaeologically and textually from the fifth century B.C. onwards, increasing somewhat with the Roman occupation of Britain (Kenney 1929, chap. 2; Warner 1991; Freeman 1995). Virtually all our information about toponyms comes from Ptolemy (O’Rahilly 1946, chap. 1; Pokorny 1954; Tierney 1976; Mac an Bhaird 1993). Despite demonstrable linguistic continuity, surprisingly few of these toponyms are now locatable. In compiling the map, I have given preference to the conservative views of O’Rahilly over the ingenious suggestions of Mac an Bhaird or Byrne (1984, 98). I have also rejected some etymologically and archaeologically tempting identifications—such as Isamnion with Navan (Irish *Emain*), or Manapia with Drumanagh (Irish *Druim Monach*)—which are at odds with Ptolemy’s locations.

The status of native culture between the seventh and third centuries B.C. is little understood. A clearer impression, however, can be gained of the Iron Age (third century B.C. to fourth century A.D.), particularly its fine metalwork derived from continental La Tène traditions (Raftery 1994). It is agreed that Ireland never became a formal part of the Roman empire, but there is little consensus concerning the level of the relationship between the two (Ó’Ríordáin 1947; Bateson 1973; Killeen 1976; Warner 1976; Raftery 1994 chap. 9; Rankin 1996 appendix). The minimalist view allows only some trade and mutual plundering, while a recent opinion suggests far more substantial contacts, including Roman invasion and settlement in Ireland (Warner 1995).

The only site of Hellenistic date marked, Navan, appears on the basis of a Barbary Ape skull, and the interpretation of later textual evidence (Warner 1996). For the Roman period, only those archaeological sites or finds whose Roman content suggests significant Roman or provincial (rather than native Romano-British) contact are shown.

Map 3 Asia Occidentalis

Compiled by M. Roaf and the Project Office, 1998

Introduction

Most of the territory shown only on this map consists of the deserts of Arabia, inland Iran and central Asia. Note that the areas marked with the “dry lake, wadi” symbol in inland Iran are treacherous “kavir,” a thin dry crust covering liquid mud beneath; many travelers have perished when the crust gave way beneath their feet. The only regions with significant settlement are in southern Iran (eastern Persis and Carmania) and Sistan (Drangiane).

Very little archaeological fieldwork has been carried out in south-east Iran and western Afghanistan, and there are many outstanding problems concerning the historical geography of these regions between the beginning of the Achaemenid period and the end of the Sasanian. The standard works on Islamic historical geography (Schwarz 1896; Le Strange 1905) are based on written sources, and do not take into consideration any twentieth-century archaeological investigations; the same general point applies to entries in RE. The suggestions made by these scholars for the identification of ancient place names are often based on the similarity of modern and ancient ones; they are sometimes plausible, but seldom certain. In several cases it is certain that names have moved from one settlement to another. Sometimes the distances are not great: for example, Sasanian and early Islamic Darabgird is little more than four miles from modern Darab, and Sasanian and early Islamic Sirjan is about ten miles from the modern town of the same name. But in other cases the distances are greater: [Bardasir], for example, is about forty miles from modern Kerman.

Where substantial ancient remains have not been identified, or the textual references do not unambiguously determine the location, a place is marked as approximate. Thus Sasanian Yazd and Bam, for example, are marked with an approximate symbol placed at the modern sites, since there is no certain evidence that the pre-Islamic cities were actually in the same place as the present-day ones.

Likewise some identifications which have appeared with great regularity in earlier studies are omitted here. These include Poura = Bampur, and Teisa = Tis, because the similarity of the name is the main evidence for the identification.

A particular problem lies in locating the chief city of ancient Carmania, which according to some sources was called Karmana. I would expect it to be in the vicinity of Jiroft/Sabzevaran, but no survey has yet revealed a suitable site. Later the name was transferred to the future capital of the province, Kerman.

Parsa in Achaemenid times included Carmania, and places later known to be in Carmania are sometimes said to be in Persis. Later, Sakastan(e) included Drangiane and western Arachosia, including modern Kandahar (ancient Alexandria/Alexandropolis/Cufis, Map 6 B3).

Map 4 Arabia-Azania

Compiled by D.T. Potts, 1996

Introduction

Despite the relative inaccessibility of southern Arabia to all but the most intrepid travelers in the pre-modern era, its historical geography has been studied intensively for over a century. Two giants of German scholarship have dominated this field, A. Sprenger in the nineteenth century, and H. von Wissmann in the twentieth. To be sure, other scholars have made significant contributions, but these two stand alone with respect to the intensity of their investigations into the southern Arabian toponyms preserved in the works of Strabo, Pliny and Ptolemy.

Because of unsettled political conditions, travel in Yemen has often been dangerous, and more than one nineteenth-century explorer lost his life there. The hostility of the area has meant that the modern Arabic toponymy of southern Arabia has been only imperfectly known. Even so, through various sources such as Admiralty charts and E. Glaser's unpublished notebooks, Sprenger and von Wissmann were able to posit numerous identifications without necessarily being able to verify them on the ground. In many cases it has been difficult to decide whether to accept such identifications or not, but I have attempted to separate the more tenuous proposals from those for which there seems to be sound justification.

It should be understood that many of the probable locations marked have not been verified epigraphically. In recent years, however, several scholars, including von Wissmann (1968; 1976; 1977), Beeston (1979; 1995), al-Sheiba (1987), Robin (1995) and Sa'id (1995), have identified many southern Arabian toponyms mentioned in classical sources with those known in the thousands of southern Arabian inscriptions discovered in Yemen. Robin (1997) arrived too late to take into account for the present map, but it is an important resource for anyone interested in the Semitic names of South Arabian towns mentioned in epigraphic sources. Even so, few further identifications with Greek and Latin toponyms or ethnonyms can be offered. Eventually, progress in this field may be expected to determine the identification of many more of the toponyms listed here as unlocated.

In southern Arabia, it is notoriously difficult to establish the periods in which a given toponym was known to the Greek and Roman world. Most first-hand knowledge of the region was undoubtedly acquired during the Roman era, but von Wissmann has interpreted certain collections of toponyms in Roman sources as reflecting much earlier conditions. Thus the names mentioned in Pliny (*NH* 6.154-60; 12.52-54) are taken to reflect the Sabaeen state in the late fifth century B.C. (von Wissmann 1977, Abb. 5), while other names—because of identifications with toponyms attested in southern Arabian inscriptions—are considered to reflect conditions in the kingdom of Qataban between the fourth and second centuries B.C. (von Wissmann 1976, Abb. 17). These proposals are reflected in the periodization of the toponyms, with question marks added for caution. A similar difficulty arises with toponyms excerpted by Stephanus of Byzantium from the first-century B.C. (?) *Arabika* of Ouranios (*RE* Suppl. 11 Zabida, col. 1316); these were not necessarily still current in Late Antiquity. Within the scope of the present work, however, it has not been possible to investigate in detail the history of each such toponym. Finally, the collection of toponyms preserved by Geograv (Schnetz 1920; 1951) has been taken into account, since it represents the last of the Late Antique sources for southern Arabia.

In the case of the east African toponyms mentioned by PME, Ptolemy and Cosmas Indicopleustes, the investigation of modern toponymy with a view to positing locations has been less intense than in the case of southern Arabia (but note Chitick 1976). The lower Red Sea and the Horn of Africa have been the scene of bitter military struggles recently, in Eritrea and Somalia especially, so that knowledge of their archaeology and ancient toponymy have perforce suffered because of their inaccessibility. Most investigation has been "armchair" research, with experts on PME such as Schoff (1912), Huntingford (1980), Casson (1989) and Groom (1995) proposing identifications on the basis of distances and the suitability of various harbors and inlets as shown on modern maps. Almost inevitably, these scholars have little, if any, first-hand experience of the coasts in question; this is all the

more unfortunate in view of the notable discrepancies between distances in PME and suitable sites for toponyms mentioned there.

Directory

Note: For commentary on PME references, see Casson 1989.

Map 5 India

Compiled by M.U. Erdosy, 1995

Introduction

The map spans territories that form the modern states of India (minus the Punjab), Bangladesh, Bhutan, Burma, Nepal and Sri Lanka. It overlaps with Map 6 in several areas. All of these are treated here, with the exception of southern Sindh and Baluchistan, which enjoy much stronger geographical and historical links to the regions of Map 6, and the Himalayan regions, which feature far more extensively on Map 6.

The territories spanned by Map 5 experienced only limited contacts with the classical world, and represent the easternmost reaches of reliable Greek and Roman geographical knowledge. Until the first century A.D., they were known almost exclusively through the account of Megasthenes, a Seleucid envoy to the Mauryan imperial court. Even at the peak of commercial contacts with the West, they showed few traces of Greek or Roman settlement, and—with the exception of Menander's brief foray into the Ganges Valley c. 175 B.C.—none of conquest. Moreover, by the second century A.D. Western knowledge of their geography reached its zenith, since later works neither added new information nor even reproduced more than a fraction of the knowledge previously accumulated. By the third century, to judge by this trend as well as by the pattern of coin finds, contacts were declining in step with the fortunes of the Roman empire; by the fourth century, contact appears to have been confined largely to Sri Lanka.

Conversely, it should be stressed that while contacts with the West may have contributed to the first flowering of civilization in South India during the first century A.D., their overall impact on the cultural and political evolution of the subcontinent appears to have been minimal. This applies particularly to the kingdoms of the Ganges Valley, which enjoyed their peak periods of power and prosperity precisely at times (such as A.D. 300-450) when contacts with the West were at their lowest ebb. So it is hardly surprising that many of the great cities of Northern India (Śrāvastī, for example) are either totally absent from, or seriously misplaced by, even Ptolemy's *Geography*.

Such unique historical circumstances pose challenges for the compilation of the map. First, I have interpreted chronological attribution strictly in terms of the period during which a place was known to Greeks and Romans, regardless of its longer history. For example, even though the city of Ujjain (ancient Ozene) has been occupied since the eighth century B.C. (EIA 447-49), its relevance to the classical world stems from its role as an important inland emporium mentioned in PME and Ptolemy's *Geography*; consequently, it is assigned only to the Roman period. The Directory does, however, include references that touch on the longer history of such sites. In addition, the map marks major kingdoms and their capitals of the Hellenistic, Roman and Late Antique periods, even if they are never mentioned in classical sources.

Exceptionally, the map marks all findspots of Greek and Roman artifacts, principally coins, *terra sigillata*, amphorae and occasional sculpture. While toponyms recorded by classical sources show a distinct bias in favor of coastal sites, findspots of Greek and Roman artifacts coincide to a significant degree with important trade routes in the interior, where most of the larger cities are located. Consequently the findspots do more to convey the impact of contacts with the West. Tracing the actual trade routes, however, lies beyond the scope of the map. Despite some fine studies of the epigraphic, historical and archaeological evidence (note Chandra 1977), our knowledge rarely extends beyond recognition that there were long-established routes between certain places. Sites yielding objects produced under classical influence, such as Rouletted Ware, are omitted because of their tenuous connection to the overseas trade of South Asia.

The references given in the Directory to Greek and Latin toponyms and ethnonyms normally include an ancient source in order to present information that is not always easily accessible, as no complete catalog of this kind has been published before (the closest comparable works to date are Renou 1925, 75-89 and André 1986, 429-53). Where possible, the modern treatments cited are ones that explicitly link ancient names to modern locations, discuss alternative solutions, and provide additional bibliographic references. It is a further advantage if they also take

account of archaeological evidence, since historical references in indigenous textual sources are trivial at best, as well as difficult to date (Erdosy 1988). Fortunately, there are several excellent works of reference for archaeological, historical and topographical data (Law 1976; Casson 1989; Pollet 1990; EIA). Several translations of the relevant classics are also copiously annotated, and these are cited whenever reference works fail to provide adequate information. In general, given the way in which South Asian words have been garbled, it is not surprising that several Greek and Roman names remain totally unidentifiable, while serious disagreement persists about numerous others. In listing variant toponyms and ethnonyms, I have attempted to give precedence to the one which is closest to its presumed indigenous source (usually Sanskrit, Prakrit or Tamil).

In spite of its vast size, the subcontinent was frequently fragmented, and thus no settlement matches the Mauryan (and later Gupta) capital of Pāṭaliputra (Palibothra) in significance; it was the only city with imperial pretensions until the advent of the Mughals. Sites of the second rank include ancient regional capitals, which formed the principal nodes of the settlement lattice between c. 500 B.C. and A.D. 300, as well as major trading posts, whose economic strength and overseas contacts made up for their lack of political power. Sites of the third rank include the capitals of lesser communities, as well as trading stations that may have mattered to Greeks and Romans but had no indigenous political significance. As for lesser sites, given the sorry state of historical archaeology in India, the classical texts are often the only source of information. In such instances, sites described as “emporium,” “harbor” or “metropolis” are assigned the fourth rank, and the rest are given the fifth (lowest) ranking. It may be objected that places finding their way into classical sources had to be more than just ordinary villages; the fact is, however, that much Greek and Roman geographic information came from traders who simply listed stopping-places on major routes without concern for their importance (Vogel 1952a).

In general, the authors of relevant classical texts fall firmly into the Hellenistic or Roman period. In spite of the danger of interpolation by later authors, any passage that can be attributed to the Seleucid envoy Megasthenes (whose account survives only in quotations) is treated as belonging to the Hellenistic period. A full list of such quotations was compiled by E. Schwanbeck in the mid-nineteenth century (cf. McCrindle 1926), and these afford us our earliest glimpses of the world that fell just beyond the grasp of Alexander.

Changes to the physiognomy of the South Asian subcontinent have affected coastal areas and river courses above all. Both the gradual extension of river deltas (especially those of the Ganges, Mahanadi, Kra and Godāvarī; Spate 1954, 9) and subsidence (Spate 1954, 256) have been noted, although little precise information exists on the ancient coastline of South Asia. I have therefore followed Schwartzberg (1992) in altering the coastline only in the Indus and Ganges deltas, since historical information about their ancient aspect is available. As for river courses, while those in peninsular South Asia are generally stable, the same cannot be said of those in the North. The Ganges itself appears to have shifted gradually southward, leaving several oxbow lakes in its wake, whose banks were seasonally inhabited from at least the third millennium B.C. onward (Sharma 1973). By the Early Historic period, however, the Ganges had stabilized within a band of about three to five miles, since ancient settlements can be located all along prominent bluffs marking the limits of its movement (Erdosy 1988, 29-33). The same is true of the Jumna (ancient Iomanes), whose movements were even more constricted. Lesser rivers, however, have behaved far less predictably, in particular the Son (Erannoboas), Ghaggar (Sarabos), and Kosi (Casuagus) (Spate 1954, 197, 133, 195 respectively). Once again, given all the uncertainties surrounding the precise courses of these rivers, I have not adjusted them except for the Son; according to both historical and archaeological sources, in Megasthenes' time it clearly flowed by the city of Pāṭaliputra (Palibothra). For discussion of the Indus and its tributaries, see the Introduction to Map 6.

Map 6 Asia Orientalis

Compiled by M.U. Erdosy, 1997

Introduction

Map 6 embraces four distinct regions: central Asia and the Indus valley, which had lengthy contacts with the Greeks and Romans; and Tibet and Chinese Turkestan, which had practically none. The first two entered Western consciousness through the eastward expansion of the Achaemenid empire, which brought them into the orbit of Greek geographical knowledge, and won them prominence as the theaters of Alexander the Great's eastern campaigns. Although colonization in the wake of Macedonian conquests was short-lived, classical influence on the arts and crafts of the area, if not its religious and political institutions, remained prominent for centuries. Moreover, even though the Parthians and Sasanians effectively severed overland links between central Asia and the Mediterranean world, the Alexander legend helped preserve geographical information for posterity (albeit frequently in a distorted form), even if little in the way of fresh data was added until Late Roman times. By contrast, areas to the north and east of the Himalayas remained in effect *terra incognita* until the nineteenth century, when the heart of Asia first received serious exploration by westerners, mostly as a by-product of the "Great Game." Despite the impressive lists of toponyms and ethnonyms found in Ptolemy's *Geography* and Ammianus Marcellinus, few cities and tribes can be localized with any certitude, since ancient geographers not only lacked first-hand knowledge of the area, but were also hampered by a defective image of the world, which was sure to produce serious distortions in peripheral regions.

As a result, the eastern half of Map 6 is largely devoid of identifiable sites (although it contributes extensively to the list of unlocated toponyms and ethnonyms), while the western half is densely populated. This is not to say that the historical topography of Pakistan and central Asia constitutes a closed chapter. Just how much is left to resolve can be appreciated by merely browsing through the literature generated by, say, Stein's localization of the site of "Αρρως" at Pir Sar (for a brief survey, Bosworth 1995, 178-80). The fact that many solutions were proposed by historians without first-hand field experience, or by archaeologists who ignored historical questions, has not helped; nor has the inaccessibility of some areas, and the chronic instability of others. These factors have prevented the verification of many recent hypotheses.

Compilation of the Directory follows the principles set out in the introduction to Map 5, except that in citing Greek and Latin sources I have relied more heavily on modern treatments which either list textual references (note Renou 1925, 75-89; André 1986, 429-453), or mention them in the course of discussing the identification of certain toponyms or ethnonyms (note André 1980; Bosworth 1980; 1995; Casson 1989). This difference in approach is necessitated by the multitude of textual references, itself the product of the frequent recycling of information relating to Alexander's exploits. I have, however, cited original sources directly if they are omitted from the lists just mentioned, or if the modern treatments either do not correctly identify a name, or take no account of the possibility that one name can cover a range of geographical features (Caucasus, for example).

The most important physical changes since ancient times have been hydrological, and they are of a different order of magnitude from those experienced in either peninsular India or the Ganges valley. The two principal problems—debated for over a century—concern the movements of the R. Indus and its tributaries, and the location of the R. Oxus delta. I refrain from commenting extensively on the second problem, since both the Aral Sea and most of the Caspian Sea fall outside the scope of the *Barrington Atlas*. Suffice it to say that, even if the Oxus drained mostly into the Aral Sea in antiquity, the Uzboy channel connecting it to the Caspian could have carried some of its flow, and could have misled ancient authors into equating the channel with the principal branch. This may well explain why the Aral Sea remained unknown until Late Antiquity. Another explanation may be deduced from the shape and size of the Caspian Sea in Ptolemy's system, which suggests that at least the eastern and southern shores of the Aral Sea were known, but were considered to belong to the Caspian. It should also be noted that several of the

left-bank tributaries of the Oxus no longer reach it now, but are lost in the sands of Bactria; their lower courses in antiquity can only be guessed at.

The Indus and its tributaries are principal points of reference for all of Alexander's historians, and their location in protohistoric times is vital to the map. Fortunately, with the advent of remote sensing techniques, and advances in archaeological surveying, the general outlines of the westward shift of the Indus system, and of the desiccation of the Ghaggar and Nara channels (representing the Vedic Sarasvatī), are clear. For this reason, I have adopted Wilhelmy's scheme (1968; 1968a; 1969, summarized in Eggermont 1975; 1993) for both the palaeochannels of the Indus system and the ancient shoreline around the Indus delta. While the geographical outlines are clear and seldom contested, one historical issue does remain to be resolved, namely the channel of the Indus delta which Nearchos used as his outlet to the Arabian Sea. Here I cannot accept Eggermont's preference for the eastern channel, in spite of his detailed arguments. Instead, I maintain that Nearchos must have used a branch of the western channel which emptied itself into the Gulf of Kutch at 68° longitude (just east of Pir Patho hill: see the map in Eggermont 1975, 31).

Directory

Map 7 Aremorica

Compiled by P. Galliou, 1997

Introduction

The north-west of Gallia Lugdunensis has been investigated extensively over the past thirty years. Between them, aerial photography, rescue excavations and extensive ground-surveys have revealed thousands of Gallo-Roman sites, most of which are only recognizable as surface scatters of building materials and imported or native wares. This suggests that settlement densities were high in the most fertile parts of the area during the early Roman empire; by contrast, there was a sharp decline in the number of sites still occupied in the fourth and early fifth centuries A.D., for reasons so far not fully understood.

This dramatic expansion in our knowledge of the pattern of Roman settlement has demanded a strictly selective approach to the compilation of the map. In general, only sites named in the ancient sources are marked, together with a small number of key settlements, either fully excavated or known to have acted as administrative, commercial and religious centers for their vicinity. These include *civitas* capitals, various nucleated settlements (*vici*), road stations, rural sanctuary complexes, and a small number of well-excavated villas and Roman forts, the latter belonging to the defensive network developed in the late third and early fourth centuries A.D. Much detailed information is summarized by TIR Condate, TIR Lutetia, and the CAG series.

Few isolated rural sanctuaries—of the type so common in neighboring regions—have so far been identified here. Small shrines (*fana*), however, are far from rare in the countryside or in *vici*, but are not marked (cf. de Vesly 1909). *Vici*, discovered in growing numbers in recent years, certainly served as centers for rural communities; some appear to have specialized in the manufacturing of various commodities, such as pottery (Landerneau), and fish sauces and preserves (Douarnenez). The minor sites devoted to this fish-salting industry (mostly concentrated on the west coast of the *Osismii*) are omitted.

Recent surveys of imports have shown that a fair number of major Gallic settlements (*oppida*) had contacts with the Roman world prior to Caesar's conquest. Those offering evidence of significant Roman settlement—mostly in the form of late coastal refortification (as at Aletum and Ploulec'h)—are marked. There is, however, no evidence that Augustan or Tiberian urban foundations in the area correspond to a shift from nearby hilltop defended sites to undefended locations in valleys; rather, all the *civitas* capitals of Aremorica appear to have been new foundations at previously unoccupied sites.

The rural villa is one of the most commonest types of site in western Gaul. Though less dense on the ground than in Gallia Belgica, their sheer number—together with other small rural settlements so far unexplored—precludes any comprehensive mapping. Thus only a small selection of extensively excavated sites is shown, in order to confirm the presence of such characteristic settlement-types here; their plans have much in common with those analyzed by Agache and others in north-east Gaul.

ItAnt and TabPeut provide only a skeletal image of the road network; much can be added, however, from information gathered by TIR and CAG. A clearer image thus emerges, showing the interrelation of *civitas* capitals, minor nucleated settlements and rural sites in a fully exploited landscape.

Map 8 Britannia Superior

Compiled by A.S. Esmonde-Cleary, 1996
with the assistance of R. Warner (Ireland)

Introduction

Britain has a long tradition of antiquarian and archaeological investigation and recording of its Roman past, reaching back to figures such as Leland in the sixteenth century. In the eighteenth and nineteenth centuries the classically-educated aristocracy and gentry of a major imperial and military power naturally felt an affinity with the evidence for Rome's presence in Britain. In the twentieth century, the development of archaeology as a discipline in its own right reinforced this interest in the Roman period, resulting in intense survey and excavation on Roman sites and commensurate work on artifacts and other remains. The cartographer is therefore spoiled for choice, and must determine the objectives of a map with care so as to know what to include and what to omit, and on what grounds. British archaeology already has a long tradition of systematization, sometimes based on regions as in the work of the Royal Commissions on (Ancient and) Historic Monuments for England (Scotland and Wales), but also on types of site or monument. Consequently, there are available compendia by Rivet (1979) on the ancient evidence for geography and toponymy; Wachter (1995) on the major towns; Burnham (1990) on the "small towns"; Margary (1973) on the roads that linked them; and Scott (1993) on villas. These works give a series of internally consistent catalogs of the major types of site.

Maps of Roman Britain conventionally show the island with its modern coastline, but it is clear that there have been extensive changes since antiquity, and that the conventional approach risks understating the differences between the ancient and the modern. The east coast in particular has seen major erosional and depositional changes. The latter are the easier to assess. Recent work has shown that in the Roman period the Wash was a larger body of water than now, and that it was also surrounded by large areas of marsh and swamp, possibly subject to marine transgression (Waller 1994). In general these areas were drying out through the Roman period, perhaps in part because of the Car Dyke/Mid-Fen Dyke catch-water to the west (Simmons 1979). The map shows the best available estimates of coastline and the edge of dry land; the river courses through the area are even less certain. Smaller areas such as around the Humber estuary, the Waveney estuary (Wade-Martins 1994), the Wantsum Channel, Romney Marsh (Cunliffe 1980), the Pevensey Levels and the Somerset Levels have likewise been restored to the best current estimate of the ancient coastline. Some indication has been given, too, of the limited land reclamation along both sides of the inner part of the Severn estuary (Fulford 1994). Much more difficult to gauge is the extent of coastal erosion from Flamborough Head (the easternmost point of Map 9 G6) south along the coast of East Yorkshire, Lincolnshire and East Anglia. In the absence of any agreed reconstruction, it has only been possible to indicate that the modern coastline is not to be relied upon.

Our evidence for the Roman names of peoples, places and features derives principally from Ptolemy, ItAnt and GeogRav (cf. Rivet 1979, chaps. II-V). Despite their widely-varying dates of composition, all three depend essentially on early imperial sources. Care has been taken to adhere to attested forms of names, so that those found only in Ptolemy are not latinized, and reconstructions of corrupt forms in GeogRav are treated with caution.

Because of the wealth of known sites, there is particular difficulty in choosing what to mark on the map, and what to omit. In general, the aim is to present longer-lived sites, and thus to convey the overall impact of Rome on Britain. All sites with a Latin name and a known location are shown; these do include a few short-lived sites, but their number is too slight to affect the distribution patterns for classes of site as a whole. Otherwise, the difficulty of making choices is at its most acute in the marking of military sites. No "marching camps" (temporary campaign fortifications) are shown, nor are the semi-permanent garrison fortresses and forts which succeeded them as conquest turned to consolidation. What are shown in Wales, and in the north of England (Map 9), are the long-term garrison forts (re-)built in stone, which persisted, sometimes down to the end of the Roman period. The Late Roman "Forts of the Saxon Shore" on the southeast coast are also marked. *Coloniae* and *civitas*-capitals are shown. A selection of

the “small” towns (roadside settlements and market centers), is shown, omitting some of the less substantial. Nothing is marked as a “road-station,” since all known sites of this type coincide with towns. The main Roman roads on which the towns lay are indicated. Roads featured in ItAnt, or certain to have been long-distance routes, are marked as major; others of more local significance are left as minor. No attempt has been made to indicate the myriad local lanes and tracks.

Rural settlement presents the most difficult choices. There is archaeological evidence for thousands of such settlements of the Roman period in Britain; the map cannot accommodate more than a fraction. The most characteristically “Roman” rural sites of the period are the villas, the Romanized farms. These could have been omitted altogether, but that would have been to ignore a major aspect of the Roman impact on Britain. So some 200 have been selected out of a total somewhere in the region of 1,000. The main criterion has been to select enough to show the overall distribution pattern, almost absent from the north and west, common, but unevenly spread, in the south and east. More specifically, preference has been given to villas which are prominent in the literature on Roman Britain, as well as to those which are less well known but were evidently of some substance, judging (for instance) by the presence of mosaic. Much the same criteria have been employed for rural temples. Omitted are the even more numerous “farmsteads” and “villages,” those isolated or nucleated settlements whose plan, structures and artifacts show much less Roman influence. Thus the likely majority of the rural populace of Roman Britain is absent from the map. Their omission stems in part from the scale, in part from the focus of this atlas upon Greek and Roman civilization and culture.

Map 9 Britannia Inferior

Compiled by A.S. Esmonde-Cleary, 1996
with the assistance of R. Warner (Ireland)

Introduction

Any map of this part of Roman Britain is inevitably concerned with the shifting limits of Roman military control in the north. All study of Roman intervention in this area has been heavily biased in favor of military sites and their exploration. Thus its priorities, reflected by the map, are rather different from those set for research into the Roman presence further south in Britain. In addition, the relative scarcity of some types of site common further south (towns and villas especially) contributes to giving this map a very different aspect to *Britannia Superior* (Map 8), but an aspect that nonetheless reflects real and important contrasts.

So far as can be determined, there have been no significant changes between the Roman period and the present day in coastline or other physical topographic aspects, despite continuing post-glacial eustatic and isostatic adjustment of the relative levels of land and sea.

The map displays essentially three major episodes in the Roman occupation of northern Britain. The southern part is compiled on the same principles as Map 8. Thus the military sites shown are the long-lived garrison forts, the forts of Hadrian's Wall, and the "outpost" forts of the Wall in Northumberland and south-west Scotland. The fourth-century "signal stations" on the Yorkshire coast are likewise marked. There are also the few towns in the north, and the scatter of villas lying north of York. This part of the map is therefore directly comparable with, and a northern continuation of, its southern neighbor.

The part of the map covering Scotland reflects rather different criteria, particularly as regards site longevity. Much shorter-lived military sites are shown here, in part because of the intrinsic importance of the military campaigns which they represent. In part, too, their inclusion recognizes the labor which has been expended over the years in their location and excavation, and in the reconstruction of the successive phases of Roman failure to conquer Scotland. Two major phases of Roman incursion northwards can be seen. First, the Antonine Wall of the mid-second century A.D. and the forts held in the Lowlands at that time; second, to the north of the line of the later Antonine Wall, the aftermath of Agricola's campaigns in the 80s A.D. For the latter, the legionary fortress of Inchtuthil (ancient Victoria?) and the associated "glen-blocking" forts are shown; some of the Lowland forts, too, were first occupied at this time. None of the numerous "marching camps" (temporary campaign fortifications) known from Scotland, and linked with more or less certainty to various known Roman campaigns, has been shown. The Severan campaigns of the early third century are represented by the base at Carpow.

Even more than in the case of Map 8, the omission of native-style "farmsteads" gives a very "empty" look to much of the map. The reasons for this choice are explained in the Introduction to Map 8. The omission, however, by no means signifies that much of the area covered was uninhabited. On the contrary, the tribal names certify that it was. Equally notable is the paucity of sites beyond the frontiers. There is Roman material known from native sites in Scotland and Ireland, but for the most part it is potsherds and trinkets (for Ireland, see further the Introduction to Map 2). Again, the contrast in this respect with frontier regions elsewhere (the Danube lands, for example) is real and instructive.

Map 10 Rhenus-Albis

Compiled by J.H.F. Bloemers, 1995

Introduction

The map covers a large part of what Ptolemy (2.Prolog.; 2.11) called *Germania Megale*, that immense part of Germania outside the formal north-west limits of the Roman empire, bordered by the North Sea and Baltic Sea. During the Roman period the landscape was, as elsewhere, quite different from the present; in this region the coast, estuaries, rivers and moors deserve special attention. Long-known historical information has to be combined with knowledge acquired after World War II by intensive geological and palaeogeographical research in the Netherlands and northern Germany. Due to the rise in sea level and post-Roman shoreline changes, the coast along the southern North Sea has changed considerably since the Roman period, retreating landwards. In general, with the help of well-founded geological data, it can now be reconstructed in advance of the present-day shoreline (Kossack 1984, 51-82; van Es 1988, 88-94). Even so, it still seems prudent to render long stretches as approximate.

In antiquity, principal rivers such as the Rhenus, Visurgis and Albis spread over wide flood-plains, but are now channelled between embankments. Large areas in the north of the modern Netherlands and Germany were covered by peat, and consequently almost inaccessible. Today, these are drained and cultivated, with the result that the ground level is now many feet lower than during Roman times. In addition, ancient *Germania Megale* was famous for its extensive, dense forests.

All the Greek and Roman texts relating to the region are conveniently assembled by Byvanck (1931) and Goetz (1995).

The location of tribes is often uncertain or even unknown. Moreover the location of some may have changed over time (because of migration, for example), or groups may have merged into confederations like the Suebi or Franci.

Archaeology is a major source of information for this region. In deciding whether or not to mark a site, I have tried to determine its significance for the Romans or the Roman empire. Even then considerable uncertainty persists, and we can be sure that our understanding of the scope of military or political contacts between Romans and German groups remains far from complete. Only major published settlements and cemeteries (generally over c. 750 graves) are shown; especially in the area north-east of the R. Albis a number of large cemeteries are known, but not published (Schach-Dörjes 1970, 34; Capelle 1971). Hillforts and walled enclosures dated to the pre-Roman Iron Age and assumed to remain in use in Roman times are omitted, since proof of such continuation is always lacking (Waterbolk 1977; Mildenberger 1978).

Krüger (1976; 1986) offers a well-documented historical and archaeological overview. For Denmark, note Hedeager (1992); and for Roman imports in Scandinavia, Lund Hansen (1987). Two major collections of material are in progress: the *Corpus der römischen Funde im europäischen Barbaricum* (note von Schnurbein 1992), and *Die Fundmünzen der römischen Zeit in Deutschland* (note Berger 1992).

Directory

All place names are in the Netherlands unless otherwise noted

Map 11 Sequana-Rhenus

Compiled by C. Haselgrove and J. Kunow (Rhineland), 1996

Introduction

Gallia Belgica is one of the most extensively researched provinces of the Roman empire (note Wightman 1985). A combination of aerial survey—notably by Agache (1978) in Picardy—rescue excavations of various kinds (Bréart 1995; Bayard 1996), and most recently extensive ground survey (note Haselgrove 1996 for the Aisne valley) have identified literally thousands of major and minor Gallo-Roman sites spread right across the landscape; many are detectable only as surface scatters of pottery and building materials. These findings suggest that settlement densities in excess of one site per square mile were normal in many parts of the province during the Early empire, although site numbers fall again during the fourth and fifth centuries A.D. On present evidence, the process seems to have been a gradual one, rather than sudden (Van Ossel 1992).

This explosion of knowledge has called for a highly selective approach to mapping Roman settlement in northern Gaul. The decision was therefore taken to limit the sites marked here essentially to those named in ancient sources, and to others of some significance. In addition to *civitas* capitals, the latter include nucleated settlements (*vici*, a few of which achieved the status of *civitas* capital in the Late Empire), road stations, rural sanctuary complexes, and the few Roman forts, mainly of early date. The category of road station has been used to denote roadside settlements of limited extent, as well as those places named in ItAnt or TabPeut for which satisfactory archaeological evidence is lacking.

Isolated rural sanctuaries—comprising temples, baths and theaters—are a feature of the region, especially its western part; only the larger such complexes, often with significant monumental buildings, are marked. It would be unrealistic to mark the many small shrines (*fana*) which occur throughout the region and in every *vicus*. Cemeteries and burial mounds are omitted for similar reasons. While many *vici* clearly served a wide range of functions as local centers, some appear to have specialized in the manufacture of particular commodities, such as pottery and metal; but these are not distinguished here. Such activities, of course, occurred on at least a small scale at most larger sites as well (Petit 1994). In addition to localized industries, Gallia Belgica housed two of the major pottery production centers in the whole of the western empire, the Gallo-Belgic pottery industry in the Vesle valley south-east of Durocortorum and the Samian potteries in the Argonne forest; in each case, a single “cluster” symbol stands for the many kiln sites (Sept-Saulx and Lavoye respectively).

Most major Gallic settlements (*oppida*) in the southern part of the region had at least indirect contacts with the Roman world prior to Caesar’s conquest, as evidenced by the wine amphorae and other imported goods found there. In view of their number, these settlements are not shown unless there was also significant Roman activity on the site (for instance use by the Roman army, or as a religious center), in which case the symbol chosen reflects their status after the Roman conquest. Many of the Augustan foundations (Augusta Suessionum, for example) represent in effect a shift to a valley site from a nearby hilltop fortified site, in this case Noviodunum? (D3).

For the sake of clarity, only the names of those Gallic peoples whom the Romans later formalized into *civitates* appear on the map, thus omitting some lesser groups or tribes who are mentioned in Caesar’s time, but were subsequently subsumed into larger groupings or otherwise disappear from history.

A category of site which is particularly well attested in Gallia Belgica, largely through the work of Agache (1975; 1978), is the rural villa. Given their numbers—over 600 are known in Somme alone—it would be impossible to plot either these, or other, small rural settlements comprehensively. It appears that their distribution was not uniform; large villas are most frequent in areas where there are fewer nucleated settlements (as in western Picardy), whereas in other regions the reverse applies (as in Nord and Hainault). As Wightman (1985) has noted, we are evidently dealing with genuine variations in the pattern of settlement, which may relate to the pre-existing pattern of social structure and land tenure, as much as to factors such as agricultural potential. Only a limited selection of

well-known or extensively excavated villas is shown; this can also give an indication of the areas where they are most abundant.

The network of major roads attested in ItAnt and TabPeut can be augmented by other important routes between centers, as well as selected minor roads, based on information offered in TIR Lutetia and elsewhere (note Brulet 1990). Many Roman roads in this region are still preserved in the alignment of modern roads and tracks, or survive as cropmarks; the course of others, however, remains conjectural.

The modern coastal zone in Flanders is low-lying, and includes tracts of land reclaimed from the sea. In the earlier Roman period, much of this area was probably marsh and dunes, as reflected by the sparseness of significant settlements. During the third century A.D., the zone was inundated as a result of the Dunkirk II marine transgression, so that by the Late Roman period the coastline had in places shifted several miles further inland (note Brulet 1990, map 1; Van Ossel 1992, map 1). The linework for it is rendered as approximate, but takes into account the distribution of marine clays and peats (Vermeulen 1992, 17-18 and figs. 2, 152).

Rhineland

The ancient geography of the region remains difficult to determine in many respects. Since the ancient courses of large rivers such as the Mosa and Rhenus are not well established, no attempt is made here to reconstruct the river system. Moreover the ancient names of many rivers remain unknown. A further palaeogeographical problem concerns the position of the North Sea shoreline: this can at least be reconstructed approximately on the basis of important research by van Es (1988, 89).

The region has been the focus of much archaeological investigation ever since the early nineteenth century. From the outset, its exceptional nature as a frontier-zone led to particular concentration on military installations. Thus studies were made, for example, of the legionary fortresses at Castra Vetera, Novaesium, Bonna, Mogontiacum and Argentorate. Much attention was also given to auxiliary forts. The Reichslimes-Kommission undertook systematic work along the upper German and Raetian frontier line (*limes*), as did other institutions at various times along the lower German frontier. Although new discoveries are still being made—as in the case of Castra Herculis—the location of most auxiliary forts now seems established. More may remain to be found, however, along the R. Lupia and north-east of Mogontiacum.

By contrast, research into large urban centers, nucleated settlements (*vici*) and other rural sites presents a much less even picture. The unique location of Col. Ulpia Traiana (some miles from the medieval foundation of Xanten) made it ideal for fieldwork, with the result that we are better informed about its development than that of any other city in the region. Significant fresh discoveries of *vici* cannot be expected. In the case of rural sites, on the other hand, the situation is entirely different. Because of aerial photography above all, new villas are constantly being discovered, and it would still be premature to make any confident estimate of the settlement density of the region during the Roman period.

By definition, a single map cannot adequately reflect the continuous transformation which the region experienced from its occupation by Julius Caesar to the end of Late Roman period. Some former military installations slowly developed into civic centers, and in the Late Roman period many towns were fortified. Frequently, military installations and civil settlements coexisted at the same time.

Our knowledge of the routes within the region is very limited. TabPeut and subsequent compilations based upon it still form the most important source (Hagen 1931). As a result, although it is certain that a network of roads linked the cities marked, their courses must frequently remain approximate. The courses of aqueducts, on the other hand, are much more secure (Grewé 1986).

Map 12 Mogontiacum-Reginum-Lauriacum

Compiled by H. Bender, 1996

with the assistance of G. Moosbauer and M. Puhane

Introduction

A number of large river-systems—most notably the Rhine (ancient Rhenus) on the western edge of the map, and the Elbe (Albis) and Oder (Ouiadoua?) in the north-east—determine the landscape of the region covered by the map. Its whole southern part is dominated by the Danube (Danuvius). Even though it may be possible to reconstruct the ancient courses of these great rivers at certain points, for the most part the necessary evidence is lacking, and so no such attempt is made here. Another vital geographical feature is the Central German Highlands (Mittelgebirge), which lead from the relatively broad Bavarian foothills of the Alps (Map 19) to the low plains of the north. The latter stand out at the top of the map. The Highlands rise to 5,000 ft in the Black Forest (Abnob(ai)a Ore), for example, and in the Bohemian Forest (Gabreta? Hyle).

Despite the possibility of extreme differences in seasonal temperature, the climate can be characterized as well balanced. In general, it is continental middle European, ranging from the warmer west (in the Upper Rhine area) to the colder regions in the east (such as southern Poland). There are fertile regions with good soils in the Upper Rhine valley in the west, in the Danube region in the Bavarian foothills, to the north of Frankfurt (Nida), at the northern foot of the Central Highlands, and in Bohemia (Boihaemum).

The ancient geographical evidence is extremely scanty. The main river-names are known with more or less certainty, as well as the names of the most important ranges of the Central Highlands. ItAnt and TabPeut preserve the names of places along main routes, even if not always quite accurately. Many names supplied by Ptolemy, referring primarily to places and peoples along the trade routes beyond the Roman empire in “Barbaricum,” cannot be identified with any real certainty; for these, see further TIR Castra Regina.

The area covered by the map includes territory within modern Austria, the Czech Republic, Germany and Poland. Altogether, it is relatively well explored as a result of recent research, much of it incorporated in the valuable series of handbooks *Die Römer in...* TIR Castra Regina is likewise useful, and can now be supplemented by important later finds of cemeteries, settlements and military camps. The present map reconstructs the course of the Roman frontier-line (*limes*) in Upper Germany and Raetia on the basis of the detailed maps in relevant guidebooks (Beck 1980; Ulbert 1983; Schallmayer 1984; Klee 1989; Baatz 1993).

The map's main emphasis is clearly on military settlements, for two reasons. First, almost all the forts in the vicinity of the *limes* are known; the same cannot be said of civilian settlements. Second, the mass of rural settlements (*villae rusticae* and smaller establishments) cannot be shown here; consequently, the wide variations in our knowledge of civilian settlement across the map are masked. Concentrations of *villae rusticae* are at least known, for example, in the area beyond Mogontiacum and Nida, along the R. Neckar (Nicer), in the northern Ries (Losodica-Biriciana-Mediana), and in the neighborhood of Reginum. Where features fulfilled more than one primary role over time, the symbol by which they are marked represents that of the late second century A.D. Consequently, former forts—as in the region of the Swabian Alps (Alba Mons)—appear as civilian settlements. By the same token, many civilian settlements of the Early Empire became forts in the Late Empire.

Beyond the Roman empire, only the most significant settlements and cemeteries are marked (including those which give their name to a culture-type). Care has been taken to include sites revealing notable evidence of Greek and Roman imports. The specially full representation of sites in Boihaemum stems in part from a high level of research activity there.

The Via Claudia Augusta is the only named road known in the area of the map. It runs from the Po valley over the Alps, into the Alpine foothills in Bavaria, and on to the Danube. Aerial photography has allowed the route to be traced. It has assisted likewise in the case of many other main and secondary roads, whose approximate route we

know, but have difficulty establishing on the ground. Recent findings in dendrochronology have also assisted these efforts substantially. Some Roman roads which appear to end at the *limes* undoubtedly extended further into “Barbaricum,” but since such extensions were not built up and paved, they can scarcely be documented archaeologically.

Introduction

The knowledge shown by ancient authors (Pliny, Tacitus, Ptolemy, Cassius Dio, Cassiodorus, Iordanes) of the geography of the area north of the R. Danube, and particularly north of the Carpathians, derives primarily from trade contacts along the amber route linking the middle Danube with the south Baltic coast (Kolendo 1981; 1993; Godłowski 1985; Wolters 1990; 1991). It was this trade that generated the large quantities of Roman imports attested in the R. Vistula basin (Eggers 1951; Wołagiewicz 1970; Kolendo 1981a; Wielowiejski 1985). In the opinion of ancient geographers, this river had two sources, one to be identified with the modern upper Wisła, the other with the R. San (G2-H2).

Ancient authors mention numerous tribal names, but since few of these peoples can be located (Schmidt 1934; Kolendo 1981b), only the better attested are marked on the map. The large-scale tribal migrations that occurred are difficult to portray here. We should, however, draw attention to some of the Germanic tribes who passed through this area and played a major role in the barbarian incursions into the Roman Empire: the Marcomanni, Goths, Gepids, Vandals and Burgundi (Demougeot 1969; 1979; Thompson 1982; Demandt 1989). It should also be noted that from the end of the fifth century A.D. onwards the area north of the Carpathian mountains was increasingly settled by the Slavonic Sclaveni (Godłowski 1979; 1983; Parczewski 1993, 132-44). It is impossible to locate precisely the place names mentioned by Ptolemy, in spite of various attempts to do so (Kolendo 1981b). For example, modern scholars have very often identified Ptolemy's Kalisia with the Polish town of Kalisz (medieval Calisia); really, however, Kalisia should be placed somewhere in Slovakia (Kolendo 1981b, 14).

The fact that a major part of the map lies outside the Roman empire has influenced the choice of sites to be marked. Native settlements and cemeteries have been marked where there is evidence of ample Roman contact indicated by the presence of a wide range of Roman artifacts. Since the Marus and Duria river valleys not only enjoyed such contact but were also densely settled, it has been necessary to select here only the more significant and extensively excavated settlements, the larger cemeteries, and the so-called "chieftain graves." In addition, account is taken of some remarkable coin hoards found in the area of modern Poland because of their significance for Roman contact with the area. No site marked predates the Hellenistic period.

Attention must be drawn to a group of sites in Slovakia whose special character is not distinguished on the map. These native settlements with Roman-style buildings are shown only as "settlements" (Kolník 1986; Pitts 1987). The sites in question are Cífer-Pác, Devín, Dúbravka, Milanovce and Stupava; others which may belong in this category are Komjatice, Mikulčice, Niederleis, Šarovce and Uherské Hradiště. The reason for their special character is still to be determined: it may indicate a Roman military or trading presence, or may reflect the client relationships of the German chiefs with Rome as attested in the literary sources (Pitts 1989; Bouzek 1990).

Only permanent military sites are marked, although in recent years increased aerial photography and Austrian-Czech co-operation have resulted in the identification of several marching camps in the Marus valley (Bálek 1994). These discoveries, and future ones, will undoubtedly improve our understanding of Roman campaigns north of the Danube (Tejral 1994).

Map 14 Caesarodunum-Burdigala

Compiled by R.W. Mathisen and H.S. Sivan, 1997

Introduction

(also covering France on Map 25)

A primary concern of both maps is to mark sites to which an ancient name attested up to the sixth century A.D. can justifiably be attached. Although there is evidence of commerce with the Greek and Etruscan worlds, the main focus here has to be on the Roman presence. For the earlier periods, very few place names are known, principally from Caesar, Strabo and Marcianus of Heraclea (in GGM I).

For the Roman imperial period, many place names are provided by Pliny, ItAnt, TabPeut and inscriptions. It is not until the Late Roman period, however, that large numbers of them are attested, in sources ranging from the NotDig to church councils and Gregory of Tours. Indeed, from the sixth century onwards there is such a growth in the number of sources that only those of notable geographical importance—Gregory's work in particular—can be reflected here. Saints' lives and official documents could add quantities of further names. A great many of those attested only in the Late Roman period must in fact date back earlier too. No attempt has been made to re-create ancient names from modern ones, even though many modern place names ending in -iac, for example, clearly derive from Latin forerunners ending in -acum.

The uneven pattern of identifiable ancient toponyms is balanced by a very extensive archaeological record. As a result, the number of sites marked with only modern names is considerable, comprising in particular settlements, villas for which a plan is available (or at least evidence of hypocausts), cemeteries and sanctuaries. Since the landscape in most areas offers so many archaeological sites, at this scale it is not possible to do more than create a representative picture encompassing what seems most significant. Hence there are many omissions of minor archaeological sites such as rural cemeteries, "working" villas, small isolated pagan sanctuaries and Christian churches, and lesser centers of pottery production. It should be recognized that many sites had multiple functions (road station and shrine, for example), even though they can only be marked with a single symbol here.

Roads with courses that can be followed from itineraries and milestones are shown as major and certain. Others, whose existence is certain, but whose course remains to be accurately determined, are shown as approximate.

Some changes to physical landscape cannot be shown at this scale, in particular the silting of the internal harbor of Bordeaux in the fifth and sixth centuries. It is not possible to do more than show the modern shoreline, although those stretches sure to have been different in antiquity are rendered as approximate. Although many river-names are known, it is seldom clear how far upstream a name applied.

The ongoing CAG series is especially valuable for reference; unfortunately, not all the volumes cited in the Directory were available when the maps were being compiled.

Map 15 Arelate-Massalia

Compiled by S. Loseby, 1995

Introduction

Map 15 Arelate–Massalia

Map 16 Colonia Forum Iulii–Albingaunum

All the French *départements* covered here were treated in the CAGR series, beginning with its first volume, *Alpes-Maritimes*, in 1931. Its successor CAG is far more comprehensive, although unfortunately both maps were compiled before publication of the relevant volumes. Some references to them are incorporated in the Directories, however.

Provence and Languedoc have in recent years been among the most dynamic regions of France in archaeological terms. As well as the periodic entries in *Gallia Informations*, the archaeology of the region sustains a series of journals, notably the *Revue Archéologique de Narbonnaise*, *Documents d'Archéologie Méridionale*, *Bulletin d'Archéologie de Provence*, *Archéologie en Languedoc*, and *Revue des Etudes Ligures/Rivista di Studi Liguri*. A comprehensive, up-to-date overview of the ancient history and archaeology of the region is lacking (Rivet 1988 is the best single work available); Bromwich (1993) at least provides a basic guide to the principal Greek and Roman remains.

Of the numerous sites known exclusively from archaeology, only those significant enough to have attracted at least an article-length study are marked. The whole span from early Greek engagement with the region (c. 600 B.C.) is covered, up until c. A.D. 500; locations mentioned only in works associated with Caesarius of Arles are therefore excluded.

From Cap Couronne eastwards (see La Couronne, Map 15 E3), the Provençal coastline appears to be little altered since antiquity, while on the western side of Map 15 the evolution of the shores of Languedoc has largely been gradual and minor—involving the shifting and consolidation of the sandbars which now separate the coastal étangs (lagoons) from the sea, but which seem to have been less developed in antiquity. In between, however, in the Rhône delta (ancient Rhodanus), change has been both constant and considerable. Its most striking manifestation is the submerging of the ancient port of Fossae Marianae, and the associated ambiguities surrounding the course of the celebrated Fossae Marianae canal; but the morphology of the whole area of the delta has undergone significant evolution over the centuries. The reconstructions offered here can therefore be regarded as no more than approximate. The course of the Durance (Druentia) has been much discussed too. Although the theory of a subsidiary arm of the river running along the north side of the Alpilles should be abandoned, it is clear that much of the land around the western end of the Alpilles, extending south-west towards Arles (Col. Arelate), was considerably marshier than it is today.

Centuriation is another challenging problem. Alongside the well-known Orange cadasters (Col. Arausio), much painstaking work has now shown that the coastal plain of Languedoc was thoroughly centuriated in antiquity (note especially Clavel-Lévêque 1983). The existence of sundry overlapping centuriations (up to five in places) makes it impossible to represent all of these systems here; see the spate of specialist articles appearing in particular in *Revue Archéologique de Narbonnaise*. East of the Rhône valley, in Basse-Provence, extensive centuriation is rendered less likely by the fragmented nature of the terrain. Although attempts have been made to claim the existence of numerous small systems (Soyer 1973; 1974), these have generally been doubted on both empirical and chronological grounds. More broadly, in recent years Languedoc and Provence have given rise to numerous studies of the long-term evolution of rural settlement patterns. Much valuable and innovative survey work is being done for the areas around the Etang de Berre (Stomalimne) and Etang de Thau (Taurus in Map 15 B3) in particular.

The roads of the region have not been systematically examined as a network. The arterial routes, the east-west axis formed by the Via Iulia Augusta-Via Aurelia-Via Domitia, and the north-south route on the eastern side of the

Rhône, with their chains of road stations, are relatively well attested and discussed; but few other roads have been considered in similar detail, and their courses are often ill-defined. No attempt is made here to show really minor or extremely short stretches of road. Certain routes are omitted as too conjectural for inclusion; at the same time it must be acknowledged that some of those shown may depend upon little more than local antiquarian tradition.

Directory

All place names are in France unless otherwise noted

Rhoda	CH?	Rhodian colony on coast	Pliny, <i>NH</i> 3.33
*Samnaga/ Samnagenses	R	Gaujac?	Roth Congès 1992, 58-61
Sekoanos fl.	H	town of Massalia, probably error for river, R. Arc? R. Touloubre?	StByz Σηκοανός; Brunel 1945, 128-29; Barruol 1969, 199
Zao Pr.	R	between Massalia and La Ciotat; Cap Croisette?	Barruol 1969, 211

Names found only in Avienus

Note: Information about the earliest period of Greek contact with Iberia may be contained in the fourth century A.D. poem by Rufus Festus Avienus, *Ora Maritima*. It takes the form of a *periplus*, or coasting narrative, around the peninsula from the northwest, south through the Straits of Gibraltar, and on east and north up the Mediterranean coast, naming places and peoples along the way. The archaic date of Avienus' information has been stoutly defended by many, but it remains more likely that he was engaging in antiquarian creative invention. Hence, names attested only in Avienus are not marked on the maps, and appear in a separate list in each Directory. There is no such special treatment, however, for names known from Avienus *and* from another source.

Name	Modern Name / Location	Reference

Map 17 Lugdunum

Compiled by E. Bertrand, 1997

Introduction

From both geographic and economic perspectives, the area covered by the map divides into three zones, west to east. In the west, the economy of the Massif Central (ancient Cebenna Mons) depended upon animal husbandry, forestry and mining. Ancient authors (note Strabo 4.6.9) emphasize how hard life was in the high mountains, and this zone—like the Alps to the east—was resistant to romanization. The Alps (where the economy was similar) formed a natural boundary; securing its passes became a necessity for Roman administration. Both before and after the conquest, these passes were used more than the coast road for traffic between Italy and Gaul, and they remain vital economic arteries for the area. It has always been difficult to identify the minor towns and road stations located in the Alps by the ancient itineraries, in particular because of considerable erosion which has buried many sites beneath alluvium.

In the center, the romanization of the R. Rhône (ancient Rhodanus) valley was more rapid and more complete. In the fertile land of the Rhône plains there remain traces of extensive Roman centuriation linked to the colonies there. Archaeological survey has also located numerous villas in this zone, although very few are excavated. The Rhône and the roads along it were a key axis in the economic relationship between Italy, Gaul and Spain.

Major changes to the physical landscape since antiquity are few. In the Alps, a number of reservoirs have been constructed; notably, at Serre-Ponçon such development has led to the submersion of several valleys near Vappincum. Most important, however, are changes affecting the course of the Rhône. Historians and geomorphologists agree that this was originally more diffuse (Bravard 1987); its bed was wider and shallower, and it could certainly be forded in several places. Except over very limited stretches—as at its confluence with the Saône (ancient Arar, Desbat 1982; Bravard 1997)—the ancient course of the Rhône cannot be reconstructed. Even so, simply by removing modern modifications it is possible to give an instructive impression of the river's natural course, as is attempted here.

Submersion of the Franciens quarries (Savay-Guerraz 1997), as well as of the pottery workshops of Portout and Conjux (Magny 1990) around Lake Le Bourget, indicates a lower water level for the Rhône in antiquity (Bravard 1987, 35-65). Certainly the level of Lake Le Bourget is known to have risen over fifteen ft since the Neolithic period, and over nine ft since Roman times. Since the Middle Ages the confluence of the Rhône and the Ain (not labeled) has been steadily shifting westwards (see E2, north-west of St-Romain-de-Jalionas).

Some confusion between the Rhône and the Isère (ancient Isara) on the part of ancient authors seems likely (Van Ooteghem 1949).

Map 18 Augustonemetum-Vindonissa

Compiled by G.D. Woolf, 1998

Introduction

The most obvious influences of physical geography on human settlement in this region are the presence, on the one hand, of the volcanic massifs of the Morvan in Burgundy (north of Augustodunum) and the central Massif, and on the other, of the western end of the Alpine range. Hydrology, the presence of alluvial soils, differences in land use and variations in population density all flow from this framework, which had much the same form in antiquity as it does today. In general, apart from minor alterations to water courses created by the construction of a network of canals (and more recently reservoirs), the region's present landscape and climate are probably similar to those of the Roman period. The major exception is the location of woodland. Extensive deforestation of areas not cleared in the Neolithic period was a feature of the Late Iron Age—the idea that primeval forests existed throughout Gaul at the time of Roman conquest is a myth—and central France in the Roman period was in all likelihood as deforested as it has ever been. Subsequent reforestation reached a peak in very recent years, with the result that in some areas (the Morvan, for example) plantations make the understanding of ancient settlement very difficult indeed.

Otherwise the major obstacle to archaeological investigation is the long-term continuity of settlement in the main centers of population. No Gallic *civitas* capitals exist in the region except under medium- or large-size cities. At best, important Roman sites like Col. Aventicum or Augustodunum lie under relatively quiet modern cities, but others, like Lugdunum and Genava have had to be reconstructed piecemeal through numerous urban excavations. This long-term continuity of settlement has made it especially difficult to understand the earliest traces of Roman urbanism, marked by temporary structures in wood and earth. On the other hand, urbanization, industrialization and the accompanying rural depopulation occurred relatively late in this part of France (Weber 1976), and the population density remains low by modern European standards. As a result, if the great conurbations have hampered research there, and if the slopes of the central Massif and the Morvan are now inaccessible to much research, much of the landscape remains between these extremes.

It is no surprise, therefore, that some of the most successful work in the area has focused on the smaller settlements, especially what are now conventionally termed *agglomérations secondaires*, a term denoting all categories of settlement larger than a villa or smaller than a *civitas* capital. Extensive excavations of small towns like Alise-Ste-Reine (ancient Alesia) have been followed by regional surveys (note Mangin 1986; Bénard 1994), and the compilation of an atlas and associated analytical studies (Petit 1994). All these have made clear the central role played by villages, small sanctuaries and minor towns within this region, to the extent that around one hundred *agglomérations secondaires* are known from Burgundy and the Franche Comté alone, only the largest of which are marked here. Villas (Bayard 1996) and rural sanctuaries (Fauduet 1993) also existed, but do not seem to have been so prominent in these landscapes as in the north of France. The contrast may, however, reflect different conditions of land use, principally smaller properties and more woodland. Consequently, aerial photography has been less important here than in the Paris Basin, with the exception of a few areas like the Jurasian Finage (R. Doubs valley; ancient Dubis). Extensive survey has also been used more rarely than elsewhere—again with some exceptions, as in the valley of the R. Allier (ancient Elaver). Neither military garrisons nor centuriation (except at Mirebeau) have left much trace on these landscapes.

Perhaps the most difficult element to map is the road system. In outline the Augustan road system is clear enough, anchored on Lugdunum with routes south down the Rhône valley to Narbonensis and Italy, west to Mediolanum (Map 14 E3) and north to Andematunnum, where the trunk road divides into one route to the Rhine and another to the north-west. Equally, the main routes through the Alpine valleys have been the same in every age (Pauli 1984). The itineraries confirm the long-lasting nature of this framework. The problem comes in ranking the much smaller roads, which over the Roman period (as numerous local studies demonstrate) formed a very dense and

growing system within Gaul. To date and to follow the course of minor roads that have neither milestones nor paving is very difficult, to say the least; much, therefore, remains uncertain about such roads shown here.

New discoveries are reported regularly in *Gallia Informations*, and summarized in CAG. Otherwise, in this part of France the *Revue Archéologique du Centre* and the *Revue Archéologique de l'Est et du Centre-Est* are the main journals of record. For Switzerland, an invaluable handbook to Roman remains is *Die Römer in der Schweiz* (1988), which comprises a detailed thematic discussion by R. Fellmann, and a fully annotated gazetteer of sites by W. Drack; the first part (updated) has appeared in French (Fellmann 1992).

Map 19 Raetia

Compiled by H. Bender, 1997

with the assistance of G. Moosbauer and M. Puhane

Introduction

The map covers the central Alps at their widest extent, spanning about 160 miles from Cambodunum to Verona. Almost all the notable rivers flow either to the north or east, to the Rhine and Danube respectively, or south to the Po. Only one river, the Aenus (Inn), crosses the entire region from south-west to north-east. A number of large lakes at the foot of the Alps on both its north and south sides played an important role in the development of trade. The climate varies considerably. It ranges from the Mediterranean and temperate to permafrost in the high Alps. On the north side the soil is relatively poor and stony, but in the plain of the R. Padus (Po) there is productive arable land.

Under Roman rule, this part of the Alps was opened up by a few central routes, although large numbers of mountain tracks were already in use. The rich mineral and salt deposits, which in prehistoric times had played a major role, became less vital in the Roman period since these resources could now be imported from elsewhere. From a very early stage, however, the Romans showed interest in the high-grade iron from Noricum as well as in Tauern gold; they also appreciated wine and cheese from Raetia, and exploited the timber trade. Ancient geographical sources for the region reflect a growing degree of knowledge, which improves as the Romans advance and consolidate their hold in the north.

Today's division into a total of six countries (Austria, Germany, Italy, Slovenia, and Switzerland with Liechtenstein) has not exactly encouraged collaborative research, so that general historical and archaeological overviews are lacking. Note, however, the comprehensive account by van Berchem (1980). Olshausen (1991) assembles significant preparatory material. Pauli (1980) provides a general overview on the basis of the archaeological evidence, while Bätzing (1991) investigates aspects of cultural history from earliest times to the present.

Inventories for Italian territory, Carinthia (AUS), Swabia (GER) and Slovenia have been published. For Upper Bavaria (GER), it is possible to refer to the excellent documentation of the *Bayerisches Landesamt für Denkmalpflege*; for the Salzburg (AUS) region, information furnished by archaeologists active there proved most useful. Otherwise, the handbooks *Römer Schweiz* (1988), *Römer Baden-Württemberg* (1986), and *Römer Bayern* (1995) are valuable for reference.

It should be recognized that in some areas (around Teurnia, for example, or west of Iuvavum) the density of ancient settlement was greater than can practicably be represented at this scale. More generally, in Late Antiquity the settlement pattern changed significantly. Primarily in the eastern Alps, but also in the upper valley of the R. Aenus and elsewhere, hilltop fortifications became the norm (Ciglenečki 1987, map 163) because of the prevailing insecurity. In view of the timespan of the map, only the early phases of this new pattern are represented.

Map 20 Pannonia-Dalmatia

Compiled by P. Kos and M. Šašel Kos, 1995

Introduction

The map covers very heterogeneous landscapes ranging from the Adriatic coast to the Alps, and from the mountainous interiors of the provinces of Dalmatia and Pannonia with their rich ore sources to the Pannonian plain. The current state of research—to some degree reflected by the map—is uneven. Thus the Carinthian province of Austria (Piccottini 1989), Slovenia (ANSI 1975), and Bosnia and Herzegovina (ALBiH) are better explored topographically than other regions where no compilations of archaeological sites have been published. The results of topographical research conducted over the past thirty years by Bojanovski (1988) are of great importance. Much antiquarian and topographic information has been collected for Histria and Venetia by Vedaldi Iasbez (1994), with particular attention to Greek and Latin writers. Similarly substantial collection and assessment of data for the Dalmatian coast and islands are provided by Kozličić (1990). TIR Tergeste (1961), TIR Aquincum (1968) and TIR Naissus (1976) are also of value for the areas they cover, though not always reliable. Mócsy's work (RE Suppl. 9 Pannonia) remains fundamental for the province of Pannonia.

As Kozličić (1986) has shown, since antiquity geomorphological changes along the Dalmatian and Istrian coasts have been minimal, if only because no very large rivers flow into the Adriatic; the map therefore retains the modern coastline. The coast of the eastern Adriatic is, however, sinking at a minimal rate annually (Šegota 1976).

Geographic names by no means always appear in the nominative in the Greek and Latin sources; the point applies especially to ItAnt, ItBurd, TabPeut and GeogRav, which often represent the only evidence. Since they typically list names in the ablative or locative (genitive) cases, it can prove impossible to reconstruct the original nominative. Hence the nominative of Ragandone was undoubtedly Ragando, and that of Populos may in all likelihood have been Populi; by contrast, the nominative of place names ending in -is cannot be inferred with any certainty. Since their gender could either be neuter or feminine (and possibly even masculine), the nominative of Lentulis may have been either Lentula or Lentulae. In those cases where the original nominative remains ambiguous, the attested form of the name is therefore retained within single inverted commas; where the nominative can plausibly be reconstructed, that form is marked with an asterisk attached (see Map Key). It is no less difficult to decide between variant attested forms of any name; we have sought to mark what seems the least corrupt form, regardless of the source in which it appears.

There are many unidentifiable geographic names in Late Roman and Byzantine sources. The point applies especially to GeogRav (for Dalmatia, Čače 1993 is exhaustive). He distorts a number of known toponyms (Atamine for Emona, for example, Sicce for Siscia), but also lists others unattested elsewhere. Such are, for example, twenty-five in "Carneola, que et Alpes Iuliana antiquitus dicebatur" (present-day Upper Carniola), of which Carnium alone can be identified (Šašel 1970). Various place names mentioned by Stephanus, Procopius (Beševliev 1970) and above all Constantine Porphyrogenitus, *De administrando imperio* (notably chapters 29 and 30 on Dalmatia), reflect historical and geographical circumstances closer to the Middle Ages than to the Late Roman period. The epoch treated by Constantine was decisively influenced by the formation of the countries of Croatia, Serbia and Bulgaria, as well as by the presence of other Slavs. Some names appearing in these authors may well be corrupt beyond recovery; for certain, they distort other, more recognizable ones.

Map 21 Dacia-Moesia

Compiled by J.J. Wilkes, 1996

Introduction

The map is centered on the Carpathian basin, traversed by the middle course of the Danube, Europe's greatest river. The sandy wastes of the great Hungarian plain (Alföld), once an inland sea and still marshy in the south, are bounded on the west by the river and on the east by the mountains and high plains of Romanian Transylvania (Dacia). Further south, the rolling hills and wooded valleys of Serbia lie between the mountains of Bosnia and Montenegro to the west and the Bulgarian Stara Planina (Balkan Mts.) and Rhodope range (Map 51 C1) to the east. The plain has a continental climate of cold winters and short hot summers. South of the Danube the climate is milder, though snow and seasonal floods regularly impede movement. The Serbian plain and tributary valleys support cereal cultivation, but the region also has rich mineral deposits, gold, iron ore, silver and lead. Gold and iron ore are also present in western Transylvania.

In the Vács (Waitzen) gorge (B2, north of Aquincum) the Danube bends from an eastward to a southward course and flows 230 miles to a confluence with the Dravus (modern Drava). It then continues south-east for 220 miles, during which it receives the Pathissus (Tisza), which drains the Hungarian plain and—through its major tributaries—Transylvania. After confluences first with the Savus at Singidunum (Belgrade), and then with the Margus, the Danube next enters a succession of gorges (Djerdap), where the stream is in places narrowed to barely 500 ft. Finally it flows over the cataracts of the Iron Gate (E5, the Prigrada rock which lies across the river bed and bars all navigation) to reach its meandering lower course between the plains of Romanian Wallachia and the gentle hills of northern Bulgaria. The river's course today has been affected by many modern interventions—notably in southern Hungary, where cuttings between the twists and turns have reduced the course by 75 miles. At the end of the nineteenth century a navigable channel was created through Djerdap, and a canal dug to by-pass the Iron Gate; these initiatives imitated the Roman engineering works of A.D. 100-101 (prior to Trajan's first Dacian expedition) and the bridging of the river at Drobeta in 105.

Several prehistoric cultures have been defined in this area, notably the early Neolithic fishing settlement at Lepenski Vir (not marked) near the entrance to Djerdap. The legendary return of Jason and the Argonauts by way of the Danube may recall early voyages of exploration, but the earliest tangible contacts with the Greek world are prestigious imports in the princely tombs of the early Iron Age. At the end of the first century B.C. Roman armies entered the area to establish strategic bases at Mursa and Sirmium that secured the land route between Italy and the East via Naissus. This great Balkan highway was later traveled by many emperors and armies, not least when clashing in civil conflict. It was probably logistical considerations which caused the bases of Roman army units to be constructed along the river bank. Except during the occupation of Dacia from A.D. 106 to c. 270, this line of bases fossilized into a fixed frontier cordon that held until a rapid collapse at the end of the fourth century, following the dispersal of the Goths in the area and the subsequent arrival of the Huns. A partial imperial recovery in the sixth century ended with the Avar capture of Sirmium in 582 and the ensuing Slav migrations into the Balkans.

The legionary fortresses (Aquincum, Singidunum, Viminacium, Apulum) and the *castra* of auxiliary units were linked by a frontier road, and are named by both ItAnt and TabPeut. By contrast, most of the auxiliary *castra* in Transylvania were not linked in the same way, but some of them were abandoned within two to three decades of Trajan's conquest of Dacia. Major settlements and minor stations along the great Balkan highway in the early fourth century are listed in ItBurd. In addition, most major settlements are mentioned by Ptolemy, including several places beyond the frontier that cannot be located. Others are named in Roman or Late Roman historical sources or on contemporary inscriptions. Only a few of the forts reported by Procopius to have been renovated or constructed in this area by Justinian in the sixth century can be located. Many ancient sites or finds of material have been recorded, however. The lines of ancient roads can be reasonably inferred, even though few actual traces on the ground have been detected. Rural settlements, including fortified settlements and refuges, are marked on the map where there is a

significant association either with a major road or with mineral workings. The latter are concentrated in the area of the middle and lower Dreinos valley (Dalmatian and Pannonian lead/silver mines), in Kosovo (Dardanian gold and lead/silver), north-east Serbia (copper and lead in the Pincus and Timacus valleys), and in Transylvania (Dacian gold and iron ore).

Uncertainty persists regarding some features. The linear earthworks which cross the plains beyond the Danube in Hungary (Czörsz-árok or “Devil’s Dike”) and Romania (Brazda lui Novac de Nord) are marked, even though the fourth-century date argued by Soproni has been challenged by Fiedler (1986) in favor of a seventh-century one. Among conjectured roads across the Hungarian plain, the line Florentia-Partiskon-Maris(os) fl. is marked on the basis of some material evidence. A Roman origin for the Jarak channel which by-passes the bends of the Savus below Sirmium has been accepted from association with the road station Fossae (Serbian *jarak* = Latin *fossae*); it may be the one said to have been dug by the emperor Probus in 282 (Historia Augusta, *Probus* 21.2). The lines of roads shown by TabPeut leading south from Naissus cannot be traced with as much certainty as elsewhere; Miller’s widely accepted reconstruction is adopted here.

Modern exploration began with the Bolognese soldier and scientist L.F. Marsigli, who surveyed the frontier region between Austria and Turkey following the Treaty of Carlowitz (1698). During numerous travels he recorded the remains of ancient fortifications and settlements along the river, which he later published in the second volume of his *Danubius Pannonico-Mysicus* (1726). By the late nineteenth century the documentation of ancient topography in Austria-Hungary was well advanced; although much less progress had been made in Ottoman lands, it was possible for H. and R. Kiepert to prepare detailed maps to accompany volumes of CIL III (1873, 1902), as well as Map XVII (1894) of FOA. These were not superseded until the publication of TIR Aquincum (1968), TIR Romula (1969) and TIR Naissus (1976), which in turn are already out of date for some areas. Valuable introductions to the ancient topography of the area of Serbia are to be found in the recent volumes of IMS (1976, 1979, 1986, 1995). Aerial photographs are now adding significant new evidence for ancient remains in several areas, notably along the Hungarian Danube (Visy 1988). Finally, construction of the two Yugoslav-Romanian dams across the Danube below Belgrade (at Karataš in 1965-70, and at Kusjak in 1980-88) resulted in the discovery of several new sites during rescue work before they disappeared below the rising water (Petrović 1996).

Map 22 Moesia Inferior

Compiled by A.G. Poulter, 1996

Introduction

Reconstructing ancient topography and land-use in this region is exceedingly difficult. Although the courses of the Danube and its major left- and right-bank tributaries have changed little since antiquity, land reclamation and dredging to improve navigation along the Danube have substantially narrowed the river's flow. They have also eliminated much of the marshland which existed between its channels and especially, but not exclusively, along its left bank. Here, the series of 1:200,000 maps produced by the Militärgeographische Institut (Vienna, 1940) has been used in preference to later cartography, since they provide a more reliable, if still tentative, guide to the landscape within the Danubian plain.

Eastern Dacia and Scythia Minor are covered by TIR Romula (1969), which takes an optimistic view of the identification of ancient sites and roads. The western limit of Moesia Inferior is included in TIR Naissus (1976). Except for Poulter (1995), no recent detailed maps exist for settlement in the north Danubian plain, and none for northern Thrace. Two publications (Hoddinott 1975; Velkov 1977) remain the best authorities for Bulgaria from the classical to Late Roman periods. For Dacia (present day Romania), there is a useful and notably reliable source for military sites (Cătănciu 1981), and another for civilian settlements (Tudor 1968). The Directory cites further bibliography for sites of exceptional importance where recent excavations have been carried out. It also registers uncertainty about the function of some sites (fort or settlement, for example).

With notable exceptions (cf. Maddjarov 1990), the exact alignment of roads cannot be confidently determined. Even the Danube road, though its general course is assured, frequently deviates south to avoid low-lying ground. It is by no means certain that this important highway ran directly from one fort to another, or whether side-roads provided access to military installations and cities located on the Danube bank.

Few villas have been fully excavated; all those that have been published are marked, except where interpretation is in doubt (Nikolov 1976, 67-71). Variation in the distribution of settlement shown generally reflects regional differences in the intensity of survey and excavation. Only a limited number of major sites have been investigated along the Bulgarian section of the Danube, for example; by contrast, field-survey and excavation, supplemented by aerial reconnaissance, have added substantially to the total of sites in the Romanian Dobrogea (Scythia Minor) and along the valley of the R. Olt (ancient Alutus). Conspicuous is the thinly spread line of Roman forts known for the eastern frontier of Dacia, where field-work has been limited. No doubt there are more military bases to be found here, probably interspersed with watch-towers, as intensive survey has found along the western frontier (Map 21). Only in northeastern Bulgaria, between the R. Athrys and the Black Sea, is the scant evidence for Roman occupation likely to reflect a comparatively low density of settlement in antiquity; as late as the nineteenth century, this largely waterless landscape was forested and thinly populated. Even so, it is remarkable that the region has produced evidence for important sites of the Hellenistic period (Abritus, Sveshtari). More generally, only the well-published Late Roman "refuge settlements" have been included (Sadovets, Tsaravets). Where regional survey has been carried out (as between the R. Asamus and Abritus), numerous hill-top fortifications dating to the fifth and sixth centuries A.D. have been discovered; these were certainly common along the length of the Haemus range, especially in its northern foothills (Poulter 1983 II, 97-100).

Military occupation of the plain between the Carpathian foothills and the Danube may already have occurred by the end of Trajan's first Dacian War (101/102). The majority of forts here, however, were established after the final conquest of the Dacian kingdom in 106. The abandonment of Moldova and the creation of the so-called Limes Transalutanus fortification-line can both be tentatively dated to the reign of Hadrian. Despite claims to the contrary, the Roman abandonment of Dacia probably occurred during the reign of Gallienus (260-68), before the traditional date of around 275 when Aurelian established the new province of Dacia south of the Danube (Cătănciu 1981, 53-55). In the Late Roman period, the extent of control and military occupation over territory north of the Danube

remains controversial. One fort (Pietroasa de Jos), well beyond the Danubian Limes, would seem to have been occupied in the fourth century A.D., as were bridge-head forts (Sucidava, Barboși, and the unlocated Constantiniana Daphne) along the left bank of the river. But the earth bank and ditch, known as the Brazda lui Novac de Nord, though later than the Limes Transalutanus and often regarded as being of Late Roman date, remains problematic. Similarly, although considered first-century and believed to predate the Limes Transalutanus, the function and origins of a shorter section of bank and ditch known as the Brazda lui Novac de Sud remain uncertain. The absence of any evidence for Late Roman forts or settlements along its course and south of it rather suggests a later, probably medieval, date (see also the Czorsz-arok, Map 21 B2).

In the list of Unlocated Toponyms, where possible, a general location is provided, either with reference to a nearby site, or to the Late Roman province to which it was probably assigned (Maps 101, 102). In the case of sites mentioned by Procopius, there is particular reason for scepticism. Although he credits Justinian (527-565) with major reconstruction and the building of new fortifications, the only corroborative evidence is confined to Mesembria. Along the Danube, notably in Scythia Minor, tile-stamps and inscriptions suggest that Anastasius (491-518) was responsible for the reconstruction of frontier installations. Procopius is confused, especially in his descriptions of Moesia II and Scythia; many names are clearly corrupt, and similar names in separate lists may be the same site included twice by error, not two different places with the same name.

Map 23 Tomis-Olbia-Chersonesos

Compiled by David Braund, 1995

with the assistance of Diane Braund

Introduction

The region to the north and west of the Black Sea has received substantial archaeological attention over many years (see especially Koshelenko 1984, supplemented by Hind 1992; cf. 1994; and, on a wide range of issues, Vinogradov 1997). More recently it has been the subject of underwater investigations, which, with some support from geologists, have encouraged dramatic reconstructions of much of the coastline (notably Agbunov 1985; 1987; cf. Hind 1983, 72). It seems that the Black Sea was somewhere between three and thirty ft. lower in the first millennium B.C. (the so-called Phanagorian regression). That, however, is a huge range, while it should also be noted that much of the argument for sea-level changes depends upon archaeological work and speculations, so that there is a danger of circular argument. Yet some rise in sea-level since antiquity is clear, not only at large sites like Olbia, but also at smaller sites, like Kutsurub (numbered site 25; Marchenko 1983). Reconstructions of the coastline are therefore needed, but the process of recovering the ancient shore has not yet advanced far enough to permit great confidence in detail. In particular, while some of the problems of identifying ancient sites may be solved by a better understanding of physical changes since antiquity, recourse to reconstructions must remain a last resort for the time being. More often, the primary difficulty is the reconciliation of conflicting ancient testimony. Accordingly, much of the shoreline of this map—from the R. Danube westwards to Taphros (modern Perekop)—is marked as uncertain, but reconstructions have not been adopted wholesale.

The deltas of the rivers present the most complex areas of change. The Danube delta has evidently changed since antiquity, but the nature of that change is known only in very broad terms. Much speculation has been encouraged by the fact that ancient writers count the branches of the delta with different results (Agbunov 1979, 123; 1987, 142-44; Panin 1983; 1983a; cf. Parroni 1984, 281; Corcella 1993, 271-72; Silberman 1995, 59). While they variously refer to three, five, six or seven mouths, there are now three principal ones. By the Roman period, the figure of seven seems to become more or less standard: its value is indicated by the fact that each of the seven is named (though not by all sources, nor always in the same way). However, the delta was evidently large and marshy enough to encourage different conceptualizations of its lower course. Tacitus (*Germ.* 1) mentions six mouths emptying into the Black Sea, with a seventh into a marsh, while Strabo (7.3.15) pays attention to the relative size of the mouths and sets them out accordingly. Ptolemy seems confused (Brandis, RE 4 cols. 2117-22; cf. Treidler, RE 23 cols. 1400-1404; TIR Romula). Limited geological research (Panin 1983; 1983a), and the largely concordant accounts of the Roman period, constitute the basis of the provisional reconstruction of the delta on the map.

In making this reconstruction, particular attention has been paid to the description by Pliny (*NH* 4.83), who gives names not only for the mouths of the Danube, but also for some of the “islands” formed by the channels of the delta. Attention may be drawn to the merits of the version presented here, beyond its broad accordance with the irreconcilable evidence of our sources and its attention to such geology as we know. First, the most southerly branch of the delta leads into the saline marsh (ancient Halmyris) beyond which the city of Histria is located. In that sense, Histria (“city of the Hister”) was not as far removed from the great river as even the best maps tend to suggest. Second, the curiously named Pseudostoma is seen to be indeed a “false mouth,” in the sense that it seems to offer a useful passage to or from neither south nor north; in effect, the courses of the neighboring channels make it redundant for the traveler. Third, the version presented here accounts, too, for the fact that the Borion (“northern”) Stoma was not the most northerly mouth of the Danube delta; rather, Psilon Stoma was (though the two were sometimes equated). Even so, as the map shows, Borion Stoma could readily be envisaged as such, with the channel to its north (Psilon/Thiagola) passing into the sea through a marsh (Thiagola), rather like the most southerly channel.

The delta of the R. Dnieper (ancient Borysthenes) presents a separate set of problems. The river itself has been changed by the modern construction of a reservoir in the north-east corner of the map, an area rich in Scythian

tumuli. The map thus attempts to reproduce the earlier course of the river, with its many channels and islands. It is at the mouth, however, that changes are most significant for the classical world and also most problematic. Although I adopt a fairly conservative stance, it has been cogently argued that in antiquity a branch of the lower Dnieper cut straight through the peninsula facing the mouth of the R. Bug (ancient Hypanis) and debouched into a much reduced Yagorlytskiy Bay; consequently, Ivanovka 5 (numbered site 64), for example, lay far inland from the shore of that bay (Kryzhitskiy 1989, 15, 97 and 153). At the same time, it is argued, the “Wooded Sea” (Hylaeum Mare) to the south-east of the Bug mouth was substantially smaller than today.

The lower course of the R. Dniester (ancient Tyras) has likewise been the subject of reconstruction, though evidently with less support from geological research. The fact that Ophioussa is sometimes identified by our sources with Tyras, and at others is presented as a separate location (Kacharava 1991, 205-206), has encouraged the suggestion that it was an island, now engulfed by the lower course of the Dniester (Agbunov 1981; cf. Hind 1983, 78; Kacharava 1991, 206-207). Such problems are familiar in the western Black Sea region (see, for example, Gocheva 1996 on Dionysopolis, Map 22 F5). Until there has been a rigorous study of the geology of the lower Dniester, a more cautious solution seems preferable—for example, that Ophioussa became Tyras in the middle of the fourth century B.C. (Kacharava 1991, 205-207).

Be that as it may, rather more ancient testimony has combined with sustained archaeology on the lower Dniester, and still more on the Lower Bug, to produce substantial knowledge. Many of the sites here are so close to one another that they are shown on the map with a single symbol, as a cluster; where such a group of sites is large, the location of the cluster symbol on the map can only be an approximation. At the same time, archaeologists have given the names of nearby modern settlements to ancient sites, which may in fact be at some distance from their modern homonym; the map shows the ancient location under its modern name.

The study of the lower course of the Bug is dominated by the city of Olbia, whose lowest parts are now under water. Like Tyras, Olbia too had another name, Borysthene (a third name, Miletopolis, seems a rarity). The name Borysthene is now attested there in the archaic period, on a graffito of the sixth century B.C. on an architectural terracotta (Rusayeva 1988, 166-67), and on a bone plaque (Hind 1992, 95). Although the name was supplanted by Olbia in the city itself, it persisted in the literary tradition. Accordingly, it is used at the end of the first century A.D. by Dio Chrysostom in his Oration 36, a text which offers some circumstantial detail—for example, illustrating vividly the Hylaeum Mare—although it is not a historical description of contemporary realities (Braund 1997). Borysthene was also the name of the great R. Dnieper, as well as evidently of the island of Berezan', whence the settlement of Olbia seems to have proceeded (Kacharava 1991, 49).

Throughout the northern area of the map, river names are a persistent source of uncertainty, all the more troubling since they are so often used by sources from Herodotus onwards as points and lines of reference (Hdt. 4.82 with RE Suppl. 9 Pontos Euxinos, col. 923; Corcella 1993, 275-77).

A similar source of confusion is the name of Achilles. It was applied widely in the region, where his cult was of great significance. His name is attached not only to Achilleios Dromos (“Achilles’ Racecourse,” modern Tendra), but also to the island of Leuke (off the Danube delta) whose significance was disproportionate to its size, both as a cult-center and as a port-of-call. Leuke had a particular value in any direct voyage from the Danube delta to the western Crimea (Hind 1983, 78; cf. Hind 1996). It perhaps also facilitated an alternative route from the Danube delta to the Dniester area; certainly the island could be perceived as off the Dniester rather than off the Danube (Strabo 7.3.16). It seems that the coast between the Danube and the Dniester had little to offer: here was the Eremia Geton (“Wasteland of the Getae,” Strabo 7.3.14), another coast which seems to have lost settlements to the rising waters of the Black Sea (cf. Agbunov 1981).

Two cities of the region have dominated scholarly interest, Olbia on the Lower Bug (Hypanis) and Chersonesos in the south-west corner of the Crimea. The civic territories of both, with their associated settlements, have proved particularly rewarding. The estuary of the Lower Bug around Olbia was densely settled throughout antiquity, while at Chersonesos the pre-Roman centuriation of the chora can even be traced in some detail (Zherebtsov 1981; Zubar' 1993; Saprykin 1994). There were buildings on these plots, including tower-like structures, which came and went, though the land continued to be worked after their disuse; Kruglikova (1983) offers a detailed case-study. Nikolayenko (1988) describes such defended “villas,” and notes a preponderance towards the limits of centuriated land, as well as sites which seem to be associated with the natural defenses of the Chersonesos region, particularly the line of Khomutova Balka and Sapun Gora, the foothills of the Tauric Mountains to the east.

To the north along the coast, the chora of Chersonesos may have reached as far as modern Masliny in the Hellenistic period, much further than once thought (Treister 1993, 542-44; cf. Solomonik 1987 for epigraphy there).

The location of Karkinitis, Kerkinitis and Karkine constitutes an insoluble difficulty. The map follows the usual view that there was only one Karkinitis in the region (also known as Kerkinitis), and that this is to be located at modern Eupatoria. However, despite the strength of that orthodoxy, there remains considerable concern that Karkinitis should be located further north in the next bay of the Crimea, known today (perhaps significantly) as Karkinit'skiy bay, or that the three names refer to more than one settlement. At any rate, it seems clear enough that the ancient Karkinitis Kolpos is Karkinit'skiy bay and that the ancient R. Karkinites emptied into it, being the modern R. Kalanchak. Ptolemy's mention of a settlement named Karkine at the mouth of that river would account for these names, while causing least disruption to current orthodoxy. Accordingly, Karkine, which some would identify with Karkinitis/Kerkinitis, appears separately on the map (Kacharava 1991, 128-33 is exhaustive on the issue; cf. Silberman 1995, 56-57). Further south, the map adopts the orthodox locations of Parthenion Akron and the temple of Parthenos on Cape Fiolent, near St. George's Monastery. Yet Strabo's description of the area (7.4.2) seems rather to point to their location on Cape Chersonesos, the peninsula between Chersonesos and Palaia Chersonesos. Accordingly, the locations of both are presented as uncertain.

The "barbarian" peoples of the region pose a series of problems. Usually they are understood as three broad groupings, following one from another: the Scythians, replaced by the Sarmatians in the Hellenistic period, who in various guises (Alanoi, Bastarnae, Iazyges etc.) continued at the margins of the Roman empire until they were replaced by or, in some locations, evolved into the so-called "Chernyakhov culture" of Late Antiquity (see below). In addition, there are the "Thrakes" on the west of the map (Nikulitse 1987; Treister 1993b), and the Tauroi and Taurosokhythai of the mountains of the southern Crimea (for their antecedents, Kris 1981; cf. Shcheglov 1988), a region known as Dory in Late Antiquity (Bortoli-Kazanski 1987; Pioro 1990).

The processes of change among the "barbarians" remain at issue: the significance of invasion may well have been overestimated at the expense of evolutionary change (see further Map 84, Introduction). Similarly, while the ethnic labels familiar in modern scholarship are those used by classical writers, archaeology may be a better guide to cultural identity. The account of Herodotus has attracted particular controversy (Corcella 1993). By and large, his text has been pressed too hard in searches for literal truth characteristic of Soviet methodology, not least for the ancient world. For example, scholars have attempted to identify Skyles' house at Olbia and the *proasteion* where he left his men in Herodotus' story (cf. Hind 1983, 81). Meanwhile, Zaginaylo (1990) seeks to argue that Skyles' authority was extensive in the north-west Black Sea (including the coastal communities) from about 475 B.C.

Archaeology shows a substantial correspondence between land-use and ecology, as might be expected. The steppe behind the north shorelands of the Black Sea was generally suited to nomadic pastoralism. Here, for the most part—the Lower Dnieper is an obvious exception which proves the rule—there were no significant Scythian settlements (as we choose to call them). Rather, such settlement was largely in the wooded steppe immediately to the north of the map, notably around the R. Vorskla towards Kiev (Pogrebova 1957; cf. Rolle 1991, 64 for the geographical and cultural lines of the steppe and woodlands to the north). It is on the western bank of the Vorskla that Bel'skoye Gorodishche is situated, identified as Herodotus' Gelonos (Shramko 1987, 21, with reference also to the settlement at Kamenskoye Gorodishche).

The relations between the "barbarians" and the classical world were a particular issue on the coastlands of the Black Sea. Certainly, there was trade: thus the "Scythian" settlement at Neapolis, near Simferopol' in the Crimean hinterland, contained considerable Greek material, including graffiti (Golentsov 1979; on Neapolis and the elusive Chabon and Palakion, see Gajdukevič 1971, 309). Moreover such trade persisted into the Roman period, as Kadeyev (1989, 80-89) indicates for Chersonesos in the south-western Crimea.

There was also mundane co-existence between "barbarians" and settlers from the classical world. For example, Okhotnikov (1990, esp. 55-63) notes the close interaction and apparent cohabitation of "Greeks," "Scythians," "Thracians" and others on the Lower Dniester and Danube. Marchenko constructs a similar picture for Olbia and Berezan' (1988; cf. Hind 1992, 92-94). In the Crimea, the role of the Tauroi in the early stages of Greek settlement at Chersonesos is bound up with a current dispute over the date of the city's foundation: the case for a foundation-date (however that may be imagined) in the late sixth century seems to become ever stronger as excavation continues, though the traditional date of c. 422 retains powerful adherents (note Zedgenidze 1993; cf. Hind 1992, 97-99 on the issue). Elsewhere in the Crimea, a passage of Pliny (*NH* 4.85) has caused many to

imagine Scythian cities named Orgokynoi, Charakenoi, Assyranoi, Staktaroi, Akisalitai and Kaliordoi: as the names might suggest, however, these are tribes.

There seem to have been ditches at Perekop, the isthmus which connects the Crimea with the mainland (Vdovichenko 1986). Ptolemy (3.5.4) mentions a Neon Teichos in the area of Perekop, to be identified or at least associated with Taphros, situated on the isthmus (Pliny, *NH* 4.85). The geographical significance of the isthmus was evident enough, not only for military purposes but also (and perhaps more importantly) for the exaction of “taxes.” The creation of a wall and ditch there may be explained accordingly. Further, the north of Sivash (Bykes Limne), while separated from Coretus bay of the Sea of Azov by a rocky outcrop, was linked with Tamyrales bay and the north-west Black Sea by a ditch, apparently man-made (*fossa*: Pliny, *NH* 4.84; cf. the man-made watercourse nearby, *ibid.*). This ditch may well explain the toponym Taphrai, as well as the ethnonym of the local Taphrioi. Evidently Perekop was a line of communication east-west as well as north-south.

As usual on the north and east shores of the Black Sea, the Roman, and especially the Late Roman, period has been rather neglected by comparison with earlier centuries. The Roman military presence, particularly from the late first century A.D., has attracted significant interest (note Treister 1993a; Koshelenko 1984, 57 for forts, esp. Charax). Tile-stamps indicate the activity of Roman military units (or at least the use of their products) even on the island of Leuke (Treister 1993, 533-34; cf. Hind 1983, 78 for Tyras; Avdeyev 1993 for Chersonesos). Of particular interest is the recent discovery of evidence for the production of high-quality silverware at Kara-Tobe (no. 87 on the map), perhaps for use by Roman forces in the region as diplomatic gifts in the first century A.D.

From the turn of the fourth into the fifth century, it seems, the coast and mountains between Yalta in the west and Gurzuf in the east were inhabited by people who emerge in the middle of the sixth century as the Goths of the Dory region (Vasiliev 1936, 32-38, 52-57; Kazanski 1991, 118-24). Mangup (no. 102) in the mountains may have been the center of power in Dory, though Eski-Kermen (no. 104) was also significant in the area (cf. Myts 1990 for the medieval period there, with Vinogradov 1994 and Map 84 (introduction) on links with the Aorsoi). Procopius’ (*Aed.* 3.7) account of Justinian’s constructions in the region is doubtless as over-stated as ever in his work; Late Antique remains are largely burial grounds. He claims substantial work at Chersonesos, and the creation of a fort at Alushta (Aloustou Phourion), as well as another “among the Gorzoubitai” (the tribal name seems to survive in the modern toponym Gurzuf). He retains the ethnonyms Tauroi and Tauroskythai, but mentions also the friendly Goths of the fertile uplands of Dory, claiming that Justinian protected them with long walls across routes into their lands (*Aed.* 3.7.17).

From the end of the third century A.D., the inhabitants of the environs of such cities as Tyras and Olbia are assigned to the Chernyakhov culture (Bortoli-Kazanski 1987, 441-42). This cultural group is linked with much of the Late Antique settlement of the north Black Sea coast (Shchukin 1975; Symonovich 1979; Magomedov 1984). It is best known, however, by its burial-grounds (Kropotkin 1988; Samoylova 1989). For Late Antique coins in the region, see Kokorzhitskaya (1990), briefly supplementing Nudel'man (1976). Shchukin (1979) attempts to construct the history of the Chernyakhov culture, with its roots in that of the Sarmatians.

Map 24 Asturica-Conimbriga

Compiled by E.W. Haley, 1996

Introduction

Material for compiling a map of north-west Iberia varies in terms of accessibility, completeness and reliability. In addition to Schulten (1974) and Tovar (1976; 1989), there are now TIR Conimbriga (1991) and Caesaraugusta (1993); for Portugal (omitted from TIR Conimbriga), Alarcão (1988) is indispensable. Tovar's volume on Tarraconensis (1989) was incomplete at his death and reflects his primarily philological and etymological interests. TIR omits certain toponyms attested by epigraphy alone, and the quality of its maps is uneven.

The physical environment has changed appreciably since antiquity with virtually all of the major rivers dammed, particularly from the 1940s to the 1970s. I have attempted to reconstruct their ancient courses as accurately as possible. No substantial shoreline changes since antiquity have been identified.

The varied Celtic and Celtiberian legacy of the Iron Age survives most visibly in thousands of castros, castella or citânias of the north-west Iberian peninsula (Tranoy 1981). Even TIR omits most of these native, generally hilltop, settlements known occasionally through excavation but mostly from survey; I have aimed to mark only the best-known or most representative of them. In fact many, if not the majority, of the named Roman towns shown represent little more than pre-Roman castros endowed with varying degrees of Roman material, construction and political institutions.

An attempt has been made to record all ancient place names attested in the literary and documentary sources, and to mark as many of them as possible. A desire to include the archaeologically most significant sites has dictated the choice of rural habitations and mines, but it is important to note that even Domergue's repertorium of mines (1987) is incomplete. There is no equivalent for the north-west of Sillières' compendium of roads for southern Iberia (1990). The main highways indicated by the itineraries are shown, together with those secondary routes whose course is confirmed in places by milestones.

Many scores of villas in north-west Iberia have come to light through complete or partial excavation and survey, even since Gorges (1979) published his study. Those marked here are a representative selection: they are ones that display, through excavation, outstanding architectural features, ground-plans or stratigraphic sequences.

Directory

All place names are in Spain unless otherwise noted

Map 25 Hispania Tarraconensis

Compiled by S.J. Keay (Spain), R.W. Mathisen, H.S. Sivan, 1997

Introduction

Spain

The area of north-east Hispania spanned here encompasses a wide range of geographical differences which, in turn, embrace distinct cultural regions. One of the notable difficulties in mapping them remains the long history of piecemeal coverage of native and Roman sites by local archaeologists. Until recently, there had been few attempts to systematize the resulting data. The abortive series *Carta Arqueológica de España* listed archaeological sites of all periods, but covered only two of the modern Spanish provinces—Soria (CAE Soria) and Barcelona (CAE Barcelona)—which make up this region. Subsequently, archaeological authorities in the provinces of Burgos, Cantabria, Guipúzcoa, Guadalajara, Huesca, Navarra, Soria, Teruel, Valladolid and Vizcaya have produced catalogs of varying quality in the same tradition. More such catalogs undoubtedly exist in the archaeological services of other Spanish provinces (Jimeno Martínez 1993), although they remain unpublished for the most part. Roman settlement in the province of Girona has been the subject of a monograph (Nolla 1984), as has the hinterland of ancient Tarraco (Carreté 1995). Otherwise, since the 1950s many small regional surveys of very varying quality have been published in journals or monographs with very limited distribution, giving details of occasional discoveries of villas, inscriptions and material finds throughout the region. All this has perforce resulted in great inequality of coverage. Consequently, in this regard and many others, the publication of TIR Caesaraugusta and TIR Tarraco represents a great step forward for much of the area covered here.

Every attempt has been made to mark those sites mentioned in the ancient sources whose location is known beyond reasonable doubt, together with a representative range of sites known from archaeology alone. Even so, the selection can only be an individual one. In central Iberia, where native settlement patterns continue into the Republican and early Imperial periods, a full range of native castros or (to the east) hilltop sites has been included. Certain villas are also marked, selected because they are well known or offer an important stratigraphic sequence. Similarly, most mausolea and important church sites are shown. Systematic survey data are not reflected, however, so that the visible density of settlement in any area is not necessarily an accurate reflection of the situation in antiquity. This said, there are some areas, such as within the province of Huesca (around ancient Osca), where settlement does indeed appear to have been scarce.

Milestones have recently been synthesized for the province of Hispania Tarraconensis (Lostal Pros 1992), and comprise one of the main sources for marking roads, difficult though it is to do this with precision on many stretches. Areas of centuriation have frequently been claimed for this part of Iberia (note Ariño Gil 1986). At best, however, centuriation is hard to define here. Moreover, despite arguments to the contrary, its identification in the archaeological record remains fraught with interpretative problems. Consequently, none is shown.

Many environmental changes have undoubtedly occurred since antiquity. This is most evident in the damming of streams and rivers, and has been taken into account where possible. There is also little question that the physiognomy of the mouth of the R. Ebro (ancient H(I)berus) has changed, but to what extent is unclear; the coastline here has at least been rendered approximate.

Map 26 Lusitania-Baetica

Compiled by R.C. Knapp and F.H. Stanley, Jr. (Portugal), 1996

Introduction

Portugal

The works of Tovar (1974; 1976; 1989) and, above all, Alarcão (1988) are indispensable for the mapping of ancient Portugal. Alarcão catalogs some 3,000 known sites of all types, including Greek, pre-Roman and Roman remains. Because of the large number, it is of course impossible to mark all of them here, and his study should be consulted for additional information about villas, mines, roads, bridges and settlements. The map does, however, include all the more important settlements, and as many road stations as can be located (Roldán Hervás 1975; Mantas Soares 1990).

The physical configuration of Portugal has changed since antiquity, particularly with regard to silting of river mouths and slight changes in river courses. Less certain is the extent of topographical changes along the coasts; probably these are not significant enough to show at the scale adopted here. During the past century several large reservoirs have been built in central and southern Portugal, so that it has been necessary to restore the courses of the rivers affected.

It seems clear that the principal routes are those which receive double attestation, both through the archaeological record, and in ancient itineraries and other literary sources. By contrast, many, if not most, secondary routes may be identified only from very small surviving stretches of road, or from bridges. Reliance upon the latter as testimony for an ancient road offers special problems insofar as the dates for some are not clearly established. However, those roads represented here as approximate are marked thus only because their exact course has yet to be established; their dating is not in question.

Gorges (1979) provides extensive material on villas. Quintela (1986) offers information about the spread of Roman dams and aqueducts throughout the region south of the R. Tagus; this can further assist in locating villas. Although there was no doubt centuriation, the evidence for it remains difficult to ascertain, and none is marked.

Spain

Much material for mapping south-west Iberia is at hand. The compilation of ancient sources and modern hypotheses in *Iberische Landeskunde* (Schulten 1955; Tovar 1974; 1976; 1989) and in TIR Emerita provides a generally sound basis for further work. For Andalucía, the magisterial study by Sillières (1990) offers solid opinions on a wide variety of geographical topics. The revised edition of CIL II has begun to appear; it provides up-to-date information on the mass of inscriptional evidence relevant to geographical questions.

The physical environment has altered since antiquity. The coast has undergone little movement (Flemming 1969), except where the silting of certain river mouths has produced extensive change. An attempt has been made to reflect such change on the map in the bay of Cádiz (ancient Gades) (Escacena Carrasco 1986), the mouth of the R. Guadalquivir (Baetis), and the bay of Huelva (Onoba) (Caro Bellido 1989); for disputes concerning the area around Gades, see the judicious discussion by Sillières (1990). In the interior, many reservoirs have been constructed in the last 125 years; the ancient course of the rivers affected has been restored to the extent possible.

Although Greek goods were traded extensively in the south-west and Greek cultural influence was significant (Rouillard 1991), there were no Greek settlements. The Iron Age Iberian civilization which the Greeks found is well attested in the archaeology of the area; major indigenous sites have been marked, especially if they continued to be inhabited into the periods of more intense interaction with Greeks or Romans. No attempt has been made, however, to mark all native sites known archaeologically.

For the Roman period, after 206 B.C., archaeology provides material at an ever increasing rate. Thus the location of attested Roman settlements and road stations represents the main focus of the map. Even so, all the archaeologically attested settlement cannot be shown at this scale; more comes to light every year, increasing the impression of a densely populated region. Nonetheless the general pattern remains fairly constant, and the discovery of further places to which an attested ancient name can be attached with certainty is unusual. In order not to overburden the map, a representative selection has been made: the emphasis is on town settlements, accompanied by only a few of the hundreds of rural habitations which existed in the area by the first two centuries A.D. (for villas, see Gorges 1979; Fernández Castro 1982; much work has also been done since). The same limitation applies to mines and mining areas; these were extensive in the region, but again only a representative selection is shown. Domergue (1987; 1990) provides full information.

Roman alteration of the landscape through road- and bridge-building, as well as centuriation, leaves many marks. Sillières (1990) is fundamental for roads and bridges; Corzo Sánchez (1992) must be used with caution for Andalucía. Roldán Hervás (1975) provides information on areas further north, but lacks detail and good maps; it should be supplemented with Fernández Corrales (1987). TIR Emerita is essential for bridges and aqueducts. Fernández Casado's works (1972; 1980) are unpaginated and need to be used judiciously; much of his material also appears in Gazzola (1968). The identification of "Roman" bridges remains problematic; those marked are in general thought likely to be of Roman origin, but many others have been proposed at one time or another. Roads are marked as approximate unless long stretches are attested archaeologically or through milestones. Roads shown as major are those attested by ancient itineraries; all others are shown as minor, even though there must have been considerable variation in their importance. Disagreement about routes, especially minor ones, remains strong; the one marked along the left bank of the R. Baetis between Corduba and Hispalis is particularly controversial. Although centuriation has been sought in every nook and cranny (note Corzo Sanchez 1992), still only two areas, around Mérida (Emerita Augusta) (Gorges 1982) and Urso (Osuna), have solid evidence in support, the former on the ground, the latter from inscriptional evidence. Despite the strong likelihood that much land was divided thus, convincing evidence from specific locations remains hard to detect (Haley 1996).

Map 27 Hispania Carthaginiensis

Compiled by P.O. Spann, 1996

Introduction

For most of the named ancient settlements in the region covered by the map, the essential reference works are Tovar (1974; 1989) and Sillières (1990). The preponderance of settlement was south of the Sierra Morena (ancient Marianus Mons) and along the east coast. Iron Age Iberian settlements of no known ancient name are too numerous here to be fully represented at this scale. Since they are largely unexcavated and their status (as *oppidum* or *vicus*) can therefore only be conjectured, most have been omitted. Further coverage of them is offered by Almagro-Gorbea (1987), Blázquez Pérez (1992), and Ruiz Rodríguez (1987; 1993). Likewise the Talayotic culture and Punic settlement of the Balearic Islands (Guerrero Ayuso 1985; Harrison 1988) cannot be adequately indicated at this scale. The archaeological sites with no known ancient name that are marked thus represent only a small portion of the settlements which existed throughout the region; they are primarily those which relate to the road system in Roman times. In general, Galsterer (1971) is the authority for towns with titled or municipal status. Many, however, cannot be marked because their conjectured locations are too insecure.

Sillières (1990) provides the most recent and reliable account of the ancient road system in the southern part of the map. Corzo Sánchez (1992) can differ from Sillières and should also be consulted for roads in Andalucía. Roldán Hervás (1975) presents a very general discussion of the road system north of the Sierra Morena, and Palomero Plaza (1987) provides a comprehensive account of roads through the province of Cuenca. Many of the ancient roads and stations in the north-west part of the map have not been securely identified. Roads marked as major are those appearing in ItAnt and on the Vicarello Cups (Roldán Hervás 1975, 149-60). Roads attested by milestones or by confirmed archaeological remains are only marked as minor, however, even when they may have equaled in importance those appearing in the ancient itineraries.

Fernández Casado (1972; 1980) provides the primary works used for aqueducts and bridges. Many bridges thought to be Roman are omitted because of questionable dating. For villas, the main works of reference are Gorges (1979) and Fernández Castro (1982). Only villas with significant remains or mosaics are marked. Ancient mines are documented by Domergue (1990). In the Sierra Morena there are too many individual mines to indicate in detail at this scale, especially around Linares and La Carolina. The mine clusters marked, however, should not be taken to signify dense population in these areas. Caballero Zoreda (1982) has been used for dams, not only in the province of Toledo but elsewhere as well. Canto (1977) covers quarries. Such evidence as may be said to exist for centuriation is too dubious for this feature to be marked. For centuriation in Andalucía, consult with caution Corzo Sánchez (1992).

No attempt has been made to alter the coastline from its modern configuration. In general, it appears that no significant changes of sea level have occurred since antiquity (Flemming 1969, 4, 14-17); such ancient evidence as exists—around Saguntum and Valentia, for example—is either contradictory or indicative of no change (Schulten 1959 I, 408-11). To be sure, silting of river mouths and lagoons has occurred (Schulten 1959 I, 408-11; II, 116-17), but it cannot be indicated effectively at this scale. On specific changes, consult Scullard (1970, 48-52) for Cartagena; Harrison (1988) for southern coastal Phoenician-Carthaginian settlements; and Flemming (1969, 14-17) for the stretch of coast from Málaga to Sagunto. No good evidence exists for large lakes, although the number of “lagunas” of Ruidera on the upper R. Guadiana (ancient Anas) was perhaps somewhat greater in antiquity than now (Schulten 1959 II, 114-15).

Map 28 Mauretania Tingitana

Compiled by M. Euzennat, 1995

Introduction

Map 1a Fortunatae Insulae

Map 28 Mauretania Tingitana

The Mediterranean coast of Mauretania was regularly visited from the seventh century B.C. onwards, first by Phoenician (later Carthaginian) sailors on their way west to Spain. At the same time, the merchants of Gades (Map 26 D5) explored the Atlantic coast as far as the island of Mogador, today firmly identified as Cerne (Map 1a C2), which served as a trading station for two centuries as well as from time to time thereafter. The map attempts to reflect the current views of geologists and geographers on the nature of the physical landscape in antiquity, particularly in the Atlantic coastal plains (Desanges 1978, 111-12, 134; Euzennat 1989, 98-103; EncBerb 20 Gharb).

Little is known of the organization of the interior, occupied by warlike Moorish tribes, before the middle of the second century B.C. when it came to be ruled by King Bocchus and his descendants. Eventually, in 33, the entire kingdom of Mauretania somehow passed to the Romans, who established three colonies, Zilil, Babba (unlocated) and Banasa, spread out between Tingi and the Oued Sebou (ancient Sububus fl.), and sited in part to strengthen links with the two principal centers of the south, Sala and Volubilis.

In 25 B.C. Augustus reconstituted the kingdom of Mauretania for Juba. In A.D. 40, however, after the death of Juba's son Ptolemy, it was divided into two Roman provinces, Mauretania Caesariensis to the east and Mauretania Tingitana to the west. An extensive mountainous area occupied by Moorish tribes separated the two, and only one attempt to unify their administration was ever made, by Septimius Severus at the beginning of the third century (Euzennat 1990).

Even at its greatest extent the province of Mauretania Tingitana was in reality limited to the Tingi peninsula northwest of the Oued Lau (ancient Laud fl.), and then south along the Atlantic coast and the plains behind as far as Sala and Volubilis. The mountains and plateaux were the domain of tribes more or less loyal to Rome according to the mood of the times; their instability, however, demanded the maintenance of a considerable garrison (Euzennat 1984). In 290 at the latest, the whole southern part of the province as far as the Oued Loukos (ancient Lixus fl.) was abandoned, except for Sala and (from time to time) the trading station of Cerne. Henceforth the principal role of Mauretania Tingitana was to protect the Spanish provinces from Moorish invasions, thus confirming it in the frontier role which it had always had.

Ancient authors from Herodotus to the Ravenna Cosmographer provide copious data on western Mauretania. Their material, however, is often difficult to use, and sometimes impossible. Even so, it can be rewardingly reinforced by inscriptions (IAM 2) and by archaeological findings (Euzennat 1989, 9-19). In fact, because of the province's limited size, archaeological exploration has been more complete and more systematic here than elsewhere in Africa. It was begun before the end of the nineteenth century by Tissot (1878) and La Martinière (whose work on the Roman period was used extensively by Cagnat 1912). It was then considerably extended—at least in the area of the French protectorate—by the creation of an Antiquities Service for Morocco in 1915 (Roget 1938; Chatelain 1944; Carcopino 1943). After World War II, with the help of aerial photography, it was particularly active from 1955 to 1963.

Most recently, since 1982, new surveys undertaken between Volubilis and the Oued Loukos have contributed important fresh information. More limited research along the Mediterranean coast, as well as inland there, has so far only produced disappointing results for classical antiquity (Tarradell 1960, 76-77, 121-29; Gozalbes 1980; Cressier 1992, 398-99); the same must be said of exploration undertaken along the Atlantic coast south of Sala (Euzennat 1965; 1994; Rebuffat 1974a). These findings, however, accurately reflect the limits of the province. East

of Volubilis, communications by land with Mauretania Caesariensis always remained uncertain and probably sporadic, due to the migrations, rivalries and wars of the Moorish tribes (Euzennat 1960; 1978; 1984; Hamdoune, 1995; and Map 29 Introduction). The easternmost remains found in this direction are at Bou Hellou (E5).

ItAnt furnishes an outline of the major roads (Euzennat 1962; 1990b; Lenoir 1993), although practically no section of ancient date has yet been found. The road network confirms the organization of Mauretania Tingitana as a frontier region, a fact underlined by the number of camps, small forts and watch towers that have been identified (Rebuffat 1986; Euzennat 1989, 288-92; Limane 1992; 1995). Even so, these are altogether fewer in number than has sometimes been supposed, since nothing can more easily be mistaken for a small fort or tower than the type of farm or small rural sanctuary commonly situated on a hilltop less than a century ago, and still sometimes found there today. Similarly, one cannot deduce the presence of a permanent occupied site on the basis of a few scattered sherds (Euzennat 1989, 16-17).

Map 29 Mauretania Caesariensis

Compiled by T.W. Potter, 1995

Introduction

Much of the data presented here was assembled for AAA by Gsell, who collated evidence from a wide variety of sources, not least the pioneering survey work of A. Joly. Since then, there have been some valuable regional studies, like those of Cadenat (1957) in the vicinity of Tiaret, and some remarkable contributions by Salama (1951 onwards) on the Roman road network and its chronological evolution. For this, the ancient itineraries, together with milestones (a number of them datable), have been an important source of evidence. In addition, I have studied earlier modern maps, since French routes often seem to be closely modeled on those of the Roman period (see further Map 30 Introduction). There has been a dearth of modern field survey, however, and there is still much to be learned about such factors as the densities of settlement or agricultural strategies.

Nevertheless, the manifest concentration of Roman occupation in the north-eastern part of the area covered would seem to be an archaeological reality. It reflects several successive stages of colonization. Many of the more important coastal sites developed under Carthaginian stimulus, which gave way to Roman occupation in the first centuries B.C. and A.D. The settlements in the Chulimath (Oued Chélif) river valley, and in the flatlands to the west, were mainly military foundations in the earlier part of the second century A.D., under Trajan and Hadrian. By contrast, those to the south, along the Columnata-Ala Miliaria-Numerus Syrorum line, seem to be largely of Severan date (early third century). Most of them, too, were originally forts where considerable towns often grew up, distributed along the foot of the east-west mountain ranges. Although apparently lacking any continuous barrier or ditch, they clearly formed a *limes* or *praetentura* (Salama 1953; 1955a; Benseddik 1982). Indeed, there are very few unequivocally Roman sites in the semi-desert beyond. Notable are some probable fortified farms, conceivably of veterans (or, less plausibly, military posts: Salama 1977; Benseddik 1980); also an inscription from Aguenéb recording an expeditionary force sent far into the desert in May A.D. 174. It may derive from a commemorative monument set up in that area, where there are also two possible Roman forts, at el Khadra and el Bayadh.

To the north-west, there were some settlements on the coast as far as Rusaddir (modern Melilla); but no substantial pre-Roman or Roman site has yet been securely identified further west, on the seaward side of the great Rif Mountains, despite the listing of some places in ItAnt. This itinerary also locates the boundary between Mauretania Caesariensis and Mauretania Tingitana at the Mulucha/Malva river (Oued Moulouia). The distribution of sites, however, suggests that in practice the border ran on or close to the Siga river (Oued Tafna), between Numerus Syrorum and Siga, not far from the modern frontier between Algeria and Morocco; a road built by Macrinus (A.D. 217-18) followed its course and was conceivably a *limes* (Salama 1966). There may perhaps have been some sort of route towards Volubilis (Map 28), as the map suggests (Rebuffat 1971; 1982; Thouvenot 1973; Speidel 1977); but its existence is inferred rather than proven, and Roman sites have not been identified along its possible course. Some notable Berber hillforts are known in the region (Marion 1957), though they cannot be closely dated.

Indigenous settlements and tombs (*bazinas*) are prolific in many parts of the uplands and semi-desert. Although undoubtedly a conspicuous element of the ancient landscape (and fully cataloged in AAA), their chronology is almost wholly unknown, and they have been omitted; it is thus essentially a pattern of Roman settlement that is shown. The principal exceptions are the great Djedar funeral monuments (G1) of the Frenda region (Khadra 1974; 1979). Erected around the late fifth to late sixth centuries A.D., they serve to illustrate the emergence of a series of local Berber kingdoms, which grew up with the decline of Roman and Vandal control (Camps 1984).

Map 30 Iol Caesarea

Compiled by T.W. Potter, 1995

Introduction

West

Gsell's magisterial survey for AAA identified many major sites (and numerous minor ones) in this region, although one substantial urban center, Timici, did escape the normally meticulous recording of the Brigades Topographiques and of local antiquaries. More recently, there has been detailed field survey in the vicinity of Iol Caesarea, the provincial capital (Leveau 1984), and less systematic work in the mountainous terrain between Tigava Municipium and the sea (Leveau 1977). While virtually nothing of pre-Roman date came to light, the surveys did yield a large number of villas (but often lacking a *pars urbana*), as well as many village-like settlements. The more important of these are marked, although the modest size of most rural farms precludes their inclusion. In general (but not exclusively), sites of less than one hectare are omitted, the exceptions being places of significance in the archaeological record, such as the well-excavated Nador "villa" (Anselmino 1989).

Many sites in the valleys are undoubtedly buried beneath alluvium. This is especially the case in the wide valley of the R. Chulimath (Boulaine 1957), but also applies to other low-lying locations, particularly where rivers debouch into the sea (Vita-Finzi 1969, 54-58). Traces of irrigation- and land-management schemes have quite often been observed, notably in the Chulimath valley, but with too little precision to mark them here. They would seem, however, to have been an important feature of the ancient landscape, as indeed they are today.

There has been little detailed documentation of the Roman roads, although work in the Timici area, where ancient cuttings have been recorded (Marion 1950, 257), illustrates the potential of this field of study. The network shown is based primarily upon the observations of Gsell in AAA who, however, very rarely marked the courses of roads upon his maps. Salama (1951) provides important supplementary information, albeit of a generalized nature. I have also made much use of the quite excellent early French maps, which furnish a meticulous record of major and minor routes of communication as they were in the nineteenth century. It would seem that modern roads were commonly superimposed upon ancient predecessors (Leveau 1977, 263, for the Cartili? area); even so, the picture offered here remains tentative.

East

This region has seen little topographical field work since the days of AAA, although Laporte (1983) has identified a number of Roman farms in the Grande Kabylie, to the south of Iomnium and Rusazus. In AAA, many rural sites are identified as military posts of various sorts, no doubt with the contemporary network of French army bases and surveillance-points in mind. While a Roman army presence in Mauretania is not in question (Benseddik 1982), it is more likely that the majority of these sites represent fortified farms (where the walls are perhaps more for show than defense), of the sort excavated at Nador between Iol Caesarea and Tipasa. A very few of the military identifications have been allowed to stand; but a much less "militarized" landscape than Gsell envisaged is to be preferred. Still, it should be noted that the farms are generally too small to be marked on the map.

The prefix "Rus-" is an indication that many of the coastal towns originated as Phoenician settlements. The identification of their names has caused much difficulty. This would now seem to be resolved, however, by the discovery of an inscription from Cap Djinet, ancient Cissi (Laporte 1973; cf. PECS Rusuc(c)uru), which finally allows a satisfactory correlation between the archaeological and literary evidence for towns along the Kabylie coast.

One area that has yielded virtually no traces of ancient settlement is the Mitidja, a vast low-lying plain extending south and south-west of Algiers (ancient Icosium). Drained by the French in modern times, it is often said that in the Roman period it was a wet fen (AAA 5, 43). In reality, it is much more likely that the Roman levels are buried beneath alluvial silts, like those in the Chulimath valley further west. Otherwise it seems inconceivable that

so potentially fertile an area (as it is today) was not exploited in Roman times, especially given the Romans' skill in land reclamation; but the evidence has yet to emerge.

Equally, no modern fieldwork has been carried out on the Roman road network, where there is considerable room for conjecture. The views of Gsell in AAA and Salama (1951) remain influential; but the absence of really detailed plotting requires emphasis, so that there is little certainty about the precise line of most routes.

AAA identified two major areas of indigenous tumuli, one in the vicinity of Caput Cilani? and Thanaramusa Castra, the other in the mountains some 30 miles east of Auzia. They cannot be closely dated, and may belong to pre-Roman and Roman times; but their clustering appears cartographically significant, and could point to important tribal foci.

Map 31 Cirta

Compiled by E.W.B. Fentress, 1994

Introduction

Map 31 Cirta
Map 34 Numidia

Gsell's AAA, an extraordinary research tool, covers the whole of the tell and the pre-desert. Compiled in the first decade of the twentieth century, it draws upon all the available reports from local archaeologists, as well as upon the labors of the Brigades Topographiques, who marked ancient sites and features on the 1:50,000 maps. Clearly, some areas were better served than others. The large French community at Constantine (ancient Cirta), for example, supported its own archaeological society and journal, so it is not by chance that the surrounding area is very well known. The visible difference, however, between settlement in the more mountainous areas and that on the high plains to the south is a genuine reflection of ancient conditions. In areas such as the upper valley of the Oued Soummam (ancient Sava/Nasabath fl.), numerous sites are marked, but almost all of them are tumuli.

Directory references are almost exclusively to AAA, which regularly gives all the known classical references to a toponym. Major sites are also covered by other works, notably Gsell (1901). Another important source for Roman occupation in the area around Sitifis is Février (1967).

The number of sites known in the area covered by the two maps is much larger than those that have been marked. The latter include sites with an area exceeding one hectare, together with any of special significance; consequently, all small farms are omitted. The many unnamed settlements may be reckoned to date to the Roman and Late Roman periods. Unnamed forts are in most cases Late Roman; tumuli are probably all pre-Roman. Sites marked as tumuli may be cemeteries as well. The dating of the great Numidian cemeteries is never certain, and probably extends over several centuries.

The roads have been studied in detail, first by Gsell himself, then by Salama, whose work (1951; 1980) has been invaluable in preparing the maps. Roads shown are based on the work of both these scholars, with some modifications of my own. Desanges (1962), with the adjustments found in his edition of Pliny (1980), is followed for the placement of tribal names. The Late Roman topography of North Africa, which derives mainly from Christian sources, has been the subject of two essential studies, one by Desanges and Lancel (Desanges 1983), the other by Lancel (1991). X. Dupuis and P. Salama have offered advice on the more dubious attributions.

In spite of the rich epigraphic record, our inability to match toponyms with sites remains acute. For over 90 sites we can make a reasonably confident attempt. Yet 80 other toponyms attested in such sources as Augustine and TabPeut cannot be identified on the ground, while more than 20 settlement sites (villages or larger) remain anonymous.

Directory

All place names are in Algeria

Map 32 Carthago

Compiled by R.B. Hitchner, 1997

Introduction

Map 32 Carthago
Map 33 Theveste-Hadrumetum

These two maps cover most of modern Tunisia and the extreme east of Algeria. From 200 B.C. at the latest, control of this area was divided between Punic Carthage (mainly northern and eastern Tunisia), and the kingdom of Numidia (western Tunisia and eastern Algeria). The Roman province of Africa, established in 146 B.C., corresponded more or less to the territory held by Carthage prior to its destruction in that year. The Fossa Regia marked the boundary between the province and the kingdom of Numidia. The latter was annexed in 46 B.C. as the province of Africa Nova. In 40 B.C. the two provinces were united. Security in the united province of Africa Proconsularis was maintained by a single legion, initially under the governor's authority. Around A.D. 40, however, control of both this force and essentially the former territory of Numidia including the steppe was transferred to the legionary legate. Then around A.D. 200 that area became the new province of Numidia. A century later, under Diocletian, a further subdivision occurred with the formation of the new province of Byzacena to the south of Africa Proconsularis.

The area covered by Map 32 was densely settled in antiquity, particularly during the Roman period. Earlier, for the Hellenistic period, both literary and archaeological evidence reveals a countryside dominated by nucleated settlements ranging in size from villages to full-scale towns. The growth of agricultural estates comprising isolated farms centered on a villa or estate center (including a large number of imperial estates), is a phenomenon of the Roman period, though its antecedents are already evident in Hellenistic times. Northern Proconsularis is noteworthy for its large number of towns and villages; these survived well into Late Antiquity.

Map 33 comprises the eastern coastal plain known today as the Sahel, together with interior steppes of central and southern Tunisia and eastern Algeria. In the Hellenistic period, the Sahel was dominated by small towns inhabited by the Libyphoenices, a mixed African-Phoenician population. The interior, by contrast, was largely devoid of towns, and was controlled by tribes practicing a mixture of pastoralism and light agriculture. The only urban or semi-urban centers in the interior during the Hellenistic period were in the Atlas Dorsal (notably Mactaris) and in the oases of the southern steppe (notably Capsa). There do appear, however, to have been a number of hillforts scattered throughout the high steppe area.

The Roman period saw considerable growth in agriculture, first along the coast and then into the steppe. Garum (fish relish) production also became an important element in the economy of the Sahel from the second century A.D. The military conquests of the first century A.D. opened the steppe to agricultural development, but it was the spread of olive cultivation in particular that accounts for the remarkable growth in rural and urban settlement in the region from the late first century A.D. through the fourth and even later. In addition to the olive, there is also archaeological evidence for considerable estate-centered stockraising, cereal culture, and even some wine production. The Late Antique period witnessed some contraction in rural settlement, as well as the fortification of towns, particularly after the Byzantine reconquest in the sixth century.

The large number of identifiable urban sites on these maps is a reflection of the thousands of inscriptions published since the late nineteenth century, together with the relatively full record of towns and other settlements found in the itineraries and ecclesiastical sources. In recent years, this information has been supplemented not only by many new inscriptions, but also by new letters and sermons of Augustine. Definitive editions have appeared, too, of the North African section of Pliny's *NH* (Desanges 1980), and of the Acts of the Council of Carthage in 411 (Lancel 1991).

Despite the high level of preservation of both urban and rural sites, our knowledge of the archaeological landscape here remains uneven, and the maps inevitably reflect this. AAT, although still an invaluable cartographic tool, is not of the same quality as its counterpart AAA, and unfortunately it never achieved completion. ACRT adds new information derived from aerial photographs, but mostly limits itself to the area already covered by AAT. The results of recent excavation and field survey now contribute significantly to our understanding of settlement densities, chronologies and typologies throughout northern and central Tunisia. In addition, a new series of archaeological maps at 1:50,000 by the Tunisian Institut National du Patrimoine and Ministère de la Culture is now under way. It means to incorporate not only recent research, but also new data yielded by surveys made specifically for it.

Recent research on coastal change in Tunisia has permitted an improved understanding of the ancient coastline covered by the two maps. Over the last 2,500 years the sea-level along the coast has risen approximately 20-30 inches, and more than 3 feet in the northern Gulf of Gabès (Map 33 F4). This has resulted in the submersion of a number of archaeological sites along the coast. Over the last three millennia, some 188 square miles of alluvial deposits have formed at the mouth of the Oued Medjerda (ancient Bagrađa fl.), leaving ancient Utica some seven and a half miles inland. Moreover the Medjerda has changed course at least nine times since antiquity.

Map 35 Tripolitana

Compiled by D.J. Mattingly, 1996

Introduction

Tripolitana was the name of the fourth century province constituted from a region of Africa Proconsularis that had always been somewhat separate geographically and culturally (Merighi 1940; Haynes 1959; Buck 1985; Mattingly 1989; 1994). Although parts of the coastal zone and the chain of hill ranges to its south (the Tripolitanian Gebel) benefit from a Mediterranean climate and flora, a large proportion of the area shown on the map can be classified as desert or pre-desert lands. It is a region of very few perennial streams and of generally poor water resources, with great ingenuity being shown by its inhabitants in the exploitation of the meager rainfall (Vita-Finzi 1969; Barker 1996). Tripolitana is best known for its wealthy coastal cities, Lepcis Magna, Oea, Sabratha, Gighthis and Tacape, although there were also several minor towns, mostly along the littoral (Gascou 1972; 1982; Lepelley 1979; 1981). The western part of the map covers southern Tunisia, but the eastern part lies within modern Libya, thus causing archaeological research to follow two separate traditions, French-influenced in the former case, Italian and British in the latter. Modern place names reflect this division for the most part; those in the east generally follow Italian conventions of transliteration (normally those given in *Governo della Tripolitania* 1916), those in the west French ones.

For the Tunisian part, there are only a few sketchy sheets of AAT available, together with the published notes of the French Brigades Topographiques responsible for recording the sites noted there and on their 1:100,000 and 1:200,000 series maps (Toutain 1903; Toussaint 1905; 1906; 1907; 1908). More recent research has focused either on the frontier, or on the coastal sites (Troussset 1974; 1992). For the Libyan part, all research owes a great debt to the work of Goodchild (1976), who systematized earlier knowledge of roads and settlement and carried out many pioneering surveys. His TIR Lepcis Magna covers the eastern half of this map. Hafemann's (1975) historical map of North Africa, centered on Tunisia, covers the western zone in part, but is generally less useful. Brogan's work (1965; 1971; 1977; 1984) has been of great significance for the exploration of the Libyan pre-desert, and is now supplemented by the results of the Libyan Valleys survey (Barker 1996; Mattingly 1996). In addition, I have relied heavily on the American Map Service 1:250,000 and 1:50,000 series. For the Syrtic coast eastwards from Lepcis Magna, Purcaro Pagano (1976) has reviewed the ancient testimony for toponyms, though many of the precise identifications remain unsubstantiated on the ground. E.W.B. Fentress and P. Troussset gave advice and information on a number of controversial identifications.

Broadly, Tripolitana may be divided into four zones: a coastal plain of varying depth, the hill ranges, the pre-desert beyond, and finally the true desert comprising sand sea in the west and a desolate rock plateau in the south (Hamada el-Hamra, ancient Ater M.). In all four zones, spring-fed oases have been important foci for human settlement, and the map seeks to reflect this. Most of the coastal cities had their own oases, even where rainfall permitted dry cultivation. The major inland settlements were almost invariably attached to oases, as in the dense grouping in the north-west corner of the map around Turris Tamalleni (modern Nefzaoua), or around Cidamus (modern Ghadamès) to the south-west.

Most evidence for dispersed human settlement is to be found in the coastal plain (Gefara) and the Gebel, though in antiquity as today it was not evenly spread. In the pre-desert and desert areas the preservation of sites can be spectacular (Brogan 1984, for the well-known site of Ghirza), but in comparison with many other parts of the Greco-Roman world there has been little excavation either of rural sites or of urban centers apart from Lepcis Magna, Sabratha and Gighthis. In mapping rural settlement, which for the most part lacks ancient toponyms, I have followed two principles: first, to show major sites (typically villas, large farms, fortified farms, mausolea) by their modern names so that they may be easily located; second, to include a number of other sites (not named individually) in order to give an impression of overall settlement trends. This seems the best means of indicating the state of current knowledge since to some extent the major gaps on the map are representative of ancient reality. For instance, the

central area of the great coastal plain enclosed by the curving line of the Gebel marks a notable northward advance of arid conditions, and thus divides the region into eastern and western zones. The Gebel hills provided the best possibilities for non-irrigated agriculture, with olive cultivation of particular importance, and consequently the eastern coastal cities competed for control of large hinterland territories (Mattingly 1994, 50-54). However, although the Gebel region south of Lepcis Magna and Oea is reasonably well-known archaeologically, it should be noted that ancient settlement from the Gebel Nefusa (south of Sabratha) west to the Tunisian Gebel is less well-preserved and comparatively unexplored (Corò 1928). Intensive study would be sure to yield many more sites from these areas. In the pre-desert zone, settlement possibilities were more restricted, but the cultivation of the dry river systems of the Wadi Sofeggin and Wadi Zemzem basins in eastern Tripolitana by the Macae tribes is a distinct exception to environmental logic (Barker 1996, where the detailed settlement record for that remarkable region can best be appreciated). Tripolitana was also a frontier zone, and some of the remains of forts, fortlets and linear earthworks and embankments for the control of transborder movement compare with the best preserved examples elsewhere in the Roman world, though a number of key sites remain uninvestigated (Rebuffat 1972; 1975; Troussset 1974; Fentress 1979; Daniels 1987; Mattingly 1994; 1995).

Most place-name evidence is summarized by entries in RE, which should be consulted as a matter of course alongside the works cited in the Directory; wherever possible, these seek to pinpoint information on the physical remains of the sites. Several corpora of inscriptions cover all or part of the region (ILAf; ILT; IPT; IRT; Reynolds 1955), with post 1950s material best traced through AE. A large number of the place names have Phoenician (*lpqy* for Lepcis Magna) or Libyan derivations (for instance, places beginning with *Th*).

The problems of mapping the roads and locating named sites along them is particularly acute in Tripolitana due to a combination of circumstances (Toutain 1903; Donau 1907; Goodchild 1948; 1971; 1976; Salama 1951; Hammond 1967; Rebuffat 1973; Euzennat 1978; Mattingly 1994). With the exception of streets within towns, the roads were not paved, so that outside sectors where milestones have been recorded they leave no physical traces to distinguish them from the myriad dirt roads and tracks of the region. The course of the majority of roads marked is therefore a best approximation, taking account of the topography between places known, or believed, to have been linked in antiquity.

Another problem is that many of the road stations named in ItAnt or TabPeut were evidently of a very minor nature, and their names are descriptive of features that can no longer be discerned or differentiated between rival locations (sites such as Ad Puteam, Puteos, Ad Cisternas, Ad Palmam, Ad Ficum). The identification of modern toponyms for sites that lie away from the major fixed points is thus hazardous, although I have sometimes chosen to indicate a best guess. There are two main circumstances where I have done this: first, where the mileage distance when measured from fixed points seems to indicate a fairly secure approximate location (primarily on the coast road between Tacape and Lepcis Magna); second, where I have suggested revised lines for the roads on which the sites lay (as in the region immediately east of Lepcis Magna). I have deliberately not pursued these efforts beyond a certain level of uncertainty, and have thus refrained from identifying all the minor road stations shown by TabPeut on the western side of the Syrtic gulf. Rebuffat (1973) and Purcaro Pagano (1976) summarize earlier views, but their contrasting identifications illustrate the intractability of the problems. Similarly, the identification of many of the sites named by Ptolemy in the interior of the country is to my mind unresolvable because his co-ordinate locations for this part of Africa are exceedingly unreliable. The towns on the island of Gerba present another instance where the conventional identifications cannot be satisfactorily reconciled with the available archaeological evidence (Jerba Actes 1986).

Tribal names have caused much confusion in the past, not least because different sources provide a variety of ethnic names for the same general geographic areas (Bates 1914; Desanges 1962; 1980; Brogan 1975; EncBerb). I have proposed elsewhere that this confusion can best be resolved by recognizing the operation of a hierarchy of tribal names, of which the major groupings were the Gaetuli in western Tripolitana (and their major sub-group the Phazanii in the desert to the south), the Macae in the east and the Libyphoenices along the coast, with the Garamantes lying to the south on Map 36 (Mattingly 1994, 17-49). In Late Antiquity, the Laguatan emerged as a major confederation of tribes, expanding from bases in the region of the Syrtis Maior (Mattingly 1994, 173-85). Most of the remaining names in the sources can be seen to relate to sub-groupings of one of these larger units, and although approximate locations can be suggested for some, it must be noted that only a handful are confirmed by independent epigraphic data (Arzosei, Cinithi, Nybgenii).

Directory

All place names are in Libya unless otherwise noted

Map 36 Garama

Compiled by D.J. Mattingly, 1996

Introduction

The desert landscapes of modern Fezzan in Southern Libya were the heartlands of the Garamantes tribe, with their capital at the oasis site of Garama in the Wadi el-Agial. The Garamantes clashed with the Romans several times in the reigns of Augustus and Tiberius, and again in Flavian times. Long-range desert campaigns, as in 20 B.C., A.D. 70 and c. 87, demonstrated Roman military power and seem to have provided a basis for longer-term treaty arrangements.

The ancient literary sources for this area provide us with few fixed points, and archaeological research has been unevenly spread. Thanks to Italian work in the 1930s and excavations and survey by Daniels in the 1960s-1970s, the bare outline of the settlement and ritual landscapes has been traced (RSGI 1937; Lethielleux 1948; Pace 1951; Daniels 1968; 1970a; 1971; 1989; cf. Ruprechtsberger 1989; 1997). Pliny's account of the triumph of Cornelius Balbus in 19 B.C. is a fundamental source for ancient toponyms, since it names the places represented in the actual procession. Desanges, however, has rightly cast doubt on the geographical integrity of the list, and it appears that many names relate to a subsidiary campaign far to the west in Algeria (Desanges 1957; 1978; 1980). With a few exceptions, I have little confidence in our ability to assign firm locations to the places named by Pliny, though I indicate those that are more likely to have been in Fezzan. The map, then, at best approximates the ancient picture of settlement, and offers few firmly locatable ancient toponyms.

Fezzan is a region of minimal rainfall (about 0.5 inches per year and less), where settlement is entirely dependent on subterranean water sources (Scarin 1934; RSGI 1937; Kanes 1969). Most of the oasis settlement falls in three parallel east-west depressions, from north to south the Wadis esc-Sciati, el-Agial and Berguig (the latter linked with the Hofra depression east of Murzuk). To the north of the esc-Sciati lies the Hamada el-Hamra, a near-waterless stony wasteland whose burnt reddish color may have earned it the epithet of Ater Mons. Between the esc-Sciati and the el-Agial, and to the west and south of the main oases, there are extensive sand seas, posing obstacles for settlement and travel alike. Water sources differ across the region. In the northernmost wadi, the esc-Sciati, there are over 270 natural springs, especially around Edri and Brach (perhaps the likely locations for ancient Dedris/ Debris and Baracum; indeed Dedris is specifically indicated as a settlement on a thermal spring which must be in the esc-Sciati). In the 1930s, the esc-Sciati was the most populous area of Fezzan, with the largest number of date- palms and gardens. The combination of more intensive agriculture and lack of detailed archaeological research there undoubtedly gives a poor impression of the ancient settlement pattern. By contrast the Wadis el-Agial and Berguig have no natural springs, but numerous wells and *foggaras* exploit the phreatic aquifer that is close to the surface (between 3-20 feet deep in the el-Agial). The *foggaras* are subterranean channels, identifiable by numerous vertical shafts from the surface and comparable with the Persian *qanat* system. Some, probably many, of the *foggaras* appear to be pre-Islamic in date.

There are some important outliers to the three main bands of oases, notably Gat (just beyond the south-western margins of the map), where Garamantian-style tombs are known in an area of many natural springs (for recent work in this vicinity, Liverani 1999). The map traces the main communication lines between oases and wells in the region, indicating where oases lie beyond the margins. It is clear that there were three groups of routes leading north towards the Roman frontier installations: north-west towards Cidamus (Ghadamès), north towards Gheriat el-Garbia and esh-Shergia, north-east towards Gholaiia (Bu Njem) (see Map 35). In addition there was an important series of tracks leading east towards the oases of Zella and Augila (Map 38). Tmessa, El-Fogaha and Uau el Chebir (the latter two lying beyond the eastern limit of the map) are vital links between the Garamantian heartlands and Zella, so pre-Islamic activity is likely here, especially at Uau el Chebir where there are also natural springs (Aroca 1942). The importance of these eastward connections of the Garamantes must not be underestimated (Bates 1914; Rebuffat 1969; 1970). Another series of tracks led south and south-west, and it is clear from Ptolemy's account of

Roman travelers who journeyed south with Garamantian parties that these trans-Saharan links were exploited in classical antiquity. It is likely that the Garamantes were involved in slaving and trans-Saharan trade, but the scale of these activities is hard to judge (Law 1967; Bovill 1968; Mattingly 1994, 155-57).

It must be stressed that none of these routes was in any sense a formal "Roman" road. Rather, they were all unmarked desert tracks, whose courses were determined by the availability of water at intervals along them. Although there have been minor local variations over time in the principal trans-Saharan routes, the validity of what is mapped here for the Roman period can be assumed with a fair degree of confidence (Bovill 1968; Ward 1968).

Another problem concerns the mapping of wells. The precise antiquity of most of those marked along the desert routeways is unknown. I have only named sites where ancient activity seems particularly likely, and have not attempted to add all the many wells known from early modern travelers' accounts.

The mapping of Garamantian settlement reflects to a large extent the geographical limits of modern archaeological fieldwork. The settlement of the esc-Sciati (with its abundant natural springs) seems drastically under-represented, while that of the Berguig east and west of Murzuk is only partially known through limited reconnaissance survey. In the el-Agial, the visibility of the Garamantes is raised dramatically by the existence of a cliff-like escarpment along most of the length of the wadi directly south of the oases (el-Rashedy 1986; Daniels 1989). This was a preferred location for many cemeteries. While the oasis center settlements are obscured below modern cultivation or later settlements, the presence of the Garamantes is securely attested by almost continuous burials along approximately 75 miles of the wadi. A number of hillforts have been located on top of the mesa-like escarpments, including the excavated site of Zinchecra (Daniels 1968, ninth century B.C. to first century A.D.). It would appear that these hilltop locations gave way to oasis-floor villages during the period of contact with Rome. The metropolis of Garama (Germa) has been partly excavated, revealing impressive buildings of first century A.D. date with ashlar footings, surrounded by the more usual mud-brick constructions. However, the nearby 'suburbs' of Saniat Gebril and Saniat Suleiman suggest that the more recent pattern of an oasis center comprising a number of discrete villages may also have applied in antiquity. Certainly, we should envisage an ancient settlement pattern that was more dispersed than the few certain ancient oases would suggest. I have therefore marked a number of major oases where ancient settlement is likely but as yet unproven (Ubari, Marzuch, Traghen, Tesaura, Tmessa, Socna and Hun). In most of these there are hints of Garamantian activity, but the actual settlement is in all probability overlain by medieval structures. The distribution of oases is also indicated by the Oasis Area pattern (see Map Key). Again, in all likelihood there has been a long history of exploitation in many locations where ancient remains have yet to be recorded. Where cemeteries have been adequately mapped, their distribution attests to such exploitation. In particular, new, ongoing archaeological work in the region of Germa (Mattingly 1997; 1998; 1999; Edwards 1999) now confirms that there are numerous additional settlements to match the impressive distribution of cemeteries.

Archaeological findings also call for significant modification of the view derived from the ancient sources that the Garamantes were a nomadic and ill-disciplined people. In fact they were clearly skilled oasis-farmers, cultivating bread-wheat, the vine and dates by 500 B.C. at the latest (Van der Veen 1992). They constructed sophisticated hydraulic irrigation systems, and developed substantial nucleated settlements. Their burials contain a great range of imported goods, reflecting extensive contact and trade with the Mediterranean world.

Map 37 Syrtica

Compiled by D.J. Mattingly, 1996

Introduction

The region of Syrtica is one of the least hospitable coastal stretches anywhere in the Mediterranean basin. With the exception of the immediate hinterland of Macomades (modern Sirte), much of the route round the Syrtis Maior gulf—between Cephalae Promunturium (Cape Misurata) and Berenice (Benghazi)—runs through a barren-looking and poorly watered landscape. Early exploration by Beechey (1828) and Cerrata (1933) was supplemented in dramatic fashion by Goodchild's study (1976, 145-94) undertaken specifically for TIR Lepcis and TIR Cyrene. Many of his identifications in this sector still look secure, though Stucchi (1975) and Purcaro Pagano (1976) in particular have suggested further alternatives.

The Sebkha Tauorgha, a great salt-flat and seasonal lake into which the pre-desert wadi systems of Sofeggin and Zemzem disgorge, dominates the western side of the Syrtis (Map 35). Most of the road stations mentioned by the ancient itineraries in this sector were minor installations, and almost none can be securely identified on the ground (Rebuffat 1973; Mattingly 1994). The south-western sector of the Syrtic coastline is the best watered, and was served in antiquity by a series of good anchorages (Aspis, Macomades, Charax/(I)scina). Some of the larger coastal settlements served as *civitas* centers or attained *municipium* status (Gascou 1972; Lepelley 1979; 1981; Mattingly 1994). In modern times this region has been noted for the quality of its pasture. The typical farmsteads here in the Roman period, extending up to 31 miles into the interior along the wadis, likewise suggest a high level of stock-raising (for recent field survey, see Rebuffat 1988; Reddé 1988; work by Laronde and Longerstay is in progress). There were also numerous small agglomerations of such farmsteads (hamlets or villages) in the pre-desert wadis, clustered around the wells and cisterns. In addition, along the coastal plain itself on either side of Macomades, there were a number of more substantial villas, several with evidence of olive- or wine-presses (Reddé 1988, 77). With the exception of a dense group at Tmed Hassan (Praetorium) and a few elsewhere in the coastal plain, there were few fortified farms (*gsur*) here in comparison with the Tripolitanian pre-desert zone to the west.

The south-eastern coastline becomes increasingly barren after Charax/(I)scina (Medina Sultan). For the most part the main road seems to have kept very close to the coast, making use of a series of wells in a narrow corridor. The short inland diversion to the town of Digdida (Wadi el-Hariga) forms a rare exception. There appear to have been only a handful of anchorages and a series of very minor road stations along this section of the coast, although new fieldwork by Laronde has shown that the wadis inland were more fully exploited than Goodchild had believed. On the eastern side of the gulf, beyond Kozyntion Akron (Marsa Brega), dispersed ancient settlements increase in number, and fortified farms are again strongly represented among rural estate centers. Water resources and pasturage are better here than in the southern sector of the Gulf.

As Goodchild observed (1976, 149; cf. Laronde 1987), comparison between the overland itineraries and the maritime listings (notably StadMM) suggests that some of the major sites were known in the latter sources by their Greek names and in the former by the Latin/Phoenician/Libyan equivalents current in the Roman period (for example, Euphranta/Macomades; Charax/(I)scina). With the exception of the descriptive names of minor way stations (Ad Palmam, Ad Puteum, Ad Turrem, etc.), the majority of the settlement names current in the Roman period were of Libyan or Phoenician derivation (Bisi 1977).

The exact course of the Roman roads around the Syrtic gulf is very uncertain, but it seems probable that for most of the way from Macomades eastwards to the provincial boundary at Arae Philaenorum, ItAnt and TabPeut document an essentially similar path, normally very close to the coast (Tissot 1888; Goodchild 1948; 1971; Purcaro Pagano 1976). Only in the vicinity of the town of Digdida did the roads have significant inland detours. Beyond the foot of the Gulf, the route divided, with one road continuing along the coastal plain and the other diverting inland towards an important road junction at Corniclanum (Agedabia; see Map 38). Although the exact location of most of

the places recorded along these roads is thus also conjectural, I have made tentative suggestions for many. The hollow symbols and question marks used emphasize the need for caution concerning the reliability of the specific attributions, while allowing the general shape of the limited permanent settlement here to be appreciated.

The east-west coastal route is mirrored in part by interior desert routes linking the oases of the northern Sahara (Rebuffat 1970; 1970a), notably from Augila (Map 38 C4), via Marada, Zella (an important oasis lying just beyond the southern margin of the map), and Tagrifet with the oases of the Giofra (Waddan, Hun, Socna) and Fezzan (Sabae, Garama and others; see Map 36). Desert tracks also link these oases with the Syrtic coast at various points; these south-north tracks have traditionally been important transhumance routes for the movement of flocks between the Syrtic pastures and the oases. There was probably always a close interrelationship between the coastal Macae and Nasamones sub-tribes and those of the interior (Bates 1914; Desanges 1978; 1980). In Late Antiquity, the oases (and indeed much of Syrtica) appear to have been dominated by new confederations of tribes, the Austuriani, later known also as the Laguatan or Leuathae (Roques 1987; Mattingly 1994, 173-76).

Map 38 Cyrene

Compiled by D.J. Mattingly, 1996

Introduction

The region known as Cyrenaica (and in Roman times also as the Pentapolis) comprised an important group of cities: notably Cyrene, Apollonia, Euesperides/Berenice, Barke, Ptolemais and Taucheira. It was successively a center for Greek colonization in Libya, a kingdom based around the power and wealth of Cyrene, a satellite of the Hellenistic kingdom in Egypt, and a Roman province for long governed jointly with Crete (Romanelli 1943; Chamoux 1953; Goodchild 1959; Stucchi 1975; Barker 1985; Laronde 1987; Roques 1987). Throughout its history it was also one of the foremost areas of Libyan settlement, for reasons which are easily determined. The high, terraced plateau of the Gebel Akhdar (Green Mountain), which dominates the northern part of the map, has been a favored location for settlement since prehistoric times. Although the rainfall there is modest by Mediterranean standards, it is the highest anywhere within modern Libya, and is supplemented by abundant springs and shallow water sources. Elsewhere, too, in the region covered by the map, the settlement pattern generally reflects the availability of water resources.

The plateau of the Gebel Akhdar itself is mostly very fertile, despite some variation in rainfall between its eastern and western extremities (Johnson 1973). The highest annual rainfall figures are recorded for the plateau around Cyrene; Slonta (ancient Lasamices), Beit Tamer and Gasr Beni Gdem mark its approximate limits to south, east and west respectively. It is no surprise, therefore, to note the extremely high density of settlement within this particular zone. Nonetheless, there is good potential further west too, notably in the el-Merj plain, near ancient Barke. Another topographical peculiarity is the massively entrenched Wadi el-Cuf (ancient Myrsinitis fl.), which cuts through the plateau and posed for ancient road-makers the problem of how best to link the western coastal cities to Cyrene by land (see further below). The low population level and non-intensive exploitation of this region in the early modern period have contributed to the superb preservation of sites here (Beechey 1828; Fantoli 1923; Touring Club d'Italia 1929; Oliviero 1931; Romanelli 1943; Stucchi 1975).

Both west and east of this upland area, conditions are not quite so favorable for settlement. The Syrtic coastal zone south of Benghazi (Berenice) merges into the pre-desert steppe, and this shift is to some extent mirrored at the other edge of the plateau too, to the south-east of Derna (Darnis). As might be expected therefore, the settlement pattern in these zones as currently known is limited to a handful of road stations, forts, fortified farms and minor sites. A papyrus, however, offers a detailed census record for the Cherronesos region to the east of Derna, and this depicts a busy countryside, with an important agricultural component (Norsa 1931; cf. Romanelli 1940; 1943, 122-28; Catani 1985, 150-54). The prominent mausolea known at a few sites in the area suggest that intensive archaeological work would reveal a much fuller landscape here. On the other hand, the line of sites extending across the steppe to the south of the plateau (et-Tailimun, Zaviet Msus, el-Mechili) lie in the true pre-desert zone, with far fewer ground-water sources available. Such settlement as is known clusters around the main wells and cisterns.

Knowledge of the coastal toponyms recorded by Scylax, Strabo, Ptolemy, StadMM and others is reasonably secure, even if the choice between archaeological sites is not always certain (Stucchi 1975; Purcaro Pagano 1976; Laronde 1987; Mastino 1990). By contrast, there are tremendous problems in attempting to match the inland settlements in Ptolemy's lists or other literary sources with sites known archaeologically, not least because in several cases Ptolemy's co-ordinates are demonstrably very far out indeed. For the most part I have resisted the temptation to add to speculation.

The concentration of small towns and villages in the central and eastern parts of the Gebel Akhdar is particularly striking, though it should be emphasized that current knowledge of rural settlement in Cyrenaica is patchy. I have therefore not attempted to map more than a small sample of the known fortified farms and open farms of the region. Even allowing for our ignorance of lesser sites in the settlement hierarchy, it is clear that this intensive pattern of villages and small towns is very different from other regions of Cyrenaica, Syrtica, Tripolitana and

Marmarica (compare Maps 35, 37, 73). The architectural pretensions of some of the minor harbors and of towns on the plateau close to Cyrene are notable; attention is drawn to the most significant of these sites through the use of larger type where appropriate. Many of the villages were provided with churches in Late Antiquity, and it is these (surveyed by Goodchild) that currently offer the most reliable indicator for the size and importance of the sites. Another point of interest concerns the development of harbors (Jones 1971), and the frequent linkage between coastal harbors and towns on the northern edge of the plateau (thus Apollonia and Cyrene, Ptolemais and Barke, Kainopolis and Neapolis Theodorias (Gasr Lebia), Aptouchou Hieron (Haniya?) and Artamis (Messa?), Phykous and Balagrae, Erythron and el-Marazig, etc.). In all periods the connection between the inland towns and the sea would appear to have remained important (Laronde 1987, 257-87).

A particular problem concerns the exact course of the main roads from west to east across the plateau (Laronde 1987, 261-314). Both ItAnt and TabPeut follow the coast until Ptolemais, but thereafter they turn inland and diverge. TabPeut's route would appear to follow a course nearer to the coast, crossing the el-Cuf system (Myrsinitis fl.) near its mouth and then climbing the Gebel again near Messa (Artamis). From there to Cyrene its route is fairly secure from milestone evidence. ItAnt's route took a longer and more southerly line, avoiding the Cuf altogether, and passing through Slonta (Lasamices?), before approaching Cyrene from the south. A fragment of milestone was recorded by Goodchild at Sidi Mohamed el-Homri, and J. Reynolds has now recorded one from slightly further west (as yet unpublished). It should confirm that this was indeed the line of the second route (here I broadly support the views of TIR Cyrene; Goodchild 1971; Laronde 1983; 1987 against those of Stucchi 1975; Purcaro Pagano 1976).

To the south and east of Cyrenaica extended Marmarica, a desert region with comparatively few major population centers. The Roman frontier in this direction is poorly researched on the ground (Daniels 1987; Goodchild 1976, 195-209; Reynolds 1988) and merits further study, not least for what might be learned of the province's relationship with its southern neighbors. The oasis of Augila (comprising at least three separate centers) was the most important such neighbor. Its significance lies not merely in its south-north communications with Cyrenaica, but also in its links with the transhumant Nasamones of Syrtica, and with the great east-west desert routes that linked Egypt, Ammon (Siwa) and Garama (see further, Maps 35, 36, 37 and 73). The archaeology of the Augila oasis group is practically unknown, but it can be argued that it was a secondary oracle of Ammon (Mattingly 1994, 33). Desert routes were a vital part of the regional communications network, operating both south to north and east to west (Bates 1914; Rebuffat 1970; Luni 1979; Laronde 1987, 203-206; cf. also Maps 36, 37, 73).

The location of tribal groups on the map is very approximate, and follows essentially the lines laid down by Bates (1914) and Desanges (1962; 1980). It is clear that some of these groups were very thoroughly assimilated into the life of the main cities and their satellite villages. More work, however, is needed on non-classical sites and on the earliest settlement in the region (White 1994).

Silphium, the medicinal plant that was highly prized by both Greeks and Romans, grew in the pre-desert zone to the south of Euesperides and Barke, where it was harvested by Libyans. This plant became extinct in antiquity, and no attempt is made to indicate its zone of cultivation (Chamoux 1953, 246-63; Laronde 1987, 49).

Knowledge of place names (many cited by Purcaro Pagano 1976) is derived from the usual range of Greco-Roman sources (gathered by Fantoli 1933), with the notable addition of the Late Roman correspondence and other works of Synesius (Fitzgerald 1926; 1930). Most of the place name evidence is summarized by entries in RE, which should be consulted as a matter of course alongside the works cited in this Directory. A high proportion of the place names have Greek or Libyan derivations, and many sites were known by different names in successive phases of the region's history (Ward 1968; Bisi 1977). The question of the location of mythical features in the landscapes of Cyrenaica, such as the Gardens of the Hesperides, has been another focus of study (Jones 1971; Ferri 1976).

Goodchild's work (1968; 1971; 1976; TIR Cyrene) was vital for the compilation of the map, supplemented largely by the compendia on Cyrenaican architecture by Stucchi (1975), Purcaro Pagano's compilation of place names (1976), Laronde's acute sense of historical geography (1987), and several valuable reviews of archaeological work (Vickers 1972; Humphrey 1980; Lloyd 1989). Joyce Reynolds made available information about many rural villages from a manuscript by Ward-Perkins and Goodchild on Cyrenaican churches (1989).

Map 39 Mediolanum

Compiled by M. Pearce and P. Tozzi, 1997

Introduction

The compilation of the map posed a number of problems, many of which also affect Map 40. In both cases we found the maps compiled by P. Fraccaro (in Baratta 1938) an important starting-point. He had produced a map of centuriation in Italy for the 1937 Bimillenary of Augustus exhibition in Rome, and was able to draw on this for northern Italy in particular. Otherwise he followed Kiepert's FOA closely, although his collaboration with Maratta, an eminent geographer, greatly enriched his compilations. Our debt to him is considerable, since he has been a useful measure against which to test ideas and solutions to many thorny problems. It was also possible to consult his unpublished maps and notes held at Pavia University; these were particularly valuable for the reconstruction of centuriation.

As with Map 40, we have retained the modern courses of the rivers in the Po plain except where firm evidence exists for the Roman period. Many of the water-courses in the plain south of the Po—and indeed the Po itself—have frequently migrated, and much important work has been done recently on these problems by Dall'Aglia and others. Similarly, we have not felt sure enough to follow some recent hypotheses about changes in prealpine lake levels, although it should be borne in mind that the level of Lake Como, for example, has certainly oscillated quite dramatically through time.

Duality of river names, noted again in the introduction to Map 40, may be found in the two rivers called Duria (A2 and B3), and in the suggestion, derived from Fraccaro (1957, 125-26), that the ancient name Iria refers both to the modern Scrivia and to the Staffora.

Modern knowledge of the ancient geography and archaeology of northern Italy is far from being complete, and varies greatly from area to area. Thus while the present-day regions of Lombardy and the Veneto are relatively well known (not least thanks to Fraccaro's pioneering work), the same cannot be said for the modern regions of Piedmont and Liguria; the many uncertainties will be very clear to users of the map. Lamboglia (1939; 1941) remains the best source for Liguria, and little progress has been made in much of Piedmont since Gribaudi's seminal work (1928).

The route of the Via Aemilia Scauri between Genua and Luna (Map 41) is far from being certain. We have resolved the disagreement between the Roman itineraries by suggesting two alternative routes, one following the ridge to the Bracco Pass, the other the Val Petronio to the Mola Pass; both routes are attested in the Middle Ages. The road network south of Augusta Taurinorum and the trans-Appennine routes between the Po plain and the Tyrrhenian coast are similarly problematic.

Although for much of the map our knowledge is surprisingly scant, in two cases the information is so detailed that it cannot all be included at this scale. These are the territory of Veleia, documented by the famous Trajanic Alimentary Table (CIL 11.1147), and the Porcibera river valley above Genua, where the Roman senate intervened in a territorial dispute between the V(e)ituri Langenses and the city of Genua in 117 B.C. (CIL 5.7749). Because of the differing nature of these documents, our criteria for marking their toponyms vary somewhat. For the Veleia Alimentary Table, we have selected the most securely identified place names from the long list mentioned in the inscription. There has been much discussion about some identifications; the most up-to-date treatment of the problems can be found in Criniti (1990), whose solutions we largely follow. In contrast to the large area documented by this Table, the *Sententia Minuciorum* deals in great detail with the small Porcibera river valley. Much of its detail about the placement of boundary stones is difficult to reconstruct, so here we have marked only the more important toponyms. Pasquinucci (1992) and Pastorino (1995) offer useful discussions and reports of archaeological fieldwork.

Although there is clear evidence from thin sections and chemical analysis that various marble and stone quarries were worked in antiquity (Tozzi 1981; Zezza 1982; Buonopane 1987)—for example, at Botticino, Candoglia, Monselice, Musso and Verona—there is a lack of secure evidence for their exact location. In Late Antiquity

soapstone from the Alps was also widely used (Mannoni 1987), and Roman quarries are known at modern Chiavenna (in the vicinity of Clavenna, Map 19 B3). Gold was certainly exploited, at Victumulae by the Victimuli (Strabo 5.1.2), and by the Salassi in the Vallanzasca (Del Soldato 1996) and in the Val di Cogne (Strabo 4.6.7; GAL Piemonte 119) south of Augusta Praetoria. It is very likely, too, that the copper and rich iron resources of the Alps were widely tapped. Because of the difficulty of locating ancient workings, however, only those sites for which there is a good measure of certainty are marked.

Directory

All place names are in Italy unless otherwise noted

Map 40 Patavium

Compiled by M. Pearce, R. Peretto and P. Tozzi, 1994

Introduction

Mapping this region poses many problems, particularly in the reconstruction and representation of the ancient landscape. Indeed, the lower plain (the *bassa pianura*) is a landscape in constant evolution; the floods and the changes in the courses of its rivers are a *topos* in ancient literature. What appears here must thus be considered as a plausible, but hypothetical, model.

The hydrography (water courses, lagoons, coastline) shown follows the present-day pattern except where important changes are involved. In such cases, our proposals are based on geomorphology, the ancient sources, and evidence from archaeology and aerial photography. In the interests of clarity, we have had to sacrifice a diachronic approach for the Po delta, where the situation represented is that of the Roman period.

River communications assumed great importance in the Po plain, and regular services are attested along the Po itself (Tozzi 1987, 16). We have shown two principal branches of the river (as attested by Polybius 2.16), and the seven major mouths attested by other ancient sources (Mela 2.62; Pliny, *NH* 3.119-21). It should not be thought, however, that all these mouths and branches functioned together fully at any one time in antiquity. The areas of lagoon shown in the delta are hypothetical. Further information on its evolution can be found in Schmiedt (1970, plates LVI, LVII, CXXXVII), Veggiani (1972; 1974), and Bondesan (1990; 1990a).

The lagoons of *Venetia marittima* were certainly occupied during antiquity, and this settlement steadily acquired importance in Late Antiquity as the unstable political and military conditions made the islands more inviting. Traditionally (H)Eraclia preceded the medieval foundation of Venice (Tozzi 1984), but evidence is accumulating for settlement in the area of Venice from Roman times (Tuzzato 1991; 1993; Ammerman 1992; 1995). Some idea of the changes in the geography of the lagoon since the fourteenth century can be gained from early maps (Tiepolo 1983; Tozzi 1984).

The ancient sources attest important hydraulic engineering work by the Etruscans and Romans in the delta. We have shown hypothetical courses for two canals (Fossa Augusta and Fossa Flavia), but have been unable to propose plausible reconstructions for Fossa Philistina or Fossa Claudia.

Other rivers present different problems, to which the ancient sources contribute. For example, the Plavis is not mentioned by Pliny in his list of rivers (*NH* 3.126), so that many authors have suggested that originally it may have joined the Silis (note Lacchini 1972, 196-98). Blake (1988, 113-19) and Castiglioni (1987) discuss the courses of the Plavis and the Limentia. Another peculiarity of the ancient sources is the duality assigned to many rivers: thus the Meduacus and the Tiliaventum both have two branches (Pliny, *NH* 3.121, 126). For the problem of the Brenta and the Bacchiglione (neither named on the map), see Marcolongo (1973) and Castiglioni (1981; 1982). The At(h)esis followed a markedly more northern course in antiquity, passing through Ateste (Marcolongo 1987). Since many road stations are located at the crossing of a water-course, this makes their secure identification more difficult.

We show only those roads that are attested in ancient sources or can be reconstructed along the greater part of their route. Consequently, we have been unable to offer an adequate picture of communications across the Appennines and the central Po plain. Although the major trans-Appennine routes were certainly towards the east (the Via Flaminia in particular), other connections certainly existed too, particularly towards Bononia and Faventia (Viabilità 1992). Since natural routes across the plain are less obvious, we have followed the most plausible hypotheses for the connections between Bononia/Mutina (Map 39 H4) and Ateste via Vicus Serninus, Vicus Varianus and Montagnana (Calzolari 1989a; 1990; Ferri 1990; Bosio 1991, 35-41). The lack of a secure identification for the Anneianum attested here hampers the reconstruction.

Although most of the fertile Po plain was probably centuriated, we have limited our reconstruction to those areas where such land-division is well attested (Misurare 1983).

The Bronze Age banked and ditched settlements of Castello del Tartaro, Fabbrica dei Soci and Fondo Paviani are marked. Their defense works were a visible part of the later environment, respected by the Roman centuriation and conspicuous in the flat landscape of the Po plain. All three have yielded Aegean-type pottery. So, too, have the later settlements at Montagnana and Frattesina. Frattesina, a trading station, has an impressive range of eastern Mediterranean goods (Bietti Sestieri 1997).

Map 41 Pisae

Compiled by W.V. Harris, 1994

Introduction

Much about the ancient hydrography of this region remains unknown, especially with regard to the mouth of the R. Arno and the coastal areas both to the north (as far as the area of the Lago di Massaciuccoli), and to the south. To show that further research is still needed, it is enough to point out that one geological account of the coastline near Pisa (Pasquinucci 1988, 138; cf. 1992, 540; 1995, 211) simply neglects the fact that in antiquity the R. Auser debouched into the Arno and not into the sea (still so at the time of Rutilius Namatianus 1.565-67). Moreover a further theory has never been properly argued—to the effect that, while the Auser joined the Arno at Pisa, another river called the Auserculum (a name not attested) more or less took the line of the modern Serchio (Menchelli 1987, 498-99). Two other coastal areas with particularly problematic morphology are the marshy district to the east of Populonia and the Prilius L., though the latter has now been studied with care (FormIt Vetulonia). There are additional problems inland, for instance in the area of the Lago di Biéntina (east of Luca), where archaeological finds have been sufficient to suggest that the district was already quite well drained in Etruscan times (ASAT 79-82). Indeed Etruscan and Roman drainage works of quite uncertain extent contribute notably to the problems of making the map; there is universal agreement that such works must eventually have come to exist on a large scale (the Fossae Papirianae, for example), but it is seldom possible to define their degree of success. In addition, the courses of rivers have undoubtedly undergone numerous minor realignments since Roman times, and some of these changes may well have escaped notice.

This region teems with settlements whose names must be of ancient origin, even though there is a lack both of ancient testimony and of significant archaeological remains. Often, they may have been single *fundi*, in some cases large ones, with names such as Gragnano (from *Granianum) (Pieri 1919; 1969). Some names are of the type Vico Pancellorum or Vicopisano. All these are omitted in the absence of specific evidence for their importance as settlements. Most Etruscan place names are unknown, and in consequence a number of purely or mainly Etruscan sites appear under their modern names.

The region was an important source of metal ores in the first millennium B.C.; from the beginning of the Principate, large quantities of marble were also quarried. These activities are necessarily represented here in a very selective fashion; it should be borne in mind that on Elba, for example, there were many other mining sites besides those indicated.

A surprising amount of uncertainty persists about the placement of both roads and road stations, and the destruction of ancient remains by the modern economy is now helping to ensure that some of these problems will never be solved. Unlike Kiepert (FOA XXIII) and Fraccaro (1937), this map does not mark stations mentioned in the itineraries if their whereabouts are substantially in doubt. Rather, such places appear only as Unlocated Toponyms. Road courses shown as certain may either still be visible on the ground (a rare circumstance in this region), or they may be known from other sources; road courses known within a range of several hundred metres are also shown as certain.

Detecting centuriation seems easier than it is: thus recent authors have claimed to discover it in areas of Italy where it has left no real traces (Luna, for example), if it ever existed at all. The map therefore marks only those areas where there is actual evidence of centuriation. There are also some debatable cases which have not been marked, especially in the lower Val d'Elsa and around Empoli (cf. Ciampoltrini 1981, 48-49).

Map 42 Arretium-Asculum

Compiled by W.V. Harris, 1995

Introduction

As elsewhere in Italy, there are innumerable modern place names here of obviously ancient origin, such as Dicomano (= *decumanus*) on the R. Sieve, Traiana northwest of Arezzo (cf. Pieri 1919, 154, not as simple a case as it may seem), and Fiamignano (= *Flaminianum) in the Cicolano region. Such places are omitted from the map unless there is known to have been an ancient settlement on the site that merits marking. Where a modern name is attached to a site, naturally the placement of its symbol may not necessarily correspond with the exact site of the modern settlement: thus the symbols for Murlo and Allumiere, for example, mark the relevant ancient sites, not the modern villages. A modern name that seems to correspond to an ancient one is in fact often a “learned” imposition, which may be justified (as in the case of Corfinio), or not (as in the case of Casperia, which appears among the Unlocated Toponyms). Further research in medieval and early-modern documents and maps may well bring to light traces of the many unlocated ancient toponyms.

Since settlements changed in size from period to period, it is impossible to indicate the beginnings of urbanization, which may in any case be quite problematic (as in Picenum). Hilltop forts have been marked in a very selective fashion, and only when they are at least two hectares in extent. Numerous rural sanctuaries are known in some areas (Rastrelli 1992), but it is doubtful whether they were of more than purely local importance, and thus they have been omitted.

The hydrographic history of the Val di Chiana (B2) needs further study, and its depiction here can only be tentative.

Contradictory information, not to mention the vagaries of TabPeut, sometimes makes it impossible to locate road stations. It has to be acknowledged that much remains unknown or hypothetical, and the temptation to invent ancient roads, however plausible (in the manner of Deggrasi 1983; Staffa 1983; and others), must be resisted. The hypotheses advanced in RE Suppl. 13 *Viae publicae Romanae* are emphatically not reflected on the map for the reasons sketched by Wiseman (1970) and others. The only bridges marked are those that may be considered important, based on their size or their association with the course of a major road.

Here, as elsewhere in central Italy, recent scholarship has not always been sufficiently critical in detecting centuriation (note Moscatelli 1990, fig. 2; most of Moscatelli 1993 is to be firmly rejected). Most of the authentic centuriation marked was already known to Castagnoli (1958). Centuriation attested only by the unreliable *Liber coloniarum* has not been marked in the absence of confirmation from aerial photography or other means. The “cippo di Amandola” (Bonvicini 1972, 201-202) shows that in the upper Val di Tenna (E2-F2) there was centuriation which can hardly have been strictly rectangular.

Map 43 Latium Vetus

Compiled by L. Quilici and S. Quilici Gigli, 1995

Introduction

The environs of Rome have undergone enormous changes from antiquity onwards, caused more by human intervention than by natural phenomena. Changes were already occurring in the archaic period as the region's population increased; these earliest phases of urbanization have been considerably illuminated by recent research. The changes intensified in Late Republican and imperial times, when urbanization reached a level unique for antiquity. Building activity connected with the city extended far enough into the countryside to link with construction centered upon surrounding towns. Thus the towns on the Tiburtine, Praenestine and Alban hills, as well as Ostia and Antium on the coast, were considered suburbs of the metropolis.

After antiquity, by contrast, the region was almost deserted except in the hills. In the Late Middle Ages and subsequently, the spread of malaria and the extension of a pastoral economy reduced it to little more than a wilderness littered with the ruins remaining from an earlier era.

By definition, there is some difficulty about showing settlements of different periods on a single map. We have marked those that can be located with either certainty or a fair degree of probability. At this scale no attempt is made to include every small settlement, let alone the whole complex infrastructure of the area. But we do mark cultural features notable for their size, state of preservation, or historical significance. These include large Late Republican and imperial villas, and the greatest monumental tombs. Inevitably, many estates, villas and tombs (some of them far from negligible) have had to be omitted.

Accurate representation of the road network has been a primary concern; most of it was paved with hard local basalt during the Late Republic and Early Empire, with some stretches remaining in use almost within living memory.

To return the coastline, rivers, lakes and marshes to their ancient aspect is particularly difficult, and all this linework is therefore rendered with varying degrees of confidence. Notable uncertainty attaches to the Tiber estuary and to the Pomptine marshes; the latter were much changed by drainage and subsequent land reclamation and development (*bonifica*) in the first half of the twentieth century.

For detailed coverage of specific areas, see the *Forma Italiae* and *Latium Vetus* series. Also valuable are the reports of the British School at Rome's *Ager Veientanus* surface survey (Kahane 1968). For new findings, the *Bullettino della Commissione Archeologica Comunale* and the *Archeologia Laziale* series (1978-1995) are indispensable.

Map 44 Latium-Campania

Compiled by N. Purcell, 1997

Introduction

The landscape of central Italy has not been intrinsically stable. The steep slopes of the mountains have been deforested—several times in many cases—with consequent erosion; *frane* or avalanches remove large tracts of regolith, and doubly obliterate the archaeological record. In the valley-bottoms active streams have deposited and eroded successive layers of fill, sealing and destroying the evidence of settlement in many relatively favored niches. The more extensive lowlands have also seen substantial depositions of alluvial and colluvial material; the coasts have been exposed to erosion, aggradation and occasional tectonic deformation, or—spectacularly in the Bay of Naples—alternating collapse and re-elevation (“bradyseism”) at a staggeringly rapid pace. Earthquakes everywhere have accelerated the rate of change; vulcanicity in Campania has several times transformed substantial tracts of landscape beyond recognition—and reconstruction (thus no attempt is made here to re-create the contours of any of the sometimes very different forerunners of today’s Mt. Vesuvius).

To this instability must be added the effect of intensive and continuous intervention by humanity. Episodes of depopulation in the Italian peninsula have arguably been neither prolonged nor pronounced within the timespan of the map and beyond. Even so, over the centuries the settlement pattern has been more than usually mutable, which has tended to obscure or damage the archaeological record. More archaeological evidence has emerged as modern urbanization spreads; but even more has been destroyed.

What is available to the historical cartographer varies in quality from area to area in surprising ways. Certain zones, deserted for long periods of post-classical history because of the prevalence of malaria, offer surprising opportunities for the reconstruction of the ancient landscape, although the reclamation schemes of the early twentieth century have made the process harder. The economic marginality of those parts of the Papal State and the Kingdom of the Two Sicilies which were predominantly pastoral has preserved—at least in locations such as summit plateaus—a vast amount of pre-Roman material. Similarly, the huge tracts of what was once very marginal land in the Tavoliere (north Apulian plain) and other parts of the southern lowlands have conserved many traces of their pre-Roman and Roman pasts. In the case of the Tavoliere, the unique soil geology, making ancient agricultural patterns visible to the first generation of aerial photographers, gave the region a place in the history of modern landscape archaeology (see Bradford 1949). Conversely, the richest lands in peninsular Italy—and some of the richest in the Mediterranean basin—in the plains of Campania have proved (and will continue to prove) elusive archaeologically, despite the tantalizing harvest of scattered finds and sites of all periods which has inevitably followed the development of the Naples megalopolis. The pace of investigation has also varied with the cultural geography of the area. Our ignorance of the archaeology of the Adriatic coast north of Daunia (Map 45 B2) is no doubt due in part to the distance of the region from the learned academies of Naples and Rome.

The earliest cultures that can find some representation on the map are the developers of the striking cemeteries (whence it is legitimate to deduce nucleated settlements) which have given their name to the Fossakultur in its various subdivisions. Bisaccia, Cairano, Montecorvino Rovella, Oliveto Citra, S. Marzano and S. Valentino Torio are all such instances. It is now certain that these cultures rapidly came to form a hinterland to ports-of-trade, through which they maintained contacts with a wider Mediterranean world. The labeling of the cultures with the names of peoples used by the elite Greco-Roman tradition can be a harmless academic recreation, but at least there is little doubt that the label “Etruscan” legitimately applies to the archaic settlements of Pontecagnano and its neighbors, and above all to Capua.

A large category of the Unlocated Toponyms in the Directory derives from notices in the historical tradition about conflicts early in the timespan of the map. Undoubtedly these names (which reflect a relatively restricted toponymic range, and were very prone to corruption and confusion) refer to some of the spectacular hilltop enceintes which we are beginning to know quite well—as with the application of the name Aquilonia to the great settlement at

Monte Vairano. Even so, in these instances it is likely to be almost always impossible to match up name and site, and I have normally preferred to remain agnostic. In the space available it is not feasible to represent the multiple and conflicting speculations about the identity of many of the sites. The fact is that we have a limited understanding of the communities of much of this area in the fourth and third centuries; the problems of identifying those whose names appear on the coinages of that period only serve to confirm this.

More important in any case is the point that this period, especially from the middle of the fourth century onwards, saw the development of a far more complex settlement geography in the mountains, which is abundantly reflected on the map. The clusters and voids, however, owe more to the state of research than to ancient realities. It is vital to remember how dramatically our knowledge has grown in this area during the last thirty years, and how much it is likely to change in the near future. Nonetheless, as the numbers of known sanctuary-centers and fortified hilltops grow, it becomes more difficult to choose which of these features to mark on a map at this scale; they clearly represent a much repeated pattern in the mountain landscape.

The appearance of a network of Roman cities across this part of the peninsula—constituting, with the roads that linked them, the most visible single element on the map—now appears a distinctly less sudden phenomenon than it did to earlier generations of researchers. Many Roman and Latin foundations of the fourth to second centuries are reworkings or relocations of earlier cities. The genesis of many an allied town, made into a *municipium* in the changes of the Late Republic, now seems to lie back in the formative phases of the fourth century; Larinum is a case in point. This gradual process is hard to represent cartographically. Even when a city manifestly ceased to exist as a fully independent entity for political reasons—like Fregellae or Stabiae—it retained some (sometimes important) existence as a toponym, and cannot therefore be designated with a single-period color. Many of the more remote settlements of the mountain zones, however, do seem to have been decisively abandoned.

The great increase in the epigraphic evidence for the Late Republic and Empire reinforces some of the more rewarding literary texts of the period (notably Strabo and Pliny) to give us a fairly full picture of the developed “cellular” landscape of this region in the Roman age. Only in some of the mountainous zones is it at all likely that new communities might emerge; note Frigento, for instance. The certain localization of Cluviae, a *municipium* of moderate importance, and the probable identification of the historically significant town of Ligure Corneliani, are relatively recent discoveries. At the lower levels of the settlement hierarchy there is much to await; some villages (such as the recently pinpointed Pagus Vescinus), sanctuaries, and thermal springs (note Aquae Caeretanae), are now much better known, but in a largely unrepresentative fashion.

Centuriated landscapes, and, perhaps more surprisingly, the exact courses of major stretches of the most important “consular” roads, are far more controversial. The former have received considerable scholarly attention—an excessive amount, one might almost say, since over-imaginative identifications and over-confident cartography have often given rise to bitter controversy. Sometimes genuine discoveries still defy mapping, as with the Gracchan centuriation now attested in the Valfortore (middle Furtur valley).

The choice of roads shown has been made conservatively, and equal caution has been exercised in marking stretches as certain. The accurate plotting of the thousands of genuine archaeological attestations of built roads in this area (as opposed to the tracing of plausible, but often unverified, routes on small-scale maps) is a goal very far from realization. We must bear in mind, too, that over time even major roads underwent numerous small alterations of route, and that they shaded into an extensive hierarchy of capillary routeways, which it would be impossible to show at this scale even with better information. No attempt is made here to indicate changes of route over time, even where they are very likely—as on the Via Appia at Tarracina, or in the vicinity of Massicus Mons, or around Fregellae on the Via Latina. Even roads that bear imperial names are not marked in single-period colors, since it is likely that their routes were in use long before a road was formally laid. Equally, no attempt is made to indicate renaming of roads.

It is not possible to show all bridges either (Mosca 1995 lists well over 300 for Regio VII alone). The itineraries, here as elsewhere, provide information of the first importance (note Calzolari 1996), but it is often difficult to relate it to literary and archaeological data. Even as near Rome as this region, the identification of highly significant routes may be very vexed (note ‘Herculis Rani’?). There is an abundant scholarly literature on these questions, but so far few new certainties have emerged. I have tried not to adopt unverifiable hypotheses, and in particular have erred on the side of caution in declining to assume that the *tratturi* (drove-roads) of the Neapolitan *dogana* and its equivalent in the Papal State are of any direct assistance in tracing ancient routes.

The scale of the modification of landscape by the Romans—most spectacularly by drainage works such as the Fucinus Lacus project—is becoming clearer all the time; but only a limited number of cases lend themselves to mapping at this scale. The marking of aqueducts here is another task with a strong element of the arbitrary. Publication of individual sections of conduit and channel proceeds piecemeal, but most of the numerous city-aqueducts attested in inscriptions have never been surveyed; in addition, many of the fragments plotted in the countryside probably belong to systems supplying villas rather than towns (cf. Pagano 1996).

Likewise of the highest importance to the landscape was the phenomenon of the villa. As is now becoming clearer, it derived from pre-Roman units of primary exploitation. Often with accompanying village-structures or similar smaller nuclei of habitation, it became the distinctive unit of the settled landscape. But like the infrastructures of communications and water-supply, as well as the topography of religion, its density here is too great to represent at this scale. Its importance is therefore indicated only by the marking of a small selection of the archaeologically best-documented examples (note Matrice, Posto). The same symbol is otherwise used for a selection of the architecturally and historically most important estates, often properties of the emperor.

Map 45 Tarentum

Compiled by I.E.M. Edlund-Berry and A.M. Small, 1997

Introduction

The landforms of South Italy have changed in many respects since the classical period. On both the Tyrrhenian and Adriatic coasts the sea level has risen in relation to the landmass, submerging the Oenotrides islands which once provided anchorage off the west coast at Velia, and drowning Roman coastal installations on the Adriatic (Michaelides 1992, 21). As elsewhere in the peninsula, the increase in human population has led to deforestation of the hills, with consequent erosion of the slopes and sedimentation in the valley bottoms (Boenzi 1989; Campbell 1994; Barker 1995, 62-83). Increased silting in the lower courses of the rivers created marshy conditions in the coastal plains, which were only drained and rendered safe from malaria in the mid-twentieth century. The alluvial deposits have pushed out the coastline along the Ionian Gulf and the Gulf of Paestum, so that the remains of the ancient ports there now lie a considerable distance inland. Deforestation has also led to flash flooding, which in turn has caused rivers to change their courses. Such change is vividly illustrated by the Via Traiana, which crossed the Cerbalus and Carapelle (ancient name unknown) rivers by bridges that now straddle dry land.

Other changes have been brought about by more deliberate human intervention. Several inland lakes have been drained since Roman times to provide arable land or relieve malaria. We have reconstructed these on the map where the evidence is reasonably clear, as it is at Forum Popili on the R. Tanager (Bracco 1962, 431-34), at Lagopesole at the headwaters of the Bradanus (C3), and in the valley below the heights of the Murge north of Silvium (D3). Modern irrigation schemes have taken most of the water out of many rivers, with the result that several known to have been navigable in Roman times (Strabo 6.264, 283-84), at least in their lower reaches—the Cerbalus, Aufidus, Aciris and Siris—are now reduced to small streams.

In general, we have tried to represent changes to landforms where they can be detected, but given the extent of these processes and the uncertainty involved, the coastlines and even some of the river courses shown should be regarded as approximations for the most part. The Oenotrides islands off Velia cannot be restored.

The area of the map corresponds broadly to Roman Apulia, Calabria and Lucania, with parts of Samnium and Campania. In the Iron Age these regions were inhabited by a number of different tribes whose names are recorded in the historical texts; but the tribal structures changed over time, and there is little evidence for the boundaries between each tribe, if ones even existed. The tribal names can therefore be located only approximately on the map.

Aerial photography has revealed many traces of early roads, especially in the north Apulian plain (Alvisi 1970) and in the coastal plain at Metapontum and Heraclea (Adamesteanu 1962, 50-52). Elsewhere the exact course of pre-Roman roads is often doubtful, for there are few, if any, actual remains. In cases where it is probable that a road connected two major settlements, its most likely route is shown as minor and approximate. Systematic road construction began only after the Roman conquest. In the third century B.C. the Via Appia was extended from Beneventum (Map 44) to Brundisium (Quilici 1989), and another public road (probably known as the Via Annia) was built in the second century B.C. to link Capua (Map 44) with Regium (Map 46). Some time in the Late Republic the Via Minucia was created to provide an alternative route from Beneventum to Brundisium by way of the Adriatic cities. It was reconstructed under Trajan as the Via Traiana. These roads are marked as major, as are other public roads attested by inscriptions, by the itineraries, or by TabPeut. Not all the roads shown by TabPeut can be plausibly located on the ground, however, and a few doubtful cases are therefore omitted. In general, the dates assigned to roads in the Directory can be only approximations at best. Most roads follow natural lines of communication which are likely to have been in use for a much longer span than the literary and epigraphic sources indicate.

The Lucanian mountains were still extensively forested in antiquity (Magaldi 1948, 47-51), but there were many pastures in the mountain glades. Numerous drove-roads connected the summer grazing in the mountains with the winter grazing in the plains (Gabba 1979). Most such roads cannot be shown here, but a very important one is

marked approximately; it ran through the geological rift that separates the Apennines from the plateau of the Murge, and connected the coastal plain at Metapontum with the north Apulian plain (Tavoliere). In all probability it already existed in Roman times, as we may infer from a string of sites along the route, and some epigraphic evidence (Chelotti 1983, 19 (no. 1)).

Aerial photography has produced abundant evidence for schemes of land division in this part of Italy. The hinterland of Metapontum was subdivided in the sixth century B.C. Vast stretches of land were centuriated in the Roman Republic and early Empire in the Tavoliere, in the lower valleys of the Aufidus and Fertur rivers, in the upland valleys (A2) north-east of Beneventum (Map 44), in the coastal plain behind Paestum, and in the Sallentine peninsula. In these areas the configuration of the subdivided blocks shown is derived from analysis of aerial photographs, and is reasonably reliable. In the Tanager valley and at Volcei and Grumentum it is more conjectural, being based on the topographical features of the area, on the assumption that the principal road in the vicinity formed the *cardo maximus* or *decumanus maximus* of the blocks, and on the location of boundary stones set up by the commissioners of 131 B.C.; these have been found near Atina, Co(n)silinum and Volcei (Bracco 1978). What is shown amounts to perhaps half the total area originally centuriated. In addition, the *Liber coloniarum* (Blüme 1848, 208-11) records land division at Aeclanum, Austrinum, Barium, Buxentum, Compsa, Potentia, Tarentum, Teanum Apulum, Tegianum, Velia and Venusia. There can be no doubt that the territories of the colonies planted at Brundisium and Copia were subdivided too. All of this centuriation is missing, however, since there is no good evidence for the extent or orientation of the schemes.

Most of the larger Roman cities must have been supplied by aqueducts. Apart from those shown here at Brundisium, Canusium, Tarentum, Thurii and Venusia, some remains of aqueducts have been recorded at Vibinum (Mertens 1994) and Luceria (BTCGI IX, 264). Moreover there are traces of a second aqueduct at Canusium; it brought water to the city from a source to the north-west (Cassano 1992, 724, 727, 729), and was constructed earlier than the one marked of the mid-second century A.D. An inscribed lead pipe records the officials responsible for maintaining an aqueduct at Aeclanum (Corbier 1984, 265-66). There is insufficient published evidence for the courses of any of these lesser-known aqueducts to be marked.

Sanctuaries have proved especially difficult to classify. Most of those marked were rural centers in which a temple or votive deposit was the main or predominant feature. Some, however, were situated close to village settlements, like the spring sanctuary at Pizzica (near Metapontum) which adjoined a village at the modern site of Pantanello, where the necropolis has recently been excavated (Carter 1998). There were important sanctuaries, too, at many other sites marked as settlements (Edlund 1987; *Il sacro e l'acqua* 1988).

It is impossible to map the numerous small settlements and isolated farms known from field survey and excavation. For a more complete picture, consult the volumes in the FormIt series for Larinum, Venusia and Siris-Heraclea, and the publications of surface surveys in the Tifernus/Biferno (Barker 1995) and Basentello (Small 1998) valleys, as well as near Hyria/Uria (Yntema 1993), Metapontum (Carter 1985), Hydruntum (Roller 1994), Paestum (Paestum 1987), Roccagloriosa (Gualtieri 1990) and San Giovanni di Ruoti (C3; Roberto 1985). Intensive field surveys at Muro Tenente (ancient Scamnum?), Muro Maurizio, Li Castelli, and the Masseria Mea near Cellino S. Marco, all in the Sallentine peninsula, have recently been published by Burgers (1998).

Wherever possible, citations are given to BTCGI, which has exhaustive bibliographies for sites arranged in alphabetical order. For the Roman period, there are several articles with useful lists of archaeological sites and bibliographies covering most of the map in SRPS I (1981).

Map 46 Bruttii

Compiled by I.E.M. Edlund-Berry and A.M. Small, 1997

Introduction

The name Calabria, currently given to most of the area covered by the map, originally denoted the territory of the Calabri in the Sallentine peninsula (Map 45 H4 and inset); but from the mid-seventh century A.D. it was gradually transferred to the Toe of Italy as a result of a series of administrative changes made by the Byzantine emperors (Gay 1904, 6-7). The region had no settled name in classical antiquity. According to tradition, it was once inhabited by the Ausones or Aurunci. Greeks in the fifth century B.C. knew of Oenotri who inhabited the land mass to the north of the Terina/Scylletium isthmus, and of Itali in the south, so that the peninsula south of this isthmus was Italia proper. After the rise of the Brettii in the late fourth century B.C., Greek writers used the name Brettia to refer to the whole peninsula south of the R. Laos on the west and Thurii on the east. The Romans referred to it sometimes as the Ager Bruttius, and sometimes as Bruttii (Paoletti 1994, 467-71). To the north were the Lucani and Lucania (Map 45).

As in other parts of Italy, the coastline has undergone many modifications since classical times. These are particularly striking in the estuaries of the larger rivers, where the sediments brought down by the current have been deposited in the flood plains, continuously pushing out the shore line. Thus the Greek site of Sybaris, founded near the mouth of the R. Crathis, now lies two miles inland, buried below twelve ft of alluvium. The map shows a conjectural reconstruction of the shoreline in the period of Greek colonization (cf. Schmiedt 1966; 1967), but the process continued throughout classical antiquity. Erosion has been aggravated by deforestation over a long period. More recently, river flows have been drastically affected by extraction of water for irrigation. Water transport would be impossible now on the Carcinus, Crotalus, Semirus, Arocas or Thagines rivers, all of which are listed by Pliny (*NH* 3.96) as navigable.

In contrast to the "indigenous" Iron Age settlements occupying hilltops in the interior, Greek colonies were founded on the coastal plains. Because of the mountainous character of the hinterland, communications between them were generally easiest by sea. They were, however, linked by roads which followed the narrow coastal plain, interrupted on the west coast by the massif of Vibo Valentia. There were also routes across the isthmuses (Vallet 1958; Guzzo 1986); in addition, the long valley of the Crathis gave access to the interior at Consentia from the coastal plain of Sybaris. Numerous tracks, too uncertain to map, linked the mountain grazings with the coast (Givigliano 1994). After the Roman conquest, Regium was connected with Capua (Map 44)—probably by the Via Annia (Bracco 1954; Wiseman 1964; see Map 45), or perhaps the Via Popilia (Degrassi 1955)—and thence to Rome by the Via Appia. The road's main stages are known from the itineraries (Crogiez 1990), although there is doubt about its course in detail (La Torre 1990). Another road continued around the east coast from Regium to Tarentum (Map 45). TabPeut shows a road across the isthmus from Vibo Valentia to Castra Hannibalis, and another connecting Forum Popili in the valley of the R. Tanager (Map 45) with Consentia. From here there was perhaps a link with Vibo Valentia by way of 'Aque Ange'; but TabPeut is corrupt at this point, and neither the road nor 'Aque Ange' have been detected on the ground.

It is reasonable to suppose that the main Greek colonies—Rhegion, Lokroi Epizephyrioi, Croto(n) and Sybaris (and its successor Thurii)—all had land division schemes comparable to those at Metapontum (Map 45) and Heraclea, but the details at present escape us. The same points may apply, too, to Kaulonia and the second-generation colonies on the Tyrrhenian coast at Medma, Hipponion, Terina, Laos and Pyxous. The territories of the Latin colonies of Copia (Livy 35.9) and Vibo Valentia (Livy 35.40; Blüme 1848, 209) were certainly centuriated. The *Liber coloniarum* (Blüme 1848) records centuriation of the Roman period at Buxentum, Consentia and Clamptetia, but these land divisions do not appear on the map since they have not yet been clearly detected on the ground or by aerial survey. Presumably the territories of the Roman colonies at Croto(n) and Tempsa, as well as the Gracchan settlement at Scylletium, were also centuriated, although this is not recorded in the sources.

Most of the larger settlements must have been supplied by aqueducts. One, at Thurii, is sufficiently well attested to be marked on the map, as are two short aqueducts which served villas or road stations at S. Teodoro south of Nicotera (C4) and at Ad Vicesimum (E2). Remains of aqueducts have also been recorded at Vibo Valentia (Albanese 1962), but these cannot be marked for lack of detailed evidence.

The main wealth of Bruttii lay in its forests, especially in the conifers of the Sila mountains, which were a valuable source of timber and pitch (De Caro 1985), and provided shelter for grazing cattle. Granite was quarried at Nicotera, conveniently near the sea for transportation, and there were important copper mines at Tempesa, though these had been exhausted by the late first century B.C. (Strabo 6.1.5). Lenormant (1881 II, 15) records traces of ancient silver workings at Verzino on a tributary of the R. Neto six miles north-west of Zinga, and at Longobucco (both E3); but these have not been adequately documented. It seems probable, however, that the unlocated toponym Argentanum refers to a silver-working center.

No attempt has been made to map the numerous small settlements identified only by field surveys. The areas most intensively studied include the territories of Temesa (Maddoli 1982), Medma (Paoletti 1981), Croto(n) (D'Annibale 1990), and Sybaris (Quilici 1968).

Wherever possible, citations are given to BTCGI, which has exhaustive bibliographies for sites arranged in alphabetical order. For the Roman period, there is a useful list of archaeological sites with bibliographies in Guzzo (1981b). Volumes I and II of Settis (1987) are indispensable, despite the absence of an index.

Map 47 Sicilia

Compiled by R.J.A. Wilson, 1997

Introduction

The island of Sicily has a long tradition of antiquarian interest, and books and articles have been written on its topography since the sixteenth century. Some of the older works, such as Fazello (1558), Cluverius (1619), D'Orville (1764), and especially Houel (1782), still repay study. In more recent times, Sicily is fortunate to have had published, in Manni (1981), a systematic listing of all place names and other toponyms which occur in the ancient sources, although his identification with modern sites on the ground is not always reliable (cf. Wilson 1985). Another invaluable tool of research is Nenci and Vallet's BTCGI (1977-). In the last fifty years especially, there has been an explosion of archaeological research, the results of which can be followed in the quadrennial reports to the Palermo conferences appearing in *Kokalos*, as well as in other important conference volumes such as those on the area of the Elymi in western Sicily (Nenci 1992; 1997), or through the periodic reviews of Sicilian archaeological work published in *ArchRep* (most recently Wilson 1987; 1995). Also very useful are two volumes reporting on recent work by the Palermo Soprintendenza (Di Stefano 1993b; 1997). Yet despite all this scholarly interest and activity, many topographical questions remain unanswered.

With regard to physical geography, coastline changes since antiquity are believed to have been minor, but little geomorphological work has been undertaken, with the exception of a pioneering survey of the south-east coastline (Basile 1988; Lena 1988). This has demonstrated a rise in sea level since antiquity affecting, among other places, the coastal topography of Syracuse itself. We also know that the ancient shoreline on the north coast at Himera was some 650 ft inland from the modern one (Allegro 1992, 146), a shift too small to show on the map, and that the sea level has risen nearly two ft since antiquity in the Stagnone di Marsala, thus flooding the ancient causeway which linked Motya to the Sicilian mainland, and turning the peninsula of Aigithallos into an island, the modern Isola Grande (Famà 1995). Elsewhere, in the absence of detailed information, the coastline shown is the same as the modern one, because the changes detectable since antiquity, such as the silting-up of harbors at Akragas/Agrigentum, Camarina, Helorus and Selinus, are too limited to show at this scale. In the extreme south-east, however, an attempt has been made to show ancient harbors in areas which are now marsh or inland lagoon; but further geomorphological work is needed here for more precise mapping, and the coastline shown may not be reliable in detail. For a very different reason—the eruption of Mount Etna in 1669—the ancient harbor of modern Catania has also disappeared; the Castello Ursino, until then on the sea, is now a quarter-mile inland. There are also likely to have been some physical changes, especially of water courses, in the major plain of Catania's hinterland. Here, for example, we know that until 1621 the R. Gornalunga had a separate mouth from the R. Simeto (ancient Symaethus), of which it is now a tributary. Its separate mouth and lower ancient course are thus shown with approximate linework, immediately south of the Symaethus (G4); its ancient name remains unknown.

There has likewise been very little work done on the road system. Although the sources have been extensively reviewed, archaeological fieldwork is still in its infancy (Interdonato 1988 makes a start). The island is peculiar in having produced only a single certain milestone, on the Pan(h)ormus-Agrigentum road (Di Vita 1955). Even the *Via Pompeia* (Cicero, *II in Verrem* 5.169) has not been certainly identified, since opinion is divided over whether this refers to the east coast trunk route, or the road running along the north coast. Roads have been shown as certain where the coastal strip between mountains and sea is so restricted that the modern and ancient alignments must surely coincide; otherwise, wherever a route has not been traced by detailed fieldwork on the ground, it has been marked as approximate. Local topography has been taken into account, following river valleys, *trazzere* (field tracks, sometimes on the course of the royal coach roads of the seventeenth and eighteenth centuries), and in part modern roads. Particular uncertainty attaches to the Agrigentum-Pan(h)ormus road (despite its milestone), since none of the nucleated centers listed along its line by ItAnt has been identified with certainty on the ground. Equally uncertain are the courses of the two alternative routes between Agrigentum and Philosophiana given by the same itinerary. The map marks Petiliana on the more southerly of the two, on the basis of the findspot of a tile stamped

PETIL. Cosconiana and Calloniana will therefore be situated on the northern route, but that contradicts most previous scholarship (Manni 1981, 153, 161).

Altogether, in marking roads a conservative policy has been adopted. Apart from routes indicated by the Roman road itineraries, a Phintias-(H)Enna-Halaesa road is implied by a passing comment of Cicero (*II in Verrem* 3.192). A road is suspected on the west side of Etna connecting Adranon to the main road; likewise a route across the Madonie range linking the hill towns of Agyrium, Engyon, Capitium and Amestratus, the existence of which is logical but not actually proven. Except for the Adranon road, whose existence is proved by the recorded remains of a Roman bridge, none of these is marked on the map. Many other such routes could have been added in speculative fashion—clearly, roads would have linked many of the hill towns of the interior in archaic, classical and Hellenistic times, for example—but in the absence of specific ancient evidence they are omitted.

Identification of the main ancient urban centers, situated on the coast, is not in doubt; they have long been known and recognized. The urbanism of the interior, however, is another matter. Many of the hilltop towns here were gradually given up from the fourth century B.C. onwards, a process accelerated by the *pax Romana* and continuing into the first century A.D. (Wilson 1985b). As a result, such places do not appear in the itineraries detailing Roman roads, which with few exceptions (such as (H)Enna and Centuripae) passed them by. What we have, therefore, is a large number of urban centers more or less well defined by modern archaeology, and a list of inland towns offered by sources characteristically lacking geographical precision. Matching the two is not easy. The map is conservative, marking an ancient name only when we may be reasonably confident that it is correctly applied to the place in question. Consequently, many such settlements are identified by their modern name only. Ancient town-names which cannot confidently be matched with a known site are listed as Unlocated Toponyms.

One further point should be made about the distribution of urban settlement. Because of the lengthy chronological span embraced by the map, there is insufficient scope to represent the very considerable shifts in the pattern of urban settlement over time. Thus the Greek colony of Himera on the north coast, founded in the seventh century B.C. but largely abandoned at the end of the fifth, was succeeded by Thermae Himeraeae ten miles to the west, a new foundation c. 403 B.C., which flourished throughout Hellenistic, Roman and Byzantine times, and beyond. Both sites appear, therefore; but they never co-existed, although the hot spring at the latter was frequented from classical times at least. More generally, by the middle of the Roman imperial period, Sicily had less than two dozen major urban settlements.

Urban aqueducts feature less than might be expected. They existed, to be sure; but, with some notable exceptions, they have as yet been the subject of insufficient fieldwork and publication. The exceptions are those at Thermae Himeraeae, which have received notable treatment in a monograph (Belvedere 1986), and that of Catina, studied by Lagona (1964) and again more recently by Lamagna (1997). For the water supply of Syracusae, however, we have to go back to the splendid topographical research of Cavallari (1883) and Holm over a century ago, who identified four aqueducts of Hellenistic and Roman date there. There is also a hint that Selinus may have had its own aqueduct, but again the research reporting it dates back more than a century (Salinas 1885). It may have been a Roman rural aqueduct, but too little is known about it or its destination for it to feature on the map. The Roman aqueduct(s) of Tauromenium, of which some brick-faced concrete arcading survives above the village of Mongiuffi, remains completely unpublished, and the water supply of most other urban centers of Sicily remains unstudied (but note Crouch 1993 for details on Syracusae, Agrigentum and Morgantina). Lilybaeum is known to have had an aqueduct built in *opus quadratum* by Domitian in A.D. 84 (CIL 10.7227), but it has never been traced on the ground. Rural aqueducts are little known. The two channels serving the villa at Casale di Piazza Armerina have been traced over too short a distance to feature here (Carandini 1982, 371-73). The same applies to those suspected at Montallegro, possibly serving the settlement at Campanaio (C4), and at S. Venera al Pozzo (G3), where there appears also to have been a siphon (Wilson 1990, 8, 227-28). On the other hand, the indisputably Roman aqueduct serving the road station of Philosophiana, bringing water over a quarter-mile from the west, is marked. The aqueduct described as 'ancient' by Orsi (1895) near a Roman site in the region of Canicattini (west of Syracusae) may be post-antique and is thus omitted.

Rural settlement as a whole poses problems of a different kind. Sporadic fieldwork over many years has identified a wide range of settlement from pottery and tile debris on the ground, and this information has been usefully assembled by Bejor (1986). The evidence for many other settlements has been presented, somewhat uncritically, in the various compilations of Giustolisi (for example, 1973; 1975; 1976; 1981; 1985; 1988a). Only occasionally, however, have the size or nature of the settlement been closely defined by more rigorous fieldwork or

excavation (Wilson 1982; 1985a; 1996 for the area near Heraclea Minoa; Belvedere 1988 for the hinterland of Himera; Johns 1992 for the Belice valley; Vassallo 1992 more generally for the province of Palermo; Canzanella 1993 for the area around Entella). The only such rural sites marked are those where the results of research are important enough to warrant more than casual mention in modern scholarship. There are of course countless more such sites not marked.

Virtually all known villas are marked—that is, those sites clearly demonstrated to have had architectural or artistic embellishments appropriate to a private country mansion of some social pretensions. In fact, very few have been excavated so far (Wilson 1990, 194-214). Rural findspots of sarcophagi or portrait busts alone, although probably indicative of villas nearby, are omitted (see Wilson 1990, 212 (fig. 173) for their location). The most convenient listing of all known ancient sites in the island (including a map at 1:500,000), is that recently produced by the Regione Siciliana: this is the first attempt at a Sicilian “Sites and Monuments Record” (D’Andria 1996).

The **Maltese islands**, famous for their prehistoric monuments, played only a minor role in subsequent antiquity. In the Hellenistic period they fell within the orbit of Carthage, until their absorption by Rome in 218 B.C. Thereafter, administratively, they formed part of the province of Sicilia. Melita on Malta and Gaulus on Gozo were the only significant urban settlements. A number of *villae maritimae* are known, but much still remains to be learned of these islands in Greek and Roman antiquity (Trump 1972; Lewis 1977).

Map 48 Sardinia-Corsica

Compiled by S.L. Dyson, 1995

Introduction

The ancient geographical information on **Sardinia** is rich and varied. Moreover, as part of their strategy of controlling the island, the Romans developed a complex network of roads with associated garrisons and way-stations. This complexity is reflected both in the detail of ItAnt, and by the large number of milestones recovered (over 150 to date).

Information from classical authors (especially Strabo, Pliny and Ptolemy), the itineraries and inscriptions, together with archaeological remains, allows most locations known from the sources to be identified with reasonable precision. Sardinia also has a long and solid tradition of topographical research, beginning with Ferrero della Marmora (1839). This continued with the researches of Giovanni Spano in the mid to late nineteenth century. The history and archaeology of the island are well summarized in such more recent works as Meloni (1990). It seems clear, however, that its interior saw little in the way of monumental development during Roman times. Even at an important administrative center like Hydata Hypsitana/Forum Traiani (modern Fordongianus), few public or private structures remain. The situation is worse still at smaller centers.

Both in Roman times and earlier Sardinia was noted for its mining activity, but so far efforts to locate this with much confidence have largely failed. It is likely that at least some areas mined in modern times were exploited similarly in antiquity, but specific proof remains lacking (cf. Agus 1989).

For **Corsica**, the quantity and quality of the evidence are very different. The Romans made only a limited effort to develop and even control the island. Thus here the information from Ptolemy assumes a special importance. Thirty-two out of the 38 names he lists appear only in his text. Clearly, for contemporaries the most significant parts of the island were the coastal settlements, coastal landmarks and associated sea routes. The Romans appear to have made relatively little attempt to control the interior. Significant urban development was limited to a few coastal centers like Mariana and Aleria. Tribal peoples who generally lived in small, scattered communities, dominated the interior. The road system was limited to one east coast road, with possibly a cross-island route somewhere too. Just three place names appear in the Roman itineraries, only two of which can be located with any precision. This paucity of itinerary information and the lack of milestones make the task of reconstructing the road network extremely difficult.

Since Ptolemy is our major source, much of the topographical research on Corsica has been focused on place names in his text that can be related to specific modern locations. Jehasse (1976) and Moracchini-Mazel (1989) represent the two most recent reconstructions. Given the lack of archaeological and epigraphical evidence for the classical period, most of these locations remain hypothetical. The general pattern is probably correct, but seldom can a toponym be confidently associated with a specific ancient site. The problem is compounded for the interior by the fact that tribal peoples were often transhumant, and that the territories controlled by them shifted.

Classical archaeologists have focused on the few major sites, especially Aleria. One of the first volumes in the CAGR series (1933) was devoted to the island. Classical finds are regularly reported in *Gallia*. Zucca (1996) gathers and discusses the most recent archaeological and epigraphical evidence for the Roman period.

Directory

All place names in Corsica are in France; all place names in Sardinia are in Italy

Map 49 Illyricum

Compiled by J.J. Wilkes, 1995

Introduction

The map is dominated by the mountainous watersheds of the south-west Balkans—between the Danube basin and the Mediterranean, and between the Adriatic and the Aegean Seas—which meet at the great massif of the Sar Planina (ancient Skardon Mons) between the upper valleys of the R. Drin (Drilon) and the R. Vardar (Axios). The region is crossed from the west and from the north by two major routes; these converge at Salonica (Thessalonica) on the Thermaic Gulf, the dominant city of the area since its foundation in the late fourth century B.C. In the north two routes, from the Upper Ibar and Upper Morava, unite at Skopje (Scupi), ancient center of Dardania, and then follow the course of the Vardar through the narrows above Titov Veles (Bylazora?) to Stobi, ancient center of Paionia, at the confluence of the R. Crna Reka (Erigon). From there the route again follows the Vardar, though bypasses the Demir Kapu defile, to enter the historical heartland of Lower Macedonia around Pella. The general line of the road is not in doubt, although its exact course, and the locations of some minor stations recorded in TabPeut, have yet to be identified.

The same applies both to the next passage through the watershed to the east, down the R. Struma (Strymon) valley from Kjustendil (Pautalia) in north-west Thrace to Amphipolis on the main coastal route, and to a lesser route from Pautalia via Stobi to Herakleia in Pelagonia (D2). Both routes are recorded by TabPeut. In the second century B.C. the Romans constructed a strategic route from the ancient Corinthian colonies at Apollonia and Dyrr(h)achium/ Epidamnos on the Adriatic to Thessalonica in order to secure their new province of Macedonia. This road, the Via Egnatia, named after an early Roman proconsul Cn. Egnatius (Collart 1976), followed a difficult course along the R. Shkumbini (Genusus) over the Candaviae mountains to Ohrid (Lychnidos) in the high lakeland; thence, crossing several high passes, it proceeded via Herakleia and Edessa to Pella. In spite of its difficulty, it remained the major route between the southern Adriatic and the Aegean until modern international boundaries supervened. Recent investigations in Albania, the Former Yugoslav Republic of Macedonia, and Greece have established the line of the road in many places. Also now identified are the locations of most of the stations listed by the itineraries. For some stretches, the lists of ItAnt and TabPeut do not correspond. The most detailed record of relay stations (*mutationes*) and stopping-places (*mansiones*), however, is furnished by ItBurd. Few traces have yet been found of the road recorded by TabPeut between Lezha (Lissus) and Niš (Naissus, Map 21 D6) via the Drin and Ibar river valleys, along part of the most direct route between the southern Adriatic and the lower Danube.

A significant number of the places and communities named in ancient accounts of wars in the area have yet to be located. The topography of these episodes has been studied by Hammond, drawing on an exceptional knowledge of the terrain and the pattern of Balkan warfare. Some of his more radical and intuitive reconstructions, which are accepted here, have been doubted by Papazoglou in her studies of the topography and settlements of Roman Macedonia.

The many fortified hill settlements in Albania, the Former Yugoslav Republic of Macedonia, and north-west Greece—shown by TIR Naissus—are omitted here, except where they relate directly to significant areas of ancient mining.

Map 50 Macedonia

Compiled by E.N. Borza, 1994

Introduction

Map 50 Macedonia

Map 51 Thracia

The single most valuable guide to Greek and Roman settlements as far east as Philippi is Papazoglou (1988). While ostensibly a treatment of Roman towns in Macedonia, it incorporates considerable information about pre-Roman periods at many sites, and includes exhaustive and valuable notes on the ancient sources and modern scholarship. Although now largely supplanted by Papazoglou on the treatment of individual sites and the road system, Hammond (1972) presents a comprehensive overview of the historical geography and topography of Macedonia. For Chalcidice, Zahrt's (1971) study emphasizes pre-Roman periods. TIR Philippi, covering those parts of Thrace lying within modern Greece, is generally accurate and has comprehensive bibliographies. Isaac (1986) is a useful survey with references to the ancient sources and modern scholarship. Since the 1920s much of Thrace, especially the Chersonese, has been a military zone, with the result that archaeological survey and excavation have been severely restricted.

TIR Naissus provides information about hundreds of Roman sites within the modern state of Macedonia; for areas within Greece today, however, it is less reliable. References to south Slavic scholarly investigations more recent than those listed by it can be found in MAA and ArchJug. On the Greek side, two annual publications cover continuing archaeological work in the region: the summaries of recent work cited in BCH, and the archaeologists' own reports in AEMT. RE remains a comprehensive guide to the ancient evidence for toponyms.

The ancient courses of the principal rivers flowing into the central Macedonian plain are largely conjectural because over the centuries they have frequently shifted in this highly alluviated region. The extent of the lake below Pella—even its very existence in antiquity—is a matter of dispute. I do not follow Hammond's reconstruction (1972, 142-52) here in several respects, since our views differ on the sea levels in antiquity relative to modern times. To illustrate this constantly changing environment, the map marks the approximate coastline in the late fourth century B.C., and again in the mid-second century A.D.; by the latter period, alluviation had progressed sufficiently to support a major Roman highway from the Pierian coastal plain to Thessalonica.

It would be well-nigh impossible to cite in detail the scholarly literature for the placement of all the segments of ancient road marked. The methods by which such roads are reconstructed in this part of the Balkans—with varying degrees of confidence—often depend upon a multiplicity of interlocking evidence, including archaeological remains of roads, stations, bridges and milestones, as well as literary references. Autopsy, too, has been significant in some instances. For the most important route across the lower Balkans in antiquity, the Via Egnatia, TIR Naissus, TIR Philippi and RE should be consulted; on the details of some western sections of this road, see Hammond (1982; 1983) and Gounaropoulou (1985). Considerable detail on Macedonia is offered also in the sections on historical geography in Hammond (1972) and Hatzopoulos (1987; 1989). Thrace is less well served, both because of the remoteness of much of the region and because it has been less studied. TIR Philippi offers an excellent map and useful indexes, and the individual entries have the advantage of being well researched and up to date. Valuable discussions (with maps) of many other roads are to be found in Collart's study of the vicinity of Philippi (1937), Samsares' monograph on the historical geography of eastern Macedonia (1976), Hodinott's study of ancient Bulgaria (1975), and the presentation of evidence relating to roads in IGBulg and CIL III.

Elaborate Macedonian tombs dot the countryside; many are found in places where there are no known ancient settlements. The absence of such evidence, however, may indicate only that the settlement has yet to be discovered. Even so, it remains problematic whether the Macedonians consistently built tombs in conjunction with a settlement. It is possible that these are to be found along roads, too, or in the countryside far from any town, in the manner of Etruscan and many Roman tombs.

Map 51 Thracia

Compiled by E.N. Borza, 1994
with the assistance of G. Reger

Introduction

Mainland: see Introduction to Map 50.

Islands

For Thasos in particular, the harvest of toponyms and sites is very rewarding, and grows every year with the work of the Franco-Hellenic archaeological teams that continue to scour the island. The map marks only a selection of the sites that could have been shown here, and possibly a rather arbitrary one at that. As on other islands rich in towers, only a selection is marked (again, perforce somewhat arbitrarily); all are shown as forts without prejudice to their actual function (see Bon 1930; and above all Osborne 1986), except for two of the three structures identified as lighthouses by Kozelj (1989). Omitted are the potteries that seem to be coming to light with bewildering frequency (Garlan 1996). For a variety of reasons, Imbros remains underexplored.

Directory

All place names are in Greece unless otherwise noted
