

THE  TIMES

ATLAS
OF THE
WORLD

MINI EDITION

THE TIMES ATLAS OF THE WORLD

The Times Atlas of the World

has long been famous for its tradition and authority, and each atlas in the range offers outstanding quality and attention to detail.

This fully revised Mini Edition provides a complete and up-to-date picture of today's world. The detailed reference maps have been created specifically for this format and provide balanced and accurate coverage of every part of the world in the distinctive '*Times*' style. They include new maps of the world's countries and physical features.

The introductory section provides an overview of the world today in a series of satellite images, maps, graphics and statistics, and the index includes over 20,000 place names.

INDEX

161-256

OCEANIA

Australia and the vast expanse of the Pacific Ocean dominate this satellite image of Oceania. The islands of Indonesia lie to the northwest of Australia and New Guinea to the north, with the islands of the Solomon Islands chain, Vanuatu and New Caledonia stretching southeast from New Guinea towards New Zealand. The Hawaiian Islands appear top right of the image.

EUROPE

The distribution depicts Scandinavia, the British Isles, Spain and Italy can be clearly seen on this map. Greenland lies to the northwest with Svalbard top center. The huge land mass of the Russian Federation stretches from the Gulf of Bothnia into the Black Sea on the centre right of the map, northeast into Asia and beyond the horizon.

Copyright © 2004 John Wiley & Sons, Ltd.

SOUTH AMERICA

South and Central America appear in the center of this image with the Pacific Ocean to the west and the Atlantic Ocean to the east, and Africa appearing on the northern and southeast horizons. The Galapagos Islands lie off the coast of Ecuador and the Falkland Islands, South Georgia and the Antarctic Peninsula off the southern tip of the continent.

Maxwell's demon

- A. Rainy climates with no winter coldest month above 10 °F (4 °C)
- B. Dry climates. Limits are defined by formulas based on rainfall effectiveness
 - BS Steppes or semi arid
 - BW Desert or arid climate
- C. Rainy climates with mild winters coldest month above 0 °C (32 °F) but below 18 °F (4 °C) warmest month above 10 °F
- D. Rainy climates with severe winters coldest month below 0 °F warmest month above 10 °F
- E. Polar climates with no warmest month below 10 °F
 - ET "undra climate warmest month below 10 °F but above 0 °F
 - EF Perpetual frost all months below 0 °F

- a Warmest month above 22°C (71.6°F)
- b Warmest month below 22°C (71.6°F)
- c Less than four months over 10°C (50°F)
- d As c but with severe cold: coldest month below -38°C (-36.4°F)
- f Constantly moist rainfall throughout the year
- h Warmer dry all months above 0°C (32°F)
- k Cooler dry at least one month below 0°C (32°F)
- m Monsoon rain: short dry season, compensated by heavy rains during rest of the year
- n Frequent fog
- s Dry season in summer
- w Dry season in winter
- * Modification of Köppen definition

WORLD WEATHER EXTREMES

Highest shade temperature	57.8°C/138°F Al 'Aziziyah, Libya (13th September 1922)
Hottest place — Annual mean	34.4°C/93.9°F Dabol, Ethiopia
Driest place — Annual mean	0.1 mm/0.004 inches Desierto de Atacama, Chile
Most sunshine — Annual mean	90% Yuma, Arizona, USA (over 4 000 hours)
Least sunshine	Nil for 182 days each year, South Pole
Lowest screen temperature	-89.2°C/-128.6°F Vostok Station, Antarctica (21st July 1983)
Coldest place — Annual mean	-56.6°C/-69.9°F Plateau Station, Antarctica
Wettest place — Annual mean	11 873 mm/467.4 inches Meghalaya, India
Highest surface wind speed	
— High altitude	372 km per hour/231 miles per hour Mount Washington, New Hampshire, USA, (12th April 1934)
— Low altitude	333 km per hour/207 miles per hour Qaanaaq (Thule), Greenland (8th March 1972)
— Tornado	512 km per hour/318 miles per hour Oklahoma City, Oklahoma, USA (3rd May 1959)
Greatest snowfall	31 102 mm/1 224.5 inches Mount Ranier, Washington, USA (19th February 1971 — 18th February 1972)

2. Africa, Asia (excluding Japan), Latin America and the Caribbean, and Oceania (excluding Australia and New Zealand).

3. Includes Russian Federation.

4. South America, Central America (including Mexico) and all Caribbean Islands.

CITIES

THE WORLD'S
LARGEST CITIES 2001

Figures are for the urban agglomeration, defined as the population contained within the contours of a contiguous territory inhabited at urban levels without regard to administrative boundaries. They incorporate the population within a city plus the suburban fringe lying outside of, but adjacent to, the city boundaries.

INTRODUCTION TO THE ATLAS

In the tradition of The Times Atlas of the World, the map sequence in this edition starts at the International Date Line in the Pacific Ocean and broadly works westwards, moving from Oceania through Asia, Europe, Africa, North America and finally to South America. Each continent is introduced by a politically coloured map on the same projection as the satellite images on pages 6-17 at the beginning of the atlas.

The map pages include a key to the relief layer-colouring and scale bars. The measurements on the relief key are given in both metric and imperial units and there are separate metric and imperial scale bars. The symbols and place name abbreviations used on the maps are fully explained on pages 42-43. The alphanumeric reference system used in the index is based on latitude and longitude, and the number and letter for each graticule square is shown along the sides, top and bottom of each map, within the map frame, in red.

PROJECTIONS

The creation of new computer-generated maps presented the opportunity to review the map projections used and to select projections specifically for the area and scale of each map, or suite of maps. As the only way to show the Earth with absolute accuracy is on a globe, all map projections are compromises. Some projections seek to maintain correct area relationships (equal area projections), true distances and bearings from a point (equidistant projections) or correct angles and shapes (conformal projections); others attempt to achieve a balance between these properties. The choice of projections used in this atlas has been made on an individual continental and regional basis. Projections used, and their individual parameters, have been defined to minimize distortion and to reduce scale errors as much as possible.

The selection of projections for the series of regional maps within each continent has been made on an individual basis for that region. The Albers Conic Equal Area projection has been selected for Asia; in Europe the Conic Equidistant projection has been used and the Lambert Azimuthal Equal Area projection has been employed in North America, South America, Africa and Australia. The projection used is indicated at the bottom left of each map page.

PLACE NAMES

The spelling of place names on maps has always been a matter of great complexity, because of the variety of the world's languages and the systems used to write them down. There is no standard way of spelling names or of converting them from one alphabet, or symbol set, to another. Instead, conventional ways of spelling have evolved in each of the world's major languages, and the results often differ significantly from the name as it is spelled in the original language. Familiar examples of English conventional names include Munich (München), Florence (Firenze) and Moscow (from the transliterated form, Moskva).

In this atlas, local name forms are used where these are in the Roman alphabet, though for major cities, and main physical features, conventional English names are given first. The local forms are those which are officially recognized by the government of the country concerned, usually as represented by its official mapping agency. This is a basic principle laid down by the United Kingdom government's Permanent Committee on Geographical Names (PCGN) and the equivalent United States Board on Geographic Names, BGN. The names of continents, oceans, seas and under water features in international waters

BOUNDARIES

The status of nations, their names and their boundaries, are shown in this atlas as they are at the time of going to press, as far as can be ascertained. Where an international boundary symbol appears in the sea or ocean it does not necessarily infer a *de jure* maritime boundary, but shows which off-shore islands belong to which country. The extent of island nations is shown by a short boundary symbol at the extreme limits of the area of sea or ocean within which all land is part of that nation.

Where international boundaries are the subject of dispute it may be that no portrayal of them will meet with the approval of any of the countries involved, but it is not seen as the function of this atlas to try to adjudicate between the rights and wrongs of political issues. Although reference mapping at atlas scales is not the ideal medium for indicating the claims of many separatist and irredentist movements, every reasonable attempt is made to show where an active territorial dispute exists, and where there is an important difference between '*de facto*' (existing in fact, on the ground) and '*de jure*' (according to law) boundaries. This is done by the use of a different symbol where international boundaries are disputed, or where the alignment is unconfirmed, to that used for settled international boundaries. Cease-fire

lines are also shown by a separate symbol. For clarity, disputed boundaries and areas are annotated where this is considered necessary. The atlas aims to take a strictly neutral viewpoint of all such cases, based on advice from expert consultants.

JAMMU AND KASHMIR

The territory is *de facto* divided between India and Pakistan along a cease-fire line established following hostilities in 1948 and formalized in 1972 as the Line of Control. It terminates at a grid reference known as NJ9842: between that point and the Chinese border there is no agreed dividing line. The area known as Aksai Chin is regarded by India as an integral part of Jammu and Kashmir and therefore of Indian territory, but is *de facto* controlled by China.

SCALE

appear in English throughout the atlas, as do those of other international features where such an English form exists and is in common use. International features are defined as features crossing one or more international boundary.

Country names are shown in conventional English form, but include changes promulgated by national governments and adopted by the United Nations - Myanmar (replacing Burma), Belarus (replacing Belorussia) and a variety of other versions including the traditional White Russia), Kyrgyzstan (for Kirghizia or Kirgizia), Moldova (Moldavia), and Côte d'Ivoire (Ivory Coast).

In order to directly compare like with like throughout the world it would be necessary to maintain a single scale throughout the atlas. However, the desirability of mapping the more densely populated areas of the world at larger scales, and other geographical considerations, such as the need to fit a homogeneous physical region within a uniform rectangular page format, mean that a range of scales have been used. Scales for continental maps range between 1:40 000 000 and 1:70 000 000, depending on the size of the continental land mass being covered. Scales for regional maps are typically in the range 1:20 000 000 to 1:30 000 000. Mapping for most countries is at scales between 1:8 000 000 and 1:15 000 000.

SYMBOLS AND ABBREVIATIONS

Map symbols used on the map pages are explained here. The depiction of relief follows the tradition of layer-colouring, with colours depicting altitude bands. Ocean pages have a different contour interval. Settlements are classified in terms of both population and administrative significance. The abbreviations listed are those used in place names on the map pages and within the index.

BOUNDARIES

-  International boundary
-  Disputed international boundary or alignment unconfirmed
-  Undefined international boundary in the sea
All land within this boundary is part of state or territory named
-  Administrative boundary
Shown for selected countries only
-  Ceasefire line or other boundary described on the map

TRANSPORT

-  Motorway
-  Main road
-  Track
-  Main railway
-  Canal

INTRODUCTION TO THE INDEX

The index includes all names shown on the maps in the Atlas of the World. Names are referenced by page number and by a grid reference. The grid reference correlates to the alphanumeric values which appear within each map frame. Each entry also includes the country or geographical area in which the feature is located.

Entries relating to names appearing on insets are indicated by a small box symbol: , followed by a grid reference if the inset has its own alphanumeric values.

Name forms are as they appear on the maps, with additional alternative names or name forms included as cross-references which refer the user to the entry for the map form of the name. Names beginning with Me or Mac are alphabetized exactly as they appear. The terms Saint, Sainte, etc, are abbreviated to St, Ste, etc, but alphabetized as if in the full form.

Names of physical features beginning with generic, geographical terms are permuted – the descriptive term is placed after the main part of the name. For example, Lake Superior is indexed as Superior, Lake; Mount Everest as Everest, Mount. This policy is applied to all languages.

Entries, other than those for towns and cities, include a descriptor indicating the type of geographical feature. Descriptors are not included where the type of feature is implicit in the name itself.

Administrative divisions are included to differentiate entries of the same name and feature type within the one country. In such cases, duplicate names are alphabetized in order of administrative division. Additional qualifiers are also included for names within selected geographical areas.
